NOTICE

This reference is intended to provide data about chemical hazards and guidelines for those trained in the proper use and application of pesticides and agricultural chemicals and trained to respond to hazardous materials spills and accidents. It is not intended as a primary source of research information. **As with any reference, it cannot include all information or discuss all situations that might occur. It cannot be assumed that all necessary warnings and precautionary measures are contained in this work, and that other, or additional, information or assessments may not be required. Most of all, it cannot replace the training and experience of individual responders. Extreme care has been taken in the preparation of this work and, to the best knowledge of the publisher and the editors, the information presented is accurate and no warranty is expressed or implied. No warranty,**

express or implied, is made. Information may not be available for some chemicals; consequently, an absence of data does not necessarily mean that a substance is not hazardous. For major incidents it will be necessary to obtain additional detailed information from other resources as well as more expertise from those with more extensive training. Neither the publisher nor the editors assume any liability or responsibility for completeness or accuracy of the information presented or any damages of any kind alleged to result in connection with, or arising from, the use of this book. The publisher and the editors strongly encourage all readers, and users of chemicals, to follow the manufacturers' or suppliers' current instructions, technical bulletins, and material safety data sheets (MSDSs) for specific use, handling, and storage of all chemical materials.

About the Editors

Stanley A. Green and Richard P. Pohanish are the authors of numerous technical and scientific works, including the *Wiley Guide to Chemical Incompatibilities*, *Hazardous Materials Handbook: Storage, Handling, Transportation, and Emergency Management*, and the *Hazardous Substance Resource Guide, Second Edition*, which was selected by the American Library Association as a Notable Reference in 1994. Mr. Pohanish is also the editor of the best selling *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens, Fourth Edition, Volumes I and II*, also published by William Andrew Publishing.

Preface

This companion to *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* provides chemical, regulatory, health, and safety information on nearly 800 pesticides and other agricultural chemicals. These products are organized with common names, chemical synonyms, trade names, chemical formulae, US EPA (United States Environmental Protection Agency) pesticide codes, EEC (European Economic Community), EINECS (European Inventory of Existing Commercial Substances), RTECS (Registry of Toxic Effects of Chemical Substances), CAS (Chemical Abstract Service numbers), and other unique identifiers so that all who may have contact with, or interest in them can find needed information quickly.

For the most part, and in keeping with the broad changes initiated with the fourth edition of *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens*, this work is focused on "regulated chemicals." This implies recognition by some government agency, or rule-making body. For example, the "Regulatory Authority" section has been expanded, now containing U.S. federal listings as well as those for California, the largest agricultural state. Data are furnished, to the extent currently available, in a multi-section uniform format to make it easy for users who wish to find information quickly or to compare data within various records in any or all of these important categories:

- Chemical Name
- Use Type
- CAS Number
- Formula
- Alert
- Synonyms
- Trade Names
- Producers
- Chemical Class
- EPA/OPP PC Code
- California DPR Chemical Code
- ICSC Number
- RTECS Number
- EEC Number
- EINECS Number
- Uses
- Human toxicity (long-term)
- Fish toxicity (threshold)
- U.S. Maximum Allowable Residue Levels (with CFR citations)
- Carcinogen/Hazard Classifications
- U.S. EPA Carcinogens
- U.S. NTP
- California Prop. 65
- U.S. TRI
- IARC
- Label Signal Word
- WHO Acute Hazard

- Endocrine Disruptor
- Regulatory Authority
- Description (and physical properties)
- Incompatibilities
- Permissible Exposure Limits in Air
- Determination in Air
- Permissible Concentration in Water
- Determination in Water
- Routes of Entry
- Harmful Effects and Symptoms
- Short Term Exposure
- Long Term Exposure
- Points of Attack
- Medical Surveillance
- First Aid
- References

It should be noted that a "regulated chemical" need not indicate that it is a "registered product." Products are constantly being registered, canceled, or transferred in the U.S. by the EPA. Nevertheless they may be acceptable in other countries. When used on food products imported into the U.S., they may be subjected to inspection by the USDA (U.S. Department of Agriculture) at ports of entry.

Although every effort has been made to produce an accurate and highly useful handbook, the author appreciates the need for constant improvement. Any comments, corrections, or advice from users of this book are welcomed by the author who asks that all correspondence be submitted in writing and mailed to the publisher who maintains a file for reprints and future editions.

ACKNOWLEDGMENTS

The editors would like to thank the following individuals and institutions, without whose encouragement and generous help, this work would not have been possible. Wendy Kramer, Administrative Librarian, and Judith Foster, Information Technology Assistant, both at the USDA Agriculture Research Service, Eastern Region Research Center in Wyndmoor, Pennsylvania; and Ken Pfeiffer, Pest Management Specialist/Agronomist, USDA/NRCS National Water and Climate Center. The library staff at the Delaware Valley College in Doylestown, Pennsylvania, was most helpful in describing the information needs of students and professionals in the agriculture industry. We are also extremely grateful to our publisher, Bill Woishnis, his excellent staff. We want to thank our editor, Millicent Treloar, for her many suggestions and encouragement. We appreciate the vigilant care of Valerie Haynes and Betty Leahy in the preparation of this work for publication.

This page intentionally left blank

Introduction

Each year, over 350 billion pounds of toxic chemicals are manufactured worldwide. In the United States over 120 billion pounds of pesticides are used annually by industry, government and homeowners. In 2001, worldwide expenditures on pesticides totaled more than \$32 billion, with herbicides accounting for 40% of the total, followed by insecticides, fungicides and other types of pesticides. One third of the world's overall expenditures for pesticides come from the U.S.^(*)

The toxic chemicals problem in the United States, and indeed in all the world, is frightening and abundant news stories abound. In the night of December 2, 1984, in Bhopal, India, 7,000 people died from a leak of methyl isocyanate gas, causing the world's worst industrial accident.

In the U.S. alone, nearly five million chemical poisonings occur annually, resulting in thousands of deaths. A good preponderance of those are from pesticides and other chemicals used in agriculture. Local news outlets frequently report incidents that do not reach national attention. Near Bakersfield, California, 22 farm workers were poisoned when a crop dusting plane applied a mixture of chlorpyrifos, fenprothrin, and profenofos to a neighboring cotton field. In addition, as many as 225 farm workers in nearby grape fields were exposed and later released.^(*)

The widespread use of pesticides and other chemicals on our food supply and other crops is a constant, potential threat to the health and economic livelihood of millions of farm workers. These workers face the highest rate of chemical-related illness of any occupational group in a workplace. Moreover, in many cases, collateral exposure in their homes and drinking water occurs. In June, 1999, the coalition Californians for Pesticide Reform (CPR) published *Fields of Poison: California Farmworkers and Pesticides* which presented data on the use and ramifications of the use of pesticides based on a report by the California Department of Pesticide Regulations (DPR). For five years beginning in 1991, DPR reported nearly 4,000 cases of pesticide poisoning in farmworkers. It can be assumed that not all cases are reported and that pesticides can have a long-term affect on workers and their families from run-off into their water supply, from ambient air, and from living in or near fields that have been treated with pesticides.

The effects of pesticide poisoning stretch far beyond state borders. U.S. sales for food and feed crops were halted in 1989 because of health considerations caused by the Alar scare on apples. An entire industry was halted for months. And today, the mere idea of intentionally poisoning our food supply with pesticides or microorganisms has given rise to a new threat—“agrorterrorism.”

The use of pesticides and agricultural chemicals has been the theme of numerous books and database materials.

However, none of these resources publish a clear, quick, and concise reference containing hazard information with a focus on identification, regulation and food product usage. This is the goal of *Sittig's Handbook of Pesticides and Agricultural Chemicals*.

This book highlights critical data on nearly 800 important and/or regulated toxic and hazardous chemicals that are used as pesticides in agriculture or in residential and commercial applications. In addition to pesticides, hundreds of fertilizers, plant and insect growth regulators, and biocides are covered. Many of these chemicals are not allowed to be used in the United States but many have worldwide application. Others products are manufactured or formulated in one country (such as the United States) and shipped to other parts of the world to be used on another country's agricultural products.

Here is an important addition to the libraries of all persons engaged in agriculture, e.g., food processing, pesticide and agrochemical manufacturing/formulating personnel, agriculture extension personnel, agricultural and environmental management, pesticide applicators, and food safety scientists and toxicologists. In addition, industrial hygienists and industrial safety engineers, lawyers, physicians, legislators, enforcement officials, emergency response personnel, technical librarians, and waste disposal operators will also find essential information in this resource.

The use of this reference is not meant to be a substitute for environmental or workplace hazard communication programs required by regulatory bodies such as EPA, USDA, or OSHA, and/or any other U.S., foreign, or international government agencies. If data are required for legal purposes, the original source documents and appropriate agencies, which are referenced, should be consulted.

Following the Introduction is a key to the abbreviations and acronyms used in the handbook.

How to Use This Book

Nearly 800 substances are profiled in this reference and the information is organized into sections described here. When a category is omitted, it indicates a lack of available information.

Chemical Name: Each record is arranged alphabetically by a chemical name used by regulatory and advisory bodies. In most cases, this is not a product name or trade name.

Use Type: The general agricultural use is given, e.g., herbicide, insecticide, fungicide, rodenticide, miticide, fertilizer, biocide, etc. The U.S. Department of Agriculture recognizes the following types of pesticides that are related because they are used against the same type of pests.

- Acaricides: Kill mites, ticks, and spiders that feed on plants and animals. Also called miticides.
- Algicides: Control algae in lakes, canals, swimming pools, water tanks, and other sites.

*<http://www.pesticide.org/index.html>

- Antifouling agents: Kill or repel organisms that attach to underwater surfaces, such as boat bottoms.
- Antimicrobials: Kill microorganisms (such as bacteria and viruses).
- Attractants: Attract pests, e.g., to lure an insect or rodent to a trap. Food is not considered a pesticide when used as an attractant.
- Avicides: Kill birds
- Biopesticides: These are certain types of pesticides derived from such natural materials as animals, plants, bacteria, and certain minerals.
- Biocides: Kill microorganisms.
- Defoliants: Cause leaves or other foliage to drop from a tree or growing plant, usually to facilitate harvest. Various highly persistent types have been used by the military.
- Desiccants: Promote drying of living tissues, such as unwanted plant tops.
- Disinfectants and sanitizers: Kill or inactivate disease-producing microorganisms on inanimate objects.
- Fungicides: Kill fungi (including blights, mildews, molds, and rusts).
- Fumigants: Produce gas or vapor intended to destroy pests in buildings or soil.
- Herbicides: Kill weeds, grasses and other plants that grow where they are not wanted. May be organic or inorganic.
- Insect growth regulators: Disrupt the molting, maturity from pupal stage to adult, or other life processes of insects.
- Insecticides: Kill insects and arthropods.
- Miticides: Kill mites, ticks, and spiders that feed on plants and animals. Also called acaricides.
- Microbial pesticides: Microorganisms that kill, inhibit, or out compete pests, including insects or other microorganisms.
- Molluscicides: Kill snails and slugs.
- Nematicides: Kill nematodes (microscopic, worm-like organisms that feed on plant roots).
- Ovicides: Kill eggs of insects and mites.
- Pheromones: Biochemicals used to disrupt the mating behavior of insects.
- Piscicides: Kill fish.
- Plant growth regulators: Substances (excluding fertilizers or other plant nutrients) that alter the expected growth, flowering, or reproduction rate of plants.
- Predacides: Kill vertebrate predators.
- Repellents: Repel pests, including insects (such as mosquitoes) and birds.
- Rodenticides: Control mice and other rodents.
- Synergists: Improve the performance of another pesticide. Usually an inert ingredient.

CAS Number: The CAS number is a unique identifier assigned to each chemical registered with the Chemical Abstracts Service (CAS) of the American Chemical Society. This number is used to identify chemicals on the basis of their molecular structure. CAS numbers, in the

format xxx-xx-x, can be used in conjunction with chemical names for positive identification. CAS numbers should always be used in conjunction with substance names to avoid confusion with like-sounding names, like benzene (71-43-2) and benzine (8032-32-4).

Formula: Generally, this has been limited to a commonly used one-line chemical formula. In the case of some organic compounds it has been possible to represent chemical structure.

Alert: This section serves as a notice of particular information that does not fit neatly into other categories in the chemical record, such as special regulatory actions and EPA designations.

Synonyms: This section contains scientific, product, trade, and other synonym names that are commonly used for each hazardous substance. Some of these names are registered trade names. Some are provided in other major languages other than English including Spanish, French, German, Dutch, Polish, and Italian. In some cases, “trivial” and important nicknames (such as TDE for tetrachlorodiphenylethane) have been included because they are frequently used in general communications, in the workplace, and in regulatory matters. This section is important because the various “regulatory” lists published by federal, state, international, and advisory bodies and agencies often use different names for the same pesticides and agricultural chemicals. Every attempt has been made to ensure the accuracy of the synonyms and trade names found in this volume, but errors are inevitable in compilations of this magnitude. Please note that this volume may not include the names of all products currently in commerce, particularly mixtures, that may contain regulated chemicals. The synonym index contains all synonym names listed in alphabetical order. It should be noted that organic chemical prefixes and interpolations such as α , β , δ , Δ , or other Greek letters; *o*- (ortho-), *m*- (meta-); *p*- (para-); *as*- or *asym*- (asymmetric), *prim*- (primary), *sec*- (secondary), *trans*-, *cis*-, *n*- (normal-), and numerals are not treated as part of the chemical name for the purposes of alphabetization.

Trade Names: Most of the registered trade names included in this work are in current use or were registered at one time in the United States. In many cases, the trade names are also marketed in foreign markets; where available, trade names of pesticides made by foreign manufacturers and marketed primarily in foreign markets are also included.

Producers: The companies named here are major manufacturers of the agrochemicals or retain the registered trade names. Each company is identified with the country where their main headquarters are. Not included are companies that repackage the principal chemicals into their own products, such as formulators, wholesalers, distributors, farm co-ops, importers, and exporters. Also not included are those companies, many of whom are major manufacturers, who hold licenses to market products of other producers in various countries.

Chemical Class: This field describes pesticide family. i.e., carbamate, organophosphate, triazine, etc.; or the chemical

family, i.e., aromatic amine, aldehyde, inorganic metals, halogenated organic compounds, etc.

EPA/OPP PC Code: This field contains the six-digit pesticide code assigned by the US EPA.

California DPR Chemical Code: This field contains the pesticide code assigned by the California Department of Pesticide Registration (DPR).

ICSC Number: International Chemical Safety Cards summarize essential information on chemical substances and are developed cooperatively by the International Programme on Chemical Safety (IPCS) and the Commission of the European Union (EC).

RTECS Number: The RTECS numbers (Registry of Toxic Effects of Chemical Substances) are assigned and published by NIOSH. The RTECS number in the format ABxxxxxx may be useful for online searching for additional toxicologic information on specific substances. For example, it can be used to provide access to the MEDLARS® computerized literature retrieval services of the National Library of Medicine in Washington, DC.

EEC Number: The EEC and identification number is used by the European Economic Community.

EINECS Number: An identification number from "European Inventory of Existing Commercial Chemical Substances," published by the European Community, Luxembourg, Brussels.

Use of these identification numbers for hazardous materials will (a) serve to verify descriptions of chemicals; (b) provide for rapid identification of materials when it might be inappropriate or confusing to require the display of lengthy chemical names on vehicles; (c) aid in speeding communication of information on materials from accident scenes and in the receipt of more accurate emergency response information; and (d) provide a means for quick access to immediate emergency response information in the "North American Emergency Response Guidebook."⁽³¹⁾ In this latter volume, the various compounds have assigned "ID Numbers" or identification numbers which correspond closely (but not always precisely) to the UN listing.⁽²⁰⁾

Uses: This is a brief summary of agricultural applications and uses found for the substance in other fields. For specific crops, target insects, weeds, varmints and fungi, the user is referred to the reference sources cited at the end of each chemical listing. In many cases, the pesticides are not registered for use in the U.S. but are used in other countries.

U.S. Maximum Allowable Residue Levels: These are the tolerance levels, in parts per million (ppm), for individual crops. The tolerance levels are established by the EPA and reported in 40 CFR 180. Readers are cautioned that these levels for country-wide usages and are reviewed and modified frequently to reflect regulatory changes, petitions by individual companies, or scientific developments; consequently, be encouraged to verify the tolerances in the EPA web site. State exceptions to the federal standards are not included here.

Human toxicity (long-term): This field contains 3 items: The hazard rating/long-term toxicity level (ppb)/toxicity

type. This represents a relative long-term toxicity index for humans. The hazard rating (Extra High, High, Intermediate, Low, Very Low) are indicators of the relative risk to humans. The figure in ppb is calculated with respect for humans by the US EPA. The last item in this field is the toxicology "type" for the value expressed in ppb. Toxicities are based on availability in the priority order: MCL, HA, and CHCL. HA is used for Cancer Groups C, D, E, and Unclassified. CHCL is used for Cancer Groups A, B1 and B2 when MCL is unavailable.

- MCL (EPA's Maximum Contaminant Level). Maximum permissible long-term pesticide concentration allowed in a public water source.
- HA (Health Advisory) Determined by the US EPA Office of Water (OW). The concentration of a chemical in drinking water that is not expected to cause any adverse non-carcinogenic effects over the lifetime exposure with a margin of safety. In accordance with OW policy, Health Advisories are not calculated for chemicals that are known or probable carcinogens (EPA Cancer class A and B).
- CHCL* (Chronic Human Carcinogen Level, calculated). The concentration at which there is a 1 in 100,000 probability of contracting cancer. A CHCL provides a concentration comparable to an MCL.

Fish toxicity (threshold): This field contains three items: The hazard rating/toxicity threshold (ppb)/toxicity type. The hazard rating (Extra High, High, Intermediate, Low, Very Low) is based on Maximum Acceptable Toxicant Concentration (MATC), the soluble pesticide toxicity level for fish that is an indicator of the relative risk to the environment. The hazard rating is followed by the fish toxicity threshold for an active ingredient expressed in parts per billion (ppb) and determined empirically by performing long-term or life-stage toxicity tests. The final item in this field contains the type of toxicity for the toxicity threshold (MATC).

Carcinogen/Hazard Classifications:

U.S. EPA Carcinogens: The EPA has evaluated chemicals for their carcinogenic potential according to "Proposed Guidelines for Carcinogenic Risk Assessment," published April 23, 1996 in the Federal Register (FR: 17960-18011)

NTP: The National Toxicology Program, U.S. Department of Health and Human Services, *10th Report on Carcinogens*. Coordinates studies from several government agencies and classifies results in two categories:

- *Known to be a human carcinogen:* There is sufficient evidence of carcinogenicity from studies in humans which indicates a causal relationship between exposure to the agent, substance or mixture and human cancer.
- *Reasonably anticipated to be a human carcinogen:* There is limited evidence of carcinogenicity from studies in humans, which indicates that causal interpretation is credible, but that alternative explanations, such as chance, bias or confounding factors, could not adequately be excluded; or there is sufficient evidence of carcinogenicity from studies in experimental animals which indicates there is an increased incidence of

malignant and/or a combination of malignant and benign tumors: (1) in multiple species or at multiple tissue sites, or (2) by multiple routes of exposure, or (3) to an unusual degree with regard to incidence, site or type of tumor, or age at onset; or there is less than sufficient evidence of carcinogenicity in humans or laboratory animals; however, the agent, substance or mixture belongs to a well defined, structurally-related class of substances whose members are listed in a previous Report on Carcinogens as either a known to be human carcinogen or reasonably anticipated to be human carcinogen, or there is convincing relevant information that the agent acts through mechanisms indicating it would likely cause cancer in humans. See <http://ehp.niehs.nih.gov/roc/toc10.html#toc>

California Prop. 65: California's Proposition 65, The Safe Drinking Water and Toxic Enforcement Act of 1986, requires that warnings be given to individuals exposed to substances which cause cancer or reproductive toxicity. *Chemicals Known to the State to Cause Cancer or Reproductive Toxicity* is published each year and describes the type of toxicity (cancer; male and/or female developmental), the CAS number, and the date listed or delisted. For updated information, see

http://www.oehha.ca.gov/prop65/prop65_list/files/P65single061104a.pdf

U.S. TRI: The Toxic Release Inventory (TRI) is an EPA database that contains information on toxic chemical releases and other waste management activities reported by industrial and federal facilities. If the agricultural is reported by TRI as a known carcinogen, it is indicated here.

IARC: The International Agency for Research on Cancer (IARC) coordinates and conducts both epidemiological and laboratory research into the causes of cancer. See www.iarc.fr.

Label Signal Word: The EPA assigns a signal word that is a description of the short-term (acute) toxicity of a formulated product. It must be displayed on product labels to alert users to potential hazards. There are four categories of signal words; their levels are shown below. Formulated products contain both active and inert or other ingredients. Examples of inert ingredients are carriers, stickers, solvents, and adjuvants.

WHO Acute Hazard: The acute risk to health over a relatively short period of time, as established by the World Health Organization (WHO). See www.inchem.org/documents/pds/pdsotter/class.pdf

HAZARD INDICATORS	CATEGORY I	CATEGORY II	CATEGORY III	CATEGORY IV
Signal Words	Danger	Warning	Caution	Caution
Oral LD ₅₀	0-50 mg/kg	50-500 mg/kg	500-5000 mg/kg	>5000 mg/kg
Dermal LD ₅₀	0-200 mg/kg	200-2000 mg/kg	2000-20,000 mg/kg	> 20,000 mg/kg
Inhalation LC ₅₀	0-0.2 mg/l	0.2-2.0 mg/l	2.0-20 mg/l	>20 mg/l
Eye Effects	Corrosive corneal opacity not reversible within 7 days	Corrosive corneal opacity reversible within 7 days; irritation for 7 days	No corneal opacity; irritation reversible within 7 days	No irritation
Skin Effects	Corrosive	Severe irritation at 72 hours	Moderate irritation at 72 hours	Mild or slight irritation at 72 hours.

Source: 40CFR156.64 (February 12, 2002)

The LD₅₀ value is a statistical estimate of the number of mg of toxicant per kg of body weight required to kill 50% of a large population of test animals.

Class	LD ₅₀ for the rat (mg/kg body weight)			
	Oral		Dermal	
	Solids*	Liquids*	Solids*	Liquids*
Ia Extremely hazardous	5 or less	20 or less	10 or less	40 or less
Ib Highly hazardous	5 – 50	20 – 200	10–100	40 – 400
II Moderately hazardous	50 – 500	200 - 2000	100 – 1000	400 – 4000
III Slightly hazardous	Over 500	Over 2000	Over 1000	Over 4000b

*Note: The terms "solids" and "liquids" refer to the physical state of the active ingredient being classified. The LD₅₀ value is a statistical estimate of the number of mg of toxicant per kg of body weight required to kill 50% of a large population of test animals.

Endocrine Disruptor: EPA defines endocrine disruptors as compounds that “interfere with the synthesis, secretion, transport, binding, action, or elimination of natural hormones in the body that are responsible for the maintenance of homeostasis (normal cell metabolism), reproduction, development, and/or behavior.” Many endocrine disruptors are thought to mimic hormones, such as estrogen or testosterone. They have chemical properties similar to hormones that allow binding to hormone specific receptors on the cells of target organs. More information on endocrine effects can be found at the EPA Endocrine home page at <http://www.epa.gov/endocrine>.

Regulatory Authority: Contains a listing of major regulatory jurisdictions and authorities. Many law or regulatory references in this work have been abbreviated. For example, Title 40 of the Code of Federal Regulations, Part 261, subpart 32 has been abbreviated as 40CFR261.32. The symbol “§” may be used as well to designate a section or part. Under the title of each substance, there are designations indicating whether the substance is:

- A carcinogen (the agency making such a determination, the nature of the carcinogenicity — whether human or animal and whether positive or suspected, are given in each case). These are frequently cited by IARC (International Agency for Research on Cancer)⁽¹²⁾, DFG (Deutsche Forschungsgemeinschaft)⁽³⁾, NIOSH (U.S. National Institute for Occupational Safety and Health)⁽⁵⁸⁾ or the NTP (U.S. National Toxicology Programs).⁽¹⁰⁾ It should be noted that the DFG have designated some substances as carcinogens not so classified by other agencies.
- A banned or severely restricted product as designated by the United Nations⁽¹³⁾ or by the U.S. EPA Office of Pesticide Programs under FIFRA (The Federal Insecticide, Fungicide and Rodenticide Act).⁽¹⁴⁾
- A substance cited by the World Bank⁽¹⁵⁾
- A substance with an air pollutant standard set or recommended by OSHA and/or NIOSH,⁽⁵⁸⁾ ACGIH,⁽¹⁾ DFG,⁽³⁾ or HSE.⁽³³⁾ OSHA limits are the enforceable pre-1989 PELs. The transitional limits that were vacated by court order have not been included. The NIOSH and ACGIH airborne limits are recommendations that do not carry the force of law.
- A substance whose allowable concentrations in workplace air are adopted or proposed by the American Conference of Government Industrial Hygienists⁽¹⁾, Deutsche Forschungsgemeinschaft (German Research Society).⁽³⁾ Substances whose allowable concentrations in air and other safety considerations have been considered by OSHA and NIOSH⁽²⁾. Substances which have limits set in workplace air, in residential air, in water for domestic purposes or in water for fishery purposes as set forth by the former USSR-UNEP/IRPTC Project.⁽⁴³⁾
- Substances that are specifically regulated by OSHA under 29CFR1910.1001 to 29CFR1910.1050
- Highly hazardous chemicals, toxics, and reactives regulated by OSHA’s “Process Safety Management of Highly Hazardous Chemicals” under 29CFR1910.119, Appendix A.
- Substances that are Hazardous Air Pollutants (Title I, Part A, Section 112) as amended under 42USC7412. This list provided for regulating at least 189 specific substances using technology-based standards that employ Maximum Achievable Control Technology (MACT) standards; and, possibly health-based standards if required at a later time. Section 112 of the Clean Air Act (CAA) requires emission control by the EPA on a source-by-source basis. Therefore, the emission of substances on this list does not necessarily mean that a firm is subject to regulation
- Regulated Toxic Substances and Threshold Quantities for Accidental Release Prevention. These appear as Accidental Release Prevention/Flammable Substances, Clean Air Act (CAA) § 112(r), Table 3, TQ (threshold quantity) in pounds and kilograms under 40 CFR68.130. The accidental release prevention regulations applies to stationary sources that have present more than a threshold quantity of a CAA Section 112(r) regulated substance.
- Clean Air Act (CAA)Public Law 101-549, Title VI, “Protection of Stratospheric Ozone,” Subpart A, Appendix A-Class I and Appendix B, Class II, Controlled Substances, (CFCs) Ozone depleting substances under 40 CFR, Part 82.
- Clean Water Act (CWA) Priority toxic water pollutants defined by the U.S. Environmental Protection Agency for 65 pollutants and classes of pollutants which yielded 129 specific substances.⁽⁶⁾
- Chemicals designated by EPA as "Hazardous Substances"⁽⁴⁾ under the Clean Water Act (CWA) 40 CFR§116.4, Table 116.4A.
- Clean Water Act (CWA) Section 311 Hazardous Materials Discharge Reportable Quantities (RQs). This regulation establishes reportable quantities for substances designated as hazardous (see §116.4, above) and sets forth requirements for notification in the event of discharges into navigable waters. Source: 40 CFR§117.3, amended at 60FR30937.
- Clean Water Act (CWA) Section 307 List of Toxic Pollutants. Source: 40 CFR§401.15.
- Clean Water Act (CWA) Section 307 Priority Pollutant List. This list was developed from the List of Toxic Pollutants classes discussed above and includes substances with known toxic effects on human and aquatic life, and those known to be, or suspected of being, carcinogens, mutagens, or teratogens. Source: 40CFR423, Appendix A.
- Clean water Act, Section 313 Water Priority Chemicals. Source: 57FR41331.
- RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic with Regulatory levels in mg/L. Source: 40CFR§261.24.
- RCRA Hazardous Constituents. Source: 40CFR§261, Appendix VIII. Substances listed in this list have been shown, in scientific studies, to have carcinogenic, mutagenic, teratogenic or toxic effects on humans and other life forms. This list also contains RCRA waste codes. The words, "waste number not listed" appears when a RCRA number is NOT provided in Appendix VIII.

Characteristic Hazardous Wastes	
Ignitability	<ul style="list-style-type: none"> •A nonaqueous solution containing less than 24% alcohol by volume and having a closed cup flashpoint below 60°C (140°F) using Pinsky-Martens tester or equivalent. •An ignitable compressed gas. •A non-liquid capable of burning vigorously when ignited or causes fire by friction, moisture absorption, spontaneous chemical changes at standard pressure and temperature. •An oxidizer. See §261.21.
Corrosivity	Liquids with a pH equal to or less than 2 or equal to or more than 12.5 or which corrode steel at a rate greater than 6.35 mm (0.25 in) per year @ 55°C (130°F). See §261.22.
Reactivity	<ul style="list-style-type: none"> •Unstable substances that undergo violent changes without detonating. •Reacts violently with water or other substances to create toxic gases. •Forms potentially explosive mixtures with air. See §261.23.
Toxicity	A waste that leaches specified amounts of metals, pesticides, or organic chemicals using Toxicity Characteristic Leaching Procedure (TCLP). See §261, Appendix II, and §268, Appendix I.
Listed Hazardous Wastes	
“F” wastes	Hazardous wastes from nonspecific sources §261.31.
“K” Wastes	Hazardous wastes from specific sources §261.32.
“U” Wastes	Hazardous wastes from discarded commercial products, off-specification species, container residues §261.34. Covers some 455 compounds and their salts and some isomers of these compounds.
“P” Wastes	Acutely hazardous wastes from discarded commercial products, off-specification species, container residues §261.33. Covers some 203 compounds and their salts plus soluble cyanide salts.

Note: If a waste is not found on any of these lists, it may be found on a state hazardous waste list.

RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic. Source: 40CFR§261.24, Table I. These are listed with regulatory level in mg/L and "D" waste numbers representing the broad waste classes of ignitability, corrosivity, and reactivity.

- EPA Hazardous Waste code(s), or RCRA number, appears in its own field. Acute hazardous wastes from commercial chemical products are identified with the prefix "P." Nonacutely hazardous wastes from commercial chemical products are identified with the prefix "U."
- RCRA Universal Treatment Standards. Lists hazardous wastes that are banned from land disposal unless treated to meet standards established by the regulations. Treatment standard levels for wastewater (reported in mg/L) and nonwastewater [reported in mg/kg or mg/L TCLP (Toxicity Characteristic Leachability Procedure)] have been provided. Source: 40CFR§268.48 and revision, 61FR15654.
- RCRA Ground Water Monitoring List. Sets standards for owners and operators of hazardous waste treatment, storage, and disposal facilities, and contains test methods suggested by the EPA (see Report SW-846) followed by the Practical Quantitation Limit (PQL) shown in

parentheses. The regulation applies only to the listed chemical; and, although both the test methods and PQL are provided, they are *advisory only*. Source: 40CFR§264, Appendix IX.

- Maximum Contaminant Levels (MCL) for Inorganic Contaminants. Source: 40CFR§141.62.
- Maximum Contaminant Levels for Inorganic Chemicals. The maximum contaminant level for arsenic applies only to community water systems. Compliance with the MCL for arsenic is calculated pursuant to §141.23. Source: 40CFR§141.11.
- Secondary Maximum Contaminant Levels (SMCL). Federal advisory standards for the States concerning substances that affect physical characteristics (i.e., smell, taste, color, etc.) of public drinking water systems. Source: 40CFR§143.3.

- CERCLA Hazardous Substances ("RQ" Chemicals). From *Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and Section 112(r) of the Clean Air Act, as Amended*. Source: EPA 550-B-98-017 "Title III List of Lists."
 - Releases of CERCLA hazardous substances in quantities equal to or greater than their reportable quantity (RQ), are subject to reporting to the National Response Center under CERCLA. Such releases are also subject to state and local reporting under §304 of SARA Title III (EPCRA). CERCLA hazardous substances, and their reportable quantities, are listed in 40CFR§302, Table 302.4. RQs are shown in pounds and kilograms for chemicals that are CERCLA hazardous substances. For metals listed under CERCLA (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, thallium, and zinc), no reporting of releases of the solid is required if the diameter of the pieces of solid metal released is 100 micrometers (0.004 inches) or greater. The RQs shown apply to smaller particles.
 - EPCRA §302 Extremely Hazardous Substances (EHS). From *Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and Section 112(r) of the Clean Air Act, as Amended*. Source: EPA document 550-B-98-017 "Title III List of Lists" The presence of Extremely Hazardous Substances in quantities in excess of the Threshold Planning Quantity (TPQ), requires certain emergency planning activities to be conducted. The Extremely Hazardous Substances and their TPQs are listed in 40CFR§355, Appendices A & B. For chemicals that are solids, there may be two TPQs given (e.g., 500/10,000). In these cases, the lower quantity applies for solids in powder form with particle size less than 100 microns; or, if the substance is in solution or in molten form. Otherwise, the higher quantity (10,000 pounds in the example) TPQ applies.
 - EPCRA §304 Reportable Quantities (RQ). In the event of a release or spill exceeding the reportable quantity, facilities are required to notify State emergency response commissions (SERCs) and Local Emergency Planning Committees (LEPCs). From *Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and Section 112(r) of the Clean Air Act, as Amended*. Source: EPA document 550-B-98-017, *Title III List of Lists*
 - EPCRA Section 313 Toxic Chemicals. From *Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and Section 112(r) of the Clean Air Act, as Amended*. Source: EPA document 550-B-98-017 Title III List of Lists." Chemicals on this list are reportable under §313 and §6607 of the Pollution Prevention Act. Some chemicals are reportable by category under §313. Category codes needed for reporting are provided for the EPCRA§313 categories. Information and Federal Register references have been provided where a chemical is subject to an administrative stay, and not reportable until further notice.
 - From *Toxic Chemical Release Inventory Reporting Form R and Instructions, Revised March 1996*, EPA document 745-K-96-001 was used for *de minimis* concentrations, toxic chemical categories. Missing from the category listing was "chlorophenols" which has a reportable *de minimis* concentration of 1.0%.
 - Chemicals which EPA has made the subject of Chemical Hazard Information Profiles or "CHIPS" review documents.
 - Chemicals which NIOSH has made the subject of *Information Profile* review documents on *Current Intelligence Bulletins*.
 - Carcinogens identified by the National Toxicology Program of the U.S. Department of Health and Human Services at Research Triangle Park, NC.⁽¹⁰⁾
 - Chemicals that were covered in the periodical *Dangerous Properties of Industrial Materials Report* formerly edited by N. Irving Sax, Richard Lewis, and Jan C. Prager, published by Van Nostrand Reinhold, New York.
 - Chemicals described in the 2-volume *Encyclopedia of Occupational Health and Safety* published by the International Labor Office.⁽³⁰⁾
 - Most of the chemicals covered in the Legal File published by International Register of Potentially Toxic Chemicals Program (IRPTC) of the United Nations.⁽³⁵⁾ The reader who is particularly concerned with legal standards (allowable concentration in air, in water or in foods) is advised to check these most recent references because data may exist in this UN publication which has not been quoted *in toto* in this volume because of time and space limitations.
 - A substance regulated by EPA⁽⁷⁾ under the major environmental laws: Clean Air Act, Clean Water Act, Safe Drinking Water Act, RCRA, CERCLA, EPCRA, etc. A more detailed list appears above. And a substance with environmental standards set by some international bodies including Canada and the former USSR.⁽⁴³⁾
- If additional guidance or compliance assistance is needed, you are encouraged to use the information resources found in the *Appendix*. In particular, the *Directory of Industrial and Professional Agrichemical and Food-related Organizations*, the *Directory of Hotlines, Databases and Web Sites*, and the *Agrichemical Web Sites* directory provide gateways into a wealth of information on agrichemicals and food safety much too extensive to be included in this reference work. In addition, each state in the U.S. has its own statutes and regulations. Their agencies can be located in the *Directory of State Regulatory Agencies*.
- Description:** This section contains a summary of physical properties of the substance including state (solid, liquid or gas), color, odor description*, solubility or miscibility in water, molecular weight, boiling point, freezing/melting point, vapor pressure, flash point, autoignition temperature, explosion limits in air, Hazard Identification (based on NFPA-704 M Rating System) in the format, Health x, Flammability x, Reactivity x (see also below for a detailed explanation of the System and Fire Diamond), and

Octanol/Water coefficient. This section may also contain relevant comments about the substance.

Boiling Point at 1 atm: The value is the temperature of a liquid when its vapor pressure is 1 atm. For example, when water is heated to 100°C (212°F) its vapor pressure rises to 1 atm and the liquid boils. The boiling point at 1 atm indicates whether a liquid will boil and become a gas at any particular temperature and sea-level atmospheric pressure.

Melting/Freezing Point: The melting/freezing point is the temperature at which a solid changes to liquid or a liquid changes to a solid. For example, liquid water changes to solid ice at 0°C (32°F). Some liquids solidify very slowly even when cooled below their melting/freezing point. When liquids are not pure (for example, salt water) their melting/freezing points are lowered slightly.

Vapor Pressure: The pressure exerted by a vapor when it is in equilibrium with the liquid from which it is derived. Pesticides with vapor pressure values of more than 10⁻⁷ have a high potential for volatile loss. Pesticides with vapor pressure values of less than 10⁻⁷ have a low potential for volatile loss.

Flash Point: This is defined as the lowest temperature at which vapors above a volatile combustible substance will ignite in air when exposed to a flame. Depending on the test method used, the values given are either Tag Closed Cup (cc.) (ASTM D56) or Cleveland Open Cup (oc) (ASTM D93). The values, along with those in *Flammable Limits in Air* and *Autoignition Temperature* below, give an indication of the relative flammability of the chemical. In general, the open cup value is slightly higher (perhaps 10° to 15°F higher)

than the closed cup value. The flash points of flammable gases are often far below 0° (F or C) and these values are of little practical value, so the term “flammable gas” is often used instead of the flash point value.

Autoignition Temperature: This is the minimum temperature at which the material will ignite without a spark or flame being present. Values given are only approximate and may change substantially with changes in geometry, gas, or vapor concentrations, presence of catalysts, or other factors.

Flammable Limits in Air: The percent concentration in air (by volume) is given for the LEL (lower explosive-flammable-limit in air, % by volume) and UEL (upper explosive-flammable-limit in air, % by volume), at room temperature, unless otherwise specified. The values, along with those in Flash Point and Autoignition Temperature give an indication of the relative flammability of the chemical.

NFPA Hazard Classifications: The NFPA 704 Hazard Ratings (Classifications) are reprinted with permission from "Fire Protection Guide to Hazardous Materials," 11th edition, National Fire Protection Association, Quincy, MA, ©1994. The classifications are defined in the Table below.

It should be noted that OSHA and DOT have differing definitions for the term "flammable liquid" and "combustible liquid." DOT defines a flammable liquid as one which, under specified procedures, has a flashpoint of 140°F (60°C) or less. A combustible liquid is defined as "having a flashpoint above 140°F (60°C) and below 200°F (93°C)." OSHA defines a combustible liquid as having a flash point above 100°F (37.7°C).

National Fire Protection Association (NFPA) Fire Diamond

Health Hazard (Blue)		Flammability (Red)		Reactivity (Yellow)	
Signal	Type of Possible Injury	Signal	Susceptibility of Materials to Burn	Signal	Susceptibility to Release of Energy
4	Materials which on very short exposure could cause death or major residual injury.	4	Materials which will rapidly or completely vaporize at atmospheric pressure and normal ambient temperature, or which are readily dispersed in air and which will burn readily.	4	Materials that, in themselves, are readily capable of detonation, explosive decomposition or explosive reaction at normal temperatures and pressures.
3	Materials which on short exposure could cause serious temporary or residual injury.	3	Liquids and solids that can be easily ignited under almost all normal temperature conditions.	3	Materials that, in themselves, are capable of detonation or explosive decomposition but require a strong initiating source or which must be heated under confinement before initiation or which react explosively with water.
2	Materials that, on intense or continued (but not chronic) exposure, could cause temporary incapacitation or possible residual injury.	2	Materials that must be moderately heated or exposed to relatively high ambient temperatures before ignition can occur.	2	Materials that readily undergo violent chemical changes at elevated temperatures and pressure or which react violently with water or which may form explosive mixtures with water.

Signal	Type of Possible Injury	Signal	Susceptibility of Materials to Burn	Signal	Susceptibility to Release of Energy
1	Materials which on exposure would cause irritation but only minor residual injury.	1	Materials that must be preheated before ignition can occur.	1	Materials that in themselves are normally stable, but which become unstable at elevated temperatures and pressures.
0	Materials that, on exposure under fire conditions, would offer no hazard beyond that of ordinary combustible material.	0	Materials that will not burn.	0	Materials that in themselves are normally stable, even under fire exposure conditions, and which are not reactive with water.

Special Notice (White): Water Reactive: Avoid the use of Water; OXY: Oxidizer; Radioactive

Octanol/Water Coefficient (Log K_{ow}). A statement of the ratio of the concentration in octanol to the concentration in water when a pesticide or agricultural chemical is dissolved in a mixture of these two liquids. This coefficient is used to indicate the pesticide's or agricultural chemical's relative potential for endangering the environment. The greater the value, the greater the chance of the pesticide or agricultural chemical accumulating in fats of living tissue, in particular at values greater than 3.0.

Potential Exposure: A brief indication is given of the nature of exposure to each compound in the industrial environment. Where pertinent, some indications are given of background concentration and occurrence from other than industrial discharges such as water purification plants. Obviously in a volume of this size, this coverage must be very brief. It is of course recognized that non-occupational exposures may be important as well.

Incompatibilities: Important, potentially hazardous incompatibilities of each substance are listed where available. Where a hazard with water exists, it is described. Reactivity with other materials are described including structural materials such as metal, wood, plastics, cement, and glass. The nature of the hazard, such as severe corrosion formation of a flammable gas, is described. This list is by no means complete or all inclusive. In some cases a very small quantity of material can act as a catalyst and produce violent reactions such as polymerization, disassociation and condensation. Some chemicals can undergo rapid polymerization to form sticky, resinous materials, with the liberation of much heat. The containers may explode. For these chemicals the conditions under which the reaction can occur are given.

Permissible Exposure Limits in Air: The permissible exposure limit (PEL), has been cited as the Federal Standard where one exists. Inasmuch as OSHA has made the decision to enforce only pre-1989 PELs, we decided to use these values rather than the transitional limits that were vacated by court order. Except where otherwise noted, the PELs are 8-hour work-shift time-weighted average (TWA) levels. Ceiling limits, Short Term Exposure Limits (STEL), and TWAs that are averaged over other than full work-shifts are noted.

The short-term exposure limit (STEL) values are derived from NIOSH⁽⁵⁸⁾, ACGIH⁽¹⁾ and HSE⁽³³⁾ publications. This value is the maximal concentration to which workers can be

exposed for a period up to 15 minutes continuously without suffering from: irritation; chronic or irreversible tissue change; or narcosis of sufficient degree to increase accident proneness, impair self-rescue, or materially reduce work efficiency, provided that no more than four excursions per day are permitted, with at least 60 minutes between exposure periods, and provided that the daily TWA also is not exceeded.

The "Immediately Dangerous to Life or Health" (IDLH) concentration represents a maximum level from which one could escape within 30 minutes without any escape-impairing symptoms or any irreversible health effects. However, the 30-minute period is meant to represent a MARGIN OF SAFETY and is NOT meant to imply that any person should stay in the work environment any longer than necessary. In fact, every effort should be made to exit immediately. The concentrations are reported in either parts per million (ppm) or milligrams per cubic meter (mg/m^3). Most U.S. specifications on permissible exposure limits in air have come from ACGIH⁽¹⁾ or NIOSH⁽²⁾. In the U.K. the Health and Safety Executive has set forth Occupational Exposure Limits.⁽³³⁾ In Germany the DFG has established Maximum Concentrations in the workplace⁽³⁾ and the former USSR-UNEP/IRPTC project has set maximum allowable concentrations and tentative safe exposure levels of harmful substance in workplace air and residential air for many substances.⁽⁴³⁾ This section also contains numerical values for allowable limits of various materials in ambient air⁽⁶⁰⁾ as assembled by the US EPA.

Where available, this field contains legally enforceable airborne Permissible Exposure Limits (PELs) from OSHA. It also contains recommended airborne exposure limits from NIOSH, ACGIH, and international sources and special warnings when a chemical substance is a Special Health Hazard Substance. Each are described below.

- TLVs have not been developed as legal standards and the ACGIH does not advocate their use as such. The TLV is defined as the time weighted average (TWA) concentration for a normal 8-hour workday and a 40-hour workweek, to which nearly all workers may be repeatedly exposed, day after day, without adverse effects. A ceiling value (TLV-C) is the concentration that should not be exceeded during any part of the working exposure. If instantaneous monitoring is not feasible, then the TLV-C can be assessed by sampling over a 15-minute period

except for those substances that may cause immediate irritation when exposures are short. As some people become ill after exposure to concentrations lower than the exposure limits, this value cannot be used to define exactly what is a "safe" or "dangerous" concentration. ACGIH threshold limit values (TLVs) are reprinted with permission of the American Conference of Governmental Industrial Hygienists, Inc., from the booklet entitled, "*Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices*." This booklet is revised on an annual basis. No entry appears when the chemical is a mixture; it is possible to calculate the TLV for a mixture only when the TLV for each component of the mixture is known and the composition of the mixture by weight is also known. According to ACGIH, "*Documentation of the Threshold Limit Values and Biological Exposure Indices*" is necessary to fully interpret and implement the TLVs.

- OSHA permissible exposure limits (PELs), are found in Tables Z-1, Z-2, and Z-3 of OSHA General Industry Air Contaminants Standard (29CFR1910.1000) that were effective on July 1, 2001 and which are currently enforced by OSHA. Unless otherwise noted, PELs are the time weighted average (TWA) concentrations that must not be exceeded during any 8-hour shift of a 40-hour workweek. An OSHA ceiling concentration must not be exceeded during any part of the workday; if instantaneous monitoring is not feasible, the ceiling must be assessed as a 15-minute TWA exposure. In addition there are a number of substances from Table Z-2 that have PEL ceiling values that must not be exceeded except for a maximum peak over a specified period (e.g., a 5-minute maximum peak in any 2 hours).
- NIOSH Recommended Exposure Limits (RELs) are time weighted average (TWA) concentrations for up to a 10-hour work day during a 40-hour work week. A ceiling REL should not be exceeded at any time. Exposure limits are usually expressed in units of parts per million (ppm) - i.e., the parts of vapor (gas) per million parts of contaminated air by volume at 25°C (77°F) and one atmosphere pressure. For a chemical that forms a fine mist or dust, the concentration is given in milligrams per cubic meter (mg/m³).
- Short-Term Exposure Limits (15 minute TWA): This field contains Short Term Exposure Limits (STELs) from ACGIH, NIOSH and OSHA. The parts of vapor (gas per million parts of contaminated air by volume at 25°C (77°F) and one atmosphere pressure is given. The limits are given in milligrams per cubic meter (mg/m³) for chemicals that can form a fine mist or dust. Unless otherwise specified, the STEL is a 15-minute TWA exposure that should not be exceeded at any time during the workday.

Determination in Air: The citations to analytical methods are drawn from various sources, such as the *NIOSH Manual of Analytical Methods*⁽¹⁸⁾ In addition, methods have been cited in the latest US Department of Health and Human

Services publications including the *NIOSH Pocket Guide to Chemical Hazards*, published June 1997.⁽²⁾

Permissible Concentrations in Water: The permissible concentrations in water are drawn from various sources also, including:

- The National Academy of Sciences/National Research Council publication, *Drinking Water and Health* published in 1980.⁽¹⁶⁾
- The priority toxic pollutant criteria published by U.S. EPA in draft form in 1979 and in final form in 1980.⁽⁶⁾
- The multimedia environmental goals for environmental assessment study conducted by EPA.⁽³²⁾ Values are cited from this source when not available from any other.

The U.S. EPA has come forth with a variety of allowable concentration levels:

- For allowable concentrations in "California List" wastes.⁽³⁸⁾ The California list consists of liquid hazardous wastes containing certain metals, free cyanides, polychlorinated biphenyls (PCBs), corrosives with a pH of less than or equal to 2.0, and liquid and nonliquid hazardous wastes containing halogenated organic compounds (HOCs).
- For regulatory levels in leachates from landfills.⁽³⁷⁾
- For concentrations of various materials in effluents from the organic chemicals and plastics and synthetic fiber industries.⁽⁵¹⁾
- For contaminants in drinking water⁽³⁶⁾.
- For National Primary and Secondary Drinking Water Regulations⁽⁶²⁾.
- In the form of health advisories for 16 pesticides,⁽⁴⁷⁾ 25 organics,⁽⁴⁸⁾ and 7 inorganics.⁽⁴⁹⁾
- For primary drinking water standards starting with a priority list of 8 Volatile Organic Chemicals.⁽⁴⁰⁾
- State drinking water standards and guidelines⁽⁶¹⁾ as assembled by the US EPA.

Determination in Water: The sources of information in this field have been primarily US EPA publications including the test procedures for priority pollutant analysis⁽²⁵⁾ and later modifications.⁽⁴²⁾

Routes of Entry: The toxicologically important routes of entry of each substance are listed. These are primarily taken from the *NIOSH Pocket Guide*⁽²⁾ but are drawn from other sources as well.

Harmful Effects and Symptoms: These are primarily drawn from NIOSH, EPA publications, and New Jersey and New York State fact sheets on individual chemicals, and are supplemented from information from the draft criteria documents for priority toxic pollutants⁽²⁶⁾ and from other sources. The other sources include:

- EPA Chemical Hazard Information Profiles (CHIPS) cited under individual entries.
- NIOSH Information Profiles cited under individual entries.
- EPA Health and Environmental Effect Profiles cited under individual entries.
- Particular attention has been paid to cancer as a "harmful

effect" and special effort has been expended to include the latest data on carcinogenicity.

Short Term Exposure: These are brief descriptions of the effects observed in humans when the vapor (gas) is inhaled, when the liquid or solid is ingested (swallowed), and when the liquid or solid comes in contact with the eyes or skin. The term LD₅₀ signifies that about 50% of the animals given the specified dose by mouth will die. Thus, for a Grade 4 chemical (below 50 mg/kg) the toxic dose for 50% of animals weighing 70 kg (150 lb) is $70 \times 50 = 3500 \text{ mg} = 3.5 \text{ g}$, or less than 1 teaspoonful; it might be as little as a few drops. For a Grade 1 chemical (5 to 15 g/kg), the LD₅₀ would be between a pint and a quart for a 150-lb man. All LD₅₀ values have been obtained using small laboratory animals such as rodents, cats, and dogs. The substantial risks taken in using these values for estimating human toxicity are the same as those taken when new drugs are administered to humans for the first time.

Long Term Exposure: Where there is evidence that the chemical can cause cancer, mutagenic effects, teratogenic effects, or a delayed injury to vital organs such as the liver or kidney, a description of the effect is given.

Points of Attack: This category is based in part on the "Target Organs" in the *NIOSH Pocket Guide*⁽²⁾ but the title has been changed as many of the points of attack are not organs (blood and central nervous system for example).

Medical Surveillance: This information is often drawn from a NIOSH publication⁽²⁷⁾ but also from New Jersey State Fact Sheets on individual chemicals. Where additional information is desired in areas of diagnosis, treatment and medical control, the reader is referred to a private publication⁽²⁸⁾ which is adapted from the products of the NIOSH Standards Completion Program.

First Aid: Simple first aid procedures are listed for response to eye contact, skin contact, inhalation, and ingestion of the toxic substance as drawn to a large extent from the *NIOSH Pocket Guide*⁽²⁾ but supplemented by information from recent commercially available volumes in the U.S.⁽²⁹⁾, in the U.K. and in Japan⁽²⁴⁾ as well as from state fact sheets. They deal with exposure to the vapor (gas), liquid, or solid and include inhalation, ingestion (swallowing) and contact with eyes or skin. The instruction "Do NOT induce vomiting" is given if an unusual hazard is associated with the chemical being sucked into the lungs (aspiration) while the patient is vomiting. "Seek medical attention" or "Call a doctor" is recommended in those cases where only competent medical personnel can treat the injury properly. In all cases of human exposure, seek medical assistance as soon as possible. In many cases, medical advice has been included for guidance only.

References: The general bibliography for this volume appears in the Appendix. It includes general reference sources and references dealing with analytical methods. The references at the end of individual product entries are generally restricted to references dealing only with that particular compound.

The following Internet web sites provided sources for

much of the data in this reference and should be referred to for current and expanded information.

- U.S. Environmental Protection Agency, Office of Prevention, Pesticides and Toxic Substances, Washington, DC, for *Reregistration Eligibility Decisions (RED)*. These comprehensive documents present revised human health and ecological risk assessments and tolerance reassessments for products originally registered prior to November 1, 1984, as mandated by the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Food Quality Protection Act of 1996, which amended the Federal Food, Drug and Cosmetics Act). See <http://www.epa.gov/pesticides/reregistration>
- EXTTOXNET, Extension Toxicology Network, Oregon State University, Corvallis, OR , *Pesticide Information Profile*. This web page provides data about exposure to the most frequently encountered pesticides. EXTTOXNET is a cooperative effort of University of California-Davis, Oregon State University, Michigan State University, Cornell University, and the University of Idaho. Primary files are maintained and archived at Oregon State University. See <http://exttoxnet.orst.edu/ghindex.html>
- New Jersey Department of Health and Senior Services, Right-to-Know Project, *Hazardous Substance Fact Sheets*, Trenton, NJ (various dates from 1985-2004). See <http://www.state.nj.us/health/eoh/rtkweb/rtkhsfs.htm>
- Pesticides Action Network (PAN) Pesticides Database provides a compendium of current information on pesticides toxicity and regulatory information. It is maintained by Pesticides Action Network of North America, which, in turn, is affiliated with International Pesticide Action Network, the UK PAN and several other Pesticide Action Networks. See <http://www.pesticideinfo.org/Index.html>
- International Programme on Chemical Safety INCHEM web site consolidates current, internationally peer-reviewed chemical safety publications. Its *Pesticide Data Sheets* contain basic information on pesticides and are revised from time to time. See <http://www.inchem.org/pages/pds.html>

Key to Abbreviations, Symbols, and Acronyms

α -	Greek letter alpha; used as a prefix to denote the carbon atom in a straight chain compound to which the principal group is attached.	GUP	General Use Pesticide
<i>as</i> -	Prefix for asymmetric	h	hour(s)
ACGIH	American Conference of Governmental Industrial Hygienists	HAPs	Hazardous Air Pollutants (CAA)
approx.	approximately	HCFC	hydrochlorofluorocarbons
ASTDR	Agency for Toxic Substances and Disease Registry	HCS	Hazard Communication Standard
<i>asym</i> -	Prefix for asymmetric	HOC	Halogenated Organic Compounds
@	at	HSE	Health and Safety Executive (United Kingdom)
atm.	Atmosphere	IARC	International Agency for Research on Cancer
β	Greek letter beta	ICSC	International Chemical Safety Cards
BP	Boiling point	IDLH	Immediately Dangerous to Life or Health
C	Centigrade	IPCS	International Programme on Chemical Safety
CAA	Clean Air Act	<i>iso</i> -	(Greek, equal, alike). Usually denoting an isomer of a compound
CAAA	Clean Air Act Amendments of 1990	kg	Weight in kilograms (one thousand grams)
carc.	Carcinogen	L or l	Liter(s)
CAS	Chemical Abstract Service	lb	Weight in pound(s)
cc	Closed cup; cubic centimeter	LEL	Lower explosive (flammable) limit in air, % by volume at room temperature or other temperature as noted
CEPA	Canadian Environmental Protection Act	LEPC	Local Emergency Planning Committees
CERCLA	Comprehensive Environmental Response, Compensation, And Liability Act	<i>m</i> -	an abbreviation for " <i>meta</i> -," a prefix used to distinguish between isomers or nearly related compounds
CFR	Code of Federal Regulations	m^3	cubic meter
CHCL	Chronic Human Carcinogen Level	MACT	Maximum Achievable Control Technology (CAA)
CHEMTREC	Chemical Manufacturers Association (CMA) Transportation Emergency Center	MAK	airborne exposure limit used by the Deutsche Forschungsgemeinschaft (DFG)
<i>cis</i> -	(Latin, on this side). Indicating one of two geometrical isomers in which certain atoms or groups are on the same side of a plane	MATC	Maximum Acceptable Toxicant Concentration
comp.	Compound	MCLs	Maximum Contaminant Levels (SDWA)
CWA	Clean Water Act	MCLGs	Maximum Contaminant Level Goals (SDWA)
<i>cyclo</i> -	(Greek, circle). Cyclic, ring structure; as cyclohexane	m^3	Cubic meter
Δ or δ	Greek letter delta	mg	Milligram

Abamectin (ANSI)

Use Type: Insecticide and miticide

CAS Number: 71751-41-2; 65195-55-3 (B_{1a}); 65195-56-4 (B_{1b})

Synonyms: Avermectin; Avermectin B₁; Avermectin B_{1a} + Avermectin B_{1b} mixture

Trade Names: ABACIDE[®], J. J. Mauget Co. (USA); AFFIRM[®], Syngenta (Switzerland); AGRI-MEK[®], Merck (Germany), canceled 7/21/1998; AVID[®], Syngenta (Switzerland); AVOME[®]; INJECT-A-CIDE AV[®], J. J. Mauget Co. (USA); MK 936[®](B_{1a}); L 676,863[®] (B_{1a}); MK 936[®]; VERTIMEC[®], VIVID[®]; ZEPHEYR[®], Syngenta (Switzerland)

Producers: J. J. Mauget Co. (USA); Ki-Hara Chemicals Ltd. (UK); Syngenta (Switzerland)

Chemical Class: Avermectins

EPA/OPP PC Code: 122804

California DPR Chemical Code: 2254

Uses: Used on citrus and nut crops and pears to control mite and insect pests, and also to control household and lawn insects.

Human toxicity (long-term)⁽⁷⁷⁾: High–2.80 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Extra High–0.00570 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, unlikely carcinogen

TRI Developmental Toxin: Developmental toxin

Label Signal Word: WARNING, CAUTION, or DANGER, depending on the formulation

Regulatory Authority:

- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- Actively registered pesticide in California.

Description: Antibiotic. Vapor pressure = 1.5×10^{-9} mmHg.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical

has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Acenaphthene

Use Type: Insecticide and fungicide intermediate

CAS Number: 83-32-9

Formula: C₁₂H₁₀

Synonyms: Acenafeno (Spanish); Acenaphthylene, 1,2-dihydro-; 1,2-Dihydroacenaphthylene; 1,8-Dihydroacenaphthalene; 1,8-Dihydroacenaphthylene; Ethylenenaphthalene; 1,8-Ethylenenaphthalene; Naphthyleneethylene; NSC 7657; *peri*-Ethylenenaphthalene

Producers: Deza AS (Czech Republic); Dow Chemical (USA); Fluorochem Ltd. (UK); Merck (Germany); Messer Group (Germany); Penta Manufacturing (USA); Sigma-Aldrich (USA); Sigma-Aldrich Laborchemikalien (Germany); TCI America (USA)

EPA/OPP PC Code: 442200

RTECS Number: AB1000000

EINECS Number: 201-469-6

Uses: Acenaphthene occurs in coal tar produced during the high-temperature carbonization or coking of coal, petroleum processing, shale oil processing. It is used as a dye intermediate, in the manufacture of some plastics as well as an insecticide and fungicide. It has been detected in cigarette smoke and gasoline exhaust condensates.

Regulatory Authority:

- OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1002) as coal tar pitch volatiles
- List of priority pollutants (U.S. EPA)
- AB 1803-Well Monitoring Chemical (CAL)
- The “Director’s List” (CAL/OSHA)
- Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants, 40CFR 413.02, Total Toxic Organics, 40CFR423, Priority Pollutants RCRA 40CFR258, Appendix 2
- RCRA 40CFR§268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4

- RCRA, 40CFR264, Appendix 9, Ground Water Monitoring List, Suggested Testing Methods (PQL $\mu\text{g/L}$): 8100(200); 8270(10)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.4 kg)
- Canada, WHMIS, Ingredients Disclosure List
- Mexico, Drinking Water, Criteria (Ecological): 0.02 mg/L; wastewater: organic toxic pollutant

Description: Acenaphthene is a combustible polyaromatic hydrocarbon (PAH). White or pale yellow crystalline solid. Insoluble in water. Boiling Point = 277°C. Melting/Freezing point = 95–97°C. Molecular weight = 154.23. Log K_{ow} = 3.91–4.44. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Ozone and oxidizing agents such as perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine and fluorine. It is also incompatible with ozone and chlorinating agents.

Permissible Exposure Limits in Air: No standards have been established for acenaphthene. The ACGIH⁽¹⁾ and OSHA⁽²⁾ recommended TLV as coal tar pitch volatiles as benzene solubles is 0.2 mg/m³. NIOSH⁽²⁾ considers coal tar products to be occupational carcinogens; the NIOSH⁽²⁾ REL (10-hour TWA) for coal tar products is 0.1 mg/m³.

Determination in Air: See NIOSH Method 5506 (HPLC) and 5515 (GC)⁽¹⁸⁾.

Permissible Concentration in Water: To protect freshwater aquatic life: 1,700 $\mu\text{g/L}$. To protect saltwater aquatic life—on an acute basis 970 $\mu\text{g/L}$ and on a chronic basis 520 $\mu\text{g/L}$. To protect human health: 20.0 $\mu\text{g/L}$ (based on organoleptic data)⁽⁶⁾. See also Regulatory Authority for U.S. and Mexico regulatory levels.

Determination in Water: Gas chromatography or high performance liquid chromatograph (EPA Method 610) or gas chromatography and mass spectrometry (EPA Method 625).

Routes of Entry: Ingestion, inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Acenaphthene is irritating to eyes, skin and respiratory tract causing coughing and wheezing. May cause vomiting if swallowed in large quantities.

Long Term Exposure: Although acenaphthene has not been identified as a carcinogen, it should be handled with care as several related polycyclic aromatic hydrocarbons (PAHs) are carcinogens. Repeated or high exposures may cause lung irritation, bronchitis with cough, phlegm, and/or shortness of breath. Acenaphthene may affect the liver and kidneys. The most thoroughly investigated effect of acenaphthene is its ability to produce nuclear and cytological changes in microbial and plant species. Most of these changes, such as an increase in cell size and DNA content, are associated with disruption of the spindle mechanism during mitosis and the biological impact of acenaphthene on mammalian cells, these effects are reported here because they are the only substantially investigated effects of acenaphthene. Reported to be a mutagen⁽¹¹⁾.

Points of Attack: Liver, kidneys and skin.

Medical Surveillance: Preplacement and regular physical

examinations are indicated for workers having contact with acenaphthene in the workplace. Liver and kidney function tests recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL)
- Actively registered pesticide in California.
- FIFRA, 180.3(5); class of cholinesterase-inhibiting pesticide
- U.S. DOT Inhalation Hazard Chemicals as organophosphates

Description: Colorless crystalline solid (80% or more pure) or white powder (technical). Has an odor. Readily soluble in water; solubility = 8.2×10^{-5} ppm @ 25°C. Molecular weight = 183.19. Melting/Freezing point = 92–93°C; also listed at 82–89°C (technical grade 80 to 90% purity). Vapor pressure = 1.7×10^{-6} mmHg @ 25°C. Log K_{ow} = < 1.0. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Strong oxidizers. Acephate emits toxic oxides of phosphorus, nitrogen, and sulfur when heated to decomposition.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSHIV⁽¹⁸⁾, Method #5600, Organophosphorus pesticides.

Routes of Entry: Inhalation, ingestion, skin contact, passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. Contact may cause burns to skin and eyes. Eye pupils appear small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a

corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Do not drink any alcoholic beverages before or during use; alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution.

Inhalation: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting. If the victim is alert and asymptomatic**, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or

having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Chemical Class: Organochlorine; Halo-organics

EPA/OPP PC Code: 121601

California DPR Chemical Code: 2349

Uses: A Restricted Use Pesticide (RUP). A pre-emergence herbicide for control of annual grasses and broadleaf weeds. It is used on cabbage, citrus cots, coffee, all types of corn, cotton, green peas, maize, onion, peanuts, potatoes, vineyards, sugar cane, and sugar beets, among others. It is compatible with most other pesticides.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–20.71006 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Low–187.34840 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Acetochlor (40 CFR 180. 470):

CROP	ppm
Corn, field, forage	1
Corn, field, grain	0.05
Corn, field, stover	1.5
Sorghum, forage	0.1
Sorghum, grain, grain	0.02
Sorghum, grain, stover	0.1
Soybean	0.1
Soybean, forage	0.7
Soybean, hay	1
Wheat, forage	0.5

Wheat, grain	0.02
Wheat, straw	0.1

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

California Prop. 65: Carcinogen

Label Signal Word: CAUTION or WARNING

WHO Acute Hazard: Class III, slightly hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- FIFRA, 40CFR180.470: Tolerances and exemptions from tolerances for pesticides in or on raw agricultural commodities
- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL)
- Proposition 65 chemical (CAL)

Description: Pale yellow liquid. Soluble in water; solubility = 400 ppm @ 25°C. Molecular weight = 269.77.

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids, alkaline reagents. Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. May attack some forms of plastic, rubber, and coatings.

Permissible Concentration in Water: Unknown, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, absorbed through the intact skin

Harmful Effects and Symptoms

Short Term Exposure: Attacks central nervous system. Apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death.

Points of Attack: CNS. May be fatal if inhaled, ingested, or absorbed through the skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with

water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. The patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. *In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal *before or with* ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. *Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus.* If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Acetylaminofluorene

Use Type: A carcinogenic pesticide that was never marketed in the United States. See Uses section, below.

CAS Number: 53-96-3

Formula: C₁₅H₁₃NO

Alert: This is a carcinogen and must be handled with extreme caution. It is not produced in the U.S.

Synonyms: AAF; 2-AAF; Acetamide,*N*-fluorene-2-yl-; Acetamide,*N*-9*H*-fluorene-2-yl-; 2-Acetamidofluorene; 2-2-Acetylamidofluorene; 2-Acetylaminofluorene (German); *N*-Acetyl-2-aminofluorene; 2-Acetylaminofluorene;

N-Acetyl-2-aminofluorene; 2-Acetylaminofluorene; Azetylaminofluoren; FAA; 2-FAA; 2-Fluorenylacetaamide; *N*-2-Fluorenylacetaamide; *N*-2-Fluoren-2-ylacetaamide; *N*-2-Fluorenylacetaamide

Producers: Sigma-Aldrich Fine Chemicals (USA)

Chemical Class: Aromatic amine

RTECS Number: AB9450000

EINECS Number: 200-188-6

Uses: 2-Acetylaminofluorene (AAF) was intended to be used as a pesticide, but it was never marketed because this chemical was found to be carcinogenic. AAF is used frequently by biochemists and technicians engaged in the study of liver enzymes and the carcinogenicity and mutagenicity of aromatic amines as a positive control.

Carcinogen/Hazard Classifications

- RCRA 40CFR266, Appendix 7, Basis for Listing Hazardous Waste
- EPA Hazardous Waste Number (RCRA No.): U005
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 11b (0.454 kg), SARA 313: Form R *de minimis* Concentration Reporting Level: 0.1%.
- Banned or Severely Restricted (Industrial Chemicals) (Belgium, Finland, Sweden) (UN)⁽¹³⁾
- Air Pollutant Standard Set (New York)⁽⁶⁰⁾
- Canada WHMIS Ingredients Disclosure List. Concentration Reporting Level: 0.1%.

Description: 2-Acetylaminofluorene, $\text{C}_{15}\text{H}_{13}\text{NO}$, is a combustible, tan powder or crystalline solid. Insoluble in water. Molecular weight = 223.28. Melting/Freezing point = 194°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0.

Incompatibilities: Contact with strong oxidizers may cause fire and explosions. Not compatible with cyanides, acids, and acid anhydrides.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ recommends that exposure to occupational carcinogens be limited to the lowest feasible concentration. 0.03 $\mu\text{g}/\text{m}^3$ (New York)⁽⁶⁰⁾ for ambient air.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion, inhalation, mucous membrane, skin absorption, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical has limited use in industry, and contact is kept to a minimum to prevent cancer. Reduced function of liver, kidneys, bladder, pancreas; [Potential occupational carcinogen]. Contact with skin, eye, or respiratory tract may cause irritation.

Long Term Exposure: Incorporation of this compound in feed caused increased incidences of malignant tumors in a variety of organs in the rat. Long-term studies in which mice were given 2-acetylaminofluorene in their diet showed that this compound caused increased incidences of tumors and cancer of the liver, kidney, urinary bladder, lung, skin, and pancreas. There is limited evidence that this chemical is a teratogen in animals.

Points of Attack: Liver, bladder, kidney, pancreas, skin, lungs.

Medical Surveillance: Urine cytology for abnormal cells in the urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Acifluorfen

Use Type: As sodium acifluorfen, a broad spectrum herbicide

CAS Number: 50594-66-6; 62476-59-9 (sodium salt)

Formula: $C_{14}H_7ClF_3NO_5$; $F_3C-C_6H_3(Cl)-O-C_6H_3(NO_2)(COOH)$

Alert: A General Use Pesticide (GUP). Slated to be withdrawn by the European Commission in July 2003. Some exemptions may apply. Human toxicity (long-term): High

Synonyms: Acifluorfene; Benzoic acid, 5-(2-chloro-4-(trifluoromethyl)phenoxy)-2-nitro-; 5-(2-Chloro-4-(trifluoromethyl)phenoxy)-2-nitrobenzoic acid; 5-(2-Chloro- α - α -trifluoro-*p*-tolylloxy)-2-nitrobenzoic acid; Sodium acifluorfen

Trade Names: ASIF[®], Sanonda Zhengzhou Pesticide (China); BLAZER[®], BASF Canada (Canada); CARBOFUORFEN[®]; KLEENUP[®] Grass and Weed Killer, Bonide Products (USA); KLEERAWAY[®] Grass & Weed Killer, Solaris Group of Monsanto (USA); GALAXY[®], I. Producers: Agrimor International (USA); BASF Agriculture Products (Germany); BASF Canada (Canada); Bonide Products, Inc. (USA); Monsanto Co. (USA); Sanonda Zhengzhou Pesticide (China)

Chemical Class: Diphenolic ether (diphenyl ether); an organofluorine pesticide

EPA/OPP PC Code: 114401; sodium salt: 114402, 209800

California DPR Chemical Code: 2218 as sodium salt

RTECS Number: DG5643200

EINECS Number: 256-634-5

Uses: Used to control pre-emergent and post-emergent broadleaf weeds and grasses in soybean, peanut, pea and rice crops. It is also registered for use by homeowners as a spot treatment on driveways, sidewalks, and patios. It should not be mixed with oils, surfactants, liquid fertilizers, and other pesticides.

U.S. Maximum Allowable Residue Levels for Acifluorfen (40 CFR 180.383):

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2 as sodium salt; probable human carcinogen (possible human; animal positive)

California Prop. 65: Carcinogen

Label Signal Word: DANGER

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- FIFRA 40 CFR 180.383
- FIFRA 40 CFR 372
- AB 1803-Well Monitoring Chemical (CAL) [62476-59-9]
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) [62476-59-9]
- Proposition 65 chemical (CAL) [62476-59-9]
- Actively registered pesticide in California. [62476-59-9]
- SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0% (Sodium salt)
- US Code 40 CFR 455.65

Description: Acifluorfen is a combustible, off-white to light tan solid. The sodium salt is a white or brown crystalline powder. Molecular weight = 361.65. Melting/Freezing point = 152–157°C⁽²³⁾; 124–126°C (sodium salt). The sodium salt is soluble in water.

Incompatibilities: Strong oxidizers. Avoid contact with all sources of ignition

Permissible Exposure Limits in Air: Not established.

Permissible Concentration in Water: A no-adverse-effect level (NOAEL) has been determined to be 20 mg/kg. Body weight/day based on fetotoxicity. However a NOAEL of 5.6 was determined based on increase in liver size of male rats; further a NOAEL of 1.25 mg/kg/day was determined in a 2-generation rat reproduction study. On this last basis, a long term health advisory of acifluorfen has been set at 0.44 mg/L for a 70-kg adult. A lifetime health advisory for that same adult of 0.009 mg/L. The U.S. EPA has also determined a reference dose (acceptable daily intake) of 0.013 mg/kg/day.

Determination in Water: Analysis of acifluorfen is by a gas chromatographic (GC) method applicable to the determination of certain chlorinated acid pesticides in water samples. In this method, approximately 1 liter of sample is acidified. The compounds are extracted with ethyl ether using a separatory funnel. The derivatives are hydrolyzed with potassium hydroxide, and extraneous organic material is removed by a solvent wash. After acidification, the acids are extracted and converted to their methyl esters using diazomethane as the derivatizing agent. Excess reagent is removed, and the esters are determined by electron capture GC. The method detection limit has not been determined for this compound, but it is estimated that the detection limits for analytes included in this method are in the range of 0.5 to 2 μ g/L.

Routes of Entry: Ingestion

Harmful Effects and Symptoms

Short Term Exposure: Acifluorfen is a moderate dermal and eye irritant.

Long Term Exposure: A known animal carcinogen. Similar chlorinated diphenyl ethers have caused liver damage in

laboratory animals. The acute oral LD₅₀ for male rats is 2025 mg/kg; for female rats is 1370 mg/kg.

Points of Attack: Skin and liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Acrolein

Use Type: Algaecide and rodenticide.

CAS Number: 107-02-8

Formula: C₃H₄O; CH₂CHCHO

Alert: A Restricted Use Pesticide (RUP). Exposure occurs mostly from breathing it in the air, from cigarette smoke, vehicle exhaust, and the burning of plants and trees.

Synonyms: Acrehyde; Acroleina (Italian); Acroleine (Dutch, French); Acrylehyd (German); Acrylehyde; Acrylic aldehyde; Acrylaldehyde; Acrylic aldehyde; Akrolein (Czech); Akroleina (Polish); Allylaldehyde; Aldehyde acrylique (French); Aldeide acrilica (Italian); Aqualine; Biocide; Ethylene aldehyde; NSC 8819; Propenal; 2-Propenal; Prop-2-en-1-al; 2-Propen-1-one; Propylene aldehyde; Slimicide

Trade Names: Aqualin[®], Baker Petrolite (USA); Acquinite[®]; Crolean[®]; Magnacide[®] H, Baker Petrolite (USA)

Producers: Advanced Synthesis Technologies (USA); Air Products & Chemicals (USA); ATOFINA (France); Baker Petrolite (USA); BASF (Germany); Celanese (Germany); Ciba (Switzerland); Creanova (USA); Daicel Chemical Industries (Japan); Degussa (Germany); DSM (Netherlands); Goldschmidt (Germany); Nippon Kayaku Co. (Japan); Sumitomo Chemical (Japan); Union Carbide (USA)

Chemical Class: Aldehyde; Organics, non-halogenated

EPA/OPP PC Code: 000701

California DPR Chemical Code: 3

ICSC Number: 0090

RTECS Number: AS1050000

EEC Number: 605-008-00-3

EINECS Number: 203-453-4

Uses: Acrolein is produced by oxidation of propylene. Acrolein is principally used as a biocide to control plants, algae, molluscs, fungi, rodents, and microorganisms. Acrolein has also been used in the manufacture of other chemicals, plastics, and drugs; as a warning agent in gases, as a test gas for gas masks, in military poison gases, in the manufacture of colloidal metals, in leather tanning, and as a fixative in histology. Acrolein is primarily used as an intermediate in the production of glycerine and in the production of methionine analogs (poultry feed protein supplements). It is also used in chemical synthesis (1,3,6-hexametriol and glutaraldehyde), as a liquid fuel, antimicrobial agent, and as a slimicide in paper manufacture.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–14.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–1.89088 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Acrolein (40 CFR 180.1156)

CROP

Raw Agricultural Commodities

ppm

Carcinogen/Hazard Classifications

IARC: Not classifiable as to human carcinogenicity

Note: The Department of Health and Human Services has determined that acrolein may possibly be a human carcinogen. Testing has not been completed by NIOSH to determine the carcinogenicity of acrolein and related low-molecular-weight-aldehydes. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to acrolein.

- Mexico: Drinking Water 0.3 mg/L (ecological criteria); Listed as an organic toxic pollutant in wastewater.

Description: At room temperature, acrolein is a clear, colorless to straw-colored liquid. It has a pungent, suffocating odor at 0.16 ppm and causes tears. Suffocating, pungent odor at 0.16 ppm. Soluble in water; solubility = 208 g/L @ 20 °C. Molecular weight = 56.06. Boiling point = 52.5°C. Melting/Freezing point = -87.7°C. Vapor pressure = 210 mmHg @ 20 °C. Flash point = -26°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3. Explosive limits: LEL = 2.8%, UEL = 31.0%. Autoignition temperature (unstable) = 220°C. Odor threshold = 0.174 ppm. Soluble in water. The vapor is heavier than air and may travel along the ground. Distant ignition is possible. Log K_{ow} = 0.89. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Acrolein should be stored in a cool, dry, well-ventilated area in tightly sealed containers separated from alkaline materials such as caustics, ammonia, organic amines, or mineral acids, strong oxidizers, and oxygen. Forms explosive mixture with air. Elevated temperatures or sunlight may cause explosive polymerization. A strong reducing agent; reacts violently with oxidizers. Reacts with acids, alkalis, ammonia, organic amines, oxygen, peroxides, sulfur dioxide, thiourea and metal salts. Shock-sensitive peroxides or acids may be formed over time. Attacks zinc and cadmium.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard⁽⁵⁸⁾ the ACGIH⁽¹⁾ and NIOSH⁽²⁾ recommendations for exposure to acrolein is 0.1 ppm (0.25 mg/m³) as an 8-hr TWA concentration. The ACGIH⁽¹⁾, NIOSH⁽²⁾, and HSE⁽³³⁾ (U.K.) 15-minute TWA as STEL value is 0.3 ppm (0.8 mg/m³). The NIOSH⁽²⁾ IDLH = 2 ppm. The Australian, Mexican, Israeli and Canadian Provincial (Alberta, British Columbia, Ontario Quebec) TWA and STEL values are the same as ACGIH⁽¹⁾ and NIOSH⁽²⁾ and Israel has a Action

Level of 0.05 ppm (0.115 mg/m³). The DFG (German)⁽³⁾ TWA value is also the same, and Peak Limitation (5 min) is 2 times the normal MAK; do not exceed more than 8 times during a workshift. AIHA ERPG-2 (maximum airborne concentration below which it is believed that nearly all persons could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms that could impair their abilities to take protective action) = 0.5 ppm. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a value in workplace air of 0.2 mg/m³ (1993) and of 0.03 mg/m³ for ambient air in residential areas on either a momentary or an average daily basis. In addition, a number of states have set guidelines or standards for acrolein in ambient air⁽⁶⁰⁾ ranging from 0.83 $\mu\text{g/m}^3$ (N.Y.) to 1.25 $\mu\text{g/m}^3$ (South Carolina) to 2.5 $\mu\text{g/m}^3$ (Florida, North Dakota) to 4 $\mu\text{g/m}^3$ (Virginia) to 5 $\mu\text{g/m}^3$ (Connecticut) to 6.9 $\mu\text{g/m}^3$ (Nevada) to 80.0 $\mu\text{g/m}^3$ (North Carolina).

Determination in Air: See NIOSH Method #2501⁽¹⁸⁾ and OSHA Method #52⁽⁵⁸⁾. See website <http://www.osha-slc.gov/> (and applicable method, e.g., OSHA Method #21).⁽⁵⁸⁾

Permissible Concentration in Water: To protect freshwater aquatic life on an acute basis 68 $\mu\text{g/L}$ and on a chronic basis 21 $\mu\text{g/L}$. To protect saltwater aquatic life 55 $\mu\text{g/L}$ on an acute toxicity basis. To protect human health 320 $\mu\text{g/L}$ ⁽⁶⁾. In addition, two states have set guidelines for acrolein in drinking water⁽⁶¹⁾. These are both 320 $\mu\text{g/L}$ as set by Arizona and Kansas.

Determination in Water: Gas chromatography (EPA Method #603) or gas chromatography and mass spectrometry (EPA Method #624).

Routes of Entry: Acrolein is toxic by all exposure routes: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin. Systemic effects may occur after exposure by any route.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation Inhaled acrolein is highly toxic. Acrolein is irritating to the upper respiratory tract even at low concentrations. Its odor threshold of 0.16 ppm is similar to the OSHA permissible exposure limit (0.1 ppm); thus odor may provide an adequate warning of potentially hazardous concentrations. Acrolein vapor is heavier than air, but asphyxiation in enclosed, poorly ventilated, or low-lying areas is unlikely due to its strong odor. Children exposed to the same levels of acrolein vapor as adults may receive a larger dose because they have greater lung surface area:body weight ratios and higher minute volumes:weight ratios. In addition, they may be exposed to higher levels than adults in the same location because of their short stature and the higher levels of acrolein vapor found nearer to the ground. **Skin/Eye Contact** Direct contact with liquid acrolein causes rapid and severe eye and skin irritation or burns. Exposure to vapor produces inflammation of mucous membranes and it is a potent lacrimator. Because of their relatively larger surface area:body weight ratio, children are more vulnerable to toxicants affecting the skin. **Ingestion** Acrolein produces chemical burns of the lips, mouth, throat, esophagus, and stomach.

Nausea, vomiting, and diarrhea also occur.

Extremely toxic; probable oral human lethal dose is 5-50 mg/kg, between 7 drops and one teaspoon for a 70 kg (150 lb) person.

Long Term Exposure: This chemical is a metabolite of cyclophosphamide, a well-recognized animal teratogen. Acrolein may cause mutations. Such chemicals have a cancer risk. Long-term exposure can cause drying and cracking of the skin. High or repeated lower exposure may cause permanent lung damage. NIOSH testing has not been completed to determine the carcinogenicity of acrolein. However, the limited studies to date indicate that this substance has chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this related aldehyde. *Reproductive and Developmental Effects* No studies were located that address reproductive or developmental effects of acrolein in humans. Acrolein caused developmental effects when injected into rats, but did not cause developmental effects when ingested by rabbits. No information was found as to whether acrolein crosses the placenta, but it has been measured in breast milk.

Points of Attack: Heart, lungs, eyes, skin and respiratory system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Preplacement and periodic medical examinations should consider respiratory, skin, and eye disease. For those with frequent or potentially high exposure, lung function tests are recommended before beginning work and at regular times after that. If symptoms develop or overexposure is suspected, consider chest x-ray.

First Aid: Victims exposed only to acrolein vapor do not pose contamination risks to rescuers. Victims whose clothing or skin is contaminated with liquid acrolein can secondarily contaminate response personnel by direct contact or by off-gassing vapor. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert, asymptomatic, and has a gag reflex, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and a straw may be of assistance when offering charcoal to a child. Victims who are conscious and able to swallow should be given 4 to 8 ounces of milk or water (not to exceed 15 mL/kg in a child). If the victim is symptomatic, delay decontamination until other emergency measures have been instituted. children at the exposure site. Provide reassurance to the child during decontamination, especially if separation from a parent occurs. Do not make an unconscious person vomit. Medical

observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Note to physician or authorized medical personnel. In cases of respiratory compromise, secure airway and respiration via endotracheal intubation. If not possible, perform cricothyrotomy if equipped and trained to do so. Treat patients who have bronchospasm with an aerosolized bronchodilator such as albuterol. Consider that acrolein inhalation may cause hypertension and tachycardia, in which case the use of bronchodilators that are known cardiac sensitizing agents may pose enhanced risk. Administer corticosteroids as indicated to patients who have persistent wheezing or hypersensitivity pneumonitis. Consider racemic epinephrine aerosol for children who develop stridor. Dose 0.25–0.75 mL of 2.25% racemic epinephrine solution; repeat every 20 minutes as needed, cautioning for myocardial variability. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. If evidence of shock or hypotension is observed, begin fluid administration. For adults with systolic pressure less than 80 mmHg, bolus perfusion of 1000 mL/hour intravenous saline or lactated Ringer's solution may be appropriate. Higher adult systolic pressures may necessitate lower perfusion rates. For children with compromised perfusion, administer a 20 mL/kg bolus of normal saline over 10 to 20 minutes, then infuse at 2 to 3 mL/kg/hour.

Acrolein Diacetate

Use Type: Herbicide

CAS Number: 869-29-4

Formula: C₇H₁₀O₄

Synonyms: Allylidene diacetate; Diacetoxypropene; 1,1-Diacetoxy-2-propene; 1,1-Diacetoxypropene-2; 3,3-Diacetoxypropene; 2-Propene-1,1-dioldiacetate

Trade Names: MAGNACIDE H[®], Baker Petrolite (USA); SD-345[®], Shell Chemicals (UK); SHELL 345[®], Shell Chemicals (UK); SHELL SD 345[®], Shell Chemicals (UK)

Producers: ABCR (Germany); Advanced Synthesis Technologies (USA); Air Products & Chemicals (USA); ATOFINA (France); Baker Petrolite (USA); BASF (Germany); Celanese (Germany); Ciba (Switzerland); Creanova (USA); Daicel Chemical Industries (Japan); Degussa (Germany); DSM (Netherlands); Goldschmidt (Germany); Lancaster Synthesis (UK); Nippon Kayaku Co. (Japan); Shell Chemicals (UK); Sumitomo Chemical (Japan); Union Carbide (USA)

Chemical Class: Organics, non-halogenated

EPA/OPP PC Code: 068402

California DPR Chemical Code: 196

RTECS Number: UC9625000

EINECS Number: 212-789-0

Uses: Not registered in the U.S.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen, as acrolein

IARC: Group 3, Unclassifiable, as acrolein

WHO Acute Hazard: Class 1B, highly hazardous, as acrolein

Description: Flammable liquid. Molecular weight = 158.17. Melting/Freezing point = -36.6°C. Boiling point = 107°C @ 50 mmHg, Flash point = 180°F (open cup). Density = 1.0749 @ 20°F/20°C.

Incompatibilities: Forms explosive mixture with air. A strong reducing agent; reacts violently with oxidizers. Reacts with acids, alkalis, ammonia, amines, oxygen, peroxides. Shock-sensitive peroxides or acids may be formed over time. Acetates are generally incompatible with

nitrites. Moisture may cause hydrolysis or other forms of decomposition

Permissible Concentration in Water: The U.S. EPA recommends that levels in lakes and streams should be limited to 0.32 parts of acrolein per million parts of water (0.32 ppm) to prevent possible health effects from drinking water or eating fish contaminated with acrolein. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous. Severe irritant. This chemical can be absorbed through the skin, thereby increasing exposure. Eye and skin contact may cause intense tearing, irritation, blisters, and burns. Inhalation can irritate the lungs causing irritation, coughing, wheezing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Aldehydes such as acrolein may cause mutations. Such chemicals have a cancer risk. Long-term exposure can cause drying and cracking of the skin. High or repeated lower exposure may cause permanent lung damage.

Points of Attack: Heart, lungs, eyes, skin, respiratory system.

Medical Surveillance: Periodic medical examinations should consider respiratory, skin, and eye disease. For those with frequent or potentially high exposure, lung function tests are recommended. If symptoms develop or overexposure is suspected, consider chest x-ray.

First Aid: See also acrolein. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Acrylamide

Use Type: Soil-conditioning agent

CAS Number: 79-06-1

Formula: C₃H₅NO; CH₂CHCONH₂

Alert: Acrylamide is a carcinogenic breakdown product from cooking. It should be handled with extreme caution. Although it is not used as an agricultural pesticide, its potential residual presence in prepared food is of importance to food chemists.

Synonyms: AAM; Acrilamida (Spanish); Acrylamide, 30%; Acrylamide, 50%; Acrylamide monomer; Acrylic acid amide (50%); Acrylic acid amide, (50%); Acrylic amide; Acrylic amide 30%; Acrylic amide 50%; Akrylamid (Czech); Ethylenecarboxamide; Ethylene monoclinic tablets carboxamide; Propenamamide; 2-Propenamamide Propenamamide; Vinyl amide

Trade Names: ACRYLAGEL[®]; AMERESCO ACRYL-40[®]; OPTIMUM[®]

Producers: Cyanamid BV (Netherlands), now part of Degussa

Chemical Class: Organics, non-halogenated

EPA/OPP PC Code: 600008

California DPR Chemical Code: 02111 as polyacrylamide polymer

ICSC Number: 0091

RTECS Number: AS3325000

EEC Number: 616-003-00-0

EINECS Number: 201-173-7

Uses: Not actively registered as a pesticide in the U.S. The major application for monomeric acrylamide is in the production of polymers as polyacrylamides. Polyacrylamides are used for soil stabilization, gel chromatography, electrophoresis, papermaking strengtheners, clarifications and treatment of potable water, sewage treatment, and foods.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

U.S. NTP Carcinogen: Reasonably anticipated carcinogen

California Prop. 65: Carcinogen

IARC: Group 2A, probable carcinogen

Regulatory Authority:

- EPCRA 40CFR302, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4,540 kg)
- EPCRA 40CFR302.4, Appendix A, RQ: 5,000 lb (2,270 kg)
- EPCRA Section 313 Form R *de minimis* Concentration Reporting Level: 0.1%
- TSCA: 716.120 (a), listed chemical
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, WHMIS, Ingredients Disclosure List. Concentration Reporting Level: 0.1%

Description: Acrylamide in monomeric form is an odorless, flakelike crystals. Soluble in water. Molecular weight = 71.13. Melting/Freezing point = 84.5°C. Flash point = 138°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2. Autoignition temperature = 240°C. It is shipped as clear, colorless to pale-yellow 30% or 50% by weight aqueous solution, or white crystalline solid or pellets. Log K_{ow} = -1.65 to -0.67. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Thermally unstable. Unless inhibited (with antioxidant like hydroquinone), ultraviolet light, oxidizers, peroxides, vinyl polymerization initiators or temperatures above melting point (85°C) can cause explosive polymerization. Reacts violently with reducing agents, peroxides, mineral acids, strong acids, oleum, ammonia and isocyanates. Finely divided particles form explosive mixture with air.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard is 0.3 mg/m³ as a time-weighted average (TWA) concentration for up to a 10-hour workshift. NIOSH⁽²⁾ and ACGIH⁽¹⁾ has a TWA of 0.03 mg/m³(58). The notation "skin" indicated possible cutaneous absorption. The NIOSH⁽²⁾ IDLH, (potential occupational carcinogen)= 60 mg/m³. HSE⁽³³⁾ (U.K.), Australia, Israel, and Mexico TWA is 0.3 mg/m³ and Israel Action Limit is 0.015 mg/m³ and Mexico STEL is 2.6 mg/m³. Canadian Provincial TWAs are: Alberta and British Columbia: 0.3 mg/m³ and STEL of 0.6 mg/m³; Ontario and Quebec TWAEVs are 0.03 mg/m³. California's PEL is 0.3 mg/m³ TWA. In addition. Several states have set guidelines or standards for acrylamide ambient concentrations in air⁽⁶⁰⁾: 0.3 µg/m³ (South Carolina) to 1.0 µg/m³ (New York) to 3.0 µg/m³ (South Dakota) to 5.0 µg/m³ (Virginia) to 6.0 µg/m³ (Connecticut) to 7.0 µg/m³ (Nevada).

Determination in Air: Filter/Si gel; Methanol; Gas chromatography/Nitrogen/phosphorus detection; OSHA (#21)

Permissible Concentration in Water: Health advisories have been developed by EPA⁽⁴⁸⁾ on a long term (7-year) basis as 0.02 mg/L for a 10 kg child and 0.07 mg/L for a 70 mg adult. A guideline for acrylamide in drinking water of 0.10 µg/L has been developed by the State of Minnesota⁽⁶¹⁾.

Determination in Water: There is no standardized method for the determination of acrylamide in drinking water. An analytical procedure for the determination of acrylamide has been reported in the literature. This procedure consists of bromination, extraction of the brominated product from water with ethyl acetate and quantification using high performance liquid chromatography (HPLC) with an ultraviolet detector. The concentration of the ethyl acetate to dryness and dissolution in a small volume of distilled water prior to HPLC analysis allows the detection of acrylamide at concentrations of 0.2 µg/L⁽⁴⁸⁾.

Routes of Entry: Eyes, skin, central and peripheral nervous systems, reproductive system. Acrylamide can be absorbed through unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin and respiratory tract. Symptoms of Exposure include complaints of drowsiness, fatigue, tingling of fingers, and a stumbling, propulsive type of walking with sense of unsteadiness have been reported. Motor and sensory impairment, numbness, tremor, abnormal feelings in the lower limbs accompanied by weakness, and speech disturbances were also reported. Classified as very toxic; probably oral lethal human dose is between 50 and 500 mg/kg or between 1 teaspoon and 1 ounce for a 150 lb. person. Polymerized acrylamide may not be toxic, but the monomer can cause peripheral nerve damage.

Long Term Exposure: There is evidence that acrylamide causes cancer in animals. It may cause skin and lung cancer in humans. There is limited evidence that this chemical damages the male testes. Can cause damage to the central nervous system, causing numbness, and weakness of the hands and feet. Acrylamide is a cumulative neurotoxin and repeated exposure to small amounts may cause serious injury to the nervous system. The neurological effects may be delayed. Polymer inhibitors or stabilizers added to the monomer may also produce toxicity. The symptoms of acrylamide toxicity are consistent with mid-brain lesions and blocked transport along both motor and sensory axons.

Points of Attack: Central nervous system, peripheral nervous system, skin and eyes.

Medical Surveillance: Since skin contact with the substance may result in localized or systemic effects, NIOSH recommends that medical surveillance be made available to all employees working in an area where acrylamide is stored, produced, processed, or otherwise used, except as an unintentional contaminant in other materials at a concentration of less than 1% by weight. For those with frequent or potentially high exposure, nerve condition tests should be considered. The use of alcoholic beverages may enhance the harmful effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately. If this chemical contacts the skin, flush with water immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Acrylonitrile

Use Type: Insecticide and fumigant

CAS Number: 107-13-1

Formula: C₃H_{3.5}N_{1.5}; CH₂CHCN_{1.5}

Alert: A Restricted Use Pesticide (RUP)

Synonyms: Acrilonitrilo (Spanish); Acrylnitril (Dutch, German); Acrylonitrile monomer; Akrylonitril (Polish); AN; Carbacryl; Cianuro di vinile (Italian); Cyanoethylene; Cyanure de vinyle (French); ENT 54; NCI-C50215; Nitrile acrilico (Italian); Nitrile acrylique (French); Propenenitrile; 2-Propenenitrile; TL 314; VCN; Vinyl cyanide; Vinyl cyanide, propenenitrile

Trade Names: ACRITET[®] component of (with Carbon tetrachloride), canceled; ACRYLOFUME[®], component of (with Carbon tetrachloride, Chloroform, and Chloropicrin); ACRYLON[®] component of (with Carbon tetrachloride); CARBACRYL[®], component of (with Carbon tetrachloride); FUMIGRAIN[®]; MILLER'S FUMIGRAIN[®]; VENTOX[®] component of (with Carbon tetrachloride)

Producers: BASF (Germany); BP Chemicals (UK); China Petrochemical Development Corp. (Taiwan); Cytec (USA); DSM (Netherlands); DuPont (USA); EniChem (Italy); Huntsman (USA); Lukoil Oil Company (Russia); Mitsubishi

Chemical (Japan); Mitsui Chemicals (Japan); Petrobras Energia S.S. (Argentina); Showa Denko (Japan); Sigma-Aldrich Laborchemikalien (Germany); Sinopec Corporation (Singapore); Sterling Chemicals (USA); Sumitomo (Japan); Zeon (Japan)

Chemical Class: Organics, non-halogenated

EPA/OPP PC Code: 000601

California DPR Chemical Code: 3019

ICSC Number: 0092

RTECS Number: AT5250000

EEC Number: 608-00300-4

EINECS Number: 203-466-5

Uses: Acrylonitrile is used in the manufacture of synthetic fibers, polymers, acrylostyrene plastics, acrylonitrile-butadiene-styrene plastics, nitrile rubbers, chemicals, and adhesives. It is also used as a pesticide intermediate. In the past, this chemical was used as a room fumigant and pediculicide (an agent used to destroy lice).

Description: Acrylonitrile, is a highly flammable, clear, colorless or light yellowish liquid. Inadequate; unpleasant onion or garlic odor at 17 ppm. Odor can only be detected above the PEL. Floats on water; solubility = 7% @ 20 °C. Molecular weight = 53.1. Boiling point = 77°C @ 760 mmHg. Melting/Freezing point = -82 °C. Specific gravity (water : 1) = 0.80. Gas density (air: 1) = 1.8. Vapor pressure = 83 mmHg @ 20 °C. Flash point = -1°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 2. Explosive limits: LEL= 3%, UEL = 17%. Log K_{ow} = 0.28. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Forms explosive mixture with air. Reacts violently with strong acids, strong alkalis, bromine, and tetrahydrocarbazole. Copper, copper alloys, ammonia and amines may cause breakdown to poisonous products. Unless inhibited (usually with methylhydroquinone) acrylonitrile may polymerize spontaneously. It may also polymerize on contact with oxygen, heat, strong light, peroxides, and concentrated or heated alkalis. Reacts with oxidizers, acids, bromine, amines. Attacks copper and copper alloys. Attacks aluminum in high concentrations. Heat and flame may cause release of poisonous cyanide gas and nitrogen oxides.

Permissible Exposure Limits in Air: The Federal OSHA PEL is 2 ppm 8 hr. TWA and 10 ppm not to be exceeded during any 15 minute work period. This chemical can be absorbed through the skin, thereby increasing exposure. NIOSH⁽²⁾ has a recommended airborne exposure limit of 1 ppm TWA on an 10-hour workshift and a 10 ppm ceiling not to be exceeded during any 15 minute work period. ACGIH's recommendation is a TLV of 2 ppm averaged over an 8-hour workshift, with the notation that acrylonitrile is a human carcinogen⁽¹⁾. The odor threshold is about 10-fold greater than the OSHA PEL, so workers can be overexposed to acrylonitrile without being aware of its presence. The NIOSH⁽²⁾ IDLH level = 85 ppm. This chemical is a probable carcinogen in humans; there may be no safe level and all contact should be reduced to lowest possible level. AIHA ERPG-2 (maximum airborne concentration below which it is believed that nearly all persons could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms that could impair their abilities to take protective action) = 35 ppm. The DFG⁽³⁾ TRK is 3 ppm (7 mg/m³), Animal Carcinogen, Suspected Human Carcinogen Australia's and Israel's limit is 2 ppm (4.3 mg/m³) TWA. The (HSE)⁽³³⁾ (U.K) limit is 2 ppm (4 mg/m³) TWA⁽³³⁾. Mexico's limit is 2 ppm (5.4 mg/m³) TWA. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of

0.5 mg/m³ in workplace air and a limit of 0.03 mg/m³ in ambient air in residential areas on a daily, average basis. In addition, several states have set guidelines or standards for acrylonitrile in ambient air⁽⁶⁰⁾: 0.0147 µg/m³ (Indiana) to 0.145 µg/m³ (North Carolina) to 0.15 µg/m³ (Massachusetts) to 11.3 µg/m³ (Pennsylvania) to 15.0 µg/m³ (New York) to 22.0 µg/m³ (Connecticut and South Dakota) to 22.5 µg/m³ (South Carolina) to 45.0 µg/m³ (Florida and Virginia).

Determination in Air: Charcoal adsorption followed by acetone extraction and gas chromatographic analysis. See NIOSH Method 1604⁽¹⁸⁾, or OSHA Method 37⁽⁵⁸⁾. See NIOSH Criteria Document 78-212 NITRILES

Permissible Concentration in Water: The substance is toxic to aquatic organisms. Acrylonitrile usually breaks down in about 1 or 2 weeks, but this can vary depending on conditions. For example, high concentrations (such as might occur following a spill) tend to be broken down more slowly. In one case, measurable amounts of acrylonitrile were found in nearby wells 1 year after a spill (ATSDR public Health Statement, December 1990). See RCRA and Clean Water Act under Regulatory Authority. The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L). To protect freshwater aquatic life—on an acute basis, 7,550 µg/L and on a chronic basis, 2,600 µg/L over 30 days. To protect saltwater aquatic life—insufficient data to yield a value. To protect human health—preferably zero. Water concentration should be below 0.58 µg/L to keep lifetime cancer risk below 10⁻⁵. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 2.0 mg/L for water bodies used for domestic purposes. The Mexico drinking water ecological criteria is 0.0006 mg/L, reduce human exposure to a minimum. In addition, several states have set guidelines for acrylonitrile in drinking water⁽⁶¹⁾ ranging from 0.67 µg/L (Minnesota) to 3.8 µg/L (Kansas) to 10 µg/L (Arizona) to 35 µg/L (Connecticut).

Determination in Water: Charcoal tube; Acetone/CS₂; Gas chromatography/Flame ionization detection; NIOSH (IV) Method #1604.⁽¹⁸⁾ Also, by gas chromatography (EPA Method #603) or gas chromatography plus mass spectrometry (EPA Method #624). Also, cyanide may be determined titrimetrically by EPA Methods 335.2 and 9010 which give total cyanide.

Routes of Entry: Persons whose clothing or skin are contaminated with liquid acrylonitrile can secondarily contaminate response personnel by direct contact or through off-gassing vapor. Inhalation and percutaneous absorption. It may be absorbed from contaminated rubber or leather. Routes include ingestion and eye and skin contact. Acrylonitrile vapor is absorbed readily from the lungs, and inhalation is an important route of exposure. This chemical's odor generally provides inadequate warning of hazardous concentrations and olfactory fatigue develops rapidly. The odor threshold is about 10-fold greater than the OSHA PEL, so response personnel and workers can be overexposed to acrylonitrile without being aware of its presence.

Harmful Effects and Symptoms

Short Term Exposure: Acrylonitrile is irritating to the skin,

eyes, and respiratory tract. Toxic effects range from headache, fatigue, dyspnea, nausea and vomiting to asphyxiation, lactic acidosis and cardiovascular collapse. Toxic effects are due primarily to the bioreactivity of acrylonitrile with cellular proteins and to its epoxide intermediate that is mutagenic and genotoxic. Toxicity is also due to the release of cyanide during the metabolism of acrylonitrile. Persons whose clothing or skin are contaminated with liquid acrylonitrile can secondarily contaminate response personnel by direct contact or through off-gassing vapor. Splashes in the eye may result in corneal damage. Skin contact can cause severe irritation and blistering. Breathing acrylonitrile can irritate the lungs causing coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can result in death. Skin contact contributes significantly in overall exposure and can lead to systemic toxicity. Acrylonitrile reaction causes redness, blisters and some systemic signs. Symptoms derive from tissue anoxia in order of onset: limb weakness, dyspnea (difficult breathing), burning sensation in throat, dizziness, impaired judgement, cyanosis (turning blue), nausea, collapse, irregular breathing, convulsions and death. In later stages collapse, irregular breathing or convulsions and cardiac arrest may occur without warning. Some patients appear hysterical or may even be violent. Acrylonitrile is classified as very toxic. Probable oral lethal dose for human is 50-500 mg/kg (between 1 teaspoon and 1 oz.) for a 70 kg (150 lb) person. Toxic concentrations have been reported at 16 ppm/20 min. Acute toxicity is similar to that due to cyanide poisoning and the level of cyanide ion in blood is related to the level of poisoning. Inhalation or ingestion can result in fatal systemic poisoning, collapse and death due to tissue anoxia (lack of oxygen) and cardiac arrest (heart failure). At higher concentrations there may be damage to red blood cells and the liver. Jaundice may develop 24 hours following exposure and persist for several days. Because of continued metabolic release of cyanide, symptoms of severe poisoning may recur and the patient may relapse.

Long Term Exposure: Chronic exposures to acrylonitrile have been associated with liver damage. Chronic exposure may be more serious for children because of their potential longer latency period. **Carcinogenicity** The Department of Health and Human Services has determined that acrylonitrile may reasonably be anticipated to be a carcinogen. IARC has determined that acrylonitrile is possibly carcinogenic to humans (Group 2B) based on sufficient evidence of carcinogenicity in experimental animals and inadequate evidence for carcinogenicity in humans. ACGIH classifies it as a suspected human carcinogen. In animals, chronic exposure can cause tumors of the mammary gland, gastrointestinal tract, and CNS. Increased rates of lung and prostate cancer have been documented in some groups of chronically exposed workers, but not in others. **Reproductive and Developmental Effects:** According to *Shepard's Catalog of Teratogenic Agents*, when large doses of acrylonitrile were administered to experimental animals by oral, inhalation, or intraperitoneal routes, teratogenic effects were produced. In humans, there

is no documented evidence that acrylonitrile is a reproductive or developmental toxicant. Acrylonitrile is not currently reviewed in the TERIS or Reprotex databases. Acrylonitrile is not included in *Reproductive and Developmental Toxicants*, a 1991 report published by the U.S. General Accounting Office that lists 30 chemicals of concern because of widely acknowledged reproductive and developmental consequences. There is no information regarding whether acrylonitrile can cross the placenta or whether it can accumulate in breast milk and be transferred to nursing infants.

Points of Attack: Eyes, skin, cardiovascular system, liver, kidneys, central nervous system. Cancer Site: brain tumors, lung and bowel cancer.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. For those with frequent or high exposure, consider urine thiocyanate levels, blood cyanide levels, liver function tests, fecal occult blood screening, pulmonary function tests. Consider chest x-ray following acute exposure. Consider the skin, respiratory tract, heart, central nervous system, renal and liver function in placement and periodic examinations. A history of fainting spells or convulsive disorders might present and added risk to persons working with toxic nitriles.

First Aid: Persons whose clothing or skin are contaminated with liquid acrylonitrile can secondarily contaminate response personnel by direct contact or through off-gassing vapor. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Note to physician or authorized medical personnel. In cases of respiratory compromise secure airway and respiration via endotracheal intubation. If not possible, perform cricothyroidotomy if equipped and trained to do so. Administer 100% oxygen. Treat patients who have bronchospasm with aerosolized bronchodilators. The use of bronchial sensitizing agents in situations of multiple chemical exposures may pose additional risks. Also consider the health of the myocardium before choosing which type of bronchodilator should be administered. Cardiac sensitizing agents may be appropriate; however, the use of cardiac sensitizing agents after exposure to certain chemicals may pose enhanced risk of cardiac arrhythmias (especially in the elderly). Acrylonitrile poisoning is not known to pose additional risk during the use of bronchial or cardiac

sensitizing agents. Consider racemic epinephrine aerosol for children who develop stridor. Dose 0.25–0.75 mL of 2.25% racemic epinephrine solution in water, repeat every 20 minutes as needed cautioning for myocardial variability. Patients who are comatose, hypotensive, or have seizures or cardiac dysrhythmias should be treated according to advanced life support protocols. These patients may be seriously acidotic; under medical control, consider giving them 1 ampule of sodium bicarbonate (pediatric dose: 1 mEq/kg may be appropriate). If massive exposure is suspected or if the patient is severely symptomatic with hypotension, infuse intravenous saline or lactated Ringer's solution. For adults, bolus 1000 mL/hour if blood pressure is under 80 mmHg; if systolic pressure is over 90 mmHg, an infusion rate of 150 to 200 mL/hour is sufficient. For children with compromised perfusion administer 20 mL/kg of normal saline or Ringer's lactate delivered over 10 to 20 minutes, then at a 2 to 3 mL/kg/hour infusion rate. **Antidotes:** When possible, treatment with cyanide antidotes should be given under medical-base control to unconscious victims with known or strongly suspected acrylonitrile poisoning. Cyanide antidotes amyl nitrite perles and intravenous infusions of sodium nitrite and sodium thiosulfate are packaged in the cyanide antidote kit. Amyl nitrite perles (0.2 mL) should be broken onto a gauze pad and held under the nose, over the Ambu valve intake, or placed under the lip of the face mask. A new perle is crushed and inhaled for 30 seconds every minute until intravenous sodium nitrite is given. Infuse sodium nitrite intravenously as soon as possible. The usual adult dose is 10 to 20 mL of a 3% solution infused over no less than 5 minutes to produce a 20% methemoglobin level in adults. Children should receive 0.33 mL/kg of the 3% solution at an infusion rate of 2.5 mL/minute, up to a maximum of 10 mL. Administer sodium nitrite doses to children on the basis of body weight, since fatal methemoglobinemia has occurred in children dosed at adult rates. Monitor blood pressure during administration, and slow the rate of infusion if hypotension develops. Immediately after sodium nitrite infusion, administer sodium thiosulfate intravenously. The usual adult dose is 50 mL (12.5 g) of a 25% solution infused at a rate of 3 to 5 mL/minute; the average pediatric dose is 1.65 mL/kg (412.5 mg/kg) up to 50 mL. If symptoms reappear or persist within 1 hour, readminister sodium nitrite and sodium thiosulfate at 50% of the initial dose.

Alachlor

Use Type: A pre-emergence herbicide

CAS Number: 15972-60-8

Formula: C₁₄H₂₀ClNO₂

Alert: A Restricted Use Pesticide (RUP). Human toxicity (long-term): High.

Synonyms: A13-51506; Acetamide, 2-chloro-*n*-(2,6-diethylphenyl)-*N*-(Methoxymethyl)-; Acetanilide, 2-chloro-2',6'-diethyl-*N*-(methoxymethyl)-; Alachlore; α -Chloro-2',6'-diethyl-*N*-(methoxymethyl)acetanilide; 2-Chloro-*N*-(2,6-diethylphenyl)-*N*-(methoxymethyl)acetamide; Glyphosate isopropylamine salt; Metachlor; Methachlor; *N*-(Methoxymethyl)2,6-diethylchloroacetamide

Trade Names: AGIMIX[®], Milenia Agro Ciencias (Brazil); ALAGAM[®], Makhteshim-Agan Industries (Israel); Proficol (Colombia); ALAGAN[®], Makhteshim-Agan Industries (Israel); Proficol (Colombia); ALANEX[®], Makhteshim-Agan Industries (Israel); Proficol (Colombia); ALAPAZ[®], Pazchem Ltd., (Israel), suspended; ALAZINE[®], Makhteshim Agan (Israel); ALATOX 480[®]; ALCLOR 48 LE[®], Alcotan Laboratories (Spain); BRONCO[®], Monsanto (USA), canceled; CANNON HERBICIDE[®], Monsanto (USA), canceled; CHIMICHLOR[®]; CROP STAR[®],

Chemical Class: Chloroacetanilide

EPA/OPP PC Code: 090501

California DPR Chemical Code: 678

ICSC Number: 0371

RTECS Number: AE1225000

EEC Number: 616-015-00-6

EINECS Number: 240-110-8

Uses: A pre-emergence herbicide for corn, soybeans, and peanuts, and other field crops. It is a selective systemic herbicide, absorbed by germinating shoots and by roots. It works by interfering with a plant's ability to produce protein and by interfering with root elongation. Alachlor is a Restricted Use Pesticide (RUP). This compound is one of the most highly used herbicides in the U.S. It is available as granules or emulsifiable concentrate. Alachlor is used in mixed formulations with atrazine, glyphosate, trifluralin, and imaquin.

Human toxicity (long-term)⁽⁷⁷⁾: High—2.00 ppb, MCL (Maximum Contaminant Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate—26.19584 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Alachlor (40 CFR 180.249):

Carcinogen/Hazards Classifications:

U.S. EPA Carcinogens: Likely for high doses; not likely for low doses

California Prop. 65: Carcinogen

IARC: Not evaluated

Label Signal Word: DANGER

TRI Developmental Toxin: Developmental toxin

WHO Acute Hazard: Class III, slightly hazardous

Endocrine Disruptor: Suspected

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- Proposition 65 chemical (CAL)
- Actively registered pesticide in California.
- Banned or Severely Restricted (EPA-FIFRA)
- Safe Drinking Water Act, MCL, 0.002 mg/L; MGLC, zero; Regulated chemical (47 FR 9352)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 1lb (0.454 kg), SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0%.
- Water Pollution Standard Proposed (Various States)⁽⁶¹⁾

Description: Alachlor, a poly-substituted single aromatic nucleus, is a cream-colored solid. Insoluble in water. Molecular weight = 269.79. Melting/Freezing point = 39.5–41.5°C. Flash point = 137°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Log K_{ow} = 3.48. Values at or above 3.0 are likely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Strong oxidizers. Corrosive to iron and steel.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No adverse effect

level in drinking water has been calculated by NSA/NRC⁽⁴⁶⁾ as 0.7 mg/L. Allowable daily intake (ADI) has been calculated at 0.1 mg/kg/day. More recently, the U.S. EPA⁽⁴⁷⁾ has reviewed alachlor and determined a ten-day health advisory value of 0.1 mg/L for a 10 kg child. An acceptable daily intake was calculated as 0.01 mg/kg/day in the study. A maximum level in drinking water of 0.002 mg/L has been proposed by EPA⁽⁶²⁾. In addition, a number of states⁽⁶¹⁾ have set guidelines for alachlor in drinking water ranging from 0.15 µg/L (Arizona) to 0.2 µg/L (Illinois) to 2.0 µg/L (Massachusetts) to 10.0 µg/L (Minnesota) to 15 µg/L (Kansas) to 200 µg/L (Maine).

Determination in Water: May be accomplished by liquid-liquid extraction gas chromatographic procedure⁽⁴⁷⁾.

Routes of Entry: Ingestion

Harmful Effects and Symptoms

Short Term Exposure: Toxic by skin contact, ingestion, and inhalation. Eye contact may cause severe irritation or injury. Skin contact may irritate and burn skin. No effects found in human studies⁽⁴⁷⁾. Exhibits relatively low acute oral toxicity; the LD₅₀ value for rats is 0.93 g/kg. The technical product has only slight skin and eye irritation potential after an acute exposure⁽⁴⁷⁾. However, alachlor feeding studies have demonstrated oncogenic effects including lung tumors in mice and stomach, thyroid and nasal turbinate tumors in rats.

Long Term Exposure: Human mutation data reported. Suspected carcinogen; some experimental data reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Air Pollutant Standard Set (New York, South Carolina)⁽⁶⁰⁾ Water Pollution Standard Proposed (U.S. EPA)⁽⁴⁷⁾ (Several States)⁽⁶¹⁾

Description: Aldicarb is a broad spectrum carbamate pesticide; a fast-acting cholinesterase inhibiting agent with effective direct contact and stomach action; and, a plant systemic of extremely high acute toxicity to mammals. It is a noncombustible, white crystalline solid with a slight sulfurous odor. Slightly soluble in water. Melting/Freezing point = 98–100°C. Vapor pressure = 0.01 Pa @ 25°C. Log K_{ow} = 1.35. Although this chemical is an environmental hazard, it is unlikely to bioaccumulate in marine organisms.

Incompatibilities: Strong alkalis.

Permissible Exposure Limits in Air: The American Industrial Hygiene Association (AIHA/WEEL) recommends a TWA level of 0.07 mg/m³, and warns that aldicarb can be absorbed through the skin, thereby increasing exposure. Guidelines or standards have been set for aldicarb in ambient air⁽⁶⁰⁾ ranging from 2.0 µg/m³ (New York) to 6.0 µg/m³ (South Carolina).

Permissible Concentration in Water: EPA/Safe Drinking Water Act Levels for MCL, 0.003 mg/L; MCLG 0.001 mg/L. Canada Drinking Water Quality = 0.009 mg/L MAC.

Determination in Water: Aldicarb may be determined in water by gas-liquid chromatography with flame photometric detection after oxidation to the sulfone (aldoxycarb) by peracetic acid or 3-chloro-perbenzoic acid. Colorimetric methods have also been used based on hydrolysis to hydroxyl-amine which is oxidized to nitrous acid, the latter used to diazotize sulfanilic acid which is then coupled to give a dye⁽²³⁾.

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical is one of the most highly toxic pesticides. It can be harmful or fatal if swallowed, inhaled or absorbed through the skin.

Exposure can cause rapid severe poisoning with headache, blurred vision, sweating, nausea, abdominal pain, vomiting, diarrhea, loss of coordination, and death. In severe cases, unconsciousness and convulsions may occur. The probable oral lethal dose for humans is less than 5 mg/kg, or a taste (less than 7 drops) for a 150-lb person; it is extremely toxic by both oral and dermal routes. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: May affect the immune system. There is no evidence that aldicarb affects reproduction. Aldicarb is questionable carcinogen with no firm human evidence.

Points of Attack: Skin, lungs.

Medical Surveillance: Test plasma and red blood cell cholinesterase levels (for enzyme poisoned by this chemical). For this substance, these tests are accurate only if done within about two hours of exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is **UNCONSCIOUS OR HAVING CONVULSIONS**, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup.

Inhalation: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Note to physician or authorized medical personnel. Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. **Medical note:** 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Aldoxycarb (ANSI)

Use Type: Insecticide, acaricide and nematocide

CAS Number: 1646-88-4

Formula: C₇H₁₄N₂O₄S

Synonyms: Aldicarb sulfure (French); Carbamic acid, methyl-, *O*-[(2-methyl-2-(methylsulfonyl)propylidene)amino] derivative; ENT AI 3-29261; 2-Methyl-2-(methylsulfonyl)propanal-*O*-[(methylamino)carbonyl]oxime; 2-Methyl-2-(methylsulfonyl)propionaldehyde-*O*-(methylcarbamoyl)oxime; Propanal, 2-methyl-2-(methylsulfonyl)-, *O*-[(methylamino)carbonyl]oxime
Trade Names: ALDICARB SULFONE®; TEMIK

SULFONE®; SULFOCARB®, STANDAK®, Bayer CropScience (Germany); UC-21865®, Union Carbide (USA)

Producers: Bayer CropScience (Germany); Union Carbide (USA)

Chemical Class: Carbamate

EPA/OPP PC Code: 110801

California DPR Chemical Code: 2265

RTECS Number: UE2080000

Uses: Used to control honey locust gall midge and other insects and mites on cotton, potatoes, sugar beets and ornamentals. Applied to the soil by soluble mixture or spikes.

Human toxicity (long-term)⁽⁷⁷⁾: High—7.00 ppb, MCL (Maximum Contaminant Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low—7683.76758 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Description: White, crystalline solid. Slight sulfur odor. Slightly soluble in water; solubility = 8,000 ppm @ 20°C. Molecular weight = 222.29. Melting/Freezing point = 141°C. Vapor pressure = 12 mPa @ 25°C; 1.0 x 10⁻⁴ mmHg.

Incompatibilities: May react violently with bromine, ketones. Incompatible with strong acids, azo dyes, caustics, ammonia, amines, boranes, hydrazines, strong oxidizers. May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a

corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is **UNCONSCIOUS OR HAVING CONVULSIONS**, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Note to physician or authorized medical personnel.

Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Aldrin

Use Type: Insecticide and termiticide

CAS Number: 309-00-2

Formula: C₁₂H₈Cl₆

Alert: There is no manufacture, sale, or commercial use permitted for aldrin in the U.S. EPA banned all uses of aldrin in 1974, except to control termites. In 1987, EPA banned all uses. Human toxicity (long-term): Very high.

Synonyms: Aldrine (French); Aldrina (Spanish); 1,4,5,8-Dimethanonaphthalene,1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-(1 α ,4 α ,4 β ,5 α ,8 α ,8 β)-; 1,4:5,8-Dimethanonaphthalene,1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-, *endo-exo*-; ENT 15949; Hexachlorohexahydro-*endo-exo*-dimethanonaphthalene; 1,2,3,4,10,10-Hexachloro-1,4,4a,5,8,8a-hexahydro-1,4,5,8-dimethanonaphthalene; 1,2,3,4,10,10-Hexachloro-1,4,4a,5,8,8a-hexahydro-*exo*-1,4-*endo*-5,8-dimethanonaphthalene; 1,2,3,4,10,10-Hexachloro-1,4,4A,5,8,8A-Hexahydro-1,4-*endo-exo*-5,8-dimethanonaphthalene; HHDM; HHDN; HHPN; Octalene; 1,2,3,4,10-10-Hexachloro-1,4,4a,5,8,8a-hexahydro-1,4,5,8-*endo-exo*-dimethanonaphthalene

Producers: Bharat Pulverizing Mills (India); Ehrenstorfer, Dr. (Germany); IMC Vigoro, see Vigoro (Canada); Prentiss Inc. (USA); Rhone-Poulenc Agro France (France); Shell Chemical (Netherlands); Sigma-Aldrich Laborchemikalien (Germany); Zeneca Agro (UK) (now Syngenta) (Switzerland); Vigoro (Canada)

Chemical Class: Organochlorine, Halo-organics

EPA/OPP PC Code: 045101

California DPR Chemical Code: 9

ICSC Number: 0774

RTECS Number: IO2100000

EEC Number: 602-048-00-3

EINECS Number: 206-215-8.

Uses: There is no sale or commercial use permitted for aldrin. Formerly used as an insecticide against termites, grasshoppers and worms in the U.S. Some people may be exposed to aldrin (and dieldrin) in air, water and food because of its persistence in the environment. See dieldrin for more details.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.02058 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Extra high–0.18049 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

California Prop. 65: Carcinogen

IARC: Group 3, unclassifiable

Label Signal Word: DANGER

Endocrine Disruptor: Suspected endocrine disruptor

- CERCLA/SARA 40CFR302, Extremely Hazardous Substances: Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 1 lb (0.454 kg); SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0%. Aldrin has been found in at least 207 of the 1,613 National Priorities List sites identified by the Environmental Protection Agency (EPA).
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Aldrin, is a colorless, crystalline solid. The technical grade is a tan to dark brown solid. It has a mild, chemical odor. Practically insoluble in water. Molecular weight = 364.89. Melting/Freezing point = 104°C.(pure); 49–60°C (technical grade). Vapor pressure = 6.6×10^{-6} mmHg. Although noncombustible, Aldrin may be dissolved in a flammable solvent that may change its physical and toxicological properties. Odor threshold = 0.3 mg/m³. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Log K_{ow} = 7.4. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Avoid concentrated mineral acids, acid catalysts, acid oxidizing agents, phenol, or active metals.

Permissible Exposure Limits in Air: The OSHA⁽²⁾, ACGIH⁽¹⁾, and NIOSH⁽²⁾ TWA is 0.25 mg/m³ as is the DFG MAK⁽³⁾ (total dust), Australian, (HSE)⁽³³⁾ (U.K.), Mexico and Israel value, with the notation “skin” indicating potential for cutaneous adsorption. (HSE)⁽³³⁾ and Mexico suggests a STEL of 0.75 mg/m³. NIOSH⁽²⁾ has recommends that Aldrin be held to the lowest feasible concentration (LFC). The NIOSH⁽²⁾ IDLH level = 25 mg/m³, with the notation [potential occupational carcinogen]. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC in workplace air of 0.01 mg/m³. In addition, several states have set guidelines or standards for Aldrin in ambient air⁽⁶⁰⁾: 0.035 $\mu\text{g/m}^3$ (Pennsylvania) to 0.595 $\mu\text{g/m}^3$ (Kansas) to 1.5 $\mu\text{g/m}^3$

(Connecticut) to 2.5 $\mu\text{g}/\text{m}^3$ (North Dakota) to 4.0 $\mu\text{g}/\text{m}^3$ (Virginia) to 6.0 $\mu\text{g}/\text{m}^3$ (Nevada).

Determination in Air: A filter plus bubbler containing isooctane followed by workup with isooctane and analysis by gas chromatography. See NIOSH Method #5502⁽¹⁸⁾.

Permissible Concentration in Water: The U.S. EPA limits the amount of aldrin that may be present in drinking water to 0.001 and 0.002 milligrams per liter (mg/L) of water, respectively, for protection against health effects other than cancer. The U.S. EPA has determined that a concentration of aldrin of 0.0002 mg/L in drinking water limits the lifetime risk of developing cancer from exposure to each compound to 1 in 10,000. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 0.01 mg/L in water used for domestic purposes. Mexico limit in drinking water 0.00003 mg/L. In addition, several states have set guidelines and standards for aldrin in drinking water⁽⁶¹⁾. Illinois has set a standard of 0.1 $\mu\text{g}/\text{L}$. Guidelines in other states range from 0.013 $\mu\text{g}/\text{L}$ (Kansas) to 0.03 $\mu\text{g}/\text{L}$ (Minnesota) to 0.05 $\mu\text{g}/\text{L}$ (California). Aldrin is highly toxic to aquatic organisms and every care must be taken to avoid release to the environment. In the food chain important to humans, bioaccumulation takes place, specifically in aquatic organisms. It is strongly advised not to let the chemical enter into the environment because of its persistence.

Determination in Water: Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625)

Routes of Entry: Inhalation, skin absorption, ingestion and eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: High exposure can cause headache, dizziness, nausea and vomiting, muscle jerks, severe seizure and death. Eye and skin contact can cause irritation and burns. Can be fatal if swallowed or absorbed through the skin. Aldrin tends to produce convulsions before other, less serious signs of illness have appeared. Victims have reported headache, nausea, vomiting, dizziness, and mild clonic jerking. Some victims have convulsions without warning. Poisoning by Aldrin usually involves convulsions due to its effects on the central nervous system. Probable oral lethal dose for humans is between 7 drops and one ounce for a 150 pound adult human.

Long Term Exposure: Aldrin accumulates in the human body. It may cause tumors, cancer, mutations, and reproductive effects. Liver effects have also been reported. Drinking alcohol can increase the liver damage caused by aldrin. Aldrin may be a teratogen in humans since it has been shown to be a teratogen in animals. Aldrin may decrease fertility in males and females. It is classified as an extremely toxic chemical. Conflicting reports of carcinogenicity of this compound remain an area of controversy. Similar chemically and toxicologically to dieldrin.

Points of Attack: Central nervous system, liver, kidneys and skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Laboratory tests can measure aldrin and dieldrin in blood, urine, and body tissues. These tests are not routinely available because they require specialized equipment. Aldrin changes to dieldrin fairly quickly in the body, the test has to be done shortly after you are exposed to aldrin. Dieldrin can stay in the body for months, measurements of dieldrin can be made much longer after exposure to either aldrin or dieldrin. The tests cannot tell you whether harmful health effects will occur.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink. Do NOT induce vomiting.

EEC Number: 006-025-00-3

EINECS Number: 209-542-4

Uses: Allethrin is used almost exclusively to control flying and crawling insects in homes and industrial locations. Used extensively in pet animal shampoos, to treat lice in humans and in home and industrial sprays for flying insects, mosquitos, etc. It is available as mosquito coils, mats, oil formulations and as an aerosol spray. It may be hazardous to the environment; special attention should be given to fish and honey bees.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION. Containers of technical grade *d*-trans-allethrin have the Signal Word WARNING.

WHO Acute Hazard: Group II, moderately hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL) as pyrethrins
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum
- Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins
- Actively registered pesticide in California.
- EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg) as pyrethrins

Description: Allethrins are synthetic analogs of naturally occurring insecticides. Clear, yellow to amber, oily liquids which is also available as wettable powder or granules. Sprays may be dissolved in xylene or kerosene. Slight aromatic odor. Practically insoluble in water (I & II). Molecular weight = 302.39 (*S*-bioallethrin). Boiling point = approx. 140–160°C. Flash point = approx 120–123°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Log K_{ow} = 4.75–4.80. Values at or above 3.0 are likely to bioaccumulate in marine organisms. May be combined with organophosphates.

Incompatibilities: Strong alkalis and oxidizers. Unstable in light, UV, air, and alkaline conditions.

Permissible Exposure Limits in Air: Not established.

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV⁽¹⁸⁾, Method #5008, Pyrethrum.

Routes of Entry: Skin, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact causes irritation and burns. Inhalation can cause respiratory tract irritation with coughing and wheezing. High exposure may cause dizziness, shaking, irritability, seizures, and unconsciousness. Allethrin may cause effects on the nervous system.

Long Term Exposure: May cause skin allergy. If the allergy develops, very low future exposure can cause itching and skin rash. Allethrin may cause an asthma-like allergy. Future exposure can cause asthma attacks with shortness of breath, wheezing, cough and/or chest tightness. Allethrin can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may cause liver and kidney damage. There is no evidence that allethrin affects reproduction.⁽²⁾ See also pyrethrins.

Points of Attack: Skin, lungs, liver, and kidneys.

Medical Surveillance: Liver and kidney function tests. Lung function test. (These could be normal if the person is not having an attack at the time of the test). Evaluation by a qualified allergist may help to diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Allidochlor

Use Type: Herbicide

CAS Number: 93-71-0

Formula: C₈H₁₂ClNO

Synonyms: Acetamide, 2-chloro-*N,N*-di-2-propenyl-; Alidochlor; CDAA; CDAAT; 2-Chloro-*N,N*-diallylacetamide; α -Chloro-*N,N*-diallylacetamide; 2-Chloro-*N,N*-di-2-propenylacetamide; Diallylchloroacetamide; *N,N*-Diallylchloroacetamide; *N,N*-Diallyl- α -chloroacetamide; *N,N*-Diallyl-2-chloroacetamide; NCI-C04035

Trade Names: ACTOX[®], canceled; CP 6343[®]; RADOX[®]; RANDOX[®], Monsanto (USA), canceled; RANTOX T[®]; VEGA-RAND[®], Helena Chemical (USA), canceled

Producers: Helena Chemical (USA); Monsanto (USA)

Chemical Class: Organochlorine; Halo-organics; acetamide herbicide

EPA/OPP PC Code: 019301

California DPR Chemical Code: 114

RTECS Number: AB5250000

Uses: There are no products registered with the U.S. EPA; all tolerances were revoked on July 21, 1999. It was primarily used to control weeds growing in onion crops. Used as a pre-emergence and post-emergence control for most annual grasses and broadleaf weeds on corn, sorghum,

lima beans, snap beans, soybeans, cabbage, peas for canning, celery, onions and some fruits and ornamentals.

Fish toxicity (threshold)⁽⁷⁷⁾: Low–269.85657 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: WARNING

Description: An oily, amber liquid. Slightly irritating odor. Slightly soluble in water. Boiling point = 116°C; 74°C @ 0.3 mm. Molecular weight = 173.66. Vapor pressure = 1.0×10^{-2} mmHg.

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids. Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion. Absorbed through the intact skin.

Harmful Effects and Symptoms

Short Term Exposure: Attacks the central nervous system. Apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death.

Long Term Exposure: May cause kidney damage.

Points of Attack: May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own

decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses.

Ingestion: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. In cases of ingestion, Do not induce vomiting *; the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Allyl Alcohol

Use Type: Fungicide and herbicide.

CAS Number: 107-18-6

Formula: C₃H₆O; CH₂CHCH₂OH

Alert: May be fatal if swallowed.

Synonyms: AA; Alcool allilco (Italian); Alcool allylique (French); Alilico alcohol (Spanish); Allyl Al; Allylalkohol (German); Allylic alcohol; 3-Hydroxypropene; Orvinylcarbinol; Propenol; 2-Propenol; 2-Propen-1-ol;

Propen-1-ol-3; 1-propen-3-ol; Propenyl alcohol; 2-Propenyl alcohol; Vinyl carbinol; Vinyl carbinol, 2-propenol

Trade Names: SHELL UNDRAUTTED A®; WEED DRENCH®

Producers: BP Chemicals (UK); Lyondell Chemical (USA); Showa Denko (Japan); Sigma-Aldrich Fine Chemicals (USA)

Chemical Class: Alcohol/Ether; organics, non-halogenated

EPA/OPP PC Code: 068401

California DPR Chemical Code: 3023

ICSC Number: 0095

RTECS Number: BA5075000

EEC Number: 603-015-00-6

EINECS Number: 203-470-7

Uses: Allyl alcohol is used in the production of allyl esters. These compounds are used as monomers and prepolymers in the manufacture of resins and plastics. Allyl alcohol is also used in the preparation of pharmaceuticals, in organic syntheses of glycerol and acrolein and warfare gas.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1b, highly hazardous

Regulatory Authority:

- Canada, WHMIS, Ingredients Disclosure List; National pollutant Release Inventory (NPRI)

Description: Allyl alcohol is a flammable, colorless liquid. Pungent, mustard-like odor. Soluble in water. Odor threshold = 1.4 to 2.1 ppm. The odor and irritant properties of allyl alcohol should be sufficient warning to prevent serious injury. Boiling point = 97°C. Melting/Freezing point = -48°C. Flash point = 21°C (cc); 32°C (oc). Autoignition temperature = 378°C. Explosive limits : LEL = 2.5%, UEL

= 18.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1. Log K_{ow} = 0.17. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Forms explosive mixture with air. Reacts explosively with carbon tetrachloride, strong bases. Also incompatible with strong acids, oxidizing agents, metal halides, oleum, diallyl phosphate, sodium, potassium, aluminum and magnesium. Contact with oxidizers may cause fire and explosions. Polymerization may be caused by heat, peroxides, or oxidizers.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard (TWA), ACGIH⁽¹⁾, NIOSH⁽²⁾, DFG MAK⁽³⁾, Australian, Mexico, Israel value⁽³⁾ is 2 ppm (5 mg/m³). ACGIH⁽¹⁾ and NIOSH⁽²⁾ add the notation "skin" indicating potential for cutaneous absorption. The NIOSH⁽²⁾, ACGIH⁽¹⁾, HSE⁽³³⁾, Israel, and Mexico STEL is 4 ppm (10 mg/m³). The DFG Peak Limitation (30 min.) is 2 times normal MAK; do not exceed more than 4 times during a workshift. The Canadian Provincial TWA limits are: 2 ppm (4.7-5.0 mg/m³) TWA or TWAEV and STEL is 4 ppm (9.5-10 mg/m³) [Alberta, British Columbia, Ontario, Quebec]. The NIOSH⁽²⁾ IDLH value = 20 ppm. Guidelines or standards for allyl alcohol in ambient air have been set⁽⁶⁰⁾ by various states: 5 mg/m³/STEL 10 mg/m³ (California), 5 mg/m³ (North Dakota); 8 mg/m³ (Virginia); 10 mg/m³ (Connecticut); 11.9 mg/m³ (Nevada).

Determination in Air: Adsorption on charcoal, workup with CS₂ and gas chromatographic analysis. See NIOSH Method #1402⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: May be fatal if swallowed or inhaled. Allyl alcohol vapor can cause serious irritation and burns of eyes, nose and throat. Eye irritation may be accompanied by sensitivity to light, pain, blurred vision leading to permanent damage. The pain may not begin until 6 hours after exposure. Contact with the liquid may cause first and second degree burns of skin and blister formation. Areas of contact will become swollen and painful and local muscle spasms may occur. Allyl alcohol causes burns on contact, and may cause pulmonary edema, a medical emergency, if inhaled. It is poisonous in small quantities. The probable oral lethal dose is 50-500 mg/kg, or between 1 teaspoonful and 1 ounce for a 150 lb person.

Long Term Exposure: Allyl alcohol may cause mutations; such chemicals may have a cancer or reproductive risk. This chemical may cause liver and kidney damage. Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Preplacement and periodic

examinations should include lung function tests, liver and kidney function tests. Following acute exposure, chest x-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Allyl Bromide

Use Type: Insecticide

CAS Number: 106-95-6

Formula: C₃H₅Br

Synonyms: Bromuro de alilo (Spanish); Bromallylene; 1-Bromo, 2-propene; 3-Bromopropene; 3-Bromopropeno (Spanish); 3-Bromopropylene; 1-Propene, 3-bromo-; 3-Bromopropylene

Producers: Albemarle (USA); ATOFINA Chemicals (USA); Chemada Fine Chemicals (Israel); Ocean Chemicals Group (UK); Rhone-Poulenc (France); Shell Chemical (Netherlands)

RTECS Number: UC7090000

EINECS Number: 203-446-6

Uses: Also used as an intermediate in the manufacture of resins, pharmaceuticals, fragrances, and other chemicals.

Regulatory Authority:

- Air and Water Pollutant Standard Set: see Bromine

- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

- Canada, WHMIS, Ingredients Disclosure List

Description: Allyl bromide is a highly flammable, colorless to light yellow liquid. Unpleasant, pungent odor. Slightly soluble in water. Boiling point = 71.3°C. Flash point = -2°C. Autoignition temperature = 295°C. Explosive limits: LEL = 4.4%, UEL = 7.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers may cause fire and explosions. Heat or light exposure may cause decomposition and corrosive vapors.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard for bromine is 0.1 ppm (TWA, 8-hour workshift). NIOSH⁽²⁾ recommends an airborne exposure limit of 0.1 ppm (TWA, 10-hour workshift), with an STEL of 0.3 ppm, not to be exceeded during any 15 minute work period. ACGIH⁽¹⁾ recommends 0.1 ppm (TWA, 8-hour workshift), and STEL of 0.2 ppm. *Note:* It should be recognized that allyl bromide can be absorbed through the skin, thereby increasing exposure. The NIOSH⁽²⁾ IDLH for bromine = 3 ppm.

Routes of Entry: Skin, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous. This chemical can be absorbed through the skin, thereby increasing exposure. Irritates eyes, skin, and respiratory tract, and can cause burns and permanent damage. Inhalation can cause respiratory tract irritation with coughing and wheezing. Exposure can cause headache, dizziness, and severe digestive irritation with pain, nausea, vomiting and diarrhea. High exposure may cause pulmonary edema, a medical emergency, with severe shortness of breath. This can cause death.

Long Term Exposure: Allyl bromide can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may cause liver and kidney damage, and mutations. May cause skin disorders.

Points of Attack: Skin, lungs

Medical Surveillance: If symptoms develop or overexposure is suspected, chest x-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large

quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Allyl Isothiocyanate

Use Type: Fumigant

CAS Number: 57-06-7

Formula: C₄H₅NS

Synonyms: AITC; Allyl isorhodanide; Allyl isosulfocyanate; Allyl isothiocyanate, stabilized; Allyl mustard oil; Allylsenfoel (German); Allyl sevenolum; Allyl thiocarbonimide; Artificial mustard oil; Isothiocyanic acid, allyl ester; Isothiocyanate d'allyle (French); 3-Isothiocyanato-1-propene; Mustard oil; NCI-C50464; Oil of mustard, artificial; Oleum sinapis volatile; 1-Propene, 3-isothiocyanato-; 2-Propenyl isothiocyanate; Senf oel (German); Synthetic mustard oil; Volatile oil of mustard

Trade Names: CARBOSPOL[®]; REDSKIN[®]

Producers: Fluorochem Ltd. (UK); Lancaster Synthesis (UK); Penta Manufacturing (USA); Sigma-Aldrich Laborchemikalien (Germany); Tokyo Kasei Kogyo (Japan)

Chemical Class: Thiocyanate; essential oil

EPA/OPP PC Code: 004901

California DPR Chemical Code: 1153 (Mustard oil); 1010 (Allyl isothiocyanate)

ICSC Number: 0372

RTECS Number: NX8225000

EINECS Number: 200-309-2

Uses: Used as an animal and insect repellent, food flavorings, ointments and mustard plasters, and in the manufacture of warfare gases.

Carcinogen/Hazard Classifications

IARC: Group 3, unclassifiable

Label Signal Word: CAUTION

Regulatory Authority:

- Carcinogen (animal evidence) (NTP)⁽⁹⁾
- Actively registered pesticide in California.
- Hazardous Substances List (The Director's List) (CAL/OSHA)

- U.S. DOT 49CFR172.101, Inhalation Hazardous Chemical

Description: Highly flammable, colorless to pale yellow, oily liquid. Pungent, irritating odor and acrid taste like mustard. Insoluble in water. Molecular weight : 99.18. Boiling point = 151°C. Melting/freezing point = -103°C. Density = 1.015 @ 15°F/4°C; 1.013-1.016 @ 25°F/25°C. Vapor pressure = 10 millimeter @ 38.3°C; Vapor density = 3.41. Flash point = 46°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Log K_{ow} = 2.12. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids may cause fire and explosion. Also incompatible with alcohols, strong bases, and amines.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation and skin contact

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin and respiratory tract. Eye and skin contact can cause skin irritation. Prolonged contact can cause burns and blisters. This chemical can be absorbed through the skin, thereby increasing exposure.

Long Term Exposure: There is limited evidence that this chemical causes cancer in animals; it may cause bladder cancer in male rats. It may damage the developing fetus. Exposure can cause an allergy-type reaction to develop with symptoms of asthma, watery eyes, sneezing, runny nose, coughing, sneezing, chest tightness. Once allergy develops, small exposures can cause symptoms to develop. **Developmental Effects:** No reproductive or developmental effects of this thiocyanate have been reported in experimental animals or humans. Increased levels of thiocyanate in the umbilical cords of fetuses whose mothers smoked compared to those whose mothers were non-smokers suggests that thiocyanate, and possibly also cyanide, can cross the placenta.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: Pre-employment and regular lung function tests are recommended (these may be normal if the person is not having an attack at the time of the test). Urine thiocyanate levels. Blood cyanide levels. If symptoms develop or if overexposure is suspected, evaluation by a qualified allergist may help diagnose skin allergy.

First Aid: Treatment is as for aliphatic thiocyanates. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin

rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Victims who are conscious and able to swallow should be given 4 to 8 ounces of water or milk. Gastric lavage with a small bore NG tube should be considered if it can be performed within 1 hour after ingestion. The effectiveness of activated charcoal administration is unknown, but it is suggested following lavage (administer activated charcoal at 1 gm/kg, usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. *Note:* Because cyanide is probably largely responsible for poisonings, antidotal measures against cyanide should be instituted promptly. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1-2 years.

Aluminum Phosphide

Use Type: Fumigant, fungicide, rodenticide, and insecticide

CAS Number: 20859-73-8

Formula: AIP

Alert: A Restricted Use Pesticide (RUP). Metallic phosphides on clothes, skin, or hair can react with water or moisture to generate phosphine gas. Vomitus containing phosphides can also off-gas phosphine.

Synonyms: AIP; Aluminum fosfide (Dutch); Aluminum monophosphide; Caswell No. 031; Fosfuri di alluminio (Italian); Fosfuro aluminico (Spanish); Phosphures d'aluminium (French)

Trade Names: AL-PHOS[®]; CELPHIDE[®]; CELPHOS[®]; Excel Industries (India); DELICIA[®]; DETIA[®]; DETIA-EX-B[®]; DETIA GAS EX[®]; DETIA-GAS-EX-B[®]; DELICIA GASTOXIN; FARMOZ[®]; FUMITOXIN[®]; Pestcon Systems (USA); PHOSTOXIN[®]; Degesch America (USA); PHOSTOXIN-A[®] Degesch America (USA); QUICKPHOS[®]; United Phosphorus (India); QUICK TOX[®]; RENTOKIL GASTION[®]; Rentokil (Australia)

Producers: Bhageria Dye-Chem (India); Biesterfeld

Siemsglueß International. GmbH (Germany); China Chemical (China); Degesch America (USA); Excel Industries (India); Hunan Tianyu Pesticide Chemical Group (China); Pestcon Systems (USA); Quantum Chemicals (Australia); Rentokil (Australia); Shenzhen Guomeng Industry Co., Ltd. (China); United Phosphorus (India); Webcot (Australia)

Chemical Class: Inorganic phosphide

EPA/OPP PC Code: 066501

California DPR Chemical Code: 484

ICSC Number: 0472

RTECS Number: BD1400000

EEC Number: 015-004-00-8

Uses: Used as an insecticidal fumigant for grain, peanuts, processed food, animal feed, leaf tobacco, cottonseed, and as space fumigant for flour mills, warehouses and railcars. It is also used in baits for rodent and mole control in crops. Used as a source of phosphine; in semiconductor research. Zinc phosphide is often mixed with bait food such as cornmeal, which can be a danger to pets and children. When phosphides are ingested or exposed to moisture, they release phosphine gas.

U.S. Maximum Allowable Residue Levels for Aluminum Phosphide (40 CFR 180.225):

Note: The following residue limits are for phosphine compounds that produce phosphine gas.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not listed; Group D, unclassifiable for phosphine, its parent chemical

Label Signal Word: DANGER

Regulatory Authority:

- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- U.S. DOT 49CFR172.101, Inhalation Hazardous Chemical
- Canada, WHMIS, Ingredients Disclosure List
- EPA Hazardous Waste Number (RCRA No.): P006⁽⁵⁾
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (228 kg)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 100 lb (45.4 kg)
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- Banned or Severely Restricted (Belgium)⁽¹³⁾

Description: Aluminum phosphide is a pyrophoric, dark gray or dark yellow crystalline solid. Has an odor like decaying fish or garlic. Melting/Freezing point => 1000°C.

Decomposes in water forming highly poisonous and flammable phosphine gas. NFPA-704 Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2, Water reactive; dangerous when wet.

Incompatibilities: Reacts violently with water, carbon dioxide, and foam fire extinguishers. Contact with water and bases rapidly releases highly toxic and flammable phosphine gas. Contact with steam and acids may be violent. Can ignite spontaneously in moist air.

Permissible Exposure Limits in Air: The NIOSH⁽²⁾ recommended airborne exposure limit for soluble aluminum salts (measured as aluminum) is 2 mg/m³ TWA for a 10-hour workshift. ACGIH recommends the same criterion for an 8-hour workshift⁽¹⁾. *Note:* Metallic phosphides on clothes, skin, or hair can react with water or moisture to generate phosphine gas (colorless gas; odor of garlic or decaying fish). Vomitus containing phosphides can also off-gas phosphine. For *phosphine*: OSHA PEL = 0.3 ppm (averaged over an 8-hour workshift) NIOSH⁽²⁾ IDLH (immediately dangerous to life or health) = 50 ppm ERPG-2 (Emergency Response Planning Guideline) (maximum airborne concentration below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious adverse health effects or symptoms that could impair an individual's ability to take protective action) = 0.5 ppm

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: A severe health hazard. Irritates the eye, skin and respiratory tract. Inhalation can cause lung irritation with coughing, wheezing, and shortness of breath. Affects metabolism and the central nervous system; exposure can lead to death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Acute toxicity occurs primarily by the inhalation route when aluminum phosphide decomposes into the toxic gas, phosphine. The human median lethal dose for aluminum phosphide has been reported to be 20 mg/kg. Rated as super toxic: probable oral lethal dose is less than 5 mg/kg or less than 7 drops for a 70 kg (150 lb) person. Symptoms of phosphine gas poisoning include restlessness, headache, dizziness, fatigue, nausea, vomiting, coma, convulsions; lowered blood pressure, pulmonary edema, respiratory failure, and disorders of the kidney, liver, heart, and brain may be observed.

Long Term Exposure: This chemical may cause lung, kidney, and liver damage. It may be able to cause skin rash or eczema

Points of Attack: Central nervous system, liver, kidney, lungs.

Medical Surveillance: Lung, liver, kidney, and nervous system function tests.

First Aid: If this chemical gets into the eyes, remove any

contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician or authorized medical personnel (Advanced Treatment for phosphine exposure): In cases of respiratory compromise secure airway and respiration via endotracheal intubation. If not possible, perform cricothyroidotomy if equipped and trained to do so. Treat patients who have bronchospasm with aerosolized bronchodilators. The use of bronchial sensitizing agents in situations of multiple chemical exposures may pose additional risks. Consider the health of the myocardium before choosing which type of bronchodilator should be administered. Cardiac sensitizing agents may be appropriate; however, the use of cardiac sensitizing agents after exposure to certain chemicals may pose enhanced risk of cardiac arrhythmias (especially in the elderly). Consider racemic epinephrine aerosol for children who develop stridor. Dose 0.25–0.75 mL of 2.25% racemic epinephrine solution in 2.5 cc water, repeat every 20 minutes as needed, cautioning for myocardial variability. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. If evidence of shock or hypotension is observed begin fluid administration. For adults, bolus 1000 mL/hour intravenous saline or lactated Ringer's solution if blood pressure is under 80 mmHg; if systolic pressure is over 90 mmHg, an infusion rate of 150 to 200 mL/hour is sufficient. For children with compromised perfusion administer a 20 mL/kg bolus of normal saline over 10 to 20 minutes, then infuse at 2 to 3 mL/kg/hour.

Aluminum Sulfate

Use Type: Molluscicide and plant growth regulator

CAS Number: 10043-01-3

Formula: $Al_2S_3O_{12}$, $Al_2(SO_4)_3$

Synonyms: Alum; Aluminum alum; Aluminum sulphate; Aluminum trisulfate; Alunogenite mineral; Cake alum (octahydrate); Dialuminum sulfate; Diaaluminum trisulfate; Paper maker's alum; Patent alum (octahydrate); Sulfato aluminico (Spanish); Sulfuric acid, aluminum salt

Producers: Abaquim (Mexico); Adheswara Group of Companies (India); Alcan Chemicals (Canada); Central Glass (Japan); Chongqing Chuandong Chemical (Group) (China); Coogee Chemicals (Australia); Delta (USA); Dharamsi Morarji (India); General Alum (USA); GFS Chemicals (USA); Holland (USA); Kemira Chemicals (Finland); Marsulex (Canada); Rhodia Eco (France); Sumitomo Chemical (Japan); YiHua Group (China)

Chemical Class: Inorganic

EPA/OPP PC Code: 013906

California DPR Chemical Code: 1415

ICSC Number: 1191

RTECS Number: BD1700000

Uses: Widely used in tanning leather, sizing paper, mordant in dyeing, purifying water, fireproofing and waterproofing cloth, clarifying oils and fats, treating sewage, in antiperspirants, in manufacturing aluminum salts and others.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (North Dakota)⁽⁶⁰⁾
- The "Director's List" (CAL/OSHA)
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 5,000 lb (2270 kg)

Description: Aluminum sulfate is a white crystalline solid, powder, or granules; often used in water solution. Soluble in water. Molecular weight = 342.18. Melting/Freezing point = 770°C (decomposes). Noncombustible.

Incompatibilities: In aqueous solution aluminum sulfate

forms sulfuric acid; reacts with bases and many other substances.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard for soluble aluminum salt, including aluminum sulfate, is 2 mg/m³ TWA averaged over an 8-hour workshift. This same standard is recommended by ACGIH⁽¹⁾, and HSE⁽³³⁾. In addition, North Dakota⁽⁶⁰⁾ has set a guideline for in ambient air of 0.02 mg/m³.

Permissible Concentration in Water: An ambient water level of 73 µg/L for aluminum compounds has been suggested by EPA⁽³²⁾ based on health effects.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Aluminum sulfate powder can irritate the eyes, skin and respiratory tract. It is capable of causing eye damage. Ingestion of large doses can cause stomach irritation, nausea and vomiting.

Long Term Exposure: Aluminum sulfate may cause skin disorders, and may cause lung problems

Points of Attack: Lungs and skin.

Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Chemical Class: Triazine

EPA/OPP PC Code: 080801

California DPR Chemical Code: 18

RTECS Number: XY91000000

EINECS Number: 212-634-7

Uses: Ametryn is a herbicide which inhibits photosynthesis

and other enzymatic processes. Ametryn is an unrestricted or General Use Pesticide (GUP). It is used to control broadleaf weeds and annual grasses in pineapple, sugarcane and bananas. It is used on corn and potato crops for general weed control. It is also used as a vine desiccant on dry beans and potatoes. Ametryn is available as an emulsifiable concentrate, flowable wettable powder and a wettable powder. The U.S. EPA classifies ametryn as Toxicity Class III, slightly toxic. Used in premixes with atrazine, diuron, simazine, and terbutryn.

Human toxicity (long-term)⁽⁷⁷⁾: Low–60.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–989.94257 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Ametryn: (40CFR 180.258):

CROP	ppm
Banana	0.25
Cassava, roots	0.1
Corn, fodder	0.5
Corn, forage	0.5
Corn, fresh (inc. sweet)(k+cwhr)	0.25
Corn, grain	0.25
Pineapple	0.25
Pineapple, fodder	0.25
Pineapple, forage	0.25
Sugarcane, cane	0.25
Sugarcane, fodder	0.25
Sugarcane, forage	0.25
Tanier	0.25
Yam, true, tuber	0.25

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.5 kg), 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.
- AB 1803-Well Monitoring Chemical (CAL)

Description: Ametryn is a colorless powder. Readily soluble in organic solvents. Melting/Freezing point = 84–86°C. Vapor pressure = 2.7×10^{-6} mmHg.

Incompatibilities: Triazines are incompatible with nitric acid.

Permissible Concentration in Water: The No-Adverse-Effect-Level (NOAEL) has been found to be 100 mg/kg/day and on that basis a ten-day health advisory of 8.6 mg/L was determined for a 10-kg child. If, however, one assumes a NOAEL of 10 mg/kg/day one arrives at a long term health advisory of 0.86 mg/L for a 70-kg adult. The lifetime health advisory for an adult is 0.06 mg/L using a NOAEL of 10.

Determination in Water: Extraction with methylene chloride may be followed by gas chromatography using a

nitrogen phosphorus detector. The detection limits are in the range of 0.1 to 2.0 $\mu\text{g/L}$.

Routes of Entry: Ingestion and skin.

Harmful Effects and Symptoms

Short Term Exposure: Ametryn is an eye and skin irritant. It is mildly toxic by skin contact. Poisonous if swallowed or inhaled.

Long Term Exposure: It apparently causes liver degeneration. The LD_{50} value for male Charles River rats was 1207 mg/kg and 1543 mg/kg for female rats.

Points of Attack: Liver

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Aminoethoxyvinylglycine hydrochloride

Use Type: Plant growth regulator

CAS Number: 55720-26-8

Formula: $\text{C}_5\text{ClF}_2\text{H}_{10}\text{MNO}_4$

Synonyms: *trans*-L-2-Amino-4-(2-aminoethoxy)3-butenoic acid hydrochloride; AVG; *L*- α -(2-Aminoethoxyvinyl)glycine hydrochloride; (*s*)-*trans*-2-Amino-4-(2-aminoethoxy)-3-butenoic acid hydrochloride; 3-Butenoic acid, 2-amino-4-(2-aminoethoxy)-,

monohydrochloride, [*s-(E)*]-

Trade Names: ABG-3097[®], Valent BioSciences Corporation (USA); RETAIN[®], Valent BioSciences Corporation (USA); X-11085[®]

Producers: Valent BioSciences Corporation (USA)

EPA/OPP PC Code: 129104

California DPR Chemical Code: 3907

RTECS Number: EM9080000

Uses: A plant growth regulator used on apples, pears and ornamentals. In apples, it delays fruit maturity and the resulting pre-harvest fruit drop, and in pears, it helps maintain fruit firmness. It is used as a spray solution.

U.S. Maximum Allowable Residue Levels for Aminoethoxyvinylglycine Hydrochloride (40 CFR 180.502):

CROP	ppm
Apple	0.08
Fruit, stone, group 12, except cherry	0.170
Pear	0.08

Description: Molecular weight = 183.61.

Incompatibilities: When heated to decomposition or on contact with acids or acid fumes, may produce highly toxic chloride fumes; deadly phosgene gas may be formed. It may cause pitting of some metals.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. No significant risk from dietary exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

4-Aminopyridine

Use Type: Avicide

CAS Number: 504-24-5 (*p*-isomer); 504-29-0 (*o*-isomer); 462-08-8 (*m*-isomer)

Formula: C₅H₆N₂; C₅NH₄NH₂

Alert: A Restricted Use Pesticide (RUP)

Synonyms: 4-Aminopyridina (Spanish); Amino-4-pyridine; γ -Aminopyridine; *p*-Aminopyridine; 4-Pyridinamine; Pyridine, 4-amino-

Trade Names: 4-AP[®]; AVITROL[®], Avitrol Corporation (USA); AVITROL 200[®], Avitrol Corporation (USA); COMPOUND 1861[®]; PRC-1237[®]; VMI 10-3[®]

Producers: Aldrich Chemical (USA); Avitrol Corporation (USA); Mitsubishi Corp. (Japan); Richman Chemical (USA); Seal Sands Chemicals (UK); Shanghai Chemical Reagent Co. (China); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Pyridine

EPA/OPP PC Code: 069201

California DPR Chemical Code: 50

RTECS Number: US1750000

Uses: A bird poison for control of crows, pigeons, grackles, gulls, blackbirds and other pests to crops, feed lots, grain processing plants and similar locations. Highly toxic to mammals. Also used as a chemical intermediate in pharmaceuticals and for treatment of certain nerve conditions.

Regulatory Authority:

- RCRA Section 261 Hazardous Constituents.
- EPA Hazardous Waste Number (RCRA No.): P008
- EPCRA Section 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4,540 kg)
- EPCRA Section 304 RQ: CERCLA, 1000 lb (454 kg)
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.

Description: White to tan or brown powder. Odorless. Boiling point = 274°C. Melting/Freezing point = 159°C. Flash point = 164°C. Moderately soluble in water. Log K_{ow} = < 1.0. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Sodium nitrite, strong oxidizers. Avoid contact with acid anhydrides, acid chlorides, and strong acids.

Permissible Exposure Limits in Air: ACGIH TLV 0.5 ppm (1.9 mg/m³)⁽¹⁾. NIOSH IDLH = 5 ppm (*o*-isomer).

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, absorbed through the intact skin.

Harmful Effects and Symptoms

Short Term Exposure: Material may be fatal if inhaled, swallowed or absorbed through skin. Symptoms of exposure include rapid onset of disagreeable taste, immediate burning of throat, and abdominal discomfort; in addition, weakness, dizziness, disorientation, convulsions and seizures may occur. Delayed symptoms of oral ingestion include elevated liver enzymes, and respiratory arrest. Contact may cause burns to skin and eyes. Material attacks the nervous system and affects neural transmission. In sufficient concentration, material may cause metabolic acidosis, respiratory arrest, and cardiac arrhythmia. The fatal dose to a 70 kg. person is about 5 grams.

Long Term Exposure: High exposure or repeated exposure may cause liver damage.

Points of Attack: Central nervous system and liver.

Medical Surveillance: Pre-employment and regular physical examinations with emphasis on central nervous system. Liver function tests. Persons exposed to *strychnine* or other chemicals capable of causing seizures are probably at increased risk.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Amiton

Use Type: Insecticide, miticide, and acaricide

CAS Number: 78-53-5

Formula: C₁₀H₂₄NO₃PS; (C₂H₅O)₂POSCH₂CH₂N(C₂H₅)₂

Alert: A Restricted Use Pesticide (RUP). Amiton is highly poisonous and has been suspected for being developed as a chemical weapon.

Synonyms: *S*-(2-Diethylamino)ethyl phosphorothioic acid-*O,O*-diethyl ester; Diethyl-*S*-2-diethylaminoethyl phosphorothioate; *O,O*-Diethyl-*S*-(2-diethylaminoethyl) thiophosphate; *O,O*-Diethyl-*S*-2-diethylaminoethyl phosphorothioate; *O,O*-Diethyl-*S*-(β-Diethylamino)ethyl phosphorothioate; *O,O*-Diethyl-*S*-diethylamino ethyl phosphorothioate; *O,O*-Diethyl-*S*-2-diethylaminoethyl phosphorothioate; DSDP; ENT 24,980-X; R-5,158; Phosphorothioic acid, *S*-(2-(diethylamino)ethyl) *O,O*-diethyl ester

Trade Names: CHIPMAN 6200[®], Chipman Chemicals (Canada); CITRAM[®]; INFERNO[®]; METRAMAC[®]; METRAMAK[®]; RHODIA-6200[®], Rhodia Group (France); TETRAM[®], ICI Group (UK), canceled

Producers: ICI Group (UK); Rhodia Group (France)

Chemical Classes: Organothiophosphate

EPA/OPP PC Code: 057302

RTECS Number: TF0525000

Label Signal Word: DANGER

Regulatory Authority:

- Very Toxic Substance (World Bank)⁽¹⁵⁾
- CERCLA/SARA 40CFR355 Extremely Hazardous Substances: TPQ = 500 lb (227 kgs)
- CERCLA/SARA Section 304 RQ: EHS, 1 lb (0.454 kg)
- Classified by EPA as a Restricted Use Pesticide (RUP)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Regulated under the Chemical Weapons Convention of 1994 as a toxic organophosphate nerve agent

Description: Amiton is a colorless liquid. Soluble in water. Molecular weight = 269.32. Boiling point = 110°C @ 0.2 mm pressure. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 1. Emits highly toxic nitrogen oxides, phosphorus oxides, and sulfur oxides when heated to decomposition.

Permissible Exposure Limits in Air: No standards set.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Danger-poisonous; can be fatal if swallowed, inhaled, or absorbed through the skin or eyes. This material is highly toxic orally. It is a cholinesterase inhibitor. The LD₅₀ (oral, rat) = 3.3 mg/kg. The toxic effects are similar to parathion. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. It may cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate

PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water do NOT induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Note to physician or authorized medical personnel. Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. **Notes to physician or authorized medical personnel:** N-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 gm in 100 ml of sterile water or in 5% dextrose and water, intravenously, slowly, in 15-30 minutes; if sufficient fluid is not available, give 1 gm of 2-PAMCI in 3 ml of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also, Diazepam, an anticonvulsant, or

1,1'-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 Dibromide and TMV-4) have been used as an antidote for organophosphate poisoning.

Amiton Oxalate

Use Type: Insecticide and acaricide.

CAS Number: 3734-97-2

Formula: C₁₂H₂₆NO₇PS; (C₂H₅O)₂POSCH₂CH₂N (C₂H₅)₂·HOCCOOH

Alert: A Restricted Use Pesticide (RUP)

Synonyms: Acid oxalate; [2-(2-Diethylamino)ethyl]-*O,O*-diethyl ester, oxalate (1:1); Amiton hydrogen oxalate; *S*-(2-Diethylaminoethyl)-*O,O*-diethylphosphorothioate hydrogen oxalate; *O,O*-Diethyl-*S*-(2-diethylamino)ethylphosphorothioate hydrogen oxalate; *O,O*-Diethyl-*S*-(β-diethylamino)ethylphosphorothioate hydrogen oxalate; *O,O*-Diethyl-*S*-(2-ethyl-*N,N*-diethylamino)ethylphosphorothioate hydrogen oxalate; Hydrogen oxalate of Amiton; Phosphorothioic acid, *S*-[2-(diethylamino)ethyl] *O,O*-diethyl ester, ethanedioate (1:1); Phosphorothioic acid, *S*-[2-(diethylamino)ethyl] *O,O*-diethyl ester, oxalate (1:1)

Trade Names: CHIPMAN® 6199, Nomix-Chipman Chemicals (UK); CHIPMAN® R-6, 199, Nomix-Chipman Chemicals (UK); CITRAM®, TETRAM® 75; TETRAM®, ACID OXALATE; TETRAM® MONOOXALATE *S*-

Chemical Class: Organophosphate

EPA/OPP PC Code: 057301

RTECS Number: TF1400000

Regulatory Authority:

- CERCLA/SARA 40CFR355 Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg)
- CERCLA/SARA Section 304 RQ: EHS, 1 lb (0.454 kg)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Classified by EPA as a Restricted Use Pesticide (RUP)

Description: Amiton oxalate is a crystalline solid or powder. Molecular weight = 359.48. Melting/Freezing point = 98-99°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 1. Soluble in water.

Incompatibilities: Avoid sources of heat including fire. Will emit very toxic fumes of nitrogen, phosphorus and sulfur oxides when heated to decomposition.

Permissible Exposure Limits in Air: No standards set.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV⁽¹⁸⁾, Method #5600, Organophosphorus pesticides.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Amiton oxalate is a cholinesterase inhibitor. Symptoms include headache, giddiness, nervousness, blurred vision, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, miosis, tearing, salivation and other excessive respiratory tract secretion, vomiting, cyanosis, uncontrollable muscle twitching followed by muscular weakness, convulsions, coma, loss of reflexes, and loss of muscular control. The LD₅₀ (oral, rat) = 3 mg/kg. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Amiton oxalate may damage the nervous system causing numbness, tingling and/or weakness in the hands and feet. Repeated exposure may cause personality changes of depression, anxiety or irritability.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. See entry on parathion as referred to under amiton. Bear in mind that the oxalate is a solid whereas amiton is a high-boiling liquid.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself.

Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as

its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

California Prop. 65: Developmental toxin

TRI Developmental Toxin: Reproductive and developmental toxin

Label Signal Word: CAUTION. WARNING-Toxicity Class II for technical grade

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Unrestricted or General Use Pesticide (GUP)
- Carcinogen (Animal Positive) (U.S. EPA)⁽¹³⁾
- Actively registered pesticide in California.
- Banned in Norway.
- CERCLA/SARA 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.

Description: Amitraz forms colorless needle-like crystals or needles. Insoluble in water. Molecular weight = 293.43. Melting/Freezing point = 86–87°C. Vapor pressure = 2.6 x 10⁻⁶ mmHg.

Incompatibilities: Decomposes on burning, producing toxic

fumes including nitrogen oxides. When stored for prolonged periods, slow decomposition occurs.

Potential Exposure: A rebuttable presumption against registration for amitraz was issued on April 6, 1977 by U.S. EPA on the basis of oncogenicity.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin

Harmful Effects and Symptoms

Short Term Exposure: This chemical is poisonous if ingested or absorbed through the skin. Eye or skin contact can cause irritation. It may affect the central nervous system. May cause sedation with slow heart beat, low blood pressure, low body temperature.

Because Amitraz has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures.

Long Term Exposure: May affect the central nervous system and liver. Amitraz metabolizes to 2,4-dimethylaniline which is a potential human carcinogen. A mouse oncogenic bioassay was conducted by Boots Chemical Company and reported by EPA; the results of that study have been disputed. Acute oral LD₅₀ for rats is 800 mg/kg; for mice is greater than 1600 mg/kg.

Points of Attack: Eyes, skin

Medical Surveillance: Liver function test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

Description: Amitrol is a colorless to off white crystalline solid. Odorless when pure. Soluble in water; solubility = 2.8×10^5 ppm @ 25°C. Molecular weight = 84.08.

Melting/Freezing point = 154–157°C. Vapor pressure = 4.4×10^{-7} mmHg @ 20°C; 2.4×10^{-4} mPa @ 60°C. Log K_{ow} = -0.7. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Strong oxidizers, strong acids, and light (decomposes). Corrosive to iron, aluminum, and copper.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ recommends a limit of 0.2 mg/m³ for a 10-hour workshift. ACGIH has set a TLV of 0.2 mg/m³ TWA for an 8-hour workshift⁽¹⁾. Australia and Israel use the same level. DFG set the MAK (total dust) at 0.2 mg/m³⁽³⁾. In addition, several states have set guidelines or standards for amitrole in ambient air⁽⁶⁰⁾: 0.2 mg/m³ (California), 0.476 µg/m³ (Kansas), 1.8 µg/m³ (Pennsylvania), 2.0 µg/m³ (North Dakota), 3,000 µg/m³ (Virginia). Canadian province Levels for 0.2 mg/m³ TWA and 0.5 mg/m³ (Alberta), 0.2 mg/m³ TWA (Ontario, Quebec).

Determination in Air: NIOSH Method #0500⁽¹⁸⁾

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Amitrol can be absorbed through the skin, thereby increasing exposure. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures.

Long Term Exposure: Causes liver, thyroid, and pituitary cancer in animals. May damage the developing fetus. May cause liver, thyroid gland (possible goiter or underactive thyroid), and pituitary gland damage. Carcinogenicity is the primary observed effect. Amitrole is carcinogenic in mice and rats, producing thyroid and liver tumours following oral or subcutaneous administration. Railroad workers who were exposed to amitrole and other herbicides showed a slight (but statistically significant) excess of cancer when all sites were considered together. Because the workers were exposed to several different herbicides, however, no conclusions could be made regarding the carcinogenicity of amitrole alone.

Points of Attack: Liver, thyroid, and pituitary gland.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: Physical examination of the thyroid and thyroid function tests (T₄, TSH, and T₃). If symptoms develop or overexposure is suspected, the following may be useful: Liver function tests. Pituitary gland function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped.

Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Ammonia

Use Type: Intermediate in fertilizer manufacturing; used as an insecticide, fungicide and deer repellent.

CAS Number: 7664-41-7

Formula: NH₃

Synonyms: AM-FOL; Ammonia gas; Ammonia, anhydrous; Amoniaco anhidro (Spanish); Ammoniac (French); Ammoniaca (Italian); Ammoniale (German); Ammonium amide; Ammonium hydroxide; Amoniaco (Spanish); Amoniaco anhidro (Spanish); Amoniak (Polish); Anhydrous ammonia; Aqua ammonia; Liquid ammonia; Spirit of Hartshorn

Trade Names: DAXAD-32s[®]; NITRO-SIL[®]; PRO 330 CLEAR THIN SPREAD[®]; R717[®]

Producers: Air Products & Chemicals (USA); Amomex (Mexico); ANWIL (Poland); BOC Gases (UK); Bombay Ammonia and Chemical Company (India); Caffaro (Italy); Carbuos Metalicos (Spain); Cargill Crop Nutrition (USA); CF Industries (USA); Chimco (Bulgaria); DSM Agro (Netherlands); Grande Paroisse (France); Hoek Loos (Netherlands); Holox (USA); Hydro Agri Chemicals (Norway); Industria Quimica Loser (Mexico); Juhua Group Corp. (China); Linde Gas Group (Germany); Lonza (Switzerland); Messer Group (Germany); Nissan Chemical Industries (Japan); Occidental (USA); Petroquimica de Venezuela (Pequiven) (Venezuela); Praxair (USA); Qatar Fertiliser (Qatar); Rashtriya Chemicals & Fertilizers (India); Sasol Chemical (South Africa); Saudi Basic Industries Corp. (Saudi Arabia); Showa Denko Chemicals Group (Japan); Simplot (USA); Sumitomo Chemical Co., Ltd. (Japan); Terra Industries (USA); Ube Industries (Japan); Westfarmers CSBP (Australia)

Chemical Class: Inorganic

EPA/OPP PC Code: 005302 (anhydrous, gas); 005301 (monohydrate, aqua)

California DPR Chemical Code: 22

ICSC Number: 0414

RTECS Number: BO0875000

EEC Number: 007-001-00-5 (anhydrous)

EINECS Number: 231-635-3

Uses: Ammonia is used as an insecticide, deer repellent, and to control fungal growth during storage of citrus, e.g. oranges, grapefruit, and lemons. Ammonia is used as a nitrogen source for many nitrogen-containing compounds. It is used in the production of ammonium sulfate and ammonium nitrate for fertilizers and in the manufacture of nitric acid, soda, synthetic urea, synthetic fibers, dyes, and plastics. It is also utilized as a refrigerant and in the petroleum refining and chemical industries. It is used in the production of many drugs and pesticides. Other sources of occupational exposure include the silvering of mirrors, gluemaking, tanning of leather, and around nitriding furnaces. Ammonia is produced as a by-product in coal distillation and by the action of steam on calcium cyanamide, and from the decomposition of nitrogenous materials.

U.S. Maximum Allowable Residue Levels for Ammonia (40 CFR 180.1003):

CROP	ppm
Grapefruit, post-h	none
Lemon, post-h	none
Orange, post-h	none
Corn, grain, post-h	none

Carcinogen/Hazard Classifications

U.S. EPA and IARC Carcinogens: The Department of Health and Human Services, IARC, and the U.S. EPA have not classified ammonia for carcinogenicity.

Regulatory Authority:

- Toxic Substance (World Bank)⁽¹⁵⁾

- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.4 kg), 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%; includes anhydrous ammonia and aqueous ammonia from water dissociable ammonium salts and other sources; 10% of total aqueous ammonia, and 100% of anhydrous forms of ammonia is reportable under this listing. If a facility manufactures, processes, or otherwise uses anhydrous ammonia or aqueous ammonia, they must report under the ammonia listing. Solutions containing aqueous ammonia at a concentration in excess of 1% of the 10% reportable under this listing should be factored into threshold and release determinations.
- U.S. DOT 49CFR172.10; Poisonous by inhalation substances (anhydrous UN1005)
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory

Description: Ammonia is a colorless, strongly alkaline, and extremely soluble gas. Pungent, suffocating odor at 5.75 ppm; eye irritation @ 20 ppm. Water solubility = 33.1% @ 20 °C Molecular weight = 17.0 daltons. Boiling point = -33°C @ 760 mmHg. Vapor pressure = >6,000 mmHg 20 °C. Gas density (air = 1) = 0.59. Flash point = (flammable gas). Autoignition temperature = 630°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Explosive limits: LEL = 15%; UEL = 28%. Anhydrous ammonia is a colorless, highly irritating gas at room temperature with a pungent, suffocating odor. Ammonia gas is lighter than air; hugs the ground when cool; and flammable at high concentrations and temperatures. Easily compressed, it forms a clear, colorless liquid under pressure. When released, the liquid under pressure floats and “boils” on water. The liquid dissolves in water and evaporates quickly, forming ammonium hydroxide, an alkaline, corrosive solution. A poisonous, visible vapor cloud is produced. The amount of ammonia produced by humans every year is almost equal to that produced by nature every year. Ammonia is produced naturally in soil by bacteria, decaying plants and animals, and animal wastes. Ammonia is essential for many biological processes. Ammonia does not build up in the food chain, but serves as a nutrient source for plants and bacteria. Plants and bacteria rapidly take ammonia from soil and water. Some ammonia in water and soil is changed to nitrate and nitrite by bacteria.

Incompatibilities: Ammonia dissolves readily in water to form ammonium hydroxide, a corrosive, alkaline solution at high concentrations. Violent reaction with strong oxidizers and acids. Shock-sensitive compounds may be formed with gold, halogens, mercury, mercury oxide, and silver oxide. Fire and explosions may be caused by trimethylammonium amide, 1-chloro-2,4-dinitrobenzene, *o*-chloronitrobenzene, platinum, trioxxygen difluoride, selenium difluoride dioxide, boron halides, mercury, chlorine, iodine, bromine, hypochlorites, chlorine bleach, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin, and aldehydes. Attacks some coatings, plastics, and rubber, copper, brass, bronze, aluminum, steel, tin, zinc, and their alloys.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard is 50 ppm (35 mg/m³) TWA, averaged over an 8-hour workshift. NIOSH⁽²⁾ recommended limit is 25 ppm (17 mg/m³) averaged over a 10-hour workshift and 35 ppm (27 mg/m³) not to be exceeded during any 15 minute work period. Australia, HSE⁽³³⁾, Israel, and Mexico limits are similar to NIOSH. Israel has an action level of 12.5 ppm. ACGIH⁽¹⁾ recommends values of 25 ppm (18 mg/m³) TWA and STEL 35 ppm (27 mg/m³). 35 ppm. The NIOSH⁽²⁾ IDLH value is 300 ppm. The DFG MAC is 20 ppm (14 mg/m³) TWA⁽³⁾. In addition, several states have set airborne guidelines or standards for ammonia in ambient air⁽⁶⁰⁾: 25 ppm (18 mg/m³) TWA and STEL of 35 ppm (27 mg/m³) (California); 0.024 mg/m³ (Massachusetts), 0.042857 mg/m³ (Kansas), 0.18 to 0.27 mg/m³ (North Dakota), 0.25 mg/m³ (Virginia), 0.36 mg/m³ (Connecticut, Florida, New York, South Dakota), 0.429 mg/m³ (Nevada, Wyoming), 2.7 mg/m³ (North Carolina); Canadian Provinces of Alberta, British Columbia, Ontario, and Quebec have limits of 25 ppm TWA/TWAEV and STEL/STEV of 35 ppm. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 20 mg/m³ in workplace air and a MAC of 0.2 mg/m³ in ambient air in residential areas.

Determination in Air: Sampling by absorption in sulfuric acid followed by measurement by ion chromatography, conductivity. See NIOSH Method #6015, #6016⁽¹⁸⁾.

Permissible Concentration in Water: The Former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 2.0 mg/ml in water bodies used for domestic purposes and 0.05 mg/ml in water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye or skin contact with ammonia can cause irritation, burns, frostbite (anhydrous), and permanent damage. Ammonia is highly irritating to the eyes and respiratory tract. Swelling and narrowing of the throat and bronchi, coughing, and an accumulation of fluid in the lungs can occur. Ammonia causes rapid onset of a burning sensation in the eyes, nose, and throat, accompanied by lacrimation, rhinorrhea, and coughing. Upper airway

swelling and pulmonary edema may lead to airway obstruction. Prolonged skin contact (more than a few minutes) can cause pain and corrosive injury. Exposure can cause headache, loss of sense of smell, nausea, and vomiting. *Inhalation:* Nose and throat irritation have been reported at 72 ppm after 5 minutes exposure. Exposures of 500 ppm for 30 minutes have caused upper respiratory irritation, tearing, increased pulse rate and blood pressure. Death has been reported after an exposure to 10,000 ppm for an unknown duration. *Skin:* Solutions of 2% ammonia can cause burns and blisters after 15 minutes of exposure. These burns may be slow to heal. Anhydrous ammonia may cause skin to freeze. *Eyes:* Levels of 70 ppm (gas) have caused eye irritation. If not flushed with water immediately contact with eye may cause partial or complete blindness. *Ingestion:* ammonia will cause pain if swallowed and burning of the throat and stomach. May cause vomiting. One teaspoon of 28% aqua ammonia may cause death.

Long Term Exposure: Repeated exposure to ammonia may cause chronic irritation of the respiratory tract. Repeated lung irritation can result in bronchitis with coughing, shortness of breath, and phlegm. Levels of 170 ppm of ammonia vapor has caused mild changes in the spleens, kidneys and livers of guinea pigs. Chronic cough, asthma and lung fibrosis have been reported. Chronic irritation of the eye membranes and dermatitis have also been reported. *Carcinogenicity:* Ammonia has not been classified for carcinogenic effects. *Reproductive and Developmental Effects:* No data exist to evaluate the reproductive and developmental effects of ammonia in humans. Decreased egg production and conception rates have been observed in animals, and ammonia has been shown to cross the ovine placental barrier.

Points of Attack: Skin, respiratory system, eyes.

Medical Surveillance: Pre-employment physical examinations for workers in ammonia exposure areas should be directed toward significant changes in the skin, eyes, and respiratory system. Persons with corneal disease, and glaucoma, or chronic respiratory diseases may suffer increased risk. Periodic examinations should include evaluation of skin, eyes, and respiratory system, and pulmonary function test to compare with baselines established at pre-employment examination. Consider chest x-ray following acute exposure.

First Aid: Irrigate eyes that were exposed or that become irritated with plain water or saline for at least 15 minutes. Remove contact lenses, if easily removable without additional trauma to the eye. Seek medical attention immediately. Flush liquid-exposed skin and hair with water for at least 5 minutes. If feasible, wash exposed skin extremely thoroughly with soap and water. Use caution to avoid hypothermia when decontaminating of children or the elderly. Use blankets when appropriate. In cases of ingestion **do not induce vomiting**, perform gastric lavage, or attempt

neutralization. **Do not administer activated charcoal.** Victims who are conscious and able to swallow should be given 4 to 8 ounces of water or milk. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions; assist ventilation with a bag-valve-mask device if necessary) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. There is no antidote for ammonia poisoning. Treatment consists of supportive measures. These include administration of humidified oxygen and bronchodilators and airway management; treatment of skin and eyes with copious irrigation; and dilution of ingested ammonia with milk or water. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician or authorized medical personnel: In cases of respiratory compromise secure airway and respiration via endotracheal intubation. If not possible, perform cricothyroidotomy if equipped and trained to do so. Patients who are hypotensive or have seizures should be treated according to advanced life support protocols. Treat patients who have bronchospasm with aerosolized bronchodilators. The use of bronchial sensitizing agents in situations of multiple chemical exposures may pose additional risks. Also consider the health of the myocardium before choosing which type of bronchodilator should be administered. Cardiac sensitizing agents may be appropriate; however, the use of cardiac sensitizing agents after exposure to certain chemicals may pose enhanced risk of cardiac arrhythmias (especially in the elderly). Ammonia poisoning is not known to pose additional risk during the use of bronchial or cardiac sensitizing agents. Consider racemic epinephrine aerosol for children who develop stridor. Dose 0.25–0.75 mL of 2.25% racemic epinephrine solution in water, repeat every 20 minutes as needed cautioning for myocardial variability. Patients who are comatose, hypotensive, or are having seizures or have cardiac arrhythmias should be treated according to advanced life support protocols. Monitor fluid and electrolyte balance and restore if abnormal. Fluids should be administered cautiously to patients with pulmonary edema.

Ammonium Carbamate

Use Type: A fertilizer and ammoniating agent.

CAS Number: 1111-78-0

Formula: $\text{CH}_6\text{N}_2\text{O}_2$; $\text{NH}_4\text{COONH}_2$

Synonyms: Ammonium aminoformate; Anhydride of ammonium carbonate; Carbamato amonico (Spanish); Carbamic acid, Monoammonium salt; Carbamic acid, Ammonium salt

Producers: BASF (Germany); Potash Corporation (Canada); SNPE Agro (France)

Chemical Class: Inorganic

California DPR Chemical Code: 3041

RTECS Number: EY8575000

Uses: A general fertilizer and used in combination with other fertilizing agents.

Regulatory Authority:

- Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3, (same as CERCLA)
- The "Director's List" (CAL/OSHA)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5,000 lb (2270 kg); Section 313: Form R *de minimis*

concentration reporting level: 1.0% (as ammonia); NH_3
Equivalent molecular weight: 21.81

- Canada, WHMIS, Ingredients Disclosure List

Description: Ammonium carbamate is a colorless crystalline powder or white powder with an ammonia odor. Melting/Freezing point = about 60°C (sublimes). The odor threshold is 5 ppm as NH_3 (detection) and 46.8 ppm as NH_3 (recognition). Highly soluble in water. Molecular weight = 99.10. Boiling point = 60°C.

Incompatibilities: Strong bases, strong oxidizers. Keep away from heat (forms urea), moisture, and direct sunlight.

Permissible Exposure Limits in Air: No standards set. Loses ammonia in air, changing to ammonia carbonate. *The following are Exposure Limits for ammonia:* The Federal OSHA⁽²⁾ standard is 50 ppm (35 mg/m³)TWA, averaged over an 8-hour workshift. NIOSH⁽²⁾ recommended limit is 25 ppm (17 mg/m³) averaged over a 10-hour workshift and 35 ppm (27 mg/m³) not to be exceeded during any 15 minute work period. ACGIH⁽¹⁾ recommends values of 25 ppm (18 mg/m³) TWA and STEL 35 ppm (27 mg/m³). 35 ppm. The NIOSH⁽²⁾ IDLH value is 300 ppm.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, eye or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates skin, respiratory tract and mucous membranes on contact. Inhalation can irritate the nose and lungs with coughing, and/or shortness of breath.

Long Term Exposure: Repeated or prolonged exposure can cause lung irritation and the development of bronchitis.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Lung function testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Ammonium Chromate

Use Type: Fungicide

CAS Number: 7788-98-9

Formula: $\text{CrH}_8\text{N}_2\text{O}_4$; $(\text{NH}_4)_2\text{CrO}_4$

Synonyms: Ammonium chromate(VI); Chromic acid, diammonium salt; Cromato amonico (Spanish); Diammonium chromate; Neutral ammonium chromate

Producers: Bayer Group (Germany); GFS Chemicals (USA)

RTECS Number: GB2880000

EINECS Number: 232-138-4

Uses: It is used to inhibit corrosion and in dyeing, photography and many chemical reactions. Used as a fungicide and fire retardant.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group A, known carcinogen

U.S. NTP Carcinogen: Carcinogen

California Prop. 65: carcinogen, as chromium(VI).

IARC: Group 1,

Label Signal Word: DANGER,

Regulatory Authority:

- Actively registered pesticide in California.
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)

- RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed (chromium compounds)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 152.07; NH_3 Equivalent weight: 22.04. Also must be reported as a chromium compound: "Includes any unique chemical substances that contains chromium as part of that chemical's infrastructure." Form R *de minimis* concentration reporting level: Chromium (VI) compounds: 0.1%.
- Canada, WHMIS, Ingredients Disclosure List

Description: Yellow crystalline compound which can be

used in solution. Ammonia odor. Soluble in water. Melting/Freezing point = 185°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1.

Incompatibilities: A strong oxidizer. Contact with combustible, organic and other readily oxidizable substances may cause fire and explosions. Hydrazine, other reducing agents. Corrosive to metals.

Permissible Exposure Limits in Air: OSHA⁽²⁾: The legal airborne PEL is 0.1 mg/m³ for chromic acid and chromates (as Cr), not to be exceeded at any time. NIOSH⁽²⁾: The recommended airborne exposure limit is 0.001 mg/m³ averaged over a 10-hour workshift. ACGIH: The recommended airborne exposure limit is 0.05 mg/m³ for Chromium compounds (as Cr) averaged over an 8-hour workshift⁽¹⁾. These exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are less than the limits listed. The NIOSH⁽²⁾ IDLH for chromates is 15 mg/m³ as Cr(VI) [Carcinogen]. The former USSR-UNEP/IRPTC project has set a MAK value of 0.01 mg/m³ for chromates and bichromates in the workplace⁽⁴³⁾. California Prop. 65 No significant risk level (inhalation) = 0.001 µg/day.

Determination in Air: Hexavalent chromium may be determined by filtration followed by visible absorption spectrophotometry according to NIOSH Method #7600⁽¹⁸⁾. Also, Filter (5.0-µm PVC membrane); Ion chromatography, conductivity detection; NIOSH Method #7604⁽¹⁸⁾

Permissible Concentration in Water: To protect human health, hexavalent chromium should be held below 0.05 mg/L according to EPA⁽⁶⁾ in studies on priority toxic pollutants, This is also a WHO recommendation for total chromium in drinking water.

Determination in Water: Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide).

Routes of Entry: Ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause severe damage with possible loss of vision. Breathing Ammonium Chromate can cause a sore or hole through the inner nose (septum), sometimes with bleeding, discharge or crusting. Irritation of nose, throat and bronchial tubes can also occur, with cough and/or wheezing. Skin contact can cause deep ulcers or an allergic skin rash.

Long Term Exposure: Some water-soluble chromium⁽¹⁶⁾ compounds are inferred non-carcinogens; the water-insoluble compounds are generally deemed to be carcinogens but the border line is not precise nor universally agreed to. Ammonium chromate is a hexavalent chromium compound which may be carcinogenic and should be handled with extreme caution. Breathing ammonium chromate can cause sores or hole in the septum dividing the inner nose, sometimes with bleeding, discharge, and/or

formation of a crust. May cause skin allergy and kidney damage.

Points of Attack: Blood, respiratory system, liver kidneys, eyes, skin.

Medical Surveillance: Skin and nose examination, kidney function tests, evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Ammonium Hexafluorosilicate

Use Type: Insecticide, miticide, and preservative

CAS Number: 16919-19-0

Formula: $F_6H_8N_2Si$; $(NH_4)_2SiF_6$

Alert: There are no products currently registered with the U.S. EPA.

Synonyms: Ammonium fluorosilicate; Ammonium silicofluoride; Ammonium silicon fluoride; Crytophthalite; Diammonium fluosilicate; Diammonium silicon hexafluoride; Fluosilicate de ammonium (French); Picrato amonico (Spanish); Fluosilicato amonico (Spanish); Silicate(2-), hexafluoro-, diammonium; Ammonium hexafluorosilicate; Silicofluoruro amonico (Spanish)

Trade Names: ALL BUG[®], canceled; BYE BUGS[®], canceled; COMMON SENSE DRIONE 79700[®], canceled;

DEXOLEARWIG BAIT[®], canceled; DRI-DYE[®], canceled; XR-29[®], canceled

Producers: Ozark Fluorine Specialties (USA)

Chemical Class: Inorganic

EPA/OPP PC Code: 075301

California DPR Chemical Code: 695

RTECS Number: GQ9450000

EINECS Number: 240-968-3

Uses: This material is also used as a wood preservative, soldering flux, as a sand inhibitor in magnesium light metal casting, and in the etching of glass.

Regulatory Authority:

- Air Pollutant Standard Set (NIOSH)⁽²⁾ (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (DFG)⁽³⁾ (Former USSR)⁽⁴³⁾
- Water Pollution Standard Proposed (Former USSR)⁽⁴³⁾
- Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA); 40CFR423, Priority
- Pollutants (as inorganic fluorides)
- RCRA Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4 (as inorganic fluorides)
- RCRA, 40CFR264, Appendix 9, Ground Water Monitoring List, Suggested Testing Methods (PQL $\mu\text{g/L}$): 8100(200); 8270(10) (as inorganic fluorides)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: CERCLA, 1000 lb (454 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent weight: 19.12
- The "Director's List" (CAL/OSHA)
- Canada, WHMIS, Ingredients Disclosure List (as silicofluoride compounds)
- Mexico, Wastewater (inorganic fluorides)

Description: Ammonium hexafluorosilicate is a white crystalline powder. Odorless. Sinks and mixes with water. Molecular weight: 178.18. Boiling point = decomposes.

Incompatibilities: Liquid is corrosive. Contact with acids reacts to form hydrogen fluoride, which is a highly corrosive and toxic gas. Corrosive to aluminum. Keep away from strong oxidizers.

Permissible Exposure Limits in Air: OSHA⁽²⁾: The legal airborne PEL is 2.5 mg/m^3 for fluorides (measured as fluorine) averaged over an 8-hour workshift. This is also the HSE⁽³³⁾ value (UK) and the MAC value in Germany⁽³⁾. NIOSH⁽²⁾: The recommended airborne exposure limit is 2.5 mg/m^3 for fluorides, inorganic (measured as fluorine) averaged over a 10-hour workshift. ACGIH: The recommended airborne exposure limit is 2.5 mg/m^3 for fluorides (measured as fluorine) averaged over an 8-hour workshift⁽¹⁾. The NIOSH⁽²⁾ IDLH is 250 mg/m^3 as Fluorides (F). The former USSR-UNEP/IRPTC project⁽⁴³⁾ has not set a MAC in workplace air but readily soluble fluorides have assigned a MAC in residential air of 0.03 mg/m^3 on a momentary basis and 0.01 mg/m^3 on an average daily basis.

Determination in Air: Fluorides may be measured by collection on a filter and measurement by ion-specific electrode according to NIOSH Method 7902⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set for ammonium fluorosilicate as such. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a limit of 1.5 mg/L for fluorine in water used for domestic purposes.

Routes of Entry: Inhalation, eyes and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause difficult breathing and burning of the mouth, throat and nose which may result in bleeding. These may be felt at 7.5 mg/m³. Nausea, vomiting, profuse sweating and excess thirst may occur at higher levels. May cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. Skin contact may cause rash, itching and burning and ulceration of skin. Solutions of 1% strength may cause sores if not removed promptly. Eye contact may cause severe irritation. Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. Five to 40 mg may cause nausea, diarrhea and vomiting. More severe symptoms of burning and painful abdomen, sores in mouth, throat and digestive tract, tremors, convulsions and shock will occur around a dose of 1 gm. Death may result by ingestion of 2 to 5 grams. Also reported as 1 teaspoon to 1 ounce.

Long Term Exposure: May cause chronic lung irritation and kidney and liver damage. Bronchitis may develop. Chronic exposure may cause weight loss, nausea, vomiting, weakness, shortness of breath. Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20 to 50 mg/m³ or higher. May cause mottling of teeth at this level.

Points of Attack: Lungs and eyes.

Medical Surveillance: Pre-employment and periodic examinations should consider possible effects on the skin, eyes, teeth, respiratory tract, and kidneys. Chest x-ray and pulmonary function should be followed. Kidney function should be evaluated. If exposures have been heavy and skeletal fluorosis is suspected, pelvic x-rays may be helpful. Intake of fluoride from natural sources in food or water should be known. In the case of exposure to fluoride dusts, periodic urinary fluoride excretion levels have been very useful in evaluating industrial exposures and environmental dietary sources.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if

breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a physician or authorized paramedic may consider administering a corticosteroid spray.

Note to physician or authorized medical personnel: Ingestion: Give aluminum hydroxide gel, if conscious. Inject intravenously 10 ml of 10% calcium gluconate solution. Gastric lavage with lime water of 1% calcium chloride.

Ammonium Nitrate

Use Type: Used as a rodenticide, fertilizer and microbiocide.

CAS Number: 6484-52-2

Formula: H₄N₂O₃; NH₄NO₃

Alert: Relatively stable but when decomposition is accelerated or substance becomes contaminated, violent explosion may result. It is important that stored material be kept cool and well ventilated.

Synonyms: Ammoniumnitrat (German); Ammonium(I) nitrate(1:1); Ammonium Saltpeter; Ansax; Caswell No. 045; German Saltpeter; Nitram; Nitrate d'ammonium (French); Nitrato amonico (Spanish); Nitric acid, ammonium salt; Norway Saltpeter; Varioform I

Trade Names: AMTRATE[®], Mississippi Chemical (USA); E-2[®], El Dorado Chemical Company (USA); EASIGRAZE[®], Terra Industries (USA); FIRST CUT No. 8[®], Terra Industries (USA); HERCO PRILLS[®] (Hercules); KAYNITRO[®], Terra Industries (USA); NITRAM[®], Terra Industries (USA); OLD PLANTATION[®] (Columbia Nitrogen Corp.); SPRING-K[®], Terra Industries (USA);

TURNOUT[®], Terra Industries (USA)

Producers: Achema (Lithuania); Agrium (Canada); ANWIL (Poland); Apache Nitrogen Products (USA); Azot Association (Ukraine); Deepak Fertilizers and Petrochemicals (India); DSM Agro (Netherlands); Dynamit Nobel Group (Germany); El Dorado Chemical Company (USA); Fluorochem (UK); GFS Chemicals (USA); Grande Paroisse (France); Hydro Agri Chemicals (Norway); Incitec (Australia); Jilin Chemical (China); Kemira Agro (Finland); Kynoch (South Africa); LaRoche Industries (USA); Mallinckrodt Baker (USA); Mississippi Chemical (USA); Orica (Australia); Prodicta (USA); Rashtriya Chemicals & Fertilizers (India); Sumitomo Chemical Co. (Japan); Terra Industries (USA); Ube Industries (Japan); Wesfarmers CSBP Ltd. (Australia)

Chemical Class: Inorganic

EPA/OPP PC Code: 076101

California DPR Chemical Code: 3052

ICSC Number: 0216

RTECS Number: BR9050000

EINECS Number: 299-347-8

Uses: Used as a nitrogen fertilizer, herbicide, insecticide, and as a desiccant for cotton. Widely used in the manufacture of liquid and solid fertilizers and has a broad application for all crops. California reports the top crops for ammonium nitrate usage in 2000 were cotton, oranges, white grapes, table and raisin grapes, figs and plums. Also used in explosives, propellants, matches, cosmetics, and antibiotics.

Regulatory Authority:

- EPA TSCA Section 8(b) Chemical Inventory
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- Highly Reactive Substance and Explosive (World Bank)⁽¹⁵⁾
- Air Pollutant Standard Set (former USSR)⁽³⁵⁾
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as nitrate compounds
- Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)
- CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 80.04; NH₃ Equivalent weight: 21.28 also reportable as a nitrate compound, water dissociable, (reportable only when in an aqueous solution), at the same reporting level (1.0%).
- Canada, National Pollutant Release Inventory (solution only)

Description: Ammonium nitrate is an odorless white to gray to brown, odorless beads, pellets or flakes. Melting/Freezing point = about 169°C with slow decomposition; the decomposition accelerates at about 210°C and may become explosive. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 0, Reactivity 3, Oxidizer. Soluble in water.

Incompatibilities: A strong oxidizer. Reducing agents, combustible materials, organic materials, finely divided (powdered)metals may form explosive mixtures or cause fire and explosions. When contaminated with oil, charcoal or flammable liquids, can be considered an explosive which can be detonated by combustion or shock.

Permissible Exposure Limits in Air: A MAC value of 0.3 mg/m³ on a daily average basis in ambient air has been set in the Former USSR⁽³⁵⁾.

Permissible Concentration in Water: A MAC value of 0.3 mg/m³ on a daily average basis in ambient air has been set in the Former USSR⁽³⁵⁾.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The potential for ammonia poisoning in the course of NH₄NO₃ and fertilizer manufacture is the chief toxic effect associated with ammonium nitrate. Exposure may irritate the skin, eyes, nose, throat and lungs. Overexposure can cause nausea and vomiting, headaches, weakness, faintness and collapse. Severe overexposure may lower the ability of the blood to carry oxygen. This can result in a bluish color to skin and lips, headaches, dizziness, collapse and even death.

Long Term Exposure: Unknown at this time.

Points of Attack: Inhalation and skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Ammonium Phosphate

Use Type: Fertilizer, insecticide, fungicide, herbicide, microbiocide, soil pH adjustment

CAS Number: 7783-28-0

Formula: $H_9N_2O_4P$; $(NH_4)_2HPO_4$

Synonyms: Ammonium phosphate, dibasic; Ammonium orthophosphate, monohydrogen; Ammonium orthophosphate, dibasic; Ammonium phosphate, hydrogen; Ammonium phosphate secondary; Diammonium hydrogen phosphate; Diammonium orthophosphate; Diammonium orthophosphate, hydrogen; Diammonium phosphate; Diammonium phosphate, hydrogen; Diammonium phosphate, monohydrogen; Dibasic ammonium phosphate; Secondary ammonium phosphate

Trade Names: 18-46-0 DI-AMMONIUM PHOSPHATE[®], Simplot, J.R., Company (USA); DAP-DIAMMONIUM PHOSPHATE[®], IMC Phosphates Company (USA)

Producers: Agrium (Canada); Albright & Wilson (UK); Astaris (USA); Cargill (USA); Central Glass (Japan); CF Industries (USA); Clariant Functional Chemicals (Germany); Coromandel Fertilisers Ltd. (India); EID Parry (India); Ercros (Spain); FMC (USA); GFS Chemicals (USA); Goldschmidt (Germany); IMC Global (USA); Jost Chemical (USA); Kemira Chemicals (Finland); Kynoch (South Africa); Potash Corporation (Canada); OxyChem (USA); Rhodia Specialty Phosphates (USA); Saudi Basic Industries Corp. (Saudi Arabia); Showa Denko Chemicals Group (Japan); Sichuan Chuanxi Xingda Chemical Plant (China); Simplot, J.R., Company (USA); Thermphos (Netherlands); WMC (Australia)

Chemical Class: Inorganic (Ammonium phosphates)

ICSC Number: 0217

RTECS Number: TB9375000

EINECS Number: 231-987-8

Uses: Used in fireproofing of textiles, wood, and paper; in soldering flux, as a fertilizer; a buffer; in baking powder and food additives.

Regulatory Authority:

- CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent weight: 25.79
- Actively registered pesticide in California.

Description: Ammonium phosphate is a white crystalline or powdery substance. Molecular weight: 132.06. Melting/Freezing point = 185°C (decomposes). Soluble in water. Odorless or weak ammonia odor. Not flammable or combustible.

Incompatibilities: Incompatible with strong oxidizers, strong bases. Contact with air causes this chemical to produce anhydrous ammonia fumes.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: On short term exposure, may cause skin and eye irritation; ammonia fumes can cause eye irritation above 70 ppm. In closed spaces, inhalation of ammonia fumes may cause nose and throat irritation (70 ppm, 5 minutes). Levels of 500 ppm for 30 minutes may cause irritation to throat and lungs. High levels may result in accumulation of fluid in the lung and suffocation. Ammonia poisoning upon ingestion is characterized by sagging of facial muscles, tremors, anxiety, difficulty in controlling muscles, stupor and coma. There is only a slight chance of this happening from ingestion of ammonium phosphates, except in persons with impaired liver function. Large doses may cause calcium imbalance and an increased flow of urine.

Points of Attack: Liver, skin and eyes.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Seek medical attention, if necessary. Give large quantities of water or milk. Inhalation. Move to fresh air. Give oxygen or artificial respiration if required. Seek medical attention, if necessary.

Ammonium Sulfamate

Use Type: Herbicide and fertilizer

CAS Number: 7773-06-0

Formula: $H_6N_2O_3S$; $NH_2SO_3NH_4$

Alert: As with many herbicides used to clear woody growth, ammonium sulfate may be deadly to animals.

Synonyms: Ammonium aminosulfonate; Ammonium

amidosulphate; Ammonium salz der amidosulfonsaure (German); Ammonium sulphamate; Ammonium amidosulfonate; AMS; Monoammonium sulfamate; Monoammonium salt of sulfamic acid; Sulfamato amonico (Spanish); Sulfaminsaure (German); Sulfamic acid, monoammonium salt

Trade Names: AMCIDÉ®, Nufarm (Australia); AMICIDE®, Nufarm (Australia); AMIDOSULFATE®, AMMAT®, AMMATE®, DuPont Agricultural Products, USA, canceled; AMS® AMMONIUM SULFAMATE WEED & BRUSH KILLER, Clariant International, Switzerland, canceled, 3/11/83; BRUSH-OFF® AMMONIUM SULFAMATE BRUSH WEED KILLER, Crown Chemical, USA, canceled 10/8/85; FYRAN 206K®, IKURIN®, canceled; ROOT-OUT® (Dax Products, Ltd); SILVICIDE®, SOBIN® AMMONIUM SULFAMATE, IMC Chemicals, USA, canceled 3/11/83; SULFAMATE®, Southern Chemical Products, USA, canceled 1/22/91

Producers: Clariant International (Switzerland); GFS Chemicals (USA); IMC Chemicals (USA); Merck (Germany); Nufarm (Australia); Rhodia (France); Rutherford Chemicals (USA)

Chemical Class: Sulfamate

EPA/OPP PC Code: 005501

RTECS Number: WO6125000

EINECS Number: 231-871-7

Uses: Used as a contact herbicide and also as a fertilizer. Used to control herbaceous perennials and annual broadleaf weeds and grasses in fruit orchards. Also used for general weed and poison ivy control along rights-of-ways, commercial buildings and the home.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–2000.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–43475.60557 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION, Toxicity class III

Regulatory Authority:

- Air Pollutant Standard Set (NIOSH)⁽²⁾ (DFG)⁽³⁾ (ACGIH)⁽¹⁾ (Former USSR)⁽⁴³⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces) (Australia) (Israel)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents
- Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: CERCLA, 5,000 (2,270 kg). Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 114.12; NH₃ Equivalent weight: 14.92

• Canada, WHMIS, Ingredients Disclosure List

Description: Ammonium sulfamate is a white to yellow crystalline solid although some products containing high levels of this chemical are brown. Highly soluble in water. Molecular weight = 114.15. Melting/Freezing point = 131°C (with decomposition). Boiling point = 160°C.

Incompatibilities: Strong oxidizers, potassium, potassium chlorate, sodium nitrite, metal chlorates, and hot acid solutions. Elevated temperatures cause a highly exothermic reaction with water.

Permissible Exposure Limits in Air: The OSHA⁽²⁾ PEL is (total dust) 15 mg/m³ TWA and (respirable fraction) 5 mg/m³ TWA for an 8-hour workshift. The NIOSH⁽²⁾ IDLH level = 1500 mg/m³. NIOSH⁽²⁾ REL is (total dust) 10 mg/m³ and (respirable fraction) 5 mg/m³. The MAK set by DFG⁽³⁾ is 15 mg/m³. The ACGIH TWA value is 10 mg/m³⁽¹⁾. Australia limit is 10 mg/m³. Israel limit is 10 mg/m³ with a 5 mg/m³ Action Level. HSE⁽³³⁾ level is 10 mg/m³ TWA and a STEL of 20 mg/m³. The DFG MAK value for total dust is 15 mg/m³⁽³⁾. In addition, several states have set guidelines or standards for ammonium sulfamate in ambient air⁽⁶⁰⁾: (total dust) 15 mg/m³ TWA and (respirable fraction). The California PEL is 5 mg/m³ TWA. In addition, several states have set guidelines or standards for ammonium sulfamate in ambient air⁽⁶⁰⁾: 0.1 mg/m³ (North Dakota), 0.15 mg/m³ (Virginia), 0.2 mg/m³ (Connecticut), 0.238 mg/m³ (Nevada). Canadian provincial guidelines follow: 10 mg/m³ TWA (8-hour workshift) and STEL of 20 mg/m³ (Alberta, British Columbia), 10 mg/m³ TWA (Ontario) 10 mg/m³ TWAEV (Quebec).

Determination in Air: Collection on a filter followed by gravimetric analysis. See NIOSH Method # S348⁽¹⁸⁾.

Permissible Concentration in Water: The No-Observed-Adverse-Effect-Level (NOAEL) is 250 mg/kg/day according to the U.S. EPA Health Advisory cited below. From this a health advisory of 21.4 mg/L of water was derived for a 10 kg child on a one-day, ten-day or longer term basis. An acceptable daily intake has been determined to be 0.214 mg/kg/day and a lifetime health advisory for a 70 kg adult is 1.5 mg/L.

Determination in Water: There is no standard method for determining ammonium sulfamate in water. There is, however, a method for detection in foods which is a colorimetric method based on liberation of SO₄, reduction to H₂S which is measured after treatment with zinc, *p*-aminodimethylaniline and ferric chloride to give methylene blue.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is moderately toxic by ingestion and may cause gastrointestinal disease. High levels may irritate the eyes, skin and respiratory tract, nausea and vomiting. The LD₅₀ (oral, rat) = 3900 mg/kg.

Long Term Exposure: Unknown at this time.

Medical Surveillance: Nothing special indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Ammonium Sulfite

Use Type: Preservative and treating agricultural grain.

CAS Number: 10196-04-0 (diammonium salt); 10192-30-0 (monoammonium salt)

Formula: $H_8N_2O_3S$; $(NH_4)_2SO_3$

Synonyms: *Monoammonium salt:* Ammonium acid sulfite; Ammonium hydrogen sulfite; Ammonium hydrosulfite; Ammonium monosulfite; Monosodium sulfite; Sulfito amonico (Spanish); Sulfurous acid, monoammonium salt; Ammonium sulfite, hydrogen

Diammonium salt: Diammonium sulfite; Sulfurous acid, diammonium salt; Sulfito amonico (Spanish)

Producers: Brotherton Specialty Products (UK); Rutherford Chemicals (USA); Shanghai Agricultural Chemical Industry (China); Showa Denko (Japan); William Blythe (UK)

RTECS Number: WT3505000 (diammonium); WT3595000 (monoammonium)

Uses: Ammonium sulfite is also used in medicines, metal lubricants, explosives, photography, hair wave solutions, and to make other chemicals.

Regulatory Authority:

- Clean Water Act: 40CFR116.4 Hazardous Substances;

40CFR117.3, RQ (same as CERCLA) (diammonium salt)

- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: CERCLA, 5,000 lb (2,270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 99.10; NH_3 Equivalent weight: 17.18 (monoammonium salt)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: CERCLA, 5,000 lb (2,270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 116.13; NH_3 Equivalent weight: 29.33
- The "Director's List" (CAL/OSHA)

Description: Ammonium sulfite is a colorless to yellow crystalline (sand-like or sugar-like) solid, normally sold or used in a solution. Melting/Freezing point = 150°C (sublimes). Soluble in water.

Incompatibilities: A strong reducing agent. Reacts violently with strong oxidizers, acids.

Permissible Exposure Limits in Air: No standards set

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation of dust, ingestion

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Ammonium sulfite can affect you when breathed in; exposure can irritate the nose, throat, bronchial tubes, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Ammonium sulfite may cause an asthma-like allergy. Future exposures could then cause asthma attacks with cough, shortness of breath and wheezing. Very severe (anaphylactic) reactions could also occur, and could be fatal.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposure, the following are recommended: Lung function tests; Seek prompt medical attention if symptoms are suspected.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first

aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Ammonium Thiosulfate

Use Type: Insecticide, fungicide, and herbicide

CAS Number: 7783-18-8

Formula: H₈N₂O₃S₂

Alert: A notice was filed in the Federal Register, March 5, 2003, indicating the filing of a Pesticide Petition to establish a tolerance in or on food.

Synonyms: Ammonium hyposulfite; Amthio; Diammonium thiosulfate; Thiosulfuric acid, diammonium salt; Tiosulfato amonico (Spanish)

Trade Names: AMTHIO®

Producers: Agrium (Canada); Brotherton Specialty Products (UK); DuPont (USA); NorFalco (USA); Potash Corporation (Canada); Simplot, J.R., Company (USA); William Blythe (UK)

Chemical Class: Inorganic

EPA/OPP PC Code: 080103

California DPR Chemical Code: 892

RTECS Number: XN6465000

Uses: Used in poultry houses to reduce phosphorus runoffs into lakes and rivers. Also used as a metal lubricant, metal cleaner, and in photographic chemicals, making other chemicals, and as a laboratory reagent.

Regulatory Authority:

- CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 148.20; NH₃ Equivalent weight: 22.98
- Actively registered pesticide in California.

Description: Ammonium thiosulfate is a white crystalline solid with an ammonia odor. Melting/Freezing point = 150°C (decomposes below Melting/Freezing point. solution: <50°C, anhydrous crystals> 100°C). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Highly soluble in water.

Incompatibilities: Contact with sodium chlorate may cause a violent reaction. Corrodes brass, copper, and copper-based metals.

Permissible Exposure Limits in Air: None established. However, care must be taken in its use.

Routes of Entry: Skin contact

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause

irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. Harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

References:

Ampelomyces Quisqualis isolate M10

Use Type: Fungicide

Trade Names: AQ-10 Biofungicide®, Ecogen Inc. (USA); AQ-10 Technical Powder®, Ecogen Inc. (USA)

Producers: Ecogen Inc. (USA)

Chemical Class: Microbial

EPA/OPP PC Code: 021007

Uses: Used to treat powdery mildew on fruits, vegetables and ornamental crops. Can be used both outdoors and in controlled situations, e.g., greenhouses.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce*

vomiting when formulations containing petroleum solvents are ingested. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Anagrapha Falcifera

Use Type: Insecticide

Synonyms: Anagrapha falcifera multi-nuclear polyhedrosis virus (AfMNPV); Anagrapha falcifera multi-nuclear polyhedrosis virus polyhedral inclusion bodies in aqueous suspension; Anagrapha falcifera MNPV PIB's in aqueous suspension; Celery looper moth NPV

Producers: Certis USA (USA)

Chemical Class: Botanical insect virus

EPA/OPP PC Code: 127885

California DPR Chemical Code: 5089

Uses: This insect virus is used to kill various larval pests that feed on food crops and other plants. It targets various species of worms and moths including gypsy moths, codling moths and Indian meal moths and is used on vegetables, cotton, corn, peanuts, walnuts, apples, pears and ornamentals. It is sprayed on leaves during plant growth or on the crop after harvest. The virus interferes with the function of several larval organs, including food absorption in the gut. Larvae die after a few days. These viruses occur naturally and present no known risks to humans, other non-target organisms, or the environment.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents*

are ingested. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Ancymidol (ANSI)

Use Type: Plant growth regulator

CAS Number: 12771-68-5

Formula: C₁₅H₁₆N₂O₂

Synonyms: α -Cyclopropyl- α -(4-methoxyphenyl)-5-pyrimidinemethanol-; α -Cyclopropyl-4-methoxy- α -(pyrimidin-5-yl)benzyl alcohol; 5-Pyrimidinemethanol, α -cyclopropyl- α -(4-methoxyphenyl)

Trade Names: A-REST[®], Sepro (USA); EL 531[®]; QUEL[®]; REDUCYMOL

Producers: Sepro (USA)

Chemical Class: Pyrimidine

EPA/OPP PC Code: 108601; (251200 old EPA code number)

California DPR Chemical Code: 1744

Uses: Ancymidol is a plant growth regulator registered for treating container-grown herbaceous plants, ornamental woody shrubs, and bedding plants grown in greenhouses and other plant bedding areas for primarily commercial production. Growth regulator effects produced by ancymidol are the result of inhibition of gibberellin biosynthesis. It produces a more compact growth form by suppressing internode elongation.

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–19952.6231500 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or WARNING

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: White to buff crystalline granular. Slightly aromatic odor. Soluble in water; solubility = 645 ppm (approx). Melting/Freezing point = 112°C. Vapor pressure = 2.0 x 10⁻⁷ mm Hg.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Anilazine

Use Type: Fungicide

CAS Number: 101-05-3

Formula: C₉H₅Cl₃N₄

Alert: Not registered in the U.S. Human toxicity (long-term): High.

Synonyms: 2-(2-Chloranilin)-4,6-dichlor-1,3,5-triazin (German); (*o*-Chloroanilino)dichlorotriazine; 2,4-Dichloro-6-(*o*-chloroanilino)-*s*-triazine; 2,4-Dichloro-6-*o*-chloranilino-*s*-triazine; 2,4-Dichloro-6-(2-chloroanilino)-1,3,5-triazine; 4,6-Dichloro-*N*-(2-chlorophenyl)-1,3,5-triazin-2-amine; ENT 26,058; NCI-C08684; 1,3,5-Triazine-2-amine, 4,6-dichloro-*N*-(2-chlorophenyl)-; *s*-Triazine, 2,4-dichloro-6-(*o*-chloroanilino)-

Trade Names: ANILAZIN[®]; B-622[®], Bayer CropScience (Germany), canceled 7/1/1987; BORTRYSAN[®]; DIREZ[®]; DYRENE[®], Bayer CropScience (Germany), canceled 11/27/1992; DYRENE 50W[®], Bayer CropScience (Germany), canceled 8/31/1988; KEMATE[®]; NU-RENE 5 DUST[®], J. R. Simplot (USA), canceled 7/1/1987; NUTRO[®]; PAX FUNGUS CONTROL[®]; TRIASYM[®]; TRIAZIN[®]; TRIAZINE[®]; ZINOCHLOR[®]

Producers: Bayer CropScience (Germany); J. R. Simplot (USA)

Chemical Class: Triazine

EPA/OPP PC Code: 080811

California DPR Chemical Code: 256

EINECS Number: 202-910-5

Uses: Broad spectrum fungicide used on fruits, vegetables, tobacco, cereals, potatoes, turf and ornamentals.

Human toxicity (long-term)⁽⁷⁷⁾: High–2.80 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–14.47908 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION, WARNING or DANGER, depending upon formulation

Regulatory Authority:

- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- Actively registered pesticide in California.

Description: White to whitish-brown crystalline solid. Insoluble in water. Molecular weight = 275.53. Melting/Freezing point = 161°C. Vapor pressure = 6.2 x 10⁻⁸ mmHg.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, passing through the skin and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May cause skin and severe eye irritation. Moderately poisonous if ingested or inhaled. Exposure to a triazine (simazine) has caused acute and subacute dermatitis in the former USSR, characterized by erythema, slight edema, moderate pruritus, and burning lasting 4 to 5 days.

Long Term Exposure: May cause lung irritation and damage. May cause skin allergy. Contact with some triazine compounds (such as atrazine) may increase risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects on the hypothalamic pituitary gonadal axis. Repeated exposure may cause weight loss and reduced red blood cell count. May be mutagenic.

Points of Attack: Liver, lungs and skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Consider chest x-ray following acute overexposure. Evaluation by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Anisole

Use Type: A vermicide.

CAS Number: 100-66-3

Formula: C₇H₈O; C₆H₅OCH₃

Synonyms: Benzene, methoxy; Ether, methyl phenyl; Methoxybenzene; Methyl phenyl ether; Metil fenil eter (Spanish); Phenyl methyl ether

Producers: Atul (India); Bayer CropScience (Germany); Bhageria Dye-Chem (India); Cognis (Germany); Degussa (Germany); Great Lakes Chemical (USA); Penta Manufacturing (USA); Rhodia (France); Shell Chemical (UK); Syngenta (Switzerland)

ICSC Number: 1014

RTECS Number: BZ8050000

EEC Number: 202-876-1

EINECS Number: 202-876-1

Uses: Also used as a solvent, a flavoring, making perfumes, and in organic synthesis.

Regulatory Authority:

- Water pollution standard proposed (former USSR)⁽⁴³⁾
- Canada, WHMIS, Ingredients Disclosure List

Description: Anisole is a colorless to yellowish liquid. Aromatic, spicy-sweet odor. Insoluble in water. Molecular weight = 108.13. Boiling point = 154°C. Melting/Freezing point = -37.3°C. Flash point = 51.6°C (oc). Autoignition temperature = 475°C. Hazard Identification (based on NFPA-704M Rating System): Health 1, Flammability 2, Reactivity 0.

Incompatibilities: Keep away from strong oxidizers; may cause violent reaction.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: The former USSR-UNEP/IRTC Project⁽⁴³⁾ has set a MAC of 0.05 mg/L in water bodies used for domestic purposes. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, absorbed through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: A skin irritant since it degreases the skin; prolonged skin contact can cause drying and cracking. It irritates the eyes and respiratory tract if exposure occurs⁽⁵⁷⁾. Exposure can cause dizziness, lightheadedness,

and unconsciousness. It is moderately toxic by ingestion⁽⁴⁴⁾. The LD₅₀ (oral, rat) = 3700 mg/kg; (oral, mouse) = 2800 mg/kg⁽⁹⁾.

Long Term Exposure: Skin problems, dryness, cracking.

Points of Attack: Eyes, skin, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Anthracene

Use Type: Insecticide, herbicide, and rodenticide

CAS Number: 120-12-7; 906-80-5 (anthracene oil)

Formula: C₁₄H₁₀

Synonyms: Anthracen (German); Anthracene oil; Anthracene polycyclic aromatic compound; Anthracin; Antraceno (Spanish); Carbolineun; Coal tar distillate (boiling between 270-300° C); Green Oil; Paranaphthalene
Trade Names: STERILITE HOP DEFOLIANT[®]; TETRA OLIVE N2G[®]

Producers: ATOFINA (France); Bayer Group (Germany); Bilbaina de Alquitrans (Spain); Cindu (Netherlands); Crowley (USA); Deza (Czech Republic); Nippon Steel Chemical (Japan); Sigma-Aldrich Fine Chemicals (USA); Sigma-Aldrich Laborchemikalien (Germany); Wujin LinChuan Chemical Factory (China)

Chemical Class: A petroleum derivative

EPA/OPP PC Code: 006101 (Anthracene oil)

California DPR Chemical Code: 5042

ICSC Number: 0825

RTECS Number: CA9350000

EINECS Number: 204-371-1

Uses: It is also used in dye stuffs (alizarin), and wood preservatives, making synthetic fibers, anthraquinone and

other chemicals. May be present in coke oven emissions, diesel fuel, and coal tar pitch volatiles.

Carcinogen/Hazard Classifications

IARC: Group 3, unclassifiable

Regulatory Authority:

- Banned or Severely Restricted (UN) (in cosmetic products in the EEC)⁽³⁵⁾
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾
- List of priority pollutants (U.S. EPA)
- AB 1803-Well Monitoring Chemical (CAL)
- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL)
- The “Director’s List” (CAL/OSHA)
- Water Pollution Standard Set (U.S. EPA)⁽⁶⁾ (Kansas)⁽⁶¹⁾ (Mexico)
- Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92)
- RCRA 40CFR§268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4
- RCRA 40CFR264, Appendix 9; Ground Water Monitoring List: Suggested methods (PQL $\mu\text{g/L}$): 8100(200); 8270(10)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5,000 lb (2,270 kg), 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.
- TSCA: 716.120 (a), listed chemical
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI)

Description: Anthracene, $\text{C}_{14}\text{H}_{10}$, is colorless, to pale yellow crystalline solid with a bluish fluorescence. Boiling point = 340°C . Melting/Freezing point = 216.5°C . Flash point = 121°C . Autoignition temperature = 540°C . NFPA 704 M Hazard Identification (based on NFPA-704M Rating System): Health 0, Flammability 1, Reactivity 0. Explosive limits: LEL = 0.6% ⁽¹⁷⁾. NFPA 704 M Hazard Identification (based on NFPA-704M Rating System): Health 0, Flammability 1. Insoluble in water.

Incompatibilities: Dust or fine powder forms an explosive mixture with air. Contact with strong oxidizers, chromic acid, calcium hypochlorite, or fluorine may cause violent reactions.

Permissible Exposure Limits in Air: No occupational limits have been established for anthracene. However this chemical may be present as coke oven emissions and coal tar pitch volatiles.

Determination in Air: Use NIOSH Methods [for polynuclear aromatic hydrocarbons]: 5506 (HPLC), 5515 (GC), or OSHA Method #ID-58.⁽⁵⁸⁾

Permissible Concentration in Water: Anthracene falls in the “polynuclear aromatic hydrocarbon” category of priority toxic pollutants as defined by EPA⁽⁶⁾. The U.S. EPA has considered setting criteria in the range from 0.097 to 9.7 nanograms/liter for the protection of human health from

polynuclear aromatic hydrocarbons. In addition, Kansas has set forth a guideline for anthracene in drinking water⁽⁶¹⁾ of $0.029 \mu\text{g/L}$.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Anthracene can affect you when breathed in. Skin contact can cause irritation or a skin allergy which is greatly aggravated by sunlight on contaminated skin. Breathing irritates the nose, throat and bronchial tubes. Eye contact or “fume” exposure can cause irritation and burns.

Long Term Exposure: Repeated skin contact can cause thickening, pigment changes and growths. Anthracene may cause mutations. Handle with extreme caution. The carcinogenic status of anthracene is a bit confusing: Animal negative⁽⁹⁾ compares with ACGIH⁽¹⁾ and DFG⁽³⁾ categorization of coal tar volatiles as proven carcinogens. The Lewis/Sax reference below states that it is a mutagen and questionable carcinogen.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Anthraquinone

Use Type: Used as a bird repellent on seeds.

CAS Number: 84-65-1

Formula: C₁₄H₈O₂

Synonyms: 9,10-Anthracenedione; Anthradione; 9,10-Anthraquinone; Antraquinona (Spanish); 9,10-Dioxoanthracene; Anthradione

Trade Names: (p)ANTHRAPEL®; MORKIT®

Producers: BASF (Germany); Bayer Group (Germany); China Chemical (China); Clariant (Switzerland); Deza (Czech Republic); Kawasaki Kasei Chemicals (Japan); Orica (Australia); Quantum Chemicals (Australia); Rhone-Poulenc Agro (France); Sigma-Aldrich Laborchemikalien (Germany); Sumitomo Chemicals (Japan)

EPA/OPP PC Code: 122701

RTECS Number: CB4725000

EINECS Number: 201-549-0

Uses: Anthraquinone is an important starting material for vat dye manufacture. Also used in making organics.

Regulatory Authority:

- Air Pollutant Standard Set (former USSR)⁽⁴³⁾
- TSCA 40CFR704.30; 40CFR716.120(a) List of substances; 40CFR712.30(m); 40CFR 799.500 Testing Requirements. Export notification required by §12(b).

Description: Colorless to yellow crystalline solid. Insoluble in water. Melting/Freezing point= 286°C. Boiling point = 380°C. Flash point = 185°C (cc). NFPA 704 M Hazard Identification (based on NFPA-704M Rating System): Health 0, Flammability 1, Reactivity unknown.

Incompatibilities: Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air: The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC value of 5 mg/m³ in workplace air.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Through the skin, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Can be absorbed through the skin, thereby increasing exposure. Eye or skin contact can cause irritation. An allergen, may cause skin irritation and sensitization. Severe poisoning may cause seizures and coma.

Long Term Exposure: May cause skin allergy, with itching and rash. It may be mutagenic.

Points of Attack: Skin and lungs.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical

has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antimony Potassium Tartrate

Use Type: Insecticide

CAS Number: 28300-74-5

Formula: C₄H₄KO₇Sb

Synonyms: Antimonate (2-), bis μ -2,3-dihydroxybutanedioate (4-)-01,02:03,04 di-, dipotassium, trihydrate, stereoisomer; Antimonate(2-), bis(μ -(2,3-dihydroxybutanedioato(4-)-01,02:03,04))di-, dipotassium, trihydrate, stereoisomer (9CI); Antimony potassium tartrate; Bis(μ -2,3-Dihydroxybutanedioato(4-)-0(2):0(3),0(4))diantimonate(2-), dipotassium, trihydrate, stereoisomer; Emetique (French); ENT 50,434; Potassium antimony tartrate; Potassium antimony tartrate; Potassium antimony tartrate; Tartaric acid, antimony potassium salt; Tartar emetic; Tartarized antimony; Tartrated antimony; Tartrato de antimonio y potasio (Spanish)

Trade Names: TASTOX®, Zeneca Inc (USA) (now Syngenta), canceled 7/1/87

Chemical Class: Antimony

EPA/OPP PC Code: 006201

California DPR Chemical Code: 3057

RTECS Number: CC6825000

EINECS Number: 229-436-1

Uses: It is also used in medicine and textile and leather dyeing.

U.S. Maximum Allowable Residue Levels for Antimony Potassium Tartrate (40 CFR 180.179):

CROP	ppm
Fruit, stone, group	3.5
Grape	3.5
Onion	3.5

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

TRI Developmental Toxin: Reproductive and developmental toxin as antimony compounds.

Regulatory Authority:

- Banned or Severely Restricted (New Zealand)⁽¹³⁾ (Many countries, especially in food) (UN)⁽³⁵⁾
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (OSHA)⁽²⁾ (California) (HSE)⁽³³⁾ (Ontario, Quebec)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as antimony compounds

- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as antimony compounds
- The "Director's List" (CAL/OSHA) as antimony compounds
- Clean Air Act, 42USC7412; Title I, Part A, §112 hazardous pollutants (as antimony compounds)
- Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA); 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR401.15 Section 307 Toxic
- Pollutants, as antimony compounds.
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed (as antimony compounds, n.o.s.)
- Safe Drinking Water Act, MCL, treatment technique; MCL, 0.006 mg/L; MCLG, 0.006 mg/L; Regulated Chemical (47FR9352)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 100 lb (45.4 kg)
- EPCRA Section 313: Includes any unique chemical substance that contains antimony as part of that chemical's infrastructure. Form R *de minimus* concentration reporting level: 0.1%
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory as antimony compounds.

Description: Colorless, crystalline material or white powder. Odorless. Soluble in water; solution is slightly acidic. Molecular weight = 667.91. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0.

Incompatibilities: Solution will react with alkaline materials, mineral acids.

Permissible Exposure Limits in Air: The legal Federal OSHA⁽²⁾ airborne PEL as Sb is 0.5 mg/m³ averaged over an 8-hour workshift. The recommended NIOSH⁽²⁾ airborne exposure limit (PEL) is 0.5 mg/m³ averaged over a 10-hour workshift. and 2.5 mg/m³ as F for an 8-hour workshift⁽⁹⁾. The recommended ACGIH⁽¹⁾ airborne exposure limit is 0.5 mg/m³ averaged over a 8-hour workshift. The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. The HSE⁽³³⁾ (U.K.), California, Ontario, and Quebec airborne exposure limits for antimony compounds are the same as the OSHA levels show above. The Former USSR-UNEP/IRPTC MAC value⁽⁴³⁾ is 0.3 mg/m³. The NIOSH⁽²⁾ IDLH value for antimony and compounds = 50 mg/m³.

Permissible Concentration in Water: The U.S. EPA allows 0.006 ppm of antimony per million parts of drinking water.

Routes of Entry: Absorbed through the skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Antimony Potassium Tartrate is poisonous if swallowed. It can affect you when breathed in

and by passing through your skin. Eye and skin contact can cause irritation and skin rash. Exposure can cause poor appetite, abdominal pain, nausea, headaches, sore throat and irritation of air passages, with cough. Higher levels can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may make the heart beat irregularly or stop. High or repeated exposure may damage the liver or heart muscle.

Long Term Exposure: Prolonged or repeated contact can cause ulcers or sores in the nose, kidney, liver, and heart damage.

Points of Attack: Skin, eyes, respiratory system, cardiovascular system, kidneys and liver. Lung cancer has been observed in some studies of rats that breathed high levels of antimony. No human studies are available. It is unknown whether antimony will cause cancer in people.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood for several days after exposure. EKG. Liver and kidney function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Antimycin A

Use Type: Specific uses for Antimycin A were not found;

however, Antimycin A₁, and Antimycin A₃ are reported to be antibiotic substances produced by *Streptomyces* for use as a fungicide, possible insecticide and miticide. Registered as a pesticide in the U.S.

CAS Number: 1397-94-0 (A₁-); 642-15-9 (A₁-) 11118-72-2 (antimycin)

Note: Both A₁ CAS numbers are found in RTECS, with the same chemical formula, although EPA regulates only 1397-94-0 as Antimycin A

Formulas: C₂₈H₄₀N₂O₉ (Antimycin A₁); C₂₆H₃₆N₂O₉ (Antimycin A₃); C₂₅H₃₄N₂O₉ (Antimycin A₄)

Synonyms: Antimicina A (Spanish); Antimycin A; Antipiricullin; Dihyrosamidin; Isovaleric acid-8-ester with 3-formamido-*N*-(7-hexyl-8-hydroxy-4,9-dimethyl-2,6-dioxo-1,5-dioxonan-3-yl)salicylamide isovaleric acid 8 ester

Trade Names: FINTROL[®]; VIROSIN[®]

Producers: BIMOL Research Laboratories (USA); Kyowa Hakko Kogyo (Japan)

EPA/OPP PC Code: 006314

RTECS Number: CD0350000

Uses: Fungicide, possible insecticide and miticide

Regulatory Authority:

- CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg)⁽⁷⁾
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)

Description: C₂₆H₃₆N₂O₉ (Antimycin A₃) and C₂₈H₄₀N₂O₉ (Antimycin A₁) are crystalline solids. Practically insoluble in water. Melting/Freezing point = 170–175°C; (A₃); 149–150°C (A₁). They are complex 9-membered (2 oxygens and 7 carbons) ring derivatives with complex side chains.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion and intramuscular.

Harmful Effects and Symptoms

Short Term Exposure: Subcutaneous, intravenous, and intraperitoneal route poisons. Moderately toxic by ingestion and intramuscular routes. The LD₅₀ (oral rat) = 28 mg/kg⁽⁹⁾.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

ANTU

Use Type: Rodenticide

CAS Number: 86-88-4

Formula: C₁₁H₁₀N₂S

Synonyms: α -Naphthyl thiourea; Alphanaphtyl thiourea (French); Chemical 109; 1-Naftil-tiourea (Italian); 1-Naftythioureum (Dutch); α -Naphthothiourea; α -Naphthylthiocarbamide; 1-Naphthyl-thioharnstoff (German); 1-Naphthylthiourea; *N*-(1-Naphthyl)-2-thiourea; α -Naphthylthiourea; 1-(1-Naphthyl)-2-thiourea; 1-Naphthylthiouree (French); Thiourea, 1-naphthalenyl-; Urea,1-(1-naphthyl)-2-thio-

Trade Names: ALRATO[®]; ANTURAT[®]; BANTU[®]; DIRAX[®]; KILL KANTZ[®]; KRYSID[®]; KRYSID PI[®]; NAPHTOX[®]; RATTRACK[®]; RAT-TU[®]; SMEESANA[®]

Producers: Prentiss Inc. (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Thiourea rodenticide

EPA/OPP PC Code: 004501

California DPR Chemical Code: 38

ICSC Number: 0973

RTECS Number: YT9275000

EEC Number: 006-008-00-0

EINECS Number: 201-706-3

Uses: Used specifically as a control for the adult Norway rat. It is less toxic to other rat species; relatively safe for domestic animals. It has been withdrawn from the market in some countries.

Carcinogen/Hazard Classifications

IARC: Group 3, unclassifiable

Label Signal Word: DANGER

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (DFG)⁽³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Australia) (Israel) (Mexico) (California) (Several Canadian Provinces)
- EPA Hazardous Waste Number (RCRA No.): P072
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- EPA Hazardous Waste Number (RCRA No.): P072
- 40CFR261.11 Hazardous Constituents
- CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)
- CERCLA/SARA Section 304 RQ: CERCLA, 100 lb (45.4 kg)

Description: White crystalline solid or gray powder. Odorless. Melting/Freezing point = 198°C. Hazard

Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water. Noncombustible.

Incompatibilities: Strong oxidizers and silver nitrate.

Permissible Exposure Limits in Air: The Federal OSHA/NIOSH⁽²⁾ standard⁽⁵⁸⁾ is 0.3 mg/m³ TWA. ACGIH TLV⁽¹⁾, DFG⁽³⁾ MAK, Australia, Israel, Mexico have set the same value. The DFG peak limitation is 5 times the normal MAK (30 min.), do not exceed 2 times during a workshift⁽³⁾. Israel has an Action Level of 0.15 mg/m³. The Mexico STEL is 0.9 mg/m³. The NIOSH⁽²⁾ IDLH level = 100 mg/m³. Several states have set guidelines or standards for ANTU in ambient air⁽⁶⁰⁾ ranging from 3 µg/m³ (North Dakota) to 5 µg/m³ (Virginia) to 6 µg/m³ (Connecticut) to 7 µg/m³ (Nevada). Canadian Provincial level for Alberta, British Columbia, Ontario and Quebec are 0.2 mg/m³ TWA or TWAEV (Quebec). Alberta and British Columbia STEL is 0.9 mg/m³ (15 min.).

Determination in Air: Collection on a filter and analysis by gas-liquid chromatography. See NIOSH Method 5276⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion and skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous. Symptoms include seizures, and dermal irritation. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Ingestion may cause vomiting, shortness of breath, and bluish discoloration of the skin. ANTU is moderately toxic: probable oral lethal dose (human) 0.5-5 mg/kg, or between 1 ounce and 1 pint (or 1 lb) for 150 lb. person. TheLD50 (oral, rat) = 6 mg/kg⁽⁹⁾. Chronic sublethal exposure may cause antithyroid activity. Can produce hyperglycemia of three times normal in three hours.

Long Term Exposure: May cause chronic dermatitis, increased production of white blood cells. A questionable carcinogen (IARC, Group 3, inadequate human evidence) and a possible mutagen.

Points of Attack: Respiratory system.

Medical Surveillance: Consider the points of attack in replacement and periodic physical examinations. People with chronic respiratory disease or liver disease may be especially at risk. Lung function tests. Consider chest x-ray following acute overexposure. Evaluation by a dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if

breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Aramite®

Use Type: Insecticide and miticide

CAS Number: 140-57-8

Formula: C₁₅H₂₃ClO₄S; (CH₃)₃C-C₆H₄-OCH₂CH(CH₃)OSO₂-(CH₂)₂Cl

Alert: A carcinogen, handle with care. No products registered in the U.S.

Synonyms: Butylphenoxyisopropyl chloroethyl sulfite; 2-(*p*-Butylphenoxy)isopropyl 2-chloroethyl sulfite; 2-(4-*tert*-Butylphenoxy)isopropyl-2-chloroethyl sulfite; 2-(*p*-*tert*-Butylphenoxy)isopropyl 2'-chloroethyl sulphite; 2-(*p*-*tert*-Butylphenoxy)-1-methylethyl 2-chloroethyl ester of sulphurous acid; 2-(*p*-Butylphenoxy)-1-methylethyl 2-chloroethyl sulfite; 2-(*p*-*tert*-Butylphenoxy)-1-methylethyl-2-chloroethyl sulfite ester; 2-(*p*-*tert*-Butylphenoxy)-1-methylethyl 2'-chloroethyl sulphite; 2-(*p*-*tert*-Butylphenoxy)-1-methylethyl sulphite of 2-chloroethanol; 1-(*p*-*tert*-Butylphenoxy)-2-propanol-2-chloroethyl sulfite; CES; 2-Chloroethanol-2-(*p*-*tert*-butylphenoxy)-1-methylethyl sulfite; 2-Chloroethanol ester with 2-(*p*-*tert*-butylphenoxy)-1-methylethyl sulfite; β-Chloroethyl-β'-(*p*-*tert*-butylphenoxy)-α'-methylethyl sulfite; β-Chloroethyl-β-(*p*-*tert*-butylphenoxy)-α-methylethyl sulphite; 2-Chloroethyl 1-methyl-2-(*p*-*tert*-butylphenoxy)ethyl sulphite; 2-Chloroethyl sulfurous acid-2-[4-(1,1-dimethylethylphenoxy)-1-methylethyl ester; 2-Chloroethyl sulphite of 1-(*p*-*tert*-butylphenoxy)-2-propanol; ENT

16,519; Sulfurous acid 2-(*p*-*tert*-butylphenoxy)-1-methylethyl-2-chloroethyl ester

Trade Names: ACARACIDE®; ARACIDE®; ARARAMITE-15W®; ARATRON®; COMPOUND 88R®; NIAGARAMITE®, FMC Agricultural Products Group (USA), canceled 6/13/1977; ORTHO-MITE®, Scotts Company, The (USA), canceled; 88-R®

Producers: FMC Agricultural Products Group (USA)

EPA/OPP PC Code: 062501

California DPR Chemical Code: 39

RTECS Number: WT2975000

Uses: Aramite is a miticide and antimicrobial agent. Use of it was voluntarily canceled by the sole producer in 1975.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

California Prop. 65: Carcinogen

IARC: Group 2b, possible carcinogen

WHO Acute Hazard: Class III, slightly hazardous (as propargite)

Regulatory Authority:

- Carcinogen (Animal Positive) (IARC)⁽⁹⁾
- Air Pollutant Standard Set (Pennsylvania)⁽⁶⁰⁾
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- Proposition 65 chemical (CAL)
- The "Director's List" (CAL/OSHA)
- 40CFR261.11 Hazardous Constituents

Description: Aramite is a heavy liquid. Practically insoluble in water. Boiling point = 175°C @t 0.1 mmHg. Melting/Freezing point = -32°C.

Incompatibilities: Incompatible with alkaline material such as lime or Bordeaux mixture (slaked lime and copper sulfate solution.).

Permissible Exposure Limits in Air: A limit on aramite in ambient air has been set in Pennsylvania⁽⁶⁰⁾ at 18.07 µg/m³.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause severe skin and eye irritation. This material is slightly toxic (LD₅₀ value for rats is 3,900 mg/kg) but it is carcinogenic to animals.

Long Term Exposure: Aramite is carcinogenic in rats and dogs (oral). It produced liver tumors in rats and carcinomas of the gall bladder and biliary ducts in dogs. Aramite was tested in two strains of mice by the oral route and produced a significant increase of hepatomas in males of one strain.

Points of Attack: Liver.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Arosurf® MSF

Use Type: Insecticide

CAS Number: 52292-17-8

Synonyms: POE isooctadecanol; Poly(oxy-1,2-ethanediyl), α -isooctadecyl- ω -hydroxy-; α -Isodecyl- ω -hydroxypoly(oxy-1,2-ethanediyl); Isosteareth-2

Trade Names: AGNIQUE MMF MOSQUITO LARVICIDE & PUPICIDE®, Goldschmidt (Germany); AROSURF® 66ES, Goldschmidt (Germany); AROSURF® 66E2, Goldschmidt (Germany); ISA-20E®

Producers: Cognis GmbH (Germany); Goldschmidt (Germany); Witco Corp (USA)

Chemical Class: Polyalkyloxy compound

EPA/OPP PC Code: 124601

Uses: Used to control mosquito larvae in fresh and salt water habitats such as irrigation and roadside ditches, reservoirs and other pollution sources. Also used as emulsifying agents for road paving and in cosmetics.

Description: Arosurf MSF is a clear to light amber liquid. Melting point = -3 to -7°C.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Mildly toxic by ingestion and by skin contact.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents*

are ingested. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

ASPON®

Use Type: Insecticide

CAS Number: 3244-90-4

Formula: C₁₂H₂₈O₅P₂S₂

Synonyms: Bis-*O, O*-di-*n*-propylphosphorothionic anhydride; ENT 16,894; NPD; Propyl thiopyrophosphate; Tetra-*n*-propyl dithionopyrophosphate; Tetra-*n*-propyl dithiopyrophosphate; *O, O, O, O*-Tetrapropyl dithiopyrophosphate; Thiopyrophosphoric acid, tetrapropyl ester

Trade Names: A 42®; ASP 51®; STAUFFER ASP-51®

Producers: Stauffer Chemical (USA), Albright & Wilson (UK)

Chemical Class: Organophosphate

EPA/OPP PC Code: 079101

California DPR Chemical Code: 1693

Uses: Not registered in the U.S.

Regulatory Authority:

- DOT Inhalation Hazard Chemicals as organophosphates
- Actively registered pesticide in California.

Description: Amber liquid. Practically insoluble in water. Molecular weight = 378.46. Density = 1.12 @ 4°C. Boiling point = 104°C @ 0.1 mmHg; 148°C @ 2mmHg.

Incompatibilities: React violently with acetaldehyde. Incompatible with strong bases. May react violently with antimony(V)pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV⁽¹⁸⁾, Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death.

Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Do not drink any alcoholic beverages before or during use; alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all

clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary

to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Arsenic Acid

Use Type: Used as desiccant for cotton. Registered in California as herbicide, insecticide, and rodenticide.

CAS Number: 1327-52-2; 7778-39-4 (*o*-isomer) (These two CAS number are regulated by the US EPA, New Jersey, California, and others); 10102-53-1 (*m*-isomer)

Formula: AsH₃O₄ (*o*-isomer); AsHO₃ (*m*-isomer)

Alert: Arsenic compounds are generally regarded as carcinogens. Human toxicity (long-term): High.

Synonyms: Acido arsenico (Spanish); Arsenate; Arsenic pentoxide; *o*-Arsenic acid; Metaarsenic acid; Orthoarsenic acid (*o*-)

Trade Names: DESICCANT L-10[®], Cerexagri (USA), canceled 5/6/1993; CRAB GRASS KILLER (*o*-isomer); DESICCANT L-10 (*o*-isomer); H-10[®]; HI-YIELD DESICCANT H-10[®] (*o*-isomer), Voluntary Purchasing Group, Inc. (USA), canceled 5/6/1993; INTRACEL-15[®], Chemical Specialties (USA), canceled 4/1/1987; POLY B RAND DESICCANT[®], Voluntary Purchasing Group, Inc. (USA), canceled 5/6/1993; SCORCH[®], Cerexagri (USA), canceled 7/1/87; SYNERGIZED H-10[®]; ZOTOX[®] (*o*-isomer)

Producers: Drexel Chemical (USA); Great Western Inorganics (USA); Merck (Germany); Minerals Research & Development (USA); Rhodia (France); Rhone-Poulenc (France), See Aventis SA (France); William Blythe (UK)

Chemical Class: Inorganic arsenicals

EPA/OPP PC Code: 006801

California DPR Chemical Code: 40

RTECS Number: CG0700000

EINECS Number: 231-901-9

Uses: It is used as a cotton defoliant and soil sterilant, and on harvested cotton as a desiccant. Also used on seed crop okra in Arizona as a desiccant. It is also used as a wood treatment, drying agent, and to make other arsenates.

Human toxicity (long-term)⁽⁷⁷⁾: High–5.00 ppb, MCL (Maximum Contaminant Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–1357.56302 ppb, MATC (Maximum Acceptable Toxicant Concentration)

- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, WHMIS, Ingredients Disclosure List. Concentration Reporting Level: 0.1%
- Canada: Priority Substance List & Restricted Substances/Ocean Dumping Forbidden (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds)

Description: White semi-transparent crystalline material or in a commercial grade that is a pale yellow syrup-like liquid. Odorless. Melting/Melting/Freezing point = 36°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. It converts to As₂O₃ (arsenic pentoxide) when heated above 300°C. See also arsenic pentoxide. Noncombustible.

Incompatibilities: Incompatible with sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides, oxidizers, epichlorohydrin, vinyl acetate, amides. Avoid contact with chemically active metals. Corrodes brass, mild steel and galvanized steel. Contact with acids or acid mists releases deadly arsine gas.

Permissible Exposure Limits in Air: OSHA⁽²⁾: The legal airborne PEL is 0.01 mg/m³ averaged over an 8-hour workshift for Arsenic and compounds as Arsenic, inorganic. NIOSH⁽²⁾: The recommended airborne exposure limit is 0.002 mg/m³, which should not be exceeded during any 15 minute work period for Arsenic, inorganic. ACGIH: The recommended airborne exposure limit is 0.2 mg/m³ average over an 8-hour workshift for Arsenic and soluble compounds⁽¹⁾. The British HSE⁽³³⁾ has also adapted the ACGIH value of 0.2 mg/m³ as an 8-hour TWA value. The DFG⁽³⁾ has not set numerical limits for arsenic in air on the grounds that it is a proven human carcinogen. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC value for inorganic arsenic compounds (except arsine) of 0.003 mg/m³ for ambient air in residential areas.

Determination in Air: Collection on a filter and analysis by atomic absorption spectrometry. See NIOSH Methods 7900 and 73000, Elements⁽¹⁸⁾. See also OSHA Method ID 105.⁽⁵⁸⁾

Permissible Concentration in Water: EPA has set a limit of 0.05 parts per million (ppm) for arsenic in drinking water. The U.S. EPA arsenic drinking water standard of 0.01 ppm (10 ppb) is based on the U.S. EPA final rule for arsenic in drinking water published in the January 22, 2001, *Federal Register*. However, the U.S. EPA is currently reviewing the science and cost estimate supporting this rule, and, in the interim, has reverted to the previous standard for arsenic. Thus, in the US, the current EPA arsenic drinking water standard remains at 0.05 ppm (50 ppb). To protect freshwater aquatic life-total recoverable trivalent inorganic arsenic never to exceed 440 µg/L. To protect saltwater aquatic life: 508 µg/L on an acute basis. To protect human health: preferably zero. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic⁽⁵⁸⁾.

Routes of Entry: Inhalation, ingestion, and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact can cause irritation, itching, burning sensation, and rash. Eye contact can cause irritation and burns. Inhalation can cause irritation of the

respiratory tract. High exposure can cause poor appetite, nausea, vomiting and muscle cramps. High exposure can cause nerve damage with numbness, "pins and needles" sensation, weakness of the arms and legs. Arsine, a very deadly gas is released in the presence of acid or acid mist. The LD₅₀ (oral, rat) = 48 mg/kg⁽⁹⁾. Ingestion of 130 mg of arsenic may be fatal to humans. Smaller doses may become fatal since arsenic accumulates in the body.

Long Term Exposure: Arsenic acid is a mutagen that may cause changes to genetic material and an animal teratogen. Can cause an ulcer of the septum dividing the inner nose. It can cause nerve damage, thickening of the skin with patch areas of darkening and loss of pigment, or the development of white lines in the nails.

Points of Attack: Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer.

Medical Surveillance: Examination of the nose, skin, eyes, nails, and nervous system. Test for urine arsenic. At NIOSH recommended exposure limits, urine arsenic should not be greater than 50 to 100 micrograms per liter of urine. See also entry for Arsenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures: For severe poisoning BAL has been used. For milder poisoning *penicillamine* (not *penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Arsenic and inorganic arsenic compounds

Use Type: Arsenates and arsenites are used in agriculture as insecticides, herbicides, larvicides, and pesticides.

CAS Number: 7440-38-2 (metallic arsenic)

Formula: As

Alert: Arsenic compounds are generally considered carcinogens, handle with extreme caution.

Synonyms: Arsen (German, Polish); Arsenicals; Arsenic-75; Arsenic black; Arsenic, metallic; Arsenic, solid; Arsenico (Spanish); As-120; As-217; Colloidal arsenic; Grey arsenic; Metallic arsenic; Ruby arsenic; Realgar; Butter of Arsenic
Note: The above synonyms are for metallic arsenic. Other inorganic synonyms vary depending on the specific arsenic compound. The term "inorganic arsenic" does not include Arsine.

Trade Names: ACCUSPIN ASX-10 SPIN-ON DOPANT®

Producers: Air Products & Chemicals (USA); Aldrich Chemical (USA); ATOFINA N.A. (USA); ASARCO (USA); Cia. Universal de Industrias (Mexico); Degussa (Germany); Great Western Inorganics (USA); GFS Chemicals (USA); Mining & Chemical Products Ltd. (MCP) (UK); Mitsubishi Materials (Japan); Newmont Koch (UK); PPM Pure Metals (Germany); Union Miniere (Belgium)

Chemical Class: Inorganic arsenical

EPA/OPP PC Code: 006802 (arsenic pentoxide); 007001 (arsenic trioxide)

California DPR Chemical Code: 710 (arsenic); 11 (arsenic pentoxide); 1 (arsenic trioxide)

ICSC Number: 0013 (arsenic); 0377 (arsenic pentoxide)

RTECS Number: CG0525000 (arsenic)

EEC Number: 033-001-00-X (arsenic); 033-004-00-6 (arsenic pentoxide)

EINECS Number: 231-148-6 (arsenic)

Uses: When used as pesticides, organic compounds of arsenic are used primarily on cotton. Inorganic arsenic compounds are mainly used to preserve wood. Arsenic compounds have a variety of uses other than agriculture chemicals. Other arsenic compounds are used in pigment production, the manufacture of glass as a bronzing or decolorizing agent, the manufacture of opal glass and enamels, textile printing, tanning, taxidermy, and antifouling paints. They are also used to control sludge formation in lubricating oils. Metallic arsenic is used as an alloying agent for heavy metals, and in solders, medicines, herbicides.

Carcinogen/Hazard Classifications

U.S. NTP Carcinogen: Known carcinogen

California Prop. 65: Carcinogen. Developmental toxin for inorganic oxides

IARC: Group 1, known carcinogen (human positive)

Label Signal Word: CAUTION

Endocrine Disruptor: Suspected endocrine disruptor

Description: Elemental arsenic, As, occurs to a limited extent in nature as a steel-gray, amorphous metalloid. Boiling point = 612° (sublimes). Melting/Freezing point = 814° @ 36 atm; 817°C @ 28 atm. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water. Arsenic in this entry includes the element and any of its inorganic compounds excluding arsine. Arsenic trioxide (As_2O_3), the principal form in which the element is used, is frequently designated as arsenic, white arsenic, or arsenous oxide. Arsenic is present as an impurity in many other metal ores and is generally produced as arsenic trioxide as a by-product in the smelting of these ores, particularly copper. Most other arsenic compounds are produced from the trioxide.

Incompatibilities: Incompatible with strong acids, strong oxidizers, peroxides, bromine azide, bromine pentafluoride, bromine trifluoride, cesium acetylene carbide, chromium trioxide, nitrogen trichloride, silver nitrate. Can react vigorously with strong oxidizers (chlorine, dichromate, permanganate). Forms highly toxic fumes on contact with acids or active metals (iron, aluminum, zinc). Hydrogen gas can react with inorganic arsenic to form highly toxic arsine gas.

Permissible Exposure Limits in Air: The following exposure limits are for air levels only. When skin contact also occurs, overexposure is possible, even though air levels are less than the limits listed below. OSHA⁽²⁾: The legal airborne PEL is 0.010 mg/m³ averaged over an 8-hour workshift. NIOSH⁽²⁾: The recommended airborne exposure limit is 0.002 mg/m³ (ceiling), not to be exceeded during any 15 min. work period. ACGIH⁽¹⁾: The recommended airborne exposure limit is 0.01 mg/m³ averaged over an 8-hour workshift. The HSE⁽³³⁾ (U.K.) Maximum Exposure Limit as As is 0.1 mg/m³ TWA. California's workplace PEL is the same as ACGIH⁽¹⁾ and an Action Level of 0.005 mg/m³. The Australia limit is 0.05 mg/m³ TWA (confirmed carcinogen); Israel 0.01 mg/m³ TWA and Action Level 0.005 mg/m³. Mexico level 0.2 mg/m³ TWA. Canada: Alberta level 0.2 mg/m³ TWA and STEL of 0.6 mg/m³ (15 min.); British Columbia level 0.5 mg/m³ TWA; Ontario level 0.01 mg/m³ TWAEV and STEV of 0.05; Quebec level 0.2 mg/m³ TWAEV. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 0.003 mg/m³ on an average

daily basis for residential areas. In addition, several states have set guidelines or standards for arsenic in ambient air⁽⁶⁰⁾: 0.06 mg/m³ (California Prop. 65), 0.0002 µg/m³ (Rhode Island), 0.00023 µg/m³ (North Carolina), 0.024 µg/m³ (Pennsylvania), 0.05 µg/m³ (Connecticut), 0.07 to 0.39 µg/m³ (Montana), 0.67 µg/m³ (New York), 1.0 µg/m³ (South Carolina), 2.0 µg/m³ (North Dakota), 3.3 µg/m³ (Virginia), 5 µg/m³ (Nevada).

Determination in Air: Collection on a filter and analysis by atomic absorption spectrometry. See NIOSH Methods 7900 and 73000, Elements⁽¹⁸⁾. See also OSHA Method ID 105⁽⁵⁸⁾.

Permissible Concentration in Water: EPA has set a limit of 0.05 ppm for arsenic in drinking water. The U.S. EPA arsenic drinking water standard of 0.01 ppm (10 ppb) is based on the U.S. EPA final rule for arsenic in drinking water published in the January 22, 2001, *Federal Register*. However, the U.S. EPA is currently reviewing the science and cost estimate supporting this rule, and, in the interim, has reverted to the previous standard for arsenic. Thus, in the US, the current EPA arsenic drinking water standard remains at 0.05 ppm (50 ppb). To protect freshwater aquatic life-total recoverable trivalent inorganic arsenic never to exceed 440 µg/L. To protect saltwater aquatic life: 508 µg/L on an acute basis. To protect human health: preferably zero. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic⁽⁵⁸⁾.

Routes of Entry: Inhalation, through the skin, and ingestion of dust and fumes.

Harmful Effects and Symptoms

Local: Trivalent arsenic compounds are corrosive to the skin. Brief contact has no effect, but prolonged contact results in a local hyperemia and later vesicular or pustular eruption. The moist mucous membranes are most sensitive to the irritant action. Conjunctiva, moist and macerated areas of the skin, eyelids, the angles of the ears, nose, mouth, and respiratory mucosa are also vulnerable to the irritant effects. The wrists are common sites of dermatitis, as are the genitalia if personal hygiene is poor. Perforations of the nasal septum may occur. Arsenic trioxide and pentoxide are capable of producing skin sensitization and contact dermatitis. Arsenic is also capable of producing keratoses, especially of the palms and soles. Arsenic has been cited as a cause of skin cancer, but the incidence is low. **Systemic:** The acute toxic effects of arsenic are generally seen

following ingestion of inorganic arsenical compounds. This rarely occurs in an industrial setting. Symptoms develop within ½ to 4 hours following ingestion and are usually characterized by constriction of the throat followed by dysphagia, epigastric pain, vomiting, and watery diarrhea. Blood may appear in vomitus and stools. If the amount ingested is sufficiently high, shock may develop due to severe fluid loss, and death may ensue in 24 hours. If the acute effects are survived, exfoliative dermatitis and peripheral neuritis may develop. Cases of acute arsenical poisoning due to inhalation are exceedingly rare in industry. When it does occur, respiratory tract symptoms—cough, chest pain, dyspnea-giddiness, headache, and extreme general weakness precede gastrointestinal symptoms. The acute toxic symptoms of trivalent arsenical poisoning are due to severe inflammation of the mucous membranes and greatly increased permeability of the blood capillaries. Chronic arsenical poisoning due to ingestion is rare and generally confined to patients taking prescribed medications. However, it can be a concomitant of inhaled inorganic arsenic from swallowed sputum and improper eating habits. Symptoms are weight loss, nausea and diarrhea alternating with constipation, pigmentation and eruption of the skin, loss of hair, and peripheral neuritis. Chronic hepatitis and cirrhosis have been described. Polyneuritis may be the salient feature, but more frequently there are numbness and paresthesias of “glove and sticking” distribution. The skin lesions are usually melanotic and keratotic and may occasionally take the form of an intradermal cancer of the squamous cell type, but without infiltrative properties. Horizontal white lines (striations) on the fingernails and toenails are commonly seen in chronic arsenical poisoning and are considered to be a diagnostic accompaniment of arsenical polyneuritis. Inhalation of inorganic arsenic compounds is the most common cause of chronic poisoning in the industrial situation. This condition is divided into three phases based on signs and symptoms. **First Phase:** The worker complains of weakness, loss of appetite, some nausea, occasional vomiting, a sense of heaviness in the stomach, and some diarrhea. **Second Phase:** The worker complains of conjunctivitis, and a catarrhal state of the mucous membranes of the nose, larynx, and respiratory passages. Coryza, hoarseness, and mild tracheobronchitis may occur. Perforation of the nasal septum is common, and is probably the most typical lesion of the upper respiratory tract in occupational exposure to arsenical dust. Skin lesions, eczematoid and allergic in type, are common. **Third Phase:** The worker complains of symptoms of peripheral neuritis, initially of hands and feet, which is essentially sensory. In more severe cases, motor paralyzes occur; the first muscles affected are usually the toe extensors and the peronei. In only the most severe cases will paralysis of flexor muscles of the feet or of the extensor muscles of hands occur. Liver damage from chronic arsenical poisoning

is still debated, and as yet the question is unanswered. In cases of chronic and acute arsenical poisoning, toxic effects to the myocardium have been reported based on EKG changes. These findings, however, are now largely discounted and the EKG changes are ascribed to electrolyte disturbances concomitant with arsenicalism. Inhalation of arsenic trioxide and other inorganic arsenical dusts does not give rise to radiological evidence of pneumoconiosis. Arsenic does have a depressant effect upon the bone marrow, with disturbances of both erythropoiesis and myelopoiesis. Evidence is now available incriminating arsenic compounds as a cause of lung cancer as well as skin cancer. Skin Cancer in humans is causally associated with exposure to inorganic arsenic compounds in drugs, drinking water and the occupational environment. The risk of lung cancer was increased 4 to 12 times in certain smelter workers who inhaled high levels of arsenic trioxide. However, the influence of other constituents of the working environment cannot be excluded in these studies. Case reports have suggested an association between exposure to arsenic compounds and blood dyscrasias and liver tumors.

Short Term Exposure: Skin contact can cause irritation, itching, burning sensation, and rash. Eye contact can cause irritation and burns. Inhalation can cause irritation of the respiratory tract. High exposure can cause poor appetite, nausea, vomiting and muscle cramps. High exposure can cause nerve damage with numbness, "pins and needles" sensation, weakness of the arms and legs.

Long Term Exposure: Arsenic is a carcinogen; causes skin, lung, bladder, liver, kidney, prostate, and lymphatic cancer, possible reproductive hazard (a teratogen in animals). Can cause an ulcer of the septum dividing the inner nose. It can cause hoarseness, sore eyes, nerve damage, thickening of the skin with patch areas of darkening and loss of pigment, liver damage and stomach problems. Small doses can accumulate in the body. Birth defects have been observed in animals exposed to inorganic arsenic. It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

Points of Attack: Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer.

Medical Surveillance: Before first exposure and every 6 to 12 months thereafter, OSHA 1910.1018 requires employers to provide (for persons exposed to 0.005 mg/m³ of Arsenic) a medical history and exam which shall include: Chest x-ray, exam of the nose, skin, and nails, sputum cytology examination, test for urine Arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a workday). Levels should not be greater than 100 micrograms per gram creatinine in the urine. Exam of the nervous system. After suspected overexposure, repeat these tests and consider complete blood count and liver function

tests. Also examine skin periodically for abnormal growths. Skin cancer from arsenic can easily be cured when detected early. Employees have a legal right to testing information under OSHA 1910.20.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note: For severe poisoning BAL has been used. For milder poisoning *penicillamine* (not *penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Arsenic Pentoxide

Use Type: Herbicide, fungicide, rodenticide, insecticide and as a soil sterilant.

CAS Number: 1303-28-2

Formula: As₂O₅

Alert: Arsenic compounds are generally considered carcinogens.

Synonyms: Anhydride arsenique (French); Anidriuo arsenioso (Italian); Arsenic acid anhydride; Arsenic anhydride; Arsenic oxide; Arsenic(V) oxide; Arsenic acid anhydride; Arsenic pentoxide; Diarsenic pentoxide; Fotox; Peroxido de arsenico (Spanish)

Producers: GFS Chemicals (USA); Great Western Inorganics (USA); Merck (Germany); PPM Pure Metals (Germany)

Chemical Class: Inorganic arsenical

EPA/OPP PC Code: 006802

California DPR Chemical Code: 631

ICSC Number: 0377

RTECS Number: CG2275000

EEC Number: 033-004-00-6

EINECS Number: 215-116-9

Uses: This material is also used as a chemical intermediate and as an ingredient in wood preservatives and in glass.

Carcinogen/Hazard Classifications

- Description:** Arsenic pentoxide, As₂O₅, is an odorless white lumpy solid powder and non-flammable. Melting/Freezing point = 315°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Highly soluble in water.
- Incompatibilities:** Chemically active metals such as aluminum and zinc. Incompatible with acids, strong alkalis, halogens, rubidium carbide, zinc. Corrosive to metals in the presence of moisture. Contact with acids or acid mists releases deadly arsine gas.
- Permissible Exposure Limits in Air:** OSHA⁽²⁾: The legal airborne PEL is 0.01 mg/m³ averaged over an 8-hour workshift for Arsenic and compounds as Arsenic, inorganic. NIOSH⁽²⁾: The recommended airborne exposure limit is 0.002 mg/m³, which should not be exceeded during any 15

minute work period for Arsenic, inorganic. ACGIH: The recommended airborne exposure limit is 0.2 mg/m³ average over an 8-hour workshift for Arsenic and soluble compounds⁽¹⁾. The British HSE⁽³³⁾ has also adapted the ACGIH value of 0.2 mg/m³ as an 8-hour TWA value. The DFG⁽³⁾ has not set numerical limits for arsenic in air on the grounds that it is a proven human carcinogen. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC value for inorganic arsenic compounds (except arsine) of 0.003 mg/m³ for ambient air in residential areas. In addition, several states have set specific guidelines or standards for arsenic pentoxide in ambient air⁽⁶⁰⁾ ranging from zero (New York) to 0.0002 µg/m³ (North Carolina) to 1.0 µg/m³ (South Carolina).

Determination in Air: Collection on a filter and analysis by atomic absorption spectrometry. See NIOSH Methods 7900 and 73000, Elements⁽¹⁸⁾. See also OSHA Method ID 105.⁽⁵⁸⁾

Permissible Concentration in Water: EPA has set a limit of 0.05 parts per million (ppm) for arsenic in drinking water. The U.S. EPA arsenic drinking water standard of 0.01 ppm (10 ppb) is based on the U.S. EPA final rule for arsenic in drinking water published in the January 22, 2001, *Federal Register*. However, the U.S. EPA is currently reviewing the science and cost estimate supporting this rule, and, in the interim, has reverted to the previous standard for arsenic. Thus, in the US, the current EPA arsenic drinking water standard remains at 0.05 ppm (50 ppb). To protect freshwater aquatic life-total recoverable trivalent inorganic arsenic never to exceed 440 µg/L. To protect saltwater aquatic life: 508 µg/L on an acute basis. To protect human health: preferably zero. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic⁽⁵⁸⁾.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: It is irritating to eyes, nose, and respiratory system. This chemical can be absorbed through the skin, thereby increasing exposure. Skin contact can cause irritation, burning, itching, and a rash. Symptoms usually appear ½ to 1 hour after ingestion, but may be delayed. Symptoms include a sweetish, metallic taste and garlicky odor of breath; difficulty in swallowing; abdominal pain; vomiting and diarrhea; dehydration; feeble heart beat; dizziness and headache; and eventually coma, sometimes convulsions, general paralysis, and death. The LD₅₀ (oral,

rat) = 8 mg/kg⁽⁹⁾. This material is extremely toxic; the probable oral lethal dose for humans is 5-50 mg/kg, or between 7 drops and 1 teaspoonful for a 150-lb. person.

Long Term Exposure: Arsenic pentoxide is a carcinogen in humans. It has been shown to cause skin cancer. May damage the male reproductive glands. Chronic exposure may cause nerve damage to the extremities, alter cellular composition of the blood, and cause structural changes in blood components. Repeated exposure can cause an ulcer in the septum dividing the inner nose. Long term skin contact can cause thickened skin and pigmentation changes. Some persons develop white lines in the finger nails. Birth defects have been observed in animals exposed to inorganic arsenic. It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

Points of Attack: Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer.

Medical Surveillance: See entry under Arsenic compounds.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Arsenous Oxide

Use Type: Herbicide, insecticide, and rodenticide

CAS Number: 1327-53-3

Formula: As₂O₃

Alert: Highly toxic. Persons whose clothing or skin is contaminated with arsenic trioxide can secondarily contaminate rescuers by direct contact or through release of inhalable dust. May be fatal if swallowed. May cause allergic respiratory reaction. May act as a carcinogen; inorganic arsenic is a known cancer hazard.

Synonyms: Acide arsenieux (French); Anhydride arsenieux (French); Arsenic blanc (French); Arsenic(III) oxide; Arsenic sesquioxide; Arsenic trioxide, solid; Arsenicum album; Arsenigen saure (German); Arsenious acid; Arsenious oxide; Arsenious trioxide; Arsenite; Arsenolite; Arsenous acid; Arsenous acid anhydride; Arsenous anhydride; Arsenous oxide anhydride; Arsenic sesquioxide; Arsenic trioxide; Arsodent; Claudelite; Claudetite; Crude arsenic; Diarsenic trioxide; Spinrite arsenic; Trioxido de arsenico (Spanish); White arsenic

Producers: ESPI (USA); Great Western Inorganics (USA); Merck (Germany); Mitsubishi Chemicals (Japan); Mitsui Chemical (Japan); Noah Technologies (USA); PPM Pure Metals (Germany); Quantum Chemicals (USA); Sumitomo Chemical (Japan)

Chemical Class: Inorganic arsenic, heavy metal

EPA/OPP PC Code: 007001

California DPR Chemical Code: 42

ICSC Number: 0378

RTECS Number: CG3325000

EEC Number: 033-003-00-0

EINECS Number: 215-481-4

Uses: This is a primary raw material for all arsenic compounds. It is also an intermediate for insecticides, herbicides and fungicides. The material is used as a wood and tanning preservative, sheep dips, making enamels, and a decoloring and refining agent in glass manufacture. It is also used in pharmaceuticals and in the purification of synthetic gas.

Carcinogen/Hazard Classifications

U.S. NTP Carcinogen: Known carcinogen

California Prop. 65: Carcinogen

IARC: Group 1, carcinogen

Description: Arsenic trioxide is a white or transparent solid in the form of glassy, shapeless lumps or a crystalline powder that resembles sugar. It has no odor or taste. **Warning properties:** inadequate; odorless and tasteless; airborne arsenic trioxide may produce a burning sensation to the nose, mouth, and eyes and cause coughing, shortness of breath, headache, sore throat, and dizziness. Slightly soluble in water; solubility = 37 g/L @ 20 °C; 115 g/L @100°C. Molecular weight = 197.84 daltons. Density (solid-water = 1.00) = 3.74. Boiling point = 465 °C @ 760 mmHg. Sublimes at 193 °C. Melting/Freezing point = 312 °C.

Vapor pressure = 66.1 mmHg @ 312 °C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Incompatibilities: Sodium chlorate; sodium hydroxide, sulfuric acid, fluorine; chlorine trifluoride; chromic oxide; aluminum chloride; phosphorus pentoxide; hydrogen fluoride; oxygen difluoride; tannic acid; infusion cinchona and other vegetable astringent infusions and decoctions; iron in solution. Contact with acids or acid mists releases deadly arsine gas. Not flammable, but emits highly toxic arsine gas and oxides of arsenic fumes when burned.

Permissible Exposure Limits in Air: OSHA: The legal airborne PEL is 0.01 mg/m³ averaged over an 8-hour workshift for Arsenic and compounds as Arsenic, inorganic. NIOSH⁽²⁾: The recommended airborne exposure limit is 0.002 mg/m³, which should not be exceeded during any 15 minute work period for Arsenic, inorganic. ACGIH: The recommended airborne exposure limit is 0.2 mg/m³ average over an 8-hour workshift for Arsenic and soluble compounds⁽¹⁾. The British HSE⁽³³⁾ has also adapted the ACGIH value of 0.2 mg/m³ as an 8-hour TWA value. The DFG⁽³⁾ has not set numerical limits for arsenic in air on the grounds that it is a proven human carcinogen. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC value for inorganic arsenic compounds (except arsine) of 0.003 mg/m³ for ambient air in residential areas. In addition, some states have set guidelines or standards for arsenic trioxide in ambient air⁽⁶⁰⁾: zero (New York), 0.0002 µg/m³ (North Carolina), 3.0 µg/m³ (Virginia).

Determination in Air: Use NIOSH Method 7901, Arsenic trioxide⁽¹⁸⁾.

Permissible Concentration in Water: EPA has set a limit of 0.05 parts per million (ppm) for arsenic in drinking water. The U.S. EPA arsenic drinking water standard of 0.01 ppm (10 ppb) is based on the U.S. EPA final rule for arsenic in drinking water published in the January 22, 2001, *Federal Register*. However, the U.S. EPA is currently reviewing the science and cost estimate supporting this rule, and, in the interim, has reverted to the previous standard for arsenic. Thus, in the US, the current EPA arsenic drinking water standard remains at 0.05 ppm (50 ppb). To protect freshwater aquatic life-total recoverable trivalent inorganic arsenic never to exceed 440 µg/L. To protect saltwater aquatic life: 508 µg/L on an acute basis. To protect human health: preferably zero. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: For arsenic: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively

coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic⁽⁵⁸⁾.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: • Toxic effects of arsenic trioxide usually result from ingestion. Small amounts of arsenic trioxide can lead to multiple organ damage and death. Acute signs and symptoms include nausea, vomiting, diarrhea, gastrointestinal hemorrhage, cerebral edema, tachycardia, dysrhythmias, and hypovolemic shock. Symptoms are dose dependent and can be delayed. Dermal contact and inhalation of airborne arsenic trioxide can cause localized irritation and usually does not result in systemic effects. Skin contact can cause burning, itching, and rash. Inhalation can cause respiratory irritation. Eye contact can cause irritation and possible permanent damage. High exposures can cause an abnormal EKG. Symptoms of acute poisoning may take from ½ hour to several hours after ingestion to appear. They may include: sweetish metallic taste; garlicky odor of breath and feces; constriction in throat and difficulty in swallowing; burning and colicky pains in esophagus, stomach and bowel; vomiting and profuse painful diarrhea (stools are watery initially, later becoming bloody); dehydration with intense thirst and muscular cramps; bluing of skin; feeble pulse and cold extremities; vertigo, frontal headache, stupor, delirium and mania (these symptoms may occur without concurrent or preceding gastric symptoms); fainting, coma, convulsions, general paralysis and then death. This material is considered super toxic; probable oral lethal dose (human) is less than 5 mg/kg, i.e., a taste (less than 7 drops) for a 70 kg (150 lb) person. Material causes acute gastrointestinal and central nervous system symptoms.

Long Term Exposure: Chronic exposure is characterized by malaise, peripheral sensorimotor neuropathy, anemia, jaundice, gastrointestinal complaints, and characteristic skin lesions including hyperkeratosis (small corn-like elevations) and hyperpigmentation. Hyperkeratosis usually appears on the palms or soles. Pigmentation changes and hyperkeratosis can take 3 to 7 years to appear. Chronic inhalation can also lead to conjunctivitis, irritation of the throat and respiratory tract, and perforation of the nasal septum. Chronic exposure can cause allergic contact dermatitis. Chronic exposure may be more serious for children because of their potential longer latency period. **Carcinogenicity:** The Department of Health and Human Services, IARC, the U.S. EPA, and the NTP have classified arsenic as a human carcinogen based on sufficient evidence from human data. Arsenic trioxide causes skin and lung cancer, and may cause internal cancers such as liver, bladder, kidney, colon, and prostate cancers. Arsenic ions released from arsenic trioxide within the body can cross the placenta and affect the developing fetus; arsenic is also excreted in breast milk. Experimental animal studies support an association between high ingested arsenic dose and fetal toxicity. **Reproductive and Developmental**

Toxicants: Special consideration regarding the exposure of pregnant women may be warranted, since arsenic trioxide has been shown to be mutagenic and clastogenic, and is suspected of being teratogenic; thus, medical counseling is recommended for the acutely exposed pregnant woman. Birth defects have been observed in animals exposed to inorganic arsenic. It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

Points of Attack: Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer.

Medical Surveillance: Before first exposure and every 6 to 12 months thereafter, OSHA 1910.1018 requires employers to provide (for persons exposed to 0.005 mg/m³ of Arsenic) a medical history and exam which shall include: Chest x-ray, Exam of the nose, skin, and nails, sputum cytology examination, test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a workday). Levels should not be greater than 100 micrograms per gram creatinine in the urine. Exam of the nervous system. After suspected overexposure, repeat these tests and consider complete blood count and liver function tests. Also examine skin periodically for abnormal growths. Skin cancer from arsenic can easily be cured when detected early. Employees have a legal right to testing information under OSHA 1910.20.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with large amounts of soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. Aggressive decontamination with gastric lavage is recommended within 1 hour of ingestion of a life-threatening amount of poison. The effectiveness of activated charcoal in binding arsenic trioxide is questionable, but administration of a charcoal slurry is recommended pending further evaluation in cases of ingestion of unknown quantities (at 1 gm/kg, usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child.

Note to physician or authorized medical personnel: There is no specific antidote for arsenic trioxide. In cases of respiratory compromise secure airway and respiration via endotracheal intubation. If not possible, perform cricothyroidotomy if equipped and trained to do so. Treat patients who have bronchospasm with aerosolized

bronchodilators. The use of bronchial sensitizing agents in situations of multiple chemical exposures may pose additional risks. Also consider the health of the myocardium before choosing which type of bronchodilator should be administered. Cardiac sensitizing agents may be appropriate; however, the use of cardiac sensitizing agents after exposure to certain chemicals may pose enhanced risk of cardiac arrhythmias (especially in the elderly). Arsenic trioxide poisoning is not known to pose additional risk during the use of bronchial or cardiac sensitizing agents. Consider racemic epinephrine aerosol for children who develop stridor. Dose 0.25–0.75 mL of 2.25% racemic epinephrine solution in 2.5 cc water, repeat every 20 minutes as needed cautioning for myocardial variability. Patients who are comatose, hypotensive, or have seizures or cardiac dysrhythmias should be treated according to advanced life support protocols. If massive exposure is suspected or if the patient is hypotensive, infuse intravenous saline or lactated Ringer's solution. For adults, bolus 1000 mL/hour if blood pressure is under 80 mmHg; if systolic pressure is over 90 mmHg, an infusion rate of 150 to 200 mL/hour is sufficient. For children with compromised perfusion administer a 20 mL/kg bolus of normal saline over 10 to 20 minutes, then infuse at 2 to 3 mL/kg/hour. Chelation therapy is strongly recommended.

Asulam (ANSI)

Use Type: Herbicide

CAS Number: 3337-71-1

Formula: C₈H₁₀N₂O₄S

Synonyms: 4-Amino-benzolsulfonyl-methylcarbamate (German); Methyl sulfanilylcarbamate; Carbamic acid, sulfanilyl-, methyl ester; 4-(Aminophenylsulfonyl) carbamate, methyl ester; Carbamic acid, [(4-aminophenyl) sulfonyl]-, methyl ester; Methyl-N-(4-amino benzenesulfonyl)carbamate; Methyl [(4-aminophenyl)sulfonyl]carbamate; Methyl sulfanilylcarbamate; Sulfanilylcarbamic acid, methyl ester

Trade Names: ASILAN®; ASULFOX F®; ASULOX®; ASULOX 40®; JONNIX®; MB 9057®

Producers: Agrimor International (USA); Rhone-Poulenc (France)

Chemical Class: Carbamate

EPA/OPP PC Code: 106901

California DPR Chemical Code: 5076

EINECS Number: 222-077-1

Uses: Not registered in the U.S. Use as a post-emergence herbicide to control broadleaf weeds, perennial grasses and nonflowering plants in sugarcane and reforestation areas, bananas, cocoa, coffee, coconuts and citrus crops.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–252.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–841072.39665 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: A colorless, crystalline solid. Odorless. Molecular weight = 230.25. Melting/Freezing point = 143–146°C. Moderately soluble in water. Solubility 5,000 mg/L.

Incompatibilities: May form explosive materials with phosphorus pentachloride.

Determination in Air: Filter; none; Gravimetric; NIOSH⁽²⁾ IV [Particulates NOR; #0500 (total), #0600 (respirable)]

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a

corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or

intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary.

Medical note: 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Chemical Class: Triazine

EPA/OPP PC Code: 080803

California DPR Chemical Code: 00045

ICSC Number: 0099

RTECS Number: XY5600000

EEC Number: 613-068-00-7

EINECS Number: 217-617-8

Uses: Atrazine is a selective pre- and post-emergence herbicide used for the control of broadleaf and grassy weeds in crops, such as corn (field and sweet), guava, hay, macadamia nuts, range grasses for the establishment of permanent grass cover on range lands and pastures in Oklahoma, Nebraska, Texas and Oregon, wheat, residential and recreational turf and sod farms, sorghum, sugarcane, pineapples, and Christmas trees and ornamentals. It is also used in forestry and, at higher application rates, for non-selective weed control in non-crop areas. It is the most widely used pesticide in the United States. Use data from 1900 to 1997 indicates that approximately 76.5 million pounds of atrazine active ingredient is used domestically each year. Certified herbicide workers may spread atrazine

on crops or crop lands as a powder, liquid, or in a granular form. Atrazine is usually used in the spring and summer months. For it to be active, atrazine needs to dissolve in water and enter the plants through their roots. It then acts in the shoots and leaves of the weed to stop photosynthesis. Atrazine is taken up by all plants, but in plants not affected by atrazine, it is broken down before it can have an effect on photosynthesis. Atrazine degrades into hydroxy compounds and chlorotriazine degradates. The application of atrazine to crops as a herbicide accounts for almost all of the atrazine that enters the environment, but some may be released from manufacture, formulation, transport, and disposal. Atrazine does not tend to accumulate in living organisms such as algae, bacteria, clams, or fish, and, therefore, does not tend to build up in the food chain. Atrazine can be applied by ground boom sprayer, aircraft, tractor-drawn spreader, rights-of-way sprayer, hand-held sprayers, backpack sprayer, lawn handgun, push-type spreader, and bellygrinder.

Human toxicity (long-term)⁽⁷⁷⁾: High–3.00 ppb, MCL (Maximum Contaminant Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–88.31816 ppb, MATC (Maximum Acceptable Toxicant Concentration)

- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Water Pollution Standard Set (U.S. EPA) (Canada)
- Safe Drinking Water Act: 40CFR141.61(c)5, MCL, 0.003 mg/L; 40CFR141.50(b)7, MCGL 0.003 mg/L;

40CFR142.62, Variances and Exceptions from the MCLs; 40CFR9352 Regulated Chemical; 40CFR141.24, Requirements for Sampling and Analytical Testing; 40CFR141.32 Public Notification Requirements.

- FIFRA 40CFR180.220 tolerances on raw agricultural commodities.

- CERCLA/SARA 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 0.1%.

Description: Atrazine is a colorless or white, crystalline solid or powder. Often mixed with a liquid. Soluble in water; solubility = 68 ppm @ 25°C. Odorless. Molecular weight = 215.71. Melting/Freezing point = 174–177°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water. Vapor pressure = 2.9×10^{-7} mmHg @ 20°C. Log K_{ow} = 2.24–2.78. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Strong oxidizers, acids.

Permissible Exposure Limits in Air: The NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommended airborne exposure limit is 5 mg/m³ TWA for a 10-hour and 8-hour workshift, respectively⁽¹⁾. The DFG⁽³⁾ has set a MAK limit value of 2 mg/m³. The Australian and Israel limit is 5 mg/m³ and Israel's Action Limit is 2.5 mg/m³. The HSE⁽³³⁾ (U.K.) and Mexico limit is 10 mg/m³ TWA. Canadian Provincial Limits are: Alberta: 5 mg/m³ TWA and 15 min. STEL of 10 mg/m³; British Columbia: 10 mg/m³; Ontario and Quebec: 5 mg/m³ TWAEV. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 2 mg/m³ in workplace air and of 0.02 mg/m³ for both momentary and daily average exposure in ambient air in residential areas. In addition, several states have set guidelines or standards⁽⁶⁰⁾ for atrazine in ambient air ranging from 50 µg/m³ (North Dakota) to 80 µg/m³ (Virginia) to 100 µg/m³ (Connecticut) to 119 µg/m³ (Nevada).

Determination in Air: Use OSHA versatile sampler-2; Reagent; Gas chromatography/Electron capture detection; NIOSH #5602⁽¹⁸⁾.

Permissible Concentration in Water: A maximum level (MCL and MCGL) in drinking water of 0.003 mg/L has been set by EPA⁽⁶²⁾. The Canadian Drinking Water IMAC is 0.06 mg/L. A suggested no-adverse effect level in drinking water has been calculated by NAS/NRC as 0.15 mg/L. An acceptable daily intake (ADI) of 0.0215 mg/kg/day has been calculated for atrazine⁽⁴⁶⁾. A limit of 0.5 mg/L of atrazine has been specified by the former USSR-UNEP/IRPTC program⁽⁴³⁾ in water bodies used for domestic purposes. Also, several states have set guidelines for atrazine in drinking water⁽⁶¹⁾ ranging from 0.093 µg/L (Massachusetts) to 15 µg/L (California) to 25 µg/L (New York) to 43 µg/L (Maine) to 150 µg/L (Kansas).

Determination in Water: Analysis of atrazine is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen-phosphorus containing pesticides in water samples. In this method, approximately

1 l of sample is extracted with methylene chloride. The extract is concentrated, and the compounds are separated using capillary column GC. Measurement is made using a nitrogen phosphorus detector. The method detection limit has not been determined for this compound, but it is estimated that the detection limits for the method analytes are in the range of 0.1 to 2 µg/L.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause congestion of heart, lungs and kidneys; low blood pressure; muscle spasms; weight loss; damage to adrenal glands, and skin and severe eye irritation. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures.

Long Term Exposure: Atrazine is a suspected human carcinogen when exposure is chronic. It causes many kinds of cancer, including cancer of the breast, ovaries, uterus, testicles, as well as leukemia and lymphoma. It is an endocrine disrupting chemical. It interrupts regular hormone function, causing birth defects, reproductive tumors, and weight loss in mothers and embryos. Atrazine may cause skin allergy. Atrazine has the potential to cause weight loss, cardiovascular damage, retinal and some muscle degeneration, and mammary tumors from a lifetime exposure at levels above the MCL. Atrazine is possibly carcinogenic to humans (IARC, 3). There is inadequate evidence to confirm carcinogenicity of atrazine in humans. However, there is the increased risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects of atrazine on the hypothalamic pituitary gonadal axis.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver.

Medical Surveillance: Evaluation by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Auramine

Use Type: Fungicide

CAS Number: 492-80-8; 2465-27-2 (hydrochloride salt)

Formula: C₁₇H₂₁N₃; (CH₃)₂N-C₆H₄CNH-C₆H₄-N(CH₃)₂

Alert: Auramine should be handled as a carcinogen with extreme caution.

Synonyms: Apyonine auramarine base; Auramina (Spanish); Auramine base; Auramine N base; Auramine OAF; Auramine O base; Auramine SS; Basic Yellow 2; Baso Yellow 124; Benzeneamine, 4,4'-carbonimidoylbis[N-dimethyl-; C. I. Solvent Yellow 34; Brilliant Oil Yellow; 4,4'-carbonimidoylbis(N,N-dimethylbenzenamine); C.I. 41000B; C.I. Basic Yellow 2, free base; C.I. Solvent Yellow 34; 4,4'-Dimethylaminobenzophenonimide; Glauramine; 4,4'-(Imidocarbonyl)bis(N,N-dimethylaniline); Tetramethyldiaminodiphenylacetimine; Yellow pyoctanine
Trade Names: TOBAZ[®], Mallinckrodt, Inc. (USA), canceled; WAXOLINE YELLOW O[®]

Producers: Aldrich Chemical (USA); Merck (Germany); Whyte Agrochemical (UK)

Chemical Class: Unclassified

EPA/OPP PC Code: 039501

California DPR Chemical Code: 702

RECS Number: BY3500000; BY3675000 (hydrochloride salt)

EINECS Number: 219-567-2

Uses: Auramine is used industrially as a dye or dye intermediate for coloring textiles, paper, and leather. Also

used as an antiseptic (a powerful antiseptic in ear and nose surgery and in gonorrhea treatment).

Carcinogen/Hazard Classifications

California Prop. 65: Carcinogen

IARC: Group 2B; Carcinogenic, Sufficient animal data

Label Signal Word: CAUTION

Regulatory Authority:

- Carcinogenic (UN)⁽¹³⁾ (Animal Positive) (DFG)⁽³⁾ (IARC)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- Proposition 65 chemical (CAL)
- The "Director's List" (CAL/OSHA)
- Banned or Severely Restricted (Italy, Sweden) (UN)⁽¹³⁾
- Air Pollutant Standard Set (North Dakota, New York)⁽⁶⁰⁾
- EPA Hazardous Waste Number (RCRA No.): U014 (as C.I. Solvent Yellow 34)
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: CERCLA, 100 lb (45.4 kg)
- CERCLA/SARA 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 0.1%.

Description: Auramine is a yellow, crystalline powder or flaky material. Melting/Freezing point = 136°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Incompatibilities: Strong oxidizers. Emits nitrogen oxides and hydrogen chloride when heated to decomposition.

Permissible Exposure Limits in Air: No occupational exposure limits have been established. However auramine may be a carcinogen; there may be no safe level of exposure. This chemical can be absorbed through the skin, thereby increasing the potential for exposure. Zero in New York, North Dakota⁽⁶⁰⁾ in ambient air.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin absorption. Low-level dermal exposure to the consumer may occur but would be limited to any migration of auramine from fabric, leather, or paper goods.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes, and may cause damage. Skin absorption may result in dermatitis and burns, nausea and vomiting.

Long Term Exposure: Commercial auramine is carcinogenic in mice and rats after oral administration, producing liver tumors, and after subcutaneous injection in rats, producing local sarcomas. The manufacture of auramine (which also involves exposure to other chemicals) has been shown in one study to be causally associated with an increase in bladder cancer. The actual carcinogenic compound(s) has not been specified precisely.

Points of Attack: Liver, bladder.

Medical Surveillance: Monthly urinalysis. Physical exam every 6 months focused on bladder.

First Aid: If this chemical gets into the eyes, remove any

contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Azacosterol Dihydrochloride

Use Type: A bird sterilant

CAS Number: 1249-84-9

Formula: C₂₅H₄₆Cl₂N₂O

Synonyms: Androst-5-en-3-ol, 17-[[[(3-(dimethylamino)propyl)methyl]amino]-,dihydrochloride, (3β,17β)-; Azasterol HCL; Azacosterol hydrochloride; Diazacholesterol dihydrochloride; 20,25-Diazacosterol hydrochloride; 17-β-[(3-(Dimethylamino)-propyl)methylamino]androst-5-en-3-β-ol dihydrochloride

Trade Names: AZASTEROL®; IMD-760®; ORNITROL®, Avitrol (USA), canceled; SC-12937®

Producers: Avitrol (USA)

Chemical Class: Organochlorine

EPA/OPP PC Code: 098101

California DPR Chemical Code: 2026

Uses: Not registered in the U.S. Used as an avian sterilant.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

Description: Crystalline solid. Molecular weight = 388.71.

Incompatibilities: When heated to decomposition or on contact with acids or acid fumes, may produce highly toxic chloride fumes; deadly phosgene gas may be formed. May cause pitting of some metals.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion. Absorbed through the intact skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritating to eyes, skin, mucous

membranes. Large doses can cause central nervous system depression, dizziness, weakness, headache, nausea, vomiting, and difficult breathing. Apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death. At fire temperatures can produce coughing, choking, difficult breathing, and cyanosis.

Points of Attack: CNS. May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. Skin: Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. Ingestion: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* In cases of ingestion, Do not induce vomiting; the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is

UNCONSCIOUS OR HAVING CONVULSIONS, do nothing except keep victim warm.

*In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal *before or with* ipecac syrup.

Inhalation: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Azadirachtin

Use Type: Insecticide and nematocide

CAS Number: 11141-17-6

Formula: C₃₅H₄₄O₁₆

Synonyms: Azadirachtin A

Trade Names: ALIGN[®]; AZATIN EC[®], Certis USA (USA); AZATIN[®]-XL PLUS, Certis USA (USA); AZATROL EC[®], Pbi/Gordon (USA); AMAZIN[®], AMVAC Chemical (USA); ECOZIN[®], AMVAC Chemical (USA); EI-783[®], Pbi/Gordon (USA); MARGOSAN-O[®], Certis USA (USA); NEEM[®], Certis USA (USA); NEEMAZAL[®] Coromandel Fertilisers (India); ORNAZIN[®], AMVAC Chemical (USA); SALANNIN[®]; SUPERNEEM[®], Certis USA (USA); TURPLEX[®]

Producers: AMVAC Chemical (USA); Certis USA (USA); Coromandel Fertilisers (India); Pbi/Gordon (USA); Pioneer Enterprise (India); United Agro Industries (India)

Chemical Class: Tetranortriterpenoid

EPA/OPP PC Code: 121701

California DPR Chemical Code: 2328

Uses: Azadirachtin is an extract of fruit from the Neem tree, which is largely grown in India. It is used as a commercial insect growth regulator that controls the metamorphosis process as the insect passes from the larva stage to the pupa stage. The Neem tree also yields extracts from its bark, leaves and wood that are used in medicine and cosmetics.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–225.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–4.46000 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Azadirachtin (40 CFR 180.1119):

CROP ppm

Raw agricultural commodities -

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or WARNING

Regulatory Authority:

- Actively registered pesticide in California.

Description: A yellow to amber viscous liquid. Characteristic odor. Molecular weight = 720.69. Melting/Freezing point = 155°C.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Producers: Bayer CropScience (Germany); Makhteshim Agan (Israel); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate

EPA/OPP PC Code: 058002

California DPR Chemical Code: 4053

RTECS Number: TD8400000

EINECS Number: 220-147-6

Uses: It is a non-systemic organophosphate insecticide and miticide with good ovicidal properties and long persistence. It is not registered for use in the U.S. Among other crops, it is used on cotton, citrus, vegetables, potatoes, tobacco, rice and cereals to control caterpillars, beetles, aphids, spiders and many other insects.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

WHO Acute Hazard: Class 1b, highly hazardous

Regulatory Authority:

- Banned or Severely Restricted (UN)⁽³⁵⁾
- Very Toxic Substance (World Bank)⁽¹⁵⁾
- AB 1803-Well Monitoring Chemical (CAL)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg)
- Superfund/EPCRA 40CFR302.4, Appendix A, RQ: EHS, 1 lb (0.454 kg)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Azinphos-ethyl is a colorless crystalline substance. Melting/Freezing point = 53°C. Boiling point = 111°C. Slightly soluble in water.

Incompatibilities: Strong oxidizers, strong acids.

Permissible Exposure Limits in Air: No standards set. However dusts or mists are poisonous.

Determination in Air: OSHA versatile sampler-2;

Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: The symptoms are similar to parathion. Nausea is often the first symptom followed by vomiting, abdominal cramps, diarrhea and excessive salivation. Also common in inhalation exposure are headache, giddiness, vertigo and weakness, nasal discharge and a sensation of tightness in the chest. Other symptoms include blurring or dimness of vision; tearing; eye muscle spasm and pain; pinpoint pupils; loss of muscle coordination; slurring of speech; muscle twitching (especially tongue and eyelids); difficulty in breathing; excessive secretions of mucous in mouth, nose, and respiratory tract; convulsions and coma. The systemic effects of this compound are similar to parathion. It is an extremely potent systemic toxicant via ingestion, inhalation and skin contact. It may cause death or permanent injury after very short exposure to small quantities. The LD₅₀ (oral, rat) = 7 mg/kg⁽⁹⁾. A cholinesterase inhibitor. Like similar organic phosphorus poisons, guthion-ethyl may act as an irreversible inhibitor of the enzyme cholinesterase. This enzyme allows the accumulation of large amounts of acetylcholine. Death can be caused when a critical level of cholinesterase depletion is reached. Recovery may be complete when the poisoned victim has had time to recover and regenerate cholinesterase. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous

system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting.** If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of

training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes*: Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Azinphos-methyl

Use Type: Insecticide and acaricide

CAS Number: 86-50-0

Formula: C₁₀H₁₂N₃O₃PS₂

Alert: Azinphos-methyl liquids with a concentration greater than 13.5% are classified as Restricted Use Pesticides (RUP).

Synonyms: Azinfos-methyl (Dutch); Azinphosmetile (Italian); Benzotriazine derivative of a methyl dithiophosphate; Benzotriazinedithiophosphoric acid dimethoxy ester; DBD; *S*-(3,4-Dihydro-4-oxobenzol[a][1,2,3]triazin-3-ylmethyl) *O,O*-dimethyl phosphorodithioate; *S*-(3,4-Dihydro-4-oxobenzol[d][1,2,3]triazin-3-ylmethyl) *O,O*-dimethyl phosphorodithioate; *S*-(3,4-Dihydro-4-oxo-1,2,3-benzotriazin-3-ylmethyl) *O,O*-dimethyl phosphorodithioate; Dimethoxy ester of (4-oxo-1,2,3-benzotriazin-3(4H)-yl)methyl ester of dithiophosphoric acid; *O,O*-Dimethyl-*S*-(1,2,3-benzotriazinyl-4-keto) methylphosphorodithioate; *O,O*-Dimethyl-*S*-(3,4-dihydro-4-keto-1,2,3-benzotriazinyl-3-methyl) dithiophosphate; *O,O*-Dimethyl-*S*-(4-oxo-1,2,3-benzotriazin-3(4H)-yl methyl)phosphorodithioate; Dimethyldithiophosphoric acid *N*-methylbenzazimide ester; *O,O*-Dimethyl-*S*-(4-oxo-3H-1,2,3-benzotriazine-3-methyl) phosphorodithioate; *O,O*-Dimethyl-*S*-(4-oxo-benzotriazino-3-methyl) phosphorodithioate; *O,O*-Dimethyl-*S*-(4-oxo-1,2,3-benzotriazino(3)-methyl) thiophosphorodithioate; *O,O*-Dimethyl-*S*-[(4-oxo-3H-1,2,3-benzotriazin-3-yl)-methyl]dithiophosphat (German); *O,O*-Dimethyl-*S*-oxo-1,2,3-benzotriazin-3-(4H)-yl-methyl phosphodithioate; Ent 23,233; 3-(Mercaptomethyl)-1,2,3-benzotriazin-4(3H)-one-*O,O*-dimethyl phosphorodithioate; 3-(Mercaptomethyl)-1,2,3-benzotriazin-4(3H)-one-*O,O*-dimethyl phosphorodithioate-*S*-ester; Methyl azinphos; *N*-methylbenzazimide, dimethyldithiophosphoric acid ester; Metil azinfos (Spanish); Metiltriazon (Russian); NCI-C00066

- Actively registered pesticide in California.
- EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg)
- EPCRA Section 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg)

Description: Colorless crystalline solid (pure) or brown waxy solid. Solubility in water; solubility = 29 mg/L @ 20°C. Molecular weight = 317.33. Density = 1.44 @ 20°C. Melting/Freezing point = 73°C. Vapor pressure = 2.0×10^{-7} mmHg; 0.53 mPa @ 20°C. Log K_{ow} = 2.78. Values of more than 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: May be dissolved in flammable solvent; containers may explode at elevated temperatures. Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin.

Permissible Exposure Limits in Air: The Federal NIOSH/OSHA⁽²⁾ value is 0.2 mg/m³ TWA with the notation "skin" indicating the potential for cutaneous absorption. The ACGIH value is the same, including "skin" notation⁽¹⁾. The DFG⁽³⁾ has set a MAK of 0.2 mg/m³ and Peak Limitation of 10 times normal MAK (30 min. average value; do not exceed during workshift). HSE⁽³³⁾ level is 0.2 mg/m³ and STEL value of 0.6 mg/m³. California, Australia, Mexico, and Israel values are 0.2 mg/m³ TWA. Israel set an Action Level of 0.1 mg/m³ TWA. Mexico's STEL is 0.6 mg/m³. Canadian Provincial: Alberta and British Columbia: 0.2 mg/m³ TWA and STEL of 0.6 mg/m³. Ontario and Quebec: 0.2 mg/m³ TWAEV. All regulatory authorities have warnings about skin absorption. The NIOSH⁽²⁾ IDLH level = 10 mg/m³. Because no useful data on acute inhalation toxicity are available concerning the toxic effects produced by azinphos-methyl, the chosen IDLH has been based on an analogy with parathion, which has an IDLH of 20 mg/m³. (NIOSH⁽²⁾)

Determination in Air: Collection by impinger or fritter bubbler, analysis by gas liquid chromatography. OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method (IV) #5600, Organophosphorus pesticides.⁽¹⁸⁾

Permissible Concentration in Water: For the protection of freshwater and marine aquatic life, a criterion of 0.01 µg/L has been suggested by EPA. For the protection of human health, a no-adverse effect level in drinking water has been calculated by NAS/NRC⁽⁴⁶⁾ as 0.088 mg/L. An allowable daily intake of 0.0125 mg/kg/day was calculated. Canada's maximum allowable concentration (MAC) in drinking water is 0.02 mg/L. The State of Maine⁽⁶¹⁾ has set a guideline of 25 µg/L for Azinphos-methyl in drinking water.

Determination in Water: Pesticide residue methods which should be applicable involve hydrolysis with KOH in isopropanol to give anthranilic acid which is diazotized and coupled to give a measurable color.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Symptoms include nausea, vomiting, diarrhea, excessive salivation, blurring of vision and other signs of

cholinesterase inhibition, loss of muscle coordination, twitching of muscles, confusion, difficulty breathing, convulsions, and death are observed with this organophosphate poison. The LD₅₀ (oral, rat) = 11 mg/kg. The acute toxicity rating is extremely toxic. Probable oral lethal dose in humans is 5-50 mg/kg. or between 7 drops and 1 teaspoon for a 70 kg (150 lb) person. This is a potent cholinesterase inhibitor which can cause death.

Lethal concentration data: Rat 69/1H*; Rat 79/1H**

*Newell & Dilley 1978; **Sanderson 1961.

Short Term Exposure: Exposure can cause rapid, fatal organophosphorus poisoning. Inhalation can irritate the lungs causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system causing weakness, "pins and needles," and poor coordination in arms and legs, with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Repeated exposure may cause personality changes of depression, anxiety, or irritability.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory

support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated

according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Producers: Gustafson (USA); Syngenta (Switzerland)

Chemical Class: Strobilin

EPA/OPP PC Code: 128810

California DPR Chemical Code: 4037

Uses: Azoxystrobin is a systemic, broad-spectrum fungicide that was first introduced in 1998. It inhibits spore germination and is used on grape vines, cereals, potatoes, apples, bananas, citrus, tomatoes and other crops. Largest crop uses in California are on almonds, rice, pistachios, wine grapes, raisins and garlic. Among the diseases it controls are rusts, downey and powdery mildew, rice blast and apple scab.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–1260.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–54.86655 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications**Label Signal Word:** CAUTION or WARNING**WHO Acute Hazard:** Class III, slightly hazardous**Routes of Entry:** Skin contact and inhalation**Harmful Effects and Symptoms****Short Term Exposure:** Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. May cause skin sensitization.**First Aid:** If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.**References:**

B

Barban (ANSI)

Use Type: Herbicide

CAS Number: 101-27-9

Formula: C₁₁H₉Cl₂NO₂

Synonyms: 2-Butynyl-4-chloro-*m*-chlorocarbanilate; Carbamic acid, 3-chlorophenyl-, 4-chloro-2-butynyl ester; Carbanilic acid, 3-chloro-, 4-chloro-2-butynyl ester; 4-Chloro-2-butynyl-(3-chlorophenyl)carbamate; CBN; (4-Chlor-but-2-in-yl)-*n*-(3-chlor-phenyl)-carbamate (German); Chlorinat; Chloro-2-butynyl-*m*-chlorocarbamate; 4-Chlorobut-2-ynyl-*m*-chlorocarbanilate; 4-Chloro-2-butynyl-*m*-chlorocarbanilate; 4-Chlorobut-2-ynyl-3-chlorophenylcarbamate; 4-Chloro-2-butynyl-*n*-(3-chlorophenyl)carbamate; *m*-Chloro carbanilic acid-4-chloro-2-butynyl ester; *n*-(3-Chlorophenyl)carbamate de 4-chloro-2-butynyle (French); (3-Chlorophenyl)carbamic acid 4-chloro-2-butynyl ester

Trade Names: A-980[®]; BARBAMATE[®]; BARBANE[®]; CARBIN[®]; CARBYNE[®]; Velsicol Chemical (USA) canceled 4/25/1986; CARYNE[®]; CS-847[®]; FISONS B25[®]; NEOBAN[®]; S-847[®]

Producers: Fisons, Ltd; Spencer Chemical (USA); Syngenta (Switzerland); Velsicol Chemical (USA)

Chemical Class: Carbamate

EPA/OPP PC Code: 017601

California DPR Chemical Code: 55

EINECS Number: 202-930-4

Uses: Not registered in the U.S. Used for post-emergence control of grasses and wild oats in barley, lentils, peas, lentils, sugar beets, wheat, sunflower and flax crops.

Fish toxicity (threshold)⁽⁷⁷⁾: Low-168.01099 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

Regulatory Authority:

- The "Director's List" (CAL/OSHA)
- AB 1803 Well Monitoring Chemicals (CAL)
- RCRA Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4

Description: A colorless, crystalline solid. Practically insoluble in water. Molecular weight = 258.11. Melting/Freezing point = 75°C. Vapor pressure = 3.8×10^{-7} mmHg.

Incompatibilities: May form explosive materials with phosphorus pentachloride. Contact with alkalis forms chlorine gas. Contact with acids forms β -chloroacrylic acid. When heated to decomposition, emits nitrogen oxides and chlorine fumes.

Permissible Concentration in Water: No criteria set.

Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion and inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Can cause contact dermatitis. Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15

minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Barium and Barium compounds

Use Type: Rodenticide and used in making other pesticides.

CAS Number: 7440-39-3

Formula: Ba

Synonyms: Bario (Spanish); Barium, elemental; Barium metal

Producers: Aisonschem (China); Ashland Specialty Chemical (USA); Alquimia Mexicana (Mexico); ATOFINA

(France); Barium & Chemicals (USA); Bayer (Germany); Chemical Products (USA); Clariant (Switzerland); Degussa-Huls (Germany); Gayatri Minerals & Chemicals (India); GFS Chemicals (USA); Merck (Germany); Solvay Barium Strontium (Germany)

Chemical Class: Inorganic metal

ICSC Number: 1052

RTECS Number: CQ8370000

EINECS Number: 231-149-1

Uses: Metallic barium is used for removal of residual gas in vacuum tubes and in alloys with nickel, lead, calcium, magnesium, sodium, and lithium. Barium compounds are used in the manufacture of lithopone (a white pigment in paints), chlorine, sodium hydroxide, valves, and green flares; in synthetic rubber vulcanization, x-ray diagnostic work, glassmaking, papermaking, beet-sugar purification, animal and vegetable oil refining. They are used in the brick and tile, pyrotechnics, and electronics industries. They are found in lubricants, pesticides, glazes, textile dyes and finishes, pharmaceuticals, and in cements which will be exposed to saltwater; and barium is used as a rodenticide, a flux for magnesium alloys, a stabilizer and mold lubricant in the rubber and plastics industries, an extender in paints, a loader for paper, soap, rubber, and linoleum, and as a fire extinguisher for uranium or plutonium fires.

- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%.
- Canada MAC for drinking water quality: 1.0 mg/L
- Mexico, Drinking Water 1.0 mg/L

Description: Barium, Ba, a flammable, silver white or yellowish metal in various forms including powder. Barium may ignite spontaneously in air in the presence of moisture, evolving hydrogen. Density = 3.6. Melting/Freezing point = 725°C. Boiling point = 1640°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 3. The primary sources are the minerals barite (BaSO₄) and witherite (BaCO₃).

Incompatibilities: Barium powder may spontaneously ignite on contact with air. It is a strong reducing agent and reacts violently with oxidizers and acids. Reacts violently with fire extinguishing agents including water, bicarbonate, powder, foam, and carbon dioxide. The reaction with water, forms combustible hydrogen gas and barium hydroxide. Reacts violently with halogenated hydrocarbon solvents, causing fire and explosion hazard.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard and ACGIH⁽¹⁾ recommended airborne limit for soluble barium compounds is 0.5 mg/m³ TWA for an 8-hour workshift⁽¹⁾. The NIOSH⁽²⁾ level is the same for a 10-hour workshift. The DFG⁽³⁾, HSE⁽³³⁾, Australia, Mexico, and Israel have adopted this same value and DFG has a Peak Limitation (5 min.) of 2 times normal MAK⁽³⁾; do not exceed more than 8 times during workshift. Israel's Action Level is one half the TWA. The NIOSH⁽²⁾ IDLH level = 50 mg/m³ (Ba, soluble compounds). In addition, several states have set guidelines or standards for barium in ambient air⁽⁶⁰⁾ ranging from 0.67 µg/m³ (New York) to 5.0 µg/m³ (Florida and North Dakota) to 8.0 µg/m³ (Virginia) to 10.0 µg/m³ (Connecticut) to 12.0 µg/m³ (Nevada).

Determination in Air: Filter; Water; Flame atomic absorption spectrometry; NIOSH Methods (IV) #7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. See NIOSH Method #8310⁽¹⁸⁾.

Permissible Concentration in Water: EPA allows 2 parts of barium per million parts of drinking water (2 ppm). See Regulatory Authority for Canadian and Mexican levels. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 4.0 mg/L in water bodies used for domestic purposes. Also, these states have set standards for barium in drinking water⁽⁶¹⁾: a standard of 100 µg/L in Massachusetts and guidelines of 1000 µg/L in Maine and 1500 µg/L in Minnesota.

Determination in Water: Conventional flame atomization does not have sufficient sensitivity to determine barium in most water samples; however, a barium detection limit of 10 µg/L can be achieved, if a nitrous oxide flame is used. A concentration procedure for barium uses thenoyltrifluoroacetone-methylisobutylketone extraction at a pH of 6.8.

With a tantalum liner insert, the barium detection limit of the flameless atomic absorption procedure can be improved to 0.1 µg/L according to NAS/NRC⁽⁴⁶⁾.

Routes of Entry: Ingestion or inhalation of dust or fume, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: Alkaline barium compounds, such as the hydroxide and carbonate, may cause local irritation to the eyes, nose, throat, and skin.

Long Term Exposure: Barium poisoning is virtually unknown in industry, although the potential exists when the soluble forms are used. When ingested or given orally, the soluble, ionized barium compounds exert a profound effect on all muscles and especially smooth muscles, markedly increasing their contractility. The heart rate is slowed and may stop in systole. Other effects are increased intestinal peristalsis, vascular constriction, bladder contraction, and increased voluntary muscle tension. The inhalation of the dust of barium sulfate may lead to deposition in the lungs in sufficient quantities to produce "baritosis" (a benign pneumoconiosis). This produces a radiologic picture in the absence of symptoms and abnormal physical signs. x-rays, however, will show disseminated nodular opacities throughout the lung fields, which are discrete, but sometimes overlap.

Points of Attack: Heart, lungs, central nervous system, skin, respiratory system and eyes.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If a soluble barium compound gets into the eyes, remove any contact lenses at once and irrigate immediately. If a soluble barium compound contacts the skin, flush with water immediately. If a person breathes in large amounts of a soluble barium compound, move the exposed person to fresh air at once and perform artificial respiration. When a soluble barium compound has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Benazolin Ethyl

Use Type: Herbicide

CAS Number: 25059-80-7

Synonyms: Ethyl 4-chloro-2-oxo-3(2H)-benzothiazoleacetate; 4-Chloro-2-oxo-3(2H)-benzothiazoleacetic acid, ethyl ester; 3(2H)-Benzothiazoleacetic acid, 4-chloro-2-oxo-, ethyl ester

Producers: Anhui Huaxing Chemical Industry Co., Ltd. (China); SuYan Agrochemical Group (China)

EPA/OPP PC Code: 126801

Uses: Not registered in the U.S.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class U, unlikely to be hazardous (as benazolin)

Incompatibilities: Acetates are generally incompatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Bendiocarb (ANSI)

Use Type: Insecticide

CAS Number: 22781-23-3

Formula: C₁₁H₁₃NO₄

Alert: The use of all bendiocarb products in the United

States was canceled at the end of December, 2001, because of the potential of acute and subacute toxicity and cholinesterase inhibition.

Synonyms: AI3-27695; Bencarbate; Bendiocarbe; 1,3-Benzodioxole, 2,2-dimethyl-1,3-benzodioxol-4-ol methylcarbamate; 2,2-Dimethyl-4-(N-methylaminocarboxylato)-; 1,3-Benzodioxole, 2,2-dimethyl-4-(N-methylcarbamato)-; 1,3-Benzodioxol-4-ol, 2,2-dimethyl-,methylcrbamate; Bicom ULV; Carbamic acid, methyl-, 2,3-(isopropylidenedioxy)phenyl ester; Carbamic acid, methyl-, 2,3-(dimethylmethylenedioxy)phenyl ester; 2,2-Dimethyl-1,3-benzodioxol-4-yl-N-methylcarbamate; 2,2-Dimethylbenzo-1,3-benzodioxol-4-yl-N-methylcarbamate; 2,2-Dimethyl-4-(N-methylaminocarboxylato)-1,3-benzodioxole; 2,2-Dimethylbenzo-1,3-dioxol-4-yl methylcarbamate; 2,3-Isopropylidene-dioxyphenyl methylcarbamate; Methylcarbamic acid 2,3-(isopropylidenedioxy)phenyl ester

Trade Names: BENCARBATE®; DYCARB®, Scotts Company (USA), canceled; FICAM®, Bayer CropScience (USA), canceled 10/31/2000; FICAM 80W®; FICAM ULV®; FUAM®; GARVOX®, AgrEvo France; MC 6897®; MULTAMAT®; MULTIMET®; NC 6897®; NIOMIL®; OMS-1394®; ROTATE®; SEEDOX®; TATTOO®; TURCAM®

Producers: BASF (Germany); Bayer CropScience (Germany); NOR-AM Chemical (USA), see Bayer CropScience (Germany); Roussel Uclaf (France); Sigma-Aldrich Laborchemikalien (Germany); Zago Asia Ltd. (Singapore)

Chemical Class: N-Methyl Carbamate

EPA/OPP PC Code: 105201

California DPR Chemical Code: 1924

RTECS Number: FC1140000

Uses: Used against pests in the home, industrial sites and food storage sites; in agriculture as a seed treatment and as a foliar spray. It is used against insects in the soil, such as snails and slugs.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–35.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low–379.47332 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Bendiocarb (40 CFR 180.530):

CHEM.	CROP	ppm
Bendiocarb	ANIMAL FEED	–
Bendiocarb	PROCESSED FOOD	–

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely carcinogenic.

TRI Developmental Toxin: Reproductive and developmental toxin.

WHO Acute Hazard: Class II, moderately hazardous

Regulatory Authority:

- EPA Hazardous Waste Number (RCRA No.): U278

- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
- Actively registered pesticide in California.
- RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%.
- U.S. DOT 49CFR172.101, Appendix B, Regulated marine pollutant
- Canada: Drinking Water Quality Level Set

Description: Bendiocarb is a white odorless crystalline powder. Melting/Freezing point = 129–130°C. Slightly soluble in water.

Incompatibilities: Keep away from flammable materials and sources of heat and flame. Should not be mixed with alkaline preparations.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: Canada's Drinking Water Quality is 0.04 mg/L MAC.

Routes of Entry: Inhalation, skin, contact and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Bendiocarb is a toxic carbamate chemical. Bendiocarb can affect you when inhaled. Exposure can cause rapid poisoning, with headaches, sweating, nausea and vomiting, diarrhea, loss of concentration and death. Eye contact can cause irritation and blurred vision.

Medical Surveillance: Before starting work, at regular times after that, and if symptoms develop or over exposure occurs, the following is recommended: Serum and RBC cholinesterase levels (a test for the body substance affected by Bendiocarb). For this substance, these tests are accurate only if done within about two hours of exposure, and can return to normal before the person feels well.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Benefin

Use Type: Herbicide

CAS Number: 1861-40-1

Formula: C₁₃H₁₆F₃N₃O₄

Synonyms: Benfluralin; Benfluraline; Benzenamine, *N*-Butyl-*N*-ethyl-2,6-dinitro-4-(trifluoromethyl)-; *N*-Butyl-2,6-dinitro-*N*-ethyl-4-trifluoromethylaniline; *N*-Butyl-*N*-ethyl-2,6-dinitro-4-trifluoromethylbenzenamine; *N*-Butyl-*N*-ethyl-2,6-dinitro-4-(trifluoromethyl)benzenamine; *N*-Butyl-*N*-ethyl-2,6-dinitro-4-trifluoromethylaniline; *N*-Butyl-*N*-ethyl- α,α,α -trifluoro-2,6-dinitro-*p*-toluidine; Caswell No. 130; *p*-Toluidine, *N*-butyl-*N*-ethyl- α,α,α -trifluoro-2,6-dinitro-; α,α,α -Trifluoro-2,6-dinitro-*N,N*-ethylbutyl-*p*-toluidine

Trade Names: BALAN[®], Dow AgroSciences (USA); BALFIN[®]; BENEFEX[®], Makhteshim-Agan Industries (Israel); BETHRODINE[®]; BHULAN[®]; BINNELL[®]; BONALAN[®]; CARPIDOR[®]; EL-110[®], Dow AgroSciences (USA); EMBLEM[®]; FLUBALEX[®]; PEL-TECH[®]; QUILAN[®]; TEAM; XL 2G

Producers: Dow AgroSciences (USA); Makhteshim-Agan Industries (Israel)

Chemical Class: Organofluorine

EPA/OPP PC Code: 084301

California DPR Chemical Code: 53

RTECS Number: XU4550000

EINECS Number: 217-465-2

Uses: Selective pre-emergence herbicidal control of annual grasses and broad-leaf weeds. Used on alfalfa, red clover, seeded lettuce, trefoil; peanuts, certain tobaccos, vegetables such as endive, field and French beans and lentils.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–2100.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–3.08219 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Benfluralin (40 CFR 180.208):

CROP	ppm
Alfalfa, forage	0.05
Alfalfa, hay	0.05
Clover, forage	0.05
Clover, hay	0.05
Lettuce	0.05
Peanut	0.05

Trefoil, birdsfoot, forage 0.05

Trefoil, birdsfoot, hay 0.05

Carcinogen/Hazard Classifications

Label Signal Word: WARNING or CAUTION

TRI Developmental Toxin: Reproductive toxin as dinitrobenzene isomer

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL)
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Description: Yellow-orange crystalline solid. Molecular weight = 335.31. Melting/Freezing point = 66°C. Vapor pressure = 1×10^{-4} mmHg @ 20°C. Solubility = 70 mg/L @ 25°C; <1 mg/L @ 25°C. Log K_{ow} = 4.67. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Absorbed through the skin, inhalation of the dust or vapor when these materials are heated.

Harmful Effects and Symptoms

Short Term Exposure: Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, yellowish tint to skin and lips, anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmia is commonly noted. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. Severe exposure can cause death from heart failure. LD₅₀ (rat oral) = 10,000 mg/kg. Dinitrobenzene materials are toxic to the blood; prevents hemoglobin from carrying oxygen. May be more toxic than aniline.

Long Term Exposure: May damage the liver, kidneys and blood cells. May stain yellow the skin, eyes, and fingernails. Repeated exposure can cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss and cataracts in the eyes. May affect the thyroid gland.

Points of Attack: Skin, liver, kidneys, lungs, peripheral nervous system, eyes, thyroid gland, blood.

Medical Surveillance: Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: Exam of eyes for cataracts. Exam of skin and nails for staining. Liver and kidney function tests. Complete blood count. Blood methemoglobin levels.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Benfuracarb

Use Type: Insecticide and nematocide

CAS Number: 82560-54-1

Formula: C₂₀H₃₀N₂O₅S

Synonyms: β -Alanine, *N*-[(((2,3-dihydro-2,2-dimethyl-7-benzofuranyl)oxy)carbonyl)methylamino)thio]-*N*-(1-methylethyl)-, ethyl ester; Aminofuracarb; Aminosulfuran; Benfuracarb; 2,3-Dihydro-2,2-dimethyl-7-benzofuranyl *N*-(*N*-2-(ethoxycarbonyl)ethyl-*N*-isopropylaminosulfenyl)-*N*-methylcarbamate; Ethyl *N*-(2,3-dihydro-2,2-dimethylbenzofura-7-yloxy)carbonyl(methyl)aminothio)-*N*-isopropyl- β -alaninate; Ethyl [(((2,3-dihydro-2,2-dimethyl-7-benzofuranyl)oxy)carbonyl)methylamino)thio]-*N*-(1-methylethyl)- β -alanine

Trade Names: FURACON[®]; OC-11588[®]; OK 174[®]; ONCOL[®]. Otsuka Chemical (USA), Whyte Agrochemicals (UK); ONCOL 5G[®]. Otsuka Chemical (USA), Whyte Agrochemicals (UK)

Producers: Otsuka Chemical (USA); Whyte Agrochemicals (UK); Zhejiang Chem-tech Group Co., Ltd. (China)

Chemical Class: Carbamate

EPA/OPP PC Code: 123201

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class II, moderately hazardous

Description: Molecular weight = 410.58

Incompatibilities: May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion and skin absorption

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision;

eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison

control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup.

Inhalation: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Proposition 65 chemical (CAL)

- U.S. DOT 49CFR172.101, Appendix B, Regulated marine pollutant

Description: White crystalline solid. Faint acid odor. Slightly soluble in water; solubility = 1.8 ppm @ 25°C; also listed at 3.8 ppm (no temperature). Molecular weight = 290.42. Melting/Freezing point = >572°F (decomposes). Boiling point = decomposes. Vapor pressure = <1 x 10⁻¹⁰ mmHg. Log K_{ow} = < 2.5. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Strong bases [forms toxic oxides of nitrogen], strong acids, peroxides and oxidizers.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ standard is 10 mg/m³ TWA for benomyl dust and 5 mg/m³ TWA for the respirable fraction. California has set the same TWAs. ACGIH has set a TWA of 0.8 ppm (10 mg/m³) but no STEL⁽¹⁾. The HSE⁽³³⁾ has set the same TWA plus a STEL of 1.3 ppm (15 mg/m³). The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a tentative safe exposure limit in the workplace of 0.01 mg/m³. In addition, The former USSR has set⁽³⁵⁾ a limit in ambient air of 0.35 mg/m³ on a once-a-day basis and 0.05 mg/m³ on an average daily basis. Several states have set guidelines or standards for benomyl in ambient air⁽⁶⁰⁾ ranging from 100 µg/m³ (North Dakota and Virginia) to 200 µg/m³ (Connecticut) to 238 µg/m³ (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH IV⁽¹⁸⁾ [Particulates NOR; #0500 (total), #0600 (respirable)]

Permissible Concentration in Water: The former USSR has set a MAC in surface water of 0.5 mg/L of benomyl⁽³⁵⁾.

Routes of Entry: Inhalation

Harmful Effects and Symptoms

Short Term Exposure: The substance irritates the skin eyes and upper respiratory system. Exposure could cause depression of the central nervous system and lack of muscular coordination.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Human mutation data reported. Also experimental and reproductive effect. May damage the male reproductive system; cause heritable genetic damage in humans. Animal tests show that this substance possibly cause birth defects in human babies, miscarriage, or cancer. Benomyl is generally felt to have a low order of acute and chronic toxicity⁽⁵³⁾. However, a rebuttable presumption against registration for benomyl was issued on December 6, 1978 by U.S. EPA on the basis of reduction in nontarget species, mutagenicity, teratogenicity, reproductive effects, and hazard to wildlife. The ADI for man is 0.02 mg/kg⁽²³⁾.

Points of Attack: Eyes, skin, respiratory system, reproductive system

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely a carcinogen

Label Signal Word: CAUTION or WARNING

WHO Acute Hazard: Class II, moderately hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- U.S. Dot Inhalation Hazard Chemicals as organophosphates

Description: Amber, viscous liquid, or forms colorless or white crystalline solid below 34.4°C. Practically insoluble in water; solubility = 0.0025 g/ml @ 20°C. Molecular weight = 397.49. Insoluble and sinks in water. Density =

1.25 @ 22°C. Molecular weight = 397.54. Melting/Freezing point = 34°C. Vapor pressure = 8×10^{-7} mmHg; 0.53 mPa @ 20°C. Log K_{ow} = 4.2. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Incompatibilities: Corrosive to copper, aluminum, magnesium, zinc. Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Permissible Exposure Limits in Air:

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV⁽¹⁸⁾, Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin contact, passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Do not drink any alcoholic beverages before or during use; alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the

bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can

reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Bentazon (ANSI)

Use Type: Selective post-emergent herbicide.

CAS Number: 25057-89-0

Formula: C₁₀H₁₂N₂O₃S

Alert: A General Use Pesticide (GUP)

Synonyms: 1*H*-2,1,3-Benzothiadiazin-4(3*H*)-one, 3-(1-methylethyl)-, 2,2-dioxide (9CI); 1*H*-2,1,3-Benzothiadiazin-4(3*H*)-one, 3-isopropyl-, 2,2-dioxide (8CI); 3-Isopropyl-1*H*-2,1,3-benzothiadiazin-4(3*H*)-one-2,2-dioxide; 3-Isopropyl-1*H*-benzo-2,1,3-thiadiazin-4-one-2,2-dioxide; 3-Isopropyl-2,1,3-benzothiadiazinon-(4)-2,2-dioxid (German); 3-Isopropyl-1*H*-2,1,3-benzothiadiazin-4(3*H*)-one-2,2-dioxide; 3-(1-Methylethyl)-1*H*-2,1,3-benzothiazain-4(3*H*)-one-2,2-dioxide

Trade Names: ASAGIO®; BAS 351-H®; BASAGRAN®, BASF Agricultural Products Group (Germany); BENDIOXIDE®; BENTA®; BENTAZONE®; BLAST®, Veterinary & Agricultural Products Manufacturing Co., Ltd. (VAPCO) (Jordan); ENTRY®, LADDOK®, BASF Agricultural Products Group (Germany); LEADER®, PLEDGE®, STORM®

Producers: Agrimor International (USA); Agsin (Singapore); BASF Agricultural Products (Germany); Ehrenstorfer, Dr.(Germany); Kunshan Chemical Group (Industries) Corp. (China); Sevencontinent Agrichemical Co., Ltd. (China); Shenzhen Guomeng Industry Co., Ltd. (China); Sigma-Aldrich Laborchemikalien (Germany); Syngenta (Switzerland); Veterinary & Agricultural Products Manufacturing Co., Ltd. (VAPCO) (Jordan)

Chemical Class: Unclassified

EPA/OPP PC Code: 275200

California DPR Chemical Code: 2999 (Bentazon); 1944 (Bentazon, sodium salt)

ICSC Number: 0828

RTECS Number: DK9900000

EEC Number: 613-012-00-1

Uses: A post-emergence herbicide used to control broadleaf weeds in crops such as beans, corn, mint, soybeans, rice, and peanuts. All products marketed in the U.S. contain the sodium salt of bentazon as the active ingredient, referred to as sodium bentazon. Also used in selective post-emergent control of broadleaf weeds and sedges in alfalfa, asparagus, cereals, clover, digitalis, dry peas, flax, garlic, grasses, green lima beans, mint, onions, potatoes, snap beans for seed, sorghum, soybeans and sugarcane.

U.S. Maximum Allowable Residue Levels for Bentazon (40 CFR 180.355):

CROP	ppm
Bean, dry, seed	0.05
Bean, succulent	0.5
Cattle, meat, mby	0.05
Cattle, mby	0.05

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, Unlikely

Label Signal Word: CAUTION

WHO Acute Hazard: Class III

Regulatory Authority:

- Safe Drinking Water Act, 55FR1470 Priority List
- AB 1803-Well Monitoring Chemical (CAL)
- MCL(Maximum Contaminants Levels) list of contaminants (CAL)
- The "Director's List" (CAL/OSHA)

Description: Bentazon is a colorless crystalline powder. Soluble in water; solubility = 490 ppm @ 20°C. Molecular weight = 240.28. Melting/Freezing point = 137-139°C. Boiling point = 200°C (decomposes). Vapor pressure = 0.53 mPa @ 20 °C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Log K_{ow} = -0.47. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Keep away from flammable materials, heat and flame. Risk of fire and explosion if formulations contain flammable/explosive solvents.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: A no-observed adverse effect level (NOAEL) of 2.5 mg/kg/day has been determined by EPA based on the absence of prostatic effects in dogs. This led to the determination of a longer-term health advisory of 0.875 mg/L for a 70-kg adult. It also led to the establishment of a lifetime health advisory of 0.0175 mg/L. In addition, California⁽⁶¹⁾ has set a guideline in drinking water of 8.0 µg/L.

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: The LD₅₀ (oral, rat) = 1100 mg/kg which puts in the “slightly toxic” category. Avoid eye contact; may cause severe irritation or injury. May cause skin burns.

Long Term Exposure: May be a reproductive hazard.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

6-Benzaldenine

Use Type: Plant growth regulator

CAS Number: 1214-39-7

Formula: C₁₂H₁₁N₅

Synonyms: Adenine, *N*-benzyl-; 6-BAP; BAP; Benzyladenine; *N*-Benzyladenine; *N*⁶-Benzyladenine; Benzylaminopurine; *N*⁶-(Benzylamino)purine; 6-(Benzylamino)purine; 6-(*N*-Benzylamino)purine; *N*-

(Phenylmethyl)-1*H*-purin-6-amine; 1*H*-Purin-6-amine, *N*-(phenylmethyl)-; Promalin, component of (with Gibberellin D); Verdan senescence inhibitor

Trade Names: ABG[®] 3034; ACCEL[®], Valent BioSciences Corporation (USA); AGTROL[®], Nufarm (Australia); 6-BA[®], Nufarm (Australia); BA[®] (growth stimulant); CHRYSAL BVB[®]; EXILIS[®], Fine Agrochemicals(UK); PERLAN[®], Fine Agrochemicals (UK); PROMALIN[®], Valent BioSciences Corporation (USA); SD[®] 4901; SQ[®] 4609

Producers: Fine Agrochemicals(UK); Fluorochem (UK); Lancaster Synthesis (UK); Nufarm (Australia); Valent BioSciences Corporation (USA)

EPA/OPP PC Code: 116901

California DPR Chemical Code: 2000 (*N*⁶-Benzyladenine)

EINECS Number: 214-927-5

Uses: A plant growth regulator used to lengthen and enhance the shape of apples and to increase the fruit set in pears. It increases the yield of pistachios and tomatoes.

Carcinogen/Hazard Classifications

Label Signal Word: WARNING, CAUTION or DANGER, depending on formulation

Regulatory Authority:

- Actively registered pesticide in California.

Description: Molecular weight = 225.28

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Benzoic Acid

Use Type: Fungicide and insecticide

CAS Number: 65-85-0

Formula: C₇H₆O₂; C₆H₅COOH

Synonyms: Acide benzoïque (French); Acido benzoico (Spanish); Benzenecarboxylic acid; Benzeneformic acid; Benzenemethanoic acid; Benzoate; Benzoësäure (German); Carboxybenzene; Carboxylbenzene; Dracyclic acid; Oracylic acid; Phenyl carboxylic acid; Phenylformic acid

Trade Names: RETARDER BA[®]; TENN-PLAS[®]; RETARDEX[®]; SALVO LIQUID[®]; SALVO POWDER[®]

Producers: ATOFINA (France); Bayer Group (Germany); China Chemical (China); Cia. Quimica Universal de Industrias (Mexico); DSM Fine Chemicals (Netherlands); EniChem (Italy); Gayatri Minerals & Chemicals (India); GFS Chemicals; Gwalior Chemicals Industries (India); Merck (Germany); Penta Manufacturing (USA); Reilly Industries; TCI America (USA); Total Specialty Chemicals (USA), see ATOFINA (France); Varsal Instruments; Velsicol Chemical Corporation (USA)

Chemical Class: Benzoic Acid

EPA/OPP PC Code: 009101

California DPR Chemical Code: 1329

ICSC Number: 0103

RTECS Number: DG0875000

EINECS Number: 200-618-2

Uses: Used in the manufacture of benzoates; plasticizers, benzoyl chloride, alkyd resins, in the manufacture of food preservatives, in use as a dye binder in calico printing; in curing of tobacco, flavors, perfumes, dentifrices, standard in analytical chemistry.

U.S. Maximum Allowable Residue Levels for Benzoic Acid (40 CFR 180.482):

CROP	ppm
Apple	1.0
Walnut	0.1

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, unclassifiable, inadequate data

Regulatory Authority:

- Water Pollution Standard Proposed (former USSR)⁽³⁵⁾
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 5,000 lb (2270 kg)
- Canada, WHMIS, Ingredients Disclosure List

Description: White crystalline solid, flakes, or powder. Faint, pleasant odor. Highly soluble in water; sinks and dissolves; solubility 3.1 x 10³ ppm. Molecular weight = 122.13. Melting/Freezing point = 122.4°C. Boiling point = 249°C. Flash point of 121°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Log K_{ow} = < 1.90 @ 20°C. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Incompatible with strong oxidizers, caustics, ammonia, amines, isocyanates.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: The former USSR has proposed a MAC of 0.6 mg/Liter in surface water⁽³⁵⁾.

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritating to skin, eyes (possibly severe), and mucous membranes. Skin contact may cause irritation, skin rash, or burning feeling on contact. Ingestion causes nausea and G.I. troubles. For most people, ingestion of 1/10 to 2/10 ounce will have no effect although some sensitive people may experience allergic reactions. Larger amounts may cause stomach upset. Information from animal studies show that about 6 ounces may be lethal to a 150 pound person. LD₅₀ = 1700 mg/kg (rat, oral).

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Mutation data reported.

Points of Attack: Skin, eyes, and mucous membranes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Benzyl Alcohol

Use Type: Insecticide and fungicide

CAS Number: 100-51-6

Formula: C₇H₈O

Synonyms: Alcohol bencilico (Spanish); Benzenecarbinol; Benzenemethanol; α -Hydroxytoluene; Methanol, phenyl-; NCI-C06111; Phenylcarbinol; Phenylmethanol; Phenylmethyl alcohol; α -Toluenol

Trade Names: BENATOL[®]; BENTALOL[®]; EUXYL[®]-K-100; BENZYLICUM[®]

Producers: ATOFINA Chemicals (France); Bayer Chemicals (Germany); DSM Fine Chemicals (Netherlands); Gayatri Minerals & Chemicals (India); BP Chemicals (UK); Interstate Chemical (USA); Mallinckrodt Baker (USA); Rhone-Poulenc (France); Richman Chemical (USA); Tessengerlo (Belgium); Tokyo Ohka Kogyo (Japan); Velsicol Chemical Corporation (USA)

Chemical Class: Simple aromatic alcohol

EPA/OPP PC Code: 009502

California DPR Chemical Code: 915

ICSC Number: 0833

EEC Number: 603-057-00-5

EINECS Number: 202-859-9

Uses: Used as a solvent, degreaser, photographic developer, filament dying agent and chemical intermediate. It can also relieve itching.

Regulatory Authority:

- Actively registered pesticide in California.

Description: Combustible, clear, colorless liquid. Faint, pleasant odor. Sharp, burning taste. Moderately soluble in water; solubility = 1 gm/25 ml; 40,000 ppm @ 17°C. Molecular weight = 108.14. Density = 1.0454 @ 20°C. Boiling point @ 1 atm = 205°C. Melting/Freezing point = -15°C. Vapor pressure = 0.15 mmHg @ 25°C. Flash point = 104°C (oc); 101°C (cc); Hazard Identification (based on NFPA-704 M Rating System): Health Hazards (Blue): 2; Flammability (Red): 1; Reactivity (Yellow): 0. Log K_{ow} = 1.11. Unlikely to bioaccumulate in aquatic organisms.

Incompatibilities: Strong reactions with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids, bases, aliphatic amines, isocyanates.

Permissible Exposure Limits in Air:

Determination in Air: Collection by charcoal tube, 2-Butanol/CS₂; analysis by gas chromatography/flame ionization detection; NIOSH (IV). Method #1400, Alcohols I⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Toxic to aquatic organisms. Runoff from spills or fire control may cause water pollution.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Bifenox (ANSI)

Use Type: Herbicide

CAS Number: 42576-02-3

Formula: C₁₄H₉Cl₂NO₅

Synonyms: Benzoic acid, 5-(2,4-dichlorophenoxy)-2-nitro-, methyl ester; 5-(2,4-Dichlorophenoxy)-nitrobenzoic acid, methyl ester; 2,4-Dichlorophenyl 3-(methoxycarbonyl)-4-nitrophenyl ether; Methyl 5-(2,4-dichlorophenoxy)-2-nitrobenzoate

Trade Names: MODOWN[®], Bayer CropScience (Germany), canceled; MC-4379[®], Aventis (France) and Bayer CropScience (Germany)

Producers: Aventis (France); Bayer CropScience (Germany)

Chemical Class: Chlorophenoxy; diphenyl ether; nitrophenyl ether herbicide

EPA/OPP PC Code: 104301; (285200 old EPA code number)

California DPR Chemical Code: 1953

Uses: Not registered in the U.S. Used to control a variety of broadleaf weeds and grasses in legumes such as soybeans and peanuts, and post emergent weed control in wheat, barley and sugar beets. The Japan Food Chemical Research Foundation has established Maximum Residue Limits for bifenox of 0.1 ppm for rice, wheat, barley and other cereal grains; and 0.05 for potatoes.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or DANGER

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides
- The "Director's List" (CAL/OSHA) as chlorophenoxy pesticides

Description: Yellow to beige crystalline powder. Practically insoluble in water. Molecular weight = 342.22. Vapor pressure = Very low.

Incompatibilities: Strong oxidizers. When heated to decomposition, emits nitrogen oxides and chlorine gas.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin/eyes contact.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years.

Long Term Exposure: Workers exposed to chlorophenoxy compounds such as 2,4-D (in the manufacturing process) over a five to ten year period at levels above 10 mg/m³ complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affect human reproduction.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidney

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Carcinogen/Hazard Classifications**U.S. EPA Carcinogens:** Group C, possible carcinogen**Label Signal Word:** CAUTION or WARNING**TRI Developmental Toxin:** Reproductive toxin**WHO Acute Hazard:** Class II, moderately hazardous**Endocrine Disruptor:** Suspected**Regulatory Authority:**

1. EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
2. EPA 40 CFR 372.65, Specific Toxic Chemical Listings
3. Actively registered pesticide in California.

Description: Thick, dark yellow to light brown oily liquid. Practically insoluble in water; solubility = < 0.1 mg/L. Melting/freezing point = 57-63°C. Vapor pressure = 1.8×10^{-7} mmHg.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds.

Mixture with some silver compounds forms explosive salts of silver oxalate.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chemical Class: Dinitrophenyl

EPA/OPP PC Code: 012201

California DPR Chemical Code: 73

ICSC Number: 0835

RTECS Number: GQ5600000

EEC Number: 609-024-00-1

Uses: Not registered in the U.S.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen as dinoseb, the parent chemical

California Prop. 65: Developmental toxin and male reproductive toxin, as dinoseb, the parent chemical.

U.S. TRI: Developmental and reproductive Toxin, as dinoseb, the parent chemical

Regulatory Authority:

- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA); Section 307 Toxic Pollutants as nitrophenols.
- EPCRA Section 304 RQ: CERCLA, 100 lb (45.4 kg) as nitrophenols.
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant

Description: Binapacryl is the dimethyl acrylic ester of Dinoseb. Colorless, crystalline solid or powder. Crystals may turn pale-yellow to brownish on contact with air. Practically insoluble in water. Mild, ammonia odor. Molecular weight = 322. Density = 1.23 @ 20°C. Melting/Freezing = 66°C. Vapor pressure = 4.2×10^{-7} mmHg @ 20°C. Log K_{ow} = 4.72. Values above 3.0 are likely to bioaccumulate in marine organisms. See also Dinoseb.

Incompatibilities: Slight hydrolysis on long contact with water. Keep away from caustics and concentrated acids that can cause decomposition. Slowly decomposed by ultraviolet light

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. To protect freshwater aquatic life—230 µg/L on an acute toxicity basis for nitrophenols as a class. To protect saltwater aquatic life 4,850 µg/L on an acute toxicity basis for nitrophenols as a class. To protect human health—70.0 µg/L⁽⁶⁾.

Determination in Water: Filter/Bubbler; 2-Propanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH II⁽⁵⁾ Method #S166⁽¹⁸⁾. Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection. EPA Method 604, or gas chromatography plus mass spectrometry EPA Method 625.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, yellowish tint to skin and lips, anxiety and confusion, convulsions, risk of lung edema. The effects may be delayed. Medical observation is recommended. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Severe exposure can cause death from heart failure.

Long Term Exposure: May damage the liver, kidneys and blood cells. May stain yellow the skin, eyes, and fingernails. Repeated exposure can cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss and cataracts in the eyes.

Points of Attack: Skin, liver, kidneys, lungs, peripheral nervous system, eyes, thyroid gland, blood.

Medical Surveillance: Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: Exam of eyes for cataracts. Exam of skin and nails for staining. Blood tests for dinitro-*o*-cresol. Persons with blood levels over 10 ppm (10 mg/L) should be kept away from further exposure until levels return to normal. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Biphenyl

Use Type: Fungicide

CAS Number: 92-52-4

Formula: C₁₂H₁₀; C₆H₅C₆H₅

Synonyms: Bibenzene; 1,1'-Biphenyl; Dibenzene; Diphenyl; 1,1'-Diphenyl; Phenylbenzene; PHPH; Xenene

Trade Names: LEMONENE[®]; PHENADOR-X[®]

Producers: Bayer (Germany); Koch Specialty Chemicals (USA; Rhodia (France); Sumika Fine Chemicals (Japan); Wuzhou International (China)

Chemical Class: Unclassified

EPA/OPP PC Code: 017002

California DPR Chemical Code: 227

ICSC Number: 0106

RTECS Number: DU8050000

EEC Number: 601-042-00-8

EINECS Number: 202-163-5

Uses: Biphenyl is used in household disinfectants and also as a heat transfer agent and as an intermediate in organic synthesis.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, Unclassifiable, insufficient data

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (DFG)⁽³⁾ HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ Australia) (Israel) (Mexico) (Several Canadian Provinces)
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%.
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI)

Description: White flakes or crystalline solid. Pleasant, characteristic odor. Practically insoluble in water; solubility = 8 ppm @ 25°C. Molecular weight 154.23. Melting/Freezing point = 69–70°C. Boiling point = 256°C.

Flash point = 113°C. Autoignition temperature = 540°C. Explosive limits in air: LEL = 0.6%, UEL = 5.8%⁽¹⁷⁾. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Log K_{ow} = 3.4. Values at or above 3.0 may bioaccumulate in marine organisms.

Incompatibilities: Mist forms explosive mixture with air. Strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air: The Federal OSHA⁽²⁾ PEL and NIOSH⁽²⁾ recommended standard is 0.2 ppm (1 mg/m³)TWA. The ACGIH TLV is 0.2 ppm (1.3 mg/m³)⁽¹⁾. The HSE⁽³³⁾ and DFG⁽³⁾ use this same value as do several other countries⁽³⁵⁾ including Australia, Mexico, Israel. The Canadian Provinces of Alberta, British Columbia, Ontario and Quebec use the same TWA/TWAEV. The ACGIH has set no STEL value⁽¹⁾ but the HSE⁽³³⁾, Mexico, Alberta and British Columbia STEL value is 0.6 ppm (3.0 mg/m³). The NIOSH⁽²⁾ IDLH level = 100 mg/m³. Several states have set guidelines or standards for biphenyl in ambient air⁽⁶⁰⁾ ranging from 0.086 µg/m³ (Massachusetts) to 0.4 µg/m³ (Rhode Island) to 5.0 µg/m³ (New York) to 15.0 µg/m³ (Florida and North Dakota) to 20.0 µg/m³ (Connecticut) to 25 µg/m³ (Virginia) to 36 µg/m³ (Nevada) to 40 µg/m³ (North Dakota).

Determination in Air: Tenax Gas chromatography; CCl₄; Gas chromatography/Flame ionization detection; NIOSH(IV) Method #2530⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set but EPA has suggested an ambient limit of 13.8 µg/L based on health effects.

Routes of Entry: Inhalation of vapor or dust; percutaneous absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact contributes significantly to overall exposure. Repeated exposure to dust may result in irritation of skin and respiratory tract. The vapor may cause moderate eye irritation. Repeated skin contact may produce a sensitization dermatitis. In acute exposure, biphenyl exerts a toxic action on the central nervous system, on the peripheral nervous system, and on the liver. Symptoms of poisoning are headache, diffuse, gastrointestinal pain, nausea, indigestion, numbness and aching of limbs, and general fatigue. The LD₅₀ (oral, rat) = 3280 mg/kg⁽⁹⁾.

Long Term Exposure: Chronic exposure is characterized mostly by central nervous system symptoms, fatigue, headache, tremor, insomnia, sensory impairment, and mood changes. However, such symptoms may be rare. May cause lung irritation and bronchitis. liver and kidney damage. May cause skin allergy with itching and rash.

Points of Attack: Liver, skin, central nervous system, upper respiratory system, eyes.

Medical Surveillance: Consider skin, eye, liver function, and respiratory tract irritation in any preplacement or

periodic examination. Examination by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Bitertanol

Use Type: Fungicide

CAS Number: 55179-31-2

Formula: C₂₀H₂₃N₃O₂

Synonyms: β-[(1,1'-Biphenyl)-4-yloxy]-α-(1,1-dimethylethyl)-1H-1,2,4-triazole-1-ethanol; 1H-1,2,4-Triazole-1-ethanol, β-[(1,1'-biphenyl)-4-yloxy]-α-(1,1-dimethylethyl)-

Trade Names: BAYCOR[®], Bayer CropScience (Germany); BAY KWG 0599[®], Bayer CropScience (Germany); BAYMAT-SPRAY[®], Bayer CropScience (Germany); BILOXAZOL[®]; BITERTANOL[®]; KWG 0599[®]; SIBUTOL[®], component of (with Fuberidazole)

Producers: Bayer CropScience (Germany); Saeryung Chemicals (South Korea)

Chemical Class: Triazole

EPA/OPP PC Code: 117801

Uses: Not registered in the U.S. On July 23, 2004, the U.S. EPA announced the revocation of tolerances for residues of bitertanol. Registered in Australia for use on beans (all types) and various ornamentals. Also used for prunes when drying.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

Description: Colorless crystalline solid. Aromatic odor. Slightly soluble in water; solubility = 5 ppm @ 20°C. Molecular weight 337.48. Melting/Freezing point = 126°C. Vapor pressure 10⁻⁵ mmHg @ 20°C. Log K_{ow} = 4.11. Values greater than 3.0 may bioaccumulate in marine organisms.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion, skin contact

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if swallowed. Contact may irritate skin and cause eye irritation and possible severe injury. Avoid inhalation.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Bithionol

Use Type: Fungicide (proposed)

CAS Number: 97-18-7

Formula: C₁₂H₆Cl₄O₂S

Synonyms: Bidiphenbis(2-hydroxy-3,5-dichlorophenyl) sulfide; CP 3438; 2,2'-Dihydroxy-3,3',5,5'-tetrachlorodiphenylsulfide; 2-Hydroxy-3,5-dichlorophenyl sulphide; NCI-C60628; TBP; 2,2'-Thiobis(4,6-dichlorophenol); USAF B-22

Trade Names: ACTAMER[®]; BIDIPHEN[®]; BITHIONOL[®]; BITHIN[®]; LOROTHIDOL[®]; NEOPELLIS[®]; NOBACTER[®]; PREVENOL[®]; VANCIDE BL[®]; VANCIDE BL[®] (sodium salt); XL 7[®]

Producers: Sigma-Aldrich Laborchemikalien (Germany); ISOICHEM (France)

Chemical Class: Chlorinated phenol

EPA/OPP PC Code: 064201

RTECS Number: SN0525000

Uses: It is used as a surfactant-formulated antimicrobial against bacteria, molds and yeast, and is an ingredient in household sprays for animal pets. It is proposed as an agricultural fungicide. Other uses include deodorant, germicide, fungistat and in the manufacture of pharmaceuticals. It is no longer allowed (banned by the FDA) to be used in cosmetics. A food additive in feed and

drinking water of animals. Also a food additive permitted in food for human consumption.

Carcinogen/Hazard Classifications

IARC: Group 2B, possible carcinogen

Note: In animal studies, one chlorophenol, 2,4,6-trichlorophenol, caused leukemia in rats and liver cancer in mice. The Department of Health and Human Services has determined that 2,4,6-trichlorophenol may reasonably be anticipated to be a carcinogen.

Regulatory Authority:

- Banned or Severely Restricted (USA, Japan) (UN)⁽¹³⁾
- TSCA 40CFR716.120(a)
- List of priority pollutants (U.S. EPA) as chlorophenols
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenols
- The "Director's List" (CAL/OSHA) as chlorophenols
- Clean water act: Toxic Pollutant (Section 401.15) other than those listed elsewhere; includes trichloro phenols
- RCRA Section 261 Hazardous Constituents, waste number not listed as chlorophenols
- EPCRA Section 313 (as chlorophenols) Form R *de minimus* concentration reporting level: 1.0%.

Description: White or grayish crystalline solid or powder. Slight phenolic odor. Practically insoluble in water. Molecular weight = 356.05. Melting/Freezing point = 188°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set for this chemical; however, EPA recommends that drinking water contain no more than 0.04 mg/L of 2-chlorophenol for a lifetime exposure for an adult, and 0.05 mg/L for a 1-day, 10-day, or longer exposure for a child.

Routes of Entry: Ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. Probable oral lethal dose for humans is 5-15 g/kg for a 70 kg (150 lb) person. The toxicity of this compound is similar to that of phenol. Major hazard of phenol poisoning stems from its systemic effects which include central nervous system depression with coma, hypothermia, loss of vasoconstrictor tone, cardiac depression and respiratory arrest. Symptoms of exposure include burning pain in mouth and throat; white necrotic lesions in mouth, esophagus and stomach; abdominal pain; vomiting, bloody diarrhea; paleness; sweating; weakness; headache; dizziness; tinnitus; scanty, dark-colored urine; weak irregular pulse and shallow respiration.

Long term Exposure: Chlorophenols leave the body quickly, so they are not likely to accumulate in the mother's tissues or breast milk. There are no human studies on the

effects of chlorophenols on developing fetuses. Studies in rats showed that chlorophenols can pass through the placenta and produce toxic effects to the developing fetuses. The most common problems in children are delayed hardening of the bones of the breastbone, spine, and skull.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Borax and Boric Acid

Use Type: Insecticide and herbicide

CAS Number: 1303-96-4 (borax); 10043-35-3 (boric acid)

Formula: B₄H₂Na₂O₈, Na₂B₄O₇·H₂O (borax); BH₃O₃; H₃BO₃ (boric acid)

Synonyms: *Borax:* Disodium tetraborate; Disodium tetraborate decahydrate; Sodium borate; Sodium borate decahydrate; Sodium tetraborate; Sodium tetraborate decahydrate (Na₂B₄O₇·10H₂O). *Boric acid:* Boracic acid; Orthoboric acid

Trade Names: BORASCU[®]; BORICIN[®]; BOROFAX[®] (boric acid); GERSTLEY BORATE[®] (borax); KILL-OFF[®]; SOLUBOR[®] (borax)

Producers: Agrium (Canada); American Borate (USA); Allipo Chemicals (India); Chemettal (Germany); Cia. Quimica Universal de Industrias (Mexico); Eagle-Picher Minerals (USA); Holvoet Chimie (Belgium); Humco (USA); IMC Global (USA); Kerr-McGee (USA); OxyChem (USA); Quantum Chemicals (Australia); Rio Tinto (UK);

Rohm & Haas (USA); SQM (Chile); Textron Systems (USA); SB Boron (USA); TCI America (USA); U.S. Borax (USA); Varsal Instruments (USA)

Chemical Class: Inorganic

EPA/OPP PC Code: 011102 (borax); 011001 (boric acid)

California DPR Chemical Code: 79 (borax); 769 (boric acid)

ICSC Number: 0567 (borax); 0991 (boric acid)

RTECS Number: VZ2275000 (borax); ED4550000 (boric acid)

EINECS Number: 233-139-2 (boric acid)

Uses: Borax and boric acid are commodity chemicals which are used by formulators, packagers and distributors under a variety of trade names for agricultural and domestic use. Boric acid is a fireproofing agent for wood, a preservative, and an antiseptic. It is used in the manufacture of glass, pottery, enamels, glazes, cosmetics, cements, porcelain, borates, leather, carpets, hats, soaps, and artificial gems, and in tanning, printing, dyeing, painting, and photography. It is a constituent in powders, ointments, nickeling baths, electric condensers and is used for impregnating wicks and hardening steel. Borax is used as a soldering flux, preservative against wood fungus, and as an antiseptic. It is used in the manufacture of enamels and glazes and in tanning, cleaning compounds, for fireproofing fabrics and wood, and in artificial aging of wood. Boron is used in metallurgy as a degasifying agent and is alloyed with aluminum, iron, and steel to increase hardness. It is also a neutron absorber in nuclear reactors.

U.S. Maximum Allowable Residue Levels for Borax and Boric Acid (40 CFR 180.1121):

CHEMICAL	CROP	ppm
Borax		
(B ₄ Na ₂ O ₇ •10H ₂ O)	r.a.c.	–
Boric acid	r.a.c.	–
Boric acid (HBO ₂), sodium salt	r.a.c.	–

r.a.c. = raw agricultural commodities

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Borax and Boric Acid: Group E, Unlikely to be Carcinogenic

WHO Acute Hazard: Borax: Class U, Unlikely to be hazardous; Boric acid: Not listed

Regulatory Authority:

- Banned or Severely Restricted (In many products) (UN)⁽¹³⁾
- Actively registered pesticide in California. as sodium tetraborate (borax) and boric acid
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (former USSR)⁽⁴³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾.
- Safe Drinking Water Act, 5FR1470 Priority List
- Canada Drinking Water Quality: 5.0 mg/L IMAC
- Mexico Drinking Water Criteria: 1.0 mg/L

Description: Boric acid is a white, amorphous powder or

colorless, crystalline solid. Melting/Freezing point = 168° – 169°C (decomposes above 100°C). Saturated solutions: @ 0°C, 2.6% acid; @ 100°C, 28% acid. Boric acid is soluble in water (5 g/100 ml @ 20°C). Borax is a bluish-gray or green, odorless crystalline powder or granules. Boiling point = 320°C. Melting/Freezing point = 75°C (rapid heating). Borax is soluble in water (6g/100 ml @ 20°C). Boron, B is a yellow or brownish-black powder and may be either crystalline or amorphous. It does not occur free in nature and is found in the minerals borax, colemanite, boronatrocalcite, and boracite. Melting/Freezing point = 2190°C. Boiling point = 3660°C. Practically insoluble in water, although boron is reported to be slightly soluble under certain conditions.

Incompatibilities: Contact with strong oxidizers may cause explosions. Boron dust is explosive on exposure with air. Boron is incompatible with ammonia, bromine tetrafluoride, cesium carbide, chlorine, fluorine, interhalogens, iodic acid, lead dioxide, nitric acid, nitric oxide, nitrosyl fluoride, nitrous oxide, potassium nitrite, rubidium carbide, silver fluoride. Boric acid decomposes in heat above 100 °C forming boric anhydride and water. Boric acid aqueous solution is a weak acid; incompatible with alkali carbonates and hydroxides.

Permissible Exposure Limits in Air: The TWA set by ACGIH⁽¹⁾ and by HSE⁽³³⁾ for anhydrous sodium tetraborate (borax) is 1.0 mg/m³; for sodium tetraborate decahydrate it is 5.0 mg/m³; for the pentahydrate it is 1.0 mg/m³. OSHA⁽²⁾ has set a TWA of 10 mg/m³ for all sodium tetraborates. A MAC value in workplace air has been set by the former USSR-UNEP/IRPTC project⁽⁴³⁾ at 10 mg/m³ for boric acid. Several states have set guidelines or standards for sodium tetraborates in ambient air⁽⁶⁰⁾, ranging from 10 µg/m³ (North Dakota) to 16 µg/m³ (Virginia) to 20 µg/m³ (Connecticut) to 24 µg/m³ (Nevada) to 100 µg/m³ (Connecticut).

Permissible Concentration in Water: EPA in July 1976 established a criterion for boron of 750 µg/L for long term irrigation on sensitive crops. More recently⁽³²⁾, EPA has suggested an ambient water limit of 43 µg/L based on health effects. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values in mg/L, in water used for fishery purposes of 0.1 for boric acid and 0.05 for sodium tetraborate. See Regulatory Authority for Canadian and Mexican levels.

Routes of Entry: Inhalation of dust, fumes, and aerosols; ingestion.

Harmful Effects and Symptoms

Local: These boron compounds may produce irritation of the nasal mucous membranes, the respiratory tract, and eyes.

Systemic: These effects vary greatly with the type of compound. Acute poisoning in man from boric acid or borax is usually the result of application of dressings, powders, or ointment to large areas of burned or abraded skin, or accidental ingestion. The signs are: nausea, abdominal pain, diarrhea and violent vomiting, sometimes

bloody, which may be accompanied by headache and weakness. There is a characteristic erythematous rash followed by peeling. In severe cases, shock with fall in arterial pressure, tachycardia, and cyanosis occur. Marked CNS irritation, oliguria, and anuria may be present. The oral lethal dose in adults is over 30 g. Little information is available on chronic oral poisoning, although it is reported to be characterized by mild GI irritation, loss of appetite, disturbed digestion, nausea, possibly vomiting, and erythematous rash. The rash may be "hard" with a tendency to become purpuric. Dryness of skin and mucous membranes, reddening of tongue, cracking of lips, loss of hair, conjunctivitis, palpebral edema, gastro-intestinal disturbances, and kidney injury have also been observed. Workers manufacturing boric acid had some atrophic changes in respiratory mucous membranes, weakness, joint pains, and other vague symptoms. The biochemical mechanism of boron toxicity is not clear but seems to involve action on the nervous system, enzyme activity, carbohydrate metabolism, hormone function, and oxidation processes coupled with allergic effects. Borates are excreted principally by the kidneys. No toxic effects have been attributed to elemental boron. The LD₅₀ (oral mouse) for boron = 2000 mg/kg. The LD₅₀ (oral, rat) for boric acid = 2660 mg/kg (slightly toxic). The LD₅₀ (oral, rat) for borax = 2660 mg/kg (slightly toxic).

Short Term Exposure: Boric acid irritates the eyes, skin, and the respiratory tract. High exposure may cause effects on the gastrointestinal tract, liver and kidneys. Borax and Boric acid may affect the nervous system. Serious overexposure can cause seizures, unconsciousness and death.

Long Term Exposure: May cause brain, kidney and liver damage. Repeated or prolonged contact with skin may cause dermatitis. Animal tests show that this substance possibly causes toxic effects upon human reproduction. (WHO).

Medical Surveillance: No specific considerations are needed for boric acid or borates except for general health and liver and kidney function. In the case of boron trifluoride, the skin, eyes, and respiratory tract should receive special attention. In the case of the boranes, central nervous system and lung function will also be of special concern.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large

quantities of water and induce vomiting. Do not make an unconscious person vomit.

BPMC

Use Type: Insecticide

CAS Number: 3766-81-2

Formula: C₁₂H₁₇NO₂

Synonyms: *o*-sec-Butylphenyl methylcarbamate; 2-sec-Butylphenyl *n*-methylcarbamate; Fenobucarb; Methylcarbamic acid *o*-sec-butylphenyl ester; Phenol, 2-(1-methylpropyl)-, methylcarbamate; 2-(1-Methylpropyl)phenyl methylcarbamate

Trade Names: BARIZON[®]; BASSA[®]; BAY-41637[®], Bayer CropScience (Germany); BAY-41637-C[®], Bayer CropScience (Germany); BAYCARB[®], Bayer CropScience (Germany); BAYER-41367C[®], Bayer CropScience (Germany); CARVIL[®]; FENOBCARB[®]; GEOCARB-50EC[®]; HOPCIN[®]; OSBAC[®]

Producers: Bayer CropScience (Germany); Saeryung Chemicals (South Korea); Yellow River Enterprise (Taiwan)

Chemical Class: *N*-Methyl carbamate

Uses: Not registered in the U.S. BPMC, fenobucarb, is extensively used for control of plant hopper in rice, and for leafhoppers, rice stem-borers, and rice bugs on rice, and to control bollworms and aphids on cotton.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class II, moderately hazardous

Description: Yellowish liquid. Slight odor. Soluble in water; solubility = 610 ppm @ 20°C. Molecular weight = 207.32. Melting/freezing point = 31°C. Vapor pressure = 48 mPa @ 20°C. Density = 1.03; Log K_{ow} = 3.2. Values greater than 3.0 may bioaccumulate in marine organisms.

Incompatibilities: May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamates inhibit the acetylcholinesterase enzymes and alter the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure.

First Aid: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through

the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. Skin: Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. *Do NOT induce vomiting.** If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. Inhalation: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Bromacil (ANSI)

Use Type: Herbicide

CAS Number: 314-40-9

Formula: C₉H₁₃BrN₂O₂

Alert: A General Use Pesticide (GUP)

Synonyms: Bromacil 1.5; Bromazil; 5-Bromo-3-*sec*-butyl-6-methyluracil; 5-Bromo-6-methyl-3-(1-methylpropyl)-2,4-(1H,3H)-pyrimidinedione; 5-Bromo-6-methyl-3-(1-methylpropyl)-2,4(1H,3H)-pyrimidinedione; 3-*sek*-Butyl-5-

brom-6-methyluracil (German); Cynogan; 2,4(1H,3H)-Pyrimidinedione, 5-bromo-6-methyl-3-(1-methylpropyl)-; Uracil, 5-Bromo-3-*sec*-butyl-6-methyl

Trade Names: BOREA[®]; BOROCIL EXTRA[®]; α -BROMACIL 80 WP[®]; BROMAX[®]; CROPTEX ONYX[®]; CYNOGEN[®]; DUPONT HERBICIDE 976[®], DuPont Crop Protection (USA); EEREX[®]; FENOCIL[®]; HERBICIDE 976[®]; HIBOR; HYDON[®]; HYVAR[®], DuPont Crop Protection (USA); HYVAR-X[®], DuPont Crop Protection (USA); HYVAR X BROMACIL[®] DuPont Crop Protection (USA); HYVAR X-L[®] DuPont Crop Protection (USA); HYVAR X WEED KILLER[®] DuPont Crop Protection (USA); HYVAR X-WS[®] DuPont Crop Protection (USA); ISOCIL[®]; KROVAR[®], DuPont Crop Protection (USA); NALKIL[®]; ROUT[®]; URAGAN[®]; URAGON[®]; UROX[®]; UROX B WATER SOLUBLE CONCENTRATE WEED KILLER[®]; UROX HX GRANULAR WEED KILLER[®]; WEED-BROOM[®] (mixture of DSMA, Bromacil & 2,4-D)

Producers: Agan Chemical Manufacturers Ltd. (Israel); DuPont Crop Protection (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Uracil

EPA/OPP PC Code: 012301

California DPR Chemical Code: 83

ICSC Number: 1448

RTECS Number: YQ9100000

EINECS Number: 206-245-1

Uses: Bromacil is used primarily for the control of annual and perennial grasses and broadleaf weeds, both nonselectively on noncrop lands and selectively for weed-control in citrus and pineapple crops. The top five applications in California for which this is used are oranges, lemons, grapefruit, and right-of-ways and landscapes. A limit of 0.1 mg/kg of agricultural products is set in several countries⁽³⁵⁾.

Human toxicity (long-term)⁽⁷⁷⁾: Low–90.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–6485.34001 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Bromacil (40 CFR 180.210):

CROP	ppm
Fruit, stone, group	0.1
Pineapple	0.1
Fruit, stone, group	0.1
Pineapple	0.1

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: CAUTION (for dry formulations); WARNING (for liquid formulations)

WHO Acute Hazard: Class U, Not likely to be hazardous

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (NIOSH)⁽²⁾

(HSE)⁽³³⁾ (Several States)⁽⁶⁰⁾ (Australia) (Israel) (Mexico) (Canada, Provincial)

- AB 1803-Well Monitoring Chemical (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- Safe Drinking Water Act: Priority List (55 FR 1470)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%.
- Canada, WHMIS, Ingredients Disclosure List

Description: White crystalline solid. May be dissolved in a flammable liquid. Odorless. Slightly soluble in water; solubility = 820 ppm @ 25°C. Boiling point = (sublimes). Melting/Freezing point = 158–159°C (sublimes). Vapor pressure = 3.1×10^{-7} mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0

Incompatibilities: Incompatible with strong acids, oxidizers, heat. Decomposes slowly in strong acids. Emits toxic fumes of nitrogen oxides and bromine and when heated to decomposition.

Permissible Exposure Limits in Air: A TWA value of 1 ppm (10 mg/m³) has been recommended by NIOSH⁽²⁾ and ACGIH⁽¹⁾. This same TWA has been set by Australia, Israel, Mexico, and HSE⁽³³⁾. HSE⁽³³⁾ and Mexico set a STEL value at 2 ppm (20 mg/m³). The Canadian provinces of Alberta, Ontario and Quebec have the same TWAs and Alberta’s STEL is 2 ppm (21 mg/m³). Four states have set guidelines or standards for bromacil in ambient air⁽⁶⁰⁾ ranging from 100 $\mu\text{g}/\text{m}^3$ (North Dakota) to 160 $\mu\text{g}/\text{m}^3$ (Virginia) to 200 $\mu\text{g}/\text{m}^3$ (Connecticut) to 238 $\mu\text{g}/\text{m}^3$ (Nevada).

Determination in Air: Filter; none; Gravimetry; NIOSH Methods (IV) #0500, Particulates NOR (total).⁽¹⁸⁾

Permissible Concentration in Water: A no-adverse effects level in drinking water has been calculated by NAS/NRC⁽⁴⁶⁾ as 0.086 mg/L. Some states have set guidelines for bromacil in drinking water⁽⁶¹⁾, including Maine at 25 $\mu\text{g}/\text{L}$, and Kansas at 87.5 $\mu\text{g}/\text{L}$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, upper respiratory system, lungs. Inhalation can cause irritation, coughing and wheezing.

Long Term Exposure: Has caused thyroid affects in animals.

Points of Attack: Eyes, skin, respiratory system, thyroid.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Thyroid function tests. Consider x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Bromadiolone

Use Type: Rodenticide

CAS Number: 28772-56-7

Formula: C₃₀H₂₃BrO₄

Synonyms: 2H-1-Benzopyran-2-one, 3-(3-[4'-bromo(1,1'-biphenyl)-4-yl]-3-hydroxy-1-phenylpropyl)-4-hydroxy-; Bromadiolone; 3-[3-(4'-bromo(1,1'-biphenyl)-4-yl)-3-hydroxy-1-phenylpropyl]-4-hydroxy-2H-1-benzopyran-2-one; 3-[3-(4'-Bromobiphenyl)-4-yl]3-hydroxy-1-phenylpropyl)-4-hydroxy-coumarin; 3-[α -(ρ -Bromophenyl)- β -hydroxyphenethyl)benzyl]-4-hydroxy-coumarin; Coumarin, 3-[3-(4'-bromo-1,1'-biphenyl-4-yl)-3-hydroxy-1-phenylpropyl]-4-hydroxy-; Coumarin, 3-[α -(ρ -bromophenyl)- β -hydroxyphenethyl)benzyl]-4-hydroxy-; (Hydroxy-4-coumarinyl 3)-3 phenyl-3(bromo-4 biphenyl-4)-1 propanol-1 (French)

Trade Names: BOLDO[®]; BOOT HILL[®]; BROMONE[®]; CANADIEN 2000[®]; CONTRAC[®]; Bell Laboratories (USA); HAWK[®]; LM-637[®]; MAKI[®]; Liphatech, Inc. (USA); RAT ARREST[®]; RAT FREE[®]; RATIMUS[®]; RENTOKIL DEADLINE[®]; Rentokil Environmental Service (Netherlands); SLAYMOR[®]; SUPER-CAID[®]; Liphatech, Inc. (USA); SUPER-ROZOL[®]; Liphatech, Inc. (USA); SUP'ORATS[®]; TEMUS[®]

Producers: Agrimor International (USA); Agro-care

Chemical Industry Group (China); Bell Laboratories (USA); BP Chemicals (UK); I.N.D.I.A. Industrie Chimiche (Italy); Liphatech, Inc (USA); Sigma-Aldrich Laborchemikalien (Germany); Sumitomo (Japan); Wuhan kernel Bio-pesticide (China)

Chemical Class: Coumarin

EPA/OPP PC Code: 112001; (208500 & 214600 use code No. 112001)

California DPR Chemical Code: 2135

RTECS Number: GN4934700

EINECS Number: 249-205-9

Uses: Bromadiolone is used as bait for rodent control against house mice, roof rats and warfarin-resistant Norway rats. It is also authorized by USDA for use in official establishments operating under the Federal meat, poultry, shell egg grading and egg products inspection program.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

WHO Acute Hazard: Class 1 a, extremely hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 100 lb (45.4 kg)
- Actively registered pesticide in California.

Description: Bromadiolone is a white to yellowish powder. Practically insoluble in water. Melting/Freezing point = 200-210°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion, inhalation, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. The compound is toxic by oral exposure, the LD₅₀ (rabbit, oral) = 1.0 mg/kg and the LD₅₀-(oral, rat) = 1.125 mg/kg. (Extremely toxic)⁽⁹⁾.

Long Term Exposure: May cause skin and eye irritation.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large

quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Bromophos

Use Type: Insecticide and acaricide

CAS Number: 2104-96-3

Formula: C₈H₈BrCl₂O₃PS

Synonyms: *O*-(4-Brom-2,5-dichlor-phenyl)-*O,O*-dimethylmonothiophosphat (German); 4-Bromo-2,5-dichlorophenyl dimethyl phosphorothionate; *O*-(4-bromo-2,5-dichlorophenyl) *O,O*-dimethylphosphorothioic acid; Bromofos; Bromofos methyl; Bruomophos (Russian); *O,O*-Dimethyl-*O*-(4-bromo-2,5-dichlorophenyl) phosphorothioate; *O,O*-Dimethyl-*O*-(2,5-dichlor-4-bromphenyl)-thionophosphat (German); *O,O*-dimethyl-*O*-(2,5-dichloro-4-bromophenyl)phosphorothioate; *O,O*-Dimethyl-*O*-(2,5-dichloro-4-bromophenyl) thiophosphate; ENT 27,162; Methyl bromofos; Mtehyl bromophos; Phosphorothioic acid, *O*-(4-bromo-2,5-dichlorophenyl) *O,O*-dimethyl ester; Thiophosphate de *O,O*-dimethyle et de *O*-4-bromo-2,5-dichlorophenyle (French)

Trade Names: BROFENE[®], canceled; BROPHENE[®]; CELA S-1942[®]; EL 400[®]; MONSANTO[®]-CP 51969; NETAL[®]; NEXION[®]; NEXION[®], canceled; NEXION[®]-40, canceled; OMEGAN[®]; OMS-658[®]; S 1942[®]

Producers: Epochem (China); Monsanto (USA)

Chemical Class: Organophosphate

EPA/OPP PC Code: 008706

RTECS Number: TE7175000

Uses: Not registered in the U.S. Bromophos is a broad spectrum, non-cumulative non-systemic organophosphorus insecticide. It is used on field crops, vegetable and fruit crops, on ornamentals, and on grain storage. It is also used as a sheep dip.

Regulatory Authority:

- DOT Inhalation Hazard Chemicals as organophosphates.

Description: White to slightly yellow crystalline solid. Very slightly soluble in water. Molecular weight = 366.00. Melting point: 53°C.

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines,

isocyanates, alkylene oxides, epichlorohydrin. May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV⁽¹⁸⁾, Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. Skin: Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able

to swallow, rinse mouth and have victim drink 4 to 8 ounces of water do NOT induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. Inhalation: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Notes to physician or authorized medical personnel:* N-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 gm in 100 ml of sterile water or in 5% dextrose and water, intravenously, slowly, in 15-30 minutes; if sufficient fluid is not available, give 1 gm of 2-PAMCI in 3 ml of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also Diazepam, an anticonvulsant, might be considered.

Bromophos-ethyl

Use Type: Insecticide

CAS Number: 4824-78-6

Formula: C₁₀H₁₂BrCl₂O₃PS

Synonyms: 4-Bromo-2,5-dichlorophenol-*O*-ester with *O*,*O*-diethyl phosphorothioate; *O*-(4-Bromo-2,5-dichlorophenyl) *O*,*O*-diethyl phosphorothioate; Bromophos-ethyl; *O*,*O*-Diaethyl-*O*-(4-brom-2,5-dichlor)-phenyl-monothiofosphat (German); *O*,*O*-Diaethyl-*O*-(2,5-dichlor-4-bromphenyl)-thionophosphat (German); *O*,*O*-Diethyl *O*-2,5-dichloro-4-bromophenyl-phosphorothioate; *O*,*O*-Diethyl *O*-(2,5-dichloro-4-bromophenyl)thiophosphate; ENT 27,258; Ethyl bromophos; Phosphorothioic acid, *O*-(4-bromo-2,5-dichlorophenyl) *O*,*O*-diethyl ester; Thiophosphate de *O*,*O*-diethyle et de *O*-(2,5-dichloro-4-bromo) phenyle (French)
Trade Names: CELA S-2225[®]; FILARIOL[®]; NEXAGAN[®]; OMS-659[®]; S 2225[®]

Chemical Class: Organophosphate

EPA/OPP PC Code: 214500

Uses: Not registered in the U.S.

Regulatory Authority:

- DOT Inhalation Hazard Chemicals as organophosphates
- List of priority pollutants (EPA) as chlorophenols
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenols
- The "Director's List" (CAL/OSHA) as chlorophenols
- Clean Water Act: Toxic Pollutant (Section 401.15) other than those listed elsewhere; includes trichloro phenols.
- RCRA Section 261 Hazardous Constituents, waste number not listed as chlorophenols
- EPCRA Section 313 (as chlorophenols) Form R *de minimis* concentration reporting level: 1.0%.

Description: Pale-yellow liquid. Molecular weight = 394.05. Density = 1.53 @ 20°C. Boiling point = 123°C @ 4 x 10⁻³ mmHg.

Incompatibilities: May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate.

Permissible Exposure Limits in Air:

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus Pesticides.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath;

salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. Skin: Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water do NOT induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use

mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Notes to physician or authorized medical personnel:* N-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 gm in 100 ml of sterile water or in 5% dextrose and water, intravenously, slowly, in 15-30 minutes; if sufficient fluid is not available, give 1 gm of 2-PAMCI in 3 ml of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also Diazepam, an anticonvulsant, might be considered.

Bromoxynil (ANSI)

Use Type: Herbicide

CAS Number: 1689-84-5; 1689-99-2 (octanoate)

Formula: C₇H₃Br₂NO; C₁₅H₁₇Br₂NO (octanoate)

Alert: A Restricted Use Pesticide (RUP).

Synonyms: Bensonitrile, 3,5-dibromo-4-hydroxy-; Benzonitrile, 3,5-dibromo-4-hydroxy-; Butylchlorofos; Caswell No. 119; 2,6-Dibromo-4-cyanophenol; 2,6-Dibromo-4-hydroxybenzonitrile; 2,6-Dibromo-4-phenylcyanide; 3,5-Dibromo-4-hydroxybenzonitrile; 3,5-Dibromo-4-hydroxyphenyl cyanide; ENT 20,852; 4-Hydroxy-3,5-dibromobenzonitrile

octanoate: 3,5-Dibromo-4-octanoyloxybenzonitrile

Trade Names: BRIOTRIL[®], Makhteshim-Agan Industries (Israel); BRUCIL[®]; BRITTOX[®]; BROMINAL[®]; BROMINEX[®]; BROMINAL[®]; BROMINAL ME-4[®];

BROMINIL®; Bromox 2E, Micro-Flo (USA); BROMOTRIL®; BROMOXYNIL NITRILE HERBICIDE®; BRONATE® Bayer CropScience (Germany); BROXYNIL®; BUCTRIL®, Bayer CropScience (Germany); BUCTRIL® GEL HERBICIDE (octanoate), Bayer CropScience (Germany); BUCTRIL® 4EC GEL (mixture of bromoxynil octanoate and bromoxynil heptanoate), Bayer CropScience (Germany); BUCTRIL INDUSTRIAL®, Bayer CropScience (Germany); CHIPCO BUCTRIL®, Bayer CropScience (Germany); CHIPCO CRAB-KLEEN®; FLAGON®, 400 EC, Makhteshim-Agan Industries (Israel); HOBANE®, LABUCTRIL®, LITAROL®, M&B 10064®, MB 10064®, MB 10731® (octanoate); M&B 10731®, ME4 BROMINAL®, MERIT®, MEXTROL-BIOX®, Whyte Agrochemicals (UK); MOXY 2E®, Agriliance (USA); NCR CE EE DOV7® (octanoate); NU-LAWN WEEDER®, OXYTRIL M®, PARDNER®, SABRE®, TORCH®

Producers: Agriliance (USA); Agsin (Singapore); Bayer CropScience (Germany); Makhteshim-Agan Industries (Israel); Micro-Flo (USA); Sanonda Ltd. (Australia); Whyte Agrochemicals (UK)

Chemical Class: Nitriles (organic cyanides)

EPA/OPP PC Code: 035301; 035302 (octanoate)

California DPR Chemical Code: 2429

RTECS Number: DI3150000

EINECS Number: 216-882-7

Uses: For post-emergent control of broadleaf weeds. Used on alfalfa, garlic, corn, sorghum, flax, cereals, turf and on pasture and rangelands.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–10.50 ppb, Health Advisory; (octanoate) Very low–140.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low–283.24412 ppb, MATC (Maximum Acceptable Toxicant Concentration); (octanoate) High–4.40230 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

California Prop. 65: Reproductive toxin

Label Signal Word: WARNING

TRI Developmental Toxin: Developmental toxin

WHO Acute Hazard: Class II, moderately hazardous

Regulatory Authority:

- Actively registered pesticide in California. (octanoate)
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%. (also, octanoate)
- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL)
- The “Director’s List” (CAL/OSHA)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Proposition 65 chemical (CAL): Reproductive toxin

Description: Colorless to white crystalline solid; needles. Odorless. Slightly soluble in water; solubility = 130 ppm @ 20–25°C. Molecular weight 276.93; 403.15 (octanoate). Melting/Freezing point = 187°–194°C; 45–46°C (octanoate);

360°C (sodium or potassium salt). Boiling point sublimes @ 135°C @ 0.2 mmHg. Vapor pressure = $<10^{-5}$ mmHg @ 20°C; 4.8×10^{-6} mmHg (octanoate). Log K_{ow} = Very low. Unlikely to bioaccumulate in aquatic organisms.

Incompatibilities: React with boranes, alkalies, aliphatic amines, amides, nitric acid, sulfuric acid. Keep away from oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc) and strong acids.

Determination in Air: Bromoxynil/bromoxynil octanoate, NIOSH: #5010. See NIOSH Criteria Document 78-212 NITRILES⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. May affect the iron metabolism, causing asphyxia. It is highly toxic. Forms cyanide in the body. Exposure results in headache, dizziness, rapid pulse, deep-rapid breathing, nausea, vomiting, unconsciousness, convulsions and sometimes death. May cause cyanosis (blue coloration of skin and lips caused by lack of oxygen). Some nitriles have a probable oral lethal dose in humans of less than 5 mg/kg or a taste (less than 7 drops) for a 70 kg (150 lb) person.

Long Term Exposure: Chronic exposure over long periods may cause fatigue and weakness. Can cause same general symptoms as hydrogen cyanide but onset of symptoms is likely to be slower. May cause liver and kidney damage.

Points of Attack: In animals: liver, kidney damage.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1-2 years to ensure freshness. Persons trained

in the use of this kit, oxygen use, and CPR must be quickly available.

Brucine

Use Type: Rodenticide

CAS Number: 357-57-3

Formula: $C_{23}H_{26}O_4 \cdot 4H_2O$

Synonyms: Brucina (Italian, Spanish); (-)Brucine; (-)Brucine dihydrate; Brucine hydrate; Dimethoxy strychnine; 2,3-Dimethoxystrychnidin-10-one; 2,3-Dimethoxystrychnine; 10,11-Dimethoxystrychnine; 10,11-Dimethylstrychnine; Strychnidin-10-one, 2,3-dimethoxy-

Trade Names: DOLCO MOUSE CEREAL[®]; PIED PIPER MOUSE SEED[®]

Producers: Kothari Phytochemicals International (India); Merck (Germany)

ICSC Number: 1017

RTECS Number: EH8925000

EEC Number: 614-006-00-1

EINECS Number: 206-614-7

Uses: Used in the manufacture of other chemicals, in perfumes, as a medication for animals, and as a poison for rodents.

Regulatory Authority:

- EPA Hazardous Waste Number (RCRA No.): P018
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 100 lb (45.4 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%.
- Canada, WHMIS, Ingredients Disclosure List

Description: Brucine is colorless to white, crystalline solid. Odorless with a very bitter taste. Slightly soluble in water. Molecular weight = 394.5. Freezing/Melting point = 178°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Log K_{ow} = <1.0 . Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Reacts with strong oxidizers. Finely dispersed material in air can cause dust explosions.

Permissible Exposure Limits in Air: None established.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. Exposure can cause headache, nausea, vomiting, ringing in the ears, disturbed vision, restlessness, excitement, twitching and convulsions, seizures, breathing difficulties. An alkaloid. Severe poisoning can cause paralysis, unconsciousness, and death.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Bufencarb (ANSI)

Use Type: Insecticide

CAS Number: 8065-36-9

Formula: C₁₃H₁₉NO₂

Alert: In April of 1986, all registered products containing bufencarb in the U.S. were cancelled, although existing stocks were allowed to be used until exhausted.

Synonyms: 3-(1-Methylbutyl)phenyl methylcarbamate and 3-(1-ethylpropyl)phenyl methylcarbamate, mixed esters (3:1); Carbamic acid, methyl-, mixed (1-methylbutyl)phenyl and (1-ethylpropyl)phenyl esters; Methylcarbamic acid-*m*-[(1-methyl)butyl]phenyl ester mixed with carbamic acid, methyl-*m*-(1-ethylpropyl)phenyl ester (3:1)

Trade Names: METALKAMATE®; BUX®, BUX-TEN®, ORTHO 5353®, Chevron (Ortho) (USA)

Producers: Chevron (Ortho) (USA)

Chemical Class: Carbamate

EPA/OPP PC Code: 059303

California DPR Chemical Code: 91

Uses: Bufencarb was used in the U.S. on corn fodder and forage, fresh corn (includes sweet corn kernels plus cob with husk removed), corn grain, rice grain, and rice straw.

Regulatory Authority:

- Actively registered pesticide in California.

Description: Yellow-amber solid. Practically insoluble in water. Molecular weight = 221.30. Melting/Freezing point = 26.4-39°C. Density = 1.024. Boiling point = 125°C.

Incompatibilities: Strong oxidizers. When heated to decomposition, emits nitrogen oxides and carbon dioxide.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)].⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as

soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary.

Medical note: 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Buprofezin

Use Type: Insect growth regulator

CAS Number: 69327-76-0

Synonyms: 2-*tert*-Butylimino-3-isopropyl-5-phenylperhydro-1,3,5-thiadiazin-4-one; 4*H*-1,3,5-Thiadiazin-4-one, 2-[(1,1-dimethylethyl)imino]tetrahydro-3-(1-methylethyl)-5-phenyl-

Trade Names: APPLAUD®, Nihon Nohyaku Co., Ltd. (Japan)

Producers: Agsin (Singapore); Ki-Hara Chemicals Ltd. (UK); Nihon Nohyaku Co., Ltd. (Japan); SuYan Agrochemical Group (China)

EPA/OPP PC Code: 275100

California DPR Chemical Code: 3947

Uses: For insect control in food crops and greenhouse ornamentals.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Possible Carcinogen

Regulatory Authority:

- Actively registered pesticide in California.

WHO Acute Hazard: Class U, unlikely to be hazardous

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Busulfan

Use Type: An insect sterilant.

CAS Number: 55-98-1

Formula: C₆H₁₄O₆S₂; CH₃SO₂O(CH₂)₄OSO₂CH₃

Alert: Busulfan is a carcinogen and teratogen and should be handled with extreme caution.

Synonyms: 1,4-Bis(methanesulfonyloxy)butane; [1,4-Bis(methanesulfonyloxy)butane]; Bisulfan; Bisulphane; 1,4-Butanediol dimethyl sulfonate; 1,4-Butanediol dimethanesulphonate; Buzulfan; C.B. 2041; Citosulfan; 1,4-Dimesyloxybutane; 1,4-Dimethanesulfonyloxybutane; 1,4-Di(methanesulfonyloxy)butane; 1,4-Dimethanesulphonyloxybutane; 1,4-Dimethylsulfonyloxybutane; Methanesulfonic acid tetramethylene ester; NCI-C01592; NSC-750; Sulphabutin; Tetramethylene bis(methanesulfonate); Tetramethylene dimethane sulfonate

Trade Names: BUSULFEX[®], Orphan Drug Company; GT41[®]; GT 2041[®]; LEUCOSULFAN[®]; MABLIN[®]; MIELUCIN[®]; MISULBAN[®]; MITOSTAN[®]; MYELOLEUKON[®]; MYLERAN[®], GlaxoSmithKline (UK) (a drug for treating chronic myelogenous leukemia); X 149[®]

Producers: GlaxoSmithKline (UK)

Chemical Class: A bifunctional alkylating agent

RTECS Number: EK1750000

Uses: This compound has applications as an insect sterilant and as a chemotherapeutic agent taken orally or by injection to treat chronic myelogenous leukemia.

Carcinogen/Hazard Classifications

California Prop. 65: Carcinogen as 1,4-BUTANEDIOL DIMETHANESULFONATE

IARC: Carcinogen (human carcinogen)

Regulatory Authority:

- Carcinogen (human carcinogen) (IARC) (NTP)⁽¹⁰⁾
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- Proposition 65 chemical (CAL)
- The "Director's List" (CAL/OSHA)

Description: Busulfan is a white crystalline powder. Practically insoluble in water; hydrolyzes slowly. Molecular weight = 246.33. Melting/Freezing point = 117°C.

Incompatibilities: Oxidizers, moist air and water.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin causing rash. Exposure can cause nausea, vomiting, diarrhea, and seizures.

Long Term Exposure: A carcinogen in humans, causes leukemia and kidney and uterine cancer. A probable teratogen in humans. May damage the developing fetus. May cause testes damage in males (decrease sperm count, cause impotence), and decrease fertility in females. Long term exposure may cause cataracts, lung irritation, permanent lung scarring, bone marrow damage, liver damage. Symptoms of exposure include bleeding tendencies, decreased leucocyte count or depressed bone marrow activity⁽⁵²⁾.

Points of Attack: See above.

Medical Surveillance: Completed blood count, chest x-ray, lung function tests, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately with water or normal saline for at least 20-30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Butachlor (ANSI)

Use Type: Herbicide

CAS Number: 23184-66-9

Formula: C₁₇H₂₆ClNO₂

Alert: Not registered in the U.S.

Synonyms: Butoxymethyl; *N*-(Butoxymethyl)-2-chloro-*N*-(2,6-diethylphenyl)acetamide; 2-Chloro-2',6'-diethyl-*N*-(butoxymethyl)acetanalide; *N*-(Butoxymethyl)-2-chloro-2',6'-diethylacetanilide; Acetanilide, 2-chloro-2',6'-diethyl-*N*-(butoxymethyl)-; Acetamide, *N*-(butoxymethyl)-2-chloro-*N*-(2,6-diethylphenyl)-

Trade Names: BUTANEX[®]; BUTANOX[®]; CP 53619[®]; HILTACHLOR[®]; LAMBAST[®]. Monsanto (USA); MACHETE[®]. Monsanto (USA); MACHETTE[®]. Monsanto (USA); PILLARSET[®]; RASAYANCHLOR[®]

Producers: Agrimor International (USA); Agsin (Singapore); BEC Group Ltd. (India); Hindustan Insecticides (India); Monsanto (USA); Nagarjuna Agrichem (India); Vijayalakshmi Insecticides and Pesticides (India)

Chemical Class: Chloroacetanilida

EPA/OPP PC Code: 112301

California DPR Chemical Code: 4056

EINECS Number: 245-477-8

Uses: Used for preemergence control of annual grasses, sedges and broadleaf weeds in rice crops. Used primarily in Asia, South America, Europe and Africa.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–259.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–14.47908 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Likely Carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Actively registered pesticide in California.

Description: Light yellow or amber oily liquid. Slightly soluble in water; solubility = 20 mg/L @ 20°C; Molecular weight = 311.88; D: 1.070 @ 30°F/4°C. Melting/Freezing point -5°C. Boiling point = 156°C @ 0.66 mmHg (decomposes @ 165°C); 196°C @ 0.5 mm. Vapor pressure = 4.5×10^{-6} mmHg.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death.

Points of Attack: May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the

skin is swollen or inflamed, cool affected areas with cold compresses. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. The patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

***Note:** In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup.

Butralin

Use Type: Herbicide

CAS Number: 33629-47-9

Formula: $C_{14}H_{21}N_3O_4$

Synonyms: Aniline, *N-sec-butyl-4-tert-butyl-2,6-dinitro-*; Benzenamine, 4-(1,1-dimethylethyl)-*N*-(1-methylpropyl)-2,6-dinitro-; Butalin; Butraline; *N-sec-Butyl-4-tert-butyl-2,6-dinitroaniline*; Dibutalin; 4-(1,1-Dimethylethyl)-*N*-(1-methylpropyl)-2,6-dinitrobenzenamine; Dimethyl-ethyl-*n*-(1-methylpropyl)-2,6-dinitrobenzeneamine[4-(1,1-)]; Rutralin

Trade Names: A-820®, Amchem (USA), canceled; 72-A34®, AMCHEM 70-25®, Amchem (USA), canceled; AMCHEM A-280®, Amchem (USA), canceled; AMEX®, Cfp Agri (France), canceled; AMEX 820®, Cfp Agri (France), canceled; AMEXINE®, canceled; NO CRAB®, Cfp Agri (France), canceled; SECTOR®, STIFLE®,

Crompton Corporation (USA); TAMEX[®], CfpI Agro (France)

Producers: Amchem (USA); Crompton Corporation (USA); CfpI Agro (France), Sub. of Nufarm (Australia)

Chemical Class: Dinitroaniline

EPA/OPP PC Code: 106501

California DPR Chemical Code: 1756

Uses: Butralin is used as a plant grow regulator on tobacco after the tobacco is topped. All tobacco is topped to stimulate desirable chemical and physical characteristics but also stimulates the growth of suckers. Butralin is a contact-local systemic type of plant growth regulator that inhibits sucker growth. All uses on food crops were canceled in January, 1991, and all uses on turf and ornamental grasses were voluntarily canceled in March, 1997. Butralin is been found effective in destroying opium poppy crops.

Human toxicity (long-term): Low–70.00 ppb, Health Advisory

Fish toxicity (threshold): Intermediate–42.17178 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or DANGER

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: Yellow-orange crystalline solid. Slightly soluble in water; solubility = <1.0 ppm. Molecular weight = 295.37. Flash point = 35.8°C.

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May cause irritation to the eyes, skin, or respiratory tract. May be toxic if ingested or upon skin contact.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Butylate

Use Type: Herbicide

CAS Number: 2008-41-5

Formula: C₁₁H₂₃NOS

Alert: Classified as a General Use Pesticide (GUP) with applications limited to corn fields.

Synonyms: Bis(2-methylpropyl)carbamothioic acid-S-ethyl ester; Butilate; Diisobutylthiocarbamic acid-S-ethyl ester; Diisocarb; S-Ethyl N,N-diisobutylthiocarbamate; S-Ethyl bis(2-methylpropyl)carbamothioate; Ethyl-N,N-diisobutylthiocarbamate; S-Ethyl diisobutyl thiocarbamate; Ethyl-N,N-diisobutyl thiolcarbamate

Trade Names: ANELDA PLUS[®]; ANELDAZIN[®]; ANELIROX[®]; ATRA-BUTE[®], Zeneca Ag Products (USA) (now Syngenta), canceled Nov. 1992; BUTILATE[®]; GENATE[®], Zeneca Ag Products (USA) (now Syngenta), canceled August 1994; R-1910[®], Zeneca Ag Products (USA) (now Syngenta), canceled Dec. 1987; STAUFFER R-1910[®], Zeneca Ag Products (USA) (now Syngenta), canceled Dec. 1987; SUTAN[®], Zeneca Ag Products (USA) (now Syngenta), canceled Sept. 1994; SUTAZINE[®], Zeneca Ag Products (USA) (now Syngenta), canceled Dec. 1987; TOMAHAWK[®]

Producers: Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Thiocarbamate

Label Signal Word: CAUTION

EPA/OPP PC Code: 041405

California DPR Chemical Code: 565

RTECS Number: EZ7525000

EINECS Number: 217-916-3

Uses: A selective herbicide for use on field corn, sweet corn, and popcorn to control grassy and broadleaf weeds and seeds in the soil prior to sowing a crop. Often applied in combination with atrazine and/or cyanazine.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–400.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–22.61732 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Butylate, Federal Register (67FR49689-49691, July 31, 2002): "By itself, butylate poses no risk concerns within the limits of the existing tolerances, which will remain in effect at 0.1 part per million (ppm) for all registered commodities; however, the Agency intends to revise the commodity definitions in accordance with current Agency administrative practice."

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, Unlikely to be Carcinogen

WHO Acute Hazard: Class U, unlikely to be hazardous
Regulatory Authority:

- Water Pollution Standard Proposed (U.S. EPA) (See reference below) (Wisconsin)⁽⁶¹⁾
- CAL-DHS/DHS Drinking Water Action Levels
- Actively registered pesticide in California.
- RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.003; Nonwastewater (mg/kg), 1.4

Description: Clear liquid with an aromatic odor. Slightly soluble in water; solubility = 4ppm @ 25°C. Boiling point = 130°C @ 10 mmHg. Vapor pressure = 1×10^{-3} mmHg.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: A No-Adverse Effects Level (NOAEL) in the range of 24-40 mg/kg body weight/day has been determined by USEPA. This leads to derivation of a 10-day health advisory for Butylate of 2.4 mg/L and a lifetime health advisory of 0.05 mg/L for a 70-kg man. Wisconsin has set a guideline for butylate in drinking water of 200 µg/L⁽⁶¹⁾.

Determination in Water: Analysis of butylate is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen- and phosphorus-containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen-phosphorus detector. The method detection limit has not been determined for butylate, but it is estimated that the detection limits for analytes included in this method are in the range of 0.1 to 2 µg/L.

Harmful Effects and Symptoms

The LD₅₀-(oral, rat) = 4,000 mg/kg (slightly toxic). Applying the criteria described in EPA's guidelines for assessment of carcinogenic risk, butylate may be placed in Group C: a possible human carcinogen. This category is for substances that show limited evidence of carcinogenicity in animals and inadequate evidence in humans.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Butylphenols

Use Type: Insecticide and fumigant.

CAS Number: 3180-09-4 (*o*-isomer); 89-72-5 (*o*-*sec*-isomer); 99-71-8 (*p*-*sec*-isomer); 4074-43-5 (*m*-isomer); 88-18-6 (*o*-*tert*-isomer); 98-54-4 (*p*-*tert*-isomer); 1638-22-8 (*p*-isomer); 28805-86-9 (mixed isomers)

Formula: C₁₀H₁₄O, C₄H₉C₆H₄OH

Synonyms: (*o*-*n*-): 2-*n*-Butylphenol; (*o*-*sec*-): 2-*sec*-Butylphenol; *o*-*sec*-Butylphenol; (*o*-*tert*-): 2-*tert*-Butylphenol; Phenol, *o*-(*tert*-butyl)-; (*p*-*sec*-): 4-*sec*-Butylphenol; *p*-*sec*-Butylphenol; (*p*-*tert*-): 4-*tert*-Butylphenol; 4-*tert*-Butylphenol; 4-(1,1-Demethylethyl)phenol; Butylphen; 1-Hydroxy-4-*tert*-Butylbenzene; UCAR butylphenol 4-*tert*

Producers: Albemarle (USA); CONDEA (Germany); Dainippon Ink & Chemicals (Japan); Degussa (Germany); Fluorochem Ltd. (UK); Great Lakes Chemical (USA); Honshu Chemical Industry (Japan); Mitsubishi Chemical (Japan); Schenectady International (USA); Shell Chemical (Netherlands); Tokyo Chemical Industry (Japan)

Chemical Class: Phenols

EPA/OPP PC Code: 064113 (*p*-*tert*-)

California DPR Chemical Code: 1000 (*p*-*tert*-)

ICSC Number: 1472 (*o*-*sec*-); 0637 (*p*-*tert*-)

RTECS Number: SJ8850000 (*o*-*n*-); SJ8920000 (*o*-*sec*-); SJ8810000 (*m*-); SJ8924000 (*p*-*sec*-); SJ8925000 (*p*-*tert*-); SJ8922500 (*p*-*n*-)

EINECS Number: 201-933-8 (*o*-*sec*-); 202-679-0 (*p*-*tert*-)

Uses: Butylphenols may be used as intermediates in manufacturing varnish and lacquer resins; as a germicidal agent in detergent disinfectants; as a pour point depressant, motor-oil additive, de-emulsifier for oil, soap-antioxidant, plasticizer, fumigant and insecticide.

Regulatory Authority:

- Actively registered pesticide in California.
- (*o*-*sec*-isomer) Air Pollutant Standard Set (ACGIH)⁽¹⁾ (OSHA)⁽⁵⁸⁾ (DFG)⁽³⁾ (HSE)⁽³³⁾ (Several States)⁽⁶⁰⁾ (Australia) (Israel) (Several Canadian Provinces)
- U.S. DOT 49CFR172.101, Appendix B, Regulated marine pollutant (as butyl phenol)

- Canada, WHMIS, Ingredients Disclosure List (*o-sec-*; *p-tert-*; *p-*; *o-*; *m-*)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) (*o-sec-*)
- The "Director's List" (CAL/OSHA) (*o-sec-*)

Description: The butylphenols, $C_4H_9C_6H_4OH$ include a number of isomers, the two most highly regulated are *o-sec*-butylphenol and *p-tert*-butylphenol. Their properties are as follows: (*o-sec-*): Colorless liquid or solid (below 61°F). Boiling point = 108°C. Flash point = 108°C. Insoluble in water. (*p-tert-*): White crystalline solid. Melting/Freezing point = 97°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Incompatibilities: Incompatible with strong acids, caustics, aliphatic amines, amides, oxidizers.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL for the *o-sec*-isomer. The NIOSH⁽²⁾ recommended REL is 5 ppm (30 mg/m³) TWA with the notation that skin absorption is of concern. The ACGIH⁽¹⁾, Australia, HSE, and Israel TWA is the same as NIOSH⁽²⁾. In Canada Alberta, Ontario, and Quebec TWA is 5 ppm and Alberta's STEL is 10 ppm. *p-tert-isomer:* The DFG⁽³⁾ has set a MAK of 0.08 ppm (0.5 mg/m³) and Peak Limitation of 5 times the normal MAK (30 min.), not to be exceeded 2 times during a workshift. Mexico's TWA is 10 ppm and STEL of 20 ppm. Several states have set guidelines or standards for the *o-sec-isomer* in ambient air⁽⁶⁰⁾ ranging from 300 µg/m³ (North Dakota) to 500 µg/m³ (Virginia) to 600 µg/m³ (Connecticut) to 714 µg/m³ (Nevada).

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause irritation to nose, throat and lungs. Sensitization may occur. Skin contact studies with animals suggest that severe irritation at concentrations above 10% may occur. May cause rash, redness and irritation, especially when skin is wet. Absorption is significant and contact may lead to allergic reaction. Eye studies with animals suggest that severe irritation may occur. Ingestion studies on animals suggest that 8 oz. May be lethal to a 150 lb. person.

Long Term Exposure: May cause skin color changes by contact or inhalation of levels between 10 and 100 ppm. Allergy may develop after repeated exposure. Liver damage may also occur. There is limited evidence that butylphenol causes skin cancer in animals. Repeated or prolonged skin contact can cause skin ulcers and lead to permanent loss of skin pigment in affected areas.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

(USA), canceled; PHYTAR 138[®], APC Holdings Corp. (USA), canceled 9/30/1991; PHYTAR 560[®] (with Sodium cacodylate), APC Holdings Corp. (USA), canceled 11/30/1992; PHYTAR 600[®], APC Holdings Corp. (USA), canceled; RAD-E-CATE 25[®], Vineland Chemical Co. (USA), canceled 8/12/1987; SALVO[®]; SILVISAR 510[®], TSI Company (USA), canceled 10/10/1989; SYLVICOR[®]

Producers: Drexel Chemical (USA); Research Organics (USA); Scott Company (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organoarsenic

EPA/OPP PC Code: 012501

California DPR Chemical Code: 32

RTECS Number: CH7525000

Uses: Cacodylic acid is an arsenical non-selective contact herbicide which will defoliate or desiccate a wide variety of plant species. It is used as a cotton defoliant and for lawn renovation, for weed control in non-crop areas such as around buildings, near perennial ornamentals, along fence rows, and in forest management. It is used as a soil sterilant and in timber thinning. *Agent Blue* (0.37 kg/L cacodylic acid) was used to control vegetation during the Vietnam war. The top five crop usages in California are on cotton, rights of way, landscaping, uncultivated agricultural areas, and in outdoor container nurseries.

Human toxicity (long-term)⁽⁷⁷⁾: High–5.61798 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–2841.14769 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Cacodylic Acid (40 CFR 180.311):

CROP	ppm
Cotton, undelinted seed	2.8
Cattle, mbyp, except kidney and liver	0.7
Cattle, fat	0.7
Cattle, kidney	1.4
Cattle, meat	0.7

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

California Prop. 65: Carcinogen

IARC: Group 1, known carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- EPA Hazardous Waste Number (RCRA No.): U136
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
- EPCRA Section 313 Form R (as organic arsenic compound) *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as dimethylarsinic acid.
- Actively registered pesticide in California.
- Canada, WHMIS, Ingredients Disclosure List
- Canada: Priority Substance List & Restricted Substances/Ocean Dumping Forbidden (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds)

Description: Cacodylic acid is a colorless, odorless, crystalline solid arsenic compound. Melting/Freezing point = 192°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Highly soluble in water.

Incompatibilities: Aqueous solution react violently with chemically active metals releasing toxic arsenic fumes. Incompatible with oxidizers, sulfuric acid, caustics (strong bases), reducing agents, ammonia, amines, isocyanates, alkylene oxides, epichlorohydrin.

Permissible Exposure Limits in Air: The following exposure limits are for air levels only. When skin contact also occurs, overexposure is possible, even though air levels are less than the limits listed below. The OSHA⁽²⁾ PEL 8-hour TWA is 0.5 mg(As)/m³. ACGIH recommends a TWA of 0.2 mg(As)/m³.⁽¹⁾

Determination in Air: Filter; Reagent; Ion chromatography/Hydride generation atomic absorption spectrometry; NIOSH IV Method #5022, Arsenic, Organo-⁽¹⁸⁾

Permissible Concentration in Water: EPA has set a limit of 0.05 parts per million (ppm) for arsenic in drinking water. The U.S. EPA arsenic drinking water standard of 0.01 ppm (10 ppb) is based on the U.S. EPA final rule for arsenic in drinking water published in the January 22, 2001, *Federal Register*. However, the U.S. EPA is currently reviewing the science and cost estimate supporting this rule, and, in the interim, has reverted to the previous standard for arsenic. Thus, in the US, the current EPA arsenic drinking water standard remains at 0.05 ppm (50 ppb). To protect freshwater aquatic life-total recoverable trivalent inorganic arsenic never to exceed 440 $\mu\text{g/L}$. To protect saltwater aquatic life: 508 $\mu\text{g/L}$ on an acute basis. To protect human health: preferably zero. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: For arsenic: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic⁽⁵⁸⁾.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can also cause burning, itching, thickening and color changes.

Long Term Exposure: Certain other arsenic compounds have been identified as carcinogen. Although this chemical has not been identified as a carcinogen it should be handled with extreme caution. May cause an ulcer of the septum dividing the inner nose. It can cause nerve damage, thickening of the skin with patch areas of darkening and loss of pigment, or the development of white lines in the nails. May cause liver and kidney damage. Repeated exposure can lead to a metallic or garlic taste in the mouth, loss of appetite, nausea, vomiting, difficulty swallowing, stomach pain, diarrhea, and death. Birth defects have been observed in animals exposed to inorganic arsenic. It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

Points of Attack: Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer.

Medical Surveillance: Test for urine arsenic. Levels should not be greater than 100 micrograms per gram of creatinin in the urine. Examine the skin for abnormal growths. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cadmium

Use Type: Compounds used for fungicides, insecticides, and nematocides.

CAS Number: 7440-43-9 (metal)

Formula: Cd

Synonyms: Cadmio (Spanish); C.I. 77180; Colloidal cadmium; Elemental cadmium; Kadmium (German); Kadmu (Polish)

Producers: ASARCO (USA); Boliden (Sweden); Degussa (Germany); Dowa Mining (Japan); Goldschmidt (Germany); Great Western Inorganics (USA); Hall (USA); Industrias Penoles (Mexico); Metaleurop (France); Noranda (Canada); PPM Pure Metals (Germany); Sigma-Aldrich Fine Chemicals; Teck Cominco (Canada); UMICORE (Belgium); Zinc Corp. (USA)

Chemical Class: Inorganic-cadmium, heavy metal

ICSC Number: 0020

RTECS Number: EU9800000 (metal)

EINECS Number: 231-152-8 (cadmium)

Uses: EPA doesn't allow cadmium in pesticides. Food products account for most of the human exposure to

cadmium, except in the vicinity of cadmium-emitting industries. Human cadmium toxicity caused by contaminated rice plants was first reported in Japan in the 1950s. These studies showed that subsistence rice farmers had been sickened by ingesting cadmium that had passed from municipal sewage sludge used as fertilizer through the rice crop. Cadmium is taken up through the roots of plants to edible leaves, fruits and seeds. It will also build up in animal milk and fatty tissues. Therefore, people are exposed to cadmium upon consumption of cadmium containing plants or animals. Seafood, such as mollusks and crustaceans, can be a source of cadmium, as well. Cadmium is highly corrosion resistant and is used as a protective coating for iron, steel, and copper; it is generally applied by electroplating, but hot dipping and spraying are possible. Cadmium may be alloyed with copper, nickel, gold, silver, bismuth, and aluminum to form easily fusible compounds. These alloys may be used as coatings for other materials, welding electrodes, solders, etc. It is also utilized in electrodes of alkaline storage batteries, as a neutron absorber in nuclear reactors, a stabilizer for polyvinyl chloride plastics, a deoxidizer in nickel plating, an amalgam in dentistry, in the manufacture of fluorescent lamps, semiconductors, photocells, and jewelry, in process engraving, in the automobile and aircraft industries, and to charge Jones reducers. Various cadmium compounds find use as fungicides, insecticides, nematocides, polymerization catalysts, pigments, paints, and glass; they are used in the photographic industry and in glazes. Cadmium is also a contaminant of superphosphate fertilizers. Human exposure to cadmium and certain cadmium compounds occurs through inhalation and ingestion. The entire population is exposed to low levels of cadmium in the diet because of the entry of cadmium into the food chain as a result of its natural occurrence. Tobacco smokers are exposed to an estimated 17 μg /cigarette. Cadmium is present in relatively low amounts in the earth's crust; as a component of zinc ores, cadmium may be released into the environment around smelters.

U.S. Maximum Allowable Levels for Cadmium:

The Food and Drug Administration (FDA) limits the amount of cadmium in food colors to 15 parts per million (15 ppm).

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B1, probable carcinogen

- Mexico Drinking Water Criteria: 0.01 mg/L

Description: Cadmium is a bluish-white metal. Boiling point = 765°C. Melting/Freezing point = 321°C. Cadmium metal dust has an Autoignition temperature = 250°C. Hazard Identification (based on NFPA-704 M Rating System): (powder) Health 2, Flammability 2, Reactivity 0. The only cadmium mineral, greenockite (CdS), is rare; however, small amounts of cadmium are found in zinc, copper, and lead ores. It is generally produced as a by-product of these

metals, particularly zinc. Cadmium is insoluble in water but is soluble in acids. "Cadmium dust" includes dust of various cadmium compounds such as CdCl_2 . "Cadmium fume" has the composition Cd/CdO.

Incompatibilities: Air exposure with cadmium powder may cause self ignition. Moist air slowly oxidizes cadmium forming cadmium oxide. Cadmium dust is incompatible with strong oxidizers, ammonium nitrate, elemental sulfur, hydrazoic acid, selenium, zinc, tellurium. Contact with acids cause a violent reaction producing flammable hydrogen gas.

Permissible Exposure Limits in Air: The Federal standard⁽⁵⁸⁾ for cadmium fume or dust is 0.005 mg/m^3 (as Cd) as an 8-hour TWA. ACGIH has recommended a TWA value of 0.01 mg/m^3 for Cd dusts/salts and 0.002 mg/m^3 for respirable dust⁽¹⁾. NIOSH⁽²⁾ recommends that exposure to cadmium be at the lowest feasible level. The NIOSH⁽²⁾ IDLH: Carcinogen [9 mg/m^3 (as Cd)]. Several states have set guidelines or standards for cadmium in ambient air⁽⁶⁰⁾ ranging from zero (North Dakota) to $0.0006 \text{ } \mu\text{g/m}^3$ (Rhode Island) to $0.0055 \text{ } \mu\text{g/m}^3$ (North Carolina) to $0.0056 \text{ } \mu\text{g/m}^3$ (Massachusetts) to $0.07 \text{ } \mu\text{g/m}^3$ (Montana) to $0.12 \text{ } \mu\text{g/m}^3$ (Pennsylvania) to $0.25 \text{ } \mu\text{g/m}^3$ (South Carolina) to $0.4 \text{ } \mu\text{g/m}^3$ (Connecticut and South Dakota) to $0.8 \text{ } \mu\text{g/m}^3$ (Virginia) to $1.0 \text{ } \mu\text{g/m}^3$ (Nevada) to $2.0 \text{ } \mu\text{g/m}^3$ (New York).

Determination in Air: Collection of particles on a filter, workup with acid and measurement by atomic absorption has been specified by NIOSH. See NIOSH Methods #7048 (Cd) and #7300 (Elements), #7200 (Welding and Brazing Fume)⁽¹⁸⁾ or OSHA: #ID-125G.⁽⁵⁸⁾

Permissible Concentration in Water: The U.S. EPA has set a limit of 5 ppb. Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L ; Japan, 0.1 mg/L . Drinking water standards have been set⁽³⁵⁾ by Czechoslovakia, 0.010 mg/L ; EEC, $5.0 \text{ } \mu\text{g/L}$ (0.005 mg/L); Japan, $<0.01 \text{ mg/L}$; USSR/UNEP, 0.01 mg/L ; WHO, 0.005 mg/L . Further, guidelines for cadmium in drinking water have been set⁽⁶¹⁾ ranging from $5 \text{ } \mu\text{g/L}$ (Kansas and Minnesota) to $10 \text{ } \mu\text{g/L}$ (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by Inductively Coupled Plasma Optical Emission Spectrometry. Dissolved cadmium is determined by $0.45 \text{ } \mu$ filtration followed by the previously cited methods. See also reverence⁽⁴⁹⁾.

Routes of Entry: Inhalation or ingestion of fumes or dust.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Dust may cause irritation of the nose and throat. Non-fatal lung inflammation has been reported from concentrations of 0.5 to 2.5 mg/m^3 . In 4 to 10 hours after exposure severe chest pain, with persistent cough and difficult breathing, headache, chills, muscle aches, nausea, vomiting, diarrhea. Fluid in the lungs (pulmonary

edema) and dark-purple coloration of the skin may occur. Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death. Breathing becomes more difficult and is accompanied by wheezing or coughing of blood. Other symptoms which may occur 12 to 36 hours after exposure in addition to those above include dizziness, irritability, gastrointestinal disturbances, shortness of breath, fever, profuse sweating, exhaustion and inflammation of the lungs. Death may result within 7 to 10 days after exposure. The average concentrations of fume responsible for fatalities have been 40 to 50 mg/m^3 for 1 hour, 9 mg/m^3 for 5 hours, or 5 mg/m^3 for 8 hours. *Skin:* Absorption is negligible. *Eyes:* Cadmium compound dust may cause irritation. *Ingestion:* A dose of 15 - 30 mg ($1/1000 \text{ oz.}$) of metal or soluble compounds may cause increased salivation, choking, vomiting, abdominal pain, anemia, kidney malfunction, diarrhea, and persistent desire to empty the bladder. Symptoms may occur within 15-30 minutes after ingestion. May cause heart and lung failure.

Long Term Exposure: Continued exposure to low levels of cadmium in air may cause irreversible lung injury, abnormal lung function and kidney disease. Other consequences of cadmium exposures are inflammation of the nose and throat, open sores in the nose, soreness, bleeding and reduced nose size, loss of sense of smell, damage to the olfactory nerve, yellow cadmium stains on teeth, sleeplessness, nausea, lack of appetite, weight loss, anemia, lung distention with scar formation, and liver damage. May cause bone disease characterized by softening, bending and reduction in bone size. Difficulty walking, pain in back and extremities, and spontaneous fractures may result. Inhalation of 0.06 mg/m^3 to 0.68 mg/m^3 for 4 to 8 years may cause throat irritation, cough, chest pain, upset stomach and fatigue. Exposure to levels of 3.0 to 15.0 mg/m^3 of fumes or dust over a period of 20 years has caused lung distention, anemia, protein in urine and kidney dysfunction. Studies indicate that there is an increased incidence of prostatic cancer and possible kidney and respiratory cancer in cadmium workers. Cadmium causes birth defects in rats, mice and hamsters. Cadmium does not readily go from a pregnant woman's body into the developing child, but some portion can cross the placenta. It can also be found in breast milk. Animals given cadmium in food or water had high blood pressure, iron-poor blood, liver disease, and nerve or brain damage. We don't know if humans get any of these diseases from eating or drinking cadmium. Skin contact with cadmium is not known to cause health effects in humans or animals. The babies of animals exposed to high levels of cadmium during pregnancy had changes in behavior and learning ability. Cadmium may also affect birth weight and the skeleton in developing animals. **Points of Attack:** Respiratory system, lungs, kidneys, prostate, blood.

Medical Surveillance: In preemployment physical examinations emphasis should be given to a history of, or

actual presence of, significant kidney disease, smoking history, and respiratory disease. A chest x-ray and baseline pulmonary function study is recommended. Periodic examinations should emphasize the respiratory system, including pulmonary function tests, kidneys and blood.

A low molecular weight proteinuria may be the earliest indication of renal toxicity. The trichloroacetic acid test may pick this up, but more specific quantitative studies would be preferable. If renal disease due to cadmium is present, there may also be increased excretion of calcium, amino acids, glucose, and phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Cadmium Chloride

Use Type: Fungicide

CAS Number: 10108-64-2

Formula: CdCl₂

Synonyms: Cadmium dichloride; Cloruro de cadmio (Spanish); Dichlorocadmium; Kadmiumchlorid (Germany)

Trade Names: CADDY[®], Cleary Chemical Corp. (USA), canceled 8/13/1990; VI-CAD[®], Vineland Chemical (USA), canceled 12/31/1987

Producers: Advance Research Chemicals, Inc. (USA); Degussa (Germany); Great Western Inorganics (USA); Nihon Kagaku Sangyo (Japan); Honeywell Performance P & C (USA); Rhone-Poulenc (France)

Chemical Class: Inorganic, heavy metal

EPA/OPP PC Code: 012902

California DPR Chemical Code: 94

ICSC Number: 0116

RTECS Number: EV0175000

EEC Number: 048-008-00-3

EINECS Number: 233-296-7

Uses: Cadmium chloride is also used in dyeing and printing of fabrics; in electronic component manufacture; in photography.

U.S. Maximum Allowable Levels for Cadmium:

The Food and Drug Administration (FDA) limits the amount of cadmium in food colors to 15 parts per million (15 ppm).

Carcinogen/Hazard Classifications

U.S. NTP Carcinogen: Known carcinogen

California Prop. 65: Carcinogen

IARC: Group 1, known carcinogen

Label Signal Word: CAUTION

Endocrine Disruptor: Not listed as cadmium chloride; Probable ED as cadmium.

Regulatory Authority:

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 10 lb (4.54 kg).
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%.
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds.
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited, as cadmium compounds.

Description: Colorless, crystalline solid or powder. Odorless. Boiling point = 960°C. Melting/Freezing point = 568°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Incompatibilities: Sulfur, selenium, potassium, and strong oxidizers.

Permissible Exposure Limits in Air: The Federal standard⁽⁵⁸⁾ for cadmium compounds is 0.005mg/m³ (as Cd) as an 8-hour TWA. ACGIH⁽¹⁾ has recommended a TWA value of 0.01 mg/m³ for Cd dusts/salts and 0.002 mg/m³ for respirable dust. NIOSH⁽²⁾ recommends that exposure to cadmium be at the lowest feasible level. See also this section in the entry on Cadmium. Guidelines for cadmium chloride in ambient air have been set⁽⁶⁰⁾ ranging from 1.67 µg/m³ (New York) to 5.0µg/m³ (Florida).

Determination in Air: Collection of particles on a filter, workup with acid and measurement by atomic absorption has been specified by NIOSH. See NIOSH Methods #7048 (Cd).⁽¹⁸⁾

Permissible Concentration in Water: The U.S. EPA has set a limit of 5 ppb. Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L.

Drinking water standards have been set⁽³⁵⁾ by Czechoslovakia, 0.010 mg/L; EEC, 5.0 µg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR/UNEP, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set⁽⁶¹⁾ ranging from 5 µg/L (Kansas and Minnesota) to 10 µg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by Inductively Coupled Plasma Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 µ filtration followed by the previously cited methods. See also reverence⁽⁴⁹⁾.

Routes of Entry: Inhalation of dust, ingestion

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause irritation. Cadmium chloride can cause severe irritation of the gastrointestinal tract and the respiratory tract. Inhalation can cause nose, throat, and lung irritation. Fumes can cause flu-like illness with chills, headache, aching muscles and/or fever. Higher exposures can cause nausea, salivation, vomiting, cramps, diarrhea, and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Cadmium chloride is highly toxic. As little as 14.5 mg of Cd orally causes nausea and vomiting; 8.9 grams has caused death. Cadmium salts cause cramps, nausea, vomiting and diarrhea. Acute poisoning causes lung damage. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: This chemical is a probable carcinogen in humans, with some evidence that it causes prostate and kidney cancer in humans and it has been shown to cause lung and testes cancer in animals. It may also be a reproductive hazard in humans. Repeated low exposures may cause permanent kidney and liver damage, anemia, and/or loss of the sense of smell. Chronic poisoning damages kidneys, lungs, bones and causes blood changes (anemia). Cadmium does not readily go from a pregnant woman's body into the developing child, but some portion can cross the placenta. It can also be found in breast milk. The babies of animals exposed to high levels of cadmium during pregnancy had changes in behavior and learning ability. Cadmium may also affect birth weight and the skeleton in developing animals.

Points of Attack: Respiratory system, lungs, kidneys, prostate, blood.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Urine test for cadmium (levels should be less than 10 µgms/L of urine). Urine test for "low molecular weight proteins" to detect kidney damage. Urinalysis. Complete Blood Count. Lung function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Cadmium Sulfate

Use Type: Fungicide

CAS Number: 10124-36-4

Formula: O₄S·Cd

Synonyms: Cadmium monosulfate; Cadmium sulphate; Sulphuric acid, cadmium salt; Sulfuric acid, cadmium(2+) salt; Sulfuric acid, cadmium(II) salt

Producers: Degussa (Germany); Fluorochem Ltd. (UK); Goldschmidt (Germany); Merke (Germany); Rhodia Group (France)

Chemical Class: Inorganic heavy metal

EPA/OPP PC Code: 012905

ICSC Number: 1318

EEC: 048-009-00-9

EINECS Number: 233-331-6

Uses: It is used in pigments, electroplating, and in synthetic and analytical chemistry. Also used in fluorescent screens, as an electrolyte. See also "Cadmium."

U.S. Maximum Allowable Levels for Cadmium:

The Food and Drug Administration (FDA) limits the amount of cadmium in food colors to 15 parts per million (15 ppm).

Description: Cadmium sulfate is a white or colorless, crystalline solid. Odorless. Molecular weight = 208.48. Melting/Freezing point = 1000°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Incompatibilities: Incompatible with strong oxidizers, sulfur, selenium, tellurium, zinc. May ignite combustible materials.

Permissible Exposure Limits in Air: The Federal standard⁽⁵⁸⁾ for cadmium compounds is 0.005mg/m³ (as Cd) as an 8-hour TWA. ACGIH⁽¹⁾ has recommended a TWA value of 0.01 mg/m³ for Cd dusts/salts and 0.002 mg/m³ for respirable dust⁽¹⁾. NIOSH⁽²⁾ recommends that exposure to cadmium be at the lowest feasible level.

Determination in Air: Collection of particles on a filter, workup with acid and measurement by atomic absorption has been specified by NIOSH. See NIOSH Methods #7048 (Cd).⁽¹⁸⁾

Permissible Concentration in Water: The U.S. EPA has set a limit of 5 ppb. Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set⁽³⁵⁾ by Czechoslovakia, 0.010 mg/L; EEC, 5.0 µg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR/UNEP, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water

have been set⁽⁶¹⁾ ranging from 5 µg/L (Kansas and Minnesota) to 10 µg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by Inductively Coupled Plasma Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 µ filtration followed by the previously cited methods. See also reverence⁽⁴⁹⁾.

Routes of Entry: Inhalation, ingestion

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes on contact. Inhalation irritates the nose, throat and lungs with coughing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Cadmium sulfate can cause nausea, salivation, vomiting, cramps and diarrhea, metal fume fever with flu-like symptoms, chills, headache, weakness, metallic tasted in the mouth. IDLH level = 50 mg/m³ dust; 9 mg/m³ fume. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Repeated exposure can cause anemia, brittle and painful bones, diminished or loss of the sense of smell, fatigue, and/or yellow staining of the teeth. May cause lung and prostate cancer, kidney damage with kidney stones, liver damage, lung damage with bronchitis, cough, phlegm, and/or shortness of breath. There is some evidence that cadmium sulfate is a teratogen in humans. It is unknown if cadmium causes birth defects in people. Cadmium does not readily go from a pregnant woman's body into the developing child, but some portion can cross the placenta. It can also be found in breast milk. The babies of animals exposed to high levels of cadmium during pregnancy had changes in behavior and learning ability. Cadmium may also affect birth weight and the skeleton in developing animals.

Points of Attack: Lungs, liver, kidneys, blood.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Urine test for cadmium (levels should be less than 10 µgms/L of urine). Urine test for low molecular weight proteins (β -2-microglobulin) to detect kidney damage. Complete blood Count. Lung function tests. Liver function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been

swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician or authorized medical personnel: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics. The symptoms of metal fume fever may be delayed for 4-12 hours following exposure: it may last less than 36 hours

Cadusafos

Use Type: Insecticide and nematicide

CAS Number: 95465-99-9

Formula: C₁₀H₂₃O₂PS₂

Synonyms: *O*-Ethyl *S,S*-[di(sec-butyl)]phosphorodithioate; *O*-Ethyl *S,S*-[bis(1-methylpropyl)]phosphorodithioate; Phosphorodithioic acid, *O*-ethyl *S,S*-bis(1-methylpropyl) ester

Trade Names: APACHE®; EBUFOS®; FMC® 67825, FMC (USA); RUGBY®, FMC (USA); TAREDAN®

Producers: FMC (USA)

Chemical Class: Organophosphate

EPA/OPP PC Code: 128864

RTECS Number:

EEC Number:

EINECS Number:

Uses: Not registered in the U.S. It is used to control nematodes and soil insects on bananas in Mexico, Guatemala, Honduras, Costa Rica, and Ecuador. Although it is not registered for use in the U.S., an import tolerance was established for cadusafos in or on bananas in 1987.

U.S. Maximum Allowable Residue Levels for Cadusafos (40 CFR 180.461):

CROP	ppm
Banana	0.01

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, unlikely carcinogen

WHO Acute Hazard: Class 1b, highly hazardous

Regulatory Authority:

- DOT Inhalation Hazard Chemicals as organophosphates

Description: Molecular weight = 270.41

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus Pesticides.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Do not drink any alcoholic beverages before or during use; alcohol promotes absorption of organophosphates.

First Aid: **Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt.** Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush

skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. **Antidotes:** Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and

sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Calcium Arsenate

Use Type: Insecticide, herbicide, rodenticide, and molluscicide

CAS Number: 7778-44-1

Formula: $\text{As}_2\text{Ca}_3\text{O}_8$; $\text{Ca}_3(\text{AsO}_4)_2$

Synonyms: Arseniato calcico (Spanish); Arsenic acid, calcium salt (2:3); Arsenate de calcium (French); Calciumarsenat (German); Calcium orthoarsenate; Kalziumarseniat (German); Tricalcium arsenate; Tricalciumarsenat (German); Tricalcium orthoarsenate

Trade Names: CAL-META[®], Zeneca Inc. (USA) (now Syngenta), canceled 7/01/1987; CHIP-CAL[®], Rhone-Poulenc Agrochemical (France) canceled 9/27/1985; CUCUMBER DUST[®]; FENCAL[®]; FLAC[®]; KALO[®]; KILMAG[®]; METAG[®], Ortho Business Group (USA), canceled 10/04/1985; NIAGARA[®], FMC (USA), canceled 5/01/1987; PENCAL[®]; PROTARS[®]; SECURITY[®] (trade

name for lead arsenate also), Mallinckrodt Inc. (USA), canceled 10/10/1989; SPRA-CAL[®]; TURF-CAL[®]

Producers: Great Western Inorganics (USA); Helena Chemical Company (USA)

Chemical Class: Inorganic arsenical

EPA/OPP PC Code: 013501

California DPR Chemical Code: 96

ICSC Number: 0765

RTECS Number: CG0830000

RCRA Number: 231-904-5

EEC Number: 033-005-00-1

EINECS Number: 231-904-5

Uses: In 1988, EPA revoked the registration for the pesticide calcium arsenate, which in years past was used to control insects on a variety of raw agricultural commodities. Calcium arsenate was registered for use on asparagus, beans, blackberries, blueberries (huckleberries), boysenberries, broccoli, Brussels sprouts, cabbage, carrots, cauliflower, celery, collards, corn, cucumbers, dewberries, eggplant, kale, kohlrabi, loganberries, melons, peppers, pumpkins, raspberries, rutabagas, spinach, squash and youngberries.

Carcinogen/Hazard Classifications

U.S. NTP Carcinogen: Known carcinogen

California Prop. 65: Listed; carcinogen

IARC: Group 1, known carcinogen

Label Signal Word: WARNING

WHO Acute Hazard: Class 1b, highly hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- Air Pollutant Standard Set (former USSR/UNEP),⁽⁴³⁾⁽⁶⁰⁾ (HSE),⁽³³⁾ and (Several Canadian Provinces) as arsenic
- Carcinogen (Human) (IARC)⁽⁹⁾ (DFG)⁽³⁾ (NTP) (OSHA)
- Banned or Severely Restricted (UK, India) (UN)⁽¹³⁾ (Various) (UN)⁽³⁵⁾ as arsenic compounds
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- Proposition 65 chemical (CAL)
- The "Director's List" (CAL/OSHA)
- Carcinogen User Register Chemical (CAL/OSHA) as inorganic arsenic compound
- AB 1803-Well Monitoring Chemical (CAL) as inorganic arsenic compound
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as inorganic arsenic compound
- Clean Air Act: List of high risk pollutants (Section 63.74) as arsenic compounds.
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15) as arsenic and compounds.
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%.
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4,540 kg).
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), listed by name; also listed as calcium arsenate and calcium arsenite, mixtures, solid.
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: $\text{Ca}_3(\text{AsO}_4)_2$, a white flocculent powder. Molecular weight = 398.10. Slightly soluble in water. Boiling point = (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0.

Incompatibilities: None reported, according to NIOSH. When heated produces As fumes.

Permissible Exposure Limits in Air: The Federal limit is 0.010 mg/m^3 (2). NIOSH⁽²⁾ has recommended a limit of 0.002 g/m^3 with a 15-minute ceiling. The NIOSH⁽²⁾ IDLH level = 5 mg/m^3 (as As). The German DFG⁽³⁾ has set no MAK value because of the notation that this is a proven human carcinogen. The former USSR-UNEP/IPRTC project⁽⁴³⁾ has set a MAC for calcium arsenate in ambient air of residential areas as 0.009 mg/m^3 on a momentary basis and 0.004 mg/m^3 on an average daily basis. North Carolina has set a limit in ambient air⁽⁶⁰⁾ of $0.0002 \text{ } \mu\text{g/m}^3$.

Determination in Air: Filter collection followed by atomic absorption analysis. NIOSH 7900; OSHA ID105.

Permissible Concentration in Water: EPA has set a limit of 0.05 parts per million (ppm) for arsenic in drinking water. The U.S. EPA arsenic drinking water standard of 0.01 ppm (10 ppb) is based on the U.S. EPA final rule for arsenic in drinking water published in the January 22, 2001, *Federal Register*. However, the U.S. EPA is currently reviewing the science and cost estimate supporting this rule, and, in the interim, has reverted to the previous standard for arsenic. Thus, in the US, the current EPA arsenic drinking water standard remains at 0.05 ppm (50 ppb). To protect freshwater aquatic life-total recoverable trivalent inorganic arsenic never to exceed $440 \text{ } \mu\text{g/L}$. To protect saltwater aquatic life: $508 \text{ } \mu\text{g/L}$ on an acute basis. To protect human health: preferably zero. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: For arsenic: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an

alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic⁽⁵⁸⁾.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin and respiratory tract. Can cause poor appetite, a metallic or garlic taste, nausea, vomiting, stomach pain, diarrhea, abnormal heart rhythm, seizures, pain in extremities and muscles, weakness, flushing of skin, numbness and tingling in extremities, intense thirst, and muscular cramps, delirium and even death. Kidney failure may occur. Jaundice may appear within an hour. In severe poisoning, death can occur within an hour, but the usual interval is 24 hours. This material is extremely toxic; the probable oral lethal dose for humans is 5-50 mg/kg; or between 7 drops and 1 teaspoonful for a 150 lb. person. It is an irritant to eyes, respiratory tract, mouth and stomach. IDLH level = 100 mg/m^3 .

Long Term Exposure: Calcium arsenate is a carcinogen in humans and may be a reproductive hazard. Damage to kidneys, liver and the nervous system have been reported. Chronic exposure can cause bone marrow damage, often leading to aplastic anemia. Long term exposure can cause an ulcer in the septum dividing the inner nose. High or repeated exposure may damage the nerves causing weakness, and poor coordination in the limbs. Repeated skin contact can cause thickened skin and/or patch areas of darkening and loss of pigment. Some may develop white lines on the nails. There is epidemiological evidence that chronic ingestion or arsenic compounds causes a predisposition to skin cancers. A rebuttable presumption against pesticide registration was issued on October 18, 1978 by U.S. EPA on the basis of oncogenicity, teratogenicity and mutagenicity. Birth defects have been observed in animals exposed to inorganic arsenic. It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

Points of Attack: Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Examination of the nose, eyes, nails, and nervous system. Liver function tests. Tests for Urine arsenic. NIOSH⁽²⁾ recommends urine arsenic should not exceed 100 micrograms per gram of creatine in the urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure.

Calcium Arsenite

Use Type: Herbicide, insecticide and rodenticide

CAS Number: 52740-16-6

Formula: CaAsO_3H ; $\text{AsH}_2\text{O}_3 \cdot \text{Ca}$

Synonyms: Arsenito calcico (Spanish); Arsenous acid, calcium salt; Arsonic acid, calcium salt (1:1); Calcium meta-arsenate; Monocalcium arsenite

Chemical Class: Arsenical

EPA/OPP PC Code: 013602

RTECS Number: CG3380000

Uses: Not registered in the U.S. Used in dormant and delayed dormant application to apricots, cherries, and peaches.

U.S. Maximum Allowable Residue Levels:

Tolerances for residue limits of combined arsenic (calculated as As) in food are established in edible tissues and in eggs of chickens and turkeys and in edible tissues of swine. (total arsenic). See 21 CFR 556.60 (4/1/90) for U.S. Residue Limits for Veterinary Drugs and Unavoidable Contaminants in Meat, Poultry, and Egg Products.

Carcinogen/Hazard Classifications

U.S. NTP Carcinogen: Known carcinogen

California Prop. 65: Carcinogen (as arsenic) and developmental toxin

IARC: Group 1, known carcinogen

Endocrine Disruptor: Suspected endocrine disruptor as an arsenic compound

Regulatory Authority:

- Marine pollutant (49CFR, Subchapter 172.101, Appendix B).

Description: White, granular powder. Odorless. Slightly soluble in water. Molecular weight =164. Hazard Identification (based on NFPA-704 M Rating System): Health Hazards (Blue): 4; Flammability (Red): 0; Reactivity (Yellow): 0

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air: ACGIH⁽¹⁾ TLV 0.01 mg/m³; OSHA PEL⁽²⁾ [1910.1080] 0.010 mg/m³; NIOSH⁽²⁾ REL ceiling 0.002 mg/m³/15 min, as arsenic; potential human carcinogen; reduce exposure to lowest feasible level

Determination in Air: Filter collection followed by atomic absorption analysis. NIOSH 7900; OSHA ID105.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. EPA⁽⁶⁾ recommends a zero concentration of arsenic for human health reasons but has set a guideline of 50 µg/L⁽⁶¹⁾ for drinking water.

Determination in Water: See OSHA Method ID-105 for arsenic.

Routes of Entry: Inhalation, absorbed through the skin, eyes, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: IDLH: 5 mg/m³ as inorganic arsenic.

Inhalation : Dust is readily absorbed from the lungs, but inhaled quantities are usually insufficient to cause acute systemic toxicity. Can cause cough with foamy sputum and rales. Inhalation Limit: 10 mg/m³ **Skin/Eye Contact:** Dust can cause localized skin irritation, but systemic absorption through the skin is negligible. Skin contact is unlikely to cause systemic effects unless the dermal barrier is

compromised. Eye exposure may produce burns and ulcerations. *Ingestion:* The most important route of acute exposure. Arsenicals are quickly absorbed and can be extremely hazardous. Significant tissue and organ damage and death may result. *Symptoms of exposure include:* headache (lethargy, delirium, hallucinations, seizures, or coma can occur); dizziness; acute nausea and occasional vomiting; labored breathing; restlessness; cyanosis (pale or bluish lips, face and fingernails); perspiration; difficult breathing; abdominal pain with diarrhea; trembling and feeling of “pins and needles” or electrical shock like pains in the lower extremities.; convulsions; unconsciousness; possible pulmonary edema, a medical emergency. Very acute poisoning: extreme headache; muscular paralysis, and liver and kidney dysfunction, loss of consciousness; death.

Long Term Exposure: Chronic exposure is characterized by malaise, peripheral sensorimotor neuropathy, anemia, jaundice, gastrointestinal complaints, and characteristic skin lesions including hyperkeratosis (small corn-like elevations) and hyperpigmentation. Hyperkeratosis usually appears on the palms or soles. Pigmentation changes and hyperkeratosis can take 3 to 7 years to appear. Chronic inhalation can also lead to conjunctivitis, irritation of the throat and respiratory tract, and perforation of the nasal septum. Chronic exposure can cause allergic contact dermatitis. Chronic exposure may be more serious for children because of their potential longer latency period. **Carcinogenicity:** The Department of Health and Human Services, IARC, EPA, and NTP have classified arsenic as a human carcinogen based on sufficient evidence from human data. Arsenic trioxide causes skin and lung cancer, and may cause internal cancers such as liver, bladder, kidney, colon, and prostate cancers. Arsenic ions released from arsenic trioxide within the body can cross the placenta and affect the developing fetus; arsenic is also excreted in breast milk. Experimental animal studies support an association between high ingested arsenic dose and fetal toxicity.

Points of Attack: Muscles, liver, and kidney.

Medical Surveillance: In acutely ill patients, the agent most frequently recommended is dimercaprol, also known as BAL (British Anti Lewisite). The standard dosage regimen is 3 to 5 mg/kg IM every 4–6 hours until the 24-hour urinary arsenic level falls below 50 µg/L, unless an orally administered chelating agent (e.g., DMSA, see below) is substituted. This regimen may be adjusted depending upon the severity of the exposure and the symptoms. Do not chelate asymptomatic patients without the guidance of a 24-hour urinary arsenic level. Contraindications to BAL include preexisting renal disease, pregnancy (except in life-threatening circumstances) and concurrent use of medicinal iron (BAL and iron together form a complex that is very toxic).

First Aid: Do not contaminate yourself. Positive-pressure, self-contained breathing apparatus (SCBA) is recommended

in response situations that involve exposure to potentially unsafe levels of arsenicals or combustion products which may include arsine and arsenic trioxide fumes. **Eyes:** Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Although it is poorly absorbed dermally, skin contact should be avoided because arsenicals may irritate the skin. Wearing the appropriate PPE equipment and respirator for arsenicals. Immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. *Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able to swallow, aggressive decontamination with gastric lavage is recommended within 1 hour of ingestion of a life-threatening amount of poison. The effectiveness of activated charcoal in binding arsenic trioxide is questionable, but administration of a charcoal slurry is recommended pending further evaluation in cases of ingestion of unknown quantities (at 1 gm/kg, usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. If victim is **UNCONSCIOUS OR HAVING CONVULSIONS**, do nothing except keep victim warm. **Inhalation:** Get medical aid. Wearing the appropriate PPE equipment and respirator for arsenicals, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Calcium Carbonate

Use Type: Fungicide, herbicide, microbiocide, and used as a pH soil adjustment

CAS Number: 471-34-1 (monocarbonate); 1317-65-3

Formula: CCaO_3

Synonyms: Agricultural limestone; Aragonite (mineral); Calcite (mineral); Calcium(II)carbonate (1:1); Carbonic acid, calcium salt (1:1); Chalk; Domolite; Limestone;

Lithographic stone; Marble; Parcpitated chalk; Portland stone; Slaker rejects; Sohnhofen stone; Vaterite (mineral); Whiting

Trade Names: AGLIME[®]; AGSTONE[®]; ATOMIT[®]; BELL MINE PULVERIZED LIMESTONE[®]; FRANKLIN[®]

Producers: Advance Research Chemicals, Inc; Ashland Chemical (USA); BASF (Germany); Bombay Mineral Supply (India); Chemettal (Germany); Clariant (Switzerland); C.P. Hall (USA); Dankalk (Denmark); Franklin Industrial Minerals (USA); General Chemical (USA); Humco (USA); ICI Group (UK); Infinity Industries (USA); Lhoist Group (France); Lime Chemicals (India); Martin Marietta (USA); Microfill K. Zafranias (Greece); Minerals Technologies (USA); Mississippi Lime (USA); Ocean Chemicals Group (UK); Omya (Switzerland); Pfizer (USA); Quimica Industrial Agricola (Mexico); Solvay Group (Belgium); Specialty Minerals (USA)

Chemical Class: Inorganic

EPA/OPP PC Code: 073502

California DPR Chemical Code: 1007

ICSC Number: 1193

RTECS Number: EV9580000; FF9335000 (mono-carbonate)

EINECS Number: 207-439-9

Uses: Calcium carbonate is used as a source of lime; neutralizing agent; manufacturing or rubber, plastics, paint, paper, dentifrices, ceramics, putty, polishes, insecticides, inks and cosmetics; whitewash; Portland cement; antacid; analytical chemistry and others.

U.S. Maximum Allowable Residue Levels for Calcium Carbonate [40 CFR 180.1001© and 180.1001(e)]:

CROP	ppm
Raw Agricultural Commodities	–
Animal Products	–

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (Australia) (Israel) (Mexico) (Several Canadian Provinces)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- Actively registered pesticide in California.

Description: Calcium carbonate, CaCO₃ (CAS 471-34-1) is a white, odorless powder or crystalline solid. Very slightly soluble in water. Molecular weight = 100.05. Melting/Freezing point = 1517-2442°F (decomposes). Boiling point = 825°C (decomposes)

Incompatibilities: Calcium carbonate decomposes in high temperature forming carbon dioxide and corrosive materials. Reacts with acids producing carbon dioxide gas release. Incompatible with acids, ammonium salts, fluorine. NIOSH⁽²⁾ also lists alum as incompatible, but this is questionable.

Permissible Exposure Limits in Air: ACGIH⁽¹⁾ has set a TWA of 10 mg/m³ (for dust containing no asbestos and <1%

free silica). The HSE⁽³³⁾ has set a TWA of 10 mg/m³ for total inhalable dust and 5 mg/m³ for respirable dust. OSHA⁽²⁾ has set a TWA of 15 mg/m³ on a total dust basis and 5 mg/m³ on a respirable fraction basis. NIOSH⁽²⁾ has set a TWA of 10 mg/m³ on a total dust basis and 5 mg/m³ on a respirable fraction basis.

Determination in Air: Filter; Acid; Flame atomic absorption spectrometry; IV NIOSH Method #7020 (Calcium)⁽¹⁸⁾. Calcium Carbonate may be measured by gravimetric means after filter collection. See NIOSH analytical methods #0500⁽¹⁸⁾ for nuisance dust, total and 0600 for nuisance dust, respirable.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause irritation to nose. *Eyes:* Contact can cause irritation. *Ingestion:* Large amounts can cause irritability, nausea, dehydration and constipation. Estimated lethal dose is over 2 lb.

Long Term Exposure: Ingestion of more than 8 grams (1/3 ounce) a day can cause blood and kidney disorders.

Points of Attack: Eyes, respiratory system, digestive system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Calcium Cyanamide

Use Type: Herbicide, insecticide, fertilizer and defoliant

CAS Number: 156-62-7

Formula: CCaN₂; CaCN₂

Synonyms: Calcium carbimide; Calcium cyanamid; CCC; Cianamida calcica (Spanish); Cy-L 500; Cyanamid; Cyanamide; Cyanamide, calcium salt (1:1); Cyanamide calcique (French); Cyanamid granular; Cyanamid special grade; Lime nitrogen; NCI-C02937; Nitrogen lime; Nitrolime; USAF Cy-2

Trade Names: AERO-CYANAMID®; AERO-CYANAMID®, SPECIAL GRADE; ALZODEF®

Producers: Degussa (Germany); Fluorochem Ltd. (UK); ICI Group (UK); Denki Kagaku Kogyo (Japan); Hunan Darong Chemical & Pesticide Company (China); Jilin Chemical Industrial (China); Juhua Group Corp. (China); Nippon Carbide Industries (Japan); Orica (Australia); Quantum Chemicals (Australia)

Chemical Class: Inorganic

EPA/OPP PC Code: 014001

RTECS Number: GS6000000

EINECS Number: 205-861-8

Uses: Calcium cyanamide is used a defoliant for cotton plants in addition to its other agriculture uses. It is also used in the manufacture of dicyandiamide and calcium cyanide as a desulfurizer in the iron and steel industry, and in steel hardening.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not listed. Group C, possible carcinogen (as cyanide)

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (UNEP)⁽⁴³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Australia) (DFG) (Israel)
- (Mexico) (Several Canadian Provinces)

- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- Clean water act: Section 307 Priority Pollutants as cyanide, total; Toxic Pollutant (Section 401.15)
- EPA Hazardous Waste Number (RCRA No.): P030
- RCRA Section 261 Hazardous Constituents.
- RCRA Universal Treatment Standards: Wastewater (mg/L), 1.2 (total); 0.86 (amenable); Nonwastewater (mg/kg), 590 (total); 30 (amenable)
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 9010(40)
- Safe Drinking Water Act: MCL, 0.1 mg/L; MCLG, 0.1 mg/L; Regulated chemical (47 FR 9352)
- U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B) as cyanides, mixtures or solutions

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg).
- EPCRA Section 313 Form R de minimus concentration reporting level: 1.0%.
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI)

Description: Calcium cyanamide is a blackish-grey, shiny crystalline material or powder. Insoluble in water. Molecular weight = 80.09. Melting/Freezing point = ~1342°C (sublimes >1200°C).

Incompatibilities: Commercial grades of calcium cyanamide may contain calcium carbide; contact with any form of moisture solutions may cause decomposition, liberating explosive acetylene gas and ammonia. May polymerize in water or alkaline solutions to dicyanamide. Contact with all solvents tested also cause decomposition.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ and ACGIH⁽¹⁾ TLV recommends 0.5 mg/m³. The MAK set by DFG⁽³⁾ is 1.0 mg/m³. The HSE⁽³³⁾ TLV is 0.5 mg/m³ and they have set a STEL of 1.0 mg/m³. The former USSR/UNEP joint project⁽⁴³⁾ has set a MAC in ambient residential air of 0.02 mg/m³ either on a momentary or a daily average basis. Several states have set guidelines or standards for calcium cyanamide in ambient air⁽⁶⁰⁾ ranging from 5.0 µg/m³ (North Dakota) to 8.0 µg/m³ (Virginia) to 10.0 µg/m³ (Connecticut) to 12.0 µg/m³ (Nevada).

Determination in Air: Filter; none; Gravimetric; IV NIOSH Method #0500, Particulates NOR (total)⁽¹⁸⁾

Permissible Concentration in Water: The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L). The former USSR/UNEP joint project⁽⁴³⁾ has set a MAC of 1.0 mg/L in water for domestic purposes.

Determination in Water: Cyanide may be determined titrimetrically by EPA Methods 335.2 and 9010 which give total cyanide.

Routes of Entry: Inhalation of dust, ingestion

Harmful Effects and Symptoms

Short Term Exposure: Calcium cyanamide can cause nausea, headache, dizziness, and flushing of the skin. It is a primary irritant of the mucous membranes of the respiratory tract, eyes, and skin. Drinking alcohol shortly before or within 1-2 days after exposure can cause a severe reaction. Inhalation may result in rhinitis, pharyngitis, laryngitis, and bronchitis. Conjunctivitis, keratitis, and corneal ulceration may occur. An itchy erythematous dermatitis has been reported and continued skin contact leads to the formation of slowly healing ulcerations on the palms and between the fingers. Sensitization occasionally develops. Chronic rhinitis and perforation on the nasal septum have been reported after

long exposures. All local effects appear to be due to the caustic nature of cyanamide.

Long Term Exposure: Calcium cyanamide may damage the developing fetus. This chemical may damage the nervous system, causing numbness, and weakness in the hands and feet. Prolonged contact can cause skin ulcers. It causes a characteristic vasomotor reaction. There is erythema of the upper portions of the body, face and arms accompanied by nausea, fatigue, headache, dyspnea, vomiting, oppression in the chest and shivering. Circulatory collapse may follow in the more serious cases. The vasomotor response may be triggered or intensified by alcohol ingestion. Pneumonia or lung edema may develop. Cyanide ion is not released in the body, and the mechanism of toxic action is unknown.

Points of Attack: Eyes, skin, respiratory system, vasomotor system

Medical Surveillance: Examination of the nervous system. Evaluation by a qualified allergist. Evaluate skin, respiratory tract and history of alcohol intake in placement or periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Calcium Cyanide

Use Type: Rodenticide and fumigant

CAS Number: 592-01-8

Formula: C_2CaN_2 , $Ca(CN)_2$

Synonyms: Calcid; Calcyan; Calcyanide; Cianuro calcico (Spanish); Cyanogas; Cyanure de calcium (French)

Trade Names: AERO[®], Sasol Ltd. (South Africa)

Producers: Sasol Ltd. (South Africa)

Chemical Class: Inorganic

EPA/OPP PC Code: 074001

California DPR Chemical Code: 176

ICSC Number: 0407

RTECS Number: EW0700000

EEC Number: 020-002-00-5

Uses: Calcium cyanide is used as a fumigant, as a rodenticide, and for killing honey bees in the hives. Also used in leaching precious metal ores; in the manufacture of stainless steel and as a stabilizer for cement.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1 a, extremely hazardous

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (DFG)⁽³⁾ (HSE)⁽³³⁾ (UNEP)⁽⁴³⁾ (OSHA)⁽⁵⁸⁾
- The "Director's List" (CAL/OSHA)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92)
- EPA Hazardous Waste Number (RCRA No.): P021
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
- RCRA Universal Treatment Standards: Wastewater (mg/L), 1.2 (total); 0.86 (amenable); Nonwastewater (mg/kg), 590 (total); 30 (amenable)
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 9010(40)
- Safe Drinking Water Act: MCL, 0.1 mg/L; MCLG, 0.1 mg/L; Regulated chemical (47 FR 9352)
- EPCRA Section 304 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B) as cyanides, mixtures or solutions
- Canada, WHMIS, Ingredients Disclosure List (cyanide compounds, inorganic, n.o.s)

Description: Calcium cyanide is a white crystalline solid or powder. Almond odor. Melting/Freezing point = $>350^\circ\text{C}$ (dangerous decomposition below m.p.). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water; violent reaction.

Incompatibilities: Contact with water, acids, acidic salts, moist air, or carbon dioxide, forms highly toxic and flammable hydrogen cyanide. Incompatible with fluorine, magnesium. Reacts violently when heated with nitrites, nitrates, chlorates and perchlorates. Calcium cyanide decomposes in high heat forming hydrogen cyanide and nitrous oxides fumes.

Permissible Exposure Limits in Air: OSHA⁽²⁾ and ACGIH⁽¹⁾: 5 mg/m³TWA; NIOSH⁽²⁾: Ceiling limit, 4.7 ppm;

5 mg/m³ per 10 minutes as cyanides. All have notations that skin contact contributes significantly in overall exposure. IDLH level = 25 mg/m³ as CN. The former USSR/UNEP Project⁽⁴³⁾ has set a MAC of 0.3 mg/m³.

Determination in Air: Filter/Bubbler; Potassium hydroxide; Ion-specific electrode; IV NIOSH Method #7904, Cyanides⁽¹⁸⁾.

Permissible Concentration in Water: The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L).⁽⁶⁾ as part of the priority toxic pollutant program.

Determination in Water: Cyanide may be determined titrimetrically by EPA Methods 335.2 and 9010 which give total cyanide.

Routes of Entry: Can be absorbed through the skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: The substance is corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the central nervous system, blood, heart and respiratory tract. Delayed pulmonary edema may occur after inhalation. Calcium cyanide is highly toxic. The lethal human dose is 18 mg/kg. The hazard is that of hydrogen cyanide. The dust is irritating to the eyes, nose and throat⁽⁴¹⁾. Inhalation or ingestion causes headache, nausea, vomiting and weakness; high concentrations are rapidly fatal.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May be a reproductive toxin in humans.

Points of Attack: Skin, lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Lung function tests. Examination by a qualified allergist. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Do not allow water to enter nose or mouth. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering

a corticosteroid spray. Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1-2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Calcium Hydroxide

Use Type: Soil pH adjustment, fungicide, herbicide

CAS Number: 1305-62-0

Formula: CaH₂O₂; Ca(OH)₂

Synonyms: Bell mine; Calcium hydrate; Carboxide; Hydrated kemikal; Hydrated lime; Slaked lime; Lime water

Producers: Chemical Lime (USA); Continental Lime (USA); C.P. Hall (USA); Dankalk (Denmark); ICI Group (UK); Lhoist (France); Merck (Germany); Omya (Switzerland); Orica (Australia); Showa Denko (Japan)

Chemical Class: Inorganic

EPA/OPP PC Code: 075601

California DPR Chemical Code: 99, 3669

RTECS Number: 1305-62-0

EINECS Number: 215-137-3

Uses: Calcium hydroxide is used in agriculture as fertilizer and in fertilizer manufacturing; it is used in the formulation of mortar, plasters and cements and as a scrubbing and neutralizing agent in the chemical industry.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Australia) (Israel) (Mexico) (Several Canadian Provinces)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Canada, WHMIS, Ingredients Disclosure List

Description: Calcium hydroxide is a soft white crystalline, odorless powder with an alkaline, bitter taste. Melting/Freezing point (decomposes; dehydrates to calcium oxide) = 580°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0.

Insoluble in water. *Note:* Readily absorbs CO₂ from the air to form calcium carbonate.

Incompatibilities: May react violently with acids, maleic anhydride, nitromethane, nitroethane, nitropropane, nitroparaffins and phosphorus.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ REL: TWA 5 mg/m³. OSHA⁽²⁾ PEL: TWA 15 mg/m³ (total); 5 mg/m³ (respirable fraction). ACGIH recommends a TWA value of 5 mg/m³⁽¹⁾. Several states have set guidelines or standards for calcium hydroxide in ambient air⁽⁶⁰⁾ ranging from 50 µg/m³ (North Dakota) to 80 µg/m³ (Virginia) to 100 µg/m³ (Connecticut) to 119 µg/m³ (Nevada).

Determination in Air: Filter collection followed by atomic absorption analysis. See NIOSH Method #7020 for Calcium⁽¹⁸⁾. See also OSHA Method ID 121.⁽⁵⁸⁾

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause severe irritation to mouth, throat and lungs if dust is inhaled. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Skin: May cause painful irritation and chemical burns on contact with open cuts or sores or on prolonged contact with intact skin. *Eyes:* Powders and slurries may cause severe chemical burns. Blindness can result. *Ingestion:* Powders, crystals or slurries may give rise to irritation, soreness and chemical burns. The estimated lethal dose is about one pound.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Lungs may be affected by repeated or prolonged exposure to dust particles.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Calcium Methanearsonate

Use Type: Herbicide, defoliant

CAS Number: 5902-95-4

Formula: C₂H₈As₂O₆·Ca

Synonyms: Arsonic acid, methyl-, calcium salt (2:1); Calcium acid methanearsonate; Calcium hydrogen methanearsonate; Calcium methanearsonate; Methanearsonic acid, calcium salt (2:1); Methylarsonic acid, calcium salt (2:1)

Trade Names: CALAR[®], Drexel Chemical (USA); CAMA[®], canceled; SUPER CRAB-E-RAD-CALAR[®]; SUPER DAL-E-RAD[®], Drexel Chemical (USA); SUPER DAL-E-RAD-CALAR[®], Drexel Chemical (USA); WEED-B-GON[®], The Scotts Company (USA)

Producers: Drexel Chemical (USA); Ortho Business Group (USA); The Scotts Company (USA)

Chemical Class: Organoarsenical

EPA/OPP PC Code: 013806

California DPR Chemical Code: 101

Uses: Used to control a wide variety of broadleaf weeds and annual grasses, primarily in industrial and residential environments. Tolerances for residue limits of combined arsenic (calculated as As) in food are established in edible tissues and in eggs of chickens and turkeys and in edible tissues of swine. (total arsenic). See 21 CFR 556.60 (4/1/90) for U.S. Residue Limits for Veterinary Drugs and Unavoidable Contaminants in Meat, Poultry, and Egg Products.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely a carcinogen; Group B2, Probable carcinogen as cacodylic acid, its parent chemical

California Prop. 65: Carcinogen as cacodylic acid, its parent chemical.

IARC: Group 1, known carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class III, slightly hazardous as cacodylic acid, the parent chemical

Regulatory Authority:

- CLEAN AIR ACT: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds.
- Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds.
- RCRA Section 261 Hazardous Constituents, waste number not listed.
- EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg).
- EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: (inorganics) 0.1%; organics 1.0%.
- Marine pollutant (49CFR, Subchapter 172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as arsenic compounds
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as arsenic compounds
- The "Director's List" (CAL/OSHA) as arsenic compounds

Description: Colorless. Odorless. Soluble in water.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air: The OSHA limit for organic arsenic compounds is 0.5 mg/m³ TWA. For an 8-hour workshift. There is no NIOSH recommendation. The ACGIH TLV is 0.2 mg/m³ TWA.

Determination in Air: Filter; Reagent; Ion chromatography/Hydride generation atomic absorption spectrometry; NIOSH IV⁽¹⁸⁾, Method #5022, Arsenic, organo-

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. EPA⁽⁶⁾ recommends a zero concentration of arsenic for human health reasons but has set a guideline of 50 µg/L⁽⁶¹⁾ for drinking water.

Determination in Water: See OSHA Method ID-105 for arsenic.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritating to skin and eyes. If swallowed, will cause nausea, vomiting, or loss of consciousness. Poisonous. Grade 2; LD₅₀ = 0.5 to 5 g/kg (rat).

Long Term Exposure: Repeated contact may cause skin sensitivity. Chronic exposure to arsenic compounds can cause dermatitis and digestive disorders. Renal damage may develop. In animals: kidney damage; muscle tremor, seizure; possible gastrointestinal tract, reproductive effects; possible liver damage

Points of Attack: Skin, kidneys, liver.

Medical Surveillance: Kidney function tests. Examination by a qualified allergist. Kidney, liver, lung function tests. Consider chest x-ray following acute overexposure.

First Aid: If artificial respiration is administered, *avoid mouth-to-mouth resuscitation; use bag/mask apparatus.* Remove contaminated clothing and shoes. Flush affected areas with plenty of water. If in eyes, hold eyelids open and flush with plenty of water. If swallowed and victim is conscious and able to swallow, have victim drink 4 to 8 ounces of water and have victim induce vomiting. If swallowed and victim is unconscious or having convulsions, do nothing except keep victim warm.

Calcium Nitrate

Use Type: Fertilizer

CAS Number: 10124-37-5

Formula: CaN₂O₆; Ca(NO₃)₂

Synonyms: Calcium (II) Nitrate (1:2); Nitric acid, calcium salt; Lime saltpeter; Nitric acid, calcium salt; Lime saltpeter; Norwegian saltpeter; Nitrocalcite

Producers: GFS Chemicals (USA); Mineral Research & Development (USA); Hydro Agri Chemicals (Norway); Kynoch (South Africa); Omnia Group (South Africa); Pechiney (France); Rallis India (India); Timminco (Canada); Varsal Instruments (USA)

Chemical Class: Inorganic

EPA/OPP PC Code: 070582

California DPR Chemical Code: 5809

ICSC Number: 1037

RTECS Number: EW2985000

EINECS Number: 233-332-1

Uses: It is used to make explosives, fertilizers, matches, fireworks and other industrial products.

Regulatory Authority:

- Actively registered pesticide in California.

Description: Calcium Nitrate is a colorless, moisture absorbing crystalline material. Melting/Freezing point = 561°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1. Oxidizer. Soluble in water.

Incompatibilities: A strong oxidizer. Incompatible with combustible materials, reducing agents, organics and other oxidizable materials, chemically active metals, aluminum nitrate, ammonium nitrate.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Eyes, skin, respiratory system.

Harmful Effects and Symptoms

Short Term Exposure: Calcium nitrate can the skin, eyes, nose, throat, bronchial tubes and lungs. Overexposure may cause nausea and vomiting, headaches, flushing, weakness, faintness and collapse. Severe overexposure can cause nausea, vomiting, flushing of the head and neck, headache, weakness faintness and collapse; the lips and fingernails may become bluish. There may be shortness of breath. Coma, convulsions and death are possible.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: Lung function tests. If overexposure is suspected, also consider: Complete blood count and test for methemoglobin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician or authorized medical personnel: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Calcium Oxide

Use Type: Fungicides, herbicides, and in soil treatment

CAS Number: 1305-78-8

Formula: CaO

Synonyms: Burnt lime; Calcia; Calx; Fluxing lime; Lime; Lime, burned; Lime, unslaked; Oxyde de calcium (French); Quicklime; Pebble lime

Producers: Chemical Lime (USA); Continental Lime

(USA); GFS Chemicals (USA); C.P. Hall (USA); Dankalk (Denmark); Holvoet Chimie (Belgium); Lhoist Group (France); Lime Industries (Australia); Mississippi Lime (USA); Ube Industries (Japan)

Chemical Class: Inorganic

EPA/OPP PC Code: 075604

California DPR Chemical Code: 977

ICSC Number: 0409

RTECS Number: EW3100000

EINECS Number: 215-138-9

Uses: Calcium oxide is used as a refractory material, a binding agent in bricks, plaster, mortar, stucco and other building materials, a dehydrating agent, a flux in steel manufacturing, and a laboratory agent to absorb CO₂; in the manufacture of aluminum, magnesium, glass, pulp and paper, sodium carbonate, calcium hydroxide, chlorinated lime, calcium salts, and other chemicals; in the flotation of nonferrous ores, water and sewage treatment, dehairing hides, the clarification of cane and beet sugar juice, and in drilling fluids and lubricants.

U.S. Maximum Allowable Residue Levels for Calcium Oxide [40 CFR 180.2 and 180.1001 (c)]:

CROP	ppm
Animal products	-
Raw agricultural commodities	-

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (DFG)⁽³⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Australia) (Israel) (Mexico) (Several Canadian Provinces)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)

Description: Calcium oxide, CaO, occurs as white or grayish-white lumps or granular powder. The presence of iron gives it a yellowish or brownish tint. Soluble in water (reactive). Molecular weight = 56.09. Melting/Freezing point = 2575°C. Boiling point = 2858°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0.

Incompatibilities: The water solution is a medium strong base. Reacts with water generating calcium hydroxide and sufficient heat to ignite nearby combustible materials. Reacts violently with acids, halogens, metals.

Permissible Exposure Limits in Air: The OSHA⁽²⁾ TWA calcium oxide is 5 mg/m³. NIOSH⁽²⁾, ACGIH⁽¹⁾, and HSE⁽³³⁾ recommend a TWA value of 2 mg/m³. The NIOSH⁽²⁾ IDLH level = 25 mg/m³. There is no DFG MAK at present. Other countries regulations⁽³⁵⁾ include: 10 mg/m³ (Argentina:), 0.3 mg/m³ (former USSR). In addition, several states have set guidelines or standards for calcium oxide in ambient air⁽⁶⁰⁾ ranging from 20 µg/m³ (North Dakota) to 35 µg/m³ (Virginia) to 40 µg/m³ (Connecticut) to 48 µg/m³ (Nevada).

Determination in Air: Filtration, workup with acid and analysis by atomic absorption are specified in NIOSH Method 7020 for calcium. See also OSHA Method ID121.⁽⁵⁸⁾

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms

Short Term Exposure: The corrosive action of calcium oxide is due primarily to its alkalinity and exothermic reaction with water. It is irritating and may be caustic to the skin, conjunctiva, cornea and mucous membranes of upper respiratory tract; may produce burns or dermatitis with desquamation and vesicular rash, lacrimation, spasmodic blinking, ulceration, and ocular perforation, ulceration and inflammation of the respiratory passages, ulceration of nasal and buccal mucosa, and perforation of nasal septum. Bronchitis and pneumonia have been reported from inhalation of dust. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The lower respiratory tract may not be affected because irritation of upper respiratory passages is so severe that workers may be forced to leave the area.

Long Term Exposure: Repeated or prolonged contact with skin may cause brittle nails and thickening and cracking of the skin. Repeated or prolonged exposure to dust particles may cause lung problems. Calcium oxide may cause ulceration and perforation of the cartilage separating the nose (septum).

Points of Attack: Respiratory system, skin and eyes.

Medical Surveillance: Preemployment physical examinations should be directed to significant problems of the eyes, skin and the upper respiratory tract. Periodic examinations should evaluate the skin, changes in the eyes, especially the cornea and conjunctiva, mucosal ulcerations of the nose, mouth and nasal septum, and any pulmonary symptoms. Smoking history should be known.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Calcium Phosphide

Use Type: Rodenticide

CAS Number: 1305-99-3

Formula: Ca₃P₂

Synonyms: Calcium phosphid; Phosphure de calcium (French); Photophor; Tricalcium diphosphide

Trade Names: POLYTANOL®

EPA/OPP PC Code: 066503

ICSC Number: 1126

RTECS Number: EW3860000

EEC Number: 015-003-00-2

EINECS Number: 215-142-0

Uses: Calcium phosphide is used to kill rodents and in explosives and fireworks.

Description: Calcium phosphide is a grey granular solid or reddish-brown crystalline solid with a musty odor, somewhat like acetylene. Water reactive. Melting/Freezing point = about 1600°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2.

Incompatibilities: A strong reducing agent. Forms spontaneously flammable phosphine gas in moist air. Contact with water or acids release spontaneously flammable phosphine gas, and can cause explosions. Incompatible with oxidizers, acids, chlorine, chlorine monoxide, halogens, halogen acids, oxygen, sulfur.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation of dust, Eye or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Calcium phosphide can affect you when breathed. Phosphine gas is a highly toxic gas released when calcium phosphide is wet or has contacted moisture. Consult the entry on phosphine. As noted by Sax (reference below), phosphine is an acute local irritant, is toxic upon

inhalation causing restlessness, tremors, fatigue, gastric pain, diarrhea, coma and convulsions. Also, calcium phosphide is a dangerous fire and explosion hazard.

Long Term Exposure: Long term or high exposure can cause pulmonary edema, a buildup of fluid in the lungs.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Capsaicin

Use Type: Bird, animal and insect repellent

CAS Number: 404-86-4

Formula: C₁₈H₂₇NO₃

Synonyms: Capsaicin (in oleoresin of capsicum); Capsaicine; 8-Methyl-*N*-vanillyl-6-nonenamide, (*E*)- (8CI); *N*-[(4-Hydroxy-3-methoxyphenyl)methyl]-8-methyl-6-nonenamide; *trans-N*-[(4-Hydroxy-3-methoxyphenyl)methyl]-8-methyl-6-nonenamide; *trans*-8-Methyl-*N*-vanillyl-6-nonenamide; Major Capsaicinoids (Capsaicin+Dihydrocapsaicin+Nordihydrocapsacin); 6-Nonenamide, *N*-[(4-hydroxy-3-methoxyphenyl)methyl]-8-methyl-, (*E*)- (9CI); 6-Nonenamide, 8-methyl-*N*-vanillyl-, (*E*)- (8CI)

Trade Names: AGRIGARD®; CAPSYN® (Capsaicin+Dihydrocapsaicin+Nordihydrocapsacin); DEER-OFF®; FRONTIERSMAN®; HALT®; KEEPOUT®; STYPTYSAT®

Chemical Class: Botanical

EPA/OPP PC Code: 070701

California DPR Chemical Code: 470

Uses: Capsaicin, which is made from the Capsicum red chili pepper, is used as a bird, animal and insect repellent.

Specifically, it is used to repel birds, voles, deer, rabbits, squirrels, insects and attacking dogs. Capsaicin repellents are used indoors to protect carpets and upholstered furniture, and outdoors to protect fruit and vegetable crops, flowers, ornamental plants, shrubbery, trees, and lawns. It is also used in pepper sprays such as MACE, and as an analgesic in creams, lotions and solid sticks to reduce arthritic, post-operative and neuropathic pain, such as shingles. Capsaicin is obtained by grinding dried, ripe Capsicum frutescens L. chili peppers into a fine powder. The oleoresin is derived by distilling the powder in a solvent and evaporating the solvent. The resulting highly concentrated liquid has little odor but has an extremely pungent taste.

U.S. Maximum Allowable Residue Levels for Capsaicin (40 CFR 180.1165):

Capsaicin is exempt from the requirement of a tolerance in or on all food commodities when used in accordance with approved label rates and good agricultural practice.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or DANGER

Regulatory Authority:

- Actively registered pesticide in California.

Description: Crystalline solid, rectangular plates, or scales. Pungent odor and burning taste. Practically insoluble in cold water. Molecular weight = 305.40. Boiling point = 210 –218°C. Melting/Freezing point = 65°C.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Routes of Entry: Eyes and skin

Harmful Effects and Symptoms

Short Term Exposure: Irritates skin, eyes and mucous membranes. Poisonous if ingested; with severe gastritis, stomach pain, and diarrhea.

Long Term Exposure: Mutagen.

Points of Attack: Nerve endings and eyes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Captafol

Use Type: Fungicide

CAS Number: 2939-80-2; 2425-06-1 (this CAS used in the California "Lists of Lists" and other reference sources)

Formula: C₁₀H₉Cl₄NO₂S

Alert: Captafol is no longer sold in the United States. Human toxicity (long-term): High.

Synonyms: 4-Cyclohexene-1,2-dicarboximide, *N*-(1,1,2,2-Tetrachloroethyl)thio-1*H*-Isoindole-1,3(2*H*)-dione, 3A,4,7,7A-tetrahydro-2-(1,1,2,2-tetrachloroethyl)thio-; *N*-[(1,1,2,2-Tetrachloroethyl)thio]-4-cyclohexene-1,2-dicarboximide *N*-[(1,1,2,2-Tetrachloroethyl)thio]-4-cyclohexene-1,2-dicarboximide *N*-[(1,1,2,2-Tetrachloroethyl)thio]-4-cyclohexene-1,2-dicarboximide; *N*-(1,1,2,2-Tetrachloroethylthio)-cyclohex-4-en-1,4-diacarboximid (German); *N*-1,1,2,2-Tetrachloroethylmercapto-4-cyclohexene-1,2-carboximide; *N*-[(1,1,2,2-Tetrachloroethyl)sulfonyl]-*cis*-4-cyclohexene-1,2-dicarboximide; *N*-(1,1,2,2-Tetrachloroethylthio)-4-cyclohexene-1,2-dicarboximide

Trade Names: CAPTAFOL[®], The Scotts Company (USA), canceled 4/23/1986; CAPTATOL[®]; CAPTOFOL[®]; CRISFOLATAN[®]; DIFOLATAN[®], The Scotts Company (USA), canceled 5/1/1987; DIFOCAP[®], The Scotts Company (USA), canceled 4/23/1986; DIFOSAN[®]; FOLCID[®]; HAIPEN[®]; KENOFOL[®]; MERPAFOL[®]; ORTHO[®] 5865, The Scotts Company (USA), canceled 5/1/1987; PILLARTAN[®]; SANSEAL[®]; SANSPOR[®]; SANTAR-SM[®]; SULFONIMIDE[®]; SULPHEIMIDE[®]

Producers: Agsin (Singapore); Chevron Phillips Chemical (USA); Rallis India (India); Rhone-Poulenc (France); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Carboximide

EPA/OPP PC Code: 081701, 081702 (unspecified isomer)

California DPR Chemical Code: 292

ICSC Number: 0119

RTECS Number: GW4900000

EEC Number: 613-046-00-7

EINECS Number: 219-363-3

Uses: Captafol was a General Use Pesticide and used for the control of practically all forms of fungal diseases except powdery mildew, but is not permitted for use in the United States. Outside of the US, it is used to control fruit disease

on apples, citrus, tomato, cranberry, coffee, pineapple, potato, onion, stone fruit, cucumber, watermelon, and much more. It is also used as a seed protectorant on cotton, rice and peanut crops.

Human toxicity (long-term)⁽⁷⁷⁾: Not listed.

Fish toxicity (threshold)⁽⁷⁷⁾: High-1.75895 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Captafol (40 CFR 180.267):

Chemical name	Crop	ppm
Captafol	onion	0.1
Captafol	potato	0.5
Captafol	tomato	15
Captafol (cis- <i>N</i> -[(1,1,2,2-tetrachloroethyl)thio]-4-cyclohex	onion	0.1
Captafol (cis- <i>N</i> -[(1,1,2,2-tetrachloroethyl)thio]-4-cyclohex	potato	0.5
Captafol (cis- <i>N</i> -[(1,1,2,2-tetrachloroethyl)thio]-4-cyclohex	tomato	15

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

California Prop. 65: Carcinogen

IARC: Group 2A, probable carcinogen

Label Signal Word: WARNING

WHO Acute Hazard: Class 1 a, extremely hazardous

Regulatory Authority:

- Banned or Severely Restricted (E. Germany, Norway) (UN)⁽¹³⁾
- AB 1803-Well Monitoring Chemical (CAL)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- Proposition 65 chemical (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Australia) (Israel) (Mexico) (Several
- Canadian Provinces)
- Canada, WHMIS, Ingredients Disclosure List

Description: Captafol is a colorless or white to pale yellow crystalline solid. Weak, mercaptan odor. Practically insoluble in water; solubility = 1.6 ppm @ 20°C. Molecular weight = 349.09. Melting/Freezing point = 160-161°C. Vapor pressure 1.22 x 10⁻⁸ mmHg @ 20°C.

Incompatibilities: Reacts violently with bases causing fire and explosion hazard. Not compatible with strong acids or acid vapor, oxidizers. Strong alkaline conditions contribute to instability. Attacks some metals.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommended airborne exposure limit is 0.1 mg/m³ TWA with the notation "skin" indicating the possibility of cutaneous absorption. HSE⁽³³⁾, Mexico, Israel, and Australia have set this same value as has NIOSH. In addition, several states have set guidelines or standards for

captafol in air⁽⁶⁶⁾ ranging from 1.0 $\mu\text{g}/\text{m}^3$ (North Dakota) to 1.5 $\mu\text{g}/\text{m}^3$ (Virginia) to 2.0 $\mu\text{g}/\text{m}^3$ (Connecticut and Nevada).

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin and respiratory tract. Captafol can affect you when breathed in and by passing through your skin. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. Captafol may cause an asthma-like allergy. Future exposures can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness. Exposure can irritate the skin. It can also cause a skin allergy to develop. Exposure to the sun (or other ultraviolet light) after exposure to captafol may cause severe rash with itching, swelling, and blistering.

Long Term Exposure: Repeated or prolonged contact cause skin sensitization, dermatitis, allergic conjunctivitis. Repeated or prolonged inhalation exposure may cause asthma. The substance may have damaging effects on the liver and kidneys. Captafol is a probable carcinogen in humans. There is some evidence that it causes liver cancer in humans and it has caused kidney cancer in animals. Captafol may cause mutations. Handle with extreme caution.

Points of Attack: Skin, respiratory system, liver and kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function test; lung function test. Skin testing with dilute Captafol may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

ICSC Number: 0120

RTECS Number: GW5075000

EEC Number: 613-044-00-6

EINECS Number: 205-087-0

Uses: Most uses of captan on food crops in the United States have been canceled since 1989. It is often applied to packing and shipping boxes for fruits and vegetables. Captan is rapidly degraded in natural soil by chemical as well as biologic means (estimated half-life, days to weeks). It is also used as a preservative for awnings, draperies and leather, as a root dip and seed treatment. It is also added to paints, wallpaper paste, plastic and leather goods. There are over 320 federally registered pesticide products that contain captan.

Human toxicity (long-term)⁽⁷⁷⁾: Very low—145.83333 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate—25.36705 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Description: Captan, when pure, is a colorless crystalline solid. The technical grade is a cream to yellow powder with a strong odor. It is commonly dissolved in a “carrier” which may be combustible or flammable. Very slightly soluble in water; solubility = 3.3 ppm. Melting/Freezing point = 178°C (decomposes). Vapor pressure 8×10^{-8} mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Log K_{ow} = 2.34. Unlikely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Incompatible with tetraethyl pyrophosphate, parathion. Keep away from strong alkaline materials (e.g., hydrated lime) as captan may become unstable. May react with water releasing hydrogen chloride gas. Corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air: ACGIH⁽¹⁾ and NIOSH⁽²⁾ have recommended a TWA for captan of 5 mg/m³. In addition, several states have set guidelines or standards for captan in ambient air⁽⁶⁰⁾ ranging from 11.9050 µg/m³ (Kansas) to 35 µg/m³ (Pennsylvania) to 50 µg/m³ (North Dakota) to 100 µg/m³ (Connecticut) to 119 µg/m³ (Nevada).

Determination in Air: OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; IV NIOSH Method #5601⁽¹⁸⁾.

Permissible Concentration in Water: A no-adverse-effect level of drinking water has been calculated by NAS/NRC as 0.35 mg/L. The former USSR/UPEN joint project⁽⁴³⁾ has set

a MAC of 2.0 mg/L in water bodies used for domestic purposes. Guidelines have been set in two states for Captan in drinking water ranging from 100 µg/L in Maine to 350 µg/L in California.

Routes of Entry: Skin contact, inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: The substance irritates the eyes and the skin. The acute LD₅₀ (oral, rat) = 9,000 mg/kg (insignificantly toxic). Most of the chronic-oral-toxicity data on captan suggest that the no-adverse-effect or toxicologically safe dosage is about 1000ppm (50 mg/kg/day). However, on the basis of fetal mortality observed in monkeys exposed to captan (12.5 mg/kg/day), the acceptable daily intake of captan has been established at 0.1 mg/kg of body weight by the FAO/WHO. Based on long-term feeding studies results in rats and dogs, ADIs were calculated at 0.05 mg/kg/day for captan. A rebuttal presumption against registration for captan was issued on August 19, 1980 by EPA on the basis of possible oncogenicity, mutagenicity, and teratogenicity.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin allergy to develop. Once this occurs, even very small future exposures can cause itching and a skin rash. Exposure may cause mutations or damage the developing fetus; however, this needs further study. Animal studies have found the development of cancer in animals. Whether captan is a human cancer hazard may require further study.

Points of Attack: Eyes, skin, respiratory system, gastrointestinal tract, liver, kidneys. Cancer Site in animals: duodenal tumors.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Skin testing with dilute captan may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chemical Class: N-Methyl Carbamate

EPA/OPP PC Code: 056801

California DPR Chemical Code: 105

ICSC Number: 0121

RTECS Number: FC5950000

EEC Number: 006-011-00-7

EINECS Number: 200-555-0

Uses: Carbaryl is one of the most widely used insecticides in agriculture, professional turf management and ornamental production, as well as in residential pet, lawn, and garden markets. It controls over 100 species of insects that infect citrus, cotton, nuts, and forest and ornaments trees, as well as poultry and livestock. Carbaryl also is used as a mosquito adulticide. It is available in a variety of formulations –bait, dust, wettable powders, granules, dispersions and suspensions. Washington State, for example, has a Special Local Needs registration to control burrowing shrimp in oyster beds.

Human toxicity (long-term)⁽⁷⁷⁾: Low–70.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–27.39896 ppb, MATC (Maximum Acceptable Toxicant Concentration)

- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada: Drinking water MAC = 0.09 mg/L

Description: Carbaryl is a white or grayish, odorless, crystalline solid, or various other forms including liquid and paste. Soluble in water; solubility = 115 ppm @ 25°C. Molecular weight = 201.19. Boiling point = (decomposes below BP). Melting/Freezing point = 142°C. Vapor pressure 1.2×10^{-6} mmHg @ 20°C. Flash point = 203°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Log K_{ow} = 2.34–2.38. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Contact with strong oxidizers can cause fire and explosions.

Permissible Exposure Limits in Air: The OSHA⁽²⁾ PEL is 5 mg/m³ TWA for an 8-hour workshift. NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommended limit is also 5 mg/m³. Australia, Israel, Mexico, DFG⁽³⁾ and HSE⁽³³⁾ have all set this same value. The STEL set by HSE⁽³³⁾ is 10 mg/m³. The NIOSH⁽²⁾ IDLH level = 100 mg/m³. The former USSR/UNEP joint project⁽⁴³⁾ sets a MAC in workplace air of 1 mg/m³ and limits in the ambient air in residential areas of 0.02 mg/m³ on a momentary basis and 0.01 mg/m³ on an average daily basis. In addition, several states have set guidelines or standards for carbaryl in ambient air⁽⁶⁰⁾ ranging from 3.5 µg/m³ (Pennsylvania) to 11.9050 µg/m³ (Kansas) to 50 µg/m³ (North Dakota) to 80 µg/m³ (Virginia) to 100 µg/m³ (Connecticut) to 119 µg/m³ (Nevada).

Determination in Air: OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; IV NIOSH Method #5601; also NIOSH Method #5006⁽¹⁸⁾.

Permissible Concentration in Water: A no-adverse effect level in drinking water has been calculated as 0.574 mg/L by NAS/NRC. The UNEP/USSR joint project⁽⁴³⁾ has set a MAC of 0.1 mg/L in water used for domestic purposes and 0.0005 mg/L in water bodies used for fishery purposes. Further, several states have set guidelines for carbaryl in drinking water⁽⁶¹⁾ ranging from 10 µg/L (Wisconsin) to 60 µg/L (California) to 164 µg/L (Maine) to 574 µg/L (Kansas). See Regulatory section for Canada drinking water level.

Routes of Entry: Inhalation, skin contact or eye contact, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Carbaryl is an acetylcholinesterase inhibitor. Carbaryl irritates the eyes, skin, and respiratory tract. The hot liquid may cause severe skin burns. The substance may affect the nervous system, resulting in convulsions and respiratory failure. The effects may be delayed. The LD₅₀ (oral, rat) = 250 mg/kg (moderately toxic). Single doses of up to about 140 mg (0.005 oz.) have been reported to cause no effect. However, a single dose of about 200 mg has caused stomach pain and excessive sweating. Individual responses may vary. Several milliliters (0.1 fluid oz) of an 80% solution of carbaryl has caused nausea, salivation, headache, tremors, and excessive tearing. 500 ml (1 pint) of a 80% solution has resulted in death.

Long Term Exposure: The major health problem associated with occupational exposure to carbaryl is related to its inhibition of the enzyme cholinesterase in the central, autonomic and peripheral nervous systems. The inhibition of cholinesterase allows acetylcholine to accumulate at these sites and thereby leads to over stimulation of innervated organs. The signs and symptoms observed as a consequence of exposure to carbaryl in the workplace environment are manifestations of excessive cholinergic stimulation, e.g., nausea, vomiting, mild abdominal cramping, dimness of vision, dizziness, headache, difficulty in breathing, and weakness. Carbaryl may affect the kidneys and nervous system. It may cause mutations and be a teratogen in humans. There is limited evidence that it reduces fertility in both males and females.

Points of Attack: Respiratory system, skin, central nervous system, cardiovascular system.

Medical Surveillance: NIOSH recommends that workers subject to carbaryl exposure have comprehensive preplacement medical examinations, with subsequent annual medical surveillance. If symptoms develop or overexposure has occurred, the following may be useful: Kidney function tests. Exam of the nervous system. If done within 2-3 hours after exposure, serum and RBC cholinesterase levels may be helpful. Levels can return to normal before the exposed person feels well.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Producers: Agrimor International (USA); Agsin (Singapore); Gharda Chemicals (India); Hebei Huafeng Chemical Group (China); Hindustan Insecticides (India); J. J. Mauget (USA); Ki-Hara Chemicals (UK); Nagarjuna Agrichem (India); Sanonda Zhengzhou Pesticide Co., Ltd. (China); Shandong Huayang Pesticide Group (China); Rotam Agrochemical (Hong Kong); Vijayalakshmi Insecticides and Pesticides (India); Whyte Agrochemicals (UK); Yellow River Enterprise Co., Ltd. (Taiwan)

Chemical Class: Carbamate; Benzimidazole

EPA/OPP PC Code: 128872

California DPR Chemical Code: 2176

ICSC Number: 1277

RTECS Number: DD6500000

EEC Number: 613-048-00-8

EINECS Number: 234-232-0

Uses: Carbendazim is a systemic fungicide used to control a broad range of fungi in cereals, vegetables, oilseed rape, sugar beets, grapes, tomatoes, pome fruit and stone fruit. It is also used in post-harvest storage and as treatment in seed pre-planting, frequently in combination with other fungicides. In some areas, it has been used to combat Dutch Elm disease.

Human toxicity (long-term)⁽⁷⁷⁾: High–7.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–1.44530 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: WARNING, CAUTION or DANGER, depending on formulation

WHO Acute Hazard: Class U, unlikely to be hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL)
- U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B)

Description: Colorless crystalline solid or light-gray powder. Slightly soluble in water; solubility = 5.8 ppm @ 24°C; 4.8 ppm @ pH 7. Molecular weight = 191.20. Melting/Freezing point = (decomposes) 300–305°C. Vapor pressure 4.9×10^{-10} mmHg @ 20°C. Log K_{ow} = 1.51. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids. May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the

nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is UNCONSCIOUS OR HAVING CONVULSIONS, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE

equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Carbetamide (ANSI)

Use Type: Herbicide

CAS Number: 16118-49-3

Formula: C₁₂H₁₆N₂O₃

Synonyms: *d*-(-)-Carbanilic acid(1-ethylcarbamoyl)ethyl ester; Carbetamid (German); *N*-Ethyl-2-[[[(phenylamino)carbonyl]oxy]propanamide, (*d*) isomer; *d*-*N*-Ethylacetamide carbanilate; *d*-*N*-Ethyllactamide carbanilate (ester); (R)-*N*-Ethyl-2-[[[(phenylamino)carbonyl]oxy]propanamide; *d*-(-)-1-(Ethylcarbamoyl)ethylphenyl carbamate; 2-Phenyl-carbamoyloxy-*N*-aethyl-propionamid (German); (Phenylcarbamoyloxy)-2-*N*-ethylpropionamide; *N*-Phenyl-1-(ethylcarbamoyl-1)-ethylcarbamate, *d*-isomer; 11,561 RP

Trade Names: CARBETAMEX[®], Makhteshim-Agan Industries (Israel); HELMSMAN[®], Bayer CropScience (Germany); LEGURAME[®]

Producers: Bayer CropScience (Germany); Makhteshim-Agan Industries (Israel)

Chemical Class: Carbamate

EPA/OPP PC Code: 259200

EINECS Number: 240-286-6

Uses: Not registered in the U.S.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: Soluble in water; solubility = 3,500 ppm @ 20°C. Molecular weight 236.27. Melting/Freezing point = 110°C. Boiling point = decomposes. Vapor pressure = <1 x 10⁻⁵ mmHg @ 20°C.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids.

Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Carbofuran (ANSI)

Use Type: Insecticide, acaricide and nematocide.

CAS Number: 1563-66-2

Formula: C₁₂H₁₅NO₃

Alert: A Restricted Use Pesticide (RUP). According to the Ecological Incident Investigation System, carbofuran has been responsible for more avian deaths than any other pesticide. Toxicity (human): Intermediate.

Synonyms: 7-Benzofuranol, 2,3-dihydro-2,2-dimethylmethylcarbamate; Carbamic acid, methyl-, 2,2-dimethyl-2,3-dihydrobenzofuran-7-yl ester; Carbofurano (Spanish); 2,3-Dihydro-2,2-dimethylbenzofuran-7-yl-N-methylcarbamate; 2,3-Dihydro-2,2-dimethyl-7-benzofuranolmethylcarbamate; 2,3-Dihydro-2,2-dimethyl-7-benzofuranol-N-methylcarbamate; 2,3-Dihydro-2,2-dimethylbenzofuran-7-yl methylcarbamate; 2,2-Dimethyl-7-coumaranyl N-methylcarbamate; 2,2-Dimethyl-2,2-dihydrobenzofuran-7-yl N-methylcarbamate; 2,2-Dimethyl-2,3-dihydro-7-benzofuran-yl-N-methylcarbamate; ENT 27,164; Methyl carbamic acid 2,3-dihydro-2,2-dimethyl-7-benzofuran-yl ester; NSC 167822

- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada: Drinking water quality, 0.09 mg/L MAC

Description: Carbofuran is a white, crystalline solid. Odorless. Slightly soluble in water; solubility = about 500-750 ppm @ 25°C; 325 ppm @ 20°C. Molecular weight = 221.29. Melting/Freezing point = 150-152°C. Vapor pressure 6×10^{-6} mmHg @ 20°C; 1.8×10^{-5} mmHg @ 30°C; 2.7×10^{-3} Pa @ 33°C. Log K_{ow} = 2.33. Unlikely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Alkaline substances, acid, strong oxidizers such as perchlorates, peroxides, chlorates, nitrates, permanganates.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommend an airborne exposure limit of 0.1 mg/m³ TWA. This is also the British HSE, Israeli, Australian, Mexican, and Canadian Provincial (Alberta, British Columbia, Ontario, and Quebec) limit, and Alberta's STEL 0.3 mg/m³. Several States have set guidelines or standards for carbofuran in ambient air⁽⁶⁰⁾ ranging from 1.0 µg/m³ (North Dakota) to 1.6 µg/m³ (Virginia) to 2.0 µg/m³ (Connecticut and Nevada).

Permissible Concentration in Water: EPA⁽⁴⁷⁾ has determined one-day, ten-day and longer-term health advisories for a 10 kg. child of 50 µg/L of carbofuran. The longer term (1 year) value for a 70 kg. adult is 0.18 mg/L or 180 µg/L. A lifetime health advisory for a 70 kg. adult has been determined to be 36 µg/L of carbofuran. Most recently, EPA has proposed a limit of 40 µg/L in drinking water⁽⁶²⁾. Further, several states have set guidelines for carbofuran in drinking water⁽⁶¹⁾ ranging from 10 µg/L (Massachusetts) to 15 µg/L (New York) to 36 µg/L (Arizona and Minnesota) to 50 µg/L (Kansas and Wisconsin).

Determination in Water: Analysis of carbofuran is by a high performance liquid chromatographic procedure used for the determination of N-methyl carbamoyloximes and N-methylcarbamates in drinking water (U.S. EPA 1984). In this method, the water sample is filtered and a 400 µl aliquot is injected into a reverse phase HPLC column. Separation of compounds is achieved using gradient elution chromatography. After elution from the HPLC column, the compounds are hydrolyzed with sodium hydroxide. The methylamine formed during hydrolysis is reacted with o-phthalaldehyde (OPA) to form a fluorescent derivative which is detected using a fluorescence detector. The method detection limit has been estimated to be approximately 0.9 µg/L for carbofuran.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Carbofuran may affect the nervous system, resulting in convulsions and respiratory failure. Cholinesterase inhibitor. Exposure may result in death. The effects may be delayed and exposed personnel should be kept under medical observation. Symptoms include headache, giddiness, blurred vision, weakness; nausea,

cramps, diarrhea, chest discomfort, sweating, contraction of pupils, tearing; salivation, blue lips, lungs and abdomen fill with fluid, convulsions, coma, loss of reflexes and sphincter control. This material is extremely poisonous. The LD₅₀ (oral, rat) = 5.3 mg/kg. May be fatal if swallowed, inhaled, or absorbed through skin. Contact may burn skin or eyes. Probable lethal oral dose to humans 5 to 50 mg/kg or 7 drops to 1 teaspoon for 150 lb. person.

Long Term Exposure: The major health problem associated with occupational exposure to carbaryl is related to its inhibition of the enzyme cholinesterase in the central, autonomic and peripheral nervous systems. The inhibition of cholinesterase allows acetylcholine to accumulate at these sites and thereby leads to over stimulation of innervated organs. The signs and symptoms observed as a consequence of exposure to carbaryl in the workplace environment are manifestations of excessive cholinergic stimulation, e.g., nausea, vomiting, mild abdominal cramping, dimness of vision, dizziness, headache, difficulty in breathing, and weakness. Carbofuran may affect the immune system.

Points of Attack: Central nervous system, peripheral nervous system, blood cholinesterase

Medical Surveillance: Before starting work, at regular times after that, and if any symptoms develop, or overexposure occurs, the following is recommended: Serum and red blood cell cholinesterase levels (a special test for the substance in the body that carbofuran affects). For this substance these tests are accurate only if done within about two hours of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Carbon Disulfide

Use Type: Fumigant, insecticide, miticide, and as a pesticide intermediate

CAS Number: 75-15-0

Formula: CS₂

Alert: Persons whose skin or clothing is contaminated with liquid carbon disulfide can secondarily contaminate rescuers by direct contact or through off-gassing of vapor. Carbon disulfide is readily absorbed through the upper respiratory tract. Carbon disulfide can also be readily absorbed through the digestive tract or skin.

Synonyms: Carbon bisulfide; Carbon bisulphide; Carbon disulphide; Carbone (sufure de) (French); Carbonio (solfuro di) (Italian); Carbon sulfide; Dithiocarbonic anhydride; Kohlendisulfid (schwefelkohlenstoff) (German); NCI-C04591; Schwefelkohlenstoff (German); Sulphocarbonic anhydride

Trade Names: DE-PESTER FUMIGANT[®], Crompton (USA), canceled 11/22/1985; DOWFUME[®], Dow Chemical (USA), canceled 11/10/1983; SERFUME[®], Dow Chemical (USA), canceled 11/10/1983; WEEVILTOX[®]

Producers: Akzo Nobel Chemicals (Netherlands); ATOFINA Chemicals (France); Chimco (Bulgaria); GFS Chemicals (USA); Industrial Quimica de Mexico (Mexico); Merck (German); Rhodia Eco (France); Shanxi Friends Union Chemicals (China)

Chemical Class: Inorganic

EPA/OPP PC Code: 016401

California DPR Chemical Code: 108

RTECS Number: FF6650000

RCRA Number: P022

EEC Number: 006-003-00-3

EINECS Number: 200-843-6

Uses: Carbon disulfide is widely used as a pesticide intermediate. It is also used in the manufacture of viscose rayon, ammonium salts, carbon tetrachloride, carbanilide, xanthogenates, flotation agents, soil disinfectants, dyes, electronic vacuum tubes, optical glass, paints, enamels, paint removers, varnishes, varnish removers, tallow, textiles, explosives, rocket fuel, putty, preservatives, and rubber cement; as a solvent for phosphorus, sulfur, selenium, bromine, iodine, alkali cellulose, fats, waxes, lacquers,

camphor, resins, and cold vulcanized rubber. It is also used in degreasing, chemical analysis, electroplating, grain fumigation, oil extraction, and dry-cleaning.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–700.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–27756.65644 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Description: Gaseous carbon disulfide is more than twice as heavy as air. Pure carbon disulfide liquid is colorless with a pleasant odor. Most industrially-used carbon disulfide liquid is yellowish in color and has an unpleasant foul smelling odor, characteristic of hydrogen sulfide (a contaminant of technical grade carbon disulfide). **Warning properties:** Sweet odor of pure carbon disulfide and foul odor of commercial and technical grade carbon disulfide are usually adequate to warn of acute exposure. Most people can detect carbon disulfide at levels of 0.02 to 0.1 ppm (1 ppm is equivalent to 3.1 mg/m³). However, the sense of smell fatigues rapidly and, therefore, odor does not serve as a good warning property. Slightly soluble in water; solubility = 0.23 g/100 mL @ 22 °C. Molecular weight = 76.14 daltons. Boiling point = 46.3°C. Melting/Freezing point = -111.6°C. Vapor density (air = 1.00) = 2.67 g/mL. Vapor pressure = 352.6 mmHg @ 25 °C. At room temperature, carbon disulfide is a very flammable liquid that readily evaporates when exposed to air. It is handled and transported as a very flammable and explosive liquid. Flash point = -30°C. Autoignition temperature = 90°C. The explosive limits are LEL = 1.3%; UEL = 50%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Log K_{ow} = 1.85. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Carbon disulfide is incompatible with air, alkali metals, aluminum, azides, many oxidants, and phenyl copper-triphenylphosphine complexes. Such incompatible mixtures may result in violent, and possibly explosive, reactions. Chemically active metals (such as sodium, potassium, zinc), organic amines, halogens. May explosively decompose on shock, friction, or concussion. May explode on heating. The substance may spontaneously ignite on contact with air and on contact with hot surfaces producing toxic fumes of sulphur dioxide. Reacts violently with oxidants to produce oxides of sulfur and carbon monoxide and causing fire and explosion hazard. Attacks some forms of plastic, rubber, and coatings.

Permissible Exposure Limits in Air: The OSHA⁽²⁾ legal PEL is 20 ppm TWA for an 8-hour work shift and 30 ppm as an acceptable ceiling, and 100 ppm as a maximum peak above the acceptance ceiling concentration not to be exceeded during any 30-minute work period. NIOSH⁽²⁾ recommended exposure limit is 1 ppm TWA for a 10-hour work shift, and 10 ppm not to be exceeded during any 15-minute work period. The ACGIH recommended TWA value is 10 ppm (30 mg/m³) for an 8-hour work shift⁽¹⁾. They add the notation "skin" indicating the possibility of cutaneous

absorption. AIHA ERPG-2 (maximum airborne concentration below which it is believed that nearly all persons could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms that could impair their abilities to take protective action) = 50 ppm. The NIOSH⁽²⁾ IDLH level = 500 ppm. The odor threshold is approximately 200 to 1000 times lower than the OSHA PEL-TWA (20 ppm). Australia, DFG, HSE, Israel, and Mexico airborne limit is 10 ppm. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 1.0 mg/m³ in workplace air, of 0.03 mg/m³ in ambient residential air on a momentary basis, and 0.003 mg/m³ in residential ambient air on a daily average basis. Further, several states have set guidelines or standards for carbon disulfide in ambient air⁽⁶⁰⁾ ranging from 60 µg/m³ (Connecticut) to 100 µg/m³ (New York) to 150 µg/m³ (South Carolina) to 186 µg/m³ (North Carolina) to 300 µg/m³ (Florida and North Dakota) to 714 µg/m³ (Nevada). The WHO⁽³⁵⁾ has recommended a TWA of 10 mg/m³ for male workers but a TWA of 3 mg/m³ for women of fertile age.

Determination in Air: Adsorption on charcoal, workup with benzene, gas chromatographic analysis per NIOSH Method #1600⁽¹⁸⁾.

Permissible Concentration in Water: In view of the relative paucity of data on the mutagenicity, carcinogenicity, and long-term oral toxicity of carbon disulfide, it was stated that estimates of the effects of chronic oral exposure at low levels cannot be made with any confidence. It was recommended by NAS/NRC that studies to produce such information be conducted before limits in drinking water are established. Now, however, EPA⁽³²⁾ has suggested a permissible ambient goal of 830 µg/L. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has suggested that limits in drinking water be set on an organoleptic basis and that a MAC of 1 mg/L be set in water bodies used for fishery purposes. Arizona has set a guideline for CS₂ in drinking water of 830 µg/L⁽⁶¹⁾.

Routes of Entry: Carbon disulfide is readily absorbed through the upper respiratory tract. Carbon disulfide can also be readily absorbed through the digestive tract or skin.

Harmful Effects and Symptoms

Short Term Exposure: Carbon disulfide is irritating to the eyes, mucous membranes, and skin. Acute neurological effects may result from all routes of exposure and may include headache, confusion, psychosis, and coma. Acute exposure to extremely high levels of carbon disulfide may result in death. The neurotoxic effects caused by carbon disulfide may be due, in part, to its metabolic conversion to dithiocarbamates. Individuals especially susceptible to the toxic effects of carbon disulfide include those with existing disorders of the nervous system, respiratory system, cardiovascular system, or eyes. Swallowing the liquid may cause aspiration into the lungs with the risk of chemical

pneumonitis. This chemical may affect the central nervous system. In acute poisoning, early excitation of the central nervous system occurs, followed by depression with stupor, restlessness, and unconsciousness. If recovery occurs, the patient usually passes through the after-stage of narcosis, with nausea, vomiting, headache, etc. Also possible are motor disturbances of the bowel, anemia, disturbances of cardiac rhythm, loss of weight, polyuria and menstrual disorders. Severe chronic poisoning may also result in liver degeneration and jaundice. Exposure can cause a loss of consciousness. Exposure far above the PEL may result in death. The probable oral lethal dose for a human is between 0.5 and 5 g/kg or between 1 ounce and 1 pint (or 1 pound) for a 70 kg (150 lb) person. In chronic exposures, the central nervous system is damaged and results in the disturbance of vision and sensory changes as the most common early symptoms. Lowest lethal dose for humans has been reported at 14 mg/kg or 0.98 grams for a 70 kg person. Alcoholics and those suffering from neuropsychic trouble are at special risk.

Long Term Exposure: Chronic exposure to carbon disulfide can result in neurological effects similar to those experienced during acute exposure, but at much lower exposure levels. In addition, chronic exposure may cause effects such as permanent central and peripheral nervous system damage, atherosclerotic tendencies, ECG abnormalities, gastrointestinal disturbances, fatty degeneration of the liver, kidney damage, sexual dysfunction, hearing loss, visual disturbances, retinal microaneurism, and blood dyscrasia. Chronic exposure may be more serious for children because of their potential for a longer latency period. **Carcinogenicity:** A carcinogenicity classification for carbon disulfide has not been established by the Department of Health and Human Services, the International Association for Research on Cancer, or the U.S. EPA. **Reproductive and Developmental Effects:** Carbon disulfide is included in the list of "Reproductive and Developmental Toxicants," a 1991 report published by the U.S. General Accounting Office. Carbon disulfide-induced reproductive effects include alterations of the menstrual cycle in women and altered libido and abnormalities in spermatogenesis in men. There is no conclusive evidence that carbon disulfide is a genotoxin in humans.

Points of Attack: The material affects the central nervous system, cardiovascular system, eyes, kidneys, liver, and skin.

Medical Surveillance: Preplacement and periodic medical examinations should be concerned especially with skin, eyes, central and peripheral nervous system, cardiovascular disease, as well as liver and kidney function. Routine laboratory studies include chest radiography, electrocardiogram, blood chemistry, and arterial blood gases. CS₂ can be determined in expired air, blood, and urine. The iodine-azide test detects carbon disulfide metabolites in the urine, and it may indicate other sulfur

compounds. Examination of the nervous system, including mental status. If a work-related incident has occurred, you might be legally required to file a report; contact your state or local health department. Cigarette smoking can exacerbate pulmonary injury and should be discouraged for 72 hours after exposure.

First Aid: Persons exposed only to carbon disulfide vapor pose no risk of secondary contamination. Persons whose skin or clothing is contaminated with liquid carbon disulfide can secondarily contaminate rescuers by direct contact or through off-gassing of vapor. There is no antidote for carbon disulfide. Treatment consists of removal of the victim from the contaminated area, support of respiratory and cardiovascular functions, and irrigation of contaminated eyes or skin. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. Rinse the mouth and administer water for dilution if the patient can swallow, has a strong gag reflex, and does not drool. If the victim is not symptomatic, administer activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. occurs Do not make an unconscious person vomit.

Carbon Tetrachloride

Use Type: Fumigant and solvent

CAS Number: 56-23-5

Formula: CCl₄

Synonyms: Benzinoform; Carbona; Carbon chloride; Carbon tet; Czterochlorek wegla (Polish); ENT 4705; Fasciolin; Flukoids; Freon 10; Halon 104; Katharin; Methane Tetrachloride; Methane, tetrachloro-; Necatorina; Necatorine; Perchloromethane; R 10; Tetrachloorkoolstof (Dutch); Tetrachloormetan; Tetrachlorkohlenstoff, tetra (German); Tetrachlormethan (German); Tetrachlorocarbon; Tetrachloromethane; Tetrachlorure de carbone (French); Tetraclorometano (Italian); Tetracloruro di carbonio (Italian); Tetracloruro de carbono (Spanish); UN 1846

Trade Names: ACRITET[®] (mixture of Acrylonitrile and Carbon tetrachloride); DOWFUME[®], Dow Chemical (USA), canceled 11/22/1985; F.C.[®] FORMULAS, Vulcan Chemicals (USA), canceled 11/10/1983; F.i.a. GRAIN FUMIGANT[®], Zeneca (UK) (now Syngenta), canceled 11/22/1985; TETRAFINOL[®]; TETRAFORM[®]; TETRASOL[®]; TAWAPIT[®]; UNIVERM; Ventox (mixture of Acrylonitrile and Carbon tetrachloride); VERMOESTRICID[®]

Producers: Akzo Nobel Chemicals (Netherlands); Asahi Glass (Japan); Alquimia Mexicana (Mexico); ATOFINA (France); Degussa (Germany); Dow Chemical (USA); EniChem (Italy); GFS Chemicals (USA); ICC Chemical Industries (USA); Juhua Group Corp. (China); Merke (Germany); OxyChem (USA); Richman Chemical (USA); Samsung Fine Chemicals (South Korea); Scott Specialty Gases (USA); Shanghai Tian Yuan (Group) Corp. (China); Shin-Etsu Chemical (Japan); Solvay Group (Belgium); Vulcan Chemicals (USA)

Chemical Class: Halogenated organic compound

EPA/OPP PC Code: 016501; (Use two codes: 000601 & 016501 for mixture of Acrylonitrile and Carbon tetrachloride)

California DPR Chemical Code: 109

RTECS Number: FG4900000

ICSC Number: 0024

EEC Number: 602-008-00-5

EINECS Number: 200-262-8

Uses: Wide use as a grain fumigant and wood preserver. Used as a solvent and carrier for pesticides. Carbon tetrachloride is used as a solvent for oils, fats, lacquers, varnishes, rubber, waxes, and resins. Fluorocarbons are chemically synthesized from it. It is also used as an azeotropic drying agent for spark plugs, a dry-cleaning agent, a fire extinguishing agent, a fumigant, and an anthelmintic agent. The use of this solvent is widespread, and substitution of less toxic solvents when technically possible is recommended.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group 2B, probable carcinogen

U.S. NTP Carcinogen: Reasonably anticipated carcinogen

California Prop. 65: Carcinogen

IARC: Group 2B, possible carcinogen

- Proposition 65 chemical (CAL)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Toxic Substance List
- Mexico, Drinking water criteria, 0.004 mg/L

Description: Colorless, nonflammable liquid with a characteristic ether-like odor. The odor threshold is 0.52 mg/L in water and 140 to 548 ppm in air. Boiling point = 76.5°C. Melting/Freezing point = -23°C. Very slightly soluble in water. Log K_{ow} = 2.6. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Oxidative decomposition on contact with hot surfaces, flames or welding arcs. Decomposition forms toxic phosgene fumes and hydrogen chloride. Violent decomposition, producing heat, on contact with chemically active metals such as aluminium, barium, magnesium, potassium, sodium; with fluorine gas, allyl alcohol, and other substances, causing fire and explosion hazard. Attacks copper, lead and zinc. Attacks some coatings, plastics and rubber. Becomes corrosive when in contact with water; corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air: The OSHA⁽²⁾ PEL is 10 ppm TWA for an 8-hour workshift; 25 ppm not to be exceeded during any 15-minute workperiod, and 200 ppm as an acceptable maximum peak level for 5-minutes in any 4-hours. NIOSH⁽²⁾ recommends an airborne exposure limit of 2 ppm which should not be exceeded during any 1-hour period. ACGIH recommends a limit of 5 ppm TWA for an 8-hour workshift and STEL of 10ppm⁽¹⁾. These limits contain notations that CCl_4 is a substance suspect of carcinogenic potential for man and with the further notation "skin" indicating the possibility of cutaneous absorption. The NIOSH⁽²⁾ IDLH level = 200 ppm with the notation "occupational carcinogen." HSE⁽³³⁾ has set a TWA of 10 ppm (65 mg/m³) and a STEL of 20 ppm (130 mg/m³). DFG⁽³⁾ has set a TWA of 10 ppm (65 mg/m³). Australia's, Israel's and Mexico's TWA is 5 ppm (30 mg/m³) and Mexico's STEL is 20 ppm (120 mg/m³). The former-USSR/UNEP joint project⁽⁴³⁾ has set a MAC in workplace air of 20 mg/m³ and a MAC in ambient air of residential areas of 4 mg/m³ on a momentary basis and 2 mg/m³ on an average daily basis. In

addition, several states have set guidelines or standards for CCl_4 in ambient air⁽⁶⁰⁾ ranging from zero (North Dakota) to 0.03 $\mu\text{g}/\text{m}^3$ (Rhode Island) to 0.0667 $\mu\text{g}/\text{m}^3$ (Indiana) to 0.67 $\mu\text{g}/\text{m}^3$ (Massachusetts and North Carolina) to 72 $\mu\text{g}/\text{m}^3$ (Pennsylvania) to 100 $\mu\text{g}/\text{m}^3$ (New York) to 150 $\mu\text{g}/\text{m}^3$ (South Carolina) to 300 $\mu\text{g}/\text{m}^3$ (Connecticut and Virginia) to 714 $\mu\text{g}/\text{m}^3$ (Nevada).

Determination in Air: Charcoal adsorption followed by workup with CS_2 and analysis by gas chromatography; see NIOSH Method #1003 for Hydrocarbons, Chlorinated⁽¹⁸⁾.

Permissible Concentration in Water: To protect freshwater aquatic life: 35,2000 $\mu\text{g}/\text{L}$ on an acute toxicity basis. To protect saltwater aquatic life: 50,000 $\mu\text{g}/\text{L}$ on an acute toxicity basis. To protect human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is presented by a concentration of 4.0 $\mu\text{g}/\text{L}$. Mexico's drinking water criteria is 0.004 mg/L. The former USSR/UNEP joint project⁽⁴³⁾ has set a MAC in water bodies used for domestic purposes of 0.3 mg/L. The USEPA⁽⁴⁸⁾ has set a lifetime health advisory of 0.0007 mg/kg/day and a drinking water equivalent level of 25 $\mu\text{g}/\text{L}$.

In addition, several states have set standards and guidelines for CCl_4 in drinking water⁽⁶¹⁾ ranging from standards of 2 $\mu\text{g}/\text{L}$ (New Jersey) to 3 $\mu\text{g}/\text{L}$ (Florida) to 10 $\mu\text{g}/\text{L}$ (New Mexico) and guidelines of 2.7 $\mu\text{g}/\text{L}$ (Minnesota) to 5 $\mu\text{g}/\text{L}$ (California, Kansas and Maine, Colorado).

Determination in Water: Gas chromatography (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion and skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Carbon tetrachloride irritates the eyes, causing redness. **Inhalation:** Levels of 20 ppm may cause dizziness, headache, vomiting, visual disturbances, extreme fatigue and nose and throat irritation. Other symptoms may include restlessness, loss of balance, twitching and tremors. Severe exposure can lead to liver, kidney, eye and nerve damage that may be delayed after exposure; can cause breathing stoppage, coma and death. 1000ppm for an unspecified time has caused death. **Skin:** May cause irritation and redness; carbon tetrachloride is readily absorbed through the skin. Symptoms as listed above may occur through skin absorption even when vapor concentrations are below OSHA standards. **Ingestion:** May cause severe abdominal pain with diarrhea, followed by symptoms described under inhalation. Death may occur by ingestion of as little as ½ teaspoon. Between 45 and 100 ppm, carbon tetrachloride may cause headache, drowsiness, fatigue, nausea and vomiting. 100 to 300 ppm may cause additional effects of mental confusion, weight loss and sluggishness. Liver, kidney, eye and nerve damage can result from more severe exposures. Coma and death may occur.

Long Term Exposure: Repeated or prolonged skin contact may cause dermatitis. Carbon tetrachloride is a possible human carcinogen. Cancer site in animals: liver cancer.

Points of Attack: Central nervous system, eyes, lungs, liver, kidneys and skin.

Medical Surveillance: Preplacement and periodic examinations should include an evaluation of alcohol intake and appropriate tests for liver and kidney functions. Special attention should be given to the central and peripheral nervous system, the skin, and blood. Expired air and blood levels may be useful as indicators of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Carbophenothion (ANSI)

Use Type: Insecticide and acaricide

CAS Number: 786-19-6

Formula: C₁₁H₁₆ClO₂PS₃

Alert: A Restricted Use Pesticide (RUP). Human toxicity (long-term): Very high.

Synonyms: Akarithion; Carbofenothion (Dutch); S-[(p-Chlorophenylthio)methyl]-O,O-diethyl Phosphorodithioate; S-(4-chlorophenylthiomethyl)diethyl Phosphorothiothionate; O,O-Diethyl-S-p-chlorophenylthiomethyl dithiophosphate; O,O-Diethyl-S-[(4-chlor-phenyl-thio)-methyl]dithiophosphat (German); O,O-Diethyl-S-[(4-chlor-fenyl-thio)-methyl]dithiofosfaat (Dutch); O,O-diethyl-S-(p-chlorophenylthiomethyl)phosphorodithioate; O,O-Diethyl-p-chlorophenylmercaptomethyl dithiophosphate; O,O-Diethyl-4-chlorophenylmercaptomethyl dithiophosphate; O,O-Diethyl-dithiophosphoric acid, p-chlorophenylthiomethyl ester; O,O-Diethyl-S-[(4-chlorofenil-tio)-metile]-dithiofosfato (Italian); O,O-Diethyl-S-[(p-clorofenil-tio)-metile]-dithiofosfato (Italian); Dithiophosphate de O,O-Diethyle et de (4-chlorophenyl) thiomethyle (French); ENT 23,708; Oleoakarithion

Trade Names: ACARITHION[®]; DAGADIP[®]; ENDYL[®]; GARRATHION[®]; HEXATHION[®]; LETHOX[®]; NEPHOCARP[®]; R-1303[®], Zeneca (USA) (now Syngenta) canceled 7/1/1987; STAUFFER R-1,303[®], Zeneca (USA) (now Syngenta) canceled 7/1/1987; TRITHION[®] MITICIDE

Producers: Calliope (France); ICI Americas (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate

EPA/OPP PC Code: 058102

California DPR Chemical Code: 110

ICSC Number: 0410

RTECS Number: ID5250000

EEC Number: 015-044-00-6

EINECS Number: 212-324-1

Uses: Primarily used to control mites, suckers, and aphids on citrus crops, deciduous fruits and nuts, vegetables, sorghum and maize. Also used to enhance the toxicity of malathion and other similar compounds.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.91 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–1.06008 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

Regulatory Authority:

- Banned or Severely Restricted Use (India) (UN)⁽¹³⁾
- Very Toxic Substance (World Bank)⁽¹⁵⁾
- AB 1803-Well Monitoring Chemical (CAL)
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- CAL-DHS/DHS Drinking Water Action Levels

- The "Director's List" (CAL/OSHA)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227 kg).
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg).
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

Description: Carbophenothion is a colorless to light amber liquid. Mercaptan odor. Practically insoluble in water; solubility = < 35 ppm. Boiling point = 82°C @ 0.01 mmHg. Vapor pressure = 8.3×10^{-6} mmHg. Log K_{ow} = 5.1. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: The substance decomposes on heating or on burning producing toxic fumes including phosphorus oxides, sulfur oxides, hydrogen chloride.

Permissible Exposure Limits in Air: No criteria set, but runoff from spills or fire control may cause water pollution.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: The substance may affect the nervous system, resulting in convulsions and respiratory failure. Cholinesterase inhibitor. Exposure may result in death. Produces headaches, nausea, weakness and dizziness. Symptoms may include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, weakness, muscle twitching, difficult breathing, blurring or dimness of vision, and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. This material is highly toxic; the estimated fatal oral dose is 0.6 g for a 150 lb. (70 kg) person. LD₅₀ (oral, rat) = 6.8 mg/kg. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible: see acute hazards/symptoms. The state of Massachusetts lists this chemical as a neurotoxin.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops,

plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting.** If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically*

instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Carbosulfan (ANSI)

Use Type: A broad spectrum insecticide

CAS Number: 55285-14-8

Formula: C₂₀H₃₂N₂O₃S

Synonyms: Carbamic acid,[(dibutylamino)thio]methyl-, 2,2-dimethyl-2,3-dihydro-7-benzofuranyl ester; [(Dibutylamino)thio]methylcarbamic acid, 2,2-dimethyl-2,3-dihydro-7-benzofuranyl ester; 2,2-Dihydro-2,2-dimethyl-7-benzofuranyl[(dibutylamino)thio]methylcarbamate; 2,3-Dihydro-2,2-dimethyl-7-benzofuranyl(di-N-butylaminosulfonyl)methylcarbamate; Carbamic acid, [(dibutylamino)thio]methyl-, 2,3-dihydro-2,2-dimethyl-7-benzofuranyl ester

Trade Names: ADVANTAGE[®]; FMC 35001[®]; FMC (USA); MARSHAL[®]; Rallis India (India); MARSHALL[®]; Rallis India (India); POSSE[®]

Producers: Agsin (Singapore); FMC (USA); Rallis India (India); Yellow River Enterprise (Taiwan)

Chemical Class: Carbamate

EPA/OPP PC Code: 090602

California DPR Chemical Code: 2182

EINECS Number: 259-565-9

Uses: Carbosulfan is a low toxic derivative from cabofuran. It is a broad spectrum insecticide, nematocide, miticide, effective against pests and mites. It is used to protect alfalfa, apple, citrus, corn, deciduous fruit, potato, rice, sorghum, soybean, sugar beets, sugarcane, and other vegetable, field, tree and orchard crops. It is used for seed treatments.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class II, moderately hazardous

Description: Molecular weight = 380.59

Incompatibilities: May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and

shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Carboxin (ANSI)

Use Type: Fungicide

CAS Number: 5234-68-4

Formula: C₁₂H₁₃O₂NS; C₆H₂NHCO-C₅OSH₇

Alert: General Use Pesticide (GUP). Human toxicity (long-term): Very high.

Synonyms: Carbathiin; 5-Carboxanilido-2,3-dihydro-6-methyl-1,4-oxathiin; Carboxine; DCMO; 2,3-Dihydro-5-carboxanilido-6-methyl-1,4-oxathiin; 2,3-Dihydro-6-methyl-1,4-oxathiin-5-carboxanilide; 5,6-Dihydro-2-methyl-1,4-oxathiin-3-carboxanilide; 5,6-Dihydro-2-methyl-N-phenyl-1,4-oxathiin-3-carboxamide; 2,3-Dihydro-6-methyl-5-phenylcarbonyl-1,4-oxathiin; DMOC; NSC 263492; 1,4-Oxathiin-3-carboxamide,5,6-dihydro-2-methyl-n-phenyl; 1,4-Oxathiin-3-carboxanilide,5,6-dihydro-2-methyl; 1,4-

Oxathiin-3-carboxanilide,5,6-dihydro-2-methyl-; 1,4-Oxathiin-2,3-dihydro-5-carboxanilido-6-methyl-

Trade Names: CADAN[®]; CARBOXIN OXATHION PESTICIDE[®]; CASWELL No. 165 A[®]; D-735[®]; F-735[®]; FLO PRO V SEED PROTECTANT[®], Cargill, Inc. (USA) canceled 12/12/1983; KEMIKER[®]; KISVAX[®]; OXALIN[®]; PADAN[®]; SANVEX[®]; THIOBEL[®]; VEGETOX[®]; VITAFLO[®]; VITAVAX[®], Gustafson LLC (USA); V 4X[®]

Producers: Agro-care Chemical Industry Group (China); Bharat Pulverising Mills (India); Crompton Corp. (USA); Epochem Co., (China); Gustafson LLC (USA); Hindustan Insecticides (India); Nufarm (Australia); Sigma-Aldrich Laborchemikalien (Germany); Uniroyal Crop Protection Div (USA)

Chemical Class: Carboxamide or anilide

EPA/OPP PC Code: 090201

California DPR Chemical Code: 1755

RTECS Number: RP4550000

EINECS Number: 226-031-1

Uses: Carboxin is a General Use Pesticide (GUP) and is used as a seed protectant and wood preservative. It is often used in combination with other fungicides such as thiram or captan. Carboxin is a systemic anilide fungicide. It is used as a seed treatment for control of smut, rot, and blight on barley, oats, rice, cotton, vegetables, corn and wheat. It is also used to control fairy rings on turf grass. Carboxin may be used to prevent the formation of these diseases or may be used to cure existing plant diseases.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

WHO Acute Hazard: Group U, unlikely to be hazardous

Regulatory Authority:

- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Cited in U.S. State Regulations: Actively registered pesticide in California.

Description: Carboxin is a crystalline solid. Soluble in water; solubility = 170 ppm @ 25°C. Molecular weight 235.31. Melting/Freezing point = 93-101°C. Vapor pressure = 1.78×10^{-7} mmHg.

Permissible Concentration in Water: The no-observed-adverse-effect level has been determined by EPA to be 10 mg/kg body weight/day. This results in a long-term health advisory of 3.5 mg/L and a lifetime health advisory of 0.7 mg/L.

Determination in Water: Analysis of carboxin is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen-phosphorus containing pesticides in water samples. In this method, approximately

1 liter of sample is extracted with Methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen phosphorus detector. The method detection limit has not been determined for carboxin but it is estimated that detection limits for analyses included in this method are in the range of 0.1 to 2 µg/L.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. The LD₅₀-oral for mice has been reported to be 3550 mg/kg (slightly toxic). A value for LD₅₀-rat of 430 mg/kg puts carboxin in the moderately toxic category. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cartap Hydrochloride

Use Type: Insecticide

CAS Number: 15263-52-2

Formula: C₇H₁₅N₃O₂N₂S₂Cl

Synonyms: 1,3-Bis(carbamoylthio)-2-(N,N-dimethylamino)propane hydrochloride; Carbamothioic acid-S,S'-[2-(dimethylamino)-1,3-propanediyl]ester, monohydrochloride; Cartap monohydrochloride; S,S'-[2-

(Dimethylamino)trimethylene]bis(thiocarbamate)hydrochloride; Thiocarbamic acid-S,S'-[2-(Dimethylamino)trimethylene]ester hydrochloride

Trade Names: CADAN[®], Sumika Takeda Agrochemical (Japan); CALDAN[®], KRITAP[®];NTD 2[®]; PADAN[®]; PATAP[®], Sumika Takeda Agrochemical (Japan); SANVEX[®]; THIOBEL[®], Sumika Takeda Agrochemical (Japan); TI-1258[®]; VEGETOX[®], Sumika Takeda Agrochemical (Japan)

Producers: Saeryung Chemicals (South Korea); Sumika Takeda Agrochemical (Japan)

Chemical Class: Nereistoxin insecticide

EPA/OPP PC Code: 041415

Uses: Not registered in the U.S. Cartap hydrochloride is used to control chewing and sucking insects on many crops, including rice, potatoes, cabbage and other vegetables, soy beans, peanuts, sunflowers, maize, sugar beet, wheat, pearl barley, pome fruit, stone fruit, citrus fruit, vines, chestnuts, ginger, tea, cotton, and sugar cane.

Regulatory Authority:

U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B)

Description: Molecular weight = 273.81

Incompatibilities: When heated to decomposition or on contact with acids or acid fumes, may produce highly toxic chloride fumes; deadly phosgene gas may be formed. May cause pitting of some metals.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, skin, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate

pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Chloramben (ANSI)

Use Type: Herbicide

CAS Number: 133-90-4

Formula: C₇H₅Cl₂NO₂

Alert: A General Use Pesticide (GUP) that is no longer produced or sold in the United States.

Synonyms: 3-Amino-2,5-dichlorobenzoic acid; Benzoic acid, 3-amino-2,5-dichloro-; Chloramben; Chlorambene; Chloramben, Aromatic carboxylic acid; Chloramben benzoic acid herbicide; Benzoic acid, 3-amino-2,5-dichloro-; 3-Amino-2,6-dichlorobenzoic acid; 2,5-Dichloro-3-aminobenzoic acid; NCI-C00055

Trade Names: ACP-M-728[®]; AMBEN[®], Aventis CropScience (France); Bayer CropScience (Germany); Rhone-Poulenc (France); AMBIBEN[®]; AMIBEN[®], Bayer CropScience (Germany) canceled 1/22/1991; AMIBIN[®]; AMOBEN[®]; ORNAMENTAL WEEDER[®], Bayer CropScience (Germany) canceled 10/10/1989; VEGABEN[®]; VEGIBEN[®], Bayer CropScience (Germany) canceled 4/9/1982; WEEDONE[®] GARDEN WEEDER, Bayer CropScience (Germany)

Producers: Aventis CropScience (France); Bayer CropScience (Germany); Flourochem (UK); Nufarm (Australia); Rhone-Poulenc (France); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Benzoic acid

EPA/OPP PC Code: 029901

California DPR Chemical Code: 2184

RTECS Number: DG1925000

Uses: A herbicide for grasses, and broadleaf weeds. Mostly used on soybeans, and also on corn, beans, asparagus, pumpkins, peanuts, sunflowers, peppers, cotton, sweet potatoes, squash, melons, hardwood trees, and some conifers, but is no longer produced or sold in the U.S.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–100.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–1584.89319 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Deferred

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Carcinogen, (animal positive) (NTP)
- Air Pollutant Standard Set (former USSR)⁽³⁵⁾ (Pennsylvania)⁽⁶⁰⁾
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- The "Director's List" (CAL/OSHA) Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg).
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%.

Description: Chloramben is a colorless, crystalline solid. Odorless. Molecular weight = 206.03. Melting/Freezing point = 200° to 201°C. Soluble in water; solubility = 690 ppm @ 25°C. It is practically nontoxic. Vapor pressure = 6.8 x 10⁻³ mmHg @ 100°C.

Incompatibilities: Rapidly decomposed by light. Strong acids and acid fumes.

Permissible Exposure Limits in Air: Although no occupational exposure limits have been established, this chemical can be absorbed through the skin. The former USSR⁽³⁵⁾ has set a MAC in ambient air in residential areas of 0.01 mg/m³ on a momentary basis and 0.006 mg/m³ on an average daily basis. Pennsylvania⁽⁶⁰⁾ has set a guideline for chloramben in ambient air of 1.3333 mg/m³.

Permissible Concentration in Water: The USSR⁽³⁵⁾ has set a MAC of 0.5 mg/L in surface water. A lifetime health advisory of 0.105 mg/L has been determined by EPA (see reference below).

Routes of Entry: Inhalation, passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. The available data on Chloramben are very sparse. Much additional information is needed regarding its chronic toxicity, teratogenicity, and carcinogenicity before limits can be confidently set. No-observed-adverse-effect doses for chloramben were 15 mg/kg/day. Based on these data an ADI was calculated at 0.015 mg/kg/day

Long Term Exposure: There is evidence that this chemical causes cancer in animals. It may cause cancer of the liver. Repeated exposure may cause skin rash with itching.

Points of Attack: Skin, liver.

Medical Surveillance: Liver function tests. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chlordane

Use Type: Insecticide

CAS Number: 57-74-9; 12789-03-6 (technical grade chemical)

Formula: C₁₀H₆Cl₈

Alert: Since 1988, the use and commercial production of chlordane (except for export) has been prohibited in the United States and many other countries. However, chlordane residue is still present from prior use in many homes and other structures, as well as the surrounding soil. Old supplies of chlordane may still exist in locations such as warehouses, garages, and landfills. The only commercial use still permitted is for fire ant control in power transformers. Human toxicity (long-term): High.

Synonyms: Chloordaan (Dutch); Chlordan; Clordan (Italian); Clordano (Spanish); Cortilan-Neu; Dichlorochlordene; ENT 9,932; ENT 25,552-X; 4,7-Methanoindan, 1,2,3,4,5,6,7,8,8-octachloro-2,3,3a,4,7,7a-hexahydro-; 4,7-Methano-1H-indene, 1,2,4,5,6,7,8,8-octachloro-2,3,3a,4,7,7a-hexahydro-; 4,7-Methanoindan, 1,2,4,5,6,8,8-octachloro 3a,4,7,7a-tetrahydro; NCI-C00099; Octachlor; Octachlorodihydrodicyclopentadiene;

Chemical Class: Organochlorine; Halo-organics

EPA/OPP PC Code: 058201, 058202 (technical grade chemical)

California DPR Chemical Code: 130

ICSC Number: 0740

RTECS Number: PB9800000

RCRA Number: U036

EEC Number: 602-047-00-8

Uses: Chlordane is a broad spectrum insecticide of the group of polycyclic chlorinated hydrocarbons called cyclodiene insecticides. Chlordane has been used extensively since the 1950's for termite control, as an insecticide for homes and gardens, and as a control for soil insects during the production of crops such as corn. Both the uses and the production volume of chlordane have decreased extensively since the issuance of a registration suspension notice for all food crops and home and garden uses of chlordane by the U.S. Environmental Protection Agency. However, significant commercial use of chlordane for termite control continues. Special groups at risk include children as a result of milk consumed; fishermen and their families because of

the high consumption of fish and shellfish, especially freshwater fish; persons living downwind from treated fields; and persons living in houses treated with chlordane pesticide control agents. Formulations include dusts, emulsifiable concentrates, granules, oil solutions, and wettable powders.

Human toxicity (long-term)⁽⁷⁷⁾: High–2.00 ppb, MCL (Maximum Contaminant Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Extra high–0.04936 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, Probably Carcinogen
California Prop. 65: Carcinogen

IARC: Group 2B, Possibly Carcinogenic to Humans

WHO Acute Hazard: Class II, moderately hazardous

Endocrine Disruptor: Known ED

- Canada, Drinking water quality: 0.007 mg/L MAC
- Mexico, Drinking water quality: 0.003 mg/L

Description: Technical-grade chlordane is a mixture of chlordane isomers and more than 140 related reaction products. Depending on the composition, the mixture may be an amber-to-brown, viscous liquid or a white powder. As a commercial pesticide, chlordane is usually dissolved in hydrocarbons and used as a spray. At room temperature, chlordane is almost odorless or may have a slight chlorine-like odor, but the odor is inadequate as a warning of exposure. Practically insoluble in water. Molecular weight = 409.8 daltons. Boiling point = 175°C @ 2 mmHg. Melting/Freezing point = (*cis* isomer) $107\text{--}109^{\circ}\text{C}$; (*trans* isomer) $103\text{--}105^{\circ}\text{C}$. Vapor pressure = 1×10^{-5} mmHg @ 25°C . Noncombustible liquid (but the commercial product may be dissolved in various flammable solvents). Hazard Identification (based on NFPA-704 M Rating System): (in a flammable solution) Health 3, Flammability 3 [may vary depending on carrier], Reactivity 0.

Incompatibilities: Contact with strong oxidizers may cause fire and explosions. High heat and contact with alkaline solutions cause decomposition with the production of toxic fumes including chlorine, phosgene, hydrogen chloride. Attacks iron, zinc, plastics, rubber and coatings.

Permissible Exposure Limits in Air: The Federal (OSHA PEL) limit⁽⁵⁸⁾ is 0.5 mg/m^3 TWA for an 8-hour workshift. NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommend the same limit. Australia, DFG (MAK)⁽³⁾, Israel and Mexico TWA value is 0.5 mg/m^3 and Mexico's STEL value is 2.0 mg/m^3 . Many of these regulatory and advisories add the notation "skin," indicating the possibility of cutaneous absorption. The NIOSH⁽²⁾ IDLH level = 100 mg/m^3 . The Canadian provinces of Alberta, British Columbia, Ontario, and Quebec set a limit of 0.5 mg/m^3 TWA and STEL value of 2.0 mg/m^3 . The former USSR-UNEP/IRPTC project has set a MAC of 0.01 mg/m^3 in workplace air⁽⁴³⁾. Several states have set guidelines or standards for chlordane in ambient air⁽⁶⁰⁾ ranging from $0.068 \text{ }\mu\text{g/m}^3$ (Massachusetts) to $0.36 \text{ }\mu\text{g/m}^3$ (Pennsylvania)

to $1.19 \text{ }\mu\text{g/m}^3$ (Kansas) to $1.7 \text{ }\mu\text{g/m}^3$ (New York) to $2.5 \text{ }\mu\text{g/m}^3$ (Connecticut and South Carolina) to $5.0 \text{ }\mu\text{g/m}^3$ (Florida) to $5\text{--}20 \text{ }\mu\text{g/m}^3$ (North Dakota) to $8.0 \text{ }\mu\text{g/m}^3$ (Virginia) to $12.0 \text{ }\mu\text{g/m}^3$ (Nevada).

Determination in Air: Filter/Chromosorb tube-102; Toluene; Gas chromatography/Electrochemical detection; NIOSH IV, Method #5510⁽¹⁸⁾.

Permissible Concentration in Water: EPA has set a limit in drinking water of 2 ppb. The U.S. EPA recommends that a child should not drink water with more than 60 parts of chlordane per billion parts of drinking water (60 ppb) for longer than 1 day. To protect freshwater aquatic life: $0.0043 \text{ }\mu\text{g/L}$ as a 24-hour average, not to exceed $2.4 \text{ }\mu\text{g/L}$ at any time. To protect saltwater aquatic life: $0.0040 \text{ }\mu\text{g/L}$ as a 24-hour average, never to exceed $0.09 \text{ }\mu\text{g/L}$. To protect human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is presented by a concentration of $0.0046 \text{ }\mu\text{g/L}$ ⁽⁶⁾. The U.S. EPA⁽⁴⁷⁾ has found a lowest-observed-adverse-effect-level (LOAEL) of 0.045 mg/kg body weight/day which results in a lifetime health advisory of $2 \text{ }\mu\text{g/L}$. Several states have set standards and guidelines for chlordane in drinking water⁽⁶¹⁾. Standards range from $0.5 \text{ }\mu\text{g/L}$ (New Jersey) to $3.0 \text{ }\mu\text{g/L}$ (Illinois) and guidelines range from $0.055 \text{ }\mu\text{g/L}$ (California) to $0.22 \text{ }\mu\text{g/L}$ (Kansas and Minnesota) to $0.50 \text{ }\mu\text{g/L}$ (Arizona) to $0.55 \text{ }\mu\text{g/L}$ (Maine). See values listed under Regulatory Authority for Canada and Mexico. It is strongly advised not to let the chemical enter into the environment because it persists in the environment. The substance may cause long-term effects in the aquatic environment.

Determination in Water: Filter/Chromosorb tube-102; Toluene; Gas chromatography/Electrochemical detection; NIOSH IV, Method #5510⁽¹⁸⁾. Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Chlordane is absorbed well by the lungs and gastrointestinal tract and through intact skin. Exposure by any route can cause systemic effects.

Harmful Effects and Symptoms

Short Term Exposure: Significant chlordane exposure by any route disrupts the transmission of nerve impulses, resulting in CNS excitation, convulsions, and respiratory depression. Chlordane is absorbed well through intact skin. Early formulations contained impurities that were skin and mucous-membrane irritants. Common symptoms of chlordane poisoning include headache, nausea, excitability, confusion, and muscle tremors that may precede convulsions. Chlordane can irritate the eyes and skin and can cause burns on contact. Skin rash or acne may develop. Exposure can cause blurred vision, nausea, headache, abdominal pain and vomiting. Exposure at high levels may result in disorientation, tremors, convulsions, respiratory failure and death. Medical observation is indicated. Symptoms include increased sensitivity to stimuli, tremors,

muscular incoordination, and convulsions with or without coma. Fatal oral dose to adult humans is between 6 and 60 g with onset of symptoms within 45 minutes to several hours after ingestion, although symptoms have occurred following very small doses either orally or by skin exposure. Some reports of delayed development of liver disease, blood disorders and upset stomach. Chlordane is considered to be borderline between a moderately and highly toxic substance. The LD_{50} (oral, rat) = 283 mg/kg.

Long Term Exposure: Chronic chlordane exposure can cause permanent alterations of nervous system function, including problems with memory, learning, thinking, sleeping, personality changes, depression, numbness in the extremities, headache, and sensory and perceptual changes. It has been suggested that chronic exposure can cause blood disorders, but these disorders were not shown to have an increased incidence in heavily exposed groups of workers. Besides blood disorders, jaundice has been reported in persons living in homes treated with chlordane for termite control, but liver-function tests were normal in workers who manufactured chlordane. Chronic exposures may be more serious for children because of their potential longer latency period. **Carcinogenicity:** IARC has determined that chlordane is possibly carcinogenic to humans (group 2B). The U.S. EPA has determined that technical grade chlordane is a likely human carcinogen. Chlordane is structurally similar to rodent carcinogens and chronic chlordane exposure can cause hepatocellular carcinoma in several strains of mice. The evidence for carcinogenicity in humans is weak: a few case reports and mixed or equivocal case-control study results associating exposure to chlordane with leukemia and non-Hodgkin's lymphoma. Epidemiological evidence for an association is supported by limited evidence of mutagenicity in human and rodent lymphocytes tested *in vitro*. **Reproductive and Developmental Effects:** The TERIS database states that no epidemiologic studies have reported birth defects among infants born to mothers exposed to chlordane during pregnancy. Chlordane is excreted in breast milk. No teratogenic effects from acute exposure have been reported. Prenatal exposure to chlordane has been reported for a few cases of neuroblastoma, blood dyscrasias, and depressed cell-mediated immunity, but no direct link with the chemical was established. Chlordane induces liver enzymes and enhances metabolism of steroid hormones, including oral contraceptives; sterility has been reported in animals.

Points of Attack: Central nervous system, eyes, lungs, liver, kidneys, skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Examination by a qualified allergist. Complete blood count.

First Aid: Persons exposed only to chlordane vapor do not pose risks of secondary contamination to others. Persons

whose skin or clothing is contaminated with liquid or powdered chlordane can cause secondary contamination by direct contact. **Inhalation:** Monitor for respiratory distress. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Administer 100% humidified supplemental oxygen if breathing is difficult. **Basic Decontamination:** Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs chlordane; therefore, items such as leather shoes, gloves, and belts should be discarded. If there has been direct contact with liquid or powdered chlordane, flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. **Do not scrub**, since this can increase absorption through the skin. Rinse thoroughly with water. **Eyes:** irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Keep victims (adults or children) warm and quiet to avoid triggering seizures and the complication of hypothermia. **Ingestion: Do not induce vomiting.** If the victim is conscious and able to swallow, administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. (The efficacy of activated charcoal for chlordane poisoning is uncertain).

Note to physician or authorized medical personnel: In cases of respiratory compromise secure airway and respiration via endotracheal intubation. If not possible, perform cricothyroidotomy if equipped and trained to do so. To control metabolic acidosis, treat with sodium bicarbonate under medical base control (adult dose = 1 ampule; pediatric dose = 1 mEq/kg). Patients who are comatose, hypotensive, or have seizures or cardiac dysrhythmias should be treated according to advanced life support protocols. High concentrations of chlordane can increase cardiac irritability, use caution with cardiac or bronchial sensitizing agents.

Chlordecone (Kepone®)

Use Type: Insecticide

CAS Number: 143-50-0

Formula: C₁₀Cl₁₀O

Alert: Chlordecone is no longer used in the U.S. Introduced in 1958, it was used until 1978 as an insecticide for leaf-eating insects, ants, and cockroaches, and as a larvicide for flies.

Synonyms: 1, 2, 3, 5, 6, 7, 8, 9, 10, 10-Decachloro(5.2.2.0².6.0³.9.0⁵.8)decano-4-one; Decachloroketone; Decachlorooctahydro-1,3,4-metheno-2H-cyclobuta[c,d]pentalen-2-one; Decachlorooctahydrokepone-2-one; 1,1a,3,3a,4,5,5a,5b,6-Decachloro-octahydro-1,3,4-metheno-2H-cyclobuta[c,d]pentalen-2-one; Decachlorooctahydro-1,3,4-metheno-2H-cyclobuta[c,d]pentalen-2-one; 1,1a,3,3a,4,5,5a,5b,6-Decachlorooctahydro-1,3,4-metheno-2H-cyclobuta[c,d]pentalen-2-one; Decachlorotetracyclodecanone; Decachlorotetrahydro-4,7-methanoindeneone; ENT 16,391; 1,3,4-Metheno-2H-cyclobuta[c,d]pentalen-2-one, 1,1a,3,3a,4,5,5a,5b,6-decachloro-octahydro-Kepone®; NCI-C00191

Trade Names: CIBA® 8514, Ciba-Geigy (Switzerland); COMPOUND 1189®, General Chemicals (USA); GC-1189®, General Chemicals (USA); GENERAL CHEMICALS 1189®, General Chemicals (USA); KEPONE®, Allied Signal Inc. (USA) canceled 12/31/1987; MEREX®

Producers: Ehrenstorfer, Dr. (Germany); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Cyclo-diene; Halo-organics

EPA/OPP PC Code: 027701

California DPR Chemical Code: 347

ICSC Number: 1432

RTECS Number: PC8575000

RCRA Number: U142

EEC Number: 606-019-00-6

Uses: Kepone was registered for the control of root borers on bananas with a residue tolerance of 0.01 ppm. This constituted the only food or feed use of Kepone. Non-food uses included wireworm control in tobacco fields and bait to control ants and other insects in indoor and outdoor areas. A rebuttable presumption against registration of chlordecone was issued by the U.S. EPA on March 25, 1976 on the basis of oncogenicity. The trademarked Kepone and products of six formulations were the subject of voluntary cancellation according to a U.S. EPA notice dated July 27, 1977. In a series of decisions, the first of which was issued on June 17, 1976, the U.S. EPA effectively canceled all registered products containing kepone as of May 1, 1978.

Carcinogen/Hazard Classifications

IARC: Group 2B, suspected human carcinogen

California Prop. 65: Carcinogen; developmental toxin

Regulatory Authority:

- Carcinogen (Animal Positive, Human Suspected) (IARC)⁽⁹⁾ (NPT)⁽¹⁰⁾ (DFG)⁽³⁾
- Banned or Severely Restricted (Many Countries) (UN)⁽¹³⁾(35)

- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 8270(10).
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)

Description: Kepone is a tan to white, crystalline solid. Odorless. Very slightly soluble in water; solubility = 8.1 ppm @ 25°C; about 0.4% @ 100°C. Molecular weight = 490.58. Melting/Freezing point = 360°C (sublimes without melting). Vapor pressure = < 3.1 x 10⁻⁷ mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Incompatibilities: Acids, acid fumes. Technical grade kepone contains small amounts of hexachlorocyclopentadiene.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ recommends that the workplace environmental level be limited to 0.001 g/m³ TWA for up to a 10-hour workday, 40-hour workweek, as an emergency standard. Guidelines or standards for Kepone in ambient air have been set⁽⁶⁰⁾ ranging from zero (South Carolina) to 0.03 µg/m³ (New York) to 0.88 µg/L (Pennsylvania).

Determination in Air: Collection by membrane filter and backup impinger containing NaOH solution, workup with benzene, analysis by gas chromatography with electron capture detector. See NIOSH Method 5508.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation of dust, ingestion, skin absorption.

Harmful Effects and Symptoms

In July 1975, a private physician submitted a blood sample to the Center for Disease Control (CDC) to be analyzed for Kepone, a chlorinated hydrocarbon pesticide. The sample had been obtained from a Kepone production worker who suffered from weight loss, nystagmus, and tremors. CDC notified the State epidemiologist that high levels of Kepone were present in the blood sample, and he initiated an epidemiologic investigation which revealed other employees suffering with similar symptoms. It was evident to the State official after visiting the plant that the employees had been exposed to Kepone at extremely high concentrations through inhalation, ingestion, and skin absorption. He recommended that the plant be closed, and company management complied. Of the 113 current and former employees of this Kepone-manufacturing plant examined, more than half exhibited clinical symptoms of Kepone poisoning. Medical histories of tremors (called "Kepone shakes" by employees), visual disturbances, loss of weight, nervousness, insomnia, pain in the chest and abdomen and, in some cases, infertility and loss of libido were reported. The employees also complained of vertigo and lack of muscular coordination. The intervals between exposure and onset of the signs and symptoms varied between patients but appeared to be dose related. NIOSH has received a report on a carcinogenesis bioassay of technical grade Kepone which was conducted by the National Cancer Institute using Osborne-Mendel rats and mice, Kepone was administered in the diet at two tolerated dosages. In addition to the clinical signs of toxicity, which were seen in both species, a significant increase ($P < 0.05$) of hepatocellular carcinoma in rats given large dosages of Kepone and in mice at both dosages was found. Rats and mice also had extensive hyperplasia of the liver. In view of these findings, NIOSH must assume that Kepone is a potential human carcinogen. The LD₅₀ (oral, rat) = 95 mg/kg (moderately toxic).

Short Term Exposure: May be poisonous if absorbed through the skin. Eye or skin contact may cause irritation and rash. Poisonous if swallowed. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. Exposure can cause headache, nervousness, tremor; liver, kidney damage; visual disturbance; ataxia, chest pain, skin erythema (skin redness). The Food and Drug Administration (FDA) suggests that eating fish and other foods with concentrations of chlordecone below 400 ppt, will not cause harmful health effects in people.

Long Term Exposure: Has been shown to cause liver cancer in animals; potential human carcinogen. May cause testicular atrophy, low sperm count, damage to the developing fetus, reproductive damage; sterility, breast enlargement; skin changes; liver and kidney damage; brain and nervous system damage with hyperactivity, hyperexcitability, muscle spasms, tremors.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys, reproductive system

Medical Surveillance: Employers shall make medical surveillance available to all workers occupationally exposed to Kepone, including personnel periodically exposed during routine maintenance or emergency operations. Periodic examinations shall be made available at least on an annual basis.

First Aid: Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Qualified medical personnel may consider the administration of cholestyramine resin (QUESTAN®). Medical personnel should wear neoprene gloves as protection against contamination. (Dreisbach)

Chlordimeform (ANSI)

Use Type: Acaricide and insecticide

CAS Number: 6164-98-3

Formula: C₁₀H₁₃ClN₂

Synonyms: CDM; Chlorfenamidine; *N*'-(4-chloro-2-methylphenyl)-*N,N*-dimethylmethanimidamide; Chlorphenamidine; *N*'-(4-Chloro-*o*-tolyl)-*N,N*-dimethylformamidine; Dimethylformamidine *N*'-(4-chloro-*o*-tolyl)-*N,N*-dimethylformamidin (German); *N,N*-Dimethyl-*N*'-(2-methyl-4-chlorophenyl)formamidine; *N,N*-Dimethyl-*N*'-(2-Methyl-4-chlorophenyl)-formadin (German); ENT 27,335; ENT 27,567; EP-333; Formamidine, *N*'-(4-chloro-*o*-tolyl)-*N,N*-dimethyl-; Methanimidamide, *N*'-(4-chloro-2-methylphenyl)-*N,N*-dimethyl-; *N*'-(2-Methyl-4-chlorophenyl)-*N,N*-Dimethylformamidine; *N*'-(2-Methyl-4-chlorophenyl)-formamidin-hydrochlorid (German); NSC-190935

Trade Names: ACARON[®]; BERMAT[®]; C 8514[®]; CARZOL[®]; CIBA[®] 8514; FUNDAL[®]; FUNDAL[®] 500; FUNDEX[®]; GALECRON[®]; RS 141[®]; SCHERING[®] 36,268, Schering (Germany); SN[®] 36268; SPANON[®]; SPANONE[®]
Producers: Ciba-Geigy (Switzerland); Schering (Germany); Syngenta (Switzerland)

Chemical Class: Formamidine; Halo-organics

EPA/OPP PC Code: 059701

California DPR Chemical Code: 300

ICSC Number: 0124

RTECS Number: LQ4375000

EEC Number: 650-007-00-3

EINECS Number: 228-200-5

Uses: Not registered in the U.S. Was a Restricted Use Pesticide (RUP). Used for control of bollworm and tobacco budworm in cotton, and to control mites and their eggs. Banned for use on cotton in 1989.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.26923 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–2150.95498 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

California Prop. 65: Carcinogen

IARC: Group 3, unclassifiable

Label Signal Word: CAUTION or WARNING

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- The "Director's List" (CAL/OSHA)
- Proposition 65 chemical (CAL)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Colorless, crystalline solid. Slightly soluble in water; solubility = 250 ppm @ 20°C. Molecular weight 196.68. Melting/Freezing point = 35°C. Boiling point = 156°C (decomposes below BP). Vapor pressure = 3.5 x 10⁻⁴ mmHg @ 20°C. Log K_{ow} = 0.11. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: May form explosive materials with phosphorus pentachloride. Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids; alkaline reagents. May attack some forms of plastic, rubber, and coatings. Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion and inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration; bluish lips, fingernails or face; convulsions; loss of consciousness; breathing stops; death. May have blood in the urine or a sweet taste in the mouth. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures.

Points of Attack: May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large

quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Chlorethoxyfos (ANSI)

Use Type: Insecticide

CAS Number: 54593-83-8

Formula: C₆H₁₁Cl₄O₃PS

Alert: A Restricted Use Pesticide (RUP). Human toxicity (long-term): High.

Synonyms: Chlorethoxyphos; *O,O*-Diethyl *O*-(1,2,2,2-tetrachloroethyl) phosphorothioate; *O,O*-Diethyl *O*-(1,2,2,2-tetrachloroethyl) thionophosphate; Phosphorothioic acid, *O,O*-diethyl *O*-(1,2,2,2-tetrachloroethyl)ester

Trade Names: DPX-43898®; FORTRESS®, Amvac Chemicals Corp (USA); SD 208304®

Producers: Amvac Chemicals Corp (USA)

Chemical Class: Organophosphate; Halo-organics

EPA/OPP PC Code: 129006

California DPR Chemical Code: 5106

Uses: Chlorethoxyfos is a restricted use organophosphate insecticide registered for use on field corn, seed corn, sweet corn, and popcorn for the control of corn rootworms, wireworms, cutworms, seed corn maggots, white grubs, and symphylans.

Human toxicity (long-term)⁽⁷⁷⁾: High–4.20 ppb, Health Advisory

Fish toxicity (threshold): Extra high–0.40299 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Chlorethoxyfos (40 CFR 180.486):

CROP	ppm
Corn, field, forage	0.01
Corn, field, grain	0.01
Corn, field, stover	0.01
Corn, pop, grain	0.01
Corn, pop, stover	0.01
Corn, sweet, forage	0.01
Corn, sweet, kernel plus cob with husks removed	0.01
Corn, sweet, stover	0.01

Carcinogen/Hazard Classifications

Label Signal Word: WARNING or DANGER

WHO Acute Hazard: Class 1 a, extremely hazardous

Regulatory Authority:

- U.S. Dot Inhalation Hazard Chemicals as organophosphates

Description: Molecular weight = 335.98.

Incompatibilities: May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus Pesticides.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin

contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Note to physician or authorized medical personnel:* Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established,

atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Chlorfenapyr

Use Type: Insecticide and miticide

CAS Number: 122453-73-0

Formula: C₁₅H₁₁BrClF₃N₂O

Alert: Chlorfenapyr is a new pesticide that, in 2000, American Cyanamid applied for registration with the U.S. EPA for food crop use. Objections arose because it could greatly harm the bird population. The application was withdrawn and reapplied for, and accepted for non food use in January, 2001.

Synonyms: 1*H*-Pyrrole-3-carbonitrile, 4-bromo-2-(4-chlorophenyl)-1-(ethoxymethyl)-5-(trifluoromethyl)-; 4-Bromo-2-(4-chlorophenyl)-1-(ethoxymethyl)-5-(trifluoromethyl)pyrrole-3-carbonitrile (IUPAC)

Trade Names: AC 303630[®]; CL 303630[®]; PHANTOM[®]; BASF Agricultural Products Group (Germany); PIRATE[®]; PYLON[®], BASF Agricultural Products Group (Germany); SUMILARV[®]

Producers: Agsin (Singapore); BASF Agricultural Products Group (Germany)

Chemical Class: Pyrazole; Pyrroles (new); Halo-organics

EPA/OPP PC Code: 129093

California DPR Chemical Code: 3938

Uses: Used on ornamental crops in commercial greenhouses to control mites, caterpillar pests, thrips and fungus gnats. Not for food use. Registered in the U.S. January, 2001. Chlorfenapyr has not been previously registered in the United States. However, it has been used on cotton (under the trade name Pirate) under Sec. 18 of the Federal Insecticide Fungicide and Rodenticide Act (FIFRA).

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Unclassifiable

Label Signal Word: CAUTION or WARNING

WHO Acute Hazard: Class II, moderately hazardous

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chlorfenvinphos

Use Type: Insecticide

CAS Number: 470-90-6

Formula: C₁₂H₁₄Cl₃O₄P

Alert: Banned in the U.S. since 1991 and in Australia since December, 2000.

Synonyms: Benzyl alcohol,2,4-dichloro- α -(chloromethylene)-, Diethyl phosphate; Clorfenvinfos (Spanish); O-2-Chloro-1-(2,4-dichloro-fenyl)-vinyl-O, O-diethylfosfaat (Dutch); O-2-Chlor-1-(2,4-dichlor-phenyl)-vinyl-O, O-diaethylphosphat (German); 2-Chloro-1-(2,4-dichlorophenyl)vinyl diethyl phosphate; β -2-Chloro-1-(2',4'-dichlorophenyl) vinyl dethylphosphate; Chlorfenvinphos; Chlorpheninfos; Chlorphenvinphos; Clorfenvinfos; O-2-Chloro-1-(2,4-dichloro-fenil)-vinil-O, O-di etilfosfato (Italian); CVP; O, O-Diethylo-(2-chloro-1-(2',4'-dichlorophenyl)vinyl) phosphate; Diethyl-1-(2,4-dichlorophenyl)-2-chlorovinyl phosphate; ENT24969; Phosphate de O, O-diethyle etdeo-2-chloro-1-(2,4-dichlorophenyl) vinyle (French); Phosphoric acid, 2-chloro-1-(2,4-dichlorophenyl)ethenyldiethyl ester

Trade Names: APACHLOR[®]; BIRLANE[®]; BIRLANE LIQUID[®]; C8949[®]; C-10015[®]; CFV[®]; CGA 26351[®]; COMPOUND 4072[®], Shell Chemical Co. (UK) canceled 10/10/1989; DERMATON[®], Coopers Animal Health (USA) canceled 7/1/1987; GC 4072[®], General Chemicals (USA); OMS 1328[®]; SAPECRON[®]; SAPECRON[®] 240; SAPECRON[®] 10FGEC; SD 4072[®]; SD 7859[®]; SHELL 4072[®]; STELADONE[®]; SUPONA[®]; SUPONE[®]; UNITOX[®]; VINYLPHATE[®]

Producers: Cyanamid Agriculture Products (USA); Ehrenstorfer, Dr. (Germany); Shell Chemical (UK); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate; Halo-organics

EPA/OPP PC Code: 084101

California DPR Chemical Code: 306

ICSC Number: 1305

RTECS Number: TB8750000

EEC Number: 015-071-00-3

EINECS Number: 207-432-0

Uses: Since 1991, all products containing chlorfenvinphos have been banned in the U.S. It was widely used to control pests such as flies, fleas and mice. It is used in veterinary applications to control ticks and buffalo flies on cattle and blowflies on sheep. It is also used to control insects in mushroom, potato, lucern, dairy barns and pasture crops.

U.S. Maximum Allowable Residue Levels

The Food and Drug Administration (FDA) has set tolerances for chlorfenvinphos for agricultural products ranging from 0.005 to 0.2 parts chlorfenvinphos per million parts of food (0.005-0.2 ppm).

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1b, highly hazardous

Regulatory Authority:

- Very Toxic Substance (World Bank)⁽¹⁵⁾
- The "Director's List" (CAL/OSHA)
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Chlorfenvinphos is a nonflammable, yellow or amber liquid with a mild odor. Slightly soluble in water; solubility = 145 ppm @ 23°C. Boiling point = 110°C @ 0.001 mmHg; 168–170°C @ 0.5 mmHg. Melting/Freezing point = –16 to –23°C. Vapor pressure = 1.9×10^{-7} mmHg @ 25 °C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Log K_{ow} = 3.82. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Strong oxidizers, strong bases, moisture. May be corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air: No standards set. However, it should be recognized that this chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV #5600, Organophosphorus pesticides.⁽¹⁸⁾

Permissible Concentration in Water: 0.1 mg/L in drinking water is a recommended drinking water limit.

Routes of Entry: Inhalation, passes through the unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: Highly toxic (LD_{50} rats = 10 mg/kg). Symptoms exhibited on chlorfenvinphos exposure are typical of cholinesterase poisoning. Nausea is often first symptom, with vomiting, abdominal cramps, diarrhea, and excessive salivation. Headache, giddiness, weakness, tightness in chest, blurring of vision, pinpoint pupils, loss of muscle coordination, and difficulty breathing. Convulsions and coma precede death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Chlorfenvinphos can cause the heart to beat slower (bradycardia) or irregularly (arrhythmia). Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: There is no evidence that long-term exposure to small amounts of chlorfenvinphos causes any harmful health effects in people. It is not known whether chlorfenvinphos can affect reproduction or cause birth defects in people. One animal study reported decreased fertility in rats given chlorfenvinphos in their food, and another study reported that chlorfenvinphos interfered with the development of rats when the pregnant animals were fed chlorfenvinphos. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as

pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting.** If the victim is

alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the

combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Chlorfluazuron

Use Type: Insecticide

CAS Number: 71422-67-8

Formula: C₂₀H₉Cl₃F₃N₃O₃

Alert: Withdrawn, as one of 320 pesticides, by the European Commission July 25, 2003. Also withdrawn in Australia where contamination of livestock has resulted in a multitude of law suits.

Synonyms: Benzamide, *N*-[[(3,5-dichloro-4-{{3-chloro-5-(trifluoromethyl)-2-pyridinyl}oxy}phenyl)amino]carbonyl]-2,6-difluoro- (9CI); *N*-[4-(3-Chloro-5-trifluoromethyl-2-pyridinyl-oxy)-3,5-dichloro-phenyl-aminocarbonyl]-2,6-difluorobenzamide; CFZ

Trade Names: ATABRON[®]; CGA-112913[®]; EXTERRA REQUIEM TERMITE BAIT[®], HELIX[®], Crop Care Australasia (Australia), canceled; IKI-7899[®]; PP-145[®]; UC-62644[®]

Producers: Crop Care Australasia (Australia); ICI Group (UK); Union Carbide (USA)

Chemical Class: Pyridine

EPA/OPP PC Code: 108202

Uses: Not registered in the U.S. Used as an insect development inhibitor insecticide for control of termites in the soil, moths and other insects, primarily on cotton.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class U, unlikely to be hazardous

Synonyms: Benzamide, *N*-[[(3,5-dichloro-4-{{3-chloro-5-(trifluoromethyl)-2-pyridinyl}oxy}phenyl)amino]carbonyl]-2,6-difluoro- (9CI); *N*-[4-(3-Chloro-5-trifluoromethyl-2-pyridinyl-oxy)-3,5-dichloro-phenyl-aminocarbonyl]-2,6-difluorobenzamide; CFZ

Trade Names: ATABRON[®]; CGA-112913[®]; EXTERRA REQUIEM TERMITE BAIT[®]; HELIX[®]; Crop Care Australasia (Australia), canceled; IKI-7899[®]; PP-145[®]; UC-62644[®]

Producers: Crop Care Australasia (Australia); ICI Group (UK); Union Carbide (USA)

Chemical Class: Pyridine

EPA/OPP PC Code: 108202

Uses: Not registered in the U.S. Used as an insect development inhibitor insecticide for control of termites in the soil, moths and other insects, primarily on cotton.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: White powder. Odorless. Disperses in water.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Eyes and inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Mechanical action of the powder may cause mild eye irritation and coughing.

Points of Attack: Eyes and throat

Medical Surveillance:

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chlorimuron-ethyl

Use Type: Herbicide

CAS Number: 90982-32-4

Formula: C₁₃H₁₁ClN₄O₆S

Synonyms: Benzoic acid,2-[[[(4-chloro-6-methoxy-2-pyrimidinyl)amino]carbonyl]amino]sulfonyl]-,ethyl ester; Caswell No. 193B; Chlorimuronethyl ester; Chlorimuronethyl [Ethyl-2-[[[(4-chloro-6-methoxyprimidin-2-yl)-carbonyl]-amino]sulfonyl]benzoate]; 2-[[[(4-Chloro-6-methoxy-2-pyrimidinyl)amino]carbonyl]amino]sulfonyl]benzoic acid, ethyl ester; Ethyl-2-[[[(4-chloro-6-methoxyprimidin-2-yl)-carbonyl]-amino]sulfonyl]benzoate;

Ethyl 2-[[[(4-chloro-6-methoxyprimidine-2-yl)aminocarbonyl]aminosulfonyl]benzoate; Ethyl 2-[[[(4-chloro-6-methoxy-2-pyrimidinyl)amino]carbonyl]amino]sulfonyl]benzoate

Trade Names: AUTHORITY[®], FMC Agricultural Products (USA); CANOPY[®] (chlorimuron-ethyl + Metribuzin), DuPont Crop Protection (USA); CLASSIC[®], DuPont (USA); CONCERT[®], DuPont Crop Protection (USA); DPX-F6025[®], DuPont (USA); GEMINI[®], DuPont Crop Protection (USA), canceled 10/11/1994; LOROX[®], DuPont Crop Protection (USA), canceled 1/17/1996; PREVIEW[®], DuPont Crop Protection (USA), canceled 3/9/2000; RELIANCE[®], DuPont Crop Protection (USA); SKIRMISH[®], FMC Agricultural Products (USA); SYNCHRONCY[®], DuPont Crop Protection (USA); SYNCHRONY[®], DuPont Crop Protection (USA), canceled 1/17/1996

Producers: Agrimor International (USA); DuPont Crop Protection (USA); FMC Agricultural Products (USA)

Chemical Class: Sulfonylurea

EPA/OPP PC Code: 128901

California DPR Chemical Code: 2458

Uses: Used to control broadleaf weeds and annual morning glory in soybeans and peanuts.

Human toxicity (long-term): Very low–140.00 ppb, Health Advisory

Fish toxicity (threshold): Very low–1308.29960 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Chlorimuron-ethyl (40 CFR 180.429):

CROP	ppm
Peanuts	0.02
Soybeans	0.05

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or WARNING

Regulatory Authority:

- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
- EPA 40 CFR 372.65, Toxic Chemical Release, Specific Toxic Chemical Listings

Description: Off white to pale yellow crystals or powder. Odorless. Soluble in water. Melting point = 181°C.

Incompatibilities: Nitrates.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or burns. Inhalation of dust should be avoided; use NIOSH-approved air purifying respirators for pesticides. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. May be harmful if swallowed. Skin contact may cause allergic reaction.

Long Term Exposure: Repeated or prolonged contact may cause skin and lung sensitization, resulting in allergies.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chlormephos

Use Type: A soil insecticide

CAS Number: 24934-91-6

Formula: C₅H₁₂ClO₂PS₂

Alert: No longer sold in the United States.

Synonyms: *S*-(Chloromethyl)-*O*,*O*-diethyl phosphorodithioate; *S*-Chloromethyl-*O*,*O*-diethyl phosphorodithioate; *S*-Chloromethyl-*O*,*O*-diethyl phosphorodithiothiolothionate; *S*-(Chloromethyl)-*O*,*O*-diethyl phosphorodithioic acid; *S*-(Chloromethyl) *O*,*O*-diethyl ester phosphorodithioic acid; Phosphorodithioic acid, *S*-(chloromethyl) *O*,*O*-diethyl ester

Trade Names: DOTAN[®]; MC2188[®]; SHERMAN[®]; Calliope (France)

Producers: Calliope (France); Feinchemie Schwebda (Germany); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate; halo-organics

EPA/OPP PC Code: 295300

RTECS Number: TD5170000

Uses: Not registered as a pesticide in the U.S.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1 a, extremely hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Chlormephos is an organophosphate, colorless to pale yellow liquid. Slightly soluble in water; solubility = 60 ppm @ 20°C. Molecular weight = 234.72. Boiling point = 81-85°C @ 0.1 mmHg. Vapor pressure 5 × 10⁻³ mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion. May corrode metals.

Permissible Exposure Limits in Air: No standards set. Passes through the skin.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV #5600, Organophosphorus pesticides.⁽¹⁸⁾

Routes of Entry: Inhalation, ingestion, skin contact, passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This material is poisonous; it may be fatal if inhaled, swallowed, or absorbed through the skin. The acute LD₅₀ (oral, rat) = 7 mg/kg (highly toxic). Symptoms exhibited on chlormephos exposure are typical of cholinesterase poisoning. Nausea is often first symptom, with vomiting, abdominal cramps, diarrhea, and excessive salivation. Headache, giddiness, weakness, tightness in chest, blurring of vision, pinpoint pupils, loss of muscle coordination, and difficulty breathing. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. Convulsions and coma precede death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Chlormephos can cause the heart to beat slower (bradycardia) or irregularly (arrhythmia). Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: There is limited evidence that this chemical may damage the developing fetus. Can affect the nervous system and cause impaired memory, depression, anxiety, or irritability. Repeated exposure may damage the nerves, causing weakness, prickly feeling, and affect coordination in the arms and legs. Symptoms resembling influenza with headache, nausea, weakness have been reported.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all

clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. **Antidotes:** Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary

to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Chlormequat Chloride

Use Type: Plant growth regulator

CAS Number: 999-81-5

Formula: $C_5H_{13}Cl_2N$; $ClCH_2CH_2N(CH_3)_3Cl$

Synonyms: Ammonium, (2-chloroethyl)trimethyl-, Chloride 2-chloro-*N,N,N*-trimethylethanaminium chloride; Choline dichloride; 2-Chloroethyl-trimethylammoniumchlorid (German); 2-Chloroethyl trimethylammonium chloride; Chlorcholinchlorid; Chlorcholine chloride; Chlormequat; Chlorocholine chloride; (β -Chloroethyl)trimethylammonium chloride; 2-Chloro-*N,N,N*-trimethylammonium chloride; (2-Chloroethyl)trimethylammonium chloride; 2-Chloro-*N,N,N*-ethyl)trimethylethanaminium chloride; Clormecuato de cloroacetilo (Spanish); Ethanaminium, 2-Chloro-*N,N,N*-trimethyl-, Chloride (9CI); NCI-C02960; Trimethyl- β -chloroethylammoniumchlorid; Trimethyl- β -chloroethyl ammonium chloride

Trade Names: AC 38555[®]; ADJUST[®], Mandops (UK); ATLAS CHLORMEQUAT[®], Whyte Agrochemicals (UK); CCC PLANT GROWTH REGULANT[®]; 60-CS-16[®]; CYCLOCEL[®]; CYCOCEL[®], BASF (Germany); CYCOCEL-EXTRA[®], BASF (Germany); CYCOGAN[®]; CYCOGAN EXTRA[®]; CYOCEL[®]; EI 38,555[®]; HICO CCC[®]; HORMOCEL-2CCC[®]; INCRECEL[®]; LIHOCIN[®]; RETACEL[®]; RETACIL[®]; STABILAN[®]; TUR[®]; WR 62[®]

Producers: Agan Chemical Manufacturers Ltd. (Israel); Agsin (Singapore); BASF (Germany); Fluorochem (UK); Rhodia (France); Rhone-Poulenc Agro (France); Sigma-

Aldrich Laborchemikalien (Germany); TCI America (USA); Whyte Agrochemicals (UK)

Chemical Class: Quaternary ammonium compound; Haloorganics

EPA/OPP PC Code: 018101

California DPR Chemical Code: 1512

ICSC Number: 0781

RTECS Number: BP5250000

EEC Number: 007-003-00-6

EINECS Number: 213-666-4

Uses: Said to be effective for cereal grains, tomatoes, and peppers. In California, major uses are in greenhouse plants and flowers and in nurseries.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Air Pollutant Standard Set (former USSR)⁽³⁵⁾
- Actively registered pesticide in California.
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Chlormequat chloride is a white to yellowish crystalline solid. Fishy odor. Soluble in water; solubility = 75 g/100 ml @ 20°C. Molecular weight = 158.13. Melting/Freezing point = 245°C (decomposes). Vapor pressure = very low. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Highly soluble in water. Carrier solvents used in commercial products may alter physical and toxicological properties

Incompatibilities: Chlormequat chloride decomposes on heating or in fire forming nitrogen oxides, carbon monoxide, and hydrogen chloride fumes. This chemical decomposes on heating with strong aqueous alkali solutions forming trimethylamine and other gaseous products. Contact with strong oxidizers may cause fire and explosions. Attacks many metals in presence of water.

Permissible Exposure Limits in Air: There is no U.S. airborne exposure limit. This chemical can be absorbed through the skin, thereby increasing exposure. The former USSR⁽³⁵⁾ has set a ceiling TLV in workplace air of 0.3 mg/m³.

Permissible Concentration in Water: The former USSR⁽³⁵⁾ has set a MAC in surface water of 0.2 mg/L.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: The LD_{low} (oral, human) = 10 mg/kg. It is an irritant and can be absorbed through the skin. Irritates the eyes and the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause nausea and vomiting. Higher levels can

cause slow or irregular heartbeat, tremors, seizures, and coma. This can be fatal. Chlormequat chloride may affect the nervous system.

Long Term Exposure: May cause liver damage.

Points of Attack: Lungs, liver, nervous system.

Medical Surveillance: Liver function tests. Consider chest x-ray following acute overexposure. EKG examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Chloroacetaldehyde

Use Type: Fungicide

CAS Number: 107-20-0

Formula: C₂H₃ClO; ClCH₂CHO

Synonyms: Acetaldehyde, chloro-; 2-Chloroacetaldehyde; Chloroacetaldehyde monomer; 2-Chloroethanal; 2-Chloro-1-ethanal; Cloroacetaldehido (Spanish); Monochloroacetaldehyde

Producers: Cilariant (Switzerland); Daicel Chemical Industries (Japan); Fluorochem (UK); Junsei Chemical Co., Ltd. (Japan); Showa Denko (Japan); Sumitomo Seika Chemicals (Japan)

ICSC Number: 0706

RTECS Number: AB2450000

RCRA Number: P023

EINECS Number: 203-472-8

Uses: Chloroacetaldehyde is used as a fungicide, as an intermediate in 2-aminothiazole manufacture. It is used to control algae, bacteria and fungi in water. It is also used in dentistry and in bark removal from tree trunks.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (DFG)⁽³⁾ (HSE)⁽³³⁾ (Israel) (Mexico) (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)
- U.S. DOT Inhalation Hazard Chemicals
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- EPA Hazardous Waste Number (RCRA No.): P023
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1000 lb (454 kg)
- U.S. DOT 49CFR172.101, Inhalation Hazardous Chemical
- Canada, WHMIS, Ingredients Disclosure List

Description: Chloroacetaldehyde is a combustible, colorless liquid. Very sharp, irritating odor. Soluble in water; solubility = 4.42 x 10⁵ ppm @ 20°C. Molecular weight = 78.51. Boiling point = 85–90°C (decomposes) @ 760 mmHg. Melting/Freezing point = –16.3; also 43–48°C (Merck/12). Soluble in water. Flash point = 88°C (40% solutions). Autoignition = 88 °C. Vapor pressure = 139 hPa @ 25°C; 95 torr @ 20 °C. Log K_{ow} = < 0.5. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Reacts with oxidizers, acids. On heating, chloroacetaldehyde forms chlorine fumes

Permissible Exposure Limits in Air: The Federal (OSHA PEL) ceiling limit is 1 ppm (3 mg/m³), not to be exceeded at any time. NIOSH⁽²⁾ and ACGIH⁽¹⁾ also recommend the same ceiling limit. The British (HSE)⁽³³⁾, Australian, Israeli, Mexican and Canadian Provinces of Alberta, British Columbia, Ontario, and Quebec have set a limit of 1 ppm (3 mg/m³) as a ceiling value and the British HSE's⁽³³⁾ STEL is 1 ppm (3 mg/m³). The German DFG MAK is also 1 ppm and Peak Limitation is 2 times normal MAK (5 minute) not to be exceeded 8 times during a workshift⁽³⁾. The NIOSH⁽²⁾ IDLH level = 45 ppm. The odor threshold = 0.92 ppm. In addition, several states have set guidelines or standards for chloroacetaldehyde in ambient air⁽⁶⁰⁾ ranging from 1.0 µg/m³ (New York) to 25 µg/m³ (Virginia) to 30 µg/m³ (North Dakota) to 60 µg/m³ (Connecticut) to 71 µg/m³ (Nevada).

Determination in Air: Si gel; Methanol; Gas chromatography/Electrochemical detection; NIOSH IV Method #2015.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause burns and permanent

damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Can cause sensitization of skin and respiratory system. The LD₅₀ (oral, mouse) = 21 mg/kg.

Long Term Exposure: This chemical may cause mutations. It can cause skin allergy and an asthma-like lung allergy.

Points of Attack: Eyes, skin, respiratory system, lungs.

Medical Surveillance: Consider the points of attack in replacement and periodic physical examinations. Lung function tests., evaluation by a qualified allergist. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Chloroacetic Acid

Use Type: Herbicide and defoliant

CAS Number: 79-11-8

Formula: C₂H₃ClO₂; ClCH₂COOH

Synonyms: Acide chloracetique (French); Acide monochloracetique (French); Acido cloroacetico (Spanish); Acidomonochloroacetico (Italian); Acetic acid, chloro-

Chloroacetic acid; Chloroethanoic acid; MCA; Monochloroacetic acid; Monochloorazijnzuur (Dutch); Monochloressigsaeure (German); Monochloroacetic acid; Monochloroethanoic acid; NCI-C60231

Producers: Acetex (Canada); Akzo Nobel (Netherlands); ATOFINA Chemicals (USA); Clariant (Switzerland); Daicel Chemical Industries (Japan); Dow Chemical (USA); GFS Chemicals (USA); ICC (USA); Merck (Germany); Mitsui Chemicals (Japan); Niacet (USA); Sigma-Aldrich Laborchemikalien (Germany); United Phosphorus (India); Whyte (UK)

Chemical Class: Halo-organics

EPA/OPP PC Code: 279400

California DPR Chemical Code: 3102

ICSC Number: 0235

RTECS Number: AF8575000

EEC Number: 607-003-00-1

EINECS Number: 201-178-4

Uses: Chloroacetic acid major use is a defoliant. It is also used as a chemical intermediate in the synthesis of sodium carboxymethyl cellulose (used for drilling muds, detergents, food, and pharmaceuticals), and such other diverse substances as ethyl chloroacetate, glycine, synthetic caffeine, sarcosine, thioglycolic acid, and various dyes, and synthetic caffeine.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Air Pollutant Standard Set (former USSR)⁽⁴³⁾ (HSE)⁽³³⁾
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- U.S. DOT Inhalation Hazard Chemicals
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg).
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg).
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI)

Description: Colorless to white crystalline solid. It has a strong vinegar-like odor and an odor threshold of 0.15 mg/m³. Very soluble in water; solubility = 85 g/100 ml. Molecular weight = 94.48. Boiling point = 188°C (α , β , γ forms). Melting/Freezing point = 63°C (α); 5-56°C (β); 50°C (γ). Vapor pressure = 1 mmHg @ 43. Flash point = 126°C. Autoignition temperature = >500°C. Hazard Identification (based on NFPA-704 M Rating System):

Health 3, Flammability 1, Reactivity 0. Log K_{ow} = 0.24. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: The solution in water is a strong acid. Contact with strong oxidizers, strong bases, and strong reducing agents can cause violent reactions. Chloroacetic acid decomposes on heating producing toxic and corrosive hydrogen chloride, phosgene gases. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air: No U.S. exposure limits have been set by OSHA⁽²⁾, NIOSH⁽²⁾, or ACGIH⁽¹⁾, however, the HSE⁽³³⁾ (UK) and the American Industrial Hygiene Association recommends an airborne exposure limit of 0.3 ppm (1 mg/m³) TWA and the AIHA recommends a STEL of 1 ppm (4 mg/m³). Skin absorption is indicated. This chemical can be absorbed through the skin, thereby increasing exposure. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC in workplace air of 1.0 mg/m³.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion and skin contact. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause severe irritation and burns. Inhaling this chemical can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Chloroacetic acid can cause a feeling of anxiety, restlessness, blurred vision, a feeling of "pins and needles" in the limbs, muscle twitching, and/or hallucinations, may affect the cardiovascular system, central nervous system and kidneys, resulting in heart problems, convulsions, and kidney damage. These effects may be delayed. Symptoms of exposure include irritation and pain in skin. If chloroacetic acid is inhaled the patient may exhibit difficulty in breathing. Vomiting may occur if the material is ingested. It can burn the skin, cornea and respiratory tract. This material is very toxic. The probable lethal oral dose is 50-500 mg/kg of body weight, between one teaspoon and one ounce, for a 150 lb. person. Chloroacetic acid is irritating to the skin, cornea, and respiratory tract and causes burns. It may severely damage skin and mucous membranes. Ingestion may interfere with essential enzyme systems and cause perforation and peritonitis. Burns to skin result in marked fluid and electrolyte loss. Death may follow if more than 3% of the skin is exposed to this material. Other health hazards include central nervous system depression, and respiratory system depression.

Long Term Exposure: Repeated exposure may cause kidney damage and affect the lungs.

Points of Attack: Lungs, kidneys, central nervous system.

Medical Surveillance: Lung function tests, kidney function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

1-Chloro-1-nitropropane

Use Type: Fungicide

CAS Number: 600-25-9

Formula: C₃H₆ClNO₂; C₂H₅CHClNO₂

Synonyms: 1-Chloro-1-nitropropano (Spanish); Chloronitropropane; 1,1-Chloronitropropane; Propane, 1-chloro-1-nitro-

Trade Names: KORAX[®]; KORAX 6[®]; LANSTAN[®]

Chemical Class: Halo-organics

ICSC Number: 1423

RTECS Number: TX5075000

EEC Number: 610-007-00-6

Uses: This compound is also used in the synthetic rubber industry and as a component in rubber cements.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (DFG)⁽³⁾ (Israel) (Mexico) (OSHA)⁽⁵⁸⁾ (Several Canadian Provinces) (Several States)⁽⁶⁰⁾
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Canada, WHMIS, Ingredients Disclosure List

Description: Chloronitropropane is a flammable, colorless liquid with an unpleasant odor that causes tears (lachrymator). Slightly soluble in water; solubility = 6 ppm @ 20°C. Molecular weight = 123.53. Boiling point = 141°C. Vapor pressure 6 mmHg @ 25°C. Flash point = 62°C. Hazard Identification (based on NFPA-704 M Rating System): Health U (unknown), Flammability 3, Reactivity 2.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause a fire and explosion hazard. May explode when exposed to heat.

Permissible Exposure Limits in Air: The Federal limit (OSHA PEL)⁽⁵⁸⁾ is 20 ppm (100 mg/m³) as is the Mexico and DFG MAK value⁽³⁾. The TWA recommended by NIOSH⁽²⁾ and ACGIH⁽¹⁾ is 2 ppm (10 mg/m³) as is the Australian and Israeli value. The NIOSH⁽²⁾ IDLH level = 100 ppm. Canadian provincial limits are: British Columbia TWA 20 ppm and STEL of 30 ppm; Alberta, Ontario and Quebec TWA is 2 ppm and Alberta's STEL is 4 ppm. In addition, several states have set guidelines or standards for chloronitropropane in ambient air⁽⁶⁰⁾ ranging from 10 µg/m³ (North Dakota) to 150 µg/m³ (Virginia) to 200 µg/m³ (Connecticut) to 238 µg/m³ (Nevada).

Determination in Air: Chromosorb tube-108; Ethyl acetate; Gas chromatography/Flame ionization detection; See NIOSH II(5) Method #S-211⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: 1-Chloro-1-Nitropropane can affect you when breathed in. Exposure can irritate and burn the eyes, skin and cause respiratory tract irritation with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause damage to the heart, liver, and kidneys. Similar irritating substances can cause lung injury and bronchitis.

Points of Attack: In animals: respiratory system, lungs, liver, kidneys, cardiovascular system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. EKG.

Lung function tests. Liver and kidney function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

p-Chloro-*m*-cresol

Use Type: Fungicide and microbiocide

CAS Number: 59-50-7

Formula: C₇H₇ClO; C₆H₃OHCH₂Cl

Synonyms: Chlorocresol; *p*-chlorocresol; 4-Chloro-*m*-cresol; 6-Chloro-*m*-cresol; 2-Chloro-hydroxytoluene; 6-Chloro-3-hydroxytoluene; 4-Chloro-3-methylphenol; 4-Chloro-3-methylphenol (Spanish); 3-Methyl-4-chlorophenol; Parachlorometacresol; PCMC

Trade Names: APTAL[®]; BAKTOL[®]; BAKTOLAN[®]; CANDASEPTIC[®]; CMK[®]; NIPACIDE PCMC[®]; Clariant (Switzerland); OTTAFAC[®]; PARMETOL[®]; PARSOL[®]; PREVENTOL[®], Bayer CropScience (Germany); RASCHIT[®]; RASCHIT K[®]; RASEN-ANICON[®]

Producers: Bayer CropScience (Germany); Clariant (Switzerland); Lancaster Synthesis (UK); Molekula Fine Chemicals (UK)

Chemical Class: Chlorophenols; Halo-organics

EPA/OPP PC Code: 064206

California DPR Chemical Code: 1813

ICSC Number: 0131

RTECS Number: GO7100000

RCRA Number: U039

EEC Number: 604-014-00-3

EINECS Number: 200-431-6

Uses: Primarily registered for non-food use. Used to control bacteria, yeasts and fungi in industrial environments, oil recovery operations and industrial preservatives, e.g., for paints, inks, glues, gums, textiles and leather goods.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, unclassifiable, inadequate data

California Prop. 65: Listed

Regulatory Authority:

- Proposition 65 chemical (CAL)
- Clean Water Act: Section 307 Priority Pollutants; Section 313 Priority Chemicals.
- RCRA Section 261 Hazardous Constituents.
- RCRA Universal Treatment Standards: Wastewater (mg/L), 0.018; Nonwastewater (mg/kg), 14
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 8040(5); 8270(20)
- EPCRA Section 304 RQ: CERCLA, 5,000 lb (2270 kg)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- The "Director's List" (CAL/OSHA) as chlorophenols
- List of priority pollutants (U.S. EPA)
- EPCRA Section 313 (as chlorophenols) Form R *de minimis* concentration reporting level: 1.0%

Description: Crystalline solid when pure. Odorless. Partially soluble in water. Molecular weight=142.57. Melting/Freezing point = 56°C. Boiling point =235°C. Log K_{ow} = 3.12. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Incompatibilities: React with boranes, alkalies, aliphatic amines, amides, nitric acid, sulfuric acid. Contact with oxidizing agents may cause a fire and explosion hazard. Heat produces hydrogen chloride and chlorine. Corrosive to aluminum, copper, tin, and other chemically active metals.

Permissible Concentration in Water: No criteria set for this chemical; however, EPA recommends that drinking water contain no more than 0.04 mg/L of 2-chlorophenol for a lifetime exposure for an adult, and 0.05 mg/L for a 1-day, 10-day, or longer exposure for a child.

Determination in Water: Gas chromatography (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Skin absorption, inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause severe irritation, burns to the nose and throat, headache, dizziness, vomiting, lung damage, muscle twitchings, spasms, tremors, weakness, staggering and collapse. Skin contact can cause severe irritation and burns. Can be absorbed through the skin to cause or increase the severity of symptoms listed above. Eye contact causes severe irritation. May cause burns. Ingestion can cause irritation, burns to the mouth and throat, low blood pressure, profuse sweating, intense thirst, nausea, abdominal pain, stupor, vomiting, red blood cell

damage and accumulation of fluid in the lungs followed by pneumonia. May also cause restlessness and increased breathing rate followed by rapidly developing muscle weakness. Tremors, convulsions and coma can promptly set in and will continue until death. Based on animal studies, the estimated lethal dose is between one teaspoon and one ounce for a 150 pound adult. *p*-isomer: The substance irritates the eyes, the skin and the respiratory tract. The substance may cause effects on the central nervous system and bladder.

Long Term Exposure: Skin sensitivity may develop. May have effects on the blood, heart, liver, lung, kidney. The state of New Jersey lists the 2-chloro-isomer as probable carcinogen in humans, and that it causes leukemia and soft tissue cancers in humans. Chlorophenols leave the body quickly, so they are not likely to accumulate in the mother's tissues or breast milk. There are no human studies on the effects of chlorophenols on developing fetuses. Studies in rats showed that chlorophenols can pass through the placenta and produce toxic effects to the developing fetuses. The most common problems in children are delayed hardening of the bones of the breastbone, spine, and skull.

Points of Attack: Liver, kidneys. An allergen, may cause skin irritation and sensitization.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver function tests. Kidney function tests. Examination by a qualified allergist. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chlorobenzilate

Use Type: Miticide and insecticide

CAS Number: 510-15-6

Formula: C₁₆H₁₄C₁₂O₃

Synonyms: Benzeneacetic acid, 4-chloro- α -(4-chlorophenyl)- α -hydroxy-.ethyl ester; Benzilan; benzilic acid, 4,4'-dichloro-.ethyl ester; Benzilic acid 4,4'-dichloro, ethyl ester; Benz-*o*-chlor; Chlorbenzilat; Chlorbenzalate; 4-Chloro- α -(4-chlorophenyl)- α -hydroxybenzeneacetic acid ethyl ether; 4,4'-Cichlorbenzilsaeureaethylester (German); 4,4'-Dichlorobenzilic acid ethyl ester; 4,4'-dichlorobenzilate; ECB; ENT 18,596; Ethyl 4-chloro- α -(4-chlorophenyl)- α -hydroxybenzene acetate; Ethyl-*p,p'*-dichlorobenzilate; Ethyl 4,4'-dichlorobenzilate; Ethyl-4,4'-dichlorodiphenyl glycollate; Ethyl-4,4'-dichlorophenyl glycollate; Ethyl ester of 4,4'-dichlorobenzilic acid; Ethyl 2-hydroxy-2,2-bis(4-chlorophenyl)acetate; NCI-C00408; NCI-C60413

Trade Names: ACAR®; ACARABEN®, Syngenta (Switzerland), canceled; ACARABEN 4E®, Syngenta (Switzerland), canceled 12/23/1988; AKAR 338®, BENZILAN®, Makhteshim-Agan Industries (Israel), canceled 7/01/1987; BENZ-O-CHLOR®, Tower Chemical (USA), canceled 7/01/1987; COMPOUND 338®; FOLBEX®; FOLBEX SMOKE STRIPS®; G 338®, Syngenta (Switzerland); G 23992®, Syngenta (Switzerland); GEIGY 338®, Syngenta (Switzerland); KOP MITE®; MAL-O-CHLOR®, Tower Chemical (USA), canceled 7/01/1987; MITROL®, American Refining (USA), canceled 1/06/1983; RID-A-MITE®, Tex-Ag Company (USA), canceled 1.06/1983

Producers: Helena Chemicals (USA); Makhteshim-Agan Industries (Israel); Syngenta (Switzerland)

Chemical Class: Organochlorine

EPA/OPP PC Code: 028801

California DPR Chemical Code: 132

ICSC Number: 0749

RTECS Number: DD2275000

EEC Number: 607-159-00-0

EINECS Number: 208-110-2

Uses: It is used to kill mites, ticks, and other insects, and as a synergist for DDT.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–140.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–81.03680 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, Probable carcinogen

IARC: Group 3, unclassifiable

Label Signal Word: CAUTION or WARNING

Regulatory Authority:

- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- AB 1803-Well Monitoring Chemical (CAL)

- Proposition 65 chemical (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The “Director’s List” (CAL/OSHA)
- EPA Hazardous Waste Number (RCRA No.): U038
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
- RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.10; Nonwastewater (mg/kg), N/A.
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μ g/L): 8270(10)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Description: Ethyl 4,4'-dichlorobenzilate is a colorless solid when pure. The technical product is a yellow or brown liquid. Slightly soluble in water; solubility = 13 ppm @ 20°C. Molecular weight = 325.20. Boiling point = 146–148°C. Melting/Freezing point = 36–37°C. Vapor pressure = 6.8×10^{-6} mmHg. @ 20°C. This chemical is not expected to bioconcentrate in aquatic organisms (SRC). However its metabolite, dichlorobenzophenone, has a Log K_{ow} = 4.8. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Moisture may cause hydrolysis or other forms of decomposition.

Permissible Exposure Limits in Air: No OELs have been established.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, absorbed through the skin, eye contact, ingestion

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death.

Long Term Exposure: This chemical may damage the male reproductive glands. May cause liver and kidney damage. Repeated or prolonged exposure may affect the nervous system, causing a loss of coordination, muscle weakness, tremors, convulsions, dizziness, and possible coma. This chemical may be a human carcinogen.

Points of Attack: Liver, kidneys, nervous system.

Medical Surveillance: Examination of the nervous system. Liver and kidney function tests. More than light alcohol consumption may exacerbate liver damage. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

First Aid: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. *Do not induce vomiting.** In cases of ingestion, the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do not give activated charcoal before or with ipecac syrup.* **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. *Do not use*

mouth-to-mouth resuscitation; use bag/mask apparatus. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Carcinogen/Hazard Classifications**Label Signal Word:** WARNING, CAUTION or DANGER**Regulatory Authority:**

- Actively registered pesticide in California.
- AB 1803-Well Monitoring Chemical (CAL)

Description: A solid. Molecular weight = 207.06. Melting/Freezing point = 134°C. Boiling point = 262° @ 744 mmHg. Vapor pressure = 3×10^{-3} mmHg. @ 20°C.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)].⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death.

Points of Attack: May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate

PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. **Do not scrub skin or hair**, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. *Do not induce vomiting.** In cases of ingestion, the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do not give activated charcoal before or with ipecac syrup.* **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. *Do not use mouth-to-mouth resuscitation; use bag/mask apparatus.* If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Chlorophacinone

Use Type: Rodenticide

CAS Number: 3691-35-8

Formula: C₂₃H₁₅ClO₃

Alert: Chlorophacinone could be hazardous to other small mammals and birds if used indiscriminately. Persons with bleeding problems and children should not come in contact. Human toxicity (long-term): Very high.

Synonyms: Chlorfacinon (German); 2-(α -*p*-chlorophenylacetyl)indane-1,3-dione; 2-[(*p*-Chlorophenyl)phenylacetyl]-1,3-indandione; 2[2-(4-Chlorophenyl)-2-phenylacetyl]indan-1,3-dione; 2[(4-Chlorophenyl)phenylacetyl]-1*H*-indene-1,3(2*H*)-dione; Clorphacinon (Italian); [(4-Chlorophenyl)-1-phenyl]-acetyl-1,3-indandion (German); 1-(4-Chlorophenyl)-1-phenyl-acetyl indan-1,3-dion (German); Clorofacinona (Spanish); Chlorphacinon (Italian); 1*H*-Indene-1,3(2*H*)-dione, 2-[(4-chlorophenyl)phenylacetyl]-; 1,3-Indandione, 2-[(*p*-chlorophenyl)phenylacetyl]-; 2-[2-Phenyl-2-(4-chlorophenyl)acetyl]-1,3-indandione

Trade Names: AFNOR[®]; CAID[®]; DELTA[®]; DRAT[®]; LIPHADIONE[®]; LiphaTech (USA); LM 91[®]; MICROZUL[®]; MURIOL[®]; PARTOX[®]; LiphaTech (USA) canceled 7/1/1987; QUICK[®]; RAMUCIDE[®]; RANAC[®]; RATOMET[®]; RAVIAC[®]; ROZOL[®]; LiphaTech (USA) canceled 7/1/1987; TOPITOX[®]

Producers: Agrimor International (USA); BASF Agricultural Products Group (Germany); I.N.D.I.A. Industrie Chimiche (Italy); Jingma Chemicals Ltd. (China); LiphaTech (USA); Rhone-Poulenc Jardin (France)

Chemical Class: 1,3-Indandione; Halo-organics

EPA/OPP PC Code: 067707

California DPR Chemical Code: 1625

RTECS Number: NK5335000

EINECS Number: 223-003-0

Uses: This material is an anticoagulant rodenticide used around livestock and also on crops such as artichokes. Some brands are labeled for use indoors and outdoors for the control of mice, rats, moles, muskrats, voles and vampire bats.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.03500 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–27.64016 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1 a, extremely hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg).
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg).

- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.

Description: Chlorophacinone is a pale yellow crystalline solid. Slightly soluble in water. Melting/Freezing point = 140°C.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Contact may cause burns to skin and eyes. Symptoms of exposure are similar to those of warfarin. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. Symptoms develop after a few days or a few weeks or repeated ingestion and include nosebleed and bleeding gums; pallor and sometimes a rash; massive bruises, especially of the elbow, knees, and buttocks; blood in urine and feces; occasionally paralysis from cerebral hemorrhage; and hemorrhagic shock and death. Chlorophacinone is highly toxic orally and by skin adsorption. The probable oral lethal dose for humans is less than 5 mg/kg to 50 mg/kg, or between a taste (less than 7 drops) and 1 teaspoonful for a 150 lb. (70 kg) person. The LD₅₀ (oral, mouse) = 1.06 mg/kg.

Long Term Exposure: See above

Points of Attack: Blood, cardiovascular system

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chemical Class: Halo-organics

EPA/OPP PC Code: 081501

California DPR Chemical Code: 136

ICSC Number: 0750

RTECS Number: PB6300000

EINECS Number: 200-930-9

Uses: Chloropicrin is used in the manufacture of the dye-stuff methyl violet and in other organic syntheses. It has been used as a chemical warfare gas. It is used as a preplant soil fumigant in seed beds and transplant nurseries for control of verticillium wilt, nematodes, weed seeds and insects. In grain elevators, it is used to control insects and rodents. The top five uses in California are on strawberries, tomatoes, bell peppers, and outdoor nursery plants.

Human toxicity (long-term)⁽⁷⁷⁾: Low–56.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–1.37795 ppb, MATC (Maximum Acceptable Toxicant Concentration)

- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, WHMIS, Ingredients Disclosure List

Description: Chloropicrin is a highly reactive, colorless, oily liquid. Sharp, penetrating odor that causes tearing. Odor threshold = 1.1 ppm. Molecular weight = 164.38. Boiling point = 112°C. Melting/Freezing point = –64°. Slightly soluble in water; solubility = 1950 ppm; 0.2272 g/100 ml @ 0°C, 0.1621 g/100 ml at 25°C. Vapor pressure = 16.9 mmHg @ 20°C.

Incompatibilities: Can be self reactive. Chloropicrin may explode when heated under confinement. Quickly elevated temperatures, shock, contact with alkali metals or alkaline earth may cause explosions. A strong oxidizer; violent reaction with reducing agents, aniline (especially in presence of heat), alcoholic sodium hydroxide, combustible substances, sodium methoxide, propargyl bromide, metallic powders. Liquid attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air: The Federal limit (OSHA PEL)⁽⁵⁸⁾, the DFG⁽³⁾, the HSE⁽³³⁾, the Japanese⁽³⁵⁾, Australian, Israeli, Mexican, and the ACGIH⁽¹⁾ TWA value is 0.1 ppm (0.7 mg/m³) and the ACGIH⁽¹⁾, Mexican, and HSE⁽³³⁾ STEL value is 0.3 ppm. The NIOSH⁽²⁾ IDLH level = 2 ppm. The former USSR⁽³⁵⁾ has set a MAC for ambient air in residential areas of 0.01 mg/m³ on a momentary basis and 0.007 mg/m³ on a daily average basis. Several states have set guidelines or standards for chloropicrin in ambient air⁽⁶⁰⁾ ranging from 7-20 µg/m³ (North Dakota) to 11.7 µg/m³ (Virginia) to 14 µg/m³ (Connecticut) to 17 µg/m³ (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: California⁽⁶¹⁾ has set guidelines for chloropicrin in drinking water of 50 µg/L on a taste basis and 37 µg/L on an odor basis.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Chloropicrin was used as poison gas in WW I. Exposure causes intense tearing of the eyes, headache, nausea and vomiting, diarrhea, and cough. Contact can severely irritate the skin causing rash or burning sensation. Higher exposures can irritate and burn the lungs, causing a build-up of fluid (pulmonary edema), a medical emergency that can be delayed for several hours. This can cause death. The LD₅₀ (oral, rat) = 250 mg/kg (moderately toxic). IDLH level = 2 ppm.⁽⁵⁸⁾

Long Term Exposure: Repeated exposure can damage the lungs, causing bronchitis. It may also damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: Lung function test. If symptoms develop or overexposure has occurred, the following may be useful: Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if

breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Chlorothalonil (ANSI)

Use Type: Fungicide

CAS Number: 1897-45-6

Formula: C₈Cl₄N₂; C₆Cl₄(CN)₂

Alert: A General Use Pesticide (RUP). It is the second most used fungicide in the U.S. It can be found in formulations with many other pesticides.

Synonyms: 1,3-Benzenedicarbonitrile,2,4,6,6-tetrachloro-; Chlorthalonil (German); 1,3-Dicyanotetrachlorobenzene; Isophthalonitrile, tetrachloro; Metatetrachloro phthalodinitrile; NCI-C00102; 2,4,5,6-Tetrachloro-1,3-benzenedicarbonitrile; 2,4,5,6-Tetrachloro-1,3-dicyanobenzene; Tetrachloroisophthalonitrile; meta-tetrachlorophthalodinitrile; Tetrachlorophthalodinitrile, meta-; Thalonil

Trade Names: ATLAS CROPGARD[®], Whyte Agrochemicals (UK); BANOL C[®], Bayer CropScience (Germany); BB CHLOROTHALONIL[®]; BOMmHgDIER[®]; BRAVO[®], Syngenta (Switzerland); Zeneca Ag Products (USA) (now Syngenta); BRAVO[®] 6F, Syngenta (Switzerland); Zeneca Ag Products (USA) (now Syngenta); BRAVO[®] 500, Syngenta (Switzerland); Zeneca Ag Products (USA) (now Syngenta); BRAVO[®] 6F, Syngenta (Switzerland); Zeneca Ag Products (USA) (now Syngenta); BRAVO ULTRES[®], Syngenta (Switzerland); Zeneca Ag Products (USA) (now Syngenta); BRAVO-W-75[®], Syngenta

ICSC Number: 0134

RTECS Number: NT2600000

EEC Number: 608-014-00-4

EINECS Number: 217-588-1

Uses: Chlorothalonil is a broad spectrum fungicide. It is used on vegetables, peanuts, potatoes, small fruits, trees, turf, roses, ornamentals, and other crops. In California, the top crops are tomatoes, onions, celery, and landscaping. It targets fungal blights, needlecasts, and cankers on conifer trees. It is also used as a fungicide additive in paints and grouts.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate-45.69190 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: High-4.41591 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Likely carcinogen

California Prop. 65: Carcinogen

IARC: Group 2B, possible carcinogen

Label Signal Word: Chlorothalonil is often used in combination with other compounds and, depending upon the formulations, requires different levels of Signal Words—WARNING, CAUTION or DANGER.

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Carcinogen (Animal Positive) (NCI) (NTP) (California)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- AB 1803-Well Monitoring Chemical (CAL)
- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL)
- Proposition 65 chemical (CAL)
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants as cyanide compound
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cyanide compound
- Clean water act: Section 307 Priority Pollutants as cyanide, total; Toxic Pollutant (Section 401.15) as cyanide compound
- EPA Hazardous Waste Number (RCRA No.): P030 as cyanide compound
- RCRA Section 261 Hazardous Constituents. as cyanide compound

- RCRA Universal Treatment Standards: Wastewater (mg/L), 1.2 (total); 0.86 (amenable); Nonwastewater (mg/kg), 590 (total); 30 (amenable) as cyanide compound
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 9010(40) as cyanide compound
- Safe Drinking Water Act: MCL, 0.2 mg/L; MCLG, 0.2 mg/L; Regulated chemical (47 FR 9352) as cyanide compound EPCRA Section 304 RQ: CERCLA, 10 lb (4.54 kg) as cyanide compound
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0% as cyanide compound
- U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B) as cyanides, mixtures or solutions

Description: White, crystalline solid. Odorless. Soluble in water; solubility = 0.6 ppm @ 25°C. Molecular weight 265.91.

Boiling point = 350°C. Melting/Freezing point = 260°C. Vapor pressure = 1×10^{-3} mmHg. @ 20°C. Based on the NFPA rating system. (FEMA) Hazard Identification: Health 3, Flammability 1, Reactivity 0. BCF = -820. Bioconcentration in aquatic organisms may occur.

Incompatibilities: Contact with strong oxidizers may cause a fire and explosion hazard. Thermal decomposition may include fumes of hydrogen cyanide.

Permissible Exposure Limits in Air: No standards set. However, inasmuch as it is a cyanide compound, the exposure limits are listed here: OSHA⁽²⁾ and ACGIH: 5 mg/m³ TWA; NIOSH⁽²⁾: Ceiling limit, 4.7 ppm; 5 mg/m³ per 10 minutes as cyanides⁽¹⁾. All have notations that skin contact contributes significantly in overall exposure. IDLH level = 25 mg/m³ as CN

Determination in Air: NIOSH REL: (Nitriles) TWA 22 mg/m³; NIOSH REL: (Nitriles) CL 4 mg/m³/15minute. See also NIOSH Criteria Document 78-212 NITRILES.⁽¹⁸⁾

Permissible Concentration in Water: The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 ppm (0.2 mg/L). A ten-day health advisory for a 10 kg child has been calculated by EPA to be 0.25 mg/L. A longer term health advisory for a 10-kg child was calculated to be 0.15 mg/L and for a 70-kg adult was calculated to be 0.525 mg/L. The estimated excess cancer risk associated with lifetime exposure to drinking water containing 0.525 mg/L of Chlorothalonil is 3.5×10^{-4} .

Determination in Water: Analysis of chlorothalonil is by a gas chromatographic (GC) method applicable to the determination of certain chlorinated pesticides in water samples. In this method, approximately 1 liter of sample is extracted with Methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using an electron capture detector. The method detection limit has not been determined for chlorothalonil, but it is estimated

that the detection limits for analytes included in this method are in the range of 0.01 to 0.1 µg/L.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Johnson et al. (1983) reported that chlorothalonil exposure resulted in contact dermatitis in 14 of 20 workers involved in woodenware preservation. The wood preservative used by the workers consisted mainly of "white spirit," with 0.5% chlorothalonil as a fungicide. Workers exhibited erythema and edema of the eyelids, especially the upper eyelids, and eruptions on the wrist and forearms. Results of patch test conducted with 0.1% chlorothalonil in acetone were positive in 7 of 14 subjects. Reactions ranged from a few erythematous papules to marked popular erythema with a brownish hue without infiltration. *Wilson et al. (1985)* gave chlorothalonil (98.1% pure with less than 0.03% hexachlorobenzene) to Fischer 344 rats (60/sex/dose) in their diet at dose levels of 0, 40, 80 or 175 mg/kg/day. Males were treated for 116 weeks, while females received the chemical for 129 weeks. Survival among the various groups was comparable. In both sexes, at the high dose level, there were significant decreases in body weights. In addition, there were also significant increases in blood urea nitrogen and creatinine, while there were decreases in serum glucose and albumin levels. In both sexes, there were dose-dependent increases in kidney carcinomas and adenomas at doses above 40 mg/kg/day. In the high-dose females, there was also a significant increase in stomach papillomas. The data show that, in the Fischer 344 rat, chlorothalonil is a carcinogen. The LD₅₀ (oral, rat) = 10 g/kg (insignificantly toxic).

Short Term Exposure: Irritates the eyes, skin, respiratory tract. Inhalation can cause coughing, phlegm, and/or tightness in the chest.

Long Term Exposure: Repeated or prolonged contact with skin may cause nose bleeding, skin sensitization and dermatitis with skin rash. May affect the kidneys and gastrointestinal tract. This chemical causes cancer of the kidneys in animals.

Points of Attack: Skin., lungs and kidneys.

Medical Surveillance: Complete blood count. Lung function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20-30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical

attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

***o*-Chlorotoluene**

Use Type: Insecticide and bactericide

CAS Number: 95-49-8

Formula: C₇H₇Cl; CH₃C₆H₄Cl

Synonyms: Benzene, 1-chloro-2-methyl-; 2-Chloro-1-methylbenzene; 2-Chlorotoluene; 1-Methyl-2-chlorobenzene; 2-Methylchlorobenzene; Toluene, *o*-chloro-; *o*-Tolylchloride

Producers: ATOFINA (France); Bayer Chemicals (Germany); China Chemical (China); EniChem (Italy); Kawaguchi Chemical Industry (Japan); OxyChem (USA); Sigma-Aldrich Laborchemikalien (Germany); Tessenderlo (Belgium)

Chemical Class: Halo-organics

EPA/OPP PC Code: 216300

California DPR Chemical Code: 2467

ICSC Number: 1458

RTECS Number: XS9000000

EEC Number: 602-040-00-X

EINECS Number: 202-424-3

Uses: *o*-Chlorotoluene is also widely used as a solvent and intermediate in the synthesis of dyes, synthetic rubber, pharmaceuticals, and other organic chemicals.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (HSE)⁽³³⁾ (Israel) (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)
- EPA Toxic Substance Control Act (TSCA) Sec. 8(b) Chemical Inventory
- AB 1803-Well Monitoring Chemical (CAL)

- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Canada, WHMIS, Ingredients Disclosure List

Description: Colorless liquid with an aromatic odor. The odor threshold = 0.32 ppm. Slightly soluble in water. Molecular weight = 126.59. Boiling point = 159°C. Flash point = 52°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0.

Incompatibilities: Incompatible with acids, alkalis, oxidizers, reducing materials, water.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾ recommends an airborne exposure limit of 50 ppm (250 mg/m³) TWA for a 10-hour workshift and STEL of 75 ppm (375 mg/m³) not to be exceeded during any 15 minute work period., with the notation "skin" indicating the possibility of cutaneous absorption. The ACGIH recommends the same TWA averaged over an 8-hour workshift and does not have an STEL value⁽¹⁾. This chemical can be absorbed through the skin, thereby increasing exposure. There is no NIOSH⁽²⁾ IDLH. The UK HSE, Australia, Israel, and Canadian provinces of Alberta, BC, Ontario, and Quebec have adopted the same TWA as NIOSH⁽²⁾ and Alberta, BC, Ontario use the same STEL value. Several states have set guidelines or standards for chlorotoluene in ambient air⁽⁶⁰⁾ ranging from 2.5–3.75 mg/m³ (North Dakota) to 4.0 mg/m³ (Virginia) to 5.0 mg/m³ (Connecticut) to 5.95 mg/m³ (Nevada).

Permissible Concentration in Water: No criteria set, but EPA⁽³²⁾ has suggested a permissible ambient goal of 3.450 µg/L based on health effects.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the eyes and skin. Inhalation can irritate the respiratory tract, causing coughing, and/or shortness of breath. High exposure can cause dizziness, loss of coordination, convulsions and coma. Vasodilatation, labored respiration, and narcosis have been observed in test animals.

Long Term Exposure: May affect the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys. Prolonged or repeated contact may cause dermatitis.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Kidney function tests. Examination by a dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chloroxuron (ANSI)

Use Type: Herbicide

CAS Number: 1982-47-4

Formula: C₁₅H₁₅ClN₂O₂; (CH₃)₂NCONHC₆H₄OC₆H₄Cl

Synonyms: *N'*-[4-(4-chlorophenoxy)phenyl]-*N,N*-dimethylurea; 3-[4-(4-Chlorophenoxy)phenyl]-1,1-dimethylurea; 3-[*p*-(*p*-chlorophenoxy)phenyl]-1,1-dimethylurea; Chloroxifenidum; Cloroxuron (Spanish); Urea, *N'*-[4-(4-Chlorophenoxy)phenyl]-*N,N*-dimethyl-; Urea, 3-[*p*-(*p*-chlorophenoxy)phenyl]-1,1-dimethyl-

Trade Names: C 1983[®], Ciba Specialty Chemicals (Switzerland)U.S. DOT Regulated Marine PollutantCIBA 1983[®], Ciba Specialty Chemicals (Switzerland); NOREX[®]; TENORAN[®], Syngenta (Switzerland), canceled 7/2/1985

Producers: Ciba Specialty Chemicals (Switzerland); Sigma-Aldrich Laborchemikalien (Germany); Syngenta (Switzerland)

Chemical Class: Urea; Halo-organics

EPA/OPP PC Code: 025501

California DPR Chemical Code: 576

RTECS Number: YS6125000

EINECS Number: 217-843-7

Uses: A selective pre- and early post-emergency herbicide in soybeans, strawberries, onions, celery and ornamentals. It is a root- and foliage-absorbed herbicide selective in leek, celery, onion, carrot and strawberry.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–35.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–49.75254 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Regulatory Authority:

- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides
- The "Director's List" (CAL/OSHA) as chlorophenoxy pesticides
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4,540 kg)

- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: White crystalline solid. Practically insoluble in water; solubility = 3 ppm. Molecular weight = 290.77. Melting/Freezing point = 151-152°C. Vapor pressure = 3.9×10^{-9} mmHg. @ 20°C. Log K_{ow} = 3.9. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard. When heated to decomposition this chemical may emit toxic nitrogen oxides and chlorine gas.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion

Harmful Effects and Symptoms

Short Term Exposure: Slightly irritating to eyes and skin. The LD₅₀-oral (dog) is 10 mg/kg (highly toxic). The LD₅₀ (oral, rat) = 3700 mg/kg. Chloroxuron is stated to be highly toxic to humans by ingestion and under certain conditions, it can form carcinogenic dimethylnitrosamine. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA standard 1910.1045.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

4-Chloro-3,5-xyleneol

Use Type: Microbiocide

CAS Number: 88-04-0

Formula: C₈H₉ClO

Synonyms: Benztytol; 4-Chloro-3,5-dimethylphenol; Chloroxylenol; Chloro-*m*-xyleneol; 3,5-Dimethyl-4-chlorophenol; Parachlorometaxylenol; *p*-Chloro-*m*-xyleneol

Trade Names: BAR-FUNGAL PLUS[®], canceled; BIO SLIME[®], canceled; DESSON[®]; DETTOL[®]; ECOTRU[®]; ESPADOL[®]; HUSEPT[®]; HUSEPT EXTRA[®]; NIPACIDE[®], Clariant International (Switzerland); OTTASEPT[®], Clariant International (Switzerland), canceled; OTTASEPT[®] EXTRA, Clariant International (Switzerland), canceled; PCMX; RBA 777[®]

Producers: Clariant International (Switzerland)

Chemical Class: Chlorophenol

EPA/OPP PC Code: 086801

California DPR Chemical Code: 925

Uses: Chloroxylenol was first registered in the U.S. for use as a fungicide and is now applied as an antimicrobial for control of bacteria, algae and fungi in adhesives, emulsions, paints and wash tanks. It is registered for use in household and domestic dwellings, laundry equipment, bathrooms, diaper pails and in industrial water and aqueous systems. It is also used to sanitize industrial and hospital premises and pet living quarters, and in hand and body lotions.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or DANGER *Note:* In animal studies, one chlorophenol, 2,4,6-trichlorophenol, caused leukemia in rats and liver cancer in mice. The Department of Health and Human Services has determined that 2,4,6-trichlorophenol may reasonably be anticipated to be a carcinogen.

Regulatory Authority:

- Actively registered pesticide in California.
- List of priority pollutants (EPA) as chlorophenols
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenols
- The "Director's List" (CAL/OSHA) as chlorophenols
- Clean Water Act: Toxic Pollutant (Section 401.15) other than those listed elsewhere; includes trichloro phenols.
- RCRA Section 261 Hazardous Constituents, waste number not listed as chlorophenols
- EPCRA Section 313 (as chlorophenols) Form R *de minimis* concentration reporting level: 1.0%

Description: A white to buff crystalline powder. Phenolic odor. Slight soluble in water. Boiling point = 246°C. Melting/Freezing point = 116°C. Molecular weight = 156.65.

Incompatibilities: React with boranes, alkalis, aliphatic amines, amides, nitric acid, sulfuric acid. Keep away from oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc).

Permissible Concentration in Water: No criteria set for this chemical; however, EPA recommends that drinking water contain no more than 0.04 mg/L of 2-chlorophenol for a lifetime exposure for an adult, and 0.05 mg/L for a 1-day, 10-day, or longer exposure for a child.

Routes of Entry: Inhalation, absorbed by skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause severe irritation, burns to the nose and throat, headache, dizziness, vomiting, lung damage, muscle twitching, spasms, tremors, weakness, staggering and collapse. Skin contact can cause severe irritation and burns. May be absorbed through the skin to cause or increase the severity of symptoms listed above. Eye contact may cause severe irritation. May cause burns. Ingestion may cause irritation, burns to the mouth and throat, low blood pressure, profuse sweating, intense thirst, nausea, abdominal pain, stupor, vomiting, red blood cell damage and accumulation of fluid in the lungs followed by pneumonia. May also cause restlessness and increased breathing rate followed by rapidly developing muscle weakness. Tremors, convulsions and coma can promptly set in and will continue until death.

Long Term Exposure: Skin sensitivity may develop. May have effects on the blood, heart, liver, lung, kidney. The state of New Jersey lists at least one chlorophenol as a probable carcinogen in humans; may cause leukemia and soft tissue cancers in humans. The substance may cause effects on the central nervous system and bladder. Chlorophenols leave the body quickly, so they are not likely to accumulate in the mother's tissues or breast milk. There are no human studies on the effects of chlorophenols on developing fetuses. Studies in rats showed that chlorophenols can pass through the placenta and produce toxic effects to the developing fetuses. The most common problems in children are delayed hardening of the bones of the breastbone, spine, and skull.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver function tests. Kidney function tests. Examination by a qualified allergist. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8 ounces of water. Do not induce vomiting. *Note to physician*

or authorized medical personnel: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Chlorpropham

Use Type: Herbicide (pre-emergence) and plant growth regulator

CAS Number: 101-21-3

Formula: C₁₀H₁₂ClNO₂

Synonyms: Carbamic acid, (3-chlorophenyl)-, 1-methylethyl ester; Chlor-IFC; Chlor-IPC; *m*-Chlorocarbanilic acid, isopropyl ester; 3-Chlorocarbanilic acid, isopropyl ester; Chloro IPC; *N*-(3-Chloro phenyl)carbamate diisopropyle (French); *N*-3-Chlorophenylisopropylcarbamate; *N*-(3-Chlorophenyl)carbamic acid, isopropyl ester; (3-Chlorophenyl)carbamic acid, 1-methylethyl ester; Chlorpropham; *N*-(3-chlor-phenyl)-isopropyl-carbamate (German); Chlorprophame (French); C1CP; Cl-IPC; CIPC; ENT 18,060; Isopropyl-*m*-chlorocarbanilate; Isopropyl-3-chlorophenylcarbamate; Isopropyl-*N*-(3-chlorophenyl)carbamate; *o*-Isopropyl-*N*-(3-chlorophenyl)carbamate; Isopropyl-*N*-(3-chlorophenyl)-carbamate (German)

Trade Names: ATLAS[®] CIPC 40; BEET-KLEEN[®] (with Fenuron[®] and isopropyl carbanilate); BUD-NIP[®]; CAMPBELL'S[®] CIPC 40%; CHLORO IPC[®]; ELBANIL[®]; FASCO[®] WY-HOE; FURLOE[®]; FURLOE[®] 4EC; JACK WILSON[®] CHLORO 51 (OIL); LIRO METOXON[®]; MIRVALE[®]; MORCRAN[®] (with *m*-1-naphthylphthalamic acid); MSS[®] CIPC; NEXOVAL[®]; PREVENOL[®] 56, Bayer CropScience (Germany); PREVENTOL[®], Bayer CropScience (Germany); PREVENTOL[®] 56, Bayer CropScience (Germany); PREWEED[®]; RESIDUREN[®]; RESIDUREN[®] EXTRA; SPROUT NIP[®]; SPROUT-NIP[®] EC; SPUD-NIC[®]; SPUD-NIE[®]; STOPGERME[®]-S; TATERPEX[®]; TRIPEC[®], (with carbamic acid, phenyl-, 1-methylethyl ester); TRIHERBICIDE[®] CIPC; UNICROP[®] CIPC; WAREFOG[®]; Y3[®]

Producers: Cerexagri (France); Epochem Co., (China); Ki-Hara Chemicals Ltd. (UK); Whyte Agrochemicals (UK)

Chemical Class: Carbamate; Halo-organics

EPA/OPP PC Code: 018301

California DPR Chemical Code: 141

EINECS Number: 202-925-7

Uses: Chlorpropham is a plant growth regulator that is used primarily in the U.S. to inhibit post-harvest potato sprouting. Other uses include pre-emergence control of grass weeds in alfalfa, beans, blueberries, cane berries, carrots, cranberries, ladino clover, garlic, seed grass, onions, spinach, sugar beets, tomatoes, safflower, soybeans, gladioli and woody nursery stock. It is used to control suckers in tobacco.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–350.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low–424.62703 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, unlikely carcinogen

IARC: Group 3, unclassifiable

Label Signal Word: CAUTION or DANGER

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- AB 1803 Well monitoring chemical (CAL)
- DHS drinking water action levels (CAL)
- Actively registered pesticides in California

Description: Light-tan powder or commercial liquid. Slightly soluble in water. Solubility 89 mg/L @ 25°C. Molecular weight 213.67. Density = 1.18 @ 30°C. Melting/Freezing point = 41°C. Boiling point = 149°C. Vapor pressure = 8×10^{-6} mmHg; 2 mmHg @ 149°C.

Incompatibilities: May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the

nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes.

Ingestion: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is **UNCONSCIOUS OR HAVING CONVULSIONS**, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE

equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Chlorpyrifos (ANSI)

Use Type: Insecticide and nematicide

CAS Number: 2921-88-2

Formula: C₉H₁₁Cl₃NO₃PS

Alert: A General Use Pesticide (GUP). Under a Revised Risk Assessment, EPA and the registrants have agreed to the following modifications: (The complete Agreement can be found at the U.S. EPA page shown in the footnote below).

Reducing Food Risks: The agreement will expeditiously address food uses posing the greatest risks to children. It decreases the use of chlorpyrifos on apples, terminating or canceling all post-bloom applications, and cancels the use on tomatoes. EPA will also propose to (1) lower the tolerance or maximum residue limit on apples to reflect this change in use, (2) revoke the tolerance on tomatoes, and (3) lower the tolerance on grapes to a level that will allow for dormant applications (the only use allowed domestically), but not foliar applications typically made in foreign countries on grapes that are imported into the U.S. These actions will reduce acute dietary risk by 75 percent,

effectively eliminating dietary risk concerns for children and others.

Reducing Residential Risks: About 50 percent of chlorpyrifos is used in and around the home. The agreement will cancel and phase out nearly all indoor and outdoor residential uses. It effectively eliminates the use of chlorpyrifos by homeowners, limiting use to certified, professional, or agricultural applicators. Those uses that pose the most immediate risks to children, including home lawn, indoor crack and crevice treatments, and whole house "postconstruction" termiticide treatments, will be canceled first. Spot and local post-construction and pre-construction termiticide uses will be phased out over the next several years.

Reducing Drinking Water Risks: The actions on residential uses also will reduce exposure to chlorpyrifos through drinking water, since residential applications are potentially a major source of drinking water contamination.

Reducing Non-Residential Risks: Chlorpyrifos use in schools, parks, and other settings where children may be exposed will be canceled. Only use in some limited commercial settings, like warehouses, ship holds and railroad boxcars, may continue.

Synonyms: α -Chlorpyrifos 48EC (α); Chlorpyrifos-ethyl; Clorpirifos (Spanish); *O,O*-Diethyl; ENT 27311; *O*-3,5,6-Trichloro-2-pyridylphosphorothioate; *O,O*-Diaethyl-*O*-3,5,6-trichloro-2-pyridylmonothiophosphat (German); *O,O*-Dimethyl *O*-(3,5,6-trichloro-2-pyridinyl)phosphorothioate; Phosphorothioic acid, *O,O*-diethyl *O*-(3,5,6-trichloro-2-pyridinyl)ester; 2-Pyridinol, 3,5,6-trichloro-,*O*-ester with *O,O*-Diethylphosphorothioate

Chemical Class: Organophosphate

EPA/OPP PC Code: 059101

California DPR Chemical Code: 253

ICSC Number: 0851

RTECS Number: TF6300000

EEC Number: 015-084-00-4

EINECS Number: 220-864-4

Uses: Chlorpyrifos is one of the most widely-used insecticide in the U.S., both around the home and in agriculture. A broad-spectrum insecticide, originally used primarily to kill mosquitoes but no longer registered for that use. Chlorpyrifos is effective in controlling cutworms, corn rootworms, cockroaches, grubs, flea beetles, flies, termites, fire ants, and lice. It is used as an insecticide on grain, cotton, field, fruit, nut and vegetable crops, and well as on lawns and ornamental plants. It is also registered for direct use on sheep and turkeys, for horse site treatment, dog kennels, domestic dwellings, farm buildings, storage bins, and commercial establishments. Chlorpyrifos acts on pests primarily as a contact poison, with some action as a stomach poison. It is available as granules, wettable powder, dustable powder and emulsifiable concentrate. Top crop uses in California include cotton, alfalfa, almonds, and oranges.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–20.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Extra high–0.36660 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Chlorpyrifos (40 CFR 180.342):

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, unlikely carcinogen

Label Signal Word: WARNING or CAUTION, depending on the formulation.

WHO Acute Hazard: Class II, moderately hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (HSE)⁽³³⁾ (Israel) (Mexico) (OSHA)⁽⁵⁸⁾ (former USSR)⁽³⁵⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)
- AB 1803-Well Monitoring Chemical (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant
- Canada, Drinking Water Quality MAC = 0.09 mg/L

Description: White crystalline compound. Mild mercaptan odor. The odor is also described as like natural gas. Practically insoluble in water; solubility = 2.2 ppm; 0.4 ppm @ 23°C. Molecular weight = 350.58. Melting/Freezing point = 41–43°C. Vapor pressure = 1.89×10^{-5} mmHg @ 20°C. Log K_{ow} = 4.98. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Above 130°C this chemical may undergo violent exothermic decomposition. The substance decomposes on heating at approximately 160°C and on burning producing toxic and corrosive fumes including hydrogen chloride, nitrogen oxides, phosphorous oxides, sulfur oxides. Reacts with strong acids, strong bases, causing hydrolysis. Attacks copper and brass.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾ recommends a REL of 0.2 mg/m³ TWA for a 10-hour workshift, and STEL of 0.6 mg/m³ [skin]. ACGIH, has recommended the same TWA (for an 8-hour workshift)⁽¹⁾. Both limits bear the notation “skin” indicating the cutaneous absorption should be prevented so the threshold limit value is not invalidated. UK’s HSE⁽³¹⁾, Australia, Mexico, and the Canadian provinces of Alberta, BC, Ontario, and Quebec have set these same TWA values as ACGIH. The former Soviet Union⁽³⁵⁾ has set a MAC in workplace air of 0.3 mg/m³. Several states have set guidelines or standards for Chlorpyrifos in ambient air⁽⁶⁰⁾ ranging from 2–6 µg/m³ (North Dakota) to 3.0 µg/m³ (Virginia) to 4.0 µg/m³ (Connecticut) to 5 µg/m³ (Nevada). **Determination in Air:** OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH IV Method #5600, Organophosphorus pesticides.⁽¹⁸⁾

Permissible Concentration in Water: Mexico⁽³⁵⁾ has set a limit of 3.0 µg/L in coastal waters and 0.03 mg/L in estuaries. The former USSR⁽³⁵⁾ has set a MAC in water bodies used for fishery purposes of 5.0 µg/L.

Routes of Entry: Skin absorption, inhalation of dust, ingestion.

Short Term Exposure: May cause eye and skin irritation. Cholinesterase inhibitor. Exposure at high levels may result in death. The effects may be delayed. The LD₅₀ (rat) = 82 mg/kg (moderately toxic). Chlorpyrifos can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is a moderately toxic organophosphate chemical. Exposure can cause rapid severe poisoning with headache, sweating, nausea and vomiting, diarrhea, loss of coordination, and death. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Chlorpyrifos may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate

PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. **Antidotes:** Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly.

subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Chlorpyrifos-methyl (ANSI)

Use Type: Insecticide

CAS Number: 5598-13-0

Formula: C₇H₇Cl₃NO₃P₅

Alert: In 2000, the registrants of Chlorpyrifos-methyl requested voluntary cancellation of their products rather than committing to develop additional data for reregistration.

Synonyms: Clorpirifos metil (Spanish); Chlormethylfos; *O, O*-Dimethyl *O*-(3,5,6-trichloro-2-pyridyl)phosphorothioate; Dursban methyl; ENT 27,520; Methyl chlorpyrifos; Methyl dursban; NSC-60380; OMS 1155; Phosphorothioic acid, *O, O*-dimethyl *O*-(3,5,6-trichloro-2-pyridyl)ester; Trichlormethylfos

Trade Names: DOWCO-217[®], Dow Chemical (USA); NOLTRAN[®]; RELDAN[®], Gustafson (USA); STORCIDE[®], Gustafson (USA); ZERTELL[®]

Producers: Dow Chemical (USA); Gustafson (USA)

Chemical Class: Organophosphate; Halo-organics

EPA/OPP PC Code: 059102

California DPR Chemical Code: 2468

RTECS Number: TG0700000

EINECS Number: 227-011-5

Uses: Chlorpyrifos-methyl is a general use organophosphate insecticide for use on stored grain (for protection of stored food, feed oil, and seed grains against injury from stored grain weevils, moths, borers, beetles and mealworms including granary weevil, rice weevil, red flour beetle, confused flour beetle, saw-toothed grain beetle, Indian meal moth, and Angoumois grain moth, lesser grain borers), seed treatment, grain bin and warehouse.

Human toxicity (long-term)⁽⁷⁷⁾: Low–70.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–1.02425 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

WHO Acute Hazard: Class U, unlikely to be hazardous; Class II, moderately hazardous as chlorpyrifos

Regulatory Authority:

- U.S. Dot Inhalation Hazard Chemicals as organophosphates
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- FIFRA, 180.3(4); class of chlorinated organic pesticide
- FIFRA, 40CFR186: tolerances for pesticides in animal feeds

Description: Amber crystalline solid; Slightly soluble in water; solubility = 4 mg/L. Molecular weight = 322.5. Melting/Freezing point = 46°C. Vapor pressure = 4.2 x 10⁻⁵ mmHg @ 25°C. Density = 1.39 @ 50°C.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus Pesticides.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Chlorsulfuron (ANSI)

Use Type: Herbicide

CAS Number: 64902-72-3

Formula: C₁₂H₁₂ClN₅O₄S

Synonyms: 2-Chloro-*N*-[[(4-methoxy-6-methyl-1,3,5-triazin-2-yl)amino]carbonyl]benzenesulfonamide; 2-chloro-*N*-[[(4-methoxy-6-methyl-1,3,5-triazin-2-yl)aminocarbonyl]benzenesulfonamide; 1-[(*O*-chlorophenyl)sulfonyl]-3-(4-methoxy-6-methyl-*S*-triazin-2-yl)urea; Benzenesulfonamide, 2-chloro-*N*-[[(4-methoxy-6-methyl-1,3, 5-triazin-2-yl)amino]carbonyl]-; Urea, 1-[(*O*chlorophenyl)sulfonyl]-3-(4-methoxy-6-methyl-*S*-triazin-2-yl)-

Trade Names: DPX 4189[®]; FINESSE[®], DuPont Crop Protection (USA); GLEAN[®], DuPont Crop Protection (USA); GLEAN 20DF[®], DuPont Crop Protection (USA); LANDMARK[®] MP, DuPont Crop Protection (USA); LASHER[®], Sanonda (Australia); RIVERDALE CORSAIR[®], Nufarm Ltd. (Australia); TELAR[®] DF, DuPont Crop Protection (USA)

Producers: Agsin (Singapore); DuPont Crop Protection (USA); Ki-Hara Chemicals Ltd. (UK); Nufarm Ltd. (Australia); Sanonda (Australia); Yellow River Enterprise (China)

Chemical Class: Sulfonylurea; Halo-organics

EPA/OPP PC Code: 118601

California DPR Chemical Code: 2143

EINECS Number: 265-268-5

Uses: A selective systemic herbicide used to control most broadleaf weeds and some annual grasses in wheat, barley, oats, durum, rye, triticale and flax. Applied to non-crop sites such as rights-of-way, fence rows and roadsides.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–350.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–45107.62902 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Chlorsulfuron (40 CFR 180.405):

Carcinogen/Hazard Classifications

California Prop. 65: Listed: Developmental, female, male
Label Signal Word: CAUTION

TRI Developmental Toxin: Reproductive and developmental toxin

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- AB 1803-Well Monitoring Chemical (CAL)
- Proposition 65 chemical (CAL)
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Description: Colorless, odorless crystals. Soluble in water; solubility = 113 mg/L @ 25°C. Molecular weight = 357.79. Melting/Freezing point = 176°C; decomposes @ 192°C. Vapor pressure = 4.6 x 10⁻⁶ mmHg @ 20°C.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. When heated to decomposition, emits oxides of sulfur and nitrogen and chlorine fumes.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, passing through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or burns. Inhalation of dust should be avoided; use NIOSH-approved air purifying respirators for pesticides. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. May be harmful if swallowed. Skin contact may cause allergic reaction.

Long Term Exposure: Repeated or prolonged contact may cause skin and lung sensitization, resulting in allergies.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chlorthiophos

Use Type: Insecticide and acaricide

CAS Number: 60238-56-4; 21923-23-9 (Chlorthiophos I isomer)

Formula: C₁₁H₁₅Cl₂O₃PS₂

Alert: The registered use of chlorthiophos was canceled by the U.S. EPA in 1984. Residue tolerances were revoked in 1996.

Synonyms: *O*-[Dichloro(methylthio)phenyl] *O,O*-diethyl phosphorothioate (3 isomers); *O,O*-[Diethyl-*O*-2,4,5-dichloro(methylthio)phenyl]thionophosphate; ENT 27,635; NSC 195164

Trade Names: CELAMERCK S-2957[®], canceled; CELA S-2957[®], canceled; CELATHION[®], canceled; CM S[®] 2957, canceled; OMS[®] 1342, canceled

Producers: Ehrenstorfer, Dr. (Germany); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate; Halo-organics

EPA/OPP PC Code: 111811

California DPR Chemical Code: 2469

RTECS Number: TF1590000

Uses: Registration and residue tolerances for this chemical in the U.S. have been canceled by the U.S. Environmental Protection Agency.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1b, Extremely Hazardous

Regulatory Authority:

- Banned or Severely Restricted (In Agriculture)(Germany, Malaysia) (UN)⁽¹³⁾
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Chlorthiophos is a yellowish-brown liquid. Boiling point = 153-158°C @ 13 mmHg pressure and crystallizes at less than 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Incompatibilities: Strong acids, strong bases, strong oxidizers

Permissible Exposure Limits in Air: No standards set. However, this chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin contact. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: The LD50-oral (rabbit) is 20 mg/kg which is in the highly toxic class. Symptoms of chlorthiophos exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Chlorthiophos may damage the nervous

system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer

oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment

should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Cholecalciferol

Use Type: Rodenticide

CAS Number: 67-97-0

Formula: C₂₇H₄₄O

Synonyms: Colecalciferol; 7-Dehydrocholesterol; Oleovitamin D₃; 9,10-Secocholesta-5,7,10(19)-trien-3-β-ol; 9,10-Secocholesta-5,7,10(19)-trien-3-ol, (3.β,5Z,7E)-; Vitamin D₃

Trade Names: DELSTEROL[®]; DEPARAL[®]; D3-VIGANTOL[®]; QUINTOX[®]; Bell Laboratories (USA); RAMPAGE[®]; RICKETON[®]; TRIVITAN[®]; VIGORSAN[®]; VITINC DAN-DEE-3[®]

Producers: Bell Laboratories (USA)

Chemical Class: Unclassified

EPA/OPP PC Code: 202901; (208700 old EPA code number)

California DPR Chemical Code: 2232

Uses: Used in bait for vermin control and in vitamin supplements. Vitamin D is a steroid hormone that has an important role in regulating body levels of calcium and phosphorus, and in mineralization of bone.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

Regulatory Authority:

- Actively registered pesticide in California.

Description: White crystalline solid. Odorless. Insoluble in water. Melting/freezing point = 87°C.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

C. I. Basic Green 1

Use Type: Fungicide

CAS Number: 633-03-4

Formula: C₂₇H₃₄N₂O₄S; C₂₇H₃₃N₂:HSO₄

Alert: Not registered as a pesticide in the U.S.

Synonyms: Brilliant green; Ethyl green; Emerald green; Malachite green G

Producers: Aldrich Chemical (USA); China Chemicals (China); Deepak Group (India); Flourochem (UK); Merck (Germany)

RTECS Number: BP6825000

EINECS Number: 211-190-1

Uses: C. I. Basic Green 1 is used in dyeing silk, wool, leather, jute and cotton yellowish-green; manufacturing green ink; as staining constituent of bacteriological media; indicator, an intestinal anthelmintic; a wound antiseptic; treatment of mycotic infections; agricultural fungicide.

Description: C.I. Basic Green 1 is a metallic green, odorless crystal or powder. Soluble in water.

Incompatibilities: Oxidizing agents, reducing agents, anionics, and aqueous solutions of bentonite. Keep away from moisture. When heated to decomposition, forms carbon dioxide and carbon monoxide.

Permissible Exposure Limits in Air: No occupational exposure limits have been established

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion

Harmful Effects and Symptoms

Short Term Exposure: C.I. Basic Green can irritate and burn the skin and eyes. Ingestion causes nausea, vomiting, diarrhea and abdominal pain. It is classified as very toxic; probable lethal dose is 50-500 mg/kg in humans (between 1 teaspoon and 1 ounce for a 150-lb. person). This substance

is classified as very toxic; probable lethal dose is 50-500 mg/kg in humans (between 1 teaspoon and 1 ounce for a 150-lb. person). It is a skin irritant. Ingestion causes diarrhea and abdominal pain.

Long Term Exposure: Skin contact can cause drying and cracking.

Points of Attack: Skin

Medical Surveillance: There is no special test for this substance.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cimectacarb

Use Type: Plant growth regulator

CAS Number: 95266-40-3

Formula: C₁₃H₁₆O₅

Alert: A Restricted Use Pesticide (RUP)

Synonyms: Cyclohexanecarboxylic acid, 4-(cyclopropylhydroxymethylene)-3,5-dioxo-, ethyl ester; 4-(Cyclo- α -hydroxymethylene)-3,5-dioxocyclohexane carboxylic acid ethyl ester; Ethyl 4-(cyclopropylhydroxy methylene)-3,5-dioxocyclohexanecarboxylate; Trinexapac-ethyl; Ethyl 4-(cyclopropylhydroxymethylene)-3,5-dioxocyclohexanecarboxylate

Trade Names: CGA 163935[®]; VISION[®]; PRIMO[®] Syngenta Crop Protection (Switzerland); PRIMO[®] WSB, Syngenta Crop Protection (Switzerland)

Producers: Syngenta Crop Protection (Switzerland)

Chemical Class: Carbamate (cyclopropyl derivative of cyclohexenone plant growth Inhibitor)

EPA/OPP PC Code: 112602

California DPR Chemical Code: 2345

ICSC Number: 1268

RTECS Number: GU8473500

Uses: A Restricted Use Pesticide (RUP) used on commercial and residential turf. Provides chemical alternatives to mechanical and hand removal of aggressive stoloniferous grasses such as Bermudagrass, zoysiagrass, St. Augustinegrass and kikuyigrass.

Carcinogen/Hazard Classifications

Label Signal Word: WARNING or CAUTION

Description: White powder. Soluble in water; solubility = 0.28-2.11 g/100 ml @ 20°C (depends on pH). Molecular weight = 252.31. Melting Point=36°C. Flash point = 132°C. Autoignition temperature = 355°C. Vapor pressure = 2.9 x 10⁻³ Pa @ 20°C. Log K_{ow} = 2.43. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate. May form explosive materials with phosphorus pentachloride.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin adsorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When

acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is **UNCONSCIOUS OR HAVING CONVULSIONS**, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical*

note: 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Cinnamaldehyde

Use Type: Fungicide, insecticide and dog and cat repellent

CAS Number: 104-55-2; 14371-10-9 (*trans*-isomer)

Formula: C₉H₈O

Synonyms: Benzylideneacetaldehyde; Cassia aldehyde; Cinnamal; Cinnamyl aldehyde; Cinnimic aldehyde; NCI-C56111; Phenylacrolein; β -phenylacrolein; 3-Phenylacrolein; 3-Phenylpropenal; 3-Phenyl-2-propenal; Mixture of cinnamaldehyde, cinnamyl alcohol, 4-methoxycinnamaldehyde, 3-phenyl-1-propanol, 4-methoxyphenethyl alcohol, indole, and 1,2,4-trimethoxybenzene. *trans*-isomer: (*E*)-Cinnamaldehyde; *trans*-Cinnamaldehyde; *trans*-Cinnamic aldehyde; *trans*-Cinnamylaldehyde; (*E*)-3-Phenylpropenal; (*E*)-3-Phenyl-2-propenal; 2-Propenal, 3-phenyl-, (*E*)-

Trade Names: ADIOS[®], Micro-flo (USA), ZIMTALDEHYDE[®], ZIMTALDEHYDE[®] LIGHT

Producers: DSM Agro (Netherlands); Micro-flo (USA)

Chemical Class: Botanical

EPA/OPP PC Code: 040506; 040516 (*trans*-isomer)

California DPR Chemical Code: 2277

EINECS Number: 203-213-9

Uses: Used as an antifungal agent, corn rootworm attractant, and dog and cat repellent. Can be used on soil casing for mushrooms, row crops, turf and all food commodities.

U.S. Maximum Allowable Residue Levels for Cinnamaldehyde (40 CFR 180.1127 and 1156):

Chemical	Crop	ppm	CFR
Cinnamaldehyde	r.a.c.*	—	180.1156
Mixture of cinnamaldehyde, cinnamyl alcohol, 4-methoxy cinnamaldehyde, 3-phenyl-1-propanol, 4-methoxyphenethyl alcohol, indole, and 1,2,4-trimethoxybenzene	r.a.c.*	—	180.1127

* r.a.c.= raw agricultural commodities

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

Description: Combustible, yellowish, oily liquid (thickens on exposure to air); strong cinnamon odor. Very slightly soluble in water. Molecular weight = 132.16. Density = 1.048-1.052 @ 25°C; 1.1 @ 4°C. Melting/Freezing point = -7.5°C. Boiling point = 251°C. Flash point = 120°C. Vapor

pressure = 1 mmHg @ 76.1°C, 40 mmHg @ 152°C. Log K_{ow} = 1.9. Unlikely to bioaccumulate in aquatic organisms.

Incompatibilities: May react violently with bromine, ketones. Incompatible with strong acids, azo dyes, caustics, ammonia, amines, boranes, hydrazines, strong oxidizers.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause severe irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. Has anesthetic properties.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- Actively registered pesticide in California.

Description: Magenta crystalline solid. Molecular weight = 303.16. Melting/Freezing point = 180°C. Vapor pressure = 1×10^{-9} mmHg @ 20°C.

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Clomazone (ANSI)

Use Type: Herbicide

CAS Number: 81777-89-1

Formula: C₁₂H₁₄ClNO₂

Synonyms: 2-[(2-Chlorophenyl)methyl]-4,4-dimethyl-3-isoxazolidinone; 2-(2-Chlorobenzyl)-4,4-dimethyl-1,2-oxazolidin-3-one; Dimethazone

Trade Names: CERANO[®], FMC Agricultural Products (USA); COLZOR TRIO[®], Syngenta (Switzerland); COMMAND[®], FMC Agricultural Products (USA) and Rallis India (India); COMMENCE[®], DIBEL[®], FMC Agricultural

Products (USA); FMC[®] 57020, FMC Agricultural Products (USA); GAMBIT[®]; MAGISTER[®]; MERIT[®]; STRATEGY[®]
Producers: Agsin (Singapore); Epochem Co., (China); FMC Agricultural Products (USA); Rallis India (India); Syngenta (Switzerland)

Chemical Class: Oxazolidione

EPA/OPP PC Code: 125401

California DPR Chemical Code: 3537

Uses: Clomazone is a broad-spectrum herbicide used on rice, peas, pumpkins, soybeans, sweet potatoes, winter squash, cotton, tobacco and fallow wheat fields to control annual grasses and broadleaf weeds.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–301.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–3156.16718 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Clomazone (40 CFR 180.425):

CROP	ppm
Bean, snap, succulent	0.05
Cabbage	0.1
Cotton, undelinted seed	0.05
Cucumber	0.1
Pea, succulent	0.05
Pepper	0.05
Peppermint, tops	0.05
Pumpkin	0.1
Rice, grain	0.02
Rice, straw	0.02
Soybean	0.05
Spearmint, tops	0.05
Squash, summer	0.1
Squash, winter	0.1
Sugarcane, cane	0.05
Sweet potato	0.05
Vegetable, cucurbit, group 9	0.05
Vegetable, tuberous and corm, except potato, subgroup 1(d)	0.05
Watermelon	0.1

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not Likely a Carcinogen

Label Signal Word: WARNING or CAUTION

WHO Acute Hazard: Class II, moderately hazardous

Description: Vapor pressure = 1×10^{-4} mmHg @ 20°C.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Clonitralid

Use Type: Molluscicide

CAS Number: 1420-04-8

Formula: C₁₅H₁₅Cl₂N₃O₅

Synonyms: 2-Aminoethanol salt of 2',5-dichloro-4'-nitrosalicylanilide; 5-Chloro-N-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide with 2-aminoethanol (1:1); Clonitralid; 5-Chloro-N-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide, 2-aminoethanol salt; 2',5-Dichloro-4'-nitrosalicylanilide, 2-aminoethanol salt; 5,2'-Dichloro-4'-nitrosalicylanilide ethanolamine salt; 5,2-Dichloro-4-nitrosalicylanilide-2-aminoethanol salt; 2',5-Dichloro-4'-nitrosalicyloylanilide ethanolamine salt; Ethanolamine salt of 5,2'-dichloro-4'-nitrosalicylanilide; NCI-C00431; Niclosamide; 2-Aminoethanol salt of 5-chloro-N-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide

Trade Names: BAY 73[®], Bayer CropScience (Germany) and U.S. Fish and Wildlife Service; BAY 6076[®], Bayer CropScience (Germany); BAYER 73[®], Bayer CropScience (Germany); BAYER 25648[®], Bayer CropScience (Germany); BAYLUSCID[®], Bayer CropScience (Germany), canceled; BAYLUSCIDE[®], Bayer CropScience (Germany) and U.S. Fish and Wildlife Service; M 73[®]; MOLLUSCICIDE BAYER 73[®], Bayer CropScience (Germany); NICLOSAMIDE[®]; SR 73[®]

Producers: Bayer CropScience (Germany); U.S. Fish and Wildlife Service (USA)

Chemical Class: Chloronitrophenol derivative; chlorinated aromatic amide

EPA/OPP PC Code: 077401

California DPR Chemical Code: 2472

Uses: Niclosamide, the parent chemical, is a relatively selective, non-cumulative chlorinated aromatic amide

pesticide. Clonitralid (ethanolamine salt of Niclosamide) is used principally against molluscs, especially fresh water snails and to control sea lamprey larvae and also as an antiparasitic drug in human, pets and livestock. Niclosamide is toxic to all fish species at 0.5 mg/L (48 hours).

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION or DANGER

WHO Acute Hazard: Class U, unlikely to be hazardous as niclosamide, the parent chemical.

Regulatory Authority:

- FIFRA, 40CFR152.175 (RUP)
- The "Director's List" (CAL/OSHA)

Description: A yellow or brownish-yellow crystalline solid. Odorless. Soluble in water. Molecular weight = 388.23. Melting point = 191°C.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion, inhalation or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: May result in nausea and abdominal pain.

Points of Attack: Gastrointestinal system

Medical Surveillance:

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Clopyralid (ANSI)

Use Type: Herbicide

CAS Number: 1702-17-6

Formula: C₇H₃Cl₂NO₂

Synonyms: 3,6-Dichloropicolinic acid; 3,6-Dichloro-2-pyridinecarboxylic acid; 2-Pyridinecarboxylic acid, 3,6-

dichloro-; 3,6-Dichloro-2-picolinic acid; 3,6-DCP; Picolinic acid, 3,6-dichloro-

Trade Names: ACCENT[®], DuPont Crop Protection (USA); CONFRONT[®], Dow AgroSciences (USA); CURTAIL[®], Dow AgroSciences (USA); CURTAIL M[®], Dow AgroSciences (USA); DOWCO[®]-290, Dow AgroSciences (USA); HORNET[®], Dow AgroSciences (USA); LONTREL[®], Dow AgroSciences (USA); LONTREL[®] 3, Dow AgroSciences (USA); LONTRIL[®] F, Dow AgroSciences (USA); LONTRIL[®] T, Dow AgroSciences (USA); MATRIGON[®]; MILLENNIUM[®], Nufarm (Australia); NAF[®]-280, Dow AgroSciences (USA); PARADIGM[®], Dow AgroSciences (USA); RECLAIM[®]; REDEEM[®], Dow AgroSciences (USA); RIVERDALE[®], Nufarm (Australia); SCORPION[®]; STINGER[®], Dow AgroSciences (USA); TRANSLINE[®]; WIDEMATCH[®], Dow AgroSciences (USA); XRM-3972[®]

Producers: Dow AgroSciences (USA); DuPont Crop Protection (USA); Nufarm (Australia)

Chemical Class: Chlorophenoxy

EPA/OPP PC Code: 117403

California DPR Chemical Code: 5135

ICSC Number: 0443

RTECS Number: TJ550700

EEC Number: 607-231-00-1

Uses: Clopyralid is used to control annual and perennial broadleaf weeds on rangeland, pastures, turf and lawns, rights-of-way and a few agricultural products such as sugarbeets, oats, barley, mint and wheat.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–3500.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–20832.27357 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely a carcinogen

Label Signal Word: WARNING, CAUTION or WARNING, depending on formulation

Regulatory Authority:

- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL) as chlorophenoxy pesticides
- The “Director’s List” (CAL/OSHA) as chlorophenoxy pesticides

Description: Odorless and colorless crystalline solid. Combustible. Poor solubility in water. Molecular weight = 192.00. Melting/Freezing point = 152°C. Vapor pressure = 2×10^{-3} Pa @ 20°C.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate. Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Solutions are corrosive to aluminum, iron and tin. When heated to

decomposition, this chemical may form nitrogen oxides and chlorine gas.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. Can cause permanent impairment of vision or irreversible damage.

Long Term Exposure: Workers exposed to chlorophenoxy compounds such as 2,4-D (in the manufacturing process) over a five to ten year period at levels above 10 mg/m³ complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affect human reproduction.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver and kidney

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cloransulam-methyl

Use Type: Herbicide

CAS Number: 147150-35-4

Synonyms: *N*-(2-carboxymethyl-6-chlorophenyl)-5-ethoxy-7-fluoro(1,2,4)triazolo-(1,5-c)pyrimidine-2-sulfonamide; Benzoic acid, 3-chloro-2-[[((5-ethoxy-7-fluoro(1,2,4)triazolo(1,5-c)pyrimidin-2-yl)sulfonyl)amino]-, methyl ester

Trade Names: AMPLIFY™, Monsanto (USA); FIRSTRATE®, Dow AgroSciences (USA); FRONTROW, Dow AgroSciences (USA); GAUNTLET®, FMC (USA); XDE-565

Producers: Dow AgroSciences (USA); FMC (USA); Monsanto (USA); Nufarm (Australia)

Chemical Class: Triazolopyrimidine sulfonanilide

EPA/OPP PC Code: 129116

California DPR Chemical Code: 5781

Uses: Used as a pre-emergence or post-emergence control of broadleaf weeds in soybeans.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely to be a carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: Off-white powder. Slight mint odor. Melting Point= 216-218°C.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. Copper Ammonium Carbonate

Use Type: Fungicide

CAS Number: 33113-08-5

Synonyms: Carbonic acid, ammonium copper salt; Copper Count N

Trade Names: ACQ®, Chemical Specialties (USA); COPSOL®, Chemical Specialties (USA), canceled

Producers: Chemical Specialties (USA)

Chemical Class: Inorganic copper compound

EPA/OPP PC Code: 022703

California DPR Chemical Code: 1762

Uses: Used to treat wood and burlap. All food uses were canceled by Chemical Specialties, Inc. in March, 2001. Canceled were uses on mangos, beans, carrots, celery, citrus, grapes, cucurbits, peanuts, potatoes, peppers, strawberries, tomatoes and sugarbeets.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER or CAUTION

Regulatory Authority:

- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)

Copper and Copper compounds

Use Type: Copper is used as a fungicide. Copper compounds are used as insecticides, algicides, molluscicide, and plant fungicides.

CAS Number: 7440-50-8; 1317-38-0 (CuO, copper fume)

Formula: Cu

Synonyms: Bronze powder; C.I. 77400; C.I. Pigment metal 2; Cobre (Spanish); Copper bronze; Elemental copper; 1721 Gold; Gold bronze; Kafar copper; M2 Copper; M1 (Copper); OFHC Cu; Raney copper

Trade Names: ALLBRI NATURAL COPPER®; ANAC 110®; ARWOOD COPPER®; CDA 101®; CDA 110®; CDA 122®; CDA 102®

Producers: Adrian Resources (Canada); Aldrich Chemical (USA); Anglo American (UK); Antofagasta (UK); ASARCO (USA); BHP Billiton (Australia & UK); Boliden (Sweden); Codelco (Chile); Dowa Mining (Japan); First Quantum Minerals (Canada); Goldschmidt (Germany); Great Western Inorganics (USA); Grupo Mexico (Mexico); Indo Gulf (India); Ingenieria Industrial (Mexico); Metorex (South Africa); Minera Escondida (Chile); Minerals Research & Development (USA); Mitsubishi Materials (Japan); Mitsui Mining (Japan); Nippon Mining & Metals (Japan); Noranda (Canada); PCF Chimie (France); Phelps Dodge (USA); Philbro-Tech (USA); Rio Tinto (UK); Shyam (India); Southern Peru (Peru); Spiess-Urania Chemicals (Germany); Teck Cominco (Canada); UMICORE (Belgium); William Blythe (UK); WMC (Australia)

Chemical Class: Inorganic; Metals

EPA/OPP PC Code: 022501

California DPR Chemical Code: 714

ICSC Number: 0240

RTECS Number: GL5325000; GL7900000 (CuO, copper fume)

EINECS Number: 231-159-6 (copper)

Uses: Copper is used as a fungicide on table and raisin grapes, wine grapes, oranges and pears. Copper compounds are used as copper supplements for pasture lands. Metallic copper is an excellent conductor of electricity and is widely used in the electrical industry in all gauges of wire for circuitry, coil, and armature windings, high conductivity tubes, commutator bars, etc. It is made into castings, sheets, rods, tubing and wire, and is used in water and gas piping, roofing materials, cooking utensils, chemical and pharmaceutical equipment and coinage. Copper forms many important alloys: Be-Cu alloy, brass, bronze, gunmetal, bell metal, German silver, aluminum bronze, silicon bronze, phosphor bronze, and manganese bronze. Copper compounds are used as mordants, pigments, catalysts, and

in the manufacture of powdered bronze paint and percussion caps. They are also utilized in analytical reagents, in paints for ships' bottoms, in electroplating, and in the solvent for cellulose in rayon manufacture.

U.S. Maximum Allowable Residue Levels for Copper and Copper Compounds (40 CFR 180.1021; 180.136; 180.538):

- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List. Ocean dumping prohibited; Drinking Water Quality \leq 1.0 mg/L.
- Mexico, Drinking Water = 1.0 mg/L

Description: Copper is a reddish-brown metal which occurs free or in ores such as malachite, cuprite, and chalcopyrite. Copper fume is finely divided black particulate dispersed in air. Copper dusts and mists have been assigned the formula $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}/\text{CuCl}$ by NIOSH. Copper fume has been designated as $\text{Cu}/\text{CuO}/\text{Cu}_2\text{O}$ by NIOSH. Boiling point =

2595°C. Melting/Freezing point = 1083°C It may form both mono- and divalent-compounds. Copper is insoluble in water, but soluble in nitric acid and hot sulfuric acid.

Incompatibilities: Copper dust, fume, and mists form shock-sensitive compounds with acetylene gas, acetylenic compounds, azides, and ethylene oxides. Incompatible with acids, chemically active metals such as potassium, sodium, magnesium, and zinc, zirconium, strong bases. Violent reaction, possibly explosive, if finely-divided material come in contact with strong oxidizers.

Permissible Exposure Limits in Air: NIOSH⁽²⁾ recommends the same level for a 10-hour workshift. ACGIH⁽¹⁾ recommends a TWA of 0.2 mg/m³ for copper fume and 1 mg/m³ for dusts and mists, as has HSE⁽³³⁾, Australia, Israel, and the Canadian provinces of Alberta, BC, Ontario, and Quebec and HSE, Alberta, BC set a STEL for dusts and mists of 2.0 mg/m³. The NIOSH⁽²⁾ IDLH is 100 mg/m³ (as Cu). The DFG MAK for total dust is 1 mg/m³; 0.1 mg/m³ for fine dust and Peak Limitation is 2 times MAK (30 min), not to be exceeded 4 times during a workshift⁽³⁾. Mexico set a limit of 0.2 mg/m³ TWA and STEL of 2 mg/m³. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC value for copper in workplace air of 1.0 mg/m³ and 0.5 mg/m³ on an average value per workshift basis. Several states have set guidelines or standards for copper in ambient air⁽⁶⁰⁾ ranging from 0.26-1.57 $\mu\text{g}/\text{m}^3$ (Montana) to 2.0 $\mu\text{g}/\text{m}^3$ (North Dakota) to 2.0-20.0 $\mu\text{g}/\text{m}^3$ (Connecticut) to 4.0-20.0 $\mu\text{g}/\text{m}^3$ (Florida) to 5.0 $\mu\text{g}/\text{m}^3$ (Nevada) to 16.0 $\mu\text{g}/\text{m}^3$ (Virginia) to 20.0 $\mu\text{g}/\text{m}^3$ (New York).

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper⁽¹⁸⁾. For copper fume: filter collection, acid digestion, measurement by atomic absorption. See NIOSH Method #7200 for welding and brazing fume⁽¹⁸⁾.

Permissible Concentration in Water: To protect freshwater aquatic life: 5.6 $\mu\text{g}/\text{L}$ as a 24-hour average, never to exceed $e^{[0.94 \ln(\text{hardness}) - 1.23]} \mu\text{g}/\text{L}$. To protect human health: 1000 $\mu\text{g}/\text{L}$ ⁽⁶⁾. Canada: Drinking Water Quality (AO) \leq 1.0 mg/L. Mexico, Drinking Water = 1.0 mg/L. Czechoslovakia⁽³⁵⁾ has set a MAC in surface water of 0.1 mg/L and in drinking water of 0.05 mg/L. The former USSR⁽³⁵⁾ and The former USSR-UNEP/IRPTC joint project have set a MAC in water used for domestic purposes of 1.0 mg/L and 0.001 mg/L in fresh water and 0.005 mg/L in seawater used for fishery purposes. Two states have set guidelines for copper in drinking water⁽⁶¹⁾; they are Kansas at 1000 $\mu\text{g}/\text{L}$ and Minnesota at 1300 $\mu\text{g}/\text{L}$.

Determination in Water: Total copper may be determined by digestion followed by atomic absorption or by colorimetry (using neocuproine) or by Inductively Coupled Plasma Optical Emission Spectrometry. Dissolved Copper may be determined by 0.45 μ filtration followed by the preceding methods.

Routes of Entry: Inhalation of dust or fume, ingestion, or skin or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Copper salts act as irritants to the intact skin causing itching, erythema, and dermatitis. In the eyes, copper salts may cause conjunctivitis and even ulceration and turbidity of the cornea. Metallic copper may cause keratinization of the hands and soles of the feet, but it is not commonly associated with industrial dermatitis. The fumes and dust cause irritation of the upper respiratory tract, metallic taste in the mouth, nausea, metal fume fever. Inhalation of dusts, fumes, and mists of copper salts may cause congestion of the nasal mucous membranes. If the salts reach the gastrointestinal tract, they act as irritants producing salivation, nausea, vomiting, gastric pain, hemorrhagic gastritis, and diarrhea. It is unlikely that poisoning by ingestion in industry would progress to a serious point as small amounts induce vomiting, emptying the stomach of copper salts. Chronic human intoxication occurs rarely and then only in individuals with Wilson's disease (hepatolenticular degeneration). This is a genetic condition caused by the pairing of abnormal autosomal recessive genes in which there is abnormally high absorption, retention, and storage of copper by the body. The disease is progressive and fatal if untreated.

Long Term Exposure: Copper may decrease fertility in both males and females. Repeated or prolonged contact may cause skin sensitization and allergy, thickening of the skin, and greenish color to the skin, teeth, and hair. Repeated exposure can cause chronic irritation of the nose and cause ulcers and hole in the septum dividing the inner nose. Repeated high exposure to copper can cause liver damage. There is evidence that workers in copper smelting plants have an increased risk of lung cancer, but this is thought to be due to arsenic trioxide and not copper.

Points of Attack: For copper dusts and mists: respiratory system, lungs, skin, liver, including risk with Wilson's disease, kidneys. For copper fume: respiratory system, skin, eyes, and risk with Wilson's disease.

Medical Surveillance: Serum and urine copper levels. Evaluation by a qualified allergist. Liver function tests. Copper often contains arsenic as an impurity. Wilson's disease is a rare hereditary condition which interferes with the body's ability to get rid of copper. If you have this condition, consult your doctor about copper exposure.

First Aid: If copper dust or powder gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If copper dust or powder contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician or authorized medical personnel: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics. The symptoms of metal fume fever may be delayed for 4-12 hours following exposure: it may last less than 36 hours.

Copper Carbonate, Basic

Use Type: Algacide, insecticide and fungicide

CAS Number: 12069-69-1

Formula: $\text{Cu}_2(\text{OH})_2\text{CO}_3$

Synonyms: Basic cupric carbonate; (Carbonato)dihydroxydicopper; Chestnut compound; Copper carbonate hydroxide; Cupric carbonate; Diccopper dihydroxycarbonate; Kupfercarbonat (German); Malachite
Trade Names: KOP KARB[®]; NOAH GOLD[®]; Osmose (USA); NW 200[®]; Osmose (USA); SPIN OUT 400[®]; Griffin (USA)

Producers: Griffin (USA); Nihon Kagaku Sangyo (Japan); Nufarm (Australia); Osmose (USA); Philbro-Tech (USA); William Blythe (UK)

Chemical Class: Inorganic copper compounds
EPA/OPP PC Code: 022901

California DPR Chemical Code: 60

EINECS Number: 235-113-6

Uses: A fungicide used against a broad spectrum of fungi. Also used as an insecticide.

U.S. Maximum Allowable Residue Levels for Copper Carbonate (40 CFR 180.136; 180.1001 (b); 180.1021):

CROP	ppm	CFR
Pear, post-h	3	180.136
Raw agricultural commodities	—	180.1001 (b)
Raw agricultural commodities	—	180.1021

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION, WARNING, DANGER

Regulatory Authority:

- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL) (as copper compounds)
- The “Director’s List” (CAL/OSHA) (as copper compounds)
- Clean Water Act: Toxic Pollutant (Section 401.15) as copper and compounds.
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.
- FIFRA, 40CFR185: tolerances for pesticides in food, as copper compounds, total.
- EPCRA (Section 313): Includes any unique chemical substance that contains copper as part of that chemical’s infrastructure. Form R *de minimis* concentration reporting level: 1.0%

Description: Green powder. Insoluble in water. Molecular weight = 221.10. Density 3.9. Melting/Freezing point = decomposes @ 197°C.

Incompatibilities: Incompatible with germanium, lead diacetate, magnesium, mercurous chloride, silicon, silver nitrate, titanium. Incompatible with calcium (metal hydroxides), nitroethane, nitromethane, 1-nitropropane, zirconium.

Permissible Exposure Limits in Air: As copper: ACGIH TLV 0.2 mg/m^3 (fume); 1 mg/m^3 (dusts and mists); NIOSH/OSHA 0.1 mg/m^3 (fume); 1 mg/m^3 as (dusts and mists).

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper. For copper fume: filter collection, acid digestion, measurement by atomic absorption.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. The U.S. EPA (6) has set a maximum of 1.0 mg/L in water to protect human health.

Determination in Water: Total copper may be determined by digestion followed by atomic absorption or by colorimetry (using neocuproine) or by Inductively Coupled Plasma Optical Emission Spectrometry. Dissolved Copper

may be determined by 0.45 μ filtration followed by the preceding methods.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if ingested. Irritates eyes, skin and mucous membranes. Possible skin discoloration.

Long Term Exposure: May cause mutations in humans. May damage the testes and decrease fertility in both males and females. May cause skin allergy and thickening of the skin; copper deposits can cause discoloration in the skin and hair, leaving a green color. Repeated exposure can cause shrinking of the lining of the inner nose with watery discharge, liver damage. Individuals with Wilson’s disease absorb, retain, and store copper excessively.

Points of Attack: Skin, reproductive system., liver

Medical Surveillance: Serum and urine copper level. Liver and kidney tests. Examination by a qualified allergist. More than light alcohol consumption may exacerbate the liver damage caused by copper sulfate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Copper Acetoarsenite

Use Type: Insecticide and fungicide

CAS Number: 12002-03-8

Formula: $\text{C}_4\text{H}_6\text{As}_2\text{Cu}_4\text{O}_{16}$

Synonyms: Acetoarsenito de cobre (Spanish); Acetato(trimetaarsenito)dícopper; Acetoarsenite de cuivre (French); Basle green; C.I. Pigment Green 21; Copper aceto-arsenite; Cupric acetoarsenite; Emerald green; French green; Imperial green; King’s green; Meadow green; Mitis

green; Moss green; Mountain green; Paris green; Parrot green; Patent green; Schweinfurt green; Swedish green; Vienna green

Trade Names: FASCO PARIS GREEN[®], Kerr-McGee Chemical (USA); LACCO PARIS GREEN[®], Los Angeles Chemical Co. (USA); ORTHO P-G BAIT[®]

Producers: Bayer CropScience (Germany); Kerr-McGee Chemical (USA)

Chemical Class: Inorganic, arsenite, copper

EPA/OPP PC Code: 022601

California DPR Chemical Code: 2485 (cupric acetoarsenite) and 460 (Paris green)

ICSC Number: 0013

RTECS Number: GL6475000

Uses: It is also used as a wood preservative and in paints for marine vessels.

Carcinogen/Hazard Classifications

U.S. NTP: Carcinogen

California Prop. 65: Listed

IARC: Group I, known carcinogen

WHO Acute Hazard: Group 1b, highly hazardous

Regulatory Authority:

- OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1018)
- The "Director's List" (CAL/OSHA)

Arsenic compounds:

ug/L): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 100 lb (45.4 kg)
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: Copper acetoarsenite is an emerald-green, crystalline powder. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Incompatibilities: Decomposes in water with prolonged heating. Incompatible with strong bases, strong acids.

Permissible Exposure Limits in Air:

Copper compounds: The Federal standard (OSHA PEL 8-hour TWA)⁽⁵⁸⁾ for copper fume is 0.1 mg/m³, and 1 mg/m³ for copper dusts and mists. NIOSH⁽²⁾ recommends the same level for a 10-hour workshift. ACGIH⁽¹⁾ recommends a TWA of 0.2 mg/m³ for copper fume and 1 mg/m³ for dusts and mists. The NIOSH⁽²⁾ IDLH level = 100 mg/m³ (as copper)

Arsenic compounds: The following exposure limits are for air levels only. When skin contact also occurs, overexposure is possible, even though air levels are less than the limits listed below. OSHA⁽²⁾: The legal airborne PEL is 0.010 mg/m³ averaged over an 8-hour workshift. NIOSH⁽²⁾: The recommended airborne exposure limit is 0.002 mg/m³ (ceiling), not to be exceeded during any 15 min. work period. ACGIH⁽¹⁾: The recommended airborne exposure limit is 0.01 mg/m³ averaged over an 8-hour workshift. The HSE⁽³³⁾ (U.K.) Maximum Exposure Limit (as As) is 0.1 mg/m³ TWA. California's workplace PEL is the same as ACGIH⁽¹⁾ and an Action Level of 0.005 mg/m³. The Australia limit is 0.05 mg/m³ TWA (confirmed carcinogen); Israel 0.01 mg/m³ TWA and Action Level 0.005 mg/m³. Mexico level 0.2 mg/m³ TWA. Canada: Alberta level 0.2 mg/m³ TWA and STEL of 0.6 mg/m³ (15 min.); British Columbia level 0.5 mg/m³ TWA; Ontario level 0.01 mg/m³ TWAEV and STEV of 0.05; Quebec level 0.2 mg/m³ TWAEV. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 0.003 mg/m³ on an average daily basis for residential areas. In addition, several states have set guidelines or standards for arsenic in ambient air⁽⁶⁰⁾: 0.06 mg/m³ (California Prop. 65), 0.0002 μg/m³ (Rhode Island), 0.00023 μg/m³ (North Carolina), 0.024 μg/m³ (Pennsylvania), 0.05 μg/m³ (Connecticut), 0.07 to 0.39 μg/m³ (Montana), 0.67 μg/m³ (New York), 1.0 μg/m³ (South Carolina), 2.0 μg/m³ (North Dakota), 3.3 μg/m³ (Virginia), 5 μg/m³ (Nevada).

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper⁽¹⁸⁾. For

copper fume: filter collection, acid digestion, measurement by atomic absorption.

Permissible Concentration in Water: EPA has set a limit of 0.05 parts per million (ppm) for arsenic in drinking water. The U.S. EPA arsenic drinking water standard of 0.01 ppm (10 ppb) is based on the U.S. EPA final rule for arsenic in drinking water published in the January 22, 2001, *Federal Register*. However, the U.S. EPA is currently reviewing the science and cost estimate supporting this rule, and, in the interim, has reverted to the previous standard for arsenic. Thus, in the US, the current EPA arsenic drinking water standard remains at 0.05 ppm (50 ppb). To protect freshwater aquatic life-total recoverable trivalent inorganic arsenic never to exceed 440 $\mu\text{g/L}$. To protect saltwater aquatic life: 508 $\mu\text{g/L}$ on an acute basis. To protect human health: preferably zero. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: For arsenic: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic⁽⁵⁸⁾.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause severe irritation and burns. Skin contact can cause irritation, burning sensation, itching, thickening and color changes. This chemical can be absorbed through the skin, thereby increasing exposure.

Long Term Exposure: Repeated exposure can cause copper to deposit in the liver, kidneys, and other body organs, causing damage, atrophy of the inner lining of the nose and possible hole in the nasal septum, with a watery or bloody discharge. Metallic or garlic taste may also occur. Repeated skin exposure can cause skin allergy and possibly a green discoloration of the skin and hair. Some copper and arsenic compounds, but not this one, have been identified as carcinogens and certain arsenic compounds have been determined to be reproductive hazards. Therefore this chemical should be handled with extreme caution. May damage the nervous system. Birth defects have been observed in animals exposed to inorganic arsenic. It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

Points of Attack: Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer.

Medical Surveillance: Urine arsenic test. Examine skin for abnormal growths. Examination of the nose, skin, nails, and nervous system. Liver function tests, Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Copper Arsenite

Use Type: Insecticide, herbicide and rodenticide

CAS Number: 10290-12-7

Formula: CuHAsO_3

Alert: Not registered in the U.S. A teratogen.

Synonyms: Acid orthoarsenite; Arsenito de cobre (Spanish); Arsonic acid, copper(2+) salt (1:1); Arsenious acid, copper(2+) salt (1:1); Cupric arsenite; Cupric green; Copper orthoarsenite; Scheele's green; Scheele's mineral; Swedish green

Trade Names: KOCIDE® 2000, Griffin (USA)

Producers: Griffin (USA)

Chemical Class: Inorganic arsenic; Metals

EPA/OPP PC Code: 022401

ICSC Number: 1211

RTECS Number: CG3385000

EEC Number: 033-002-00-5

EINECS Number: 233-644-8

Uses: No longer registered in the U.S. Formerly used in agriculture as and insecticide, fungicide, rodenticide and fungicide. Also used in pigments and animal medications.

Description: An odorless, yellow-green powder that gives off irritating and/or toxic fumes in a fire.

Permissible Exposure Limits in Air: OSHA⁽²⁾: 0.01 mg/m^3 ; NIOSH⁽²⁾: Ceiling 0.002 $\text{mg/m}^3/15$ min; carcinogen; ACGIH⁽¹⁾: 0.01 mg/m^3 ; carcinogen

Determination in Air: Collection on a filter and analysis by atomic absorption spectrometry. See NIOSH Methods #7900 and #73000, Elements⁽¹⁸⁾. See also OSHA Method ID 105.⁽⁵⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution

Routes of Entry: Inhalation, skin, eyes and ingestion

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Dust is readily absorbed from the lungs, but inhaled quantities are usually insufficient to cause acute systemic toxicity. Can cause cough with foamy sputum and rales. *Skin/Eye Contact:* Dust can cause localized skin irritation, but systemic absorption through the skin is negligible. Skin contact is unlikely to cause systemic effects unless the dermal barrier is compromised. Eye exposure may produce burns and ulcerations. *Ingestion:* The most important route of acute exposure. Arsenicals are quickly absorbed and can be extremely hazardous. Significant tissue and organ damage and death may result. *Symptoms of exposure include:* headache (lethargy, delirium, hallucinations, seizures, or coma can occur);

dizziness; acute nausea and occasional vomiting; labored breathing; restlessness; cyanosis (pale or bluish lips, face and fingernails); perspiration; difficult breathing; abdominal pain with diarrhea; trembling and feeling of "pins and needles" or electrical shock like pains in the lower extremities; convulsions; unconsciousness; possible pulmonary edema, a medical emergency. Very acute poisoning: extreme headache; muscular paralysis, and liver and kidney dysfunction, loss of consciousness; death.

Long Term Exposure: Chronic exposure is characterized by malaise, peripheral sensorimotor neuropathy, anemia, jaundice, gastrointestinal complaints, and characteristic skin lesions including hyperkeratosis (small corn-like elevations) and hyperpigmentation. Hyperkeratosis usually appears on the palms or soles. Pigmentation changes and hyperkeratosis can take 3 to 7 years to appear. Chronic inhalation can also lead to conjunctivitis, irritation of the throat and respiratory tract, and perforation of the nasal septum. Chronic exposure can cause allergic contact dermatitis. Chronic exposure may be more serious for children because of their potential longer latency period. *Carcinogenicity:* The Department of Health and Human Services, IARC, U.S. EPA, and NTP have classified arsenic as a human carcinogen based on sufficient evidence from human data. Arsenic trioxide causes skin and lung cancer, and may cause internal cancers such as liver, bladder, kidney, colon, and prostate cancers. Arsenic ions released from arsenic trioxide within the body can cross the placenta and affect the developing fetus; arsenic is also excreted in breast milk. Experimental animal studies support an association between high ingested arsenic dose and fetal toxicity.

Points of Attack: Muscles, liver, and kidney.

Medical Surveillance: In acutely ill patients, the agent most frequently recommended is dimercaprol, also known as BAL (British Anti Lewisite). The standard dosage regimen is 3 to 5 mg/kg IM every 4–6 hours until the 24-hour urinary arsenic level falls below 50 $\mu\text{g/L}$, unless an orally administered chelating agent (e.g., DMSA, see below) is substituted. This regimen may be adjusted depending upon the severity of the exposure and the symptoms. Do not chelate asymptomatic patients without the guidance of a 24-hour urinary arsenic level. Contraindications to BAL include preexisting renal disease, pregnancy (except in life-threatening circumstances) and concurrent use of medicinal iron (BAL and iron together form a complex that is very toxic).

First Aid: Do not contaminate yourself. Positive-pressure, self-contained breathing apparatus (SCBA) is recommended in response situations that involve exposure to potentially unsafe levels of arsenicals or combustion products which may include arsine and arsenic trioxide fumes. *Eyes:* Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical

aid immediately. *Skin:* Although it is poorly absorbed dermally, skin contact should be avoided because arsenicals may irritate the skin. Wearing the appropriate PPE equipment and respirator for arsenicals. Immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. If conscious, alert, and able to swallow, aggressive decontamination with gastric lavage is recommended within 1 hour of ingestion of a life-threatening amount of poison. The effectiveness of activated charcoal in binding arsenic trioxide is questionable, but administration of a charcoal slurry is recommended pending further evaluation in cases of ingestion of unknown quantities (at 1 gm/kg, usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *Inhalation:* Get medical aid. Wearing the appropriate PPE equipment and respirator for arsenicals, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

RTECS Number: GL7150000 (I); GL7175000 (II)

EINECS Number: 208-883-6

Uses: Copper Cyanide is also used in electroplating copper on iron, and as a catalyst.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH⁽¹⁾) (DFG⁽³⁾) (HSE⁽³³⁾) (former USSR)⁽⁴³⁾ (OSHA)⁽⁵⁸⁾
- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL) as cyanide compounds
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants as cyanide compounds
as copper(I) cyanide:
- Clean Air Act: Hazardous Air Pollutants (Title 1, Part A, Section 112) as cyanide compounds
- Clean Water Act: Toxic Pollutant (Section 401.15)
- EPA Hazardous Waste Number (RCRA No.): P029
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 10 lb (4.54 kg)
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 6010(60); 7210(200) **Note:** All species in the ground water that contain copper are included.
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0% (copper)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0% (cyanide)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited, as copper compounds, n.o.s; Drinking Water Quality = 0.2 mg (CN)/L MAC as cyanide compounds.

Description: Copper(I) cyanide is a white crystalline substance. Cupric cyanide, Cu(CN)₂ is a yellowish-green powder which decomposes on heating. Melting/Freezing point = 473°C (in nitrogen). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Insoluble in water.

Incompatibilities: Contact with heat forms deadly hydrogen cyanide gas. May form hydrogen cyanide with water. Keep away from acetylene gas and chemically active metals such as potassium, sodium, magnesium, and zinc, strong oxidizers (chlorine, fluorine, peroxides, etc).

Permissible Exposure Limits in Air: The legal airborne permissible exposure limit (OSHA) PEL⁽⁵⁸⁾ and the ACGIH⁽¹⁾ recommended TLV is 1 mg/m³ as copper dust and mist. The NIOSH⁽²⁾ IDLH is 100 mg (Cu)/m³. The limit set by the former USSR-UNEP/IRPTC project⁽⁴³⁾ is 0.3 mg/m³ as a MAC in workplace air and 0.009 mg/m³ as a momentary value in ambient air of residential areas; the daily average MAC allowable in residential areas is 0.004 mg/m³.

Determination in Air: Collection by a filter and bubbler followed by measurement with an ion-specific electrode. See NIOSH Method #7904⁽¹⁸⁾.

Permissible Concentration in Water: The permissible concentration for copper set by USEPA to protect human health is 1 mg/Liter. The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L)⁽⁶⁾. The Canadian MAC is the same. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 0.1 mg/Liter in water bodies used for domestic purposes and 0.05 mg/Liter in water bodies used for fishery purposes.

Determination in Water: Cyanide may be determined titrimetrically by EPA Methods 335.2 and 9010 which give total cyanide.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Copper Cyanide can affect you when breathed in. Eye contact can cause severe burns with loss of vision. Skin contact can cause irritation or burns. Breathing Copper Cyanide causes irritation of respiratory tract, and may cause nose bleeds or sores in the nose. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Repeated exposure can cause copper to deposit in the liver and other body organs, causing damage, atrophy of the inner lining of the nose, with a watery discharge. Metallic taste may also occur. Repeated skin exposure can cause skin allergy and possibly a green discoloration of the skin and hair. May be able to affect the lungs.

Points of Attack: Skin, lungs, possibly other body organs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful. Urine copper test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Copper Hydroxide

Use Type: Fungicide, nematocide and microbiocide

CAS Number: 20427-59-2

Formula: Cu(OH)₂

Synonyms: Copper dihydroxide; Copper hydrate; Copper(II) hydroxide; Copper oxide hydrated; Cupravit blau (German); Cupravit blue; Cupric hydroxide; Kuprablau (German)

Trade Names: CHAMPION[®], Nufarm (Australia); CHILTERN KOCIDE[®] 101, Griffin (USA); COMAC PARASOL[®]; CRISCOBRE[®]; KOCIDE[®] 101, Griffin (USA); KOZINC[®], Micro-Flo (USA); MEFENOXAM/COPPER[®], Syngenta Crop Protection (Switzerland); NU-COP[®], Micro-Flo (USA); PARASOL[®]; SPIN-OUT[®], Griffin (USA)

Producers: American Chemet; Cuproquim (Mexico); Drexel Chemical (USA); Feasy & Besthoff (USA); Gowan (USA); Griffin (USA); Hebei Huafeng Chemical Group (China); Micro-Flo (USA); Nufarm (Australia); Philbro-Tech (USA); Syngenta Crop Protection (Switzerland); William Blythe (UK)

Chemical Class: Inorganic copper

EPA/OPP PC Code: 023401

California DPR Chemical Code: 151

EINECS Number: 243-815-9

U.S. Maximum Allowable Residue Levels for Copper Hydroxide [40 CFR 180.1001(b); 180.102]:

CROP ppm

Raw agricultural commodities –

Carcinogen/Hazard Classifications

Label Signal Word: WARNING, CAUTION or DANGER

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- The "Director's List" (CAL/OSHA)
- Clean Water Act: Toxic Pollutant (Section 401.15) as copper and compounds
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.
- EPCRA (Section 313): Includes any unique chemical substance that contains copper as part of that chemical's infrastructure.
- Form R *de minimis* concentration reporting level: 1.0%

Description: Blue, gelatinous or amorphous powder. Insoluble in water. Molecular weight = 97.56. Density 3.368. Melting/Freezing point (decomposes).

Incompatibilities: Incompatible with calcium (metal hydroxides), nitroethane, nitromethane, 1-nitropropane, zirconium.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8 ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel:* Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Copper(II)-8-hydroxyquinoline

Use Type: Fungicide and microbiocide

CAS Number: 10380-28-6

Formula: C₁₈H₁₂CuN₂O₂

Synonyms: Bis(8-quinolinato)copper; Bis(8-quinolinolato)copper; Bis(8-quinolinolato-N1,O8)-copper; Bis(8-oxyquinoline)copper; Copper-8; Copper hydroxyquinolate; Copper-8-hydroxyquinolate; Copper-8-hydroxyquinolinolate; Copper-8-hydroxyquinoline; Copper oxinate; Copper(II) oxinate; Copper oxine; Copper oxyquinolate; Copper oxyquinoline; Copper quinolate; Copper-8-quinolate; Copper-8-quinolinol; Copper quinolinolate; Copper-8-quinolinolate; Cupric-8-hydroxyquinolate; Cupric-8-quinolinolate; 8-

Hydroxyquinoline copper complex; Oxime-copper; Oxine-copper; Oxine-Cu; Oxine cuivre (French); Oxyquinolinolate de cuivre (French)

Trade Names: BIOQUIN[®]; BIOQUIN[®]-1; BLUE CONTROL[®]; CELLU-QUIN[®]; CHAMPMAN PQ-8; CUNILATE[®], Rohm and Haas (USA); CUNILATE[®]-2472, Rohm and Haas (USA); DOKIRIN[®]; FRUITDO[®]; MILMER[®]; NYTEK[®], Rohm and Haas (USA); QUINONDO[®]

Producers: Rohm and Haas (USA)

Chemical Class: Inorganic copper compound

EPA/OPP PC Code: 024002

California DPR Chemical Code: 159

ICSC Number: 0756

RTECS Number: VC5250000

Carcinogen/Hazard Classifications

IARC: Group 3, unclassifiable

Label Signal Word: CAUTION, WARNING or DANGER

WHO Acute Hazard: Class U, Unlikely to be hazardous

Regulatory Authority:

- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as copper compounds
- The "Director's List" (CAL/OSHA) as copper compounds
- Clean Water Act: Toxic Pollutant (Section 401.15) as copper and compounds.
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.
- EPCRA (Section 313): Includes any unique chemical substance that contains copper as part of that chemical's infrastructure.
- Form R *de minimis* concentration reporting level: 1.0%

Description: Yellow-green crystalline solid or powder. Odorless. Insoluble in water. Molecular weight = 351.85.

Incompatibilities: May form highly unstable acetylides. Decomposes on burning producing toxic and corrosive fumes including copper and nitrogen oxides.

Permissible Exposure Limits in Air: As copper: ACGIH TLV 0.2 mg/m³ (fume); 1 mg/m³ (dusts and mists); NIOSH/OSHA 0.1 mg/m³ (fume); 1 mg/m³ as (dusts and mists).

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper. For copper fume: filter collection, acid digestion, measurement by atomic absorption.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. The U.S. EPA (6) has set a maximum of 1.0 mg/L in water to protect human health.

Determination in Water: Total copper may be determined by digestion followed by atomic absorption or by colorimetry (using neocuproine) or by Inductively Coupled

Plasma Optical Emission Spectrometry. Dissolved Copper may be determined by 0.45 μ filtration followed by the preceding methods.

Harmful Effects and Symptoms

Long Term Exposure: Repeated or prolonged inhalation exposure may cause asthma. May cause skin allergy and thickening of the skin; copper deposits can cause discoloration in the skin and hair, leaving a green color. Repeated exposure can cause shrinking of the lining of the inner nose with watery discharge, liver damage. Individuals with Wilson's disease absorb, retain, and store copper excessively. May cause mutations in humans. May damage the testes and decrease fertility in both males and females.

Points of Attack: Skin, reproductive system, liver

Medical Surveillance: Serum and urine copper level. Liver and kidney tests. Examination by a qualified allergist. More than light alcohol consumption may exacerbate the liver damage caused by copper sulfate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Copper Octanoate

Use Type: Fungicide

CAS Number: 20543-04-8

Synonyms: Octanoic acid, copper salt

Trade Names: CONCERN[®]; NEU[®] 1140F, W. Neudorff GmbH (Germany)

Producers: W. Neudorff GmbH (Germany)

Chemical Class: Inorganic copper

EPA/OPP PC Code: 023306

California DPR Chemical Code: 5225

Uses: A copper soap fungicide that controls many common diseases on vegetables, fruits and ornamentals, both indoors and outdoors. Treats mildew, powdery mildew, fruit rots, white rust, blue mold, downy mildew and anthracnose. Registered on beans, peas, beets, broccoli, Brussels sprouts,

cantaloupes, cucumbers, pumpkins, squash, carrot, celeriac, celery chichory, chive, corn, currant, gooseberry, eggplant, pepper, tomato, endive, lettuce, garlic, leek, onion, shallots, ginseng, grape, hop, kale, kohlrabi, potato, quince, spinach, chard, strawberry, sunflowers, and turnip

Chemical Class: Inorganic, a sulfate

EPA/OPP PC Code: 024408; 024401 (pentahydrate)

California DPR Chemical Code: 1778

ICSC Number: 0751

RTECS Number: GL8800000

EINECS Number: 231-847-6 (Copper II Sulfate)

Uses: Copper sulfate is a fungicide used to control bacterial and fungal diseases of fruit, vegetable, nut, and field crops. These diseases include mildew, leaf spots, blights, and apple scab. It is used as a protective fungicide (Bordeaux mixture) for leaf application and seed treatment. It is also used as an algicide and herbicide, and to kill slugs and snails in irrigation and municipal water treatment systems. It has been used to control Dutch elm disease. It is available as a dust, wettable powder, or liquid concentrate. Used as a fungicide and algicide, in veterinary medicine and others. Copper sulfate is also used to detect and to remove trace amounts of water from alcohols and organic compounds.

- Clean water act: Toxic Pollutant (Section 401.15) as copper and compounds.
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.

- EPCRA (Section 313): Includes any unique chemical substance that contains copper as part of that chemical's infrastructure. Form R *de minimus* concentration reporting level: 1.0%

- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: Copper sulfate is a greenish-white crystalline solid. Boiling point = 650°C (decomposes to CuO). Melting/Freezing point = decomposes slightly above 200°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Highly soluble in water; forms bright blue solution.

Incompatibilities: Aqueous solution is an acid. May form explosive materials on contact with acetylene and nitromethane. Incompatible with strong bases, hydroxylamine, magnesium, zirconium, sodium hypobromite, hydrazine.

Permissible Exposure Limits in Air: The Federal standard (OSHA PEL 8-hour TWA)⁽⁵⁸⁾ for copper fume is 0.1 mg/m³, and 1 mg/m³ for copper dusts and mists. NIOSH recommends the same level for a 10-hour workshift. ACGIH⁽¹⁾ recommends a TWA of 0.2 mg/m³ for copper fume and 1 mg/m³ for dusts and mists. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set limits in the ambient air of residential areas of 0.009 mg/m³ on a momentary basis and 0.004 mg/m³ on a daily average basis. The NIOSH⁽²⁾ IDLH is 100 mg (Cu)/m³. Czechoslovakia⁽³⁵⁾ has set a MAC of 0.1 mg/m³ on a daily average basis; a MAC of 0.3 mg/m³ on a 30-minute basis.

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper⁽¹⁸⁾. For copper fume: filter collection, acid digestion, measurement by atomic absorption.

Permissible Concentration in Water: The former USSR-UNEP/IRPTC joint project⁽⁴³⁾ has set a MAC in water used for fishery purposes of 0.004 mg/L (0.001 as Cu). The U.S. EPA⁽⁶⁾ has set a maximum of 1.0 mg/L in water to protect human health.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation: May cause irritation to nose, throat and lungs causing coughing and wheezing.

Skin: May cause irritation of skin, localized coloration, itching and burns. **Eyes:** May cause severe irritation, inflammation, burns, excessive tissue fluid and a cloudy cornea; possible permanent damage. **Ingestion:** Poisonous if swallowed. May cause burning and metallic taste in mouth, blue skin coloration, intense inflammation of the stomach and intestines, abdominal pain, vomiting, diarrhea, blood in feces, headache, cold sweat, weak pulse, salivation, nausea, dehydration, low blood pressure, jaundice, and

kidney failure. Death may result from a dose of a little as 1 teaspoon for a 150 pound person.

Long Term Exposure: May cause mutations in humans. May damage the testes and decrease fertility in both males and females. May cause skin allergy and thickening of the skin; copper deposits can cause discoloration in the skin and hair, leaving a green color. Repeated exposure can cause shrinking of the lining of the inner nose with watery discharge, liver damage. Individuals with Wilson's disease absorb, retain, and store copper excessively.

Points of Attack: Skin, reproductive system., liver

Medical Surveillance: Serum and urine copper level. Liver and kidney tests. Examination by a qualified allergist. More than light alcohol consumption may exacerbate the liver damage caused by copper sulfate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician or authorized medical personnel: Empty stomach by lavage with 0.1% solution of potassium ferrocyanide or milk. Liver or kidney function tests may be indicated. May result in methaemoglobinemia.

Coumafuryl

Use Type: Rodenticide

CAS Number: 117-52-2

Formula: C₁₇H₁₄O₅

Alert: As with many rodenticides used in domestic situations, this substance may severely harm pets, squirrels and otherwise harmless species.

Synonyms: 3-(α -Acetonylfurfuryl)-4-hydroxycoumarin; Coumafuryl (German); 3-(α -Furyl- β -acetylaethyl)-4-hydroxycoumarin (German); 3-(1-Furyl-3-acetylethyl)-4-hydroxycoumarin

Trade Names: FOUMARIN[®]; FUMARIN[®], Bayer CropScience (Germany) canceled 4/1/1987; KRUMKIL[®]; RATAFIN[®], HGP Inc. (USA) canceled 4/26/1988; RAT-A-WAY[®]; TOMARIN[®]

Producers: Bayer CropScience (Germany); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Coumarin

EPA/OPP PC Code: 086001

California DPR Chemical Code: 298

RTECS Number: GN4850000

Uses: This material is an anticoagulant rodenticide. It is used for rodent control in landscapes, right-of-ways and structures. It is also used in almond groves.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

Regulatory Authority:

- Extremely Hazardous Substance (EPA-SARA) (TPQ = 10,000)⁽⁷⁾ (Dropped from listing in 1988)

Description: Coumafuryl is a colorless, white, crystalline solid. Melting/Freezing point = 124°C. Insoluble in water.

Incompatibilities: Strong oxidizers may cause a fire and explosive hazard.

Permissible Exposure Limits in Air: No standards set

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Coumafuryl is very similar to warfarin, a hemorrhagic agent. Inhalation may cause symptoms described in long term exposure. With a single large ingested dose may cause hemorrhagic shock. The LD50-oral (mouse) is 14.7 mg/kg (highly toxic). This chemical can be absorbed through the skin, thereby increasing exposure or hemorrhagic effect. High exposure can cause death.

Long Term Exposure: Chronic exposure may cause death by hemorrhagic shock. Absorption by the lungs or after a few days or few weeks of repeated ingestion, may cause inhibition of prothrombin synthesis, nose bleeds and bleeding gums, hematoma, small reddish spots like a rash, bruises of the elbows, knees and buttocks, blood in urine and stools, anemia, occasional paralysis due to a stroke.

First Aid: Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical

contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed. Keep victim under observation.

Coumaphos

Use Type: Used as a feed additive to control larvae of flies that fecal breed around cattle and poultry. Also used as a dip or dust for control of mange, horn flies, face flies, lice, cattle grubs and parasites around cattle, swine, poultry, horses and other farm animals.

CAS Number: 56-72-4

Formula: C₁₄H₁₆ClO₅PS

Alert: The U.S. Environmental Protection Agency (U.S. EPA) classifies most formulations of coumaphos as General Use Pesticides (GUPs). The formulations 11.6% EC and 42% flowable concentrate end-use products have been classified as Restricted Use Pesticides (RUPs) because they pose a hazard of acute poisoning from ingestion. Human toxicity (long-term): High.

Synonyms: 3-Chloro-7-hydroxy-4-methyl-coumarin *O,O*-diethyl phosphorothioate; 3-Chloro-7-hydroxy-4-methyl-coumarin-*O,O*-diethylphosphorothionate; 3-Chloro-7-hydroxy-4-methyl-coumarin *O*-ester with *O,O*-diethylphosphorothioate; 3-Chloro-4-methyl-7-coumarinyldiethyl phosphorothioate; *O*-3-Chloro-4-methyl-7-coumarinyl *O,O*-Diethyl phosphorothioate; 3-Chloro-4-methyl-7-hydroxycoumarindiethyl thiophosphoric acid ester; 3-Chloro-4-methylumbelliferoneo-ester with *O,O*-diethyl phosphorothioate; Coumafos; Cumafos (Dutch, Spanish); *O,O*-Diaethyl-*O*-(3-chloro-4-methyl-coumarin-7-yl)-monothiophosphat (German); *O,O*-Diethyl-*O*-(3-chloro-4-methyl-coumarin-7-yl)monothiofosfaat (Dutch); *O,O*-Diethyl-*O*-(3-chloro-4-methyl-7-coumarinyl) phosphorothioate; *O,O*-Diethyl-*O*-(3-chloro-4-methylcoumarinyl-7)thiophosphate; *O,O*-Diethyl-*O*-(3-chloro-4-methyl-2-oxo-2H-benzopyran-7-yl)phosphorothioate; *O,O*-Diethyl-3-chloro-4-methyl-7-

umbelliferone thiophosphate; *O,O*-Diethyl-*O*-(3-chloro-4-methylumbelliferyl)phosphorothioate; Diethyl-3-chloro-4-methylumbelliferyl thionophosphate; Diethylthiophosphoric acid ester of 3-chloro-4-methyl-7-hydroxycoumarin; *O,O*-Diethyl-*O*-(3-chloro-4-methyl-coumarin-7-yl)-monothiofosfato (Italian); ENT 17,957; NCI-C08662; Phosphorothioic acid, *O*-(3-chloro-4-methyl-2-oxo-2H-1-benzopyran-7-yl) *O,O*-diethyl ester; Phosphorothioic acid, *O,O*-diethyl ester, *O*-ester with 3-chloro-7-hydroxy-4-methylcoumarin; Thiophosphate de *O,O*-diethyl et de *O*-(3-chloro-4-methyl-7-coumarinyle) (French)

Trade Names: AGRIDIP[®]; ASUNTOL[®]; AZUNTHOL[®]; BAY[®] 21/199, Bayer CropScience (Germany); BAYER[®] 21/199, Bayer CropScience (Germany); BAYMIX[®], Bayer CropScience (Germany); BAYMIX[®] 50, Bayer CropScience (Germany); CHECKMITE[®]; CO-RAL[®], Bayer Healthcare (USA) canceled 3/10/2000; DELICE[®]; MELDANE[®]; MELDONE[®]; MUSCATOX[®]; NEGASHUNT[®]; DIOLICE[®]; RESITOX[®]; SUNTOL[®]; UMBETHION[®]

Producers: Bayer CropScience (Germany); Miles (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate

EPA/OPP PC Code: 036501

California DPR Chemical Code: 165

ICSC Number: 0422

RTECS Number: GN6300000

EEC Number: 015-038-00-3

Uses: Coumaphos is an insecticide/acaricide used to control a wide variety of liver stock insects including cattle grubs, fleeceworms, lice scabies, flies, and ticks; the common ectoparasites of beef cattle, dairy cows, sheep, goats, horse, swine, and poultry as well as for screw worms in all these animals. The USDA uses coumaphos in dip vats along the U.S./Texas border to control ticks that carry Texas Cattle Fever. It is rated Category I, II, or III depending upon the routes of exposure. It is added to cattle and poultry feed to control the development of fly larvae that breed in manure. It has applications in beekeeping.

Human toxicity (long-term)⁽⁷⁷⁾: High-1.75 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate-16.96524 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Coumaphos (40 CFR 180.189):

CROP	ppm
Cattle, fat	1.0
Cattle, meat	1.0
Cattle, mbyp	1.0
Goat, fat	1.0
Goat, meat	1.0
Goat, mbyp	1.0
Hog, fat	1.0
Hog, meat	1.0
Hog, mbyp	1.0

Honey	0.10
Honeycomb	100
Horse, fat	1.0
Horse, meat	1.0
Horse, mby	1.0
Milk, fat (= n in whole milk)	0.5
Sheep, fat	1.0
Sheep, meat	1.0
Sheep, mby	1.0

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, noncarcinogenic to humans

Label Signal Word: WARNING

WHO Acute Hazard: Group 1b, highly hazardous

Regulatory Authority:

- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.5/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 10 lb (4.54 kg)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Water Pollution Standard Proposed (Mexico)⁽³⁵⁾

Description: White to tan crystalline solid. Slight, sulfurous odor. Practically insoluble in water. Melting/Freezing point = 91°C. Odor threshold = 0.02 ppm. Molecular weight = 362.79. Vapor pressure = 1×10^{-7} mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3. Flammability 1. Reactivity 0. Insoluble in water. Log K_{ow} = 4.12. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Reacts with piperonyl butoxide, oxidizers, strong bases. Slowly reacts with caustics to be hydrolyzed. Keep away from water and heat. When heated to decomposition this chemical may emit toxic nitrogen oxides.

Permissible Exposure Limits in Air: No standards set.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: Mexico has set a maximum permissible concentration in estuaries of 0.02 mg/Liter.

Routes of Entry: Inhalation, ingestion; this chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. Fatal skin absorption can occur even if there is no feeling of irritation after contact. Cholinesterase inhibitor. Exposure can cause rapid, fatal organophosphate poisoning: with headache, sweating, nausea and vomiting, diarrhea, salivation, abdominal cramps, difficult breathing, stiffness of legs, blurring of vision, followed by loss of muscle coordination, muscle twitching, convulsions, coma, and death. The LD₅₀ (oral, rat) = 13 mg/kg (highly toxic). The probable oral lethal dose is 50-500 mg/kg; or between 1 teaspoonful and 1 oz. For a 70 kg (150 lb) person. May be fatal if inhaled, swallowed, or absorbed through skin. The effects may be delayed. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: High or repeated exposure may cause nerve damage causing weakness, poor coordination in the arms and legs. May cause personality changes, depression, memory loss, or irritability. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty

of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin*: Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation*: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion*: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Note to physician or authorized medical personnel*: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes*: Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous

dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Coumatetralyl

Use Type: Rodenticide

CAS Number: 5836-29-3

Formula: C₁₉H₁₆O₃

Synonyms: 2H-1-Benzopyran-2-one, 4-hydroxy-3-(1,2,3,4-tetrahydro-1-naphthalenyl)-; Coumatetralyl (German, Dutch); Coumarin, 4-hydroxy-3-(1,2,3,4-tetrahydro-1-naphthyl)-; ENE 11183; 4-Hydroxy-3-(1,2,3,4-tetrahydro-1-naftyl)-4-cumarine (Dutch); 4-Hydroxy-3-(1,2,3,4-tetrahydro-1-naphthalenyl)-2H-1-benzopyran-2-one; 4-Hydroxy-3-(1,2,3,4-tetrahydro-1-naphthyl)cumarin; 3-(α -Tetral)-4-oxycoumarin; 3-(α -Tetrayl)-4-hydroxycoumarin; 3-(D-Tetrayl)-4-hydroxycoumarin

Trade Names: BAY[®] 25634, Bayer CropScience (Germany); BAY ENE[®] 11183B, Bayer CropScience (Germany); BAYER[®] 25,634, Bayer CropScience (Germany); ENDOX[®]; ENDROCID[®]; ENDROCID[®]; RACUMIN[®]; RAUCUMIN[®] 57; RODENTIN[®]

Producers: Agrimor International (USA); BASF Agricultural Products Group (Germany); Bayer CropScience (Germany)

Chemical Class: Coumarin

EPA/OPP PC Code: 496100

RTECS Number: GN7630000

EINECS Number: 227-424-0

Uses: Coumatetralyl is used for rat control and functions as an anticoagulant, of the warfarin type, that does not induce bait-shyness.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

WHO Acute Hazard: Group 1b, highly hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Coumatetralyl is a yellowish-white, crystalline solid. Boiling point = 290°C. Melting/Freezing point = 69–70°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in hot water.

Incompatibilities: Oxidizers may cause fire and explosion hazard. Keep away from metals.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause symptoms described in long term exposure. With a single large ingested dose may cause hemorrhagic shock. This chemical can be absorbed through the skin, thereby increasing exposure or hemorrhagic effect. High exposure can cause death. The LD₅₀-(oral, rat) = 16.5 mg/kg (highly toxic).

Long Term Exposure: Chronic exposure may cause death by hemorrhagic shock. Absorption by the lungs or after a few days or few weeks of repeated ingestion, may cause inhibition of prothrombin synthesis, nose bleeds and bleeding gums, hematoma, small reddish spots like a rash, bruises of the elbows, knees and buttocks, blood in urine and stools, anemia, occasional paralysis due to a stroke. Pre-existing blood clotting disease or liver disease are aggravated by Coumatetralyl exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 36 hours following overexposure, as effects may be delayed.

Crimidine

Use Type: Rodenticide

CAS Number: 535-89-7

Formula: C₇H₁₀ClN₃; C₇H₁₀N₃Cl

Alert: Not registered in the United States.

Synonyms: 2-Chloro-4-dimethylamino-6-methyl-pyrimidine (Dutch); 2-Chloro-4-methyl-6-dimethylaminopyrimidine; Crimidin (German); Crimidina (Italian); Pyrimidine, 2-Chloro-4-(dimethylamino)-6-methyl-

Trade Names: CASTRIX[®]; CRIMITOX[®]; W 491[®]

Producers: Sigma-Aldrich Laborchemikalien (Germany)

EPA/OPP PC Code: 288200

RTECS Number: UV8050000

EINECS Number: 208-622-6

Uses: Crimidine is used as a rodenticide but is not registered in the U.S. as a pesticide.

Regulatory Authority:

- Banned or Severely Restricted (In Agriculture) (Germany) (UN)⁽¹³⁾
- Very Toxic Substance (World Bank)⁽¹⁵⁾
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (4.54/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Brown, waxy solid. Practically insoluble in water. Boiling point = 144°C @ 4 mmHg. Melting/Freezing point = 87°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0.

Incompatibilities: Acids and acid fumes, strong bases.

Permissible Exposure Limits in Air: No standards set. This chemical can be absorbed through the skin, thereby increasing exposure.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation and burns. Inhalation can irritate the nose and throat. Exposure may result in serious central nervous system damage with anxiety, restlessness, muscle stiffness, light sensitivity, noise sensitivity, touch sensitivity, cold sweat, and leading to convulsions that may be fatal. If patient survives 5 to 6 hours there may not be serious problems. Extremely toxic; the LD₅₀ (oral, rat) = 1.25 mg/kg. The probable oral lethal dose in humans is less than 5 mg/kg or less than 7 drops for a 70 kg (150 lb) person.

Long Term Exposure: May cause central nervous system damage.

Points of Attack: Central nervous system.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: Eye Contact: Immediately remove any contact lenses and flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. **Skin Contact:** Quickly remove contaminated clothing. Immediately wash area with large amounts of water. Seek medical attention immediately. **Inhalation:** Remove the person from exposure, trying to avoid rapid, jerky motions or noise. Begin rescue breathing if breathing has stopped, and CPR if heart action has stopped. If seizures occur, begin seizure first aid measures. Call for immediate medical attention to visit the patient

prior to transfer if possible. Any facility using this chemical should have 24 hour rapid access to medical personnel with training and equipment for emergency treatment. All area employees should be trained in first aid measures for Castrix, including seizure management and CPR.

Crotoxyphos

Use Type: Insecticide and acaricide

CAS Number: 7700-17-6

Formula: C₁₄H₁₉O₆P

Synonyms: Crotonic acid, 3-hydroxy-, α -methylbenzyl ester, dimethylphosphate, (E)-; (E)-3-; [(dimethoxyphosphinyl)oxy]-2-butenic acid 1-phenylethyl ester; O,O-Dimethyl-O-(1-methyl-2-carboxy- α -phenylethyl)vinyl phosphate; dimethyl-*cis*-1-methyl-2-(1-phenylethoxycarbonyl)vinyl phosphate; Dimethyl phosphate ester of α -methylbenzyl-3-hydroxy-*cis*-crotonate; ENT 24,717; (E)-3-Hydroxy-crotonic acid, α -methylbenzyl ester, dimethyl phosphate; 1-Methylbenzyl-3-(dimethoxyphosphinyl)isocrotonate; α -Methylbenzyl-3-(dimethoxyphosphinoxy)-*cis*-crotonate; α -Methylbenzyl-3-hydroxy-crotonate dimethyl phosphate; *cis*-2-(1-Phenylethoxy)carbonyl-1-methylvinyl dimethylphosphate

Trade Names: CIODRIN[®], Pbi/Gordon (USA), canceled; Boehringer Ingelheim (Germany), canceled; CIODRIN VINYL PHOSPHATE; CIOVAP[®]; COOPRTU[®] CATTLE SPRAY; CYODRIN[®]; CYPONA E.C.[®]; DECROTOX[®]; DUO-KILL[®]; PANTOZOL-1[®]; SD 4294[®]; SHELL[®] SD 4294, Shell Chemical (UK); VAPORIN[®] DAIRY SPRAY; VOLFAZOL[®]

Producers: Boehringer Ingelheim (Germany); Pbi/Gordon (USA); Shell Chemical (UK)

Chemical Class: Organophosphate

EPA/OPP PC Code: 058801

California DPR Chemical Code: 140

Uses: A contact and stomach poison; controls flies, lice, and ticks on lactating dairy and beef cattle; may also be used on swine, goats, horses, and sheep.

Carcinogen/Hazard Classifications

Label Signal Word: WARNING, CAUTION

Regulatory Authority:

- U.S. DOT Inhalation Hazard Chemicals

Description: Yellowish liquid. Soluble in water; solubility = 1,200 ppm. Molecular weight = 314.28. Density = 1.19; 1.2 @ 15°C. Boiling point = 135°C @ 0.04 mmHg. Vapor pressure = 1.8×10^{-5} mmHg @ 20°C.

Incompatibilities: May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus Pesticides.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to

be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. **Antidotes:** Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot

be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Crufomate (ANSI)

Use Type: Insecticide and anthelmintic for cattle

CAS Number: 299-86-5

Formula: C₁₂H₁₉ClNO₃P

Alert: All residue limits for crufomate, as listed in 40 CFR 180.295, were revoked by the U.S. EPA on June 9, 1993. All registered uses of crufomate in or on fat, meat, and mby of cattle, goats, and sheep were canceled.

Synonyms: 4-*t*-Butyl-2-chlorophenyl methyl methylphosphoramidate; *O*-(4-*tert*-Butyl-2-chlor-phenyl)-*O*-methyl-phosphorsaeure-*N*-methylamid (German); 4-*tert* Butyl 2-chlorophenyl methylphosphoramidate de methyle (French); ENT 25,602-X; *O*-Methyl *O*-2-chloro-4-*tert*-butylphenyl *N*-methylamidophosphate; Methylphosphoramidic acid,4-*t*-butyl-2-chlorophenyl methyl ester; Phenol,4-*t*-butyl-2-chloro-, ester with methyl

methylphosphoramidate; Phosphoramidic acid, 4-*tert*-butyl-2-chlorophenylphosphor amidate; Phosphoramidic acid, methyl-,2-chloro-4-(1,1-dimethylethyl)phenyl methyl ester; Phosphoramidic acid, methyl-,4-*tert*-butyl-2-chlorophenyl; *O*-(4-Tertbutyl-2-chloor-fenyl)-*O*-methyl-fosforzuur-*N*-methyl-amide (Dutch)

Trade Names: DOWCO[®] 132, Dow Chemical Co. (USA) canceled; MONTREL[®], canceled; RUELENE[®], Dow Chemical Co. (USA) canceled 10/1/1988; DRENCH[®], canceled; RULENE[®], canceled

Producers: Dow Chemical Co. (USA)

Chemical Class: Organophosphate

EPA/OPP PC Code: 012101

California DPR Chemical Code: 519

ICSC Number: 1143

RTECS Number: TB3850000

EEC Number: 015-074-00-X

Uses: It is applied as a spray on plants to kill insects and worms.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾(Australia) (Israel) (Mexico) (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)

Description: Colorless, crystalline compound. Commercial product is a yellow oil. Very slightly soluble in water. Molecular weight = 291.47. Melting/Freezing point = 60–63°C (decomposes). Vapor pressure = 0.107 Pa @ 25°C.

Incompatibilities: The substance decomposes on heating forming corrosive and toxic fumes of hydrogen chloride, nitrogen oxides and phosphorous oxides. Incompatible with strongly alkaline and strongly acidic media. Unstable over long periods in aqueous preparations or above 140°F.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. The NIOSH⁽²⁾ REL 10-hour TWA and ACGIH⁽¹⁾ recommended 8-hour TWA is 5 mg/m³ and the NIOSH⁽²⁾ STEL is 20 mg/m³, not to be exceeded during any 15 minute work period. The Australian, Mexican, and Israeli TWA is the same as NIOSH and Mexico's STEL is 20 mg/m³. The Canadian provinces of Alberta, BC, Ontario, and Quebec have adopted a TWA of 5 mg/m³ and except for Quebec use the STEL of 20 mg/m³. Several states have set guidelines or standards for crufomate in ambient air⁽⁶⁰⁾ ranging from 50-200 µg/m³ (North Dakota) to 80 µg/m³ (Virginia) to 100 µg/m³ (Connecticut) to 119 µg/m³ (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH IV Method #0500, Particulates NOR (total)⁽¹⁸⁾. OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus;

NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Cholinesterase inhibitor. Cruformate irritates the eyes, skin, and respiratory tract. Cruformate can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is a moderately toxic organophosphate chemical. Exposure can cause effects on the nervous system, rapid severe poisoning with headache, sweating, nausea and vomiting, diarrhea, loss of coordination, convulsions, respiratory failure, and death. The LD₅₀ (oral, rat) = 460 mg/kg (slightly toxic). The health effects may be delayed. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Exposure may affect the developing fetus. Cruformate may damage the testes. High or repeated exposure may cause nerve damage and poor coordination in arms and legs. Repeated exposure may cause personality changes of depression, anxiety, or irritability.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15

minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. **Antidotes:** Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the

severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Cupric Acetate

Use Type: Fungicide

CAS Number: 142-71-2

Formula: $C_4H_6CuO_4$; $Cu(OOCCH_3)_2$

Alert: Not registered with the U.S. EPA.

Synonyms: Acetate de cuivre (French); Acetato de cobre (Spanish); Acetic acid, copper(2+) salt; Acetic acid, copper(II) salt; Acetic acid, cupric salt; Copper(2+) acetate; Copper(II) acetate; Copper acetate; Copper diacetate; Copper(2+) diacetate; Copper(II) diacetate; Crystallized

verdigris; Crystals of Venus; Cupric diacetate; Neutral verdigris

Producers: Celtic Chemicals (UK); GFS Chemicals (USA); Goldschmidt (Germany); Nihon Kagaku Sangyo (Japan); Omya (Switzerland); Philipp Brothers Chemicals (USA); Shyam Chemicals (India)

Chemical Class: Inorganic

California DPR Chemical Code: 3013

RTECS Number: AG3480000

EINECS Number: 205-553-3

Uses: Cupric acetate is also used as a catalyst for organic reactions, in textile dyeing and as a pigment for ceramics.

Regulatory Authority:

- Water Pollution Standard Proposed (U.S. EPA)⁽⁶⁾ (former USSR)⁽³⁵⁾
- The "Director's List" (CAL/OSHA)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as copper compounds
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15) as copper and compounds.
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 100 lb (45.4 kg).
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: Greenish blue powder or small crystals. Soluble in water; solubility = 7.2 g/100 ml. Molecular weight = 181.65. Boiling point = 240°C (decomposes). Melting/Freezing point = 115°C.

Incompatibilities: Forms explosive materials with acetylene gas, ammonia, caustic solutions, sodium hypobromite, nitromethane. Keep away from chemically active metals, strong acids, nitrates. Decomposes above 240°C forming acetic acid fumes.

Permissible Exposure Limits in Air: The Federal standard (OSHA PEL 8-hour TWA)⁽⁵⁸⁾ for copper fume is 0.1 mg/m³, and 1 mg/m³ for copper dusts and mists. NIOSH⁽²⁾ recommends the same level for a 10-hour workshift. ACGIH⁽¹⁾ recommends a TWA of 0.2 mg/m³ for copper fume and 1 mg/m³ for dusts and mists. The NIOSH⁽²⁾ IDLH is 100 mg/m³.

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper⁽¹⁸⁾. For copper fume: filter collection, acid digestion, measurement by atomic absorption

Permissible Concentration in Water: A limit of 1.0 µg/L in drinking water has been set for copper by EPA⁽⁶⁾ and by The former USSR⁽³⁵⁾ as noted in the entry on copper.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhaling cupric acetate dust and vapors can irritate the respiratory tract causing coughing and wheezing. High levels may cause fluid to build up in the lungs (pulmonary edema). This can cause death. Corrosive: contact can irritate and may burn the skin and eyes. The LD₅₀ (oral, rat) = 595 mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure can cause skin allergy, thickening of the skin, and/or a green discoloration of the skin and hair. Repeated exposure can cause shrinking (atrophy) of the inner lining of the nose and may cause sores in the nose. Can cause liver and kidney damage.

Points of Attack: Skin, lung, liver, and kidney damage.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Consider chest x-ray after acute overexposure. Serum and urine tests for copper can measure recent exposure. Liver and kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Cupric Nitrate

Use Type: Insecticide

CAS Number: 3251-23-8

Formula: CuN₂O₆; Cu(NO₃)₂

Synonyms: Copper dinitrate; Copper(2+) nitrate; Copper(II) nitrate; Nitrato de cobre (Spanish); Nitric acid, copper(2+) salt; Nitric acid, copper(II) salt; Cupric dinitrate

Producers: Celtic Chemicals (UK); Goldschmidt (Germany); Merck (Germany); PCF Chimie (France); Pechiney (France); Philbro-Tech (USA); Rhodia (France); Rhone-Poulenc (France); Shyam Chemicals (India); William Blythe (UK)

Chemical Class: Inorganic, metal salt

EPA/OPP PC Code: 076102

California DPR Chemical Code: 3118

RTECS Number: WU7400000

EINECS Number: 221-838-5

Uses: Cupric nitrate is used as an insecticide, in paint, varnish, enamel and in wood preservatives. Metal compounds are often used in "hot" operations in the workplace. These may include, but are not limited to, welding, brazing, soldering, plating, cutting, and metalizing. At the high temperatures reached in these operations, metals often form metal fumes which have different health effects and exposure standards than the original metal compound and require specialized controls.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (DFG)⁽³⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾
- The "Director's List" (CAL/OSHA)
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15), as copper and compounds.
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL µg/L): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 100 lb (45.4 kg).
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: Blue crystalline solid. Soluble in water. Boiling point = 172°C (decomposes below this point). Melting/Freezing point = 255°C.

Incompatibilities: A strong oxidizer. Aqueous solution is acidic; incompatible with bases. Violent reaction with potassium hexacyanoferrate; ammonia and potassium amide mixtures; acetic anhydrides, cyanides, ethers. Forms explosive materials with nitromethanes, sodium hypobromite, acetylene, chemically active metals such as potassium, sodium, etc. May ignite on contact with aluminum foil or tin. Risk of spontaneous combustion with combustibles (wood, cloth, etc.) organics, or reducing

agents and readily oxidizable materials. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air: The Federal standard (OSHA PEL 8-hour TWA)⁽⁵⁸⁾ for copper fume is 0.1 mg/m³, and 1 mg/m³ for copper dusts and mists. NIOSH⁽²⁾ recommends the same level for a 10-hour workshift. ACGIH⁽¹⁾ recommends a TWA of 0.2 mg/m³ for copper fume and 1 mg/m³ for dusts and mists. The NIOSH⁽²⁾ IDLH is 100 mg/m³.

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper⁽¹⁸⁾. For copper fume: filter collection, acid digestion, measurement by atomic absorption

Permissible Concentration in Water: A limit of 1.0 µg/L in drinking water has been set for copper by EPA⁽⁶⁾ and by The former USSR⁽³⁵⁾ as noted in the entry on copper.

Routes of Entry: Inhalation, ingestion or skin contact

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact can cause irritation and burns. Inhalation can irritate the nose and throat, causing coughing and wheezing. Cupric nitrate may produce fumes that can cause "metal fume fever." Ingestion cause salivation, nausea, vomiting, stomach pain. May cause blood effects if swallowed. High exposure can cause unconsciousness. The LD₅₀ (oral, rat) = 940 mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure can cause copper to deposit in various parts of the body. Large deposits can make the skin and hair a green color. Repeated exposure can cause shrinking of the inner lining of the nose and may cause runny nose and sores. Excess deposits in the liver can cause liver damage. Metallic taste may also occur. Skin allergy with rash sometimes occurs. If allergy develops, even small future exposures can trigger rash. Repeated exposures can also cause thickening of the skin not caused by allergy.

Points of Attack: Skin, liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for copper can measure recent exposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cuprous Chloride

Use Type: Fungicide, plant growth regulator

CAS Number: 7758-89-6

Formula: ClCu

Synonyms: Copper(I) chloride; Copper monochloride; Cuprous dichloride; Diccopper dichloride

Trade Names: CUPROID®

Producers: Celtic (UK); GFS Chemicals (USA); Goldschmidt (Germany); Kawaguchi Chemical Industry (Japan); Merck (Germany); Mineral Research (USA); Shyam (India); World Metal (USA)

Chemical Class: Inorganic copper compound

EPA/OPP PC Code: 108303

California DPR Chemical Code: 5597

EINECS Number: 231-842-9

Uses: Used to control root growth of plants grown in nursery pots. Not widely used in agricultural applications.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION, DANGER

Regulatory Authority:

- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) (as copper compounds)
- The "Director's List" (CAL/OSHA) (as copper compounds)
- Clean Water Act: Toxic Pollutant (Section 401.15) as copper and compounds.
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL µg/L): 6010(60); 7210(200) Note: All species in the ground water that contain copper are included.
- EPCRA (Section 313): Includes any unique chemical substance that contains copper as part of that chemical's infrastructure. Form R *de minimus* concentration reporting level: 1.0%

Description: White, odorless crystalline solid. Stable in dry air; becomes green on exposure to moist air and brown on

exposure to light. Slightly soluble in water. Molecular weight = 98.99. Melting/Freezing point = 430°C. Undergoes a phase transition @ 4°C. Boiling point = 1490°C. Density = 3.58. Vapor pressure = 1 mmHg @ 546°C.

Incompatibilities: When heated to decomposition or on contact with acids or acid fumes, may produce highly toxic chloride fumes; deadly phosgene gas may be formed. May cause pitting of some metals.

Permissible Exposure Limits in Air: As copper: ACGIH⁽¹⁾ TLV 0.2 mg/m³ (fume); 1 mg/m³ (dusts and mists); NIOSH/OSHA 0.1 mg/m³ (fume); 1 mg/m³ as (dusts and mists).

Determination in Air: Copper dusts and mists are collected on a filter, worked up with acid, measured by atomic absorption. See NIOSH Method #7029 for copper. For copper fume: filter collection, acid digestion, measurement by atomic absorption.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. The U.S. EPA⁽⁶⁾ has set a maximum of 1.0 mg/L in water to protect human health.

Determination in Water: Total copper may be determined by digestion followed by atomic absorption or by colorimetry (using neocuproine) or by Inductively Coupled Plasma Optical Emission Spectrometry. Dissolved Copper may be determined by 0.45 μ filtration followed by the preceding methods.

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Long Term Exposure: May cause mutations in humans. May damage the testes and decrease fertility in both males and females. May cause skin allergy and thickening of the skin; copper deposits can cause discoloration in the skin and hair, leaving a green color. Repeated exposure can cause shrinking of the lining of the inner nose with watery discharge, liver damage. Individuals with Wilson's disease absorb, retain, and store copper excessively.

Points of Attack: Skin, reproductive system., liver

Medical Surveillance: Serum and urine copper level. Liver and kidney tests. Examination by a qualified allergist. More than light alcohol consumption may exacerbate the liver damage caused by copper sulfate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8

ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel:* Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Cuprous Oxide

Use Type: Fungicide and insecticide

CAS Number: 1317-39-1

Formula: Cu₂O

Synonyms: Brown copper oxide; C.I. 77402; Copper(I) oxide; Copper oxide (Cu₂O); Copper suboxide; Diccopper monoxide; Kupferoxydul (German); Oleocuvivre(French); Red copper oxide; Yellow cuprocide

Trade Names: COPOX[®]; FUNGI-RHAP[®]; COPPER NORDOX[®]; COPPER SARDEX[®]; Cu-75[®]; FUNGIMAR[®]; OLEO NORDOX[®]; PERECOT[®]; PERENOX[®]

Chemical Class: Inorganic copper compound

EPA/OPP PC Code: 025601

California DPR Chemical Code: 175

Uses: In December, 1991, the U.S. EPA announced its intention to cancel the registration of products containing cuprous oxide as a fungicide used on fruits and vegetables. Used primarily as a wood preservative and produced mainly by paint companies.

U.S. Maximum Allowable Residue Levels for Cuprous Oxide (40 CFR 180.1021):

CROP	ppm
Egg	--
Fish	--
Meat	--
Milk	--
Poultry	--
Raw agricultural commodities	--
Shellfish	--

- Safe Drinking Water Act: MCL, 0.01 mg/L; MCLG, 0.01 mg/L; Regulated chemical (47 FR 9352)
- EPCRA Section 304 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- Marine pollutant (49CFR, Subchapter 172.101, Appendix B) as cyanides, mixtures or solutions
- Canada, WHMIS, Ingredients Disclosure List (cyanide compounds, inorganic, n.o.s)

Description: White to yellowish powder. Practically insoluble in water. Molecular weight = 121.65.

Incompatibilities: Violent reaction with chlorates, nitrates including nitric acid, oxidizers, especially peroxides.

Permissible Exposure Limits in Air: For cyanides, the OSHA PEL 8-hour TWA is 5 mg/m³ (4.7 ppm). NIOSH recommended ceiling (10 minute) is also 5 mg/m³ (4.7 ppm). ACGIH recommends 5 mg/m³ as a TWA. The NIOSH⁽²⁾ IDLH level = 25 mg/m³. ACGIH adds the notation "skin" indicating the possibility of cutaneous absorption.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. As of 1980, the U.S. EPA criteria are: To protect freshwater aquatic life: 3.5 µg/L as a 24-hour average, never to exceed 52.0 µg/L. To protect saltwater aquatic life: 30.0 µg/L on an acute toxicity basis; 2.0 µg/L on a chronic toxicity basis. To protect human health: 200 µg/L. The allowable daily intake for man is 8.4 mg/day (6).

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Inhalation, skin absorption, ingestion.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Cyanamide

Use Type: Herbicide and plant growth regulator

CAS Number: 420-04-2

Formula: CH₂N₂; H₂NCN

Alert: A Restricted Use Pesticide (RUP)

Synonyms: Amidocyanogen; Carbamonitrile; Carbimide; Carbodiimide; Cyanogen nitride; Cyanogenamide; Hydrogen cyanamide

Trade Names: DORMEX[®], Degussa (Germany); SKW 83010[®], SKW (Germany)

Producers: Degussa (Germany); Denki Kagaku Kogyo (Japan); Nippon Carbide Industries (Japan); Odla (Norway); Richman Chemicals (USA); SKW (Germany); Union Carbide (USA)

Chemical Class: Inorganic

EPA/OPP PC Code: 014002; (011139 old EPA code number)

California DPR Chemical Code: 2238

ICSC Number: 0424

RTECS Number: GS5950000

EEC Number: 615-013-00-2

Uses: Used primarily as a plant growth regulator. Cyanamide may be melted to give a dimer, dicyandiamide or cyanoguanidine. At higher temperatures it gives the trimer, melamine, a raw material for melamine-formaldehyde resins.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: DANGER

Regulatory Authority:

- EPCRA Section 304 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- EPA Hazardous Waste Number (RCRA No.): P030 as cyanides
- Marine pollutant (49CFR, Subchapter 172.101, Appendix B) as cyanides, mixtures or solutions

Description: Cyanamide is a combustible crystalline solid, but it is usually found as a 25% liquid solution. Boiling point = (decomposes) 260°C. Melting/Freezing point = 45°C. Flash point = 141°C. Molecular weight = 42.00. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 3. Soluble in water.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. Cyanamide may polymerize at temperatures above 122°C, or on evaporation of aqueous solutions. Reacts with acids, strong oxidants, strong reducing agents and water causing explosion and toxic hazard. Attacks various metals. Decomposes when heated above 49°C, on contact with acids, bases, 1,2-phenylene diamine salts, and moisture producing toxic fumes including nitrogen oxides and cyanides.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommend a TWA of 2 mg/m³ as does HSE⁽³³⁾, Australia, Israel, and Mexico. The Canadian provinces of Alberta, BC, Ontario, and Quebec use the same TWA as well, and Alberta's STEL is 4 mg/m³. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set an MAC of 0.5 mg/m³ in workplace air and limits for ambient air in residential areas of 0.01 mg/m³ on an average daily basis. Several states have set guidelines or standards for Cyanamide in ambient air (60) ranging from 6.7 µg/m³

(New York) to 20.0 µg/m³ (Florida and North Dakota) to 35 µg/m³ (Virginia) to 40 µg/m³ (Connecticut) to 50 µg/m³ (South Carolina).

Determination in Air: Filter; none; Gravimetric; NIOSH Methods (IV) #0500, Particulates NOR (total)

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Cyanamide is caustic and severely irritates the eyes, skin, and respiratory tract, and may affect the liver. Ingestion or inhalation may cause transitory intense redness of the face, headache, vertigo, increased respiration, tachycardia and hypotensions. The adverse effects of Cyanamide are potentiated by the ingestion of alcohol (beer, wine or liquor) within 1-2 days before or after exposure. Cyanamide is a highly reactive chemical and is a dangerous explosion hazard.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Exposure may cause liver and nervous system damage.

Points of Attack: Liver and skin

Medical Surveillance: If overexposure occurs or if illness is suspected, the following are recommended: Liver function tests. Exam of the nervous system. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Cyanazine

Use Type: Herbicide

CAS Number: 21725-46-2

Formula: C₉H₁₃CIN₆

Alert: On August 2, 1995, the U.S. EPA announced a voluntary phase-out of the use of cyanazine. On January 6, 2000, the U.S. EPA announced the cancellation of all cyanazine registrations. It had been a Restricted Use Pesticide (RUP) because of its teratogenicity and because it has been found in groundwater. Human toxicity (long-term): High.

Synonyms: 2-Chloro-4-((1-cyano-1-methylethyl)amino)-6-(ethylamino)-s-triazine; 2-Chloro-4-(1-cyano-1-methylethylamino)-6-ethylamino-1,3,5-triazine; 2-Chloro-4-ethylamino-6-(1-cyano-1-methyl)ethylamino-s-triazine; 2-(4-Chloro-6-ethylamino-1,3,5-triazin-2-ylamino)-2-methylpropionitrile; 2-[(4-Chloro-6-(Ethylamino)-S-triazin-2-yl)amino]-2-methylpropionitrile; 2-[(4-Chloro-6-(ethylamino)-1,3,5-triazin-2-yl)amino]-2-methylpropanenitrile; 2-((4-Chloro-6-(ethylamino)-s-triazin-2-yl)amino)-2-methylpropanenitrile; Cyanazine triazine pesticide; Propanenitrile, 2-((4-Chloro-6-(ethylamino)-1,3,5-triazin-2-yl)amino)-2-methyl-; Propanenitrile, 2-((4-Chloro-6-(ethylamino)-s-triazin-2-yl)amino)-2-methyl-; S-Triazine, 2-chloro-4-ethylamino-6-(1-cyano-1-methyl)ethylamino-

Chemical Class: Triazine

EPA/OPP PC Code: 100101

California DPR Chemical Code: 1640

ICSC Number: 0391

RTECS Number: UG1490000

EEC Number: 613-013-00-7

EINECS Number: 244-544-9

Uses: Cyanazine is used as a pre- and post-emergent herbicide to control annual grasses and broadleaf weeds. It is used mostly on corn, some on cotton, and less than 1% on grain sorghum and wheat fallow. The compound is formulated as a wettable powder, a flowable suspension, or as granules. In California, major usages are on cotton, corn and corn for forage, almonds, and uncultivated agricultural

areas. In 1995, cyanazine was the fourth most widely used synthetic pesticide in the U.S. Cyanazine, atrazine, and simazine are collectively referred to as the triazines and may be alternatively used for each other on corn and in some other situations.

Human toxicity (long-term)⁽⁷⁷⁾: High–1.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–1411.45410 ppb, MATC (Maximum Acceptable Toxicant Concentration)

- Proposition 65 chemical (CAL)
- Actively registered pesticide in California.
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.
- Canada, Drinking Water Quality, IMAC = 0.01 mg/L

Description: Off-white to tan crystalline solid. Soluble in water; solubility = 170 ppm @ 20°C; 0.02 g/100 mL @ 25°C. Molecular weight = 240.69. Melting/Freezing point = 167–169°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Vapor pressure = 1.6 x 10⁻⁹ mmHg @ 20°C; 2.2 x 10⁻⁷ Pa @ 20°C. Physical properties may be altered by carrier solvents used in commercial formulations. Log K_{ow} = 2.2. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Cyanazine decomposes in heat producing very toxic fumes and gases of hydrogen cyanide, hydrogen chloride, ethyl chloride, ammonia, acetone, and ethylene. Attacks metals in the presence of heat and moisture.

Permissible Exposure Limits in Air: No standards set. This chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: NIOSH⁽²⁾ REL: (Nitriles) TWA 22 mg/m³; NIOSH⁽²⁾ REL: (Nitriles); ceiling limit 4 mg/m³/15minute. See also NIOSH Criteria Document 78-212 NITRILES.

Permissible Concentration in Water: The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L). Kansas⁽⁶¹⁾ has set a guideline for cyanazine in drinking water of 42 µg/L. Canada's IMAC for drinking water is 0.01 mg/L.

Determination in Water: High-performance liquid chromatography is applicable to the determination of cyanazine in water according to EPA.

Routes of Entry: Inhalation, passing through the unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Inhalation of dust can irritate the nose, throat and bronchial tubes. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. Contact can irritate the skin or eyes. Overexposure can cause weakness, nausea and difficulty breathing. The LD₅₀ (oral,rat) = 149 mg/kg (moderately toxic). Toxicological properties may be altered by carrier solvents used in commercial formulations.

Long Term Exposure: Long-term effects are unknown. Related chemicals in the triazin chemical groups can cause liver damage, reduce thyroid function and/or cause skin allergy. May cause reproductive toxicity in humans.

Medical Surveillance: Liver function tests. Thyroid function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cyanogen Bromide

Use Type: Fumigant and pesticide

Alert: Not registered with the U.S. EPA

CAS Number: 506-68-3

Formula: BrCN

Synonyms: Bromine cyanide; Bromocyan; Bromocyanide; Bromocyanogen; Bromure de cyanogen (French); Bromuro de cianogeno (Spanish); Campilit; Cyanobromide; Cyanogen monobromide

Producers: Eastman Chemical (USA)

Chemical Class: Inorganic

ICSC Number: 0136

RTECS Number: GT2100000

EINECS Number: 208-051-2

Uses: Used in organic synthesis or as a fumigant, in textile treatment, in gold cyaniding or as a military poison gas.

Regulatory Authority:

- EPA Hazardous Waste Number (RCRA No.): U246
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance
- List, Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: Colorless or white, crystalline solid. Penetrating odor. Soluble in water: 10%. Molecular weight = 105.93.

Boiling point = 61-62°C @ 760 mmHg. Melting/Freezing point = 49-51°C; decomposes slowly forming hydrogen cyanide and hydrogen bromide. Vapor pressure = 92 mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3 (severe, poison), Flammability 0, Reactivity 3 (severe, water reactive).

Incompatibilities: May be unstable unless dry and pure. Impure material may explode. Violent reaction with acids, ammonia, amines. The substance decomposes on heating or on contact with water, acids, or acid vapors producing highly toxic and flammable hydrogen cyanide and corrosive hydrogen bromide.

Permissible Exposure Limits in Air: No standards set.

Determination in Air: No criteria set. However, inasmuch as it is a cyanide compound, the exposure limits are listed here: OSHA⁽²⁾ and ACGIH⁽¹⁾: 5 mg/m³ TWA; NIOSH⁽²⁾: Ceiling limit, 4.7 ppm; 5 mg/m³ per 10 minutes as cyanides. All have notations that skin contact contributes significantly in overall exposure. IDLH level = 25 mg/m³ as CN

Permissible Concentration in Water: The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L). Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Cyanogen bromide's toxic action resembles that of hydrocyanic acid. Cyanogen bromide is corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may result in death. Super toxic; probable oral lethal dose in humans in less than 5 mg/kg or a taste (less than 7 drops) for a 70 kg (150 lb) person. Vapors are highly irritant and very poisonous. High concentrations produce excessive respiration (causing

increased uptake of cyanide), then labored breathing, paralysis, unconsciousness, convulsions and respiratory arrest. Headache, dizziness, nausea, and vomiting may occur with lesser concentrations. Patients may experience confusion, anxiety, an initial rise in blood pressure with a decreased heart rate followed by an increased heart beat; cyanosis is not a consistent finding, in fact, the patient may be reddish. An odor of bitter almonds on the patient's breath may be present. Individuals with chronic diseases of the kidneys, respiratory tract, skin, or thyroid are at greater risk of developing toxic cyanide effects. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Repeated or prolonged exposure to cyanogen bromide may cause thyroid gland enlargement. Chronic exposure may cause fatigue and weakness.

Points of Attack: Eyes, respiratory system, cardiovascular system, central nervous system and thyroid gland.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Thyroid gland examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. Do not perform direct mouth to mouth resuscitation; use bag/mask apparatus. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1-2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Cyanogen Chloride

Use Type: Fumigant

CAS Number: 506-77-4

Formula: CCIN; CNCI

Synonyms: Chlorocyan; Chlorine cyanide; Chlorocyan; Chlorocyanide; Chlorocyanogen; Chlorure de cyanogene (French); Cloruro de cianogeno (Spanish); Cyanogen chloride [(CN)Cl]; Cyanogen chloride, containing less than 0.9% Water

Producers: Air Liquid (France); American Gas Group (USA); Degussa (Germany); Praxair (USA)

Chemical Class: Organic cyano halide

EPA/OPP PC Code: 025801

ICSC Number: 1053

RTECS Number: GT2275000

EINECS Number: 208-052-8

Uses: Cyanogen chloride is used as a fumigant, metal cleaner, in ore refining, production of synthetic rubber and in chemical synthesis. Cyanogen chloride can be used in the military as a poison gas.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Not listed as cyanogen chloride. Class 1b, highly hazardous as sodium cyanide.

Regulatory Authority:

- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- U.S. DOT 49CFR172.101, Inhalation Hazardous Chemical
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: Cyanogen chloride is a colorless gas or liquid (below 55°F/13°C) with a pungent, irritating odor. Shipped as a liquefied gas. A solid below 20°F/-7°C. Soluble in water (slowly decomposes). Boiling point = 14°C. Melting/Freezing point = -6°C. Vapor pressure = 1987 kPa @ 21°C. Flash point = 51°C.

Incompatibilities: May be stabilized to prevent polymerization. Cyanogen chloride may polymerize violently if contaminated with chlorine. In crude form chemical trimerizes violently if catalyzed by traces of hydrogen chloride or ammonium chloride. Contact with alcohols, acids, acid salts, amines, strong alkalis, olefins, strong oxidizers may cause fire and explosion. Heat causes decomposition producing toxic and corrosive fumes of hydrogen cyanide, hydrochloric acid, nitrogen oxides. Reacts slowly with water or water vapor to form hydrogen chloride. Attacks copper, brass, and bronze in the presence of moisture.

Permissible Exposure Limits in Air: No PEL has been set. NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommend a ceiling value of 0.3 ppm (0.6 mg/m³). HSE⁽³³⁾ and Israel set a STEL 0.3 ppm (0.6 mg/m³). The Canadian provinces of Alberta, British Columbia, Ontario and Quebec set the same STEL value. Some states have set guidelines and standards for cyanogen chloride in ambient air⁽⁶⁰⁾ ranging from 5.0 $\mu\text{g/m}^3$ (Virginia) to 6.0 $\mu\text{g/m}^3$ (North Dakota) to 14.0 $\mu\text{g/m}^3$ (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L). Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption (liquid), ingestion (liquid), skin and/or eye contact (liquid)

Harmful Effects and Symptoms

Short Term Exposure: Cyanogen chloride is converted to cyanide in the body. A lacrimator. Cyanogen chloride severely irritates the eyes, skin, and respiratory tract. Inhalation can cause weakness, headache, giddiness, dizziness, confusion, nausea, vomiting; irregular/irregularities heartbeat, and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Skin contact with the liquid may cause frostbite and irritation. The toxicity of cyanogen chloride resides very largely on its pharmacokinetic property of yielding readily to hydrocyanic acid in vivo. Inhaling small amounts of cyanogen chloride causes dizziness, weakness, congestion of the lungs, hoarseness, conjunctivitis, loss of appetite, weight loss, and mental deterioration. These effects are similar to those found from inhalation of cyanide. Ingestion or inhalation of a lethal dose of cyanogen chloride ($LD_{50} = 13 \text{ mg/kg}$), as for cyanide or other cyanogenic compounds, causes dizziness, rapid respiration, vomiting, flushing, headache, drowsiness, drop in blood pressure, rapid pulse, unconsciousness, convulsions, with death occurring within 4 hours. Delayed pulmonary edema may occur after inhalation.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Lung function tests. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide

poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1-2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Cyanophos

Use Type: Insecticide and avicide

CAS Number: 2636-26-2

Formula: $C_8H_{16}N_2O_6P_2S_2$

Alert: Not registered as a pesticide in the U.S.

Synonyms: Ciafos; Cianofos (Spanish); *O-p*-Cyanophenyl *O,O*-dimethyl phosphorothioate; *O*-(4-Cyanophenyl) *O,O*-dimethyl Phosphorothioate; Cyanophos organophosphate compound; *O,O*-Dimethyl-*O*-(4-cyano-phenyl)-monothiophosphat (German); *O,O*-dimethyl-*O-p*-cyanophenyl-phosphorothioate; *O,O*-Dimethyl-*O*-4-cyanophenyl-phosphorothioate; *O,O*-Dimethyl-*O*-4-cyanophenyl-phosphorothioate; ENT 25,675; Phosphorothioic acid, *O*-(4-cyanophenyl)-9,9-dimethyl ester; Phosphorothioic acid, *O*-(4-cyanophenyl)-*O,O*-dimethyl ester; Phosphorothioic acid, *O,O*-dimethyl ester, *O*-ester with *p*-hydroxybenzotrile

Trade Names: BAY[®] 34727, Bayer CropScience (Germany); BAYER 34727, Bayer CropScience (Germany); CYANOX[®], CYAP[®], S 4084[®], Sumitomo Chemical (Japan); SUMITOMO S[®] 4084, Sumitomo Chemical (Japan)

Producers: Bayer CropScience (Germany); Samsung Fine Chemicals (South Korea); Sigma-Aldrich Laborchemikalien (Germany); Sumitomo Chemical (Japan)

Chemical Class: Organophosphate

EPA/OPP PC Code: 268200

RTECS Number: TF7600000

Uses: This insecticide is used against rice stem borers and house flies. It is not registered as a pesticide in the U.S.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Group II, moderately hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS. 1 lb (0.454 kg)

- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, WHMIS, Ingredients Disclosure List; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Description: Cyanophos is a yellow to reddish-yellow or amber liquid. Slightly soluble in water. Boiling point = 119°C (decomposes). Melting/Freezing point = 14–15°C.

Incompatibilities: Alkaline materials and exposure to light can cause rapid decomposition.

Permissible Exposure Limits in Air: No standards set. However, inasmuch as it is a cyanide compound, the exposure limits are listed here: OSHA⁽²⁾ and ACGIH⁽¹⁾: 5 mg/m³TWA; NIOSH⁽²⁾: Ceiling limit, 4.7 ppm; 5 mg/m³ per 10 minutes as cyanides. All have notations that skin contact contributes significantly in overall exposure. IDLH level = 25 mg/m³ as CN

Determination in Air: Filter/Bubbler; Potassium hydroxide; Ion-specific electrode; NIOSH IV Method #7904, Cyanides⁽¹⁸⁾. OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600⁽¹⁸⁾, Organophosphorus pesticides.

Permissible Concentration in Water: The U.S. EPA has set a maximum contaminant level of cyanide in drinking water of 0.2 milligrams cyanide per liter of water (0.2 mg/L). Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin contact. Absorbed through the skin

Harmful Effects and Symptoms

Short Term Exposure: Cyanophos is an organophosphorus insecticide. It is a cholinesterase inhibitor. Death may occur after a large oral dose; with smaller accidental doses, onset of illness may be delayed. The LD₅₀ (oral, rat) = 25 mg/kg (highly toxic). Symptoms of organophosphorus pesticide poisoning include: headache, giddiness, nervousness, blurred vision, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include: sweating, pinpoint pupils, tearing, salivation and other excessive respiratory tract secretion, vomiting, cyanosis, papilledema, uncontrollable muscle twitches followed by muscular weakness, convulsions, coma, loss of sphincter control. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; possible cumulative effect. Cyanophos may damage the nervous system, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before

employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg

(infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of

seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Cyclanilide

Use Type: Plant growth regulator

CAS Number: 113136-77-9

Formula: C₁₁H₆Cl₂NO₃

Synonyms: 1-(2,4-Dichlorophenylaminocarbonyl) cyclopropanecarboxylic acid; Cyclopropanecarboxylic acid, 1-[(2,4-dichlorophenyl)amino]carbonyl-; Cyclopropanecarboxamide, 1-carboxy-, N-(2,4-dichlorophenyl)-

Trade Names: FINISH[®], Bayer CropScience (Germany); RPA 90946[®]; EXP 31039B[®]

Producers: Bayer CropScience (Germany)

Chemical Class: Malonanilate

EPA/OPP PC Code: 026201

California DPR Chemical Code: 4030

Uses: Cyclanilide is a plant growth regulator used as a cotton harvest aid.

U.S. Maximum Allowable Residue Levels for Cyclanilide (40 CFR 180.506):

CROP	ppm
Cattle, fat	0.10
Cattle, meat	0.02
Cattle, mby (except kidney)	0.2
Cattle, kidney	2.0
Cottonseed	0.60
Cotton gin byproducts	25.0

Milk	0.04
Sheep, fat	0.10

Sheep, meat.	0.20
Sheep, mby (except kidney).	0.20
Sheep, kidney.	2.0

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely a carcinogen

Label Signal Word: DANGER

Description: A white powdery solid. No characteristic odor. Melting point=195.5°C.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate. Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cycloate

Use Type: Herbicide

CAS Number: 1134-23-2

Formula: C₁₁H₂₁NOS

Synonyms: Cyclohexylethylcarbamothioic acid-S-ethyl ester; Cyclohexylethylthiocarbamic acid-S-ethyl ester; S-Ethyl cyclohexylethylthiocarbamate; S-Ethyl-N-ethyl-N-cyclohexylthiocarbamate; Hexylthiocarbamate

Trade Names: ETSAN[®]; EUREX[®]; R-2063[®]; RO-NEET[®]; RO-NEET[®]-6E; RO-NEET[®] 10G; RONIT[®]; SABET[®]

Chemical Class: Thiocarbamate

EPA/OPP PC Code: 041301

California DPR Chemical Code: 516

EINECS Number: 214-482-7

Uses: Used to control broadleaf weeds, annual and perennial grasses and nutgrass in spinach, beets, and sugar beets.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–35.00 ppb. Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–658.46663 ppb. MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Cycloate (40 CFR 180.212):

CROP	ppm
Beet, garden, roots	0.05
Beet, garden, tops	0.05
Beet, sugar, roots	0.05
Beet, sugar, tops	0.05
Spinach	0.05

Carcinogen/Hazard Classifications

California Prop. 65: Developmental toxin

Label Signal Word: WARNING, CAUTION

TRI Developmental Toxin: Reproductive and developmental toxin

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- RCRA Universal Treatment Standards: Wastewater (mg/L), 0.003; Nonwastewater (mg/kg), 1.4
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Description: An oily, clear amber to yellow liquid. Aromatic odor. Slightly soluble in water; solubility = 100 mg/L. Molecular weight 215.36. Density = 1.0 @ 20°C. Boiling point = 145–146°C @ 10 mmHg. Vapor pressure = 1.6×10^{-3} mmHg @ 20°C.

Incompatibilities: Reacts violently with powerful oxidizers such as calcium hypochlorite.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Low levels of toxicity. Concentrated solutions are slightly corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Skin contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid respiration, slow heart beat. Severe exposure may result in death.

Long Term Exposure: High or repeated exposures may cause nerve damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, skin, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure.

First Aid: Eyes: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8 ounces of water. Do not induce vomiting.

Note to physician or authorized medical personnel: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Cycloheximide

Use Type: Fungicide; plant growth regulator

CAS Number: 66-81-9

Formula: C₁₅H₂₃NO₄

Alert: Restricted Use Pesticide (RUP)

Synonyms: 3[2-(3,5-Dimethyl-2-oxocyclohexyl)-2-hydroxyethyl]glutarimide; NSC-185; 2,6-Piperidinedione, 4-(2-3,5-dimethyl-2-oxocyclohexyl)-2-hydroxyethyl-, (1S)-(1 α (S*),3 α ,5 β)-

Trade Names: ACTI-AID[®], Pharmacia & Upjohn (USA) canceled 4/22/1985; ACTIDIONE[®], Pharmacia & Upjohn

(USA) canceled 4/22/1985; ACTIDIONE[®] TGF, Pharmacia & Upjohn (USA) canceled 4/22/1985; ACTIDONE[®], Pharmacia & Upjohn (USA) canceled 4/22/1985; ACTISPRAY; HIZAROCIN[®]; KAKEN[®]; NARAMYCIN[®]; NARAMYCIN A[®]; NEOCYCLOHEXIMIDE[®]; U-4527

Producers: Aldrich Chemical (USA); Merck (Germany); Pharmacia & Upjohn (USA)

EPA/OPP PC Code: 043401

California DPR Chemical Code: 5

ICSC Number: 0244

RTECS Number: MA4375000

EINECS Number: 200-636-0

Uses: Used as an antibiotic, plant growth regulator, and protein synthesis inhibitor. Inhibits growth of many plant pathogenic fungi. Effective for control of powdery mildew on roses and many other ornamentals, rusts and leaf spots on lawn grasses, and azalea petal blight. Also used as a repellent for rodents and other animal pests, and in cancer therapy.

Human toxicity (long-term): Very low–140.00 ppb, Health Advisory

Fish toxicity (threshold): Very low–1308.29960 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

California Prop. 65: Developmental toxin

Regulatory Authority:

- Banned or Severely Restricted (In Agriculture) (Malaysia) (UN)⁽¹³⁾
- Very Toxic Substance (World Bank)⁽¹⁵⁾
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- Proposition 65 chemical (CAL)
- The "Director's List" (CAL/OSHA)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg).
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg)
- Canada, WHMIS, Ingredients Disclosure List

Description: Cycloheximide is a colorless crystalline solid. Slightly soluble in water; solubility = 2.08 g/100 ml @ 2°C. Melting/Freezing point = 119–121°C. Log K_{ow} = < 0.75. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Incompatible with oxidizers, acid anhydrides, strong bases.

Permissible Exposure Limits in Air: No OEL has been established

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion and skin

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation. Exposure can cause excessive salivation, nausea,

vomiting, diarrhea, and elevated blood urea nitrogen (BUN). High exposures can also cause imbalance, tremors, seizures and coma. Extremely toxic [LD_{50} (oral, rat) = 3.7 mg/kg]. The probable oral lethal dose in humans is 5-50 mg/kg, or 7 drops to 1 teaspoonful for a 150-lb. person. Signs of skin irritation may appear as much as 6 to 24 hours after exposure.

Long Term Exposure: May cause mutations and damage the developing fetus. May cause liver and kidney damage.

Points of Attack: Reproductive system. Liver and kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours following skin contact.

Cyfluthrin

Use Type: Insecticide

CAS Number: 68359-37-5

Formula: $C_{22}H_{18}Cl_2FNO_3$

Alert: Cyfluthrin can be found in both Restricted Use Pesticides (RUP) and General Use Pesticides (GUP).

Synonyms: Cyano(4-fluoro-3-phenoxyphenyl)methyl 3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropanecarboxylate;

Cyclopropanecarboxylic acid, 3-(2,2-dichloroethenyl)-2,2-dimethyl-, cyano(4-fluoro-3-phenoxyphenyl)methyl ester; Cyclopropanecarboxylic acid, 2-(2,2-dichlorovinyl)-3,3-dimethyl-, ester with (4-fluoro-3-phenoxyphenyl)hydroxyacetonitrile; Cyfluthin; Cyfluthrine; Cyfoxylate

Trade Names: AZTEC[®], Bayer CropScience (Germany); ATTATOX[®]; BAY FCR 1272[®], Bayer CropScience (Germany); BAYTHROID[®], Bayer CropScience (Germany); BAYTHROID[®] H, Bayer CropScience (Germany); BAYTHROID[®] TECHNICAL, Bayer CropScience (Germany); BUG-B-GON[®], Scotts (USA); CONTUR[®]; CYLATHRIN[®], Bayer CropScience (Germany); EULAN SP[®]; FCR 1272[®]; INTUDER[®], Bayer CropScience (Germany); INTUDER HPX[®], Bayer CropScience (Germany); LASER[®], Bayer CropScience (Germany); RENOUNCE[®], Bayer CropScience (Germany); RESPONSAR[®]; SOLFAC[®]; TEMPO[®]; TEMPO[®] H; TEMPO[®] 20WP

Producers: Agsin (Singapore); Bayer CropScience (Germany); Changzhou Kangmei Chemical Industry Co., Ltd. (China); Scotts Company, The (USA)

Chemical Class: Organofluorine

EPA/OPP PC Code: 128831

California DPR Chemical Code: 2223

EINECS Number: 269-855-7

Uses: Cyfluthrin is a non-systemic insecticide used to control a variety of chewing and sucking insects on cotton, hops, cereals, corn, peanuts, fruit, potatoes and other crops and vegetables. It is also used to control structural pests such as termites.

Human toxicity (long-term)⁽⁷⁷⁾: Very low-175.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Extra high-0.01330 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

California Prop. 65: Developmental toxin

Label Signal Word: WARNING. Toxicity Class II

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (HSE)⁽³³⁾ (Israel)(Mexico)(OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾
- EPCRA Section 313: Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B), severe pollutant, as organotin pesticide compounds. The "Director's List" (CAL/OSHA)
- Canada, CEPA Prohibited Export Substance List

Description: Cyhexatin is a colorless to white, nearly odorless, crystalline powder. Boiling point = 227°C (decomposes). Melting/Freezing point = 195-198°C. Practicall insoluble in water. An organotin compound.

Incompatibilities: Strong oxidizers, ultraviolet light

Permissible Exposure Limits in Air: The OSHA⁽²⁾ PEL for organotin compounds is 0.32 mg/m³ [0.1 mg/m³ (as Sn)]. The ACGIH⁽¹⁾ recommended TWA value is 5 mg/m³. Australia, Israel, Mexico, and the HSE⁽³³⁾ have set that same TWA as ACGIH⁽¹⁾ and HSE's STEL value is 10 mg/m³. In Canada the provinces of Alberta, BC, Ontario, and Quebec have set aTWA of 5 mg/m³ and the STEL for Alberta and BC is 10 mg/m³. Several states have set guidelines or standards for cyhexatin in ambient air⁽⁶⁰⁾ ranging from 50 µg/m³ (North Dakota) to 80 µg/m³ (Virginia) to 100 µg/m³ (Connecticut) to 119 µg/m³ (Nevada). The NIOSH⁽²⁾ IDLH is 80 mg/m³ [25 mg/m³ (as Sn)].

Determination in Air: Filter/XAD-2[®] (tube); Acetic acid / CH₃CN; High-pressure liquid chromatography/Graphite furnace atomic absorption spectrometry; NIOSH IV, Method #5504, Organotin compounds.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set, but EPA⁽³²⁾ has suggested a permissible ambient goal of 1.4 µg/L based on health effects (organotin)

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: These chemicals are strong poisons that can cause neurologic emergencies. Irritates eyes, skin, and respiratory system. Symptoms of exposure include headache, vertigo (an illusion of movement); sore throat, cough; abdominal pain, vomiting; skin burns, pruritus. Cyhexatin is moderate in acute oral toxicity to animals. This is in contrast to alkyl tin compounds with smaller (methyl and ethyl) radicals which are highly toxic. A diet including 6 mg/kg of body weight of cyhexatin for two years showed

no effect in rats. The LD₅₀ (oral, rat) = 180 mg/kg. Breathing, swallowing, or skin contact with some organotin compounds, such as trimethyltin and triethyltin compounds, can interfere with the way the brain and nervous system work. In severe cases, they can cause death.

Long Term Exposure: This chemical has been shown to cause liver and kidney damage in animals. Some organotin compounds, such as dibutyltins and tributyltins, have been shown to affect the immune system in animals, but this has not been examined in people. Studies in animals also have shown that some organotin compounds, such as dibutyltins, tributyltins, and triphenyltins, can affect the reproductive system. This, also, has not been examined in people.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys

Medical Surveillance: Liver function tests. Kidney function tests.

First Aid: Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Cymoxanil (ANSI)

Use Type: Fungicide

CAS Number: 57966-95-7

Formula: C₇H₁₀N₄O₃

Synonyms: Acetamide, 2-cyano-N-[(ethylamino)carbonyl]-2-(methoxyimino)-; 2-Cyano-N-[(ethylamino)carbonyl]-2-(methoxyimino)acetamide; Acetamide, 2-cyano-N-[(ethylamino)carbonyl]-2-(methoxyimino)-; 2-Cyano-N-ethylcarbamoyl-2-methoxyiminoacetamide

Trade Names: CURZATE[®], DuPont Crop Protection (USA); DPX 3217[®]; DPX 3217M[®]; DPX-T3217[®]; EVOLVE[®], Gustafson (USA); MZ-CURZATE[®], Gustafson (USA); TANOS[®], DuPont Crop Protection (USA)

Producers: DuPont Crop Protection (USA); Gustafson (USA); Ki-Hara Chemicals Ltd. (UK); Limin Chemical (China); OXON Italia (Italy)

Chemical Class: Aliphatic nitrogen fungicide

EPA/OPP PC Code: 129106

California DPR Chemical Code: 4002

EINECS Number: 261-043-0

Uses: Cymoxanil is applied as a seed treatment to cut potato seed pieces or as a foliar to control late blight.

Human toxicity (long-term)⁽⁷⁷⁾: Low-91.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High 1.53362 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Cymoxanil (40 CFR 180.503):

CROP	ppm
Grape	0.1
Hop, dried cones	1
Lettuce, head	4
Lychee	1
Potato	0.05
Vegetable, cucurbit, group 9	0.05
Vegetable, fruiting, group 8	0.2

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely a carcinogen

Label Signal Word: WARNING, CAUTION

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- Clean water act: Section 307 Priority Pollutants as cyanide, total; Toxic Pollutant (Section 401.15)
- RCRA Section 261 Hazardous Constituents.
- RCRA Universal Treatment Standards: Wastewater (mg/L), 1.2 (total); 0.86 (amenable); Nonwastewater (mg/kg), 590 (total); 30 (amenable).
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 9010(40)
- Safe Drinking Water Act: MCL, 0.2 mg/L; MCLG, 0.2 mg/L; Regulated chemical (47 FR 9352)
- EPCRA Section 304 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%

- Marine pollutant (49CFR, Subchapter 172.101, Appendix B) as cyanides, mixtures or solutions

Description: A peach color powder. Molecular weight = 198.21. Melting point=159-160°C.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chemical Class: Pyrethroid; Botanical

EPA/OPP PC Code: 109702

California DPR Chemical Code: 2171

ICSC Number: 0246

RTECS Number: GZ1250000

EINECS Number: 257-842-9

Uses: A Restricted Use Pesticide (RUP) used to control a variety of insects on cotton, fruit and vegetable crops. Also used in commercial and residential settings, ships, laboratories and food processing plants.

Human toxicity (long-term)⁽⁷⁷⁾: High–7.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Extra high -0.21494 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: WARNING, CAUTION, DANGER

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL) as pyrethrins
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum
- Actively registered pesticide in California, as pyrethrins
- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins
- EPCRA Section 304 RQ; CERCLA, 1 lb (0.454 kg) as pyrethrins

Description: Thick, yellow-brown liquid or semisolid mass (technical product). Very sparingly soluble in water; solubility = 0.041 ppm @ room temp; about 0.01 ppm @ 20°C. Molecular weight = 416.31. Density = 1.12 @ 22°C. Melting/Freezing point = 60–80°C. Vapor pressure = 5.1×10^{-8} mmHg @ 70°C. Log K_{ow} = 4.47. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate.

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008⁽¹⁸⁾. (pyrethrum)

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008⁽¹⁸⁾.

Harmful Effects and Symptoms

Short Term Exposure: Pyrethrins can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness, rhinorrhea (discharge of thin nasal mucous).

Long Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic “pneumonia” can also occur with cough, chest pain, breathing difficulty and abnormal chest x-ray.

Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Skin contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse.

Points of Attack: Respiratory system, skin, central nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest x-ray if lung symptoms are present. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

alpha-Cypermethrin

Use Type: Insecticide

CAS Number: 67375-30-8; 66841-24-5 (d-trans-β-Cypermethrin)

Formula: C₂₂H₁₉Cl₂NO₃

Synonyms: Alphacypermethrin; (+)-Alphamethrin; α-Cyano-3-phenoxybenzyl 3-(2,2-dichlorovinyl)-2,2-dimethylcyclopropanecarboxylate, (±)-*cis* isomer; Cyano(3-phenoxyphenyl)methyl 3-(2,2-dichlorovinyl)-2,2-dimethylcyclopropanecarboxylate, (±)-*cis* isomer; Cyclopropanecarboxylic acid, 3-(2,2-dichloroethenyl)-2,2-dimethyl-, cyano(3-phenoxyphenyl)methyl ester, [1α(S*), 3α]-(+)-

Cypermethrin-s: *s*-Cyano(3-phenoxyphenyl)methyl (±)-*cis/trans*-3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropanecarboxylate; Cyclopropanecarboxylic acid, 3-(2,2-

dichloroethenyl)-2,2-dimethyl-, cyano(3-phenoxyphenyl)methyl ester, (S)-; Cypermethrin-minus; *zeta*-Cypermethrin

Trade Names: BESTOX[®]; CONCORD[®]; DOMINEX[®]; FASTAC[®]; FENDONA[®]; FMC 45497[®]; FMC (USA), canceled; NRDC 160[®]; RENEGADE[®]; WL-85871[®]

Cypermethrin-s: FURY[®] (*s*-isomer); FMC 56701[®] (*s*-isomer)

Producers: FMC (USA)

Chemical Class: Pyrethroid; botanical

EPA/OPP PC Code: 209600; 129064; (109702 use code 129064) cypermethrin-s

California DPR Chemical Code: 3866

Uses: Not registered in the U.S. Formerly used for the control of a wide range of chewing and sucking insects (particularly Lepidoptera, Coleoptera, and Hemiptera) in fruit (including citrus), vegetables, vines, cereals, maize, beet, oilseed rape, potatoes, cotton, rice, soya beans, forestry, and other crops. Control of cockroaches, mosquitoes, flies, and other insect pests in public health; and flies in animal houses. Also used as an animal ectoparasiticide. (Hartley, D., and Kidd, H. (eds.), "The Agrochemicals Handbook," 2nd Ed. The Royal Society of Chemistry, p. A649, Lechworth, Herts, England, August, 1987). Control of cotton leaf perforator, cotton semi-looper, false codling moth, red bollworm, cotton stainers, spiny bollworm, American bollworm, cotton bollworm, cotton spotted bollworm, native budworm, pink bollworm, tobacco budworm, cotton leafworm, boll weevil (cotton). For major pests in coffee, maize, sweet corn, sorghum, flax, soybean, mung bean, navy bean, sunflower, tobacco, rice, bush, and trellis tomato, cruciferous crops, field peas, lupines, and pasture. Cutworm control in all row crops (Farm Chemicals Handbook 1993. Willoughby, OH: Meister Publishing Co., 1993)

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class II, moderately hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL) as pyrethrins
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum
- Actively registered pesticide in California, as pyrethrins
- Clean Water Act; Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins
- EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg) as pyrethrins
- U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B), severe pollutant

Description: Viscous yellowish-brown semisolid mass; colorless crystalline solid; mild aromatic odor. Very low solubility in water; solubility = 0.2 ppm @ 20°C. Boiling point = 200°C @ 0.07 mmHg. Melting/Freezing point = 80.5°C. Vapor pressure = 170 nPa @ 20°C. Log K_{ow} = 6.29.

Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate. When heated to decomposition this chemical emits toxic nitrogen oxides and chlorine gas.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008⁽¹⁸⁾.

Harmful Effects and Symptoms

Cyproconazole

Use Type: Fungicide

CAS Number: 94361-06-5

Formula: C₁₅H₁₈ClN₃O

Synonyms: α -(4-Chlorophenyl)- α -(1-cyclopropylethyl)-1H-1,2,4-triazole-1-ethanol; (2R,S,3R,S)-2-(4-Chlorophenyl)-3-cyclopropyl-1-(1H-1,2,4-triazol-1-yl)butan-2-ol; 1H-1,2,4-Triazole-1-ethanol, α -(4-chlorophenyl)- α -(1-cyclopropylethyl)-

Trade Names: ALTO[®], Syngenta (Switzerland); ATEMI[®], Syngenta (Switzerland); ATEMI-50-SL[®], Syngenta (Switzerland); EVIPOI[®], Osmose (USA); FLINT[®], Bayer CropScience (Germany); NOAH GOLD[®], Osmose (USA); SAN-619F[®]; SENTINEL, Syngenta (Switzerland); SN 108266[®]

Producers: Bayer CropScience (Germany); Osmose (USA); Syngenta (Switzerland)

Chemical Class: Triazole

EPA/OPP PC Code: 128993

California DPR Chemical Code: 5105

Uses: Used to control fungus on cereals, coffee beans; anthracnose and other diseases on turfgrass; used against rust and leaf spot disease.

Human toxicity (long-term)⁽⁷⁷⁾: High-1,15894 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low-3210.91612 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Cyproconazole (40 CFR 180.485):

CROP	ppm
Coffee, bean	0.1

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group 2B, probable carcinogen

Label Signal Word: CAUTION, DANGER

WHO Acute Hazard: Class III, slightly hazardous

Description: Colorless, crystalline solid. Practically insoluble in water; solubility = <0.015 @25°C. Melting/Freezing point = 104°C. Vapor pressure = 2.5 x 10⁻⁷ mPa @ 20°C.

Routes of Entry: Ingestion, skin contact

Harmful Effects and Symptoms

Short Term Exposure: Contact may irritate skin and cause eye irritation and possible severe injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. Poisonous if swallowed.

Medical Surveillance: Contact physician if poisoning is suspected or if redness, itching, burning of the skin or eyes develop.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit

Cyprodinil

Use Type: Fungicide

CAS Number: 121552-61-2

Formula: C₁₄H₁₃N₃

Synonyms: *N*-(4-Cyclopropyl-6-methyl-pyrimidin-2-yl)-4-Cyclopropyl-6-methyl-*N*-phenyl-2-pyrimidinamine; 2-Pyrimidinamine, 4-cyclopropyl-6-methyl-*N*-phenyl-; aniline

Trade Names: CGA 219417[®] technical: CHORUS[®], Syngenta (Switzerland); SWITCH[®], Syngenta (Switzerland); UNIX[®]; VANGUARD[®], Syngenta (Switzerland)

Producers: Syngenta (Switzerland)

Chemical Class: Anilino-pyrimidine

EPA/OPP PC Code: 288202

California DPR Chemical Code: 4000

Uses: Cyprodinil is applied to the foliage of almonds, grapes, stone fruit crops, and pome fruit crops to control plant diseases. Target fungi for cyprodinil include scab and brown rot blossom.

Human toxicity (long-term)⁽⁷⁷⁾: Very low-262.50 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low-160.91666 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely a carcinogen

Label Signal Word: CAUTION

Description: White crystalline solid. Soluble in water; solubility = 14 ppm. Molecular weight = 225.30. Melting/Freezing point = 80°C. Vapor pressure = 5.0 x 10⁻⁴. Log K_{ow} = 4.0. Values of more than 3.0 are likely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Cyromazine (ANSI)

Use Type: Insecticide (insect growth regulator)

CAS Number: 66215-27-8

Formula: C₆H₁₀N₆

Synonyms: *N*-Cyclopropyl-1,3,5-triazine-2,4,6-triamine; 2-Cyclopropylamino-4,6-diamino-*s*-triazine; Cyclopropylmelamine; 2,4-Diamino-6-(cyclopropylamino)-*s*-triazine; 1,3,5-Triazine-2,4,6-triamine, *N*-cyclopropyl-

Trade Names: ARMOR[®], Syngenta (Switzerland); CITATION[®], Syngenta (Switzerland); CGA-72662[®]; LARVADEX[®], Syngenta (Switzerland); PATRON[®], Syngenta (Switzerland); TRIGARD[®], Syngenta (Switzerland); VETRAZIN[®]

Producers: AJE (Switzerland); Ki-Hara Chemicals Ltd. (UK); SuYan Agrochemical Group (China); Syngenta (Switzerland)

Chemical Class: Triazine

EPA/OPP PC Code: 121301

California DPR Chemical Code: 2286

Uses: As an insect growth regulator, cyromazine is feed to caged poultry and is passed through the chicken, leaving a residue in the manure. The chemical controls the growth of the fly larvae developing in the manure. Used as a foliar spray to control leaf miners in vegetables, mushrooms, potatoes and ornamentals and to control flies on animals.

Human toxicity (long-term)⁽⁷⁷⁾: Low 52.50 ppb. Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low-22450.18892 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Cyromazine (40 CFR 180.414):

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, unlikely carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- FIFRA, 40CFR186: tolerances for pesticides in animal feeds.

Description: White, odorless crystalline solid. Soluble in water. Molecular weight = 166.20. Vapor pressure = 3.36×10^{-9} mmHg @ 20°C.

Incompatibilities: Strong oxidizers.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, passing through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May cause skin and severe eye irritation. Moderately poisonous if ingested or inhaled. Exposure to a triazine (simazine) has caused acute and subacute dermatitis in the former USSR, characterized by erythema, slight edema, moderate pruritus, and burning lasting 4 to 5 days.

Long Term Exposure: May cause lung irritation and damage. May cause skin allergy. Contact with some triazine compounds (such as atrazine) may increase risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects on the hypothalamic pituitary gonadal axis. Repeated exposure may cause weight loss and reduced red blood cell count. May be mutagenic.

Points of Attack: Liver, lungs and skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Consider chest x-ray following acute overexposure. Evaluation by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

(China); Sigma-Aldrich Laborchemikalien (Germany); United Agri Products (UAP) (USA); Whyte Agrochemicals (UK); Zago Asia Ltd. (Singapore)

Chemical Class: Chlorophenoxy acid or ester; Haloorganics; Chloroorganics

EPA/OPP PC Code: 030001

California DPR Chemical Code: 636

ICSC Number: 0033

RTECS Number: AG6825000

EEC Number: 607-039-00-8

EINECS Number: 202-361-1

Uses: 2,4-Dichlorophenoxyacetic acid was introduced as a plant growth-regulator in 1942. It is registered in the United States as an herbicide for control of broadleaf plants and as a plant growth-regulator. There are many forms or derivatives of 2,4-D including esters, amines, and salts. It is used in cultivated agriculture, in pasture and rangeland applications, forest management, home, garden, and to control aquatic vegetation. It may be found in emulsion form, in aqueous solutions (salts), and as a dry compound. The product *Agent Orange*, made by Monsanto Chemical and used extensively throughout Vietnam, was about 50% 2,4-D. However, the controversies associated with the use of Agent Orange were associated with a contaminant (dioxin) in the 2,4,5-T component of the defoliant. In 1964 *Agent Orange* replaced *Agent Purple* a mixture of the *n*-butyl esters of 2,4-D and 2,4,5-T plus the isobutyl ester of 2,4,5-T.

Human toxicity (long-term)⁽⁷⁷⁾: Low–70.00 ppb, MCL (Maximum Contaminant Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–4247.00420 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for 2,4-D:

Note: There are 1,847 tolerances listed by EPA for 2,4-D and its salts, amines and esters. These can be found at the U.S. EPA site

<http://www.epa.gov/pesticides/food/viewtols.htm>, along with their CFR citations.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, unclassifiable, ambiguous data

IARC: Group 2B, possible carcinogen

WHO Acute Hazard: Class II, moderately hazardous

Endocrine Disruptor: Suspected

Regulatory Authority:

- Carcinogen (Human Suspected) (IARC)⁽⁹⁾
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (DFG)⁽³⁾ (HSE)⁽³³⁾ (Israel) (Mexico) (former USSR)⁽³⁵⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)

- AB 1803-Well Monitoring Chemical (CAL)
- MCL (Maximum Contaminants Levels) list of contaminants (CAL)
- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- Water Pollution Standard Proposed (EPA, Mexico)⁽⁵⁵⁾ (Maine, Minnesota)⁽⁶¹⁾
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92)
- RQ: CERCLA, 100 lb (45.5 kgs)
- EPA Hazardous Waste Number (RCRA No.): U240, D016
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents
- RCRA Toxicity Characteristic (Section 261.24), Maximum
- Concentration of Contaminants, regulatory level, 10.0 mg/L
- RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.72; Nonwastewater (mg/kg), 10
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List, Suggested test method(s) (PQL, $\mu\text{g/L}$): 8150(10).
- Safe Drinking Water Act: MCL, 0.1 mg/L; MCGL, 0.07 mg/L; Regulated chemical (47 FR 9352) as 2,4-D.
- CERCLA/SARA 313: Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, Drinking Water Quality, 0.1 mg/L IMAC.
- Mexico, Drinking Water Criteria, 0.1 mg/L.

Description: White to yellow crystalline powder. Slight phenolic odor. Very slightly soluble in water; solubility = 900 ppm @ 25°C. The taste and odor threshold in water is 3.0 ppm. Molecular weight = 221.04. Boiling point = (decomposes). Melting/Freezing point = 138°C. Vapor pressure = 8×10^{-6} mmHg @ 20°C. Log K_{ow} = 2.79. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: A weak acid, incompatible with bases. Decomposes in sunlight or heat, forming hydrogen chloride and phosgene. Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air: The legal limit (OSHA PEL), and ACGIH⁽¹⁾ recommended TWA is 10 mg/m³ as is the value for DFG⁽³⁾, HSE⁽³³⁾ value, Israel, Mexico, and Australia. The HSE⁽³³⁾ and Mexico adds an STEL of 20 mg/m³. The NIOSH⁽²⁾ IDLH value is 100 mg/m³. The former

USSR⁽³⁵⁾ has set an MAC in workplace air of 1.0 mg/m³. The Canadian provincial limit for Alberta, BC, Ontario, and Quebec is the same as OSHA and Alberta and BC set a STEL of 20 mg/m³. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set an MAC in ambient air in residential areas of 0.02 mg/m³ on a momentary basis and 0.01 mg/m³ on a daily average basis for the sodium salt of 2,4-D. In addition, several states have set guidelines or standards for 2,4-D in ambient air⁽⁶⁰⁾ ranging from 100 µg/m³ (North Dakota) to 105 µg/m³ (Pennsylvania) to 160 µg/m³ (Virginia) to 200 µg/m³ (Connecticut) to 238 µg/m³ (Nevada).

Determination in Air: Collection on a glass fiber filter and analysis by HPLC with UV detection. See NIOSH Method #5001⁽¹⁸⁾.

Permissible Concentration in Water: The U.S.⁽³⁵⁾ has set an MPC in bottled water intended for human consumption of 0.1 mg/L. Mexico⁽³⁵⁾ has set levels in ambient water of 0.1 mg/L in estuaries and 0.01 mg/L in coastal waters. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set an MAV of 1.0 mg/L in water bodies used for drinking purposes for the sodium salt and 0.62 mg/L in water bodies used for fishery purposes. A no-observed-adverse-effect-level (NOAEL) of 1 mg/kg/day has been determined⁽⁴⁷⁾ which results in the calculation of a lifetime health advisory of 0.070 mg/L. This level has been proposed by EPA⁽⁶²⁾ as a maximum level in drinking water. Drinking water levels for Canada and Mexico are 0.1 mg/L. States which have set guidelines for 2,4-D in drinking water⁽⁶¹⁾ include Minnesota at 70 µg/L and Maine at 100 µg/L.

Determination in Water: Filter; Methanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH IV Method #5001⁽¹⁸⁾

Routes of Entry: Inhalation, skin absorption, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation of the mouth, nose and throat, headache, nausea, vomiting, and diarrhea at levels above 10 mg/m³. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposures may result in death. *Skin:* Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. *Eyes:* Irritation may occur. *Ingestion:* The oral dose (human) required to produce symptoms is about 1/12 ounce (1/2 teaspoon). Increasing amounts may result in increasingly severe symptoms as listed above. Death has resulted from as little as 1/5 ounce. Survival for more than 48 hours is usually followed by complete recovery although symptoms may last for several months.

Long Term Exposure: Workers exposed to 2,4-D in the manufacturing process over a five to ten year period at levels above 10 mg/m³ complained of weakness, rapid

fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, 2,4-D may affect human reproduction

Points of Attack: Skin, central nervous system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, unclassifiable as 2,4-D, the parent chemical

IARC: Group 2B, possible carcinogen

Label Signal Word: CAUTION or WARNING

WHO Acute Hazard: Class II, moderately hazardous as 2,4-D, the parent chemical.

Endocrine Disruptor: Probable ED as 2,4-D, the parent chemical

Regulatory Authority:

- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL) as chlorophenoxy pesticides
- The “Director’s List” (CAL/OSHA) as chlorophenoxy pesticides
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA)
- RCRA Section 261 Hazardous Constituents
- Safe Drinking Water Act: MCL, 0.1 mg/L; MCGL, 0.07 mg/L; Regulated chemical (47 FR 9352) as 2,4-D.
- EPA Hazardous Waste Number (RCRA No.): U240
- EPCRA Section 304 RQ: CERCLA, 100 lb (45.4 kg)

- EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as 2,4-D

Description: Colorless to amber viscous liquid. Odorless (pure). Very slightly soluble in water; solubility = 12 ppm. Molecular weight = 321.21. Density = 1.23 @ 20°C. Boiling point = 190°C @ 7 mmHg. Decomposes above 200°C. Vapor Pressure = 3.8×10^{-6} @ 25°C.

Incompatibilities: May attack some forms of plastics. Keep material dissolved in organic solvents (such as hexane, benzene, acetone, and alcohols) away from oxidizers. Keep dry material away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Moisture may cause hydrolysis or other forms of decomposition.

Permissible Exposure Limits in Air: The legal limit (OSHA PEL), and ACGIH⁽¹⁾ recommended TWA is 10 mg/m³ as is the value for DFG⁽³⁾, HSE⁽³³⁾ value, Israel, Mexico, and Australia. The HSE⁽³³⁾ and Mexico adds an STEL of 20 mg/m³. The NIOSH⁽²⁾ IDLH value is 100 mg/m³. The former USSR⁽³⁵⁾ has set an MAC in workplace air of 1.0 mg/m³. The Canadian provincial limit for Alberta, BC, Ontario, and Quebec is the same as OSHA and Alberta and BC set a STEL of 20 mg/m³. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set an MAC in ambient air in residential areas of 0.02 mg/m³ on a momentary basis and 0.01 mg/m³ on a daily average basis for the sodium salt of 2,4-D. In addition, several states have set guidelines or standards for 2,4-D in ambient air⁽⁶⁰⁾ ranging from 100 µg/m³ (North Dakota) to 105 µg/m³ (Pennsylvania) to 160 µg/m³ (Virginia) to 200 µg/m³ (Connecticut) to 238 µg/m³ (Nevada).

Determination in Air: Collection on a glass fiber filter and analysis by HPLC with UV detection. See NIOSH Method #5001⁽¹⁸⁾ for 2,4-D.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. For 2,4-D, the U.S. EPA⁽³⁵⁾ has set an MPC in bottled water intended for human consumption of 0.1 mg/L.

Determination in Water: Filter; Methanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH IV Method #5001⁽¹⁸⁾ as 2,4-D.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips

turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years.

Long Term Exposure: Workers exposed to chlorophenoxy compounds such as 2,4-D (in the manufacturing process) over a five to ten year period at levels above 10 mg·m⁻³ complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affect human reproduction

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidney

Medical Surveillance: If symptoms develop or overexposure is suspected, liver or kidney function tests may be useful. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* If ingested, remove by lavage or vomiting. Use general supportive measures for CNS depression. Consider the use of quinidine for myotonia.

2,4-D, isooctyl ester

Use Type: Herbicide

CAS Number: 25168-26-7

Formula: C₁₆H₃₂C₁₂O₃

Alert: Herbicides containing 2,4-D use the amine salt or ester form. The amine and ester form of 2,4-D may differ in health-related activity and environmental fate and effects from the parent 2,4-D.

Synonyms: Acetic acid(2,4-dichlorophenoxy)-,isooctyl ester; 2,4-Dichlorophenoxyacetic acid isooctyl ester; 2,4-D Esters; 2,4-D (IOE); Isooctyl alcohol (2,4-dichlorophenoxy)acetate; Isooctyl 2,4-dichlorophenoxyacetate; Isooctyl ester of dichloro 2,4-chloroacetic acid

Trade Names: BANVEL[®]-520, canceled; CLEAN KILL[®], canceled; 2,4-D L.V. 4 ESTER[®], Nufarm (Australia); REED[®] LV 2,4-D; REED[®] LV 400 2,4-D; REED[®] LV 600 2,4-D; WEEDTRINE[®]-II

Producers: Nufarm (Australia)

Chemical Class: Chlorophenoxy acid or ester

EPA/OPP PC Code: 030064

California DPR Chemical Code: 809

RTECS Number: AG8575000

Uses: Not registered in the U.S. 2,4-D and its salts and esters are used to control broadleaf weeds, grasses, woody plants, aquatic weeds and non-flowering plants on rangeland, non-crop areas, rights-of-way and in forestry management. As a plant growth regulator it is used to cause all tomato crops to ripen at the same time and other fruit crop control. Formulations are used to control weeds in cereal, rice and other crops and to increase the output of latex from rubber trees.

Human toxicity (long-term)⁽⁷⁷⁾: Low–70.00 ppb, MCL (Maximum Contaminant Level) as 2,4-D

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–4247.00420 ppb, MATC (Maximum Acceptable Toxicant Concentration) as 2,4

U.S. Maximum Allowable Residue Levels: For allowable levels for the parent chemical, see 2,4-D.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, unclassifiable because of ambiguous data, as 2,4-D, the parent chemical

- EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as 2,4-D

Description: Colorless solid (pure). Colorless to yellowish brown liquid. Technical, 99%; 64% in petroleum oil. Fuel oil-like odor. Sinks in water; practically insoluble.

Molecular weight = 234–291, also listed at 263.11. Density: 1.255–1.270 @ 25. Boiling point: 140°C @ 1 mmHg. Melting/Freezing point = 25°C. Flash point = > 79°C (oc).

Incompatibilities: May attack some forms of plastics. Keep material dissolved in organic solvents (such as hexane, benzene, acetone, and alcohols) away from oxidizers. May not be compatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition.

Permissible Exposure Limits in Air: The legal limit (OSHA PEL), and ACGIH recommended TWA is 10 mg/m³. The NIOSH IDLH value is 100 mg/m³.

Determination in Air: Collection on a glass fiber filter and analysis by HPLC with UV detection. See NIOSH Method #5001⁽¹⁸⁾, for 2,4-D.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. For 2,4-D, the U.S. EPA⁽³⁵⁾ has set an MPC in bottled water intended for human consumption of 0.1 mg/L. Aquatic toxicity: 350 ppm/24 hr/bass, bluegill/50% kill/fresh water; 1.0–5.0 ppm/96 hr/oyster/39% shell growth disease/salt water. Waterfowl toxicity: LD₅₀ = 2025.0 mg/kg.

Determination in Water: Filter; Methanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH IV Method #5001⁽¹⁸⁾

Routes of Entry: Inhalation, ingestion, absorbed through skin.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. Dalapon (ANSI)

Use Type: Herbicide and plant growth regulator

CAS Number: 75-99-0

Formula: C₃H₄Cl₂O₂; CH₂CCl₂COOH

Synonyms: Acido 2,2-dicloropropionico (Spanish); Dalapon aliphatic acid herbicide; 2,2-Dichloropropionic acid; *α*-Dichloropropionic acid; *α,α*-Dichloropropionic acid; Propanoic acid, 2,2-dichloro-; Propop (South Africa)

Trade Names: ATLAS LIGNUM (FORMULATION)*; ALATEX*[®]; BASFAPON*[®]; BASF Agricultural Products Group (Germany); BASFAPON*[®] B, BASF Agricultural Products Group (Germany); BASFAPON*[®] N, BASF Agricultural Products Group (Germany); BASINEX*[®], BASF Agricultural Products Group (Germany); BH*[®] DALAPON; BH RASINOX R (FORMULATION)*[®]; BH TOTAL (FORMULATION)*[®]; CRISAPON*[®]; DALAPON*[®] 85; DED-WEED*[®]; DESTRAL*[®]; DEVIPON*[®]; DOWPON*[®], Dow AgroSciences (USA); DOWPON*[®] M, Dow AgroSciences (USA); DOWPON*[®]-RAE.; FYDULAN (FORMULATION)*[®]; GRAMEVIN*[®]; KENAPON*[®]; LIROPON*[®]; PROPROP*[®]; RADAPON*[®]; REVENGE*[®]; S95*[®]; S 1315*[®]; SYN-CHEMICALS COUCH AND GRASS KILLER*[®]; UNIPON*[®]; VOLUNTEERED*

Producers: BASF Agricultural Products Group (Germany); Bharat Pulverizing Mills (India); Daicel Chemical Industries

(Japan); Dow AgroSciences (USA); Ki-Hara Chemicals Ltd. (UK); R.S.A. Corp. (USA); Sigma-Aldrich (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organochlorine; Halo-organics

EPA/OPP PC Code: 028901

California DPR Chemical Code: 180

ICSC Number: 1509

RTECS Number: UF0690000

EEC Number: 607-162-00-7

EINECS Number: 200-923-0

Uses: Not registered in the U.S. Used on sugar cane and sugar beets to control annual and perennial grasses, e.g., Bermuda grass, Johnson grass and quackgrass, and rushes and cattails. Also used on fruits, potatoes, asparagus, alfalfa, flax and carrots. Commercial products consist of the sodium salt or of mixed sodium and magnesium salts of dalapon. Also used on non-crop areas such as ditches, railways and fence lines and as a defoliant.

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL)
- MCL (Maximum Contaminants Levels) list of contaminants (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
- Safe Drinking Water Act: MCL, 0.2 mg/L; MCLG, 0.2 mg/L
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 5,000 lb (2270 kg)

Description: Colorless liquid or a white to tan powder below 8°C. The sodium salt, a white powder, is often used. Acrid odor. Highly soluble in water (slowly reactive). Water solubility = 5×10^5 ppm; 8% @ 25°C. Molecular weight = 142.99. Boiling point = 185–190°C. Melting/Freezing point = 8°C; also reported @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Log K_{ow} = 0.8. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Reacts slowly in water to form hydrochloric and pyruvic acids. Very corrosive to iron and to aluminum and copper alloys. Flammable and explosive hydrogen gas may form in enclosed spaces.

Permissible Exposure Limits in Air: There is no OSHA PEL⁽²⁾, NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommend a TWA value of 1 ppm (6 mg/m³). Israel, Mexico, DFG⁽³⁾, and the Canadian provinces of Alberta, Ontario, and Quebec set the

same value as ACGIH⁽¹⁾ and Alberta's STEL is 2 ppm. The former USSR^(35, 43) has set an MAC in workplace air of 10 mg/m³ and a value for ambient air in residential areas of 0.03 mg/m³⁽³⁵⁾.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion. Absorbed through the intact skin.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to eyes and skin.

Ingestion: Grade 2; LD₅₀ (oral, mouse) = 3.65 g/kg; (oral, rat) = 7.57 g/kg. 2,2-Dichloropropionic acid is a corrosive chemical and can cause irritation and burn the skin and eyes, causing permanent damage. Symptoms include apprehension, anxiety, confusion, nervous excitation: dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death. Exposure can irritate the upper respiratory tract. 2,2-dichloropropionic acid may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash.

Long Term Exposure: May cause liver and kidney damage. May cause skin allergy.

Points of Attack: Eyes, skin, respiratory system, gastrointestinal tract, central nervous system

Medical Surveillance: If overexposure or illness is suspected, consider: Lung function tests. Kidney and liver function tests.

Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Eyes: Speed in removing material from eyes and skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. **Do not scrub skin or hair**, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with

their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. *Do not induce vomiting.** In cases of ingestion, the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do not give activated charcoal before or with ipecac syrup.* *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. *Do not use mouth-to-mouth resuscitation; use bag/mask apparatus.* If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Daminozide (ANSI)

Use Type: Plant growth regulator

CAS Number: 1596-84-5

Formula: C₆H₁₂N₂O₃

Synonyms: Bernsteinsaeure-2,2-dimethylhydrazid (German); Butanedioic acid mono(2,2-dimethylhydrazide); DIMAS; *N*-Dimethyl amino- β -carbonyl propionic acid; *N*-(Dimethylamino)succinamic acid; *N*-dimethylamino-succinamidsaeure (German) DMASA; DMSA; NCI-C03827; Succinic acid, 2,2-dimethylhydrazide; Succinic-1,1-dimethyl hydrazide

Trade Names: ALAR[®], Crompton (USA); ALAR-85[®], Crompton (USA); AMINOZID[®]; AMINOZIDE[®]; B-9[®]; B-995[®]; B-NINE[®], Crompton (USA); DAZIDE[®], Fine Agrochemicals(UK); DAZIDE[®] ENHANCE, Fine Agrochemicals(UK); DIMAS[®]; KYLAR[®]; SADH[®]

Producers: Crompton (USA); Fine Agrochemicals(UK); Rhone-Poulenc Agro France (France); Sigma-Aldrich (USA)

EPA/OPP PC Code: 035101

California DPR Chemical Code: 7

EINECS Number: 216-485-9

Uses: Daminozide is a systemic growth regulator registered for use on ornamentals, including potted chrysanthemums and poinsettias, and bedding plants in enclosed structures. U.S. sales for food and feed crops were halted in 1989 because of health considerations, i.e., the Alar scare on apples.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–40.22989 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–31007.43129 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

U.S. NTP Carcinogen: Carcinogen (Animal Positive) (NCI) (NTP)⁽⁹⁾

California Prop. 65: Carcinogen

Label Signal Word: CAUTION, DANGER

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- AB 2588-Air toxics "hot spots" chemicals (CAL)
- Prop 65 chemicals (CAL)
- Actively registered pesticides in California

Description: White crystalline solid. Soluble in water; solubility = 100 g/kg @ 25°C. Molecular weight = 160.20. Melting/Freezing point = 154°C. Vapor pressure = 1×10^{-8} mmHg @ 20°C. Log K_{ow} = very low. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin.

Determination in Air: Filter: none; Gravimetric; NIOSH IV [Particulates NOR: #0500 (total), #0600 (respirable)].⁽¹⁸⁾

Harmful Effects and Symptoms

Short Term Exposure: The acute LD₅₀ (oral, rat) = 8400 mg/kg (insignificantly toxic). However, Daminozide

metabolizes to dimethylhydrazine which is a proven carcinogen in animal tests. It has a low dermal irritation potential and it is neither teratogenic nor mutagenic⁽⁵⁵⁾. It is not an acute toxicant to fish or wildlife.

First Aid: Skin: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. **Eyes:** Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20-30 minutes. Seek medical attention. **Inhalation:** Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. **Ingestion:** If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting

Dazomet

Use Type: Fumigant, fungicide and nematicide

CAS Number: 533-74-4

Formula: C₅H₁₀N₂S₂

Synonyms: Caswell No. 840; Dimethylformocarbthialdine; 3,5-Dimethylperhydro-1,3,5-thiadiazin-2-thione (Czech, German); 3,5-Dimethyl-1,2,3,5-tetrahydro-1,3,5-thiadiazinethione-2; 3,5-Dimethyltetrahydro-1,3,5-2H-thiadiazine-2-thione; 3,5-Dimethyltetrahydro-1,3,5-thiadiazine-2-thione; 3,5-Dimethyl-1,3,5-thiadiazinane-2-thione; 3,5-Dimethyl-2-thionotetrahydro-1,3,5-thiadiazine; DMTT; Tetrahydro-2H-3,5-dimethyl-1,3,5-thiadiazine-2-thione; Tetrahydro-3,5-dimethyl-1,3,5-thiadiazine-2-thione; Tetrahydro-3,5-dimethyl-2H-1,3,5-thiadiazine-2-thione; 2H-1,3,5-Thiadiazine-2-thione, tetrahydro-3,5-dimethyl-; 2-Thio-3,5-dimethyltetrahydro-1,3,5-thiadiazine

Trade Names: AMA-20[®], Kemira Chemicals (Finland); BASAMID[®], BASF Agricultural Products (Germany);

BASAMID[®] G, BASF Agricultural Products (Germany); BASAMID[®]-GRANULAR, BASF Agricultural Products (Germany); BASAMID[®] P, BASF Agricultural Products (Germany); BASAMID-PUDER[®], BASF Agricultural Products (Germany); CARBOTHIALDIN[®]; CARBOTHIALDINE[®]; CRAG[®]; CRAG[®] FUNGICIDE 974; CRAG[®] NEMACIDE; DAZOMET[®]-POWDERBASE, BASF Agricultural Products (Germany); FENNOSAN[®] B 100; MICO-FUME[®]; MYLON[®]; MYLONE[®]; MYLONE[®] 85; N 521[®]; NALCON 243[®]; PREZERVIT[®]; STAUFFER N[®] 521; THIADIAZIN[®] (PESTICIDE); TIAZON[®]; TROYSAN[®] 142; UCC 974[®]

Producers: BASF Agricultural Products (Germany), Kemira Chemicals (Finland); Union Carbide (USA)

Chemical Class: Unclassified

EPA/OPP PC Code: 035602

California DPR Chemical Code: 233

ICSC Number: 0786

RTECS Number: X12800000

EEC Number: 613-008-00-X

Uses: Dazomet is a soil fumigant used against germinating weed seeds, soil insects, nematodes, and soil-borne diseases in forest nursery seed beds, tobacco crops, greenhouse crops, and substrates for potted plants, turf, and ornamentals. It is also used as an antimicrobial agent for slimicide preparations and for adhesives, paper-mill slimicide, paint, and cooling water slimicides.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate 24,500 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate 16,769,960 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, unclassifiable, ambiguous data

Label Signal Word: CAUTION

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- RCRA Section 261 Hazardous Constituents
- EPA Hazardous Waste Number (RCRA No.): U366
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Description: White crystalline solid. Nearly odorless. Slightly soluble in water; solubility = 1,300 mg/l. @ 25°C. Molecular weight = 162.27. Melting/Freezing point = 102-105°C (decomposes). Vapor pressure = 3.2 x 10⁻⁶ mm @ 20°C. Flash point = 93°C. Combustible in dust form. Log K_{ow} = 1.38. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Sensitive to moisture and heat. Decomposes on heating above 102°C, producing toxic fumes including nitrogen oxides and sulfur oxides. Decomposes on contact with acids producing carbon disulfide. Decomposes on contact with water or moisture producing toxic gases.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Absorbed through the skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritates skin and a severe eye irritant. Poisonous if swallowed.

Long Term Exposure: Skin sensitizer.

Points of Attack: Skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

- California Environmental Protection Agency "Chemical List of Lists." Sacramento CA (February 1997)

2,4-DB

Use Type: Herbicide

CAS Number: 94-82-6

Formula: C₁₀H₁₀Cl₂O₃

Synonyms: Acido 2,4-diclorofenoxibutirico (Spanish); 2,4-DB butyric; Butanoic acid, 4-(2,4-dichlorophenoxy)-; Butyric acid, 4-(2,4-dichlorophenoxy)-; Caswell No. 316; 4(2,4-DB); 4-(2,4-Dichlorophenoxy)butyric acid; γ -(2,4-Dichlorophenoxy)butyric acid; 2,4-DM

Trade Names: BUTIREX[®]; BUTORMONE[®]; BUTOXON[®]; BUTOXONE[®]; BUTOXONE[®] ESTER; BUTOXONE[®] AMINE; BUTYRAC[®]; BUTYRAC[®] 118; BUTYRAC[®] 200; BUTYRAC[®] ESTER; CAMPBELL'S[®] DB STRAIGHT; CAMPBELL'S[®] REDLEGOR; DESORMONE[®]; EMBUTOX KLEAN-UP[®]; EMBUTONE[®]; EMBUTOX[®]; LEGUMEX[®] D

Producers: A H Marks (UK); Lancaster Synthesis (UK); Makhteshim-Agan (Israel); United Phosphorus (India)

Chemical Class: Chlorophenoxy compound; Halo-organics

EPA/OPP PC Code: 030801

California DPR Chemical Code: 5020

RTECS Number: ES9100000

EINECS Number: 202-366-9

Uses: 2,4-DB is a selective systemic herbicide used to control annual and perennial broadleaf weeds in many field

crops such as alfalfa, peanuts, cereals and soybeans; used as a defoliant. In the plant, the compound changes to 2,4-D and inhibits growth at the tips of stems and roots.

Human toxicity (long-term)⁽⁷⁷⁾: Low-70.00 ppb. Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low-269.85657 ppb. MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

TRI Developmental Toxin: Reproductive and developmental toxin

Regulatory Authority:

- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides
- The "Director's List" (CAL/OSHA) as chlorophenoxy pesticides

Description: White to light-brown crystalline solid. Slight phenolic odor. Soluble in water; solubility = 46 mg/L @ 25°C. Molecular weight = 249.09. Melting/Freezing point = 119°C. Vapor pressure = 3.5 x 10⁻⁶ mmHg @ 25°C(est). Log K_{ow} = >3.5. Values above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin; slightly corrosive to iron, aluminum, zinc.

Permissible Exposure Limits in Air:

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)].⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years.

Long Term Exposure: Workers exposed to chlorophenoxy compounds such as 2,4-D (in the manufacturing process) over a five to ten year period at levels above 10 mg/m³ complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affect human reproduction

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidney

Medical Surveillance: See a physician if poisoning is suspected for if redness, itching, or burning of the skin or eyes develop.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

DCPA

Use Type: Herbicide

CAS Number: 1861-32-1

Formula: C₁₀H₆Cl₄O₄

Alert: A General Use Pesticide (GUP)

Synonyms: Chlorthal-dimethyl; Chlorthal-methyl; Dimethyl tetrachloroterephthalate; Dimethyl 2,3,5,6-tetrachloroterephthalate; Chlorthal dimethyl; 2,3,5,6-Tetrachloro-1,4-benzenedicarboxylic acid, dimethyl ester; Tetrachloroterephthalic acid, dimethyl ester; 2,3,5,6-Tetrachlorophthalsäure-dimethylester (German)

Note: "DCPA" is also a synonym for Propanil (CAS 709-98-8)

Trade Names: ACME[®], Pbi/Gordon (USA); DAC 893[®], Amvac Chemical (USA); DACTHAL[®], Amvac Chemical (USA); DACTHAL[®] W-75; DECIMATE[®] (with Propachlor); FATAL[®], GREEN WEEDER[®], Pbi/Gordon (USA)

Producers: Amvac Chemical (USA); Epochem (China); ISK Biosciences (USA); Pbi/Gordon (USA); Nufarm (Australia)

Chemical Class: Organochlorine; alkyl phthalate; chlorinated benzoic acid

EPA/OPP PC Code: 078701

California DPR Chemical Code: 179

Uses: This preemergent herbicide is used on annual broadleaf weeds and grasses in a wide spectrum of vegetable crops.

U.S. Maximum Allowable Residue Levels for Chlorthal-dimethyl (40 CFR 180.185):

CROP	ppm
Basil, dried leaves	5

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- Washington state requires supplemental labeling as DACTHAL[®] W-75

Description: White crystalline solid. Essentially odorless. Practically insoluble in water; solubility = 0.5 ppm @ 25°C. Molecular weight 331.97. Melting/Freezing point = 155°C. Vapor pressure <0.4 mmHg @ 30°C.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: EPA Methods 8081, 608.2, 515.2.

Routes of Entry: Inhalation, ingestion. Absorbed through the intact skin.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death.

Points of Attack: CNS. May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Eyes: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly,

irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. *Skin:* Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. *Do not induce vomiting.** In cases of ingestion, the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do not give activated charcoal before or with ipecac syrup.* *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. *Do not use mouth-to-mouth resuscitation; use bag/mask apparatus.* If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Decanoic Acid

Use Type: Microbiocide

CAS Number: 334-48-5

Formula: C₁₀H₂₀O₂

Synonyms: Acido decanoico (Spanish); Capric acid; *n*-Capric acid; Caprinic acid; Caprynic acid; *n*-Decanoic acid; *n*-Decoic acid; Decylic acid; *n*-Decylic acid; 1-Nonanecarboxylic acid

Trade Names: ECONOSAN[®], West Agro (USA); HEXACID[®]-1095; NEO-FAT 10[®]

Producers: West Agro (USA)

Chemical Class: Unclassified

EPA/OPP PC Code: 128955

California DPR Chemical Code: 2315

Uses: Used in cleaning, sanitizing and disinfecting applications for food processors and dairy farmers.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

Regulatory Authority:

- Actively registered pesticide in California.

Description: White crystalline solid or needles. Unpleasant, rancid odor. Insoluble in water. Molecular weight = 172.26. Density = 0.8858 @ 40°C. Boiling point = 268–270°C @ 30 mmHg. Melting/Freezing point = 31–32°C. Vapor pressure = 1 mm @ 125°C. Flash point = >110°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health Hazards (Blue): 0; Flammability (Red): 1; Reactivity (Yellow): 0. Log K_{ow} = 1.86. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: An organic acid. Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Corrosive solution: attacks most common metals. React violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Mixture with some silver compounds forms

explosive salts of silver oxalate. Incompatible with silver compounds.

Routes of Entry: Inhalation, skin and eye contact, ingestion.
Harmful Effects and Symptoms

Short Term Exposure: Vapors cannot be tolerated even at low concentrations; can cause severe irritation of eyes and throat; may cause eye and lung injury. If inhaled, causes coughing or difficult breathing. Contact with liquid or solid causes second and third degree burns in a short time; very injurious to the eyes. If swallowed, causes nausea and vomiting. Toxicity by ingestion: Grade 3; LD₅₀ = 129 mg/kg mouse, intravenous.

Long Term Exposure: May cause lung damage.

Medical Surveillance: Lung x-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8 ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel:* Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

D-D mixture

Use Type: Fumigant and nematicide

CAS Number: 8003-19-8

Formula: C₃H₆Cl₂:C₃H₄Cl₂

Synonyms: 1,3-Dichloro-1-propene, mixture with 1,2-dichloropropane; 1,3-Dichloropropene and 1,2-Dichloropropane mixture; Dichloropropan-Dichlorpropengemisch (German); ENT 8,420; Mezcla de dicloropropeno y dicloropropano (Spanish); Mixture of 1,3-dichloropropane, 1,3-dichloropropene, and related C₃ compounds

Trade Names: DOWFUME[®]-N, Dow AgroSciences (USA); NEMAFENE[®]; TELONE[®]; NEMAFENE[®]; VIDDEN[®]-D

Producers: Dow AgroSciences (USA)

Chemical Class: Substituted allyls; Chlorinated hydrocarbon, aliphatic

EPA/OPP PC Code: 029003

California DPR Chemical Code:

RTECS Number: TX9800000

EINECS Number: 208-826-5

Uses: Controls plant parasites (nematodes, symphylids, and wireworms) on a broad range of crops; pre-planting treatment to cankers on peach trees and other fruit; controls quackgrass in white potatoes crops.

Regulatory Authority:

- The "Director's List" (CAL/OSHA)
- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA); Toxic Pollutant (Section 401.15)
- RCRA Section 261 Hazardous Constituents, waste number not listed
- EPCRA Section 304 RQ: CERCLA, 100 lb (45.4 kg)
- Marine pollutant (49CFR, Subchapter 172.101, Appendix B)

Description: Straw to amber liquid. Pungent, garlic-like odor. Sinks and slowly mixes with water. Molecular weight = 223.96. Density = 1.4 @ 4°C (approx.). Boiling point = 103–171°C. Melting/Freezing point = (estimated) –61°C; Specific gravity = 1.2. Flash point = 19°C (cc); LEL: 5.3%; UEL: 14.5%; Hazard Identification (based on NFPA-704 M Rating System): Health Hazards (Blue): 3; Flammability (Red): 3; Reactivity (Yellow): 0. Vapor pressure = 4.6 kPa @ 20°C. Log K_{ow} = 2.0. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Inorganic bases; concentrated acids; halogens; metal salts. Corrosive to iron, aluminum, magnesium, zinc, and other active metals and alloys.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, absorbed by skin.

Harmful Effects and Symptoms

Short Term Exposure: *Liquid:* May be fatal if swallowed or absorbed through skin. Will burn exposed tissues. *Vapors:* Cause eye and upper respiratory irritation and drowsiness. Corrosive to skin or eyes; severe irritation and burns. Ingestion will cause acute gastrointestinal distress, with congestion. Inhalation will cause gasping, refusal to breathe, respiratory distress; pulmonary edema may develop.

Long Term Exposure: Repeated exposure may cause central nervous system depression, and liver and kidney damage.

Points of Attack: Liver, kidneys, CNS.

Medical Surveillance: Liver and kidney function tests.

First Aid: Move victim to fresh air. If breathing has stopped, give artificial respiration. If breathing is difficult, administer oxygen. *Eyes:* hold eyelids open and flush with water for 15 minutes. *Skin:* flush with water for 15 minutes; wash with soap and water. Remove and double bag

contaminated clothing and shoes at the site. *If ingested and victim is conscious and able to swallow,* have victim drink water and induce vomiting. *If ingested and victim is unconscious or having convulsions,* do nothing except keep victim warm.

DDT

Use Type: Insecticide

CAS Number: 50-29-3 9 (*p,p'*-DDT); 789-02-6 (*o,p'*-DDT)

Formula: C₁₄H₉Cl₅

Alert: DDT was banned from use in the U.S. on December 31, 1972, but it is still used in other countries, primarily in the subtropics to control malaria. It is in the U.S. EPA Toxicity Class II, moderately toxic. Human toxicity (long-term): High.

Synonyms: Benzene, 1,1'-(2,2,2-trichloroethylidene)bis(4-chloro); *α,α*-Bis(*p*-chlorophenyl)-*β,β,β*-trichloroethane; 1,1-Bis(*p*-chlorophenyl)-2,2,2-trichloroethane; 2,2-Bis(*p*-chlorophenyl)-1,1-trichloroethane; Chlorophenoethane; Chlorophenoethane; *α*-Chlorophenoethane; Chlorophenotoxum; Dichlorodiphenyl trichloroethane 2,2-Bis(*p*-chlorophenyl)-1,1,1-trichloroethane; *p,p'*-DDT; 4,4'-Dichlorodiphenyltrichloroethane; *p,p'*-Dichlorodiphenyltrichloroethane; 4,4'-Dichlorodiphenyltrichloroethane; Dichlorodifeniltrichloroetano (Spanish); Diphenyltrichloroethane; ENT 1,506; Ethane, 1,1,1-trichloro-2,2-bis(*p*-chlorophenyl)-; NA 2761; NC1-C00464; OMS 16; Parachlorocidum; PEB1; Pentachlorin; 1,1,1-Trichloro-2,2-bis(4-chlorofenyl)-ethaan (Dutch); 1,1,1-Trichloro-2,2-bis(4-chlor-phenyl)-aethan (German); Trichlorobis(4-chlorophenyl)ethane; 1,1,1-Trichloro-2,2-bis(*p*-chlorophenyl)ethane; 1,1,1-Trichloro-2,2-di(4-chlorophenyl)-ethane; 1,1,1-Trichloro-2,2-bis(4-cloro-fenil)-etano (Italian)

Producers: Fluorochem (UK); Hindustan Insecticides (India); Shenzhen Guomeng Industry Co., Ltd. (China)

Chemical Class: Organochlorine; Halo-organics

EPA/OPP PC Code: 029201

California DPR Chemical Code: 186

ICSC Number: 0034

RTECS Number: KJ3325000

EEC Number: 602-045-00-7

Uses: DDT is an organochlorine insecticide used mainly to control mosquito-borne malaria. It was extensively used during the Second World War among Allied troops and certain civilian populations to control insect typhus and malaria vectors, bubonic plague and body lice and was then extensively used as an agricultural insecticide after 1945. By 1970, the Bald Eagle and the Osprey population in the U.S. were near extinction. DDT was banned for use in Sweden in 1970 and in the United States in 1972. DDT is a relatively low-cost broad-spectrum insecticide. However, following an extensive review of health and environmental hazards of the use of DDT, U.S. EPA decided to ban further use of DDT in December 1972. This decision was based on several properties of DDT that had been well evidenced: (1) DDT and its metabolites are toxicants with long-term persistence in soil and water; (2) it is widely dispersed by erosion, runoff and volatilization; and (3) the low-water solubility and high lipophilicity of DDT result in concentrated accumulation of DDT in the fat of wildlife and humans which may be hazardous. Nevertheless, DDT is used to control malaria in subtropical countries, in Africa and some South American locales, where malaria is of epidemic proportions.

Human toxicity (long-term)⁽⁷⁷⁾: High-1.02941 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Extra high-0.09855 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, Probably Carcinogen

U.S. NTP Carcinogen: Reasonably anticipated carcinogen

California Prop. 65: Listed; Developmental, female, male.

IARC: Group 2B, possible carcinogen

WHO Acute Hazard: Class II, moderately hazardous

Endocrine Disruptor: Known ED

Regulatory Authority:

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.
- Canada, Drinking Water Quality, 0.03 mg/L MAC
- Mexico, Drinking Water Criteria, 0.001 mg/L.

Description: DDT is a waxy solid, colorless crystalline solid, or slightly off-white powder. Weak, chemical odor. Practically insoluble in water; solubility = 3.2×10^{-4} ppm @ 25°C. Molecular weight \approx 354.49. Melting/Freezing point = 107–109°C. Flash point = 72–75°C. Vapor pressure = 2.1×10^{-7} mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Log Kow = 6.15 @ 20°C. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard. Incompatible with salts of iron or aluminum, and bases. Do not store in iron containers.

Permissible Exposure Limits in Air: The Federal limit (OSHA PEL)⁽⁵⁸⁾ and the ACGIH⁽¹⁾ recommended TWA value is 1 mg/m³ as is the Australian, Israeli, Mexican, DFG⁽³⁾, HSE⁽³³⁾, and Canadian provincial (Alberta, BC, Ontario, Quebec) value. The NIOSH IDLH = 500 mg/m³. The HSE, Mexican and Alberta, and BC STEL value is 3 mg/m³. NIOSH⁽²⁾ recommended REL is 0.5 mg/m³. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set an MAC in workplace air of 0.1 mg/m³ and values for ambient air in residential areas of 0.005 mg/m³ on a momentary basis and 0.001 mg/m³ on a daily average basis. Several states have set guidelines or standards for DDT in ambient air⁽⁶⁰⁾ ranging from 1.8 $\mu\text{g/m}^3$ (Pennsylvania) to 2.38 $\mu\text{g/m}^3$ (Kansas) to 5.0 $\mu\text{g/m}^3$ (Connecticut) to 10.0 $\mu\text{g/m}^3$ (North Dakota) to 16.0 $\mu\text{g/m}^3$ (Virginia) to 24 $\mu\text{g/m}^3$ (Nevada).

Determination in Air: Collection on a filter, workup with isoctane, analysis by gas chromatography. See NIOSH Method #S-274⁽¹⁸⁾

a 24 hr average; never to exceed 0.13 $\mu\text{g/L}$. To protect human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is imposed by a level of 0.24 ng/l (0.00024 $\mu\text{g/L}$).

Various states have set guidelines and standards for DDT in drinking water⁽⁶¹⁾ ranging from guidelines of 0.42 $\mu\text{g/L}$ (Kansas) to 0.83 $\mu\text{g/L}$ (Maine) to 1.0 $\mu\text{g/L}$ (Minnesota) and a standard of 50 $\mu\text{g/L}$ (Illinois). The former USSR has set an MAC of 0.1 mg/L in water used for domestic purposes and zero in surface water for fishing⁽³⁵⁾. Canada has set a water quality MAC of 0.03 mg/L. Mexico⁽³⁵⁾ has set an MPC of 0.001 mg/L in drinking water supply; of 0.006 mg/L in estuaries and 0.6 $\mu\text{g/L}$ in coastal waters.

Determination in Water: Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Can cause irritation. 500-4200 mg/m³ has produced dizziness. *Skin:* Can cause irritation in very high concentrations. DDT can be absorbed through the skin if dissolved in vegetable oils or other solvents. *Eyes:* Can cause irritation. *Ingestion:* 1/30- to 1/4-ounce has caused nausea, vomiting, headache and convulsions. Other symptoms include weakness, restlessness, dizziness, incoordination, numbness of face and extremities, abdominal pain, diarrhea, tremors, and death. Symptoms may be delayed from ½ to 3 hours. Estimated lethal dose is between 1 teaspoon and 1 ounce. Can cause a prickling or tingling sensation in the mouth, tongue, lower face, nausea, vomiting, confusion, a sense of apprehension, weakness, loss of muscle control, and tremors, paresthesia tongue, lips, face; tremor; dizziness, confusion, malaise (vague feeling of discomfort), headache, fatigue; convulsions; paresis hands. High exposures can cause convulsions and death.

Long Term Exposure: DDT may cause liver and kidney damage. Prolonged or repeated exposure can cause irritation of the eyes, skin, and throat. Occupational exposure to DDT has been associated with changes in genetic material. DDT levels build up and stay in the body for long periods of time. Exposure to DDT and Aldrin may increase retention of DDT in the body. DDT causes cancer in laboratory animals. The U.S. EPA determined that DDT, DDE, and DDD are probable human carcinogens. There is no evidence that DDT, DDE, or DDD cause birth defects in people. Studies in rats have shown that DDT and DDE can mimic the action of natural hormones and in this way affect the development of the reproductive and nervous systems. Puberty was delayed in male rats given high amounts of DDE as juveniles. This could possibly happen in humans. A study in mice showed that exposure to DDT during the first weeks of life may cause neurobehavioral problems later in life.

Points of Attack: Eyes, skin, central nervous system, kidneys, liver, peripheral nervous system. Cancer Site in animals: liver, lung, and lymphatic tumors.

Medical Surveillance: Serum DDT level. Urine *dichlorodiphenyl acetic acid* level. Liver and kidney function tests.

First Aid: Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Deltamethrin

Use Type: Insecticide

CAS Number: 52918-63-5

Formula: C₂₂H₁₉Br₂NO₃

Alert: Some formulations are Restricted Use Pesticides (RUP)

Synonyms: (S)- α -Cyano-*m*-phenoxybenzyl (1R,3R)-3-(2,2-dibromovinyl)-2,2-dimethylcyclopropanecarboxylate; 1R-[1- α (S*),3- α]-cyano(3-phenoxyphenyl)methyl-3-(2,2-dibromovinyl)-2,2-dimethylcyclopropanecarboxylate; Cyclopropanecarboxylic acid, 3-(2,2-dibromoethenyl)-2,2-dimethyl-, cyano(3-phenoxyphenyl)methyl ester, [1R-(1 α (S*),3 α)]-; Decamethrin; (1R,3R)-3-(2,2-Dibromovinyl)-2,2-dimethylcyclopropane carboxylic acid, (S)- α -cyano-3-phenoxybenzyl ester

Trade Names: BUTOFLIN[®]; BUTOSS[®]; BUTOX[®]; CISLIN[®], Bayer CropScience (Germany); CRACKDOWN[®]; DECIS[®], Bayer CropScience (Germany); DELTA[®], Bayer CropScience (Germany); DELTAGUARD[®], Bayer CropScience (Germany); ESBECYTHRIN[®]; FMC 45498[®], FMC (USA); JMC 45498[®]; K-OTHRINE[®] dust; NRDC 161[®], RU 22974[®]; STRIKER[®] IEC insecticide (mixture of deltamethrin and tralomethrin)

Producers: Agrimor International (USA); Agsin (Singapore); Bayer CropScience (Germany); Bonide Products (USA); Chromos Agro (Croatia); FMC (USA); Hockley International (UK); Ki-Hara Chemicals Ltd. (UK); Nagarjuna Agrichem (India); Valent BioSciences (USA)

Chemical Class: Pyrethroid; botanical

EPA/OPP PC Code: 097805

California DPR Chemical Code: 3010

ICSC Number: 0247

RTECS Number: GZ1233000

EINECS Number: 258-256-6

Uses: Deltamethrin is a synthetic pyrethroid insecticide that kills insects on contact and through digestion. It is used to control a variety of chewing and sucking insects that infest fruit, vegetables and field crops, including apples, pears and plums; peas, glasshouse cucumbers, tomatoes, peppers, potted plants, and ornamentals; hops, oats, cotton and other field crops. Deltamethrin is also used to control residential and commercial insect pests.

Human toxicity (long-term)⁽⁷⁷⁾: Low–70.00 ppb, Health Advisory

Fish toxicity (threshold): Extra high–0.02258 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Deltamethrin (40 CFR 180.435):

CROP	ppm
Animal feed	0.05
Cotton, refined oil	0.2
Cotton, undelinted seed	0.04
Processed food	0.05
Tomato	0.2
Tomato, concentrated products	1

Carcinogen/Hazard Classifications

IARC: Group 3, unclassifiable

Label Signal Word: CAUTION

WHO Acute Hazard: Class II, moderately hazardous

Endocrine Disruptor: Suspected

Regulatory Authority:

- AB 1803-Well Monitoring Chemical (CAL) as pyrethrins
- FIFRA, 40CFR185: tolerances for pesticides in food
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum
- Actively registered pesticide in California. as pyrethrins
- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins
- EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg) as pyrethrins

Description: Crystalline solid or powder. Odorless. Combustible. Practically insoluble in water; solubility = ≤ 0.002 mg/L. Molecular weight = 505.22. Melting/Freezing point = 98-100°C. Boiling point decomposes on distillation. Vapor pressure = 2×10^{-8} mmHg @ 25°C; 0.002 mPa @ 25°C. Density = 1.22 @ 25°C. Log K_{ow} = 5.41. Values above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate.

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008⁽¹⁸⁾. (pyrethrum)

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008⁽¹⁸⁾.

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous. May be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause severe irritation and burns to skin and eyes. Pyrethrins can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness, rhinorrhea (discharge of thin nasal mucous).

Long Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic “pneumonia” can also occur with cough, chest pain, breathing difficulty and abnormal chest x-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Skin contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse.

Points of Attack: Respiratory system, skin, central nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended:

Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest x-ray if lung symptoms are present. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

EEC Number: 015-031-00-5 (demeton-*S*); 015-030-00-X (demeton-*O*)

Uses: Demeton mixture is a plant systemic and extremely toxic to bees, fish and wildlife.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.28 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–3.85101 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classification

Label Signal Word: DANGER; WARNING, DANGER (demeton-*s*)

WHO Acute Hazard: Class 1b, highly hazardous (demeton-*s*)

Regulatory Authority:

- Banned or Severely Restricted (in agriculture) (Germany and Russia)

- Very Toxic Substance (World Bank)
- AB 1803-Well Monitoring Chemical (CAL)
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (DFG)⁽³⁾ (Israel) (Mexico) (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates

For demeton and demeton-S:

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Clear, light yellow to light brown, oily liquids. Colorless to pale yellow, oily liquid (demeton-O). Odor of sulfur compounds. Slightly soluble in water; solubility = 25 mg/L (demeton-O). Molecular weight = 258.38 (demeton-O). Melting/Freezing point = < -13°C. Boiling point = 92-93° @ 0.15 mmHg (demeton-O); 123°C @ 1 mmHg; 134°C @ 2 mmHg. Vapor pressure = 1.79 to 3.4 × 10⁻³ mmHg @ 20°C. Flash point = 45°C. Explosive limits: LEL = 1%; UEL = 5.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers, strong bases, soluble mercury, other pesticides, and water.

Permissible Exposure Limits in Air: The Federal limit (OSHA⁽²⁾ PEL) is 0.1 mg/m³. The ACGIH⁽¹⁾ recommended TWA value is 0.01 ppm (0.11 mg/m³). The DFG, Australian, Israeli, Mexican, and Canadian provincial (Alberta, BC, Ontario, Quebec) TWA value⁽³⁾ is the same as OSHA and Mexico, Alberta, and BC set a STEL of 0.03 ppm (0.3 mg/m³). OSHA⁽²⁾, NIOSH⁽²⁾ and ACGIH⁽¹⁾ adds the notation "skin" indicating the possibility of cutaneous absorption. The NIOSH⁽²⁾ IDLH level = 10 mg/m³. The MAC in workplace air set in the former USSR is 0.02 mg/m³^(35,43). Brazil has set an MAC in workplace air of 0.08 mg/m³⁽³⁵⁾. States which have set guidelines or standards for Demeton in ambient air⁽⁶⁰⁾ include North Dakota at 1.0 µg/m³ and Connecticut and Nevada at 2.0 µg/m³.

Determination in Air: Filter/XAD-2[®] (tube); Toluene; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH IV Method #5514.⁽¹⁸⁾

Permissible Concentration in Water: An MAC of 0.01 mg/L in water bodies used for domestic purposes has been set in The former USSR^(35,43).

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Demeton can be absorbed through the skin, thereby increasing exposure. Demeton may cause effects on the nervous system by cholinesterase inhibiting effect, causing convulsions, respiratory failure and possible death. High exposure (above OEL) may result in unconsciousness and death. Acute exposure to Demeton may produce the following symptoms of exposure: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. This material is a cholinesterase inhibitor. It is readily absorbed through the skin and is extremely toxic. Probable human lethal oral dose is 5-50 mg/kg or 7 drops to 1 teaspoonful for 150 lb. person. Acute dose is believed to be 12 to 20 mg by oral route. The effects may be delayed. Medical observation is indicated.

Long Term Exposure: May cause mutations. May damage the developing fetus. May damage the nervous system, causing sensation of "pins and needles" in the hands and feet. May cause depression, irritability and personality changes. Cumulative effect is possible. Demeton may affect cholinesterase, causing significant depression of blood cholinesterase.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical

contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Demeton-methyl

Use Type: Insecticide and miticide

CAS Number: 8022-00-2; 301-12-2 (oxydemeton-methyl); 919-86-8 (demeton-S-methyl); 867-27-6 (demeton-O-methyl)

Formula: C₆H₁₅O₃PS₂

Alert: Demeton-S-methyl is no longer registered for use in the U.S. Human toxicity (long-term): (oxydemeton-methyl) High High

Synonyms: Demethon-methyl; ENT 18,862; S (and O)-2-(Ethylthio)ethyl-O,O-dimethyl phosphorothioate; Methyl demeton; Methyl mercaptophos; Phosphorothioic acid, O-2-(ethylthio)ethyl O,O-dimethyl ester mixed with S-2-(ethylthio)ethyl O,O-dimethyl phosphorothioate

Demeton-O-methyl: O-(2-(Ethylthio)ethyl) O,O-dimethyl phosphorothioate; Phosphorothioic acid, O-(2-(ethylthio)ethyl) O,O-dimethyl ester; Methyl demeton-O; Methyl-O-demeton

Oxydemeton-methyl: AI3-24964; Caswell No. 455; O,O-Dimethyl S-[2-(ethylsulfinyl)ethyl]phosphorothioate; O,O-Dimethyl S-[2-(ethylsulfinyl)ethyl]thiophosphate; S-[2-(Ethylsulfinyl)ethyl]O,O-dimethyl phosphorothioate; Isomethylsystox sulfoxide; Demeton-O-methyl sulfoxide; Demeton-S-methyl sulfoxide; Demeton-methyl sulphoxide; O,O-Dimethyl S-(2-eththionylethyl) phosphorothioate; Dimethyl S-(2-eththionylethyl) thiophosphate; O,O-Dimethyl S-[2-(ethylsulfinyl)ethyl] monothiophosphate; O,O-Dimethyl S-2-(ethyl sulfinylethyl)phosphorothioate; O,O-Dimethyl S-[2-(ethylsulfinyl)ethyl] phosphorothioate;

O,O-Dimethyl S-(2-ethylsulfinyl)ethyl thiophosphate; O,O-Dimethyl S-ethylsulphinyethyl phosphorothioate; ENT 24,964; Ethanethiol, 2-(ethylsulfinyl)-, S-ester with O,O-dimethylphosphorothioate; S-[2-(Ethylsulfinyl)ethyl] O,O-dimethyl ester phosphorothioic acid; S-(2-(Ethylsulfinyl)ethyl) O,O-dimethyl phosphorothioate; S-2-Ethylsulfinylethyl O,O-dimethyl phosphorothioate; S-2-Ethylsulphinyethyl O,O-dimethyl phosphorothioate; Isomethylsystox sulfoxide; Metaisostox sulfoxide; Metasystemox; Metasystemox R; Metasystox R; Methyl demeton-O-sulfoxide; Methyl oxydemeton S; NSC 370785; Oxydemetonmethyl; Oxydemeton-methyl; Oxydemeton methyl [S-2-(Ethylsulfinyl)ethyl]O,O-dimethyl ester phosphorothioic acid; Phosphorothioic acid, O,O-dimethyl S-[2-(ethylsulfinyl)ethyl] ester; Phosphorothioic acid, S-[2-(ethylsulfinyl)ethyl] O,O-dimethyl ester

Demeton-s-methyl: O,O-Dimethyl-S-(2-aethyl-thio-aethyl)-monothiophosphat (German); O,O-Dimethyl-S-(2-eththioethyl)phosphorothioate; Dimethyl-S-(2-eththioethyl)thiophosphate; O,O-Dimethyl-S-ethylmercaptoethyl thiophosphate; O,O-Dimethyl-S-ethylmercaptoethyl thiophosphate, thiole isomer; O,O-Dimethyl-S-(2-(eththio)ethyl)phosphorothioate; O,O-Dimethyl-S-(3-thia-pentyl)-monothiophosphat (German); S-(2-(ethylthio)ethyl)-O,O-dimethylphosphorothioate; S-(2-(Ethylthio)ethyl)dimethyl phosphorothioate; S-(2-(Ethylthio)ethyl)-O,O-dimethyl thiophosphosphate; Methyl demeton thioester; Methyl isosystox; Thiophosphate de O,O-dimethyle et de S-2-ethylthioethyle (French)

Trade Names: AIMCO SYSTOX[®] (oxydemeton-methyl); BAY 15203[®], Bayer CropScience (Germany); BAY 21097[®] (oxydemeton-methyl); BAYER 21097[®] (oxydemeton-methyl); BAYER 21/116[®], Bayer CropScience (Germany); DURATOX[®]; MATA-SYSTOX[®], Bayer CropScience (Germany); Gowan Company (USA) canceled 3/18/1987; METASYSTOX-R[®], Bayer CropScience (Germany); METHYL SYSTOX[®], Bayer CropScience (Germany), canceled 3/18/1987; ODM[®]; MSR[®]; R 2170[®]

Demeton-S-methyl: BAY 18436[®], Bayer CropScience (Germany); BAYER 25-154[®], Bayer CropScience (Germany); DSM[®]; DURATOX[®]; ISOMETASYSTOX[®], Bayer CropScience (Germany), canceled; ISOMETHYLSYSTOX[®]; METAISOSEPTOX[®]; METAISOSYSTOX[®], Gowan (USA); METASYSTOX[®] FORTE, Gowan (USA); MIFATOX[®]; PERSYST[®]

Producers: Bayer CropScience (Germany); Bharat Pulverizing Mills (India); Ehrenstorfer, Dr. (Germany); Gowan Company (USA); Sigma-Aldrich Laborchemikalien (Germany); **Demeton-S-methyl:** Bayer CropScience (Germany); Gowan Company (USA)

Chemical Class: Organophosphate

EPA/OPP PC Code: 058701; 058702 (oxydemeton-methyl); 058703 (demeton-O-methyl); 057603 (demeton-S-methyl)

California DPR Chemical Code: 4063

ICSC Number: 0862

RTECS Number: TG1760000; TG1750000 (demeton-S-methyl)

EEC Number: 015-031-00-5

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1b, highly hazardous

California Prop. 65: Listed; Developmental toxin, female, male for the oxydemeton-methyl form.

TRI Developmental Toxin: Reproductive and developmental toxin

Label Signal Word: WARNING, DANGER (Demeton-S-methyl)

WHO Acute Hazard: Class 1b, highly hazardous (Demeton-S-methyl)

Uses: Used to control leafminers, thrips, whiteflies, aphids, leafhoppers and mealybugs, primarily on flowering ornamental plants. Demeton-S-methyl not registered for use in the U.S. Demeton-S-methyl is a systemic and contact insecticide that is used to kill sucking insects such as aphids, sawflies and spider mites in fruits, vegetables, potato, cereals, ornamentals and forestry management.

Human toxicity (long-term): (oxydemeton-methyl) High–3.50 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low–159.50116 ppb, MATC (Maximum Acceptable Toxicant Concentration); (oxydemeton-methyl) Intermediate–89.05435 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Regulatory Authority:

- Banned or Severely Restricted (Restricted In Many Countries) (UN)⁽³⁵⁾
- Proposition 65 chemical (CAL) (oxydemeton-methyl)
- Air Pollutant Standard Set (DFG)⁽³⁾ (ACGIH)⁽¹⁾
- The “Director’s List” (CAL/OSHA) (Demeton-S-methyl)
- EPCRA Section 302 Extremely Hazardous Substances: TPQ = 500 lb (227kg) (Demeton-S-methyl)
- EPCRA Section 304 RQ: EHS, 1 lb (0.454 kg) (Demeton-S-methyl)

Description: Demeton-methyl is a colorless to pale yellow oily liquid with an unpleasant odor. Slightly soluble in water. Molecular weight : 230.31. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Vapor pressure = very low. Log K_{ow} = 1.33 (Demeton-S-methyl). Unlikely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Strong oxidizers such as chlorine, bromine, fluorine. Demeton-S-methyl may react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate. May be dissolved in hydrocarbon solvent such as xylene which forms an explosive mixture with air. Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc); strong acids, strong bases, soluble mercury, other pesticides, and water.

Permissible Exposure Limits in Air: ACGIH⁽¹⁾ recommended TLV is 0.5 mg/m³ TWA, with skin notation. The DFG MAK is 0.5 ppm (4.8 mg/m³)⁽³⁾. This chemical can be absorbed through the skin, thereby increasing exposure. *Demeton-S-methyl:* The OSHA PEL⁽⁵⁸⁾ is 0.1 mg/m³. The ACGIH TWA value is 0.01 ppm (0.11 mg/m³). OSHA, NIOSH and ACGIH adds the notation “skin” indicating the possibility of cutaneous absorption. The NIOSH IDLH level for demeton is 10 mg/m³.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾. For *Demeton-S-methyl:*

Filter/XAD-2®(tube); Toluene; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH IV Method #5514⁽¹⁸⁾.

Permissible Concentration in Water: For *Demeton-S-methyl:* A MAC of 0.01 mg/L in water bodies used for domestic purposes has been set in the former USSR^(35, 43).

Routes of Entry: Inhalation and through the skin

Harmful Effects and Symptoms

Short Term Exposure: Methyl demeton can be fatal by skin contact even if there is no feeling of irritation. Exposure can cause rapid, fatal organophosphate poisoning. Acute exposure to this chemical may produce the following signs and Symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness, vomiting, diarrhea, abdominal pain, loss of coordination, seizures, coma and death. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Eye contact may cause irritation. Delayed pulmonary edema may occur after inhalation. See also Demeton entry.

Long Term Exposure: May cause mutations. In animal studies this chemical causes a decrease in fertility and is toxic to the animal fetus. See also Demeton entry.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or

carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive

pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

2,4-DES-sodium

Use Type: Herbicide

CAS Number: 136-78-7

Formula: $C_8H_7Cl_2NaO_5$; $Cl_2C_6H_3O(CH_2)_2OSO_3Na$

Alert: Tolerances for Sesone were revoked by the U.S. EPA March, 1999.

Synonyms: 2,4-DES-Na; 2,4-DES-natrium (German); 2-(2,4-Dichlorophenoxy)ethanol hydrogen sulfate sodium salt; 2,4-Dichlorophenoxyethyl sulfate, sodium salt; Disul; Disul-Na; Disul-sodium; Natrium-2,4-dichlorphenoxyathylsulfat (German); SES; Sesone; Sodium-2-(2,4-dichlorophenoxy)ethyl sulfate; Sodium-2,4-dichlorophenoxyethyl sulphate; Sodium-2,4-dichlorophenyl cellosolve sulfate

Trade Names: CRAG HERBICIDE I[®]; CRAG SESONE[®]; SCATHE PEANUT HERBICIDE[®], Landia Chemical Co. (USA), canceled 11/13/1986

Chemical Class: Chlorophenoxy acid or ester

EPA/OPP PC Code: 030602

ICSC Number: 1142

RTECS Number: KK4900000

U.S. Maximum Allowable Residue Levels for Sesone (40 CFR 180.102):

CROP	ppm
Asparagus	2.0
Peanut hay	6.0
Peanuts	6.0
Potatoes	6.0
Strawberries	2.0

Carcinogen/Hazard Classifications

IARC: Group 2B, possible carcinogen

Label Signal Word: CAUTION

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾

- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides
- The "Director's List" (CAL/OSHA)

Description: Colorless, crystalline solid. Odorless. Very soluble in water; solubility = 25% @ 25°C. Molecular weight = 309.10. Melting/Freezing point = 245°C (decomposes). Vapor pressure = 0.1 mmHg @ 20°C. May be used in a carrier solvent which may change its physical properties.

Incompatibilities: Strong oxidizers, acids.

Permissible Exposure Limits in Air: The Federal Limit (OSHA PEL) is 10 mg/m³, respirable fraction is 5 mg/m³(58). ACGIH⁽¹⁾ as of has set a TWA of 10 mg/m³. The NIOSH⁽²⁾ IDLH level = 500 mg/m³. Several states have set guidelines or standards for sesone in ambient air⁽⁶⁰⁾ ranging from 100 µg/m³ (North Dakota) to 160 µg/m³ (Virginia) to 200 µg/m³ (Connecticut) to 238 µg/m³ (Nevada).

Determination in Air: See NIOSH Method # S-356 (II)⁵⁽¹⁸⁾

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. High levels of exposure may cause central nervous system effects, convulsions. May affect the kidneys and liver.

Long Term Exposure: May cause liver and kidney damage.

Points of Attack: Eyes, skin, central nervous system, liver, kidneys.

Medical Surveillance: Liver function. Kidney function. Tests of nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Desmedipham (ANSI)

Use Type: Herbicide

CAS Number: 13684-56-5

Formula: C₁₆H₁₆N₂O₄

Synonyms: 3-(Aethoxycarbonylamino)phenyl-*N*-phenylcarbamate (German); Carbamic acid, *N*-phenyl-, 3-[(ethoxycarbonyl)amino]phenyl ester; *m*-Carbaniloyloxycarbanilic acid ethyl ester; 3-[(Ethoxycarbonyl)amino]phenyl *N*-phenylcarbamate; Ethyl *m*-hydroxycarbanilate carbanilate; Ethyl phenyl carbamoyloxyphenyl carbamate; Phenyl carbamoyloxyphenyl carbamate

Trade Names: BETANAL[®] AM; BETANAL[®]-475; BETANEX[®], Bayer CropScience (Germany); BETAMIX[®] 70 WP, Bayer CropScience (Germany); BETANEX[®] 70 WP, Bayer CropScience (Germany); EP 475[®]; PROGRESS[®], Bayer CropScience (Germany); SCHERING[®] 38107; SN-475[®]; SN-38107[®]

Producers: Bayer CropScience (Germany)

Chemical Class: Carbamate

EPA/OPP PC Code: 104801

California DPR Chemical Code: 1748

EINECS Number: 237-198-5

Uses: Post-emergence sugarbeet herbicide for control of annual weeds such as pigweed, wild mustard, lamb's quarters, nightshade, chickweed, buckwheat, goosefoot, ragweed, fiddleneck, and kochia.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–280.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low–225.68038 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Desmedipham (40 CFR 180.353):

CROP	ppm
Beet, garden, roots	0.2
Beet, garden, tops	15
Beet, sugar, roots	0.2
Beet, sugar, tops	0.2

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, unlikely carcinogen

Label Signal Word: WARNING, CAUTION, DANGER

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Description: Colorless, crystalline solid. Molecular weight = 300.34. Melting/Freezing point = 120°C. Vapor pressure = 2.9 × 10⁻⁹ mmHg @ 20°C.

Incompatibilities: May form explosive materials with phosphorus pentachloride. Forms Carbon monoxide and toxic nitrogen oxides when heated to decomposition.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)].⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

Long Term Exposure: A potent cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin

contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Dialifor (ANSI)

Use Type: Insecticide

CAS Number: 10311-84-9

Formula: C₁₄H₁₇ClNO₄PS₂

Alert: Tolerances were revoked in 1998.

Synonyms: *N*-(2-Chloro-1-(diethoxyphosphinpthioylthio)ethyl)phthalimide; *S*-(2-Chloro-1-(1,3-dihydro-1,3-dioxo-2*H*-isoindol-2-yl)ethyl)-*O,O*-diethyl phosphorodithioate; *S*-(2-Chloro-1-phthalimidoethyl)-*O,O*-diethyl phosphorodithioate; Dialifos; *O,O*-Diethyl-*S*-(2-chloro-1-phthalimidoethyl)phosphorodithioate; *O,O*-Diethyl phosphorodithioate *S*-ester with *N*-(2-Chloro-1-mercaptoethyl)phthalimide; ENT 27,320; Phosphorodithioic acid *S*-[2-chloro-1-(1,3-dihydro-1,3-dioxo-2*H*-isoindol-2-yl)ethyl]-*O,O*-diethyl ester; Phosphorodithioic acid-*S*-(2-chloro-1-phthalimidoethyl)-*O,O*-diethyl ester

Trade Names: HERCULES 14503[®], Hercules (USA) canceled 7/6/1979; TORAK[®], Hercules (USA) canceled 7/6/1979

Producers: Hercules (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate

EPA/OPP PC Code: 102501

California DPR Chemical Code: 1799

RTECS Number: TD5165000

Regulatory Authority:

- Banned or Severely Restricted (Malaysia, DDR)⁽¹³⁾
- Very Toxic Substance (World Bank)⁽¹⁵⁾
- The "Director's List" (CAL/OSHA)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4,540 kg)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: White crystalline solid or oily liquid. Also reported as an oil. Insoluble in water. Molecular weight = 393.85. Melting/Freezing point (solid) = 67–69°C.

Incompatibilities: Strong bases.

Permissible Exposure Limits in Air: No standards set.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, passing through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: This material is highly toxic (the LD₅₀ for rats is 5 mg/kg) This material can cause serious symptoms and in extreme cases death by respiratory arrest.

Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo

hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated

whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Diallate

Use Type: Herbicide.

CAS Number: 2303-16-4

Formula: $C_{10}H_{17}Cl_2NO_5$;
 $[(CH_3)_2CH]_2NCOSCH_2CCI=CHCl$

Alert: The U.S. Environmental Protection Agency revoked all tolerances for pesticide residue of diallate on August 30, 1996. Affected crops were alfalfa, barley, clover, field corn, flaxseed, lentils, peas, potatoes, safflower, soybeans, and sugar beets.

Synonyms: Bis(1-methylethyl) carbamothioic acid, S-(2,3-dichloro-2-propenyl)ester; Carbamothioic acid, Bis(1-methylethyl)-S-(2,3-dichloro-2-propenyl)ester; CP 15,336; DATC; 2,3-DCDT; Diallaat (Dutch); Diallat (German); Di-allate; Diallate carbamate herbicide; Dichloroallyldiisopropylthiocarbamate; S-2,3-Dichloroallyldiisopropylthiocarbamate; 2,3-Dichloroallyl N,N-diisopropylthiolcarbamate; 2,3-Dichloro-2-propene-1-

thiol, isopropylcarbamate; Diisopropylthiocarbamic acid, (2,3-dichloroallyl) ester; Di-isopropylthiolcarbamate des-(2,3-dichloro allyle) (French); 2-Propene-1-thiol, 2,3-dichloro-, diisopropylcarbamate; S-2,3-Dichloroallyl diisopropylthiocarbamate; S-2,3-Dichloroallyl diisopropyl(thiocarbamate); S-(2,3-Dichloroallyl) diisopropylthiocarbamate; S-(2,3-Dichloro-2-propenyl)bis(1-methylethyl)carbamothioate

Trade Names: AVADEx[®], Monsanto (USA), canceled 10/10/1989

Producers: Monsanto (USA)

Chemical Class: Thiocarbamate

EPA/OPP PC Code: 078801

California DPR Chemical Code: 48

RTECS Number: EX8225000

EINECS Number: 218-961-1

Uses: Used as a before or after planting treatment depending on the crop for control of wild oats. For use on alfalfa, alsike clover, barley, corn, flax, soybeans, lentils, peas, potatoes, red clover, sugar beets and sweet clover.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–35.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low–344.93242 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

IARC: Group 3, unclassifiable

Label Signal Word: WARNING

Regulatory Authority:

- Carcinogen (Animal Positive) (IARC)⁽⁹⁾
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- The "Director's List" (CAL/OSHA)
- EPA Hazardous Waste Number (RCRA No.): U062
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 8270(10)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 100 lb (45.4 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Diallate is a brown liquid. Slightly soluble in water; solubility = 14 ppm @ 25°C. Molecular weight = 270.22. Boiling point = 150°C @ 9 mmHg. Melting/Freezing point = 25–30°C. Vapor pressure = 1.9×10^{-4} mmHg @ 25°C Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Log K_{ow} = >3.1. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Alkalis.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: The former USSR has set an MAC of 0.03 mg/L in water used for domestic purposes^(35, 43).

Routes of Entry: Inhalation, passing through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can irritate and possibly cause burns. Inhalation caused irritation of the respiratory tract with chest tightness and/or difficulty breathing. Higher levels can affect the nervous system. With nausea, vomiting, diarrhea, abdominal pain, reduced muscle coordination, blurred vision, muscle twitching, convulsions, coma and possible death.

Long Term Exposure: High or repeated exposures can cause liver and kidney damage. There is limited evidence that diallate causes liver cancer in animals.

Points of Attack: Skin, eyes, nervous system.

Medical Surveillance: Lung function tests. Kidney and liver function tests. Examination of the nervous system. Interview exposed person for brain effects, including memory, mood, concentration, headaches, malaise, and altered sleep patterns.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Diatomaceous Earth

Use Type: Diatomaceous earth is used as an insecticide, molluscicide, and as a filler in pesticides.

CAS Number: 61790-53-2; 7631-86-9 [Silica, amorphous-diatomaceous earth (uncalcined)]

Formula: SiO₂

Synonyms: Amorphous Silica; Diatomaceous silica; Diatomite, uncalcined; Kieselguhr (German); Silica, amorphous diatomaceous earth; Precipitated amorphous silica; Silicon dioxide (amorphous)

Trade Names: CELITE[®], Celite (USA); CROP GUARD[®], Eagle-Picher Minerals (USA); DIACTIV[®], Celite (USA); DIAFIL[®], Celite (USA); DI-ATOMATE[®], White Mountain Natural Products (USA); DIE-SECTICIDE[®], White Mountain Natural Products (USA); KENITE[®], Celite (USA); PRIMISIL[®], Celite (USA)

Producers: ATOFINA (France); Bombay Mineral Supply (India); CECA (France); Celite (USA); Eagle-Picher Minerals (USA); Harcros Chemicals (USA); Hellenic Corundum (Greece); Merck (Germany); Omya (Switzerland); White Mountain Natural Products (USA); World Minerals (USA)

Chemical Class: Inorganic

EPA/OPP PC Code: 072605

California DPR Chemical Code: 195

ICSC Number: 0428

RTECS Number: HL8600000

Uses: Diatomaceous earth kills and repels insects by dehydrating them, rather than chemically poisoning them, and has been used since early times. It is also used as a filtering agent and as a filler in construction materials, pesticides, paints, and varnishes. The calcined version (which has been heat treated) is the most dangerous and contains crystallized silica, and should be handled as silica.

Carcinogen/Hazard Classifications

IARC: Group 3, unclassifiable

Label Signal Word: CAUTION, Group 3

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (former USSR)⁽⁴³⁾ (OSHA)⁽⁵⁸⁾
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)

Description: Diatomaceous earth is a transparent to gray, amorphous powder. Odorless. Insoluble in water. Molecular weight = 60.09. Boiling point = 2230°C. Melting/Freezing point = 1610°C. Vapor Pressure = 10 mmHg @ 1732°C.

Incompatibilities: High temperatures cause the formation of crystalline silica. Incompatible with oxygen difluoride, chlorine difluoride.

Permissible Exposure Limits in Air: The OSHA⁽²⁾ PEL TWA 20 mppcf [80 mg/m³/%SiO₂]. NIOSH⁽²⁾ recommends 6 mg/m³ as the limit. The ACGIH⁽¹⁾ recommended airborne exposure limit for respirable (small particles) diatomaceous earth is 1.0 mg/m³ of total dust (large and small particles containing no asbestos and less than 1% free silica) averaged over an 8-hour workshift. The NIOSH⁽²⁾ IDLH is 3,000 mg/m³. The former USSR-UNEP/IRPTC project has set an MAC of 2 mg/m³ in workplace air⁽⁴³⁾.

Determination in Air: Filter; Low-temperature ashing; x-ray diffraction spectrometry; NIOSH IV, Method #7501⁽¹⁸⁾; or, Gravimetric plus OSHA Method ID/42⁽⁵⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation

Harmful Effects and Symptoms

Short Term Exposure: Unknown at this time

Long Term Exposure: Exposure can cause permanent scarring of the lungs, especially if diatomaceous earth has been calcined (heat treated). Symptoms include shortness of breath and cough. This can begin anywhere from months to years after exposure. The name of this disease is silicosis. With heavy exposure, individuals may become respiratory cripples. This can be fatal.

Points of Attack: Lungs.

Medical Surveillance: Before first exposure to calcined diatomaceous earth and at regular times after, the following are recommended: Medical exam of the lungs. Lung function tests. Chest x-ray (every two to five years).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility.

Diazinon (ANSI)

Use Type: Non-systemic insecticide and acaricide

CAS Number: 333-41-5

Formula: C₁₂H₂₁O₃N₂SP

Alert: A Restricted Use Pesticide (RUP). The U.S. EPA initiated a program to phase out all non-agricultural uses of diazinon commencing in March, 2001. Many commercial outdoor uses of diazinon have been canceled or restricted to license pesticide applicators because of its known toxicity to birds and aquatic life. Diazinon is highly toxic to bees and very highly toxic to birds, fish and aquatic invertebrates. Diazinon was canceled for use on golf courses and sod farms in 1988 because of its high risk to birds.

Synonyms: *O,O*-Diaethyl-*O*-(2-isopropyl-4-methylpyrimidin-6-yl)-monothiophosphat (German); *O,O*-Diaethyl-*O*-(2-isopropyl-4-methyl-6-pyrimidyl)-thionophosphat (German); *O,O*-Diethyl-*O*-(2-isopropyl-4-

methyl-pyrimidin-6-yl)-monothiofosfaat (Dutch); Diethyl-4-(2-isopropyl-6-methylpyrimidinyl)phosphorothionate; Diethyl 2-isopropyl-4-methyl-6-pyrimidinyl phosphorothionate; *O,O*-Diethyl *O*-2-isopropyl-6-methylpyrimidin-4-ylphosphorothionate; *O,O*-Diethyl-*O*-(2-isopropyl-4-methyl-6-pyrimidyl)phosphorothionate; *O,O*-Diethyl 2-isopropyl-4-methylpyrimidyl-6-thiophosphate; *O,O*-Diethyl *O*-(2-isopropyl-4-methyl-6-pyrimidyl)thionophosphate; Diethyl 2-isopropyl-4-methyl-6-pyrimidylthionophosphate; *O,O*-Diethyl *O*-6-methyl-2-isopropyl-4-pyrimidinyl phosphorothionate; *O,O*-Diethyl *O*-(6-methyl-2-(1-methylethyl)-4-pyrimidinyl) phosphorothionate; ENT 19,507; Isopropylmethylpyrimidyl diethyl thiophosphate; *O*-2-Isopropyl-4-methylpyrimidyl-*O,O*-diethyl phosphorothionate; NA2783 (DOT); NCI-C08673; Phosphoric acid, *O,O*-diethyl *O*-6-methyl-2-(1-methylethyl)-4-pyrimidinyl ester; Phosphorothioate, *O,O*-diethyl *O*-6-(2-isopropyl-4-methylpyrimidyl); Phosphorothioic acid, *O,O*-diethyl *O*-(2-isopropyl-6-methyl-4-pyrimidinyl) ester; Phosphorothioic acid, *O,O*-diethyl *O*-(isopropylmethylpyrimidyl) ester; Phosphorothioic acid, *O,O*-diethyl *O*-(6-methyl-2-(1-methylethyl)-4-pyrimidinyl) ester; 4-Pyrimidinol, 2-isopropyl-6-methyl-, *O*-ester with *O,O*-diethylphosphorothionate; Thiophosphate de *O,O*-diethyle et de *O*-2-isopropyl-4-methyl-6-pyrimidyle (French); Thiophosphoric acid 2-isopropyl-4-methyl-6-pyrimidyl diethyl ester

Chemical Class: Organophosphate

EPA/OPP PC Code: 057801

California DPR Chemical Code: 198

ICSC Number: 0137

RTECS Number: TF3325000

EEC Number: 015-040-00-4

EINECS Number: 206-373-8

Uses: Diazinon is the most widely used pesticide by homeowners on lawns, and is one of the most widely used pesticide ingredients for application around the home and in gardens. It is used to control insects and grub worms. It is a non-systemic organophosphate insecticide used to control cockroaches, silverfish, ants, and fleas in residential, non-food buildings. Bait is used to control scavenger yellow jackets in the western U.S. It is used on home gardens and farms to control a wide variety of sucking and leaf eating insects. It is used on rice, fruit trees, sugarcane, corn, tobacco, potatoes and on horticultural plants, and is also an ingredient in pest strips. Diazinon has veterinary uses against fleas and ticks. It is available in dust, granules, seed dressings, wettable powder, and emulsifiable solution formulations. In 1988, there were 500 different products containing diazinon on the market, and used in such products as agricultural sprays and granules, animal ear tags, household sprays and dust and veterinary products.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.60 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Extra high–0.09200 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Diazinon (40 CFR 180.153):

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION, Moderately Toxic

WHO Acute Hazard: Class II, moderately hazardous

TRI Developmental Toxin: Developmental toxin

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Argentina) (Australia) (DFG)⁽³⁾ (HSE)⁽³³⁾ (Israel) (Mexico) (former USSR)⁽³⁵⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)
- AB 1803-Well Monitoring Chemical (CAL)
- CAL-DHS/DHS Drinking Water Action Levels
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant
- Canada, Drinking Water Quality, 0.02 mg/L MAC

Description: Colorless, oily liquid. Technical grade is pale to dark brown. Faint amine odor. Slightly soluble in water; solubility = 40 ppm. Molecular weight = 304.39. Boiling point = (decomposes) 120°C; 83-84°C@0.002 mmHg. Flash point = 82°C. Vapor Pressure = 1.7×10^{-4} mmHg @ 20. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Log K_{ow} = 3.09. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Hydrolyzes slowly in water and dilute acid. Reacts with strong acids and alkalis with possible formation of highly toxic tetraethyl thiopyrophosphates. Incompatible with copper-containing compounds.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommend an airborne exposure limit of 0.1 mg/m³ TWA with the notation "skin" indicating the possibility of cutaneous absorption. Argentina, Australia, Israel, Mexico, HSE⁽³³⁾, and the Canadian provinces of Alberta, BC, Ontario, and Quebec use this same value but HSE, Mexico, Alberta, and BC add the STEL of 0.3 mg/m³ as does Argentina⁽³⁵⁾. The DFG, however, has set an MAK of 1.0 mg/m³ and an STEL of 10 mg/m³ (3). The former USSR⁽³⁵⁾ has set an MAC of 0.2 mg/m³ in workplace air and an MAC for ambient air in residential areas of 0.01 mg/m³ on either a momentary or a daily average basis. In addition, several states have set guidelines or standards for Diazinon in ambient air⁽⁶⁰⁾ ranging from 1.0 µg/m³ (North Dakota) to 1.6 µg/m³ (Virginia) to 2.0 µg/m³ (Connecticut and Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH IV Method #5600⁽¹⁸⁾, Organophosphorus pesticides. See also OSHA Method #62⁽⁵⁸⁾.

Permissible Concentration in Water: The U.S. EPA has developed one- and 10-day health advisories (maximum recommended drinking water concentrations) for adults and children of 20 micrograms per liter of water (20 mg/L). The USEPA has determined a NOAEL of 0.05 mg/kg/day which gives a long-term health advisory of 0.0175 mg/L and a lifetime health advisory of 0.00063 mg/L. Canada set a MAC of 0.02 mg/L. The former USSR⁽³⁵⁾ has set an MAC in water bodies for domestic purposes of 0.3 mg/L. Several states have set guidelines for Diazinon in drinking water⁽⁶¹⁾ ranging from 4 µg/L (Maine) to 14 µg/L (California and Kansas).

Determination in Water: By Methylene chloride extraction followed by gas chromatography.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: Diazinon can affect you when breathed in and quickly enters the body by passing through the skin. May cause skin and eye irritation. Exposure can cause organophosphate poisoning with headache, sweating, nausea, and vomiting, diarrhea, muscle twitching and possible death. It is a moderately toxic organophosphate chemical. The LD₅₀ (oral, rat) = 66 mg/kg (moderately toxic). Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Damage to the pancreas has developed in some people and in laboratory animals exposed to large amounts of diazinon. In animal studies, high doses of diazinon produced effects on the nervous system similar to those seen in people. There is no evidence that long-term exposure to *low* levels of diazinon causes any harmful health effects in people.

Points of Attack: Eyes, respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell acetylcholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates. Liver function tests. Exam of the nervous system. Complete blood count.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help

arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. **Antidotes:** Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a

reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Dibenzofuran

Use Type: Insecticide

CAS Number: 132-64-9

Formula: C₁₂H₈O

Synonyms: [1,1'-Biphenyl]-2,2'-diyl oxide; 2,2'-Biphenylene oxide; 2,2'-Biphenylene oxide; Dibenzo[b,d]furan; Dibenzofurano (Spanish); Diphenylene oxide

Producers: Fluorochem (UK); Nippon Steel (Japan); Sigma-Aldrich Laborchemikalien (Germany)

RTECS Number: HP4450000

EINECS Number: 205-071-3

Uses: This material is used as an insecticide and in organic synthesis to make other chemicals. It is derived from coal tar creosote.

Regulatory Authority:

- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 8270(10)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, CEPA Toxic Substances

Description: Dibenzofuran, C₁₂H₈O is a white crystalline powder. Very slightly soluble in water. Molecular weight = 168.21. Boiling point = 285–288°C. Melting/Freezing point = 85–87°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Log K_{ow} = 4.1. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Dibenzofuran can be absorbed through the skin, thereby increasing exposure. Exposure irritates the eyes, skin and respiratory tract. Poisonous if ingested.

Long Term Exposure: Repeated contact may cause skin growths, rashes, and changes in skin color. Exposure to sunlight may make rash worse.

Points of Attack: Skin

Medical Surveillance: Evaluation by a qualified allergist

First Aid: Skin Contact: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. **Eye Contact:** Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20-30 minutes. Seek medical attention. **Inhalation:** Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. **Ingestion:** If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Dibromochloropropane (DBCP)

Use Type: nematicide and fumigant

CAS Number: 96-12-8

Formula: C₃H₅Br₂Cl; CH₂BrCHBrCH₂Cl

Alert: Withdrawn by the U.S. EPA on November 3, 1977. No longer available in the United States. Human toxicity (long-term): Very high.

Synonyms: 1,2-Dibromo-3-cloropropano (Spanish); 1-Chloro-2,3-dibromopropane; 3-Chloro-1,2-dibromopropane; DBCP; Dibromchloropropan (German); 1,2-Dibrom-3-chloropropan (German); 1,2-Dibromo-3-cloro-propano (Italian); 1,2-Dibromo-3-cloropropano (Spanish); 1,2-Dibroom-3-chloorpropan (Dutch); NCI-C00500; Propane, 1,2-dibromo-3-chloro-

Trade Names: BBC 12[®]; FUMAGONE[®]; FUMAZONE[®], Dow Chemical Co. (USA), canceled 12/9/1979; MEMATOCIDE[®]; NEMABROM[®]; NEMAFUM[®]; NEMAGON[®], Chem-nut Inc. (USA), canceled; Helena Chemical (USA), canceled, plus several other companies; NEMAGON SOIL FUMIGANT[®], Chem-nut Inc. (USA), canceled; NEMANAX[®]; NEMAPAZ[®]; NEMASET[®]; NEMATOCIDE[®], Amvac Chemical Co. (USA), canceled 7/1/1987; NEMATOX[®]; NEMAZON[®]; OS 1897[®]; OXY BCP[®], Occidental Chemical Corp. (USA), canceled 12/9/1979; SD 1897[®]

Producers: Amvac Chemical Co. (USA); Dow Chemical Co. (USA); Helena Chemical ((USA); Occidental Chemical Corp. (USA); Simplot, J.R., Company (USA)

Chemical Class: Halogenated organic compound

EPA/OPP PC Code: 011301

California DPR Chemical Code: 183

ICSC Number: 0002

RTECS Number: TX8750000

EEC Number: 602-021-00-6

EINECS Number: 202-479-3

Uses: DBCP has been used in agriculture as a nematicide since 1955, being supplied for such use in the forms of liquid concentrate, emulsifiable concentrate, powder, granules, and solid material. A rebuttable presumption against registration for pesticide uses was issued by U.S. EPA on September 22, 1977, on the basis of oncogenicity and reproductive effects. Then, as of November 3, 1977, EPA in a further action suspended all registrations of end use products, subject to various specific restrictions.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.20 ppb, MCL (Maximum Contaminant Level)

- EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%
- Canada, WHMIS, Ingredients Disclosure List

Description: Amber to brown liquid (a solid below 6°C). Strong, pungent odor. It has an odor and taste threshold at 0.01

mg/L in water. Slightly soluble in water; solubility = 1000ppm. Molecular weight = 236.35. Boiling point = 196°C.

(decomposes). Melting/Freezing point = 6.7°C. Vapor pressure = 0.9 mmHg @ 20°C. Flash point = 77°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0.

Incompatibilities: Reacts with oxidizers and chemically active metals (i.e., aluminum, magnesium and tin alloys).

Attacks some rubber materials and coatings. Corrosive to metals.

Permissible Exposure Limits in Air: The OSHA⁽²⁾ PEL is 1 ppb (0.01 mg/m³) TWA and that no exposure to eyes or skin should occur⁽³⁵⁾. Argentina has set a TWA of 0.25 mg/m³ with an STEL of 0.75 mg/m³. Sweden and Germany have set no limits; simply stated that DBCP is a carcinogenic substance and should be avoided. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC in ambient air in residential areas of 0.0004 mg/m³ on a momentary basis and 0.00003 mg/m³ on a daily average basis. In addition, several states have set guidelines or standards for DBCP in ambient air⁽⁶⁰⁾ ranging from zero (North Dakota) to 0.05 µg/m³ (Connecticut) to 1.0 µg/m³ (Pennsylvania).

Permissible Concentration in Water: The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set a MAC of 0.01 mg/L in water bodies used for domestic purposes. The USEPA⁽⁴⁷⁾ has set a one-day health advisory of 0.2 mg/L and a ten-day health advisory of 0.02 mg/L both for a 10 kg child. Longer term health advisories could not be calculated because of the carcinogenicity of DBCP. EPA has recently proposed⁽⁶²⁾ a maximum drinking water level of 0.0002 mg/L (0.2 µg/L). Several states have set guidelines for DBCP in drinking water⁽⁶¹⁾ ranging from 0.025 µg/L (Arizona) to 0.25 µg/L (Minnesota) to 0.5 µg/L (Wisconsin) to 1.0 µg/L (California).

Determination in Water: By purge-and-trap gas chromatography⁽⁴⁷⁾.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include severe local irritation to eyes, skin and mucous membranes. Nausea and vomiting may occur after ingestion. Exposure to DBCP can cause headache, nausea, vomiting, weakness, lightheadedness, unconsciousness, and possible death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Narcotic at high levels of concentration.

Long Term Exposure: The possible effects on the health of employees chronically exposed to repeated or lower exposures of DBCP may include sterility, diminished renal function, and degeneration and cirrhosis of the liver. DBCP is a probable carcinogen in humans. It has been shown to cause stomach, breast, tongue, and nasal cavity cancer in animals. May damage the testes and decrease fertility in males and females. Repeated exposure can damage the eyes causing clouding of lens or cornea, opens sores on the skin, liver and kidney damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys, spleen, reproductive system, digestive system

Medical Surveillance: Medical surveillance shall be made available to employees as outlined below:

Comprehensive preplacement or initial medical and work histories with emphasis on reproductive experience and menstrual history. Comprehensive physical examination with emphasis on the genito-urinary tract including testicle size and consistency in males. Semen analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be carried out if, in the opinion of the responsible physician, they are indicated. In addition, screening tests of the renal and hepatic systems may be considered.

A judgment of the worker's ability to use positive pressure respirators. Employees shall be counseled by the physician to ensure that each employee is aware that DBCP has been implicated in the production of effects on the reproductive system including sterility in male workers. In addition, they should be made aware that cancer was produced in some animals. While the relevancy of these findings is not yet clearly defined, they do indicate that both employees and employers should do everything possible to minimize exposure to DBCP. Periodic examinations containing the elements of the preplacement or initial examination shall be made available on at least an annual basis. Examinations of current employees shall be made available as soon as practicable after the promulgation of a standard for DBCP. Medical surveillance shall be made available to any worker suspected of having been exposed to DBCP. Pertinent medical records shall be maintained for all employees subject to exposure to DBCP in the workplace. Such records shall be maintained for 30 years and shall be available to medical representatives of the U.S. Government, the employer and the employee.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20-30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Contact local poison control center for advice about inducing vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

1,2-Dibromo-2,4-dicyanobutane

Use Type: Microbiocide

CAS Number: 35691-65-7

Formula: C₆H₆Br₂N₂

Synonyms: 2-Bromo-2-(bromomethyl)glutaronitrile; 1-Bromo-1-(bromomethyl)-1,3-propanedicarbonitrile; Dibromodicyanobutane; Glutaronitrile, 2-bromo-2-(bromomethyl)-; Pentanedinitrile, 2-bromo-2-(bromomethyl)-

Trade Names: BIOCHEK®, Bayer Group (Germany); BIOCLEAR®, MERCK® 48051, Merck (Germany); METACIDE® 38; METASOL, Bayer Group (Germany); TEKTAMER, Bayer Group (Germany)

Producers: Bayer Group (Germany); Merck (Germany)

Chemical Class: Nitrile

EPA/OPP PC Code: 111001; (217700 and 218500 are old EPA code numbers)

California DPR Chemical Code: 2313

Uses: Tolerances have been established by the U.S. Food and Drug Administration when this substances is used as a preservative in food grade adhesives and as a slimicide in the manufacture of food grade paper and paperboard. Used to control slime-forming bacteria and fungi in recirculating water cooling system; oil recovery drilling mud systems; paper mill and pulp mill water systems and similar industrial processing and chemical systems.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

Regulatory Authority:

- Actively registered pesticide in California.

Description: Crystalline solid. Insoluble in water. Mild, acrid, bitter odor. Molecular weight = 266.02.

Incompatibilities: Strong oxidizers and reducing agents, strong acids and bases. Reacts with acids, steam, warm water producing toxic and flammable hydrogen cyanide fumes. Hydrogen cyanide is produced when propionitrile is heated to decomposition.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. May affect the iron metabolism, causing asphyxia. It

is highly toxic. Forms cyanide in the body. Exposure results in headache, dizziness, rapid pulse, deep-rapid breathing, nausea, vomiting, unconsciousness, convulsions and sometimes death. May cause cyanosis (blue coloration of skin and lips caused by lack of oxygen).

Long Term Exposure: Chronic exposure over long periods may cause fatigue and weakness. Can cause same general symptoms as hydrogen cyanide but onset of symptoms is likely to be slower. May cause liver and kidney damage.

Points of Attack: In animals: liver, kidney damage

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1-2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Chemical Class: Benzoic acid

EPA/OPP PC Code: 029801

California DPR Chemical Code: 200

ICSC Number: 0139

RTECS Number: DG7525000

EEC Number: 607-043-00-X

EINECS Number: 217-635-6

Uses: Used to control annual and perennial broad leaf weeds in corn, sorghum, small grains, pastures, hay, rangeland, sugarcane, asparagus, turf, grass-seed crops, and non-croplands. It can be applied to the leaves or to the soil. Dicamba controls annual and perennial broadleaf weeds in grain crops and grasslands, and it is used to control brush and bracken in pastures. It will kill broadleaf weeds before and after they sprout. Legumes will be killed by dicamba. In combination with a phenoxyalkanoic acid or other herbicide, dicamba is used in pastures, range land, and non-crop areas such as fence-rows and roadways to control weeds.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–200.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–4918.96611 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group D, unclassifiable, inadequate data

Label Signal Word: Signal words for products containing dicamba range from CAUTION to DANGER, reflecting the combined toxicity of dicamba and other ingredients in each product.

TRI Developmental Toxin: Developmental toxin

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Air Pollutant Standard Set (former USSR)⁽³⁵⁾
- AB 1803-Well Monitoring Chemical (CAL)
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
- Safe Drinking Water Act: Priority List (55 FR 1470)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1000 lb (454 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, Drinking Water Quality, 0.12 mg/L MAC

Description: White or brown crystalline solid. Slightly soluble in water; solubility = 8.0×10^3 ppm @ 25°C; also reported at 5.6×10^3 ppm. Molecular weight = 221.03. Boiling point = 200°C (decomposes below B.P.). Melting/Freezing point = 115°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Log K_{ow} = 2.19. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Incompatible with sulfuric acid, bases, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Dicamba decomposes in heat producing toxic and corrosive fumes including hydrogen chloride.

Permissible Exposure Limits in Air: The former USSR⁽³⁵⁾ has set an MAC in workplace air of 1.0 mg/m³. Although no U.S. exposure limits have been established, this chemical can be absorbed through the skin, thereby increasing exposure.

Permissible Concentration in Water: A no-adverse effect level in drinking water has been calculated by NSA/NRC⁽⁴⁶⁾ at 0.009 mg/L. States which have set guidelines for dicamba

in drinking water⁽⁶¹⁾ include Maine at 9.0 µg/L and Wisconsin at 12.5 µg/L. Canada's MAC in drinking water is 0.12 mg/L.

Routes of Entry: Ingestion, inhalation, and through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Dicamba irritates the eyes, skin, and respiratory tract. Exposure can cause nausea, vomiting, loss of appetite and weight, muscle weakness, and exhaustion. The acute toxicity of dicamba is relatively low. Dicamba produced no adverse effect when fed to rats at up to 19.3 mg/kg/day and 25 mg/kg/day in subchronic and chronic studies. The no-adverse-effect dose in dogs was 1.25 mg/kg/day in a 2-year feeding study. Based on these data, an ADI was calculated at 0.0012 mg/kg/day. The LD₅₀ (oral, rat) = 1037 mg/kg (slightly toxic).

Long Term Exposure: May affect the liver.

Points of Attack: Liver

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dichlobenil (ANSI)

Use Type: Herbicide

CAS Number: 1194-65-6

Formula: C₇H₃Cl₂N

Synonyms: Benzonitrile, 2,6-Dichloro-; DCBN; DBN; 2,6-DBN; DCB; Decabane; 2,6-Dichlorobenzonitrile; 2,6-Dichlorocyanobenzene

Trade Names: BARRIER[®], Pbi/Gordon (USA); BH Prefix D[®]; CARSORON[®], Crompton Corporation (USA); CASORON[®] 133, Crompton Corporation (USA); CARSORON[®] G, Crompton Corporation (USA); CARSORON[®] G4, Crompton Corporation (USA); CARSORON[®] G20-SR, Crompton Corporation (USA); CODE H 133[®]; DECABANE[®]; DU-SPREX[®]; DYCLOMEC[®]; FYDULAN; FYDUMAS; FYDUSIT; H 133[®]; H 1313[®]; NIA 5996[®]; NIAGARA[®] 5006; NIAGARA[®] 5,996; NOROSAC[®], Pbi/Gordon (USA); PREFIX D[®]

Producers: Crompton Corporation (USA); Fluorochem (UK); Pbi/Gordon (USA)

Chemical Class: Benzonitrile

EPA/OPP PC Code: 027401

California DPR Chemical Code: 112

ICSC Number: 0867

RTECS Number: DI3500000

EEC Number: 608-015-00-X

EINECS Number: 214-787-5

Uses: Dichlobenil is a herbicide used on cranberry bogs, dichondra, ornamentals, blackberry, raspberry, and blueberry fields, apple, pear, filbert and cherry orchards, vineyards, hybrid poplar-cottonwood plantations, and rights-of-way to control weeds; and sewers to remove roots. It acts on dandelion, prickly oxtongue (pre-emergence), and tree roots.

Human toxicity (long-term)⁽⁷⁷⁾: High–9.10 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–973.64357 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Dichlobenil (40 CFR 180.231):

CROP	ppm
Apple	0.5
Blackberry	0.1
Blueberry	0.15
Cranberry	0.1
Filbert	0.1
Fruit, stone, except cherry	0.15
Grape	0.15
Pear	0.5
Raspberry	0.1

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Regulatory Authority:

- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA)
- EPCRA Section 304 RQ: CERCLA, 100 lb (45.4 kg)

Description: White solid. Gives off irritating or toxic fumes or gases in a fire. Practically insoluble in water; solubility = 18 ppm @ 20°C. Molecular weight = 172.01. Melting/Freezing point = 143–146°C. Boiling point = 269°C. Vapor pressure = 1 x 10⁻³ mmHg @ 25. Log K_{ow} = 2.63. Unlikely to bioaccumulate in marine organisms.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)]. Determination in Air.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Absorbed by dry skin and inhalation

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the skin and eyes. Inhalation may irritate the nose and throat. High exposure can cause headache, dizziness, a drop in blood pressure, rapid pulse, loss of appetite, seizures, coma and death. Repeated high exposure may result in a loss of smell, acne-like rash.

Points of Attack: Eyes, skin, liver and kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Dichlone

Use Type: Fungicide

CAS Number: 117-80-6

Formula: C₁₀H₄Cl₂O₂

Synonyms: 2,3-Dichloro-1,4-naphthochinon (German); 2,3-Dichloro-1,4-naphthalenedione; 2,3-Dichloro-1,4-naphthoquinone; Dichloronaphthoquinone; 2,3-Dichloronaphthoquinone; 2,3-Dichloro- α -naphthoquinone; 2,3-Dichloronaphthoquinone-1,4; Diclona (spanish); Diclone; ENT 3,776; 1,4-Naphthalenedione, 2,3-dichloro-
Trade Names: ALGISTAT[®]; COMPOUND 604[®]; PHYGON[®]; PHYGON[®] PASTE; PHYGON[®] SEED PROTECTANT; PHYGON[®] XL; QUINTAR[®]; QUINTAR[®] 540F; SANQUINON[®]; UNIROYAL[®] 604; USR[®] 604; U.S. RUBBER[®] 604

Producers: Whyte Agrochemical (UK)

Chemical Class: Organochlorine; Halo-organics; naphthoquinone fungicide

EPA/OPP PC Code: 029601

California DPR Chemical Code: 202

RTECS Number: QL7525000

EINECS Number: 204-210-5

Uses: Not currently registered in the U.S. Dichlone is used as a fungicide for foliage and to control blue algae in ponds, swimming pools and lakes. As a substitute for copper and sulfur to control of rot on fruit trees, vegetables, field crops, ornamentals, resident and commercial outdoor areas.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–560.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–4.56263 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Regulatory Authority:

- The “Director’s List” (CAL/OSHA)
- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA)
- EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg)

Description: Golden-yellow crystals, leaflets, or needles from alcohol. Practically insoluble in water; solubility = <0.1 mg/L @ 25°C. Molecular weight = 227.05. Melting/Freezing point = 193°C. Boiling point = 275°C @ 2 mmHg; Vapor Density = 7.8. Vapor pressure = 8.2 mmHg @ 20°C. Toxicity (human): Low. Log K_{ow} = 3.15. Values above 3.0 are likely to bioaccumulate in marine organisms.

Routes of Entry: Dangerous through all routes of contact. Absorbed through intact skin.

Harmful Effects and Symptoms

Short Term Exposure: Central nervous system depressant. Irritating to eyes, skin, mucous membranes. Large doses can cause central nervous system depression, dizziness, weakness, headache, nausea, vomiting, and difficult

breathing. Apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death. At fire temperatures can produce coughing, choking, difficult breathing, and cyanosis.

Long Term Exposure: Irritating to the skin; may cause dermatitis.

Points of Attack: May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. The patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is **UNCONSCIOUS OR HAVING CONVULSIONS**, do nothing except keep victim warm.

**In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup.*

Inhalation: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Description: Colorless liquid. Pungent odor. Soluble in water; solubility = 8.5 x 10⁴ ppm. Molecular weight = 128.95. Boiling point = 193–194°C. Melting/Freezing point = 9.7°C. Flash point = 110°C. Vapor pressure = 1 mmHg @ 44°C; 20 Pa @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Log K_{ow} = -1.1 to 0.9. Unlikely to bioaccumulate in marine organisms.**Incompatibilities:** DCA is a medium strong acid; incompatible with non-oxidizing mineral acids, organic acids, bases, acrylates, aldehydes, alcohols, alkylene oxides, ammonia, aliphatic amines, alkanolamines, aromatic amines, amides, glycols, isocyanates, ketones. Attacks metals generating flammable hydrogen gas. Attacks some plastics, rubber and coatings.**Permissible Exposure Limits in Air:** The former USSR set an airborne exposure limit of 4 mg/m³.**Routes of Entry:** Inhalation, ingestion.**Harmful Effects and Symptoms****Short Term Exposure:** Corrosive to the eyes, skin, and respiratory tract; causes severe irritation and burns. Eye contact may cause permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be

delayed for several hours. This can cause death. Corrosive if swallowed.

Long Term Exposure: May cause damage to the developing fetus. May affect the liver and kidneys. May damage the nervous system causing numbness, "pins and needles," and/or weakness in the hands and feet. Repeated exposure may cause lung irritation, bronchitis. There is limited evidence that DCA causes liver cancer in animals.**Points of Attack:** Lungs, liver, kidneys, nervous system.**Medical Surveillance:** Liver and kidney function tests. Lung function tests. Examination of the nervous system. Consider chest x-ray following acute overexposure.**First Aid:** If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.**References:**

para*-Dichlorobenzene*Use Type:** Insecticide, rodenticide, and fungicide**CAS Number:** 106-46-7**Formula:** C₆H₄Cl₂**Alert:** The *para* isomer of dichlorobenzene is the isomer most prominently used in agriculture.**Synonyms:** *p*-DCB; 1,4-DCB; Benzene, 1,4-dichloro-; Benzene, *p*-dichloro-; *p*-Chlorophenyl chloride; PDCB; Dichloride; 1,4-Diclorobenceno (Spanish); *p*-Diclorobenceno (Spanish); *p*-Dichlorobenzene; Paradichlorobenzene**Mixed Isomers:** Amisia-mottenschutz; Benzene, dichloro-; Diclorobenceno (Spanish); DCB; Diclorobenceno (Spanish); Dichlorobenzene (Mixed Isomers)**Trade Names:** DowTHERM[®], Dow Chemical Co. (USA); EVOLA; PARACIDE[®], PARA CRYSTALS[®], PARADI[®];

PARADOW®; PARAMOTH®; PARANUGGETS®; PARAZENE®; PERSIA-PERAZOL®; SANTOCHLOR®; Solutia (USA); *Mixed isomers*: DILATIN DBI®; MOTTENSCHUTZMITTEL EVAU P®; MOTT-EX®; TOTAMOTT®

Producers of Chlorobenzenes: ATOFINA (France); Bayer Chemicals (Germany); Changshan Chemical (China); Clariant (Switzerland); Clorobencenos (Mexico); Degussa (Germany); Dow Chemical (USA); EniChem (Italy); ICI Group (UK); Ishihara Sangyo Kaisha (Japan); Kureha (Japan); Mitsubishi Gas Chemical (Japan); Monsanto (USA); Nippon Kayaku (Japan); Piedmont (USA); PPG Industries (USA); Sigma-Aldrich Laborchemikalien (Germany); Solution (USA); Sumitomo Chemical (Japan); Tekchem (Mexico); Toagosei (Japan); Toray Industries (Japan)

Chemical Class: Halogenated organic compound

EPA/OPP PC Code: 061501

California DPR Chemical Code: 455

ICSC Number: 0037

RETECS Number: CZ4550000 (*p*-DCB); CZ4430000 (mixed isomers)

EEC Number: 602-035-00-2

EINECS Number: 202-425-9

Uses: *p*-Dichlorobenzene is used primarily as an air deodorant, as moth balls, and in insecticides, which accounts for 90% of the total production of this isomer. Information is not available concerning the production and use of *m*-DCB. However, it may occur as a contaminant of *o*- or *p*-DCB formulations. Both *o*- and *p*-isomers are produced almost entirely as by-products during the production of monochlorobenzene. The major uses of *o*-DCB are as a process solvent in the manufacturing of toluene diisocyanate and as an intermediate in the synthesis of dyestuffs, herbicides, and degreasers.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

U.S. NTP Carcinogen: Reasonably anticipated Carcinogen

California Prop. 65: Carcinogen

IARC: Group 2B, possible carcinogen

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (DFG)⁽³⁾ (HSE)⁽³³⁾ (Israel) (Mexico) (OSHA)⁽⁵⁸⁾ (former USSR)^(35, 43) (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)

Description: There are three isomeric forms of dichlorobenzene, C₆H₄Cl₂: *o*-DCB is a colorless to pale yellow liquid with a pleasant, aromatic odor. Odor threshold = 0.30 ppm. Boiling point = 117°. Melting/Freezing point = -17°C. Flash point = 66°C (cc). Autoignition temperature: 648°C. Explosive limits: LEL = 2.2%; UEL = 9.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water. *m*-DCB is a liquid. Boiling point = 172°C. *p*-DCB is a colorless or white solid with a mothball-like odor. Odor threshold = 0.18 ppm. Boiling point = 174°C. Melting/Freezing point = 53°C. Flash point = 66°C. Insoluble in water. Explosive limits: LEL = 2.5%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water. Log K_{ow} = 3.36. Values at or above 3.0 are likely to bioaccumulate in marine organisms (*p*-DCB).

Incompatibilities: *o*-DCB and *m*-DCB: acid fumes, chlorides, strong oxidizers, hot aluminum or aluminum alloys. *p*-DCB: Strong oxidizers; although, incompatibilities for this chemical may also include other materials listed for *o*-DCB.

Permissible Exposure Limits in Air: *p*-DCB: OSHA⁽²⁾ PEL, 75 ppm (450 mg/m³) TWA; ACGIH⁽¹⁾ TLV, 10 ppm TWA (60 mg/m³) TWA; NIOSH⁽²⁾ IDLH, 150 ppm [Carcinogen]. Foreign Regulations (ppm) TWA (except as noted) *p*-DCB for Australia, Germany (DFG), United Kingdom (HSE), Mexico and the Canadian provinces of Alberta, British Columbia, Ontario, and Quebec.

Australia	DFG	HSE	Israel	Mexico	Canada
75	50	75	75	75	75
110*	100*	110*	110*	110*	110*

*As a ceiling or peak limitation value, not to be exceeded at any time, except for DFG Peak Limitation (30 minute) which is not to be exceeded 4 times during a normal workshift⁽³⁾. The former USSR set a MAC for ambient air in residential areas of 0.035 mg/m³ on a once daily basis for *p*-DCB⁽³⁵⁾.

Determination in Air: Charcoal adsorption followed by CS₂ workup and gas chromatographic analysis. See NIOSH Method 1003 for halogenated hydrocarbons.⁽¹⁸⁾

Permissible Concentration in Water: To protect freshwater aquatic life: 1,120 µg/L on an acute toxicity basis and 763 µg/L on a chronic basis. To protect saltwater aquatic life: 1,970 µg/L on an acute toxicity basis. To protect human health: 400 µg/L for all isomers⁽⁶⁾. The former USSR established a MAC of 0.002 mg/L for water bodies used for domestic purposes^(35,43). The USEPA⁽⁴⁸⁾ has derived lifetime health advisories for *o*- and *m*-DCB as 0.62 mg/L (620 µg/L) and for *p*-DCB of 0.075 mg/L (75 µg/L). EPA⁽⁶²⁾ has recently proposed a maximum level for *o*-DCB of 0.6 mg/L

in drinking water. See also Regulatory section for drinking water criteria for Mexico and Canada.

Determination in Water: Gas chromatography (EPA Methods 601, 602, 612) or gas chromatography plus mass spectrometry (EPA Method 625). Gas-chromatographic methods have been developed for PDB with a sensitivity of 380 pg/cm peak high, and PDB concentrations as low as 1.0 ppb in water have been analyzed according to NAS/NRC.

Routes of Entry: For *p*-DCB: Inhalation, ingestion, eye and skin contact

Harmful Effects and Symptoms

Human exposure to dichlorobenzene is reported to cause hemolytic anemia and liver necrosis, and 1,4-dichlorobenzene has been found in human adipose tissue. In addition, the dichlorobenzenes are toxic to nonhuman mammals, birds, and aquatic organisms and impart an offensive taste and odor to water. The dichlorobenzenes are metabolized by mammals, including humans, to various dichlorophenols, some of which are as toxic as the dichlorobenzenes. Exposure can damage blood cells. Contact can cause irritation of the skin and eyes. Prolonged contact can cause severe burns. It may damage the liver, kidneys and lungs. Exposure can cause headache, dizziness, swelling of the eyes, hands and feet, and nausea. Higher levels can cause severe liver damage and death. Persons with preexisting pathology (hepatic, renal, central nervous system, blood) or metabolic disorders, who are taking certain drugs (hormones or otherwise metabolically active), or who are otherwise exposed to DCBs or related (chemically or biologically) chemicals by such means as occupation, or domestic use or abuse (e.g., pica or "sniffing") of DCB products, might well be considered at increased risk from exposure to DCBs.

Short Term Exposure: For *p*-DCB: Can be absorbed through the skin, thereby increasing exposure. Exposure can cause headache, dizziness, nausea, swelling of the hands and feet. Contact with the dust can irritate and burn the eyes and skin. Skin allergy may develop.

Long Term Exposure: For *p*-DCB: May be carcinogenic to humans; it causes kidney and liver cancer in animals. There is a suggested association between this chemical and leukemia. There is evidence that *p*-DCB can damage the developing animal fetus. Repeated exposure can damage the nervous system, skin allergy and damage the lungs, liver, and kidneys. *p*-May affect the blood and cause hemolytic anemia.

Points of Attack: For *p*-DCB-liver, respiratory system, eyes, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: Liver, kidney and lung function tests. Complete blood count. If symptoms develop or overexposure is suspected, the following may be useful: Evaluation by a qualified allergist, including careful

exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dichloroethyl Ether

Use Type: Soil fumigant

CAS Number: 111-44-4

Formula: C₄H₈Cl₂O; ClCH₂CH₂OCH₂CH₂Cl

Alert: This should be handled as a carcinogen, with extreme caution.

Synonyms: BCEE; Bis(β-chloroethyl) ether; Bis(2-chloroethyl) ether; Bis(2-cloroetil)eter (Spanish); Chlorex;

1-Chloro-2-(β-chloroethoxy)ethane; Chloroethyl ether (DOT); Clorex; DCEE; Dichloroethyl ether; 2,2'-Dichloorethylether (Dutch); 2,2'-Dichloro-diethylether; 2,2'-Dichlor-diaethylaether (German); Dichloroethyl ether; 2,2'-Dichlorethyl Ether (DOT); β,β'-Dichlorodiethyl ether; Dichloroether; Di(β-chloroethyl)ether; Di(2-chloroethyl) ether; β,β'-Dichloroethyl ether; *sym*-Dichloroethyl ether; 2,2'-Dichloroethyl ether; Dichloroethyl oxide; 2,2'-Dichloroetitere (Italian); ENT 4,504; Ethane, 1,1'-oxybis(2-chloro-; Ether dichlore (French); 1,1'-Oxybis(2-chloro)ethane; Oxyde de chlorethyle (French)

Producers: Richman Chemical (USA)

EPA/OPP PC Code: 029501

California DPR Chemical Code: 203

ICSC Number: 0417

RTECS Number: KN0875000

Uses: Dichloroethyl ether is used as an acaricide and in an oil solution to control earworms on corn silk. It is also used in the manufacture of paint, varnish, lacquer, soap, and finish remover. It is also used as a solvent for cellulose esters, naphthalenes, oils, fats, greases, pectin, tar, and gum; in dry cleaning and in textile scouring.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

- EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%
- Canada, WHMIS, Ingredients Disclosure List
- Mexico, drinking water criteria = 0.0003 mg/L.

Description: Dichloroethyl ether is a clear, colorless liquid with a pungent, fruity odor. It is also described as having a chlorinated solvent-like odor. Soluble in water; solubility = 1.3×10^4 ppm. Molecular weight = 143.02. Boiling point = 176–178°C. Vapor pressure = 0.73 mmHg @ 20. Flash point = 55°C⁽¹⁷⁾. Autoignition temperature = 369°C. Explosive limits: LEL = 2.7%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Insoluble in water. Log K_{ow} = 1.12. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Contact with moisture caused decomposition producing hydrochloric acid. Can form peroxides. Forms explosive mixture with air. Contact with strong oxidizers may cause fire and explosion hazard. Attacks some plastics, rubber and coatings. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air: The Federal Limit (OSHA PEL) and the ACGIH⁽¹⁾ recommended TLV is 5 ppm (30 mg/m³) and the STEL value in both cases is 10 ppm (60 mg/m³). They both add the notation “skin” indicating the possibility of cutaneous absorption. Australia, Israel and the Canadian provinces of Alberta, BC, Ontario, and Quebec set the same TWA and STEL as OSHA. The DFG MAK value is 10 ppm⁽³⁾. NIOSH⁽²⁾ IDLH level = [Ca]100 ppm. The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set an MAC in workplace air of 2 mg/m³. Several states have set guidelines or standards for BCEE in ambient air⁽⁶⁰⁾ ranging from 0.0714 mg/m³ (Kansas) to 0.3-0.6 mg/m³ (North Dakota) to 0.5 mg/m³ (Virginia) to 0.6 mg/m³ (Connecticut) to 0.714 mg/m³ (Nevada) to 0.72 mg/m³ (Pennsylvania).

Determination in Air: Charcoal tube; CS₂; Gas chromatography/Flame ionization detection; NIOSH IV Method #1004⁽¹⁸⁾

Permissible Concentration in Water: To protect freshwater aquatic life: 238,000 µg/L, for chloroalkyl ethers in general. No criteria developed for protection of saltwater aquatic life due to insufficient data. For the protection of human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 0.3 µg/L⁽⁶⁾. Some states have set guidelines for BCEE in drinking water⁽⁶¹⁾ ranging from 0.31 µg/L (Minnesota) to 4.2 µg/L (Kansas) to 8.3 µg/L (Maine) to 10.0 µg/L (Arizona).

Determination in Water: CH₂Cl₂ extraction followed by gas chromatography with halogen; specific detector (EPA

Method 611) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: BCEE can be absorbed through the skin, thereby increasing exposure. Exposure irritates the eyes, skin, and respiratory tract. Skin and eye contact may cause burns. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. At concentrations above 500 ppm, coughing, retching, and vomiting may occur, as well as profuse tearing. There can be irritation at lower concentrations. This material is very toxic; the probable oral lethal dose is 50-500 mg/kg, or between 1 teaspoon and 1 ounce for a 150 pound person. It can be a central nervous system depressant in high concentrations. It is extremely irritating to the eyes, nose, and respiratory passages. It can penetrate the skin to cause serious and even fatal poisoning. Poisonous; may be fatal if inhaled, swallowed or absorbed through skin.

Long Term Exposure: BCEE may damage the liver and kidneys. Can irritate the lungs; repeated exposures may cause bronchitis.

Points of Attack: Respiratory system, skin, eyes, liver and kidneys. This chemical causes liver cancer in animals and may be a potential human carcinogen.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: Liver, kidney, and lung function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Dichloroisocyanuric Acid

Use Type: Biocide and water treatment chemical

CAS Number: 2782-57-2

Formula: C₃H₂Cl₂N₃O₃

Synonyms: Dichloroisocyanurate; Dichloroisocyanuric acid; Dichloroisocyanuric acid, dry or dichloroisocyanuric acid salts; Dichloro-*s*-triazinetriene; 1,3-Dichloro-*s*-triazine-2,4,6-(1*H*,3*H*,5*H*)-trione; Isocyanuric acid, dichloro-; Isocyanuric dichloride

Trade Names: ACL 70[®]; CDB 60[®]; FI CLOR 71[®]; HILITE 60[®]; ORCED[®]; TROCLOSENE[®]

Chemical Class: Triazinetrione

EPA/OPP PC Code: 081401

California DPR Chemical Code: 204

Uses: Used in disinfectants and cleaning solution in domestic products and in food processing plants.

Regulatory Authority:

- Actively registered pesticide in California.
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- CAL Air Resources Board/AB 1807 Toxic Air Contaminants
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112);
- Clean Water Act: Section 307 Priority Pollutants as cyanide, total; Toxic Pollutant (Section 401.15)
- RCRA Section 261 Hazardous Constituents
- RCRA Universal Treatment Standards: Wastewater (mg/L), 1.2 (total); 0.86 (amenable); Nonwastewater (mg/kg), 590 (total); 30 (amenable).
- RCRA Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 9010(40)
- Safe Drinking Water Act: MCL, 0.2 mg/L; MCLG, 0.2 mg/L; Regulated chemical (47 FR 9352)

- EPA Hazardous Waste Number (RCRA No.): P030 as cyanide compound
- EPCRA Section 304 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanides, mixtures or solutions

Description: White, crystalline solid or powder, or granules. Chlorine odor. Soluble in water. Melting/Freezing point = 225°C (decomposes). Molecular weight = 197.97.

Incompatibilities: A strong oxidizer. Violent reaction with organic and flammable materials.

Permissible Exposure Limits in Air: No standards set. However, inasmuch as it is a cyanide compound, the exposure limits are listed here: OSHA and ACGIH: 5 mg/m³ TWA; NIOSH: Ceiling limit, 4.7 ppm; 5 mg/m³ per 10 minutes as cyanides. All have notations that skin contact contributes significantly in overall exposure. IDLH = 25 mg/m³ as CN

Determination in Air: Filter/Bubbler; Potassium hydroxide; Ion-specific electrode; NIOSH IV Method #7904, Cyanides. See also Method #6010, Hydrogen Cyanide.⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. The U.S.EPA⁽⁴⁹⁾ has determined a no-observed-adverse-effect-level (NOAEL) of 10.8 mg/kg/day which yields a lifetime health advisory of 154 $\mu\text{g/L}$. States which have set guidelines for cyanides in drinking water⁽⁶¹⁾

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Inhalation, passing through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May cause skin and severe eye irritation. Moderately poisonous if ingested or inhaled. Exposure to a triazine (simazine) has caused acute and subacute dermatitis in the former USSR, characterized by erythema, slight edema, moderate pruritus, and burning lasting 4 to 5 days.

Long Term Exposure: May cause lung irritation and damage. May cause skin allergy. Contact with some triazine compounds (such as atrazine) may increase risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects on the hypothalamic pituitary gonadal axis. Repeated exposure may cause weight loss and reduced red blood cell count. A mutagen.

Points of Attack: Liver, lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Consider chest x-ray following acute overexposure. Evaluation by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Dichlorophene

Use Type: Fungicide, herbicide and bactericide

CAS Number: 97-23-4

Formula: C₁₃H₁₀Cl₂O₂

Synonyms: AI3-02370; Bis(5-chloro-2-hydroxyphenyl)methane; Bis(chlorohydroxyphenyl)methane; Bis(2-hydroxy-5-chlorophenyl)methane; Caswell No. 563; DDDM; DDM; 5,5'-Dichloro-2,2'-dihydroxydiphenylmethane; Dichlorofen; Di(5-chloro-2-hydroxyphenyl)methane; 4,4'-Dichloro-2,2'-methylenediphenol; diclorofeno (Spanish); Dihydroxy dichlorodiphenylmethane; 2,2'-Dihydroxy-5,5'-dichloro diphenylmethane; [(Dihydroxydichloro)diphenyl]methane; GH; 2,2'-Methylenebis(4-chlorophenol); 2,2'-Methylenebis(4-chlorophenol); NSC 38642; Phenol, 2,2'-methylenebis(4-chloro-

Trade Names: ANTHIPHEN®; DIPHENTANE 70®; DICHLOROPHEN®; DICHLOROPHEN B®; DICHLOROPHENE 10®; DICHLORPHEN®; DIDROXANE®; DIPHENTHANE 70®; FUNGICIDE F®; FUNGICIDE GM®; FUNGICIDE M®; G 4®; GEFIR®; HYOSAN; KORIU®; PLATH-LYSE®; PREVENTAL®, Bayer CropScience (Germany); PREVENTOL®, Bayer CropScience (Germany); PREVENTOL GD®, Bayer CropScience (Germany); PREVENTOL GDC®, Bayer CropScience (Germany); SUPER MOSSTOX®; TAENIATOL®; TENIATOL®; TENIATHANE®; TRIVEX®; VERMITHANA®; WESPURIL®

Producers: GlaxoSmithKline Animal Health (UK)

Chemical Class: Chlorophenol

EPA/OPP PC Code: 055001

California DPR Chemical Code: 206

RTECS Number: SM0175000

Uses: Not registered in the U.S. Dichlorophene is a wide spectrum, non-oxidizing biocide used against all types of algae and bacteria. Widely used to treat fungi, fleas and

worm conditions in pet animals and livestock. See U.S. Food and Drug Administration 20 CFR 520.580 and 20 CFR 520.581.

Carcinogen/Hazard Classifications

California Prop. 65: Developmental toxin

U.S. TRI: Developmental toxin

IARC: Group 2B, possible carcinogen

Label Signal Word: CAUTION or WARNING

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Actively registered pesticide in California.
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Description: White crystalline solid or tan, sand-like powder. Odorless when pure; weak phenol odor from contact with air. Practically insoluble in water; solubility = 29.5 ppm @ 25°C. Molecular weight = 269.12. Melting/Freezing point = 177°C. Vapor pressure = 1 x 10⁻¹⁰ mmHg @ 25°C.

Incompatibilities: React with boranes, alkalies, aliphatic amines, amides, nitric acid, sulfuric acid.

Routes of Entry: Skin contact

Harmful Effects and Symptoms

Short Term Exposure: Skin irritation. May damage liver, kidneys, spleen and central nervous system.

Points of Attack: Liver, kidneys, spleen and CNS.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

1,2-Dichloropropane

Use Type: Fumigant and nematicide

CAS Number: 78-87-5

Formula: C₃H₆Cl₂; ClCH₂CHClCH₃

Alert: 1,2-Dichloropropane production in the United States has declined over the past 20 years. It was used in the past as a soil fumigant, chemical intermediate, and industrial solvent and was found in paint strippers, varnishes, and furniture finish removers. Most of these uses were discontinued. Today, almost all of the 1,2-dichloropropane

is used as a chemical intermediate to make perchloroethylene and several other related chlorinated chemicals. Human toxicity (long-term): High.

Synonyms: Bichlorure de propylene (French); α,β -Dichloropropane; 1,2-Dicloroprpano (Spanish); Dwuchloropropan (Polish); ENT 15,406; NCI-C55141; Propane, 1,2-dichloro-; Propylene chloride; α,β -Propylene dichloride; Propylene dichloride

Trade Names: D-D SOIL FUMIGANT[®], Shell Chemical (Netherlands), canceled 9/29/1988; VIDDEN D[®], Dow Chemical Co. (USA), canceled 7/1/1987

Producers: ATOFINA (France); BASF (Germany); Bayer Chemicals (Germany); Cyanamid Agro Products; Dow Chemical Co. (USA); Mitsui Chemicals (Japan); Shell Chemical (Netherlands); Showa Denko (Japan); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Halogenated organic compound

EPA/OPP PC Code: 029002; 600030 (as impurity only; no longer cleared as inert)

California DPR Chemical Code: 2501

ICSC Number: 0441

RTECS Number: TX9625000

EEC Number: 602-020-00-0

EINECS Number: 201-152-2

Uses: Dichloropropane is used as a soil fumigant, alone and in combination with dichloropropane, for nematodes on stored grain, and as an insecticide for livestock. It is used as a chemical intermediate in perchloroethylene and carbon tetrachloride synthesis and as a lead scavenger for antiknock fluids. It is also used as a solvent for fats, oils, waxes, gums and resins, and in solvent mixtures for cellulose esters and ethers. Other applications include scouring compounds and metal degreasing agents.

Human toxicity (long-term)⁽⁷⁷⁾: High–5.00 ppb, MCL (Maximum Contaminant Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–25952.79223 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

California Prop. 65: Carcinogen

IARC: Group 3, unclassifiable

Regulatory Authority:

- Carcinogen (Animal Suspected) (IARC)⁽⁹⁾
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (DFG)⁽³⁾ (Israel) (Mexico) (former USSR)^(35, 43) (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)

- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL $\mu\text{g/L}$): 8010(0.5); 8240(5)
- Safe Drinking Water Act: MCL, 0.005 mg/L; MCLG, zero; Regulated chemical (47 FR 9352); Priority List (55 FR 1470)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1000 lb (454 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, WHMIS, Ingredients Disclosure List, National Pollution Release Inventory (NPRI)

Description: Colorless stable liquid with an odor similar to chloroform. The odor threshold in air is 0.25 ppm. Somewhat soluble in water; solubility = 0.26 g/100mL @ 20°C. Boiling point = 96°C. Melting/Freezing point = –100°C. Flash point = 16°C (cc). Autoignition temperature = 557°C. Explosive limits: LEL = 3.4%; UEL = 14.5%. Vapor pressure = 30 kPa @ 20°C; 50 mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Log K_{ow} = 2.02. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Forms explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. contact with strong oxidizers, powdered aluminum may cause fire and explosion hazard. Strong acids can cause decomposition and the formation of hydrogen chloride vapors. Reacts with strong bases, *o*-dichlorobenzene, 1,2-dichloroethane. Corrosive to aluminum and its alloys. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air: The Federal Limit (OSHA PEL)⁽⁵⁸⁾, DFG MAK⁽³⁾ and the ACGIH⁽¹⁾ TWA recommended value is 75 ppm (350 mg/m³) TWA and the ACGIH⁽¹⁾ STEL is 110 ppm (510 mg/m³). Australia, Israel, Mexico, and the Canadian provinces of Alberta, BC, Ontario, and Quebec use the same values as ACGIH⁽¹⁾. The NIOSH⁽²⁾ IDLH level = 400 ppm [Carcinogen]. Brazil⁽³⁵⁾ has set a workplace limit of 59 ppm (275 mg/m³). Russia^(35, 43)

has set an MAC in workplace air of 10 mg/m³ and a limit in ambient air in residential areas of 0.18 mg/m³ on a daily average basis. Several states have set guidelines or standards for propylene dichloride in ambient air⁽⁶⁰⁾ ranging from 5.1 µg/m³ (Massachusetts) to 13.89 µg/m³ (Kansas) to 3,500-5,100 µg/m³ (North Dakota) to 5,800 µg/m³ (Virginia) to 7,000 µg/m³ (Connecticut) to 8,330 µg/m³ (Nevada).

Determination in Air: Charcoal tube (petroleum-based); Acetone/Cyclohexane; Gas chromatography /Electrochemical detection; NIOSH IV Method #1013, 1,2-Dichloropropane⁽¹⁸⁾.

Permissible Concentration in Water: To protect freshwater aquatic life: 23,000 µg/L on an acute toxicity basis and 5,700 µg/L on a chronic basis. To protect saltwater aquatic life: 10,300 µg/L on an acute toxicity basis and 3,040 µg/L on a chronic basis. To protect human health: No value set because of insufficient data⁽⁶⁾. EPA⁽⁶²⁾ has recently proposed a limit in drinking water of 0.005 mg/L (5 µg/L). Several states have set guidelines for propylene dichloride in drinking water⁽⁶¹⁾ ranging from 1 µg/L (Arizona, Massachusetts) to 6 µg/L (Kansas and Minnesota) to 10 µg/L (California and Connecticut). The former USSR^(35, 43) has set an MAC in water bodies used for domestic purposes of 0.4 mg/L. The USEPA⁽⁴⁷⁾ has derived a no-observed adverse effects level (NOAEL) of 8.8 mg/kg/day which gives a 10-day health advisory for a 10-kg child of 0.09 mg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation of vapor, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: 1,2-Dichloropropane irritates the eyes, skin, and respiratory tract. It may affect the nervous system. High concentration exposure can result in lightheadedness, dizziness, and unconsciousness. Propylene dichloride may cause dermatitis by defatting the skin. More severe irritation may occur if it is confined against the skin by clothing. Undiluted, it is moderately irritating to the eyes, but does not cause permanent injury. The vapor can irritate the nose, throat, eyes and air passages. Repeated or prolonged skin contact can cause rash.

Long Term Exposure: Repeated exposure can cause skin drying and dermatitis. There is limited evidence that this chemical causes cancer in animals. It may cause liver cancer. In animal experiments, acute exposure to propylene dichloride produced central nervous system narcosis, fatty degeneration of the liver and kidneys. High or repeated exposure can damage the liver, kidneys and brain. Early symptoms include headaches, nausea, personality changes. Based on animal tests this chemical may affect reproduction and may cause malformations in the human fetus.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, central nervous system. **Cancer Site:** (in animals) liver & mammary gland tumors.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Evaluate the skin condition.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

1,3-Dichloropropene

Use Type: A soil fumigant and nematicide.

CAS Number: 542-75-6; 10061-01-5 (*cis*-); 10061-02-6 (*trans*-)

Formula: C₃H₄Cl₂; CHCl=CHCH₂Cl

Alert: 1,3-Dichloropropene should be handled with extreme caution, as a Carcinogen.

Synonyms: β -Chloroallyl chloride; 3-Chloroallyl chloride; 3-Chloropropenyl chloride; 1,3-D; 1,3-Dichloro-1-propene; 1,3-Dichloro-2-propene; 1,3-Dichloropropeno (Spanish); α , β -Dichloropropylene; 1,3-Dichloropropylene; 1-Propene, 1,3-dichloro-; Propene, 1,3-dichloro-

Trade Names: DURHAM NEMATOCIDE[®], AMVAC chemical Corp. (USA), canceled 7/1/1987; FUMAZONE[®], Dow chemical Co. (USA), canceled 11/10/1983; NEMAGON[®], Shell Chemical Co. (UK), canceled 12/9/1979; NEMEX[®]; PRO-KILL NEMATOCIDE[®], Gowan Co. (USA), canceled 7/31/1979; TELONE[®]; TELONE II[®]; VIDDEN D[®]; VORLEX[®]

Producers: Asahi Glass (Japan); Dow AgroSciences (USA); Solvay Group (Belgium)

Chemical Class: Chlorinated hydrocarbon

EPA/OPP PC Code: 029001

California DPR Chemical Code: 573

RTECS Number: UC8310000

EINECS Number: 201-153-8

Uses: It is also used in combinations with dichloropropanes as a soil fumigant to kill nematodes, insects and fungus on cotton, potatoes, tobacco, sugar beets, vegetables, grain, citrus planting sites, deciduous fruit and nut-tree planting sites, and ornamental trees and floral sites. Top five applications in California are on sweet potatoes, carrots, wine grapes and outdoor propagation nurseries. It is used on a wide variety of crops.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group B2, probable carcinogen

U.S. NTP Carcinogen: Reasonably anticipated carcinogen

California Prop. 65: Carcinogen

IARC: Group 2B, possible carcinogen

Label Signal Word: DANGER

Regulatory Authority:

 - EPCRA Section 313 Form R de minimus concentration reporting level: 0.1%.
 - U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
 - Canada, WHMIS, Ingredients Disclosure List
 - Mexico, drinking water, 0.09 mg/L
- trans*-isomer:
- RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.036; Nonwastewater (mg/kg), 18
 - RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μ g/L): 8010(5); 8240(5)
 - EPCRA Section 313 Form R de minimus concentration reporting level: 0.1%.

Description: Colorless to straw-colored liquid with a sharp, sweet, irritating, chloroform-like odor. Boiling point = 106°C; 103–110°C (mixed *cis*- and *trans*-isomers). Melting/Freezing point = -84°C. Flash point = 35°C. Vapor pressure = 29 mmHg @ 20°C. The explosive limits are: LEL = 5.3%; UEL = 14.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Practically insoluble in water.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers. May accumulate static electrical charges, and may cause ignition of its vapors. Incompatible with strong acids, oxidizers, aluminum or magnesium compounds, aliphatic amines, alkanolamines, alkaline materials, halogens, or corrosives. *Note:* Epichlorohydrin may be added as a stabilizer.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾ and ACGIH⁽¹⁾ recommend a TWA of 1.0 ppm (5 mg/m³). HSE, Australia, Israel, and the Canadian provinces of Alberta, Ontario, and Quebec set the same TWA as ACGIH⁽¹⁾ and HSE⁽³³⁾, and Alberta add an STEL of 10 ppm (50 mg/m³). DFG has no numerical limit, but notes carcinogenic effect in animals⁽³⁾. The additional notation "skin" indicates the possibility of cutaneous absorption. The former USSR^(35, 43) has set an MAC in workplace air of 5.0 mg/m³ and MAC values for ambient air in residential areas of 0.1 mg/m³ on a momentary basis and 0.01 mg/m³ on a daily average basis. Several states have set guidelines or standards for 1,3-dichloropropene in ambient air⁽⁶⁰⁾ ranging from 50 mg/m³ (North Dakota) to 80 μ g/m³ (Virginia) to 100 mg/m³ (Connecticut) to 119 mg/m³ (Nevada).

Determination in Air: No method listed.

Permissible Concentration in Water: To protect freshwater aquatic life: 6,060 μ g/L on an acute toxicity basis and 244 μ g/L on a chronic basis. To protect saltwater aquatic life:

790 µg/L on an acute toxicity basis. To protect human health: 87.0 µg/L⁽⁶⁾. The former USSR^(35,43) has set an MAC in water bodies used for domestic purposes of 0.4 mg/L. Mexico's drinking water criteria is 0.09 mg/L. A no-observed-adverse-effects level (NOAEL) of 3.0 mg/kg/day has been determined by the U.S. EPA (see Health Advisory reference below). This results in a drinking water level on a lifetime basis of 0.011 mg/L (11.0 µg/L). Several states have set guidelines for 1,3-dichloropropene in drinking water⁽⁶¹⁾ ranging from 10 µg/L (Connecticut) to 87 µg/L (Arizona and Kansas) to 89 µg/L (Vermont).

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Exposure can cause headaches, chest pain, and dizziness. High levels can cause you to pass out. Contact can severely burn the eyes and skin, with permanent damage. High exposures can damage the kidneys, liver and lungs

Long Term Exposure: There is evidence that 1,3-dichloropropene causes cancer in animals and humans. May damage the kidneys, liver and lungs. May cause chronic headache, and personality changes.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys. Cancer Site [in animals: cancer of the bladder, liver, lung & stomach].

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Liver function tests. Lung function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dichlorprop

Use Type: Herbicide and plant growth regulator

CAS Number: 120-36-5

Formula: C₉H₈C₁₂O₃

Synonyms: Acide-2-(2,4-dichloro-phenoxy)propionique (French); Acido-2-(2,4-dicloro-fenossi)propionico (Italian); Acido 2-(2,4-diclorofenoxi)propionico (Spanish); BH 2,4-DP; Caswell No. 320; 2(2,4-Dichloro-fenoxy)propionzuur (Dutch); 2,4-Dichlorophenoxy- α -propionic acid; α -(2,4-Dichlorophenoxy)propionic acid; (\pm)-2-(2,4-Dichlorophenoxy)propionic acid; 2,4-Dichlorophenoxy propionic acid; 2-(2,4-Dichlorophenoxy) propionic acid; Dichloroprop; 2-(2,4-Dichloro-phenoxy)-propionsaeure (German); 2,4-DP (U.S. EPA); 2-(2,4-DP); NSC 39624; Propanoic acid, 2-(2,4-dichlorophenoxy)-; Propionic acid, 2-(2,4-dichlorophenoxy)-

Trade Names: BH 2,4-DP[®]; CAMPBELL'S[®] REDIPON; CELATOX-DP[®]; CORNOX RD[®]; DESORMONE[®]; EMBUTOX[®]; GRAMINON-PLUS[®]; HEDONAL[®]; HERBIZID DP[®]; HORMATOX[®]; KILDIP[®]; POLYCLENE[®]; POLYMONE[®]; POLYTOX[®]; RD 406[®]; SERITOX 50[®]; U46[®]; DP-FLUID[®]; VISKO-RHAP[®]; WEEDONE 170[®]; WEEDONE DP[®]

Producers: A H Marks & Company (UK); Bayer CropScience (Germany); Dow AgroSciences (USA)

Chemical Class: Chlorophenoxy acid or ester

EPA/OPP PC Code: 031401

California DPR Chemical Code: 2503

ICSC Number: 0038

RTECS Number: UF1050000

EEC Number: 607-045-00-0

EINECS Number: 204-390-5

Uses: A phenoxy herbicide. Dichlorprop is a translocated post-emergence herbicide effective in the control of some *Polygonum persicaria* and other weeds in small grain cereals. It may be used either alone or in combination with other herbicides such as MCPA, benazolin, and dicamba. The latter mixture is an extremely effective broad spectrum herbicide controlling such weeds as *Anthemis* spp., *Matricaria* spp., *Stellaria media*, *Galium aparine*, as well as *Polygonum* spp. Dichlorprop is also used for brush control in nonagricultural land, for weed control in aquatic environments, and to prevent premature fall of apples.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–35.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–58.73095 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

IARC: Group 2B, possible carcinogen

TRI Developmental Toxin: Developmental toxin

WHO Acute Hazard: Class III, Slightly Hazardous

Regulatory Authority:

- AB 2588-Air Toxics “Hot Spots” Chemicals (CAL) as chlorophenoxy pesticides
- The “Director’s List” (CAL/OSHA) as chlorophenoxy pesticides
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%
- U.S. DOT Regulated Marine Pollutant (49CFR, Subchapter 172.101, Appendix B) as phenoxy herbicide

Description: White, crystalline powder. Faint phenolic odor. May be applied as a liquid containing a flammable carrier. Slightly soluble in water; solubility = 2.3×10^3 ppm @ 20°C. Molecular weight = 235.07. Boiling point = 215°C. Melting/Freezing point = 114 (technical grade) –118°C. Vapor pressure = 2.9×10^{-6} mmHg @ 20°C. Log K_{ow} = 5.89. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. The aqueous solution is a weak acid. Attacks many metals in presence of moisture.

Permissible Exposure Limits in Air: No occupational exposure limits have been established

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain,

redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years.

Long Term Exposure: Workers exposed to chlorophenoxy compounds such as 2,4-D (in the manufacturing process) over a five to ten year period at levels above 10 mg/m³ complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affect human reproduction

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidney

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Diclofop-methyl

Use Type: Herbicide

CAS Number: 51338-27-3

Formula: C₁₆H₁₄Cl₂O₄

Alert: Some uses are classified Restricted Use Pesticide (RUP). Human toxicity (long-term): High.

Synonyms: Caswell No. 319A; Diclofop methyl ester; Dichlordiphenprop; dichlorfop-methyl; 2-[4-(2,4-Dichlorophenoxy)phenoxy]-methyl-propionate; 2-[4-(2,4-Dichlorophenoxy)phenoxy]propanoic acid methyl ester; Methyl 2-[2-(2,4-dichlorophenoxy)phenoxy]propanoate; Methyl ester of 2-[4-(2,4-dichlorophenoxy)phenoxy]propanoic acid; Propanoic acid, 2-[4-(2,4-dichlorophenoxy)phenoxy]-, methyl ester

Trade Names: DICHLORDIPHENPROP[®]; HOELON[®], Bayer CropScience (Germany); HOELON[®] 3EC, Bayer CropScience (Germany); HOE-GRASS[®], Bayer CropScience (Germany); HOEGRASS[®], Bayer CropScience (Germany); HOE[®] 23408, Bayer CropScience (Germany); ILOXAN[®], Bayer CropScience (Germany); ILLOXAN[®], Bayer CropScience (Germany); ONE SHOT[®], Clariant (Switzerland), canceled

Producers: Bayer CropScience (Germany); China Shenghua Group Agrochemical (China)

Chemical Class: Chlorophenoxy

EPA/OPP PC Code: 110902

California DPR Chemical Code: 2034

RTECS Number: UF1180000

EINECS Number: 257-141-8

Uses: Some uses are classified Restricted Use Pesticide (RUP). Diclofop-methyl is a selective post-emergence herbicide used to control wild oats and annual grassy weeds in grain and vegetable crops: alfalfa, carrots, celery, box, field and french beans, barley, wheat, brassicas, parsnips, peas, potatoes, rapeseed (canola), soy beans, oilseed rape, onions, sugar beets and lettuce.

Human toxicity (long-term)⁽⁷⁷⁾: High–1.40 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–10.60669 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Diclofop-methyl (40 CFR 180.385):

CROP	ppm
Barley, grain	0.1
Barley, straw	0.1
Lentil	0.1
Pea, dry	0.1
Wheat, grain	0.1

Chemical Class: Organophosphate; Halo-organics

EPA/OPP PC Code: 084001 and 600020

California DPR Chemical Code: 187

ICSC Number: 0690

RTECS Number: TC0350000

EEC Number: 015-019-00-X

EINECS Number: 200-547-7

Uses: Dichlorvos is used for insect control in food storage areas, green houses, and barns, and control of insects on livestock. It is not generally used on outdoor crops. Dichlorvos is sometimes used for insect control in workplaces and in the home. Dichlorvos used in pest control is diluted with other chemicals and used as a spray. It can also be incorporated into plastic that slowly releases the chemical. Veterinarians use it to control parasites on pets. Dichlorvos is effective against mushroom flies, aphids,

spider mites, caterpillars, thrips, and white flies in greenhouse, outdoor fruit, and vegetable crops. It is used to treat a variety of parasitic worm infections in dogs, livestock, and humans. Dichlorvos can be fed to livestock to control botfly larvae in the manure. It acts against insects as both a contact and a stomach poison. It is used as a fumigant and has been used to make pet collars and pest strips. It is available as an aerosol and soluble concentrate.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.35 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–7.24703 ppb, MATC (Maximum Acceptable Toxicant Concentration)

- Proposition 65 chemical (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section
- 313 Water Priority Chemicals (57FR41331, 9/9/92)
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R de minimus concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Colorless to amber liquid. Mild aromatic odor. Moderate solubility in water; solubility = 1.0×10^4 ppm. Molecular weight = 220.98. Boiling point = 140°C @ 20 mmHg. Vapor pressure = 0.01 mmHg @ 20°C. Flash point = > 79°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Log K_{ow} = <1.5. Unlikely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the organic carrier solvents used in commercial formulations.

Incompatibilities: Strong acids, strong alkalis. Corrosive to iron, mild steel, and some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air: The Federal limit (OSHA PEL), Australian, Israeli, DFG MAK⁽³⁾, HSE, Canadian provincial (Alberta, BC, Ontario, Quebec), and ACGIH⁽¹⁾ value is 0.1 ppm (1 mg/m³) TWA. and HSE⁽³³⁾, Alberta, BC add STEL value of 0.3 mg/m³. The Mexican TWA is 0.16 ppm. The NIOSH⁽²⁾ IDLH level = 100 mg/m³. The notation “skin” is added indicating the possibility of cutaneous absorption. Argentina⁽³⁵⁾ uses the same TWA limits set forth above. The former USSR⁽³⁵⁾ has set an MAC in workplace air of 0.2 mg/m³ and an MAC for ambient air in residential areas of 0.07 mg/m³ on a once-a-day basis and 0.002 mg/m³ on a daily average basis.

Determination in Air: XAD-2[®] (tube); Toluene; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH II(5), P&CAM Method #295⁽¹⁸⁾.

Permissible Concentration in Water: The former USSR⁽³⁵⁾ has set an MAC in water bodies used for domestic purposes of 1.0 mg/L and in water for fishing of zero.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Dichlorvos irritates the eyes and skin. Symptoms include miosis, aching eyes; rhinorrhea (discharge of thin nasal mucous); headache; chest tightness, wheezing, laryngeal spasm, salivation; cyanosis; anorexia, nausea, vomiting, diarrhea; sweating; muscle fasciculation, paralysis, giddiness, ataxia; convulsions; low blood pressure, cardiac irregular/irregularities. The substance may cause effects on the central nervous system. Cholinesterase inhibitor. High levels of exposure may result in death. Delayed pulmonary edema may occur after inhalation. Symptoms of exposure include sweating, twitching, contracted pupils, respiratory distress (tightness in the chest and wheezing), salivation (drooling), lacrimation (tearing), nausea, vomiting, abdominal cramps, diarrhea, involuntary defecation and urination, slurred speech, coma, apnea (cessation of breathing), and death. Dichlorvos is a very toxic compound with a probable lethal oral dose in humans between 50 and 500 mg/kg, or between 1 teaspoon and 1 oz. for a 70 kg (150 lb) person. However, brief exposure (30-60 minutes) to vapor concentrations as high as 6.9 mg/Liter did not result in clinical signs or depressed serum cholinesterase levels. Toxic changes are typical of organophosphate insecticide poisoning with progression to respiratory distress, respiratory paralysis, and death if there is no clinical intervention.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization and dermatitis. Cholinesterase inhibitor; cumulative effect is possible: see short term exposure. A study in rats and mice reported that rats had an increase in cancer of the pancreas and in

leukemia, and female mice had an increase in stomach cancer after they were fed dichlorvos for 2 years. Animal studies have also shown effects on the nervous system when animals drank water or ate food containing dichlorvos. It is not known whether dichlorvos can affect reproduction or cause birth defects in people. Animal studies have not reported effects on reproduction or birth defects when animals were exposed to dichlorvos.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, central nervous system, blood acetylcholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell acetylcholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months.

When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite

solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Note to physician or authorized medical personnel:* Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as

its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Chemical Class: Organochlorine; Halo-organics

EPA/OPP PC Code: 010501

California DPR Chemical Code: 346

ICSC Number: 0752

RTECS Number: DC8400000

EEC Number: 603-044-00-4

EINECS Number: 204-082-0

Uses: Dicofol is an organochlorine miticide/pesticide used for foliar applications, mostly on cotton, apples, and citrus crops. Other crops include: strawberries, mint, beans, peppers, tomatoes, pecans, walnuts, stonefruit, cucurbits, and non-residential lawns/ornamentals. Formulations registered for use on food/feed crops include emulsifiable concentrates, and wettable powder formulations. These formulations may be applied as concentrated or dilute sprays using aircraft, duster, groundboom, and sprayer. Dicofol is manufactured from DDT. In 1986, use of dicofol was temporarily canceled by the U.S. EPA because of concerns raised by high levels of DDT contamination. However, it was reinstated when it was shown that modern manufacturing processes can produce technical grade dicofol which contains less than 0.1% DDT.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

IARC: Group 3, unclassifiable

Label Signal Word: WARNING or CAUTION, depending on the formulation.

WHO Acute Hazard: Class III, slightly hazardous

Endocrine Disruptor: Suspected endocrine disruptor

Regulatory Authority:

- Carcinogen (animal positive) NTP
- AB 1803-Well Monitoring Chemical (CAL)
- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL)
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 10 lb (4.54 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%

Description: Dicofol is a white or brown waxy solid. Practically insoluble in water; solubility = 1.5 ppm @ 20°C. Molecular weight = 370.47. Boiling point = 180°C @ 0.13 mmHg. Melting/Freezing point = 79°C. Vapor pressure = 4×10^{-7} mmHg. Flash point = 120°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Log K_{ow} = 3.55. Values at or above 3.0 are likely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Incompatible with alkaline pesticides, strong acids, acid fumes, aliphatic amines, isocyanates, and steel.

Permissible Exposure Limits in Air: No occupational exposure limits have been established.

Routes of Entry: Inhalation, passing through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Dicofol can be absorbed through the skin, thereby increasing exposure. It irritates the skin and the respiratory tract. Exposure can cause headache, nausea, vomiting and poor appetite. Dicofol may affect the central nervous system causing numbness and weakness in the hands and feet., muscle twitching, seizures, unconsciousness and death.

Long Term Exposure: May affect the liver and kidneys. May cause personality changes with depression, anxiety, and irritability. May decrease fertility in females. Prolonged or repeated skin contact may cause dermatitis. There is limited evidence that dicofol causes liver cancer in animals.

Points of Attack: Skin, nervous system. liver, kidneys.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Dermatological examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dicrotophos

Use Type: Insecticide and acaricide.

CAS Number: 141-66-2

Formula: C₈H₁₆NO₅P

Alert: A Restricted Use Pesticide (RUP). One of the major degradates of dicrotophos is monocrotophos. All uses of monocrotophos have been voluntarily cancelled in the United States due to its extreme toxicity to humans and wildlife. Human toxicity (long-term): Very high.

Synonyms: Crotonamide, 3-hydroxy-*N,N*-dimethyl-, *cis*-, Dimethyl phosphate; Crotonamide, 3-hydroxy-*N,N*-dimethyl-, dimethylphosphate, *cis*-; Crotonamide, 3-hydroxy-*N,N*-dimethyl-, dimethylphosphate, (*E*)-; Dicrotophos (Dutch); Dicrotophos; 3-(Dimethoxyphosphinyloxy)-*N,N*-dimethyl-(*E*)-crotonamide; 3-(Dimethoxyphosphinyloxy)-*N,N*-dimethyl-*cis*-crotonamide; 3-(Dimethoxyphosphinyloxy)-*N,N*-dimethylisocrotonamide; 3-(Dimethylamino)-1-methyl-3-oxo-1-propenyl dimethyl phosphate; *cis*-2-Dimethylcarbamoyl-1-methylvinyl dimethylphosphate; (*E*)-2-Dimethylcarbamoyl-1-methylvinyl dimethylphosphate; *O,O*-Dimethyl-*O*-(2-dimethyl-carbamoyl-1-methylvinyl)phosphat (German); *O,O*-Dimethyl-*O*-(*N,N*-

dimethylcarbamoyl-1-methylvinyl) phosphate; *O,O*-Dimethyl-*O*-(1,4-dimethyl-3-oxo-4-aza-pent-1-enyl)fosfaat (Dutch); *O,O*-Dimethyl-*O*-(1,4-dimethyl-3-oxo-4-aza-pent-1-enyl)phosphate; Dimethyl phosphate of 3-hydroxy-*N,N*-dimethyl-*cis*-crotonamide; Dimethyl phosphate ester with 3-hydroxy-*N,N*-dimethyl-*cis*-crotonamide; *O,O*-Dimethyl-*O*-(1,4-dimethyl-3-oxo-4-aza-pent-1-enyl)-fosfato (Italian); ENT 24,482; 3-Hydroxydimethyl crotonamide dimethyl phosphate; 3-Hydroxy-*N,N*-dimethyl-*cis*-crotonamide dimethyl phosphate; 3-Hydroxy-*N,N*-dimethyl-(*E*)-crotonamide dimethyl phosphate; Phosphatede dimethyle et de 2-dimethylcarbamoyl 1-methyl vinyle (French); Phosphoric acid, 3-(dimethylamino)-1-methyl-3-oxo-1-propenyl dimethyl ester, (*E*)-; Phosphoric acid, dimethyl ester with *cis*-3-hydroxy-*N,N*-dimethylcrotonamide; Phosphoric acid, dimethyl ester with (*E*)-3-hydroxy-*N,N*-dimethylcrotonamide

Trade Names: BIDIRL[®]; BIDRIN[®], Amvac Chemical Corp. Chemical Class: Organophosphate

EPA/OPP PC Code: 035201

California DPR Chemical Code: 72

ICSC Number: 0872

RTECS Number: TC3850000

EEC Number: 015-073-00-4

Uses: Dicrotophos was introduced in 1956 as a contact systemic pesticide with a wide range of applications. Today, dicrotophos is currently used mainly as an insecticide for apples and other fruit crops, and for cotton pests, mostly in the Mississippi Valley. It is acutely toxic to birds, especially those that follow their migratory corridors and feed in the farmlands that have been treated with this pesticide. Internationally, dicrotophos is used on rice, coffee and citrus.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.70 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–953.39880 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Dicrotophos (40 CFR 180.299):

CROP	ppm
Cotton, undelinted seed	.05

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: A suggestive carcinogen

Label Signal Word: DANGER

WHO Acute Hazard: Class 1B, highly hazardous

Regulatory Authority:

- Banned or Severely Restricted (DDR and Malaysia) (UN)⁽¹³⁾
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Australia) (Israel) (Mexico) (Several States)⁽⁶⁰⁾ (Several Canadian Provinces)
- AB 1803-Well Monitoring Chemical (CAL)
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPO = 100 lb (45.4 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)
- U.S. DOT Inhalation Hazard Chemicals as organophosphate
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Amber liquid. Mild ester odor. Soluble in water. Boiling point = -400°C . Decomposes below boiling point @ 75°C after storage for 31 days. Flash point = 93°C (cc). Vapor pressure = 2×10^{-4} mmHg; 1.29 mPa @ 20°C . Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Log K_{ow} = -0.5 . Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Attacks some metals: Corrosive to cast iron, mild steel, brass, and stainless steel 304. Decomposes after prolonged storage, but is stable when stored in glass or polyethylene containers with temperatures to 40°C . Forms highly toxic fumes of phosphorous and nitrogen oxides when heated to decomposition.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. The ACGIH⁽¹⁾ recommended airborne exposure limit 0.25 mg/m^3 TWA. NIOSH⁽²⁾ recommends the same exposure limit. Australia, Israel, Mexico, and the Canadian provinces of Alberta, BC, Ontario, and Quebec set the same limit as ACGIH⁽¹⁾ and Alberta's STEL is 0.75 mg/m^3 . The TWA bears the notation "skin" indicating the possibility of cutaneous absorption. Several states have set guidelines or standards for dicrotophos in ambient air⁽⁶⁰⁾ ranging from $2.5 \mu\text{g/m}^3$ (North Dakota) to $4.0 \mu\text{g/m}^3$ (Virginia) to $5.0 \mu\text{g/m}^3$ (Connecticut) to $6.0 \mu\text{g/m}^3$ (Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH IV, Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Dicrotophos may affect the nervous system, causing convulsions, respiratory failure. Dicrotophos is a cholinesterase inhibitor which can penetrate the skin. Effects may be cumulative. It is extremely toxic. Probable human oral lethal dose is 5 to 50 mg/kg, 7 drops to one teaspoonful for a 70 kg (150 lb) person. Closely related in toxicity to azodrin. Acute exposure to dicrotophos may produce the following signs and symptoms; pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. The effects may be delayed. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Dicrotophos is a cholinesterase inhibitor; cumulative effect is possible. May damage the nervous system causing numbness, "pins and needles," sensation and/or weakness of the hands and feet. Repeated exposure may cause personality changes of depression, anxiety or irritability.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Eyes: Speed in removing

material from eyes and skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the

nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Dieldrin

Use Type: Insecticide and also a breakdown product

CAS Number: 60-57-1

Formula: C₁₂H₈Cl₆O

Alert: Manufacture in the United States prohibited since 1974. In 1987, EPA banned all uses. Human toxicity (long-term): Very high.

Synonyms: Dieldrina (Spanish); Dieldrine (French); 2,7:3,6-Dimethanonaphtha[2,3B]oxirene,3,4,5,6,9,9-hexachloro-1a,2,2a,3,6,6a,7,7a-octahydro-(1a α ,2 β ,2A α ,3 β ,6 β ,6A α ,7 β ,7A α); 1,2,3,4,10,10-Hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo,exo-5,8-dimethanonaphthalene; 3,4,5,6,9,9-Hexachloro-1a,2,2a,3,6,6a,7,7a-octahydro-2,7:3,6-dimethano; ENT 16,225; HEOD; Hexachloroepoxyoctahydro-endo,exo-dimethanonaphthalene; 3,4,5,6,9,9-Hexachloro-1a,2,2a,3,6,6a,7,7a-octahydro-2,7:3,6-dimethanonaphth(2,3-b)oxirene; NCI-C00124; (1R,4S,4AS,5R,6R,7S,8S,8AR) 1,2,3,4,10,10-Hexachloro-1,4,4a,5,6,7,8,8a-octahydro-6,7-epoxy-1,4:5,8-dimethanonaphthalene

Trade Names: ALVIT[®]; BELCO[®], Bell Laboratories (USA), canceled; COMPOUND 497[®]; D-31[®]; DIELDREX[®]; DIELDRITE[®]; ILLOXOL[®]; KILLGERM DETHLAC INSECTICIDAL LAQUER[®]; OCTALOX[®]; OXRALOX[®]; PANORAM[®]; PANORAM D-31[®]; PRENTOX[®], Prentiss (USA), canceled; QUINTOX[®]; ROYAL BRAND[®], Amvac Chemical Corp. (USA), canceled; SD 3417[®]

Producers: Aldrich Chemical (USA); Amvac Chemical Corp. (USA); Bell Laboratories (USA); Ehrenstorfer, Dr. (Germany); Prentiss Inc. (USA); Shell Chemical (UK); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organochlorine; Halo-organics

EPA/OPP PC Code: 045001

California DPR Chemical Code: 210

ICSC Number: 0787

RTECS Number: IO1750000

EEC Number: 602-049-00-9

Uses: Aldrin and dieldrin are manmade compounds belonging to the group of cyclodiene insecticides. They are a subgroup of the chlorinated cyclic hydrocarbon insecticides which include DDT, BHC, etc. From the 1950s until 1970, aldrin and dieldrin were widely used pesticides for crops like corn and cotton, and also on citrus. Because of concerns about damage to the environment and potentially to human health, EPA banned all uses of aldrin and dieldrin in 1974, except to control termites. In 1987, EPA banned all uses. Dieldrin's persistence in the environment is due to its extremely low volatility (i.e., a

vapor pressure of 1.78×10^{-7} mm mercury @ 20°C), and low solubility in water (186 $\mu\text{g/L}$ at 25° to 29°C). In addition, dieldrin is extremely apolar, resulting in a high affinity for fat which accounts for its retention in animal fats, plant waxes, and other such organic matter in the environment. The fat solubility of dieldrin results in the progressive accumulation in the food chain which may result in a concentration in an organism which would exceed the lethal limit for a consumer.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.02187 ppb, CHCL (Chronic Human Carcinogen Level)

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg). Dieldrin has been found in at least 287 of the 1,613 National Priorities List sites identified by the Environmental Protection Agency (EPA).
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Mexico, Drinking Water Criteria, 0.7×10^{-7} mg/L

Description: Dieldrin is a colorless to light tan solid with a mild chemical odor. The odor threshold in water is 0.04 mg/L. Practically insoluble in water; solubility = 0.1 ppm. Boiling point = (decomposes). Molecular weight = 380. 91. Melting/Freezing point = 175–176°C. Vapor pressure = 3×10^{-6} mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Log K_{ow} = 6.24. Values at or above 3.0 are likely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Incompatible with strong acids: concentrated mineral acids, acid catalysts, phenols, strong oxidizers, phenols, active metals, like sodium, potassium, magnesium, and zinc. Keep away from copper, iron, and their salts.

Permissible Exposure Limits in Air: The Federal Limit (OSHA⁽²⁾ PEL), as well as the recommended ACGIH⁽¹⁾ TWA value is 0.25 mg/m³. The DFG MAK⁽³⁾, HSE, Australian, Israeli, Mexican and Canadian provincial (Alberta, BC, Ontario, and Quebec) TWA is the same as OSHA and the STEL value set by Mexico, Alberta, British Columbia, and HSE⁽³³⁾ is 0.75 mg/m³. The ceiling value in Germany⁽³⁵⁾ is 2.5 mg/m³. The notation “skin” indicates the possibility of cutaneous absorption. The NIOSH⁽²⁾ IDLH level = [Ca] 50 mg/m³. The former USSR^(35, 43) has set an MAC in workplace air of 0.01 mg/m³. Several states have set guidelines or standards for dieldrin in ambient air⁽⁶⁰⁾ ranging from 0.035 µg/m³ (Pennsylvania) to 0.595 µg/m³ (Kansas) to 2.5 µg/m³ (North Dakota) to 4.0 µg/m³ (Virginia) to 5.0 µg/m³ (Connecticut) to 6.0 µg/m³ (Nevada).

Determination in Air: Filter; Isooctane; Gas chromatography/Electrochemical detection; NIOSH II(3), Method #S283⁽¹⁸⁾.

Permissible Concentration in Water: The U.S. EPA limits the amount of dieldrin that may be present in drinking water to 0.001 and 0.002 milligrams per liter (mg/L) of water, respectively, for protection against health effects other than cancer. The U.S. EPA has determined that a concentration of dieldrin of 0.0002 mg/L in drinking water limits the lifetime risk of developing cancer from exposure to each compound to 1 in 10,000.⁽⁶⁾ Mexico⁽³⁵⁾ has set MAC values for dieldrin of 0.0000007 mg/L in water used for drinking water supply; of 0.003 mg/L in estuaries and 0.03 µg/L in estuaries. WHO⁽³⁵⁾ has set a limit of 0.03 µg/L in drinking water. A NOAEL (no observed adverse effects level) of 0.005 mg/kg/day has been calculated by EPA which results in the calculation of a drinking water equivalent of 1.75 µg/L. No lifetime health advisory could be calculated in view of the cancer risk. Several states have set standards or guidelines for dieldrin in drinking water⁽⁶¹⁾ ranging from 0.01 µg/L (Minnesota) to 0.019 µg/L (Kansas) to 0.05 µg/L (California) to 1.0 µg/L (Illinois).

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

During the past decade, considerable information has been generated concerning the toxicity and potential carcinogenicity of the two organochlorine pesticides, aldrin and dieldrin. These two pesticides are usually considered together since aldrin is readily epoxidized to dieldrin in the environment. Both are acutely toxic to most forms of life including arthropods, mollusks, invertebrates, amphibians, reptiles, fish, birds and mammals. Dieldrin is extremely persistent in the environment. By means of bioaccumulation it is concentrated many times as it moves up the food chain.

Short Term Exposure: Inhalation: May cause nausea, drowsiness, loss of appetite, visual disturbances and insomnia. Sprays of 1 to 2 1/2% have caused giddiness, headache, muscle twitching, convulsions and loss of consciousness. **Skin:** Can be absorbed to cause or increase the severity of symptoms as listed under ingestion. Contact may cause skin rash. **Eyes:** May cause irritation, redness, and affect vision. **Ingestion:** Can cause headache, nausea, irritability, insomnia, high blood pressure, vision problems, loss of coordination, profuse sweating, dizziness, frothing at the mouth, convulsions and loss of consciousness. Death may occur from as little as 1/20 ounce (1.4 gram). Some symptoms may be delayed up to 12 hours. Exposure to dieldrin may affect the central nervous system, resulting in convulsions.

Long Term Exposure: May cause liver damage. Dieldrin accumulates in the human body. Dieldrin has caused cancer in laboratory animals. It is considered a suspect occupational carcinogen. may damage the developing fetus. May reduce fertility in males and females. Dieldrin concentrates in breast milk, and therefore, may be transferred to breast feeding infants. Repeated higher exposure can cause tremors, muscle twitching and seizures (convulsions) and may lead to coma and death. Convulsions are somewhat delayed and may occur weeks or months following exposure. Repeated exposure may cause personality changes of depression, anxiety or irritability.

Points of Attack: Central nervous system, liver, kidneys, skin. Cancer Site in animals: lung, liver, thyroid and adrenal gland tumors.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below

preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates. Blood dieldrin level. Examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: Liver function tests. EEG. Blood dieldrin levels (Normal = less than 1 mg/100 ml; level should not exceed 15 mg/100 ml. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 12 hours after overexposure.

Dienochlor

Use Type: Acaricide, miticide

CAS Number: 2227-17-0

Formula: C₁₀Cl₁₀

Synonyms: Bis(pentachloro-2,4-cyclopentadien-1-yl); Bis(pentachlorocyclopentadienyl); Bis(pentachloro-2,4-cyclopentadien-1-yl); Decachlor; ENT 25,718; 1,1',2,2',3,3',4,4',5,5'-Decachloro-bis(2,4-cyclopentadien-1-yl); Decachlorobis(2,4-cyclopentadiene-1-yl); Dienochlor; Bis(pentachloro-2,4-cyclopentadien-1-yl)

Trade Names: HOOKER[®] HRS-16; HOOKER[®] HRS 1654; HRS-16[®]; HRS 16A[®]; HRS 1654[®]; PENTAC[®] Syngenta (Switzerland), canceled; PENTAC[®] Aquaflo, Syngenta (Switzerland), canceled; PENTAC[®] WP, Syngenta (Switzerland), canceled; SATHON[®], Sandoz (Switzerland), canceled; ZOECON[®], Sandoz (Switzerland), canceled

Producers: Dow Elanco (USA); Occidental (USA), Syngenta (Switzerland)

Chemical Class: Chlorinated hydrocarbons (aliphatic); Organochlorine; Halo-organics

EPA/OPP PC Code: 027501

California DPR Chemical Code: 468

EINECS Number: 218-763-5

Uses: No products currently registered in the U.S. Used in formulations in combination with many other pesticides for the control of mites on ornamental trees and shrubs, and other non-food crops.

Fish toxicity (threshold)⁽⁷⁷⁾: High—4.66516 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: WARNING or CAUTION

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Actively registered pesticide in California.

Description: Tan crystalline solid or yellow prisms. Molecular weight = 474.5. Melting/Freezing point = 122°C.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death.

Long Term Exposure:

Points of Attack: May be fatal if inhaled, ingested, or absorbed through the skin

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first

aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. **Do not scrub skin or hair**, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. *Do not induce vomiting.** In cases of ingestion, the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60–90 g, child dose 25–50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do not give activated charcoal before or with ipecac syrup.* **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. *Do not use mouth-to-mouth resuscitation; use bag/mask apparatus.* If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified

supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Diethyl-ethyl

Use Type: Herbicide

CAS Number: 38727-55-8

Formula: C₁₄H₁₈ClNO₃

Synonyms: Caswell No. 179; *N*-Chloroacetyl-*N*-(2,6-diethylphenyl)glycine, ethyl ester; Ethyl *N*-(chloroacetyl)-*N*-(2,6-diethylphenyl)glycinate; Glycine, *N*-(chloroacetyl)-*N*-(2,6-diethylphenyl)-, ethyl ester

Trade Names: AC 22,234[®]; ANTOR[®], Bayer CropScience (Germany), canceled; BAY NTN 6867[®], Bayer CropScience (Germany); H 22234[®]; HERCULES[®] 22234

Producers: Bayer CropScience (Germany)

Chemical Class: Chloracetanilide

EPA/OPP PC Code: 279500

California DPR Chemical Code: 1995

RTECS Number: MB9200000

Uses: No products currently registered in the U.S. Diethyl-ethyl is a selective pre-emergence herbicide used to control many annual grasses and broadleaf weeds in alfalfa, carrots, dry beans, flax, lima beans, peanuts, peas, southern peas, potatoes, red beets, soybeans, spinach, sugar beets, tomatoes, cotton and others.

Human toxicity (long-term)⁽⁷⁷⁾: High–1.75 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Low–243.26438 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: WARNING or CAUTION

Regulatory Authority:

- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings

Description: White crystalline solid. Soluble in water. Vapor pressure = 3.2 x 10⁻⁶ mmHg @ 20°C.

Harmful Effects and Symptoms

Short Term Exposure: Toxic if swallowed. Contact with skin or eyes may cause severe irritation, burns, and severe eye injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides.

Medical Surveillance: Consult physician if the solvent has been inhaled or if poisoning is suspected or of burning or itching skin develops.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water. Do not induce vomiting when formulations containing petroleum solvents are ingested. Do not make an unconscious person vomit.

Difenacoum

Use Type: Rodenticide

CAS Number: 56073-07-5

Formula: C₃₁H₂₄O₃

Synonyms: 3-(3,1,1'-Biphenyl-4-yl-1,2,3,4-tetrahydro-1-naphthalenyl)-4-hydroxy-1(2H)-benzopyran-2-one

Trade Names: COMPO[®], MATRAK[®], NEOSOREXA, Sorex (UK); NEOSOREXA PP580[®] Sorex (UK), RASTOP[®], RATAK[®], RATRICK[®], SILO; SOREXA, Sorex (UK); STORM, Sorex (UK)

Producers: I.N.D.I.A. Industrie Chimiche (Italy); Sorex (UK)

Chemical Class: Coumarin

EPA/OPP PC Code: 119901

California DPR Chemical Code:

RTECS Number: GN4934500

EINECS Number: 259-978-4

Uses: Not registered in the U.S. Difenacoum is an anticoagulant that is effective against rats and mice, including warfarin-resistant strains. It is used in agriculture and urban rodent control as ready-to-use baits.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1 a, extremely hazardous

Description: Off-white powder. Low solubility in water. A weak acid. Melting point = 215-219°C.

Points of Attack: Liver

Medical Surveillance: Gastric lavage and repeated administration of charcoal. Blood sample to measure

hemoglobin level, prothrombin time, blood grouping and cross-matching. (See Pied Piper site in reference.)

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Difenoconazole

Use Type: Fungicide

CAS Number: 119446-68-3

Formula: C₁₉H₁₇Cl₂N₃O₃

Synonyms: CGA 169374; 1H-1,2,4-Triazole, 1-[(2-(2-chloro-4-(4-chlorophenoxy)phenyl)-4-methyl-1,3-dioxolan-2-yl)methyl]- (9CI)

Trade Names: CGA 169374[®], Syngenta (Switzerland); DIVIDEND[®], Syngenta (Switzerland); DIVIDEND[®] EXTREME FUNGICIDE, Syngenta (Switzerland); HELIX[®], Syngenta (Switzerland); SCORE[®], Syngenta (Switzerland); TECHNICAL CGA-169374[®], Syngenta (Switzerland)

Producers: Syngenta (Switzerland)

Chemical Class: Chlorophenoxy; azole

EPA/OPP PC Code: 128847

California DPR Chemical Code: 5024

Uses: For suppression of fungi diseases in crops and seeds.

U.S. Maximum Allowable Residue Levels for Difenoconazole (40 CFR 180.475):

CROP	ppm
Banana	0.2
Barley, grain	0.1
Canola, seed	0.01
Cattle, fat	0.05

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group C, possible carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- AB 2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides
- The "Director's List" (CAL/OSHA) as chlorophenoxy pesticides

Description: Molecular weight = 406.30

Routes of Entry: Ingestion, skin contact

Harmful Effects and Symptoms

Short Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years.

Long Term Exposure: Workers exposed to chlorophenoxy compounds such as 2,4-D (in the manufacturing process)

over a five to ten year period at levels above 10 mg/m³ complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affects human reproduction

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidney

Medical Surveillance: If symptoms develop or overexposure is suspected, liver or kidney function tests may be useful. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person drink or vomit. *Note to Physician:* If ingested, remove by lavage or vomiting. Use general supportive measures for CNS depression. Consider the use of quinidine for myotonia.

Difenzoquat (ANSI)

Use Type: Herbicide

CAS Number: 43222-48-6 (salt)

Formula: C₁₇H₂₀N₂O₄S

Synonyms: 1,2-Dimethyl-3,5-diphenyl-1*H*-pyrazolium methyl sulfate; Difenzoquat methyl sulfate; 1*H*-Pyrazolium, 1,2-dimethyl-3,5-diphenyl-, methyl sulfate

Trade Names: AVENGE[®], American Cyanamid (USA); AC 84777[®]; FINAVEN[®]; MATAVEN[®]; PYRAZOLIUM[®]; EH-YAN-KU[®]

Producers: American Cyanamid Agricultural Products Group (USA)

Chemical Class: Pyrazolium

EPA/OPP PC Code: 106401 (salt)

California DPR Chemical Code: 1930 (Difenzoquat methyl sulfate)

EINECS Number: 256-152-5

Uses: Registered to control wild oats in alfalfa, wheat and barley crops.

U.S. Maximum Allowable Residue Levels for Difenzoquat (40 CFR 180.369):

CROP	ppm
Barley, grain	0.2
Barley, straw	20
Cattle, fat	0.05
Cattle, meat	0.05
Cattle, mbyop	0.05
Goat, fat	0.05

Poultry, meat	0.05
Poultry, mbyop	0.05
Sheep, fat	0.05
Sheep, meat	0.05
Sheep, mbyop	0.05
Wheat, grain	0.05
Wheat, straw	20

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class II, moderately hazardous

Description: White to off-white solid. Odorless. Highly soluble in water; solubility = 765,000 mg/L. Molecular weight = 348.58. Melting/Freezing point = 156°C.

Incompatibilities: May react violently with carbon dust, finely divided aluminum, magnesium, potassium

Permissible Exposure Limits in Air:

Determination in Air: Filter; none; Gravimetric; NIOSH IV⁽¹⁸⁾ [Particulates NOR; #0500 (total), #0600 (respirable)]

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation and skin contact

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Diflubenzuron (ANSI)

Use Type: Insecticide, larvicide

CAS Number: 35367-38-5

Formula: C₁₄H₉ClF₂N₂O₂

Synonyms: AI 329054; Benzamide, *N*-[[(4-chlorophenyl)amino]carbonyl]-2,6-difluoro; *N*-[[(4-Chlorophenyl)amino]carbonyl]-2,6-difluorobenzamide; 1-(4-Chlorophenyl)-3-(2,6-difluorobenzoyl)urea; Diflubenzuron (Spanish); ENT 29,054; Urea, 1-(*p*-chlorophenyl)-3-(2,6-difluorobenzoyl)-

Trade Names: ADEPT[®], Crompton Corporation (USA); ASTONEX[®]; DIMILIN[®], Crompton Corporation (USA); DU-112307[®]; DUPHAR[®] PH 60-40; ODC-45[®]; DIFLURON[®]; DU 112307[®]; LARGON[®]; LARVAKIL[®]; MICROMITE[®], Crompton Corporation (USA); OMS 1804[®]; PDD 60401[®]; PH 60-40[®]; PHILIPS-DUPHAR[®] PH 60-40; TH 60-40[®]; THOMPSON-HAYWARD[®] 6040; VIGILANTE[®], Crompton Corporation (USA)

Producers: Agrimor International (USA); Crompton Corporation (USA); Hebei Huafeng Chemical Group (China)

Chemical Class: Organofluorine

EPA/OPP PC Code: 108201

California DPR Chemical Code: 1992

RTECS Number: YS6200000

EINECS Number: 252-529-3

Uses: Diflubenzuron is used primarily on citrus, cattle feed, cotton, forestry, mushrooms, ornamentals, pastures, soybeans, standing water, sewage systems, and wide-area general outdoor treatment sites. The insecticide behaves as a chitin inhibitor to inhibit the growth of many leaf-eating larvae, mosquito larvae, aquatic midges, rust mite, bollweevil, and flies. Diflubenzuron was first registered in the United States in 1979 for use as an insecticide.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–140.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–20.00 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, Unlikely a Carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous
Regulatory Authority:

- 40CFR186: tolerances for pesticides in animal foods
- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- Actively registered pesticide in California.
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Description: Colorless or white crystalline solid. Practically insoluble in water; solubility = 2×10^{-5} % @ 20°C. Molecular weight = 310.70. Melting/Freezing point = 220°C. Boiling point = decomposes. Vapor pressure = 9×10^{-10} mmHg @ 20°C. Log K_{ow} = 3.10. Values above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Permissible Exposure Limits in Air:

Determination in Air: Filter; none; Gravimetric; NIOSH IV⁽¹⁸⁾ [Particulates NOR; #0500 (total), #0600 (respirable)]

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or burns. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed. Skin contact may cause allergic reaction.

Long Term Exposure: Repeated or prolonged contact may cause skin and lung sensitization, resulting in allergies.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Diflufenican

Use Type: Herbicide

CAS Number: 83164-33-4

Formula: C₁₉H₁₁F₅N₂O₂

Synonyms: *N*-(2,4-Difluorophenyl)-2-[3-(trifluoromethyl)phenoxy]-3-pyridinecarboxamide; 2',4'-Difluoro-2-(α - α -trifluoro-*m*-tolylloxy)nicotinamide; DFF; Diflufenicanil (French); 3-Pyridinecarboxamide, *N*-(2,4-difluorophenyl)-2-[3-(trifluoromethyl)phenoxy]-

Trade Names: ARDENT[®]; BACARA[®]; CAPTURE[®]; COUGAR[®]; CUB[®]; GRENADIER[®]; IONIZ[®]; JAVELIN[®]; KWARC[®]; MB-38183[®]; M&B 38544[®]; PANTHER[®]; QUARTZ[®]; SPEARHEAD[®]

Producers: Bayer CropScience (Germany); Ki-Hara Chemicals Ltd. (UK)

Chemical Class: Anilide

Uses: Not registered in the U.S. Used on crops such as apples, apricot, barley, beans (dry), broad beans, cherry, grapefruit, lemon, lime, loquat, natsudaikai (whole), nectarine, orange, peach, pear, peas, persimon, plum, quince, rye, soybeans, unshu orange and wheat.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: Light brown oily suspension. Miscible in water.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Routes of Entry: Ingestion, eye, skin contact

Harmful Effects and Symptoms

Short Term Exposure: May irritate mucous membranes in the mouth and nose. Mild eye irritation.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Dihydroazadirachtin

Use Type: Insecticide and nematicide

CAS Number: 108189-58-8

Synonyms: 22,23-Dihydroazadirachtin

Trade Names: DAZA[®], Certis USA (USA), canceled 7/25/2000

Producers: Certis USA (USA)

Chemical Class: Biochemical

EPA/OPP PC Code: 121702

California DPR Chemical Code: 3994

Uses: Exempted from the requirement of a tolerance for residues. Used to control insects, centipedes, millipedes, mites, nematodes, sowbugs and more, for horticulture and ornamental plants, trees, shrubs and agricultural crops.

Regulatory Authority:

- CFR 180.1169, Dihydroazadirachtin: exemption from the requirement of a tolerance

Description: Dihydroazadirachtin is a reduced (hydrogenated) form of the naturally occurring azadirachtin (AZA) obtained from the seed kernels of the neem tree, *Azadirachta indica* A. Juss.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Dimefox

Use Type: Insecticide

CAS Number: 115-26-4

Formula: C₄H₁₂FN₂OP

Synonyms: BFPO; Bis(dimethylamido)fluorophosphate; Bis(dimethylamido)fluorophosphine oxide; Bis(dimethylamido)phosphoryl fluoride; Bis(dimethylamino)fluorophosphate; Bisdimethylaminofluorophosphine oxide; BPF; CR 409; DIFO; DMF; ENT 19,109; Fluorophosphoric acid di(dimethylamide); Fluorure de N,N,N',N'-tetramethyle phosphoro-diamide (French); N,N,N',N'-Tetramethyl-diamido-fosforzuur-fluoride (Dutch); Tetramethyldiamidophosphoric fluoride; N,N,N',N'-Tetramethyl-diamido-phosphorsaeure-fluorid (German); Tetramethylphosphorodiamidic fluoride; N,N,N,N'-Tetramethylphosphorodiamidic fluoride; N,N,N',N'-Tetrametil-fosforodiammido-fluoruro (Italian)

Trade Names: HANANE[®]; PESTOX IV[®]; PESTOX XIV[®]; PESTOX 14[®]; T-2002[®]; TERRA-SYSTAM[®]; TERRA-SYSTAM[®]; TERRASYTUM[®]; TL 792[®]; WACKER 14/10[®]

Producers: Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Organophosphate

EPA/OPP PC Code: 443100

RTECS Number: TD4025000

Uses: A selective systemic insecticide which is absorbed into the plant sap and remains active for long periods of time. Selective systemic organophosphate insecticides are toxic to plant pests but not to their predators.

Regulatory Authority:

- Very Toxic Substance (World Bank)⁽¹⁵⁾
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Dimefox is a clear liquid. Fishy odor. Soluble in water. Molecular weight = 154.17. Boiling point = 86°C @15 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1.

Incompatibilities: Strong oxidants, strong acids and halogens.

Permissible Exposure Limits in Air: No standards set.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of

reflexes and loss of sphincter control. This material is extremely toxic; the probable oral lethal dose (human) is 5-50 mg/kg, or 7 drops to 1 teaspoonful for a 150-lb. person. Death may occur from respiratory arrest. Hazards of vapor toxicity are high. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Dimefox may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin

may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be

used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Chemical Class: Organophosphate

EPA/OPP PC Code: 035001

California DPR Chemical Code: 216

ICSC Number: 0741

RTECS Number: TE1750000

EEC Number: 015-051-00-4

EINECS Number: 200-480-3

Uses: Dimethoate is used to kill mites and insects systemically and on contact. It is used against a wide range of insects, including aphids, thrips, planthoppers, and whiteflies on ornamental plants, alfalfa, apples, corn, cotton, grapefruit, grapes, lemons, melons, oranges, pears, pecans, safflower, sorghum, soybeans, tangerines, tobacco, tomatoes, watermelons, wheat, and other vegetables. It is also used as a residual wall spray in farm buildings for house flies. Dimethoate has been administered to livestock for control of botflies. Dimethoate is available in aerosol spray, dust, emulsifiable concentrate, and ULV concentrate formulations. It has not been produced in the U.S. Since 1982.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high–0.35 ppb, Health Advisory

- Canada Drinking Water Quality, 0.02 mg/L MAC

Description: Colorless crystalline solid. Camphor-like odor. Slightly soluble in water; solubility = $> 5.0 \times 10^3$ ppm @ 20°C. Boiling point = 107°C @ 0.05 mmHg. Melting/Freezing point = 52°C. Vapor Pressure = 1.1 mPa @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Log K_{ow} = 0.5 to 0.8. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Strong bases (alkalis). Do not store solid above 77–86°F (25–30°C). Liquid solutions must be stored above 45°F/7°C.

Permissible Exposure Limits in Air: The former USSR^(35, 43) has set air MAC in workplace air of 0.5 mg/m³ and limits in the ambient air of residential areas of 0.003 mg/m³ on either a momentary or a daily average basis.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water:

Determination in Water: An MAC in water bodies used for domestic purposes of 0.03 mg/L has been set by the former USSR^(35, 43). States which have set guidelines for Dimethoate in drinking water include California at 140 $\mu\text{g/L}$ and Wisconsin at 10 $\mu\text{g/L}$.

Routes of Entry: Inhalation, skin absorption, eyes and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Acute exposure to Dimethoate may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) and chest pain may be noted. Hypertension (high blood

pressure) is not uncommon. Respiratory effects may include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Dimethoate is very toxic; the probably oral lethal dose in humans is between 50-500 mg/kg, or between 1 teaspoon and 1 ounce for a 70 kg (150 lb) person. Dimethoate is a cholinesterase inhibitor, meaning it affects the central nervous system. Death is due to respiratory arrest arising from failure of respiratory center, paralysis of respiratory muscles, intense bronchoconstriction or all three, Dimethoate is a mutagen. Mutagens may have a cancer risk. All contact with this chemical should be reduced to the lowest possible level. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Animal tests indicate that this chemical possibly causes toxic effects upon human reproduction.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges or "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin

contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should

be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Dimethomorph

Use Type: Fungicide

CAS Number: 110488-70-5

Formula: C₂₁H₂₂ClNO₄

Synonyms: (*E,Z*)-4-[3-(4-Chlorophenyl)-3-(3,4-dimethoxyphenyl)acryloyl]morpholine; 4-[3-(4-Chlorophenyl)-3-(3,4-dimethoxyphenyl)-1-*oxo*-2-propenyl]morpholine; 3-(4-Chlorophenyl)-3-(3,4-dimethoxyphenyl)acrylic acid morpholide; Morpholine, 3-[3-(4-chlorophenyl)-3-(3,4-dimethoxyphenyl)-1-*oxo*-2-propenyl]-

Trade Names: ACROBAT® WP; FORUM DC®, [mancozeb + dimethomorph], BASF Canada (Canada), BASF Agricultural Products Group (Germany); BASF Canada (Canada); CME 151®, STATURE®, BASF Agricultural Products Group (Germany)

Producers: BASF Agricultural Products Group (Germany); BASF Canada (Canada); Epochem Co., (China); Shenyang Harvest Agrochemical (China); Wuzhou International (China)

Chemical Class: Morpholine

EPA/OPP PC Code: 268800

California DPR Chemical Code: 4003

Uses: A systemic fungicide that protects crops from mold. It also kills mold and prevents their spread; controls late blight on tomatoes; and is used as a wood preservative to control downy mildew.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–700.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–34.00 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Dimethomorph (40 CFR 180.493):

CROP	ppm
Brassica, leafy greens, subgroup 5B.	20.0
Grape	3.5
Grape, raisin	6.0
Hop, dried cones	60
Lettuce, head	10
Lettuce, leaf	10
Potato, wet peel	0.15
Taro, corm	0.5
Taro, leaves	6.0
Vegetable, bulb, group 3	2.0
Vegetable, cucurbit, group 9	0.5
Vegetable, fruiting, group 8	1.5

* There are no U.S. registrations as of August 25, 2000, for the use of dimethomorph on the growing crops, grape, hop, and raisins.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Not likely a carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: Colorless or gray crystalline solid. Odorless. Commercial product is a mixture of *cis*- and *trans*-isomers. Practically insoluble in water; solubility = <0.005 ppm.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use

NIOSH-approved air purifying respirators for pesticides. May be harmful if swallowed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dimetilan

Use Type: Insecticide

CAS Number: 644-64-4

Formula: C₁₀H₁₆N₄O₃

Alert: No longer produced in the U.S.

Synonyms: Carbamic acid, dimethyl-, 1-[(dimethylamino)carbonyl]-5-methyl-1*H*-pyrazol-2-yl ester; Carbamic acid, dimethyl-, ester with 3-hydroxy-*N,N*-5-trimethylpyrazole-1-carboxamide; Dimethyl carbamate ester of 3-hydroxy-*N,N*-5-trimethylpyrazole-1-carboxamide; Dimethylcarbamic acid-1-[(dimethylamino)carbonyl]-5-methyl-1*H*-pyrazol-3-yl ester; Dimethylcarbamic acid ester with 3-hydroxy-*N,N*-5-trimethylpyrazole-1-carboxamide; Dimethylcarbamic acid-5-methyl-1*H*-carboxamine; Dimethylcarbamic acid-5-methyl-1*H*-pyrazol-3-yl ester; 2-Dimethylcarbamoyl-3-methylpyrazolyl-(5)-*N,N*-dimethylcarbamate; Dimethylcarbamoyl-3-methyl-5-pyrazolyl dimethylcarbamate; 1-Dimethylcarbamoyl-5-methylpyrazol-3-yl dimethylcarbamate; Dimetilane; ENT 25,595-X; ENT 25,922; 3-Hydroxy-*N,N*-5-trimethylpyrazole-1-carboxamidedimethylcarbamate (ester); 5-Methyl-1*H*-pyrazol-3-yl dimethylcarbamate

Trade Names: FLYBANDS®, canceled; GEIGY 22870®, Syngenta Crop Protection (Switzerland), canceled; GEIGY GS-13332®, Syngenta Crop Protection (Switzerland),

canceled; SNIP[®], Syngenta Crop Protection (Switzerland), canceled; SNIP FLY[®], Syngenta Crop Protection (Switzerland), canceled

Producers: Sigma-Aldrich Laborchemikalien (Germany); Syngenta Crop Protection (Switzerland)

Chemical Class: Carbamate

EPA/OPP PC Code: 090101

RTECS Number: EZ9084000

Uses: Formerly an insecticide for insect control on livestock, especially housefly control. It is no longer produced commercially in the U.S.

Regulatory Authority:

- Banned or Severely Restricted (Portugal) (UN)⁽¹³⁾
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents
- RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Dimetilan, Yellow to reddish-brown solid. Highly soluble in water. Molecular weight = 240.30. Melting/Freezing point = 68-71°C (the technical grade at 55-65°C). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Incompatibilities: Hydrolyzed by acids and alkalis.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin contact, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Very toxic; probable oral lethal dose for humans is 50-500 mg/kg or between 1 teaspoon and 1 oz for a 70 kg (150 lb) person. Dimetilan is highly toxic by ingestion and moderately toxic by contact with the skin. Death is primarily due to respiratory arrest of central origin, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. This compound is a cholinesterase inhibitor. Symptoms are similar to carbaryl poisoning: nausea, vomiting, abdominal cramps, diarrhea, pinpoint pupils, excessive salivation, and sweating are common symptoms. Running nose and tightness in chest are common in inhalation exposures. Difficulty in breathing, raspy breathing, and loss of muscle coordination may also be seen. Exposure may also result in random jerky movements, incontinence, convulsions, and coma and death.

Long Term Exposure: Many carbamates affect the central nervous system.

Points of Attack:

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels

return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organophosphates. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes.

First Aid: Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is **UNCONSCIOUS OR HAVING CONVULSIONS**, do nothing except keep victim warm. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Note to physician or authorized medical personnel.** Administer atropine, 2 mg (1/30 gr) intramuscularly or

intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary.

Medical note: 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Dinex

Use Type: Pesticide, acaricide

CAS Number: 131-89-5

Formula: C₁₂H₁₄N₂O₅

Synonyms: 6-Cyclohexyl-2,4-dinitrophenol; 2-Cyclohexyl-4,6-dinitrophenol; Dinitrocyclophenol; 4,6-Dinitro-*o*-cyclohexylphenol; 2-Cyclohexyl-4,6-dinitrophenol; Dinitrocyclohexylphenol; Dinitro-*o*-cyclohexylphenol; 2,4-Dinitro-6-cyclohexylphenol; 4,6-Dinitro-*o*-cyclohexylphenol; DNOCHP; ENT 157; Phenol, 2-cyclohexyl-4,6-dinitro-

Trade Names: DN[®]; DN-111[®]; DN dry mix; MIX No. 1[®]; DN dust No. 12[®]; DOW SPRAY[®]-17, Dow AgroSciences (USA); DRY MIX No. 1[®]; PEDINEX[®]; SN 46[®]

Producers: Dow AgroSciences (USA)

Chemical Class: Dinitrophenol

EPA/OPP PC Code: 037501

RTECS Number: SK6650000

RCRA Number: P034

Uses: Not registered in the U.S. Used to control mites on citrus fruits.

Regulatory Authority:

- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA); Section 307 Toxic Pollutants as nitrophenols.
- EPCRA Section 304 RQ: CERCLA, 100 lb (45.4 kg) as nitrophenols.
- Marine pollutant (49CFR, Subchapter 172.101, Appendix B) as nitrophenols.

Description: Yellow, crystalline solid. Very slightly soluble in water. Molecular weight = 266.25. Melting/Freezing point = 107°C; (NFPA) Health Hazards (Blue): 2; Flammability (Red): 2; Reactivity (Yellow): 2; Relative vapor Density = 9.2. Log K_{ow} = 4.63. Values above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Reacts with oxidizing materials and combustibles; risk of fire and explosion. Incompatible with sulfuric acid, nitric acid, caustics, aliphatic amines, isocyanates. React with boranes, alkalies, aliphatic amines, amides, nitric acid, sulfuric acid. May detonate when heated under confinement.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)]⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. To protect freshwater aquatic life: 230 µg/L on an acute toxicity basis for nitrophenols as a class. To protect saltwater aquatic life: 4,850 µg/L on an acute toxicity basis for nitrophenols as a class. To protect human health: 70.0 µg/L⁽⁶⁾.

Determination in Water: Filter/Bubbler; 2-Propanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH II⁽⁵⁾ Method #S166. Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection. EPA Method 604, or gas chromatography plus mass spectrometry EPA Method 625.

Routes of Entry: Skin contact, inhalation and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Solid is poisonous if swallowed. Grade 4: LD₅₀ = 50 mg/kg (mouse). Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, yellowish face and lips, anxiety, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Severe exposure can cause death from heart failure.

Long Term Exposure: May damage the liver, kidneys and blood cells. May stain yellow the skin, eyes, and fingernails. Repeated exposure can cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss and cataracts in the eyes.

Points of Attack: Skin, liver, kidneys, lungs, peripheral nervous system, eyes, thyroid gland and blood.

Medical Surveillance: Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: Exam of eyes for cataracts. Exam of skin and nails for staining. Blood tests for dinitro-*o*-cresol. Persons with blood levels over 10 ppm (10 mg/L) should be kept away from further exposure until levels return to normal. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Diniconazole

Use Type: Fungicide

CAS Number: 83657-18-5

Formula: C₁₅H₁₇Cl₂N₃O

Synonyms: [(*R*-(*E*))-1-(2,4-Dichlorophenyl)-4,4-dimethyl-2-(1*H*-1,2,4-triazol-1-yl)pent-1-en-3-ol]; Diniconazole M; 1*H*-1,2,4-Triazole-1-ethanol, β-[(2,4-dichlorophenyl)methylene]-α-(1,1-dimethylethyl)-, [(*R*-(*E*))]-**Trade Names:** EMBASSADOR[®], Sanonda (Australia); (R)-S 3308[®]; S-3308 L[®]; SPOTLESS (XE-779L)W[®]; SUMI-EIGHT[®] 12.5 WP

Producers: Ascot International UK); Sanonda (Australia); SuYan Agrochemical Group (China)

Chemical Class: Azole

EPA/OPP PC Code: 128932

California DPR Chemical Code: 2500

Uses: Not registered in the U.S. It is a broad spectrum fungicide that is used on corn, wheat, peanut, apple, pear etc. to control covered smut, powdery mildew, etc. It is effective on powdery mildew, rust of coffee, flowers and vegetable.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class III, slightly hazardous

Description: White, odorless crystals. Molecular weight = 326.24.

Incompatibilities: Strong oxidizers.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Ingestion, skin contact

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if swallowed. Contact may irritate skin and cause eye irritation and possible severe injury. Avoid inhalation.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Dinitro-*o*-cresol (DNOC)

Use Type: Herbicide, fungicide and pesticide

CAS Number: 534-52-1

Formula: C₇H₆N₂O₅

Alert: DNOC's registration in the U.S. as a pesticide was canceled in 1991.

Synonyms: *o*-Cresol, 4,6-dinitro-; Dinitro; Dinitrocresol; Dinitro-*ortho*-cresol; Dinitrodendtroxal; 3,5-Dinitro-2-hydroxytoluene; Dinitrol; 4,6-Dinitro-2-methylphenol; 2,4-Dinitro-6-methylphenol; Dinitrocresol; 3,5-Dinitro-*o*-cresol; 4,6-Dinitro-*o*-cresol and salts; 2-Methyl-4,6-dinitrophenol; 6-Methyl-2,4-dinitrophenol; Phenol, 2-methyl-4,6-dinitro-**Trade Names:** ANTINONIN[®]; ANTINONNIN[®]; ARBOROL[®]; DEGRASSAN[®]; DEKRYL[®]; DETAL[®]; DILLEX[®]; DINOC[®]; DINURANIA[®]; DITROSOL[®]; DNOC[®], Gowan Co. (USA), canceled; EFFUSAN[®]; EFFUSAN 3436[®]; ELGETOL[®]; ELGETOL 30[®]; ELIPOL[®]; EXTRAR[®]; FLAVIN-SANDOZ[®]; HEDOLIT[®]; HEDOLITE[®]; K III[®]; K IV[®]; KREOZAN[®]; KREZOTOL 50[®]; LIPAN[®]; NEUDORFF DN 50[®]; NITROFAN[®]; PROKARBOL[®]; RAFEX[®]; RAFEX 35[®]; RAPHATOX[®]; SANDOLIN[®]; SANDOLIN A[®]; SELINON[®]; SINOX[®]; WINTERWASH[®]

Producers: A H Marks (UK); ATOFINA (France); BASF Agricultural Products Group (Germany); Bayer Chemicals (Germany); Calliope (France); Cyanamid Agro Products Group (USA); Eli Lilly (USA); Gowan Co. (USA); Rhone-Poulenc Agro (France); Shell Chemical (UK); SNPE Chemie (France)

Chemical Class: Derivative of dinitrophenol

EPA/OPP PC Code: 037507 and 600023

California DPR Chemical Code: 3170

RTECS Number: GO9625000

Uses: DNOC is widely used in agriculture as a herbicide and pesticide; it is also used in the dyestuff industry. Although 4,6-dinitro-*o*-cresol (DNOC) is no longer manufactured in the United States (since 1991), it was used as a blossom-thinning agent on fruit trees and as a fungicide, insecticide, and miticides on fruit trees during the dormant season. It is used in mushroom houses to control foreign fungi; to kill locusts and other insects; and as a pre-harvest desiccant of potatoes and leguminous seed crops.

Fish toxicity (threshold)⁽⁷⁷⁾: High–6.33138 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

WHO Acute Hazard: Group 1B, highly hazardous

Regulatory Authority:

- Banned or Severely Restricted (Sweden) (UN)⁽¹³⁾

- Canada, WHMIS, Ingredients Disclosure List

Description: This chemical exists in nine isomeric forms of which 4,6-dinitro-*o*-cresol is the most important commercially, and the most heavily regulated. It is a

noncombustible, yellow crystalline solid. Practically insoluble in water; solubility = 130 ppm @ 15°C. Molecular weight = 198.13. Boiling point = 312°C. Melting/Freezing point = 85–87°C. Vapor Pressure = 1.1×10^{-4} mmHg @ 25°C. Log K_{ow} = 2.6. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: Dust can form an explosive mixture with air. Strong oxidizers, oxidizers, strong bases. Protect from heat and shock.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air: The Federal Limit (OSHA PEL)⁽⁵⁸⁾, the DFG⁽³⁾ and HSE⁽³³⁾ values and recommended ACGIH⁽¹⁾ TWA value for all isomers of DNOC is 0.2 mg/m³. The notation “skin” indicates the possibility of cutaneous absorption. The HSE⁽³³⁾ STEL value is 0.6 mg/m³. The NIOSH⁽²⁾ IDLH level = 5.0 mg/m³. The MAC in workplace air set by The former USSR-UNEP/IRPTC project⁽⁴³⁾ is 0.05 mg/m³. They have also set MAC values for the ambient air in residential areas of 0.003 mg/m³ on a momentary basis and 0.0008 mg/m³ on a daily average basis. Several states have set guidelines or standards for DNOC in ambient air⁽⁶⁰⁾ ranging from 2.0 $\mu\text{g/m}^3$ (North Dakota) to 3.0 $\mu\text{g/m}^3$ (Virginia) to 4.0 $\mu\text{g/m}^3$ (Connecticut) to 5.0 $\mu\text{g/m}^3$ (Nevada).

Determination in Air: Collection by charcoal tube, analysis by gas liquid chromatography.

Permissible Concentration in Water: To protect human health, 13.4 $\mu\text{g/L}$ ⁽⁶⁾. The former USSR⁽³⁵⁾ has set an MAC in water bodies used for domestic purposes of 0.05 mg/L and in water bodies used for fishery purposes of 0.002 mg/L⁽⁴³⁾.

Determination in Water: Filter/Bubbler; 2-Propanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH II(5) Method #S166⁽¹⁸⁾. Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection. EPA Method 604, or gas chromatography plus mass spectrometry EPA Method 625.

Routes of Entry: Inhalation, percutaneous absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Early manifestations of acute dinitrocresol exposure include fever, sweating, headache, and confusion. Blood pressure, pulse, and respiratory rate are often elevated. Severe exposure may result in restlessness, seizures, and coma. Other signs and symptoms include dyspnea (shortness of breath), cyanosis (blue tint to skin and mucous membranes), pulmonary edema, nausea, vomiting, and abdominal pain. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Dermal exposure results in yellow staining of the skin and may produce burns. Dinitrocresol may irritate and burn the eyes and mucous membranes. DNOC is an extremely toxic material; probable oral lethal dose is 5–50 mg/kg in humans or between 7 drops and 1 teaspoon for

a 70 kg (150 lb) person. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: May damage the liver, kidneys and blood cells. May stain yellow the skin, eyes, and fingernails. Repeated exposure can cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss and cataracts in the eyes.

Points of Attack: Cardiovascular system, endocrine system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: Exam of eyes for cataracts. Exam of skin and nails for staining. Blood tests for 4,6-dinitro-*o*-cresol. Persons with blood levels over 10 ppm (10 mg/L) should be kept away from further exposure until levels return to normal. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If high fever is present, drench victim's clothes in cool water, or immerse person in cool bath before transfer.

Dinocap

Use Type: Fungicide and acaricide

CAS Number: 39300-45-3

Formula: C₁₈H₂₄N₂O₆

Alert: Highly explosive and flammable. Highly reactive when dry.

Synonyms: 2-Butenoic acid, 2-isooctyl-4,6-dinitrophenyl ester; 2-Butenoic acid, 4-isooctyl-2,6-dinitrophenyl ester; 2-Butenoic acid 2-(1-methylheptyl)-4,6-dinitrophenyl ester; Capryldinitrophenyl crotonate; 2-Capryl-4,6-dinitrophenyl crotonate; Caswell No. 391D; CPC; Crotonic acid 2,4-dinitro-6-(1-methylheptyl)phenyl ester; Crotonic acid 2,4-dinitro-6-(2-octyl)phenyl ester; Crotonic acid, 2-(1-methylheptyl)-4,6-dinitrophenyl ester; Crotonic acid, 4-(1-methylheptyl)-2,6-dinitrophenyl ester; Crotonic acid 2-(1-methylheptyl)-4,6-dinitrophenyl ester; DCPC; 4,6-Dinitro-2-(2-capryl)phenyl crotonate; 4,6-Dinitro-2-caprylphenyl crotonate; Dinitrocaprylphenyl crotonate; Dinitro(1-methylheptyl)phenyl crotonate; 2,4-Dinitro-6-(1-methylheptyl)phenyl crotonate; 4,6-Dinitro-2-(1-methylheptyl)phenyl crotonate; 2,4-Dinitro-6-octyl* phenyl crotonate, 2,6-Dinitro-4-octyl* phenylcrotonate, and nitrooctylphenols (principally dinitro); Dinitromethylheptylphenyl crotonate; Dinitro(1-methylheptyl)phenyl crotonate; 2,4-Dinitro-6-(2-octyl)phenyl crotonate; 2,4-Dinitro-6-octyl-phenyl crotonate; 2,6-Dinitro-4-octyl-phenyl crotonate; DNOCP; DNOPC; DPC; ENT 24727; [6-(1-Methyl-heptyl)-2,3-dinitro-phenyl]-crotonat (German); 2-(1-Methylheptyl)-4,6-dinitrophenylcrotonate; Phenol, 2-(1-methylheptyl)-4,6-dinitro-, crotonate (ester)

*(A mixture of 1-methylheptyl, 1-ethylhexyl and 1-propylpentyl derivatives, chiefly 2-(1-methyl)-4,6-dinitrophenol)

Trade Names: ACTUAL DINOCAPO[®]; ARATHANE[®]; CAPRANE[®]; CR 1639[®]; CEKUCAP[®] 25 WP; CROTOTHANE[®]; DICAP[®]; DIKAR[®]; EZENOAN[®]; ISCOTHANE[®]; ISOCOTHANE[®]; KARATHANE[®], canceled; KARATHANE[®] WD, canceled; KARATHENE[®], canceled; MILDANE[®]; MILDEX[®]

Chemical Class: Dinitrophenyl

EPA/OPP PC Code: 036001

California DPR Chemical Code: 344

ICSC Number: 0881(as isomer mixture)

RTECS Number: GQ5775000

EEC Number: 609-023-00-6

EINECS Number: 254-408-0

Uses: Not registered in the U.S. Dinocap is a foliar fungicide/miticide used to control powdery mildew. It is applied to limit mites in apples and grapes crops outside of the U.S., mainly in Europe, the Middle East and northern Africa. It is also used to control powdery mildew on fruit, vegetables and ornamentals. There are currently no registered dinocap products in the U.S. DAS, the registrant of dinocap, intends to support tolerances for dinocap residues in/on apples and grapes to permit legal importation of these commodities into the U.S.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–28.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–1.06008 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Dinocap (40 CFR 180.341):

CROP	ppm
Apple	0.1
Grape	0.1

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, Unlikely a carcinogen

California Prop. 65: Male developmental toxin

TRI Developmental Toxin: Developmental toxin

Label Signal Word: CAUTION or DANGER

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- EPA 40 CFR 372.65, Specific Toxic Chemical Listings
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- AB 2588–Air Toxics “Hot Spots” Chemicals (CAL)
- Proposition 65 chemical (CAL)
- Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA); Section 307 Toxic Pollutants as nitrophenols.
- EPCRA Section 304 RQ: CERCLA, 100 lb (45.4 kg) as nitrophenols.
- U.S. DOT Marine pollutant (49CFR, Subchapter 172.101, Appendix B) as nitrophenols.

Description: Brown liquid. Insoluble in water. Combustible. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations. Molecular weight = 364.43. Boiling point = 139°C @ 0.07 mmHg. Vapor pressure = 4×10^{-8} mmHg @ 20°C.

Permissible Exposure Limits in Air: The former USSR-UNEP/IRPTC joint project⁽⁴³⁾ has set an MAC in workplace air of 0.05 mg/m³.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. To protect freshwater aquatic life: 230 µg/L on an acute

toxicity basis for nitrophenols as a class. To protect saltwater aquatic life: 4,850 µg/L on an acute toxicity basis for nitrophenols as a class. To protect human health: 70.0 µg/L⁽⁶⁾.

Determination in Water: Filter/Bubbler; 2-Propanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH II⁽⁵⁾ Method #S166. Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection. EPA Method 604, or gas chromatography plus mass spectrometry EPA Method 625.

Routes of Entry: Skin contact, inhalation and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, yellowish tint to skin and lips, anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Severe exposure can cause death from heart failure.

Long Term Exposure: May damage the liver, kidneys and blood cells. May stain yellow the skin, eyes, and fingernails. Repeated exposure can cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss and cataracts in the eyes.

Points of Attack: Skin, liver, kidneys, lungs, peripheral nervous system, eyes, thyroid gland, blood.

Medical Surveillance: Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: Exam of eyes for cataracts. Exam of skin and nails for staining. Blood tests for dinitro-*o*-cresol. Persons with blood levels over 10 ppm (10 mg/L) should be kept away from further exposure until levels return to normal. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to physician or authorized medical personnel:* Treat

for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Dinoseb (ANSI)

Use Type: A plant growth regulator and herbicide.

CAS Number: 88-85-7

Formula: C₁₀H₁₂N₂O₅; C₆H₂(NO₂)₂(C₄H₉)OH

Alert: It was a Restricted Use Pesticide (RUP). The use of dinoseb was canceled in the U.S. in 1986. This action was based on the potential risk of birth defects and other adverse health effects for applicators and other persons with substantial dinoseb exposure. This pesticide is not commercially available in the U.S. Human toxicity (long-term): Very high.

Synonyms: 2-sec-Butyl-4,6-dinitrophenol; DBNF; Dinitrall; Dinitrobutylphenol; 4,6-Dinitro-2-sec-butylphenol (Czech); 2,4-Dinitro-6-sec-butylphenol; 4,6-Dinitro-*o*-sec-butylphenol; 4,6-Dinitro-2-sec-butylphenol; 4,6-Dinitro-2-(1-methyl-*N*-propyl)phenol; 2,4-Dinitro-6-(1-methylpropyl)phenol; 4,6-Dinitro-2-(1-methylpropyl)phenol; Dinitro-*ortho*-sec-butylphenol; 4,6-Dinitro-*o*-sec-butylphenol; 2,4-Dinitro-6-sec-butylphenol; 4,6-Dinitro-2-sec-butylphenol; DN 289; DNBP; DNOSBP;

Chemical Class: Derivative of dinitrophenol.

EPA/OPP PC Code: 037505

California DPR Chemical Code: 238

ICSC Number: 1049

RTECS Number: SJ9800000

EEC Number: 609-025-00-7

EINECS: 201-861-7

Uses: Dinoseb is a phenolic herbicide used in soybeans, vegetables, fruits and nuts, citrus, and other field crops for the selective control of grass and broadleaf weeds (e.g., in corn). It is also used as an insecticide in grapes, and as a seed crop drying agent. It is produced in emulsifiable concentrates or as water soluble ammonium or amine salts. It is no longer available in the U.S. Formerly widely used in the UK for the fumigation of potatoes, however dinoseb acetate and dinoseb amine were banned from use in 1988.

Human toxicity (long-term)⁽⁷⁷⁾: Extra high-0.70 ppb, Health Advisory

- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1000 lb (454 kg)
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Orange-brown viscous liquid or an orange crystalline solid. Pungent odor. Very slightly soluble in water; solubility = 50 ppm. Molecular weight = 240.25. Melting/Freezing point = 38–42°C. Vapor pressure = 1 mmHg @ 151°C; 7 x 10⁻³ Pa @ 20°C. Flash point = 16–29°C (for 3 commercial products). Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: The solution in water is a weak acid. Attacks many metals in presence of water.

Permissible Exposure Limits in Air: The former USSR-UNEP/IRPTC project⁽⁴³⁾ has set an MAC in workplace air of 0.05 mg/m³.

Permissible Concentration in Water: A health advisory of 3.5 $\mu\text{g/L}$ has been developed by EPA based on possible teratogenic action of dinoseb as described in the U.S. EPA document referred to below. In addition, several states have set guidelines for dinoseb in drinking water⁽⁶¹⁾ ranging from 2.0 $\mu\text{g/L}$ (Maine) to 5.0 $\mu\text{g/L}$ (Massachusetts) to 13.0 $\mu\text{g/L}$ (Wisconsin) to 39.0 $\mu\text{g/L}$ (Kansas). The former USSR⁽³⁵⁾ has set an MAC in surface water of 0.1 mg/L.

Determination in Water: Extraction with ether, conversion to methyl ester and determination by electron capture gas chromatography.

Routes of Entry: Inhalation, skin and eye contact, and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Dinoseb causes eye irritation. May affect the gastrointestinal tract and central nervous system. Early manifestations of dinoseb exposure include fever, sweating, headache, and confusion. Elevations of blood pressure, pulse, and respiratory rate are common. Severe exposure may result in restlessness, seizures, and coma. Other signs and symptoms include dyspnea (shortness of breath), nausea, vomiting, and abdominal pain. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias may be noted. Inhalation of the aerosol may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Muscle weakness may be pronounced. Dermal exposure results in yellow staining of the skin and may produce burns.

Warning: Exposure to dinoseb fumes or aerosol in hot environment may cause death. Effects may be delayed from several hours to 2 days. Caution is advised. Toxicity of dinoseb is enhanced by high ambient temperature and physical activity. Dinoseb is extremely toxic: Probable oral lethal dose is 5-50 mg/kg; between 7 drops and 1 teaspoonful for 70 kg person (150 lb). Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Dinoseb may affect the kidneys, liver, blood, immune system, and eyes; may cause cataracts. May cause reproductive toxicity in humans.

Points of Attack: Liver, kidneys, blood, cardiovascular system, immune system, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Liver and kidney function tests. Complete blood count. Eye examination. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Consult poison center on use of antidotes.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class 1B, highly hazardous

Regulatory Authority:

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg) (TPQ = 500)⁽⁷⁾

Description: Dinoterb is a yellow solid. Melting/Freezing point = 126°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 3.

Incompatibilities: Strong caustics. Heat may cause material to explode.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation and ingestion

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of poisoning are similar to other dinitrophenols and may include nausea, gastric distress, restlessness, sensation of heat, flushed skin, sweating, thirst, deep and rapid breathing, rapid heart rate, fever, and lack of oxygen to tissues (blueness of skin). This compound is toxic by all routes of exposure. The dangerous single oral dose of dinitro-*o*-cresol, a structurally similar

compound, is estimated to be about 29 mg/kg. Delayed pulmonary edema may occur after inhalation.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dioxathion

Use Type: Insecticide and acaricide

CAS Number: 78-34-2

Formula: C₁₂H₂₆O₆P₂S₄

Synonyms: 2,3-Dioxanedithiol *S,S*-bis(*O,O*-diethylphosphorodithioate); 1,4-Dioxan-2,3-diyl *S,S*-di(*O,O*-diethyl phosphorodithioate); *S,S'*-1,4-Dioxane-2,3-diyl bis(*O,O*-diethyl phosphorodithioate); *S,S'*-(1,4-Dioxane-2,3-diyl) *O,O,O',O'*-tetraethylbis phosphorodithioate); *S,S'*-*para*-Dioxane-2,3-diyl bis(*O,O*-diethylphosphorodithioate); ENT 22879; NCI-C00395; Phosphorodithioic acid, *S,S'*-1,4-dioxane-2,3-diyl-*O,O,O',O'*-tetraethyl ester; Phosphorodithioic acid, *O,O*-diethyl ester, *S,S*-diester with *p*-dioxane-2,3-dithiol; Phosphorodithioic acid-*S,S'*-1,4-dioxane-2,3-diyl, *O,O,O',O'*-tetraethyl ester; Phosphorodithioic acid-*S,S'*-*para*-dioxane-2,3-diyl, *O,O,O',O'*-tetraethyl Ester; Bis(dithiophosphate de *O,O*-diethyle) de *S,S'*-(1,4-dioxane-2,3-diyle) (French)

Trade Names: AC 528®; ALCOV®, Amvac Chemical (USA), canceled; DELNAV®, Agrevo USA Co., Helena

Chemical (USA); Scott Company (USA), canceled; DELNATEX[®]; HERCULES AC528[®]; KAVADEL[®]; NAVADEL[®]

Producers: Amvac Chemical (USA); Helena Chemical (USA); Hercules (USA)

Chemical Class: Organophosphate

EPA/OPP PC Code: 037801

California DPR Chemical Code: 192

ICSC Number: 0883

RTECS Number: TE335000

EEC Number: 015-063-00-X

EINECS Number: 201-107-7

Uses: Dioxathion is registered and used in many countries principally for treating livestock, citrus fruit, pome fruit, grapes and stone fruit. Dioxathion products are used on livestock principally cattle in the U.S.A., Australia, East and South Africa, South and Central America, France and Italy. Countries using these products on citrus fruit include the U.S.A., Africa, Japan, Turkey and Italy. There is significant use on pome fruit in the U.S.A., France, United Kingdom, South America and Italy. Use on grapes extends to the U.S.A., Germany, France and Italy. In some countries use on cattle precludes application to dairy cattle. However, in countries where ticks are a serious problem and frequent dipping is needed, dairy cows must be treated as well as beef cattle.

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾
- AB 1803-Well Monitoring Chemical (CAL)
- EPA/SARA 302 (EPCRA) Extremely hazardous substances
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- U.S. DOT Inhalation Hazard Chemicals as organophosphates
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Description: Reddish-brown, thick liquid or powder. Garlic-like odor. Molecular weight = 456.58. Boiling point = decomposes @ > 135°C. Melting/Freezing point = -20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water. Log K_{ow} = 2.9 to 3.1. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Incompatible with strong acids. Dioxathion is hydrolyzed by strong bases attacks iron and tin surfaces.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾, ACGIH⁽¹⁾ TLV and HSE⁽³³⁾ TWA value is

0.2 mg/m³ with the notation "skin" indicating the possibility of cutaneous absorption. There is no NIOSH⁽²⁾ ILDH value. Several states have set guidelines or standards for Dioxathion in ambient air⁽⁶⁰⁾ ranging from zero (New York) to 2.0 µg/m³ (North Dakota) to 3.0 µg/m³ (Virginia) to 4.0 µg/m³ (Connecticut) to 5.0 µg/m³ (Nevada).

Determination in Air: Although NIOSH lists "none available," the organophosphate method is listed: OSHA versatile sampler-2; Toluene/Acetone. Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus. NIOSH Method IV Method #5600, Organophosphorus pesticides⁽¹⁸⁾.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short Term Exposure: Dioxathion is a cholinesterase inhibitor. It may affect the nervous system, resulting in convulsions, respiratory failure. Exposure to high level may cause death. Acute exposure to Dioxathion may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Dioxathion is very toxic. LD₅₀ female rat, skin = 63 mg/kg. Probable oral lethal dose for humans is 50-500 mg/kg or between 1 teaspoonful and 1 oz for a 70 kg (150 lb) person. It is a cholinesterase inhibitor. Death is primarily due to respiratory arrest arising from failure of the respiratory center, paralysis of respiratory muscles, intense bronchoconstriction, or all three. Delayed pulmonary edema may occur after inhalation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning

is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use; alcohol promotes absorption of organophosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Diphacinone

Use Type: Rodenticide

CAS Number: 82-66-6

Formula: C₂₃H₁₆O₃

Alert: A Restricted Use Pesticide (RUP) if the formulation contains 3% or more of diphacinone.

Synonyms: Dipazin; Diphacin (Italy and Turkey); Diphacinon; Diphenacin; Diphenadion; Diphenadione; 2-Diphenylacetyl-1,3-diketohydrindene; 2-(Diphenylacetyl)indan-1,3-indandione; 2-(Diphenylacetyl)-1H-indene-1,3(2h)-dione; Ratindan (Russia)

Trade Names: DE-PESTER[®], Harcros Chemicals (USA), canceled 7/1/1987; DIDANDIN[®]; DIPAXIN[®]; DITRAC[®], Bell Laboratories (USA); GOLD CREST[®]; KILL-RO RAT KILLER[®]; LIQUA-TOX[®], diphacinone sodium salt, Bell Laboratories (USA); ORAGULANT[®]; P.C.Q.[®]; PID[®]; PROMAR[®]; RAMIK[®]; RAT KILLER[®]; RODENT CAKE[®], Bell Laboratories (USA), canceled 10/10/1989; SOLVAN[®]; TOMCAT[®]; U 1363[®]

Producers: Agrimor International (USA); Bell Laboratories (USA); Haco (USA); Harcros Chemicals (USA)

Chemical Class: 1,3-Indandione

EPA/OPP PC Code: 067701

California DPR Chemical Code: 225

RTECS Number: NK5600000

Uses: Diphacinone is an anti-coagulant rodenticide bait used for control of rats, mice, voles and other rodents. It is available in meal, pellet, wax block, and liquid bait formulations, as well as in tracking powder and concentrate formulations. It is used in general agriculture and in food processing areas. The top five uses for diphacinone in California are on landscapes, general vertebrate pest control, around structures and right of ways, and on oranges. This material is also used as an anticoagulant medication.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER for technical material; WARNING for concentrate formulations; CAUTION for bait formulations.

WHO Acute Hazard: Class 1b, Extremely Hazardous

Regulatory Authority:

- Very Toxic Substance (World Bank)⁽¹⁵⁾
- Actively registered pesticide in California.
- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Pale yellow, crystalline solid. Odorless. Very slightly soluble in water. Melting/Freezing point = 146-147°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Permissible Exposure Limits in Air: No standards set.

Permissible Concentration in Water: No criteria set, but runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: This material is extremely toxic; probable oral lethal dose in humans is 5-50 mg/kg, or between 7 drops and 1 teaspoonful for a 150 lb persons. Diphacinone is an anticoagulant (inhibits blood clotting). Hemorrhage is the most common effect and may be manifested by nose bleeding, gum bleeding, bloody stools and urine, ecchymoses (extravasations of blood into skin), and hemoptysis (coughing up blood). Bruising is heightened. Abdominal and flank pain are also common. Other signs and symptoms include flushing, dizziness, hypotension (low blood pressure), dyspnea (shortness of breath), cyanosis (blue tint to the skin and mucous membranes), fever, and diarrhea.

Long Term Exposure: May affect the liver and kidneys. Repeated exposure may cause low white blood cell count and affect the brain.

Points of Attack: Blood, liver, kidneys.

Medical Surveillance: Blood test for clotting time (PT, INR, or PTT). Stool and urine tests for blood. Liver and kidney function tests. Complete blood count. EEG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration

of an antidote or performance of other invasive procedures. Rush to a health care facility. Acute exposure to Diphacinone may require decontamination and life support for the victims. Emergency personnel should wear protective clothing appropriate to the type and degree of contamination. Air-purifying or supplied-air respiratory equipment should also be worn, as necessary. Rescue vehicles should carry supplies such as plastic sheeting and disposable plastic bags to assist in preventing spread of contamination.

Diphenamid (ANSI)

Use Type: Herbicide

CAS Number: 957-51-7

Formula: C₁₆H₁₇NO; (CH₃)₂NCOCH(C₆H₅)₂

Synonyms: Acetamide, *N,N*-dimethyl-2,2-diphenyl-; Benzeneacetamide, *N,N*-dimethyl- α -phenyl-; Difenamid (Spanish); *N,N*-Dimethyl- α,α -diphenylacetamide; *N,N*-Dimethyl- α -phenylbenzeneacetamide; *N,N*-Dimethyldiphenylacetamide; *N,N*-Dimethyl-2,2-diphenylacetamide; *N,N*-Dimethyl- α -phenylbenzeneacetamide; Dimid; Diphenamid; Diphenylamide; 2,2-Diphenyl-*N,N*-dimethylacetamide

Trade Names: DIF 4[®], DY MID[®], Dow Chemical (USA), canceled 9/27/1985; ENIDE[®], Pharmacia & Upjohn (USA), canceled 4/22/1985; FDN[®]; FENAM[®]; L 34314[®], Eli Lilly (USA); LILLY 34314[®], Eli Lilly (USA); RIDEON[®]; U 4513[®]; ZARUR[®]

Producers: Dow Chemical (USA); Scott Company (USA); Sigma-Aldrich Laborchemikalien (Germany)

Chemical Class: Amide

EPA/OPP PC Code: 036601

California DPR Chemical Code: 226

ICSC Number: 0763

RTECS Number: AB8050000

EINECS Number: 213-482-4

Uses: This material is used as a pre-emergent and selective herbicide for tomatoes, peanuts, alfalfa, soybeans, cotton and other crops.

Human toxicity (long-term)⁽⁷⁷⁾: Very low–200.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: High–5.00495 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Diphenamid (40 CFR 180.230):

Note: Tolerances are established for residues of the herbicide diphenamid (*N,N*-Dimethyl-2,2,-diphenylacetamide) including its desmethyl metabolite (*N*-Methyl-2,2-diphenylacetamide) in or on raw agricultural commodities as follows:

CROP	ppm
Apples	0.1
Cattles meat, fat & byproducts	0.05
Cotton forage	0.5
Cottonseed	0.1
Fruiting vegetables	0.1
Goat meat, fat & byproducts	0.05
Hog meat, fat & byproducts	0.05
Horse meat, fat & byproducts	0.05
Milk	0.01
Okra	0.1
Peaches	0.1
Peanut hay and forage	2.0
Peanuts	0.1
Potatoes	1.0
Raspberries	1.0
Sheep meat, fat & byproducts	0.05
Soybeans	0.1
Strawberries	1.0
Sweet potatoes	0.1

Note: Cited in 37 FR 738, Jan. 18, 1972, as amended at 46 FR 18315, Mar. 24, 1981; 55 FR 26440, June 28, 1990.

Carcinogen/Hazard Classifications

WHO Acute Hazard: Class III, slightly hazardous

Regulatory Authority:

- Air Pollutant Standard Set (former USSR)⁽³⁵⁾
- AB 1803-Well Monitoring Chemical (CAL)
- MCL (Maximum Contaminants Levels) list of contaminants (CAL)
- CAL-DHS/DHS Drinking Water Action Levels
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%

Description: White crystalline solid in various forms. Very slightly soluble in water; solubility = 255 ppm @ 27°C. Molecular weight = 239.30. Melting/Freezing point = 135°C. Vapor pressure = 2.8 x 10⁻⁸ mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Log K_{ow} = 2.19. Unlikely to bioaccumulate in marine organisms. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Reacts with strong oxidants, strong acids and alkalis.

Permissible Exposure Limits in Air: The former USSR⁽³⁵⁾ has set an MAC in workplace air of 5.0 mg/m³.

Permissible Concentration in Water: The former USSR⁽³⁵⁾ has set an MAC in water bodies used for domestic purposes of 1.2 mg/L. A lifetime health advisory of 0.2 mg/L has been calculated by EPA. California⁽⁶¹⁾ has set a guideline for diphenamid in drinking water of 40 µg/L.

Routes of Entry: Ingestion

Harmful Effects and Symptoms

Short Term Exposure: The LD₅₀ (oral, rat) = 685 mg/kg (slightly toxic).

Long Term Exposure: A slight increase in liver weights was observed in long-term animal feeding studies. Mutation data reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dipropetryn (ANSI)

Use Type: Herbicide

CAS Number: 4147-51-7

Formula: C₁₁H₂₁N₅S

Synonyms: 2,4-Bis(isopropylamino)-6-ethylthio-S-triazine; Dipropetryne; Dipropetryn [2-(ethylthio)-4,6-bis(isopropylamino)-S-triazine]; 2-(Ethylthio)-4,6-bis(isopropylamino)-S-triazine; 6-(Ethylthio)*N,N'*-bis(1-methylethyl)-1,3,5-triazine-2,4-diamine

Trade Names: COTOFOR®; GS 16068®; SANCAP®, Syngenta (Switzerland), canceled

Producers: Syngenta (Switzerland)

Chemical Class: Triazine

EPA/OPP PC Code: 104401

California DPR Chemical Code: 2532

Uses: Not registered in the U.S. Dipropetryn was used for pre-emergence control of pigweed and Russian thistle on cotton. In addition, dipropetryn was registered for use only on cotton grown on the sandy soils in Oklahoma, Texas, Arizona, and New Mexico.

Fish toxicity (threshold)⁽⁷⁷⁾: Low-211.12127 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: CAUTION

Description: A solid. Molecular weight = 255.43. Melting/Freezing point = 105°C. Vapor pressure = 7.4 x 10⁻⁷ mmHg @ 20°C.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)].⁽¹⁸⁾

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, passing through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May cause skin and severe eye irritation. Moderately poisonous if ingested or inhaled. Exposure to a triazine (simazine) has caused acute and subacute dermatitis in the former USSR, characterized by erythema, slight edema, moderate pruritus, and burning lasting 4 to 5 days.

Long Term Exposure: May cause lung irritation and damage. May cause skin allergy. Contact with some triazine compounds (such as atrazine) may increase risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects on the hypothalamic pituitary gonadal axis. Repeated exposure may cause weight loss and reduced red blood cell count. May be mutagenic.

Points of Attack: Liver, lungs and skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Consider chest x-ray following acute overexposure. Evaluation by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Sheep, meat, fat, mby	0.1

Carcinogen/Hazard Classifications**U.S. EPA Carcinogens:** Group C, possible carcinogen**California Prop. 65:** Carcinogen**U.S. TRI:** Carcinogen**Label Signal Word:** CAUTION, WARNING, DANGER**WHO Acute Hazard:** Class U, unlikely to be hazardous**Regulatory Authority:**

- Actively registered pesticide in California.
- EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Chemical Class: Bipyridylum

EPA/OPP PC Code: 032201

California DPR Chemical Code: 229

ICSC Number: 1363

RTECS Number: JM5690000

EEC Number: 613-089-00-1

Uses: Diquat or diquat dibromide is a nonselective, quick-acting herbicide and plant growth regulator, causing injury only to the parts of the plant to which it is applied. Diquat is referred to as a desiccant because it causes a leaf or an entire plant to dry out quickly. It is used to desiccate potato vines and seed crops, to control flowering of sugarcane, and for industrial and aquatic weed control in environments such as catfish farms. It is not residual; it does not leave any trace of herbicide on or in plants, soil, or water.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–35.00 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Very low–932.73871 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

Label Signal Word: WARNING, Class II, Moderately toxic

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (former USSR)⁽³⁵⁾ (OSHA)⁽⁵⁸⁾ (Several States)⁽⁶⁰⁾
- AB 1803-Well Monitoring Chemical (CAL)
- MCL (Maximum Contaminants Levels) list of contaminants (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The “Director’s List” (CAL/OSHA)
- Actively registered pesticide in California.
- Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
- Safe Drinking Water Act: MCL, 0.02 mg/L; MCLG, 0.02 mg/L; Regulated chemical (47 FR 9352)
- Superfund/EPCRA 40CFR302.4 RQ: CERCLA, 1000 lb (454 kg)

Description: yellow crystalline solid. The commercial product may be found in a liquid concentrate or a solution. Soluble in water; solubility = 7.0×10^5 ppm @ 20°C. Molecular weight = 344.08. Boiling point = decomposes. Melting/Freezing point = 335–340°C. Vapor pressure = <12 mPa @ 20. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0.

Incompatibilities: Incompatible with alkalis, UV light, basic solutions. The active ingredient is corrosive to metals. Concentrated solutions attack aluminum. Diquat cylinder may explode in heat of fire.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾ (10-hr.workshift) and ACGIH⁽¹⁾ (8-hr. workshift) recommend a TWA value of 0.5 mg/m³. The HSE⁽³³⁾ uses the same TWA and has set an STEL of 1.0 mg/m³. The former USSR⁽³⁵⁾ has set an MAC in workplace air of 0.2 mg/m³. Several states have set guidelines or standards for diquat in ambient air⁽⁶⁰⁾ ranging from 5 µg/m³ (North Dakota) to 8.0 µg/m³ (Virginia) to 10.0 µg/m³ (Connecticut) to 12.0 µg/m³ (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: No criteria set

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Diquat can affect you when breathed in and by passing through your skin. Skin contact can cause burns. High exposure can cause nausea, diarrhea, lung, liver, and kidney damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours.

Long Term Exposure: Long-term or repeated exposure may cause cataracts. Repeated contact causes dry, cracked skin and nail damage. Exposure can cause nosebleeds. Diquat may cause mutations. Handle with extreme caution. Diquat may damage the developing fetus. Lung damage may occur.

Points of Attack: Eyes, skin, respiratory system, kidneys, liver, central nervous system.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: Lung function tests. Examination of the eyes. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

- Actively registered pesticide in California.

Description: Colorless to yellow crystalline solid. Soluble in water; solubility = 70 g/100 ml @ 20°C. Molecular weight = 344.0. Density = 1.24 – 1.25 @ 20 °C. Melting/Freezing point = < 320°C; 335–340°C. Vapor pressure = <13 mPa @ 20°C; <10⁻⁵ mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Log K_{ow} = < -3.00. Unlikely to bioaccumulate in marine organisms.

Incompatibilities: The dry material is UV sensitive. Keep away from alkalis, basic solutions. Concentrated diquat solutions attacks aluminum. May explode at elevated temperatures.

Permissible Exposure Limits in Air: There is no OSHA PEL⁽⁵⁸⁾. NIOSH (10-hr.workshift) and ACGIH (8-hr. workshift) recommend a TWA value of 0.5 mg/m³.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Slowly absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Diquat can affect you when breathed in and by passing through your skin. Skin contact can cause burns. High exposure can cause nausea, diarrhea, lung, liver, and kidney damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours.

Long Term Exposure: Long-term or repeated exposure may cause cataracts. Repeated contact causes dry, cracked skin and nail damage. Exposure can cause nosebleeds. Handle with extreme caution. Diquat may damage the developing fetus. Diquat may cause mutations. Lung, liver, and kidney damage may occur.

Points of Attack: Eyes, skin, respiratory system, kidneys, liver, central nervous system.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful:

Lung function tests. Examination of the eyes. Kidney and liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Disulfiram

Use Type: A seed disinfectant and fungicide.

CAS Number: 97-77-8

Formula: C₁₀H₂₀N₂S₄

Synonyms: (Bis(diethylamino)thioxomethyl) disulphide; Bis(diethylthiocarbamoyl) disulfide; Bis(*N,N*-diethylthiocarbamoyl) disulfide; Bis(*N,N*-diethylthiocarbamoyl) disulphide; Disulfan; Disulfuram; Disulphuram; 1,1'-Dithiobis(*N,N*-diethylthioformamide); Esperal (France); Etabus; Ethyldithiourame; Ethyldithiurame; Ethyl thiram; Ethyl thiudad; Ethyl thiurad; Ethyl tuads; Ethyl tuex; NCI-C02959; Refusal (Netherlands); TETD; Tetraethylthioperoxydicarbonic diamide; Tetraethylthiram disulphide; Tetraethylthiuram; Tetraethylthiuram disulfide; Tetraethylthiuram disulphide; *N,N,N',N'*-tetraethylthiuram disulphide; Tetraetil (Spanish); TTD; TTS

Trade Names: ABSTENSIL[®]; ABSTINYL[®]; ALCOPHOBIN[®]; ALK-AUBS[®]; ANTADIX[®]; ANTAENYL[®]; ANTAETHAN[®]; ANTAETHYL[®]; ANTAETIL[®]; ANTALCOL[®]; ANTETAN[®]; ANTETHYL[®]; ANTETIL[®]; ANTEYL[®]; ANTIAETHAN[®]; ANTIETANOL[®]; ANTI-ETHYL[®]; ANTIETIL[®]; ANTIKOL[®]; ANTIVITIUM[®]; AVERSAN[®]; AVERZAN[®]; BONIBAL[®]; CONTRALIN[®]; CONTRAPOT[®]; CRONETAL[®]; DICUPRAL[®]; DISETIL[®]; EKAGOM TEDS[®]; EPHORRAN[®]; ESPENAL[®]; EXHORAN[®]; EXHORRAN[®]; HOCA[®]; KROTENAL[®]; NOCBIN[®]; NOXAL[®]; RO-SULFIRAM[®]; STOPAETHYL[®]; STOPETHYL[®]; STOPETYL[®]; TATD[®]; TENURID[®]; TENUTEX[®]; TETIDIS[®]; TETRADIN[®]; TETRADINE[®]; TETURAM[®]; TETURAMIN[®]; THIOSAN[®]; THIOSCABIN[®]; THIRERANIDE[®]; THIURAM E[®]; THIURANIDE[®]; TILLRAM[®]; TIURAM[®]

Producers: Abbott Laboratories (USA); Bayer Chemicals (Germany); Kawaguchi Chemical Industry (Japan); Sumitomo Chemical (Japan)

Chemical Class: Dithiocarbamate

ICSC Number: 1438

RTECS Number: JO1225000

EEC Number: 006-079-00-8

EINECS Number: 202-607-8

Uses: Disulfiram is also used as a rubber accelerator and vulcanizer, and in adhesives. It is widely used in the treatment of chronic alcoholism or alcohol therapy because of its effectiveness in maintaining abstinence. Its medical trade name is Antabuse[®].

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (DFG)⁽³⁾
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Canada, WHMIS, Ingredients Disclosure List

Description: Disulfiram is a white to off-white or light gray powder with a slight odor. Very slightly soluble in water. Molecular weight = 296.54. Boiling point = 117°C @ 17 mmHg. Melting/Freezing point = 70°C. Log K_{ow} = 3.89. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Incompatibilities: Oxidizers. Forms toxic sulfur and nitrogen oxides when heated to decomposition.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. NIOSH⁽²⁾ recommended REL, DFG MAK⁽³⁾, and the ACGIH⁽¹⁾ recommended TLV is 2 mg/m³ TWA. NIOSH⁽²⁾ warns that precautions should be taken to avoid concurrent exposure to ethylene dibromide.

Determination in Air: No method available.

Permissible Concentration in Water: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory system. Eye contact can lead to damage. Disulfiram can affect you when breathed in and by passing through your skin. Exposure to Disulfiram and alcohol or alcohol-containing products such as medications, cold remedies, and cough syrups within 1-2 days to each other can cause a reaction. Usually within ½-hour following ingestion of alcohol the following symptoms may occur: flushing of the face and neck, severe headache, burning eyes, rapid heart beat, nausea, and vomiting. Tightness in the chest may be mistaken for a cardiac problem. Shock may occur and this reaction could be fatal. If working with Disulfiram you should never be exposed to ethylene dibromide because of possible severe reaction. Symptoms of exposure include lassitude (weakness, exhaustion), fatigue, tremor, restlessness, headache, dizziness; metallic taste; vomiting, peripheral neuropathy

Long Term Exposure: May cause liver and kidney damage. It may damage the developing fetus. Damage to vision, nervous system with numbness, “pins and needles,” weakness and poor coordination can result from repeated exposure. May cause personality changes of depression, anxiety or irritability. Can cause skin sensitization dermatitis. Enlarged thyroid and skin rash can also occur.

Points of Attack: Eyes, skin, respiratory system, central nervous system, peripheral nervous system, liver

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Liver, kidney, and thyroid function tests. Skin testing with dilute Disulfiram may help diagnose allergy, if done by a qualified allergist. Exam of the nervous system, eyes, and vision. Evaluate for brain effects. Alcohol use may increase liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note: For alcohol–disulfiram or ethylene dibromide–disulfiram reaction, remove the person from exposure. Begin rescue breathing if breathing has stopped, and CPR if heart action has stopped. Treat for shock and transfer promptly to a medical facility. For alcohol-related reaction, physician or authorized medical personnel may administer antihistaminics, either orally or IV.

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, unlikely carcinogen

Label Signal Word: WARNING or DANGER, Toxicity class I-highly toxic, according to formulation

WHO Acute Hazard: Class 1 a, extremely hazardous

Regulatory Authority:

- Banned or Severely Restricted (Various Countries) (UN) (13)
- Very Toxic Substance (World Bank)⁽¹⁵⁾
- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (HSE)⁽³³⁾ (Several States)⁽⁶⁰⁾
- CLEAN WATER ACT: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
- EPA HAZARDOUS WASTE NUMBER (RCRA No.): P039
- RCRA, 40CFR261, Appendix 8 Hazardous Constituents
- RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.017; Nonwastewater (mg/kg), 6.2
- RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL ug/L): 8140(2)
- SUPERFUND/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500 lb (227kg)
- SUPERFUND/EPCRA 40CFR302.4 RQ: CERCLA, 1 lb (0.454 kg)
- U.S. DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
- Canada, WHMIS, Ingredients Disclosure List

Description: Disulfoton is a combustible, colorless to yellowish oil with a characteristic odor. Technical product is a brown liquid. Boiling point = 132-133°C @ 1.5 mm pressure. Freezing/Melting point = > -25°C. Flash point = >82°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Practically insoluble in water.

Incompatibilities: Alkalies, strong oxidizers. Forms toxic nitrogen and sulfur oxides when heated to decomposition.

Permissible Exposure Limits in Air: There is no OSHA PEL⁽²⁾, HSE⁽³³⁾ and the recommended ACGIH⁽¹⁾ TWA value is 0.1 mg/m³ and the HSE⁽³³⁾ has set an STEL of 0.3 mg/m³. Several states have set guidelines or standards for disulfoton in ambient air⁽⁶⁰⁾ ranging from 1.0 µg/m³ (North Dakota) to 1.6 µg/m³ (Virginia) to 2.0 µg/m³ (Connecticut and Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Method IV, Method #5600, organophosphorus pesticides.

Permissible Concentration in Water: The EPA recommends that no more than 10 parts of disulfoton per billion parts of water (10 ppb) be present in water that children drink for periods of up to 10 days. They also recommend that disulfoton should not exceed 3 ppb for children or 9 ppb for adults if they drink water for longer periods of time, and it should not exceed 0.3 ppb for adults who drink the water for a lifetime.

Determination in Water: Extraction with methylene chloride followed by measurement by gas chromatography using a nitrogen-phosphorus detector.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. Symptoms include pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) and chest pain may be noted. Hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. It is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg or a taste (less than 7 drops) for a 70 kg (150 lb) person. It is poisonous and may be fatal if inhaled, swallowed, or absorbed through the skin.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1-2 weeks while red blood cell levels may be reduced for 1-3 months. When acetylcholinesterase enzyme levels are reduced by 25% or

more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. **Eyes:** Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. **Skin:** Get medical aid. Skin contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. **Inhalation:** Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do NOT use mouth-to-mouth resuscitation; use bag/mask apparatus. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. **Ingestion:** Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a*

with ipecac syrup. *Note to physician or authorized medical personnel:* Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Dithiazanine Iodide

Use Type: An insecticide for treating animals

CAS Number: 514-73-8

Formula: C₂₃H₂₃IN₂S₂

Alert: Not registered in the United States

Synonyms: Diethylthiadicarbocyanine iodide; 3,3'-Diethylthiadicarbocyanine iodide; Dilombrin; Dithiazanine; Dithiazanine iodide; Dithiazanin iodide; 3-Ethyl-2-(5-(3-ethyl-2-benzothiazolinylydene)-1,3-pentadienyl)benzothiazolium iodide

Trade Names: ABMINTHIC®; ANELMID®; ANGUIFUGAN®; COMPOUND 01748®; DEJO®; DELVEX®; EASTMAN 7663®; L-01748®; NETOCYD®; NK 136®; OMNIPASSIN®; PARTEL®; TELMICID®; TELMID®; TELMIDE®; VERCIDON®

Producers: Molekula Fine Chemicals (UK)

RTECS Number: DL7060000

Uses: This material is used as a veterinary anthelmintic for treating dogs for large roundworms, hookworms, whipworms, and strongyloides. It is also a sensitizer for photographic emulsions and for insecticides. Not registered as a pesticide in the U.S.

Regulatory Authority:

- Banned or Severely Restricted (Several Countries) (UN)⁽¹³⁾

- Superfund/EPCRA 40CFR355, Appendix B Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4,540 kg)
- Superfund/EPCRA 40CFR302.4 RQ: EHS, 1 lb (0.454 kg)

Description: Green, needle-like crystalline solid. Practically insoluble in water. Molecular weight = 518.69. Melting/Freezing point = (decomposes) 248°C.

Harmful Effects and Symptoms

Short Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-approved air purifying respirators for pesticides. Poisonous if swallowed, or if dust is inhaled. LD₅₀ (oral, mouse) = 20 mg/kg (highly toxic).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Dithiopyr (ANSI)

Use Type: Herbicide

CAS Number: 97886-45-8

Formula: C₁₅H₁₆F₅NO₂S₂

Synonyms: 3,5-Pyridinedicarbothioic acid, 2-(difluoromethyl)-4-(2-methylpropyl)-6-(trifluoromethyl)-, S,S-dimethyl ester; S,S-Dimethyl 2-(difluoromethyl)-4-(2-methylpropyl)-6-(trifluoromethyl)-3,5-pyridinedicarbothioate

Trade Names: DIMENSION[®], Dow AgroSciences (USA); EH-1400[®], Pbi/Gordon (USA); MON 7200[®], Monsanto (USA); MON-15100[®], Monsanto (USA)

Producers: Dow AgroSciences (USA); Monsanto (USA); Pbi/Gordon (USA); J.R. Simplot (USA)

Chemical Class: Thiocarbamate

EPA/OPP PC Code: 128994

California DPR Chemical Code: 2308

Uses: Used primarily for pre-emergence control of crabgrass and goosgrass on turf and lawns.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate–25.20 ppb, Health Advisory

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate–27.92865 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Group E, Unlikely a carcinogen

Label Signal Word: CAUTION

WHO Acute Hazard: Class U, unlikely to be hazardous

Description: Colorless, crystalline solid. Soluble in water; solubility = 1.41 ppm. Molecular weight = 401.45.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Harmful Effects and Symptoms

Short Term Exposure: Low levels of toxicity. Concentrated solutions are slightly corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Skin contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid respiration, slow heart beat. Severe exposure may result in death.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, skin, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8 ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel:* Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, consider administering a corticosteroid spray. Cigarette smoking may exacerbate

pulmonary injury and should be discouraged for at least 72 hours following exposure.

Diuron (ANSI)

Use Type: Herbicide

CAS Number: 330-54-1

Formula: C₉H₁₀Cl₂N₂O; Cl₂C₆H₃NHCON(CH₃)₂

Alert: A General Use Pesticide (GUP).

Synonyms: DCMU (In Japan); 3-(3,4-Dichloro-fenyl)-1,1-dimethylureum (Dutch); Dichlorfenidim; 3-(3,4-Dichlorophenol)-1,1-dimethylurea; 3-(3,4-Dichlorophenyl)-1,1-demethylurea; N'-(3,4-dichlorophenyl)-N,N-dimethylurea; N-(3,4-Dichlorophenyl)-N',N'-dimethylurea; 1-(3,4-Dichlorophenyl)-3,3-dimethylurea; 1,1-Dimethyl-3-(3,4-dichlorophenyl)urea; 1(3,4-Dichlorophenyl)-3,3-dimethyluree (French); 3-(3,4-Dichloro-phenyl)-1,1-dimethylharnstoff (German); 3-(3,4-Diclorofenil)-1,1-dimetilurea (Spanish); 3-(3,4-Dicloro-fenyl)-1,1-dimetilurea (Italian); Urea, N'-(3,4-dichlorophenyl)-N,N-dimethyl-; Urea, 3-(3,4-dichlorophenyl)-1,1-dimethyl-

Trade Names: 330541[®]; AF 101[®]; AI3-61438[®]; AMETRON SC[®], Milenia Agro Ciencias (Brazil); BOUNDRY[®], Syngenta (Switzerland), canceled 7/21/1998; CASWELL No. 410[®]; CHEMIURON[®], Agrimont S.p.A. Chemical Class: Urea

EPA/OPP PC Code: 035505

California DPR Chemical Code: 231

RTECS Number: YS8925000

EINECS Number: 206-354-4

Uses: Diuron is a substituted urea herbicide used to control a wide variety of annual and perennial broadleaf and grassy weeds, as well as mosses. It is used on non-crop areas and many agricultural crops such as fruit, cotton, sugar cane, alfalfa, and wheat. Diuron works by inhibiting photosynthesis. It may be found in formulations as wettable powders and suspension concentrates.

Human toxicity (long-term)⁽⁷⁷⁾: Intermediate—18.32460 ppb, CHCL (Chronic Human Carcinogen Level)

Fish toxicity (threshold)⁽⁷⁷⁾: Intermediate—40.39243 ppb, MATC (Maximum Acceptable Toxicant Concentration)

U.S. Maximum Allowable Residue Levels for Diuron (40 CFR 180.106):

Carcinogen/Hazard Classifications

U.S. EPA Carcinogens: Known/likely to be carcinogen

California Prop. 65: Carcinogen

Label Signal Word: WARNING, Toxicity Class III-Slightly Toxic

WHO Acute Hazard: Class U, Unlikely to be hazardous

Regulatory Authority:

- Air Pollutant Standard Set (ACGIH)⁽¹⁾ (Argentina) (HSE)⁽³³⁾ (former USSR)^(35, 43) (Several States)⁽⁶⁰⁾
- Clean Water Act: Section 311 Hazardous Substances/RQ 40 CFR 117.3 (same as CERCLA, see below) Superfund/EPCRA 40 CFR 302.4 RQ: CERCLA, 100 lb (45.4 kg)
- AB 1803-Well Monitoring Chemical (CAL)
- Proposition 65 chemical (CAL)
- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California
- EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%
- Canada, WHMIS, Ingredients Disclosure List

Description: Diuron is a white, odorless crystalline solid. Very slightly soluble in water; solubility = 75 ppm @ 25°C. Molecular weight = 233.1. Boiling point = (decomposes) 180°C. Melting/Freezing point = 158–159°C. Vapor pressure = 6.9×10^{-8} mmHg @ 20°C; 3.1×10^{-6} mmHg @ 50°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Log K_{ow} = 2.85. Values at or above 3.0 are likely to bioaccumulate in marine organisms. Harmful to aquatic life in very low concentrations.

Incompatibilities: Strong acids.

Permissible Exposure Limits in Air: There is no OSHA⁽²⁾ PEL. The HSE⁽³³⁾ and recommended ACGIH⁽¹⁾ TLV is 10 mg/m³ TWA. Argentina⁽³⁵⁾ has adopted 10 mg/m³ as a TWA and set 20 mg/m³ as a STEL. The former USSR has set an MAC in ambient air of residential areas of 0.5 mg/m³ either on a momentary or a daily average basis^(35, 43). Several states have set guidelines or standards for diuron in ambient air⁽⁶⁰⁾ ranging from 100 µg/m³ (North Dakota) to 160 µg/m³ (Virginia) to 200 µg/m³ (Connecticut) to 238 µg/m³ (Nevada).

Determination in Air: OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH IV, Method #5601⁽¹⁸⁾.

Permissible Concentration in Water: The former USSR^(35, 43) has set an MAC in water bodies used for domestic purposes of 1.0 mg/L and an MAC in water bodies used for fishery purposes of 1.5 µg/L. A long-term health advisory of 0.875 mg/L has been calculated by EPA and a lifetime health advisory of 0.014 mg/L (14 µg/L).

Determination in Water: High performance liquid chromatography may be used after extraction with Methylene chloride. Measurement is made using an ultraviolet detector.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure may irritate the skin, eyes, and throat.

Long Term Exposure: May damage the developing fetus. In animals: anemia, methemoglobinemia

Points of Attack: Eyes, skin, respiratory system, blood

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician or authorized medical personnel: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Producers: Cognis (Germany)

Chemical Class: Soap

EPA/OPP PC Code: 098002

California DPR Chemical Code: 941

ICSC Number: 1470

RTECS Number: DB6600000

EINECS Number: 248-289-4

Uses: Dodecylbenzenesulfonic acid and its salts are used as degreasers in meat cutting rooms. Also used as a laboratory chemical, to make detergents, and in electronically cleaning and pickling baths.

Carcinogen/Hazard Classifications

Label Signal Word: DANGER

Regulatory Authority:

- Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA)
- The "Director's List" (CAL/OSHA)
- Actively registered pesticide in California.
- Rating System): Section 311 Hazardous Substances/RQ (same as CERCLA)
- EPCRA Section 304 RQ: CERCLA, 1000 lb (454 kg)

Description: Dodecylbenzene sulfonic acid is a light yellow to brown liquid with a slight SO₂ odor. Molecular weight = 326.50. Boiling point = 315°C. Melting/Freezing point = 10°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 1. Soluble in water.

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. May attack metals, forming flammable hydrogen gas.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation

Harmful Effects and Symptoms

Short Term Exposure: A corrosive. Contact with the eyes and skin can cause severe irritation and burns. Inhalation can irritate the respiratory tract.

Long Term Exposure: Repeated skin contact may cause dermatitis. Corrosive materials may affect the lungs or cause bronchitis with coughing, phlegm and/or shortness of breath.

Points of Attack: Lungs

Medical Surveillance: Lung function tests. Consider chest x-ray following acute overexposure.
