Foreword

The Architect's Handbook of Professional Practice, published by the AIA since 1920, has become the definitive information source of architectural practice for over 90 years. While major changes have altered the demand for design and architectural services in the intervening decades, this handbook has kept pace and has risen in value to the profession.

The 15th edition, which you are about to read, reflects a range of current AIA initiatives aimed at improving the built environment and public well-being. At the same time, it reflects a contemporary ethos with emphasis on diversity and inclusion, small-firm culture, sustainability, and evolving representational and project delivery methods such as BIM and architect-led design-build.

How does the Handbook reflect these factors? By including expanded content for emerging professionals, such as information on career development, as well as expanded content for established architects who work for or own small and midsize firms. Case studies and targeted articles, written by real-world practitioners, portray a discipline that has been recently segmented by economic circumstances, technological change, and generational difference. Licensed architects, who are united in their professionalism, and those on the path to licensure—both are represented here, united in their desire to meet a high standard of excellence.

Architecture has become an adaptable enterprise for a world that requires nimbleness, pragmatism, and no small amount of ingenuity. From one architect to another, I think you will appreciate the strength of the knowledge base on which this 15th edition rests. I think you will also find it to be an indispensable tool in a time of great change and even greater opportunity for architects.

Robert A. Ivy, FAIA

Washington, D.C.

Preface

The 15th edition of the *Architect's Handbook of Professional Practice* builds on its long tradition as a definitive resource while providing new and significantly revised material. Since the release of the 14th edition, rapidly developing technologies saw greater adoption and the economy plunged into recession. These and other changing conditions influence firm management, project delivery, and other aspects of practice, and the 15th edition has been modified and supplemented accordingly.

When the AIA and Wiley's editorial team asked us to serve on the Steering Group, we were honored to help guide the development of the 15th edition. Our members reflect the diversity of the profession in terms of firm size, geographical distribution, services offered, technologies and delivery methods employed, involvement in academia, and stages of firms and careers. We shared a common goal of crafting a reference relevant to firms of all sizes, and useful to emerging firms and professionals as well as established practitioners.

The Steering Group started work by reviewing the 14th edition in depth. We met for intense conversations regarding how the profession had changed and would continue to develop, which topics were important to retain and update, and what needed to be set aside or added to the 15th edition. As the content took shape, editors called on steering committee members to continue their involvement by suggesting potential authors and reviewing submissions.

We hope you find that our efforts—and the efforts of many others—have contributed to a reference that is both timely and farsighted. We were privileged to be part of this endeavor and believe that the work of the many architects and allied professionals who undertook to develop and share their expertise has resulted in an indispensable resource. We expect you will turn to this Handbook many times as you make decisions related to participating in, developing, and managing a successful practice.

Linda Reeder, AIA
Associate Editor
15th Edition Handbook Steering Group Member

Acknowledgments

It has been my privilege to work with those who have participated in the creation of the 15th edition of the Handbook. I am deeply grateful to the contributing authors who have generously shared their knowledge. I especially appreciate their willingness to engage in our peer review process and work closely with the editorial team to produce excellent content.

At the outset of content development for the 15th edition, the Handbook editors turned to subject matter experts for guidance on many of the chapters. These "chapter captains," as we called them, advised us on the articles needed for their chapter and, in many cases, recommended authors to write them. Many were tireless in their work as peer reviewers and in assisting us in creating comprehensive chapters with minimum redundancy. I would like to extend special and heartfelt thanks to these expert advisers, including Jim Atkins and Phil Bernstein, who gave significant time and thought to the Handbook effort. Similarly, the guidance and insight of the Steering Group has been critical to the development of the 15th edition and their effort is also greatly appreciated.

To enable coordination between Handbook authors and their related topics, especially within a chapter, most contributors also served as peer reviewers for the other authors in their chapters. I truly appreciate the willingness of the authors to accept this extra task on top of producing their own articles. In addition, we had a number of peer reviewers who were not Handbook authors and we are sincerely grateful for their efforts.

The efforts of AIA's publishing partner John Wiley & Sons, Inc., are also most appreciated. Katherine Malm Bourgoine, Wiley's architecture and design Senior Acquisitions Editor, was always available to offer advice on publishing matters, and Senior Editorial Assistant Danielle Giordano was extremely helpful in addressing numerous administrative details.

Finally, on a personal note, I would like to thank the Handbook editorial team for their excellent work throughout this process. Although our collaboration was conducted almost entirely online, we worked together with remarkable effectiveness. I can only describe the team as insightful and dedicated and I am honored to have been able to work with Linda Reeder, Mary Anderson, and Richard L. Hayes.

About the 15th Edition of the Handbook

Much has changed in the practice of architecture since the publication of the Handbook's 14th edition in 2008. Many tools that architects take for granted in 2013 were not widely used or available in 2008. More important, in 2008 the U.S. economy fell into the grip of a widespread and deep economic downturn, with a long-awaited recovery just now beginning at the time of this writing.

Many articles in the 15th edition discuss the significant impact of the Great Recession on the profession of architecture, including "Navigating Economic Cycles" by AIA Chief Economist Kermit Baker. Chapters on firm management, particularly in the areas of human resources and marketing, benefit from insight gained during this difficult period. Articles such as "Entrepreneurial Practice: Starting an Architectural Firm" offer understanding gained from practice experience about management strategies that respond to the new norm.

Significant changes in technology and project delivery have also taken place since 2008. Architects and owners are increasingly turning to delivery methods other than traditional design-bid-build in an effort to improve effectiveness and reduce risk. The 15th edition includes an expanded section on project delivery. It also includes, for the first time in the Handbook, an entire chapter devoted to technology.

While there is no chapter specifically focused on sustainability in the 15th edition, the topic is not being ignored. Just as sustainable design is no longer additive but instead integrated into the work of most architects, the topic of sustainable design has been integrated into other content. This is particularly true in relation to teamwork, project delivery, and codes. A case study that illuminates strategies for sustainable office management practices is also included.

NEW TO THE 15TH EDITION

Two-thirds of the 15th edition content is completely new, reflecting the state of practice in 2013 and looking ahead to emerging trends. In an effort to present the most current information, over 90 percent of 15th edition authors are new to the Handbook, although all are experts in their topics. These authors have contributed articles that are new to the Handbook, have written new articles on topics that have previously appeared in the Handbook, or have updated articles written for the 14th edition by others. Many of these authors are seasoned practitioners, sharing insight sourced from personal practice experience. Overall, they represent a diverse group that is meant to be reflective of the profession as a whole.

New Chapters

In addition to *Technology in Practice*, the 15th edition includes a number of other chapters that are new to the Handbook. These include:

- **Diversity and Demographics.** The importance of diversity as a practice management issue is discussed in this chapter along with a historical perspective on diversity in the AIA. Significant data on practice trends from *The Business of Architecture: AIA 2012 Survey Report on Firm Characteristics* are also presented.

- **Career Development.** Contributions from the National Council of Architectural Registration Boards (NCARB) explain the basics of the Intern Development Program and the path to licensure for emerging professionals. For seasoned practitioners, articles have been included to help increase understanding of the regulatory environment of professional practice, including state-mandated continuing education (MCE) and certification as a minority, women-owned, or small business enterprise.
- **Public Interest Design.** This new chapter reflects the growing interest and participation by architects in activities that benefit local communities and the public at large. Many examples of how architects are applying their skills and talents for the public good are included. Also discussed is the architect's role in disaster recovery and preparedness, pro bono work, and the profession's engagement with the nonprofit sector.
- **Research in Practice.** Research is increasingly becoming a regular and integrated aspect of architectural practice. In this chapter, academic researchers who work in practice settings and experienced practitioners who engage in research discuss various topics, including evidence-based design and research in a small firm context.

More Content for Smaller Firms

For the 15th edition, care has been taken to include information and best practices that are applicable to architects who practice in small and midsize firms, as well as large firms. Authors have been encouraged to help readers understand how to apply general information and recommend processes that work in the context of smaller practices. Authors from small firms were asked to write about their experiences to supplement information that might apply only to larger firms.

As a result there are a number of backgrounders targeted to small-firm practitioners, such as "Professional Developing and Mentoring in Small Firms," "Architect-Led Design-Build for Small Projects and Small Firms," "The Multi-Office Small Firm," and "Research in Small Firm Practice." There is also an article called "Small Firm Collaboration," which explores ways that small firms are aligning with other design firms to acquire and deliver work. And in the realm of technology, there is an article about using Building Information Modeling (BIM), called "Small Firms, Small Projects, and BIM."

Expanded Business Management Content

Twenty-first-century business realities require that entrepreneurial architects and their staffs develop skill in business management. The chapters on organizational development, marketing, finance, and human resources contain articles that demystify concepts and introduce firm leaders to best practices in each management arena. Consultants, who possess deep knowledge of specific aspects of practice, are the authors of most of these articles.

For owners of midsize firms with mature practices, there are articles on developing multiple offices or a global practice, and advice on how to maintain a culture of creativity. Articles on ownership transition, leadership effectiveness, the legal context of practice, and more provide information and knowledge vital to leaders of firms of all sizes.

NAVIGATIONAL FEATURES

The Handbook is divided into four major sections:

- Part 1: The Profession
- Part 2: Firm Management
- Part 3: Project Delivery
- Part 4: Contracts and Agreements

Each part contains a number of chapters. For example, "Part 4: Contracts and Agreements" includes the chapters "Project Definition," "Risk Management," and "Agreements and AIA Documents."

Each chapter contains multiple articles. Each article addresses a specific aspect of practice within the practice area covered by the chapter. For example, the chapter "Design Project Delivery" contains articles on integrated project delivery, design-build, and construction management, among others.

Some articles include backgrounders that elaborate on an aspect of the topic or bring a new perspective. For example, the article "Recruiting and Hiring" contains a backgrounder on social networking in recruiting activities.

Most articles conclude with a "For More Information" section, which lists and describes relevant resources about the subject. These resources may include publications, organizations, and URLs.

HOW TO USE THE HANDBOOK

The Handbook is designed to have multiple entry points. It is expected that most users will have an interest or need for knowledge in a particular area of practice and start there.

Articles can be read individually and in any order. Many chapters begin with an overview article that can direct the reader to the location of more detailed information on a particular topic. When articles in a chapter are taken together, they are intended to present the whole picture of a practice area. Users may want to read an entire chapter to gain fuller understanding of the material presented in any one of the articles. For example, the articles on financial management work best when read together.

The index, which contains key words and concepts, will help readers readily find specific information. In addition, margin elements on the article pages contain both navigational and informational features by

- Reinforcing some aspect of the narrative with a quote
- Highlighting key ideas in brief notes or comments
- Pointing to related Handbook articles and backgrounders

THE HANDBOOK AND THE "STANDARD OF CARE"

Architects are expected to perform within the legal concept of the "standard of care," which considers what reasonably prudent architects would do in the same community at the same time, facing the same or similar circumstances. As a result, fixed or uniform standards cannot be used to evaluate the performance of architects. Thus, the Handbook does not contain absolute rules and procedures. Rather, it presents concepts, principles, techniques, and other fundamental information that together provide guidance for the day-to-day needs of architects and other building design professionals.

Rena M. Klein, FAIA
Executive Editor

PART 1
THE PROFESSION

Laws, regulations, and codes of conduct govern the profession of architecture and define the obligations of architects to the public. AIA members comprise a community of practice that additionally agrees to abide by its Code of Ethics and its requirements for continuing education. For prospective architects, the path to licensure is prescribed. For emerging and mature practitioners, professional life includes participation in professional organizations and architectural education. For some architects, professional life at every stage includes engagement in public interest design.

CHAPTER 1

Ethics and Professional Practice

1.1 The AIA Code of Ethics and Professional Conduct

Michael L. Prifti, FAIA

Members of the American Institute of Architects lead the way through the highest standards of professionalism, integrity, and competence. The Code of Ethics and Professional Conduct is both guide and measurement of those practices.

INTRODUCTION TO THE CODE OF ETHICS AND ETHICAL PRACTICE

Architecture in built form is exclusively predicated on the universal constant of gravity. This is true regardless of location, weather, material, building or client type, codes and regulations, aesthetic, or other variable. Architecture as a practice is equally based on a moral foundation of professionalism, with responsibilities to the general public, our respective clients, to the profession itself, our colleagues, and to the shared environment

Michael L. Prifti is managing principal of BLT Architects, a firm headquartered in Philadelphia, Pennsylvania. Prifti has played an instrumental role in promoting professional practice, serving for two terms on the National Ethics Council and speaking at numerous AIA National Conventions on related topics such as "The Role of Ethics in Sustaining the Profession."

that surrounds all of us. For members of the American Institute of Architects (AIA), the concise language of the Code of Ethics and Professional Conduct is both guide and measuring stick for professional behavior.

HISTORY OF THE AIA CODE OF ETHICS

In 1909, the AIA first adopted a formal set of rules governing the conduct of architects. The rules were published as "A Circular of Advice Relative to Principles of Professional Practice and the Canons of Ethics." According to the National Council of Architectural Registration Boards (NCARB), only four states (Illinois, New Jersey, California, and Colorado) had by that time adopted laws regulating the practice of architecture. As a result, the AIA's rules served to set standards for practice in much of the country. The AIA periodically revised its ethical code in mostly limited ways during the ensuing 60 years.

Limitations Imposed by Antitrust Law

Unlike the NCARB member registration boards, each of which is a part of a state or other government entity, the AIA is a nongovernmental organization. State governments and their agencies enjoy various powers and privileges that do not extend to other types of organizations or to individuals. As a result, both the scope of professional rules adopted by the AIA and the manner of their enforcement by the AIA necessarily differ from what registration boards may do.

Antitrust law imposes significant restrictions on what conduct the AIA can mandate or prohibit in a code of ethics for its members. Although antitrust law is complex, its general purpose is to foster economic competition. One way that antitrust law accomplishes this goal is to prevent competitors in a given market from acting together to unreasonably restrain competition. Because the members of the AIA are competitors of each other, AIA activities cannot be carried out with the purpose or effect of reducing competition in ways that courts have found to be unreasonable, that is, without having an offsetting precompetitive effect.

In the 1970s, in various legal proceedings, the U.S. Supreme Court and other courts established new understandings of antitrust law as applied to professional membership associations, including their codes of ethics. As a direct result, the AIA's own code of ethics was repealed in 1980, temporarily replaced by unenforceable "Ethical Principles," then completely revised and reinstituted as a new enforceable Code of Ethics and Professional Conduct in 1987. The structure and much of the content adopted in 1987 continue to be reflected in the current version of the AIA's code of ethics.

Prior Provisions No Longer in the Code

Some subjects were covered in pre-1980 versions of the AIA's code of ethics but are no longer covered, mostly as a result of restrictions imposed by antitrust law. Prominent in a list of such subjects is any restriction pertaining to fees or compensation for services. In a 1978 appeal by the National Society of Professional Engineers, the U.S. Supreme Court specifically held that a professional association's ethical code may not prohibit competitive bidding—despite the argument that such a regulation would further public health, welfare, and safety.

The absence of ethical provisions regarding fees has a broader effect than just competitive bidding or minimum fee amounts, however. There is no ethical restriction on providing free services whether or not part of marketing; providing services at no charge is, of course, simply charging a fee of zero. Similarly, there are no ethical restrictions specifically pertaining to design competitions, which amount to providing services for no fee or a very small fee.

Other subjects no longer prohibited by the AIA code of ethics include:

- *Supplanting or replacing another architect on a project*. Historically, it was considered unprofessional to have any business contact with another architect's client. The AIA code of ethics does not prohibit such conduct.
- *Advertising*. The AIA's code does not prohibit advertising of professional services. The code does contain provisions that could be violated in the context of advertising, however, such as making false statements or failing to properly credit other participants in a project.
- *Contracting to do construction*. The 1909 code prohibited engaging in any of the "building trades" or guaranteeing any estimate. These restrictions, which are incompatible with design-build, disappeared by the 1970s.
- *Determinations of law*. Prior versions of the code did not shy away from provisions that required legal analysis. For example, prior to 1997 the code made explicit reference to copyright. Currently, however, in order for any legal or regulatory violation to be taken into account in application of the AIA's code of ethics, the legal or regulatory determination must have been made by an appropriate authority.

THE SIX CANONS OF THE AIA CODE OF ETHICS

CANON I: GENERAL OBLIGATIONS

Members should maintain and advance their knowledge of the art and science of architecture, respect the body of architectural accomplishment, contribute to its growth, thoughtfully consider the social and environmental impact of their professional activities, and exercise learned and uncompromised professional judgment.

CANON II: OBLIGATIONS TO THE PUBLIC

Members should embrace the spirit and letter of the law governing their professional affairs and should promote and serve the public interest in their personal and professional activities.

CANON III: OBLIGATIONS TO THE CLIENT

Members should serve their clients competently and in a professional manner, and should exercise unprejudiced and unbiased judgment when performing all professional services.

CANON IV: OBLIGATIONS TO THE PROFESSION

Members should uphold the integrity and dignity of the profession.

CANON V: OBLIGATIONS TO COLLEAGUES

Members should respect the rights and acknowledge the professional aspirations and contributions of their colleagues.

CANON VI: OBLIGATIONS TO THE ENVIRONMENT

Members should promote sustainable design and development principles in their professional activities.

STRUCTURE OF THE CODE

The code is arranged in three tiers of statements: Canons, Ethical Standards, and Rules of Conduct.

- *Canons* are broad principles of conduct. The code of ethics primarily addresses responsibilities that architects and other AIA members have to others. Except for Canon I, General Obligations, the canons reflect the categories of those to whom duties are owed: the public, clients, the architectural and related professions, colleagues (as individuals), and the environment.
- *Ethical Standards* are more specific goals toward which members should aspire in professional performance and behavior.
- *Rules of Conduct* are mandatory. Violation of a Rule of Conduct is grounds for disciplinary action by the Institute. Rules of Conduct, in some instances, implement more than one Canon or Ethical Standard.

Commentary is provided for some of the Rules of Conduct. That commentary is meant to clarify or elaborate the intent of the rule. The commentary is not part of the code, however. Enforcement is determined by application of the Rules of Conduct alone. The commentary is intended to assist those who are seeking to conform their conduct to the code as well as those who are charged with its enforcement.

NATIONAL ETHICS COUNCIL

The bylaws of the AIA establish the processes under which the ethical code is adopted, amended, and enforced. The bylaws provide for the establishment of a National Ethics Council, which has the authority to interpret the Code of Ethics. Individual members, officers, directors, employees, and officers and staff of state and local components of the AIA do not have this authority.

The National Ethics Council is the body charged by the bylaws to enforce ethical matters in the practice of architecture, in accordance with current, published editions of the Code of Ethics and Rules of Procedure. It does so through the process of complaint and response, measuring ethical behavior as defined by the code. The Council also considers proposed changes to the code for adoption by the Board of Directors or membership of the Institute, and may itself propose revisions. The Council amends its Rules of Procedure when appropriate, with any such changes requiring approval of the Board of Directors. As part of its educational mission, the Council conducts programs at the annual National Convention and at other component events. Occasionally, members of the Council publish articles on ethics.

The Council operates with operational support provided by the Institute's Office of General Counsel. The Council publishes on the Institute's website all of its publicly available information. This information can also be obtained by contacting the Office of General Counsel.

Composition of and Appointments to the Council

As established by the AIA's bylaws, the National Ethics Council consists of up to 12 architect members of the Institute, appointed by the Board of Directors to staggered three-year terms. Typically, the Council operates with seven members, each of whom generally is reappointed to a second three-year term. Individual terms are staggered to enhance institutional memory since Council members are not permitted to serve more than two consecutive three-year terms. Nominations for new appointments to the Council are made by the Institute's president with the advice of the Council. The Council's chairperson is also appointed annually by the Board of Directors following recommendation of the Council and nomination by the Institute's president.

Promulgation of the Code of Ethics

The National Ethics Council's page on the AIA website contains the current Code of Ethics, supporting documentation, and all necessary forms. In addition to violation notices published upon the conclusion of a case, decisions of the Council are also published in redacted form, that is, with names, places, and other identifying information removed. Prospective ethical matters may also be addressed through published advisory opinions issued by the Council upon request.

Redacted Decisions

Decisions of the Council in redacted form are published on the National Ethics Council's page of the AIA's website. These decisions are analogous to case law in a legal system and provide examples of how the National Ethics Council has applied various Rules of Conduct in contested cases. It should be noted, however, that prior decisions do not have binding authority on the Council in applying the Code of Ethics in any particular case that comes before it. Summaries of two such decisions are included here.

Advisory Opinions

The National Ethics Council offers the opportunity to AIA members to request advisory opinions be issued that apply the Code of Ethics to particular factual situations. Unlike complaints, which the Council always accepts in keeping with its current Rules of Procedure, granting a request for an advisory opinion is at the discretion of the Council. Decisions issued at the conclusion of a contested complaint have the benefit of the fact-gathering hearing process and usually input from both a complainant and a respondent. Advisory opinions, by comparison, ordinarily would be based on the single point of view of the member making the request.

Changes in the Code of Ethics and Complaint Process

How the Code Itself Is Modified

The AIA's bylaws provide two means for amending the Code of Ethics. The Institute's Board of Directors is empowered to adopt amendments at any time. In addition, the members as a whole, through a vote of their delegates at an annual meeting, may adopt amendments. Typically, amendments have been made by the Board.

How the Rules of Procedure Are Modified

The National Ethics Council is given authority by the AIA's bylaws to adopt the rules under which it operates, subject to specific requirements set by the bylaws themselves. Under the Council's Rules of Procedure, notice is given to the Board of Directors annually of any amendments adopted by the Council. The rules under which appeals are taken are established by the bylaws and the Board of Directors.

COMPLAINT PROCESS

Confidentiality

The AIA's bylaws require that the complaints filed with the National Ethics Council and the complaint processes that follow are maintained in confidence. Limited exceptions to the confidentiality requirement apply, as, for example, when a member is found to have committed a violation and a nonconfidential penalty is imposed. The confidentiality requirement does not prevent the complainant or respondent from contacting persons who already have knowledge of the circumstances described in the complaint and who are therefore potential witnesses. Maintaining confidentiality prevents an ethics complaint from becoming a subject of discussion beyond those who are already involved in the circumstances. In some instances, of course, no violation is ultimately found or only a confidential penalty is imposed for a minor infraction. In those instances, confidentiality ensures that the respondent does not suffer from publicity about the ethics complaint.

Filing of Complaints and Circumstances of Dismissal

Anyone who is directly aggrieved by the conduct of a member of the Institute may lodge a formal complaint against the member. This must be done in accordance with the Council's Rules of Procedure. A time limit of one year is imposed for filing a complaint after the alleged violation unless good cause for delay is shown.

Complaints are filed with the chairperson of the Council by sending them to the Institute's Office of General Counsel, which provides staff support for the Council. The format for complaints is established by the Council's Rules of Procedure, and a form is provided for this purpose. Once staff has determined that a complaint meets the formal requirements of the Rules of Procedure, the complaint will be reviewed by the Council chairperson, who may dismiss or defer the complaint, or determine that the case should proceed.

The chairperson is authorized to dismiss a complaint when the matter is trivial, when filing was delayed beyond the one year time limit without good cause, or if the matter would not result in an ethical violation, even if the facts alleged were proven to be true. The latter reason is analogous to the "motion to dismiss" standard in legal proceedings, but the Council does not follow any procedure analogous to "summary judgment."

The chairperson typically will defer a case if the parties are involved in litigation, arbitration, or another dispute resolution process, including a proceeding before a licensing board. In that instance, both parties will be notified of the deferral and a copy of the complaint will be sent to the respondent. Deferral due to another proceeding is not uncommon. About half of the complaints filed with the Council are deferred either upon initial filing or later if another dispute resolution proceeding is initiated.

In nearly all other instances, however, the Chair will determine that the initially filed complaint should proceed, and the Council forwards it to the respondent for response. As with a complaint, the form for the respondent's response is established by the Rules of Procedure, and a form is provided for this purpose. In the event that a respondent does not file a response after being notified, the complaint process will nevertheless proceed. Even if a respondent remains uncommunicative while the ethics case is proceeding, the Council sends notices of all opportunities for the parties to participate.

The Hearing Officer

Unless information received from the respondent would support dismissal or deferral of the ethics case under the same standards that apply to review of the complaint itself, the chairperson assigns the case to one of the other members of the Council who will serve as the hearing officer. This selection is predicated on an absence of previous knowledge of the matter and existence of significant ties to the complainant, the respondent, or any of the likely witnesses. To help meet these standards and to avoid other possible conflicts, the Council member selected to serve as a hearing officer is often located geographically distant from parties to the case. Notice of the hearing officer's appointment is sent to both the complainant and respondent to allow them to challenge the appointment by reason of alleged bias, prejudice, or conflict of interest.

The hearing officer serves in a capacity similar to an arbitrator. One major difference, however, is that a Council member serving as hearing officer is not the decision maker in the case but runs the process during the pre-hearing and hearing phases. The hearing officer's responsibilities for a case largely end with submission of a report and recommendation as described below.

After receiving the case file, the hearing officer will review the complaint, response, and accompanying documentation in order to independently confirm whether the case should proceed based on the same standards under which the complaint was initially reviewed by the chairperson. Dismissal or deferral by the hearing officer is subject to concurrence by the chairperson.

The complaint process does not provide for counterclaims, even in circumstances when the complainant is a member of the AIA. Upon occasion, a respondent has filed a separate complaint against an original complainant while the original complaint is pending. Although the Council formally treats the two cases separately, in the past the same Council member has been appointed to serve as hearing officer in both cases in the interest of efficiency.

Before the Hearing

The AIA's ethics complaint process is streamlined and does not include features of more formalized dispute resolution methods. Discovery of the opposing party's information through depositions and document production, which are common to litigation and arbitration, is not a part of the Council's procedures. As a nongovernmental organization, the AIA does not have governmental powers and has little means, if any, by which to enforce directives to complainants, respondents, or third parties to produce information that may be relevant to a case. With limited exceptions, a complainant and a respondent both come to a hearing primarily with the information they have in their own possession.

One essential step in preparing for an ethics hearing is for the hearing officer to conduct a pre-hearing conference, which is akin to a pretrial conference conducted by a judge in a court case.

The conference, which is typically by telephone, ordinarily includes introductions, brief statements by the parties regarding their views of the case, and reference to the possibility of settlement between the parties. The parties are permitted to have their counsel or their designated non-attorney advisers participate in this call. The conference call is neither transcribed nor recorded, and nothing said during the call becomes part of the case record. The hearing officer may ask questions of the parties in order to better understand the framework of the dispute. A date for the hearing is set, along with a location, in the event that the complainant and respondent are not in the same area.

Also established during the pre-hearing conference call is a deadline for the parties to submit and exchange various information in advance of the hearing, notably including their expected witnesses and any additional documents (not submitted with the complaint or response) that will be used as evidence at the hearing. This pre-hearing exchange largely constitutes the extent of "discovery" in the AIA's ethics complaint process.

Hearing

The hearing is conducted as an in-person meeting among the hearing officer (assisted by staff counsel), the complainant, the respondent, and their respective counsel or other designated advisers. Witnesses are ordinarily allowed to be present in the room only during the time that they are giving their testimony. The hearing is also attended by a court reporter, retained by the AIA, who makes a transcript of the proceedings for the case record. Most commonly, a hearing lasts the better part of a day, but occasionally the amount of information to be presented may require more than one day.

As with the pre-hearing conference call, the hearing officer presides. No evidence is typically permitted beyond what was indicated by the parties in their pre-hearing exchange of information. The hearing typically follows the following agenda: brief opening statements by both parties, presentation of the complainant's evidence, presentation of the respondent's evidence, and, finally, brief closing statements by both parties. After each witness (usually including the complainant and respondent) provides testimony, an opportunity is provided to the opposing party to ask questions of the witness. The hearing officer (and staff counsel) also frequently have questions to ask a witness to complete the record. During the hearing, the complaint, the response, and the supporting documentary evidence submitted by each party are marked as exhibits for inclusion in the case record.

Report and Recommendation

Following the hearing, the hearing officer prepares a Report and Recommendation. This written document describes the circumstances of the case, cites the Rule(s) of Conduct from the Code of Ethics that were alleged to be violated, presents pertinent facts, states the hearing officer's conclusions regarding violations, and, if a violation is found, recommends a penalty. This Report and Recommendation is distributed to the parties, who are given the opportunity to submit written comments.

Deliberation and Decision by the Council

The entire case record is submitted to the members of the Council for their review. The case record includes the Report and Recommendation, the reporter's transcript of the hearing, the hearing exhibits, and the written comments, if any, submitted by the parties. At a subsequent meeting of the Council, the hearing officer makes introductory remarks and responds to questions that the other Council members may have, after which the hearing officer withdraws and is not present for any case deliberations. If either of the parties has requested to appear before the Council, they also may make short statements and respond to questions the Council members may have.

The Council conducts a vigorous review and deliberation of the transcript, other evidentiary materials, and the hearing officer's Report and Recommendation. The Council makes its determinations by majority vote and authors the written decision, which is subsequently issued to the parties. In the event no ethical violation is found, the case is closed and confidentiality continues to protect the innocent respondent. Should the Council find one or more violation has occurred, a penalty will be determined.

Penalties

Penalties that may be imposed for ethical violations are set by the AIA's bylaws. The National Ethics Council does not have the authority to require a respondent to pay money. The Council also does not have the authority to require a respondent to take any action or to refrain from any conduct. Penalties are imposed in keeping with the severity of the violation by the respondent in the eyes of the Council.

Unintended or relatively minor matters may result in a nonpublic *admonishment*. More significant violations are made public and are of increasing severity. First is a *censure* of the respondent, which includes publication of a notice describing the violation in an Institute periodical. Next, membership in the Institute may be *suspended* for a period of time, usually one to three years. In more egregious matters, membership is *terminated*. In all instances of violation, the respondent's AIA membership record will reflect the penalty, although the AIA will maintain confidentiality in the matter except for the published notice of violation.

Appeals

Members found in violation of the Code of Ethics may choose to appeal the decision of the Council to the AIA's Executive Committee. In an appeal, both parties are given an opportunity to submit statements to the Executive Committee. The Executive Committee is provided the entire case record for consideration. Except in cases where the penalty is termination, the decision of the Executive Committee is final, and no further appeal is offered. Upon appeal, the Executive Committee may approve the Council's decision and penalty, approve the decision but reduce the penalty, dismiss the complaint, or return the matter to the Council for further proceedings.

Matters resulting in termination are automatically considered as an appeal. In such cases, the Council's decision is first considered by the Executive Committee. In the event that the Executive Committee approves the decision and the penalty of termination, the case is further considered as an appeal by the full AIA Board of Directors. The Board is provided the Council's decision, the parties' statements to the Executive Committee, and the Executive Committee's decision. The Board may concur in the Executive Committee's decision or return the matter for reconsideration.

PRACTICAL CONSIDERATIONS

Although the number of cases pending before the National Ethics Council varies, usually between 20 and 30 complaints are filed each year. Because of the requirement of confidentiality, most of these will never be made known to the public in any fashion. Only in cases where violations are found, accompanied by penalties of censure, suspension, or termination, are the names of the respondents disclosed.

Guidelines for Complaint and Response

Complaints

Regardless of category, the formal complaints will cite one or more Rules of Conduct and briefly describe the circumstances of alleged violation. It is essential that complainants thoroughly and accurately understand the rules chosen for citation and that the argument be clearly stated.

Responses

A member's response to a complaint falls into a few broad categories, regardless of the particulars of the matter. Best are the thoughtful, well-documented responses filed in a timely way. Unfortunately, some responses are not timely or thorough. Worse are cases where a response is not provided, which can result in a finding of violation. Regardless, the formal response should address each of the Rules of Conduct cited in the complaint and briefly refute the alleged violation. It is equally essential that respondents thoroughly and accurately understand the Rules of Conduct allegedly violated and that their rebuttal argument be clearly stated.

Effective Communications and Proof

The hearing officer's role is to facilitate fact-finding and submission of information by the parties, not as an investigator or judge. The burden of proof of a violation rests exclusively with the complainant. Inappropriate citation of Rules of Conduct, lack of supporting evidence, large amounts of irrelevant information, and presenting self-serving witnesses are unlikely to be persuasive. The same cautions hold true for the respondents, who are well advised to take care to address each of the allegations comprehensively and in correct sequence.

COMMON COMPLAINTS

Attribution of Credit

Because architecture firms market their services based on their portfolios of completed work, it is no surprise that some of the most frequent complaints are filed by architects against other architects over project credit provided or taken. These circumstances may arise out of the dissolution of a firm or the departure of a principal from a firm. Other credit disputes may be prompted by the departure of project staff members from a firm or between firms formerly in joint venture or other collaboration on project work.

ATTRIBUTION: CASE 2004–10

Case 2004–10 involved a complaint by an architect member against two other architect members regarding project credit, citing Rules 4.201, 5.201, and 5.202. The Complainant founded an architecture firm 30 years ago and was chairman of that firm. Respondent A was a former employee of the Complainant of 10 years' duration, departing to become vice president and managing principal of a regional office of the Respondents' architecture firm. Respondent B was a senior vice president of the Respondents' firm. A hearing was held with the Complainant and both Respondents present and participating.

Testimony at the hearing established that, at the time of the move, Respondents' firm hired a marketing consultant to publicize Respondent A's new presence as manager of one of the firm's regional offices. A folded announcement brochure prepared by the marketing consultant was reviewed by both Respondents and subsequently mailed to prospective clients of the Respondents' firm, including some clients of the Complainant's firm. The announcement described Respondent A as "one of this region's leaders in architectural design and project management with over $200 million in projects and 10 years of award-winning design and project management experience." The announcement also stated: "Her portfolio includes the acclaimed Office Building, Sports Facility, and College Facility, as well as other award-winning facilities like the Stadium, the University Facility, and the University Hospital." The Complainant learned of the announcement from clients who were confused by the fact that the Complainant firm's projects were being attributed to the Respondents' firm without mention of Complainant's firm.

Initially, the Complainant sought the publication of specific corrections to the announcement by the Respondents' firm but without success. The Complainant then filed a complaint with the National Ethics Council, alleging an absence of credit and improper use of photographs that had been commissioned by the Complainant's firm. At the hearing, the parties offered testimony regarding permission for Respondent A to use materials from her former firm, which had no published policy regarding the use of photographs or other project materials by former employees. It was established that another principal of the Complainant's firm, Respondent A, and the former counsel to the Complainant's firm had met as friends for lunch a few months after Respondent A's departure. During that conversation, Respondent A's experience at the Complainant's firm was discussed and use of the Complainant's firm's projects by the Respondent's firm as examples of Respondent A's experience was deemed acceptable as long as the Complainant's firm was given credit. The discussion did not include permission to use Complainant's project photographs given to Respondent A, and the type of materials her new firm might want to use was unspecified.

Other evidence submitted at the hearing included promotional materials of the Respondents' firm that incorporated photographs of Complainant's firm projects, including nine of the Complainant's firm projects as examples. While several dozen photographs were used, all of which were commissioned by Complainant's firm, identification of the Complainant's firm was by text under only one photograph of each example. The type font was smaller than that used in the body of the text describing the project and was the sole attribution.

Applying Rule 4.201 ("Members shall not make misleading, deceptive, or false statements or claims about their professional qualifications, experience, or performance, and shall accurately state the scope and nature of their responsibilities in connection with work for which they are claiming credit") and the accompanying commentary ("This rule is meant to prevent Members from claiming or implying credit for work which they did not do, misleading others, and denying other participants in a project their proper share of credit"), the Council concluded that Respondent A violated the rule by making such misleading and deceptive statements in the initial announcement.

Regarding Respondent B, prior decisions of the National Ethics Council have explained that the principals of a firm may be held accountable under the Code of Ethics for their firm's marketing materials regardless of whether they are directly involved in preparation of the materials. (*See Decision 92-07; Decision 94-07.*) In this case, the testimony reflected Respondent B's awareness of the content, review, and approval of the announcement prior to publication. Hence, Respondent B also violated Rule 4.201 by making misleading and deceptive statements.

Regarding Rule 5.201 ("Members shall recognize and respect the professional contributions of their employees, employers, professional colleagues, and business associates"), the Council concluded that Respondent A had both overstated her project influence on certain projects and understated the contributions of the Complainant's firm, creating an impression that the projects were projects of the Respondents' firm. The Council concluded that both Respondent A and Respondent B violated Rule 5.201 by failing to provide appropriate credit to the Complainant's firm for its professional contributions.

Applying Rule 5.202 ("Members leaving a firm shall not, without the permission of their employer or partner, take designs, drawings, data, reports, notes, or other materials relating to the firm's work, whether or not performed by the Member"), the Council determined that testimony did not support Respondent A's claim that she had tacit approval to take and use the Complainant's firm's photographs of that firm's projects and concluded that Respondent A had violated Rule 5.202. Having found a violation by Respondent A of three cited rules, and by Respondent B of two cited rules, these ethical lapses warranted a penalty of censure on both of the members.

Homeowner Complaints

Nowhere is the relationship between architect and client closer than in bespoke residential commissions. Another common type of complaint is filed by homeowner clients, who believe that services provided were in some way inadequate: the scope of the project was unknowingly altered; the overall schedule was hindered; and the project budget was ignored. Often, homeowners are first-time clients, without a depth of knowledge necessary for a good client-professional relationship.

HOMEOWNER COMPLAINTS: CASE 2005–15

Case 2005–15 involved a homeowner who filed a complaint against an architect, citing Rules 2.104 and 3.102. The Complainant, along with his wife, had retained the Respondent architect to design and prepare construction documents for an addition to their 100-year-old house, which was located in a historic district. An agreement for architectural services was prepared and signed, and the Respondent provided architectural services as a sole proprietor.

(continued)

Testimony during the hearing established that the Respondent had encouraged the Complainant to act as his own general contractor, so as to save construction expense. While preparation of signed and sealed drawings for the building permit took five months, the Respondent also suggested the existing kitchen be demolished at the midpoint of this period, resulting in the loss of kitchen use for two years.

The Respondent signed and sealed drawings for the project on two separate dates, although he did not have a valid architectural license for more than six months during the project because of a failure to renew the license. The Respondent proposed that he provide plumbing construction services for the project through a separate construction business that he owned, although he was not a licensed plumber. Finally, the Respondent used the Complainant's personal credit card, with permission, to purchase roofing materials for the project but charged $1,500 for materials used on another project.

Evidence in the case included a copy of a consent order with the state architectural licensing board wherein the Respondent had previously agreed to accept a reprimand, complete the NCARB Continuing Education Monograph on "Professional Conduct," and pay a $250 civil penalty. The Respondent had also signed a consent agreement with the state board of plumbing contractors, agreeing not to provide such services without a license.

The essential facts in this case were not in dispute. The Respondent performed various architectural services for the project while he did not have a valid architectural license, including signing and sealing drawings for the project. The Complainant had a right to expect that the architect he retained was licensed and would maintain a current license throughout the duration of the project. The lapse in the Respondent's architectural license created a high degree of risk that the Complainant would be adversely affected. For example, approval of submittals to a building department that required an architect's seal might be denied or substantially delayed. Therefore the Council concluded that the Respondent's failure to renew his license was in wanton disregard of the Complainant's rights and that the Respondent violated Rule 2.104 ("Members should uphold the law in the conduct of their professional activities"). The Respondent's execution of a consent order with the state architectural licensing board was an admission of fault to that state's relevant governing body and sufficient proof of an ethical violation.

The Council next considered Rule 3.102 ("Members shall undertake to perform professional services only when they, together with those whom they may engage as consultants, are qualified by education, training, or experience in the specific technical areas involved") and its commentary ("This rule is meant to ensure that Members not undertake projects that are beyond their professional capacity. Members venturing into areas that require expertise they do not possess may obtain that expertise by additional education, training, or through the retention of consultants with the necessary expertise").

The Respondent's plumbing construction was also carried out without the required state license. His execution of a consent agreement with the state board of plumbing contractors is admission of fault with that body. The Complainant alleged that the Respondent violated Rule 3.102 due to his lack of valid licenses, as Members must be "qualified by education, training, or experience" to perform the services they provide. The evidence, however, did not prove that the Respondent lacked either education, training, or experience as an architect or plumber. What the Respondent lacked was a valid plumbing license, which was not covered under Rule 3.102. Hence, the Council concluded that the Complainant had not established a violation of this particular rule. Having found a violation, albeit of Rule 2.104 only, the Council determined that this particular ethical lapse was sufficiently serious to warrant a penalty of a three-year suspension of membership.

CONCLUSION

Architects strive to provide exemplary service, while adding beauty and functionality to the built environment. Within and without, each commission brings untold decisions predicated on ethical practice, balancing the competing interests of clients, the public at large, our profession and colleagues, and of the earth itself. The AIA's Code of Ethics and Professional Conduct is that essential document by which all such decisions are benchmarked.

1.2 Ethics and Architectural Practice

Thomas Fisher, Assoc. AIA

Understanding ethics helps architects deal with the dilemmas faced in the course of practice as well as those that arise in the design and construction of the built environment. This article discusses four ways of considering the ethical issues of practice and offers three case study vignettes with analysis.

FOUR WAYS TO THINK ABOUT ETHICS

Architecture practitioners continually encounter questions such as: what is the right thing to do in a conflicted situation, and how to decide among the divergent values or opinions of people? Ethics helps architects find answers in such questions. While ethics, like any branch of knowledge, has a long and complex history, this essay explores four of the main approaches to thinking about the topic:

- Character-based ethics (Virtue)
- Contract-based ethics (Social Contract)
- Duty-based ethics (Deontology)
- Results-based ethics (Consequentialism)

Character-Based Ethics

Dating back to ancient Greece, this approach to ethics encourages people to focus on the development of a good character or what the ancient Greeks called "virtue." Virtues such as justice, courage, prudence, and temperance all stress the importance of a person acquiring a sense of balance, persistence, and moderation, which philosophers such as Aristotle thought of as key to living a good life.

Such virtues also lie at the heart of professional practice. Exhibiting fairness when dealing with others, having courage to do the right thing in the face of opposition, using good judgment when encountering new information, and displaying self-control in the midst of multiple pressures can all help architects successfully serve their clients, retain their staffs, and remain well regarded among their colleagues and coworkers.

The medieval period saw a shift toward more empathic virtues such as faith, hope, charity, and love. These, too, have direct applications to architecture practice, whether it means having faith in oneself and one's talent in competitive situations, giving people hope that they can have a better physical environment, showing charity toward the aspirations of clients or needs of users, or loving the act of designing itself.

Modern virtues like honesty, respect, tolerance, and trust also underpin the effective operation of commercial society. Following through on what one promised, recognizing the value that comes from a diversity of perspectives, accommodating viewpoints or ideas different from one's own, and having confidence that others will also do what they have committed to all enable a practice, a profession, and a community to operate effectively.

Contract-Based Ethics

If the virtues involve the development of a good character, a contractual approach to ethics focuses more on the creation of a good society. Under a "social contract," morality consists of a set of rules governing behavior, which rational people would accept on

Thomas Fisher is the dean of the College of Design at the University of Minnesota in the Twin Cities and a professor in its School of Architecture.

the condition that others accept it as well. People tend to follow the rules because, on the whole, they are to their advantage, while breaking the rules undermines that useful system. Differing historic views of what constitutes a good life and a good social contract derive from two diametrically opposed ideas about the earliest human settlements. The seventeenth-century philosopher Thomas Hobbes saw human nature as somewhat wild and early human life as "nasty, brutish, and short," and argued that people should give up some of their personal freedom in exchange for the authority of a strong government able to keep the peace and enable people to lead longer and happier lives.

In contrast, the eighteenth-century thinker Jean-Jacques Rousseau saw early life in "the state of nature" as one of blissful harmony and independence, ruined only when people started to claim property as their own. Rousseau saw the possessiveness surrounding property as a corrupting influence and argued that the best societies enabled people to live as close as possible to the original state of nature, with the least interference from outside authority.

Modern social-contract philosophers, such as John Rawls, take a more nuanced view of what a good society comprises. Rawls argued that people should imagine "a veil of ignorance" behind which they cannot predict their own individual futures or fortunes in life. Using this thought experiment, he said, a good society would distribute resources so that everyone would benefit fairly and without prejudice.

These different views of the social contract have clear parallels in architecture. Hobbes foretells the generations of architects who have reacted to urban decay with new visions of urban order, while Rousseau presages the rise of suburbanization and the modern desire to live close to nature. Meanwhile Rawls gives justification to laws such as the Americans with Disabilities Act and strategies such as universal design.

Duty-Based Ethics

All professions have a duty to those whom they serve. In the case of architects, that duty extends not only to the needs and wishes of clients but also to the present and future users of buildings as well as to past generations (via preservation), to other species (via sustainability), and even to underserved populations (via public interest design). What distinguishes professions from ordinary businesses is the obligation, embedded in professional licensure, of using disinterested judgment to do the right thing, regardless of the biases of particular interest groups. In duty-based ethics, one's own actions must be ethical regardless of the consequences, and the ends do not justify the means.

This approach to ethics is most closely associated with the eighteenth-century philosopher Immanuel Kant who argued for a set of what he called "categorical imperatives" to guide a person's decisions when faced with common ethical dilemmas. The first of these imperatives would have everyone treat others as ends in themselves, and not as a means to an end. This is a variation of the biblical appeal to "do unto others as you would have them do unto you." This imperative helps practitioners remember to treat clients, users, and society with respect and dignity.

A second categorical imperative entreats people to judge every action as if it were to become universal. In architecture, this idea relates most closely to attempts by practitioners and scholars to develop architectural theories: principles derived from particular buildings that should apply to all buildings. While some theories may have universal relevance, most do not: Think of the pretensions of "International Style" architecture and how ill-suited it was to many cultures and climates.

A possible caveat related to duty-based ethics has to do with the importance of having good intentions and acting accordingly, regardless of the results. Kant's dismissal of consequences brings to mind Colin Rowe's observation that modernism was an "architecture of good intentions," whose practitioners seemed too willing to overlook its negative impact. Architecture education, too, has had a strong focus on design intentions, with relatively little attention paid to design results, as would be learned from postoccupancy evaluations of buildings.

Results-Based Ethics

In part as a reaction to duty-based ethics, results-based ethics—consequentialism—arose in the nineteenth century, arguing that we determine the goodness of an action by looking at its consequences. In consequentialism, the ends justify the means. Architecture, of course, has always had functional utility at its core: Buildings have to meet occupants' needs, protect people from the elements, and stand up against the forces pulling or pushing a structure. And buildings make the consequence of ignoring such things quickly evident: They fail, leak, or fall down.

Utilitarianism, one example of consequentialism, is a theory that values whatever brings the greatest happiness to the greatest number. For the nineteenth-century thinker Jeremy Bentham, that involved a simple calculation: Whatever maximized the most good for the most people was, by definition, the right course of action. But that quantitative approach also brought problems. Providing everyone the same minimum shelter would maximize happiness for the greatest number, but would it result in a good built environment? Bentham's follower John Stuart Mill argued instead that qualitative consequences have more value than quantitative ones: that the quality of the built environment, for example, matters more than the quantity that each person has.

For pragmatists like William James and John Dewey, what matters is not maximizing happiness, but looking at the results of our actions to discover what works best in a given situation. James argued that something is good if it is useful and corresponds to how things actually are. Dewey thought, instead, that experimentation is needed in order to find the good, repeatedly trying things and learning from the results. A recent variation of this results-based ethic has a strong environmental component. Philosopher Peter Singer has argued that we cannot limit thinking about consequences to human beings, but instead need to include all "sentient" beings—all of the animals who, like us, can feel pleasure or pain. This presents a major challenge to architecture, which consistently degrades the habitat of other animals in the process of creating habitat for human beings. Were architects to consider the impact on all sentient beings, buildings would likely be much more energy conserving, environmentally friendly, and ecologically diverse than most are now.

Summary

TABLE 1.1 Four Approaches to Ethical Issues in Practice

	Being Good	Doing Good
As Individuals	Character-based ethics Fairness, courage, moderation, good judgment Faith, hope, charity, love Honesty, respect, tolerance, trust	Duty-based ethics Treat others as ends, not means Act as if it were to become universal Act with good intentions, regardless of consequences
As a Group	Contract-based ethics The good lies in social harmony and security The good comes from living close to nature The good comes from helping the least advantaged	Results-based ethics Do the greatest good for the greatest number Do what seems most useful and true Maximize benefits to all sentient beings

CASE STUDY VIGNETTES

These four approaches to ethics (see Table 1.1) offer different ways of resolving the ethical dilemmas faced during the course of practice. The following case studies, all adapted from real situations, show how ethics can help professionals sort through and evaluate alternative decisions and actions.

1. Conflict Between Personal and Employer Values

An architect worked, during the day, designing big-box stores. During her free time, though, she volunteered for nonprofit groups helping the poor, some of whom had been displaced by the same big-box stores she had designed. While big-box stores provide a public good in the sense of making low-cost products available to more people, such developments sometimes disrupt existing neighborhoods and environments in ways that can bring harm. This architect considered quitting her job because of its conflict with her values, but she also needed the income and had few other employment alternatives.

Analysis

In her sense of responsibility for the well-being of people negatively affected by the work of her employer, this architect exemplifies such virtues as a sense of fairness, an instinct for charity, and a deep respect for others. However, the decision to stay in her job or leave it depends upon other virtues, like the courage to act even if it runs counter to her financial best interest or the honesty to tell her employer of her misgivings even if it means her dismissal.

Situations like this also show how complicated questions of duty can become. This architect has a duty to her employer, but does that trump her feeling of duty to those negatively affected by the employer's buildings? Design as a way of thinking can help when confronted by such divided loyalties, since it can often find win-win solutions to seemingly unresolvable dilemmas, whether in a building or in life. As a way to honor duty to the community and to her employer, this architect might do better staying with the company and trying to change its practices rather than leaving and relinquishing that possibility.

From a social-contract perspective, the dilemma has to do with a paradox of capitalism. Her employer has an obligation to generate the greatest return to its shareholders and to attract customers to its products and services. But in a case like this, a company cannot maximize its returns while damaging its reputation in the community in which it wants to do business. The idea of ensuring that the least fortunate benefit from every action applies here. If this company put more emphasis on how its actions affect the community, and worked more on improving community relations and less on maximizing profit, it would likely make more money. There is a reason why the terms *ethics* and *economics* both have their origin in ancient words having to do with stewardship and care.

The company could argue that, from a strictly consequentialist perspective, the benefits of a big-box store to a community—directly through its goods and services and indirectly through its taxes—outweigh the displacement of a much smaller number of homeowners and the qualitative deficiencies of big-box stores. Making less-expensive goods available to less-affluent people can improve the quality of their lives economically, but does that have to come at the expense of the quality of their physical environment?

The architect, in this case, decided to talk to her employer about her volunteer work and her misgivings about the impact of the company's big-box stores on lower-income communities. And to her surprise, her employer asked her to move into a community-relations position in which she could work with neighborhoods prior to the development of the company's urban stores, in order to mitigate their negative effects. That response showed an understanding within the company that it is often beneficial to proffer in good as well as in goods.

2. Clash of Ethics and Aesthetics

A client came to an architect wanting his firm to design a building that would put it on the covers of magazines and get the publicity presumably needed to market the facility. The architect obliged and created a structure so striking that it achieved the coverage the client wanted, but at a price. The structure proved so difficult to occupy and unpleasant to be in that the client still had a hard time attracting tenants, and the design represented such an extreme that it triggered *a broader conversation in the profession about the absurdity of such work, ultimately leading to less coverage of the architect's work thereafter.*

Analysis

From the point of view of duty ethics, this situation seems perfectly justifiable. Architects have an obligation to meet the clients' needs and help them achieve their goals, and so, in that sense, the architect here did the right thing as a professional. While architects also have a duty to the general public and to protect people's health, safety, and welfare, that does not preclude the architect from helping a client get as much publicity as possible for a project, including getting it featured on the covers of magazines. The client, too, conceivably has a duty to get the greatest return on the investment in a building, and getting a lot of press for the project can be an effective way of doing that, attracting potential tenants without having to do as much marketing.

Other ethical approaches, however, help shed some light on why the project's reception did not turn out as either the client or architect expected. Consider the character of the client in this situation. His placing publicity above all else suggested that the building was as much about his desire for attention as it was about attracting tenants. And the architect's accommodation of the client's immoderate ambitions casts doubts on the character of this design practitioner as well. Architects may have a duty to meet clients' needs, but professionals also have a duty to advise clients about potentially unwise actions.

From a social-contract perspective, the self-importance of this project also raises ethical questions. Buildings represent creative responses to the needs of people, organizations, and communities, but at the same time, architecture also has an obligation to meet at least some of the expectations of the societies and cultures in which it stands. Moving too fast and too far away from those expectations can backfire, as happened here, when the building, having received the press coverage that the client had wanted, still could not attract tenants.

In terms of functional utility, this project hardly met that measure, either. While its design obviously held some value for the client and architect, both of whom had the freedom to largely do what they wanted, the structure lacked even the most basic utility, given the number of people who found it too hard to inhabit. By ignoring certain important consequences of their actions, in favor of pursuing publicity, both architect and client undermined their original goal of attracting tenants. In addition, the building's pragmatic flaws did not end with the structure itself; its sheer extremism cast a pall over the architect's career.

3. Difference Between Employer Obligation and Employee Needs

An intern in an office wanted to go through the Intern Development Program (IDP) required of him in order to sit for his licensing exam. The principal of the firm in which he worked, however, could not be bothered by the requirements of IDP and did not give his intern the variety of experiences in the office that IDP expected. The intern complained to the national organization that oversees the program, but its representatives told him that there was nothing they could do to force this architect to participate and, despite the poor economy and few employment options, they told him that he could always look for work in another firm.

Analysis

Being an architect involves not just the acquiring of the skills required to design and detail buildings, but also the joining of a community of professionals. Professional communities are not without their tensions. Architecture firms, for example, often have to compete against each other for commissions even as they cooperate with each other on matters affecting the profession as a whole. And, as happens in every community, practitioners have different levels of involvement in the profession; some get very engaged and even seek leadership positions in the various professional organizations in the field, while others pursue their practice and never attend a single meeting or contribute to any committee. Professional obligations range, in other words, from the mandatory—taking the licensing exam, for instance—to the voluntary, such as joining the American Institute of Architects.

That personal preference becomes an ethical issue when it affects others, as in the case here, where an architect did not see his oversight of an employee's progress through the Intern Development Program (IDP) as part of his professional obligation. The IDP arose in the 1970s to address this very problem. Because so many firms in the past did not attend to the needs of interns for diverse experiences in order to become well-rounded professionals, the National Council of Architectural Registration Boards (NCARB) made the IDP a requirement for an intern to sit for the architect registration examination (ARE). The profession saw this as being in the best interest of the entire field and, in utilitarian terms, as doing the greatest good for the greatest number of those who aspire to become architects.

▶ Intern Development Program (3.2) discusses the IDP in further detail.

The IDP, however, puts the responsibility on the interns and has little force in requiring practitioners to participate in it. Most practitioners do support interns' IDP efforts because it has become an expected part of being an architect in the United States, part of the "social contract" that an older generation has to the younger generation of professionals. Most architects also see this as part of their duty to their staff and perhaps, self-interestedly, as a way of attracting and keeping interns who want to become architects themselves. From almost every ethical position and from the perspective of an employer as well as an employee, participation in the IDP makes sense. Virtue ethics may shed some light on that question. A character-based approach to ethics emphasizes personal responsibility, and while that has many benefits in terms of helping people lead better lives, it also tends to see a community as a set of autonomous individuals. In cases like this one, an emphasis on individualism allows practitioners to opt out of their community responsibilities, with little or no leverage to force them to do otherwise. However, as of 2012, the AIA National Ethics Council has adopted a rule that makes supporting the professional development of interns an ethical obligation of AIA members.

WHAT'S NEXT FOR ETHICS AND PRACTICE?

Architecture has taken an "ethical turn" in recent decades, reflecting a renewed emphasis on ethics in other fields like medicine and law and a reinvigorated interest within the profession in issues like sustainability and social justice. Ethics has become a required part of an accredited architecture curriculum and a topic covered with greater frequency in the profession's annual meetings and academic conferences.

At the same time, ethics has highlighted areas in which the profession needs to pay more attention:

- Architects generally have good intentions, but rarely give enough time and attention to postoccupancy evaluations of the consequences of what they do.
- Architects often seek to create the greatest good for the greatest number, but have largely overlooked the needs of the world's poor and the habitat of other creatures.
- Architects frequently respond well to the contexts in which they work, but have a much worse record when it comes to giving awards to buildings that represent a-contextual extremism.

The work of architects has such an enormous effect on large numbers of people and other species that the profession cannot avoid the ethical consequences of its actions. This will continue to make ethics a relevant issue for architects in the twenty-first century as the scope of professional activity expands to include responsibility for global populations and global climate disruption, and to address the resources, systems, and infrastructures that are all part of the built environment. This ethical turn may even lead to a redefinition of what it means to be an architect, attending to the health, safety, and welfare not just of clients and building users but also of other sentient beings, future generations, and diverse ecosystems, ultimately for the good of all.

1.3 Design Beyond Ethics

Victoria Beach, AIA

As with safe food, many actors contribute to the ethical project of safe shelter: inspectors, engineers, and more. Rather than compete with them, architects, like chefs, should seek their niche with aesthetics—not in the narrow sense of beauty but in the broad sense of understanding and shaping how humans interact with their surroundings.

INTRODUCTION: THE CHEF ARCHITECT

We all experience architecture before we have even heard the word.

—Peter Zumthor, Architect

Expecting an architect to design a safe structure is like expecting a chef to cook a safe meal: It is at once a high ethical requirement and a very low expectation.

Food and shelter, the raw materials that chefs and architects work with, are absolutely essential to human survival. Because of this, their quality (or lack thereof) rises to an ethical concern that society takes seriously, creating a great umbrella involving testing, codes, inspectors, and the like to protect the public from getting sick or injured. Obviously, anyone involved with things that can save or threaten lives is ethically mandated to uphold these protections. This mandate forms a foundation for professional ethics.

American architects became subject to professional ethics fairly recently, when they formed a regulated profession in the twentieth century. A well-defined branch of applied moral philosophy, professional ethics pertains to all professionals, including doctors, lawyers, and engineers.

But just as with chefs, the core, defining work of architects—the work that differentiates them from all the other contributors to the safety of the built environment—goes beyond ethics and into aesthetics. And just as there are many sources for a safe snack, many kinds of people (and even computers) can make a building firm, but it takes an architect to make one commodious and delightful.

Currently the legal authority of architects rests with their licensure and their parallel commitment to professional ethics. But what if the raw, primal power of aesthetics could trump that of ethics? If so, aesthetics may be the key to unlocking the real authority of architects, and therefore of architecture, to shape society.

Victoria Beach is the 2012 AIA National Ethics Council chair and was faculty fellow at the Center for Ethics at Harvard, where she taught design, history, theory, and ethics. An AIA Young Architect Award recipient, Beach is principal of her own practice and city council member for Carmel, California.

AESTHETICS

Aesthetics is the mother of ethics.

Joseph Brodsky, 1987 Nobel Laureate

"Aesthetics" is not what it used to be: the term has undergone some renovations. Around the mid-nineteenth century, the word became most closely associated with ideas of beauty or taste. But this recent definition constitutes a detour away from its more enduring and ancient foundations in basic notions of perception—with etymological connotations of sensing as well as understanding:

> Greek: *aesthethikos*—pertaining to sense perception, from *aistheta*, perceptible things, from *aisthenasthai / aesthesis*, to perceive. Latin: *percipere*, to seize wholly, to see all the way through; *per*, thoroughly + *capere*, to seize.

The philosopher Immanuel Kant saw the detour coming and railed against a corruption of this word that would rob our language of a useful conceptual tool:

> At the foundation of this term lies the disappointed hope…of subjecting the criticism of the beautiful to principles of reason, and so of elevating its rules into a science…. It is advisable to give up the use of the term as designating the critique of taste, and to apply it solely to that doctrine, which is true science—the science of the laws of sensibility—and thus come nearer to the language and the sense of the ancients.

The trendy definition may have had its run, but the concept of "sensory knowledge" is too helpful to architecture's current predicament to keep it buried. It's time to reconnect the modern definition to the timeless one.

Under its timeless definition, aesthetics is a most capacious term—encompassing the perception of all material things by all living senses: the earthy warmth of fresh milk and the repulsive acridness when it spoils. An aesthetic experience, then, is simply a perceptible one, just as a medical anesthetic renders us unable to perceive. To study or to master such a fundamentally human kind of knowledge is to connect to the essence of life in a way that ethics never can.

Nobel Laureate in Literature Joseph Brodsky remarks, "The tender babe who cries and rejects the stranger…does so instinctively, making an aesthetic choice, not a moral one." In other words, aesthetic knowledge comes first, long before moral knowledge.

> An aesthetic instinct develops in man rather rapidly, for, even without fully realizing who he is and what he actually requires, a person instinctively knows what he doesn't like and what doesn't suit him. In an anthropological respect, let me reiterate, a human being is an aesthetic creature before he is an ethical one.

Aesthetics describes the first contact with reality, whether at the beginning of each day or at the beginning of life itself. Morality, in contrast, evolves as part of the culture utilizing it.

ETHICS AND MORALITY

Under their largely uncontested definitions, ethics and morality are fairly circumscribed terms—dealing with the shared values and duties developed by and describing a particular group of people, and etymologically connoting customs, manners, or habits:

> Latin: *ethicus*, Greek: *ethikos*—ethos, character; (pl.) manners.
> Latin: *moralis*, concerned with ethics, moral; *mor-*, *mos*, custom; (pl.) *mores*, habits, morals. Classical Latin *moralis* was formed by Cicero (*De Fato* ii. i) as a rendering of ancient Greek *ethikos* (*mores* being the accepted Latin equivalent of *ethe*).

Whether a person's action is right or wrong, therefore, highly depends on what the ethos of that person's group requires. For example, it would be quite wrong for members of a local street gang to try to cut a person open with sharp knives, unless, of course, those same folks were the nurses and doctors on a surgical team. The societal group called doctors is defined by its devotion to medical ethics and the ethical goal of health; the street gang has other goals.

Doctors, as we know, form a self-selected subset of a larger group called professionals. People who devote themselves to professional ethical duties (shorthand: "pro" ethics) are, by definition, professionals. But professionals are also a self-selected subcategory of a larger social group of ordinary citizens with their own set of ordinary ethics (shorthand: "joe" ethics), things like being honest, kind, or fair. Even membership in this subgroup is elective, though. Folks who eschew these neighborly values, sticking to the bare legal minimums for behavior (shorthand: "schmoe" ethics) belong to an even larger group best defined, perhaps, as the unimprisoned.

With all this talk of ethical options, it is interesting to note that deciding between being a pro, joe, or schmoe, or a member of any other identifying group actually requires an aesthetic choice. People choose to pursue the kind of life that appeals to them, the one that follows their aesthetic vision for themselves; nobody *must* grow up to be a doctor, after all. Only once that meta-choice is made must future ethical choices follow the value system of the group in order to ensure that the life pursued will actually be led.

"Aesthetics is the mother of ethics," according to Brodsky, which of course makes ethics the offspring of aesthetics. Aesthetics deals with physical truths while ethics deals with social constructs dependent upon them. Sense follows sensibility. As architect Peter Zumthor states, "We all experience architecture before we have even heard the word." If so, then aesthetics provides the foundation to ethics, not the reverse.

PROFESSIONAL ETHICS

Though professional ethics may not fully describe the ultimate aesthetic obligations of architects, it's worth sorting through the complex web of obligations it does describe. All licensed professions share at least four common characteristics. They apply (i) technical knowledge, nurtured by (ii) collegial organizations, to advance (iii) ethical public values, through (iv) client service. Each one of these four brings with it its own universe of moral duties to perform or moral virtues to cultivate.

An ethical public value (iii) provides the primary defining justification for establishing a regulated profession. This goal, such as safety for engineers, health for doctors, or justice for lawyers must be so crucial to humanity's survival that it rises to the high level of an ethical value. And it follows that the highest ethical priority professionals have is to serve the public, above serving their discipline, colleagues, or even clients. The sociologist Talcott Parsons put it well in discussing lawyers:

> [Their] function in relation to clients is by no means only to "give them what they want" but often to resist their pressures and get them to realize…what the law will permit them to do. In this sense, then, the lawyer stands as a kind of buffer between the illegitimate desires of clients and the social interest. Here he "represents" the law rather than the client.

And the public is not limited to the paying public. Medicine and law, in fact, require pro bono services to those who cannot pay, because to deny someone access to a hospital or a fair trial would be to deny someone a fundamental human right. Obviously, it requires the exercise of certain human virtues to maintain this principled stance: philanthropism, humanitas, Samaritanism, and transcendency, to name a few.

Client service (iv) is one of the four cornerstones of a profession because professionals achieve their general moral goals iteratively and incrementally, through many specific client cases. Theirs is an applied science: neither basic laboratory research nor overarching political policy. This endows the relationship between professionals and clients with the utmost societal importance and with crucial ethical dimensions. Furthermore, due to the imbalance of technical knowledge in the relationship, the situation is ripe for exploitation and must be counterbalanced. Professionals, therefore, must cherish this special relationship and must always prefer their clients' interests above their own. In doing so, they may call on such moral virtues as selflessness, trustworthiness, fidelity, and discretion.

It may seem strange to have ethical obligations toward a nonhuman abstraction. But professionals must respect technical knowledge (i) just as they might look after an important tool, like a sharp knife. If the tools do not perform, neither can the professionals using them perform their obligatory societal role. In fact, states cede power to professions to self-govern because neither the state nor any other entity is more expert than the professionals themselves to evaluate their own standards. So, a profession that does not maintain high technical standards can simply decline until it disappears or until it becomes regulated by outsiders, as occurred with accountants in the wake of the Enron scandals. In a rapidly evolving global culture, everyone must continually expand the boundaries of their knowledge even to stay current—a minimum standard for professionals. Just to stay ahead of lay knowledge can, therefore, be a Herculean task, requiring access to virtues such as inquisitiveness, disinterestedness, rigor, and diligence.

Stranger still, perhaps, are ethical obligations toward the self, which may initially appear selfish, a decidedly unvirtuous quality. But if the ethical goals of a profession are to thrive, so must the profession itself. A profession is therefore ethically obliged to ensure its own survival. In a strong collegial organization (ii), each member contributes to the unified voice of the profession's ethos and must be respected and nurtured. This is especially true for those who are most vulnerable: the aspiring professionals who quite literally represent the future of any profession. This self-referential focus performs another important function in upholding professional ethics. For example, the unanimity with which doctors in California adhered to their own ethical code led to the indefinite postponement, in 2006, of the practice of lethal injection. If a single doctor had broken this collegial bond, the profession would have remained ineffectual on this matter. To come together, sometimes against corrosive exterior forces, may involve ethical virtues such as empathy, nurturing, kinship, and protectiveness.

ETHICS OF AESTHETICS

Though complicated and with competing duties that often seem impossible to balance, professional ethics is not particularly controversial; there is widespread agreement on the specifics of its four cornerstones and on the general notion that professions entail ethics in the first place. In contrast, there is very little agreement on the general question of whether aesthetics entails ethics or on the specifics of how that might work.

And since architecture derives its identity through the artistic treatment of the medium of shelter, it is worth exploring whether this component of the work involves ethics. Over the millennia, many philosophers have investigated the moral purpose of art in search of an ethical justification for all the aesthetic activities (visual, musical, culinary) that humans just cannot seem to resist. Here is a brief sampling of the mixed results.

Human beings require an expressive outlet, goes one argument. As sports provide physical release for our animal energies, without the emotive outlet of the arts, our species descends into instability. This theory seeks moral authority for the arts based on its role in maintaining a civilized society, but many, including Plato himself, take issue with whether self-indulgent expression rechannels or actually cultivates depravity.

Many argue that art's moral purpose is to edify. Art improves us, they claim, makes us more morally virtuous—often through the empathy we feel with artists or their subjects. But counterclaims point out that interpretations of artistic works vary uncontrollably from person to person. In fact, lessons that are intentionally planned and obvious to anyone verge on the pedantic or the doctrinaire—hardly the province of art.

The Mithraditic approach to art's moral purpose may be among the most creative. King Mithradates VI ruled Pontus (modern-day Turkey) in the first century BC and took small doses of poison starting in childhood so that he could not be secretly poisoned by his enemies. Art, by analogy, provides life experience by proxy—protecting us, in small, harmless doses, from the otherwise overwhelming dimensions of life. This might provide a moral justification for art, though it does not take into account life's unusual twists and turns. In fact, the king's plan hit a major snag when, under threat of capture by Rome, he could not commit suicide by the usual, more gentle means of poison and had to command his servant to stab him to death.

Problems seem inherent to every known attempt to justify art in moral terms. Some maintain, therefore, that it is the very resistance to, or transcendence of, morality that defines the artistic endeavor. In other words, they see art as a meta-ethical thing: beyond or outside ethical consideration, ethically inert like a potato or a pebble.

This would imply that art can be neither moral nor immoral. It can neither uphold nor subvert any particular morality. Under this theory art is amoral: simply nonmoral. This is the theory that Henry Cobb, the world-renowned architect and regrettably less-renowned ethicist, espoused in a 1995 essay:

> How do principles of human duty relate or apply to works of art? We can go a long way toward answering this question by referring to an aphorism of the poet-philosopher Paul Valéry, who wrote: "We recognize a work of art by the fact that no idea it inspires in us, no mode of behavior it suggests we adopt, could exhaust or dispose of it." This statement seems to me precisely correct. And though its eloquence be sacrificed, I think its meaning is not lost when we rephrase it as follows: a work of art always transcends those principles of human duty which it may embody or to which it refer. Thus the work of art is alone among human productions in being privileged, indeed obligated, to escape the rule of human duty. Hence we can say that the only absolute duty imposed on a work of art is that of being undutiful.

The duty to have no duty, though a contradiction of logic, is an evocative description of the amorality of art and could certainly apply to the aesthetic aspect of what architects do.

ETHICS OF ARCHITECTURAL AESTHETICS

Though most moral philosophers investigate aesthetics through the general category of the fine arts, occasionally someone tackles the particular aesthetic case of architecture head-on. In a 2000 essay, philosopher and planner Nigel Taylor explores a few possibilities for understanding the aesthetic content of buildings through ethical means. He takes on three familiar historical arguments that ascribed moral imperatives to design choices: arguments for "honesty," for a certain superior style, and for following the "spirit of the age." He finds each one lacking ethical force.

Modernists and Gothicists alike argued for aesthetic honesty, for revealing structure, for being true to materials, and so on. But Taylor finds that this theory's own proponents espoused so many exceptions to their ethos that it falls apart into incoherence. Moreover, he points out, sometimes we prefer the aesthetic deceit, the elaborate ceiling shape that accommodates the old ductwork, such that ethical honesty would actually be the lesser choice.

Proponents of architectural styles often assert their moral superiority. For the Gothicists, the argument was both religious and moral, an ethical responsibility to mimic the glory of Nature. The evocation of Mother Nature was meant to add finality to the discussion. Taylor sees, however, that even the original choice to elevate nature is actually not a moral one as claimed but an aesthetic one, a fact that he says becomes clear as soon as anyone forms a similar attraction to a straight line or right angle.

The spirit of the age or Zeitgeist argument, favored by Modernists, disintegrates as well, according to Taylor. He questions the premise that we can ever successfully identify a distinctive technology or culture that characterizes a particular historical period. Then he questions the conclusion that we should necessarily design to express that distinctive technology or culture should we find it. If, for example, in our rapidly changing multicultural world, Nazi culture were somehow to become completely pervasive, it should obviously be resisted, he explains.

Taylor thus obliterates many of the best architects' attempts to bring ethics into their aesthetic choices. He also points out that buildings themselves are ultimately amoral, ethically inert artifacts, and that only people can be said to be moral or immoral.

We may find, for example, that an ancient Greek temple seems morally depraved if we discover that it hosted human sacrifice, but that would be misdirecting the blame from the people to the place, and probably would not prevent us from finding it aesthetically excellent anyway.

AESTHETIC ATTENTIVENESS

Though buildings may not embody the ethical principles of their creators or occupants, Taylor concludes that we can still detect something significant in these built artifacts: thoughtful design work, or what he calls "aesthetic attentiveness." He asks us to

> Imagine a building, which we find aesthetically displeasing, and where this displeasure arises in large part because all kinds of features and details in the building appear to have been thrown together carelessly, without any thought or sensitivity. Imagine, too, that part of our displeasure arises because the building as a whole appears as if it has just been "plonked" down on its site without any apparent consideration of how it fits on the site or relates to its surroundings. Such a building might literally offend us aesthetically, but, more than that, part of our offence might be ethical. Thus we might reasonably be angered or outraged, not just by the look of the thing, but also by the visible evidence that the person who designed it didn't show sufficient care about the aesthetic impact of his building. And this moral objection would be supported by the fact that buildings, unlike (say) paintings or books, are things we are compelled to look at, for architecture (unlike painting and literature) is necessarily a public art. Consequently, any lack of care given to the design of a building is also, in effect, a lack of care shown to the public.

Architecture serves, then, as a fossil of sorts, preserving in stone, wood, and steel, if not ethics generally, at least a work ethic. The designer's work ethic, Taylor implies, must take into account how the dimensions of architecture cut across so many scales of aesthetic human experience: affecting our individual senses at the personal scale of the detail as well as our social senses at the public scale of the city.

John Ruskin also seems to have wished that design at least demonstrate some effort:

> [T]here is not a building that I know of, lately raised, wherein it is not sufficiently evident that neither the architect nor builder has done his best.… Ours has constantly the look of money's worth, of a stopping short wherever and whenever we can, of a lazy compliance with low conditions.…

And so does Peter Zumthor offer a similar complaint about how little is required of his design efforts and a belief that he must transcend those low demands:

> Our clients are of the opinion that the careful way in which we treat our materials, the way we develop the joints and transitions from one element of the building to the other, and the precision of detail to which we aspire are all too elaborate. They want us to use more common components and constructions, they do not want us to make such high demands on the craftsmen and technicians who are collaborating with us: they want us to build more cheaply.… When I think of the air of quality that the building could eventually emanate on its appointed site in five years or five decades, when I consider that to the people who will encounter it, the only thing that will count is what they see, that which was finally constructed, I do not find it so hard to put up a resistance to our clients' wishes.

Moreover, according to Leon Batista Alberti, when architects put aesthetics first, it ensures the longevity and influence of their structures long after the designing is done:

> Thus I might be so bold as to state: No other means is as effective in protecting a work from damage and human injury as is dignity and grace of form. All care, all diligence, all financial consideration must be directed to ensuring that what is built is useful, commodious, yes—but also embellished and wholly graceful, so that anyone seeing it would not feel that the expense might have been invested better elsewhere.

Yet all these pleas for aesthetic excellence in the art of architecture in no way diminish ethical responsibilities to the underlying science of safe shelter. Confusing the two, however, has presented obstacles to the practice of architecture.

ART VS. SCIENCE IN ARCHITECTURE

Good building involves engineering and therefore relies on the science of physics, just as law relies on logic and medicine relies on biology. But the art of building, like the art of cuisine, brings so much more to the table than science that it is not quite parallel to those engineering, legal, and medical counterparts. Since modern professions are scientifically based, the professionalization of architecture does not fully encompass or describe the practice of architecture.

Not so long ago, many of the finest minds in architecture made this argument in an attempt to actually prevent architecture from becoming a regulated profession. During the late nineteenth century, a group of prominent British architects led by Richard Norman Shaw fought desperately against professional regulation, predicting that it would "kill" architecture. They observed that because the science of shelter is different from the art of architecture, the former can therefore be regulated and the latter cannot.

The Brits never disputed that the scientific aspects of building (sanitation, safety, durability) could be professionalized, because those things can be taught, tested, and objectively evaluated. They believed that building inspectors, engineers, and codes (increasingly, we can include software) do and should take charge of these technical issues.

But regulation of architecture as a whole, they claimed, would imply that its subjective, artistic aspects are as objective as its scientific aspects. Licensure would confuse and deceive an unwitting public, a lay public, into equating licensed "architects" with legitimate architects. The result, they predicted, would be an inadvertent degradation of the built environment.

In the hundred years that followed, of course, the opposite view seems to have prevailed. At its founding in 1857, the American Institute of Architects, just like their British colleagues, did recognize and promote a distinct field they called "architectural science." Moreover, the language of state regulations falls (as it must) squarely in the sciences, relying on the "health, safety, and welfare" justification for protecting monopoly privileges to practice. However, when their campaign for professional regulation began, somehow that important semantic clarification got lost, and it is "architecture" generally, rather than "architectural science" specifically, that states now regulate. The first American state to regulate architecture was Illinois in 1897; the last states were quite recent—Vermont and Wyoming in 1951—well within the lifetimes of many current practitioners.

This long-fought regulatory victory has coincided with some mixed trends. The science of building has advanced. Net zero-energy facilities, the Burj Dubai, and better protection than ever from natural disasters testify to remarkable innovations. Yet the art of building has retreated, in the sense that since architectural regulation the built environment has not seen a corresponding aesthetic improvement—quite the contrary, perhaps. The fact that clients are hiring "architects" and not always getting architecture out of them could indeed, as the Brits predicted, point to some confusion about what architects add to a project beyond safe construction.

CONCLUSION: THE CHEF ARCHITECT

In contrast, there does not seem to be much confusion about the role of chefs in society. Nobody chooses a restaurant, or even just a recipe, based on whether the meal will be safe. Fortunately, in modern societies, science and ethics make food safety virtually a given. This allows chefs to move beyond the science, beyond the merely ethical and the merely edible, and on to the aesthetically engaging.

Similarly, no chef would try to attract diners by drawing attention to the safety of their meals. Even though the issue is crucial—life and death—to dwell on it is to highlight the danger and not the joy: to court business with fear rather than with aromas from the kitchen. Scaring customers about the hazards of cuisine also runs the risk of scaring off customers altogether, sending them scrambling for their own kitchens and backyard vegetable gardens.

A fear-based approach also runs the risk of perpetuating a lie about what chefs do. If diners thought that all chefs do is help prevent food poisoning, why would customers value or pay for their other talents? While government regulators have an ethical obligation to make sure that chefs produce cuisine as safe as a Twinkie, if chefs had to deliver cuisine for the same price as a Twinkie, they just might start to feel overworked and undervalued. And legally forcing the public into hiring a chef, when all they need is a factory-sealed pastry, is surely a recipe for dissatisfaction.

However, with safety issues ethically handled back in the pantry, chefs are liberated to unleash their creativity out in the kitchen. They celebrate the aesthetic essence of what they do, the exploration of all the senses that are involved with eating. At their best, they study and understand what we humans can perceive with our taste buds, and they use that knowledge to help us experience an enhanced existence, so that when we sit down at the table, the food that we need to sustain our bodies does that plus much more: It helps us live our lives better than we knew we could.

As with safe food, there are many actors that contribute to the ethical project of building safe shelter: building officials, licensing agencies, examiners, materials testers, engineers, contractors, lawyers, and the like. Rather than argue that architects have something unusually valuable to contribute in this arena, architects, like chefs, should seek their niche with aesthetics—in the timeless sense not merely of beauty but also of profoundly understanding how humans interact with their surroundings. Ironically it is in this completely ungovernable, amoral arena of pure design, where nobody else is legally kept out, that they should find almost no competition for what they do best. Aesthetics is the value architects add, better than anyone else, to safe shelter.

If architects could just channel their inner chefs, they could better celebrate and promote the essence of their work: going beyond just the science of shelter to the art of inhabitation. Where ethics is transactional, aesthetics is sensory; and where ethics involves obligation, aesthetics involves instinct. Architecture, therefore, as the mother art, with a scale larger than most any other art, has the raw, instinctual power to move people, to direct culture and society more than any moral code ever could—to inspire rather than regulate us toward lives better lived. Architects need only honestly and unabashedly embrace design and devote their efforts to aesthetic attentiveness to assume their natural authority.

CHAPTER 2

Diversity and Demographics

2.1 Diversity and Practice Management

Craig D. VanDevere, AIA, NOMA

In the twenty-first century, everyone from firm leaders on down must learn to understand, as a fundamental principle, how the cultures, traits, values, and experiences of a diverse workforce can contribute toward maintaining a successful business and a competitive edge.

Ultimately, America's answer to the intolerant man is diversity, the very diversity which our heritage of religious freedom has inspired.

—Robert F. Kennedy

THE BENEFITS OF DIVERSITY AND INCLUSION

Historically, the architecture profession has engendered a great deal of respect from the general public. In large part, this is due to the role of architects as creative thinkers and thought leaders. However, the profession's lack of ability to develop a workforce that is reflective of the general population in the United States has the potential to create a significant drag on the image of the profession and its ability to lead in the twenty-first century.

It is important to remember that the demographics of the United States are changing quickly. In 2012, the number of nonwhite births outnumbered white births for the first time in the United States. It is predicted that by 2050, the majority of U.S. citizens will be nonwhite. Businesses, including architecture, have become more global, meaning interactions with people from other cultures are now commonplace. With the advent of Building Information Modeling (BIM) and integrated delivery systems, design and construction is becoming more of a collaborative process. As a business

Craig VanDevere is an architect with more than 35 years of experience. He founded his architecture practice, VanDevere & Associates Inc., in 2002.

strategy, having a diverse workforce and mastering the ability to work with many different kinds of people will become essential. In order to succeed, the profession and how architecture is practiced must become more flexible, scalable, relevant, and business savvy.

Definitions in Practice

- *Diversity*: A commitment to recognize, encourage, and appreciate a variety of characteristics, including but not limited to race, ethnicity, gender, national origin, religion, physical ability, age, sexual orientation, and economic background.
- *Inclusion*: The intentional act of being open, reaching out, removing barriers, and creating an environment in which all members of an organization can achieve their fullest potential.
- *Business case*: Benefits to a business entity—in this case, an architecture firm—to be gained by initiating and accomplishing diversity and inclusion in its workforce.
- *Culture*: The values and practices of a society or a group of people who interact together over time. Cultural values are used to synthesize, interpret, and experience the various events of daily life and can be defined as a shared basis for social interaction. This helps formulate worldviews as well as the perception of wrong from right. Varied worldviews and cultural perspectives can bring richness and creativity to an organization's culture.

► See the backgrounder accompanying this article, Forging a Diverse Culture: The Shepley Bulfinch Experience, for a case study of a firm that transformed its homogeneous, hierarchical environment to one of diversity and collaboration.

Increase Employee Engagement

Diversity fosters creativity. We need to generate the best ideas from our people in all levels of the company and incorporate them into our business practices.

—Frédéric Rozé, chief executive officer, L'Oréal USA

It is widely known that when companies embrace diversity and inclusion in their firms, employees feel energized. They are encouraged to believe in themselves and that what they bring to the firm is valued. Firms benefit through better client relations, higher productivity, and more informed design.

Employees who are empowered and have a sense of their value to the firm will be more willing to take risks, likely resulting in enhanced creativity, leadership, and innovation. A diverse employee base provides for a large pool of ideas reflecting different views and values.

Increase Creativity

Architectural design has its roots in asking questions in order to identify and provide a solution to meet the particular needs of clients and users. However, this process is really only as good as a firm's aggregate ability to ask provocative questions and synthesize information. Employees from varied backgrounds and experiences help improve a firm's ability to respond to clients' needs with creativity and sensitivity. Diversity can bring a variety of ideas and viewpoints to an organization and be especially important when creative problem solving is required.

Match Demographics of Clients

The lack of diversity may affect a firm's ability to appear fully capable to meet the needs of increasingly diverse clients. Institutional, governmental, and nonprofit clients are likely to be represented by a very diverse group of people. Architecture firms can look at diversity and inclusion as an opportunity to increase client service. Increased diversity leads to a boost in ideas, the ability to understand a variety of customer segments, and the ability to expand locally, nationally, and internationally with greater ease.

Facilitate Global Practice

In a global market clients look at firms whose leadership reflects their own staff and clients. Firms that demonstrate a multicultural environment to global clients are likely

MAKING DIFFERENCES MATTER

By Rena M. Klein, FAIA

According to an article by David Thomas and Robin Ely, "Making Differences Matter: A New Paradigm for Managing Diversity" (*Harvard Business Review*, 1998), the benefits of diversity to any business depend on its organizational culture and management approach.

TRADITIONAL APPROACHES

Best ethical practices, as defined by the AIA, require fairness in hiring and promotion. Clearly, it is beneficial to a firm to be perceived as responsible and unbiased. The *AIA Code of Ethics and Professional Conduct* states, in Rule 1.401, "Members shall not discriminate in their professional activities on the basis of race, religion, gender, national origin, age, disability, or sexual orientation."

Thomas and Ely name this the *Discrimination and Fairness* paradigm of workforce diversity. The emphasis is on quantity, counting employment statistics as evidence of equitable practices. While this may serve to increase the number of minorities and women employed, it minimizes the creative possibilities diversity can bring.

On the other side of the coin is the conventional business case for diversity—accessing new markets. This paradigm, called *Access and Legitimacy* by the researchers, emphasizes minority group identity as a business strategy. Organizations regularly hire minority employees in the hope of gaining increased access to new segments of the market, accompanied by expanded expertise and profitability. While this may be an effective strategy at times, the minority employees often feel pigeonholed at best and at worst, exploited.

A NEW MODEL

Thomas and Ely suggest the benefits of diversity to a business can be much greater than ethical practice or market access. These benefits include increased creativity, organizational flexibility, capacity to see issues from many perspectives, and ability to deal successfully with the challenges of change. Organizations that benefit most from a diverse workforce exhibit management structures that are egalitarian, fostering staff empowerment, continuous learning, and openness to different points of view. Egalitarian management is especially critical in architecture firms, where the main asset is an innovative staff, and the main objective of management is to increase both productivity and creativity.

Because architecture firms depend on the innovation and expertise of their professional staff, flexibility and empowerment prove to be critical factors in increasing productivity. Not surprisingly, flexibility and empowerment are qualities that also promote diversity and the creative potential it brings. This means productivity and diversity go hand in hand within practice management structures capable of encouraging both.

According to research by Thomas and Ely, these management practices are inseparable from the culture set in place by the organization's leaders. In order for a diverse workforce to flourish, the leadership must truly welcome differing perspectives and alternative points of view.

to gain the trust of international clients more quickly. Just as sustainability can become central to a firm's socially responsible activities, diversity and inclusion initiatives can become a meaningful aspect of its business strategy.

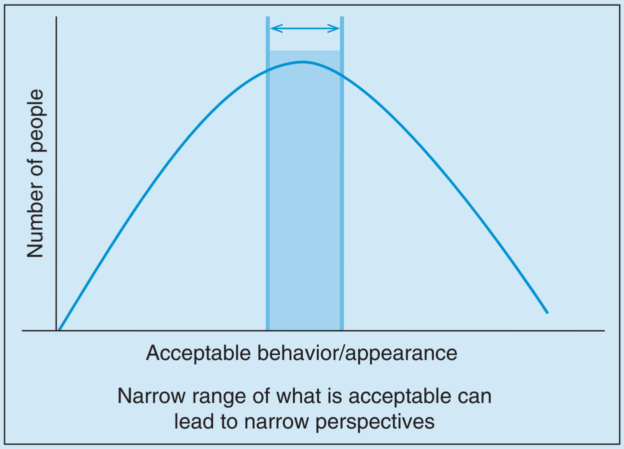
Competitive Advantage in Recruiting

A diverse and inclusive workforce and culture can provide a competitive advantage to a firm in recruiting and retention. With the looming retirement of the Baby Boom generation and the relative small size of the Generation X workforce, the percentage of staff that come from the Millennial generation is expected to increase significantly in the coming decades. Attracting and retaining talented, capable, and tech-savvy Millennials to a firm will become increasingly important to its competitive position, regardless of its size. The Millennials are the most diverse generation in U.S. history and, as a group, reportedly value multiple perspectives and broad tolerance for differences. Firms that value and foster a culture of diversity and inclusion are most likely to attract these talented younger workers. Firms that don't are not likely to keep up in a competitive and ever-changing global marketplace.

THE BELL CURVE OF INCLUSION

By Rena M. Klein, FAIA

In any organization there will be what could be called a "range of acceptable behavior" (Figure 2.1).

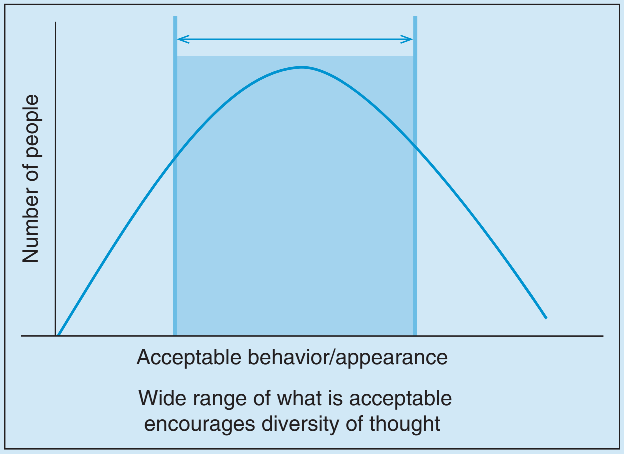


Rena M. Klein, FAIA

FIGURE 2.1 A Narrow Range of What Is Acceptable Can Lead to Narrow Perspectives.

The shaded band represents the range of normal appearance and behavior styles exhibited by the majority of people in an organization. This implicit and established culture is created by the organization's leadership and may be heavily influenced by firm legacy and the culture of an industry, as is the case with architecture. With or without awareness, most firm leaders will perpetuate the narrowness of this acceptable range by always hiring people who "fit in."

Firms that want to benefit from differing perspectives and points of view must widen the range of what is considered to be acceptable behavior and appearance. People who look and act differently may also think differently. If they are welcomed and encouraged, they will bring new ideas and creative perspectives to an organization. For architecture firms, this capacity is critical (Figure 2.2).



Rena M. Klein, FAIA

FIGURE 2.2 Wide Range of What Is Acceptable Encourages Diversity of Thought.

While widening the range of what is acceptable may be challenging, firms that want to succeed in the twenty-first century will have no choice. The next generation of American workers will be significantly more diverse than any that have come before. Having a culture of openness and acceptance will enable firms to attract young talent and retain diverse staff over the long run.

Fortunately, the time has long passed when people liked to regard the United States as some kind of melting pot, taking men and women from every part of the world and converting them into standardized, homogenized Americans. We are, I think, much more mature and wise today. Just as we welcome a world of diversity, so we glory in an America of diversity—an America all the richer for the many different and distinctive strands of which it is woven.

—Hubert H. Humphrey

THE DIVERSITY CHALLENGE

To minimize the challenges of diversity, firm leaders can start by creating a culture that is transparent and fair. A firm where all people are valued and given opportunity to contribute will create an environment of trust. When people trust each other, there can be a norm of mutual respect, even if there is not always agreement or familiarity. With respect comes creative freedom, empowerment, and a sense of responsibility toward one's work.

To foster diversity and inclusion, firm leaders must overcome the powerful human tendency to feel more comfortable when surrounded by people they resemble. This may be especially challenging to leaders of small firms, who work closely on a daily basis with their staff. The inclination to hire and trust people who are similar to oneself, in ethnicity, gender, even age, is almost irresistible. However, lack of diversity and inclusion can create blind spots. Opportunities and risks alike can be missed if everyone thinks alike or comes from similar backgrounds. This can be true of minority or women-owned firms, as well as firms owned by white men. To counter this propensity, firm leaders appreciate, value, and understand differences.

DIVERSITY WITHIN THE AIA

The United States' tumultuous and turbulent past with regard to racial and gender equality set the stage for consideration of diversity and inclusion in the workplace. According to the 1960 U.S. Census, virtually all doctors, attorneys, architects, engineers, executives, and managers were white men. The civil unrest of the sixties provided a catalyst for change.

In 1964, the Civil Rights Act was passed, which made it illegal for the organizations to engage in employment practices that discriminated against employees on the basis of race, color, religion, gender, national origin, age, and disability. In 1965, Executive Order 11246 was passed, requiring all government contractors to take affirmative actions to overcome past patterns of exclusion and discrimination. While these federal mandates plus several others helped to eliminate formal policies that discriminated against various classes of workers, professions and the organizations that represented them were slow to make changes toward a more diverse membership.

At the 1968 AIA National Convention in Portland, Oregon, Whitney M. Young Jr., civil rights activist and Executive Director of the National Urban League, in his keynote speech challenged the AIA membership on the issues of human/civil rights, diversity, and inclusion.

> It took a great deal of skill and creativity and imagination to build the kind of situation we have, and it is going to take skill and imagination and creativity to change it. We are going to have to have people as committed to doing the right thing, to inclusiveness, as we have in the past to exclusiveness.
>
> —*Whitney M. Young (1968)*

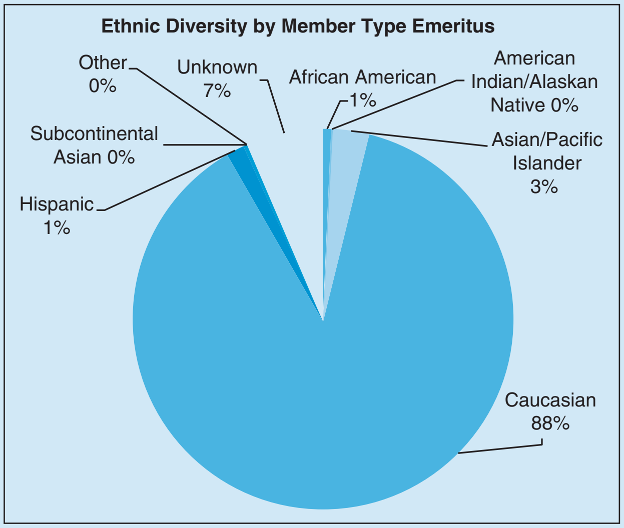
In 2012, 44 years later, it is instructive to understand how the situation has changed and has not changed. Unless otherwise noted, the source of demographic information shown is *The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics.*

In 2012, current emeritus AIA members embody the ethnic makeup of the profession during the second half of the twentieth century (see Figure 2.3).

The ethnic demographics of AIA member architects in 2012, as shown in Figure 2.4, reflect the status quo in the early twenty-first century. It is worth noting that over the past 20 years, the percentage of African American AIA architect members has remained at only 1 percent.

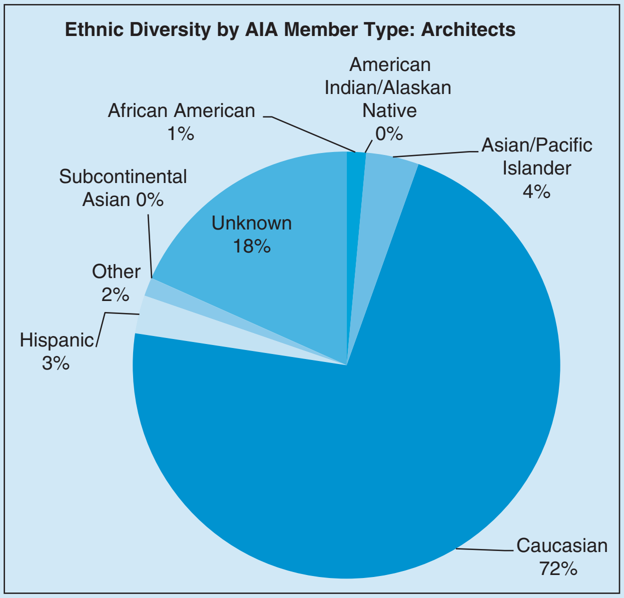
Nevertheless, the 2012 ethnic makeup of associates (see Figure 2.5) portends a future AIA and architectural profession with more non-Caucasian participants.

For women the trend is similar, as Figure 2.6 shows. Only 4 percent of emeritus members are women, while women make up 16 percent of Architect members, and 30 percent of Associates.



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.3 Ethnic Diversity: AIA Emeritus Members



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

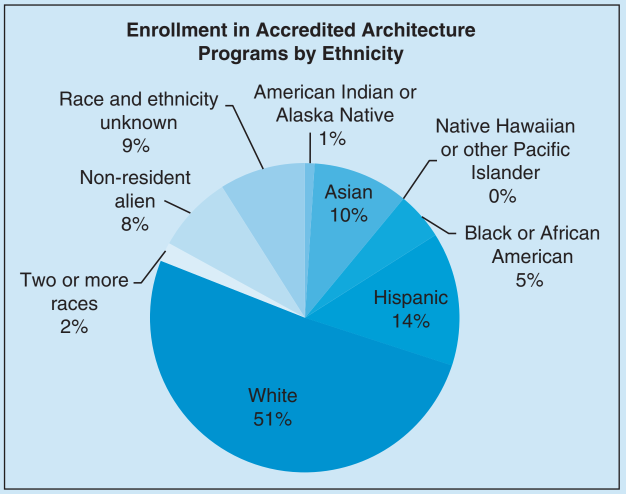
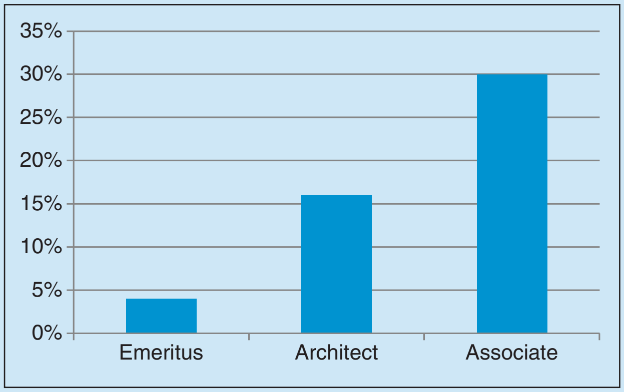
FIGURE 2.5 Ethnic Diversity: AIA Associate Members



NAAB Accreditation Report, 2011

FIGURE 2.7 Enrollment in Accredited Architecture Programs by Ethnicity



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.6 Percentage of Women in AIA Member Categories

At the university level there appears to be evidence of some change, as shown in Figure 2.7. In many architecture programs, women make up 50 percent or more of the students, with the average being about 40 percent. Although gender balance among architecture students has been in place since the mid-1980s, the number of women architect members of the AIA has remained flat at around 16 percent. Judging by the 2012 percentage of minority AIA associate members (30%), minority participation in architecture programs must also be improving. Nevertheless, it clearly still lags behind what is needed to significantly increase ethnic diversity in the profession.

CONCLUSION

A diverse and inclusive workforce is a reflection of a changing world and marketplace. Diversity among clients, especially in the global marketplace, can in itself be a challenge. Diversity and inclusion at all levels brings high value to organizations and promotes the firm's ability to adapt to any situation. In addition, diversity and inclusion will help a firm attract and retain top candidates that can add capacity and competitiveness in the global marketplace.

What follows are two backgrounders that add information and context to the topic of diversity and inclusion:

- *AIA Diversity History Timeline*. Since the early 1990s, the AIA has institutionalized an effort to engage its membership with issues of diversity and inclusion. This brief timeline highlights some of the significant moments in AIA diversity history.
- *Forging a Diverse Culture: The Shepley Bulfinch Experience*. This case study of a diversity-award-winning firm contains practical advice for fostering and implementing a culture of diversity and inclusion.

BACKGROUNDER

AIA DIVERSITY HISTORY

Marga Rose Hancock, Hon. AIA

In 2011, AIA Diversity and Inclusion commissioned the development and online publication of an AIA Diversity History, excerpted here. What follows is a brief history of activities by AIA directed at study and redress of the underrepresentation of women and racial/ethnic minorities in the profession, with statistical references and participant observations.

Marga Rose Hancock has taken an active role in AIA Diversity initiatives, as a founding member of the AIA Seattle Diversity Roundtable in 1986 and a 1992 appointee to the national Diversity Task Force. In 2011, AIA Diversity and Inclusion commissioned Rose Hancock to develop and publish an online AIA Diversity History.

DIVERSITY IN PROFESSIONAL PRACTICE

Women and people of color have practiced architecture and taken active roles in the profession, but at a rate substantially below their counterparts in other professions. Concern regarding the underrepresentation of these constituencies has engaged AIA leaders: The U.S. civil rights movement of the mid-1960s saw the initiation of policies and programs seeking to address this concern, as detailed in Table 2.2.

Following the Institute's 1857 establishment, in 1888 Louise Blanchard Bethune, FAIA, became the first woman to join the AIA, and in 1923 Paul Revere Williams, FAIA, became the first African American member.

According to U.S. Department of Labor/U.S. Bureau of Labor Statistics (BLS, 2011), compared with law and medicine, architecture lags in the percentage of women and minorities employed in the field (see Table 2.1).

TABLE 2.1 Comparison of Diversity in Architecture to Medicine and Law (2011)

	Percentage of Total Employed			
Occupation	**Women (%)**	**Black/African Americans (%)**	**Asian (%)**	**Hispanic or Latina (%)**
Architects	20.7	1.6	5.5	4.1
Lawyers	31.9	5.3	4.2	3.2
Physicians	33.8	5.3	16.1	6.6

A further comparison: As of May 2012, the BLS also notes, "Fourteen percent of architects and engineers and 34 percent of physicians and surgeons were women, whereas 61 percent of accountants and auditors and 82 percent of elementary and middle school teachers were women."

TABLE 2.2 AIA Diversity Timeline 1968–2011 (excerpted)

1968	In his keynote address to the AIA Convention in Portland, Oregon, Urban League head Whitney M. Young, Jr. challenges the AIA on issues of social responsibility and diversity within the profession: "We are going to have to have people as committed to doing the right thing to inclusiveness as we have in the past to exclusiveness."
1970	AIA/AAF Minority Disadvantaged Scholarship initiated, supporting an average 20 students/year.
1971	Establishment of National Organization of Minority Architects at AIA Convention, Detroit.
1972	AIA presents first Whitney M. Young Award, recognizing "architects and organizations that exemplify the profession's proactive social mandate," to Robert J. Nash, FAIA.
1974	AIA hires Robert T. Coles, FAIA, as Deputy VP for Minority Affairs, to develop "a master plan for minority awareness," and, working with Leon Bridges, FAIA, and Marshall Purnell, FAIA, to establish the AIA Commission on Community Services.
1980	Norma Merrick Sklarek, FAIA, the first African American woman licensed as an architect, becomes the first elevated to the AIA College of Fellows.
1982	Women constitute 3.6% of AIA membership.
1989	"The number of female architects, less than 1,500 in 1970, now approaches 5,000. The number of black architects has grown from about 1,000 to 2,000, remaining at about 2 percent of the total." —Robert Coles, FAIA, "Black Architects: An Endangered Species," *Progressive Architecture* (July 1989)
1992	First meeting of the AIA President's "Task Force on Equal Rights and Proactive Action" in Washington, DC, charged by then AIA President W. Cecil Steward, FAIA, to develop a comprehensive strategic plan to implement the 1991 civil rights policy, for presentation to the AIA Board. Named the Diversity Task Force, this group developed a vision of the AIA in the year 2000 as a multicultural organization.

(continued)

TABLE 2.2 ***(continued)***

1992–93	Susan Maxman, FAIA, serves as the first woman president since AIA's 1857 founding. L. Jane Hastings, FAIA, serves as the first woman chancellor of the AIA College of Fellows.
1994	Diversity Conference I: "Breaking the ICE" (Washington, DC). Keynoter: Charlotte, NC, Mayor Harvey Gantt, FAIA. AIA membership includes 7.3% "all minorities," 10.45% women, 0.99% minority women.
1996–97	Raj Barr-Kumar, FAIA, serves as first AIA president of color.
1996	Diversity Conference III: "Crossing Lines" (Boston, MA). Keynoter: Patricia Carbine, co-founder of *Ms.* Magazine.
1997	Diversity Conference IV: "Beyond the Rainbow" (Seattle, WA), proceeded by "Dancing in Design" National Conference for Women in Architecture organized by Seattle Association for Women in Architecture (AWA). Keynoters: Seattle Mayor Norm Rice, Professor Sharon Sutton, FAIA, and AIA President Ronald Altoon, FAIA.
1998	Diversity Conference V: "Opening Doors," Atlanta, GA. Keynoter: Atlanta Mayor Andrew Young.
2001–02	Gordon Chong, FAIA, serves as first Asian American AIA president.
2005	AIA sponsors study of architecture demographics by Holland & Knight: "Of its members, approximately 2% are Hispanic/Latino, 3% are Asian, and 1% are Black.... As of December 2004, approximately 12% of all of the AIA's architect members are female. The AIA does not collect information on disability or sexual orientation."
2007–08	Marshall Purnell, FAIA, serves as the AIA's first African American president.
2008	First AIA Diversity Plenary "MultiFORMity" in St. Louis brings together individuals representing architecture, other professions, business, academia, associations, and AIA components to identify best practices for implementation by the AIA and its partners in order to move the profession toward a more diverse and inclusive future by improving the recruitment, retention, and promotion of diverse individuals in architecture. The outcome of the plenary, the "Gateway Commitment," leads to the development of a multiyear action plan to address these issues, with a mandate to create a diversity toolkit designed to engage firms on the issue of diversity and inclusion. Leers Weinzapfel Associates selected as first woman-owned firm recipient of the AIA Architecture Firm Award. AIA recognizes Norma Merrick Sklarek, FAIA, as the first woman recipient of the Whitney Young Award. "Only 1.5 percent of America's architects are African American (at a time when the U.S. Census shows that African Americans comprise approximately 12 to 13 percent of the total population)." —Robert Ivy, FAIA, "Room for All Our Talents," *Architectural Record* (May 2008)
2009	Inaugural AIA Women's Leadership Summit, Chicago, IL: "The first national gathering of women who serve as firm principals and in other professional leadership roles drew upon their talents and experiences to describe the issues women face and sought to raise their profile within the profession." Second AIA Diversity Plenary, "Value: The Difference – a Toolkit for Firms." San Francisco plenary brings together AIA Board members, collateral organizations, related organizations, firm representatives, interns, and students to identify tools, resources, and approaches to increase diversity and inclusion within architecture firms. Adoption of the "NOMA/AIA Memorandum of Understanding," and adoption of "AIA Diversity Action Plan, 2009–2013," with strategies to 1) expand the racial/ethnic, gender, and perspective diversity of the design professions to mirror the society we serve; and 2) nurture emerging professionals and influence a preferred future for the internship process and architecture education. "According to the latest figures from the National Architectural Accrediting Board, architecture schools are still dominated by men, though by a decreasing margin. Of all the enrolled and matriculating students of architecture, 59% are men and 41% are women. The gender gap is much wider among faculty, however, with a split of 74% men, 26% women." —Lance Hosey, "Women Rule," *Architect* (December 2009)
2010	AIA hosts Women's Leadership Summit, New York. Diversity Best Practice Awards recognize the contribution of individuals, firms, and AIA component programs to the aim of advancing diversity in architecture.
2011	AIA Women's Leadership Summit, Kansas City

At the local level, many AIA components have initiated and advanced programs to reach out to K–12 youth from underrepresented populations, to support the studies of architecture students at area colleges and universities, and to engage women and ethnic/racial/gender minorities in AIA activity and leadership. Beginning in 2009, AIA Diversity and Inclusion has encouraged and supported such efforts, and also advances in this area by architecture firms, through its Diversity Recognition Program.

As multicultural globalism gains ground, the AIA continues its effort to materialize the social power of architecture and to energize architects from all backgrounds in this manifestation.

BACKGROUNDER

FORGING A DIVERSE CULTURE: THE SHEPLEY BULFINCH EXPERIENCE

Carole Wedge, FAIA, LEED AP

Carole Wedge is President of Shepley Bulfinch, a national architecture practice. Elected the firm's first woman president in 2004, she has led its cultural transformation and geographic expansion.

Diversity in design and corporate leadership has been central to the transformation of Shepley Bulfinch from a homogeneous, hierarchical environment to one of collaboration and forward momentum.

Our staff today is engaged and empowered, breaking down a permission-driven environment and embracing a culture of inquiry. In physical terms, we have created literal transparency, moving to new workspace with a collaborative model that eliminates offices and, with it, empowering teams and individuals.

MAKING DIVERSITY A PRIORITY

A diverse workplace is like good design: It is a goal reached intentionally through a series of thoughtful, informed decisions, and it is most notable in its absence.

Promoting diversity inherently supports a culture that values differences in opinion and perspective, which in turn supports our strategic goals: A diverse mix of individuals who enrich and broaden the work will advance design and will make us the best firm we can be.

As a business driver, it is important that our demographic mix reflects that of our clients. We consider our ability to listen to our clients and to understand their aspirations as a significant differentiator of a design firm. Creating a high level of comfort—eliminating any sense of the "other"—is vital for our own work environment if we are to convey that to our clients.

The Role of Leadership

What strategies and policies have created a culture of advancement at Shepley Bulfinch that is gender- and color-blind?

It started in a very personal way, as the firm's leaders saw their daughters, who were educated and trained to be intelligent contributors to society, bump up against gender bias. In 1994, the firm made a deliberate, strategic decision to develop opportunities to prepare women for leadership positions in the firm. Our Executive Committee charged the Principal for Personnel with developing a strategic initiative to recruit and advance a more diverse mix of professional staff, to bring a range of new voices, faces, and perspectives to the table. The first director of human resources was appointed that year, and the diversity of the firm today owes much to her efforts over her 15-year tenure.

The Process

While we would like to believe we can have it all, we know better. As a practice whose success rests on the intellectual capital of our staff, it is vital for us to support work-life balance as a priority. To accomplish that, our HR director complemented her ambitious recruitment efforts by working with the Human Resources Committee to establish policies and practices to support, retain, and advance the newly diverse staff. In practice, this has meant policies that make flexibility in support of excellence an integral part of our culture. This included establishing a formal flextime policy; introducing an Employee Assistance Plan; pretax Dependent Care Plan; and providing full benefits for part-time staff.

Flextime has played a particularly important role in the rise of women in leadership: supporting employees' work/family balance, professional development, and opportunities for outreach to underrepresented communities as teachers and mentors. This lets us retain and advance talented staff, whether they are work-study design students, parents of young children, or members of the "sandwich" generation.

Diversity in Practice

The underlying philosophy of our practice is that success and opportunities for advancement come by doing quality work and contributing to a team. At times this has meant working with managers to change their perceptions of how work is done: our HR team monitors this closely and addresses project team issues by facilitating dialogue rather than letting assumptions and prejudgment drive team dynamics. When project schedules or time frames do not align with those of an individual on a flexible schedule, we work to provide flexible assignments that offer alternative opportunities for growth and development.

We have also undertaken staff training on diversity, so that everyone understands which behaviors are acceptable and which are out of bounds, while providing language that helps people communicate directly if a colleague has crossed the line.

Measuring Success by Outcome

Today Shepley Bulfinch is one of few large architecture firms in the United States with a female president, and one of only two so represented on the AIA Large Firm Roundtable. Fifty percent of the firm's staff is female, and 9 of our 18 principals and directors are from groups that are underrepresented in the profession.

We succeed because we model our own success and hold ourselves accountable for promoting diversity both in

(continued)

our firm and in the profession. Based on our own experience, we encourage other firms to take the following steps to provide a diverse workplace:

- *Commitment*: Ensure that leaders of the firm and of project teams are vested in diversity as a goal.
- *Opportunities*: Mentor formally and informally, creating opportunities for success and leadership.
- *Excellence*: Keep merit central to advancement.
- *Resources*: Commit staff/human resources to the program's success.
- *Policies*: Implement and maintain policies that are fair, flexible, and available to everyone.
- *Metrics*: Regularly track progress, monitor disparities, and recalibrate your definition of success.

2.2 Demographics of Practice: 2012 AIA Firm Survey

James Chu, MBA

The total number of staff at firms fell significantly between 2008 and 2011. The down economy has also led to a decline of the single-discipline firm, while multidiscipline firms have grown to attain a more diverse portfolio in project types and design specialties offered.

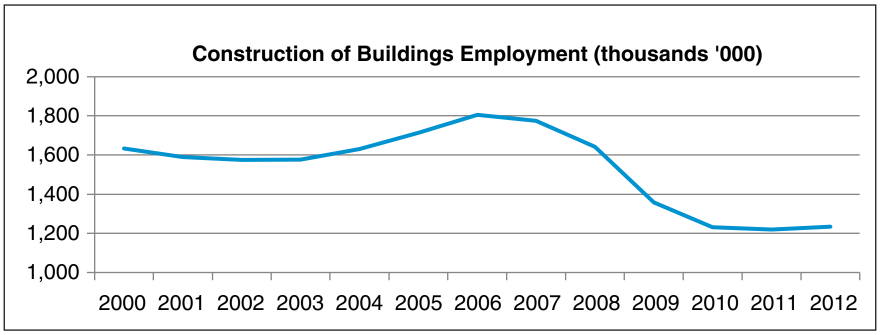
SUMMARY OF FINDINGS

The economic downturn that started around the end of 2007 had tremendous negative ramifications for the construction sector. According to the U.S. Bureau of Labor Statistics (BLS), the construction labor market (Construction of Buildings industry–NAICS Code 236) declined nearly one-third from the height of the building activities (Figure 2.8).

The labor market for the Architectural Services industry (NAICS Code 54131) suffered the same fate, declining nearly 30 percent from the peak in 2008 (Figure 2.9).

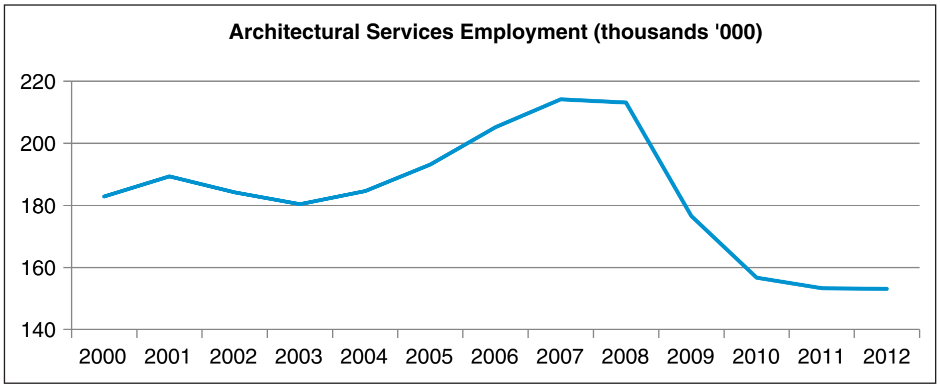
This trend is likely to continue in the short term as instability remains in the global economy. At the time of this writing, the European Union is going through its own financial malaise, while China is showing signs of economic slowdown as well. Hesitation to increase staffing comes with the uncertain economy, and a majority share of the firms reported little gain in the number of staff during 2011. On average, one in five firms reported net loss and 16 percent recounted net gain in full-time staffing at their organizations during 2011.

James Chu joined the AIA in 2005 as the director of research. He has taught and worked in the private and nonprofit sectors in the field of market research. Prior to joining the AIA he was a business consultant representing a state economic development office in Tokyo, Japan.



U.S. Bureau of Labor Statistics

FIGURE 2.8 U.S. Construction of Buildings Employment



U.S. Bureau of Labor Statistics

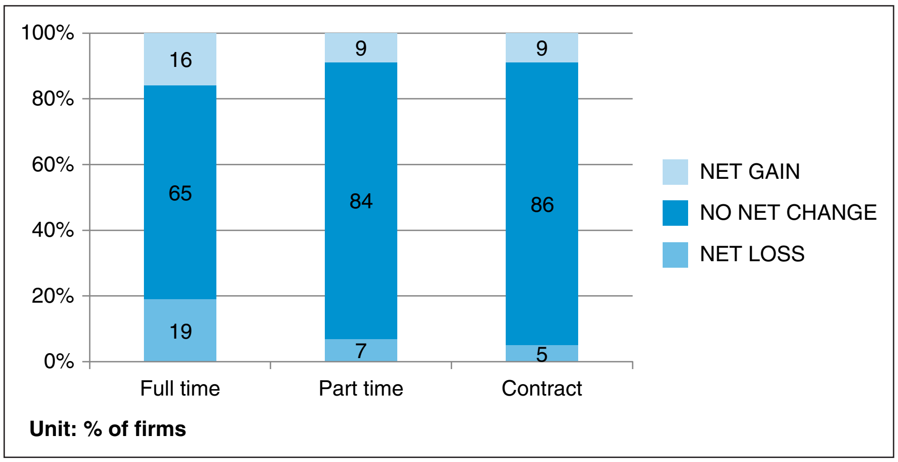
FIGURE 2.9 U.S. Architectural Services Employment

The larger the firm, the greater the variation in the share of staff gained and lost:

- *Firms with fewer than 10 employees*: 75 percent reported there was no change to their full-time staff, while only 10 percent reported gains.
- *Firms with 10 to 49 employees*: 37 percent reported gains, while 32 percent reported loss of full-time staff.
- *Firms with over 50 employees*: 50 percent reported net gains, while slightly over one-third of firms reported a net loss of full-time staffing.

The sluggish economy led to a significantly lower number of hires for contract and part-time employees. Only one in ten firms reported a net gain for contract and part-time employees in 2011 (Figure 2.10).

▶ See Navigating Economic Cycles (7.1) for the AIA 2012 survey findings on the distribution of firms by size.



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.10 Two-thirds of Firms Had No Change in Full-Time Staff in 2011.

PART 1: THE PROFESSION

STAFF AT ARCHITECTURE FIRMS

Nearly 40 Percent of Staff at Firms Are Licensed Architects

▶ Diversity and Practice Management (2.1) includes findings on the demographics of AIA members.

The economic downturn has had a major impact on the size of the architecture industry. On average, the number of staff at architecture firms has declined from about 10 in 2008 to 8 in 2011. Of those two employees lost, on average, one was from the non-design staff and one from the design staff. The loss from the design staff was primarily from nonlicensed architecture personnel.

Overall, almost two in five employees at architecture firms are licensed architects with another 16 percent of staff comprising interns on the path to licensure (Figure 2.11).

An additional 13 percent of staff is nonlicensed architecture staff that is not on the path to licensure. In general, the share of non-architecture staff, which might include engineers, interior designers, and landscape architects, increases with firm size.

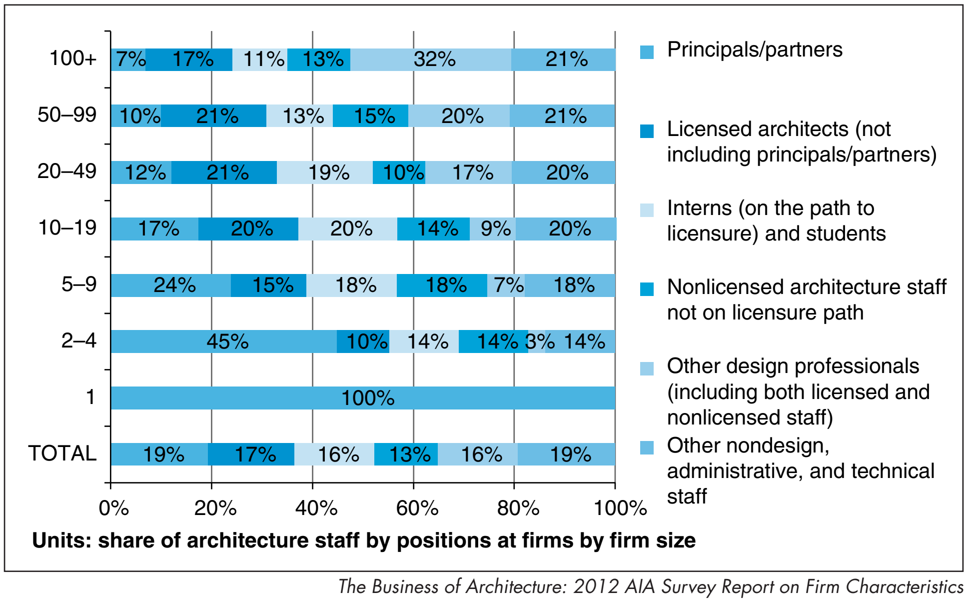
Finally, approximately 20 percent of workers at firms are non-design staff, which includes professionals such as accountants, marketers, information technology, and human resources managers.

Most Firms Use Engineering Consultants

Since the majority of architecture firms are small or midsize businesses, they rely heavily on consultants and part-time staff to provide flexibility.

The 2012 firm survey found that 85 percent of firms regularly hired engineers as consultants in the past three years, by far the most hired group of professionals. However, while firms with 100 or more employees are more likely to have engineers on staff, four in five still use engineer consultants to supplement staff. Approximately three-quarters of firms with 10 to 99 employees use landscape architect consultants, compared to slightly over one-third of firms with 1 to 4 employees. The share of firms that regularly use interior design consultants has increased, on average, 3 percentage points since 2005 and nearly 10 percentage points since 2002.

The types of consultants that firms use also tends to vary by firm specialization. Mechanical, electrical, and plumbing (MEP) engineers are hired as consultants more



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.11 The Share of Non-architect Staff Typically Increases with Firm Size.

TABLE 2.3 The Largest Share of Firms Use MEP and CS Engineers as Outside Consultants

	Total (%)	Residential (%)	Commercial/ Industrial (%)	Institutional (%)
MEP engineers	85	74	93	92
CS engineers	78	81	76	78
Landscape architects	56	50	52	65
Interior designers	31	35	33	29
Sustainability consultants	20	17	17	24
Spec writers	17	13	19	20
Planners	6	4	4	9
Other specialty consultants	27	18	28	35

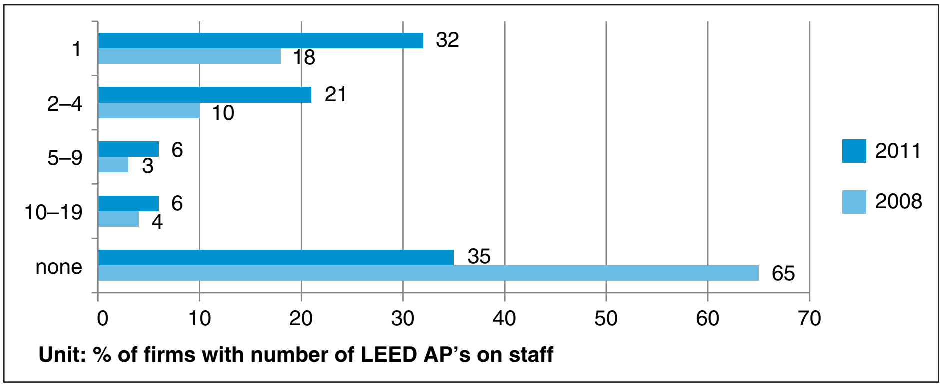
Units: use of outside consultant in last three years, % of firms by specialization
The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

frequently at firms with commercial/industrial and institutional specializations, whereas residential firms are more likely to use civil and structural (CS) engineers as consultants. Landscape architects are also used by many firms that have an institutional specialization, which may include projects like public buildings, museums, and recreational structures. In general, it is more common for firms with a commercial/industrial or institutional specialization to hire code consultants and other specialty consultants, as there are more features to incorporate into their projects, such as security and communication networks (Table 2.3).

LEED AP Certified Staff Nearly Doubles at Firms

Two-thirds of architecture firms now have at least one Leadership in Energy and Environmental Design accredited professional (LEED AP) on staff, versus just one-third in 2008. Ninety percent of firms with 10 or more employees have at least one LEED AP on staff, and more than half of small firms have at least one LEED AP certified staff member, compared to just under one-quarter in 2008.

Nearly two-thirds of large firms have more than 20 staff with LEED AP certifications. On average, firms with 20 to 49 employees have 8 LEED APs on staff, and 3 LEED certified staff typically work at firms with 10 to 19 employees (Figure 2.12).



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.12 **The Number of LEED APs on Staff Nearly Doubles in Three Years.**

▶ The backgrounder on Firm Legal Structure (5.2) discusses the most commonly used structures for architecture firms.

FORMATION OF FIRMS

S Corporation Is Most Widely Employed Business Structure

When starting a business, one of the first decisions the owner has to make is the type of business to create. The business type that is best suited for the firm's situation and objectives may vary by firm size or specialization. Liability protection and tax concerns may also play a major role in this decision.

According to the Internal Revenue Service, 70 percent of all businesses start out as sole proprietorships, since they are relatively easy to start and give the owner discretion to make decisions. On the downside, these firms have unlimited liability for all debts against the business, including personal assets.

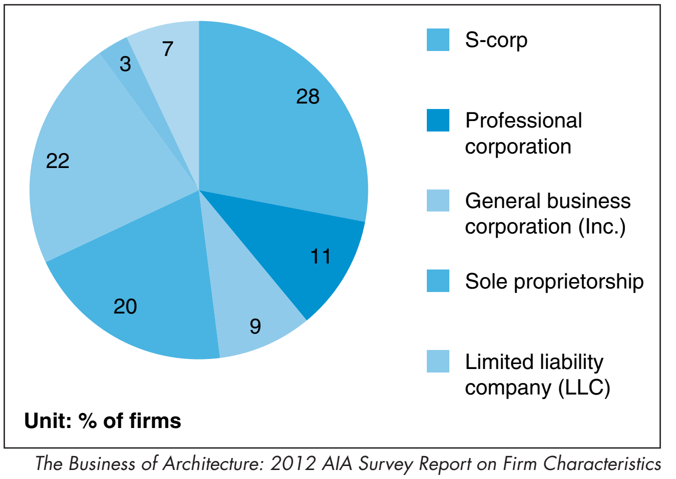
The share of architecture firms that use the sole proprietorship legal structure has continued to decline in recent years, with a drop of 5 percentage points from 2008 to just one in five firms in 2011 (Figure 2.13). The share of firms using the sole proprietorship legal structure has declined significantly since 1997, when nearly half of all firms were classified as such.

As of 2011, the most common legal structure among all firms, with the exception of sole practitioners, is the S corporation, with more than one-quarter (28 percent) of firms reporting having been formed under this legal business structure. The percentage of firms structured as limited liability companies (LLCs), a legal structure that is now permitted in most states, increased moderately to 22 percent, from 17 percent in 2008.

At firms with 50 or more employees, the General Business Corporation (Inc.), also known as a C corporation, is the second choice. Among the firms with 10 to 49 employees, the Professional Corporation (PC), LLC, and the General Business Corporation are evenly divided, averaging around 16 percent for each of the legal business formations.

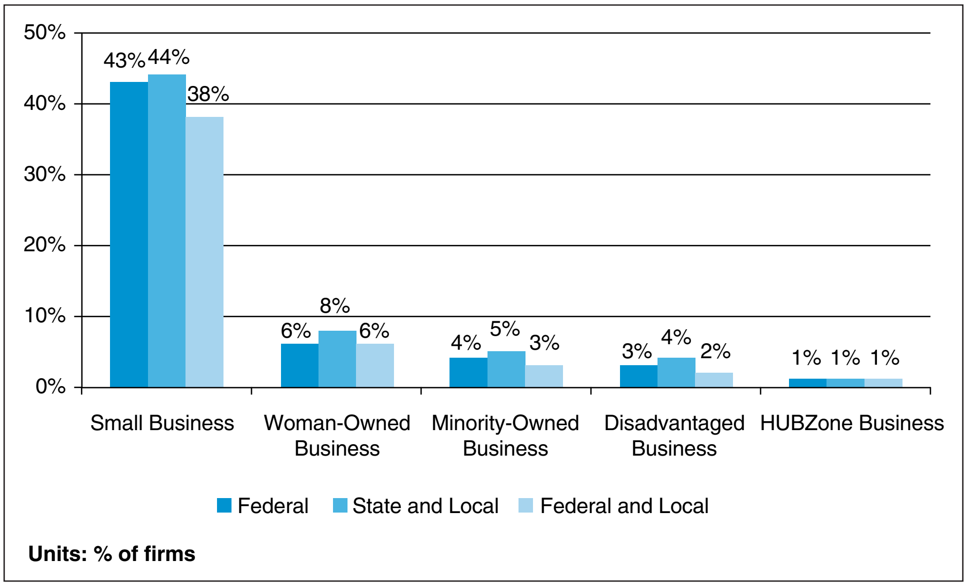
Nearly Half of All Firms Have Small Business Status

According to the Small Business Administration (SBA), small businesses represent the majority of all employer firms and employ about half of all private sector employees. They pay more than 44 percent of total U.S. private payrolls and have generated 60 to 80 percent of net new jobs annually over the past decade. Different industries will have different criteria for eligibility, primarily based on the annual gross receipts from the business. For more detail on the eligibility and standard described in the National American Industry Classification System (NAICS), visit the U.S. Small Business Administration website (www.sba.gov). The Architectural Services industry is classified under the NAICS 541310.



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.13 The S Corporation Is the Most Common Legal Structure, While Sole Proprietorship Continues to Drop.



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.14 Nearly Half of All Firms Are Recognized as Small Business Entities.

Small businesses create more than half of nonfarm private gross domestic product and supplied just over 20 percent of the total value of federal prime contracts in Fiscal Year 2010. More than 4 in 10 architecture firms report that they are recognized as a small business at either the federal or state/local level (Figure 2.14). One-half of architecture firms with fewer than 20 employees report that they are recognized (both federally and at the state/local level) as a small business, while just over one-quarter of firms with 20 to 49 employees are recognized as such.

The share of firms that are federally recognized women-owned business enterprises (WBE) is 6 percent, and the share that are state/local recognized WBEs is 8 percent, both of which are down significantly from 2008 with declines of three and five percentage points, respectively.

Approximately 4 percent of firms are federally recognized minority-owned businesses enterprises (MBEs), while 3 percent of firms are federally recognized as a Small Disadvantaged Businesses or Disadvantaged Business Enterprises (SDBs or DBEs). The HUBZone program (Historically Underutilized Business Zones) helps small businesses in urban and rural communities gain preferential access to federal procurement opportunities. Currently, just 1 percent of firms are recognized either at the federal or state/local level in this category.

▶ See the backgrounder WBE/MBE/DBE/SBE Certification (3.1) for related discussion on certification as a Woman-Owned Business Enterprise (WBE), Minority-Owned Business Enterprise (MBE), Disadvantaged Business Enterprise (DBE), or Small Business Enterprise (SBE).

Formation of New Firms Grows

The weak economy sparked new firm formations. Six percent of existing firms were formed between 2009 and 2011, and almost one-quarter of firms were formed since 2005. More than one-half of firms were formed since 1995.

In comparison, fewer than one-tenth of firms were founded before 1970. However, more than three-quarters of firms with 50 or more employees were established before 1980. Two in five sole practitioners started their firms since 2005. Not surprisingly, firm size is indicative of its longevity, since firms generally need time to grow (Table 2.4).

Number of Offices Decline at Largest Firms

▶ Developing and Managing Multiple-Office Firms (5.9) addresses the challenges of leading and managing a multi-office architecture practice.

The majority of architecture firms have one office, although just over 10 percent have multiple offices (Table 2.5). Approximately two-thirds of firms with 10 to 49 employees and one-quarter of firms with 50 or more employees have one office.

TABLE 2.4 Over One-Third of All Firms Formed After 2000

		Number of Employees						
	2011 (%)	1 (%)	2–4 (%)	5–9 (%)	10–19 (%)	20–49 (%)	50–99 (%)	100+ (%)

Units: % of firms
The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

Two in five of the firms with 100 or more employees have five or more offices. The majority of firms have offices that are located exclusively in the United States, with just 2 percent reporting that they have offices abroad including Canada.

The change in the number of offices was most dramatic at the largest firms between 2008 and 2011. The share of firms with 100 or more employees that have multiple offices and had five or more offices in 2008 has declined significantly, with the majority reporting that they now maintain just two to three offices.

On the other hand, more than one-third of firms with 50 to 99 employees that have multiple offices reported having four or more offices in 2011, versus just over one-quarter who reported the same in 2008.

South Atlantic Regional Share of Firms Increases While Middle Atlantic Sees Largest Decrease

The 2012 AIA Firm Survey geographical breakout (based on the U.S. Census: https://www.census.gov/geo/www/us_regdiv.pdf) showed the Pacific Southwest and South Atlantic regions continue to have the greatest share of firms, 22 and 18 percent, respectively. The East South Central region has the smallest share of firms, with just 4 percent, followed by West North Central, with 6 percent. The share of

FIGURE 2.15 The Pacific Southwest and South Atlantic Regions Saw the Largest Increase in the Share of Firms in the Past Decade.

firms in the New England, Pacific Northwest, West South Central, and East North Central regions has remained relatively unchanged in the past 10 years. The largest growth in the last decade was the Pacific Southwest and South Atlantic regions, with an increase of four and five percentage points in the share of firms, respectively (Figure 2.15).

THE PRACTICE

Most Design Specialty Offerings Increase

Nearly all firms (97%) report that they offered architecture services at their firm in 2011, with a significant share also reporting that they offered the design-related disciplines of pre-design services (61%), space planning (57%), interior design (57%), and planning (52%).

The share of firms offering the sustainable/green design specialty grew significantly from 2005 to 2008, but changed little from 2008 to 2011, with nearly half of firms offering this specialty in 2011. The share of firms offering the interior design, space planning, and planning design specialties grew modestly in these three years (Table 2.6).

Fewer than half of small firms reported that they offer sustainable design services, while over two-thirds of the midsize firms, and four in five large firms, do so. Of firms with an institutional specialization, 57 percent report offering sustainable design as a specialty in their practice, in contrast with an average of 45 percent of firms with a commercial/industrial or residential specialization.

Multidisciplinary Firms Continue to Grow

The economy is going through a transformation and so is the architecture industry. The share of architecture firms that describe their practice as single-discipline continued to decline in 2011, falling below 60 percent, as more than one-third of firms report

TABLE 2.6 Despite the Economic Downturn, Share of Firms Offering Most Design-Related Specialties Has Increased

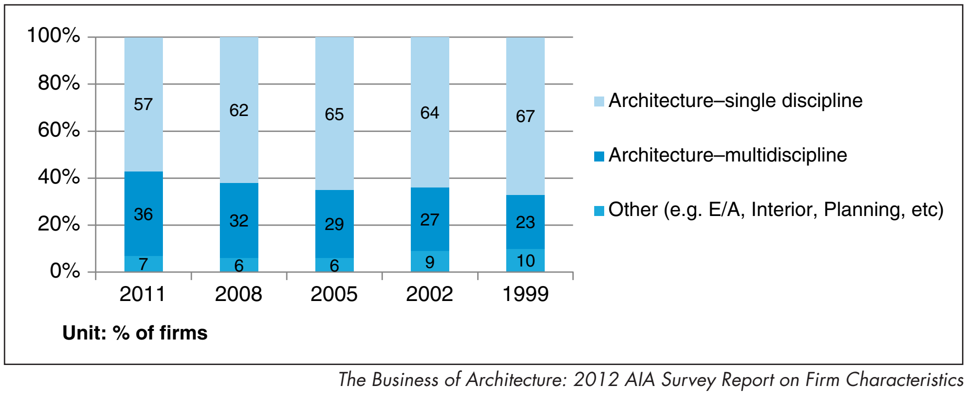
The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

that they are now multidisciplinary (with architecture as the lead discipline) versus just over one-quarter a decade ago (Figure 2.16). Firms may tend to add other disciplines to their practice at the peak of the economy, although firms may also try to find additional work by adding other disciplines during an economic downturn, even though they often cannot add any additional staff.

The share of multidisciplinary architecture firms has doubled in the past 15 years, from 18 percent in 1996 to 36 percent in 2011. More than four in five firms with 50 or more employees now characterize themselves as multidisciplinary, although it is firms with fewer than 10 workers that have shown the most growth into multidisciplinary practice (Table 2.7).

In 2011, nearly two-thirds of firms with fewer than 10 employees and one-third of firms with 10 to 49 employees described their practice as single-discipline.



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

BIM Software Used by Slightly More than One-Third of Firms

On average, just over one-third of firms were using building information modeling (BIM) software as of 2011. At the same time, 36 percent of firms do not use BIM software and do not plan to use it in the near future. About one-quarter of firms that are not using BIM software are considering purchase of this tool in the next few years.

The majority of firms with 100 or more employees are using BIM software, while three-quarters of firms with 20 to 99 staff size are doing so.

Two-thirds of firms with 10 to 19 workers are using BIM software, and just over half are currently using this tool in conjunction to billable work. Another one in five in this firm size group are not currently using BIM, but plan to acquire software in the near future (Table 2.8).

The firms using BIM software for billable work indicate that they are most likely to use it for design visualization services (91% of firms), coordinated construction documents (74%), and sharing models with consultants (55%). Larger firms also indicate that resolving conflicts with other disciplines (clash detection) and sharing models with constructors/trade contractors are primary uses of BIM software in their office (Table 2.9). Nonbillable work using BIM software might include but is not limited to training, competition, marketing, archiving older projects, etc.

TABLE 2.8 Less Than One-Third of Firms Using BIM for Billable Work

CONSTRUCTION SECTORS SERVED

Majority of Firm Billings Derived from New Construction Projects

With the economic downturn, the share of architecture firm billings from new construction projects declined dramatically from 2008 to 2011. Three years ago new construction projects accounted for nearly two-thirds of firm billings, but by 2011 that share had fallen by 12 percentage points to account for just 53 percent of billings. While new projects still constitute the overall majority of firm billings, renovations, rehabilitations, additions, and other construction projects have markedly increased their share, particularly at midsize and larger firms. At firms with fewer than 10 employees, the majority of their firm billings continue to be from renovations, rehabilitations, additions, and historic preservation, as in the past. Issues that are likely related to the economic downturn have led more clients to request modifications to existing buildings instead of entirely new structures, which were more common in the past (Figure 2.17).

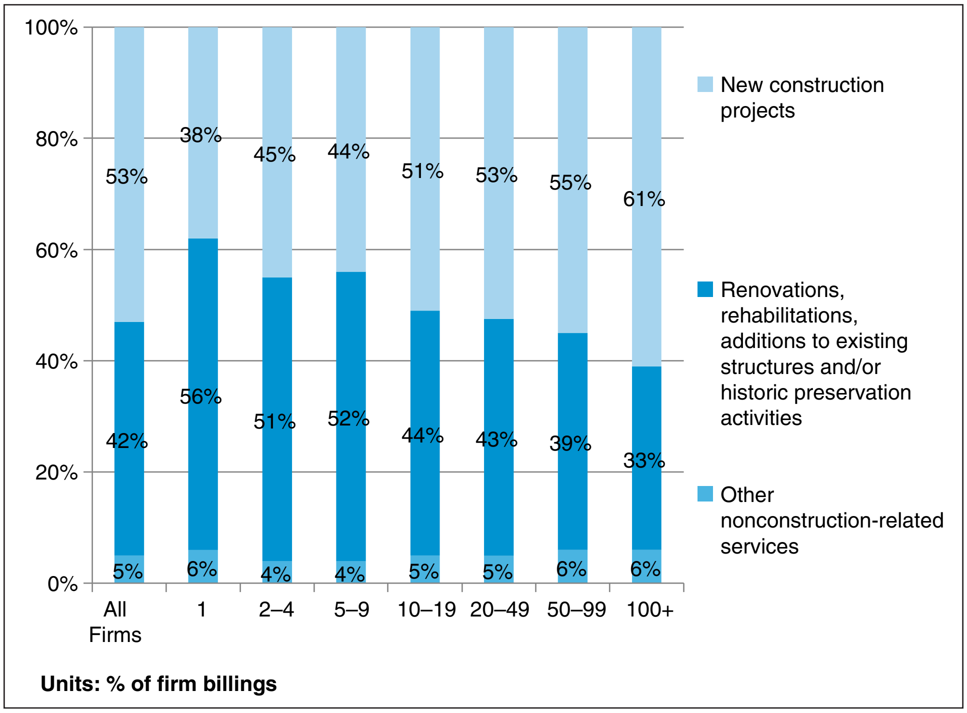
Institutional Projects Make Up Biggest Share of Firm Billings

When considering the distribution of architecture firm billings by project type, institutional projects continue to account for the largest share of billings at all firms (except for the smallest), accounting for an average of 58.2 percent of firm billings (Table 2.10).

One key change from 2008 to 2011 was the decline in the share of commercial/industrial projects, which fell by more than four percentage points in that three-year period. The shares of all types of projects in this sector declined, with the largest loss coming from office projects, where the share of billings fell by more than two percentage points.

A fairly substantial decline of nearly four percentage points can also be found in the share of projects reported as "other construction," which respondents reported included projects like auto dealerships, mixed-use projects, and parking lots/garages.

On the other hand, the share of firm billings from both the institutional and residential sectors increased from 2008 to 2011, with institutional billings climbing by nearly five percentage points. The largest gains in this sector came from education projects (both K–12 and college/university projects), which offset minimal declines in



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 2.17 New Construction Projects Account for Just Over Half of Firm Billings.

TABLE 2.10 Nearly 60 Percent of Firm Billings Are from Institutional Projects

	2011 (%)	2008 (%)

Units: % of firm billings
The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

the share of billings from health care, justice, religious, recreational, and transportation projects.

The increase in the share of billings from residential projects was primarily led by a gain of nearly two percentage points in multifamily projects, although there was a minimal increase in billings from single-family projects as well. While the downturn had a significant effect on residential projects in their earlier stages, demand was once again beginning to increase in 2011.

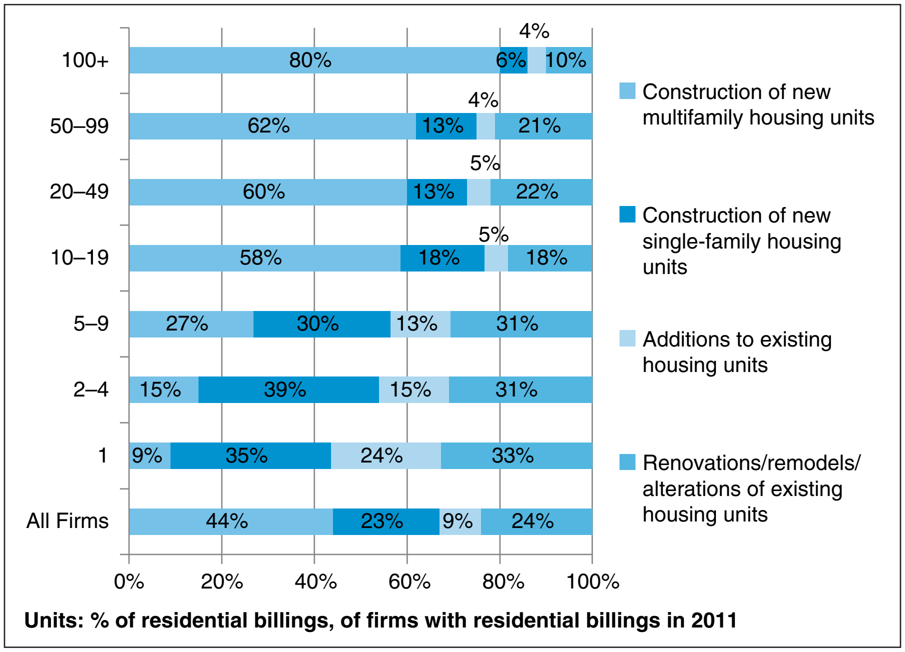
Of those firms that did report having billings from residential projects in 2011, more than two-thirds of those billings (67%) were from new housing units. An average of 44 percent of total residential billings were reported to be from new multifamily housing units, although the share ranged from less than 10 percent for sole practitioners all the way up to 80 percent for the largest firms.

Only small firms reported that a larger share of their residential billings came from new single-family units than from new multifamily units. And sole practitioners were the only group to report that more than half of their residential firm billings were from additions or renovations, which accounted for less than one-quarter of residential billings at firms with 10 or more employees (Figure 2.18).

The majority of architecture firms can be classified as having had either a residential or an institutional specialization in 2011 (defined as having 50 percent or more of 2011 firm billings from that sector). Smaller firms were more likely to have a residential specialization, while larger firms were more likely to have an institutional specialization.

The share of firms with a commercial/industrial specialization hovered around just 2 in 10 firms, regardless of firm size. The remaining firms are classified as mixed, meaning that they do not have 50 percent or more of their firm billings from any one category.

The share of firms with an institutional specialization has increased by nearly six percentage points since 2008, while the share of mixed firms has declined by nearly the same amount. Firms with a more diversified practice in the past appear to have honed their specialization more, leading to fewer of the more generalist firms with billings from a variety of project types (Table 2.11).



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

Units: % of firms with 50% or more of 2011 firm billings in given sector
The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

Majority Share of Billings from Repeat Clients

Architecture firms report that nearly two-thirds of their firm billings are from basic design services (an average of 64% of billings for all firms). Approximately 10 percent of billings are from planning and pre-design services, 9 percent from nonarchitectural design services, and 8 percent from expanded design services.

Smaller firms report that less of their billings are from nonarchitectural design services and slightly more are from basic design services than for larger firms. But for the most part, the distribution of firm billings by service type has been little affected by the downturn and is relatively the same as it was in 2008.

On average, more than two-thirds of 2011 architecture firm billings (68%) were from projects for repeat clients, an increase of 10 percentage points from 2005 (Table 2.12). Although firms have reported during the downturn that clients have been soliciting bids from more firms than was typical in the past, clients are still more likely work with a firm with whom they already have an established relationship.

Firms with a commercial/industrial specialization reported the largest share of their firm billings from repeat clients (75%), while firms with a residential specialization indicated that nearly half of their billings (45%) were from new clients.

Nearly One-Third of Firm Billings from Government Clients

Clients from state and/or local government entities remain the most common client type for architecture firms of all sizes, accounting for one-quarter of all firm billings in 2011, while at midsize firms they accounted for nearly one-third of their billings (Table 2.13). Small firms reported that nearly half of their billings were from private

TABLE 2.13 More Than One-Quarter of Firm Billings from State/Local Government Clients

	All Firms (%)	Number of Employees 1 (%)	2–4 (%)	5–9 (%)	10–19 (%)	20–49 (%)	50–99 (%)	100+ (%)
State or local government (including public schools)	25.4	8.6	13.7	25.6	29.6	32.4	30.7	17.6
Other business, commercial, or industrial companies	19.9	11.7	16.7	18.6	13.7	22.1	22.8	21.8
Nonprofit institutions (e.g., private schools, museums, churches)	15.8	10.2	11.4	9.6	11.9	10.8	11.6	29.3
Developers, construction companies	14.4	14.4	14.0	15.3	12.4	16.7	14.1	13.3
Private individuals	12.1	44.2	37.1	22.7	18.5	7.3	4.9	3.6
Federal government	7.0	0.4	1.1	4.0	7.9	6.6	9.1	8.7
Other architects, engineers, design professionals	4.3	8.2	5.1	3.1	3.9	3.5	3.5	5.7
Other	1.2	2.2	0.8	1.1	2.1	0.5	3.3	0.0

Units: % of firm billings
The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

individuals, but overall private individuals accounted for just 12 percent of billings at all firms.

Business, commercial, and industrial companies are also popular clients, accounting for 20 percent of firms' billings, while nonprofit institutions accounted for 16 percent (and nearly one-third of billings at firms with 100 or more employees). Regardless of firm size, very little work was done for the federal government in 2011.

Pro bono work is relatively common at many firms, with 6 in 10 having provided pro bono work in 2011. Large firms were much more likely to provide pro bono work than small firms, with 67 percent of firms with 50 or more employees providing the service in contrast to 55 percent of firms with 4 or fewer employees. Firms with an institutional specialization were also much more likely to report having offered pro bono work than those with residential or commercial/industrial specializations.

CONCLUSION

In an effort to document emerging trends in the practice of architecture, the American Institute of Architects periodically has conducted comprehensive surveys of its member-owned firms. These *Business of Architecture* reports present benchmarks that allow firms to assess their practices and evaluate their operations in comparison to their peers. In this way, the architecture profession can monitor its current performance while pursuing shared goals for the larger architecture community.

During the survey, conducted in early 2012, firms provided information on characteristics and operations in 2011. The analysis in part compares these results to earlier surveys to assess how the profession is changing. Generally, firm activity is compared and contrasted by the size of the firm (number of employees on payroll), the region of the country, and the construction sector concentration of the practice (residential, commercial/industrial, and institutional) for those firms that received 50 percent or more of their annual revenue from one of these three sectors.

Unless otherwise specified, all information in this report was generated by the American Institute of Architects.

AIA FIRM SURVEY BACKGROUND AND METHODOLOGY

The AIA has surveyed architecture firms since 1988 as part of a commitment to maintain an accurate profile of the business practices of the profession. Last conducted in 2009, the 2012 Firm Survey examined many of the same issues previously explored.

Survey content was developed by AIA staff and volunteer leaders. Sampling, data collection, and tabulation were handled with the assistance of Readex Research, an independent research company.

ABOUT READEX RESEARCH

Readex (www.readexresearch.com) is a nationally recognized independent research company located in Stillwater, Minnesota. Founded in 1947, its roots are found in survey research for the magazine publishing industry, but its specialization in conducting high-quality self-administered surveys has brought it clients from many other markets, including associations, corporate marketers and communicators, and government agencies.

SAMPLE COMPOSITION

The population of interest was all domestic offices of U.S. architecture firms. The sampling frame was developed from three list sources: members of AIA's Large Firm Roundtable, AIA's firm owner/partner members, and participants in the 2009 Firm Survey. When duplicates were removed to include only one individual per location using carrier route and delivery point bar code information, this list included a total of 10,827 offices. Of these, 10,405 had deliverable email addresses on file.

DATA COLLECTION

Tabulated results are based on a total of 2,805 usable responses with a response rate of 27 percent. Because a significant fraction of those invited to participate chose not to do so, the possible effects of nonresponse bias on these results should be considered. Percentages based on all 2,805 responses are subject to a margin of error of ±1.6 percent at the 95 percent confidence level. Percentages calculated on smaller tabulation bases—for example, offices in New England—are subject to more statistical variability.

CHAPTER 3

Career Development

3.1 Regulation of Professional Practice

Cornelius R. DuBois, FAIA

Individuals are licensed to practice architecture, and in doing so, to protect the health, safety, and welfare of the public. Licensing regulations vary among the 54 U.S. jurisdictions, and each architect is responsible for understanding, observing, and abiding by the appropriate statutes, rules, and policies.

THE BASIS FOR THE REGULATION OF THE PRACTICE OF ARCHITECTURE

In order to practice architecture, individuals must hold a license in the jurisdiction in which they wish to practice. The regulation of architecture and of other professions in the United States falls under the authority of the 50 states, three territories (Guam, Puerto Rico, and the U.S. Virgin Islands), and the District of Columbia. This authority is left to the states by the Tenth Amendment of the U.S. Constitution, in the Bill of Rights.

Although the licensing laws applying to the practice of architecture may at first appear to be both broad and complex, they exist principally to provide for the health, safety, and welfare of the public. To do so, these regulations set the minimum qualifications determined by a jurisdiction to be necessary to assure the public that the professionals designing buildings for human occupancy have met the appropriate requirements for education, experience (training), and examination. Equally important, these laws

Cornelius R. (Kin) DuBois has practiced architecture since 1979. He has served as 2010–11 president of the National Architectural Accrediting Board and 2007 president of AIA Colorado, and is a former member of the NCARB board of directors.

serve a critical function in consumer protection, to assure the public that when an architect is selected, that individual has met these minimal standards and has therefore demonstrated the requisite competence and integrity required of the profession.

The concept of "minimal" standards should not be misinterpreted to suggest that the bar for qualification to practice is set low. The stakes—the protection of the public—are indeed high. "Minimal" is also intended to mean that regulations should be without superfluous requirements or testing of knowledge and skills that do not relate directly to health, safety, and welfare.

HISTORY OF THE LICENSURE OF ARCHITECTS

Regulation of the practice of architecture is a relatively recent development, especially when one considers for how many centuries architects and proto-architects have been designing buildings. The regulation of some professions, particularly those of medicine (beginning with the Code of Hammurabi in 1700 BCE) and law (300 AD), had been in place and tested for many years before registration laws for architects in the United States came into being.

Regulation of architecture did not happen overnight. The first law was enacted in the State of Illinois in 1897, establishing a licensing board in 1898. Other states gradually adopted their own statutes and set up their own registration boards over the next fifty-plus years, with Wyoming and Vermont as the final states to adopt licensure in 1951. The territories of Puerto Rico, the U.S. Virgin Islands, and Guam subsequently joined the licensing jurisdictions to create, with the District of Columbia, the current total of 54.

Licensing laws are enacted by the legislatures, which establish administrative agencies to implement the laws. The registration board established by statute is typically managed and coordinated by a regulatory agency of the state that may have responsibility for licensing of a great variety of professions (medical, legal, accounting, and others) and occupations.

The regulation of professions is not static. The laws applying to licensing can be revised either when legislation is introduced to amend an existing statute or during a "Sunset" process in those states that mandate a periodic review and justification of the rationale for regulatory requirements. In a Sunset Review, a licensing statute is deemed to have automatically expired unless and until a thorough review has been conducted and it has been determined that the needs of consumer protection and safeguarding the health, safety, and welfare of the public will be served by continuation of the statute in some form. With or without a Sunset Review, the content of an architectural licensing statute is subject to a legislative process—and sometimes to political whims that are not always predictable. As a result of this, the efforts by NCARB and others to encourage uniformity among the jurisdictions counter a pull in the opposite direction as legislative cycles leave their imprint on the laws that regulate architects.

Alongside the statutes are the rules that are developed by the regulatory agencies and the registration boards. Although rules are set outside of the legislative process, they are still subject to a public process requiring, in most cases, a public hearing held by the registration board after proposed rule changes have been published and promulgated.

A generally accepted philosophy of regulation guides the process for both statute and rule: to establish the minimum threshold of regulation necessary to ensure the protection of the public. While the concept of minimum threshold may be subject to personal or political interpretation, this approach offers some assurance to counter the tendency of a statute to accumulate superfluous or inappropriate provisions over time. Whether this is always effective may be questioned, but this principle provides a consistent yardstick that must be held up to set any discussion of amendments or revisions to a licensing law.

Amendment X ("States Rights") of the U.S. Constitution says, "The powers not delegated to the United States by the constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." This is why there are 54 different licensing jurisdictions, each with its own statute, rules, and policies. This provides challenges to professionals seeking to practice in multiple states, and it can mystify, at first, those from other countries with a single licensing or credentialing authority. The National Council of Architectural Registration Boards (NCARB) has developed our system of reciprocal licensure in part as a response to this reality.

Practice Acts and Title Acts

Licensing statutes are termed either "practice" or "title" acts. All architectural licensing laws in the United States are practice acts that describe and regulate practice as well as the use of the title "architect." Other professions may be regulated by title acts only. In such instances, an individual must have met certain qualifications in order to use a specific title. This title may be a subset of a broader title ("Registered" Interior Designer or Landscape Architect, for example), but the statute does not extend to define or regulate practice under that title, is less likely to set up a registration board, and may assign discipline for misuse of the title to an administrative process. Title acts can be amended in a legislature so that they become, in effect, practice acts—or they can be "enabled" in statute so that their conversion can be effected through rule-making by the registration board. Inasmuch as other professions may affect or overlap with the practice of architecture, it becomes critical for architects to be aware of other statutes and how changes in these might affect architectural practice.

Some states, when adopting licensing laws, included grandfathering provisions. Sometimes referred to as "eminence clauses," these allowed active professionals educated and trained under an earlier and perhaps less rigorous framework to continue to practice. In general, among architectural statutes, grandfathering is now a thing of the past. It does arise occasionally when new statutes affecting "allied" or related professions make their way through the legislative process. The rationale for such clauses in new legislation is that an overly aggressive stance can deny some individuals (who may have been in successful practice for years) their means of livelihood. Negotiation of such clauses can also be a political outcome of efforts to gain adequate support for—or to ward off opposition to—new title or practice acts.

ELEMENTS IN COMMON THROUGHOUT LICENSING LAWS

Despite the forces that would seem to pull 54 statutes in 54 separate directions, there are many key elements consistent among virtually all architectural licensing laws, which:

- Establish a board and the rules governing its composition, authority, and operation.
- Define the practice of architecture.
- Set the requirements for licensure and entry into the profession.
- Include exemptions for certain structures not requiring an architect.
- Define professional conduct and misconduct.
- Establish sanctions and the parameter for the application of these when the statute is violated.

Licensing laws may include a range of other elements that are specific to the jurisdiction and not in common with all others, such as requirements for continuing education, for corporate practice, or for supplemental examinations or qualifications for practice. The balance of this article will include detailed discussion of all of these.

THE REGISTRATION BOARD

Board composition varies by jurisdiction. There are "architect-only" boards that only regulate the practice of architecture. Many states have versions of "combined boards." These boards, which are established to achieve greater administrative efficiency, may deal with the regulation of architects and allied or compatible professionals such as professional engineers or professional land surveyors. Others may include myriad other professions or credentialing categories. Not surprisingly, combined boards are found more commonly in smaller states and territories where administrative resources would be stretched if a separate board for each profession were the goal.

In addition to architects who are represented on a registration board (along with engineers and others on combined boards), there are public members. While they may not be as familiar with the practice of architecture as are the professionals, public members hold a critical function on any board, giving boards a balance of opinion and a variety of perspectives. Since architect members, in the position of regulating their own profession, may be subject to at least a perception of a conflict of interest, active public members can counteract this and confer additional legitimacy to the work of the registration board.

Some statutes require that these public members represent specific areas, such as members of the legal profession, educators, or general contractors, while other board positions are opened to any member of the public.

In 2012 there were over 400 individuals (many of whom are architects) serving on architectural registration boards in the United States, none of whom are compensated for their considerable time and voluntary effort. In most cases, the board members have all been appointed by the governor for terms that vary in length from state to state and which may or may not allow for renewal of term. The appointment process can be complex, sometimes (but not always) political, and complicated by considerations of diversity (regional, gender, ethnic, and other) within a given jurisdiction.

The 54 registration boards constitute the membership of the National Council of Architectural Registration Boards (NCARB), which represents the regulatory functions of the profession as one of the five "collateral" architectural organizations. The boards formulate the rules and policies of NCARB, and working with the boards, NCARB establishes national standards for the licensure and credentialing of architects. The other four collateral organizations are the American Institute of Architects (AIA), the American Institute of Architecture Students (AIAS), the Association of Collegiate Schools of Architecture (ACSA), and the National Architectural Accrediting Board (NAAB), each serving different aspects of the profession.

DEFINITION OF THE PRACTICE OF ARCHITECTURE

Every licensing law (usually at the beginning of the statute and often within a section on "definitions") contains a definition of the practice of architecture. A few states take the most direct approach and adopt the *NCARB Legislative Guidelines and Model Law, Model Regulations* without modification. Others use the NCARB document as a template for their statutes, modifying to suit local conditions and politics and reviewing and adapting to revisions and updates as they may be implemented through the resolution process held at the NCARB Annual Meeting.

The practice of architecture is not typically defined by means of an exclusive list of items of practice but is, rather, a collective definition. Architects do many things in the course of programming, designing, creating documentation, and administering the construction of buildings, and elements of these are shared with other occupations. In the course of their work, architects accept a unique professional responsibility that is not shared with others. Interests from other professions, trades, or occupations may seek to limit the definition of architectural practice when a licensing statute is subject to amendment or undergoing a Sunset Review process. The outcome may be a definition of practice that is at variance with that in the *NCARB Legislative Guidelines* or it may be in the form of specific exemptions.

There is a long history of the interface of the definition of the practice of architecture and that of engineering. In some states, a clear distinction is established between the activities of the two professions, while in others engineers may engage in aspects of architectural practice—or specific building types—if it falls within their "area of expertise." Likewise, architects may be permitted to "engineer" (that is, to calculate and size) structural elements in some instances, such as for smaller residential buildings. In either case, an added consideration will be the willingness of a code official to accept such work when permitting a set of construction documents.

Statutes respecting other allied professions such as landscape architecture and interior design may also overlap or conflict with the definition of the practice of architecture. An architect practicing in a new jurisdiction would be well advised to scan the corresponding statutes and rules for these to confirm that there are no potential conflicts.

Another consideration that must be weighed is that some of these professions may be regulated only via title acts instead of practice acts.

As with the overlapping practices of architecture and engineering, the ability of other professionals to stamp and submit construction documents for building permit approval will always be subject to some degree of discretion on the part of the building official. In a state where there is no statewide building code, the window of what is and what isn't acceptable may vary from one municipality or county to the next.

USE OF THE TITLE

The privilege to use the title "architect" in any form is specific to a licensing jurisdiction, and an individual licensed to practice in one jurisdiction may not use the title in another until he or she has been granted a license there.

Not only is the title "architect" regulated, but so is use of the title in combination with other terms and in the form of what is commonly called "the derivative." Not only is this a subject that can vary significantly from state to state, but individual jurisdictions, through the legislative or rule-making process, also may make changes in these provisions from time to time. This is a particularly sensitive issue affecting interns. A few states allow the use of "intern architect," while a greater number allow only "architectural intern" (use of the derivative). Still other jurisdictions allow neither, in which case an intern is an intern.

While an intern proceeding diligently through the Intern Development Program for three years or more may be flying under the radar screen, using a title on resumes, business cards, and firm marketing materials that is contrary to what is allowed, carelessness can get an intern into difficulty when actually applying for a license. This can result in fines or other sanctions, as well as delays in issuing the license. The fact that some of the offending material may have been produced by the firm for which the intern is working (possibly without the intern's knowledge) may not obscure the fact that it is the individual intern who is ultimately responsible.

Registration boards also take different approaches with respect to the use of the title by nonprofessionals. The general rule is that a term, such as "software architect," which is highly unlikely to be misconstrued as referring to someone providing actual architectural services, may be disregarded by a board, while other terms may be seen as more suspect.

The term "holding out" is commonly applied to someone representing that they are an architect without holding a license in that jurisdiction. The term is applicable, whether or not the individual is already licensed in another state or has no qualifications whatsoever. Some states offer what are termed "fishing licenses," allowing a professional to temporarily use the title while actively pursuing a specific project. These often require the architect to be affiliated with a local firm in order to be granted this status.

Some states also allow for "emeritus" or "retired" architect status, allowing continued use of the title in some form. It has often proved difficult to establish a regulatory rationale for such titles, since they serve more of a purpose of conferring or acknowledging status than of protecting the public or the consumer.

Examples of Violations of Use of the Title "Architect"

Violations of the use of the title can come in many forms, some of which are referred to in the discussion above, and professionals may inadvertently find themselves paying the price, even when there has been no intent to deceive the public. An architect from another state may prematurely use the title on a proposal, or may even do preliminary work on a project before receiving a license. Interns may use the disallowed title ("intern architect" or "architectural intern") on resumes, business cards, marketing materials, listings on awards, or magazine articles. A firm may list an intern as "project architect," when "project manager" or some alternative would be more appropriately consistent within the licensing statute. Out-of-state firms and individual practitioners may find themselves referenced inappropriately in the press, or they may directly violate the statute by entering a competition in a jurisdiction where a license is required.

Although a design firm may be called to task in some of these situations, requiring an appearance before the board, it is ultimately the individual who must take responsibility for how he or she is represented to the public. If called before the registration board, an honest account is without question the best approach.

Licensing boards must also contend with complaints about misuse of the title by nonprofessionals. There may be deliberate misuse of the title by disguising it in combination with other terms, such as "design architect" or "architectural renderer" (where the derivative is not allowed). In these cases, boards take seriously their responsibilities to protect the public and the consumer while not unnecessarily tying up their or the administrative department's time with frivolous or pointless complaints.

Licensing boards do not view the use of "AIA" after someone's name as an inappropriate use of the title—unless the title has clearly been used or manipulated (such as "AIA architect") so that it may appear as an attempt to mislead the public in a state where the individual is not licensed.

USE OF THE STAMP OR SEAL

Licensing statutes require that every architect have a stamp or seal in his or her possession. Depending on the jurisdiction, this may be in the form of a rubber stamp or an embossing seal. Some boards require verification that the licensee has indeed acquired the stamp. The particular requirements (dimensions, required text) are typically included in the rules of the registration board and not in the statute. These rules, from one jurisdiction to another, are evolving with respect to electronic documents and whether these can be "stamped" electronically, with or without an encrypted signature.

The use of the stamp on a set of documents (both drawings and specifications) submitted for a building permit signifies that the architect has been in "responsible control" of the preparation of the drawings. Responsible control is defined in the *NCARB Legislative Guidelines and Model Law, Model Regulations*, and tends to be consistently applied throughout the United States. The architect must stamp only those documents prepared under his control: The NCARB Model Law makes it clear that "Reviewing, or reviewing and correcting, technical submissions after they have been prepared by others does not constitute responsible control." In other words, an architect has no business stamping and signing someone else's shop drawings.

The comparable term in engineering is "responsible charge," which essentially means the same thing. Each of the architect's consultants must stamp their documents prepared under their own responsible charge. All changes to the drawings after the building permit issue must also be stamped and signed (and in many cases, dated) by the architect and the engineers, respectively.

Building departments, which are ultimately responsible for the acceptance or rejection of the construction documents, may refer to the "Architect of Record." This terminology may not appear in the licensing statute, but it essentially implies the same thing. A building department may require a stamp on other documents, such as a written response to a plan correction notice. The architect must comply with these requirements. However, a stamp should never be used for extraneous purposes; for example, on a certification required by a lender on a project.

The term "plan-stamping" refers to the inappropriate use of a stamp by an individual not in responsible control of the preparation of the documents. This is a serious violation of any statute, and it is discussed below in the section on discipline.

Interchangeable Terminology: The terms "registration" and "licensure" are used interchangeably. "Registration board" and "licensing board" are also used in this article, as are "states" and "jurisdictions." The states, territories, and the District of Columbia have "licensing statutes" and "registration boards." The one term that does not lead to interchangeability is "architect." There is no acceptable use of a term such as "unlicensed architect."

QUALIFICATIONS FOR LICENSURE

Licensing statutes define the qualifications for licensure, dealing in different ways with the same three topics—education, experience, and examination:

- *Education*. While the majority of jurisdictions now accept only a NAAB-accredited degree as a prerequisite to licensure, a declining number of jurisdictions allow a lower threshold for education. The bar may be set at: a minimum four-year pre-professional degree, such as a Bachelor of Science in Architectural Studies; a four-year degree in an unrelated field; a two-year associate's degree from a community college or technical college; and in some cases, a high school diploma.

- *Experience.* The second area of requirements for licensure applies to experience. Typically, this means completion of the Intern Development Program (IDP). When a state allows a lower education threshold it will usually require a longer term of internship (experience) before an individual without an accredited degree can qualify for the Architect Registration Examination® (ARE®). These jurisdictions may also allow some parallel means to documenting experience that is nevertheless based on and parallel to IDP.
- *Examination.* This is the final step. The licensing jurisdiction must determine when the individual has qualified to take the ARE, in some cases allowing early eligibility to take portions of or the entire exam before completion of the experience requirement. Whereas in the past, the "three legs of the stool" (education, experience, examination) were seen as being assembled sequentially, it is now not unusual to have candidates begin to acquire qualified experience while still enrolled in a degree program and to begin the exam before completing the experience requirement. In all cases, however, a jurisdiction will not issue a license until all steps have been successfully completed.

Upon successfully meeting their registration board's education, examination, and experience requirements, a candidate for licensure will then have to complete that board's application and fulfill any additional requirements of that jurisdiction. These will certainly require the payment of a fee, but there may also be a supplementary exam covering local conditions or a jurisprudence exam, typically a take-home open-book test of the candidate's knowledge of local licensing laws and rules. Only upon completion of all requirements will a license then be issued.

There are potential disqualifications for licensure, such as past felony convictions including specific convictions for sex-related offenses or for failure to pay child support.

Foreign-Educated and Trained Professionals

Individuals educated in other countries, and even those who have been practicing as architects in their home country, have additional hurdles to clear in order to become licensed to practice in any of the 54 jurisdictions. This may include obtaining an EESA-NCARB evaluation (performed by Education Evaluation Services for Architects) of a foreign-educated architect to determine in what areas additional education might be required. In this evaluation, the candidate's transcript (in English) is weighed against the NCARB *Education Standard*. Some states also accept individuals licensed in other countries who have demonstrated competence through the NCARB Broadly Experienced Foreign Architect Program. Other jurisdictions will not allow a foreign-educated individual to take the ARE unless he or she acquires a NAAB-accredited degree.

The difficulty of understanding the wide variation of applicable regulations is made more daunting by the fact that many foreign-educated professionals come from countries where there is a single licensing authority and a single set of rules.

RENEWAL OF A LICENSE

Licensing requirements include different renewal cycles or terms. These can be one-, two-, or three-year cycles. Although a licensing board may send out renewal notices, it is incumbent upon the individual to know when a license is due to expire. Some jurisdictions allow for a grace period for overdue renewals, and this may include an additional fee penalty. In a jurisdiction where no grace period is allowed, or where a license has lapsed beyond the period allowed, an individual is likely to have to start the licensing process all over again.

In many states, mandatory continuing education (MCE) is now a requirement for re-licensure.

The renewal form, likely to be available online, will typically include a series of questions, including those relating to whether the licensee has been the subject of disciplinary action related to a stamp held in another jurisdiction or whether another license has been voluntarily relinquished (this may be indicative of a stipulated agreement to resolve a disciplinary action). When the fee has been paid and an architect's stamp is renewed, the licensee will receive a new license to post on the wall as well as a new wallet card.

▶ The accompanying backgrounder on continuing education provides a detailed discussion of MCE requirements.

RECIPROCITY

There are two principal means of obtaining a license in a jurisdiction beyond the original one in which an architect was registered. The first, and the most common, is referred to either as "comity" or "endorsement." Even though the terms have slightly different meanings, they are essentially the same thing. The technical meaning of comity is accepting as a courtesy the qualifications for licensure from another state. Even when comity is applied, most jurisdictions will require the applicant to have a certified NCARB Council Record, which is then forwarded to the state in addition to filling out the application form and sending in a fee. In a state using the term "endorsement," the process will be the same.

▶ See the backgrounder on NCARB Certification (3.2) for related information.

The second means for reciprocal licensure is where a registration board will accept the NCARB Certificate on its own. This includes those states that will accept applicants who have qualified for NCARB certification via the Broadly Experienced Architect (BEA) program or the Broadly Experienced Foreign Architect (BEFA) program. The option applies to architects without a NAAB-accredited degree who have been licensed in another state for a minimum period of time (6 to 10 years, depending on the level of education attained). Through this process, the architect must demonstrate equivalent learning through practice in order to fulfill each of the requirements specified in the *NCARB Education Guidelines*. The BEFA option applies to architects licensed by a foreign credentialing authority. The BEFA process requires establishment of an NCARB Record, preparation of a dossier to demonstrate experience, and a personal interview.

For a number of reasons, especially pertinent to applicants under the BEA program, it often proves valuable for architects to retain a license in the first state in which they were registered. In a new state, the same rules pertaining to new licensees are likely to apply with respect to supplemental or jurisprudence exams, and some jurisdictions also include an affirmation that the architect has passed a seismic exam or taken the ARE after a certain date (1965) at which seismic content was included.

EXEMPTIONS

Perhaps no subject engenders more heated discussion of licensing statutes in the legislative arena than that of exemptions to the requirements that buildings be designed by architects. The reasons for these exemptions, which exist across the spectrum of jurisdictions, are often philosophical, practical, or purely political.

There are several types of exemptions, the most common being those for buildings not intended for human habitation or occupancy (for instance, some agricultural structures). The next most common are for residential structures, defined either by size, height, the number of occupants or families, or construction cost. These vary widely among the jurisdictions and are subject to push and pull every time an architectural licensing law is opened up to legislative and public scrutiny. Anyone designing a structure that is exempt because of size or cost must be especially attentive to the definition applying to that exemption. For example, how is cost defined? The final cost of a project might exceed a preliminary estimate and thus place the structure out of the protection of the exemption.

THE ARCHITECT IN RELATION TO OTHER PROFESSIONS

Architects practice in a broader context of related and allied professions. There are corresponding exemptions in the regulation of other professions, just as architectural licensing laws have exemptions for others to engage in aspects of practice that might fall under the definition of the practice of architecture. As architects continue the trend of expanding services both horizontally and vertically, they must become particularly attentive to the full breadth of the law and not just what is found in architectural licensing statutes.

In addition to exemptions for types of buildings, there may be exemptions for categories of practice: A statute, in deference to the Supremacy Clause of the U.S. Constitution (which says that the federal government must operate free of interference by the states) may be specific that federal employees are exempt from the requirements of the licensing statute. Also, as discussed earlier, there may be partial or full exemptions for other professions to engage in architectural practice in some form.

Likewise, the licensing statutes of these other professions may allow reciprocal exemptions for architects, for both title and practice. A simple example is when an architect is allowed to engage in site design even though this may also fall into the description of the practice of landscape architecture. Another might be when an architect is allowed to describe "interior design" services when a title act for interior designers also exists. These nuances require architects to be aware of not only their own licensing laws but also those applying to related fields.

Finally, there is an important paradox relating to exemptions and exempt structures: One does not have to be an architect in order to design an exempt structure. However, if a nonarchitect is holding out as an architect while advertising for or designing an exempt structure, they will likely be found in violation of the statute.

CORPORATE PRACTICE

Some jurisdictions require firms as well as individuals to be registered in some form. In some states the firm name must be registered with (and approved by) the licensing board. This may require an annual fee.

Beyond the mechanics of corporate registration, corporate practice requirements in licensing laws may comprise several, sometimes complex, areas. One of the most common governs the composition of firms. Depending on whether a firm is a sole proprietorship, a partnership, a professional corporation, or another type of entity, there may be a requirement for a certain number of the firm's principals or directors to be—or for a minimum percentage of stock ownership to be held by—architects licensed in the jurisdiction.

Firm names may also be regulated, and an architectural practice from another state may discover that it is operating under a name that is not acceptable in a new state. Firm name requirements may govern the use of what are termed "fictitious business titles," and may require a formal approval by the regulatory agency. "Fictitious" may be a confusing term for an architecture firm that sees itself as anything but imaginary, but it applies to a firm name that does not indicate the ownership of the firm. For instance, a firm called "Architectural Partnership" doesn't include the names of the actual partners in its title and is thus a fictitious business title.

Other provisions may limit how long a firm can keep the name of a deceased or retired partner or principal. Architecture practices may find themselves removing the name of a deceased partner or resorting to initials in order to comply with regulations in their home states or in order to practice without reincorporation in multiple jurisdictions. Similarly, a firm with only a single registered architect cannot use "Architects" in its title.

Regardless of what a licensing statute regulates with respect to corporate practice, there are likely to be other restrictions and requirements to set up a business in the state. The administration of these usually resides with the secretary of state's office. A firm must decide (factoring both legal and accounting advice) whether or not to register with the secretary of state in a new jurisdiction, and in some cases it may even be necessary to reincorporate under a different structure just to be able to practice at all in the state.

NCARB.ORG

The website of the National Council of Architectural Registration Boards, NCARB.org, is an invaluable source of information on licensing requirements, including documents such as the *Rules of Conduct* and the *Legislative Guidelines and Model Law/Model Regulations*. The site also offers a Registration Requirements Comparison Chart and provides links to the sites of the individual registration boards. Please refer to the "For More Information" section at the end of this article for specific links to documents."

Other regulations affecting corporate practice may apply. Some have requirements for the services of an architect to be retained during the construction period or for work to be performed only with a signed agreement. Such rules are not only important to understand, but they also may offer tangible benefits to practice in that state.

▶ The backgrounder on Firm Legal Structure (5.2) further addresses business entities.

COMPLAINTS

Any member of the public (whether a client, a building user, or another architect) can file a complaint with a licensing board. Once received, the complaint is reviewed first by the staff and then by the board, which will choose among several courses of action:

- *Dismissal.* A complaint can be dismissed either with or without prejudice, which has a bearing on whether the complaint can be brought up again if more information or evidence becomes available.
- *Investigation.* The board can send complaints either to staff investigators or to consultants (often other architects) to look into the matter in detail, reviewing drawings and other documents and then making a recommendation to the board.
- *Referral to the state attorney general's office.* A complaint against a nonlicensee may not fall under the actual jurisdiction of the board, in which case the attorney general's office can pursue an action, resulting in a sanction such as a cease-and-desist order.
- *Deferral.* Boards may hold off on taking an action after reviewing the complaint, sometimes until a separate civil or criminal suit is resolved.
- *Disciplinary action.* The board may take an action after reviewing the complaint.

The duty to file complaints does not fall solely on members of the public. Indeed, architects have a duty to report violations of the statute, whether this has been committed by an architect or an unlicensed individual. Architects also have a responsibility to self-report life safety issues, including those that result in insurance claims. This duty to report may be either when an event occurs or in the course of filling out the license renewal form.

The responsibility to report violations of the statute is one that architects are often uncomfortable with. An architect must, however, consider the possible consequences (to the public or to the occupants of a building) should a violation of a licensing law not be reported.

DISCIPLINE

As discussed above, there are two basic types of violations considered by licensing boards:

- *Violations by untrained and unlicensed individuals.* Discipline in such cases may not fall under the purview of the licensing board and must be referred to another agency, such as the state attorney general's office.
- *Violations by trained individuals*, either those licensed and already practicing in the jurisdiction or those who are not yet licensed there.

Those not yet licensed may have an application already in process, or they may be interns "moonlighting" (performing services outside of their regular employment and without a license). In these and in similar instances, the registration board has a purview and may ultimately grant a license pending payment of a fine and acknowledgment of the violation per a stipulated agreement.

Perhaps the most common instances leading to major disciplinary actions are those involving plan-stamping or misuse of the title (holding out). Registration boards, with the advice and guidance of their administrative agencies or state attorneys, have a range of options from which to choose, including:

- A letter of admonition that becomes part of the public record
- Fines, within the level of authority given to the board by statute or rule

- Cease-and-desist orders issued by the state attorney general's office
- Requirements for specific remedial education (such as a course in ethics)
- Suspension of a license for a specific period
- Revocation of a license
- Imprisonment: for instance, if an individual refuses to obey a cease-and-desist order

Board rules usually spell out the due process established for complaints. These define the steps that must be followed: complaint, investigations, hearing, decisions or referral, possibly negotiation, and ultimately appeal.

Discipline levied in one licensing jurisdiction can have a direct effect on a license held in another state. NCARB maintains a disciplinary database that can be accessed by licensing boards, either in the course of investigating a complaint or when a license is renewed and an architect has checked off a box indicating discipline in another jurisdiction. The outcome can be that a license may be revoked or suspended if a violation in one state is comparable to what would have been a violation in another. This general rule is important, for example, when a violation of a corporate practice requirement in one state might not be applicable in another. A felony conviction in one state, however, is almost certain to apply across state lines.

There are other, potentially grave, business consequences of performing work without a license. These include the difficulty of recovering fees for work performed once it has been discovered that someone has been practicing without a license. Courts have typically been reluctant to grant relief to the professional in such cases, when an architect has brought suit to collect against a client who has refused to pay.

BOARD RULES AS OPPOSED TO STATUTES

Licensing boards also maintain Rules of Procedure as well as written Policies. The Rules spell out the details not covered in the statute, and they often include the details applicable to qualifications for licensure, such as:

- Equivalent process and documentation to be followed in the few states that do not require IDP
- Rules for allowing early examination
- Requirements for design and use of the stamp
- Rules regarding the wall license and wallet card
- Conformance to an ethical code

Most boards develop their own ethical code based in whole or in part on the *NCARB Rules of Conduct*. A few states simply adopt these by reference.

The details applying to Mandatory Continuing Education (MCE) are also included in the board's rules. These will specify the process by which MCE must be documented as well as the categories of continuing education that are allowed and disallowed.

The rules of a registration board can be amended by the board through a public rule-making process. Such a process will include requirements for promulgation of language proposed for new rules, time for a public comment period, and adequate notice for the public hearing that must be managed by the board. Board policies, on the other hand, detail board and staff procedures that are not subject to the formalities of rule-making. These can be acted upon independently by the board, with the staff of the regulatory department.

THE U.S. ARCHITECT AND GLOBAL PRACTICE

More U.S. architects are practicing or seeking to practice in some form in countries around the world. As much as regulation varies in our country from one jurisdiction to the next, global regulation appears in even more forms. Some countries don't regulate at all, while others credential the title only. In some cases, the title of "architect" may be granted upon graduation from an architecture degree program. In the face of confusing—and occasionally ambiguous—regulation abroad, many architects wisely choose the option of teaming with a local firm instead of attempting to operate solo in another country. As with our own requirements, a foreign country may not accept education here as comparable to what is approved in that location, and if there is an examination requirement, that test will most likely be given in the language of that country. International practice is still in many ways an untested and rapidly evolving area, making attention to the particulars of architectural regulation especially important.

Rules and policies are important parts of the total framework for the regulation of practice. Any architect searching for a topic in the licensing law and coming up empty should go next to these documents to find the answer.

CONCLUSION

The regulation of architects, for which the overarching purpose is to protect the public health, safety, and welfare, is a complex world, covering many aspects of individual and corporate practice. The dynamics of regulation among the 54 separate jurisdictions can seem confusing, but it is important to consider that this complexity—and indeed richness—reflects our society, our national history and the U.S. Constitution, regional particularities, and the evolving conditions in which architects practice. It is the responsibility of each professional to keep pace with this context and to understand the laws and rules of the jurisdictions in which he or she practices or wishes to practice.

BACKGROUNDER

WBE/MBE/DBE/SBE CERTIFICATION

Katy Flammia, AIA

Women-owned, minority-owned, and small design firms may access business opportunities by becoming certified as a Woman Business Enterprise (WBE), Minority Business Enterprise (MBE), Disadvantaged Business Enterprise (DBE), or Small Business Enterprise (SBE). Understanding the definitions, processes for certification, and opportunities will help to determine if certification is a good strategy for a firm.

Katy Flammia is an architect in Boston. Her firm, THEREdesign, specializes in the design of branded environments for corporate, hospitality, and academic clients and has been certified as WBE, MBE, and DBE since 2007.

INTRODUCTION

State and local governments have established goals for awarding a portion of design and construction contracts to minority- and women-owned and small business enterprises. The purpose of these goals is to encourage the growth of these businesses and their greater participation in the economy.

The process for awarding contracts, the amount of the goal (% MBE or WBE participation required on each contract), qualification requirements, and method of certification varies from state to state, from year to year, and from awarding agency to agency. Because it is impossible to give exact numbers or qualifying information, this article will offer general definitions and will outline a strategy for determining if certification is right for a firm. It will also cover how to find the information needed to pursue certification and, most importantly, what to do once certified.

IS A FIRM ELIGIBLE?

Woman- or Minority-Owned Business Enterprise (WBE or MBE)

A firm must meet the following requirements:

- Minimum 51 percent woman or minority ownership of the firm.
- Some states have personal net worth limits for company owners.

(continued)

- Some states may have a size standard. Check state requirements.
- Certification required.

Disadvantaged Business Enterprise (DBE)

A firm must meet the following requirements:

- Minimum 51 percent woman or minority ownership of the firm.
- The personal net worth of the business owner may not exceed $1.32 million (excluding business equity and personal residence).
- Certification required.

Small Business Enterprise (SBE)

- The U.S. Small Business Administration defines "small" by industry. Most state and local governments follow the SBA guidelines when certifying SBEs. In 2012, the limits were as follows:
- Architectural services: $7 million average annual revenues over 3 years
- Interior design: $7 million average annual revenues over 3 years
- No personal net worth limit for company owners

IMPORTANT CONSIDERATIONS

Before starting the certification process, do some research about what contracts are being offered by government and corporate entities that require or encourage the use of minority-owned, woman-owned, disadvantaged, or small businesses.

What Kind of Work Does the Firm Do? What Is the Firm's Specialty?

For example, if a firm specializes in housing or K–12 and higher educational facilities, projects on which the firm's services will be needed will be offered by state and local governments.

On the other hand, if the firm designs private residences or specializes in hospitality or retail, it is much less likely there will be contracts issued that require or encourage the use of firms with MBE, WBE, DBE, or SBE certification.

What Size Is the Office, and What Size Projects Does the Firm Design?

If a firm is very small, it may be very hard to acquire large contracts for projects such as school buildings or housing developments. Nevertheless, this doesn't mean the firm shouldn't get certification and team with other firms on large projects or try for small projects. Small projects are often grouped together under an indefinite scope contract. These are awarded by an agency to several firms that are then "on call" for projects as they come up. Another good strategy is to team with larger firms as a subconsultant.

- Create a marketing plan identifying the types of projects that align with a firm's strengths and business direction.
- Research which agencies, municipalities, and corporations are offering those sorts of contracts the firm does.
- Determine what agencies require or encourage using minority-owned, woman-owned, and disadvantaged and small businesses.
- Begin the certification process once firm leaders are satisfied that there are plenty of opportunities for the firm.

CERTIFICATION PROCESS

Woman- or Minority-Owned Business Enterprise (MBE or WBE)

Most states, agencies, and corporations require a third-party certification. Many states have an agency that does the certification, and the process is free. This often means the firm is only certified in a particular state.

There are other organizations that certify for a fee. The Women's Business Enterprise National Council (WBENC) is an example. This certification is nationally accepted, but a firm will need to determine if the organization's certification is recognized by the contracting agency/corporation.

Go to a state government's website to learn about the process.

There is generally a relatively long list of documents firm owners will need to provide. Typical documents include company tax returns, copies of proposals or contracts, paystubs, or W2s.

The state may require an interview. Someone from the certifying agency will come to a firm's office and ask firm owners and staff about their work. The purpose of this visit is to establish that:

1. The company actually is a real business.
2. The woman or minority owner actually runs the firm and is not only an owner in name.

The entire process can take a few months to complete. Certification needs to be renewed every one to three years.

Disadvantaged Business Enterprise (DBE)

DBE certification is a federal program and is distinct from most states' WBE/MBE certification. It can sometimes be applied for simultaneously, reducing repetitive paperwork. There are similar requirements to the WBE and MBE certification, but in addition firm owners will need to provide:

- Personal tax returns
- Personal financial statement

DBE certification is generally up for renewal every one to three years.

Small Business Enterprise (SBE)

This is a self-certification process, as follows:

- On the Small Business Administration website, look up the firm's NIACS number and determine whether the company is within the limit for the industry.
- Get a Data Universal Numbering System (DUNS) number at http://fedgov.dnb.com/webform/.
- Register with the System for Award Management Site (SAM). This has replaced the Central Contractor Registry (CCR) and is a database that awarding agencies use to find firms and learn about the services they offer.

Certification generally needs to be renewed annually.

GETTING WORK AFTER CERTIFICATION

Being certified only gives a firm an enhanced opportunity to compete for work. Now the firm must put a marketing plan into action.

Many states have online resources listing contracts posted by the purchasing agency. Some offer an e-mail subscription to receive solicitations. Others require someone to check regularly for opportunities.

Some agencies may require that a firm submit and keep current a master file or a standardized document with information on the business.

Few of the designations give a firm access to work as "set-asides," meaning that projects or a certain percentage of a project can be given only to qualified participants. All of the designations discussed may only give a firm a small bump up among all the qualified applicants. Firm owners will still need to market, network, and pitch their company's services. It's important to meet the decision makers and become acquainted with members of designer selection boards.

If working as a subconsultant is the goal, let prime contractors know about the firm's services. Create marketing materials that list the firm's services and all certifications. Make it easy for "primes" to invite the firm onto their teams.

Most importantly, the firm needs to do very good work. In some areas, contractors have used these certifications to gain contracts and have underperformed, causing certification to sometimes be stigmatized. To counteract this, firms need to build a body of excellent work and a strong reputation.

Tips

- Entering into the world of government contracts is like learning a new language. It definitely requires a time and resource investment.
- Accept that it takes time and effort in the beginning to make the company known.
- Remember to market just as for any other work the firm is trying to get. Those who assume the phone will start to ring as soon as they get certified often give up and think the effort was useless.
- There are literally hundreds of resources for assistance. Many of these are free. The hardest part is narrowing down which events, training activities, and mentors are best for a firm leader to attend.
- Be very careful about companies promising to get the firm contracts. They are usually selling expensive services. Start with a state's local programs and with the Small Business Administration. Look for websites that have the .gov address; these are usually the legitimate sites.
- Don't take on more than the firm can handle at once. Choose two or three agencies or project types and go deep rather than broad. Once the firm is established in an agency or field, then branch out.
- Seek advice from firms who have been doing government work. Many times an allied professional, such as a landscape architect or an engineer, is a good resource. Getting work is all about teaming, so sharing leads can be very useful.

OTHER DESIGNATIONS

Small Disadvantaged Business (SDB)

The 8(a) Business Development Program is much like the WBE, MBE, and DBE, but with a very low net worth threshold. Unlike the other programs, this program has project set-asides that are given to qualified participants of this program. A firm ages out after eight years of participation or outgrows the program when the firm earns more than the program limits, whichever comes first.

Hubzone-business areas are specially designated inner-city neighborhoods employing local workers. There are also other designations that might offer opportunities, such as Veteran-Owned and Disabled-Veteran-Owned.

BACKGROUNDER

MANDATORY CONTINUING EDUCATION

Cornelius R. DuBois, FAIA

A majority of licensing jurisdictions now include requirements for mandatory continuing education (MCE) as a condition for renewal of a license to practice architecture. As with licensing laws in general, the requirements for MCE vary, and it is up to the licensee to track and comply with those in each jurisdiction.

THE RATIONALE FOR MANDATORY CONTINUING EDUCATION

Architects live and practice in a rapidly changing world. The body of knowledge required for the practice of architecture is always changing.

The licensing exam (the Architect Registration Exam®, or ARE®) evolves periodically in a process designed to keep pace with these changes. The goal is to see that individuals are examined on the knowledge and skills that have been determined to be necessary for practice. This process, called the Practice Analysis, is undertaken by the National Council of Architectural Registration Boards (NCARB) every five to seven years. The principal outcomes of the process are to define the specifications for the ARE®, inform the Intern Development Program (IDP), and guide NCARB's response to the 2013 National Architectural Accrediting Board (NAAB) Accreditation Review Conference (ARC). The results of the Practice Analysis are also used to understand the continuing education needs of architects and to inform NCARB's continuing education policies.

While the most direct rationale for MCE is to provide a means for architects to demonstrate that they have kept abreast of changes in the knowledge required to practice, legislative discussion often requires more specificity. Architects and the registration boards that grant licenses to practice architecture have recognized that many architects practicing today were originally qualified through earlier versions of the ARE that did not include all of the content that is in the most current version of the exam. Continuing education requirements can thus be viewed as a means to attempt to see that all architects in practice have demonstrated that they have met the same standards for knowledge and skills that apply to new licensees taking the exam today.

Mandatory Continuing Education is a practical and economical alternative to requiring practitioners to take the ARE all over again or for each state to devise its own psychometrically valid and legally defensible supplemental exam. As is found in many professions, the basic rationale for MCE requirements is therefore one of simple logic and acceptance of the fact that current practice requires broader and different knowledge than it may have in the past. Materials, systems, equipment, construction methods, building codes, and technology change. Continuing education requirements are in place to help architects keep pace with those changes.

MCE Cycles

Registration boards today follow different schedules and cycles for license renewal, some of which tie to a calendar year while others do not. A cycle may tie to general regulatory administrative practice within a state and may thus be more difficult to change. A resolution passed at the NCARB 2011 Annual Meeting established the calendar year as the recommended period for MCE reporting, and NCARB is actively encouraging its member registration boards to amend their rules and statutes for greater consistency. Achieving this ambitious goal will take time because some of the changes in each jurisdiction will have to move through the legislative process.

CATEGORIES OF MANDATORY CONTINUING EDUCATION

The U.S. licensing jurisdictions (the 50 states, the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands) have different requirements for the types of MCE that qualify for credit. Generally, these fall into four categories:

- Health, Safety, and Welfare (HSW)
- Sustainable Design (SD)
- Accessibility (ADA)
- Other (Non-HSW)

Many jurisdictions require only HSW subjects. The rationale for this is tied directly to the reason that architects are licensed to practice in the first place—to protect the health, safety, and welfare of the public and to provide for consumer protection.

The specific categories allowed for HSW credits are usually defined in the rules of each board. These typically include sessions and seminars that have been jointly qualified for Continuing Education Hours (CEHs) or Learning Units (LUs) by the AIA and NCARB for HSW content. But there are also categories that may not be allowed, such as service on a professional, community, or municipal board or committee. Self-reporting of HSW MCE activities is usually not allowed.

Some jurisdictions offer a form of comity, so that if an individual has met the MCE requirements of another state they are deemed to have met this state's requirements as well. As boards work to align their procedures and implement NCARB's new model regulations for MCE, requirements will become more consistent across the country.

CONTINUING EDUCATION TERMINOLOGY

There is a potentially confusing lack of consistency in the terminology applied to continuing education hours. The AIA uses LUs (Learning Units) in its Continuing Education System, while NCARB, many licensing jurisdictions, and some providers use CEHs (Continuing Education Hours). Dual acronyms for the same thing is one matter; however, some jurisdictions, employing the customs of regulatory agencies that may be administering continuing education requirements for multiple professions, use other terms, such as PDUs (Professional Development Units) or PDHs (Professional Development Hours). Essentially, these all refer to the same thing, where one credit hour is acquired during an activity (seminar or self-study) of at least 50 minutes.

ACCEPTABLE PROVIDERS

Generally, course content from the following provider organizations will be approved, with each jurisdiction having its own specific requirements:

- AIA Components, through AIA/CES (Continuing Education System)
- AIA/CES program registered providers
- NCARB (Monographs)
- Some state boards offer a limited number of their own courses.
- Registered providers to the state registration boards
- Institutions offering NAAB-accredited architecture degree programs
- State and local governments and agencies
- Many other organizations, such as the U.S. Green Building Council (USGBC), Urban Land Institute (ULI), and American Planning Association (APA)

DOCUMENTATION OF MCE

Architects must keep thorough records as they complete continuing education activities. This is especially important when an architect is licensed in multiple jurisdictions, each with a different set of requirements. It is often critical to obtain a certificate from the course or session provider—preferably as soon as possible after the course has been completed. Some online courses allow one to take a quiz, and a certificate is then generated immediately upon passing the quiz. Most jurisdictions, when auditing registrants, require submittal of certificates of completion for all continuing education units claimed for renewal of a license.

Either the certificate or some other documentation of the course should indicate the "learning objectives" of the program. If, for some reason, this has not been provided, the architect should prepare a record that notes learning objectives for all continuing education. Some states require additional documentation, and this may be on a form that is unique to that jurisdiction. For instance, an architect may be required to describe how the course met learning objectives and how this is likely to benefit his or her practice.

Most states verify conformance with MCE by auditing a certain percentage of the registrants for license renewal. Even if the odds of being audited in a given jurisdiction might be statistically small, the consequences of being unable to validate and verify one's continuing education record with the proper documentation are serious. If an audit indicates that a registrant has failed to demonstrate an adequate number of the required units or hours, or if that documentation is incomplete, the registrant may be allowed a grace period in which to either provide the appropriate documentation or complete additional continuing education courses to meet the requirements.

STATE REQUIREMENTS FOR MCE AND THE AIA CONTINUING EDUCATION SYSTEM

Participation in the AIA's Continuing Education System (AIA/CES) is a major benefit to an architect complying with the MCE requirements of licensing jurisdictions. Some jurisdictions allow submittal of the AIA transcript as verification of CEH. Where this is the case, the transcript must be sorted for the correct time period and for HSW courses where these are the only credits allowed.

Even where the transcript cannot be attached and sent along with the application form, the individual can print out his or her transcript and then transcribe the information onto the form required by the jurisdiction. As greater uniformity is achieved, more jurisdictions may allow the AIA transcript to be used directly, but for the immediate future an architect should plan on completing separate paperwork on the often unique forms provided by each jurisdiction.

As long as calendar cycles for license renewal and documentation for continuing education vary from state to state, architects may have to strategize the timing of their learning activities so that adequate credits show up in the right "window" for a particular jurisdiction. Some jurisdictions, committed for now to renewal cycles that set to a midyear date such as July 1, have implemented cycles for documentation of MCE that are tied to the calendar year, thus making it much easier on registrants who are also tracking their AIA membership requirements for CEUs.

Many architects belong to other associations or hold certifications that have their own continuing education requirements. Often, a course that qualifies for one program will also fulfill those for another.

CONCLUSION

Requirements for Mandatory Continuing Education are rapidly evolving, and more jurisdictions can be expected to include requirements in their statutes and rules. MCE is a natural manifestation of an increased emphasis in our society and the profession on life-long learning and should be valued accordingly. Architects should see continuing education requirements as an opportunity to enrich their professional knowledge and to better serve clients and the public.

3.2 Intern Development

Harry M. Falconer Jr., AIA, NCARB, and Catherine Berg

Completing a period of professional internship is essential to an architect's development—and is an important component of the licensure process. Gaining practical experience under the guidance of experienced professionals is invaluable to aspiring architects and prepares them for independent practice.

► See AIA Continuing Education System (3.4) for further discussion of AIA/CES.

THE EXPERIENCE COMPONENT OF LICENSURE

Architects are responsible for the health, safety, and welfare of the people who live or work in the buildings and environments they design. It is because of this significant responsibility that an individual must be licensed in order to practice architecture or use the title of architect. Licensure signifies to the public that an individual has completed the education, experience, and examination necessary to practice architecture.

Only individuals who are licensed by one of the 54 architectural registration boards may call themselves architects.

Gaining experience in the profession is an essential step on the path to become an architect (see Figure 3.1). It is a key component of licensure and offers an important opportunity to develop the knowledge and practical skills necessary to practice architecture.

WHO IS AN INTERN?

The term "intern" refers to any individual in the process of satisfying a registration board's experience requirement. This includes anyone not registered to practice architecture in a U.S. jurisdiction, graduates from professional degree programs accredited by the National Architectural Accrediting Board (NAAB), architecture students who acquire acceptable experience prior to graduation, and other qualified individuals identified by a registration board.

The Intern Development Program (IDP)

Through the IDP, interns learn about the daily realities of architecture practice, acquire comprehensive experience in basic practice areas, explore specialized areas of practice, develop professional judgment, and refine their career goals.

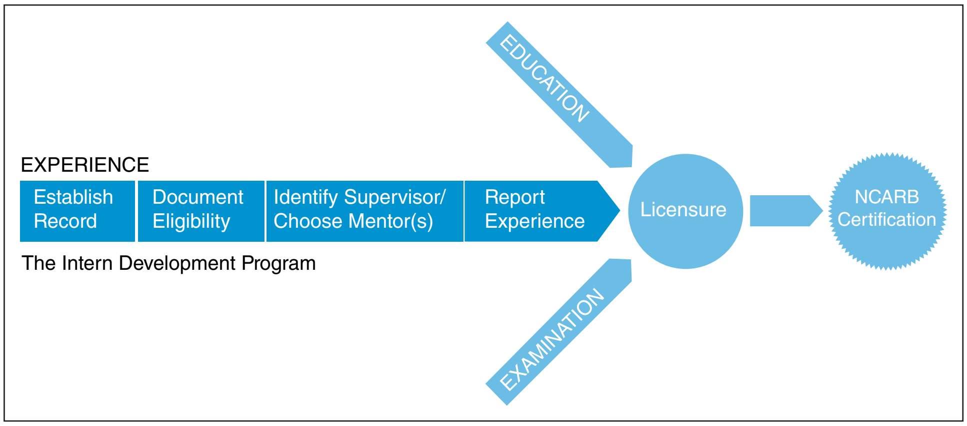
Upon completion of the program, an intern should essentially be able to complete the design of a building from start to finish and manage the project through all phases, from programming to project closeout. This means having the ability to fulfill tasks such as performing site analysis, establishing project cost and feasibility, preparing schematic design documents, applying sustainable design principles, performing code analysis, and preparing construction documents. At the completion of the IDP process, interns should be able to demonstrate knowledge and skills in a wide range of areas, such as basic engineering principles, site design, constructability, and contract negotiation. These are just some of the many tasks and knowledge/skills that the IDP identifies as essential for the independent practice of architecture as a licensed professional.

► Regulation of Professional Practice (3.1) and the backgrounders on the Architect Registration Examination and NCARB Certification (3.2) further discuss the process of achieving licensure.

MANY OPPORTUNITIES TO EARN EXPERIENCE

The IDP is designed with both rigor and flexibility in mind, identifying the experience interns will need and providing a range of opportunities to earn the required experience. It's the nature of the profession that no two interns' experiences will be exactly alike; however, upon completion of the IDP, all interns should possess the knowledge and skills required for the independent practice of architecture as a licensed professional.

Harry M. Falconer Jr. is director of internship and education for the National Council of Architectural Registration Boards (NCARB). He joined the Council in 2006 and assumed his current position in 2012. He is licensed to practice in Virginia and holds the NCARB Certificate. Catherine Berg is senior writer of the Communications Directorate for NCARB.



Kenji Bohlin, NCARB

FIGURE 3.1 Path to Licensure: Experience Requirement

Learning First-Hand from Architects

All interns must spend a period of their experience in an architecture firm, working under the supervision of an architect. Learning the practice of architecture directly from architects is integral to the development of emerging professionals.

The collaborative and mentoring relationship between intern and supervisor provides a structured environment for making the transition from school to the profession. Working in a firm under an experienced architect gives interns a grounding in the fundamentals, opportunities to exercise critical thinking, and the chance to experience firsthand how the business of architecture works.

PATH TO LICENSURE

Along the path to licensure, there are a number of choices available to aspiring architects—from selecting a professional degree program, to determining how and where to fulfill internship requirements, to deciding when to take the examination and where to seek initial licensure. Each of the key components of licensure—education, experience, and examination—plays a critical role in an architect's development, and proactively planning for how to satisfy requirements is an important way to take charge of one's career and make the most of each experience along the way.

The architectural registration board in each jurisdiction controls licensure and determines the requirements for initial and reciprocal registration in that jurisdiction. Reciprocity is when a registered architect in one jurisdiction applies for registration in another jurisdiction by presenting documentation that he or she meets that jurisdiction's registration requirements. Checking with an individual board is the best way to verify current requirements.

EDUCATION

In most jurisdictions, earning a professional degree from a program accredited by the National Architectural Accrediting Board (NAAB) is the most accepted way—and often the only way—to satisfy the education requirement for licensure.

EXPERIENCE

All registration boards require a minimum period of internship in order to fulfill experience requirements for licensure. The Intern Development Program (IDP) is required in most jurisdictions and identifies the experience needed for the independent practice of architecture.

EXAMINATION

The Architect Registration Examination® (ARE®) is required in all 54 U.S. jurisdictions and assesses whether a candidate has the knowledge, skills, and ability required for competent practice upon initial licensure. The ARE evaluates the skills that are necessary for protecting the public health, safety, and welfare.

A jurisdiction's architectural registration board ultimately determines whether a candidate has met the requirements for licensure. In addition to the education, experience, and examination requirements, there may be other jurisdictional requirements that must be met in order to complete the licensure process.

Once architects have achieved licensure, they may earn NCARB certification, which helps facilitate reciprocal registration in other jurisdictions.

Interns looking to gain international experience may also earn a portion of their IDP experience working abroad for an architecture firm, under the supervision of an architect who is credentialed by a foreign authority.

Beyond Traditional Practice

Architects can be found in a wide range of professional environments where their skill sets are in demand. In recognition of the opportunities to go beyond traditional practice, there are additional professional settings in which interns can earn experience:

- Working under registered professionals in related professions, such as landscape architecture or engineering
- Working under the direct supervision of a licensed architect in an organization that's not engaged in the practice of architecture, such as a facilities management company

Academic Internships

Interns also earn IDP credit through qualifying academic internships, giving them a jump start in fulfilling program requirements while still in school. Any internship that is integrated into an academic program, whether it be as a requirement or as an elective, is considered an academic internship.

SUPPLEMENTAL EXPERIENCE

The IDP specifies a variety of ways interns can earn experience outside of a traditional setting.

Taking advantage of options to earn supplemental experience demonstrates an intern's initiative and proactive approach to augmenting his or her professional development. Some activities can be completed under the supervision of mentors, providing an invaluable opportunity to deepen relationships and to broaden professional networks. Supplemental experiences like pro bono Leadership and Service, and service to Community-based Design Centers, offer interns the opportunity to engage the greater community. In addition, the work that results from experiences such as design competitions can contribute toward the intern's professional portfolio.

Supplemental experience options include interactive, online, and self-directed activities. Unless otherwise noted, nearly all of these experiences can be completed whether or not the intern is employed, and depending on the opportunity, will earn credit for either core or elective hours.

INTERACTIVE EXPERIENCE

- *Leadership and service*. Interns need to earn a minimum number of hours through pro bono leadership and service in support of an organized activity or a specific organization. The experience may be design industry–related (e.g., Habitat for Humanity); education-related (e.g., English for Speakers of Other Languages [ESOL] teacher, critic at design review); related to strengthening of the community (e.g., soup kitchens, civic participation); or related to a regulatory or professional organization (e.g., volunteering for the AIA or the Green Building Certification Institute).
- *Site visit with mentor*. Interns can earn core hours by visiting construction sites with their mentors. Site visits allow interns to see the progress of a job over time and engage in a dialogue with their mentors. The experience is meant to be interactive, with opportunities to discuss how issues related to the specific project were resolved and why particular decisions were made.
- *Community-based design center or collaborative*. Interns can earn core hours in most IDP experience areas for volunteer service in support of a preapproved charitable organization. The work must be in support of "building" or "planning" projects. NCARB provides a list on its website of organizations it currently recognizes.
- *Design competitions*. Under the supervision of a mentor, interns can earn core hours for completion and submission of a design competition entry for a "building" or "planning" project. Entering design competitions creates regular opportunities for the intern and mentor to interact, and offers a great way to earn core IDP hours across all related IDP experience areas.
- *Teaching or research employment*. Elective hours may be earned through teaching or research employment in a NAAB-accredited program under the direct supervision of a person experienced in the activity.

- *Design- or construction-related employment.* Under the direct supervision of a person experienced in the activity (e.g., design of interior space; engaging in building construction; working for a general contractor), interns can earn credit for employment in design- or construction-related activities.

ONLINE EXPERIENCE

- *Emerging Professional's Companion (EPC) activities.* The EPC was jointly developed by the AIA and NCARB and provides free, web-based experience opportunities outside of the studio or work environment. EPC chapters are aligned with IDP experience areas and include activities that are identified as qualifying for either core or elective credit.
- NCARB's *Professional Conduct* monograph. Interns can earn core hours by reading NCARB monographs and passing the related quizzes. NCARB monographs are written by experts in their fields and explore topics relevant to architecture practice. Interns can download PDFs of the monographs at no charge through their NCARB Record.

SELF-DIRECTED EXPERIENCE

- *AIA Continuing Education System.* Interns can earn experience by completing AIA-approved continuing education resources and programs. One AIA learning unit equals one IDP elective hour.
- *Green Building Certification Institute (GBCI) LEED AP credential.* Interns can earn elective hours by obtaining the GBCI LEED AP credential (with or without specialization).
- *Construction Specifications Institute (CSI) Certification Programs.* Interns can earn experience for completing any of these CSI certification programs: CSI Certified Construction Documents Technologist; CSI Certified Construction Specifier (CCS); or CSI Certified Construction Contract Administrator.

IDP REQUIREMENTS

The IDP has a set of requirements that all interns must satisfy in order to document completion of the program. The *IDP Guidelines* provide a comprehensive overview of all IDP requirements, including information relevant for those serving as supervisors or mentors for interns.

NCARB Record

Establishing an NCARB Record is essential for documenting the IDP. Throughout an architect's career, the NCARB Record serves as a detailed, verified record of his or her education, experience, and examination used to establish qualification for licensure and certification. Interns interested in earning NCARB certification, which facilitates reciprocal registration, can save money simply by keeping their NCARB Record active while they complete the steps for licensure.

Eligibility

To earn IDP experience, interns must establish an eligibility date, which can be based on either education or experience. In some cases, students may be able to begin documenting IDP experience after high school graduation.

Experience Settings

Interns earn IDP experience hours in "experience settings." The experience setting is defined by the type of organization, the work performed, and who verifies the experience. Interns can earn the required experience across a range of settings, and a number of experience opportunities can be completed whether or not employed.

Supervision

Interns work under the direct supervision of an IDP supervisor who is responsible for verifying the intern's experience. "Direct supervision" can include supervising interns through a mix of personal contact and remote communication; and in certain settings, supervisors need only be licensed in any U.S. jurisdiction (not necessarily where their office is located). In most experience settings, the supervisor must be a licensed architect; however, in certain settings, a professional from another discipline, such as landscape architecture, engineering, or construction, may act as an IDP supervisor.

Experience Categories and Areas

The required experience categories and areas in which an intern must gain experience have been derived from the NCARB Practice Analysis of Architecture. Each experience area is weighted based on its importance to the independent practice of architecture. The distribution of hourly requirements across the experience areas is designed to align the IDP with current practice.

Reporting

Interns report their experience hours through an online reporting system. To help facilitate more accurate reporting, interns are required to submit their experience in reporting periods of no longer than six months, and to file the reports within two months of completing the reporting period. Reporting at regular intervals helps both the intern and the supervisor better plan, track, and discuss the intern's progress through the IDP.

HISTORY OF THE IDP

In 1976, NCARB introduced the Intern Development Program (IDP) after working with the American Institute of Architects (AIA) to develop a more structured internship for emerging professionals, to ensure they were exposed to the necessary areas of practice. Administered by NCARB, the program was increasingly adopted by jurisdictions as the sole or chief means to satisfy their experience requirement for licensure.

In order to keep pace with the profession, NCARB makes any updates to the program based on empirically derived data. Since 2005, NCARB has conducted several studies to inform the IDP and align it with current practice. Most significant among them is the NCARB Practice Analysis of Architecture, which is conducted by NCARB every five to seven years. The Practice Analysis surveys the profession to identify the tasks and knowledge/skills that are important for recently licensed architects, practicing independently, to safeguard the health, safety, and welfare of the public.

NCARB and the AIA continue to work together in many ways to support the IDP and emerging professionals. The IDP Advisory Committee (IDPAC) was created by NCARB and the AIA to serve in an advisory capacity on matters related to the IDP. It was formed to bring representatives of appropriate architectural stakeholder organizations together to discuss issues of mutual interest and concern regarding the Intern Development Program. The Committee coordinates the internship-related activities between and among NCARB and the AIA, the Association of Collegiate Schools of Architecture (ACSA), the American Institute of Architecture Students (AIAS), and the Society for Design Administration (SDA). Reports and recommendations made on behalf of the IDPAC are advisory to the Boards of Directors of both AIA and NCARB. Results of its deliberations provide feedback to the participatory organizations to increase the effectiveness of all aspects of the IDP.

THE NATIONAL COUNCIL OF ARCHITECTURAL REGISTRATION BOARDS (NCARB)

NCARB, a nonprofit organization, is a federation of the architectural licensing boards in each of the 50 states, the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands. These 54 boards constitute NCARB's membership. NCARB protects the public health, safety, and welfare by leading the regulation of the practice of architecture through the development and application of standards for licensure and credentialing of architects. NCARB is responsible for establishing, interpreting, and enforcing national standards for architectural licensure.

NCARB has a variety of roles in the licensure process, including the development and administration of the Intern Development Program (IDP), the Architect Registration Examination® (ARE®), and NCARB certification, which facilitates reciprocal registration. A range of services is offered by NCARB to support emerging professionals as they progress along the path to licensure. While there are fees in place to help cover the cost of providing these services, NCARB's fee structure takes into account the realities of those just getting started in the profession. The list of services includes the following:

- Compiling, evaluating, and securely storing a comprehensive and confidential Record of credentials to assist the intern's path to licensure
- Developing and administering the IDP
- Developing and administering the ARE
- Creating tools to assist interns in completing the internship and examination process
- Transmitting an intern's Record in support of examination or initial registration
- Visiting AIA chapters and firms across the country to support interns on the path toward licensure and certification
- Engaging interns on relevant NCARB committees to contribute to the process of creating NCARB standards for registration
- Supporting the IDP Coordinator Program

PROFESSIONAL NETWORK OF RESOURCES

IDP Supervisors

IDP supervisors play a vital role in the profession by supporting intern development and supervising the intern's progress through the IDP. By offering their knowledge, guidance, and support to emerging professionals, architects add to the long-term quality and efficacy of the profession.

Serving as an IDP supervisor also contributes to the architect's own professional growth through development of mentoring, leadership, and communication skills. While architects have much to pass on to interns, interns bring a diverse set of skills, along with fresh ideas and perspective, to the table as well.

IDP supervisors have direct supervision over the work performed by the intern, foster a professional relationship that is grounded in direct professional association, and verify the intern's experience. In recognition of the global and increasingly "virtual" ways that business is conducted today, "direct supervision" can include supervising interns through a mix of personal contact and remote communication (e.g., e-mail, online markups, webinars, and Internet).

IDP supervisors:

- Supervise the intern on a daily basis.
- Have control over the work performed.
- Provide reasonable opportunities for the intern to gain the required IDP experience.
- Regularly assess and provide timely feedback on the quality of the intern's work.
- Periodically certify the intern's experience reports, and discuss career goals and overall progress in the IDP.

In most cases, an IDP supervisor must be an architect registered in a U.S. or Canadian jurisdiction; in certain experience settings, a professional from another discipline may act as a supervisor, such as a registered engineer, landscape architect, or construction project manager. For complete details regarding supervisor roles and requirements, see the NCARB *IDP Guidelines*.

A range of resources and support are available to IDP supervisors, including but not limited to regular communications that share important program updates as well as best practices; in-person outreach events hosted by firms and local AIA chapters; and the IDP Firm Awards, sponsored by AIA and NCARB, which honor firms that foster a positive internship environment.

IDP Mentors

A mentor is a loyal adviser, teacher, or coach. Architects looking for a way to give back to their profession and share their expertise with emerging professionals may wish to become an IDP mentor. It's an important opportunity to shape and develop future practitioners—and often, mentoring provides professional growth and unexpected rewards for the mentor as well, as the learning exchange can work in both directions.

Interns entering the IDP are encouraged to identify mentors who can offer professional guidance and support as they progress through the program. Mentors should be professionals whom the intern can count on to make a long-term commitment to his or her professional growth.

To serve as a mentor for the IDP, an architect must be licensed to practice in a U.S. or Canadian jurisdiction; however, the mentor does not have to be registered in the jurisdiction where the intern is located.

While the IDP supervisor is responsible for verifying the majority of the intern's experience, there are several types of supplemental experience opportunities that may be verified by a mentor. These include:

- Participating in design competitions
- Conducting visits to construction sites with the mentor
- Completion of AIA *Emerging Professionals Companion* (*EPC*) activities
- Performance of pro bono leadership and service

IDP Coordinators

▶ See the backgrounder on the IDP Coordinator Program (3.5) to learn more about becoming an IDP coordinator.

The IDP Coordinators Program provides an extensive resource network and facilitates the flow of information to emerging professionals. IDP coordinators are committed to the profession, many serving voluntarily as a point of contact and professional resource for current and future interns. These individuals often have the opportunity to be the first introduction to the licensure process; as such, they play a significant role in educating and guiding interns along the path to licensure. While responsibilities vary depending on their specific role, all coordinator positions share a common responsibility to serve as a knowledgeable information resource for interns on the required components of licensure (education, experience, and examination).

IDP coordinator positions include the following:

- *Educator coordinators* serve as on-campus resources, interacting with students on a regular basis and helping provide the first introduction to the IDP and the licensure process. They assist students in the documentation of IDP eligibility and serve as information resources on the key components of licensure. Educator coordinators will often organize events that help expose students to the licensure process, such as inviting representatives from NCARB to conduct presentations on earning IDP experience, taking the ARE, and applying for licensure and certification.
- *State coordinators* are volunteers who serve as knowledgeable conduits familiar with both the IDP and the licensure process and can provide emerging professionals with the information necessary for the transition from internship to licensure within the context of state regulatory requirements, reciprocity, and NCARB certification. Up-to-date on the latest information about the IDP, state coordinators act as resources for interns and the larger architectural community in their states and often give presentations at schools or AIA component events.
- *Auxiliary coordinators* are self-appointed volunteers with a vested interest in pursuing licensure or encouraging others to do so. They are often associated with firms, local AIA components, state boards, or AIAS chapters. Many architecture firms have an auxiliary coordinator who serves as the in-house expert on all things IDP. In some cases, an auxiliary coordinator may be an intern who has opted to lead a group of coworkers to seek their license.

All coordinators receive resources and training provided by both NCARB and the AIA. Training materials as well as online and in-person training opportunities help coordinators stay current with the latest information about the IDP and other required components of licensure, and help them learn how to serve as a guide and mentor to students and interns. The NCARB website has an IDP coordinators page that provides a full position description for each type of coordinator role, as well as contact information for state and educator coordinators.

Firms

The IDP is most beneficial to the profession when both interns and firms are fully engaged in the process. A forward-thinking firm culture recognizes the value of investing in an intern's professional development and understands that doing so offers both short- and long-term benefits to the firm, its clients, and ultimately the profession. While both supervisors and mentors play a critical role in intern development, the intern's firm can also significantly influence the internship experience.

Firms that encourage interns to become licensed and that support them through the process often find it easier to locate and hire new talent—and to keep valuable, trained employees. They view support of interns as an investment in the organization's future. When interns are embraced by the firm's culture, they are much more likely to be engaged in its mission and support its success. The creativity and skills that interns bring to the table can influence success as a team and firm both now and in the future. Some firms also believe that having more licensed professionals on staff can make the firm more marketable to potential clients.

No matter the size of the organization, focus of practice, or location, there are many ways for firms to encourage and support interns on their path to licensure. Organizations that are supportive of their staff taking on supervisory roles with interns often find rewards such as improved morale, a broader perspective, and a deeper connection to the people who are the future of the profession. All levels of experience can benefit from the information exchange that takes place when interns are an integral part of the firm.

To recognize and honor firms that foster a positive internship environment, NCARB and AIA cosponsor the IDP Firm Awards:

- *The IDP Firm Award* celebrates those firms that, by their active mentoring and engagement with interns, demonstrate a dedication to the field and its future. Twelve criteria across five categories form the basis of the award, and span all aspects of the internship experience. The five categories include mentoring, supervising, training opportunities, commitment to the IDP, and support of the ARE. A firm that demonstrates its commitment to each category establishes itself as a steward on the path to licensure.
- *The IDP Outstanding Firm Award* is awarded to those firms that, in addition to satisfying the five categories necessary for qualification for the IDP Firm Award, show an unsurpassed and proactive approach to the development of the intern experience. Organizations engaged in exceptional activities in the architecture community and in the establishment of a positive firm culture are encouraged to apply for this distinction.

WAYS FOR FIRMS TO SUPPORT INTERNS: REAL-WORLD IDEAS THAT WORK

- *Appoint an in-house IDP auxiliary coordinator* to assist staff and interns with their licensure path needs. Coordinators can provide information and training, help monitor intern progress, and even offer guidance to supervisors and mentors on how to fulfill their roles.
- *Have a structured internship policy in place* that ensures interns are exposed to as many areas of architecture practice as possible, especially those areas that may not be part of an intern's everyday role.
- *Be supportive of staff who take on supervisory or mentoring roles* with interns. Ensure they understand the IDP and the level of support and guidance they will need to provide interns.
- *Offer CE and other training opportunities.* Some firms provide scholarships to fund continuing education or set up "lunch and learn" meetings; others send interns to conferences for professional development.
- *Encourage staff to form networking and support groups* with other interns in the office. Some firms appoint a "buddy" for incoming interns who can serve as an internal expert and resource as the intern makes the transition from education to internship.
- *Assign mentors* who will meet regularly with interns to see how they are progressing in the IDP and toward licensure.
- *Encourage interns* to ask questions and take advantage of learning opportunities, and provide ways for them to grow and stretch their skills.

HOW TWO FIRMS SUPPORT INTERNS AND THE IDP

Two winners of the IDP Outstanding Firm Award discuss their commitment to the IDP and intern development.

SEAY SEAY & LITCHFIELD, MONTGOMERY, AL

Seay Seay & Litchfield (SS&L) understands the enormous learning curve that young professionals face as they leave the confines of architecture education and embark on a career in the profession. To help interns successfully make the transition, SS&L developed a multifaceted system of mentorship that fosters professional growth, personal growth, and office camaraderie. Each intern is assigned an in-office mentor who offers guidance and provides regular feedback, and is also encouraged to have official mentors outside the firm. The firm's culture promotes an environment in which all members of the firm are actively engaged in the growth of its interns.

Beginning on day one of employment, interns are tasked to a project currently under construction that is being supervised by an upper-level member of the firm. Interns at SS&L typically hold three to five project management roles during the time required to complete the IDP. These roles are comprehensive, beginning with contract negotiation and ending with construction administration through completion of a built project.

SS&L's intern development also includes a "lunch and learn" seminar series, participation in design charrettes, formal supplemental education, and regular project management forums. Interns are encouraged to join civic groups in the community, and they also have opportunities to give in-house presentations on their work.

> Pride in the successful fulfillment of their projects creates leaders with a strong backbone for creative and responsible architecture.
>
> *—Jim H. Seay Jr., AIA, LEED AP, firm owner and principal-in-charge, SS&L*

> From day one, we were involved in a range of projects in all phases of development. Through the vast arrays of experiences provided to us, and the mentoring relationships that the firm fosters, our talents were nurtured, and in the end we found ourselves fully prepared to practice architecture.
>
> *—former SS&L interns*

CLARK NEXSEN, NORFOLK, VA

Clark Nexsen places a great deal of importance on mentoring. The firm runs an in-house mentoring program that's part of its operating structure and open to all staff—interns are especially encouraged to participate. Feeding into the mentoring program is a "skills matrix" of core competencies that interns complete when they start at the firm (Table 3.1). The matrix identifies areas of proficiency and necessary/desired development; it is used in performance reviews and referenced during project assignments to help identify development opportunities.

TABLE 3.1 Sample Skills Matrix

	Employee		
Construction Documents	**Doug**	**Karla**	**Jim**
Project Phase Kickoff	C	A	B
Dimensioned Floor Plans	C	A	B
Enlarged Floor Plans	C	A	B
Plan Details	C	A	B
Fire Safety Plans	C	A	B
Roof Details	C	A	B
Reflected Ceiling Plans	C	A	B
Develop Specifications	C	A	C
Review Mechanical Equipment Layouts	D	A	C
Invoicing	–	B	D
Contract Modifications	–	B	D
Obtain Construction Documents Approval	–	B	–
Code Review—Final Check	–	B	–
Final Construction Cost Estimate	–	C	–

A = Mastered skills and able to teach
B = Able to complete without oversight
C = Can complete task with oversight
D = Identified skill goal
– = Little to no experience/skill with task

Source: Clark Nexsen.

An IDP auxiliary coordinator on staff functions as a firm-wide resource, ensuring that all supervisors are knowledgeable about IDP requirements and meeting with interns regularly to provide important program information and guidance. The Clark Nexsen Academy offers a wide range of educational activities, including in-house continuing education events (e.g., "lunch and learns," presentations by in-house or external experts) and field trips to projects under construction and completed by its firm and others.

Clark Nexsen supports interns' progress toward licensure in several ways. It covers NCARB Record fees through the completion of the ARE, and thereafter pays all fees related to professional registration, including NCARB certification. For interns preparing to take the ARE, the firm helps facilitate and organize study events, provides study resources, covers the full cost of all ARE divisions passed, and offers paid time off to interns to take ARE divisions.

> It was evident during my time completing the IDP that Clark Nexsen fundamentally believed that the continual development of its interns was mutually beneficial for both the firm as well as the interns. This approach created many opportunities to gain exposure and experience from the wide variety of projects completed within our office, and rapidly accelerated my progression as an architect.
>
> *—former Clark Nexsen intern (now architect)*

Interns

Interns have a role to play in their own success as well. Taking a proactive approach to internship can include:

- Taking time to review and understand the *IDP Guidelines*.
- Understanding jurisdictional requirements for licensure and reciprocity.
- Carefully identifying a supervisor and choosing mentor(s) who are committed to providing guidance and support along the path to licensure.
- Choosing employment with organizations that will provide a supportive internship environment—speaking to other interns currently employed in the firm is a good way to find out whether it provides interns with opportunities and a well-rounded experience.
- Making a plan for how to complete the IDP and stay on track toward licensure.
- Regularly documenting IDP experience and reviewing progress with supervisors and mentors.
- Self-advocating with supervisors or mentors if having trouble gaining experience in a specific area.
- Asking questions, and taking advantage of any and all learning and development opportunities, both inside and outside the organization.

The internship experience can also be greatly enhanced by peer-to-peer support among interns. Interns can serve as both a support and a valuable information resource to one another as they progress through the IDP and toward licensure. When there are multiple interns at a firm, they can join together and form a networking and support group. Branching out into the larger community by attending local or regional AIA component meetings or other architecture-related events offers opportunities to network and connect with other interns and professionals. Interns can also join together to enter design competitions, or do site visits with a mentor, to earn supplemental IDP experience.

▶ Professional Development and Mentoring (8.4) further addresses the importance of training, mentoring, and appraisal programs that support a firm's strategic plans.

ONE INTERN'S PATH THROUGH THE IDP

Anthony Laney, an intern at Rockefeller Partners Architects, Inc. (RPA) in El Segundo, CA, talks about his experience completing the IDP.

WHAT FACTORS DID YOU CONSIDER WHEN PLANNING FOR YOUR IDP EXPERIENCE?

Aware of the diverse range of experience areas necessary for the completion of the IDP, I sought employment with a handful of firms that assumed responsibility for projects from inception through construction. I considered the company size because small firms are often more nimble and require their employees to excel in a wide range of responsibilities. In an effort to thoroughly comprehend topics such as site analysis and construction observation, I pursued firms that invested primarily in local projects. Lastly, during my interviews, I sought to discern the priority of the IDP process within the culture of the firm. My deliberate decision to work at a small, local, full-service architecture firm significantly influenced the entirety of my IDP experience.

WHEN AND WHERE HAVE YOU FULFILLED YOUR IDP EXPERIENCE REQUIREMENTS?

During the past three and a half years, I've fulfilled my IDP requirements at RPA. I was hired immediately after graduation from architecture school and have currently completed 5,538 of the 5,600 hours required to complete the IDP experience requirements.

HOW HAS YOUR FIRM SUPPORTED YOU AS AN INTERN?

In the most fundamental sense, RPA has invested in and prioritized my learning experience. Rather than simply building on the skills I developed in architecture school, the firm has trained me in areas that were completely new to me—challenging me beyond the scope of digital design, and inviting me to learn about the intricacies and complexities of project management, construction science, and business leadership. RPA allowed me to shadow the firm principals in a wide spectrum of tasks. Although I am their most junior staff

(continued)

member, RPA has chosen to focus on my future potential, deliberately and consistently inviting me to participate in a wide range of CAD-free activities including marketing seminars, design conventions, client meetings, contractor evaluations, and financial strategizing.

HOW HAS YOUR SUPERVISOR HELPED SUPPORT YOUR PROGRESS THROUGH THE IDP?

My IDP supervisor, who is the senior partner of RPA, has guaranteed that my hours are spent on a diverse range of tasks. He is very mindful of the IDP categories that need more attention and intentionally places me on projects to target these areas. He also actively tracks my progress through the IDP, reviewing past experience reports and projecting future opportunities that will help me satisfy requirements.

IS THERE ANYTHING YOU WISH YOU HAD KNOWN WHEN YOU STARTED THE IDP?

I wish I had intentionally pursued the "harder-to-get" categories from the beginning of my employment. Though the 1,200 hours of construction documents seemed daunting, this was a relatively easy category to fulfill because I consistently contributed large quantities of time toward this experience area. On the other hand, the project cost and feasibility area, as well as the construction phase: observation area, require a fraction of the hours, but will be among the last areas for me to complete. These experience areas are relatively specific and will demand more attention and support from my supervisor in order for me to get the required hours.

DID YOU HAVE MENTORS? IF SO, HOW HAVE THEY BEEN HELPFUL TO YOU?

A commitment to mentorship is described in the first paragraph of my employment contract. Protégé development is at the core of RPA's priorities. Beyond offering guidance about the IDP, my mentor has helped to direct and inspire my career decisions, and has encouraged me to pursue teaching and extracurricular building projects outside the office.

HOW DO YOU THINK YOUR IDP EXPERIENCE IS PREPARING YOU FOR YOUR CAREER AS AN ARCHITECT?

Though I ultimately aspire to become an expert in a particular segment of design, I value the well-rounded foundation that has been laid over the past three and a half years. I am grateful for the balanced and healthy range of responsibilities that have been assigned to me for the sole purpose of enabling me to complete my IDP experience. I have also grown to appreciate the mindfulness that comes from knowing where your time is being invested. Having carefully recorded and categorized my hours, I've developed a more effective understanding of my career trajectory and future goals. As I'm aware of my progress, I can coherently manage my career course.

DO YOU HAVE ANY ADVICE FOR INTERNS ON HOW TO GET THE MOST OUT OF THE IDP?

I advise young graduates to include the IDP among the many factors to consider when interviewing for a job. The success of one's IDP experience is so closely tied to a firm's culture and structure. True mentorship is an invaluable component of professional growth and career advancement. Seek a firm that's willing to take risks with their junior staff members—and try to accurately assess the value that your future employer places on long-term relationships, mentorship, and protégé development.

Finally, I recommend that interns strive to connect their ARE study regimen with the IDP categories that they're currently engaging. A tall pile of study materials becomes less overwhelming when topics are linked to the assignments that are on your desk. I have benefited from a study system that leverages the knowledge of my colleagues and the projects that I interact with each week.

BACKGROUNDER

ARCHITECT REGISTRATION EXAMINATION® (ARE®)

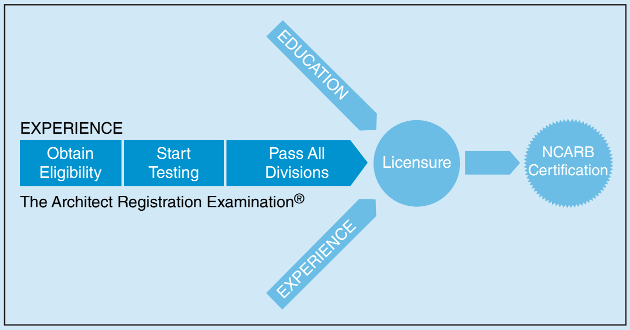
Erica J. Brown, AIA, NCARB

The Architect Registration Examination® (ARE®) assesses a candidate's knowledge, skills, and abilities to perform the various services required for the independent practice of architecture.

Erica J. Brown is director of the Architect Registration Examination for the National Council of Architectural Registration Boards (NCARB). She oversees the development, administration, and management of all divisions of the exam. She is licensed to practice architecture in Indiana and holds the NCARB Certificate.

Each U.S. jurisdiction sets its own requirements for initial registration. In addition to fulfilling education and experience requirements, a candidate must meet his or her jurisdiction's examination requirement (see Figure 3.2). All fifty-four U.S. jurisdictions require the completion of the Architect Registration Examination (ARE) to satisfy their examination requirement.

Developed and administered by the National Council of Architectural Registration Boards (NCARB), the ARE concentrates on those skills necessary for protecting the public health, safety, and welfare. Figure 3.2 illustrates the ARE process on the path to licensure.



Kenji Bohlin, NCARB

FIGURE 3.2 Path to Licensure: Examination Requirement

HISTORY OF ARCHITECTURE EXAMINATION

Licensure examinations weren't always standardized across states and jurisdictions. Previously, each registration board prepared its own test specifications and questions, and set its own passing standards. Because the examination process varied from jurisdiction to jurisdiction, an effective system for reciprocal licensure was not possible.

To address this need for standardization, NCARB worked with its Member Boards to create the first nationally recognized exam for architects in 1965, and in the ensuing years, continued to make significant improvements to the exam. In 1997, after extensive research and development, all exam divisions were delivered and scored by computer, making the ARE more accessible to candidates and providing the flexibility to test year-round. By establishing a single examination that all jurisdictions rely on, the process for achieving reciprocity was streamlined.

It is worth noting that in addition to the ARE, some Boards require candidates to pass jurisdiction-specific, supplemental exams in order to satisfy the examination requirement for licensure.

EXAMINATION OVERVIEW

The ARE is developed and regularly reviewed and validated by subject matter–expert architects, and conforms to standards established by national testing organizations. A strong research and development culture drives the ARE, with significant annual investments being made by NCARB into its continual development and evolution. In all cases, the process is rigorous, time-consuming, and necessary to ensure the ARE remains legally defensible and psychometrically valid.

Every five to seven years, NCARB conducts a practice analysis of architecture by surveying the profession to identify the tasks and knowledge/skills necessary for independent practice. Findings from the practice analysis serve as the basis for updating the ARE test specification.

Any modifications to the exam are made after deliberate, studied, and controlled evaluation. Exam updates are made for two essential reasons: to ensure questions reflect current architectural practice and to use technology that accurately assesses the ability of candidates to practice architecture independently.

The following information is current as of 2012 but is subject to change, since the exam is in a continual state of development. For the most current information about the ARE, contact NCARB or visit its website.

Format and Focus of the Examination

In addition to testing for competence in specific subject areas, NCARB is aware of the responsibilities an architect may have for coordinating the activities of others involved in the design/construction process. The ARE attempts to determine a candidate's qualifications not only in performing measurable tasks, but also in exercising the skills and judgment of a generalist working with numerous specialists. In short, the

(continued)

objective of the exam is to reflect the practice of architecture as an integrated whole.

The examination includes seven divisions:

- Programming, Planning & Practice
- Site Planning & Design
- Building Design & Construction Systems
- Schematic Design
- Structural Systems
- Building Systems
- Construction Documents & Services

Six of the seven divisions contain a section of multiple-choice items and a separate section including one or more graphic vignettes, which are problems used to assess candidates' knowledge, skills, and abilities in the different facets of architectural practice, such as site zoning and structural layout. One division contains only graphic vignettes. It is recommended that candidates use the free practice software provided by NCARB to become familiar with the software interface used for the graphic vignettes in the examination.

Eligibility

While all jurisdictions require the ARE to satisfy their licensure examination requirement, candidates will want to understand and stay informed of the requirements specific to the jurisdiction where they plan to seek initial licensure. For example, some states allow concurrent completion of the Intern Development Program (IDP) and the ARE, so candidates should contact the individual registration board to verify when they can become eligible to begin testing.

Candidates are responsible for maintaining their eligibility status. Once made eligible to take the exam, candidates must take at least one division every five years in order to maintain their eligibility to test.

Exam Administration

Candidates may take the exam divisions in the order of their choosing and must pass all divisions to complete the ARE. The ARE is administered exclusively on computers through a network of approximately 300 test centers across the United States, its territories, and Canada.

Rolling Clock

Under the terms of NCARB's rolling clock policy, candidates must pass all divisions within five years; a passing grade for any division of the ARE will be valid for five years, after which time the division (or any equivalents) must be retaken unless all divisions have been passed. Candidates should also be aware that there is a mandatory six-month waiting period before one can retake a failed division of the exam; candidates may sit for other exam divisions during this waiting period. In addition to NCARB's rolling clock policy, jurisdictions may have their own retake limit/exam validity time frame, so candidates should contact their jurisdiction directly to determine their exam status under the jurisdiction's rules and policies.

Resources

NCARB provides a number of resources, accessible on its website, to help candidates plan and prepare to take the ARE; however, it is ultimately the candidate's responsibility to acquire the knowledge and skills necessary to demonstrate competency. The NCARB *ARE Guidelines* are essential reading for anyone preparing for the exam. They include further detail on the exam, the rolling clock policy, exam eligibility information, and the steps to take and complete the ARE. NCARB also offers free Exam Guides and Practice Programs to help candidates study and practice for each division of the exam.

Preparation Tips

Planning for the ARE is critical. There are a number of steps candidates can take to prepare for the examination:

- Take time to review and understand the requirements for the jurisdiction where seeking initial licensure. If in doubt, contact the jurisdiction directly to get clarification on its requirements.
- Review the *ARE Guidelines* to understand eligibility rules and other requirements.
- Be proactive, and create a plan for taking the exam: Determine when and where eligible to sit for it, what order to take the exam divisions in, and how to prepare.
- Use the exam guides and practice programs provided by NCARB. Additional references are listed in the back of the exam guides—many of these resources include professional publications that are commonly available in libraries and offices.
- Form a study group with other candidates, either through work or locally. Regional AIA chapters may be able to connect candidates with one another as well.
- Discuss plans with supervisors or mentors for preparing and taking the exam.
- Take advantage of the resources, support, and benefits firms may offer interns taking the exam.

BACKGROUNDER

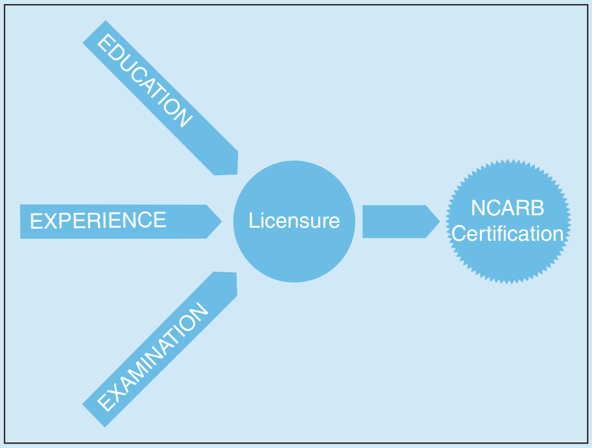
NCARB CERTIFICATION

Douglas Morgan

Architects must be licensed in each jurisdiction in which they seek to practice. The NCARB Certificate, administered by the National Council of Architectural Registration Boards (NCARB), is a recognized professional credential that helps facilitate reciprocal registration for licensed architects among U.S. and Canadian registration boards.

Douglas Morgan is the Director of Records for the National Council of Architectural Registration Boards (NCARB). With over 20 years of records management experience, Morgan has modernized and transformed NCARB records management to provide effective regulation and enhanced customer service to NCARB Record and NCARB Certificate holders.

After initial licensure, an architect can pursue NCARB certification, which helps facilitate reciprocal registration in other jurisdictions (see Figure 3.3). Reciprocity (also commonly referred to as "comity" or "endorsement") is achieved when applications for licensure in additional jurisdictions are approved based on jurisdictional review and acceptance of verified documentation showing that the architect has satisfied all of the requirements for reciprocal registration.



Kenji Bohlin, NCARB

FIGURE 3.3 Path to NCARB Certification

The NCARB Certificate is the most common and widely accepted means of gaining reciprocity, with more than half of U.S. registration boards requiring it for reciprocal registration. It certifies that an architect has met the national standards of eligibility for licensure established by the boards and recommends registration of the architect without further qualification.

NCARB certification helps streamline the process and reduce the amount of time needed to receive a reciprocal license in most states. The reality of architectural practice today is that many firms, whether large or small, practice in multiple jurisdictions. Because it expedites reciprocity, certification can help architects or their firms more quickly mobilize in pursuit of new business or meet expanding client needs across state lines. Some jurisdictions also allow the benefit of soliciting work or participating in a design competition prior to licensure if the architect holds an NCARB Certificate.

When applying for reciprocity, NCARB-certified architects pay a Record transmittal fee and request transmittal of their NCARB Record, which is sent by NCARB to the jurisdiction of interest. The fee includes the services provided as part of the Record storage, verification, and transmittal processes, and also helps subsidize the cost of programs that NCARB provides to the profession, such as the Architect Registration Examination.

Those who have an active NCARB Certificate may use the letters "NCARB" after their name, indicating that they have earned and maintain this recognized professional credential and are licensed architects.

STANDARD PATH TO CERTIFICATION

Earning NCARB certification is a relatively straightforward process. The architect needs to establish and hold an active NCARB Record in order to apply for certification. The NCARB Record is a detailed, verified record of architecture education, experience, and examination used to establish qualification for licensure and certification. The architect must also meet the following requirements:

- Be of good character as verified by employers and an NCARB Member Board where the architect is registered.
- Document completion of a professional degree in architecture from a program accredited by the National Architectural Accrediting Board (NAAB).
- Document completion of the Intern Development Program (IDP).
- Have passed the Architect Registration Examination® (ARE®) or its then-current predecessor.
- Hold an active registration in good standing in a U.S. jurisdiction.

ALTERNATE PATHS TO CERTIFICATION

Architects who don't hold a professional architecture degree from a NAAB-accredited program, or those credentialed by a foreign authority, may qualify for NCARB certification through the Broadly Experienced Architect (BEA) Program or the Broadly Experienced Foreign Architect (BEFA) Program. While most jurisdictions accept an NCARB Certificate

(continued)

through these programs for reciprocal licensure, it is important for each BEA and BEFA applicant to confirm to specific registration requirements, including those for reciprocity, with the individual jurisdiction in which they would like to be licensed.

Broadly Experienced Architect (BEA) Program

The BEA Program provides eligible architects registered in a U.S. jurisdiction an alternative to the education requirement for NCARB certification. Eligible architects can demonstrate their learning through experience by meeting the requirements of the *NCARB Education Standard*, which approximates the requirements of a professional degree from a NAAB-accredited program. The BEA Program requires establishment of an NCARB Record and preparation of an education dossier to demonstrate learning through experience, and may also require an education evaluation.

Broadly Experienced Foreign Architect (BEFA) Program

Architects credentialed by a foreign authority are eligible to apply for an NCARB Certificate through the BEFA Program. The multistep BEFA process requires establishment of an NCARB Record, preparation of a dossier to demonstrate experience, and a personal interview. An architect intending to pursue this alternative should complete and submit the BEFA Eligibility Verification form prior to applying for an NCARB Record.

Alternatives to the Intern Development Program (IDP)

Architects who did not complete the IDP may retroactively document the IDP for purposes of NCARB certification. This is the most prudent course of action and offers the best chance of securing future reciprocity, as many jurisdictions specifically require the completion of the IDP to gain reciprocal licensure.

A second alternative is available and fully explained in the NCARB *Certification Guidelines*; however, it is worth noting that some jurisdictions may not accept this alternative and may require formal IDP documentation for reciprocal licensure. To use this alternative, applicants must be licensed by a U.S. jurisdiction for five consecutive years, must verify that their experience as an architect met the intent of the IDP, and must have that experience verified by one or more other architects. This alternative does not apply to architects licensed after January 1, 2011.

To study architecture is to study all things.

—John Ruskin

Architects are broadly qualified to practice in a wide variety of roles and settings within the architecture profession and building enterprise.

—David Haviland, Hon. AIA

The building of a career is quite as difficult a problem as the building of a house, yet few ever sit down with pencil and paper, with expert information and counsel, to plan a working career and deal with the life problem scientifically, as they would deal with the problem of building a house, taking the advice of an architect to help them.

—Frank Parsons, 1909

3.3 The Career Paths of an Architect

Lee W. Waldrep, Ph.D.

This article describes career designing—a process of developing a career that parallels the architectural design process—and the roles an architect can pursue both in the architecture profession and outside traditional practice. As well, it outlines those career paths beyond architecture, often referred to as nontraditional careers.

After the rigors of an architecture education, work experience, and examination, becoming an architect may seem the simple and direct path for a career. However, other paths exist not only for the new graduate but also for the experienced architect wanting or needing to make a change.

Currently the assistant director at the School of Architecture at the University of Illinois at Urbana-Champaign, Lee W. Waldrep has 20 years of experience in higher education. With degrees from American University, ASU, and Michigan, he is the author of *Becoming an Architect: A Guide to Careers in Design,* 2nd edition (Wiley 2010).

As the father of vocational guidance Parsons states, the building of a career—the process of career development—is a difficult but important task. Yet few individuals prepare for their careers in a thoughtful, careful, and deliberate manner. Instead, many often fall into a career, while others make random career choices that show little commitment to their occupation. This approach frequently leads to dissatisfaction.

CAREER DESIGNING

Deliberately designing one's career path maximizes career success at any point on a career. As with architectural projects, careers can be planned. Actually, designing a career is parallel to designing a building. Programming, schematic design, design development, working drawings, and construction are replaced in the career designing process with assessing, exploring, decision making, and planning.

Assessing

When an architect designs a project, programming is the first step in the process. As William Pena points out in *Problem Seeking*, the main idea behind programming is the search for sufficient information to clarify, understand, and state the problem. In a similar manner, when designing a career, the process begins with assessing.

Know thyself.

—Inscription over the Oracle at Delphi, Greece

Assessing involves learning about yourself. Assess where you want to be; analyze what is important to you, your abilities, the work you would like to do, and your strengths and weaknesses. Just as programming assists the architect in understanding a particular design problem, assessment helps determine what a person wants from their career. This ongoing process must be revisited throughout a person's entire career. The details of assessment include examining values, interests, and skills.

Values

Values are feelings, attitudes, and beliefs held close to the heart. They reflect what is important to a person; they tell you what you should or should not do. Work values are the enduring dimensions or aspects of work that are regarded as important sources of satisfaction. Values traditionally held high by architects include creativity, recognition, variety, independence, and responsibility.

As a quick inventory, circle which of the following you value most in your work:

- Social contributions
- Creativity
- Excitement
- Working alone or with others
- Monetary reward
- Competition
- Change and variety
- Independence
- Intellectual challenge
- Physical challenge
- Fast pace
- Security
- Responsibility
- Making decisions
- Power and authority
- Gaining knowledge
- Spiritual/Transpersona
- Recognition

Your responses provide insight on a career path within the profession. For example, an architect who valued contributions to society most highly might look for opportunities for work in public interest design.

▶ Socially Responsible Design Overview (4.1) addresses public interest design.

Interests

Interests are those ideas, events, and activities that stimulate enthusiasm; they are reflected in choices you make about how you spend your time. In simplest terms, interests are activities that an individual enjoys doing. Typically, architects have a breadth of interests because the field of architecture encompasses artistic, scientific, and technical aspects. Architects enjoy being involved in all phases of the creative process—from original conceptualization to a tangible finished product.

To determine your interests, complete the following exercise: In 10 minutes of continuous writing, never removing pen from the paper or fingers from the keyboard, answer the question: *What do I like to do when I am not working?*

Career development theory dictates that an individual's career path should follow their interests; if they do, they will see success.

Skills

Skills or abilities can be learned. There are three types of skills—functional, self-management, and special knowledge. Having a functional skill means being able to perform some specific type of activity, action, or operation with a good deal of proficiency. According to the Bureau of Labor Statistics, an architect needs the following skills: analytical, communication, creativity, critical-thinking, organizational, technical, and visualization. Self-management skills speak to one's personal characteristics, while special knowledge are skills you have that may not necessarily pertain to your career.

The importance of knowing one's skills is echoed by Richard Bolles in *The Quick Job Hunting Map*: "You must know, for now and all the future, not only what skills you have, but more importantly, what skills you have and enjoy." With respect to skills, think back over the past five years. What were your five most satisfying accomplishments? Next to each, list the skills or abilities that enabled you to succeed. Similarly review your failures to determine traits or deficiencies you want to overcome. Knowing your skill set is important as it helps you direct your career path.

A variety of techniques may be used to conduct an assessment. The few listed here are simply to get started; others include writing an autobiography and undertaking empirical inventories or psychological assessment with the assistance of a career adviser. Regardless of the method you choose, only you can best determine what skills you have acquired and enjoy using; the issues, ideas, problems, and organizations that interest you; and the values that you care about for your life and career. By assessing yourself, you will better be able to make decisions related to your career path.

Exploring

Students spend four or more years learning how to dig data out of the library and other sources, but it rarely occurs to them that they should also apply some of the same new-found research skill to their own benefit—to looking up information on companies, types of professions, sections of the country that might interest them.

—Albert Shapero

Schematic design follows programming in the design process. Schematic design generates alternative solutions; its goal is to establish general characteristics of the design, including scale, form, estimated costs, and the general image of the building, the size and organization of spaces. In addition, schematic design identifies major issues and makes initial decisions that serve as the basis of subsequent stages.

In career designing, exploring is parallel to schematic design. It develops alternatives or career choices. Career exploration is the process of accumulating information about the world of work. Its goal is to obtain career information on a plethora of careers or specializations within a particular career. Even if you already have chosen architecture as a career, it is still a valuable and necessary process. Instead of exploring careers, you can explore firms, possible career paths within architecture, and other areas that affect your architectural path; understanding exploration will help you be flexible and adaptable when the economy or other factors require it.

To begin, collect career information from a variety of sources, both people and publications. Conduct an *information interview*—interviewing someone to obtain information. People to interview might include a senior partner in a local firm, a faculty member, a classmate or colleague, or a mentor. Other ways to explore are through attending lectures sponsored by the local AIA chapter or a university, volunteering time through a local AIA committee or other organizations of interest, becoming involved with a mentor program, and observing or shadowing someone for a day.

As Shapero states, use research skills to access any and all information on a career. Visit your local library and inquire about the following publications: *The Dictionary of Occupational Titles (DOT)*, *Occupational Outlook Handbook (OOH)*, *Guide to Occupational Exploration (GOE)*, and *What Color Is Your Parachute?* Ask a reference librarian to identify other resources that might find valuable. In addition, investigate resources at your local AIA chapter or the library/resource center at an area architecture program.

Decision Making

The heart of the design process is design development. Similarly, decision making is the heart of the career development process. Design development describes the specific character and intent of the entire project; it further refines the schematic design and defines the alternatives. Decision making means selecting alternatives and evaluating them against a predetermined set of criteria.

What most people want out of life, more than anything else, is the opportunity to make choices.

—David P. Campbell

How you make decisions? Do you rely on gut-level reactions? Or do you follow a planned strategy of weighing alternatives? Whatever your method of deciding, be aware of it. While some decisions can be made at the drop of a hat, others, including career designing, require more thought.

Decision making can be difficult and time-consuming, but knowing the quality of decisions is affected by the information used to make them, you quickly realize that making informed decisions is an important skill to learn. Decision making is making the decision based on what you learned from assessing and exploring.

Both exploring and decision making are critical steps to successful career designing. Once a decision is made and a path chosen, the next step, planning, is about taking action to realize your goals.

Planning

Planning is key to fulfilling your career goals. After the owner/client decides on a design for a potential building, the next step is the development of plans. These plans—construction documents, specifications, and construction schedules—all play an important role in realizing the design. As part of the career development process, planning ensures that a successful career will be realized.

If you do not have plans for your life, someone else does.

—Anthony Robbins

Planning is bringing the future into the present so that we can do something about it now.

—Alan Lakein

In his book *The 7 Habits of Highly Effective People*, author Stephen Covey states that a mission statement focuses on what you want to be (character) and to do (contributions and achievements) and on the values or principles on which being and doing are based. To start the planning process, draft your mission statement by asking yourself: What do I want to be? What do I want to do? What are my career aspirations? Review the mission statement example below:

> I desire to act in a manner that brings out the best in me and those important to me—especially when it might be most justifiable to act otherwise.

After you have crafted your mission statement, the next step is to develop goals that will lead to its fulfillment. Goals are future-oriented statements of purpose and direction to be accomplished within a specified time frame. They are stepping stones in achieving long-range aims and should be specific and measurable. Write down your goals. It has been said that the difference between a wish and a goal is that a goal is written down.

Once you establish your goals, you are ready to develop the action plan that will help you accomplish them. Action plans are steps on the path toward your goals; they are stepping stones in achieving related short-range intentions. Look at your accomplished goals. What steps must you take to accomplish them? As with career goals, write down your action plan, including specific completion dates.

The final step in planning is to review your action plans and goals regularly. Cross out the goals you have accomplished and revise, add to, or delete others. Be honest with yourself. Are you still committed to achieving your goals? You can change them, but remember that the magic road to achievement is *persistence*. Abandon goals only if they have lost meaning for you, not because they are tough or you have suffered a setback.

Now that you understand the career designing process—assessing, exploring, decision making, and planning—you can implement it. This process is never-ending and cyclical as you progress through your professional career. As soon as you have secured an ideal position in a firm, you will wish to assess your new life situation and make adjustments to your career design accordingly. Designing your career is one of the most important tasks during your lifetime.

CAREER PATHS

Careers in Architecture

Pursuing architecture prepares an individual for a vast array of career possibilities. Many of these are within traditional architecture practice, but many are also available in related career fields.

Within the traditional architecture firm, graduates may obtain a beginning position as an intern and progress to junior designer, project architect, and, eventually, associate or principal. Getting to the top does not happen overnight; it can take a lifetime. Aspiring professionals may pursue their careers in traditional firms regardless of their size (small, medium, or large) or may choose to work in a different setting, such as a private corporation, a government agency, or a university—or, after obtaining professional licensure, may choose to start their own firms.

► Entrepreneurial Practice: Starting an Architecture Firm (5.2) discusses why and how to start one's own firm.

Architectural Practice

How does a career in architecture begin? How does a person progress from graduation to become an architect? Following the AIA Definition of Architect Positions, the path seems linear, progressing from an intern to architect; once licensed (and depending on the firm), the path continues to architect I (3–5 years) and architect/designers III (8–10 years). From there, the path progresses to project manager, department head or senior manager, junior principal/partner, and concludes with senior principal/partner.

► Intern Development (3.2) discusses the IDP in detail.

Of course, the path of a career in architecture is not strictly linear; however, it is helpful to understand these titles with the knowledge and responsibility associated with them, as outlined in Dana Cuff's *Architecture: The Story of Practice*. Upon entry into the profession, the intern is building upon their educational foundation through practical experience under the supervision of an architect; and the intern is tracking their experience in the Intern Development Program (IDP), an essential step in becoming an architect. Once licensed, the architect is demonstrating competence, gathering responsibility, and gaining autonomy and management tasks. When at the full-fledged stage, the architect is gaining fiscal responsibility on a widening sphere of influence.

The entering graduate does face challenges. Given the gap between education and practice, what happens in the studios of schools is much different than the studios of the firms. For this reason, architecture students are strongly encouraged to seek intern positions in architecture firms during their academic years.

Those seeking licensure will find it essential to secure employment within an architecture firm to gain the necessary experience under the direct supervision of an

AIA DEFINITION OF ARCHITECT POSITIONS

- *Senior Principal/Partner*: Typically an owner or majority shareholder of the firm; may be the founder. Titles include president, chief executive officer, or managing principal/partner.
- *Mid-Level Principal/Partner*: Titles include executive or senior vice president.
- *Junior Principal/Partner*: Recently made a partner or principal of the firm. Title may include vice president.
- *Department Head/Senior Manager*: Senior management architect or nonregistered graduate; responsible for major department(s) or functions; reports to principal or partner.
- *Project Manager*: Licensed architect or nonregistered graduate with more than 10 years of experience; has overall project management responsibility for a variety of projects or project teams, including client contact, scheduling, and budgeting.
- *Architect/Designer III*: Licensed architect or nonregistered graduate with 8 to 10 years of experience; responsible for significant aspects of projects; responsible for work on minor projects. Selects, evaluates, and implements procedures and techniques used on projects.
- *Architect/Designer II*: Licensed architect or nonregistered graduate with 6 to 8 years of experience; responsible for daily design or technical development of a project.
- *Architect/Designer I*: Recently licensed architect or nonregistered graduate with 3 to 5 years of experience; responsible for particular parts of a project within parameters set by others.
- *Intern*: Unlicensed architecture school graduate under supervision of an architect.
- *Entry-Level Intern*: Unlicensed architecture school graduate in first year of internship.
- *Student*: Current architecture student working during summer or concurrently with school.

architect and meet the requirements of the Intern Development Program (IDP); however, in recognition of opportunities to go beyond traditional practice—such as working under registered professionals in related professions like landscape architecture, or working under an architect outside of a firm setting—interns can gain experience in other work settings.

When seeking employment, one should consider firm size as a factor when considering where to work; in large firms, an intern will be exposed to a broad scale of projects and a full-service firm, but may be limited in their exposure to aspects of practice. In a small firm, the intern will see the full spectrum of projects, but the projects may be limiting in scope and size. Where one works at the start of their career can have an impact on their future career trajectory in architecture.

Within what is typically referred to as traditional practice, there are firms that develop specialties. While they are still architecture firms, these specialties provide opportunities to showcase talent or strong interest. Examples of such specialties include programming, design, specifications, construction contract administration, or sustainability.

Some firms focus on particular building types, such as healthcare, religious, justice facilities, housing, interiors, sports facilities, educational, and institutional. One firm—for instance, Animal Arts in Boulder, Colorado—focuses on facilities related to animals, including veterinary hospitals, shelters, and pet resorts. As a specialist in healthcare, an architect can become a certified healthcare architect with the American College of Healthcare Architects (ACHA). Certain Knowledge Communities of the AIA that focus their energies on building types or specialties include the Academy of Architecture for Health, the Academy of Architecture for Justice, the Committee on Architecture for Education, and the Interfaith Forum on Religion, Art and Architecture, among others.

Another means to expand a career within the profession is through supplemental architectural services. Because of the recent economic downturn, the AIA created the Supplemental Architectural Services program, a series of detailed essays and slide presentations to offer assistance to architects in expanding their consulting services.

SUPPLEMENTAL ARCHITECTURAL SERVICES

Supplemental architectural services can:

- Help architects generate income.
- Increase the value of the firm through diversification.
- Help attract new clients or keep the firm involved with existing patrons.
- Be used as special projects for young professionals to nurture their development.

The AIA has identified 48 supplemental architectural services, listed below. More information on each of these—required knowledge and skills, why clients need the deliverables, associated tasks, and the AIA Contract Document that can be used in conjunction with the service—can be found at the AIA Architects Knowledge Resource, Supplemental Architectural Services (http://www.aia.org/practicing/akr/AIAB089194).

Outside Traditional Practice

Beyond traditional practice, architects work in a number of other settings. While no exact statistics are kept, it is estimated that one in five architects work outside private practice.

- *Corporations and institutions.* Do you want to work at McDonald's? It may come as a surprise that McDonald's hires architects, as do many businesses and corporations. Corporate architects may serve as in-house architects, but in most cases they represent the interests of the corporation to the outside architects they hire. Depending on the industry, they may be involved with all phases of a project.
- *Government and public agencies.* Federal, state, and local governments commission more than one-quarter of construction annually. As such, opportunities exist for architects in public agencies. Many departments of government, including the military, employ architects. In addition to traditional tasks, architects manage facilities and projects and oversee construction. Emerging professionals may find it difficult to start a career in a public agency, but such careers can be extremely worthwhile.

Employers of public architects (as represented on the 2012 Advisory Group of the AIA Public Architects Knowledge Community) include the State of Ohio, Texas A&M University, the U.S. Army Corps of Engineers, Thomas Jefferson National Lab, the City of Dallas, and the Judicial Council of California.

- *Education and research.* For some architects, a substantial career path is teaching and research. According to the National Architectural Accrediting Board (NAAB), there are over 6,064 faculty members within the accredited programs of architecture in the academic year 2011–2012, most of whom are adjunct faculty. Additionally, with over 300 programs in architectural technology at the community college level, many more opportunities exist for architects to teach at this level. In addition to teaching, architects serving as faculty will pursue research interests to test ideas that connect education and practice. Aside from teaching future architects, many faculty members also maintain a practice.

► See Research in Practice (14.1) and Participating in Architecture Education (3.6) for further discussions of architecture research and education.

Beyond Architecture

An architecture education is excellent preparation for many career paths beyond architecture. In fact, the career possibilities with an architecture education are truly limitless. Anecdotal estimates suggest that only one-half of architecture graduates pursue licensure. By applying the ideas listed earlier in "career designing," one can launch a successful career beyond architecture.

As a profession, architecture offers a myriad of possibilities for rewarding careers.

—Irene Dumas-Tyson

I am certain that architectural graduates who are in command of the powerful problem-defining and problem-solving skills of the designer will be fully capable of designing their own imaginative careers by creating new definitions of meaningful work for architects that are embedded in the social landscape of human activity and life's events.

—Leslie Kanes Weisman

Career paths beyond traditional practice tap into the creative thinking and problem-solving skills developed from an architecture education. The interest in these paths is growing; the results of the most recent AIA/NCARB Internship and Career Survey of interns and emerging professionals indicate that nearly one-fifth of the respondents do not plan on pursuing a traditional career in architecture, although they still plan to obtain their license.

Over the last four years, Archinect, an online forum for architecture, has featured over 25 architects who have applied their backgrounds in architecture to other career fields through its "Working Out of the Box" series. While most are still connected to design in some form, the range of career fields is quite diverse: filmmaker, organic farmer, artist, design director at a resort hotel chain, user experience designer, information designer, and design technology consulting. Also, the reasons for pursuing these are varied and typically not tied to the recent economic downturn.

For purposes of his doctoral thesis, Robert Douglas, FAIA, studied nontraditional careers (maverick architects) and found those that he studied credited "design thinking" as helpful in their careers beyond architecture. From his research, architecture graduates and architects pursued careers in law, investment banking and real estate development, computer software, lighting design, film production and set design, cultural policy, architectural criticism and journalism, facilities planning, land planning and management, industrial and product design, arts programming, structural engineering, highway design, public arts installation, architectural photography, painting and sculpture, and clothing design.

A June 2008 issue of *Columns*, the AIA Pittsburgh magazine, entitled, "It's a Wonderful Life," highlighted architects who built new careers after first having one as an architect. First, the article outlines the path of actor Jimmy Stewart, who graduated from Princeton University having studied architecture but instead pursued acting (hence the title of the article). Next, it highlights four individuals who, after successful careers as architects, moved to new career paths—development, needlepoint (fiber art), community design, and construction supervisor. In each case, they discuss how their education and background in architecture paved the way for their new chosen career.

- *Related design professional (landscape architecture, interior design, urban design).* Given the parallel education of design, it is clear why some architects pursue the related career fields of landscape architecture, interior design, and urban design. Many architects pursue careers in interior architecture or space designing, while other

▶ Architect-Led Design-Build and its accompanying backgrounder Architects as CM for Small Projects and Small Firms (9.5) further address the architect's role in design-build project delivery.

pursue the profession of landscape architecture to design outdoor spaces. Still others combine their talents in design to focus on urban design.

- *Engineering and technical.* As architecture is both an art and a science, many architects will pursue careers in engineering or more technical fields. Many with a joint degree in architecture and engineering will pursue civil or structural engineering, but there are other opportunities that exist if there is an interest in the technical side of the profession.
- *Construction.* Because of the connection between design and construction, many architects have pursued careers in construction as construction managers, general contractors, and/or related associates. Architecture firms have expanded their services to include design-build and construction management, bridging the two disciplines.
- *Art and design.* Because much of what architects do is considered an art, it is no surprise that many architects pursue careers in art and design; this extends from fine arts (painting) to applied arts (graphic design and furniture design). Some will determine a way to combine their background in architecture more directly with art, while others truly move away from architecture to pursue their art.
- *Architectural products and services.* Perhaps less obvious are careers in architectural products and services. As these manufacturers market and sell their products and services to architects, who better to serve in these positions but those trained as architects? With an interest in and talent for sales, opportunities exist for a rewarding and fulfilling career.
- *Other.* As stated in the quote from Irene Dumas-Tyson, an education in architecture offers myriad career possibilities. But what other career paths are open to architecture graduates, emerging professionals, or architects? The true answer: There are over 25,000 occupations as defined by the Bureau of Labor Statistics that potentially highlight skills and fulfill passion. Truly, the only limitation to possible career paths is one's imagination.

Real estate. More recently, more architects have become involved with real estate development, the creation of communities, and the repositioning of land or buildings into a higher or better use. For architects wishing to expand their influence on the building process, real estate may be a good fit, as it connects multiple disciplines (engineering, architecture, planning, finance, marketing, law, and environmental impact).

Katherine S. Proctor, FCSI, CDT, AIA, former director of student services at the University of Tennessee, shares her perspective:

> For an individual interested in the career of architecture, the possibilities are endless. I have seen students graduate and become registered architects, professional photographers, lawyers, bankers, business owners, interior designers, contractors, and artists. The education is so broad, with a strong liberal arts base, that it provides a firm foundation for a wide array of exploration. This comes from the content of the curriculums but also from the methodology. The design studio, which is the core of the curriculum, provides a method to take pieces of intellectual information and apply it within the design process. The movement from thinking to doing is powerful. The ability to integrate hundreds of pieces of information, issues, influences, and form and find a solution is a skill that any professional needs to solve problems, whether they are building issues or life issues.

EMERGING CAREERS

The future is not a result of choices among alternative paths offered by the present, but a place that is created—created first in the mind and will, created next in activity. The future is not some place we are going to, but one we are creating. The paths are not found, but made, and the activity of making them changes both the maker and the destination.

—John Schaar, Futurist

Most would agree that the architecture profession is changing; as a result of this change, opportunities are being created to expand the profession beyond what it is now. For example, sustainability has already created new emerging career paths for architects.

Many within the profession have pursued becoming a Leadership in Energy Efficient Design Accredited Professional (LEED AP). As outlined by the Green Building Certification Institute, those credentialed as LEED APs are building industry professionals who have demonstrated a thorough understanding of green building and the LEED® Green Building Rating System™ developed and maintained by the U.S. Green Building Council (USGBC).

Technology such as building information modeling (BIM) will continue to play an increasing role within the architecture profession and will also create new career paths.

SUCCEEDING IN THE BUILT ENVIRONMENT

H. Alan Brangman, AIA

H. Alan Brangman is associate vice president of facilities, real estate, and university architect, Howard University, Washington, DC.

I became an architect because I have always had a fascination with building things. I initially went to school at the University of New Hampshire to study civil engineering. At the beginning of my sophomore year I met an art professor who had been a former instructor at Cornell University. He suggested that I transfer to Cornell. My degree is the Bachelor of Architecture.

My greatest challenge as an architect has and continues to be convincing other professionals that architects are capable of doing much more than just architecture. As the university architect at Howard University, my job responsibilities are more in line with those of a principal in a real estate development firm. I am responsible for implementing and monitoring programs and processes to achieve short-term and long-term Howard-wide strategic and operational goals as they relate to facilities and real estate. I am also responsible for the hiring of design and planning consultants and for providing program, planning, and design oversight for all university facilities, as well as monitoring construction projects on campus.

Initially, I pursued a nontraditional career path because I had an interest in something more than just designing buildings. I spent nine years with the Oliver T. Carr Company, a real estate development company in Washington, D.C. That opportunity opened my eyes to the breadth of the built environment and provided me with a much more global perspective on place making.

When I started my career in real estate development, I had been counseled to consider obtaining an MBA. I did not want to commit the time required to return to graduate school. I decided to pursue the path of learning through experience. Since I had been schooled as an architect and architects are taught to solve problems, I was able to manage any of the issues that were part of my job responsibilities quite well. After getting a few years under my belt, I obtained the Real Estate Development Primer Certificate from Harvard Graduate School of Design and Wharton School of Business as a way of confirming what I had learned. It worked.

BEYOND ARCHITECTURE

OUTSIDE TRADITIONAL PRACTICE

- Academic Dean/Administrator

Firms have emerged that are assisting architecture firms in creating virtual designed environments. Additional career options, such as BIM management and facilitation, are being created as a result of technology.

Other influences that are creating new career opportunities for architects are integrated project delivery (IPD) and other alternative project delivery methods; international practice; and public interest design.

To adequately prepare for your future in architecture or beyond, consider reading *The New Architect: A New Twist on the Future of Design* (Greenway Communications, 2007) by James P. Cramer and Scott Simpson.

CONCLUSION

As stated by David Haviland, Hon. AIA, "Architects are broadly qualified to practice in a wide variety of roles and settings within the architecture profession and building enterprise." To maximize one's path, the chapter highlighted "career designing"—the process of assessing, exploring, decision making, and planning.

Further, the chapter outlined the myriad possible career paths of an architect, both within traditional practice (extending from intern to architect to principal) as well as careers outside traditional practice and beyond architecture. Finally, emerging and potential trends for design professionals were listed.

3.4 AIA Continuing Education System

John Lape, AIA, FCSI, CCS, CSC

The AIA Continuing Education System (AIA/CES) is a thriving, multifaceted, lifelong professional development program and the largest source of education specifically targeted to architects.

The American Institute of Architects Continuing Education System (AIA/CES) was developed to help members further their continuing education needs plus meet the requirements for state licensure and membership in the AIA. AIA/CES was approved at the AIA convention in Boston in the early 1990s and began as a pilot program in 1994. It started as a voluntary trial requirement and then, in January 1996, continuing education became a requirement for all architect members of AIA.

AIA/CES MISSION

As stated in the AIA/CES 2012 Providers Manual, "The AIA/CES mission is to support AIA members in mastering new knowledge and skills to meet the changing requirements of the profession and to responsibly meet a role that society entrusts to architects. AIA/CES supports its continuing education mission through its Approved Provider Program, which consists of a network of AIA/CES Approved Providers. AIA/CES hopes to inspire and guide approved providers to consistently deliver quality education courses for architects."

AIA/CES: AN EVOLVING PROGRAM

It is interesting to note how the program has evolved, as evidenced by three quotations from the years 2000, 2011, and 2012.

FROM 2000 AIA FIRM LEADERSHIP SUMMIT

"It is a continuing education system developed by the AIA that emphasizes learning and records professional learning as a requirement for architect membership. It enables the architect to keep current, master new knowledge and skills, plan for the future, and responsibly meet the role society entrusts to a professional. In doing so, it has the potential to be one of the primary forces in the improvement and revitalization of our profession."

FROM CES MANUAL, 2011

"First developed in 1994, the AIA/CES is a continuing education system developed by the AIA to organize and track professional development activities required for AIA membership. AIA/CES enables members to keep current on issues in the field, master new knowledge and skills, plan for the future, and responsibly meet the role society entrusts to a professional architect. By making available learning opportunities in every area of knowledge relevant to today's architect, the AIA/CES program has grown into a major force in the improvement and revitalization of the architecture profession in the twenty-first century."

(continued)

John Lape started his small architecture firm in Portland, Oregon, in 1988. He has served on numerous continuing education committees and advisory groups and was 2012 chair of the national AIA Education Committee. Lape has presented at many Providers Conferences and National Conventions, and he is an AIA/CES provider.

FROM CES PROVIDERS MANUAL, 2012

"The AIA Continuing Education System is a thriving, multifaceted, lifelong professional development program and the largest source of education specifically targeted to the design and building industry. This course was developed by the AIA to help members meet their state mandatory continuing education (MCE) requirements and to help fulfill their AIA continuing education requirements for membership renewal. Most state licensing boards with MCE requirements recognize the AIA/CES as the primary source of continuing education for their licensed architects. In addition, AIA/CES tracks continuing education courses taken by members and records them on their transcripts as a service and as a benefit of AIA membership."

The first quotation, from 2000, talks about the "potential" of the AIA/CES program to be *one* of the primary forces in the improvement and revitalization of our profession. There is no mention of the state licensing mandatory continuing education requirements. By 2012, that "potential" has been met as the program is described as a "thriving, multifaceted, lifelong professional development program and the *largest* source of education specifically targeted to the design… industry." AIA/CES is no longer described as being "one of the primary sources," but is widely recognized in 2012 as "*the* primary source" for architects' continuing education.

CONTINUING EDUCATION OVERVIEW

Architecture used to be referred to as an "old man's profession." This reference was only partially due to the apparent domination of seasoned (and male) practitioners. The primary reason for this perception was that it can take many, many years to acquire the experience, technical knowledge, and design expertise to truly contribute to the profession.

Even before formalized continuing education, it was well known that to be relevant and competitive in the industry, a commitment to continued learning was critical. While AIA membership is still dominated by more seasoned practitioners, the playing field has been leveled somewhat with the advent of computer technology and the Internet. The post–baby boom generations have grown up in a vastly different, and more communicative and collaborative learning environment than their elders.

CONTINUING EDUCATION REQUIREMENTS FOR LICENSURE

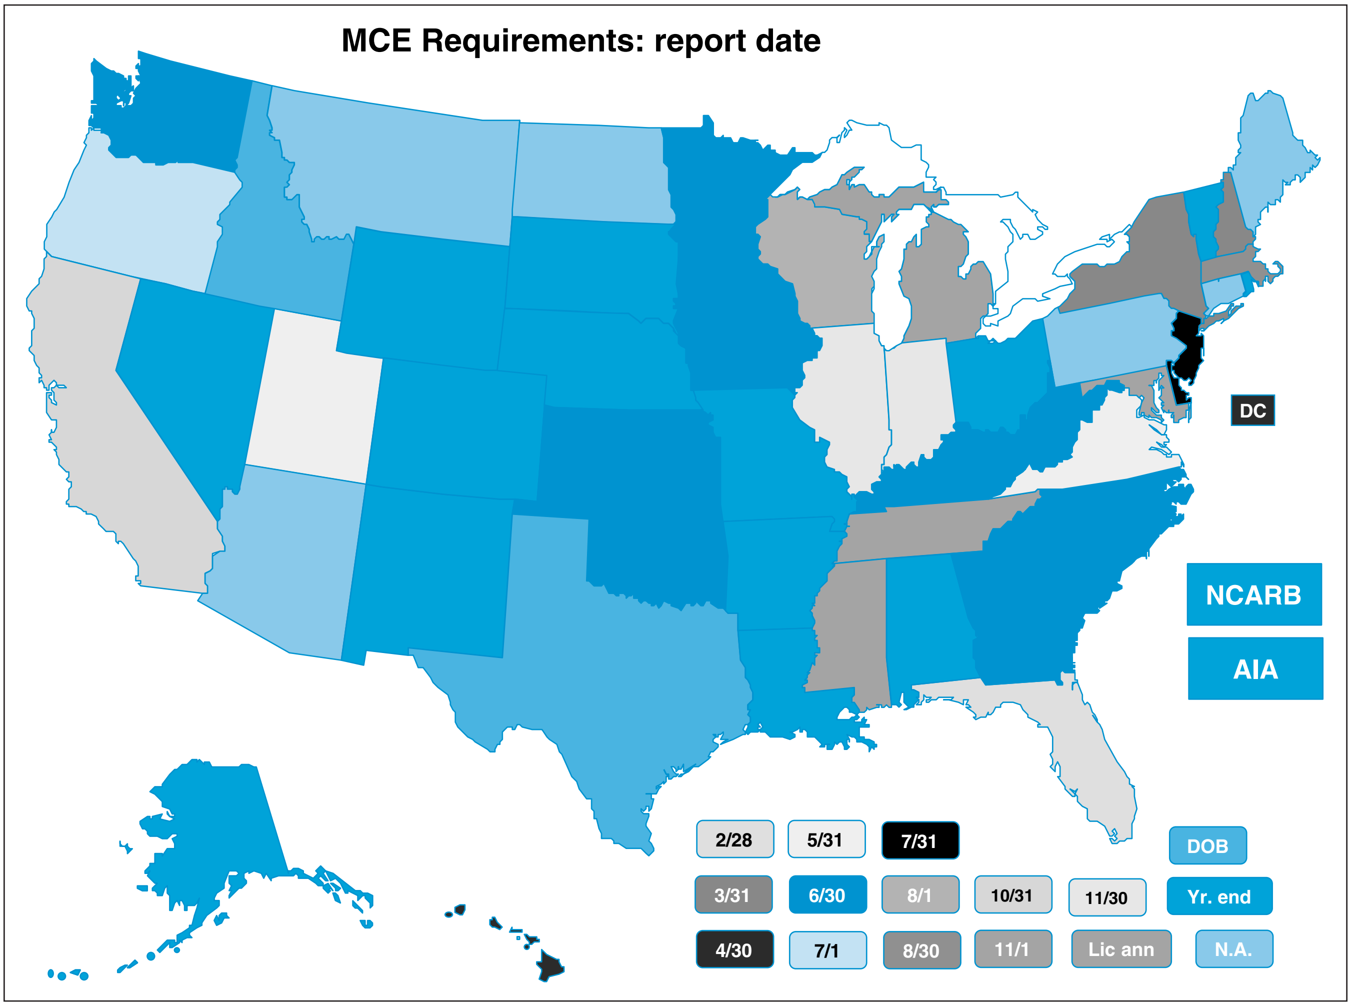
Currently, architectural boards in 42 states, the District of Columbia, Puerto Rico and Guam, 11 Canadian Provinces, and 19 countries have implemented mandatory continuing education (MCE) for an architect's state licensure renewal. Each architect must register and meet each state's licensing board standards in order to practice in that state. On average, AIA member architects are licensed to practice in four states, often with varying MCE requirements.

▶ The backgrounder on Mandatory Continuing Education (3.1) contains further information about continuing education requirements to maintain licensure.

The AIA/CES program is currently the only continuing education tracking specifically designed for architects to meet their state MCE requirements and the AIA's continuing education requirements. AIA/CES staff has worked closely with all of the state boards of architecture that require continuing education for licensure renewal (see Figure 3.4). Most state boards' mandatory continuing education requirements recognize the AIA/CES system as a primary source for architectural continuing education.

HOW AIA/CES WORKS

The AIA's online "Discovery" system is the backbone of the AIA Continuing Education System. Discovery provides general information about the AIA/CES program and about state and provincial mandatory continuing education requirements.



John Lape

FIGURE 3.4 **Mandatory Continuing Education Requirements Report Date Map**

Information and application forms needed to become a Registered CE Provider are also available. Discovery provides password-protected access that allows AIA members to view their continuing education transcripts. The site also gives AIA members access to a wide range of information about continuing education classes. In addition, Discovery is the portal that Registered Providers use to register courses and report attendance. Enhancements to CES Discovery are continuing as an ongoing process.

Types of Credits

In 2011, over one million member credits were registered in the CES Discovery system. All AIA architect members are required to acquire a minimum of 18 credits per calendar year. While there is no standard for state MCE as of 2012, the National Council of Architectural Registration Boards (NCARB) passed their Model Law and Model Regulations in June of 2011, which recommends that states require 12 Health, Safety, and Welfare (HSW) credits per calendar year. The majority of states require an average of 12 credits per year (24 credits for a two-year cycle).

Some states have requirements for continuing education that include specialized training, such as a minimum number of credits in accessibility design and in building codes. California, for example, requires a minimum of five accessibility design credits within a two-year renewal cycle.

As of 2012, AIA/CES tracks three types of credits:

- *Learning Units (LUs)*: The base measure for credits, with one hour of general education equaling one LU credit. There is no requirement for general education in NCARB'S model law and model regulations, which support the professional responsibility of architects to safeguard the general public. Nevertheless, the AIA/CES program recognizes the need to encourage architect members to get a broad range of education. This general credit type is expected to remain a part of the AIA/CES system, in part to enhance the standing of the AIA membership.
- *Learning Unit/Health, Safety, Welfare (LU/HSW)*: A specific type of credit that can only be obtained from Registered Providers conducting approved courses. Health, Safety, and Welfare (HSW) is a term borrowed from the building code, where it refers to protecting the "health, safety, and welfare" of the general public through building regulations. In the AIA/CES system, the term is carefully defined and has been expanded to include topics such as design, urban planning, all types of regulations, ethics, finishes, furnishings, historic preservation, insurance, and other legal considerations to protect owners and the general public. NCARB's Model Law and Model Regulations definition of HSW was aligned with the AIA/CES definition in 2011.
- *Learning Unit/Health, Safety, and Welfare/Sustainable Design (LU/HSW/SD)*: Implemented as a pilot program to track sustainable design (SD) as a subset of HSW credits. This pilot program was introduced to encourage education in and application of sustainable design principles. Sustainable design is becoming increasingly mainstream, with the term evolving to mean high-performance building design and other applications of environmentally responsible design. It is expected that the AIA will allow the SD credit to sunset at the end of 2012.

AIA AND NCARB DEFINITION OF "HEALTH, SAFETY, AND WELFARE"

Health, Safety, and Welfare (HSW) in architecture is anything that relates to the structural integrity or soundness of a building or building site. A course must meet three primary criteria:

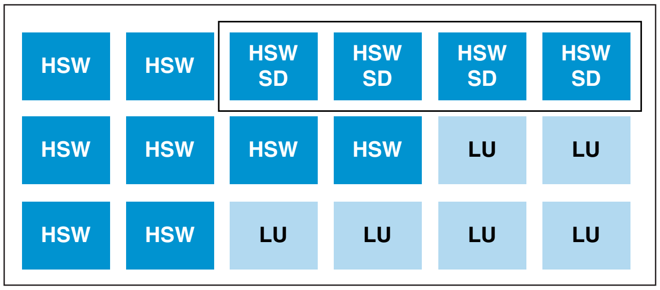
1. Course content must directly support at least one of the definitions of HSW:
   - *Health*: Aspects of architecture that have salutary effects among users of buildings or sites and address environmental concerns.
   - *Safety*: Aspects of architecture intended to limit or prevent accidental injury or death among users of the buildings or sites.
   - *Welfare*: Aspects of architecture that engender demonstrable positive emotional responses among, or enable equal access by, users of buildings or sites.
2. Content must include one or more acceptable HSW topics from a lengthy list.
3. At least 75 percent of the course content must pertain to HSW.

AIA/CES Minimum Requirements

As of 2012, AIA architect members are required to complete a minimum of 18 credits of continuing education per calendar year for membership renewal. Of those 18 LU hours, at least 12 hours are to be in health, safety, and welfare (HSW) topics. Of those 12 HSW hours, at least 4 hours must be on topics related to sustainable design (SD), as illustrated in Figure 3.5.

It should be noted that while a transcript meeting minimum requirements would show 18 total credits with 12 LU/HSW credits and 4 LU/HSW/SD credits, these requirements could be met in a variety of ways. For example, all 18 credits could be LU/HSW/SD. Or 18 credits could be made up of 6 LU/HSW/SD, 6 LU/HSW, and 6 general LU credits.

The AIA will continue to require more than the NCARB suggested minimum of 12 credits for its members. Part of the motivation for this requirement is to clearly elevate the knowledge base of AIA member architects, creating a distinction from those architects who are not AIA members. Primarily, AIA wants to encourage members to continually acquire diversified professional knowledge. Non-HSW topics such as practice management and architectural history strengthen an architect's practice and the profession.



AIA/CES

FIGURE 3.5 AIA/CES Minimum Requirements

Self-Reporting

Effective January 2012, the CES program no longer permits LU/HSW or LU/HSW/SD credits to be self-reported. NCARB and most states' MCE requirements also do not permit HSW credits to be self-reported. Self-reported education can be either self-guided (such as taking a tour of an architecturally significant building or reading an architectural book or by taking a course of any type from a nonregistered provider). Both AIA and NCARB have significant concerns that this type of learning is nonstructured, is not led by a knowledgeable source, and that the learning is not verifiable.

Another challenge relating to self-reporting is that many architects attend commercially oriented classes offered by vendors, often about proprietary systems. These sessions, while educational, are often primarily oriented toward sales. While there is a need for practitioners to understand products and building systems in architecture, these sessions do not qualify to AIA/CES credits because they are not impartial, do not offer reliable knowledge, and are often not presented in an education-oriented environment. For example, a firm may be designing a high-rise around a manufacturer's proprietary curtain-wall system and invite the manufacturer to come in to help them work on details and specifications for that system. This kind of activity will not qualify for AIA/CES self-reporting credits.

PROVIDERS

AIA/CES Providers are organizations or individuals that have been approved by AIA/CES to offer continuing education in architecture, within the guidelines of the AIA/CES Provider Manual. In 2012, there were over 2,300 registered AIA/CES providers representing a wide diversity of interests in the profession. Approved Providers include architecture firms and stakeholders in design and construction, including associations, government agencies, product manufacturers, and universities. In addition, local and regional AIA Components, AIA National in-house departments, and AIA knowledge communities are also Registered Providers.

There are numerous design- and construction-related associations that are Registered Providers. These include the Construction Specifications Institute (CSI), the International Interior Design Association (IIDA), the American Concrete Institute (ACI), the American Institute of Steel Construction (AISC), and the Building Envelope Council (BEC).

There are a few large organizations, such as Hanley-Wood, that are Registered Providers. They provide courses across the country and conduct national conventions.

There are several categories of providers to reflect the format and geographic reach of educational classes that a Registered Provider will offer. For example, the Basic Provider category permits only face-to-face, on-site learning, while providers in the Passport and Professional categories are authorized to offer face-to-face *and* distance learning courses both nationally and internationally.

The Architecture Firm Provider–Internal category permits architecture firms to conduct classes and provide credits for their firm members only. An Architectural Firm Provider–External status will allow firms to also educate non-firm members, a group that may include clients, members of another firm that are collaborating on a project, or other members of the local architecture community.

Distance Education

Distance education is a fast-growing sector of the AIA/CES program. The number of courses registered and credits applied for distance education has been rising steadily and represented about 35 percent of all AIA/CES registered programs in 2012. Distance learning includes courses offered online, via written correspondence (for example, published articles), podcasts, webinars, and other non-face-to-face types of educational offerings. To validate that learning actually takes place with distance education, a test is required with LU/HSW courses.

AIA/CES EVOLUTION

The AIA/CES program is a relatively new requirement, especially compared to continuing education programs for other professions such as attorneys, doctors, dentists, and engineers. As a new program, it will continue to evolve as it matures and in response to changes in the profession. Although initially developed primarily as a membership requirement since only a few states had mandatory continuing education requirements at the time, the AIA/CES program has become the AIA member's primary Continuing Education tracking system for state licensure renewal requirements.

In 2012 the Discovery system added quarterly reports of member AIA/CES credit status, including a listing of the experience level category of the courses completed, when applicable. A quarterly e-mail notification of credit status will provide members with both numeric and bar graph information on the annual number of credits by type that they have accumulated. This e-mail will also provide information about carryover credits and a notice of congratulations when the minimum AIA requirements have been met. There will also be information and links to local course offerings, the local component, and CES Discovery. This notification may soon also be able to report MCE continuing education renewal status to members for the various states in which they are licensed.

The AIA/CES program is also evolving with the introduction of course experience levels: basic, intermediate, and advanced. This has been a feature of the programs at the AIA National Convention, and soon all courses will be classified in these three categories. In the early years of the AIA/CES program, many members were content with simply fulfilling their minimum credit requirements. Classes were often offered at a level of basic education to appeal to the broadest and largest audience. Over the years, the demand for more advanced and higher levels of classes has driven this change toward classification by experience level. The proliferation of Registered Providers and registered course offerings has allowed architects to be more selective and have higher expectations of the courses they choose to attend. This trend will continue, and the basic, intermediate, and advanced categories of courses will help members be more selective in their education. This trend will also drive education to reach beyond fulfilling minimum mandatory continuing education requirements to lifelong learning, wherein attendees establish learning goals based on firm strategic objectives and the needs of individual professionals.

LIFELONG LEARNING

Lifelong learning is different from meeting licensing or association membership requirements. Lifelong learning goes beyond the minimum baseline to support professional needs and goals. It is a commitment, over a sustained period, to acquire the desired and needed education regardless of the credits offered.

Lifelong learning can be focused on a single, specialized topic, such as the design of a unique building type like assisted living centers. More often an architect will have multiple learning emphases over the course of their career as interests, specialties, and skills continue to evolve and develop. It is a quest to improve one's professional knowledge and ability to deliver excellent projects. A member seeks out education and learning to achieve those goals. The AIA/CES program plays a role in this quest, but most architects find that they need far more than the minimum educational requirements to succeed in the profession, and to serve an innate drive to continually grow and learn. The rewards of lifelong learning are many. By engaging in continuous learning, architects remain invigorated in their careers and about their profession.

Architect's Essentials of Professional Development (Wiley, 2003) by Jean R. Valence.

3.5 Participating in Professional Organizations

Shannon Kraus, FAIA, ACHA, MBA, and Amaya C. Labrador, Assoc. AIA, EDAC

Getting involved in professional organizations can be a key activity in an architect's professional development, as well as a great way to explore passions and contribute to the profession of architecture.

Professional organizations are a vital part of most professions and this is especially true with architecture. From the American Architectural Foundation (AAF) to the National Organization of Minority Architects (NOMA) to the National Council of Architectural Registration Boards (NCARB), professional organizations are a way to give a voice to members and constituents that share a common cause, to organize around an issue, or to serve as a vehicle for setting policy. Such organizations can focus internally on the governance of the profession or interest groups within it, or they can focus externally to provide outreach to communities and the public at large.

Participating in professional organizations is a great way to supplement professional growth, explore passions, and contribute to the development of the profession of architecture. However, it is difficult to get involved without understanding the organizations' purpose or how they are organized. By understanding the context within which organizations work, how they are organized, and their history, an architect, intern, or student can identify the type of organization that fits their personal interests and ambitions and make the most out of these opportunities.

Becoming actively engaged with civic, cultural, and professional organizations puts an architect in direct contact with community leaders who are policy-makers and potential clients. Such civic engagement enhances the architect's likelihood of being called upon to assume leadership within the communities where planning, design, and building decisions are made.

—Ted Landsmark, M.Env.D., J.D., Ph.D., president, Boston Architectural College, 2013 president, NAAB

Shannon Kraus is a senior vice president and managing director of the Washington, D.C., office of HKS. In addition to his roles in the practice, he has been involved nationally, regionally, and locally in various architectural organizations. Amaya C. Labrador is a planner and researcher for the Washington, D.C., offices of HKS.

HISTORY

For centuries, guilds have united craftsmen of a common trade. Historically, they operated with a charter or letters patent appointed to them by the governing authority. The guilds allowed knowledge to be controlled. By controlling the supply of labor, guilds were able to control the market, regulate wages, and safeguard working conditions. Some also maintained funds for elderly or infirm members and their families or for travel to find work, functioning as a sort of insurance. In addition, some guilds required apprenticeships that made it difficult to enter a field without their support. However, as modern economic principles spread, guilds began to be regarded as obstacles to free trade and their power began to fade.

The professional associations, as they are known today, came to be during the Industrial Revolution. Although modern trade or professional organizations have much in common with the historic guild system, today's professional organizations do not seek to control an industry within a geographic area, but rather provide support for its members or constituents and further commercial interests through setting policy or direction. By the end of the nineteenth century several associations were well-established, including the American Institute of Architects (1857), the American Bar Association (1878), the American Medical Association (1847), and the American Association of Public Accountants (1887).

TYPES OF ORGANIZATIONS

The most common question asked about professional organizations is, where or how do you begin to get involved? Most individuals entering the profession are generally aware of the higher-profile organizations. However, it is important to be aware of all the possibilities, including the lesser-known ones. This article won't cover every organization in existence, but it will cast a wide net. It is almost a certainty that there is an organization or committee within an organization that is suited for every architect and their passions.

Before discussing how to participate in a professional organization, it is important to understand the subtle differences among them. There are many organizations, each serving specific interests, needs, or segments of the profession. Although it might be initially daunting, finding the right fit and becoming engaged is very rewarding.

In defining the various types of organizations, the purpose is not to singularly categorize or silo them, but to help draw distinctions between the inherent missions that set them apart so individuals can find the groups that are right for them based on their own interest or what they may be looking to get out of their involvement. In many cases an organization will have components that serve each of the categories discussed below. For the purposes of this article the distinction, as subtle or controversial as it may be, is based on the actual mission of the organization, regardless of its programs or initiatives.

In the course of their development, three basic types of professional organizations have evolved:

- *Constituency-based*, which focus on serving a membership or representing a constituency
- *Cause-based*, which focus around a particular issue or cause to be addressed
- *Knowledge-based*, which exist to promote or serve a particular area of expertise

While many organizations will blur the lines across all three types, the distinction lies in how their mission statements are written and how their boards are organized to serve. The American Institute of Architects (AIA), for example, has knowledge communities focused on knowledge sharing, and sustainability committees focused on the sustainability cause. However, at its core, it is a constituency-based organization as defined by its mission to serve the best interests of its membership.

Constituency-Based Professional Organizations

Constituency-based organizations exist to serve the best interests of their membership. It is embedded in their mission statements and governance bylaws. It is through their membership that they then also typically have a higher calling, such as protecting the welfare of the public, advancing architecture, or creating healthy communities. These callings may stay the same or evolve as the membership's interests evolve. It is important to recognize that there are different types of constituency-based organizations and to be able to distinguish them. The most obvious are those that have fee-paying members, like the American Institute of Architects or National Organization of Minority Architects.

Other constituency groups are those that represent organizations or key stakeholders. For example, NCARB represents State Registration Boards, each of them with their own jurisdiction. Their higher calling is the protection of the public health, safety, and welfare through the regulation of the practice of architecture. The Association of Collegiate Schools of Architecture (ACSA) represents their member institutions, which are linked by their shared role in architecture education.

Our students and faculty care deeply about the environment, building communities, and the world's condition. Through publications, academic conferences, and communication vehicles, ACSA aims to further dialogues that advance architectural education, and so improve our collective path forward.

—Donna V. Robertson, FAIA, 2012 ACSA President

Professional Development

Typically, professional development is a core part of constituency-based organizations. Although the specific format may vary, most organizations offer programs centered on continuing education, knowledge sharing, networking, and also awarding honors and recognitions. Some organizations are focused internally, on their own constituents. The AIA, for example, assists its membership in professional development through its continuing education programs. On the other hand, NCARB's professional development programs (like the Intern Development Program) are focused externally. They are performed on behalf of the member State Boards, and they serve individuals who are not themselves members of NCARB.

- Continuing education is one of the largest vehicles for professional development. Programs can include annual conventions, topical workshops, and self-guided and online learning formats.
- Knowledge sharing, a form of knowledge-based networking, is also a vehicle for professional development. Within the AIA, knowledge communities exists, each focused on their own specialized knowledge area. Through these, groups of members come together in pursuit of this common knowledge area. Other organizations, like the ACSA, will host annual meetings where individuals may present research or white papers on emerging trends and topics.
- Of all the organization types, mentoring is most prevalent in constituency-based organizations. Although some mentoring relationships happen informally, some organizations have formalized programs that assign mentors and mentees based on location and common interests. These efforts generally include a structured program that includes scheduled meetings, online activities, and participant receptions.
- Awarding honors and recognitions is also a way to encourage professional development through honoring achievements, milestones, significant contributions, and other noteworthy accomplishments of the constituents they serve. In the AIA, the AIA Gold Medal, Firm of the Year, and Fellowship programs are all examples of this. The American Institute of Architecture Students (AIAS) honors its Chapters, and the ACSA awards the Topaz Medallion in conjunction with the AIA.

EXAMPLES OF CONSTITUENCY-BASED ORGANIZATIONS

The American Institute of Architects (AIA)
American Institute of Architecture Students (AIAS)
Association of Architecture Organizations (AAO)
Association of Collegiate Schools of Architecture (ACSA)
National Council of Architectural Registration Boards (NCARB)
National Organization of Minority Architects (NOMA)
Association for Women in Architecture + Design (AWAD)
Society for Design Administration (SDA)

Advocacy

Advocacy is often central to helping constituency-based organizations achieve their missions. The type of advocacy can vary greatly and may range from political action committees to policy making to social issues. The common thread is that the issue or item being advocated is of benefit or of direct interest to the organization's membership. AIAS focuses a lot of significant resources on representing and advocating student issues to the AIA, NCARB, ACSA, and other professional organizations. One of its biggest initiatives was the "Studio Culture Policy" that has since been adopted by all its collateral organizations and is now a key part of the conditions for architectural accreditation enforced by the National Architectural Accrediting Board (NAAB).

Cause-Based Professional Organizations

Members want to be involved with the Green Building Initiative because they have a voice in helping set direction in this ever-evolving green building industry.

—Sharene Rekow, VP Business Development, GBI

Cause-based organizations are very much professional organizations, but rather than a focus on serving the best interests of a constituency group, their mission is the pursuit or advocacy of very specific issues or topics. These vary greatly in organizational structure, and may even have categories of membership where people interested can join the cause, while also contributing financially. The distinction here is that the organizations don't exist to serve their members but rather they often have members to serve the cause, while providing a framework to help rally members to their mission. Cause-based organizations are often structured as nonprofits and may rely on donations and fund-raisings to serve their cause.

Cause-based organizations include groups like the Green Building Initiative, seeking to offer the marketplace a choice in sustainability; or others like most of the architectural foundations, which seek to promote architecture in various communities. This is a subtle distinction from the AIA, in that they serve architecture, not architects. The American Architectural Foundation (AAF) is the largest of these and has many great programs, including one that promotes architecture education and awareness in elementary schools. Many cities have local or regional architectural foundations as well (independent of the AAF), which serve a similar mission and are often a collaborative effort of the local AIA chapter, community leaders, and area schools.

EXAMPLES OF CAUSE-BASED ORGANIZATIONS

American Architectural Foundation (AAF)

Architects/Designers/Planners for Social Responsibility (ADPSR)

Architects without Borders

Architecture for Humanity

Beverly Willis Architecture Foundation

Centers for Architecture:
- The Architectural League of New York
- Center for Architecture Foundation
- Chicago Architecture Foundation (CAF)
- Dallas Center for Architecture

Public Architecture

Green Building Initiative (GBI)

U.S. Green Building Council (USGBC)

Professional Development

Professional development will happen within these organizations as well, but the organizations are almost always centered on external programs with the goal of promoting awareness or building support for their cause. The AAF and the local architectural foundations will offer speaking programs, seminars, tours, and even honors and awards to recognize outstanding achievements of volunteers that make significant contributions toward these issues.

Advocacy

Advocacy is a big part of cause-based organizations. They differ from constituency-based organizations in that they lobby for their cause. These activities can consist of formal lobbying, political action, or organizing advocacy-based conferences, workshops, and retreats. They also often organize events that serve as both advocacy and fund-raising. For example, the AAF holds Accent on Architecture each year to celebrate architecture, honor the contributions of those making a difference, and to raise money for scholarships, outreach, and programs.

Knowledge-Based Professional Organizations

Knowledge-based organizations differ from the previous two types in that they are focused around a particular area of knowledge, not just a cause or its members. They also often will take on advocacy, but it is in the pursuit of their knowledge area, so again it comes down to their official mission. They may be membership-based or volunteer-based and may also be nonprofits. The Urban Land Institute (ULI) and the Construction Specifications Institute (CSI) are examples of knowledge-based organizations.

One of the more widely known knowledge organizations is the Construction Specifications Institute. The CSI not only sets the standard for construction specifications but also offers multiple certification programs that quantitatively evaluate area of expertise. Other groups that offer certifications include the American College of Healthcare Architects (ACHA) through their board certification, and the Center for Health Design through its EDAC program.

Some knowledge-based organizations reside within other parent organizations. This is the case with most of the knowledge communities that reside under the umbrella of the AIA. These include committees on design, practice management, environment, and architecture for education; in all, there are more than twenty knowledge committees within the AIA.

My involvement with the Guidelines *and FGI (Facility Guidelines Institute) provides me the equivalent of a Master's degree in health care design every four years. No matter how much time I put into the development of each edition of the* Guidelines, *I get more out.*

—Kurt Rochstroh, FAIA, FACHA, FGI

Professional Development

Knowledge-based organizations typically offer robust continuing education programs, which can include conferences, lectures, workshops, tours, articles, white papers, and online seminars. Many of these organizations focus a lot of energy on distributing and sharing knowledge through their websites, newsletters, and other avenues.

Most knowledge groups will also offer various types of certificates or awards and recognition programs that denote expertise in the particular field.

One of the things that make knowledge-based organizations so attractive to participation is that regardless of your particular interest area within the profession of architecture, there is a group of like-minded individuals to network and learn with. From hospitality to justice to biomed life sciences, there is something for every architect.

Advocacy

Advocacy activities vary among the particular organizations, but often there is a central theme. The Facilities Guidelines Institute advocates for guidelines in health care construction both within the industry as well as through legislative channels. The Construction Specifications Institute advocates specification standards nomenclature and documentation standards. What is common to all is that advocacy is a powerful and productive way for knowledge-based organizations to leverage their members in order to build awareness for work, to help with fund-raising, or to help promote use of their specialized knowledge areas.

EXAMPLES OF KNOWLEDGE-BASED ORGANIZATIONS

American College of Healthcare Architects (ACHA)
Construction Specifications Institute (CSI)
The Center for Health Design (CHD)
Facility Guidelines Institute (FGI)
Urban Land Institute (ULI)

GETTING INVOLVED

In all of these organizations, there is no shortage of help needed, and most of the organizations struggle with converting individuals from mailbox members (the couch) to active members (going to the gym). Although it is easy to find a niche and get involved, there may be roadblocks during the couch-to-gym transformation.

The first roadblock is with understanding how to get involved. This can be overcome simply by reading about the organizations on their websites and by communicating with others who are already involved. The second big roadblock might be a general dissatisfaction with the direction of the organization in which a person is most interested.

AIA membership is like a gym membership. You can go, get involved, and get a lot of benefit. Or, you can sit on the couch, not get any benefit at all, and complain about the dues. You really get out of it what you put into it.

—John Senhauser, FAIA

It is therefore important to understand that organizations by their very nature are living, evolving entities that are defined by those who get involved, as well as those who choose not to. This is no different for professional organizations. They are people-driven entities and, further, they collectively mold the profession and shape the public perception of architects. Getting involved is a way of shaping the direction an organization takes in its development. Those who are unhappy with a policy or movement can and should get involved, in order to help shape that policy or refine that movement. Instead of criticizing something while not being a part of it, join, work to change the organization, and get more personal fulfillment along the way.

Professional organizations are about pulling together like-minded individuals who share common interests or goals. Joining, attending, or participating in them is a great way to stay in the loop; learn about the local industry; stay up to date with emerging technologies, trends, and issues; and network. Whether for networking or for a social cause, choosing where and how to participate should be done based on interests, as well as professional and personal goals.

Identify Interests

The first rule of engaging in professional organizations is to understand that involvement is most enjoyable if it aligns with personal and professional interests. Interests could be an issue, like sustainability; or it could be joining a network for professionals facing similar challenges, like one of the many local women in architecture organizations or identity groups. You should also receive something of value in return—whether personal enrichment, professional development or advancement, public service, or something else.

How to Get Involved

Get involved by helping aspiring architects build a future in the profession. Become an IDP Coordinator, mentor, or supervisor; serve as a volunteer on an NCARB committee or state licensing board; or simply help guide others along the path to licensure.

—Michael J. Armstrong, CEO, NCARB

Within each organization there are various ways to get involved. Locally, chapters host meetings, continuing education seminars, special interest events, public service programs, and networking events, among others. Participation in these events is a good way to stay connected to the local market, as well as a gateway to the larger national organizations. Typically, organizations offer member discounts to those activities that require a fee.

The larger entities, such as the national component of the American Institute of Architects (AIA), hold yearly national conventions. Held in a different location every year, they usually require travel, but provide great opportunities through their concentrated offering of continuing education seminars, roundtables, galas, and receptions that are great for networking, as well as local tours and often just-for-fun events.

Another great way to stay connected is to participate virtually. Most organizations keep frequently updated web pages with news, upcoming events, and participation opportunities, and send out regular e-newsletters. Member resources can often be accessed through web pages, like the AIA's KnowledgeNet. The KnowledgeNet website is an interactive repository for resource sharing, networking, and discussion forums, structured around subject-specific Knowledge Communities.

Social media can also be a valuable connection tool: Following an association's Facebook page or Twitter account will add their news to your newsfeed; joining their group on LinkedIn provides access to ongoing, member-led discussions as well as related job postings.

Levels of Participation

There are different "levels" of participation: for example, joining the AIA is a matter of meeting the requirements and paying your dues, which gives you the right to place "AIA" or "Assoc. AIA" after your name. However, the real value comes from taking advantage of AIA resources, attending the continuing education seminars, special events and tours, classes, ARE prep courses, and networking events.

One of the first steps is attending an organizational meeting or event and participating. Most who volunteer will be inspired by their passions or the opportunity to work with someone they respect. There are typically opportunities to participate at the local chapter as well as the national level. Organizations generally look for local members to volunteer for conventions and events, often giving discounts or other incentives in return. Many volunteer to serve multiple positions in the same organization over time, and in some cases leadership positions and director boards are usually staffed by volunteers. For example, members from the five collateral organizations form part of the visiting teams for NAAB accreditation visits, and the AIA, ACSA, NCARB, and AIAS have representative members of their organizations on the NAAB Board of Directors. Some organizations form special committees around an area of interest, such as the AIA's Young Architects Forum (YAF) or the National Associates Committee (NAC); these groups address the issues and interests of a specific subset of the organizations' membership.

Membership Benefits

Membership and participation in organizations have several benefits: education on emerging trends, publications, networking, conferences, product discounts, leadership development, and mentoring.

It wasn't until I joined CSI that I really started understanding building materials, construction technology, and the process of getting something built. Every successful building is the result of a team effort. CSI is where I get to know my teammates.

—Daniel Hargreaves, CSI, CDT, AIA, RAS

In addition to providing access to third-party resources, some professional associations perform and publish their own research regarding trends, or issue reports analyzing industry and market developments. These may be disseminated through the association's website or through their trade journal, newspaper, magazine, or newsletter.

Some organizations operate structured mentoring programs or offer matchmaking services for mentors and mentees; participating in these grants emerging professionals access to a seasoned professional and their experience. Within the AIA, the College of Fellows often works with the Young Architects Forum in a mentoring capacity. Other organizations will use mentors to help younger members achieve advanced status or honors. It is worth noting that taking on leadership roles and serving on committees as a volunteer also contribute toward mentoring and professional development. These provide members a way to pay it forward to the profession.

Finally, membership may make you eligible for discounts and reduced rates, not only for events produced by the organization itself but also for consumer products and services. For example, AIA's program AIA Advantage offers discounts on shipping services, software, insurance services, and others.

PARTIAL LIST OF PROFESSIONAL ORGANIZATIONS SHAPING THE PROFESSION

It would be nearly impossible to list all of the organizations that relate to the profession of architecture; it is also difficult to suggest that some are somehow more important than others. Each organization serves an important cause, advocates for an important issue, or represents a critical constituency and therefore helps shape the profession of architecture. However, there are several that are particularly important to know because they influence the practice of architecture directly.

The Five Collateral Organizations

Within the profession of architecture, each of the five collateral organizations plays a complementary role, addressing issues of advocacy, education, licensure, and practice. The five collaterals are: The American Institute of Architects (AIA), the American Institute of Architecture Students (AIAS), the Association of Collegiate Schools of Architecture (ACSA), the National Architectural Accrediting Board (NAAB), and the National Council of Architectural Registration Boards (NCARB).

AIA: The American Institute of Architects

The AIA was founded in 1857 by a group of 13 architects; according to its bylaws, the AIA's purpose is "to organize and unite the profession in fellowship; to promote the profession of architecture including its aesthetic, scientific, and practical efficiency; to advance the science and art of planning and building; to coordinate the building industry; and to make the profession of ever-increasing service to society."

Currently, the AIA provides many services to the architecture profession, among them sponsoring continuing education programs, setting industry standards for contract documents, providing resources for emerging professionals, conducting market research and analysis of factors affecting the profession, and advocating for the architecture profession.

Nationally, the AIA is governed through an elected Board of Directors, which includes representatives from each of the 18 defined regions. Locally, the AIA is organized into components (previously known as "chapters"), which may be state- or locally-based and through which individual membership is established. Special committees or groups within the AIA focus on particular issues and provide opportunities for participation: the Young Architects Forum, the National Associates Committee, the College of Fellows, and the yearly AIA National Convention.

AIAS: American Institute of Architecture Students

The student-run AIAS serves as the official voice of architecture students in North America, furthering its mission of promoting excellence in architecture education, training, and practice, fostering an appreciation of architecture and related disciplines, enriching communities in a spirit of collaboration, and organizing students and combining efforts to advance the art and science of architecture.

AIAS is divided into four geographic "quads," which serve to facilitate communication between the institution-based chapters and the Board. Current AIAS activities include the AIAS journal *Crit*, the national convention (FORUM), Quad Conferences, the Freedom by Design™ program, as well as numerous activities organized by individual chapters. In addition, representatives from AIAS participate on the National Architectural Accrediting Board's Board of Directors and on the NAAB teams which visit institutions for accreditation, as well as on the Association of Collegiate Schools of Architecture's Board of Directors, the AIA's Board of Directors, and some NCARB committees.

ACSA: Association of Collegiate Schools of Architecture

With the primary purpose of advancing architecture education through the support of its member schools, faculty, and students, the Association of Collegiate Schools of Architecture represents over 250 schools. Founded in 1912, the ACSA engages in multiple activities, including faculty awards and student competition programs, conferences, and publications such as the *Journal of Architectural Education* and *ACSA News*, as well as developing and supporting studies on issues affecting the architecture profession and architecture education.

NAAB: National Architectural Accrediting Board

The National Architectural Accrediting Board was established in 1940 by the Association of Collegiate Schools of Architecture, the American Institute of Architects, and the National Council of Architectural Registration Boards, eight years after the ACSA abandoned the "standard minima" needed by schools in order to be granted membership.

Today, the NAAB "develops and maintains a system of accreditation in professional architecture education that is responsive to the needs of society and allows institutions with varying resources and circumstances to evolve according to their individual needs." It is the only agency in the United States authorized to accredit professional degree programs in architecture.

The Board of Directors has 14 members: 3 members each from ACSA, AIA, and NCARB, 2 members from AIAS, 2 public board members, and 1 Executive Director. Accreditation decisions that are made by the Board rely on school visits performed by a rotating pool of volunteers who evaluate the programs based on established criteria.

NCARB: National Council of Architectural Registration Boards

The National Council of Architectural Registration Boards is a nonprofit corporation comprising the legally constituted architectural registration boards of the 50 states, the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands as its members. Founded in 1919, NCARB protects the public health, safety, and welfare by leading the regulation of the practice of architecture through the development and application of standards for licensure and credentialing of architects. NCARB provides a range of important services to the profession, such as developing and administering the Intern Development Program (IDP), the Architect Registration Examination® (ARE®), and NCARB certification, which facilitates reciprocal registration.

Additional Organizations

The organizations listed in Table 3.2 are intended to be a representative sample of the many diverse organizations that exist in their respective fields. There are numerous other associations, each with their own opportunities for participation, learning, and networking. For a more exhaustive list, please see the latest edition of the *Almanac of Architecture and Design*.

AAF: American Architectural Foundation

Headquartered in Washington, D.C., the nonprofit American Architectural Foundation (AAF) seeks to educate and inspire "elected officials, educational leaders, and other public-spirited decision makers to use design to create better communities." To achieve this, the AAF assembles design teams and connects them to community and government leaders, whose decisions have the ability to shape our communities. The AAF's programs include the Mayors' Institute on City Design, the Sustainable Cities Design Academy, and Great Schools by Design.

ACHA: American College of Healthcare Architects

The American College of Healthcare Architects offers board certification within the specialized field of healthcare architecture. The nonprofit organization recognizes four classes of certificate holders: Founding Affiliate, Affiliate, Fellowship, and Emeritus. Architects can apply to the Affiliate level if they have been licensed for at least five years, have practiced primarily in the healthcare field for at least three of those, and have passed the Board Certification examination. Affiliates are eligible to be nominated for Fellowship by a fellowship committee after five years of exemplary performance.

ASID: American Society of Interior Designers

The American Society of Interior Designers is the largest professional organization for interior designers. Although ASID was officially founded in 1975, its history predates that, through its predecessor organizations: the American Institute of Interior Designers and the National Society of Interior Designers. It is "committed to the belief that interior design, as a service to people, is a powerful, multifaceted profession that can positively change people's lives. Through education, knowledge sharing, advocacy, community building and outreach, the Society strives to advance the interior design profession and, in the process, to demonstrate and celebrate the power of design to positively change people's lives."

ASID represents more than 18,000 practicing interior designers and 10,500 interior design students through its 48 local chapters. Professional members must possess an accredited design education or work experience, and pass the accreditation examination administered by the National Council for Interior Design Qualification (NCIDQ).

Architecture for Humanity

Founded in 1999, Architecture for Humanity is a nonprofit organization that seeks to "promote architectural and design solutions to global, social, and humanitarian crises." The original Architecture for Humanity competition sought to build transitional housing to returning Kosovo refugees. The public interest generated both inside and outside the design communities through that competition, as well as the media exposure, was translated into an organization that connects the talents and expertise of over 40,000 professionals with communities that would otherwise not have access to design services. The organization counts community-based organizations, housing developers, institutions, nongovernmental organizations (NGOs), and government entities as their clients.

BWAF: Beverly Willis Architecture Foundation

The Beverly Willis Architecture Foundation (BWAF) was founded in 2002 by Beverly Willis, FAIA, together with Heidi Gifford and architectural historians Diane Favro, Ph.D., and Lian Mann, Ph.D., with the purpose of "advancing the knowledge and recognition of women's contributions to architecture." Currently, the Foundation offers a variety of programs that include museum programs, films, tours, industry roundtables, internships, and research grants.

CSI: The Construction Specifications Institute

With the original purpose of improving the quality of construction specifications, the Construction Specifications Institute was founded in 1948 by a group of government specification writers. Evolving with the times, today CSI's mission is to "advance building information management and education of project teams to improve facility performance."

Current programs include a series of certification levels (CDT, CCS, CCCA, CCPR), educational opportunities, the CONSTRUCT tradeshow, and the CSI Annual Convention. Local chapters also host educational sessions and networking opportunities, among other activities. In addition, CSI administers three formats for construction data organization: MasterFormat, GreenFormat and UniFormat. MasterFormat is an organization system for building specifications; GreenFormat is a web-based tool that standardizes construction products' sustainability properties; and UniFormat arranges information by systems, disregarding specific product selections. This allows for early construction cost estimates, among other uses.

DBIA: Design-Build Institute of America

The Design-Build Institute of America brings together leaders in the design and construction industry. Its membership comprises architects, engineers, owners, contractors, manufacturers, suppliers, students, and faculty. Headquartered in Washington, D.C., and established in 1993, the DBIA "promotes the value of design-build project delivery and teaches the effective integration of design and construction services to ensure success for owners and design and construction practitioners."

GBI: The Green Building Initiative

The Green Building Initiative's mission is to "accelerate the adoption of building practices that result in energy-efficient, healthier, and environmentally sustainable buildings by promoting credible and practical green building approaches for residential and commercial construction." Originally created as a way to help bring sustainable building practices into the mainstream, the GBI also currently administers the Green Globes® environmental assessment and rating tool in the United States, as well as their professional certifications programs: Green Globes Professional (GGP) and Green Globes Assessor (GGA).

GBI's board of directors includes representatives from construction companies, architecture firms, academic institutions, and industry representatives.

IIDA: International Interior Design Association

The International Interior Design Association was born in 1994 as the result of a merger between the Institute of Business Designers (IBD), the International Society of Interior Designers (ISID), and the Council of Federal Interior Designers (CFID). Currently, the IIDA supports 13,000 members in 31 chapters worldwide through its mission of creating "a strong niche for the most talented and visionary Interior Design professionals, to elevate the profession to the level it warrants, and to lead the way for the next generation of Interior Design innovators."

NIBS: National Institute of Building Sciences

Authorized in 1974 by the U.S. Congress through the Housing and Community Development Act, the National Institute of Building Sciences is a nonprofit organization that provides common ground where representatives of government, the professions, and industry and consumer interest groups can focus on shared problems that affect the construction industry. The Institute serves as an authoritative source of information for both the private and public sectors.

NOMA: National Organization of Minority Architects

During the 1971 AIA National Convention in Detroit, 12 African-American architects joined together to form the National Organization of Minority Architects. Founded in recognition of the need to fight discriminatory policies that limited minority architects' opportunities, NOMA currently "champions diversity within the design professions by promoting the excellence, community engagement and professional development of its members."

Public Architecture

Public Architecture is a nonprofit entity that "puts the resources of architecture in the service of the public interest." Founded in 2002 by John Peterson of Peterson Architects, the organization launched "The 1%," a program through which firms pledge 1 percent of billable hours to pro bono work. Through The 1% website, nonprofits in need of design services and design firms participating in the program can connect with each other. The program counts over 900 participating firms, which range from some of the largest in the country to sole practitioners.

USGBC: U.S. Green Building Council

Committed to sustainability, the U.S. Green Building Council is a nonprofit organization based in Washington, D.C. Pulling together local affiliates, companies, organizations, and individuals, the organization seeks to "transform the way buildings and communities are designed, built, and operated, enabling an environmentally and socially responsible, healthy, and prosperous environment that improves the quality of life." Most notably, the USGBC administers the LEED® Green Building Rating System™, but other programs include the LEED AP professional credentialing program, educational sessions, the Greenbuild International Conference and Expo, and advocacy for sustainable policies and initiatives. Nationwide, the USGBC has 79 regional chapters.

For More Information

For a list of professional and related trade organizations in the design and construction industry, see Appendix A: Allied Professional Organizations.

BACKGROUNDER

INTERN DEVELOPMENT PROGRAM (IDP) COORDINATORS PROGRAM

Harry M. Falconer Jr., AIA, NCARB

Serving as an Intern Development Program (IDP) Coordinator provides a vital service to the profession by helping to educate and guide emerging professionals along the path to licensure.

Harry M. Falconer Jr. is director of internship and education for the National Council of Architectural Registration Boards (NCARB). He joined the Council in 2006 and assumed his current position in 2012. He is licensed to practice in Virginia and holds the NCARB Certificate.

GIVING BACK TO THE PROFESSION

Architects and others—such as educators, firm administrators, career counselors, and even interns—looking for a way to serve the profession and shape the next generation of emerging professionals may wish to consider taking on the role of IDP coordinator.

The IDP Coordinators Program provides an extensive resource network that facilitates the flow of information to emerging professionals. The collective knowledge of the coordinators offers a variety of perspectives on the profession. These individuals often have the opportunity to be the first introduction to the licensure process; as such, they play a significant role in helping interns progress toward licensure.

VALUE OF PARTICIPATION

In addition to being of service to the profession, serving as an IDP coordinator provides the opportunity to enrich one's own professional development.

Chance to "Pay It Forward"

IDP coordinators, whether they are volunteers or appointees, are knowledgeable about the profession and well-positioned to advise students and interns on navigating the path to licensure. Serving as a coordinator is a rewarding way to support the next generation of professionals, since many coordinators feel they get as much back from the experience as they give toward it.

Strengthening of Firm Culture and the Profession

Coordinators can help encourage a positive firm culture that supports intern development. They know that growing future leaders depends on helping interns make a successful transition from school to work and supporting them in their pursuit of licensure. All levels of experience within a firm can benefit from the information exchange that takes place when interns are an integral part of the firm. Helping emerging professionals stay on track toward becoming licensed can go a long way toward influencing success as a firm—and as a profession.

Professional Development

Serving in an advisory capacity to emerging professionals creates a significant opportunity to build leadership and mentoring skills. The training and resources provided by the National Council of Architectural Registration Boards (NCARB) and the American Institute of Architects (AIA) can further refine those skills and help coordinators successfully fulfill their roles. Through their work as coordinators, individuals will also gain a deeper understanding of the licensure process as a whole as well as greater familiarity with key requirements—knowledge that makes them an invaluable resource to the profession. Some coordinators have gone on to play an even greater role in shaping the profession, such as serving on NCARB or AIA committees or taking on leadership roles within professional organizations like AIA components or Society for Design Administration (SDA) chapters.

(continued)

Expansion of Professional Networks

The IDP Coordinators Program offers frequent opportunities for collaboration among the extensive coordinator network to share knowledge, resources, and best practices. In addition, many coordinators develop strong ties with both NCARB and the AIA through their regular interactions. Because coordinators need to be knowledgeable of overall registration requirements in the states where they serve, they often interact and develop relationships with state registration authorities as part of their ever-expanding professional network.

ROLES AND RESPONSIBILITIES

The volunteers and appointees who serve as coordinators all share the common responsibility of serving as a knowledgeable information resource for interns on the required components of licensure (education, experience, and examination).

Auxiliary Coordinators are volunteers that educate their community about the IDP. Serving as an auxiliary coordinator presents an opportunity to enhance one's professional development and demonstrate leadership skills. Auxiliary coordinators are often associated with firms, local AIA components, state boards, or American Institute of Architecture Students (AIAS) chapters. Those located inside firms play a pivotal role in shaping a positive firm culture that supports intern development and in helping to ensure that interns have the necessary resources and opportunities to progress through the IDP and toward licensure. Interns themselves may choose to serve as auxiliary coordinators, sometimes spearheading initiatives that help strengthen and formalize their firm's intern development–related resources and processes.

> Interns are consistently exposed to both formal and informal individual discussions about their IDP progress. This allows us to tailor our efforts specifically to each intern and provides an environment that is truly conducive to mentorship.
>
> *—Architect and firm IDP [auxiliary] coordinator, Richmond, VA*

Educator Coordinators are appointed by the dean of each architecture school with a NAAB-accredited professional degree program. This role serves as a conduit for students between school and the profession, helping students understand requirements and how to get started on the path to licensure. They are responsible for distributing information and providing guidance to students at their school on the IDP and other key components of licensure.

> I post information on my website, a Facebook page, and a Twitter account. I also include a lesson plan on the IDP in my class, which includes bringing in an architect that has gone through the licensure process.
>
> *— Educator coordinator, Northeastern University, Boston*

State Coordinators are appointed by the AIA at the state level. They are volunteers that stay up-to-date on the latest information on the IDP, the Architect Registration Examination® (ARE®), and state licensing requirements, acting as resources for interns and the larger architecture community in their state. State coordinators often give presentations and participate on AIA and NCARB committees related to the IDP. They serve in a highly visible role, communicating and collaborating with NCARB and with IDP support networks, including AIAS chapters, auxiliary coordinators, local and national AIA components, the Young Architects Forum (YAF) and National Associates Committee (NAC) groups, and state registration boards. Those appointed to this voluntary position will find many opportunities to hone their leadership skills and make a positive contribution toward the profession by helping emerging professionals transition toward licensure.

> [Our state] brings interns at various states of the process together with licensed architects in small-group settings. It provides the framework and guides small groups across the state in multiple cities and towns.
>
> *— State coordinator, Montana*

SUPPORT AND RESOURCES

The commitment by IDP coordinators to support students and interns is backed by NCARB's and the AIA's commitment to partner with them, regardless of where in the 54 jurisdictions they are located. NCARB and the AIA offer a host of resources that aid IDP coordinators in executing their responsibilities:

- Training and networking through the IDP Coordinators Conference
- Collaboration and knowledge sharing via access to a web-based coordinator community
- NCARB training materials, including presentation tools for use during events
- AIA National training materials, such as its mentoring resources
- Staff support from NCARB and the AIA for assistance with understanding programs, requirements, and opportunities

Additionally, IDP coordinators can find strength in numbers by partnering with each other to share best practices, and by partnering with groups—such as NCARB Outreach, state registration boards, the AIA Young Architects Forum (YAF) and National Associates Committee (NAC), AIA components, and AIAS and SDA chapters—to develop programming/events that support intern development.

For More Information

Comprehensive information about the IDP Coordinators Program, including position descriptions, eligibility, responsibilities, and support resources, can be found online at www.ncarb.org.

3.6 Participating in Architectural Education

Donna V. Robertson, FAIA

There are numerous ways for practitioners to participate with academic institutions and the education of future design professionals. This article outlines some of the possible ways to engage.

INTRODUCTION

Involvement of practitioners in architecture schools is vital to the intent of professional education. Architecture degree programs offer unique value for the acquisition of new ways of seeing, doing, and creating beneficent change. Even if all graduates do not go on to be licensed (and approximately 50 percent don't), all gain from hearing the perspective of the practicing professional who is participating daily in creating the built environment.

Day-to-day practice can be grinding and slow, with only long-term gain. In contrast, education offers a chance to step back and consider bigger ideas, gain a different perspective, and give back to those in development. It can be enormously gratifying, and there are myriad ways beyond but also including standard classroom teaching that offer such positive experiences.

Some do choose to teach, a direct way to interact with students and academic colleagues. Also available for practitioner engagement is guest reviewing in studio courses, where a practitioner visits periodically with the studio instructor and students to evaluate the ongoing work. This offers an afternoon of stimulating conversation and debate, with student engagement at the fore. Architects can also serve as a guest lecturer in a class, offering a specialty topic based on a practice's research and discoveries. Most teachers welcome outside input. An example of this is the case study class taught at Illinois Institute of Technology (IIT). This course is aligned with Chicago projects of special note, and embeds the students in a firm's process as the project progresses. Many schools have such courses, so a firm can likely offer a special project for academic study. The only requirement is to reveal (almost) all of the project's behind-the-scenes information so that students are informed of the strategies for going from "big idea" to final execution in a real-world project. The project should exemplify some development in management of the built environment: civic, commercial, economic, political, etc.

All schools have public programs that welcome visitors to hear from special lecturers, attend workshops on new applications in the field, or participate in conferences and symposia, which gather many around specified topics. Look for these events on websites, or join an organization that suits particular interests, such as the Society for Architectural Historians or the Council for Tall Buildings and Urban Habitat. There is also the Association for Collegiate Schools of Architecture, the national organization of educators. They hold annual conferences, which showcase academics submitting papers for "peer review." This is a wonderful way to find out what is going on in academia. Conference proceedings are published on their website.

As Henry N. Cobb noted in his Gropius lecture, given at Harvard in 1985, "We teach because involvement in a professional school helps us gain a critical distance from our practice" ("Architecture and the University," Harvard University Graduate School of Design, 1986). Beyond those already mentioned, there are myriad ways for practitioners to contribute to, and gain from, architecture education beyond graduation.

Donna V. Robertson is a professor at Illinois Institute of Technology and was dean of architecture for 16 years. She is a partner in macroDesign and has executed projects throughout the United States. Robertson was the 2012 president of the Association of Collegiate Schools of Architecture and is a peer reviewer for the GSA.

INVOLVEMENT WITH AN ALMA MATER

The school from which an architect graduated is a first place to start understanding what is happening in education. Stay in touch with faculty mentors, periodically visit, and view the extensive communications that most schools have in place to foster ongoing alumni contact. Most likely, over the years the school will be continually evolving. Keep an open, curious mind as to those changes and what they indicate about the evolution of the profession and the shifts in university perspectives on the delivery of education. Significant change can happen, yet there are (at this writing) 123 schools of architecture, 154 programs of professional study, and a plethora of perspectives on what to teach and why.

Most schools have ways for alumni to actively engage, whether to help with recruitment of new students, mentor current students, hire graduates, participate in career fairs, or give workshops that focus on current standards of professional preparation. Most schools have open studio reviews, where the student work is visible and available for judicious comment (try to stay positive). Many have end-of-the-year shows, meant to engage the community in what the school is doing. These openings serve both alumni and local practitioners looking for a closer engagement and understanding. Schools publish websites, newsletters, publications of faculty work, student catalogues and broadsheets, etc., meant to disseminate the work of the school. As well, schools have formal mechanisms for feedback from the outside world, through advisory councils, alumni councils, reunions, continuing education forums, etc., that are excellent avenues for dialogue. Work through faculty mentors, colleagues, and the administrative leadership to look into how to engage.

Finally, giving back to a school by sponsoring programs as part of a firm's philanthropy is a powerful way to make a difference in a school's programs.

LOCAL PARTICIPATION

Opportunities for participating with schools located in the area in which a firm practices come from many sources. The local AIA chapter will undoubtedly have education councils, awards programs, student visits to firms, etc., that provide the means to learn what is going on in academia. Find an AIA Knowledge Community (committee) meeting on a subject close to individual practice interests. They almost always engage academics in the discussion, and can provide an overview as to trends and experts.

Schools enjoy bringing in local practitioners to serve on studio reviews, advisory councils, career fairs, public events, etc. Gaining an invitation comes with knowing someone in the school, so the open public events might be the best place to start if one lacks personal contacts. So too, the local AIA component can provide leads to link an architect's expertise to a school's faculty.

Many schools and AIA Students (AIAS) chapters welcome firm sponsorship of student interns. Offering a student scholarship or prize, even if modest, is well-received and can open up lines of communication. See if the school is sponsoring a charrette; often they rely on local professionals to work with students and judge results.

Teaching is a most stimulating way to keep in touch with education and young people, as well as see trends in the profession. The benefits of teaching include fostering student development, having interesting colleagues and conversations, and design research that can advance one's practice. Classroom teaching of "Support Courses" can also be rewarding and involve specialized topics that surround design education: Structures, Systems, History/Theory, Professional Practice,

NCARB AWARD FOR THE INTEGRATION OF PRACTICE AND EDUCATION

Harry M. Falconer Jr., AIA, NCARB

SUPPORTING THE INTEGRATION OF PRACTICE AND EDUCATION

The NCARB Award, initiated in 2006 as the NCARB Grant, supports architecture schools' efforts to create, innovate new programming that brings non-faculty practitioners into the academy to help raise awareness about issues central to practice and better prepare students for internships and future careers as architects. Projects are intended to have a long-term, ongoing impact on students, faculty, and curricula. Additionally, the Award seeks to promote development of models that can be adapted or adopted by other schools.

Full details about the NCARB Award, including available funding, eligibility rules, program requirements, and assessment criteria, are available online at www.ncarb.org or by contacting NCARB customer service.

etc. All schools have their curriculum described on their websites, making it easy to see where a particular practitioner's expertise might fit in. Many classes use expert practitioners for guest lectures and reviews.

To become a faculty member, architects need to have their special abilities known to the school. Sometimes this comes through a formal search process to find new faculty hires (mostly for full-time positions). Those positions would be posted on the school's website. Beware of the time commitment in being a full-time instructor. The position requires not only teaching but also formally advising students, helping with school service (recruitment, committees, etc.), and producing significant architecture that is nationally recognized. Most schools require approximately 15 credit hours a year for full time, which translates into about 20 hours a week minimum preparing and directing classes.

However, practitioners may prefer to teach as a part-time faculty member—less bureaucracy and time commitment. Schools usually rely on word of mouth for those appointments, so getting involved in general ways can lead to specific opportunities to teach. Attend lectures, exhibitions, symposia, and conferences where networking is possible, demonstrate unique talents and knowledge, and gain continuing education units. Written course proposals are welcome, so try to get to know a school's curriculum and discover if there is something special, or missing, to offer. Ask to see sample syllabi and read a school's accreditation report (mandated to be on reserve in their library and usually on the website) to understand the school's perspective and needs.

A most special gift that a firm can make to its employees' development and to a school's quality is allowing the time and encouraging the staff to become involved in teaching. More than a monetary gift, this offering can make a huge difference in how closely a school is aligned with the profession's values.

Many schools now participate in architectural research, and firms can become involved in those enterprises. Some firms sponsor a research project that aligns with their practice ambitions, either through extracurricular, faculty-based endeavors or through course-based activity. A school's website is a place to start to know the faculty's interests and abilities.

Schools also host societies focused on topics of special interest. IIT's Mies Society sponsors programs connected to mid-twentieth-century modernism. They partner with industry on programming, such as a children's Lego Build event. So, too, the University of Texas–Austin's Charles Moore Foundation fosters public engagement to issues and inquiry. Most museums have programs on architecture and design, and these are ways to link with others seeking a broader outlook on the profession's affects. There are specialty academic journals also offering a wider perspective, such as *Places* magazine or the *Architect's Newspaper*.

Lastly, a firm's gifts to a school are a first level of engagement in the school's values. Gifts can be tailored to specific interests and hopes for outcomes. Scholarships, internships, awards, and sponsorship of events are just a few of the possibilities. Work with the school's development director to put in motion the power of philanthropy to create change and engagement.

NATIONAL PARTICIPATION

The National Architectural Accreditation Board (NAAB) accredits American professional degree programs. This organization is sponsored by the Collateral Organizations of architecture: AIA, National Council of Architecture Registration Boards (NCARB), Association of Collegiate Schools of Architecture (ACSA), and AIAS. Accreditation visits to schools happen once every six years for a program, and the Visiting Team is made up of representatives for the sponsoring organizations. This is another avenue for participation in architecture education: providing an outsider perspective to the process of program review by being an organization's representative. The means to get on a Visiting Team is to work through a local chapter, gain national involvement with the respective organization, then let an interest in education guide participation and offerings. It is important to bring sympathy for the domain of education and an understanding that schools need to offer both professional and general education, while participating in scholarly production to the advancement of knowledge. Architecture education cannot just involve professional practice-related offerings. Each school has its unique qualities, so keep an open mind to different definitions encountered on an accreditation visit. There will always be an educator on the Visiting Team to guide others in the current issues facing higher education.

The national AIA Annual Convention and many state conventions have sessions on architecture education. These track and reveal trends in schools and offer a chance for dialogue and exchange of information. Conventions also provide a chance to stay current with the larger trends in architectural design and construction, something schools work hard to do.

OTHER OPTIONS

There are many organizations and institutions devoted to fostering architecture education outside of professional degree programs:

- *Community colleges*. Many offer two-year programs to feed into professional undergraduate programs. This is a way to advance diversity in the profession and help those without resources for four-year college to have access to becoming an architect. These programs welcome teachers, especially those engaged to work with the professional "destiny" schools to develop curriculum that prepares students to enter a profession in later years of study. Try giving a local community college design department a call to offer time and expertise.
- *High school programs* abound, from those that are extracurricular or mentoring-based to those embedded in the school programs. ACE (Architecture, Construction and Engineering) is a national program mentoring high school students to enter those professions. They have local chapters in all major cities, and are a way to be in touch with aspiring architects and other professionals who care about the future of the profession. Many local nonprofits have ways to help with high school involvement in the built environment, such as the Chicago Architecture Foundation's national programs on architecture education in grade school, or the Newhouse Competition or their program on design curricula for grade schools.
- *State arts programs*, mirroring the National Endowment for the Arts, also have programs on education. These welcome grant proposals and collaborations toward further architectural design awareness in the general population.

Participating in architecture education gives practitioners an opportunity to briefly step away from daily practice. For a chance to further explore artistic and scholarly interests, consider making a grant proposal to one of the artist colonies, such as the MacDowell Colony or the Ragdale Foundation. They welcome architects with a special research project of import. Securing some recognizable recommenders will help first-time applicants. Artist colonies can be chances to get away to think about bigger issues and connect with other artists. There is also the Rome Prize for mid-career practitioners, a wonderful way to step back and focus on the wider picture.

CHAPTER 4

Public Interest Design

4.1 Socially Responsible Design Overview

Rachel Minnery, AIA, NCARB, LEED AP

A socially responsible architect believes that buildings influence people's lives, that people influence the design of buildings, and that architects are accountable for the impact of their work on people and the environment. Public interest design tends to the common good and advocates for design as a means to help alleviate social distress.

THE SOCIAL IMPACT OF DESIGN

Social responsibility is fundamentally an ethical ideology that states that an entity, be it an organization or individual, has an obligation to act to benefit society at large and to maintain a balance between the economy and the ecosystem (International Institute for Sustainable Development, Perceptions and Definitions of Social Responsibility, 2004). Architects, through their involvement in design and construction, have direct and indirect impacts on people, the economy, and the environment, and are well positioned to engage in socially responsible activities.

Social Responsibility is an ethical ideology or theory that an entity, be it an organization or individual, has an obligation to act to benefit society at large.

—The ISO and Corporate Social Responsibility, "Perceptions and Definitions of Social Responsibility"

Socially responsible design aims to address social, environmental, economic, and political issues through design and design thinking. The socially responsible design movement has been fueled by activist designers who are troubled by the limited reach they have in a traditional architectural practice, where statistically fewer than 2 percent of people will (have the means to) work with an architect. Due to the initiative, dedication, and generosity

Rachel Minnery was 2012 chair of the AIA Disaster Assistance Committee and an architect and grants manager with Environmental Works Community Design Center in Seattle, Washington.

of designers volunteering with organizations such as Architecture for Humanity and Architects Without Borders, projects such as mobile health clinics in Africa, a post-tsunami orphanage in Sri Lanka, and schools in Haiti have garnered attention within and outside the profession for the remarkable impact they have made in people's lives. Examples like these and other designs that serve to empower people have been collected in books like *Design for the Other 90 Percent* (Editions Assouline, 2007), by Cynthia E. Smith, and *Design Like You Give a Damn* (Metropolis, 2006), by Kate Stohr and Cameron Sinclair.

Socially responsible designers say that they don't have to look past their own backyard to find opportunities to transform challenging conditions. "The transformative power of design, to achieve aesthetic richness, as well as practical and programmatic ends," writes Mark Robbins, Director of Design for the National Endowment of the Arts, "should be brought to the forefront in discussions about the very real problems of American cities and towns."

Whether focused on specific individual needs or those of society, socially responsible design typically refers to one or more of three design aspirations: to ease people's problems; improve human experience physically, emotionally, and psychologically; and, in the public realm, care for the space that connects private property to the community. Some urge architects to look beyond the property lines of their projects for the relationships, opportunities, and challenges in the surrounding community, and some architects are contributing to a new movement that addresses these common interests.

Public Interest Design

The professions of law and health have adopted the term *public interest* to describe a firm that represents the general welfare or common well-being in their work. To better understand the involvement of architects in the public interest, Architects Roberta Feldman, Bryan Bell, David Perkes, and Sergio Palleroni were awarded the AIA's Latrobe Prize in 2011. Their study increased public awareness of public interest design, or "putting creative abilities to practical use to improve communities," and encouraged a shift from a client-driven practice toward a needs-based practice. The research studied ways to increase the capacity to create and sustain public interest design, either through nonprofit design practices or by integrating public interest projects into traditional practices.

Health, Safety, and Welfare

Public interest design should not be a foreign concept to those architects who are familiar with the language of their architectural license. When granted a license to practice architecture, there are certain expectations of the architect: to protect the health, safety, and welfare of the public. *Welfare* refers to the well-being and social support for all citizens. Well-being is enhanced when healthy, safe, comfortable, and interesting spaces are created for all.

Architects can protect welfare by addressing individual needs, cultural values, and societal benefits in their design work. Others go further and engage directly in service and leadership to their communities. As *Citizen Architects*, they are civically engaged in public policy issues and the improvement of their community.

► See the backgrounder The AIA Code of Ethics and Professional Conduct (1.1), for a more detailed discussion.

While the profession has been criticized for a lack of civic participation, architects are encouraged through their professional membership in the AIA to involve themselves in public matters and socially responsible practice. The AIA's Code of Ethics and Professional Conduct, Canon II, states that Members "should promote and serve the public interest in their personal and professional activities."

To serve the public interest, socially responsible design aims to accomplish three basic goals:

- Make choices that acknowledge a building design's direct impact on the immediate context, on user health, and on community quality of life. (Community and User Needs-Based)

- Consider the potential indirect and long-term impacts of the building design on all human beings and the larger environment. (Sustainability)
- Meet the needs of those who cannot afford architectural design services and would benefit from receiving them. (Pro Bono)

Community and User Needs-Based Design

Whitney Young, the president of the National Urban League, spoke to the profession at the AIA National Convention in 1968. In that landmark speech, Young challenged young professionals, as a new and diverse base of talent, to alter the architectural profession's dependency on market forces and refocus it on helping communities meet their needs. Like other professions, architects and designers responded to the social inequities and challenges of urban environments in the 1970s by forming new community-based organizations. These included the first *community design centers* (CDCs). These nonprofit design organizations emerged as collaborations between architects, academics, students, planners, and community leaders to address specific needs in their communities. Where they initially served to rejuvenate derelict neighborhoods and create housing, parks, and social service centers, CDCs now address a variety of issues, including cultural preservation, diversity, poverty, special needs populations, social equity, and self-help projects that enhance an individual's self-sufficiency and resilience.

For more information on community design centers, see the backgrounders Community Design Centers in Context (4.3) and Independent Community Design Centers (4.4).

As population growth and development continued to rise rapidly, in 1977 a network formed of individuals, organizations, and institutions committed to increasing the capacity of planning and design professions to better serve communities—the Association for Community Design (ACD). The ACD defines *community design* as a movement focused on the creation and management of environments for people. They value the design process for promoting change to the built environment from the neighborhood to regional scale, and aim to meet community needs through participatory decision making at all levels to address:

- *Equity and justice*: Advocating with those who have a limited voice in public life
- *Diversity:* Promoting social equality through discourse that reflects a range of values and social identities
- *Participatory decision making:* Building structures for inclusion that engage stakeholders and allow communities to make decisions
- *Quality of life*: Advancing the right of every person to live in a socially, economically, and environmentally healthy community
- *Integrative approach*: Creating strategies that reach beyond the design of the built environment
- *Place-based solutions*: Generating ideas that grow from place and build local capacity
- *Design excellence*: Promoting the highest standards of quality in the design and construction of the built environment

Architects who are committed to the intensive community design process can help people act on their own behalf and facilitate community consensus on viable place-based projects. This collaborative process is a shift from designing *for* people to designing *with* people, ensuring the vision is one the community will continue to invest in over time. As a form of problem-seeking, *participatory design*

ENVIRONMENTAL WORKS COMMUNITY DESIGN CENTER

Environmental WORKS, a nonprofit community design center in Seattle, Washington, was founded in 1970 by a group of architecture graduates and professors in a storefront near the campus of the University of Washington. This group later squatted in a vacant firehouse until the City sold it to them and two other nonprofit organizations for one dollar. For more than 38 years, environmental WORKS provided free early design guidance and technical assistance to nonprofit organizations with funding from a City of Seattle Community Development Block Grant (CDBG) and General Funds.

For nonprofit organizations such as those providing community health care and child care, the preliminary design services defined the project scope and budget so that funding could be allocated for full design and construction. Nonprofit organizations were given the reassurance that their capital funds would be spent wisely, and the city and local architecture firms benefitted economically by the investment when 85 percent of the funds invested in the Community Facilities Design Fund resulted in built community services facilities. Between 2000 and 2008, $1.5 million invested in the design fund leveraged a total of $32 million in construction funds. The program was considered a great success and operated continuously until CDBG and the City's general funding were reassigned to basic human services in 2008.

elicits different ideas, interests, and values that inform the final design and ultimately add richness, variety, and character to a community environment. People who find it hard to break through a complex, formal governing system find their voices in an open visioning process, achieving greater equity and social justice through design. When the architect demonstrates an understanding of needs and benefits of proposed design elements through effective visual and verbal communication, the client and stakeholders develop confidence in new ideas. The collaborative process fosters a connected community that will make people feel safe.

Good community design cannot undermine an individual's capacity to meet his or her own needs. *Needs-based design* (NBD) is an approach to design founded on an understanding of fundamental human needs and creating spaces that eliminate or minimize barriers to people satisfying their needs (Natalie Heltrich and Geoffrey Stack, thesustainabilitysociety.org.nz). Proponents of needs-based design advocate moving beyond preconceived ideas to receive input from users that will promote health, safety, and well-being. Design can serve as a tool to address the unique needs of the disabled, elderly, economically disadvantaged, and other vulnerable populations. To limit vulnerability in the built environment, designers will consider natural and man-made hazards and other risks in the building and its surroundings.

When statistics from the EPA suggest that people in the United States spend almost 90 percent of their time indoors, it is clear that building design increasingly impacts one's life experience. Research has found that design elements can serve as change agents that can influence human behavior by encouraging implementation of healthier habits and practices. Thoughtful design that appeals to and protects the senses will reduce environmental stress and foster a sense of personal control over one's surroundings.

▶ For more information on research and design, see Chapter 14, Research in Practice.

Design research can support how design decisions will impact comfort and livability, providing owners with reassurance before the final design is executed. After construction, *postoccupancy studies* serve to inform architects of the outcomes of their design by seeking user feedback.

Sustainability

As observed by Mark Robbins, "The ways buildings, cities, and entire landscapes are designed have economic, social, and political causes and consequences." This acknowledges that all decisions have an impact on one another, forming the basis of designing for *sustainability*, or the ability to endure, wherein the choices we make today are influenced by their projected impact on the future.

Accordingly, the United Nation's Brundtland Report on Sustainable Development (1987) targets *three aspects of sustainability*: economic growth, environmental protection, and social equality. Combined, these three aspects provide a means of reducing the negative consequences of development worldwide, though a strong focus on economic growth in recent decades has tended to sacrifice the other two. The consequences of this imbalance have contributed to a resurgence of attention to the impacts of development on the environment and human beings.

The Brundtland Report cited two key initiatives:

- The concept of "needs," in particular the essential needs of the world's poor, to which overriding priority should be given
- The idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs

The architectural profession has become a respected leader and advocate of sustainability, and the reasons for that are compelling—buildings have a remarkable impact on resource use and the environment. Globally, buildings use 40 percent of raw materials (Worldwatch Paper 124, 1995, by Nicholas Lenssen and David Malin Roodman). According to the Department of Energy, buildings represent 73 percent of U.S. electricity consumption. As a response to this situation, many buildings are being designed to meet sustainability standards set by the U.S. Green Building Council's (USGBC) Leadership in Energy and Environmental Design (LEED) program. Regulations have also changed, in some cases requiring the design of buildings to meet higher performance standards and to attain a certain level of LEED certification.

Several sustainable design metrics and organizations have emerged to forward the sustainable design movement toward an end goal where building elements may produce resources rather than consume them. The groundbreaking book *Cradle to Cradle: Remaking the Way We Make Things* (North Point Press, 2002), by William McDonough and Michael Braungart, attempts to bridge this goal by encouraging a "systems thinking" decision-making model where designers and consumers first consider the full life cycle of any given building material and its impact on the whole (of the environment, society, the economy).

Forwarding the continual development of sustainable design strategies, the AIA Code of Ethics and Professional Conduct includes Canon VI: Obligations to the Environment. Canon VI states that members should "promote and practice sustainable design and development principles in their professional activities and encourage others to do so as well."

Resilient Design

Impacts to environmentally sustainable communities aren't limited to resource consumption. In the last decade natural disasters and other hazards have affected 200 million people. The increase in the cost and impact of natural disasters such as hurricanes has increased concern about the progressive impacts of climate change. The U.S. Green Building Council (USGBC) issued a wake-up call: "A central challenge of the twenty-first century is to develop strategies that can help us bounce back from potentially disastrous events. If we are to have regrets, let us do so by coming to terms with the reality that the human condition can never be free of risk, but at least let us not regret our inaction."

Following a disaster, trained architects can evaluate buildings for safety and habitability, and, more broadly, they will advocate for and incorporate mitigation measures to create more resilient, sustainable communities. Architects can perform specific *risk assessments* of buildings to inform design and decision making of conditions or events that may cause harm, injury, or loss of service over the life of the building. Emergency power generators, "safe rooms," and hurricane shutters contribute to lives saved, business continuity, and habitability so that structures can continue to meet the needs of their occupants in the face of hazardous events such as a power outage, snowstorm, or disaster.

The Role of Architects in Disaster Response and Recovery (4.2) further discusses how architects can be effective in disaster response, recovery, rebuilding, and resilience to help shape truly sustainable communities.

Pro Bono Work

Some architects enter the profession with a keen interest in making a positive difference in the community, and some will go to great lengths to do so, sacrificing evenings and weekends to work without pay. Providing pro bono services, that is, services for the public good, is an opportunity to serve those outside the usual marketplace for architectural services. While pro bono services are unpaid, there are other tangible and intangible rewards, according to Jonathon Moore. Pro bono services increase firm-name recognition, improve public understanding of the value of the profession, and develop professional skills and business relationships (Jonathon Moore, *Pro Bono Services: Improving the Profession*, 2007).

Design competitions, open-source sharing networks, and positions with nongovernmental organizations (NGOs) created an enormous opportunity to connect pro bono designers with real and pilot projects that work to alleviate acute challenges to sustainable human life: poverty, disease, suffering, and access to resources like water and power.

Inspired designers take the initiative to innovate design solutions for accessible, safe, sanitary, and healthy living conditions for the world's poor and those affected by war, disease, or disaster. In this regard, architects bring their greatest strengths—design knowledge, technical skills, and creative problem-solving—to meet the world's greatest needs.

To acknowledge the growing volunteer efforts and expand a formal pro bono movement with the profession at large, the program The One Percent launched in 2005 to challenge firms and architects to dedicate a minimum of 1 percent of their working hours to pro bono services. Proponents of The One Percent boast that if every architecture professional in the United States committed 1 percent of their time to pro bono service, it would add up to the equivalent of a 2,500-person firm working full-time for the public good.

▶ For a more detailed discussion of pro bono work, see Architects in the Nonprofit Sector (4.3).

The AIA encourages all of its members, their firms, and components to provide pro bono services as part of their contributions to the profession and the Institute in service to society. The AIA provides tools such as the Architect's Knowledge Resource Checklist to help architects decide if a pro bono project is right for them. After deciding to move forward, members can refer to the AIA's Pro Bono Services Agreement between owner and architect to formalize the work.

Project Types

Community-based design projects can improve urban conditions and create more vibrant communities with permanent and pilot projects. Architects have "designed by demonstration" creating temporary parklets, mobile food markets, and "living charrettes" that create new uses for vacant or underutilized land. Architecture firms have initiated projects in their communities, such as the Aladdin Fairy Tale Castle at the Dallas Arboretum by local firm HKS. Another example is Perkins+Will's Adopt a Room project to design a "dream room" for the University of Minnesota Children's Hospital.

Community charrettes place the architect in the position of facilitator and communicator, directly engaging with community members and stakeholders on a design issue in the built environment or proposed project to create a vision that represents the community's ideas, goals, and values.

Design-build projects bring the architect and contractor together with the owners and occupants in a comprehensive process. Habitat for Humanity is one of the most widely known programs in which volunteers and future low-income residents realize a design together. Auburn University's Rural Studio modeled an industrious academic program wherein students learn practical skills through real-world projects in impoverished communities, exercising predesign, design, and construction skills.

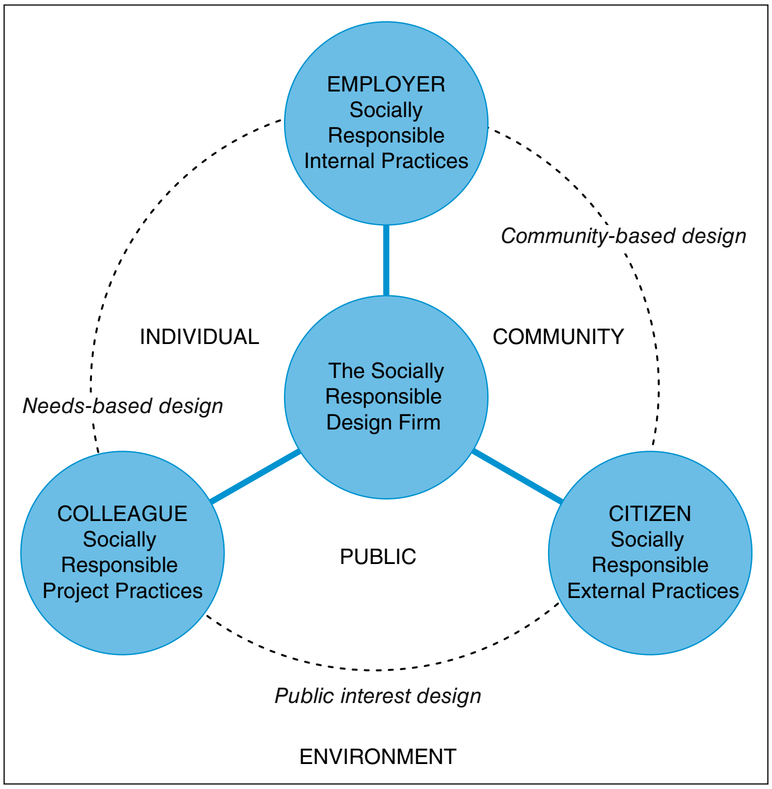
While socially responsible architects seek projects because of their values, they also turn projects down for the same reason. For instance, the professional organization, *Architects, Designers and Planners for Social Responsibility* (ADPSR), advocates against building new jails. Instead, their aim is a community-based alternative to incarceration to alleviate the prison system's moral impact on society and its economic burden on tax dollars that otherwise could be assigned to schools, health care, and affordable housing.

SOCIALLY RESPONSIBLE DESIGN PRACTICES

Socially Responsible Practice Management

Architects fully "walk the talk" of social responsibility when their firms operate and conduct business across all of their roles in the community: as citizen, employer, colleague, and fellow human. Business leaders are stewards of valuable resources: money, time, staff, supplies, space, and the resources of their clients. Increasingly, the design firm's employees expect the firm to have goals that will extend beyond profit to focus on the health of the entire community.

A socially responsible firm will have, as part of its core mission, the goal to improve the lives of everyone in its sphere of influence: employees, consultants, clients, users, communities, and the natural environment (see Figure 4.1). For a mission to be



Rachel Minnery, AIA

FIGURE 4.1 Socially Responsible Firm Diagram

successful, research shows that 80 percent of an organization needs to participate. This calls for workplace policies that will ensure the firm's socially responsible values will be implemented.

Internal Practices: The Workplace

Policies and procedures may be the most important aspect of a firm's practice because a strong organization with empowered staff and resources is more productive and innovative. According to the Labor Department, "in the 1990s, companies have found that they can achieve superior financial results by developing a superior workplace. Evidence suggests that a positive correlation [exists] between innovative approaches to workplace practices and company performance."

Some key ways to create a socially responsible workplace (adapted from *Corporate Social Responsibility: Guidelines for Top Management* [Praeger, 1989] by Jerry W. Anderson Jr.):

- *Understand staff values, goals, needs, and challenges*: First and foremost, staff resources are human beings, and their personal needs must be addressed to have a viable workforce. Consider flexible policies that express mutual vesting between employer and employee and build long-term staff retention.
- *Diversify staff:* Employment diversity should reflect that of the community's culture. "Diversity is especially important and beneficial for problem solving and innovation tasks" according to a multiyear study published in 2005 by Columbia Business School professor Elizabeth Mannix and Stanford Business School professor Margaret Neale.
- *Workplace wellness programs*: Nutrition, fitness, stress-reduction, and disease prevention have been proven to reduce sick days and increase productivity. Architects don't consider an office setting as a place for workplace safety concerns, yet those who sit at a desk for the majority of the day are more prone to back, neck, and carpal tunnel problems.

A FIRM'S SOCIAL RESPONSIBILITY INITIATIVE

Perkins+Will's *Social Responsibility Initiative* began in 2007 when the Board of Directors appointed a task force to assess current activities informally underway in the firm and to formalize them into firm-wide protocols and guidelines. The document created by the task force established the framework that fostered a national dialogue and empowered each local office to organize and implement social responsibility as part of its core philosophy, practice, and individual accountability.

Perkins+Will's mission statement for social responsibility: "*Perkins+Will is committed to engage its professional resources and leadership to benefit the social needs in the built environment where design can make a difference.*" The firm encourages volunteerism of employees and donates 1 percent of its billable time and unique intellect to initiate and execute projects and buildings that serve the broad society who otherwise would not have access to professional architectural services.

A phased approach of implementing their new commitment began with just 25 percent of donated billable hours in 2007, building to 100 percent commitment of the firm's goal over the next few years. The program has improved and become more efficient. Existing relationships with nonprofit organizations were strengthened and many new relationships with other organizations were established.

- *Diversify duties and reduce or interrupt computer use:* How work is done and the tools that are used are very different in the twenty-first century from those used even a generation ago. A 2003 study by the Journal of the American Medical Association found health problems including work-related depression and productivity loss attributable to extensive computer use. Try to limit screen time to three-hour intervals and incorporate social and educational activities, hand drawing, or journal reading to break up the day.
- *Avoid overtime*: Well-managed firms will strive to schedule deadlines to align with staff resources. Respect evening and weekend time for respite and not for additional shifts for salaried employees.
- *Provide a supportive work environment*: Know the human struggles of your staff. Invest in their "human-beingness." Allow for flexible work schedules, family leave, child care, and other personal and family-friendly programs.

External Practices: In the Community

Firms often focus on external actions for visibility and to build the reputation of the firm in their community and profession. The AIA believes that society and the profession benefit from civically engaged architects who use their insights, talents, training, and experience to contribute meaningfully, beyond self, to the improvement of the community and human condition. "Citizen architects advocate for higher living standards, the creation of a sustainable environment, quality of life, and the greater good" (AIA Issue Brief, "Citizen Architect," 2011). Architects engage in external practices of social responsibility when they institute a "Firm Social Sustainable Policy." Create and empower a committee to suggest and develop a unique social sustainability mission, goals, and proposed actions. With buy-in from the leadership, a formal commitment can be made and exercised through policies communicated to employees, clients, and partners. The commitment may include:

- *Provide pro bono services* to organizations or missions that cannot otherwise afford to hire an architect to the extent feasible. Consider committing to The One Percent, a program launched by Public Architecture that connects nonprofits with architecture and design firms willing to give their time pro bono (www.theonepercent.org).
- *Volunteer and host team-building days*: Annually include one or two days of employer-sponsored volunteer days for team-building and community outreach.
- *Contribute a portion of profits* to charitable organizations in the community that share a mission you care about.
- *Publicize and exchange knowledge*, research, and lessons learned with clients, the public, and other design professionals.
- *Participate in the community* on nonprofit and civic boards, committees, and community meetings. Host or facilitate events or guest speakers that reflect the firm's values.
- *Share your mission, successes, and innovations* on the firm's website or other social media. Convey policies, practices, and commitments that reflect the values of the firm.
- *Seek appointments to civic boards and commissions*. Refer to the AIA's guidelines, *How Architects Can Become Advocates for Livable Communities* and *Communities by Design: Influencing Your Community's Quality of Life*.

The Socially Responsible Project: Best Practices

To practice socially responsible design, an architect doesn't have to change jobs, request a new project, or get knee-deep in a pro bono project. Instead, one can offer a different approach or adjust participation within the context of current work. In practice:

- *Establish a team mission:* Inquire with engineers, consultants, and vendors as to their social responsibility practices.
- *Facilitate a participatory design process:* Identify all relevant stakeholders. Be inclusive and solicit feedback from all stakeholders, starting early in the design process and integrating it into the work.
- *Establish a project vision and measurable goals:* Collectively create goals that reflect the values of the stakeholders and develop ways to measure the success and results. Dig deep in the needs and risk assessment to uncover potential opportunities and challenges for the duration of the life of the building.
- *Utilize design research:* Consult publications and media for case studies, research, materials, and technologies.
- *Design to actively promote the health and well-being of occupants*: Incorporate design elements that reduce sensory stress, encourage movement and interaction, provide access to natural light and the outdoors, and contribute to thermal comfort, good indoor air quality, and sound control for all occupants.
- *Incorporate and forward sustainable design principles:* Address the deeper needs of the environment, the community, and the occupants through your design process.
- *Perform life cycle analysis:* For all the investment in creating the building, consider what happens after the project is complete. Assess the viability of meeting long-term goals and the structure's durability, adaptability, and re-usability. Discuss the building's end of life and how it may be disassembled.
- *Engage in the execution of the design:* Create a plan with the owner to have the design administered responsibly during construction to ensure design intent and safety standards are met.
- *Evaluate the completed project*: While measuring success can be difficult, particularly of an individual design element, interviews with clients, users, and public feedback can be illuminating. Create case studies to evaluate whether specific goals have been met.

While the majority of architects work on fee-for-service projects, alternative career paths are another option for socially minded architects. Although community design centers make up less than 1 percent of the nation's architecture firms, other architects work on staff for nonprofit organizations, a choice that provides rewarding opportunities to utilize design, management, and other necessary people and business development skills.

► For more information about working in the nonprofit sector, see the backgrounder Architects in Large Nonprofits (4.3).

ORGANIZATIONS FORWARDING SOCIALLY RESPONSIBLE ARCHITECTURE

Community-based organizations and nonprofits often originate with a focus on improving the physical, social, and mental health and well-being of a community in a way that the marketplace cannot. They do this through their work, educating future practitioners, supporting peers and colleagues, and volunteering or otherwise engaging with their communities.

The Association for Community Design (ACD) supports various types of nonprofits and those who engage in community design practices by sharing and advancing research, education, best practices, and policies related to community design.

Reflecting values and movements within the profession, in 1967 the AIA formed the AIA Regional/Urban Design Assistance Team program (R/UDAT), an interdisciplinary community design program that combines local resources and nationally recognized design professionals to identify ways to encourage desirable change in a community. In 2005, the AIA expanded this successful program with the AIA Sustainable Design Assistance Team to focus on community efforts to increase sustainability.

Local organizations like Habitat for Humanity, Architecture for Humanity, and Architects Without Borders link qualified pro bono community projects with generous volunteer designers. Pro bono undertakings can rejuvenate jobseekers and appeal to newer graduates, often entering the profession having already witnessed the visible difference their design-build studio projects have made.

Celebrities-turned-philanthropists Brad Pitt and Sean Penn have steered their fans' attention to the power of design to help communities in need. The Make it Right Foundation and J/P Haiti Relief Organization were formed to assist in, respectively, the rebuilding of New Orleans after Hurricane Katrina and Haiti after the earthquake of 2009.

Open Architecture Network—now Worldchanging—was formed with the express interest of sharing design ideas among architects, clients, and builders, all free to download from their website. The website boasts that "design is the ultimate renewable resource," promoting design as an empowering tool to build safer, more sustainable, and more innovative structures (www.openarchitecturenetwork.org). As an evolution of the Cooper-Hewitt's exhibit "Design for the Other 90 Percent," the Design Other 90 Network is another open-network database of design solutions for those living in poverty globally.

Some companies have strategically partnered with nonprofit organizations or have spun off their own nonprofits to serve a specific mission. Looking to send a call to action to the design industry, the Rockefeller Foundation partnered with IDEO to create a pilot study for connecting design firms to the social sector, known as the Initiative on Accelerating Innovation for Development. IDEO later formed a nonprofit arm to work with other nonprofits and foundations to bring design solutions to poverty-focused problem-solvers around the world.

Sponsored fellowships provide funded opportunities for postgraduate designers to work within communities. AmeriCorps, Enterprise Rose, and Design Corps are just a few fellowships available to designers interested in making an impact with their new design skills.

► For more information on the AIAS program, see the backgrounder The American Institute of Architecture Students Freedom by Design (4.4).

The American Institute of Architecture Students (AIAS) Freedom by Design (FBD) program is a community service program that utilizes the talents of architecture students to offer modest design and construction solutions to enhance the homes of low-income, elderly, and disabled people by addressing their struggles with everyday tasks.

Other nonprofit design organizations focus on the preservation of architecture as it represents the history, culture, and identity of a community. Docomomo US and the National Trust for Historic Preservation are two organizations dedicated to the documentation and conservation of buildings, sites, and neighborhoods.

Architects, Designers and Planners for Social Responsibility (ADPSR) was founded in 1981 as a coalition of designers working for peace, environmental protection, ecological building, social justice, and the development of healthy communities.

As a resource, The Environmental Design Research Association (EDRA) is an organization that advances research to improve understanding of the interrelationships between people and their built and natural surroundings, and helping to create environments responsive to human needs.

► For more information on SEED, see the backgrounder Social Economic Environmental Design (4.1).

Spearheaded by the nonprofit organization Design Corps and funded by a grant from the Surdna Foundation, the Social Economic Environmental Design (SEED) Network formed in 2005 to develop a common standard to guide, evaluate, and certify the social, economic, and environmental impact of design projects. SEED Principles include: (1) Advocate with those who have a limited voice in public life. (2) Build structures for inclusion that engage stakeholders and allow communities to make decisions. (3) Promote social equality through discourse that reflects a range of values and social identities. (4) Generate ideas that grow from place and build local capacity. (5) Design to help conserve resources and minimize waste. The Network's website hosts a SEED Evaluator, where architects are free to join, submit, and certify a project.

There are many challenges in advancing socially responsible and public interest design. According to PublicInterestArchitecture.org, "current efforts are small in scope, disconnected, and redundant, and in the profession the interest is palpable, but opportunities are few and far between." Significantly, more socially responsible employment and funding opportunities need to be created to make this movement an important mainstay in the profession.

GATHERINGS AND ORGANIZATIONS FOR SOCIALLY RESPONSIBLE DESIGN

ACADEMIC PROGRAMS AND CONFERENCES

- Structures for Inclusion Conferences
- Public Interest Practice in Architecture
- Design Like You Give A Damn

PROFESSIONAL ORGANIZATIONS

- Architects/Designers/Planners for Social Responsibility (ADPSR)
- Environmental Design Research Association (EDRA)
- International Association for People-Environment Studies
- Business for Social Responsibility

CONCLUSION

A real estate billboard in Seattle for the old Rainier Brewery's converted work lofts reads, "Own a piece of Seattle's history." Cities adopt their buildings as if they were their own, suggesting that there are more building "owners" than the one within the property lines. Buildings embed themselves in the memory of their city and reflect the character and vitality of generations of residents.

Because of the connection between people and their buildings, there may be a time when the public will demand socially responsible design practices from architects. As Matthew Patsky, of Robertson, Stephens & Company suggests, "Over time, the companies that are going to succeed are the companies that have adopted what have been labeled socially responsible criteria into their business practices.…Over time, if you are not empowering your employees, if you are not caring about the community and the environment, you are not going to survive as a company."

Following in the footsteps of the nation's first citizen-architect, Thomas Jefferson, architects can help communities sustain healthful future generations, and in doing so, redefine the meaning of successful design. As Public Interest Architecture observes, "We stand on the brink of an emerging field with the means to improve learning in our schools, health in our communities and the lives of countless people around the world" (http://www.publicinterestarchitecture.org). Buildings will continue to shape people's lives, and their design presents an opportunity for architects to access their highest contribution to others.

The rest of this chapter on public interest design will provide more information about the breadth of activity that constitute engagement in socially responsible architecture. Specific issues and examples will be discussed, including case studies of programs, organizations, and individual architects who are engaging with individuals and communities to improve the environment, the lives of people, and the public realm.

BACKGROUNDER

SOCIAL ECONOMIC ENVIRONMENTAL DESIGN (SEED)

Bryan Bell

Public-interest design is a quickly growing sector of the practice of architecture. SEED provides public interest design with a professional standard of ethical practice through a clear mission and set of principles.

Bryan Bell is the founder of Design Corps, founder of the Public Interest Design Institute, and a cofounder of SEED. He received a 2007 AIA National Honor Award in Collaborative Practice and is a co-recipient of the 2011 AIA Latrobe Prize, which focuses on public interest design.

PUBLIC INTEREST DESIGN

The goal of public interest design is that every person should be able to live in a socially, economically, and environmentally healthy community. As in the field of public health, those practicing public interest design take a holistic approach, considering a broad range of social impacts. As with public interest law, practitioners seek to provide services to serve all of the general public, not just those able to pay a fee for services.

The first decade of the new millennium saw an increasing interest in design with public benefits. In 2000, the annual Structures for Inclusion conference was launched to illustrate projects from around the world that demonstrate design in the public's interest. The first of these was held at Princeton University on October 7, 2000, and was called "Design for the 98% Without Architects." Attendees were challenged "to serve a greater segment of the population rather than the 2% currently being served by architects" (*Good Deeds, Good Design: Community Service Through Architecture* [Princeton Architectural Press, 2003] by Bryan Bell).

The first exhibit of public interest design was "Design for the Other 90%," held in 2007 in the exterior courtyard of the Cooper-Hewitt National Design Museum. Interest reached a critical level with the exhibit "Small Scale, Big Change," at the Museum of Modern Art in New York in 2010.

SOCIAL ECONOMIC ENVIRONMENTAL DESIGN (SEED)

In 2005, the Social Economic Environmental Design (SEED) Network was founded at a conference organized by the Harvard Loeb Fellowship. The SEED Network established a professional community specifically with a public interest mission and a common set of principles to guide ethical community engagement. A 2011 poll of members of the American Institute of Architects agreed that this mission (77% agreed) and principles (75% agreed) were appropriate for public interest design:

> SEED Mission: Every person should be able to live in a socially, economically, and environmentally healthy community.

SEED Principles

- Principle 1: Advocate with those who have a limited voice in public life.
- Principle 2: Build structures for inclusion that engage stakeholders and allow communities to make decisions.
- Principle 3: Promote social equality through discourse that reflects a range of values and social identities.
- Principle 4: Generate ideas that grow from place and build local capacity.
- Principle 5: Design to help conserve resources and minimize waste.

SEED EVALUATOR

To convert this mission and principles into design-based action, a new tool was developed, the SEED Evaluator. The SEED Evaluator is a communication tool that allows designers and communities to define design projects that address critical issues. The Evaluator provides for significant involvement of the community, resulting in greater transparency and accountability, and allows tracking a project through its entirety. There are four broad benefits of using the SEED Evaluator:

- Process: Provides a standard process for designers and communities to assess challenges, define priorities, set goals, and create design projects to address critical social, economic, and environmental issues.
- Participation: The Evaluator functions as an online communication platform that can include multiple stakeholders and diverse community members in the process. Broad and diverse participation in a project is a requirement of the SEED Evaluator for a project to be determined as in the public's interest.
- Transparency: Progress toward success can be tracked online and in real time. The results of the project in achieving these goals or not are made publicly visible.
- Accountability: Completion of the SEED Evaluator can lead to SEED Certification, which confirms, through a third-party review, the success of a design project in achieving the goals set by the community. SEED Certification has established a trustworthy method for the public, community organizers, civic leaders, designers, and funders to confirm the public interest aspects of design projects.

RESEARCH AND TRAINING IN PUBLIC INTEREST DESIGN

Research conducted through the 2011 FAIA Latrobe Research prize researched "Public Interest Practices in Architecture" and surveyed a representative sample of AIA members. The interest of these professionals in practicing public interest design was measured. Obstacles and support mechanisms were also determined. These responses established a need for training, which has not been provided in traditional architectural education.

Public Interest Design Training includes:

- Finding new public sector clients
- Learning about new fee sources and structures
- Understanding public interest design and how is it reshaping the design professions
- Proactively finding a public interest design project
- Using a step-by-step process of working with a community as a design partner
- Leveraging other partners and assets to address project challenges
- Maximizing a project's positive impact on a community
- Measuring social, economic, and environmental impact on communities

As a result of this research, the first professional training in Public Interest Design was started in 2011 by the Public Interest Design Institute and held at the Harvard Graduate School of Design.

BACKGROUNDER

CULTURE, DIVERSITY, AND DESIGN

Sanjoy Mazumdar, B. Arch. (Hons.), M.Arch.A.S., M.C.P., Ph.D.

Design is important to cultural groups. Design flaws and culturally inappropriate designs can be harmful. Attending to cultural and social needs is the designer's responsibility. These themes are delineated herein.

Sanjoy Mazumdar is professor at the University of California, Irvine, past chair of the Environmental Design Research Association, and Fellow of the Design Research Society. His designs exist internationally.

The effects of culture on design are manifest in the variety in architecture existing around the world, illustrated by books on, for example, Japanese or Indian architecture. In many nations, such as the United States, immigrants create various special cultural spaces, such as Little Saigon in Southern California. For a number of reasons, including place attachment, these groups have felt the need to (re)create an architectural and physical sense of place important and meaningful to them. Distinct are their architectural forms, morphological features, colors, textures, ambiences, and building–street interfaces, as well as the ways in which people use sidewalks and streets and interact with buildings.

Following is a summary of the ways culture influences design, the effects of faulty design, and some of the cultural responsibilities of architectural, urban, interior, and landscape designers. Culture is defined as a group's socially negotiated and accepted values, traditions, customs, mores, lifestyle, and ways of doing, acting, and building. This includes views of the physical environment as well as of design.

The distinctiveness of a culture's architectural designs, according to *House Form and Culture* (Prentice Hall, 1969) by Amos Rapoport, as well as other authors, is due primarily to the uniqueness of cultural approaches to design. Attitudes toward design are influenced by the culture's ideas about design problem setting (what needs attention), problem-solving (how problems ought to be resolved), design appropriateness (out of the possible solutions that are acceptable), design requisites (preferred conditions like directions, shapes, sizes, dimensions, materials, and technologies), sentience qualities (visual, including forms and colors; haptic and textural; acoustic/sonic; olfactory/smell; and gustatory), and relationships with other humans, other species, and nature, among others.

Culture's connections with design can be fairly strong, deep, influential, multifarious, and complex. Among the various cultural factors influencing design that have been

(continued)

identified by researchers are cultural values, conceptions, preferences (for forms, materials, etc.), aesthetic sensibilities, symbolism and meaning attached to forms, and attitude toward and responsibility for nature. Cultural conceptions may direct the selection and preparation of the land, the design process, construction, preparation, dedication, and occupation, as well as design features including character, location, orientation, and arrangement of spaces. House designs of religious groups tend to have special ambience and spaces, and unique décor, furnishings, furniture, items, and equipment; as well as distinctive uses, activities, rituals, and ceremonies. Not attending to cultural needs can lead to design failure and consequent costs.

DESIGN PERFORMANCE AND FAILURES

Designs perform successfully in many ways. Briefly, these include users being able to conduct intended functions, tasks, and activities, feeling a sense of comfort, and even satisfaction with the design. Designs can also innovatively provide imaginative possibilities and open new vistas.

Designs fail for several reasons (excluding those not under the designer's control; for example, planning, management, construction deficiencies, and natural or other disasters). *Cultural design failures* are designs that culture members significantly modify, refuse to use, reject, abandon, or dispose of because they deem them culturally inappropriate (e.g., Snyder, Stea, and Sadalla 1976; Mazumdar 2000). *Functional design failures* do not meet reasonable expectations regarding affordance of functions, uses, activities, or comfort conditions. *Design performance failures* refer to the inability of the design product to perform at the level expected. There could be others—for example, *structural design failures,* wherein the structural design is inadequate.

Cultural design failures can have many deleterious effects on people living in culturally inappropriately designed environments (Jaulin 1971; Mazumdar 2012). Living in inappropriately designed houses can hinder, and require adjustments to, religious rituals and activities deemed important. This can be particularly damaging to those groups for whom home is a primary site for religion (e.g., Hindus, Buddhists, etc.). Some outcomes are immediately noticeable, such as the inability of users to conduct their cultural practices and/or having to truncate, modify, or forgo them. Medium-term effects of not being able to engage in cultural routines include feelings of incompleteness and inadequacy, and failure to recall details of the process. Long-lasting consequences consist of amnesia concerning cultural knowledge about procedures and practices as well as their rationales, and inability to socialize and teach the subsequent generation, leading to loss of culture (Jaulin 1971). Besides direct and obvious ones, there can be ripple effects whereby other aspects are affected (e.g., inability to prepare certain foods might lead to nutritional deficiency in children and adults and loss of that cultural recipe). And there can be indirect and hidden effects.

Cultural design failures affect post-disaster housing. After disasters destroyed their homes, disaster victims, who had hardly any options, have nonetheless refused to occupy the houses provided because the designs were culturally unsuitable and instead chose to live in tents or use these in drastically modified ways. For example, those displaced by the 1970 earthquake in Gediz, Turkey, did not occupy the housing supplied (Oliver 2003). Knowledge of such design failures and their effects led to a proposal for a cultural ecological approach to disaster planning (Mazumdar 2012).

These cultural failures have led to the realization that one way of design (planning and landscaping) may not be suitable for all. Because the one-design-fits-all approach is not likely to lead to appropriate and acceptable environments, designers and planners will need to be knowledgeable and motivated to provide appropriate environments.

CULTURALLY APPROPRIATE DESIGN

To avoid cultural design failures and the ensuing embarrassment to designers, and to minimize harm to occupants, it may be useful to adopt the physicians' adage: "First, do no harm." Designers do not always know what is good for the local people, and so the following would be useful to incorporate into regular practice: To achieve culturally appropriate and responsible designs, a "cognoscent approach" is necessary (Mazumdar 2000, 2012). In this, it is essential to develop cultural consciousness, recognize the importance of deep understanding, and adopt an attitude of becoming as knowledgeable as possible about local culture–design relationships. This requires learning about local cultural values and their influence on design and the effects of inappropriate designs. In this culture-intensive and engaged approach, it is useful to frequently verify one's knowledge with culture members. Because cultural values are not static, it is useful to learn about core values that resist change, peripheral ones that are more amenable to modification, and problematic ones that can be considered for alteration. Once knowledge is acquired and choices and consequences properly considered based on comprehension, understanding, and astute judgment, culturally appropriate and responsible design decisions can be made that respect the culture's core and key values while improving conditions. Providing possibilities for cultural members to comprehend the proposed designs—their effects as well as the trade-offs implied—will be useful for their engagement with the design.

A few caveats deserve mention. Individuals are cultural members and agents, but culture is neither a collection of individuals nor the summation, average, mean, or mode of individual opinions or preferences. All cultural features described are important, and so selectively focusing on a few—such as prevalent forms of the region—is insufficient.

CONCLUSION: DESIGNER'S CULTURAL RESPONSIBILITIES

Designers, thus, can have positive or negative effects. Culture, once destroyed due to lack of consideration, action, or knowledge, is near-impossible to reconstitute again (Jaulin 1971). Attending to the various cultural requirements is therefore crucial.

Designers can play an important role in enriching users' lives by drawing on and respectfully using local cultural wisdom; making meaningful products through culturally appropriate design; facilitating cultural experiences (e.g., spaces for contemplation, peace, tranquility); incorporating and specifying local arts and crafts and local materials, products, and labor; and through socioculturally inspirational design that becomes a pride of the community. Additionally, whether required or not, they can address intractable problems, and provide "socially conscious" elegant, affordable, culturally appropriate, imaginative, eco-sensitive, healthy, and safe solutions that make the project suitable for persons with disabilities, children, and the elderly, powerless, and poor (Oliver 2003). Designers are in a special position to lead the way by seeing every project as an opportunity.

4.2 The Role of Architects in Disaster Response and Recovery

Rachel Minnery, AIA, NCARB, LEED AP

Architects have an opportunity to fully embrace the unique and valuable contributions they can make as design leaders in communities at risk of natural hazards. This article discusses how architects can be effective in disaster response, recovery, rebuilding and resilience to help shape truly sustainable communities.

INTRODUCTION

In the United States, the number of federally declared disasters has been steadily and swiftly on the rise. In 1958 there were 8 declared disasters; just 50 years later in 2008, there were 10 times as many. What accounts for the dramatic increase? Some view climate change and global warming as a factor, others perceive an increase in the involvement of the federal government in state and local affairs. Most agree that the compounded effects of population growth, aging infrastructure, and the expansion and development of cities contribute to the increased scale and intensity of hazardous events.

The United States is prone to various life-threatening natural hazards, including hurricanes, floods, tornados, earthquakes, volcanoes, and wildfires. History and science show that numerous faults on the Pacific coast are due or overdue for a seismic event.

Rachel Minnery, 2012 chair of the AIA Disaster Assistance Committee, is an architect and grants manager with Environmental Works Community Design Center in Seattle, Washington.

Although flooding, which accounts for more than 75 percent of federally declared disaster areas, is the most prevalent disaster event in the United States, it is excluded from typical homeowner insurance policies. Without flood insurance programs, damage due to floodwaters leaves homeowners physically and economically vulnerable.

Hurricane Katrina had a stunning impact on the nation, yet disasters of truly catastrophic proportion have largely been unseen by Americans in this past century. While the risk of occurrence is low, the threat will exist for generations to come. With over half of the American population living within 50 miles of a coastline, many are aware of the direct risk of hurricanes and windstorms. Japan's Tohoku earthquake in March of 2011 was also a reminder of the indirect risks when an earthquake many miles away sounds tsunami alarms in the United States. For some perspective: A single earthquake off the Gulf Coast could trigger a tsunami affecting 35 million people, and one off the East Coast could impact 65 million people.

When Hurricane Katrina hit in 2005, it was a wake-up call. This storm cost the federal government $85 billion, and natural disasters caused $960 billion in damage to U.S. property and infrastructure in 2010 alone. According to the United Nations International Strategy for Disaster Reduction, the severity of this financial impact of natural disasters is directly linked to unplanned development and destruction of ecosystems. Hurricane Katrina was the costliest natural disaster in the history of the United States. In New Orleans this cost was due in part to infrastructure failures: Breached levees caused the destruction of 4,000 homes in the Lower Ninth Ward. This was the sixth-strongest recorded storm, yet it claimed the lives of 1,836 people and damaged or destroyed 850,000 homes, leaving many coastal communities and neighborhoods still struggling to recover years later. In addition to the monetary costs, there is a humanitarian cost. Until Hurricane Katrina, the largest displacement of Americans had been caused by the Civil War.

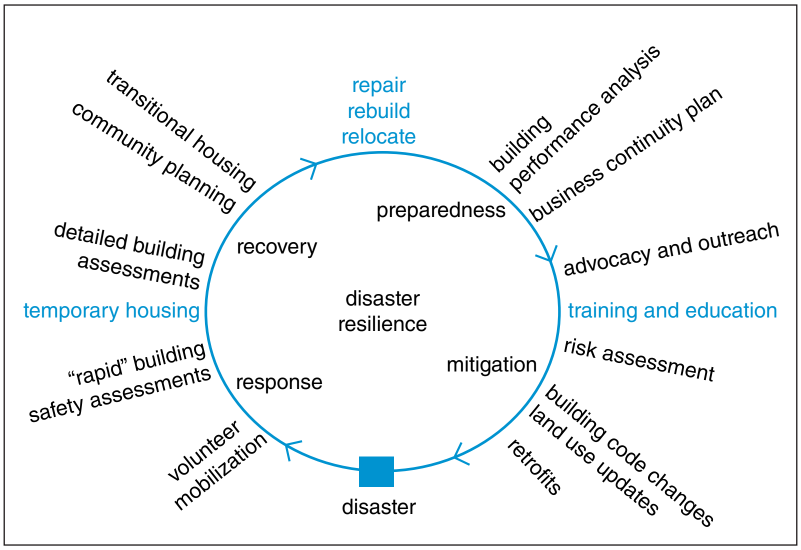
The impacts on Gulf Coast communities have been astounding: fewer than 50 percent of the residents of New Orleans had returned to their city more than five years after the storm. This aspect of prolonged displacement raises an immediate issue after the disaster: When is it safe to return to one's home?

Eager to rebuild their lives, some residents returned to damaged homes too soon, unaware of safety and health risks to themselves and their families. Doctors' visits and prescription use surged in the first year following the disaster for burns, wound care, illness, and injury. A common complaint came to be called "the Katrina cough" due to the mix of high temperatures and flooding in homes (Falk and Baldwin, "Environmental Health and Hurricane Katrina," *Environmental Health Perspective* 2006). Mental health is also fragile. A Harvard University study found that up to 50 percent of Katrina survivors were diagnosed with post-traumatic stress disorder, and another 20 percent with mental illness.

Disasters don't just cause short-term health problems; the more people are exposed to stressors, the more they are at risk for developing long-term mental illness (Gardner, "Mental Health Woes Doubled," *Health Days* 2007; and Hurricane Katrina Community Advisory Group, Overview of Survey Baseline Results, 2006). Ongoing illness and the threat of long-term illness is one of many reasons the recovery costs continue to rise. The more quickly people are able to safely return to their homes, the healthier they will be.

Design professionals and the construction industry have a significant role in the health and safety of the environment and in disaster management (see Figure 4.2.). Their role includes a range of activities designed to maintain control over emergency situations, providing a framework for helping those who are at risk to avoid or recover from the impact of the disaster (Kelly, *Limitations to the Use of Military Resources for Foreign Disaster Assistance*, 1996). FEMA recognizes both as unfilled roles, stating "the literature on natural hazard mitigation directed toward the architectural profession is scarce in spite of the fact that architects can make a significant contribution to hazard risk reduction" (FEMA, *A Manual for Architects*, 2006).

As a first priority, the American Institute of Architects has been advocating for architects to engage with local building departments and state emergency management



Rachel Minnery, AIA

FIGURE 4.2 Disaster Resilience Cycle and the Role of the Architect

agencies to perform building safety assessments when needed. This community engagement reduces the need for temporary housing and prevents further injury or loss of life by ensuring that structures are safe to occupy. See Figure 4.3 for an image of temporary shelter in Haiti provided by one of dozens of nongovernmental relief organizations after the January 2010 earthquake.

BUILDING DAMAGE AND SAFETY ASSESSMENTS

Most jurisdictions and emergency management agencies approach building damage assessments in three phases: windshield assessment, rapid assessment, and detailed assessment. The same assessment approach is used by the Applied Technology Council (ATC), a nonprofit professional organization that develops resources and applications for use in mitigating the effects of natural hazards on the built environment.

- *Windshield assessment*, just as the term implies, is a drive-by cursory view of damage. This is typically performed by emergency personnel, local firefighters, and police, from a vehicle or in conjunction with search and rescue work, to assess the severity of the damage and public safety impacts of the event.

Rachel Minnery, AIA

FIGURE 4.3 Haiti Temporary Shelter

- *Rapid assessments* are performed by local building departments to determine the habitability and extent of damage of individual structures, often conducted only at the request of the owner. Typically teams of two perform up to a 30-minute exterior and interior review of the building damage, sufficient to determine habitability and if there is a need for further investigation. Buildings are tagged on the exterior with red, yellow, or green placards to communicate to the owner, resident, and community where the building is safe to occupy and under what conditions: a red tag indicates it is unsafe to occupy; a yellow tag indicates a restricted occupancy; and green-tagged buildings are determined safe, though they may have minor damage. Unfortunately, after Hurricane Katrina, red-tagged structures were misconstrued as demolition notices, and, regrettably, historic structures were destroyed across the Gulf Coast when demolition crews haphazardly dismantled and removed red-tagged buildings.
- *Detailed assessments* are the in-depth reviews and assessment of complex buildings, and are the final step before recovery and rebuilding begins.

The AIA provides training to architects, building officials, and engineers in how to perform these crucial assessments to help building departments during what is likely to be an overwhelming situation. Following a disaster, even a minor one, local building departments very quickly become inundated by requests for help from residents and business owners. A job that could take up to six months to complete by building department staff, and often the victims of the event themselves, can be reduced to days with the help of a volunteer team of architects and engineers. This increased capacity allows residents to return more quickly and safely to their homes and places of work.

After Hurricane Katrina, 80 California Emergency Management Agency Safety Assessment Professionals, in two 10-day shifts, assessed homes and business in the face of very difficult, sometimes harrowing, conditions, reviewing and tagging over 17,500 of the 28,000 properties in St. Bernard Parish. In Alabama, after the April 27, 2011, tornadoes, 73 volunteer architects donated more than 1,300 hours and performed 7,000 inspections over a five-day period. Nonstructural components typically account for 60 to 80 percent of the overall cost of building construction, so the initial rapid building damage assessment is a job suited for the architect, as a generalist design professional. Furthermore, damaged nonstructural elements such as plumbing, mechanical equipment, light fixtures, suspended ceilings and furniture often pose a greater hazard than the building itself.

Even an earthquake as minor as the 6.8 magnitude 2001 Nisqually Earthquake in the Pacific Northwest left 400 people injured. Architects and engineers were retained for private detailed assessments of buildings. Properly trained architects aided the City of Seattle in handling rapid assessments for homeowners concerned about wall cracks and chimney damage.

When architects provide rapid assessments, engineers are freed up to focus valuable assessment efforts on detailed review and complex buildings.

Any given home is evaluated to some extent up to six times after an event: one or more times by local authorities, FEMA, insurance providers, design professionals, and nongovernmental disaster response organizations (NGOs). In the case of Hurricane Katrina, volunteer architects, with interns at their side, performed voluntary Goodwill Assessments at the request of a homeowner or small business owner for up to a full year following the storm. The Goodwill Assessment is an objective professional evaluation of the building damage and may include recommendations for repair. These reports proved invaluable to many property owners in obtaining repair work reimbursements as they engaged in extended negotiations with home insurance providers and FEMA.

THE AIA DISASTER ASSISTANCE PROGRAM AND COMPREHENSIVE RESPONSE SYSTEM

Recognizing the complexity of the problems communities face as a result of disasters and the absence of any similar program or service related to the built environment, the AIA began providing disaster assistance to communities in 1973. One of the first projects undertaken by the AIA was the recovery and plan for rebuilding after a tornado destroyed downtown and East Nashville. Architects with experience in similar disasters provided much-needed insight for the rebuilding process. They were able to effectively facilitate public workshops and design charrettes with local community stakeholders. As an outcome of this disaster and design assistance team, a nonprofit community design center was formed that remains in existence today to support the community.

Over the years, the AIA Disaster Assistance program has evolved in response to changes in emergency management practices. In 2006 the Disaster Assistance Program, led by volunteer architects from all corners of the United States, was formalized, and the Comprehensive Response System (CRS) was created. The CRS includes guidelines and protocol for architects engaged in the full cycle of disaster management: emergency, relief, and recovery.

There are five critical components of the model AIA policy for the Disaster Assistance Program, with a focus on the safety assessment process.

1. *Liability coverage.* For architects, this is typically provided through a state-enacted Good Samaritan Law. These laws protect architects and engineers while providing emergency services in a specific area within a designated time frame. While often similar in language, the Good Samaritan Law varies from state to state and is not enacted in all states. As more states exercise the use of the professional Good Samaritan Law, it has come under notable criticism for its lack of legal protection. Without indemnification, a citizen can bring suit against a volunteer architect for negligence. The process to exonerate the volunteer can be lengthy and expensive.
2. *Clarity on workers' compensation*. If an architect experiences an injury or fatality while performing voluntary damage assessments in an emergency, who is responsible for medical care or other associated costs?
3. *Standard for professional training for rapid assessment*. Many jurisdictions do not recognize a formal training program for responding architects and engineers. Those that do commonly refer to training first developed by the Applied Technology Council (ATC) with seed funding from FEMA. ATC initially created training and protocol for assessment of earthquake-stricken structures. In 2005, utilizing the same basic protocol, ATC developed a training program for structures exposed to wind and water damage. In recent years, using the methodology of ATC, the state of California developed the Safety Assessment Program (SAP) for building officials and other design professionals to assess damage due to a wide variety of natural and man-made hazards.

   With the growing number of training programs and increasing exposure to liability risk with each event, the AIA has been supporting the American Society of Civil Engineers' proposal to FEMA to establish uniform standards of training and credentialing of engineers and architects to be used nationwide. The training provided by qualified architects has allowed architects to gain firsthand response experience and provide leadership and guidance to local governments, especially valuable where hazardous events have been rare and/or formal emergency management protocol has not been developed.
4. *Network of trained volunteers available and ready for activation.* Acknowledging that response and recovery is the responsibility of the local community, the AIA State Coordinator Network was formed to encourage identification of a Disaster Assistance Coordinator and to create an individual disaster assistance program for each state. The network of volunteers is activated only when a request for professional emergency assistance comes from a local building department or state emergency management agency. Over the past 10 years, thousands of architects nationwide have been trained in the SAP or ATC program offered through the AIA, SAP, ATC, International Code Council, and engineering associations.

After Hurricane Katrina, the Governor of Mississippi, a state that is still without a Good Samaritan law for architects, provided a letter authorizing architects to be temporary contract workers of the state. Minutes later, the first team of architects headed off to the coast with state-employed building professionals to perform rapid damage assessments. Without liability coverage, the architects could not have volunteered, as it would have jeopardized their careers or employers in the states where they practice.

5. *Portability of licensure.* Because architects are licensed by each individual state, not at a national level, this fifth component of the model policy is critical for larger-scale disasters. In a disaster, local architects may be tending to their own families and businesses and thus out-of-state volunteer architects are invaluable. However, they may not be able to help unless the state architectural licensing board adopts emergency policies allowing licensed architects from other states to serve as "emergency workers" when deemed necessary by the state. Yet there is concern that allowing outside architects to participate in the emergency response phase will lead to lost work and future revenue for local architects. The disaster assistance team must be sensitive and cautious in their evaluation of the request for assistance. The Florida SAP trained architects who volunteered to help after the 2011 Alabama tornadoes were denied because they would be "practicing architecture without a license" in the state.

ARCHITECTS IN RESPONSE AND RECOVERY EFFORTS

While disasters are a problem for all nations, they are an especially critical issue in third world countries. Natural disasters are the cause of 95 percent of deaths in third world countries (United Nations Intergovernmental Panel on Climate Change, Special Report on Managing the Risks of Extreme Events and Disasters to Advance Climate Change Adaptations, 2012). U.S.-trained architects have been made available to other countries in need of assistance, as in the case of Haiti following the 2010 earthquake. Two teams of American architects and engineers were able to perform damage assessments there, via the nongovernmental disaster relief organization All Hands Volunteers.

The network of architects in the Southern United States was activated in April of 2011 when a series of tornados struck urban and rural areas of Alabama and Missouri. Members of the AIA Disaster Assistance Committee conducted damage assessment training sessions for architects in Alabama. The training sessions paid dividends to communities like Tuscaloosa, providing services valued in excess of $300,000 (see Figure 4.4.). Residents were able to quickly and safely return to their homes, allowing resources to be focused on food and other necessities rather than shelters and temporary housing. Simple prioritizations allow the community to begin recovery and rebuilding efforts quickly.

Michael Lingerfelt

FIGURE 4.4 Volunteer Architect Michael Lingerfelt Tags a Damaged Building in Alabama.

Past community recovery success stories like that of Greensburg, Kansas, offer insight and inspiration to communities struck in 2011, like Tuscaloosa, Alabama, and Joplin, Missouri. Communities affected by a disaster are eager to return their lives to the normal condition they knew before the event. The Greensburg success story offers hope to survivors of other disasters by demonstrating that opportunities for positive change can be born from devastation and pain.

Architects can provide vision and community facilitation to create a unique road map for recovery in the creation of a community's "new normal." While government agencies are best suited for response and relief efforts, it is the private sector that usually leads recovery and reconstruction. Universities and nonprofit organizations with established community networks have been a vehicle for architects, designers, and students to contribute to recovery efforts. Nonprofit design centers have sprung up and rooted themselves permanently in communities as a result of a disaster. Architecture for Humanity is one well-known organization that provides humanitarian design-build services after disasters.

Architects are eager to help after a disaster, yet those good intentions need to be guided to be effective or, if real-world parameters are not understood, they could do harm. In Mississippi, architects and historians worked together to develop design standards for repair and rebuilding the city of Biloxi. Design competitions can be a great way to energize a community by soliciting innovative ideas for reconstruction, and are especially effective when the design process is inclusive of future residents and stakeholders. The Make It Right Foundation built sustainable, storm-resistant houses in New Orleans to model responsible rebuilding on flood-prone land. Yet making structures viable and resilient has the potential to also make them unaffordable to the average homebuyer. The feasibility of reconstruction is based on many variables, first of which is the availability of funding and financing for property owners.

As a response to significant criticism of the health and habitability of the FEMA trailer, several architects developed designs for temporary and transitional housing following Hurricane Katrina. One of the most well-known is the "Katrina cottage," a 308 square foot single-story home designed by Marianne Cusato. At a cost equal to or less than the FEMA trailer, Cusato's adaptable design could be made permanent and allow for future additions and renovations. All too often, temporary housing has become permanent because of a lack of resources, and still local government officials feared that the small houses would drive property values down (Jarvie, "Post-Katrina cottages get a lukewarm welcome," *Los Angeles Times*, 2007). Yet due to their success and popularity, national retailer Lowe's began selling the house kit not just locally but nationally as an economical DIY housing alternative, similar to the Sears & Roebuck kit houses of the early 1900s.

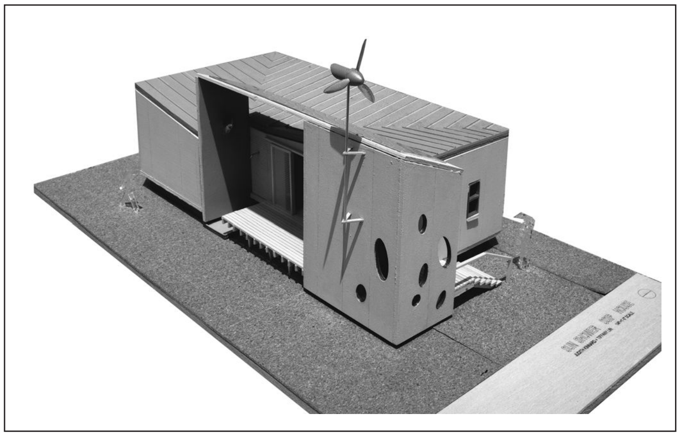
ARCHITECTS LEAD IN KANSAS DISASTER RECOVERY

In May 2007, when a 1.7-mile-wide tornado tore through the rural town of Greensburg with 205-mph winds, an AIA Kansas Disaster Assessment Team responded by performing building safety assessments of the 10 percent of structures left standing. With significant participation of the 1,400 residents of the town that was left completely devastated by the storm, the disaster assessment team and Kansas design teams facilitated the recovery decision-making process after identifying and gathering stakeholders.

Under the leadership of sustainability-minded architects and design professionals, all public buildings were rebuilt to a standard that earned them a Platinum rating from the U.S. Green Building Council's (USGBC) Leadership in Energy and Environmental Design (LEED) program. To educate residents and make them aware of their options for reconstruction, AIA Kansas hosted a green building exposition, inviting vendors of green building products and contractors to attend. This distinctive recovery effort is considered a great success and has served as a model for sustainable post-disaster recovery, with more than 50 percent of Greensburg residents having returned within three years, rebuilding their homes and businesses.

ARCHITECTURE FOR HUMANITY

Architecture for Humanity (AFH) links a broad network of young professionals through its design fellowship program and chapter organizations. The organization fields requests from communities struck by conflict, natural disaster, or other crisis and will often collaborate with other nonprofit agencies and firms to complete projects. Formed in 1999 by Cameron Sinclair and Kate Stohr, today the San Francisco–based office employs 36 full-time staff and manages numerous volunteers for their global work to alleviate poverty, build community, and address climate change. Owing to Haiti's lack of resources, the group was already working there when the earthquake struck in January 2010. In a country with only 30 architects, AFH became involved in seven master planning projects to help the country recover. While international post-disaster aid is typically earmarked to specific projects like new housing, other essential needs for recovery remain unmet. Survivability is more complex in a place that has nonexistent or inadequate water treatment, so addressing the obstacles to sustainable development has been critical to long-term recovery. As the organization has grown and learned from their post-disaster experiences, the roles of the nonprofit organization have diversified to adapt and make an impact. Collaboration and learning new skills in financing, grant-writing, land development, and public outreach have been critical to getting projects off the ground.



Judith Kinnard, FAIA, and Tiffany Lin

FIGURE 4.5 Sunshower House by Judith Kinnard, FAIA, and Tiffany Lin

Creative solutions for post-disaster homes and shelters have evolved to improve the way sustainable homes are designed for the masses. Judith Kinnard, FAIA, and Tiffany Lin's Sunshower House, as shown in Figure 4.5, is a climate-adaptable modular home design that is packaged to be flexibly transported by a single shipping container. Inspired by the walk-in coolers that had the distinction of surviving hurricane Andrew, the design features structurally insulated panels that withstand wind speeds up to 156 mph. While "deep green" sustainability promotes living "off-grid," survivors of a disaster are forced to live in those conditions. A structure that could be considered both resilient and sustainable, the roof generates electricity from either solar panels or a wind turbine and collects water from the roof for reuse.

DISASTER RESILIENCE AND BUILDING MITIGATION

Communities can prepare themselves for potential disasters and *mitigate* or reduce the impact of hazards so that they will not have to rebuild their homes and businesses. When risks are addressed ahead of time, the potential for damage will decrease. As expressed by FEMA, "mitigation has long been perceived and practiced as an essential tool for helping to save lives, reduce property damage, and decrease the money spent on disaster recovery efforts." Informed and trained architects can be advocates for increased public education and awareness by conveying the risks owners face and demonstrating how those risks can be reduced through specific building mitigation methods.

Government leadership can prioritize community needs and resources to address the hazards and mitigate the potential consequences. Vulnerability is reduced with thoughtful design and construction methodologies. Common building practices have evolved to create safer, healthier, and more affordable buildings, enhancing quality of life. Post-disaster building performance assessments and scientific analysis inform design professionals and those responsible for building code changes and flood mapping revisions.

The increasing occurrence of disasters coincides with concern over climate change because both present significant modifications in the environment that require adjustments in design approach. As climate change brings more floods and droughts, demand for clean water is projected to increase. Rising sea level will diminish coastlines and impair infrastructure. Therefore, addressing the impact of climate change is integrally connected to achieving disaster resilience. The World Mayors Council on Climate Change is working toward strengthening cities' commitment to mitigation measures. Disaster resilience can be strengthened by sustainable design methods that incorporate long-term ecological resilience: green storm water infrastructure reduces urban flooding, coastal wetlands buffer storm-surge, green roofs cool buildings, and parks reduce heat island effect.

One of the most significant issues facing the built environment is the current stock of largely unregulated existing buildings. Architects, engineers, and authorities work to ensure that buildings are constructed properly, yet after buildings are constructed little is required of a building owner in terms of testing and monitoring the building's safety.

Building Retrofits

For existing buildings, *passive retrofits* are implemented when new building codes are put into effect when property owners voluntarily decide to add, renovate, or demolish a structure or rebuild after a disaster. In some cases, local jurisdictions have enacted *active retrofit policies* to retrofit certain building types in advance, for public safety. In other cases, code requirements for seismic bracing or modest life safety improvements are not always enforced.

Retrofit and mitigation practices incorporated into building codes are credited with saving homes and lives. These are fairly simple measures such as hurricane clips, shear walls, and hold-down anchors, among other refined construction practices. Though not required in coastal communities, the use of hurricane shutters, fabric, or impact-resistant glass along with heavy-duty garage doors is shown to prevent extensive damage by protecting openings that otherwise would expose the interior of the house.

Financial incentives for pursuing existing building retrofits work well when used in combination with compliance deadlines, as is the case for early adopters of newly classified flood zones. Home and building insurance discounts and rebates provide further promise when they incentivize elective retrofits and mitigation, reducing homeowners' insurance rates up to 50 percent. In devastating tornados, safe rooms—small, fortified, self-contained rooms typically made of steel and bolted to a building's foundation—have frequently been the only vertical portions of the structure left standing. In 2012, it was reported that a safe room in Mississippi withstood an EF-5 tornado, protecting the 10 people who sought shelter in it during the storm. These lives might have been lost if the storm had occurred just a few years ago, prior to the Mississippi State Emergency Management Agency's program "A Safe Place to Go." The program incentivized homeowners with a 75 percent reimbursement of the installed cost (up to a maximum of $4,000) of a safe room.

Challenges to Disaster Resilience

Change is inevitable after a disaster strikes a community. If local governments want future federal post-disaster assistance, they are required to implement policies that will mitigate principal damage. With evidence of flood and storm surge risks, FEMA updates its Advisory Base Flood Elevations (ABFE) for inclusion in new building and land use codes and retrofit guidelines for elevating structures above grade. During Hurricane Katrina, the highest winds on land were clocked at 175 mph, though the active building code set a design wind speed of 110 mph. As a result, the 2009 International Building Code has increased the design standard to 150 mph. When the building code and land use policies change, the cost of recovery is reduced.

An obvious challenge to disaster resilience is the economic burden. Low-income populations are inherently more vulnerable in a disaster due to a lack of resources.

CASE STUDY: RETROFIT FOR A NONPROFIT HUMAN SERVICES ORGANIZATION

A highly regarded nonprofit organization in Seattle, Washington, that provides community-based human and emergency services occupies a 51,000 square foot three-story unreinforced masonry school building originally constructed in 1911. In 2003 a remodel design, which included seismic upgrades per the 2003 building code, was put out to bid. The upgrade was estimated to cost $268,000, approximately 10 percent of the overall cost. In 2010, when remodel funding was secured, the code's approach to seismic design had changed so dramatically that the seismic retrofit was estimated to cost almost five times its original bid. The project remains stalled due to increased costs, so the building has not been remodeled to meet the tenant's changed needs, and it has not been seismically retrofitted. This cost-based catch-22 is another lose-lose situation for the owner and the public. If funding becomes available, a difficult decision must be made: Demolish the 100-year-old, culturally historic, yet unsafe building, or rebuild to create a fully code-compliant facility for approximately $7 million.

The predicament the organization faces is not uncommon to nonprofit organizations and those with limited resources.

Those with the fewest resources often build and live on the least desirable land. Even without a disaster, finding affordable homes and places of business in poor communities can be a challenge, and renters are dependent on property owners to maintain safe and available homes. Seismic technologies, for instance, add on average 10 percent to the cost of residential construction. For families struggling to meet their basic needs, this slight increase can be the difference between a having a home and not having a home.

New Building Codes

For building construction to be cost effective and safe, the methodology of the building code is to preserve life, not to protect against loss of property or function. Building codes represent minimum standards, and the few who design in excess of the code usually do so because of an owner's risk management practices. The standards to which a building is designed and constructed is critical because it will determine a safety baseline, the building's capacity to weather change over time, and therefore its resilience.

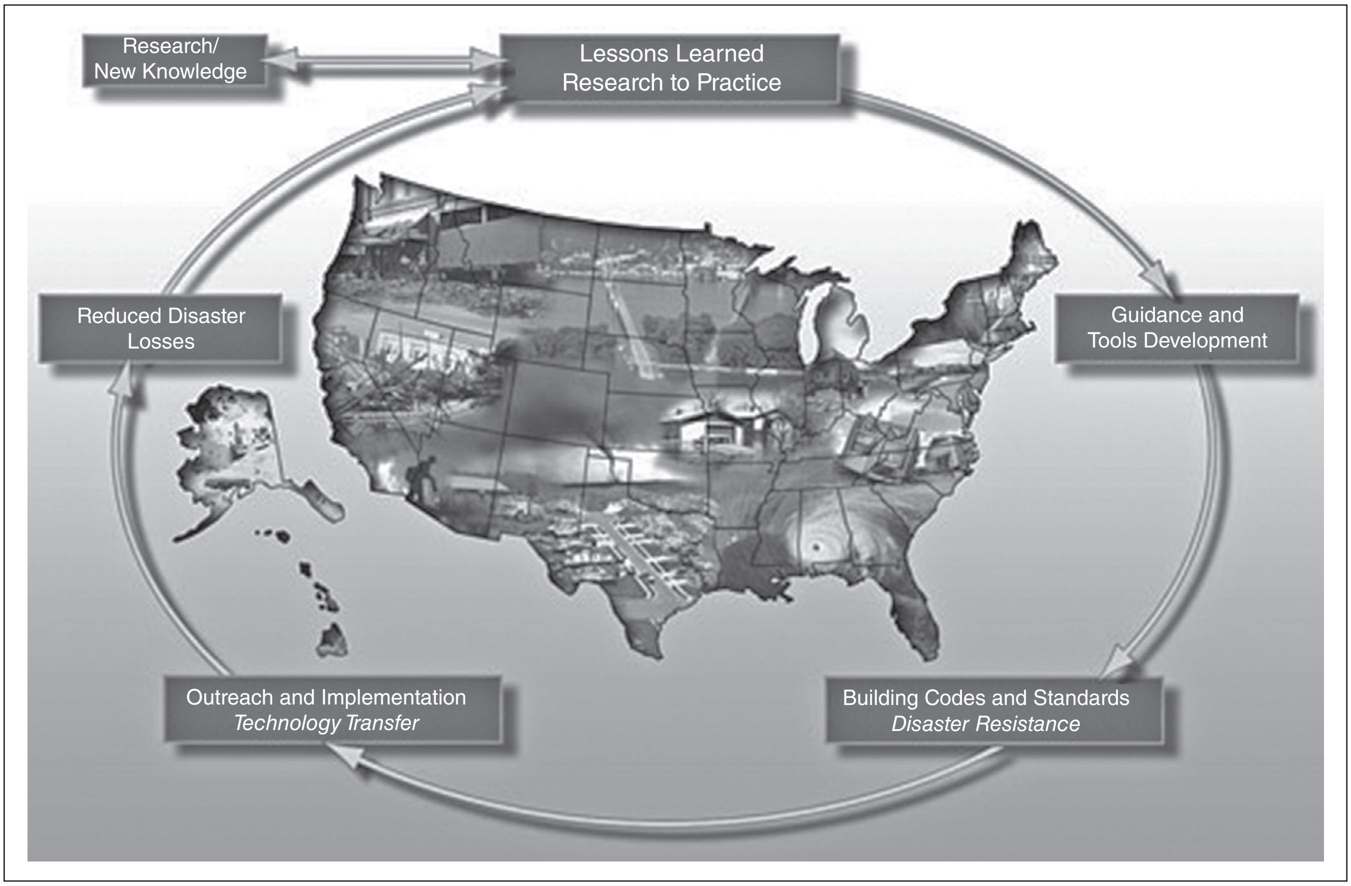
Resilience refers to an ability to adapt to change over time. A fully resilient community would suffer limited negative consequences of a natural hazard. The State of Washington, for example, has defined a resilient state as "one that maintains service and livelihood after a major hazard. In the event that services and livelihoods are disrupted, recovery occurs rapidly, with minimum disruption, and results in a new and better condition affecting *Property Protection*, *Economic Security*, *Life Safety and Human Health*, and *Community Continuity*, where all communities should have the capacity to maintain social networks and prevent social discrimination and social bias."

The resilience of the built environment is defined well in terms of its resilience as a whole system. ResilientCity.org is a not-for-profit network of design professionals whose mission is to develop creative, practical, and implementable planning and design strategies that help increase the capacity for resilience. They define a resilient city as "one that has developed capacities to help absorb future shocks and stresses to its social, economic, and technical systems and infrastructures so as to still be able to maintain essentially the same functions, structures, systems, and identity" (www.resilientcity.org).

The San Francisco Planning and Urban Research Association, or SPUR, a nonprofit with the goal to make cities truly resilient, acknowledges the direct relationship between building codes and resilience. "When we select engineering [and design] standards for buildings and lifelines, we are really choosing how many deaths, how many building demolitions, and how long a recovery time we have for various levels of earthquakes." This distinction, and the degree to which new buildings are capable of withstanding natural hazards, is largely misunderstood by the general public, who often assume that a new building can weather any storm, so to speak.

One tool to inform the design team and communicate expectations to the owner and building official is building performance modeling—the use of drawings, photos, and the like to construct a unique model within simulation software. Although modeling is only as good as its data input, it could be a useful tool for prioritizing mitigation technologies (see Figure 4.6.). With the intent to encourage the design of buildings to higher standards and with increased reliability, building codes have been moving toward a performance-based design approach. Performance-based design focuses the design on meeting a set of established goals rather than a building program based on minimum design standards.

Adoption of building codes by a jurisdiction is voluntary, and code enforcement poses a significant challenge to local building departments, whose resources are often stretched and whose personnel may lack adequate training in code enforcement. The consequence of irregular enforcement has resulted in inadequate construction and ultimately unnecessary damage and destruction of structures. Conditions such as these were discovered during damage assessments of tornado-stricken homes in the Midwest.



FEMA

FIGURE 4.6 Building Damage Mitigation Cycle

Approaches to Resilient Design

As a result of the Disaster Mitigation Act and Stafford Act, most cities have mapped their hazards, determined likelihood of occurrence, and anticipated impacts. Risks associated with those hazards are incorporated in mitigation plans to reduce loss from those hazards and to help prioritize local and federal mitigation funding. HAZUS, a software program developed by FEMA, estimates losses due to natural hazards at a regional level and can include utilities, bridges, and general number of structures. These tools inform decision making for land use and future development.

Architects can support a community's hazard mitigation plan by establishing resilience goals for their development projects. This is facilitated through site assessment, including collecting data from National Weather Service, FEMA's National Flood Insurance Program (NFIP), United States Geological Survey, and state or university surveys and research. Some jurisdictions have GIS mapping that includes hazards for floods, liquefaction, landslides, and the like. A detailed site-specific investigation, including the availability and condition of existing infrastructure, may illuminate development feasibility.

Having early conversations with clients to understand their comfort with risk will help determine acceptable levels of disruption in a disaster and establish appropriate design standards. It is important to communicate to owners that code compliance sets a minimum life safety standard with very limited protection of property. This may cause owners who depend on continuity of service for the long-term survival of their business to choose a design standard that exceeds the building code. Expectations can be outlined with a *vulnerability assessment*, where potential hazardous event scenarios are defined, modeled, holistically assessed, and analyzed for performance impacts and costs. This assessment would include investigations of resources and systems outside property limits: uses, site access, utility/infrastructure, backup systems for water, waste, electricity, and communications. This additional knowledge may alter design to provide additional safety and improve durability of the building through hazard mitigation.

Mitigation begins at the outset of design when decisions are made regarding the building's configuration and footprint, yet mitigation is not exclusively structural. Nonstructural building elements account for up to 80 percent of the value of a building—including windows, ceilings, interior partitions, equipment, furniture, and utilities—and are inherently less durable. Therefore, they are more susceptible to damage and may also negatively affect the structural performance of the building and prevent habitability.

▶ The backgrounder accompanying this article, Resilient Design, further explores the concepts of resiliency.

As seen with recent developments in the building code, the philosophy of mitigation is moving toward a resilient design, in that robust and resistant design is being replaced by design that is adaptable, flexible, and responsive.

CONCLUSION

The Loma Prieta earthquake of 1989 provides perspective on the long-term effects of a disaster in modern times. A post-earthquake economic recession struck northern California with building damage and loss greatly exceeding projections. Development decisions might have been different if building owners had understood the level of protection offered by building code standards. Engaging the public in decision making on acceptable building performance is important because the actual performance expected of a code-compliant building, and particularly existing buildings, is not widely understood. As difficult as the Loma Prieta recovery was, time has a way of minimizing if not erasing the memories of lessons learned.

FEMA statistics show that resilience is improved through mitigation. The potential for loss can be greatly reduced when mitigation practices are incorporated into both retrofits and new construction. Every dollar spent on mitigation saves at least four dollars in recovery, yet mitigation saves more than dollars—it also saves lives. However, to consider the resiliency of a home, one must consider the resilience of the community at large. As such, homeowners experiencing recurring floods who choose to relocate their families to a safer location will also have relationships and routines to rebuild to make a new house feel like home.

There will never be a lack of need for safety assessments of damaged buildings and for the skills that architects can offer to aid in the recovery from a disaster. The AIA model policy for a Comprehensive Response System is one starting point, created to equip architects with the guidance and tools they need, prepare them for the risks they face, and help them protect the communities they serve. Awareness, knowledge, and options for positive action can empower individuals to create resilient sustainable communities.

BACKGROUNDER

THE ROLE OF ARCHITECTS IN DAMAGE ASSESSMENT AND RESTORATION

Sharon Lobo

The role of architects in damage assessment and repair involves working toward solutions to unique problems, since disasters are unique events. The architect is often involved in the rebuilding efforts, since they were part of the original design team and must work with insurance adjusters, attorneys, clients, and other professionals and coordinate with governmental agencies.

Sharon Lobo is a licensed architect with over 20 years of architectural experience. With Thornton Tomasetti, Erwin Lobo Bielinski PLLC, and Indus Architect PLLC, Lobo has developed an investigation, litigation support, and construction analysis practice. She is regularly retained by national insurance carriers to investigate claims for building damage.

BUILDING DAMAGE ASSESSMENT

Building damage can be existing and may have been caused by substandard installation, poor design, or lack of maintenance. Building damage can happen at any time, ranging from minor wall cracks to structural failure, and it is not always catastrophic in nature. Any combination of these causes may result in a building's exterior and structural systems failing prematurely, and may cause additional damage such as air and water intrusion into the building's interiors. The architect can act as a conduit for communication after a disaster or damaging event to assist the owner in understanding causation.

For example, the architect can communicate to the client the difference between building damage and normal wear and tear. In the latter case, over years minor cracks may develop that are not threatening to the building. These can be caused by prolonged exposure to sunlight or wind. The client should be made aware that no construction is without flaws and that some minor instances of cracking are within accepted industry standards.

- If an architect is the original designer of the damaged building, expert opinions should not be offered regarding the cause of the damage because the client may incorrectly interpret the original architect's technical opinion regarding the cause of the damage or believe that the architect may be in some way responsible. Even if obvious, the architect should arrange for an independent third party who has expertise in the damage assessment to opine.
- The architect, if the original designer, should provide the project history to the expert who is hired. This project history is crucial in understanding what materials were used and, with the help of the original builder, under what conditions they were installed. There are often mitigating circumstances, and the architect can usually help "fill in the blanks" about the specifics.
- Even if the architect is seen as partially or wholly responsible for the damage to the building, it may be within his or her best interests to work with the client to develop the repair. The architect can serve as a conduit between the client and the contractor. When damages from disasters occur, clients sometimes consider litigation, and the architect can help facilitate bringing to the table participants necessary for diffusing such conflicts.

ASSEMBLING THE RIGHT TEAM

The right team consists of professionals with specific experience in assessing building damage and formulating a repair strategy. These professionals should be adept at following the unique protocols that are often established, such as the following:

- *Documenting the damage with photos, video, and field drawings*. A particular order and sequence of documentation must be established.
- *Developing a methodology for investigating damage*. This may involve deconstructing a building's defective assembly (such as an exterior wall system) in a controlled method to document each component of the system. Each of the interested parties should have a representative present and document the deconstructed system individually. In some cases, additional testing may be deemed necessary, and all parties must agree on the testing methodology. ASTM and ANSI standards are often used as testing guidelines.
- *Communicating with the legal or insurance representatives in a manner that they deem appropriate*. Some attorneys prohibit written or e-mail communications of any kind, citing lack of attorney-client privilege, preferring direct discussion or telephone communications only. Others depend on written communication. Be aware that e-mails are typically not protected by attorney-client privilege; rather, e-mails are increasingly used as evidence. Therefore, the architect should write them with the knowledge that they may be used in the courtroom. The tone in an e-mail should be direct but unemotional, relying on factual information only.
- *Consulting with the attorney or insurance company*. They may lead the team, but they often depend on the architect for advice on how to bid the repair, how to meet the code, and how to learn from the building damage. The rebuilding effort is more fluid than the conventional design process of a new building, and it is often constrained by increased time pressures and varying levels of available resources.

(continued)

The team may consist of forensic architects or engineers, cost estimators, restoration contractors, insurance adjusters, and attorneys. Depending on the size and scope of the building damage, the team may range from a few to several hundred professionals. The client and often the insurance provider must approve the hiring of professionals. Depending on the insurance policy, these professionals' fees may be covered.

FORMULATING A REPAIR STRATEGY

The architect often works with the building owner to plan and "program" a new building. Likewise, an architect can be especially useful to "reprogram" an existing space or footprint after a building disaster.

The architect may be asked to speak with product manufacturers in regard to warranty coverage. Manufacturers often choose to interpret building damage causation to events that negate their warranty, such as improper use or installation of the product or lack of maintenance and inspection. Clients are not always technically sophisticated enough to understand the limitations of the warranty. Architects can assist as an owner's advocate to obtain whole or partial replacement of the product, whether a roofing system or a window unit.

COORDINATING WITH GOVERNMENTAL AGENCIES

Governmental agencies often have requirements that can negatively affect a rebuilding effort, such as detailed documentation of rebuild designs when in sensitively zoned areas. For example, the New York City Department of Environmental Protection requires a Remedial Action Plan (RAP) for building modifications made within certain historic districts. This includes designing for an Alternate Means of Ventilation (AMV), which affects the design of windows, mechanical systems, and the exterior envelope. The intention is that the building be able to function with all doors and windows in the closed position with increased sound insulation and mechanical ventilation. These more stringent requirements must be taken into consideration when managing damage assessment and repair.

Additionally, energy codes and other national codes are often supplemented with more stringent requirements at the state or city levels, and they often require the approval of local code officials, specialized inspectors, and product manufacturers. After a disaster occurs, architects are sometimes held accountable for these requirements if litigation ensues. Therefore, the architect should make every effort to appropriately include these parties in the design and construction phases.

CASE STUDY

A high-end residential project in Boston experienced premature cracking in the wood flooring. The client refused to move into the residence in anticipation that the wood floors would be removed and replaced, thus costing him additional moving expenses.

The flooring subcontractor and general contractor refused to return to the project if the owner demanded total replacement. The design architect brought all parties to the table and convinced the client to hire Indus Architects as an expert to provide an opinion. The design architect arranged for Indus Architects to inspect the floors, review the project documentation, and provide an opinion regarding causation and damage repair. The architect provided supporting documentation such as project e-mails, letters, and product submittals.

Indus concluded that the product was appropriate for its use and the cracking was within industry standards. They determined that the wood floor needed to acclimate to the HVAC system and the client's occupancy would help lessen the perceived damage. The architect's role in this case was to facilitate communication, provide project history, and manage what was becoming a tense emotional situation.

CONCLUSION

The architect, as a leader and project advocate, can be beneficial as a conduit of information and communication. Though stresses of time constraints and high emotions are often present when building damage occurs, the architect should have the technical means and personal communication skills to bring about a successful resolution to most problems. Even if the architect is found to be ultimately responsible for the problem, working with the client to repair it may avoid litigation and possibly bring about a long-term professional relationship.

BACKGROUNDER

RESILIENT DESIGN

Alex Wilson

"Resilient design" is not only about surviving a storm, flood, or other natural disaster but also about creating buildings and communities that will maintain safe, livable conditions in the aftermath of a disaster. Resilient design provides for building occupants during extended power outages, shortages of water, and interruptions in motor fuel supply.

Alex Wilson, the founder of BuildingGreen Inc. in Brattleboro, Vermont, and executive editor of Environmental Building News, is a leading expert on resilient design and adaptation to climate change.

BROADENING THE DEFINITION OF RESILIENCE

Much of the focus of resilience has been on the ability of buildings to weather storms, floods, and a variety of other natural disasters. But in an age of climate change and resource constraints, the concept of resilience should be broadened to include how well buildings and communities perform with non-emergency (slow) disasters. These can include heat waves, extended drought, interruptions in water supply, extended power outages from any cause, spikes in fuel costs, outright fuel shortages, and even food shortages.

Some of these impacts can result from climate change. Others may result from natural disasters unrelated to climate, such as the devastating tsunami that struck Japan in early 2011 or a terrorism event. Some experts are particularly alarmed about the risk of cyberterrorism, in which terrorists hack into the controls of power plants or regional electric grids, causing widespread power outages that affect nearly all buildings in that area.

Resilient design is an effort to create buildings and communities that will maintain livable conditions both during disasters and in the aftermath of such disasters—which can extend much longer than the particular event. For example, in 2005 there were widespread power outages throughout the Gulf Coast region that lasted weeks or months after Hurricane Katrina, even in areas not directly affected by flooding.

Architects need to be aware of society's vulnerability to power outages—which may result as a secondary effect of other problems. An extended regional drought could result in widespread power outages if water levels drop so low that power plants have to be shut down for want of cooling water. In the United States, 89 percent of electricity is generated using thermoelectric power plants that depend on large volumes of water to condense steam. During the 2007 drought in the Southeast, one power plant was forced to shut down; several dozen more were threatened with shutdown had the drought continued. A 2003 drought and heat wave in Western Europe resulted in more than a dozen power plants either shutting down or reducing output—just when air conditioning loads were at record levels. The droughts in the West in 2011 and 2012 raised these same concerns.

Resilient design is most applicable to residential buildings—homes and apartment buildings—because unless evacuation is called for, residents are often advised to stay home during emergencies. But it also applies to public buildings that serve as emergency shelters. Schools, sporting venues, and other public buildings often serve as places of refuge during times of disaster.

ELEMENTS OF RESILIENT DESIGN

Resilient design encompasses a wide range of seemingly disparate building design and operation issues as well as much broader, macro-scale land-use planning and policy issues—all with the goal of ensuring public safety. These issues are introduced here.

Storm Resilience

Architects should consider the predicted impacts of climate change, including increased storm intensity. Warmer temperatures will drive more intense storm systems, including hurricanes, thunderstorms, and tornadoes. Changing precipitation patterns are expected to produce more intense rainfall events.

Achieving storm resilience involves designing to the most stringent wind and water-intrusion codes, such as the Miami-Dade County Hurricane Code. Such standards should be followed not only in coastal areas, but also throughout much of North America. It also makes sense to incorporate areas of safe refuge in homes or garages. Such safe rooms provide excellent protection even in tornadoes, our most devastating storm events. Requirements for safe rooms may be incorporated into future editions of buildings codes in some zones.

Flood Avoidance and Flood-Proofing

Climate change will contribute to flooding in several ways: It will produce heavier precipitation events; more intense tropical storms will result in coastal storm surges; and the sea level will gradually rise. Designers and planners should immediately begin designing buildings and communities to protect from flooding.

Risk of flooding is defined by the Federal Emergency Management Agency (FEMA) and indicated on Flood Insurance Rate Maps as follows:

- *Special Flood Hazard Areas* have a 1 percent chance of flooding in a given year ("100-year storms") and are designated as specific zones, including Zone A and Zone V.
- *Moderate Flood Hazard Areas* have a 0.2 percent risk of flooding in a given year ("500-year storms") and are often designated as Zones B and X.
- *Minimal Flood Hazard Areas* lie above the 0.2 percent risk elevation.

Building strategies related to flooding include avoidance of all areas identified on FEMA maps as Special or Moderate flood hazard areas, elevating living spaces in buildings within these zones (providing break-away barriers on the lower level), elevating mechanical and electrical systems within a building (especially in basements), and using building materials that can sustain wetting without permanent damage or fostering mold production.

Superinsulated Building Envelope with Passive Solar Gain

A resilient building is one that will maintain livable conditions in the event of an extended power outage or loss of heating fuel or mechanical cooling. (The vast majority of heating systems and virtually all cooling systems depend on electricity.) The key strategy for achieving such resilience is to design a building enclosure with high levels of insulation, high-performance windows, airtight construction, and passive solar gain.

(continued)

To achieve this level of resilience, insulation levels and glazing standards should go far beyond what is required by the International Energy Conservation Code (IECC). For example, in IECC Climate Zones 5 and higher, one should aim for the following minimum R-values:

- R-10 under slabs
- R-20 for foundation walls and slab perimeters
- R-40 for above-ground walls
- R-60 for ceilings or roofs

Window energy performance and air tightness should be commensurate. Sun tempering or passive solar design should be provided in these climates so that livable temperatures will be maintained in winter months even with loss of heating fuels or electricity.

Cooling Load Avoidance and Natural Cooling

During power outages, air conditioning systems do not function, so controlling heat gain is critically important. The summer of 2012 provided a wake-up call to this reality, when a heat wave blanketed many of the Mid-Atlantic states following intense storms that knocked out power for a week or more in some places. Strategies include minimizing glazing, especially on east and west façades; providing exterior overhangs and shading systems for fenestration; providing light-colored (reflective) roof and wall surfaces; providing vegetative shading and green roofs; and designing buildings to provide ventilative airflow through operable windows.

Daylighting

To provide livable, functional daytime-use spaces during extended power outages—a high priority in school buildings and other community spaces that can serve as emergency shelters—incorporate plenty of daylighting. Daylighting strategies vary by building configuration, but can include skylights, clerestory windows, and conventional windows, especially those high on walls. Lightshelves and light-colored ceiling and wall surfaces can help to distribute daylight deeper into rooms.

Water-Efficient Fixtures, Equipment, and Landscaping

With climate change, droughts are predicted to become more common in certain regions, such as the American West, even as overall precipitation increases. During droughts—and during extended power outages in rural areas that depend on electric pumps to provide water—minimizing water use is a high priority in achieving resilience. The use of high-efficiency toilets, low-flow showerheads, low-flow faucets, and water-efficient clothes washers and dishwashers are top-priority strategies in residences. While these systems will function with less water, the installation of composting toilets allows operability with no water and with a nonfunctioning sewage system. Low-water-use landscaping (xeriscaping) and, where needed, water-efficient irrigation equipment are top priorities outdoors.

Emergency Water

Having a supply of stored water can be extremely important during periods of water shortage. Water storage can consist of keeping on hand several carboys of potable water (the type used in water dispensers) or larger cisterns. For nonpotable uses, such as toilet flushing, a rain barrel positioned at the corner of a house can provide a water source. Full-fledged rainwater harvesting systems with aboveground or underground storage provide the best in resilience.

Emergency Generators

Backup generators are one component of resilience and, indeed, they are becoming more and more common in much of the country. But we learned in the aftermath of Hurricane Katrina that most generators either ran out of fuel or failed after just a few days—while the power outage lasted many weeks.

Renewable Energy Systems

Solar-electric (photovoltaic or PV) systems can provide the ultimate in energy resilience by providing electricity during extended power outages—but grid-connected PV systems require specialized inverters and at least some battery storage to be usable when the electric grid is down. Most PV systems are unusable during power outages, even during the daytime when the sun is shining. For resilience, be sure to provide a system that can function when the grid is down—these are sometimes referred to as "islandable" PV systems.

Solar water heating can provide hot water during power outages or fuel shortages, but to function without grid electricity it needs to be a passive solar water heater, such as a thermosiphoning system (with the tank positioned above the collector) or an integral-collector-storage (batch) heater, or an active system with its own integrated PV module to power the pump and provide control (when the sun shines, the PV module generates electricity and the pump operates). In rural areas, some homeowners augment solar water heating with a wood stove that has a heat exchanger in it through which water circulates.

Durability

With climate change, the ranges of termites and other wood-boring insect pests are extending farther north, so control measures may be needed where they were not in the past. Good building science practices will help to protect against moisture damage and other problems that lead to premature failure of building systems and buildings—one aspect of resilience.

Community Resilience

Resilient communities are communities that can function during times of gasoline and diesel shortages. Political upheaval in oil-producing countries, storms that take out a significant fraction of oil refining capacity, or terrorist actions that damage pipelines could all result in temporary shortages of fuel.

While actual shortages could occur, perhaps more likely are dramatic price increases that could effectively create fuel shortages for people who can't afford to fill their fuel tanks.

In such a situation, the ability to get around without a car will be critically important. To foster that, we should be designing towns and cities to be easily walkable and bikeable, and we should develop better public transit systems. Communities that work to achieve high rates of bicycle and public transit ridership, such as Portland, Oregon, will be at a great advantage should there be interruptions in transportation fuels. Use of locally produced biodiesel and site-generated electricity in electric vehicles or plug-in electric hybrid cars can also deliver resilience.

Food System Resilience

Food production in North America is extremely centralized, with much of our produce shipped from California and most grains from the Midwest. Severe, extended drought in food-producing regions could have significant effects, as could shortages of diesel fuel, upon which most shipping of food depends.

Greater resilience can be achieved through a focus on local food production. Strategies to achieve greater food system resilience include the creation of community gardens on abandoned urban lots, support of CSA (community-supported agriculture) farms, programs to supply schools and hospitals with local food, the protection of agricultural land (for example, through the creation of urban growth boundaries), and the relaxation of regulations that prohibit farming activities in more-developed areas. Landscape architects can even begin incorporating edible landscaping into their projects, allowing our landscapes to serve double duty.

THE ARCHITECT'S ETHICAL RESPONSIBILITIES

Faced with climate change and other vulnerabilities, should resilience be a part of the design profession's responsibility to protect public safety and welfare? Some argue that just as architects must create buildings that are structurally sound, so too should they create buildings that will ensure that residents will be safe in the event of extended power outages, loss of heating fuels, droughts, heat waves, damaging storms, and other impacts likely to increase in the years and decades ahead.

Building codes could also be expanded to address these issues more directly. Most disaster-related building codes today focus only on performance *during* the event and not the aftermath. Codes could be expanded to address building performance relative to life-safety during a scarcity of power, heating fuel, or water. New York City is already examining these issues, as are some other progressive cities around the country.

A significant benefit of many of the resilient design strategies introduced here is the mitigation of climate change. Creating more energy-efficient buildings and relying more on renewable energy sources, for example, will result in burning less fossil fuel and contributing less to climate change. Such measures will also reduce the operating costs of our buildings. These are win-win-win solutions.

4.3 Architects in the Nonprofit Sector

David Gamble, AIA, AICP, LEED AP

Increasingly, architects and young designers are looking for opportunities to become more engaged. They seek ways to have a direct and positive influence in the communities where they work and live. Civic engagement, once deemed passé, is becoming cool again.

INTRODUCTION

One of most powerful skills to learn as an architect is the ability to solve multiple variables in the fewest number of moves. Since an architect is an individual who works in the service of clients (both public and private), a primary product of an architect's work is the creation of more efficient, sustainable, and beautiful environments. This skill is directly associated with the ability to think spatially and to

David Gamble is principal of Gamble Associates, an architecture and urban planning firm in Boston. He is 2012 co-chair of the Urban Design Committee of the Boston Society of Architects and past president of the Community Design Resource Center–Boston.

synthesize. Equally important, and often more difficult to learn, is the skill of designing not just the product but also the process to arrive at an elegant design solution. Learning that the process of engagement can directly affect the process of designing the product is fundamental to the development and maturation of an architect.

Working with the nonprofit sector provides enormous benefits in this regard. Not-for-profit organizations seldom have the financial resources to allow designers unlimited constraints for a project. Tight fiscal budgets, restricted staff time, and diverse constituents require design solutions that balance multiple variables and require effective negotiation skills.

While these limits can be present in any project large or small, architects working in the nonprofit sector are embedded in an environment that demands cost-effective solutions, fostering creativity and requiring efficiency. When this work is nested in underserved or distressed neighborhoods where more diverse voices must be considered, even greater skill at community engagement is warranted.

The pedagogy of design education typically revolves around the studio culture, and most students or recent graduates feel comfortable operating in the world of design. Unfortunately, there are fewer opportunities as a young architect to be directly involved in the process of community engagement and the valuable lessons that can be drawn from direct client interaction. Working with nonprofits can open up opportunities to architects of all experience levels to be exposed to these dynamics, and provide invaluable lessons that can be applied in all facets of the profession.

► See the backgrounder Independent Community Design Centers (4.4), and the backgrounder accompanying this article, Community Design Centers in Context, for related information.

Fortunately, there are a variety of ways in which an architect, intern, or student can pursue work in the nonprofit sector. One way is to seek out volunteer (or pro bono) work on behalf of clients. This interaction often takes place in collaborative settings with other volunteers. Another venue for engagement lies with Community Design Centers (CDCs) that may or may not have an academic affiliation. There are a variety of CDC models, but these locally based organizations work directly in the communities they serve.

► A backgrounder accompanying this article, Architects in Large Nonprofits, further discusses the opportunities for architects who work on staff for nonprofit organizations.

Still another opportunity is the path of architects who work directly for a not-for-profit organization in which they apply their problem-solving skills and design acumen directly for the organization.

Regardless of the direction one takes, working in the nonprofit sector can bolster skills, foster connections, and heighten one's awareness of the communities in which one works.

PRO BONO WORK

The term "pro bono" commonly refers to work that is done without an expectation of payment. The complete phrase is *pro bono publico*, which further clarifies the meaning of the work as "for the public good." Work that is done pro bono, then, is often thought to mean labor that is free, but it really defines an effort that is in the interest of the greater public or deserving of a cause.

In law and medicine, pro bono work is considered an important component of the profession, and many doctors and lawyers feel compelled to give back to society in meaningful ways. Countless people are in need of health care or legal representation, but they simply cannot afford those services. Pro bono efforts help to fill the void. For some practitioners in these fields, pro bono work is seen as an ethical imperative, and an essential component of their practice. So it is with architects.

The Benefits of Pro Bono Work

It is a sobering fact that as much as 90 percent of the population does not come in contact with architects, or may never even be able to afford their services. Increasingly, architecture firms both large and small are performing pro bono work to address this deficiency. While the volunteer work may not contribute to the firm's financial bottom line in the short term, inculcating an ethic of pro bono work into the culture of a practice provides other benefits that can pay dividends in the future. Compensation should not be viewed as strictly monetary. Substantial rewards are also garnered by developing the skill sets of younger architects, who frequently do not have an opportunity to interact directly with clients or present plans in public forums.

Different people enter the architecture profession for different reasons: the opportunity to combine artistic and technical skills, pursuing the desire to see ideas get built, or to lead others and make a positive impact on people's lives. Doing pro bono work provides a platform for applying these skills in a community context and an opportunity to engage clients in important work that would not otherwise materialize. Advancing design skills, cultivating leadership traits, and even giving space to altruistic ambitions can be fostered when working with organizations that lack the resources to hire firms, or that lack an awareness of the design process itself. In this way, working as an architect transcends the definition of a sole designer and embraces a broader definition as an architect who leads others.

Cultivating an ethic of pro bono work is contagious and rewarding for any size firm. Within the culture of a large office, it represents an opportunity to nurture leadership skills among younger professionals and to provide them with opportunities for growth. In the context of a small practice, it advances the reputation of the firm in the public's eye and empowers architects to take initiative in forming new relationships. Cultivating relationships is one of the most important skills when running a practice, regardless of scale, and devoting a portion of one's creative efforts to pro bono work can lead to unforeseen paid opportunities in the future. At its best, the work can provide a valuable service to the client and a platform to educate the public about what architects do and the value they bring to society. Pro bono work is also encouraged by the AIA Code of Ethics.

Pro bono work moves the learning environment away from the office or classroom and into the environment in which one lives. It mirrors the realities of practice and models the type of work one will be engaged with in the future. The sooner younger architects are exposed to this work and apply their skills, the more prepared they will be for success in the profession. Even for more experienced professionals, pro bono work fosters a stronger connection to the place in which they live. Undertaking volunteer work with both seasoned professionals and emerging architects together is often the best scenario, as mentoring occurs more naturally between the groups (from both ends of the spectrum) and in a setting outside the confines of the firm.

Ethical Standard 2.2 Public Interest Services: Members should render public interest professional services, including pro bono services, and encourage their employees to render such services. Pro bono services are those rendered without expecting compensation, including those rendered for indigent persons, after disasters, or in other emergencies.

—*AIA Code of Ethics and Professional Conduct*

While most pro bono efforts are informal agreements between parties, the AIA publishes a document (AIA Document B106™–2010, Standard Form of Agreement Between Owner and Architect for Pro Bono Services) specifically tailored to providing professional services in which the architect does not anticipate receiving financial compensation. This contract serves a number of purposes, not the least of which is to formalize an agreement between parties in what otherwise can be an informal arrangement. Signing a contract underscores the value of the services by itemizing the amount of time committed to the work and demonstrating the commitment of the client to the endeavor.

Despite the numerous advantages, working in a pro bono capacity can be fraught with potential pitfalls, and it is important to go into the work with a sense of how to negotiate the terrain. What type of organization are you working for? What evidence is there of their community connections? What is the scale of the impact to the community, and what do they really need? Does the organization have effective leadership, and what funding opportunities for the work are there? Evaluating these components of a pro bono project can help to filter out projects that may not be an ideal fit and can also serve as a barometer for potential success.

CASE STUDY 1: BRAINTREE ELECTRIC LIGHT DEPARTMENT/BROWNFIELD REHABILITATION, BRAINTREE, MASSACHUSETTS

The town of Braintree, Massachusetts, lies 10 miles south of Boston. The town needed assistance on negotiating a public process surrounding the potential redevelopment of an important former industrial property on a waterfront. The town was poised to acquire the site from the area's municipal electric light department. However, redevelopment efforts were stalled due to an acrimonious relationship with residents of the adjacent neighborhood, who were concerned about the impacts of new construction. The property remained vacant for nearly a generation due to differing opinions about what new uses should emerge.

The pro bono design team established an effective community planning process by first establishing themselves as an independent party. While they were initially contacted by the town, the volunteers were not seen as "hired guns." Community aspirations were identified in the initial public meeting with a second meeting offering precedents for consideration. A final meeting brought together a range of redevelopment scenarios that built from recommendations by the community. The alternatives spanned a range of building scales to initiate dialogue and debate. Residential, arts, and business incubator plans each included an open space component, generating some economic benefit to the site but also maintaining an appropriate amount of publicly accessible open space and access to the river.

After years of acrimonious debate, a consensus vision for the site has finally emerged that balances the needs for some economic development on the site with the community's aspirations for public access. Through an effective participatory process, there is now an alignment of goals between the surrounding residents and the town. By limiting the engagement to three well-advertised public meetings, momentum was created during the three months. The process concluded by recording the effort in a document that was widely distributed and endorsed. The property is now in the predevelopment phase, and the town has control of the property.

Be Aware of the Challenges

One misconception about pro bono work is that architects who do work in a volunteer capacity are siphoning work away from firms who would otherwise do the work for a fee. In reality, most pro bono work actually creates work for others that would otherwise never have materialized. Perceived roadblocks, a lack of vision, or an unclear idea about what is actually needed are frequently the reasons that stymie nonprofits or communities from even beginning to look for an architect. This is where pro bono work can be most effective—in unleashing projects from these constraints and developing a path to move forward. Identifying goals, establishing an effective process, building consensus, and forming relationships are all skills that are essential to any client-architect relationship, and these are the geographies where pro bono work is most often entrenched.

As the scale of the project increases, so too can the number of people influenced by the work. Planning within neighborhood settings usually takes place in the midst of multiple parties with competing agendas. Often, the most substantive part of pro bono work is the time it takes to negotiate conflict. It is important to assess the potential level of conflict at the beginning of the process, and strive to understand where tensions lie. Failure to do so can lead to time squandered and aggravate participants.

Finally, it is important to be aware of the erroneous perception that volunteer work is not of the same caliber as work that is paid. Simply because the effort does not involve financial compensation does not release participants from quality work. With this in mind, below are five things to consider and five potential pitfalls in pro bono work as an architect.

Five Do's

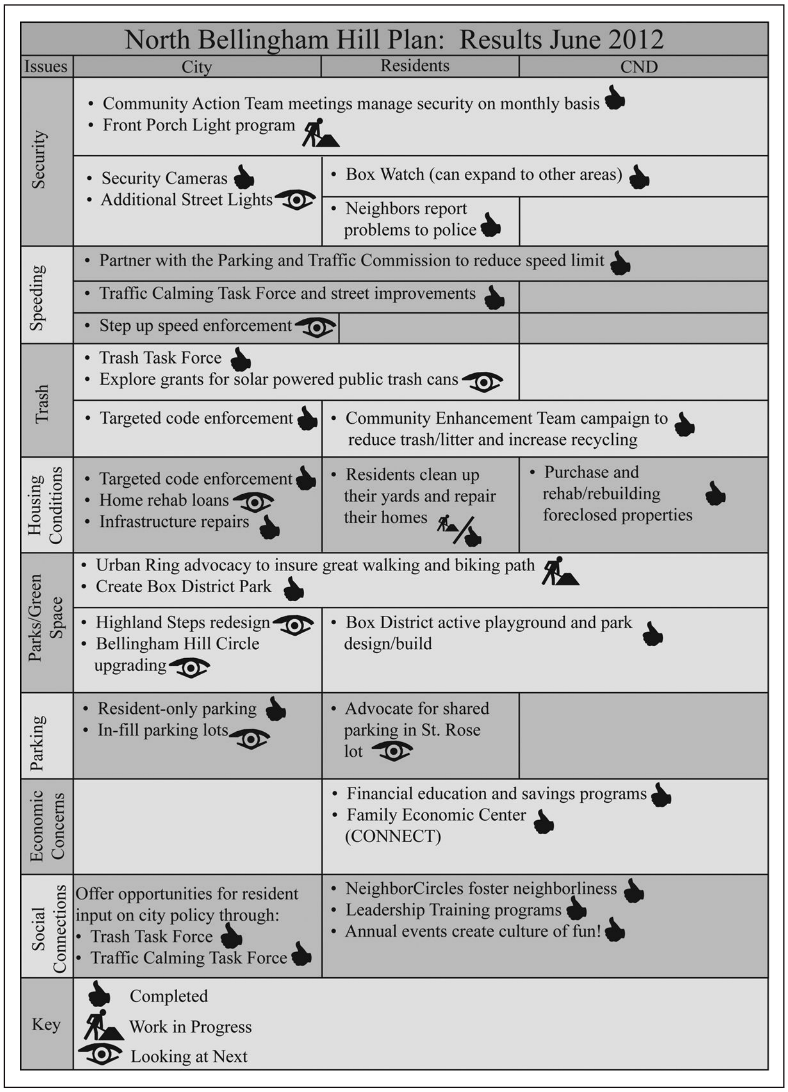
1. *Design the process.* Spend almost as much time designing the process as designing the project. A well-considered and intelligent method for engaging clients will build the confidence of the participants and provide for effective means of communication.
2. *Consider the effort as a relationship-building endeavor.* Assisting clients with an initial, short-term pro bono effort can lead to unanticipated possibilities for long-term paid work in the future. Even if it doesn't lead to new work, the engagement process will be good training for the cultivation of architect-client relationships.

CASE STUDY 2: CHELSEA NEIGHBORHOOD ACTION PLAN, CHELSEA, MASSACHUSETTS

The City of Chelsea, Massachusetts, and the nonprofit Chelsea Neighborhood Developers (now called The Neighborhood Developers) partnered together to significantly improve a distressed six-block area. The client sought to develop a plan for "transformative reconfiguration" of the dense neighborhood by taking advantage of the soft real estate market to begin implementation. Strategic demolition and housing rehabilitation, streetscape improvements, traffic calming, and public safety measures were most needed to help stabilize the neighborhood.

While ambitious designs for new streets and infill development were enticing to consider, what was most needed was a strong demonstration of community investment and recognition that the problems in the district were as much social as physical. The volunteer design team focused their efforts on near-term actions that could improve selected areas where traffic calming, safety, security, and redevelopment could take hold.

The community dialogue therefore involved close coordination of the department of public works, the city planning department, and the police department. The effort provided a forum for residents to identify the areas of greatest concern where limited resources would have the greatest effect (see Figure 4.7). The engagement began a process of regeneration from a distressed area into a healthy neighborhood by promoting affordable housing, establishing desirable public spaces, and fostering resident prosperity and leadership. Initial grants for new security cameras led to substantial local and state aid for new infrastructure investments and a community pocket-park that is serving as a catalyst for private development.



Community Design Resource Center, Boston

FIGURE 4.7 Evidence of Impact and Community Engagement Process

3. *Work hard for the client and demand excellence.* Simply because the project is not financially profitable in the way that a paid project is, that is no reason not to demand and expect excellence from both sides.
4. *Look for opportunities to enlist others in the endeavor.* While engaging more people requires more time devoted to management, having other designers involved will lighten the production load and enable synergies to emerge in the design process.
5. *Advocate and educate.* It is important to listen well, but also assert your position as someone who is trained to problem-solve, think creatively, and help to educate others about the benefits of good design.

Five Don'ts

1. *Don't overpromise.* Be realistic about what can be accomplished within the time constraints available, the number of participants, and the perceived commitment of the partners. As with any project, managing expectations is critical to success.
2. *Don't rely on jargon.* Like many professions, architects use their own language to convey meaning. This language can confound the general public and frequently distances the audience from understanding what is being said.
3. *Don't begin the work without a good understanding for what the client needs.* Strive to identify the key issues and the likely level of conflict before the engagement begins.
4. *Don't grandstand.* In a community-based setting, cultivate a dialogue with those in attendance and allow participants to share in the joy of creating. It builds capacity and ownership of the work.
5. *Don't allow the project to go on indefinitely.* Carve out time to work on the effort and stick to deadlines. Pro bono efforts need to adhere to deadlines as much as—or even more than—traditional projects. Resist the urge to be seduced by the indeterminate nature of the design process. Be decisive and keep to a time schedule.

CONCLUSION

There is an increasing desire by the emerging generation of design professionals and architects of all experience levels to be more actively involved in the shaping of their environment. Advances in technology have accelerated the possibilities for engagement and opened up new means for communication. Pro bono work provides a valuable platform to effectuate change. It helps emerging architects to develop client relationships and assists in honing design and planning skills. More important, however, as tomorrow's leaders seek to address the most pressing design challenges of the future, pro bono work not only results in a better architect but also a more enlightened and socially responsible individual.

BACKGROUNDER

COMMUNITY DESIGN CENTERS IN CONTEXT

Dan Pitera, FAIA, ACD

Community design centers relate closely to the context in which they practice. They are generally organized along two continuums based on engagement with the university and professional context and on research and project endeavors.

Dan Pitera is Executive Director of the Detroit Collaborative Design Center, University of Detroit Mercy School of Architecture.

A primary proposition for a Community Design Center (CDC) is to be specific and relevant to the context it engages. Each center determines where it will expand the practice with respect to people, programs, and geographies to make well-designed and thoughtful places. Since it is a requisite for CDCs to be specific and relevant to the contexts they engage, there is no single typical way they are organized. For a CDC, "typical" is a myth.

Community design centers are generally organized along two correlated continuums:

1. University-based centers and professional-based centers
2. Research-based centers and project-based centers

UNIVERSITY-BASED AND PROFESSIONAL-BASED CENTERS

Etymologically speaking, when someone operates in a professional context they are making a "public declaration." The history of the word *professor* means that one has something to "profess…lay claim to, declare openly." This pairing is meant to illustrate that the line between the academic and the professional is less than clear. Similarly, the distinction between professional and academic design centers is more complex than whether or not they are located within an academic institution. In many CDCs, lines between academic or professional labels are not distinct and are continuously shifting.

As an example, the Detroit Collaborative Design Center (DCDC) is an academic program within the University of Detroit Mercy School of Architecture. Though the DCDC is in an academic context, its organizational structure is essentially modeled after a year-round professional design office. It is not based on a semester system. It does not take summers off. It has a full-time professional staff of about 8 to 10 people with 1 to 2 students as full-time employees.

RESEARCH-BASED AND PROJECT-BASED CENTERS

When people conduct research, they "search closely"—they search and re-search again and again. Most CDCs participate in client-based design projects such as buildings, master plans, and/or landscape designs. Some conduct research on people, programs, and/or geographies. Some do both. This should not suggest that there is no research in design projects. Instead this distinction is directed toward the underlying focus of the work—actual projects designed and built within communities, or study (research) on those communities. One cannot happen without the other. They are distinct but interrelated. University-based centers often are hybrids resulting in unique research-based practices.

For example, since 2001, as part of its mission the DCDC, alongside community residents and artists, has coordinated and performed mercenary artistic/architectural installations within several burned houses throughout the city of Detroit. This project is titled "FireBreak: Architecture and Community Agitation."

FireBreak engenders the position that everyone—the next-door neighbor, the person down the street—can shape her or his physical world. The DCDC's research through these catalytic interventions and interferences has thrown the urban context, and one's power over it, into the public discourse through both event and word. Being in an academic environment gives the DCDC an advantage in that there is access to and emphasis on creative methods of research and project delivery, which are potentially more limited in a traditionally professional context. FireBreak is both intensely research- and project-based. It asserts that design is also a research activity, whether inside or outside of the academic environment. Being research-based is not about where the center is located but about how the center engages the process of investigation.

UNIVERSITY-BASED COMMUNITY DESIGN CENTERS

Teaching Hospitals for Architects

The DCDC has modeled itself after a teaching hospital—an operational "project-based" entity, which uses its "projects" for research and teaching. It is a place for learning by doing. Though they may have not explicitly articulated this position, many university-based design centers also can be seen as following the teaching hospital model. They are unique hybrids of professional work, applied research, and educational development. These design centers use diagnostic and analytical research accomplished through actual client-based projects. Design students work alongside design professionals, similar to how medical students work alongside doctors in a teaching hospital. Such CDCs are often independent departments within their schools. The professional staff members are full-time employees of the center, who may also teach part-time in the curriculum.

(continued)

The analogy of a teaching hospital can also bring perceived negative outcomes if projects and clients are seen as test subjects—or if the university is viewed as fulfilling a community service requirement. It is important for a center to define a methodology of community engagement in which mutual knowledge sharing is the core. This is distinct from community service that can imply a hierarchal working relationship with the design center at the top. When community stakeholders hear the word *service,* they may hear an underlying subtext that suggests they are incapable of defining and maintaining the direction of their neighborhood. Removing the notion of service from the process helps establish a meaningful engagement and partnership between the university and the community and mitigates the potential feeling within the community that they are the subjects of a scientific experiment. Neighborhood residents often use the phrase "lab rats," with hostility, when referring to the methods and means many universities use when working in their city.

Structural Relationship to the Academic Institution

The format and the relationship of the center to the university structure can vary. There are three general formats:

Some centers start in the studio environment and are limited to the time restrictions of a semester. They may use this structure to gauge the need for a more full-time and professionally staffed center. Some have found the studio format to be a unique and meaningful structure given their projects. For example, Lawrence Technological University's Detroit Studio is located off-campus and in the New Center neighborhood of Detroit. Every semester a studio of students tackles a new project or continues the prior studio's work.

There is the full-time center staffed with professionals and students, such as the Detroit Community Design Center. Another example is the Tulane City Center (TCC) at Tulane University. Born in the aftermath of Hurricane Katrina, the Tulane City Center is focused on New Orleans and is undergoing a transformation in its working model to adapt to the current community context.

A third model for CDCs develops around unique partnerships between a professional office and a university department. The bcWorkshop is a Dallas-based, independent, professionally based center that has engaged many of its projects through collaboration with the University of Texas at Arlington. It was not financially but instead pedagogically supported by the University.

CONCLUSION

Community design centers seek methods and procedures to expand the nature of practice to include more people, more projects, and more geographies in the process. They are advocates for people who are typically left out of design and place-making decisions. While many community design centers are connected to academic institutions, they vary as to their structural relationships and their engagement with research. Regardless, community design centers attempt to alter conventional ways of seeing and working. Rather than being alternative practices, they have the potential to fundamentally change the way design professionals work.

BACKGROUNDER

ARCHITECTS IN LARGE NONPROFITS

Susan A. Chin, FAIA

Many architects specialize in working with nonprofit clients, but only a small number of architects work on staff for nonprofit organizations. Working directly for a nonprofit, as an architect, can provide multiple perspectives that are unique to that environment.

Susan Chin is the vice president of planning & design and chief architect for the Wildlife Conservation Society. Chin is a licensed New York State architect and heads the renowned Exhibitions and Graphic Arts Department (EGAD), notable for its many innovations in the field of zoo design.

ABOUT THE ORGANIZATION

The Wildlife Conservation Society (WCS) is committed to protecting wildlife and wild places around the world. This is accomplished through over 300 conservation projects in more than 50 countries and by inspiring the next generation of environmental stewards at four zoos and one aquarium in New York City.

WCS is a 501(c)(3) nonprofit that operates the Bronx Zoo, New York Aquarium, Central Park Zoo, Queens Zoo, and Prospect Park Zoo, which are all on New York City Parks land. Approximately 15 percent of its operating budget is funded by New York City. The balance is provided through private funding and earned revenue. The capital program is funded through a combination of public and private funds.

The Exhibitions and Graphic Arts Department (EGAD) is the in-house design group of the WCS. EGAD designs innovative exhibit experiences that inspire guests to care about wildlife and wild places and connect them to conservation through innovative programs and animal experiences. The EGAD team combines the disciplines of architecture, landscape design, exhibit design, graphic design, and interpretive programming to produce effective results in guest experience and informal science learning. As the director of EGAD, my role involves providing design leadership and coordination of an integrated process of design and construction in collaboration with all stakeholders.

DIFFERENCES FROM TRADITIONAL ARCHITECTURE FIRM PRACTICE

A leader of a design group within a large nonprofit organization that is continually involved in capital improvement initiatives involves playing multiple roles. Many of these are similar to a senior principal in a traditional architecture firm, and there are also similarities to architects who work in the public sector. However, there are distinct differences, summarized below:

- As the representative of a nonprofit owner, it is critical to have a comprehensive organizational perspective that integrates the needs of the mission and brand-driven design.
- The majority of WCS capital projects are funded in part by New York City and occur on New York City–owned land. Similar to other nonprofits that receive public funding, there is continual engagement with public sector agencies on multiple levels.
- There are likely to be many diverse stakeholders that must collaborate in the design and construction process, including, in the case of WCS, animal departments, education, operations, finance, construction, global conservation programs, and senior administration.
- Senior leadership represents the organization to the public and interacts with the Board of Trustees, donors, and other external constituents, including government and funding agencies.

In addition, for an organization such as WCS, the annual capital program is developed across the organization with input from multiple stakeholders. Projects are measured against need, guest experience, mission, and business plans. Once approved, the capital plan is continuously managed and rebalanced as necessary throughout the year.

Many professionals are attracted to the mission of nonprofit work and the potential for gaining diverse and valuable experience, particularly as they start out their careers. However, the realities of compensation in a nonprofit can affect staff retention. In addition, developing specialized design and construction knowledge requires constant investment in training.

Nonprofit architects are usually working in an environment that exposes them to other fields and professional areas. However, it is sometimes insulated from the normal architectural environment. Keeping a connection to the profession is vital to stay current on technical information, materials, and design. When outside of traditional practice, a concerted effort is required to attend events, read about the industry, and keep a strong network of contacts in multiple professional arenas. For instance, at WCS, architects will maintain contacts with those in similar roles in zoos and aquariums around the world, those in similar cultural organizations in New York City, and fellow architects at the local AIA chapter.

BENEFITS

There are many benefits to working in a nonprofit environment. The obvious one is being paid to work for a cause with personal meaning. Although salaries are not at the high end of the spectrum for the field, there are many aspects to nonmonetary compensation.

For many, working in the nonprofit sector can accelerate learning in some areas and provide the ability to gain diverse experience. There are opportunities to be involved in all phases of design, client management, budgeting, estimating, and consultant management. In addition, there is the opportunity to collaborate with architects, designers, and construction managers—constantly being exposed to and learning from a diverse number of professionals in the field.

Nonprofit employees generally share the mission goals and inherently similar interests, resulting in a motivated, committed, and passionate staff. There is the ability to interact with professionals from fields that may not be directly connected to architecture or design. At WCS, there are opportunities to work with a diverse group of people—curators, scientists, fundraisers, educators—and, of course, other species. Collaborating on a marketing plan, financial plan, and fund-raising strategy as well as design of a project creates a unique leadership perspective that can inform design process and mission advancement.

Nonprofits are a fertile environment for emerging professionals. Many staff members gain valuable experience that enables them to go on to work at for-profit design firms, other museums and cultural institutions, and even to become zoo, aquarium, or museum directors.

One of the greatest benefits of work in the nonprofit sector is a personal connection to the mission of the organization. While most architects forge a long-term connection to their projects, in a nonprofit context one can appreciate the aggregated accomplishment toward a mission goal as projects are completed. There are many important rewards for success—salary, recognition, happy clients—but it is difficult to quantify the personal satisfaction and sense of fulfillment that comes with the understanding that your work contributes to your community or has a direct impact on a cause that you care about.

4.4 Public Service and Community Involvement

Jess Zimbabwe, AIA, AICP, LEED AP

This article offers an overview of ways that architects have committed themselves to the public interest. From casual volunteering to full-time community design advocacy, from providing technical expertise on a planning commission to running for elected office, thousands of architects across the United States have used their professional capabilities to improve their communities.

THE ARCHITECT'S ROLE IN COMMUNITY AT LARGE

We engage the problems and issues that people care about. We believe in the transformative power of design.

—from the mission statement of the Architecture + Civic Engagement Center of the School of Architecture at Woodbury University

In 1968, when Whitney Young Jr. spoke before the annual convention of the American Institute of Architects in Portland, Oregon, he excoriated the profession for doing too little to engage with the crises that American cities were facing at that time: "As a profession, you are not a profession that has distinguished itself by your social and civic contributions to the cause of civil rights, and I am sure this has not come to you as any shock. You are most distinguished by your thunderous silence and your complete irrelevance."

In the years since, architects and their professional organizations have come a long way, creating dozens of community design centers that serve needs of nonprofit organizations and underserved communities across the country, but the fact remains that, within the larger profession of architecture, public interest design is still a somewhat marginalized mode of service delivery. In 1996, the seminal Carnegie Foundation report on the state of architectural education concluded that "schools of architecture could do more…to instill in students a commitment to lives of engagement and service."

▶ For related discussions of the community design movement, see Community Design Centers in Context (4.3) as well as the backgrounder accompanying this article, Independent Community Design Centers.

Since the end of the last century, there has been a debate about whether a new, broad consciousness of public interests is emerging in architecture and the related design professions. The community design movement has been active in the United States since at least the late 1960s. In contrast to a Hollywood trope of portraying architects as heroes of abstract design ideas, the community design movement focused on delivering a useful service to under-invested communities.

Based on several lessons from successes and failures of the community design movement, several new models of a broader field called public interest design have emerged in recent years. Projects and programs that are explicitly devoted to serving the public have emerged from the underfunded shadows to be promoted in mainstream design media with funding through grants and corporate and individual gifts. Sharon Haar, an architecture professor at the University of Illinois at Chicago who is writing a book about this subject, estimates that about 250 nonprofit architecture firms, advocacy organizations, and design centers have been launched since the early 1960s. While many of the organizations founded in the 1960s and 1970s no longer exist, there are currently about 100 in operation—many launched within the last decade—demonstrating a renewed interest in this work. These architects are directly addressing architecture's relevance in the face of local and global shifts in the world climate, economy, and building industries and seek to define a new utility for the architectural skill set and sensibility.

Jess Zimbabwe is executive director of the Daniel Rose Center for Public Leadership at the Urban Land Institute. She is an architect and planner with substantial community design and nonprofit experience focused on the public impacts of design, planning, and development.

THE AIA'S DEFINITION OF A CIVIC ARCHITECT

- Uses her/his insights, talents, training, and experience to contribute meaningfully, beyond self, to the improvement of the community and human condition
- Stays informed on local, state, and federal issues, and makes time for service to the community
- Advocates for higher living standards, the creation of a sustainable environment, quality of life, and the greater good
- Seeks to advocate for the broader purposes of architecture through civic activism, writing and publishing, by gaining appointment to boards and commissions, and through elective office at all levels of government

—From the "Citizen Architect Resolution" adopted by the AIA Board of Directors on December 5, 2008

CIVICLAB, A PROJECT OF AIA BALTIMORE

To encourage its members to take on leadership roles in their community, the AIA Baltimore component developed a program called CivicLAB (**L**eadership. **A**rchitecture. **B**altimore). CivicLAB participants are emerging professionals (Associate AIA members or those who have been licensed less than 10 years) with an active history of involvement with one or more community organizations. During interactive monthly evening sessions over dinner, participants learn from architects who have held a wide variety of leadership positions. The course is broken into four distinct units:

- Citizen Lobbying
- Economic Benefit
- The Art and Practice of Urban Design
- Sustainability, Smart Growth, and Preservation

The founders and leaders of CivicLAB recognize the importance of developing younger professionals in the field to leverage their architectural skills, training, and expertise in the broader community. Klaus Philipsen, FAIA, who coordinates the Sustainability, Smart Growth, and Preservation unit of the course, states, "We can only remain successful if we foster and support new talent."

CIVIC AND COMMUNITY ENGAGEMENT: DESIGN

Citizen Engagement

Architects regularly present their ideas in front of community stakeholder groups. Since the Model Cities program of the Lyndon Johnson administration first dictated that urban redevelopment projects should include the "maximum feasible participation," residents of wealthy and poor neighborhoods alike have been given a role in determining the future of their environment. Civically inclined architects realize that their role in the stakeholder engagement process does not begin with a single community meeting or end with simply listening to public demands. Through more extensive models of engagement such as community charrettes or serial public meetings, architects engage citizens in longer-term and more meaningful ways. Increasingly, architects are looking to develop their skill sets at charrette and meeting facilitation and other, deeper methods of stakeholder engagement.

Design is not the icing on the cake but what makes architecture out of buildings and the places we want to live and eat and shop rather than avoid.

—Alexandra Lange, Writing About Architecture

Though citizens can have a voice in a public hearing, their input is usually quite passive and their opinion often lacks real power. Through more interactive workshops and charrettes, architects and their sponsors can provide a more satisfying and effective experience for stakeholders. In such a setting, participants express their concerns, but they also get involved in exercises where the purpose is to reconcile a variety of competing interests, so they come to appreciate the importance of consensus and the need for compromise. At their best, such workshops can defuse controversy and help build a constituency for projects.

▶ Architects in the Nonprofit Sector (4.3) further discusses opportunities for civic engagement.

CASE STUDY: R/UDAT (2009) DOWNTOWN AND COMMUNITY REVITALIZATION, NEWPORT, VERMONT

In March 2009, an AIA R/UDAT team visited the community of Newport, Vermont. The community invited the R/UDAT team to explore key opportunities and issues facing the city. It was the 143rd R/UDAT in the nation, but the first in the state of Vermont. In typical R/UDAT form, the team of seven architects, planners, and designers toured the city and spoke with community residents, business owners, and other stakeholders. James Logan Abell, FAIA, an architect from Tempe, Arizona, led the group. Following their community engagement, site tours, and two and a half days of deliberation, the R/UDAT team made a final presentation to a 200-person audience in the community and issued a formal report with their key findings.

In March 2011, the City of Newport contacted AIA to indicate their interest in a follow-up visit to evaluate progress to date on key priorities identified by the team in 2009. The R/UDAT Team found that Newport has made remarkable progress in its first two years of implementation. They observed that much of the earlier public conversation was colored by nostalgia. R/UDAT participants lamented the state of the city, and focused on the issues and constraints facing the community. As the team wrote then, "Civic pride is an issue for Newport city residents. While citizens' sense of attachment to the community is strong, there is a prevailing narrative of decline among many residents…the team heard a repeated chorus which described the city's glory days in the past tense, and expressed nostalgia for days when the city was more vibrant and dynamic." The R/UDAT team found in 2011 that Newport was a "community on a mission." The deep engagement of the first R/UDAT endeavor completely reshaped thinking about the community in Newport.

Sometimes architects conduct this kind of community engagement even outside of the context of their own projects. One such example of this is the AIA's Regional Design and Urban Assistance Teams (R/UDAT). Since 1967, the AIA has run the R/UDAT (pronounced ROO–dat) program, a results-driven community design program based on the principles of interdisciplinary solutions, objectivity, and public participation. The program combines local resources with the expertise of a multidisciplinary team of nationally recognized professionals who volunteer their time to identify ways to encourage desirable change in a community. The team visits the community for four intense, productive days, and team members return within the year to advise on implementation strategies. The process is fast-paced, exciting, and energizing. This approach addresses social, economic, political, and physical issues. Stakeholders must come together and agree on a set of goals for the project in order to complete the application, so the program offers communities a tool that fosters new levels of cooperation. The R/UDAT program has used this grassroots approach across the nation to help create communities that are healthy, safe, and livable, as well as more sustainable.

The R/UDAT program is a good example of a perhaps unexpected lesson from several national design assistance programs: Programs like R/UDAT that bring volunteer architects and other experts from outside the community allow those professionals to give their expert advice with more candor than they sometimes can in their own communities. Since they aren't personally vested in the project or community, their creative participation is freed from typical political or economic constraints commonly found with fee-for-service projects.

Design Review Commissions and Boards

Design review boards or commissions are independent commissions charged with upholding design guidelines and reviewing the design components of development proposals. Communities generally establish volunteer boards consisting of residents who comprise a mix of design professionals (architects, landscape architects, engineers, or historians) and committed laypeople. In addition to their project experience, architects are especially useful to communities because of their analytical capabilities, technical experience, and aesthetic sensibilities.

Depending on the process established by the community, design review boards may conduct advisory or legal reviews of development applications. Many communities have advisory design review boards that meet with developers early in the site design process, prior to submission of a formal application. In this capacity, design review boards can react to concept plans and offer suggestions and recommendations that ultimately influence the final site plan submitted with a development application.

Public Design Education

AIA components and other design-related entities around the country have recently dramatically expanded their efforts in design education for the public at large. Pioneered by the Chicago Architectural Foundation with its long tradition of docent-led architectural tours of the city, several organizations have opened new exhibition and programming centers dedicated to delivering design programming beyond just the profession. With inviting storefront spaces, the BSA Space (Boston Society of Architects), Urban Center (San Francisco Planning and Urban Research Association), the Center for Architecture (AIA New York), and several others like them work to reach out to the general public and educate them about the value of design through exhibitions, lectures, tours, K–12 educational workshops, and festivals or special events.

Some programs are directly focused on building a better and broader clientele for architects. For example, several AIA chapters offer workshops on how to choose and work with an architect that are geared toward small projects or homeowners who might otherwise choose contractor-led design. But most of the programs developed for the public at large also emphasize principles of design like environmental sustainability, the health impacts of good design, and aesthetic sensibilities. The best architectural design competitions are also used to inform and engage interested citizens and raise awareness of the relationship between design and vital communities.

The Mayors' Institute on City Design is another long-standing program that serves to educate leaders outside the design profession. The program is currently operated as a partnership between the National Endowment for the Arts and the American Architectural Foundation. Since 1986, it has helped mayors better understand their role as chief urban designers of their cities. Each year, dozens of design professionals volunteer their time to serve on resource teams to work with mayors in small group settings to tackle major urban design projects in the mayors' home communities.

CIVIC AND COMMUNITY ENGAGEMENT: LAND USE POLICY, ZONING, AND BUILDING CODES

Planning and Zoning Commissions

Many architects serve their communities as members of local planning commissions. In this role, they assist the city or town with the review of planning and development projects, to facilitate conformance with zoning requirements and the master plan. These commissions also regularly review and update master plans, zoning ordinances, and specific or neighborhood plans. Having one or more members with an architectural background helps the commission understand how the project will affect the community's form, how users and passersby will interact with the development, and how the structure will affect the broader built and natural environments. An architect who can understand and visually communicate the three-dimensional aspects of the proposed design can improve land use planning efforts. Architects who serve in roles like Planning Commissioner usually develop their abilities to work with politicians, developers, and community groups more effectively; they understand the forces that shape the city.

Too often, designers bemoan the lack of voice we have in what we can or cannot do in a particular municipality. Rather than despair, we must ensure our place within the process. That's been my approach, and I like to think that I'm making a difference.

—Antoine Bryant, NOMA, Assoc. AIA

▶ See Planning, Urban Design, and the Regulatory Environment (13.2) for related information.

Architects on these boards and commissions often find their support sought by both opponents and proponents of development projects. Community advocates who oppose or push for changes to proposed products see architects as valuable trained professionals who aren't simply representing downtown business interests and are instead basing their decisions on technical information and professional judgment that includes consideration of historic resources, neighborhood context, and environmental impacts. At the same time, since architects earn their living in the construction industry, they have an understanding of what it takes to finance and build complex projects, so developers often value their insights in a board or commission's discussion. The elected officials who are usually charged with nominating and confirming members of these boards and commissions often seek out architects to play this dual role. Houston Mayor Annise Parker appointed Antoine Bryant, NOMA, Assoc. AIA, to the Planning Commission in 2011. In addition to recognizing the opportunity to turn his architectural training into implemented design and policy, Bryant sees his role on the Commission as an opportunity to educate his professional colleagues about improving the public realm.

Building Code Development and Review

Building codes and generally accepted practices largely define the acceptable standards of practice and technique for the design, construction, and performance of buildings as a whole. Model building codes and voluntary standards are often developed by groups or committees representing manufacturers, government agencies, contractors, and other building community sectors. Upon adoption by governmental authorities having jurisdiction, these model codes and voluntary standards become laws and regulations. The architecture profession possesses special knowledge that should be applied to the formulation of building codes and standards.

Fundamentally, building codes are an expression of acceptable means and technology to meet prescribed needs at a point in time. Over time, alternative means and advanced technologies must be considered or the building code can needlessly constrain technological advances and stifle other, more suitable alternatives and practices. By incorporating architects' knowledge and experience in the code development process, code interpretation and enforcement practices of a jurisdiction can be significantly improved. It is through open code development processes that new technologies are fairly evaluated, recognized, and more rapidly implemented. Equally important, by involvement in the model building code development process and the code adoption process, architects have the ability to see that building codes do not impose inappropriate responsibilities on architects.

CIVIC AND COMMUNITY ENGAGEMENT: ECONOMIC DEVELOPMENT

The lesson is to listen and engage. In an economy built to last, everybody needs to get a shot and do their fair share.

—Shaun Donovan, U.S. Secretary of Housing and Urban Development, address to the AIA Convention in Washington, D.C., May 18, 2012

Jim Determan, AIA, testified before Congress in 2010 and told lawmakers how the credit crunch in late 2008 contributed to the demise of his previous firm, CSD Architects. As lenders broadly refused credit to the design and construction industry, many CSD projects came to a halt. In Determan's case, he and his partners were left with no choice but to close their 60-year-old Baltimore firm that had successfully weathered previous recessions. As a result, more than 100 people—many of whom had been with the firm for more than 30 years—lost their jobs. This experience led Determan to a heightened awareness of the role that architects play in a community, regional, or national economy: "The pendulum has swung so far in the direction of restricted credit that even worthy, well-secured projects by clients with impeccable credentials and proven track records are being denied access to financing," he testified. Determan works with other architects to help them present the business case for design to elected leaders and decision makers: "If they understand that good design is good business, elected officials, media, and corporate leaders become allies," he says.

When the newly elected mayor of Kansas City called for nominations for new members of several city boards and commissions, the local AIA chapter actively solicited and promoted applications from its members. Ashley Wood of Architecture, Engineering, Consulting, Operations, and Maintenance Technology Corporation (AECOM) sought and received an appointment to the Planned Industrial Expansion Authority (PIEA) under the Economic Development Corporation, where she and her colleagues work to foster commercial and industrial development in specifically designated redevelopment areas. Wood explains that her architectural background helps her to consider aspects of the built environment that are often overlooked (or perhaps not fully understood) by others on the commission. Her technical expertise is specifically useful when the Commission reviews blight studies, the first step in designating an area for redevelopment under the PIEA's purview. Wood's architectural training allows her to question the proposals that developers are putting forward. "It's important to not act simply as a rubber stamp for the professionals who are introducing these development proposals, and my background affords me the opportunity to really understand the information being presented," she says.

CIVIC AND COMMUNITY ENGAGEMENT: BROAD SUSTAINABILITY

The most apparent success of the movement for a sustainable built environment has been led since 2000 by the U.S. Green Building Council (USGBC) and its highly visible Leadership in Energy and Environmental Design (LEED) rating systems. Hundreds of architects were among those involved in the technical development and review of these systems, and many more architects have used the systems or received training in the LEED system. Beyond the purview of most LEED tools, though, lies an emerging field of practice in broader sustainable urbanism beyond the individual building scale. (The USGBC's LEED for Neighborhood Development system addresses this scale.) Because this realm extends beyond the building, it may not seem like the obvious domain of the architect, but thousands of them are in hundreds of communities around the country. With urgency created by fear of the rising price and diminishing availability of fossil fuels, the consequences of carbon emissions, and the future availability of water resources, communities are rapidly ramping up their efforts toward sustainable development.

Ophelia Wilkins was at the center of this effort in Durango, Colorado, during her years as an Enterprise Rose Architectural Fellow. She served on the Steering Committee for the La Plata Climate and Energy Action Plan (CEAP), a report that proposes strategies for reducing greenhouse gas (GHG) emissions throughout La Plata County. The report was indirectly commissioned by three local government entities, and the Steering Committee was tasked first and foremost with the creation of a countywide GHG reduction plan. Between 2009 and 2011, local professional volunteers committed over 10,000 volunteer hours to the Plan, bringing their specialized expertise in energy efficiency. Wilkins co-chaired the working group on Residential, Commercial, and Industrial Buildings while practicing as an architectural designer specializing in affordable energy-efficient construction. She was able to draw on her knowledge of energy efficiency standards and building techniques as well as her extensive professional network of local green building experts to propose substantive emissions reducing strategies. Though the Plan has subsequently encountered political obstacles, the widespread community outreach effort has created a high level of citizen discourse and demand for more efficient practices.

It was a rewarding opportunity to think big and practical, while getting out into the community and collaborating to craft a shared philosophy.

—Ophelia Wilkins

▶ The backgrounder Resilient Design (4.2) covers ways in which buildings and communities can maintain safe, livable conditions in the aftermath of a disaster.

The AIA's Sustainable Design Assistance Team (SDAT) program is an excellent example of architects putting their unique skills into practice to assist communities with the principles of sustainability. SDATs bring teams of volunteer professionals (such as architects, urban designers, landscape architects, planners, hydrologists, economists, attorneys, and others) to work with community decision makers and stakeholders to help them develop a vision and framework for a sustainable future. The SDAT program is based on the AIA's goal of helping communities create a sustainable relationship between humans, the natural environment, and place.

In May 2007, the AIA joined the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), Architecture 2030, the Illuminating Engineering Society of North America (IESNA), and the U.S. Green Building Council (USGBC), supported by representatives of the U.S. Department of Energy, to agree to establish a common starting point (benchmark) and a goal of net zero energy buildings. Edward Mazria, AIA, founded Architecture 2030 and issued the 2030 Challenge, asking the global architecture and building community to commit to significant reductions in reducing fossil fuel consumption and greenhouse gas emissions. Many individual architects and AIA components have engaged with the 2030 Challenge since then.

LEADERSHIP, POLICY, AND POLITICAL OFFICE

Elected Office

As discussed in the previous section, architects regularly build consensus to resolve environmental, traffic, and design issues with boards, clients, community groups, and city and state agencies. They are intimately familiar with building codes, land use ordinances, the management of complex construction projects, and principles of growth management, urban planning, historic preservation, and environmental impacts. Sometimes, architects consider the very public role of problem solver that can come with the profession, and ask themselves whether they should run for office—giving them a chance to do these same activities in a proactive way, rather than reacting to a client's program. The architects who have made the decision to run for office in their city, town, state, or even U.S. Congress or the Senate have realized that they have already been providing much of the leadership in shaping physical communities. With billions of dollars of investment in new public works projects, there is much at stake even in local elected offices.

Public Service Employment

Many architects devote years of their career to public service through employment at government agencies with a specialty in the planning, design, construction, and management of public facilities. These architects, who often have professional titles like "capital projects director" or "facilities manager," advocate for quality design and sustainable built outcomes in the projects that they manage. They work across large, complex public agencies to build consensus, balance competing demands, and provide strategic guidance and support to public officials on matters relating to planning, urban design, and architecture. They may also develop best practices to create better and more sustainable urban environments and buildings.

Architects who work in government formed an AIA committee for service in the 1950s, even though at that time only a few dozen state architects were serving in public roles throughout the country. In the 1980s the committee was reorganized into a Knowledge Community and renamed "Public Architects" to broaden its membership appeal to include architects working for federal agencies, states, cities, the military, school districts, and public universities, utilities, and transportation agencies. The committee meets regularly to discuss ways to foster design excellence with government clients, as well as how to effectively manage public dollars that pay for design and construction projects.

CASE STUDY: PRISON ALTERNATIVES INITIATIVE

Originally launched in 2004 as the Prison Design Boycott, the Prison Alternatives Initiative is a project of the nonprofit Architects, Designers and Planners for Social Responsibility. The Initiative calls on architects, other design professionals, and the public to support community-based alternatives to incarceration. Since launching in 2004, the campaign has secured over 1,000 endorsers to its pledge:

> I believe that too many people are being incarcerated and that our society must immediately develop and implement alternatives to incarceration. I believe in creating a society with real security and social justice for all, and I will not contribute my design to the perpetuation of wrongful institutions that abuse others. In recognition of the deep injustice of the present prison system, I pledge not to do any work that furthers the construction of prisons or jails.

Raphael Sperry, Director of the Campaign, is commonly asked whether the boycott will actually work (i.e., "Won't there always be architects who are not opposed to prisons, or who are willing to set aside their ethical objections at the right price?"). He responds:

> Probably not all architects will agree to boycott designing prisons. But that does not make our protest useless. Boycotts and other forms of protest work in many ways simultaneously—it did not take anywhere near full participation for the boycott of investment in South Africa to add substantial pressure to end apartheid, nor did Cesar Chavez's boycott of California grapes need full participation to make the treatment of farmworkers a national issue. Even absent the ability to directly impede prison projects, the pledges of design professionals to refuse to work on prisons will help to raise awareness of the problems inherent in the prison system. This boycott is a powerful tool with which to change public perceptions of the prison system, and thereby change the willingness of government decision makers to build new prisons.

CONCLUSION

As professionals, architects are trained to coordinate many disciplines and solve problems holistically and in context. But even for a profession that prides itself on being generalist, truly integrated problem-solving through design thinking often requires architects to move out of their comfort zone and into arenas that are sometimes dismissed as adjacent or outside the traditional field of training for architects: community engagement, lobbying and advocacy, and policy design and implementation.

As the case studies in this article demonstrate, these skills are not only essential for progress in our society but are also increasingly necessary for advancement in our industry. Architects who volunteer their personal time, serve professionally in a pro bono manner, or commit to full-time public service roles also have a unique perspective on the profession itself. Many architects who have served on their communities' planning commissions, for example, lament the uninspired and unhelpful presentations on proposed developments that their peers in the design professions deliver to public audiences. Professional practice without an eye toward public needs diminishes the credibility and accessibility of the profession.

The vast number of public and private construction projects being planned will profoundly affect the fabric of our communities for generations to come. There is no better time for the civic engagement of architects and design professionals. Indeed, there is a critical need for civic leadership, constructive criticism, visioning, and direction that only architects and design professionals can provide.

BACKGROUNDER

INDEPENDENT COMMUNITY DESIGN CENTERS

Ceara O'Leary

This essay focuses on the primary characteristics particular to independent community design centers, focusing on the role of the architect practitioner in public interest design. Examples from the Gulf Coast Community Design Center in Biloxi, Mississippi, and buildingcommunity WORKSHOP in Dallas help illustrate the work of community design centers.

Ceara O'Leary is an Enterprise Rose Architectural Fellow at the Detroit Collaborative Design Center. Before joining the fellowship, O'Leary was the inaugural Public Design Intern at the Gulf Coast Community Design Studio in Biloxi, Mississippi, and worked as a community designer at bcWORKSHOP in Brownsville, Texas.

Independent community design centers are a central model for public interest design practice, in addition to university-based design centers and pro bono practices—both of which are detailed elsewhere in this chapter. Since the 1960s, independent community design centers have been defining a sustainable public interest design practice that is not dependent on university support or internal subsidy. Instead, independent design centers subsist on an alternate funding model focused on third-party investment, in addition to more traditional fees for service. External support most often comes in the form of grants from foundations and other philanthropic organizations, government initiatives, or strategic partnerships. An indicator of the sector's traction, there are a number of foundations that specifically support community-based design endeavors. Government funding supports projects and research related to disaster recovery and prevention, addressing hurricane conditions or extreme neighborhood disinvestment. Independent community design centers often secure project-specific funding as well as more flexible support for operational and ongoing project needs.

The collaborative design process is central to community-based design and has been since its inception. Accordingly, effective partnerships are imperative to today's public interest design practice. Two community design centers that exemplify this type of practice are the Gulf Coast Community Design Studio in Biloxi, Mississipp, and buildingcommunity WORKSHOP in Dallas.

GULF COAST COMMUNITY DESIGN STUDIO (GCCDS)

Although the GCCDS is a university-based endeavor, with administrative and faculty support from Mississippi State University, the office—founded in the wake of Hurricane Katrina—operates largely independently. As such, GCCDS funds projects and forms partnerships as an independent community design center.

For independent community design centers, partnering for funding opportunities and government support is key. However, the most critical collaboration is with the community that the practice seeks to serve, also known broadly as the client. David Perkes, AIA, the founding director of the GCCDS, was strategic on both counts. When the GCCDS first set up shop in Biloxi in the year following Hurricane Katrina, Perkes and his team joined a community struggling to recover. The office attended weekly meetings organized by city councilman Bill Stallworth that focused on meeting the needs of East Biloxi, the poorest and most devastated Biloxi neighborhood. It became clear that an inventory of properties was essential to the effort, so the GCCDS went to work mapping the peninsula, surveying the conditions of each parcel. By contributing to this larger partnership and responding to immediate needs, the GCCDS earned the trust of the community and established lasting relationships that fostered the subsequent success of the office. At the governmental end of the spectrum, the GCCDS found an important ally in the Mississippi Development Authority, which required that federal funding for rebuilding post-Katrina homes include design services. This arrangement resulted in robust partnerships with affordable housing developers across the Mississippi Gulf Coast over the next few years. Today the GCCDS boasts a greater variety of funding sources and a broader scope of work, ranging from government support for flood-proof construction research to an environmental foundation investment for bayou restoration projects.

buildingcommunityWORKSHOP (bcWORKSHOP)

Early on, the GCCDS formed strong partnerships with other professionals and nonprofits in the area, in addition to developers and builders. The same can be said for bcWORKSHOP in Dallas, founded by Brent Brown, AIA, in 2005. Now operating out of three offices in Texas, bcWORKSHOP is an independent nonprofit organization. In 2011, bcWORKSHOP established a new office in the Lower Rio Grande Valley, embarking on projects that respond to the specific needs of the border region. Importantly, these projects are grounded and informed by strong local partnerships. A community planning effort in several flood-prone *colonias*—severely underserved neighborhoods developed in a predatory manner—was made possible through collaboration with four distinct community organizing groups with deep roots in the local community. Through this partnership, architects, planners, and organizers collaborated with community members to develop plans for future improvements. Additionally, this collaborative effort spurred an ongoing partnership with CDC Brownsville, a highly effective community development corporation. This collaboration has resulted in an array of additional community-based projects and contributed to bcWORKSHOP successfully planting new roots in the Lower Rio Grande Valley.

Ideally, all models for public interest design are based on building relationships and trust within the community and partnering with community stakeholders. Independent community design centers strive to ensure ongoing investment in a more inclusive and collaborative design process. Importantly, this partner-based model of practice alters conventional project delivery, with an emphasis on building partnerships and forming collaborative agreements.

EXPANDED SERVICES

Alternative project delivery further speaks to an expanded scope of services for the public interest designer. For the GCCDS and bcWORKSHOP, as well as other independent community design centers, the average scope of services is quite broad. Technical assistance includes architecture and planning, as well as mapping and visioning. Both offices embrace research, community education, and intern training. They also dedicate significant resources and attention to outreach efforts and community engagement. By nature, public interest design is larger in scope than conventional practice, encompassing social, economic, and environmental concerns and espousing projects that are relevant to the general public rather than the interests of an individual client. Thus, public design seeks to serve a broad population and include stakeholders that are often overlooked in typical design practice. As such, the architect serves as an advocate on behalf of underserved communities.

In public interest design, the design professional plays an important leadership role, facilitating public participation, pursuing complementary expertise, and harnessing financial support. The architect also plays a new role in acquiring projects, a process often closely aligned with identifying community needs. While community-based organizations may seek out design professionals for assistance, public interest design professionals also reach out to stakeholders in communities where design-related needs are apparent and collaborate to better define such needs. Effective public design practices work in partnership with local communities and endeavor to establish lasting relationships. Collaboration is particularly important since design-related needs often require ongoing commitment as well as trust among partners.

CONCLUSION

Independent community design centers contribute to a larger field of public interest design practice that is united by a commitment to responding to local community needs and providing design services where there are none. The GCCDS and bcWORKSHOP illustrate the use of interdisciplinary collaborative solutions to identify and solve design challenges. Independent community design centers are unique in their public mission and organizational support, combining earned income with government and philanthropic funding to meet community needs. As the new wave of public interest design gains momentum, additional government and foundation support is essential. Regardless of how public interest practice takes shape, a more mainstream presence will make for a more effective and inclusive trajectory for the field of architecture at large.

BACKGROUNDER

THE AMERICAN INSTITUTE OF ARCHITECTURE STUDENTS FREEDOM BY DESIGN

Matthew A. Barstow, Assoc. AIA

AIAS Freedom by Design is the primary service program of the American Institute of Architecture Students. The program organizes teams of students from its chapters around the country to retrofit homes for people with disabilities.

Matthew A. Barstow graduated from the University of New Mexico with a Bachelor of Arts in Architecture and served as the 56th national president of the American Institute of Architecture Students (AIAS). Barstow owned and operated a real estate management and development firm.

MISSION

AIAS Freedom by Design, the community service program of the American Institute of Architecture Students, uses the talents of architecture students to radically affect the lives of people in their community through modest design and construction solutions. Vital modifications are made to enhance the homes of low-income people with disabilities by addressing their struggles with everyday tasks such as bathing, ascending stairs, and opening doors. The program's priority is improving the safety, comfort, and dignity of individuals with accessibility challenges.

TIMELINE

AIAS Freedom by Design was founded in 1999 by Brad Buchanan, FAIA, in Denver as an independent nonprofit

(continued)

organization. The program operated independently until 2003, when the then-president of the AIAS attended a presentation on Freedom by Design at the AIA national board of directors meeting. After this experience he offered to have the AIAS take on Freedom by Design as a national program of the AIAS. AIAS Freedom by Design launched as a pilot program in early 2004, beginning with six chapters: Arizona State University, Kansas State University, University of New York Buffalo, University of Colorado Boulder, University of Nebraska at Lincoln, and the University of Wisconsin–Milwaukee. Since then, the AIAS program has grown substantially:

- In 2005 the pilot program expanded to include five new chapters.
- In 2006 the program was released nationally and grew by thirteen chapters.
- In 2011 the AIA added AIAS Freedom by Design-specific programming to its Grassroots Leadership Conference.
- As of 2012 there were approximately 60 active chapters with AIAS Freedom by Design programs.
- 195 projects were completed from 2007 to 2012.

SERVICE LEVELS

In an effort to help AIAS chapter leaders have a better understanding of the time and resources necessary for the varying levels of AIAS Freedom by Design projects, the AIAS has established three service levels that outline the parameters of the program.

Service Level One

Service Level One projects are classified as projects that can be completed in a single workday with a team of four to six volunteers. Projects at this level should not require a building permit, should cost less than $250 in materials, should be completed within 60 days of project acceptance, and should require no prior knowledge or training. Example: replacing door knobs, forming and pouring an eight-foot ramp to replace a single exterior step.

Service Level Two

Service Level Two projects are classified as projects that can be completed in four workdays with a team of four to six volunteers. A building permit may be required, and the project materials should cost no more than $1,000. Example: building an exterior wood ramp where the first two days are spent forming and pouring the foundations and the last two days are spent framing the ramp.

Service Level Three

Service Level Three projects are classified as projects that can be completed in 10 workdays with a team of four to six volunteers and a building permit will be required. The project must be less than $10,000 and should be completed within 120 days of acceptance. Projects at this level allow students to schedule and coordinate skilled laborers, such as tile setters, carpenters, draftsman, and electricians. Example: Recently the AIAS Syracuse Freedom by Design program has completed an agreement to redesign a treehouse to comply with ADA accessibility. The project will allow children with disabilities to be more included in the camp experience.

PROCESS OF A PROJECT

- Information and resource gathering
  - Selection of client and mentors
  - Fund-raising and acquisition of building materials
- Design solution
  - Students work with mentors and the client to design an affordable solution for the client's specific problem. Once a feasible solution is accepted by the client, team, and mentors, the students attain permits, assemble a volunteer team of AIAS members, and work with their mentors to complete the project build-out in a timely and professional manner.
- Information and resource dissemination
  - Students provide project documentation in the form of videos; press releases; and local, social, and national media.

Although AIAS Freedom by Design projects work through the same design and building process as typical architecture firms, it is important to remember that the process is managed by volunteer students who are working with mentors to better understand the profession they are seeking to enter. Students act as architects, project managers, and fundraisers throughout the project. This exposes students to true design and building processes through civic engagement that ultimately provides design solutions for some of our local communities' most underserved individuals and families.

PART 2

FIRM MANAGEMENT

Operating an architectural firm requires knowledge of marketing, financial management, and human resources. Firm development, including continuing attention to strategic direction, knowledge management, and administrative effectiveness, must be an ongoing concern for firms of all sizes. Throughout a firm's life cycle, from start-up through growth and development, ownership transition and potential expansion to global or multi-office practice, entrepreneurial architects benefit from increasing their understanding of management best practices.

CHAPTER 5

Organizational Development

5.1 Architects and the Law

Donald W. Doeg, Esq., PE, LEED AP

Architects, like other professionals, render their services in a difficult and complex environment. In order to be successful, knowledge of the basic components of the legal requirements that govern their profession is essential.

LEGAL OVERVIEW

Architects, like many other professionals, are confronted with legal issues on a regular basis and thus must have a basic understanding of the law in order to successfully practice architecture in today's complex world. A wide spectrum of sources creates legal requirements that dictate standards under which an architect must practice. These sources include, but are not limited to: statutes passed by federal, state, or local legislative bodies under their constitutional authority; administrative rules and regulations; building codes and standards; local ordinances; obligations established by contract between two or more parties; and law established by precedent of prior interpretations by the courts and administrative agencies regarding these requirements.

In order to meet the applicable standard of care (which will be discussed in more detail later in this section) it is the architect's obligation and duty to practice in

Don Doeg is a principal at Updike, Kelly & Spellacy, P.C., in Hartford, Connecticut, and the chairman of the firm's Construction Law and Design Professional Law practice groups. His practice is devoted to assisting clients in all aspects and stages of construction projects, including resolution of any dispute that may arise.

compliance with all applicable laws, codes, and regulations. While most of the existing construction related law will apply to architectural practice in some manner, there are laws and other legal obligations that may not be applicable to particular parties, such as the architect. For instance, certain OSHA obligations are directed to the means and methods by which a contractor performs its work on a project. Unless the architect specifically assumes some specific obligation through its contract, those obligations may not extend to the architect.

In a very broad sense, issues of law impacting architects can be broken into two general categories: party disputes and administrative proceedings. Party disputes, the focus of this article, occur when problems arise on a project, such as delays, failures, or potential failures relating to the work performed, fee controversies, and a long list of other issues. Problems don't always result in disputes and disputes don't always result in legal action. However, it is important to understand that the outcome of many of those disputes will rest heavily on whether the parties have met their legal obligations.

▶ Dispute Management and Resolution (16.4) discusses the effective and strategic use of methods for resolving project disputes.

Administrative issues and proceedings also play a very significant role in an architect's life. Administrative issues arise from regulations developed to implement civil statutes and other legal requirements, such as the area of professional licensing. Typically, this area of the law is overseen by public officials charged with ensuring compliance with certain laws, standards, and regulations. Under their statutory authority, state registration boards, code officials, and other administrative agencies are given the power to develop, implement, and enforce regulations needed to do their jobs. Individuals and entities subject to regulation typically have opportunities to seek variances or appeal decisions through administrative channels (e.g., zoning boards of appeal). When administrative avenues have been exhausted, it is possible to seek review of administrative decisions in the courts.

▶ See Regulation of Professional Practice (3.1) for related information on licensing regulations.

▶ Building Codes and Standards (13.1) and Planning, Urban Design, and the Regulatory Environment (13.2) further discuss the myriad regulations concerning building design, planning, and zoning.

COMMON CLAIMS AGAINST ARCHITECTS

If formal disputes arise relating to construction projects, attorneys will articulate their clients' claims in the lawsuits based upon various legal theories. The two legal theories most often alleged in claims against architects are "negligence" and "breach of contract."

Negligence

Overview of Negligence

The existence of negligence is often more difficult to determine than whether a breach of contract has occurred. Under the law, there are four components that must be proven in order to prevail when asserting a negligence claim. They are as follows:

- *Duty*. The architect must owe a legal duty to the person making the claim. In other words, the architect has a legal obligation to do something or refrain from doing something.
- *Breach*. The architect fails to perform the duty or does something that should not have been done.
- *Cause*. The architect's breach of duty is the proximate cause of harm to the person making the claim. That is, was the claimant injured or harmed as a consequence of the act and/or omission of the architect without any intervening cause?
- *Damage*. Actual harm or damage must have resulted from the breach.

Standard of Care

In claims against professionals, including architects, it is often difficult or impossible for a layperson to unilaterally determine the duty component of negligence as defined above. As such, the law has established that that duty is to meet a standard of reasonable care for the performance of the work. The standard of care for an architect is generally defined as what a reasonably prudent architect would do in the same general locale, in the same time frame, given the same or similar facts and circumstances. The architect's legal responsibilities to a client are examined in light of what reasonably prudent architects would have known and done at the time services were performed.

In order to prove whether the standard of care has been met in a particular instance, the courts in most states require expert witness testimony. That is, since a layperson judge or jury would not have the requisite knowledge to determine what a reasonably prudent architect would have done under similar circumstances, each of the parties must retain an expert witness to provide an opinion as to the applicable standard of care for the case (what should or should not have been done by the architect). The judge or jury is ultimately charged with applying the standard of care that they believe is most credible to the facts of the case and determining whether the architect acted appropriately.

Despite the thoughts of some owners and/or their attorneys, the law does not require perfection from an architect based upon a typical standard of care scenario. If given enough time, an experienced third-party reviewer would likely find some glitches or inconsistencies on any set of architectural drawings currently in existence. However, the mere existence of a few minor glitches or inconsistencies within project documents does not mean that the author has failed to meet the prevailing standard of care. Despite the existence of alleged "flaws," another expert may well opine that the standard of care has nonetheless been met. The outcome of these types of disputes is dependent upon the particular facts in each case.

▶ Owner-Generated Agreements (17.3) discusses a systematic approach to evaluating terms in agreements provided by owners.

It should also be noted that since architecture is an integration of art and building science, in virtually all situations there is more than one way to design a project or even a portion of a project. The fact that another architect would have used different details or materials does not necessarily dictate a violation of the prevailing standard of care. The successful practice of architecture is based upon reasoned judgment and skill and the law recognizes that even if there is differentiation among various designs, it does not necessarily mean any of them were performed negligently.

▶ Insurance Coverage for Business and Professional Liability (16.2) covers the terminology and the necessary considerations and alternatives when selecting insurance for one's firm.

The standards of care applicable to a particular project can be modified by contract or conduct. The most frequent example of this practice is an attempt by owners to elevate the standard of care. Rather than applying the typical standard of care described above, some owners' contracts seek to require a standard of "best practices," "highest prevailing standards," or some other similar language that elevates the mandated standard of care for those projects. Architects should be wary of such heightened standards for at least two reasons: (1) the new standard may not be adequately defined in the industry, which may lead to a great deal of subjectivity and debate if a conflict ever arises; and (2) such standards may not be insurable under many typical professional errors and omissions policies.

Each of the components of the aforementioned definition of the professional standard of care can be subjective in nature. Depending on the specific issue at hand, courts have given some latitude to the "in the same general locale" component. For instance, it would not be prudent for an architect in the southern states to incorporate a large factor for snow load on the roofs of their designs, and, similarly, architects in the north central states may not have the same concerns about hurricane loads as their colleagues in the southeastern states. Yet in other instances, courts have held that knowledge about basic design concepts and/or certain building products (both good and bad) should be known by architects throughout the country. This nationwide knowledge can be applied in several manners by the courts. For instance, the level of knowledge of certain questionable materials may be consistent throughout the country (e.g., use of asbestos or the risks of fire-retardant plywood) regardless of the size or nature of the specific architectural practice. In other situations, architects with certain building type specialties (e.g., large sports stadiums, large museums, and major hospitals) may have a national practice and may be compared to other architects with the same specializations, even if their respective offices are many states away.

The "in the same time frame" component has also been heavily litigated. In general, the applicable standard of care is the one in place at the time of the project, not the one in place at the time of the dispute, which can be years later. As such, experts who subsequently assert that the prevailing standard should have resulted in the use of materials or techniques that were unknown or in their formative stages at the time of the project are not persuasive with the courts. Last, but not least, the "same or similar circumstances" component must also be strongly considered. For instance, the owner's budget will significantly impact a project. The standard of care must be determined for an architect working within the same budget, and under the same constraints, as were encountered for the underlying project. Alternatively, the "same or similar circumstances" also includes the type of project and the experience of the architect. That is, a small local architectural firm designing residences in a certain locale will not be held to the same standard as a national architectural firm that routinely designs large and complex facilities such as sports stadiums or health care facilities. Unfortunately, meeting the relevant standard of care may not be enough to protect an architect from litigation. A lawsuit can be commenced by almost anyone, in most states even by a party with whom the architect had no contractual relationship. However, if an architect is mindful during the course of the project of the standard of care that must be met, it will go a long way toward both diminishing the chances of the commencement of litigation as well as providing good defenses to the architect if litigation does arise.

Modifying the Standard of Care by the Architect's Actions

Even though the law requires only reasonable and prudent behavior, an architect can expand or raise the standard of care. This may be done either consciously or inadvertently. The standard of care can be altered in literally countless ways by the architect's actions, such as promising a specific project result (e.g., that the roof or basement will not leak); taking on the contractor's responsibilities (e.g., dictating means and methods or designing something that the contractor was required to do as part of a performance specification); or promising a specific supplier performance result (e.g., delivery of certain materials by a specific date).

It is important to realize that raising the standard of care increases the architect's liability exposure by making the architect responsible for more than the professional standard requires. Sometimes design professionals—under pressure from clients or contractors or propelled by their own drive for perfection—raise the standard of care that will be applied to their services without intending to do so.

► Risk Management Strategies (16.1) addresses how to determine whether a risk is worth taking and how to manage risks.

Damages

Damages for negligence claims are typically measured by the standard of the plaintiff being entitled to compensation to remedy the negligence of the architect. If the case were litigated or arbitrated, the judge, jury, or arbitrator would have to decide what that compensation would entail based upon the arguments set forth by the litigants. For instance, if litigation resulted in a finding that an architect improperly designed a set of stairs that did not meet the applicable building code and those stairs were subsequently constructed in accordance with those faulty plans, an owner may be entitled to the cost of removing the stairs and installing another set of stairs that met the applicable code.

Breach of Contract Claims

Overview of Breach of Contract Claims

"Breach of contract" claims are relatively self-explanatory. Such claims are based upon an allegation that a specific duty or duties existed pursuant to a contract between two parties and one of those parties either failed to perform that duty or did not perform it properly. For instance, an owner/architect agreement may specifically require that the architect provide record drawings at the conclusion of the project. If the architect fails to do so, a breach of contract claim may ensue.

The elements of a breach of contract action are the formation of an agreement, performance by one party, breach of the agreement by the other party and damages. To form a valid and binding contract there must be a mutual understanding of the terms that are definite and certain between the parties. Each must be found to have been based on an identical understanding by the parties and an agreement must be definite and certain as to its terms and requirements.

Contractual Protections

Logic dictates that the quality of the architect's contract will have a large impact on the potential claims and defenses against the architect. It is imperative that the architect spend time on each and every contract to understand and negotiate each of the clauses. Each and every contractual clause may prove to be either a significant defense available to the architect or a huge detriment.

Owner/architect contracts can be either written or oral. Written contracts are preferred by almost everyone in the design industry. Perhaps the largest benefit of a written contract is the fact that it preserves a written articulation of the agreement between the parties, including all critical components, which can be referenced if a subsequent dispute arises. Coming to a common understanding of the terms of the original agreement often proves very difficult if an oral agreement is in place and a dispute subsequently arises. In addition, the applicable statutes of limitation may vary depending upon whether the contract was in written or oral form.

▶ The AIA Documents Program (17.5) details what AIA Contract Documents offer the parties involved in the design and construction of buildings.

It is important to recognize that written architectural contracts take many forms, depending upon the particular project and parties. The most common construction contracts in the industry are form contracts that are published by various construction industry groups, the industry standard being the AIA documents. The provisions included in these form contracts have been formulated over many years' use in the industry. While many parties opt to use the industry forms "as is," there are other situations in which one or both parties may seek to modify one or more of the provisions, sometimes significantly. In addition to the industry form contracts, there are many other types of contracts prepared by specific owners, design professionals, or others that also are used.

The following are some key provisions that, if properly included in an architectural contract, will go a long way toward protecting the architect.

The Absolutely Essential Terms: Whether an agreement is written on the back of a napkin or consists of a long-form agreement, it is absolutely critical that the agreement include a written summary of the project scope, the time frame in which it will be performed, and the fee agreement for the project.

▶ Defining Project Services (15.1) addresses the centrality of scope definition in developing effective agreements for professional design services.

- *The Project Scope:* It is critical to describe the scope of work to be accomplished. In some instances, it is equally or even more critical to describe any exclusions (e.g., in some instances the architect does not plan to be involved in the construction administration phase, but the owner may not comprehend that fact).
- *The Project Time Frame:* Many disputes have occurred because the owner and architect did not specifically discuss the time frame for the project and assumed vastly different parameters for the start and completion dates (and other critical milestones) of the work.
- *Project Fees:* It is essential that the architect and owner agree on the type of payment (e.g., lump sum, hourly, not to exceed, etc.) and the time frames for the payment (e.g., monthly, one payment at end of project, percentage of project completion).

▶ Services and Compensation (15.2) discusses the variables for architects to consider in setting compensation, as well as various methods of compensation and strategies for getting paid.

Other Key Terms: The following are a few of the many contract terms that can have a significant impact on an architect's exposure should problems arise during the course of the project. These terms are but a few of the many critical contract provisions that may exist for a particular project:

- *Limitations of Liability Clauses:* These clauses will limit claims by the owner against the architect to a certain amount (e.g., a set dollar limit or the balance of the remaining insurance policy) should a dispute between the parties arise. These clauses have been enforced in many, but not all, states.

- *Mutual Waiver of Consequential Damages:* This is a standard clause in many AIA form contracts, but is often stricken by owner's counsel. Consequential damages are those that are not direct damages, but only arise as a consequence of some act or omission. In the prior example, if an architect failed to design a set of stairs to code and they subsequently had to be replaced prior to a certificate of occupancy being granted, the cost to do the replacement work would be direct damages. The delay in the opening of the facility would be consequential damages and, if the waiver was part of the contract, the owner would not be able to collect damages of this type from the architect.
- *Indemnification Provisions:* Many owners attempt to add indemnification clauses to the agreements with their architects, which, in essence, are a contractual requirement that the architect reimburse the owner for damages caused by the architect's acts and/or omissions. It is absolutely critical that the architect confer with his/her insurance broker and/or attorney prior to agreeing to any such clause. Many of these clauses, as proposed, are so broad and onerous that they are not insurable by the architect's professional malpractice carrier and therefore put the architect at tremendous risk if the language is not modified.

Changes in Scope of Service

It is equally important that architects properly document any changes to their agreement with the owner during the course of the project. Almost every project is a very dynamic process, with changes occurring rapidly that impact the architect's scope of work and fee as well as the project schedule. Just as it is critical to properly document the agreement between the parties in the initial contract, it is equally important to document any subsequent changes during the course of the project. If a subsequent dispute arises, written change orders documenting any changes to the original agreement will be essential to allow a court to determine the agreement between the parties. It is essential that the architect documents these changes and brings them to the attention of the owner. If possible, a formal change order should be prepared and signed by all parties. In some instances, it may be difficult to get the owner to sign off on a change order during the course of a project. In those instances, it is critical to nonetheless document the changes in writing and send it to the owner advising them that a change has been made to the contract scope/time frame/fee and outline those changes. That documentation will be very helpful in proving the changes were known and agreed upon should a subsequent dispute arise.

Damages

Damages for breach of contract claims are typically measured by the standard of the plaintiff being entitled to compensation that would put them back in the position they would have been in if the contract had not been breached. If the case were litigated or arbitrated, the judge, jury, or arbitrator would have to decide what that compensation would entail based upon the arguments set forth by the litigants. In the previous example regarding the failure to produce record drawings a judge, jury, or arbitrator may decide that the owner is entitled to the cost of having another design professional prepare those documents.

Vicarious Liability

In General

Agency relationships are common in everyday practice. That is, one party acts on behalf of another relating to a particular project or task. However, certain obligations and liabilities arise out of these relationships. The world of construction is no different. For instance, an architect's employee acts as an agent of the architect on a project. A corporate officer acts as an agent of a corporation in signing an agreement for professional services. Partners are agents and, under the law, also principals for each other. That is, partners are agents when they act for other partners (principals) and principals when their other partners (as agents) act for them.

Under an owner-architect agreement, the architect may have an agency relationship with the owner for certain designated activities. The central question in agency relationships is the scope of authority the agent has been granted to act on behalf of the principal. Thus, architects acting as agents of the owner need to know the limits of their authority in dealing with the contractor and other third parties. Firms will want every person who can be perceived as acting as the firm's agent to understand the limits of his or her agency authority. Staying within the limits of their authority is the best protection agents can give themselves and the principals they serve.

For Consultants

▶ Project Team Agreements (17.2) addresses agreements between architects and consultants and those that establish joint ventures between firms.

In many typical projects, the architect enters into a contract with the owner for all, or virtually all, of the design services for the project. The architect, in turn, retains consultants (typically engineers in various disciplines) to perform portions of the overall scope of design work. Consultants who perform professional services on behalf of architects under the terms of an architect/consultant agreement are independent consultants. In those situations, the consultant may sometimes act as an agent of the architect.

While the law will hold these consultants to the standard of reasonable care applicable to their professional expertise, the architect may be found to have liability for the consultants should an issue arise during the course of a project. In essence, many courts have found that the architect was contracted to provide the entire scope of design services and therefore has liability if a problem arises. While the architect may likely have a claim against its consultant for indemnification in such instances, such a claim may not fully exonerate the architect for future claims by an owner if, in the intervening period, the consultant has become financially unable to take responsibility or the consultant's insurance coverage proves to be inadequate.

In some instances the owner, not the architect, engages certain consultants and the architect's obligations with respect to those consultants may be limited. Typically, the architect has far more limited exposure relating to the acts and/or omissions of those consultants. In these types of situations, the terms of engagement should be clearly stated in writing. Architects usually are not responsible for project consultants hired directly by the owner unless the architect agrees to this responsibility in the owner-architect agreement or acts in a way that makes the architect responsible, such as signing a Certificate for Payment or a Certificate of Substantial Completion for the consultant's work.

For Employees

Similarly, the architectural firm is responsible for its employees during the course of a project. The Courts will generally hold the architectural firm itself responsible for the acts and/or omissions of each employee. A possible exception to this responsibility is if the employee clearly acts beyond its role and tasks required of it by the architectural firm. For instance, if, unknown to the architectural firm, the employee sells illegal drugs while on the job site, the architectural firm will likely not be culpable for those acts.

Alternative Project Relationships

▶ Project Delivery Methods (9.1) presents an overview of available models for project delivery.

The types of relationships between members of the construction community seem to constantly evolve and expand. In addition to the conventional owner, design team, and construction team relationship, a number of other alternative relationships are being employed in the industry. Two examples of these alternative relationships are contractor-led design-build and joint ventures.

Contractor-Led Design-Build: In this variation of the conventional construction project delivery, the owner contracts with one entity, the contractor, to provide all design and construction services for the project. The architect typically subcontracts directly with the contractor to provide services for the project. While this type of arrangement may offer many advantages on certain types of projects, it also raises certain potential risks to the architect that do not exist with the more conventional project arrangement. For instance, the conventional construction project arrangement is set up, in part, to provide a layer of checks and balances that protect the owner. In such situations, the architect typically has certain obligations to identify problems relating to the contractor's work and the contractor has similar obligations regarding the architect's work. These obligations may not exist, or at a minimum are severely compromised, in a design-build relationship. Many architects have been placed in very difficult situations when their client, the contractor, wishes to perform work in a way the architect may not agree with. The drafting of the agreements in these types of arrangements is critical in order to protect the architect from these types of problems.

Joint Ventures: It is common for the courts to consider the parties to a joint venture to be jointly and separately responsible for the actions of the joint venture. That is, if an injury occurs because of the negligence of either party to the joint venture, the joint venture can be sued collectively or the parties to the joint venture can be sued individually. Therefore, professional responsibility and liability should be carefully allocated in contractual agreements between the parties to a joint venture. Because many states qualify how and under what circumstances professional responsibility may be shifted to another party, legal advice should be sought when preparing such agreements.

▶ See Contractor-Led Design-Build (9.4) and the backgrounder Design-Build Agreements (17.2) for related information.

Third-Party Actions

In addition to their obligations for damages to the party with whom they contract, architects can also be held liable for negligent acts, errors, or omissions that physically injure or damage third parties with whom the architect has no contractual relationship. These third parties include construction workers, passersby, and occupants or users of projects.

The obligations to third parties stems from a variety of sources. In many states, statutes, regulations, and prevailing case law requires architects to safeguard life, health, public safety, and property and to promote the public welfare. In fact, many of those states use this obligation for licensed architects as one of the key considerations to justify the licensing and registration statutes themselves.

Prior to 1956, the legal concept of privity barred third-party actions. Privity required the litigating parties to prove they had a direct contractual relationship with each other and that the injury occurred in the course of that relationship. Since that time, the courts in many states have, with regard to physical injury and in some cases property damage, extended the group of individuals to whom architects may owe duties to include third parties whom architects can reasonably foresee will depend on them to provide services in a non-negligent manner. However, the law differs from state to state regarding the issue of privity and it is important to get legal advice to determine the law that applies to each particular project.

The types of potential third-party actions vary widely. For instance, a worker hurt on a construction site may opt to sue a wide range of entities involved in the project, including the architect, despite the fact that they had no direct contract with any of those entities. Alternatively, a visitor to the facility after completion may option to commence litigation against the architect, owner, or others if they are injured during their visit due to alleged design or construction defects.

DEFENSES TO CLAIMS

Overview

In the unfortunate, but not infrequent, event that a dispute does arise on a construction project, the architect may have a variety of contractual or statutory defenses to bolster the factual arguments that may be made. While the law varies from state to state, the following are some issues that may impact claims against an architect:

Statute of Limitations

With very few exceptions (such as criminal charges for murder), the states have established specific time frames in which claims must be asserted, or they are permanently barred. For instance, generally stated, a claim based upon negligence against a design professional must be asserted within 3 to 10 years (depending upon the particular state's statute) after the completion of the project. As such, an aggrieved party could know about a potential claim during the construction phase of the project, but not be obligated to commence litigation until just before the statute of limitations expires. That is, the party could wait the full 3- to 10-year period of the applicable statute and then file a claim a few days before the statutory time frame expires. A breach of contract claim may be subject to a different time frame, even within the same state. While there are a few situations that would allow an exception (e.g., the existence of fraud on the part of the architect), these statutes have proven to be very helpful in protecting architects from older claims.

Statutes of Repose

Some states have incorporated statutes of limitation, while others use statutes of repose. Statutes of repose are similar to statutes of limitation and serve to set time limitations under which claims can be made against architects and others. Differing slightly from the statutes of limitation, statutes of repose commence running at the time that the alleged digression is discovered, and the statutory period for bringing a claim after discovery of the discretion is typically much shorter than a statute of limitation period. In addition, there is also a strict cutoff date for rights of action. For instance, a statute of repose against an architect could run for two years from the date a plaintiff knew or should have known about a claim, but that same statute would limit any potential claims to those filed less than six years from the date of substantial completion of the project. Under the preceding example, if a potential plaintiff knew or should have known of a potential claim at the time that the project was substantially completed but did not initiate a lawsuit until three years later, the claim would be barred. Similarly, under the same statute, if the potential plaintiff first learned of the potential claim five years after substantial completion, they would only have one year to make a claim since all claims would be barred that are not initiated within six years under that theoretical statute.

Betterment

This concept applies to some negligence claims asserted against architects. A negligence claim can be asserted against an architect either for (a) an error in some act performed (such as not designing the stairs to code, resulting in the necessity of replacing them); or (b) an omission (the architect did not include a component of the project in its design (such as not showing carpeting that was required in a hallway) and that component needed to be part of the project for a successful completion. While the law differs from state to state, generally the architect would be responsible for the costs arising from its errors, but may only be responsible for a fraction of the cost attributable to its omissions. In a situation such as described above, in which the architect did not specifically designate carpet for a particular hallway, resulting in a change order from the contractor, the courts have generally found that the owner would have had to pay for the carpeting anyway, had it been shown on the plans originally. Since the courts do not want to allow the owner to get something for free, and many courts recognize that a contractor may charge a premium for such a change order, the damages typically awarded by the courts against the architect are only the costs of that premium.

Collection Actions for Architectural Fees

Studies by some professional malpractice carriers have shown that one of the leading reasons for claims against an architect is the architect's initial pursuit (whether in formal litigation or not) of fees due on the project. There is a belief in the industry, although not scientifically proven, that the reason that some owners file counterclaims against architects is an attempt to get the architects to compromise, or walk away from, their outstanding fees.

The time and cost expended in defending such a claim may exceed any fees that are ultimately realized. As such, all architects must thoroughly consider the potential risks and benefits of asserting such a claim before commencing such a demand. It is critical that architects employ diligence during the course of the project to ensure that their fees do not fall into significant arrears, as well as to include contractual provisions when first forming their contract with the owner that will assist them if such a situation arises.

CLAIMS AVOIDANCE

There is a belief held by many in the construction industry that if an architect practices long enough, they are almost certain to be involved in a claim of some sort. In reality, many architects are never formally personally made a party to litigation, but almost everyone is ultimately involved in one or more disputes involving a project and at least threatened with litigation. Notwithstanding that fact, the architect can definitively and substantially reduce the odds of being included in a claim as well as the odds of being found liable if a claim unfortunately arises by taking proactive preventative steps. For instance, having a proper contract, as discussed above and elsewhere, is invaluable. Two other key steps that each and every architect should employ on a regular basis are proper communication with their client and using proper documentation on each project.

► Suggestions regarding proper documentation are more fully discussed in the backgrounder, Project Documentation, which accompanies this article.

A staggering percentage of claims in the construction industry are based, in whole or in part, on the failure of the parties to properly communicate. On construction projects, problems often arise when the failure in communication leads to a failure to manage the expectations of the other party. On construction projects, project participants often come to the table with markedly different backgrounds, experiences, and goals, which all result in each of the participants having significantly different expectations. Those differences are typically most acute in the relationship between architects and clients. Many clients have limited or no prior construction experience and do not understand the nuances involved in the process. Such clients have high expectations for their projects, beyond anything ever contemplated by the architect. The problem is often that both sides *assume* that the other has similar thoughts and expectations as they do regarding critical components of the project. By the time those differences become evident, significant problems may exist on the project.

It is incumbent upon the architect not to assume that the owner is of the same mindset of the architect. At the risk of being too elementary or redundant, the architect must continuously endeavor at each and every step of the project to assist the owner in knowing what to expect in both the short term and long term during the design/construction of the project.

For instance, owners may also fail to realize that professional judgment, and potentially owner input, is required at each step, since the architect makes the recommendations and the owner makes the decisions. Architects need to remind these project participants that buildings, unlike automobiles, cannot be pretested. Despite the effort, care, and conscientiousness of the architect, the process of taking a project from drawing to reality has a lot of unknowns. The architect must make the owner aware of these unknowns, their potential impact on the project, and what is being done to address them.

BACKGROUNDER

PROJECT DOCUMENTATION

Donald W. Doeg, Esq., P.E., LEED AP

Perhaps the most critical component to a successful construction project is effective communication. Among the many benefits of proper communication, one of the most compelling is that it will mitigate, and perhaps even eliminate in certain circumstances, any potential claims. Project documentation is perhaps the most essential element of communication in the construction industry.

It is critical that architects maintain appropriate documentation for each and every project. Not only is it beneficial to the daily activities for each project, it is invaluable if claims ultimately arise. If a construction dispute goes to litigation, the adjudication of many construction claims often takes place literally years after the event(s) in question occurred. In many of those disputes, the exact wording and timing of the critical communications plays a large role in the outcome of the case. Unfortunately, many of us cannot remember what we had for dinner a few days ago, let alone all of the nuances of a conversation that occurred several years prior. However, contemporaneous documentation during the project is generally allowed as evidence during a trial and can greatly influence the final outcome of the trial, in either a positive or negative way.

Documentation accomplishes a number of purposes:

- Provides a written record of the contractual relationships between the parties
- Provides a written record of the scope of the work to be accomplished
- Serves as an ongoing communication process that tends to raise the level of understanding between the parties and eliminate problems
- Provides a chronology of the events of the project
- Provides a consolidated record if the parties have to revisit the project at a later date

Written contracts provide a critical part of each and every construction project. These contracts define the relationships between the various parties, including identifying the scope of work to be performed by each party.

On virtually every construction project, the scope of work is readily defined in the project documents. From these documents, an interested party can determine the intended final result of the project and construct the project accordingly. In addition to the project specifications and drawings, a number of other documents are critical to this goal. These include shop drawings, submittals, change orders, sketches, and Request For Information (RFI) responses issued during construction, project correspondence, construction change directives, and a host of other documents. Each of these documents can be critical to the final result.

Constant communication tends to raise the understanding of each party with respect to their responsibilities and the roles of others. In addition, since no one likes surprises, it is a means by which potential surprises and problem areas can be mitigated or eliminated at a very early stage. Correspondence, clarifying sketches/drawings, and RFIs all serve this goal. More often than not, problems that are discussed during the project can be resolved with no permanent downside to any party. Without communication, if a party attempts to sweep a potential problem under the rug, it will typically lead to far more serious consequences down the road.

Unfortunately, the possibility of a lawsuit is a very real threat on almost every construction project. These claims can involve a combination of the multitude of parties central to the construction, including the owner, the surety, design professionals, the contractor, subcontractors, suppliers, or any of their employees. Lawsuits can also involve outsiders, such as visitors to the construction site. The possibilities of potential claims are seemingly endless. In such an environment, the importance of proper documentation only increases. Often, trials involving construction disputes happen years after the actual events leading to the claim. It is not uncommon for trials to take place four to seven years after the project was completed. Without proper documentation, it is difficult to properly recall the key events surrounding the alleged claims. Even the best-intentioned people have trouble remembering details, and especially when it comes to monetary or liability issues, some may have “difficulty” remembering precise details. As you might expect, there is often a heated dispute over certain key events on any trial. Contemporaneous documentation is critical in resolving those disputes or influencing the decision maker(s) several years later.

Courts often look to documentation based on the fact that court cases occur years later and memories can be faded or slanted during that time. In some instances it may seem that the party who has the most proper documentation wins.

Conversely, there are also certain potential problems associated with project documentation. If a party spends too much time attempting to document every conceivable detail (an admittedly impossible task), the project will likely become either cost prohibitive or impossible to complete in the given time frame. In addition, documenting files and sending frequent “CYA” type letters to everyone on the job, including the client, often leads to another set of problems, not the least of which may be a sense of distrust or unease created for the client.

The amount of paperwork necessary for proper communication on any given job can be extremely subjective. An architect must balance a wide range of considerations, including but not limited to the size and complexity of the project and the personalities and reputations of the other entities involved. There is a certain amount of required paperwork on any project. For instance, contracts, change orders, drawings, specifications, shop drawings, and documents relating to any governmental approval process are critical to any job. However, the required amount and nature of other project documentation is not an absolute quantity and often comes down to common sense, or a gut instinct.

Perhaps one of the best rules of thumb to use when deciding the amount of paperwork to generate is for the architect to try to put himself in the shoes of the recipient. In generating paperwork to the client, the owner, the architect wants to keep the owner informed of all of the significant events of the project. However, the architect may not want to besiege the owner with superficial details or small issues that the architect, as the professional that the owner retained to perform the project, should handle.

Another key consideration in deciding the type and volume of paperwork to generate is that, as the project architect, it is critical that an architect ***manage the expectations*** of the owner and others on the project. The architect should generate paperwork that enables other parties to understand his position and what may be expected in the future. Managing expectations goes a long way toward mitigating or eliminating problems on construction projects. Proper management of expectations can be accomplished in a variety of ways; it is important that the architect finds a style that works best for him and his firm.

ESTABLISH PROPER OFFICE PROTOCOL FOR RECORD KEEPING

As indicated above, if a matter ultimately goes to litigation, the courts will often be persuaded to allow many, but not all, project documents into evidence. In order to be permitted into evidence, the party seeking to admit the documents must get around the fact that the documents themselves generally constitute hearsay and could be precluded on that basis. Hearsay is a statement (either oral or written) made out of the court that is offered as evidence to establish the truth of the facts contained in the statement. For instance, an expert's report regarding an investigation into a roofing problem and the conclusions of that investigation are hearsay. That report will likely not be admitted into evidence. However, many documents that are generated during the construction project, while technically hearsay as well, will be admitted into evidence under the business records exception to the hearsay rule. While the rules may vary slightly from state to state, in essence, for a document to be admitted under this exception to the hearsay rule it must be shown that (1) the document was made during the regular course of business; (2) it was the regular course of business to make such a record; and (3) the record was made when the act, transaction, or event occurred, or shortly thereafter.

Accordingly, it is essential for architects to establish office protocol that requires the keeping of certain records for each and every project, and maintaining them in a timely fashion. If an architect is inconsistent with the types of records they keep from project to project, or are not timely making such records, they run the risk of having certain records excluded from evidence if litigation does arise. Given that project documentation is often very beneficial to the architect if a claim arises, it is well worth the effort to keep proper records.

The office protocol should also include provisions under which senior personnel review the work of junior associates on a periodic basis. The experienced architects can assist associates in preparing proper documentation and recognize issues soon after they arise rather than letting them fester and grow.

CONTENT OF PROJECT DOCUMENTATION

The wording of an architect's documentation is also critical. A concise description of the relevant facts, without editorializing, is essential. When problems inevitably arise during the course of a project, it is very important that the description of the issues in the contemporaneous documentation do not hastily come to any conclusions regarding the cause or liability. All too often, given limited facts available at the time that the incident first arises, architects jump to conclusions in their daily log or site observation reports as to the cause, sometimes making incriminating comments about themselves, their firm, or their consultants. ***Do not jump to hasty conclusions regarding cause or liability for problems***. Frequently, additional facts subsequently come to light after the initial discovery of the problem that shed an entirely different light on the likely cause or culprit. However, if the architect has admitted fault in their earlier documentation, it is almost certain that admission will be used against them at the time of trial.

If a problem arises, the project documentation should consist of the facts that are known, possibly as well as a listing of potential causes to be investigated further if known at the time. For instance, if a residential roof starts to leak, the architect's documentation should not consist of an entry reading, "The roof now leaks due to my failure to include the proper flashing," even if at the time this seems to be the cause. Instead, an entry should state something along the lines of, "Roof is apparently leaking. Need to investigate installation of shingles and review flashing details." Further investigation often reveals that the initial determinations of cause and liability were incorrect, either in whole or in part. However, a poorly written initial report in which liability is admitted can be fatal in subsequent litigation.

REQUIRED DOCUMENTATION

In order to persuasively present or defend a claim, adequate documentation will be needed. The goal should be to be able to re-create exactly what happened on a job, when, and why. Among the documents suggested for use from the beginning of a job, before there is any reason to even think about claims, are:

- Diary/daily notebook or site observation reports (if electronic devices are not used).
  - Write in ink.
  - Use bound or spiral notebooks (they add credibility that the notes were contemporaneous if a dispute later arises since one cannot add new pages between existing notes).

(continued)

  - Number and/or date pages sequentially (no gaps).
  - Keep contemporaneous records: The purpose of the project diary is to identify and discuss key events on the project at the time they occur for reference at some time in the future.
- Electronic devices: Establish an office protocol for contemporaneously accumulating in one location all notes taken in the field.
- Photographs/videos.
- Correspondence.
- Status letters: As part of efforts to manage expectations, your client should be updated on a regular basis.
- "Issue" letters. Flag significant changes or potential problems, because no one likes surprises:
  - Confirm issues that can later become subject to debate; for instance, changes to scope of work or determining owner's desires for project (such as owner identifying on a certain date that he wanted to accomplish X).
  - Letter sent to confirm owner's position can serve to lock him in said position.
  - Letter sent to question owner's position if contractor or others (with whom you have no contractual ties) dictate certain changes and indicate that owner has represented that it is to be done.
  - When writing letters, do not assume that the owner knows everything or is doing certain tasks. If your response to the issue or recommended actions are based on assumptions, **let the owner know each and every assumption in the letter**.
- Minutes of meetings.
- Memos of telephone conversations.
- Project scheduling information.
- Change order logs.
- Shop drawing logs.
- Progress payment logs (both from owner and to consultants).
- Payroll records.
- Equipment use records.
- Accounting records/cost reports.
- Estimates.
- Bids.
- Material invoice files.
- Claim reports.

BACKGROUNDER

COPYRIGHT LAW FOR ARCHITECTS

Joseph H. Jones Jr., Esq., AIA

Original creative expression is an intrinsic part of an architect's professional services. An understanding of copyright law and how it applies to an architect's professional service is an important part of any successful architectural practice.

Joe Jones is a risk management attorney and director of Schinnerer's risk management services. He provides risk management advice to Schinnerer and CNA insureds, and is a resource on evolving areas of professional liability exposure for both design professionals and contractors

U.S. copyright law protects the creativity captured in the architect's instruments of service, such as design and construction drawings, models, and other design representations, as well as the built structure. To protect themselves from copyright infringement, architects should be familiar with their rights under the law.

Architects need to understand the intellectual property rights intrinsic in their professional services. With some clients viewing professional services as a commodity and the plans, specifications, reports, and other documents that architects produce as products, architects should understand the business and liability issues relating to the use, ownership, and control of their designs and instruments of service.

As clients look for more ways to reduce the costs of design and construction, many view the "reuse" of designs as a way to eliminate the need to hire another architect and save money. Actions like this may put the architect at risk for professional liability from any problems that develop from subsequent uses of the same plans. In addition, the architect may lose fees if the client neglects to acquire the copyright to a design.

Maintaining the copyright to their designs gives architects a level of control over their creative and professional endeavors. Clients will have to retain them for future projects, which may help an individual architect or firm maintain a steady stream of new business. As well, surrendering copyright could lead to liability problems for the architect if that issue is not properly addressed in the professional services agreement.

COPYRIGHT BASICS

Intellectual property rights fall into three main areas: trademarks, including service marks; patents; and copyrights. Trademarks and patents are registered by the U.S. Patent and Trademark Office, while copyrights are registered with the U.S. Copyright Office. Architects appear to have the greatest exposure to copyright issues, which are the focus of this discussion.

According to statistics from the CNA/Schinnerer design professional liability program, 44 percent of intellectual property claims against architects and engineers from 2002 to 2011 involved allegations of copyright infringement. Of those claims, 66 percent involved architects and 55 percent involved residential projects. Interestingly, these statistics show that design professionals brought more than 57 percent of all claims for copyright violation.

It is a common misconception that copyright is a subject of interest only to the creators of copyrighted material. Both users and creators of copyrighted material must understand the limits of copyright protection as well as what constitutes fair use of copyrighted material.

WHAT CAN BE COPYRIGHTED

In brief, the U.S. Copyright Act protects "original works of authorship fixed in a tangible medium of expression." It does not extend to items such as procedures, processes, and systems, which are typically matters for patent law.

Many instruments of service prepared by the architect qualify for copyright protection. Article 1 of AIA Document A201™-2007, General Conditions of the Contract or Construction, defines the architect's instruments of service as "representations, in any medium of expression now known or later developed, of the tangible and intangible creative work performed by the Architect and the Architect's consultants under their respective professional services agreements. Instruments of service may include, without limitation, studies, surveys, models, sketches, drawings, specifications, and other similar materials." The words "other similar materials" may refer to renderings, reports, photos, models, and videos. The major requirement for defining such materials as an instrument of service is the same requirement for qualifying for protection under U.S. copyright law—they must be works "fixed in a tangible medium of expression." Ideas, therefore, are not instruments of service. To be protected, the "original work" must have been set down on paper or in some other tangible form.

USE OF COPYRIGHTED MATERIAL

A common misconception is that *ownership* of a thing is the same as *copyright* of that thing. The difference between ownership and copyright can be illustrated by what happens when you purchase a book, burn it, or give it as a gift, but you do not own the copyright. Copyright laws give the creator of an original work the exclusive right to reproduce or display that copyrighted work.

Clients often believe that since they paid the architect and have a set of drawings in their possession, they own the copyright to these materials. However, this is not true. As in the example above, the fact of purchase does not give the client the copyright to the architect's instruments of service. For the client to own the copyright, the architect must assign and transfer ownership of the copyright to the client in a written document. This document must be signed by the architect or the architect's duly authorized agent.

Clients who fail to realize that the architect's designs and instruments of service are copyrighted may duplicate a set of drawings and specifications with the intention of using them for future projects. This misuse of the architect's materials opens the client to a possible copyright infringement claim and may cause liability problems for the architect because the project may not be properly designed for another site. The requirements of a different set of codes, the soil-bearing capacity of the site, and other site conditions are just a few of the concerns that make reusing an original set of drawings and specifications for other projects highly risky. If, despite these issues, a client desires to reuse an architect's design, it is important for the architect to understand his or her rights as the creator of copyrighted material.

CATEGORIES OF COPYRIGHT PROTECTION

Copyright protection covers a variety of ways in which creative works can be expressed. U.S. copyright law identifies these within the following categories:

- Literary works
- Musical works
- Dramatic works
- Pantomimes and choreographic works
- Motion pictures and other audiovisual works
- Sound recordings
- Pictorial, graphic, and sculptural works
- Architectural works

The architectural works category is an obvious choice for protection of designs and instruments of service produced by architects, but the pictorial, graphic, and sculptural works category also affords architects some protection. These types of work, also termed "visual works," include two-dimensional and three-dimensional works of fine, graphic, and applied art. Examples include technical drawings, architectural plans, diagrams, and models.

In 1990 the Architectural Works Copyright Protection Act (AWCPA) became effective. Prior to that, only instruments of service identified as "pictorial and graphic" works were protected under the Copyright Act. The AWCPA specifically added "architectural works" as a protected category of original expression. An architectural work is defined as "the design of a building as embodied in any tangible medium of expression, including a building, architectural plans or drawings. The work includes the overall form as well as the arrangement and composition of spaces and elements in the design, but does not include individual standard features."

(continued)

The AWCPA does not define "building." However, U.S. Copyright Office Information Circular 41, "Copyright Claims in Architectural Work" (available at www.copyright.gov), states that the AWCPA protects "structures that are habitable by humans and intended to be both permanent and stationary, such as houses and office buildings and other permanent and stationary structures designed for human occupancy, including but not limited to churches, museums, gazebos, and garden pavilions." Equally important are the items the AWCPA does not protect. Among these are "structures other than buildings, such as bridges, cloverleafs, dams, walkways, tents, recreational vehicles, mobile homes and boats."

Although the AWCPA does not define "building," several courts have attempted to interpret the provisions of the act. In *Yankee Candle Company, Inc. v. New England Candle Company, Inc.*, 14 F.Supp.2d 154, the plaintiff, holder of a copyright and trademark on the design of a colonial-style candle store, sued a competitor for copyright infringement after the competitor opened a retail store in a mall that the plaintiff claimed was substantially similar to the design of its own retail store. The court had difficulty concluding that a "room" within a retail mall fit the definition of a "building" within the meaning of the AWCPA. The court noted that to hold that a mall store constituted a "building" would distort the plain meaning of the term, and "surely Congress did not intend for individual offices in an office building, though elaborately designed, to qualify as 'buildings' themselves."

In another case, a court ruled that buildings had to be built after AWCPA went into effect to be protected under the act. In *Richard J. Zitz, Inc. v. Dos Santos Pereira,* 232 F.3d 290, an architecture firm brought a copyright infringement action against builders of a townhouse it alleged infringed on its copyright. The court first noted that for an architectural work to qualify for protection under the AWCPA, the subject of the infringement must have been constructed or otherwise published after December 1, 1990. The court rejected the plaintiff's argument that "constructed" means "finished," or at least finished to the point of being habitable. Since the plaintiff's townhouse was not finished until *after* December 1, 1990, the plaintiff argued its design was eligible for protection under the AWCPA. The defendant argued that "constructed" means "substantially constructed," and that therefore the plaintiff's townhouse was not eligible for protection under the AWCPA. In agreeing with the defendant and the lower court, the appellate court held that "an architectural work that was substantially constructed as of December 1, 1990, is ineligible for copyright protection under the AWCPA."

The AWCPA does not prohibit protection of an architect's drawings under the "pictorial and graphic" category, and in some circumstances protection under this category may be broader. Some attorneys who have used this approach believe the plaintiff generally has to prove only that the defendant had access to the instruments of service and that substantial similarity exists between the original and the alleged copy. Since the AWCPA is meant to protect the "design," and exceptions have been made for "unprotected elements," proving copyright infringement under the architectural works category may be more challenging.

COPYRIGHT INFRINGEMENT

The question is often asked, "How much copying is copying? 50 percent? 75 percent? 90 percent?" Unfortunately, the answer is not that simple. Certain elements are required for a claim of copyright infringement to be successful. A plaintiff must prove ownership of a valid copyright and an infringement (copying) of the protected work.

Registration with the U.S. Copyright Office is not required for a copyright to be valid, although it is prima facie evidence of such copyright, which shifts the burden to prove invalidity to the defendant. Registration *is* required before a claim of copyright infringement can be filed, however, and can be a factor in the award of damages and attorneys' fees. More in-depth information on the requirements for registration, length of protection for copyrighted works, and damages available for copyright infringement can be found in information circulars available from the U.S. Copyright Office website at www.copyright.gov. Because this is a specialized area of law, consultation with an attorney who understands intellectual property law is advisable.

Ownership of a copyright is vested with the creator of the work, except in the case of "works made for hire." Under U.S. copyright law, "works made for hire include work prepared by an employee in the scope of employment," as well as works "specially ordered or commissioned." Architectural works, however, are generally not considered "works made for hire" unless the agreement between the parties explicitly states so. Article 7 of AIA Document B101-2007 explicitly states, "The Architect and the Architect's consultants shall be deemed the authors and owners of their respective instruments of Service, including the Drawings and Specifications, and shall retain all common law, statutory and other reserved rights, including copyrights." The duration of a copyright depends on several factors, including whether the creator is an individual or corporation or the work was produced in a work-for-hire arrangement. The general rule is that a copyright lasts for the life of the author plus 70 years.

As previously noted, proof that the defendant had access to the copyrighted work is another required element of a copyright infringement claim. Generally, this is not difficult to prove. All that is required is evidence that the protected expression, such as a set of plans, was published or otherwise in the public domain where the defendant could have seen it. On the other hand, if only one set of plans was created and this was never published, proof of access is more difficult.

Once ownership of a valid copyright has been established and access has been demonstrated, the next step in an infringement claim requires proof that portions of a copyrighted work have been copied. In *Sturdza v. United Arab Emirates,* 281 F.3d 1287, a case involving allegations of infringement of an architectural design, the court concluded that to prove infringement the plaintiff must show that the defendant's work is "substantially similar" to protected elements of the plaintiff's work.

The court noted that proof of substantial similarity requires identification of aspects of the author's work, if any, that are protected and identification of the infringing elements that are "substantially similar" to the protected work. According to the court, "substantial similarity" exists when "the accused work is so similar to the plaintiff's work that an ordinary reasonable person would conclude that the defendant unlawfully appropriated the plaintiff's protectable expression by taking material of substance and value." The *Sturdza* court took this precedent further, noting that substantial similarity requires a comparison of both individual elements of the two works in isolation and the "overall look and feel" of the work, even if the individual elements do not qualify for individual copyright protection.

COPYRIGHT LICENSE AND TRANSFER ISSUES

The discussion in this section on copyright license and transfer issues and license termination assumes the parties will use AIA Document B101–2007 as their agreement for professional services. For architects who may use their own professional services agreement or one offered by their client, the B101–2007 can serve as a model for addressing these issues contractually.

Although architects hold the copyright to their instruments of service, the reality is that the client, contractor, and other parties will need to access and use the architect's instruments of service for a particular project. To address this issue, the AIA has created in B101–2007 a series of licenses for those who will need to use the architect's instruments of service to construct and use the project.

The proper use of licenses is key to maintaining the architect's copyright and at the same time meeting the owner's needs—most often, the need to use the instruments of service for the construction, use, and maintenance of a project. In paragraph 7.3 of the B101, the architect grants the owner "a nonexclusive license to use the Architect's Instruments of Service solely and exclusively for purposes of constructing, using, maintaining, altering and adding to the Project, provided that the Owner shall comply with all obligations, including prompt payment of all sums when due, under this Agreement." It is important to remember that the license is contingent upon the owner meeting its obligations under the agreement. The same paragraph also requires the architect to "obtain similar nonexclusive licenses from the Architect's consultants consistent with this Agreement." This is necessary because architects can only grant a license for their own copyrighted materials. Architects have no copyright or control over the instruments of service of consultants such as structural and MEP engineers; these consultants have to grant their own licenses. Finally, paragraph 7.3 permits the owner to authorize contractors, subcontractors, and material suppliers to reproduce applicable portions of the architect's instruments of service for their use in connection with construction activities. The license granted in paragraph 1.3.2.2 thus effectively meets the client's and contractor's needs while maintaining the architect's copyright.

The B101–2007, however, does limit the license granted to the client. Paragraph 7.4 prohibits the client from transferring, assigning, or granting the license to another party without the written permission of the architect. Should the client choose to reuse the instruments of service without retaining the architect or the architect's consultant, paragraph 7.3.1 requires the client to release and indemnify the architect and the architect's consultant from all claims arising from such use.

A license is one way to meet the needs of the owner and other parties to have access to and use of the architect's instruments of service. Transferring the copyright to another entity for a fee is also an option. However, certain issues that stem from this option should be carefully considered. First, what is the proper fee for such a transfer? In calculating such a fee, the architect should account for both the cost of producing the instruments of service and the loss of potential profits, because the entity holding the copyright will not have to retain the architect for future services.

COPYRIGHT LICENSE TERMINATION

As stated above, AIA Document B101–2007 grants the owner a limited license to reproduce instruments of service solely for purposes of construction, operation, and additions to a project. The document also states that a termination of the design contract due to the owner's default automatically terminates the owner's license and thus the owner's permission to use those instruments to complete the project. If the owner terminates the contract for its convenience, or the architect terminates the contract due to the owner's suspension of the project, and the owner later resumes the project with another architect, paragraph 11.9.1 allows the initial architect to receive compensation for the owner's use of the instruments of service solely to complete, use, and maintain the project.

COPYRIGHT TRANSFER

Through a contract, a copyright license to use the design documents can be granted or the copyright can be transferred to another party. However, it is important to note that such licenses and transfers do not completely absolve the architect from all liability of the professional services provided, even if such liabilities are expressly transferred in the contract.

(continued)

In most states, courts have held that it is against public policy to contractually allow one party to transfer all its liability to another party. Therefore, in most jurisdictions, architects will not be allowed to transfer all risk of professional liability. Architects will be held responsible for their negligence based on the original professional services provided, regardless of who holds a license or to whom the copyright has been transferred.

If an architect chooses to transfer their copyrights, language similar to paragraph 7.3.1 of AIA B101-2007 should be included and effective the date of the transfer. This will not prevent future claims from third parties based on the original unmodified design, but does contractually require the party that has assumed the obligation and benefit of the transfer of copyright to also assume any liability that may flow from modification or unanticipated use of the design after the date of transfer.

AVOIDING COPYRIGHT INFRINGEMENT

Once architects understand the basics for protecting their copyright in their designs and instruments of service, they should consider the question of copyright from the other point of view: How does an architect manage the risk of infringing upon the protected work of another architect or design professional? A simple answer is, "do not copy someone else's copyrighted material." Unfortunately, a more realistic answer is not that simple. Architects often look to other creative works for inspiration or ideas about solving a particular problem, making the "perception of copying" a common issue in architectural services. Architects can take some steps, however, to minimize the risk of having to defend against a copyright infringement claim. In most cases, these suggestions are easily applied to "expressions" protected as "visual works" or "architectural works."

Maintain Copyright

Increasingly, clients are asking architects to transfer ownership of the copyright in their design. Architects need to realize that once they have transferred copyright to a client or any other party, that party has acquired all the rights of the copyright holder, including the exclusive right to reproduce the architect's original expression embodied in the design or instruments of service. In short, if an architect creates an original design, transfers the copyright for it to the client, then uses the same or similar design on a subsequent project, the architect has made it possible for the client to file a copyright infringement claim.

Read Agreements Carefully

Although the creator of an original work owns the copyright in that work from the moment of creation, copyright can be transferred to other parties unintentionally. Architects should carefully read their agreements with clients, looking for provisions stating that the services they provide are works made for hire or that the architect assigns all rights in the instruments of service to the client. Services provided as works for hire automatically grant copyright to the entity engaging the architect's services. If a client insists on a work-for-hire agreement, the architect should request an indemnity agreement for all claims that may arise from use of the instruments of service without the architect's involvement.

Project owners may require in the professional services agreement that the architect warrant that it has not infringed on another party's copyrights. In addition to the warranty requirement, project owners may also require the architect to defend and indemnify them should a claim be made against them alleging copyright infringement. Warranties and defense obligations are excluded under professional liability policies, as are indemnity obligations beyond allegation of negligence. However, this is a risk that can be managed by obtaining proper licenses from other parties if copyrighted material is used in the design.

Obtain Proof of Copyright Release or an Existing License

Architects are often asked to provide services based on another architect's efforts or to complete the services of another architect. In such instances, the "new" architect should request proof in writing from the client that the first architect has transferred copyright to the client or that the client has been granted a license to use the instruments of service. Proof of copyright release or an existing license can reduce the likelihood of claims of copyright infringement from other architects.

Use the Copyright Notice and Register Your Material

Although use of the copyright notice is no longer required under U.S. copyright law for drawings to be protected, placing the notice on the architect's instruments of service offers some protection by warning that the materials are copyrighted and discouraging copyright infringers from claiming they were unaware of that fact. To protect a work further, however, registration of the copyright with the U.S. Copyright Office is highly recommended. Most important, registration is required before an infringement claim can be filed. In addition, remedies such as attorneys' fees and statutory damages are available for protected works properly registered before an infringement occurs.

Avoid "Substantial Similarity"

As the court stated in *Sturdza,* infringement occurs when the defendant's work is "substantially similar" to protected elements of the plaintiff's work—that is, when an ordinary and reasonable person would conclude the defendant had appropriated the plaintiff's original expression. If an architect sets out to make a project look like that of another, a reasonable person would likely believe the architect copied the other work and therefore would hold the architect responsible for copyright infringement. Architects should also remember that substantial similarity requires not only comparison of the individual elements of the two works, but also of the "overall look and feel" of those works.

The best way to manage the risks of a copyright infringement claim is for architects and their legal counsel to gain knowledge and understanding of the U.S. Copyright Act. Consultation with an intellectual property attorney is strongly recommended. However, it is a good idea to familiarize yourself with the information on the U.S. Copyright website (www.copyright.gov). In particular, architects may want to download the following circulars:

- Circular 1: Copyright Basics
- Circular 9: Work-Made-for-Hire Under the 1976 Copyright Act
- Circular 40: Copyright Registration for Works of the Visual Arts
- Circular 41: Copyright Claims in Architectural Works

5.2 Entrepreneurial Practice: Starting an Architecture Firm

Derrick Choi, AIA, LEED AP, and Rena M. Klein, FAIA

Twenty-first-century practice requires architects to adopt an entrepreneurial approach dependent on risk-tolerance, self-awareness, and comfort with unpredictability. Starting a firm gives architect's opportunity to leverage talent and drive to create a work-life that is both personally satisfying and financially rewarding.

The Great Recession that began in 2008 has had significant impact on the American design and construction industry. Along with the new tools of twenty-first-century technology, the changing economy is creating irreversible industry transformation. While entrepreneurship has always been part of architectural practice, changes to the business environment have created a new normal, wherein entrepreneurial traits—business acumen, nimbleness, risk-taking, and the capacity to assess opportunities—are increasingly essential for success as an individual professional and as a design firm.

The Freelancer's Union of New York City estimates that nearly one-third of Americans are self-employed, adding up to almost 42 million people. As an advocate and insurance provider for the self-employed, the Freelancer's Union sees entrepreneurial individuals as the true engine of economic growth in the United States. They dub the new normal "the gig economy."

For architects, engaging in the entrepreneurial economy is not new. The 2012 AIA Survey found that 81 percent of architectural firms have fewer than five members, and that these firms employ over one-quarter of all architectural staff. The design and

Derrick K. Y. Choi is principal of XChange Architects. Founded in 2008, his Boston-based practice is committed to addressing architectural and urban design challenges in the public realm.

Rena M. Klein is principal of RM Klein Consulting, author of *The Architect's Guide to Small Firm Management* (Wiley, 2010), and executive editor of the *AIA Architect's Handbook of Professional Practice,* 15th edition (Wiley, 2013).

▶ For more on the findings of the 2012 AIA Firm Survey, see Demographics of Practice: 2012 AIA Firm Survey (2.2) and Navigating Economic Cycles (7.1).

construction industry has been aptly described by Barbara Golter Heller as an "immense aggregation of cottage industries" (*DesignIntelligence*, Greenway Group, 2009). That the industry is still, for the most part, local and diverse in scale creates a myriad of opportunities for entrepreneurial activities. The preponderance of very small firms and self-employed architects is in itself proof that a financially successful and personally satisfying career is possible through starting a firm.

The ability of start-up and small firms to succeed in the new economy has increased owing to a number of factors that enable expanded capacity and reach. These are: Infrastructure, Collaboration, and Global Practice.

▶ Small Firms, Small Projects, and Building Information Modeling (11.3) discusses the benefits, challenges, and best practices of BIM in smaller architecture practices.

Infrastructure: Technology is enabling architects who start their own firms to expand their capacity and the possible types of engagements. The choice to leave a larger firm and go out on one's own does not necessarily mean giving up large projects or participation on the teams that execute them. And working with larger projects or firms does not necessarily require a big operating budget. The evolution of file-sharing technologies, building information modeling (BIM), multiplatform collaboration, and online project communications and management tools have enabled small and start-up practices to quickly develop offices that are cost-effective, flexible, and scalable.

▶ Small Firm Collaboration (5.7) discusses various collaborative models and the keys to successful collaboration among small architecture firms.

Collaboration: New firms can serve as expert consultants, contract production staff, or valued collaborators. Founders of start-up firms have the opportunity to thoughtfully assess their skills, strengths, and areas of interest to determine project opportunities that are a good fit. Depending on the nature of the project team arrangement, firms can often take on discrete tasks or serve in a support role, demonstrating value and expertise.

▶ For related information about this project delivery method, see Architect-Led Design-Build (9.5) and the accompanying backgrounder, Architect-Led Design-Build and Architect as CM for Small Firms and Small Projects.

New firms also have the option of expanding their services to include the construction phase through ongoing collaboration with contractors. For instance, if the founder has the interest and aptitude, incorporating Construction Management into a practice, either as Adviser or as Constructor, is a possibility to expand one's scope beyond the design phase of the project. Architect-Led Design-Build offers the possibility of influence and revenue (commensurate with the additional risk) beyond the design phase of the project.

▶ Practicing in a Global Market (5.8) addresses international design opportunities and the related methodologies and rules of engagement.

Global Practice: Advances in production technologies and telecommunications have greatly improved access to the global design market for firms of all scales. With the appropriate roles and responsibilities, it is possible for a variety of practices to work and compete successfully in the global marketplace. Smaller firms, or those in a start-up mode, with an appetite for international work may want to consider entering the international marketplace as a designer (perhaps in collaboration with a local associate firm), or in a consulting or support role.

XCHANGE ARCHITECTS

In 2008, Derrick Choi, AIA, was presented with a rare opportunity–an unsolicited offer by a former client in the Middle East to serve as a design and planning consultant for a quarter-million square foot airport expansion. Accepting this project, Choi founded his practice, XChange Architects LLC, in July 2008, not fully cognizant of the Great Recession on the horizon.

Choi began his firm with a wide range of experiences in office management, marketing, design and planning, and construction contract administration from a decade of experience working in large firms on complex public projects. He quickly developed a firm that leveraged his accrued knowledge and problem-solving processes developed across various building typologies within the public realm.

While working on infrastructure projects with a national AE firm, he enjoyed the benefits of collaborating closely with people who possessed varied skill sets, experiences, and connections. In his new firm, Choi actively sought to replicate the same collaborative relationships with many of these contractors, consultants, and former colleagues. He pursued this course for two reasons—first, the working relationships and trust built over the years were critical to project success; and, second, the access provided by former collaborators in the public realm work was invaluable.

In the first two years of XChange Architects' existence, Choi didn't have the requisite completed projects in the firm's portfolio to competitively seek out opportunities on his own. He determined that it was more time-efficient and cost-effective to assemble a project portfolio by serving in a subconsultant role to his former business partners, consultants, and colleagues on projects that aligned with his firm's mission. Consequently, his firm's first two years of billings required Choi to be a flexible, competent collaborator, assuming myriad project roles on institutional and public projects, including:

- Code and permitting consultant
- Construction administration staff
- Executive architect
- Master plan consultant
- Peer reviewer/quality control consultant
- Programmer
- Project design staff
- Project management team member
- Sustainability and LEED certification consultant
- Visualization/rendering consultant
- Urban designer

Leveraging Choi's access to aviation client contacts, the firm's initial consulting assignments were international ones—including being a sustainability coordinator for Schiphol International Airport in Amsterdam and a terminal designer and planner in Abu Dhabi International Airport in the United Arab Emirates. Serving in a consultant role helped to build the firm's portfolio quickly, providing a reliable revenue stream in the critical start-up phase, and exposing the firm's staff to project types that were aligned with XChange Architects' mission to work on projects in the public realm.

For Choi, consulting on larger projects and working with others also helped to alleviate many of the initial requirements of building a practice. Serving as a consultant to a larger design and planning firm, Choi could tap into the larger firm's global resources for immediate infrastructural support. The ability to have access to facilities and production support significantly reduced the start-up time and costs for XChange Architects.

Collaboration in larger projects does not necessarily mean giving up complete control. In the case of XChange Architects, proving to be a reliable collaborator, with a deep commitment to providing high quality work products and results, was essential to gaining the trust of fellow collaborators. Striving to be a reliable collaborator at the outset of starting a new firm was also instrumental in gaining good will leading to follow-on work opportunities. Previous good results and good relationships led to more influence over the course of projects. The experience of gaining trust and being afforded room to innovate as a consultant led Choi to similarly offer his project staff and subconsultants more latitude in assignments where XChange Architects was prime.

While in 2012 the transition from consultant to prime contractor was not complete, XChange Architects has been able to capitalize on its firm experience working as a consultant on multiple public projects—libraries, schools, community facilities, and airports—and is now the prime contractor on several new Massachusetts public projects, including a new airport terminal and an urban design and planning project.

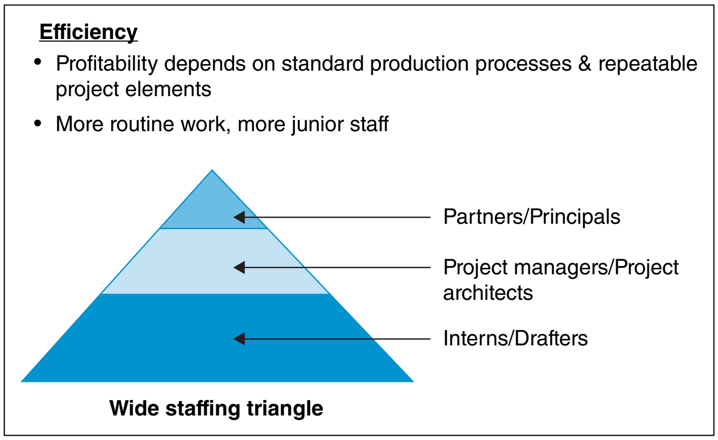
DESIGN FIRM BUSINESS MODELS

When starting a firm, being intentional and strategic about a business model may be challenging. Nevertheless, understanding the options and proceeding with self-awareness is essential. The material in this section was sourced from *The Architect's Guide to Small Firm Practice* (Wiley 2010), by Rena M. Klein, FAIA.

In general, a business model is a plan that articulates what business is being conducted and how the business will generate income. Renowned consultant David Maister, author of many books on management of professional service firms, has identified three business models that are common in organizations that offer professional services: efficiency-, experience-, and expertise-based. Each of these business models can yield growth and profitability, assuming that they are operated appropriately.

Efficiency-Based Firms

Efficiency-based firms are focused on fast and less-expensive project delivery. These firms often specialize in one project type or a narrow range of services and tend to serve clients that are looking for standard solutions and quick turnaround. For example, a small architectural firm that serves residential developers might operate effectively within this "efficiency" model (see Figure 5.1.).



The Architect's Guide to Small Firm Management (Wiley, 2010)

FIGURE 5.1 Efficiency-based Firms Rely on Repeatable Processes.

Because efficiency-based firms do projects with a significant amount of routine work, founders may be able to hire a less experienced person for production assistance as soon as workload permits. This will help to keep production costs down, while freeing the founder to acquire more work. Routine work may also lend itself to having a remote virtual workforce or to subcontracting production work. With repeatable elements and standard processes, project delivery can be streamlined. Profitability is dependent on volume and productivity and is relatively easy to obtain once systems are in place. Sustainable success in these firms requires continuous improvement of work processes and staying current with technology and trends.

Experience-Based Firms

When asked, most small firm leaders will describe their firms as operating within the second business model—experienced-based—and most are correct in their assessment, to a greater or lesser extent. In contrast with efficiency-based firms that have deep experience but engage in routine projects, true experience-based firms are proficient at solving non-routine and complex design problems. While their experience may be in a certain project type, such as public schools or museums, their core competency is the ability to successfully organize and deliver significant and complicated projects. Many successful experience-based firms find they are able to apply their accrued knowledge to a diversity of project types, a strategy that can help weather economic downturns in individual market sectors. (See Figure 5.2.)

Starting an experience-based firm requires a founder to have knowledge and experience in solving complex design problems and serving on teams that regularly execute significant projects. The initial management challenge for this type of firm is to match the project task to the "pay-grade." Much of a design fee can be spent when the founder performs work that could be done by someone with a lower salary. For solo practitioners who have meaningful experience in complex projects, a first hire might be administrative support, rather than production help. This will free the founder to do more billable work and nurture relationships that will lead to more opportunities.

DESIGN FIRM BUSINESS MODELS

EFFICIENCY

- We can do it better, faster, cheaper.
- We do projects that are not complex and have many repeatable elements.
- We employ the latest production technology and continuously improve production processes.

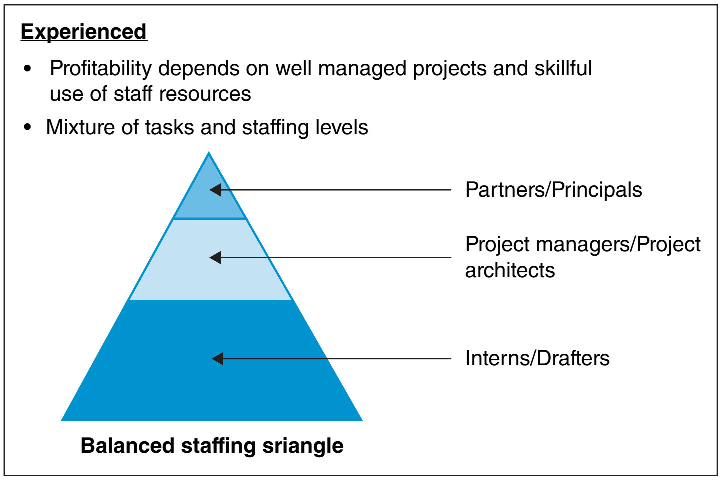
EXPERIENCED

- We know what we are doing.
- We can do unique complex projects by applying our accrued knowledge.
- We leverage relationships to acquire projects and collaborate to deliver them.

EXPERTISE

- We have special knowledge or talent.
- We serve as expert consultants or are design stars.
- We continually work to innovate and to create and acquire new knowledge.

Excerpted from *Architect's Guide to Small Firm Management*, Klein, 2010



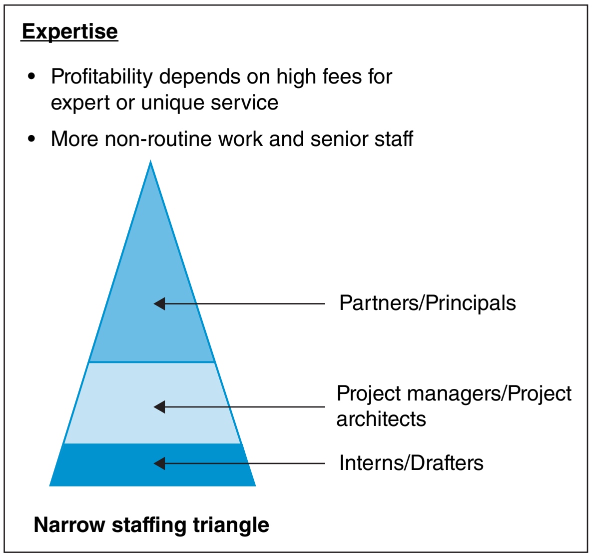
The Architect's Guide to Small Firm Management (Wiley, 2010)

FIGURE 5.2 Experience-based firms Rely on Applying Accrued Knowledge.

Once the workload of a start-up firm grows, hiring a skilled and experienced architect to assist the founder, as opposed to an intern, may be the best practice. This person should be able to manage projects and provide reliable assistance to the founder in delivering complex projects. Virtual collaboration with other experienced collaborators as subconsultants or joint venture partners is also an excellent strategy for project delivery in start-up experience-based firms. Sustainability for experience-based firms is enhanced when they are adept at creating and acquiring new knowledge from doing projects that can be applied to future commissions.

Expertise-Based Firms

Expertise-based firms have service offerings that rest upon deep knowledge and/or exceptional talent. (See Figure 5.3.) These firms include those headed by



The Architect's Guide to Small Firm Management (Wiley, 2010)

FIGURE 5.3 Expertise-based Firms Rely on Deep Knowledge or Unique Talent.

“starchitects,” with their unique style and abilities, or, more commonly, specialists in a narrow band of professional knowledge such as acoustical design or commercial kitchen design.

For founders who have deep knowledge or unique talent, an expertise-based firm may allow a financially successful one-person firm to be established and sustained. Administrative help is advisable to free the principal to complete billable work. However, the straightforward nature of this kind of practice might keep administrative demands to a minimum, allowing the principals to do it themselves. Since most of the work is non-routine, few, if any, middle-level and junior staff are needed to complete the work. More commonly, expert practitioners will partner with experts in their related field to offer a broader range of services. Many also connect with academic institutions that allow expert practitioners the opportunity to teach and facilitate research activities that forward knowledge creation. One- or two-person firms can be very successful using this model since profitability often depends on high hourly rates for services.

Any Project That Comes Through the Door: Opportunistic vs. Strategic

Most design firms will start in an opportunistic manner—a project is offered that allows an architect’s initiative, talent, and training to be exercised and showcased. Whether making the leap from employment by others to being self-employed, or starting a firm because no other option is available, since design services are project-based, having a project to do is usually a prerequisite to starting a firm. This may make the discussion of choosing a business model academic, as the kind of firm being established may be dependent on the job opportunities present in the marketplace. Given this reality—an environment where it appears that all opportunities must be explored and accepted—how is it possible to be strategic?

The answer to this question is simple. All opportunities need to be explored, but not all opportunities must be accepted. The interests, skills, and aspirations of the founder must be considered at firm start-up in order to set a course toward both personal satisfaction and financial success.

Nevertheless, accepting any project that comes along can lead to a strong generalist practice and can be a strategic choice in itself. Generalist practices may be particularly successful for firms established in smaller communities, where the work available is likely to be varied in building type and scale. These firms prosper from the broad generalized knowledge they have acquired and can become stable and well-rounded. The downside of this strategy for many practitioners and start-ups is that it may limit the depth of professional knowledge acquired over time, leading to fewer opportunities for complex projects. Firms that accept “any project that comes through the door” can become unfocused and spread too thin.

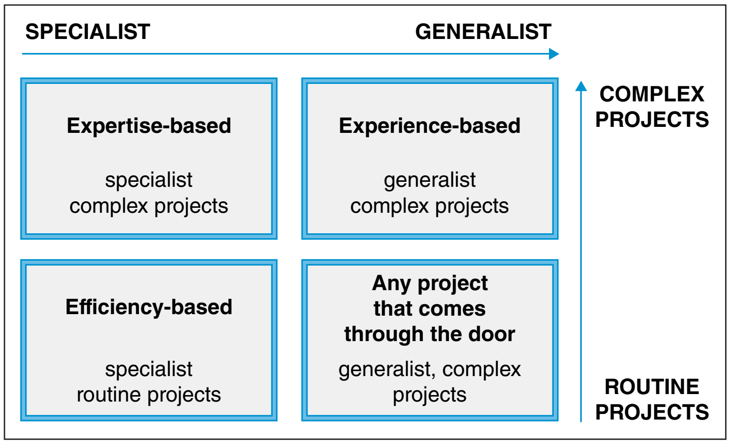
Naturally, the core competencies, personal connections, and interests of firm leaders will attract certain clients and projects even if there is no intentionality. At some point in the firm’s life, especially if firm growth is a goal, a more intentional approach to the firm’s business model will be required. Figure 5.4 illustrates how the business models are formed by the interrelationship between a firm’s level of specialization and its ability to deliver complex projects.

Once a firm’s business model is understood, firm growth or sustainable stability as a solo practitioner or small firm becomes more possible.

START-UP BUSINESS PLANNING

Legal Requirements

There are several choices for a firm’s legal structure regardless of whether a firm is founded by a single individual, a two-person partnership, or a group of owners.



The Architect's Guide to Small Firm Management (Wiley, 2010)

FIGURE 5.4 Business Models for Design Firms Relate to the Level of Project Complexity and Specialized Knowledge Required.

According to the 2012 AIA Firm Survey, 28 percent of all firms were formed as S corporations, making this the most common legal structure among all firms in 2011. This exceeded the percentage of firms formed as sole proprietorships (20 percent). Setting up as a partnership of two or more requires additional considerations besides the legal structure of the firm. It is important to consider the makeup of agreements between those entering a partnership.

► See the backgrounder accompanying this article, Firm Legal Structures, regarding the key factors to consider in choosing or modifying an architecture firm's legal structure.

PARTNER AND SHAREHOLDER AGREEMENTS

Fresh beginnings are exciting. The potential for success can seem a certainty for an enthusiastic new firm starting out. Principals with diverse backgrounds and talents can join forces to create a greater whole, but partners are distinct people who bring their own strengths and weaknesses to a firm. As hard as this can be to envision at the beginning of the new firm, disagreements among partners can ruin a business. In five or ten years, one partner can forget how important the talents of another were to starting a new business, and focus instead on something less positive.

A contract between partners can seem unnecessary when things are going smoothly, but will be a necessity when rough spots arise. Avoiding some conflicts is possible with a partnership agreement that specifies the following:

- Names of all partners, their legal relationships, and their ownership percentage. Some things that help decide who owns how much of a business include who initiated it, who brings the strongest reputation or expertise, who made financial contributions for start-up, and who does what work.
- How compensation and financial earnings are to be calculated and distributed among partners (or owners, if a corporation).
- Financial responsibilities. How will expenses be divided and paid? Who has the right to financially indebt the firm and its principals?
- Decision making and the organizational hierarchy. Determine from the beginning who is in charge and of what. When a partner has a certain skill set or specialized knowledge, responsibility for decisions in those areas can be assigned accordingly.
- Credit for work. Architecture is a creative endeavor. Decide whose name will appear first and any circumstances that might change the order.
- Dispute resolution. If a disagreement does arise, everyone will know in advance whether it will be resolved through earnest discussions, arbitration, mediation, or a court of law.
- What happens when a partner is sick for an extensive period, becomes disabled, or dies.
- How a partner can leave and divest his or her interest to the remaining partners.
- The procedure for bringing in new shareholders.

Reprinted from the AIA *Handbook* 14th edition, "Starting an Architectural Firm," Moreno.

Financial Setup

▶ Chapter 7, Financial Management, further discusses financial terms and financial management systems for the architecture firm.

Financial planning is a vital part of getting ready to open a new firm. Key tasks in the financial setup of a firm may include the following:

- Selecting and setting up an accounting system
- Establishing tax identification and filing status based on legal structure
- Establishing a business bank account
- Engaging trusted professional advisers, including an accountant and attorney, if needed, to help set up legal structure or agreements
- Acquiring start-up funding from outside sources, if necessary

Logistics

Facilities

Since home offices keep overhead low and are eligible for tax deductions, their inherent cost-effectiveness and flexibility is a natural fit for many solo practitioners and start-ups. While individual work settings can be increasingly remote, singularly efficient, and still be fully "connected," many find working alone day after day to be unsatisfying. Firm founders who have recently left a larger firm may miss the collegial company of others during the workday. In addition, the continuing need for face-to-face meetings as part of the project acquisition and delivery process requires most practitioners to have access to conference rooms and meeting spaces.

As founders contemplate the leap from the home office, or options to augment and mitigate its limitations, a number of flexible space arrangements are available for consideration:

Rental Office Spaces or "Executive" Suites: The predominant typology of emerging office arrangements, these are fully furnished, rentable office spaces for hourly, daily, or monthly rental. Office rental arrangements of this type commonly provide offerings beyond the rental of physical workstations, including social/meeting/conference spaces, high-speed Internet bandwidth and connectivity, and telephone and receptionist service, as well as mail handling. However, the typical production necessities of an architect, such as large-scale plotting and scanning, are usually not readily available in executive suites, and there are generally no spaces or accommodations for equipment storage or services like model-making or photography.

Those with a consistent need for meeting space may benefit the most from this kind of arrangement. Sole practitioners, specialty design consultants, and others not providing a full range of architectural services may also find these arrangements beneficial. Since rental costs are typically on a per-use basis, this arrangement can be cost effective.

Virtual Offices: This office arrangement offers users a professional ambience and permanent telephone number with answering services, and in some cases mail handling, while reducing the overhead costs of a traditional office.

As this is not a physical space rental, this amenity is particularly attractive to firms without a dedicated or permanent office space that would benefit from having fixed contact information for calls and mailings. This can provide stability for client correspondences regardless of where the practitioners are. For firms just starting out as well as those exploring multiple temporary or satellite locations, there may be considerable benefits to having a fixed office address and virtual phone line system.

When using an office address located in a state where an architect is not licensed, practitioners should check with the state's Architectural Licensing Board for relevant requirements or regulations.

Coworking Spaces: A work space shared with other professionals, within or outside the design disciplines, is a popular office concept. Unlike executive suites, these workplaces are set up to foster interaction between users. Sole practitioners seeking potential synergies and collaboration with other like-minded industry colleagues, or simply seeking to simulate the congeniality of the office environment, may benefit the most from this space arrangement. Rental costs are typically on a per-use to monthly basis, and can be cost effective with some limitations on the type of work done there. Similar to the rental offices/executive suites, most coworking spaces are generally "plug-and-play," and any equipment storage (e.g., laptops) is typically offered to monthly subscribers. As such, these types of workspaces can be less convenient on a per-use basis.

In many cities, design-focused coworking facilities have been established, such as the Design Annex located in Somerville, Massachusetts. The Design Annex offer amenities that cater to a design office culture, specifically, architecture, graphic design, and web design. In the Design Annex, a dedicated model-making facility encourages a robust range of creative design work.

Some coworking spaces participate in global reciprocity programs that allow their members to use other spaces in the United States and abroad. Under the Co-working Visa Program, the Design Annex allows active members of one space to use other coworking spaces around the world for free for a set number of days.

Shared Office: Subletting office space from an established firm or sharing permanent office space with a number of other sole practitioners is the most conventional of the flexible office arrangements. For the leaseholder, there are some obvious benefits such as sharing overhead (e.g., rent/mortgage, utilities, Internet service, printers, paper, and ink, etc.) as well as having tenants who offer unique skill sets and professional services. More important, if collaboration is encouraged, new tenants may provide access to new markets and clients.

For start-up renters looking for a space requiring limited customization, a shared office space could offer benefits such as reduced start-up time and cost efficiencies. While these arrangements are often short-term, since firms outgrow their shared office space arrangement, some firms may find natural synergies and ultimately consider long-term lease commitments to capitalize on both the cost-sharing benefits and the partnering opportunities.

Infrastructure

Never has the basic operating toolkit for the start-up had such relatively low barriers to entry. Full suites of Internet-based applications can be easily hosted with basic functionality at no cost, and open-source (nonproprietary) applications from sites like Oracle's OpenDocs.org have lowered the historical software acquisition investment costs for new businesses.

Telecommunications tools, such as Skype® Internet phone service and web-meeting services such as GoTo Meeting™, provide relatively low-fee services while considerably improving the lines of global teleconferencing for firms of all scales. Cloud-based data sharing tools like DropBox® allow multiple users to access electronic files from a remote, independently hosted server that is hosted for a monthly fee, thereby alleviating the business owner of the typically higher hard and soft costs of maintaining and periodically upgrading a conventional in-office server.

For project management, new integrated project tracking and management applications can provide a wide range of functionality that could put off the need for dedicated accounting staff as a firm grows. Current design-friendly software such as ArchiOffice™ provides customized project controls for timecards, project scheduling, and project tracking. A complementary accounting application can integrate with ArchiOffice™ for invoicing and expense reporting to clients. For many start-ups, more affordable and less industry-specific small business accounting software, such as Intuit's QuickBooks™, may be adequate.

Financial Resources

Start-up financing is increasingly difficult to obtain as architecture firms and their owners are often required to meet stringent loan eligibility criteria. Without considerable personal savings or personal loans, start-ups need to be wise with their resource allocation and thoughtfully prioritize office start-up investments. While firm IT infrastructure needs can be obtained at a minimal cost, there are still significant financial considerations to address at the outset of setting up a professional services firm, including but not limited to office fixtures and furnishings, licensing and insurance, marketing and business development, salaries (for the founder and/or staff), and supplies.

Traditional sources of small business loans and start-up capital made available through agencies such as the Small Business Administration (SBA) are increasingly limited and not always accessible for many founders of start-up firms. It is recommended that firms contact their local banking institutions that provide SBA loans to determine their eligibility to participate. Typically, there are two types of SBA loans: the basic 7(a) Loan Program, which is the most used type of loan the SBA offers and is available in amounts up to $2 million; and the MicroLoan Program, which specializes in loans for small business up to $35,000. According to the SBA website, their 7(a) Loan Program may be the most inclusive of all their resources, as it provides "financial help for businesses with special requirements. For example, funds are available for loans to businesses that handle exports to foreign countries, businesses that operate in rural areas, and for other very specific purposes."

In the case of new firms without established credit history, it can be difficult to qualify for loans and lines of credit, and, as such, other approaches to gathering start-up financing may need to be considered, including but not limited to these:

1. Secure personal funding and loans through:
   a. Credit cards. This is often the least desirable option, as interest rates are typically quite high and overburdening a balance can adversely affect the guarantor's credit history.
   b. Personal loans. Family, friends, and personal contacts.
   c. Vendors and supplier loans and lines of credit.
2. Securing investors through:
   a. Funding "spin-offs." New independent firms can be financed as offshoots of an existing practice or as a result of a strategic alliance with a larger firm. Sometimes large organizations are interested in funding smaller, start-up firms or even academic research units that can help advance a specific technology or practice initiative that may provide a strategic advantage or unique access to new or emerging markets.
   b. Partnership arrangements. Firm founders may consider negotiating a long-term agreement with future shareholders to consider "sweat equity" in the firm's nascent period. In the start-up phase, potential shareholders could work in exchange for future shares of the practice. It is important for potential shareholders to review all state licensure requirements for firm shareholders and to get any agreements in writing.
3. Secure grant funding through:
   a. Microfinancing or "crowd funding." Grassroots fund-raising, usually via online platforms, from many funders (often in limited and small amount) to support a particular cause, project, or organization.
   b. Not-for-profit organization status. Some firms establish themselves as 501(c)(3) entities, with a focus on public interest and pro bono design work. Organizations of this type tend to be community design centers and these entities typically do not engage in for-profit work.

► See Chapter 4, Public Interest Design, for more on community design centers and socially responsible design.

Marketing

Social media tools provide a means of online communication between the user and a larger audience. With the relative abundance of powerful and popular Internet-based social media applications—specifically Facebook©, Twitter©, Pinterest© and Linked In©—marketing for a start-up is a relatively accessible and cost-effective endeavor. Start-ups can use these social media applications to create a platform for broadcasting updates and virtually any message at the click of a button. Firms considering the relative value of social media should consider at least the following: (1) who is the potential audience, (2) the motivations and objectives behind such a marketing approach and the value of the content being broadcasted through these potentially "viral" media tools, and (3) the commitment and level of effort to maintain these applications. Lastly, it is not uncommon for firms to find themselves networking among themselves, when it may be more effective to fine-tune a social networking strategy that reaches out to a larger public audience, particularly potential clients.

The use of the Internet to market start-ups also includes participation in competitions and other online gallery opportunities. Exposure on multiple Internet sites can increase a firm's visibility on search engines and, ultimately, accelerate a firm's name recognition with relatively little financial investment, if any.

Start-ups with limited marketing budgets may find that participation in civic engagement commitments, AIA events, and public interest design projects may yield meaningful results. This is especially true when volunteer engagement is aligned with a founder's genuine interests. For example, practitioners that are committed to public realm design may be inclined to serve on planning boards and design advisory committees in their local municipalities. These types of engagements can bolster the reputation of a firm and demonstrate the founder's competence and capability to colleagues and potential future clients.

► Chapter 6, Marketing and Business Development, covers effective marketing strategies and methods for architecture firms.

► See Strategic Planning for the Design Firm (5.3), Developing Marketing Strategy (6.2), and Networking and Business Development (6.4) for more on business planning.

Writing a Business Plan

For design firms, business planning can be divided into four primary aspects: purpose, finance, operations, and marketing. Once purpose is understood, plans can be developed within each of the other three functional arenas. Please note that the business plans discussed in this section are not the kind needed for securing a bank loan. Those may have a particular form that is provided by the lending institution. Instead, these business plans are meant as documentation of intentions and the proactive measures designed to accomplish goals. Business planning brings intentionality to the management of a small firm, which is a distinctly different approach than being moved primarily by external circumstances. Much of the material in this section was sourced from *The Architect's Guide to Small Firm Practice* (Wiley, 2010) by Rena M. Klein, FAIA.

Although the components of the business plan appear as distinct parts, in reality they are interconnected. Each aspect is an element of a whole firm system and, as such, they impact each other continuously. Marketing efforts must link closely with aspirations, which often determine operational choices; operational effectiveness will impact financial growth, and market position may determine what is possible financially.

In Figure 5.5, each aspect of the business plan is shown to have each of the other aspects within. For example, consider Marketing—each quarter of the Marketing quadrant is related to one of the four major quadrants. The financial aspect of Marketing is a marketing budget; the purpose aspect of Marketing is alignment of the marketing message with vision; the operations aspect of Marketing has to do with improving job acquisition processes such as the proposal writing; and, finally, the marketing aspect of the Marketing quadrant is outreach to new prospects and forming new relationships.

ELEMENTS OF A BUSINESS PLAN

A. PURPOSE/BUSINESS MODEL
- Philosophy/core values
- Project types? Client types?
- Career contentment and disposition of owners
- Core competence and core weaknesses
- Market opportunities and threats to market position
- Firm size
- Firm future, including transition plan

B. FINANCIAL PLAN
- Financial expectations of owners
- Revenue goals over time
- Operating budget expectations over time
- Profit plan over time
- Scenario plans for firm revenue and staffing over time

C. OPERATIONS PLAN
- Organization structure
- Technology upgrades and integration
- Project delivery model
- Knowledge acquisition and development
- Promotion, recruitment, and compensation

D. MARKETING PLAN
- External market conditions and competition
- Target market
- Key differentiators
- Image and brand
- Relationship-building and networking plan

The Architect's Guide to Small Firm Management (Wiley, 2010)

FIGURE 5.5 Each Box in This Diagram Represents a Different Yet Interconnected Aspect of Business Planning.

Firm owners can customize this diagram to suit their own business plan and update the diagram as some goals are completed and some are altered by external circumstance. This fractal diagram can be used as a tool to plan and track firm development activities over time.

For start-ups, marketing is likely to be the most important aspect of the business plan initially, but marketing is not possible without knowing purpose. It is not possible to effectively deliver projects acquired without holistic knowledgeable operations. Overall profitability will be elusive without financial management. All the parts of business planning are interconnected.

ENTREPRENEURIAL PRACTICE

Self-Awareness

As a founder, the key to successful strategic and opportunistic choices is self-knowledge in two key areas: level of comfort with collaboration and tolerance for risk. Founders with self-awareness and integrity about these two issues can successfully shape a firm based on their own values and proclivities, using their understanding of self as a primary firm design criteria.

▶ Qualifications, Proposals, and Interviews (6.5) discusses approaches to RFPs and preparation for short-list interviews.

In the race to win work, keep staff billable, and build up a firm's portfolio, founders should assess the advantages and disadvantages of pursuing or accepting certain projects or tasks. This underscores the importance of being strategic about identifying assignments that reinforce the firm mission or help build the firm's brand and identity. Eugene Kohn, Founder and Chairman of KPF Associates, frequently recounts advice given to him by a friend during the recessionary times of the mid-1970s: "Your success will be measured by the work you turn down."

Level of Comfort with Collaboration

How much trust and how much control feels comfortable to a firm's founder is a function of personality and inclinations. The comfort zone will vary for different types of decisions; for example, a founder may feel comfortable collaborating on project management, but not allow collaboration on design decisions.

In control-centered practices, architects keep a tight rein on information, knowledge, and drawings (or models), sharing only the minimum necessary for subconsultants to perform their work. In collaboration-centered practices, information, knowledge, and drawings (or models) are readily shared and the entire team participates, to varying degrees, in the co-creation of the design.

Founders with a high degree of comfort with collaboration have the opportunity to participate on collaborative teams, either as a leader or an expert contributor. In addition, a highly developed interest in collaboration may lead to joint ventures with other firms, or participation in emerging project delivery methods such as Integrated Project Delivery (IPD). Founders who enjoy collaboration are likely to have success in growing their firms through cultivating an empowered and engaged staff.

▶ See Small-Firm Collaboration (5.7) for more on collaborating with other design firms.

Founders who prefer a more controlling style may choose to be solo practitioners or leaders of very small firms where they can track everything and be completely in charge. Firms such as these can also be successful, especially when the founder has specialized knowledge, unique talent, or access to high margin markets. Being a solo practitioner or leading a very small firm can also be the choice of those who enjoy external collaboration but prefer to do much of the internal project work themselves.

Clearly, there is a spectrum of practitioners within the boundaries of both extremes, but firm founders who have self-awareness about their place on this continuum are more likely to acquire and execute their projects with integrity—to say what they mean and to mean what they say. In addition, self-awareness about level of comfort with collaboration will help to unapologetically develop a firm that truly takes advantage of the founders' strengths.

Risk Tolerance

Starting a firm is risky. Architectural firms operate in an environment of unpredictability where success or failure is not solely predicated on the talent and effort of the founder(s). There are ways to mitigate unpredictable risks, such as purchasing professional liability insurance and planning contingencies on projects. Practice risks can be mitigated through the careful choice of clients and projects and by following best practices in terms of agreements and documentation.

Other risks must be accepted as inevitable, with corresponding actions taken to prepare for these risks. For example, there is likelihood that the founder's personal income may be very low in the first few years of firm operations. Founders should be prepared to partially fund their own salaries for at least 12 months and for various periods of time throughout the life of the firm.

In addition, founders must be able to provide health insurance coverage for themselves and their employees. The Affordable Care Act is expected to increase health care insurance options for individuals and as such may be beneficial to those starting a firm. As an illustration of the effects of health insurance costs on starting a business, a study by RAND corporation (*Is Employer-Based Health Insurance a Barrier to Entrepreneurship*? [RAND, 2012] by Robert W. Fairlie, Kanika Kapur, and Susan M. Gates) found that an increase in entrepreneurship at age 65 is attributable to eligibility for Medicare.

Because of the need to self-fund benefits that are usually supplied by employers, minimizing other kinds of overhead will help mitigate the financial risks incurred. If a person is uncomfortable with the notion of not receiving a predictable paycheck at regular intervals, and with providing their own insurance and retirement savings, being self-employed will be very difficult.

Architects who feel uncomfortable with the unknown— "Will the phone ever ring again?"—may find self-employment to be overly stressful. Many deal with the unpredictable nature of practice by simultaneously engaging in other endeavors that supply more reliable incomes in more predictable time frames, such as teaching, or becoming a construction management adviser or building inspector.

▶ Risk Management Strategies (16.1) and the accompanying backgrounder, Risks in Design, discuss strategies for calculated risk taking.

Despite the risk, many find the rewards of autonomy, the opportunity to design, and the ability to self-determine one's work life to be well worth it.

Why Firms Fail

Data collected by the Small Business Administration between 1992 and 2002 indicates that less than a third of new businesses started in 1992 survived their first decade of existence. Martin Zwilling, a venture capitalist and contributor to *Entrepreneur* magazine, has developed a list of 10 reasons why first-time entrepreneurs fail ("10 Top Reasons Why First-Time Entrepreneurs Fail," *Entrepreneur*, September 2012):

- Lack of or inability to execute a business plan
- Slim or no-revenue pro forma (projections)
- Limited business opportunities
- Inability or ineffectiveness in execution
- Too much competition
- Limited or lack of valuable intellectual property
- Inexperienced team/staff
- Underestimating resource requirements
- Lack of marketing
- Lack of resilience—giving in too early

The list may be helpful to consider as an internal checklist for architects about to start their own firm. Most of the items can be addressed through careful planning, realistic assessment of strengths and opportunities, and thoughtful self-awareness. Writing a business plan that includes an operations and financial plan is one way to bring discipline and careful preparation to the endeavor. Architects, who are trained as planners and designers, can bring their abilities to the creation of their firms. No architect would consider designing a building without a purpose, site, structure, or budget. Starting a firm without articulating the mission, markets, project execution, or potential revenue stream is equally foolish. Considering these issues early in the firm planning process and throughout its start-up phase is the key to sustainable success.

CONCLUSION

Like the design of a custom home, starting a design firm presents the opportunity to create a business entity and firm culture that truly reflects the strengths, tendencies, and proclivities of its founder and by extension, its staff. The skills architects apply to their work as design professionals should be used to plan the start and ongoing evolution of their firms. Designing a firm entails considering financial goals, purpose, size, optimal structure, business development strategy, and the best possible integration of the interest, skills, and aspirations of its founders. While there may be no formulas, secret techniques, or consultants that can deliver a custom-designed practice, one's awareness of self, knowledge of the basics of running a business, and understanding of the drivers of change are important first steps in the journey. Recognizing trends and patterns at the global, organizational, and interpersonal levels offers founders an insight into the potential for firm development and a growth strategy.

Planning a new design practice, like planning a new space, also entails the consideration of sustainability, something that can stand the test of time. In the midst of change and unpredictability, it is important that founders prioritize personal values and preferences that will lead to professional satisfaction, which in turn is closely connected to potential for profitability. Therefore, a key aspect of founder self-awareness is an understanding of how success and satisfaction in their work is defined.

When thinking about starting a firm, consider the following:

- How important is financial success?
- How much money is enough?

- How will direct and indirect value of firm output be measured?
- How important are name recognition and design awards?
- Does success include "doing good" for the local community?
- Does success include having a healthy and contented office culture?
- How important is fun and creativity in the firm?

Firm founders, in shaping their practice, should consider these personal factors along with external realities such as demographics, global practice, overall economic health, target market project opportunity, and the firm's role in civic engagement. Appreciation of these trends in unpredictable times is essential for firm founders to navigate through uncharted territory in the New Normal.

In some ways it has never been easier, or perhaps more necessary, to start one's own firm. The advent of "telecompanies" ("When Job-Creation Engine Stops at Just One," *New York Times*, Oct. 04, 2012) allows solo practitioners to expand their capacity with a flexible virtual workforce. Web- or cloud-based IT infrastructure and new advances in business administrative support expand capabilities at a low cost. Furthermore, social media is providing a new and unprecedented ability to reach out to and engage potential clients and collaborators. Entrepreneurial architects who are self-aware, risk tolerant, and have a vision of how their offerings can fit into the marketplace have a unique opportunity to reap the benefits of designing their own work-life that is both personally satisfying and financially rewarding.

BACKGROUNDER

FIRM LEGAL STRUCTURES

Jay Wickersham, FAIA

This backgrounder describes the most commonly used legal structures for architectural firms, and key factors to consider in choosing or modifying a firm's structure (Table 5.1).

Jay Wickersham is a founding partner of the Cambridge, Massachusetts, law firm Noble & Wickersham LLP, and a lecturer at the Harvard Graduate School of Design, where he teaches courses in the history, law, and ethics of practice.

Every architect who establishes an independent practice should consider creating a separate legal entity to serve as the framework for practice. What we commonly call a "firm" can take on many different legal forms, from sole proprietorship to partnership, limited liability partnership (LLP), corporation, or limited liability company (LLC). Even a sole practitioner can create a corporation or LLC as the vehicle for practice. What follows is an overview of the most commonly used legal structures for firms and factors to consider in choosing and shaping an entity.

The laws governing legal entities, and their availability for architectural practice, vary from state to state. The choice of entity can also have important financial and tax implications. A practitioner should always obtain legal and accounting advice to guide the process of creating or modifying an entity.

CHOICES OF LEGAL STRUCTURES FOR PRACTICE

Sole Proprietorship

An individual architect who has not taken any formal action will, by default, be considered to be practicing as a sole proprietor. A sole proprietorship may be given its own name, but in legal terms it has no independent identity. Because the owner does not enjoy any liability protection, all of his or her

(continued)

personal assets are at risk if there is a claim. From a tax perspective, a sole proprietorship is a disregarded entity; it does not file a return or pay tax, but instead all of its income and losses are reported on the owner's tax return and are taxed only there. A sole proprietorship dissolves upon the owner's death.

General Partnership

Two or more architects practicing together may be deemed to be practicing as a general partnership—regardless of whether they have taken any formal legal steps. Every state has passed a law that is a version of the Uniform Partnership Act, defining baseline assumptions about ownership and control of a partnership. However, it is extremely important for architects who intend to create a partnership to draft and sign a written partnership agreement that sets out the detailed terms of their association. In a general partnership, all of the partners actively participate in management. (Limited partnerships are generally used as investment vehicles and not for professional services; limited partners have an ownership share, but only limited management roles.) Each general partner is potentially liable for the actions of the other partners; a partner's liability may extend beyond one's partnership interest, to reach the partner's personal assets as well. A general partnership does not pay federal taxes; each partner's share of income and losses is passed through and reported on the individual's tax return.

Limited Liability Partnership (LLP)/Professional LLP

Most states have passed laws that permit the creation of a partnership variant known as an LLP. In general, LLPs offer liability protections that are not available to general partnerships; the personal assets of partners, other than their ownership interest in the LLP, are protected against liability for business claims against the partnership, except in the case of fraud or other extreme wrongdoing. But partners typically remain liable for their own professional negligence, even when acting on behalf of the LLP. In addition to a written partnership agreement, the governing documents for an LLP will include an LLP certificate filed with the Secretary of State's office.

In many states, architects can only practice through a *professional LLP,* which may be subject to further restrictions on ownership, liability protection, and insurance (see the accompanying chart for further details).

Business Corporation

The most common form of legal entity for an architectural firm is the business corporation. All corporations have three levels of participants:

- Stockholders are the owners of the corporation, with their ownership evidenced by shares of stock.
- Directors are elected by the stockholders, and have a fiduciary duty to act in their best interests. They are responsible for broad policy decisions.
- Officers are elected by the directors; they carry out the day-to-day management of the corporation.

Stockholders' personal assets, other than their ownership interest in the firm, are protected against liability for business claims against the corporation, except in the case of fraud or other extreme wrongdoing. But stockholders typically remain liable for their own professional negligence, even when acting on behalf of the corporation. The governing documents for a corporation will include articles of organization filed with the Secretary of State's office, and written corporate bylaws.

Within the category of business corporation, there are two broad subcategories.

Publicly Traded/Subchapter C Corporation

A handful of architectural firms are so large that their stock is publicly traded on a stock exchange. In publicly traded corporations, the controlling ownership interest is typically held by outside stockholders who are not actively involved in management of the firm. There is limited overlap among stockholders, directors, and officers. Publicly traded corporations pay corporate taxes on their income; their after-tax profits can then be passed through to the stockholders in the form of dividends, to be taxed a second time on the stockholder's individual tax return. (This system of double taxation is defined in subchapter C of the Internal Revenue Code—hence the name of this type of corporation.)

Closely Held/Subchapter S Corporation

Most architectural firms that choose the corporate form of entity are what is known as "closely held corporations"—they are owned by stockholders who are actively engaged in the practice, and some or all of the stockholders also act as corporate directors and officers. To ensure that ownership of a closely held corporation does not pass to outsiders, the stockholders will typically execute a stockholders agreement that contains restrictions on the transfer of stock. Under subchapter S of the Internal Revenue Code, corporations with no more than 100 stockholders, all of them being U.S. citizens or resident aliens, may elect not to pay federal taxes; instead, profits in the form of dividends, and limited amounts of corporate losses, are passed through and reported on the individual stockholder's tax return.

Professional Corporation

In many states, architects may elect a special form of entity known as a professional corporation. Because professional corporations are subject to further restrictions on ownership, liability protection, and insurance (see the chart for further details), they are rarely selected in states where architects may also practice as a business corporation. In a small number of states, the professional corporation is the only corporate entity permitted for an architectural firm.

Limited Liability Company (LLC)

The LLC is a form of legal entity that has come into widespread use in the past 20 years, following the passage of enabling laws in all 50 states. An LLC has two levels of participants:

- Members are the owners of the LLC.
- Managers are elected by the members, and have a fiduciary duty to act in their best interests. They are typically responsible for both policy decisions and the day-to-day management of the LLC.

Members' personal assets, other than their ownership interest in the firm, are protected against liability for business claims against the LLC, except in the case of fraud or other extreme wrongdoing. But members typically remain liable for their own professional negligence, even when acting on behalf of the corporation.

As with corporations, most architectural firms that choose the LLC form of entity are "closely held"; they are owned by members who are actively engaged in the practice, and who may also act as managers. Under the Internal Revenue Code, an LLC may elect to be treated for tax purposes as a sole proprietorship (if it has only one member), as a partnership, or as a corporation. If it elects sole proprietorship or partnership treatment, it will not pay federal taxes; instead, a member's share of income and losses are passed through and reported on the individual's tax return.

In many states, architects can only practice through a professional LLC, which may be subject to further restrictions on ownership, liability protection, and insurance (see the chart for further details).

ADDITIONAL CONSIDERATIONS

Government filing requirements—Secretary of State's offices. In order for an LLP, corporation, or LLC to come into legal existence, it must make an initial filing with the office of the Secretary of State (or comparable agency) in the state in which it has been formed, and pay the required filing fee. Entities must also file annual reports, or they run the risk of being dissolved. Sole proprietorships and general partnerships do not need to make these filings.

Firms are increasingly being required to make comparable filings as out-of-state ("foreign") entities with the Secretary of State's office in all states in which they practice architecture. These filing requirements are distinct from the firm practice requirements defined by the state architectural registration boards (see chart).

Government filing requirements—State architectural registration boards. Although architects are universally aware that they must become individually registered by each state in which they practice, many are not aware that in most states, in-state and out-of-state ("foreign") firms are also subject to legal requirements set forth by the state's architectural registration board. In most states, a firm must make a filing with the registration board and obtain a certificate of authorization (COA), or comparable document, before it can practice. Even those states that do not issue a COA typically impose requirements upon firm practice. Registration boards may require the registration of owners and/or managers, in the home state and/or the state of practice; they may also limit or ban certain types of legal entity, or even set rules for names under which a firm may practice.

Actions on behalf of the firm. To maintain liability protections, all formal actions of a firm (signing contracts and other legal documents, issuing letters and drawings, etc.) should be taken in its name, so that parties with whom it deals are put on notice that they are dealing with an independent legal entity and not an individual.

Informal management practices versus legal responsibilities. It is common for architectural firms to give key employees titles such as "principal" or "associate." Such titles may accompany well-defined responsibilities for project and/or firm management. Firm owners should carefully review such informal management titles and practices, to see that they are appropriately coordinated with the responsibilities set forth by law for management of the chosen form of legal structure.

TABLE 5.1 Summary of Legal Structures

	Ownership	Management	Liability Protection for Personal Assets	Tax Treatment	Secretary of State Filings	State Registration Board Filings/ Requirements
Sole Proprietorship	Individual practitioner	Individual practitioner	None	Does not file federal return or pay taxes—income/losses passed through to individual owner	None	Typically not required
General Partnership	Partners	Partners	None	Files federal return, but does not pay taxes—income/losses passed through to individual owners	None	Many states require certificate of authority (COA): varying requirements for licensing of partners

(continued)

TABLE 5.1 ***(continued)***

	Ownership	Management	Liability Protection for Personal Assets	Tax Treatment	Secretary of State Filings	State Registration Board Filings/ Requirements
Limited Liability Partnership (LLP)	Partners	Partners	Partners may be personally liable for their own professional negligence, but are typically protected against other claims (except for fraud and other extreme wrongdoing)	Same as above	LLP certificate, for formation state and foreign states	Same as above; some states permit only professional LLPs (see below)
Professional Limited Liability Partnership (LLP)	Partners—all must typically be licensed	Partners—all must typically be licensed	Same as above	Same as above	Same as above	Many states require COA: all partners must typically be licensed; LLP may need to carry minimum level of professional liability insurance (PLI)
Subchapter C Corporation	Stockholders	Directors, officers	Stockholders may be personally liable for their own professional negligence, but are typically protected against other claims (except for fraud and other extreme wrongdoing)	Files federal return, pays taxes; profits passed through as dividends to stockholders, who pay double taxation on individual returns	Articles of organization, for formation state and foreign states	Many states require COA: varying requirements for licensing of stockholders, directors, and officers; a few states permit only professional corporations (see below)
Subchapter S Corporation	Stockholders (no more than 100, who must be U.S. citizens or resident aliens)	Directors, officers	Same as above	Files federal return, but does not pay taxes—income (and some losses) passed through to individual stockholders	Same as above	Same as above
Professional Corporation	Stockholders—all must typically be licensed	Directors, officers—all must typically be licensed	Same as above	Same as above	Same as above	Many states require COA: all stockholders, directors, and officers must typically be licensed; corporation may need to carry minimum level of PLI
Limited Liability Corporation (LLC)	Members	Managers	Members may be personally liable for their own professional negligence, but are typically protected against other claims (except for fraud and other extreme wrongdoing)	If LLC selects, partnership treatment, files federal return but does not pay taxes—income/losses passed through to individual owners	LLC certificate, for formation state and foreign states	Many states require COA: varying requirements for licensing of members and managers; a few states permit only professional LLCs (see below)
Professional Limited Liability Corporation (LLC)	Members—all must typically be licensed	Managers—all must typically be licensed	Same as above	Same as above	Same as above	Many states require COA: all members and managers must typically be licensed; LLC may need to carry minimum level of PLI

5.3 Strategic Planning for the Design Firm

Raymond Kogan, AIA, and Cara Bobchek

If firm leaders want to achieve something they've never had before, they must do something they've never done before. Through strategic planning, firm leaders can envision the future of their firm, and then implement strategies and action plans that will help the firm achieve positive results.

WHY BUSINESSES USE STRATEGIC PLANNING

Strategic planning involves thinking about the future. Companies large and small use strategic planning to envision their objectives for the future and lay out the steps they will take to achieve them. The strategic planning process begins with envisioning a desired future state of the firm, a destination toward which the plan itself will plot a course for the firm to follow. If this vision for the future is considered the destination of the firm, then the strategic plan provides the road map to reach it.

The purpose of strategic planning is to create positive changes and outcomes for a firm that aligns with its values and professional aspirations. In its strategic plan, a firm can articulate its fundamental mission, describe its long-term vision, and address its issues, initiatives, and goals in management, operations, and other crucial firm functions. The strategic plan is different from a marketing plan or a business plan in that it typically encompasses a broader scope of topics over a longer period of time, combining long-, mid-, and short-term strategies and action plans.

Architecture firms—from sole practitioners to large multinational firms—can prepare for, understand, and respond to the dynamics of the ever-changing economic, social, and political environment in which they practice: They can plan for change, which is inevitable, and design their own futures through strategic planning. Business studies confirm that companies and organizations in any industry that employ strategic planning tend to be more successful than firms that do not.

A good hockey player plays where the puck is. A great hockey player plays where the puck is going to be.

Wayne Gretzky, National Hockey League record-holder for Most Career Points Scored

A STRATEGIC PLAN FOR FRANKLIN & ASSOCIATES

Throughout this article, the development of a strategic plan for a fictional firm, Franklin & Associates, will be used to illustrate the process described herein. Franklin & Associates is an architecture and interiors firm with two offices in the Pacific Northwest. The firm engages mainly in K–12 education projects, with occasional work in higher education and civic buildings. The firm was founded 25 years ago by Leigh Franklin, who remains the majority owner; he plans to retire in the next 5 to 10 years. The firm is experiencing changing dynamics in its key market sector and has had difficulty in sustaining its once steady growth, having peaked at a staff size of 18 people and recently downsized to 12 people.

Raymond Kogan is a management consultant and architect with more than 35 years of experience. He founded Kogan & Company in 2004 to advise design firms nationwide in strategic planning.

A senior consultant with Kogan & Company, Cara Bobchek has 30 years of experience working with design firms in strategic planning, marketing and communications, and market research.

"Would you tell me, please, which way I ought to go from here?"

"That depends a good deal on where you want to get to," said the cat.

—Lewis Carroll, Alice Through the Looking Glass

ELEMENTS OF THE STRATEGIC PLAN

Firms that employ strategic planning use the strategic plan as a management tool, making all of their key decisions within the context of moving toward a carefully thought-through vision that they wish to reach. The elements of a strategic plan, each of which is discussed in more detail in this section, are as follows:

- Mission
- Vision
- Issues and Initiatives
- Goals
- Strategies
- Action Plans

DESIGNING A FIRM

In strategic planning, a firm has the opportunity to design its future. The process is comparable to the steps that an architect takes to design a new house (or most any project):

PROGRAMMING

At the outset of an engagement, the architect meets with the client to determine the functional and aesthetic needs and desires for the project. This prelude to design relates to the first step in strategic planning: an objective analysis of a firm to identify the key *issues and initiatives* that affect its ability to succeed.

SCHEMATIC DESIGN

Next, the architect exercises their creativity and translates the building program into images in the form of renderings, conceptual plans, and elevations; the house begins to take shape. This first design step is comparable to the big-picture and creative process of developing a firm's long-term *vision*. At this phase in strategic planning, a firm may also develop a *mission statement* as an expression of its primary purpose for being in practice.

DESIGN DEVELOPMENT

To make the conceptual design more detailed and understandable, the architect refines the plans and elevations, describing basic building systems and materials, and more actively involves other specialists, such as engineers, in the process. This midterm design phase parallels developing specific *strategies* to undertake, as well as setting measurable, quantifiable *goals* to achieve in order to move toward your firm's vision.

CONSTRUCTION DOCUMENTS

The house cannot be built—at least not easily or accurately—from design development documents, so the architect next produces detailed construction documents. These give the contractor a set of instructions to convert the two-dimensional concepts into three-dimensional reality. This step is parallel to developing specific *action plans* that make the strategies tangible and actionable. These nuts-and-bolts action plans will be just as detailed as a set of construction documents, with each task assigned to a responsible champion with an agreed-upon deadline.

CONSTRUCTION CONTRACT ADMINISTRATION

The house isn't complete when the construction documents are prepared. The architect still needs to monitor the construction so that the project achieves its original objectives. The architect holds meetings with the owner, contractor, and subcontractors, and assesses progress to make sure that everything is being done as prescribed, or sees that, if a change is necessary, it is *implemented*. In strategic planning, a firm will also continue to manage progress toward its goals through regular meetings of the strategic planning team, assessing progress toward completing action items, adjusting the course when necessary, and also *communicating* with all employees that the firm is making deliberate forward motion toward the vision.

The parallel elements of project design and strategic planning line up neatly (see Table 5.2).

TABLE 5.2 How the Design of a Project Compares with the Strategic Planning Process

Designing a Building	Strategic Planning
Programming Determining the client's needs	**Issues and Initiatives** What works, what doesn't work, and what opportunities lie ahead?
Schematic Design Creative, big-picture concepts	**Mission** Purpose of the firm **Vision (long-term)** The firm's aspirations for the future
Design Development More defined building systems	**Goals (midterm)** Quantifiable, measurable targets **Strategies (midterm)** Good ideas to push the firm in the right direction
Construction Documents Detailed drawings and specifications	**Action Plans (short-term)** Who is going to do what, and by when?
Construction Contract Administration Assessing and maintaining progress	**Implementation and Communication** Sharing the plan and keeping it on track

Mission

By capturing the essence of a firm, a mission statement provides employees, as well as the marketplace, with a common understanding of the firm's purpose. Many firms find that a mission statement helps to rally everyone in the firm under one "flag." Any size firm may adopt a mission statement; for a smaller firm or sole practitioner, a mission statement can be an effective way to express the identity of the practice and the practitioners, lending a greater sense of permanence.

If a firm chooses to adopt a mission statement, it should be:

- Meaningful and unique to the firm.
- Inspiring and positive.
- Timeless—which means it is worth taking the time to wordsmith.
- Memorable—and therefore brief.
- Sincere—avoiding management clichés and buzz words.
- Reflective of the core values, both personal and professional, of the firm founders/leaders and the firm as a whole. Many firms, large and small, express core values as the driving motivator for their choice of vision, clients, projects, and employees. Core values may relate to topics such as sustainability, diversity of the staff, community involvement, and approach to conducting business, among others.

Because the mission statement represents the identity and purpose of the firm, employees should feel a sense of ownership in it. Therefore, it's important that the leadership of the firm models the intent of the mission statement in their everyday actions.

Vision

While a firm's mission statement is intended to stand the test of time, the vision is time-oriented. The vision describes a specific long-term future that the firm would like to reach, the destination toward which the strategic plan will serve as a road map. The vision should be evocative and inspiring, ambitious yet realistic, multidimensional and descriptive.

As a long-term description of the firm in the future, the vision should be a 5- to 10-year objective. Most firms find that 5 years is a comfortable long-term planning horizon, far enough into the future to be truly visionary as well as to provide enough time to achieve it, yet not so distant as to be too esoteric.

A firm's vision may address many items, including the following:

- Optimum organizational structure
- Services offered
- Client-type markets served
- Geographic presence
- Number of employees
- Revenue and profit goals
- Leadership
- Ownership philosophy and structure
- Culture and working environment
- Project delivery
- Technology
- Any other topics that describe the firm as it is desired to be at a point in the future

FRANKLIN & ASSOCIATES' STRATEGIC PLAN: MISSION AND VISION

MISSION

Through the environments that we design for teaching children, teachers, administrators, and community members, we shape future generations of highly educated adults.

VISION

In five years, Franklin & Associates will:

- Have grown to a staff size of 20, with two offices in the Pacific Northwest
- Derive 20 percent of our revenue from our growing higher education market sector
- Have transitioned ownership from our founder to three to five next-generation leaders
- Be named among the "Best Places to Work" by the major business publication in each city in which we have an office, setting an industry standard for recruiting, retention, and employee development

Smaller firms need a well-articulated vision as much as larger firms do. Sometimes, because of fewer underlying resources a smaller firm may take on virtually any type of work, and may, as a result, after some time lose a sense of direction. Looking ahead to the future of the firm in five or more years can provide a clear direction as well as a focus for a smaller firm leader's decision making, just as it does for a larger firm.

Firm leaders need input into and enthusiastic support for their vision and should share that vision with everyone in the firm. The vision will serve as a touchstone for the firm as its leaders and managers make key strategic decisions. As the foundation of the firm's strategic plan, the vision deserves focused attention and deep thought, as it sets the tone and provides the context for future decision making.

Issues and Initiatives

Issues are obstacles, circumstances, or attitudes—both internal within a firm and external in the world around the firm—that stand in the way of a firm's achieving its vision. *Initiatives* are positive ideas and activities that would propel a firm toward its vision. A firm should base its strategic plan on the key issues that it must address and the key initiatives that it will undertake in order to reach its stated vision.

It takes research, courage, and an open mind to uncover and fully understand a firm's key issues and initiatives. The best approach to identifying the key issues and initiatives for the firm is to begin by interviewing managers, selected staff members, and clients of the firm. Query them regarding the strengths of the firm—the things that should be preserved and built upon to achieve the vision—as well as the challenges or obstacles that are facing the firm. Then look for the patterns and trends in their responses, which should point to the key issues and initiatives. Prioritize the identified issues and initiatives in developing the plan. Sometimes it can prove difficult, or even unfeasible, for a person inside the firm to ask probing questions of other managers or staff members in the firm. Therefore, many firms engage a third-party consultant to conduct this type of investigation in order to elicit truly candid thoughts and process them objectively.

In addition to this valuable input from the firm's managers, selected staff, and the firm's clients, consider supplementing the information gleaned with additional research, especially into external trends and drivers that affect the firm's clients' businesses. The "Preparing for Strategic Planning" section of this article, which follows, contains more ideas for research avenues to explore.

To maximize the value of strategic planning, it is best to capture all of the findings from the various sources of input—internal interviews as well as external market research—in a written report. With this report, the participants in the process will be fully aware of the firm's collective thinking as illustrated in their comments about their vision and the strengths and shortcomings of the firm. And by providing verbatim quotes, there can be no dispute about any subjective interpretation of people's thoughts. This level of candor, as captured in the report, will substantiate identifying the firm's key issues and initiatives, as well as begin to prioritize them for the strategic plan itself.

In the context of the vision, a firm's strategic plan may address issues and initiatives, including the following:

- Achieving and managing growth
- Strategic market focus
- Prospective client profiles
- Design attitudes and direction
- Organizational structure
- Management roles and responsibilities
- Leadership succession planning
- Ownership transition

- Firm governance
- Marketing and business development
- Financial performance
- Firm financial management
- Employee recruiting, development, and retention
- Changes in project management and project delivery
- Applications of technology
- Adherence to firm values
- Scenarios and contingency plans for the future

It is important to rigorously prioritize the number, complexity, and balance of issues and initiatives that the firm will address in its strategic plan. The greatest obstacle to successfully implementing the plan is taking on more strategies and action plans than the firm can manage. Therefore, when developing the firm's strategic plan, recognize the finite capacity of the firm's management in light of their day-to-day duties, and perform a reality check upon drafting the plan. Asking the following questions will be helpful in performing this reality check:

- What can the firm really afford and allocate the resources to take on vs. what can the firm not afford to take on?
- What can the firm not afford *not* to take on? In other words, what is the most important or challenging item to tackle? If an item is not addressed, is there a good reason not to do so?

Issues and Initiatives for Smaller Firms

Because smaller firms and sole practitioners can be especially susceptible to certain factors and influences, such as the temptation to reactively pursue many types of project opportunities in an effort to bolster revenue, their strategic plans might typically address the following topics:

- *Marketing and business development.* Small-firm leaders and sole practitioners balance many responsibilities. They are often so consumed with "doing" the work and meeting client deadlines that proactive marketing and business development take a back seat. Therefore, it is all the more important for a smaller firm's strategic plan to address a focus on target markets and the specific actions that the firm will take in marketing and business development.
- *Financial management and performance.* Very few architects have formal business training, and smaller firms rarely have in-house financial management capabilities. For these reasons, some small firms lack a strong sense of their business performance. Identifying in the plan just a few key financial metrics to monitor can give small firms a "dashboard" view of their performance, so that they can take corrective steps to improve where needed.
- *Employee development.* Smaller firms must maximize the resources that they can devote to employee development and training, so their strategic plans should call for personal mentoring from the founder(s) and leaders as well as judicious use of highly tailored outside instructional programs. In addition to promoting the progressive responsibility and career paths of employees, an additional—and very important—benefit of mentoring can be that the firm leader(s) will identify one or more people within the firm prepared to succeed them.
- *Succession and transition.* Many smaller firms remain profoundly dependent on their founders and some make little or no preparation for future leadership succession or ownership transition. If the firm founder or leader intends to perpetuate the firm beyond him- or herself, this important topic must be addressed in the strategic plan with enough lead time to identify and develop future leaders as well as execute a mutually profitable ownership transition.

► See Chapter 6, Marketing and Business Development, for detailed discussions of marketing, communications, and business development strategies.

► Ownership Transitions (5.6) further addresses succession and transition planning.

FRANKLIN & ASSOCIATES' STRATEGIC PLAN: ISSUES AND INITIATIVES

- The firm's key market sector of K–12 education is shifting toward a preference for design-build procurement instead of a traditional qualifications-based design-bid-build model.
- The firm's ownership is currently too concentrated to effect an internal ownership transition.
- The firm has difficulty attracting and retaining employees.
- The higher education market sector remains largely untapped by the firm.

GOALS

After identifying and prioritizing the key issues and initiatives to be addressed in the strategic plan, the next step is to set shorter-term (a three-year period is generally appropriate), quantifiable targets that the firm will attempt to reach on the path to its five-year vision (see Table 5.3). Goals should be measurable in some way, whether or not they are financially related, so that the firm can aim for them with accuracy, track progress toward achieving them, and be able to mark when they are achieved.

When setting goals for a firm, set the bar high, making the attainment of the goals a stretch, but keeping them within the realm of the possible. While the types of goals that come to mind most frequently are financial—anything with a dollar sign in front of it or a percent symbol after it—some areas in which goals may be applicable are as follows:

- Revenue generation, both net and gross revenue
- Profitability, usually expressed as profit margin as a percentage of revenue
- Number of employees
- Number of offices
- Approximate market share
- Diversification into specific new markets
- Achievement of specific number of LEED-certified buildings or accreditation for professionals within the firm
- Employee turnover
- Marketing hit rates, both proposal to short list and short list to win

Goals are just as meaningful to smaller firms as they are to larger firms. While the number of actual goals may be fewer, setting the bar and marking a path toward the firm's vision is especially important in small firms, considering the unpredictable path that they can take through their business lives.

STRATEGIES

After setting midterm goals, the next step in strategic planning is to commit to general strategies. Strategies are the new directions and attitudes that the firm will pursue in order to reach its vision, the good ideas that the firm will adopt to address its issues, enact its initiatives, and achieve its goals.

TABLE 5.3 Franklin & Associates' Strategic Plan: Goals

Franklin & Associates' Three-Year Goals	Year 1	Year 2	Year 3
Net Revenue	$1.5 million	$1.8 million	$2.0 million
Staff Size	12	14	16
Ownership Distribution	1 owner	2 owners	3 owners
Employee Turnover Rate	15%	12%	10%
Number of LEED-Accredited Professionals	2	4	6
Number of Qualified Resumes Received/Month	2	3	5

The strategic planning team should brainstorm strategies to address an issue, enact an initiative, or achieve a goal. As the team discusses a given issue facing the firm, the participants should ask themselves, "What are we going to do about it?"

It's imperative that in developing strategies the firm is open to accepting and embracing constructive changes. This may mean doing things that the firm hasn't done before, or ceasing to do things that the firm has always done in the past. As strategies are brainstormed, recognize that they represent investments—of time, money, energy, attention, or other resources—in the firm's future, and consider the implications of these investments individually and collectively.

The strategies to which the firm commits will depend on the issues and initiatives to be addressed in the strategic plan. Reflecting the more limited resources available, strategic plans for smaller firms should typically contain fewer—but still high-impact—strategies and action plans. Some examples of issues, initiatives, and topics regarding which a firm's planning team might brainstorm strategies are shown in Table 5.4.

As the planning team develops the good ideas that the firm will include in its strategic plan in order to achieve the vision for the future, it is important to keep the thinking at a high, strategic level. For example, issues surrounding an individual manager or day-to-day firm administrative or housekeeping matters, such as the need to resurface the parking lot, are not strategic issues, while a program to

TABLE 5.4 Examples of Issues, Initiatives, and Strategy Development

If the firm's issue is related to…	The strategies might consider…
Strategic market focus	Market trends and potential Current capabilities Competitors
Organizational structure	Staff size goals Internal project delivery processes and client/market project delivery trends Geographic or multi-office considerations
Management effectiveness	The firm's optimal organizational structure Roles, responsibilities, compensation, and accountability
Leadership succession planning	Organizational structure Training and development Recruiting

develop future leaders for the firm and the need to lease office space in a geographic location new to the firm are strategic (see Table 5.5).

Ending the strategic planning process with the development of strategies would leave the plan incomplete. In addition to the good ideas represented by the strategies, the firm will need to adopt specific action plans that specific people will undertake to make the strategies happen.

ACTION PLANS

Action plans are the specific, short-term (up to one year) tasks that a firm implements in order to convert the good ideas represented by the strategies into results. Action plans consist of three components: A specific, well-defined, and discrete *task,* which often includes a deliverable; a *champion* responsible and accountable for completing the task; and a *date* by which the champion will complete the task (see Table 5.6). The plan will be more effective if the champions participate in creating the plan in the collaborative group setting of the strategic planning workshop, therefore having had a hand in developing the action plan at the outset.

For each strategy included in the plan, the planning team should develop and document at least one commensurate action plan so that the good idea represented by the strategy can be converted into a result for the firm.

TABLE 5.5 Franklin & Associates' Strategic Plan: Strategies

Strategies Addressing Growth, Project Delivery, Ownership Transition, and Recruiting and Retention

1. Expand our practice throughout the region
2. Develop relationships with general contractors
3. Increase proposal hit rate
4. Improve average client quality rating by 10%
5. Establish a larger presence in the higher education market sector
6. Improve profitability
7. Broaden ownership of the firm
8. Become the go-to employer in each city where we have an office; recruit and retain top talent
9. Launch an in-house employee development program

TABLE 5.6 Franklin & Associates' Strategic Plan: Action Plans

Strategies Addressing Growth, Ownership Transition, and Recruiting and Retention
Note that the strategies/action plans are now organized in chronological order of their completion deadlines.

Strategies	Action Plans	Champion	Deadline (mo./yr.)
6. Improve profitability	Engage consultant and provide negotiating training to principals and project managers	Adam	1 month
	Develop and adopt new quality assurance/quality control procedures to avoid rework and write-offs	Jerry	1 month
	Invoice continuously throughout each month to improve cash flow	Julia	2 months
2. Develop relationships with general contractors	Compile contact list of local contractors who have completed design-build work	Dennis	3 months
	Call on selected local contractors to discuss strategic alliances	Leigh	4 months

(continued)

TABLE 5.6 *(continued)*

	Strategies	Action Plans	Champion	Deadline (mo./yr.)
3.	Increase proposal hit rate	Design and implement more rigorous go/no-go criteria	John	4 months
4.	Improve average client quality rating by 10%	Assign Quality Manager position Develop and launch post-project client "report card" survey	Chris Steve	5 months 5 months
1.	Expand our practice throughout the region	Research and identify a potential new office location	Leigh	8 months
5.	Establish a larger presence in the higher education market sector	Make strategic hire of higher education market leader	Leigh	10 months
9.	Launch an in-house employee development program	Develop curriculum for "Franklin & Associates University" with in-house and outside instructors	Caroline	10 months
8.	Become the go-to employer in each city where we have an office; recruit and retain top talent	Convene a focus group of employees to identify recruiting and retention issues	Caroline	11 months
7.	Broaden ownership of the firm	Engage an ownership transition consultant to develop an internal ownership transition plan and schedule	Mike	12 months

PREPARING FOR PLANNING

Before anything else, preparation is the key to success.

—Alexander Graham Bell

As discussed in the previous section, it is necessary to develop a strategic plan within the context of the internal vision, issues, and initiatives of the firm as well as the larger world within which the firm does business, taking into account trends, drivers, and forces that comprise these external dynamics. In order to determine the basis on which to make the decisions that form a firm's strategic plan, the planning team needs to understand what's going on both within the firm and in the wider world. Therefore it is important to gather and analyze relevant information externally, as well as from within the firm.

Conducting Research

Some internal research tools that yield actionable information include the following:

- Employee survey
- Interviews with key managers
- Financial reports showing gross and net revenue patterns, profit margin trends firm-wide and by target market, and other financial metrics including utilization, multiplier, revenue factor, as well as non-financial metrics such as resumes received, employee turnover, proposal hit rates, etc.

Some sources for external research include the following:

- Industry and general business reports regarding trends and drivers that would affect demand in the market sectors of interest, typically those publications that could be found on a client's desk, such as *Modern Healthcare*, *American School & University Magazine* for higher education, *Urban Land* for private sector development, and local/regional publications such as business journals and newspapers.
- Published data to provide peer and competitor benchmarking, widely available from the several private survey and publishing firms that serve the architecture and engineering industry.
- The firm's own survey of marketplace perceptions, including past, current, and prospective clients of the firm, as well as partner firms (peers, strategic partners such as

specialty consultants, prime firms, or subconsultants). A marketplace perception survey is particularly valuable when the insights of the participants are collected and analyzed by an objective third-party source at arm's length from the firm.

Whenever engaging in gathering information through market research, it is important that, in analyzing the data, firm leaders take a step back and perform a "reality check" on the findings and conclusions drawn. In general, firm leaders can trust their own sense of market conditions and dynamics and how they relate to the firm—a topic on which the firm leaders are the ultimate experts.

Analyzing the Findings

After completing any internal and external research in preparation for strategic planning, objectively and dispassionately examine the information that has been collected. Identify the real issues that affect the firm (and its clients) today, as well as into the future. A valuable tool that organizations in all industries employ in order to synthesize the findings from disparate sources into a systematic approach for strategic decision making is an analysis of the firm's strengths and weaknesses, opportunities and threats, known as a SWOT analysis.

The SWOT analysis allows a firm to objectively analyze its various internal and external drivers (see Table 5.7).

The top row contains the internal factors of strengths and weaknesses, those items that occur within the firm and are completely within its capability to influence. The bottom row contains opportunities and threats, items that occur outside the firm that can be researched, anticipated, and prepared for, but over which the firm does not have influence.

The left column contains the positive items of internal strengths and external opportunities, while the right column contains the negative items of internal weaknesses and external threats.

Once the firm has arrayed its strengths, weaknesses, opportunities, and threats on the diagram, it is easier to derive strategies, again by focusing on each one individually and asking "What are we going to do about this?"

Preparing the Strategic Planning Team

When the research and analysis are complete, provide the results of all of the preplanning materials—the previously mentioned report containing findings from the internal interviews with managers and key staff of the firm; results of an employee survey; results of a marketplace perception survey; and additional findings of internal and external market research—to the strategic planning team to provide ample opportunity to digest the findings, consider implications, and prepare for brainstorming and decision making.

TABLE 5.7 SWOT Analysis Template

	Internal Factors		
Positives	Strengths 1. 2. 3. 4.	Weaknesses 1. 2. 3. 4.	**Negatives**
	Opportunities 1. 2. 3. 4.	Threats 1. 2. 3. 4.	
	External Factors		

Give homework assignments to the planning team members so that they can develop their own individual visions and goals for the firm, which can be compared and reconciled during the planning workshop.

Obtaining valid input into the planning process from a range of sources remains important in a strategic plan for any size firm. For a smaller firm, conducting formal interviews with the firm's staff is also important. However, leaders of small firms, especially sole practitioners, have to be extremely introspective and honest about their vision for the firm's future and their own capacity to implement that vision. Because smaller firms are often more tightly knit and enjoy a strong sense of interdependence and camaraderie among the employees, soliciting ideas from all of the employees is not only worthwhile, it is also much more feasible than in a larger firm. Also, smaller firms are just as dependent on their clients as larger firms; so seeking objective input from their external perspective lends a market-realistic context to the plan.

To help achieve greater success in strategic planning, the firm leaders can access additional background reading materials on the subject. See the "For More Information" section at the end of the article for good references on strategic planning for architecture firms of any size.

DEVELOPING THE PLAN

In the long run, men only hit what they aim at. Therefore, though you should fail immediately, you had better aim at something high.

—Henry David Thoreau

In addition to the research and preparation that will inform a firm's strategic plan, it is also important to involve the right participants—in the right place—to develop the plan.

Strategic Planning Team

Just as a firm strives to convene the best project team for a client, firm leaders should be thoughtful in selecting the participants on the strategic planning team. The team should include, from both the operations and administrative/corporate teams, thought leaders and subject matter experts who represent the firm's leadership and management, market and practice leadership, and the best from among future firm leaders, as they will have the greatest vested interest in the firm's future.

In forming the planning team, consider the following:

- *Size of the team.* For a firm with sufficient staff size, the ideal size for the team is 6 to 12 people. This will provide enough minds for brainstorming, yet preserve a comfort zone and a sense of intimacy in the planning workshop to facilitate discussing anything and everything.
- *Responsibilities of the team.* Participating on a strategic planning team is a major commitment, so in choosing the team members, firm leaders should include only those who will contribute actively to the process. The highest and best use of some of firm's key personnel—even principals—may be to stay with their clients and projects while the planning workshop is underway, participating in implementation of the plan after it is developed.

Planning Workshop

The planning workshop is an opportunity for open and straightforward discussion of the most important matters affecting a firm: its future vision and what it will take to reach it. This means that the workshop should be in a location, and with appropriate arrangements, to facilitate these types of candid conversations.

Developing the strategic plan is an important enough activity to deserve the fully focused time and attention of the planning team, apart from their usual responsibilities. Therefore, the strategic planning team can set itself up for success by committing to a one- to two-day dedicated planning period.

Consider the following items in setting up a place and time in which to develop a firm's strategic plan:

- In order to be free of interruptions and the lure of day-to-day project demands, hold the workshop off-site. An off-site location also helps to create a "special" atmosphere in which to brainstorm and design the future of the firm.
- To make the meeting time effective and to encourage active participation and free discussion among all of the team members, set ground rules for the workshop. Chief among these are that each participant must take a big step back from his or her everyday role and take a broader, firm-wide view, think strategically, and actively participate.
- Rigorously prioritize the issues and initiatives to be included in the workshop agenda. Allow plenty of time for open discussion.
- Although a strategic planning workshop is a great opportunity to strengthen and improve the dynamics among the planning team, and may include a social activity such as a group dinner to that end, it's best to focus on the work of strategic planning and leave golf or other recreational activities to another, more appropriate event.
- Many firms benefit from involving a third-party facilitator in their strategic planning process. The facilitator can help to structure the entire process from preplanning internal and external research, such as interviews with key managers and staff and a survey of clients and partner firms in the marketplace; analysis and reporting of findings that will serve as the premises for the strategic plan; designing an ambitious and motivational—yet achievable—agenda for the workshop; and facilitating the brainstorming and documentation of the strategic plan as it is developed during the workshop.

The concept of a "workshop" in which to develop a strategic plan applies to any size firm. In the spirit of inclusiveness (and because it is more feasible), small firms sometimes involve their entire staff in the planning workshop.

For sole practitioners, it may be especially important to have an objective third party participating with them while developing the plan, primarily as a sounding board and reality check. This could be a professional colleague (not necessarily a design professional), a consultant, or even a willing friend or spouse.

Consensus

A firm makes many decisions during its strategic planning workshop. But it is a rare occasion on which a decision is so obvious that those in the workshop will voice unanimous agreement; more often there will be differences of opinion to be reconciled. While a democratic vote of ayes and nays is one way to arrive at a resolution, such a vote lends itself to "winners" and "losers," and the losers may find it difficult to support the decision. A better method is to talk through matters to reach consensus. Achieving consensus means that even those who had differing ideas are convinced by the group to support an action—always with the greater good of the firm in mind—with the same vigor as if it had originally been their own idea. The other side of reaching consensus is allowing anyone on the team to object to a decision if they can voice a reason; sometimes the person objecting can sway the consensus to their way of thinking. In the end, it is most important that the entire planning team portrays their support of the strategic plan components with one enthusiastic voice to the rest of the firm.

IMPLEMENTING THE STRATEGIC PLAN

Because the purpose of strategic planning is to bring positive change to a firm, it's imperative that plans are put into motion and are carried through to the next planning cycle, managing and delivering the elements of the plan with the same priority as the firm's most important projects. Everyone in a management role needs to model through their own actions that people's "day jobs" cannot interfere with the strategic plan; and in fact, implementing the strategic plan is a part of everyone's "day job." Implementing the strategic plan is certainly one of the most important aspects of the firm leader's "day job."

Plans are only good intentions, unless they immediately degenerate into hard work.

—Peter Drucker, noted management consultant

Implementing the Plan

The firm should employ a system for implementing the strategic plan so that it can harness the momentum gained during the preparation and workshop. The following tips will improve the firm's success in implementing its plan:

- Consider the champion responsible for each action item to be equivalent to a "project manager," with the firm leader as the "principal-in-charge" of the entire plan. Each member of the strategic planning team should be conspicuously enthusiastic about the plan as they carry out their assigned actions, report progress to their own staff, and elevate staff input back to the planning team.
- The strategic planning team should stay together through a series of regular meetings throughout the months and up to a year following the launch of the plan, using the action items as a simple agenda, to constantly assess progress on the plan's implementation. Firms that keep up monthly meetings throughout the year enjoy the greatest success from their strategic planning.
- In order to encourage accountability for completing the action plans, manage the established deadlines by using them as agenda items in the strategic planning team's regular meetings. A good rule to employ: if a champion misses a deadline once, immediately reschedule it. If the champion misses the new deadline, assign a different champion. In the long run, it's much more important that the action plans are completed than who actually completed them.
- Keep the plan relevant and active throughout the year by reviewing the effects of each action plan as it is implemented. Ask the team to reflect and report on the following:
  - Did the action item affect positive change for the firm? If so, report that positive effect to the staff and take time to celebrate the success. If not, analyze the reasons why and reexamine whether to repeat that action in the future.
  - If the action item is still relevant, have circumstances changed such that a course correction is required? If so, document the changed circumstances and update the plan accordingly, making any new assignments that may be required.

Many firms struggle with implementing their strategic plan, regretfully noting that the plan that they worked hard to develop ends up as just another notebook on their office shelf. It's wise to employ constructive peer pressure to promote mutual accountability for implementing the plan, through team meetings and regular report-outs to the staff.

Smaller-firm owners may need to be judicious so that the ambitions expressed in their strategic plans don't exceed their own capacity to implement them, and will likely need to prioritize implementation actions and execute them over a longer period of time. Owners of smaller firms will also need to be realistic when it comes to implementing their plans. Time spent to implement strategic plans will need to be carved out from the everyday demands of project acquisition and delivery.

Communicating the Plan

The strategic plan greatly affects the firm's future and requires the support of every member of the firm. Therefore, the firm leader should share the plan with all employees and refer to it often to keep it top-of-mind and inspire confidence in the firm's leadership and direction.

Consider the following in communicating the strategic plan:

- Involve the entire staff in developing and implementing the plan. Collect staff ideas through an employee survey, focus groups, or regular staff meetings during the preplanning stage, encouraging candor. Provide a conduit for suggestions from the staff for consideration at any time.
- Immediately after the team develops the plan in the workshop, communicate its highlights to all staff members. This will calm any concerns that members of the

staff may have upon knowing that the firm's management team has been sequestered in a workshop setting for the past two days.
- Share the entire plan shortly after the workshop with all staff, encouraging their questions and feedback. Provide a handout for staff members to have, hold, and even take home as a commemoration of this important advance in the history of the firm.
- Report progress often, mark positive changes, and celebrate successes.
- Use the strategic planning experience as an opportunity to commit to open and transparent communication at all levels within the firm. The more knowledgeable the employees, the more likely they are to support and help implement the plan. Many employees—the best of them—will look for ways to help.

MAINTAINING A STRATEGIC PLANNING CULTURE

Rather than being an "event," strategic planning is a process that businesses use to envision their desired future, foster continuous improvement, manage change, and achieve their goals and objectives for growth. A firm should consider its strategic plan a ready management tool. For example, when making key decisions, firm leaders and managers should ask, "Is this in concert with our vision and our plan?" If the decision diverges from the vision or intent of the plan, then a good business reason for the deviation should be documented—which may in itself signal the need to update the plan with a course correction.

A ship in port is safe, but that's not what ships are built for.

—Rear Admiral Dr. Grace Murray Hopper

Talk About It

Firm leaders can foster a strategic planning culture within their firm by keeping the plan an important topic in conversations among firm stakeholders. A discussion of the firm's progress toward achieving the action plans, as well as any questions or further input from managers and employees, should be a standing agenda item at staff meetings, management meetings, and board of directors meetings. In addition, progress can be reported periodically in a firm's internal newsletter, in a featured blog on the Intranet, at all-hands meetings, and through ongoing e-mails to all staff members.

The Firm Leader's Role

Just as each action item in the strategic plans should be led by an enthusiastic and empowered champion, the entire strategic plan is the responsibility—if not the raison d'être—of the president, CEO, or managing partner of the firm. It is the leader's charge to rally others in the firm to share a vision for the future and determine how to get there. In addition, it is generally the firm leader's responsibility to allocate investments and other resources that are necessary to pursuing the strategies and carrying out the action items laid out in the strategic plan, supporting the individual champions in their missions.

Updating the Plan

If a firm is to rely on the strategic plan as a management tool, then it will be important to keep it fresh, up-to-date, and relevant. Far too many changes occur—both outside and within most firms—for a strategic plan to remain a static document. For most firms, this means updating the plan annually or biannually, with fully rendered renewals every three to five years.

5.4 Firm Growth and Development: How to Build a Creative Culture

Kirsten R. Murray, AIA

This article focuses on how to cultivate and maintain excellence in a firm as it grows and develops. The importance of core values, organizational structure, firm culture, and balanced leadership is discussed.

INTRODUCTION

At the core, a strong set of skills and a mutually agreed-upon belief system are critical to maintaining a culture of excellence

Most firms begin very small, as entrepreneurial architects practicing on their own or as partners working in collaboration. After an initial start-up phase, founders who are successful in establishing a reputation for excellence will likely have an opportunity to grow their firm. If growth is managed well, the firm will be able to maintain the intensity and creativity typical of smaller practices while adding the resources and capabilities characteristic of larger firms. To maintain a culture of excellence during and after the transition to a larger practice, firm leaders need to be mindful of critical decisions that will define the quality of the firm's work: its culture, its people, and its legacy.

Some firms are founded by talented, driven sole practitioners, while others begin with small groups of like-minded colleagues seeking professional independence, oftentimes as offshoots of other organizations. In each case, the founders bring their experiences and preferences with them.

The growth of a firm can be reactionary—changing in response to immediate opportunities or a crisis—or it can be highly strategic, designed with the intent of achieving sought-after goals. In either case, taking time at frequent intervals to understand the drivers that underlie change and growth is critical to the development of the firm, as are planning, research, and analysis. This approach provides opportunities to assess effectiveness, observe results, and course-correct when necessary, enabling the firm to navigate change gracefully.

THE BASICS

To be successful, all firms need to address, and periodically review, the basics of running a practice—from getting the work, executing the projects, and handling administrative tasks to adopting a vision and core values. Whether they are two-person firms just starting out, midsize firms with a well-established record of achievement, or internationally renowned firms, this is essential to maintaining the health of the firm.

The Firm's Shared Vision

Most firms that establish a successful growing practice have, at their core, a strong set of goals and values and a clear vision of the workplace culture they want to cultivate.

Kirsten R. Murray is a principal and owner at Olson Kundig Architects, where she started as an intern in 1989 when the practice was a 10-person office. She acts as both design principal and president of the 100-person firm, now in its fifth decade.

Strongly held and shared values serve as the touchstone for decision making and relate to every aspect of the practice. While some strive to design highly recognized and published "critical work," others place a high value on serving the local community and providing a broad range of services. In some firms principals seek to position themselves as thought leaders in a specific practice area, and some choose to strike a balance between achievement in practice and academia. From the sole practitioner just starting out to the 100-person practice, leaders of firms that grow successfully know that all decisions about growth must rest on the foundation of their vision and be aligned with their values.

Firm operations are a direct outgrowth of a firm's values and vision. These include level of risk tolerance, expectations about work-life balance, and a desired workplace atmosphere, both physical and cultural. As a firm grows, established norms in these areas need to be maintained, but with flexibility, so that the firm responds to the changing needs of the practice. Open forums that empower staff to discuss values and priorities help these operational and cultural aspects to be continually updated and understood firm-wide.

Balanced Leadership

Leaders thrive when they contribute complementary skills and also have the ability to work in a highly creative and integrated way. Successful firms are likely to be founded by people who have the skills and desire to seek out and cultivate clients. These individuals might also possess a well-rounded set of design, technical, and management skills. However, growing firms benefit from the teamwork of multiple well-rounded people.

As part of the planning for firm growth and development, consider the skills within the firm's leadership group, develop agreements as to the way the group will work as a team and, if needed, look for ways to supplement qualities not yet present. The best practice for cultivating creativity and excellence is to cross-fertilize the office with team members who bring multiple strengths, adopting specialized or highly specific roles only when the need becomes truly evident.

Getting the Work

All architectural firms begin as entrepreneurial entities. It takes a combination of confidence in an excellent product and tireless enthusiasm for telling its story to convince clients that a particular firm is best for their project. A range of different but complementary strategies can help build the professional and client relationships needed to foster a steady flow of the right type and amount of work to provide continual opportunities for a firm.

► See Developing Marketing Strategy (6.2) and Networking and Business Development (6.4) for information on project acquisition.

Initially, a firm may be able to rely on the skill and personal connections of key firm leaders, but as a firm grows, it is no longer the sole responsibility of one or two leaders to garner work. Increasingly, the effort will need to be supported by business development specialists and by staff who are able to nurture strong relationships with consultants, other organizations, and potential clients.

As a firm grows and begins to pursue work in increasingly competitive arenas, the training and coaching of staff becomes even more important. Skills in visual, written, and verbal communication, as well as in strategy and negotiation, are critical tools, and staff development can be provided internally or with the help of outside consultants. It is also important to identify and cultivate appropriate ways for staff to participate in business development. Often referred to as the seller-doer model, this approach helps a firm retain highly motivated individuals and increases the likelihood that the firm continues to succeed.

The power of No: Not all business is good business. Sometimes, the best choice for the firm in pursuit of new business is to say "no" to a prospective client. Turning down a project is often a difficult decision for seasoned veterans; it can be an excruciating decision for new firms or smaller firms looking to grow. But if the client is not right for the practice and doesn't share the firm's values and the work isn't consistent with where the firm wants to go, there is a risk of allocating precious resources that could be better used elsewhere—and ending up with both the firm and the client dissatisfied.

The empowerment of Yes: The firm's vision, values, and goals should guide decisions about the clients and projects that best suit the practice and provide the right challenges and learning experiences for growth. This is especially important for smaller firms with limited resources, but it is true for all firms, regardless of size. Nothing is more empowering, fuels creativity more, or provides more long-term satisfaction than staying true to the firm's vision and saying "yes" to clients and projects aligned with the firm's values.

HANGAR 41

We have three principals and eight associates. By design, we created an office environment that could thrive on collaboration. One key ingredient of collaboration is equality. If one person makes all the final decisions, you close off the creative process and the ability to brainstorm fades away. That's one reason for the two-tiered hierarchy. Another is staff motivation and personal accountability. In the typical firm model, it takes years of dedication to earn responsibility at an associate level. It's a coveted position, and people sometimes do what they can to jump up the corporate ladder at any cost. In our model, there are only three principals, and no plans to add more without substantial growth or expansion. There is no motivation to gain a more prestigious title. So what happens to the motivation? Money is typically one motivator.

If you bring work into the Hangar, you earn a substantial bonus based on the revenues generated by that project. Our philosophy from a management perspective is that 11 rainmakers are better than one. We also run weekly meetings using parliamentary procedure to keep order. Everyone at Hangar has a stake in the business, not as a direct owner of the LLC, but in profit sharing and voting power. This is where recruiting becomes very important. It's critical that your staff shares the same values in design and practice, is entrepreneurial in spirit, and has an incredible passion for architecture. How the team works together is more important than any one individual. Parliamentary procedure works amazingly well when you find a group of people with the same passion and focus on what they are trying to accomplish together. Ninety-nine percent of all our votes pass unanimously. Believe me, if you put 11 talented and passionate people in the same room together day-in and day-out building a company, and give them all a voice and the power to influence decisions, you had better be prepared for some fireworks. It keeps us on our toes, and pushes us further outside our comfort zone. We believe in developing well-rounded architects. Each person is actively involved in marketing, financial decision making, business development, design, and production. Giving everyone the full picture helps us make the best decisions together.

Buddy Poppitt, Principal, Hangar 41, LLC

Project Execution

Every firm must establish expectations and maintain methods for excellence in the quality of delivery for the services it will provide, from understanding building science to knowing how to assemble a solid set of construction documents and specifications.

The distribution of design, technical, and production work in a smaller firm is usually integrated, often with the same people doing all tasks from the beginning to the end of the project. Ideally, a similar level of integration should also be the goal for a growing firm, though the way this is organized will need to evolve. In a small firm, one or two leaders can typically oversee every aspect of project execution and can continually guide other staff members to meet their expectations.

▶ Professional Development and Mentoring (8.4) addresses training, mentoring, and appraisal programs that support a firm's strategic plan.

Growing firms, on the other hand, need more structure in order for quality expectations to be widely understood by the staff. This will require that mentoring and training practices are put into place to allow staff to succeed. It also means that structured methods of reviewing work for completeness and quality must be developed.

Firm and project leaders also need more formalized ways of remaining integrated into the execution of the work. This is critical to assure quality because demands on the time of the firm's leaders increase as a firm grows. Depending on the nature of the practice, the level of complexity of the work, and the client type, this integration can be achieved in several ways:

- Maintaining small teams, where experienced staff can provide direct feedback and oversight to other staff
- Group review or discussions, critiques, and pin-ups to engage all firm members in dialogue and learning from others' experiences
- Peer review by individuals within or outside of a firm to solicit input and analysis from people with fresh perspectives
- Creating shared resources, including written and Web-based guides, to document lessons learned and best practices
- Formalized oversight processes where more experienced people are assigned to provide quality assurance horizontally across the body of a firm's work

Unless a firm is very large and has had time to develop a sophisticated network of specialists and production strategies, it is best to assume that getting the most experienced and diversified types of input and frequent review (i.e., eyes on the work) will increase its quality.

▶ Origins and Development of Quality Management (12.1) provides an overview of quality management as a system that improves a firm's performance.

As a firm grows, it becomes increasingly important to identify individuals who are leaders in the areas of technical execution and project delivery, and to recognize their achievements and reward their efforts. Success in project acquisition and design is sometimes easier to see and more often rewarded in the industry. However, the firm's technical expertise must be highly regarded, and experienced people retained and nurtured, or the results can be very detrimental for the long-term survival of the practice.

Firm and Project Management

Management is the system of processes and tools—the circulatory system for the practice—that keeps the office and the projects running smoothly together. While small practices can often navigate their way through the day-to-day operations using common sense and good judgment, larger firms require more intentional behaviors. Management systems, from the tracking of project budgets and schedules to the overall strategic direction and governance of a firm, must be put in place. At every stage in its growth, it is critical that a firm's management practices align with its larger values.

Successful management should be integrated into every aspect of the practice. It need not be seen as opposing or inhibiting the delivery of excellence, but, rather, as making excellence more likely. As with technical or project delivery, few firms succeed without an appropriate understanding and recognition of the value of management systems to the overall practice.

Both firm management and project management can be approached as centralized or collectively held responsibilities. Management-savvy design professionals can perform all these functions. But as a firm grows, certain aspects of management should be delegated to people with training in business management or finance, who are also attuned to the nuances of design practice.

To foster excellence and success as a firm grows, management skills should be taught to young practitioners with the same level of rigor and quality expectation as are matters of design and building science. Understanding and appreciation for management issues improves team dynamics, communication, and collaboration with clients and consultants. At some level, everyone in the practice is responsible for managing some aspect of the firm or its projects, if simply their own tasks.

Financial, Legal, and Administrative Tasks

All firm owners face the need to oversee the financial, legal, and administrative aspects of their practice. Small-firm owners usually choose to undertake these tasks themselves, supported by outside attorneys, accountants, and other specialists as needed. As the size of a firm increases, many firms find it advantageous to build an internal team to provide these services, and use outside consultants for advice and strategy.

As a firm continues to grow, administrative staff may evolve from generalists to more specific roles, requiring more specialized training. Like any business, defining communication systems and clarifying the flow of work between administrative and project activities protects against wasted time and frustration.

▶ Office Administration (5.10) discusses personnel, procedures, and processes that improve the efficiency and quality of services of the entire firm.

Managing Work Flow

Assuring a manageable flow of work, not too much or too little, is one of the most challenging aspects of growing a firm. Poor planning or an unstable work flow can lead to wild swings in workload that could necessitate rapid cycles of hiring and firing. This creates job insecurity and can make it difficult to retain valued staff and build on institutional knowledge. There are a number of software tools and systems designed to assist a firm in tracking and studying work flow, such as Newforma for project management or Deltek Vision for accounting and business development tracking. As a firm grows, such tools will become increasingly important.

Even when a firm has an abundance of work and growth prospects look promising, it is generally advisable to employ the smallest workforce a firm can confidently support. Look for ways to maximize productivity before making new hires, such as staggering project start-up schedules or subcontracting production. This way, growth can be approached in an intentional and strategic way. Rapid growth without careful planning can strain a firm's systems and compromise quality. In addition, over-hiring can lead to poor business decisions such as indiscriminately taking on the wrong projects for the sake of "feeding the beast." This is seldom a recipe for excellence.

Similarly, it is important to plan for temporary decreases in workload. If a firm has planned well, and is financially healthy and optimistic about future work, it can use slow times very strategically. "Found time" as a result of fewer projects can be used to focus on internal projects, getting organized, and tending to long-term initiatives like education or research and development. For firms with less financial cushion, it is often possible to work with staff to negotiate some level of short-term cash flow relief through reduced work schedules, furloughs, or job-sharing situations.

However, if a decrease in workload appears to be a long-term situation, it is in the best interests of a firm to downsize staff, sometimes at every skill level in the firm. This should be done with sensitivity to individual situations but also with an eye to the overall health, needs, and skill diversity of the remaining staff in the practice. Frank and open communication with staff as these situations arise is the best policy. Best practice is to remember that staff members are highly trained professionals who deserve to hear information that impacts their futures as soon as decisions have been made.

▶ Navigating Economic Cycles (7.1) discusses the construction industry's ups, downs, and impact on architects.

FIRM ORGANIZATIONAL STRUCTURE

Assuming a firm has the basic skill sets of design, management, and technical execution, a shared system of values, and a vision for what it wants to be, there are still many things to consider as a firm grows and develops. As with any gathering of people, firm leaders will need to agree on a way to organize as the practice grows, all the while being mindful of the intellectual and creative community they hope to establish.

The relationship between organization and creativity is nuanced and complex. Creating organizational structure for an evolving firm is more an art than a science. Some organizations can have a very rigid, ordered system and produce high-quality, creative work. Others can be very egalitarian in their organization, yet do uninspired work. More often than not, for most firms, there is a healthy balance somewhere in the middle that works. A growing firm is advised to walk a fine and well-scrutinized line between creating the collective order needed to be effective and maintaining the high level of individual freedom generally sought in creative occupations.

Ownership Structure

From sole proprietorships and partnerships to corporations, ownership structure is one of the first decisions to be made in new firms and one of the most important, as it will shape the nature of a firm's design community. Many firms begin as sole proprietorships, with all decisions remaining in the hands of the owner. And while many firms often remain sole proprietorships, there can be benefits to expanding the ownership structure to a partnership or corporation as the firm grows, including:

- Increased flexibility in ability to serve clients
- Ability to develop specialties or areas of expertise
- Financial stability for the firm
- Greater capital resources available to the firm
- Shared responsibility, risk, and reward
- Greater growth opportunity for key staff

Owners can be staff that have been identified and promoted from within. This can create a healthy culture where key staff members have incentive to stay and lead the practice when they have achieved professional maturity. However, keep in mind that the criteria for partnership are likely different than that for an excellent project lead. As well, the generational needs of the firm should be taken into account, and partnership decisions made with a view to the ongoing success of the firm. It's important to develop a clear understanding of both the firm's short- and long-term needs when making this important decision.

Owners can also be individuals with strategic skills that are solicited or brought from outside the firm. As firms grow, it can become increasingly advantageous to broaden the skills and services of the firm by partnering with individuals that have other skills, or can expand the firm's client base.

Sometimes the merger or acquisition of firms with complementary skills can provide stimulus to the practice. This sort of change can be challenging to any established practice, and care should be given to the careful planning and communication of the process to employees and clients.

In all cases, when dealing with partnerships, corporations, mergers, acquisitions, or other forms of structure that involve more than one owner, to succeed, partners must be able to:

- Identify and articulate a mutually agreed-upon vision for the firm and agreed-upon roles for each of the partners or owners.
- Establish a partnership agreement including guidelines for governance, methods of conflict resolution, agreed upon code of conduct, confidentiality requirements, and terms of separation.
- Identify an ongoing process for leadership cultivation and a structure for leadership transition.

Beginnings of Structure

Many small and newer firms tend to resemble traditional master and apprentice arrangements. There is the founder or boss, the apprentice, and perhaps a few staff members in between. While the group may enjoy the simplicity of this structure for some time, as the work becomes more demanding, the hours longer, and the levels of proficiency more equal, the midlevel staff may be the first to request more clarity in roles. It is likely they will be seeking more responsibility and craving the recognition that might come with a title or perhaps a larger paycheck.

In dealing with firm structure, it is difficult, and unwise, to ignore these basic needs. Few businesses succeed without establishing a correlation between risk and reward, experience and pay, accountability and opportunity. This is especially true when the

HOW FLAT ARE WE?

THINK OF THREE HYPOTHETICAL WORKPLACES AND THEIR TYPICAL ORGANIZATIONAL STRUCTURES.

- **An urban hospital:** Each worker has highly specialized training and correlating authorization to do a particular set of tasks, with everything from pay to social status dictated by their qualifications, training, and authorized decision-making latitude. Carefully prescribed methods of client care and engagement, and routinized procedures, punctuated with highly regulated oversight from superiors and administrators, are expected. Lives and livelihoods are at stake.
- **A high-tech gaming start-up:** Such companies often embrace a "flat" workplace structure (no titles, no offices, minimal administration) to enable and encourage people to work with relative independence and egalitarianism towards a marketable goal (the creation of a gaming product) set forth by the leadership. In this structure, there is a lucrative reward system for the highest-achieving, those that crack the code to success; and a guarantee of rapid replacement awaiting the underperformer.
- **A college within a university system:** In this situation, there are a few individuals who act as administrators, working toward established university and industry guidelines. There are professors who set forth the expectations for performance and develop a curriculum for the students, assisting them through their instruction and guidance to achieve these expectations. There are also teaching assistants and senior students who serve as mentors. In the end, the quality of the student work is a tribute to their own talents as well as the supportive structure set up by the administration, professors, and teaching assistants.

While none of these examples are entirely adaptable to most architectural practices, consider the outcomes that would result from each if it were considered as a model for practice in a firm.

The highly structured hospital model would likely result in an efficient, productive workplace capable of generating a high quantity of carefully executed work in a known arena. But there are likely fewer creative opportunities for the individual expression or personal investment that can set a firm apart from its competition. Also, it is likely that entrepreneurial personalities would tend to avoid such a structure, and that retaining talented and committed staff would be a challenge.

The entirely flat structure would conceivably offer the inverse of the pros and cons of the structured hospital model. It is likely that some significant strides could be met in areas of innovation, and the most entrepreneurial and confident of the staff would likely feel stimulated by the professional freedoms and opportunities experienced. However, it is difficult to imagine that the firm would be successful in keeping long-term senior staff, which would inevitably be strained to find, train, and manage a potentially undisciplined, highly competitive, and loosely trained workforce.

The college, perhaps, is the hybrid of these systems. In the best schools, as in the best workplaces, individual enthusiasm and passion are encouraged in a collegial atmosphere, and helpful guidelines and curriculum are put into place, along with an administration that brings governance and a faculty that brings specific occupational or subject matter knowledge to the group.

fees for professional services that are established in the market link directly to experience levels and titles set forth as industry standards.

However, depending upon the nature of the work and the goals of the practice, there can be detrimental effects that come from the push to create a tiered organizational structure. Problem-solving ability, creativity, and enthusiasm are often the strongest assets of junior staffers, for whom the right balance of encouragement and oversight must be provided to keep them motivated to stay with the practice. This is especially true in an environment where technology and social media enable less dependence on businesses for employment. Even as firms struggle to adjust to an unpredictable economy, they must provide the stable and supportive environment needed to build loyalty in a young and potentially entrepreneurial workforce.

Teams and Departments

There are a number of different general organizational attitudes that any business or practice can take, ranging in the degree to which hierarchy and definition of roles within the overall workplace are identified, maintained, or valued. Specific to growing architectural practices, there are a number of organizational models that prevail in the industry, and countless variations that occur within these models. As with all other business decisions, it is wise to consider the impact that any structure will have on the culture and business. Think about what sort of culture a firm wants and how it needs to support this in everything from workspace design to business organization.

Shared Studio/Team-Based Organization

In this model, the principal or principals may work individually or collaboratively to bring projects into the office and oversee them. They share the resources of a range of professionals who are assembled as skills and availability allow. The staff might work freely among the principals, and across the range of projects in the office. This is a common structure for small and midsize firms that do projects of a specific type (everyone knowing the work) or projects that are similar enough in type and scale that people can conceivably succeed regardless of their assignment. It is also common in this sort of environment for a project team to work from beginning to end on a particular project and to do a wide range of tasks related to design, management, and execution.

The benefits of this model include flexibility to move staff freely to the work as it comes into the office and cross training of staff by working on the widest range of projects and with the widest range of people. This can impart a general sense of opportunity and professional freedom to staff. Also, working with various firm leaders creates a stronger sense of common purpose, and shared mentorship. This shared, generalist studio model may have a number of people who work horizontally across the office to provide continuity or specialist support, and this is somewhat required at a certain scale. Larger firms that maintain an open studio model may find it helpful to adopt cultural practices to make sure people feel like they have a network within the larger group. Many high design firms are organized this way.

Once a firm grows too large to maintain a shared studio format, or begins to do projects that require a high level of specialized knowledge, it is natural to look for ways to create distinct studios within the larger practice. These studios serve the purpose of creating smaller intellectual communities within the office that act somewhat independently of the others, but share administrative resources. Depending on the particular characteristics of the workload and office, there are several typical ways for studios to be organized.

Studios Organized by Discipline

In a multidisciplinary practice it is common to see separate studios emerge around a discipline, such as urban design or interior design. This allows for variations in organization and business methodologies to emerge around best practices in each area. Typically each discipline-based studio has its own leadership and staff structure, and a somewhat individual vision for their department. Many firms in this vein rely on their complementary strengths and pursue and execute work together, as well as independently of each other.

Studios Organized by Project Type

Similarly, firms that engage deeply in a number of specific project types may find it useful to create studios focused on one or more similar building types: education, high rise, and hospitality, for example. The boundaries of these studios can be very fixed, or more permeable to allow people to move between studios if they possess the right type of experience. Typically this format is desirable for firms trying to attain deep expertise in specialized areas of design, and for those staff people who have a profound interest in a particular aspect of the field. The downside of this arrangement is the possibility that staff will become too specialized or "pigeonholed" in a particular subset of the work of the office. Sudden changes in the economic market might affect studios to different degrees and lead to an uneven distribution of work in the office, which can strain relationships and morale at all levels.

Studios Organized by Principal

Some firms organize themselves by creating studios around one or more principals, with a number of staff dedicated to working closely with a particular individual or subset of a firm's leadership. In this method, the size of a firm often correlates directly to the number of its principals, who often work rather independently in the direction of their particular subset of the practice. This can stimulate robust mentor and mentee relationships and further a firm to the goal of creating well-aligned teams. Conversely, the overall office itself may struggle to develop and maintain office-wide standards that work for everyone, and can even become competitive if performance expectations seem unevenly met. The degree to which an office will work harmoniously in this organizational pattern is linked directly to the synchronicity of the principals and the strength and clarity of their shared vision.

THE MAKING OF A CREATIVE CULTURE AND A LEARNING COMMUNITY

Regardless of the organizational structure of a firm's practice, its size, or the types of projects that are the foundation for its growth, the strength of the collective intellectual and professional community a firm is able to create is perhaps the most significant contributor to the firm's overall growth, development, and long-term success. Firm growth that is inspired by a creative culture and fueled by a learning community provides opportunities for the creation of a thriving practice that are far greater than the sum of any of its parts.

The People

▶ Recruiting and Hiring: Strategies and Methodology (8.3) discusses the research and strategic approaches that can help a firm attract and retain top talent.

▶ See Intern Development (3.2) for further discussion of the IDP as an important component of the licensure process.

The most important aspect of creating sustainable growth for a firm lies in hiring, cultivating, and promoting the most capable individuals a firm can find. It is critical to secure people who are both talented and share the values of a firm, to give them a reason to want to work with a firm, and to value their contributions. Interns, with their energy, boundless enthusiasm, creativity, and highly developed technical skills, are one of the most important sources of talented staff for firms, whether they are newly formed or more established practices.

Intern Development. Every firm benefits individually and industry-wide by paying serious attention to their role in the stewardship of people joining the architectural workforce. The step from academia to practice can be a high one. It is in everyone's best interest to create a supportive work environment where entering professionals can continue to learn the aspects of practice, while bringing their new ideas and skills to a firm. While many learn from being "thrown into the deep end," it is helpful to pay attention to the special needs of the intern and to stay abreast of current NCARB's Intern Development Program (IDP) requirements and guidelines. Firm leaders have a profound obligation to make the best attempt to align interns with situations where they are likely to receive mentorship and guidance. Interns increasingly bring highly valued technical and graphic skills that are immediately useful to a firm, but it is equally important to consider the wider range of skills they will need as their careers progress over a number of years. Make sure they are gaining a broad range of skills that will allow them to move successfully into increasing levels of responsibility.

Interns looking for their first experience should look for a firm where emerging professionals have successfully matured and progressed within the firm based on knowledge they have acquired there. Employers should consider how to create opportunities for interns to present their ideas or continue research initiated in school. Make young professionals part of the intellectual and social fabric of the office and extend to them the same level of professional courtesy that would be extended to other colleagues. Too often, the intern experience is poorly considered, and interns may find themselves in frustrating dead end positions or junctures in their careers. If this time is well managed and guided, an intern could mature to be a loyal employee and a future leader of the firm.

Practitioners should also avoid exploitive employment practices and be aware of the guidelines set by the AIA, state and federal governments with relation to paid vs. unpaid internships, and correct procedures for hourly and overtime pay.

The Learning Community

The importance of community and education is relevant beyond the intern phase and extends throughout an architect's career. A firm that seeks long-term success is wise to think of its workplace as a creative learning community. This means frequently assessing the overall collective dynamic of the office, its systems, and its culture, as well as continually renewing the commitment to the ongoing professional development of each individual in the practice. A firm should act as a framework for the continued growth of each of its members.

The Collective

The best firms are those where people are buzzing with excitement about the work they are doing work in a collaborative setting to deliver the best projects. The office, as a whole, can be an enthusiastic environment where people are encouraged to engage in open, constructive communication and knowledge sharing. While leadership is an important part of this equation, as a firm grows, it can be helpful to build opportunities for collaboration into the rituals and culture of a firm.

Cultural practices that stimulate enthusiasm, growth, and community:

- Create a shared dialogue about lectures, classes, tours, etc., in the community; consider an event calendar or e-message board to share this information.
- Encourage staff to share lessons learned from their academic studies and travels.
- Create a forum for lectures and discussion groups to share best practices internally.
- Invite other local colleagues to speak to the firm about their work and ideas.
- Support participation in learning forums provided by the local AIA and other groups that exist in the area.
- When possible, allow staff the flexibility to pursue teaching, research, or volunteer community outreach.
- Celebrate success collectively, acknowledge special events in the lives of the staff, and have parties.
- Ask the pros: Seek support from those trained in areas of organizational development (management consultants) and human resource management (facilitators, coaches) to work with a firm to assist with leadership training, team building, and change management.

The Resources

In addition to the general attitude and tenor of a practice, it is also important to recognize the importance of supportive resources, both human and physical, as a firm grows. Antiquated methods and procedures, coupled with inadequate systems, equipment, and facilities, and a lack of support staff, strains and inhibits the potential of a firm to do its best work.

- Review financial and legal procedures every year or two, with the assistance of outside consultants as needed, to make sure a firm is aware of changing industry standards and the latest business tools.
- Look at how a firm supports administrative needs in the office. Is the billable professional staff burdened by tasks that could be better performed by others? As a firm grows, be mindful of milestones where it might be wise to introduce administrative support staff.

- Assess the physical plant, and make sure the firm is maintaining its own standards for design, comfort, and usability. Make the space as flexible as possible to accommodate fluctuations in the size and needs of the staff, but avoid making commitments to too much space, especially with the possibilities today of teleworking and virtual teams.
- Don't ignore the costs of doing business in the digital age. Establish a calendar of renewal and replacement of communication infrastructure, computers, software upgrades or licenses, and personal devices, and plan for these expenses.

The Individual

People who are attracted to and succeed in acquiring the training needed to enter the fields of architecture and related professions are generally intelligent, ambitious, talented, and hard-working. They are also frequently motivated by the belief that they can make a difference in the world, and look forward to working in a creative, communicative environment with like-minded individuals, where their contributions will make a difference. With the realities of any business, including deadlines, budgets, and complex tasks, requiring painstaking and reiterative work, it is all too easy for most busy and successful offices to take the softer issues of firm culture and personnel development for granted. As a firm grows, it becomes increasingly important to be vigilant in establishing and maintaining a cycle of thoughtful review of each staff person and to give them timely performance feedback. A firm should also do what it can to align employees with educational and project opportunities that allow them to grow with the firm.

While professional continuing education is equally the responsibility of the individual, a growing firm benefits from supporting this process. Maintain an open dialogue with staff about what activities will be paid for or hosted by the office, and which are considered to be extracurricular or volunteer. The goal is to create a culture where there is mutual investment between people and the practice.

Examples of practices that cultivate the individual:

- Create a system of formal reviews to gauge progress against understood goals, and encourage immediate feedback, including both constructive criticism and praise. Don't let perceived weaknesses in performance fester, but provide interim feedback in a timely manner.
- Look for ways to let people shine, and to develop their own voice in the practice. Create opportunities for individuals to discuss or present work to the office and to clients.
- Be prepared to talk about long-term personal and career goals. Be open about planning for the future.
- Allow people to have input about issues related to the firm as a practice and include staff in planning for the future.
- Allow people to fail in an atmosphere of safety. Celebrate lessons learned by discussing mistakes and solutions openly.
- Acknowledge the contributions of people with specialty or technical knowledge.
- Allow for healthy competition: Host in-house design competitions, provide special opportunities and rewards for people doing exemplary work, and make this visible to others.

CREATING A LEGACY

The most successful practices, whether they are small or large, eventually become organizations that are greater perhaps than the talents of any particular individual. They can shape the industry and practice by their leadership in design, research, and service to the community. As the practice grows to a stable, mature entity, its leaders must become articulate in communicating the institutional values to others, and to maintain, refine, and reinvent them as necessary through transitions in its leadership and business focus. These values must become the norm for decision making if a firm seeks to maintain a culture of creativity, of rigor, of investment in community and profession, and—in short—of excellence.

Actions that will create a firm legacy for the practice and profession:

- Industry leadership, including giving back to the profession through participation in education, professional organizations, research, and development
- Community outreach and membership in cultural and educational organizations
- Personal and political engagement in local, regional, national, and global mechanisms
- Leadership in political and environmental stewardship
- Leadership in dialogues that shape the environment

5.5 Leader Effectiveness

Peter A. DeLisle, Ph.D.

In the current design environment, the need for architect-leaders has become paramount. This article presents a comprehensive model of leadership development for members of architecture firms. It is a multidimensioned approach to professional development.

THE ARCHITECT AS LEADER

All architects have the potential to be leaders. The most common expectation is that they will be technical leaders. Yet, a world driven by increasing complexity and frequent uncertainty demands the skills and abilities of people who are trained to solve problems and who can lead others in the search for effective solutions.

Architects are not trained academically or in their early careers to lead groups of people and organizations. They seldom undergo formal leadership training, so many are ill-prepared to lead projects or organizations. Too often, they are kicked off the dock and expected to know how to swim. A less harsh image, but one equally dysfunctional, is that good architects will apply some native talent to leadership problems and, through hard work and effort, will prevail.

Many architects have been ruined by this assumption about leadership rather than by their own missteps, and the unfortunate result is a significant loss: They become unhappy and marginally effective managers, sub-optimize the work of their group, and often lose their confidence as individual contributors. The worst-case scenario is that

Peter A. DeLisle is a professor of Leadership Studies and has held two endowed chairs in human behavior and leadership. He is principal faculty for the Emerging Leaders and Executive Leadership Programs at AIA Dallas and advisor to the Leadership in Collaborative Architectural Practice Program at the University of Utah.

they fail as managers and feel a need to leave the company, since they cannot regress by returning to the designer or project manager role without an apparent loss of status and dignity.

So the next question becomes, should architects strive to become effective leaders? The answer is an unqualified *yes*.

RECIPROCITY AND THE CITIZEN ARCHITECT

▶ See Public Service and Community Involvement (4.4) for more on commitment to the public interest by being a "citizen architect."

Few professions combine the rigor of technical design with the aesthetic eye. Fewer professions prepare new members with a sense of responsibility to ensure that the outcomes of their work are both pleasing and congruent in a context. None speak to the commitment of design to improve the built environment or the community to the degree that architecture does. The idea that the practicing professional should commit to a sense of duty, that the work done is respectful and sensitive to the community at large, is a significant differentiator for architects. The need for women and men with this predisposition is critical. It suits the architect to embrace this challenge. The next question becomes, *will they?*

THE PROPENSITY FOR ENGAGEMENT

Three overarching factors dictate an architect's likelihood to embrace leadership:

- Are they personally inclined to do so?
- Are they prepared to meet the challenges?
- Are they willing to step up when the opportunity is presented or emerges?

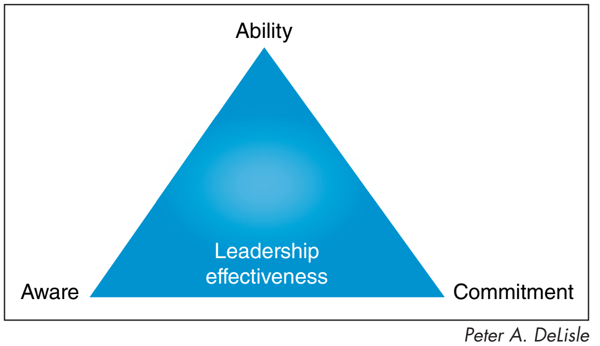
The argument can be made that the opportunities exist; however, the preparedness and inclination are a function of personal development usually not adequately addressed in an architect's professional training.

LEADER EFFECTIVENESS

Leadership effectiveness is a direct function of three interdependent elements:

- People's awareness of themselves, of other people, and of the impact of their behavior on others and on situations
- Their ability to influence others' ideas and behaviors with or without authority and then to make decisions, problem-solve, motivate others, and balance the tasks and relationships in an organization
- Their commitment to make hard decisions and face the risks of "doing the right thing"

As the Leadership Effectiveness Triangle in Figure 5.6 shows, the relationship among these elements is connected and symbiotic.



Peter A. DeLisle

FIGURE 5.6 Leadership Effectiveness Triangle

The geometry of the model suggests that all the rays of the triangle must be present to determine effectiveness. The point of each characteristic lengthens with new skill development, and the area of the triangle grows with new capabilities and awareness. Absence of one element prevents leadership effectiveness from having a perceptible influence. More simply put, a person can be *aware and able*, *but not committed*, causing problems to go unresolved or plans to fail for lack of support; they can be *able and committed and not aware*, yielding good intentions but very poor decision making; and *aware and committed but not able*, which is problematic on many levels. Ideally, leaders should master and practice all three elements.

Awareness

Awareness is a state of consciousness—the ability to recognize the state of one's personal awareness, one's sense of others' events, situations, and needs in real time. Awareness also entails the ability to assess the impact of actions on situations or people, and the ability to be critically self-reflective. Awareness is a growth and development process and a function of direct experience, communication, self-discovery, and feedback. Awareness depends on trust, from and of others, to sustain its growth.

Ability

Ability to lead is a function of influence. Architects rely on their ability to influence others to get work done, since nearly every design project requires collaboration of many disciplines and stakeholders, and accepting new or better ideas to solve problems.

Architects already possess some fundamental problem-solving skills. They are adept at not only recognizing and describing problems but also at offering acceptable solutions to the problematic environment. Architects also subject their ideas to a variety of tests before adopting them. Design review and feedbacks are normal activities for project teams. Architects must also assume responsibility for the quality of their work, and more important, recognize that their work has a direct impact on the lives of other people in a tangible and material way. When coupled with consciousness, this professional competence advances the capability of architect leaders to influence very complex situations and wade into uncertain territory—with an expectation for a positive outcome.

Recognizing complexity is at the core of design leadership, since it speaks to the ethos of architects and articulates one of the most important values of the profession. Only a few other professions share this commitment to self-examination, assessment, and regard for impact on others, such as medicine, engineering, law enforcement, and the military. These endeavors depict how the influence of leadership is very clear and material.

Commitment

Effective leaders must make the commitment to assume risk and responsibility for the outcomes of their decisions. This requires the ability to recognize and make *hard decisions*.

A *hard* decision is different from a *tough* decision—one made when ambiguity or uncertainty, competing priorities or scarcities are prominent. A hard decision is one in which the leader must act to ensure that the ethical, legal, and moral decision is made, even if the consequences are personally unacceptable. This judgment skill is one of the key behaviors that separate leaders from managers. It also lays the foundation for architects to assume more responsibility as the leaders of organizations.

A hard decision might need to be made, for example, when a leader determines that a loyal and honorable staff member's contribution is marginal or even unacceptable. Imagine further that this person was one of the original staff members and helped build the firm.

What does the leader do? Continuing employment communicates an acceptance of substandard performance; involuntary separation seems callous and risks losing valuable institutional knowledge and firm reputation as a good employer. Failure to act suggests that substandard performance is acceptable, while asking the person to leave may result in the leader seeming mean-spirited.

Assuming that creative third-way alternatives have been explored and found unavailable, the leader must make the hard decision about whether to ask the person to leave the firm.

Interdependencies: Technical, Interpersonal, and Resource Utilization Skills

Architects attend professional school and continue their training through licensure and continuing education throughout their careers. Technical training embraces design and visualization from studio to charrette. Resource utilization, the functions of planning, organizing, and controlling processes and activities, is most often referred to as management. Proposals, bids, financial models, and use of capital and human resources fall into this domain.

However, leadership is an interpersonal skill.

For architects, much leadership pertains to influencing people and events, often without the explicit authority to do so. This presents extreme challenges and requires a much higher level of sophistication than the command and control models inherent in other industries. In many instances, the architect leader must convince people of the merits of the design, the plan, and the expected outcome, with nothing other than the ability to persuade as the motivating force. This skill assumes even greater importance when the increasing complexities of design, technical coordination, building performance, agency approvals, and funding are added.

Architects must actively seek feedback and information about their interpersonal effectiveness. They must develop a sophisticated understanding of how people are motivated and how they grow and develop in the organization. Architects must develop and sustain conceptual flexibility, and be comfortable with change and ambiguity. They must hone their technical problem-solving skills, but develop an equally competent set of interpersonal skills, principally those related to communication skills.

Architect/leaders must be self-reflective and self-auditing, listening carefully and acquainting themselves with the best practices of others. Leaders must examine their personal values and recognize that leadership is an act of personal and professional integrity. The consequence for compromising integrity is a *zero* or negative multiplier—like the value of trust: You can be trustworthy a thousand times in a row and untrustworthy once, and the product of the equation is zero or less. The same algorithm holds true for leadership and integrity. Once lost by carelessness, circumstance, or unwillingness to make *hard* decisions, the leader is compromised, and the mantle of leadership can be lost.

COGNITIVE PROBLEM-SOLVING

One of the most important skill that an architect must develop is the ability to solve problems. While problem-solving is a critical capability, it is often considered simple and commonplace. We attribute mathematics and science skill as the fundamentals of problem-solving, and often use the scientific method as our approach. This results in a quantifiable and material set of solutions. Problem-solving, however, is actually much more difficult and complex. When we look at how a person formulates a problem in their mind, we begin to see the complexity of cognitive problem-solving.

To understand cognitive problem-solving, it is important to look at the various ways of interpreting approaches to problem resolution, and important to note that people have a preferred problem-solving style. The problem-solving style characterizes how a person addresses situations that need thought and an approach to resolution. A problem-solving style is an approach that an individual has generally relied on for many years, and is not only the preferred style but often the unconscious choice. There are three common problem-solving styles:

- Adaptive
- Innovative
- As a Continuum—Bridging

Adaptive Problem-Solving

The first style is called adaptive problem-solving. Adaptive problem-solvers are people who look for a few well-reasoned, well-thought-out solutions to problems, working within the system. The solutions must have a high probability of being successful. Adaptive problem-solvers are very comfortable working within the constraints and boundaries of a system or context. They also seek harmony and positive relationships among people. Adapters are very efficient, and bring discipline, order, precision, and elegance to the work they do. Adapters are the people who get things done in a timely and effective manner.

Although it is not possible to be certain, some illustrations from history might be useful. Thomas Edison is known for a very famous quotation, "*invention is one percent inspiration, and ninety-nine percent perspiration.*" Edison was renowned for his persistence and willingness to conduct experiments until a reasonable solution came to pass. If it took a thousand times to get the right answer, he considered the first 999 to be simply failed experiments. Edison gave us the phonograph, movies, and the incandescent light bulb. Unfortunately, Edison did not often see relationships between his inventions. Otherwise, he might have invented MTV at the turn of the century. Yet Thomas Edison was amazingly creative, and very prolific within a certain domain.

Another example of an adaptive problem-solver might be Michelangelo. This is an important example because we see Michelangelo as one of the most of remarkable artists, architects, and sculptors who ever lived, with great works such as *St. Peter's Basilica*, the *Sistine Chapel*, and the statue *David*. If the Sistine Chapel is looked at from structural point of view, it is immediately recognizable that Michelangelo had to work in a finite space. The ceiling had definite boundaries. Also, the medium that Michelangelo used to paint the ceiling was fresco, which is wet plaster, necessitating quick and expert work. Michelangelo, while lying in a semi-prone position, painted from the perspective of a person standing on the floor of the chapel and looking up. He was able to visualize and conceive what the picture should look like from the eyes of the viewer, not the artist. When Michelangelo was asked how he was able to carve the statue *David* from a flawed piece of marble, his simple statement was, *I simply took away the parts of the statue that didn't belong*. Was Michelangelo creative? Most assuredly. Was Michelangelo adaptive in his problem-solving style? It appears so. It is reasonable to state that adaptive problem-solvers are both creative and efficient, striving for elegance in design and execution.

Innovative Problem-Solving

The opposite cognitive problem-solving style is called innovative. Innovation normally is a synonym for creativity in our language, but Edison and Michelangelo established that adaptive problem-solvers can be creative. Innovative problem-solving means that the person looks for as many solutions to the problem as they can possibly conceive. In general, the "more the merrier," more is better than less. The solutions do not have to reflect the system and oftentimes are outside the system. The innovative problem-solver breaks out of the frame of conventional wisdom very easily, often disregarding or breaking rules. Innovators often fail to finish tasks, or are distracted easily if they see something of greater interest. Unlike adaptive problem-solvers, innovators often create a disharmony, show little concern for the welfare of others, and often are seen as renegade and outside of the system. Nevertheless, they operate extremely effectively in situations that are highly uncertain or ambiguous.

By way of comparison, living at the same time as Edison was an entrepreneur named Nicola Tesla. He was an amazingly prolific inventor. Not very many people recognize Tesla's contributions to electrical engineering, or many of the conveniences we use today. Tesla invented alternating current polyphase generators, wireless radio transmission (think cell phones), and tinkered with batteries large enough to store lightning bolts. Why is he not recognized? The answer is simple. When Tesla was asked why he never wrote anything down, he tapped his temple and said something akin to, *why bother, it's all right here*.

Tesla gave us the ability to electrify a household many miles away from the power station with his alternating current dynamo. In addition to wireless radio communication, he described television and microprocessors in the 1880s. He was eccentric, aloof, and very difficult to work with in a collaborative fashion. Frankly, it is said that he and Edison hated each other. Some evidence suggests that Edison blew up Tesla's lab.

Another example of an innovator is another Italian living at the same time as Michelangelo. We know him as the artist who painted the Last Supper and the Mona Lisa: Leonardo da Vinci. Leonardo was extraordinary, often serving as the prototype of the Renaissance man. When asked what he is known for, most recognize his paintings, but da Vinci was prolific in the range his interests. He was a military and aeronautical engineer, a mechanic, an architect, an anatomist, and a scientist. He also painted and sculpted.

It is reported that Leonardo started some 400 paintings or other works of art in his lifetime, but finished about 40. It is interesting to speculate on what his legacy would have been like had he been able to stay on task. Leonardo was extraordinarily creative, as was Tesla. They represent interesting examples of innovators who saw their work outside the bounds of conventional wisdom or tradition. These contrasts help us understand where difficulties in teamwork can exist due to different cognitive styles.

Problem-Solving as a Continuum: Bridgers

Place innovators on one end of a continuum and adapters on the other; those who contribute to solutions between these two disparate problem-solving styles might be called Bridgers. These are people that see the importance of new and different ways of approaching things, and yet recognize and understand the need for order and discipline. They can create more positive relationships between the two different problem-solving styles. They can help innovators understand the need to select few ideas, and show adapters the importance of flexibility and willingness to embrace change. A good example of a bridger is George Westinghouse. Living at the same time as Tesla and Edison, he saw the merits of both of their inventions and the need for them to collaborate. He attempted to convince them to do so, with no success. He proceeded nonetheless with Tesla's solution. His ability to see the interdependence of their inventions resulted in the World's Columbian Exposition of 1893 in Chicago having the distinction of being the first large-scale electrically lit activity in the United States (Wrigley Field was a latecomer).

Another example of a Bridger is General George Marshall. He had the uncanny ability to balance diverse interests and was committed to the employment of people from wide-ranging problem-solving styles to complete his mission. He was successful in the military and as a statesman. He is largely responsible for the economic recovery of Europe after World War II, and the relative degree of harmony in worldwide affairs that was maintained in the late twentieth century. Had Marshall not looked for compromise, and insisted on collaboration, the world would have not enjoyed the postwar stability that rebuilt Europe. Marshall also brokered the talents and abilities of leaders like Eisenhower, Patton, and Bradley, who also represent variations on problem-solving styles. Marshall was exceptionally creative in his understanding and management of interpersonal relationships.

Interdependence

All three problem-solving styles have elements of creativity, and have strengths and weaknesses. When people understand the differences in their approach to problem-solving, they can use the differences to augment and positively influence their solutions. When innovators are given the freedom to build wide-ranging solutions, bridgers articulate those solutions, judging those most applicable to the situation, and adapters execute a plan precisely, excellent solutions can be derived. In a critically reflective environment, in which people recognize and understand their skills and celebrate the differences, the best solutions can be generated.

In an environment that doesn't think about these relationships (a nonreflective environment), great interpersonal conflict can occur. There is a real difference in the way people approach problem-solving, and often people reject another person's approach because it's so radically different from their own. In the worst-case scenario, the Innovator thinks the Adapter *never* has original ideas and treats them accordingly; and the Adapter believes that Innovators are out of control, and should *never* be given any real responsibility. This can create disharmony, a tremendous difficulty since it causes people to be unwilling to work with each other in good faith.

One of most important things to recognize is that excellent solutions cannot develop unless all three of these elements—innovation, bridging, and adaption—are present. The absence of one of these problem-solving styles can create serious dysfunction in an organization. And the consequences of having only one problem-solving style in an organization can be equally as damaging. For example, a design group that is free to think divergently and try new and different approaches to the ideas is extremely desirable. But if the group never articulates or brings any of these ideas to closure, it is simply good at thinking, with no positive material consequence. Conversely if a group only works on a few ideas and never thinks expansively or examines the changing landscape around them, they might miss significant opportunities.

Problem-Solving Environments and Leadership

What is known about cognitive problem-solving suggests the following: If the environment is willing to sustain many new ideas, has a reliable way to articulate them, and can efficiently execute to plan, it will produce successful solutions. In reflective environments, where leaders are self-aware and also aware of what is happening around them, this is the kind of organization that is most desirable, and one in which everyone recognizes the importance of their contribution.

In nonreflective environments, where there is little awareness or thought about what is occurring in a process and interpersonal sense, innovators can become oblivious, bridgers are highly challenged to preserve harmony, and adapters feel like they're cleaning up after an elephant parade all the time. These conditions often exist when the dominant value of the nonreflective environment is what would be called "innovative." Fortunately, the opposite is not necessarily true. If the dominant value system is "adaptive" and reflective, lots of ideas and new and different ways of doing things (innovation) are tolerated and recognized as important, but not proliferated.

A think tank is the best example of innovation in an adaptive and reflective environment. The people inside generate ideas, but there's a containment area around them so that the proliferation of ideas does an impact the environment at large. The strategy is to extract a few good ideas and execute to plan, expecting that the ideas have a high probability of being successful.

A worse situation occurs when environment is adaptive and not reflective. This is a closed system. Any new ideas are seen to be intrusive or inconvenient, or, worse yet, insubordinate. "*We've always done it this way*" characterizes this situation. Two things can happen to innovators in this situation: They become increasingly adaptive and try to fit in, or they go elsewhere to find an environment more hospitable to their approach to problem-solving. Many start-up companies are spawned by big companies who have rejected new and different ways of approaching problem-solving.

The example of Galileo illustrates this point. In Galileo's time, lens grinding was a high art, and the observation of the heavens was the cutting edge of science. Galileo had great skill and was able to cut lenses that would allow magnification that exceeded any current capability of technology at that time. His interest in observing the nighttime sky was greatly enhanced by his ability to magnify stars and planets and make them much more visible to the human eye.

About 80 years prior to Galileo's observations of the heavens, Copernicus had postulated—in opposition to the conventional wisdom of the time that the earth was the center of the universe and the heavens rotated around it—that actually the sun was the center of the universe. He advanced his heliocentric theory, which was met with some interest but no disdain. It was considered an interesting premise, but, since it could not be proved, it was an idea without substance.

Galileo, however, developed the instrumentation that allowed observations to be made with greater precision. The physical certainty of the motions of celestial bodies, as determined by Galileo's observations, made Copernicus's theory a reality. Stepping back, it might be argued that Copernicus was an innovator, and Galileo was the bridger. However, the environment around Galileo was adaptive, not open to innovation, and the profession of science was bounded by the orthodoxy of the Roman Church. Put in another way, if scientific observation contradicted scripture, it was considered heresy.

THE LEADERSHIP CHALLENGE OF PERFORMANCE DEVELOPMENT: THE GUILD HALL

How leaders grow and develop follows a deliberate pathway and design. The move to effectiveness is a function of the person's consciousness—their awareness of the impact of their behavior in real-time—and their competence, their ability to perform at a level of mastery. This is the most desired state, but can only be derived through a deliberate process of engagement and development. Crafts were sustained after the Black Death wiped out half the population of Europe in the fourteenth century through a program of instruction within guild halls. Novices were recruited who agreed to commit to a program of work and service. They arrived with no knowledge and were given direct and immediate direction but minimal feedback until they showed appropriate responsiveness. An apprentice's level of engagement increased with increasing responsibility, and constant feedback was provided to ensure that learning was accelerated and embraced a steep learning curve. Journeymen were expected to work unsupervised for short periods of time but still to seek guidance and feedback frequently. Masters were self-organizing and self-managing.

This process did not come about by accident, and is not unlike the development of leaders and professionals in the modern context. It requires the full engagement of a leader in the demonstration of guidance and direction (the task) and feedback and encouragement (the relationship). It is also tied directly to the developmental needs of the individual or group. The leader must play the role of the taskmaster, the teacher, the encourager, and the colleague, depending on the point of growth of the individual. There are positive outcomes if the leader is adept at helping a person grow to a level of mastery. The capacity and intellectual capital of the group is enhanced.

Regrettably, the absence of this commitment from a leader to respond to the developmental needs of the individual or group can result in frustration, stagnation, malicious compliance, and, in the extreme, abandonment of the task. The leader must become adept at understanding the stage of development of a person, and respond with the right amount of task direction and constructive feedback. This requires a significant amount of critical self-reflection and other-centeredness on the part of the leader. It suggests that leaders must understand the needs of their staff and work cooperatively to meet those needs and encourage growth. The failure to do this, or the inclination to treat others "the way I was treated," is problematic.

Treating everyone the same (consistently) is also a flawed approach. One should not expect a novice to function at a level of competence, nor should one give detailed and specific instructions to a master. The rule of thumb is to understand their needs and match the combination of task and relationship behaviors to their growth.

Architecture embraces this process of novice to master. The rigor of school and the licensing process certainly speaks to the early stages of professional development (student to intern to associate), but much of the growth is self-directed. A more deliberate and positively structured approach would greatly accelerate competence. This is where the emerging leader can make an immediate and significant contribution. An architect's ability to perform is directly linked to the leader's effectiveness in this area.

THE LEADER'S ROLE IN CONFLICT MANAGEMENT

Leadership effectiveness is centered around the issue of conflict. Conflict management is our ability to influence other people in a positive fashion, and successfully complete the task at hand in a finite period of time. This means that essentially all work is a conflict. Trying to get great work done while sustaining excellent relationships in a finite time frame is an art. Many organizations are unable to achieve this.

Simply stated, conflict can't be managed the way finance is managed. It takes interpersonal effectiveness to manage conflict. Many organizations are completely committed to tasks with little or no regard for people. These organizations will get work done effectively in the short term, but have difficulty in sustaining a long-term level of effectiveness. They tend to chew up the people, or see them as interchangeable or expendable resources. Individuals sometimes also approach work with high task expectations but with little regard for relationships. They tend to be combative, self-centered, and unappreciative of the work that others do for them. Some people with this inclination are simply oblivious to the impact of their behavior on others.

Some organizations and individuals have a low-task, high-relationship orientation. These are people who tend to place conflict avoidance and positive feelings above successful completion of the task. This can disable an organization, because it fails to get the work done. Another approach to low-task, high-relationship orientation is seen in organizations that demand compliance and conformance. This is not necessarily a positive relationship, but it is one that demands a person put individual needs second to the needs of the organization, or be concerned with "fitting in" or "not rocking the boat." This mindset often stifles creativity and positive feelings as much as an organization that is committed to task only.

Relationships are often critical to the functioning of an organization because the performance of individuals is largely based upon the resolution of personal problems and motivations. Failure to consider and recognize that these things are important will cause an organization to collapse, perhaps due to key people leaving the organization, often at critical times. Similarly, organizations that are too relationship-oriented, with low commitment to task, often make for harmonious workplaces but may not be able to produce the work effectively.

Ideally, people working in organizations need a balance between task and relationship. The best workplace is one where there is a high commitment to this balance. People like to work hard, but also like to feel their work is valued and that they will be well-regarded for the contributions they make. The best organizations recognize and understand this, and build their values system and culture around the practice of a high-task, high-relationship work environment.

TEAMS: WHEN AND HOW

Teams are best employed when there is too much to be done by individuals working independently to hope for effective synthesis in a finite period of time. Teams should only be used either when time is the key factor or the complexity of the project requires multiple subject-matter experts, as is often the case in architecture.

There are some misunderstood aspects to working in teams that must be addressed by leaders. First, people should only be placed on teams when their level of competence is high and their ability to work cooperatively with others is unquestioned. High-performance teams are not a place for untested or self-interested people, mostly because they can waste time with backfill learning or by advancing personal agendas. The effective team leader must see that all members are fully informed of the expectations of their contribution, the relatedness of their work to other team members, the desired methodology of the team process, and the plan of action. Teams cannot solve all problems, although sometimes they are expected to do so. Above all, members of a team must be dedicated to the task and to other team members. Trust and acceptance is expected, not negative conflict or strife. For example, imagine the mission control team of *Apollo 13* arguing about resources or taking a break.

► See Project Teams (10.2) and Firm Growth and Development: How to Build a Creative Culture (5.4) regarding the importance of firm culture and best practices in selecting and organizing teams for project delivery.

DEVELOPING LEADERS: THE IMPERATIVE

Time will always be the factor that dictates how architects are trained and developed. The challenge is to identify processes and concepts that will bring utility and pragmatism to the process of leadership development. It will also be necessary to determine the points at which architects should be introduced to these practices. The other, more complex question is: who is responsible for the growth and development of effective leaders in the profession, regardless of their stage of professional status (partner, associate, intern, student)?

► Professional Development and Mentoring (8.4) further discusses training, mentoring, and appraisal programs that help to build firm strength and continuity.

Conventional wisdom is that one will learn from experience—hard knocks, so to speak. Some firms, with resources available due to the scale of their operation, can afford internal leadership development programs. All architects and emerging practitioners, if so inclined, can seek seminars or self-directed online programs to augment their skills.

The AIA has promoted much professional development, as have state associations, to address continuing professional education needs; and a few have embraced leader development with commitment and continuity. For example, the AIA–Dallas Emerging Leaders Program was started in 2008 and is supported by a significant number of firms in the region.

The AIA, at the national, state, and local levels, as a provider of continuing education has a significant opportunity to include leadership development in the offerings. A comprehensive approach would be to include a model of professional development that includes leader effectiveness beginning in architecture school (learning about effective teams and interpersonal communication) and continuing in the early stage professional certification. The process could be carried out through self-directed learning, augmented by online learning and component or knowledge community-sponsored programs. The ideal process would be a cooperative effort between the academy and the profession. If treated with the degree of interest, support, and respect that the role of architect as

> The most influential lesson I took away from the Emerging Leaders (EL) program is an understanding of the leadership qualities and skills I had within and finding my voice. Being a young professional, you don't always recognize when you have transitioned to a mentor and leader within your firm. The EL program helped me recognize that I had evolved into a different role. I became more aware of my influence on others and the responsibility I have to respect, improve, and value that quality.
>
> Being someone with typically a soft demeanor who never questioned or defied my superiors, the Emerging Leaders program also helped me develop my voice and learn how to engage and address my superiors appropriately in situations where my role, processes, or ideas needed to be understood and/or implemented. Surprisingly, achieving this hurdle was something senior leadership in our firm was hoping would occur in my situation, as they mentioned it was time for me to "come out of my shell."
>
> *—Dallas AIA, Emerging Leader 2010*

leader deserves, this effort could become a natural part of professional growth and development.

The concepts presented in this article were developed and enhanced by support from a grant from the Severns Family Foundation of San Francisco. This article is written in gratitude for the exceptional regard, the insight, and the wisdom of Robert B. Severns. The hope is that this work enhances the growth and development of architects and professional leaders.

5.6 Ownership Transitions

Michael Strogoff, FAIA

Architects are trained to design buildings and environments that nurture people and provide value to clients. An architect can apply the same skills and intense focus to create and nurture an architecture firm, to provide opportunities for future generations of owners, and to support the owners as they transition toward retirement.

AN OVERVIEW OF OWNERSHIP TRANSITIONS

Owning an architecture firm can be tremendously rewarding. Ownership allows professionals to shape a firm around an owner's specific interests, to pursue projects and clients to their liking, to define how to interact with clients, and to surround themselves with like-minded colleagues and employees.

Owning a firm is also full of challenges, and one of the largest revolves around how to successfully transfer ownership of a firm from its current owners to others. When owners start the process of transitioning the ownership of a firm, they must consider many issues:

- Whether to transition a firm internally or sell to an outside entity
- How the changing economic and societal landscape affects timing and options
- Why ownership transitions are increasingly difficult to accomplish
- How to create incentives for future owners while rewarding outgoing owners for efforts and investments
- How to develop a valuation methodology that reflects a firm's history, intellectual capital, and future outlook
- How to ensure that a firm's values and culture endure as a transition is completed

Despite the many issues, crafting and implementing an ownership transition plan is not beyond most owners' abilities. What is needed is a successful firm to sell, adequate time, a willing buyer(s), and a good set of guidelines.

After managing a 40-person architecture firm, Michael Strogoff started advising other architecture firms in strategic planning, leadership development, and ownership transitions. Strogoff is a frequent speaker and author on succession planning and mergers and acquisitions, and is a former chair of AIA's Practice Management Knowledge Community's advisory group.

The Need for "Ownership Transition"

Architecture firms can be viewed as living, adaptable entities, responding to internal and external forces: owners wanting to retire, key employees examining alternative opportunities, shifting demographics, generational differences, economic and market forces, technological changes, evolving project delivery methods, and rapidly changing client expectations. Firms that successfully adapt to these forces can prosper through many generations of ownership and leadership transitions.

There are many reasons to proactively plan for an orderly ownership transition:

- Leveraging and perpetuating the reputation, contacts, and portfolio that a firm and/or an owner spent decades to build
- Retaining and rewarding key employees that contribute to a firm's success
- Broadening a firm's skill base and service offerings by expanding its ownership team
- Providing outgoing owners income to help fund their retirements in exchange for years of hard work and risks assumed
- Continuing to service loyal clients that depend on a firm's ongoing operations
- Ensuring a firm's access to professional liability insurance after an owner retires

Firms need to plan for ownership transitions throughout the economic cycles that invariably occur. During periods of growth and profitability, firms should be setting aside funds to at least partially fund the transition process and should be hiring with an eye toward future owners. During economic downturns, firms should be making swift, strategic decisions to ensure their survival, retain key staff, and position themselves to rebound as the economy improves. For some firms, prolonged economic downturns will diminish their staying power and create an urgency to attract new owners, to merge practices, or to sell to a larger, more stable firm.

The Changing Landscape

For many decades it was not unusual for ownership transitions to occur with little more than a few discussions, a handshake, and a short written agreement. The transition choices that an owner of an architectural firm had were relatively straightforward, and the factors influencing how a transition was structured didn't change much. As architectural practice has gotten more complicated, new forces and factors have emerged, which require firms to consider transition planning as an essential strategic initiative.

Shifting Demographics

On October 15th, 2007, the first baby boomers (those born between 1946 and 1964) filed for Social Security retirement benefits, representing a milestone in the workforce. Many firms in existence today were founded in the 1970s and early 1980s by baby boomers. Those founders are now at or approaching retirement age. With 20 percent fewer people in Generation X (those born from about 1965 through the early 1980s), there is significant pressure on firm owners to think about ownership transition in new ways. These might include partially funding internal transitions through larger bonuses and deferred compensation plans, providing greater flexibility to accommodate more work-life balance, and encouraging prospective owners to start setting aside funds to invest in the firm.

Generally speaking, Generation X and the generation behind them, Generation Y, are more cautious and want a more diverse portfolio of investments—the days of having all one's retirement funded by the value of one's home and one's business are dwindling. These generations also tend to be more focused on living a balanced life, of which work is but one element—and have fewer financial resources to invest in a firm. Lack of financial resources is a problem especially during and immediately after economic downturns, when salaries and bonuses have been frozen or possibly reduced.

Adding to the shortage of future owners, fewer professionals entered the profession after each of the recessions of 1980 and early 1990s. Others left during the 2000 to 2001 dot-com bubble and bust, and again during the recession in 2008 to 2010. According to many firm owners, fewer of those licensed architects remaining are interested in assuming ownership. During boom times, when employees were in high demand, many thought, "Why would I want to buy into a practice when I am making such a good living and so many firms want to employ me?" During times of great economic uncertainty, the prevailing attitude was, "Why would I want to buy into a firm in this economy?"

Increasing Complexities of an Architecture Practice

The business and practice of architecture continues to increase in complexity as clients become more sophisticated and demanding, new technologies emerge, and buildings become more complex to design, document, and deliver. The knowledge and skills required to lead a practice, even a relatively small practice, requires an ownership and leadership team with a wider set of skills than previously needed.

Economic Cycles

Architecture and construction are among the most cyclic of industries, prone to large swings as national and global economies shift. When the economy declines, valuation prices decrease, risk factors increase, expected payback periods increase, and ownership becomes less desirable.

► Navigating Economic Cycles (7.1) further discusses the construction industry's ups, downs, and impact on architecture firms.

Consolidation Trends

Although economic downturns generally spur consolidation, the wave of consolidation within the architecture industry from 2009 to 2012 is unprecedented. Large and midsize firms looked at mergers and acquisitions as a strategy to expand geographically, acquire new expertise, expand their pool of future leaders, realize greater economies of scale, and/or simply eliminate competitors. Additionally, many larger firms are persuading their large institutional and corporate clients to centralize their relationships, adding still more pressure to smaller and midsize firms.

On the other side, more firms are finding it harder to compete with larger or more highly specialized firms, and difficult to fund the technology and software required to compete effectively. In response, some firm owners are actively looking to sell their practice or merge their practice into a larger operation. Baby boomers who did not develop an effective internal transition plan, plan adequately for their retirement, and/or don't have the next generation of leaders in place are left with two alternatives: work longer or sell their firm to an outside entity.

Transition Options

Regardless of the reasons an owner wants to sell a firm, there are two options available to those who plan ahead—internal transitions and external mergers or sales. For owners without an adequate transition plan, a less desirable third option, closing shop, may be the only choice available. However, closing the doors represents a unique set of challenges:

- It is difficult and often expensive to wind down projects on different schedules.
- It is difficult to maintain employees to complete projects when it becomes known that the firm is closing.
- Maintaining insurance to protect owners against claims of negligence is both expensive and seldom available to provide adequate protection throughout the entire period until statutes of limitation expire.
- Depending only on savings and investments to fund retirement.

Internal Ownership Transitions

Internal transitions can take different forms: selling portions of the firm to other firm members; recruiting senior people from outside the firm to join the firm as key employees and eventually assume ownership; or creating an employee stock ownership plan (ESOP). As ESOPs are typically appropriate for larger firms and only under special circumstances, firm owners should engage outside accountants and attorneys for guidance.

Benefits of selling a firm internally include maintaining control of the firm longer; handpicking the successors; structuring the transition gradually; the opportunity to attract, retain, and reward future leaders; a higher likelihood of maintaining a culture within the firm; and greater client acceptance of the transition.

Challenges with internal transitions include making internal transitions affordable and attractive to new owners; hiring and mentoring enough candidates who have the resources, interests, and skill sets required to assume ownership; gaining the acceptance by employees of new leaders whom they have previously viewed as peers; and allocating the time and providing the training needed to mentor new owners. And, once an internal transition is implemented, if a firm's profitability suffers and its value declines, morale decreases, the ability of new owners to make payments to outgoing owners declines, and some new owners search for an exit strategy.

External Ownership Transitions

Selling a firm to an outside entity can likewise come in two forms: a merger or a sale. Benefits of selling a firm to an outside entity include higher sale prices; more liquidity; lesser risk, as transitions typically occur over a shorter time frame and payments are not

UNSUCCESSFUL TRANSITION

After gaining experience at a few other firms throughout his early career, Karl Stevens decided that he would start his own firm. He was attracted to the opportunity of creating a firm modeled around his strong design beliefs, and was tired of working excessive hours for other people's benefit.

Over the years, Stevens Architects grew to 12 people, enjoyed a steady flow of repeat clients, and produced several award-winning projects. Stevens earned a reputation among his clients as an architect that provided exceptional client service and produced highly responsive designs. As the sole owner, Karl enjoyed his autonomy and received tremendous satisfaction from winning new commissions.

By all appearances, Karl ran a successful firm. Through tightly controlling the firm's finances, he consistently earned profits hovering around 20 percent, and, due to the quality of his work, had an easy time attracting staff. However, Karl did not delegate well, and even his senior-level staff tended not to stay with the firm for more than a few years.

At the age of 67, Karl was starting to think about traveling and spending more time with his extended family. Sitting down with three of his senior staff, Karl informed them that he would like to start transitioning to a less hectic schedule and would like to offer each of them an opportunity to become owners. Because the firm had been so profitable, Karl told his underlings that he would offer the firm at a price of $1.4 million, which equated to slightly more than four times the firm's average annual profit.

The three staff members voiced initial enthusiasm and said that they would consider Karl's offer. They held several meetings among themselves. The three staff respected each other and believed that they could run the firm successfully. But they kept coming back to the same conclusions: Karl had done 100 percent of the marketing and, when he retired, a large part of the firm's business development success would also be gone. They were also concerned about Karl's ability to relinquish control. He had always controlled every aspect of the firm, so why, they thought, would the future be any different? Finally, Karl seemed set on his asking price, which was beyond the financial means of any of the three staff.

A few weeks later, Karl sat down with his three senior staff. As everyone took their places around the conference table, the mood was sullen. They thanked Karl for the opportunity but politely told him that they decided not to purchase the firm. Karl abruptly left the meeting, knowing that he had waited too long to start the transition process and had few, if any, alternatives. He also felt betrayed.

Two weeks later, the three senior staff gave notice and set out to start their own firm, vowing not to make the firm dependent on any one of them.

Although Karl did replace his senior staff and started involving each of the replacements in more day-to-day decisions, he ended up working for another three years before he felt comfortable taking more time off to spend with his family. Finally, at age 70, Karl started winding down his firm. He slowly reduced his staff count to align with the staggered completion dates of the firm's projects, and awarded pay increases and distributed occasional bonuses to those that remained. Although it was relatively expensive, Karl decided to purchase a tail-end insurance policy that covered his professional liabilities for three years following the official closing of Stevens Architects. In the end, the earnings from working for an additional five years slightly outweighed the purchase price Karl would have received had the three staff to whom he offered ownership actually purchased the firm. The trade-off for Karl, however, was less flexibility in the timing of his retirement and greater personal risk after the tail-end insurance coverage expired in three years.

as linked to ongoing profitability; and opportunities to redefine the day-to-day responsibilities of the owners of the selling firm. In addition, the owners of the selling firm (for as long as they remain), as well as its key employees, often benefit from a buyer's broader portfolio, market diversity, and access to larger clients, and therefore the opportunity to work on more challenging projects. For owners, a major attraction of selling a firm is the ability to get away from spending time running a business. And for many employees of a selling firm, working for a larger firm often provides new project and leadership opportunities.

Challenges for external transitions include the difficult and often time-consuming process of finding a buyer with whom a selling firm shares common values, and maintaining confidentiality while searching for and conducting exploratory discussions. During negotiations, stalemates often occur as buyers and sellers place different values on the seller's firm. External transitions are also more prone to employee and client defections. Finally, for many owners, giving up control of a company they once owned is emotionally stressful.

Making the Choice

Owners should carefully evaluate their options every few years. Some owners choose to focus on an internal ownership transition because of a desire to see the lasting value of the firm continue to prosper in the hands of people they mentored, and want to reward the loyalty of key employees. Others focus on an external transition because it might result in a higher price or because it creates opportunities to work on more exciting projects. (See Table 5.8.)

From a financial perspective, if a firm is generating above-average profits and possesses a strong backlog, an owner is probably better off implementing an internal transition plan and continuing to receive profit distributions as shares are sold. Many think that internal ownership transitions are preferable, and probably better for the profession; this is only true if owners plan properly and are able to attract and retain younger colleagues who have the talent, the personality, the skills, and the entrepreneurial drive to successfully take over the helm.

TABLE 5.8 Internal vs. External Transitions

Internal Transition—Benefits	External Transition (Merger or Sale)—Benefits
Current principals retain control longer	Higher price, more liquidity, generally less risk
Continuity of culture and values	Access to more capital
Retains and rewards key employees	Shorter time frame, faster transition
More gradual transition over longer time frame	Marketing opportunities
Clients more accepting of internal transitions	Adds skills and capacity
	Ability for a seller to focus on a more fulfilling professional role
Internal Transition—Challenges	**External Transition (Merger or Sale)—Challenges**
Unproven leaders and/or lack of candidates	Difficult to find the right buyer
Candidates more risk-averse	Confidentiality
Less liquidity, more risk, longer time frame	Cultures difficult to match
Dependent on future growth and profits	Current owners giving up control
Morale of new owners suffer if value declines	More prone to employee and client defections
Need to make more affordable (incoming owners have less money and less liquidity)	Some contracts difficult to transfer or assign, although this is often solved through a stock sale vs. an asset sale

On the other hand, if a firm is highly desirable (e.g., it opens new markets, brings expertise in new building types, has a large backlog, and/or strengthens a buyer's leadership team) and can therefore command a price based on a high multiple of earnings, an owner can realize considerably higher financial returns with much less risk by selling his firm externally.

The important thing is for firm owners to always look ahead, so that they have options to pursue and a plan in place when they do decide to transition out of the architectural profession.

DEVELOPING AN EFFECTIVE INTERNAL TRANSITION

Offering ownership internally allows an existing owner to retire or transition to another chapter in their life in an orderly and predictable way, to recognize and retain key people, and to pass on a legacy that they were instrumental in creating. Strategically identifying and offering ownership to hand-selected successors who possess strong skills and special expertise also allows a firm to broaden the services it offers to clients.

Keys to Successful Internal Ownership Transitions

- Allow ample time to implement, preferably seven to ten years before the first owner retires.
- Consistently build value.
- Start early and communicate often.
- Ensure a common set of values and vision of the firm's future.
- Identify, motivate, and foster the development of future generations of leaders.
- Develop an ample pool of qualified prospective owners.
- Communicate openly and objectively with prospective owners.
- Provide necessary training and mentoring.
- Give incoming owners increasing amounts of responsibility and gradually relinquish authority.
- Enable leaders to gracefully decline invitations to become owners and remain strong firm leaders.
- Encourage ongoing communication about the firm's value and future direction.
- Include a realistic valuation that is easily measurable, understandable by all owners, and accounts for changes in the firm's profitability and future outlook.
- Align incentives that reinforce the firm's ongoing profitability, growth, culture, and design values.
- Develop a purchase plan that is affordable to incoming owners, many of whom lack cash and liquidity.
- Balance financial rewards to outgoing owners with maintaining financial stability of the firm.
- Structure buyout payments to departing owners over a period of years so the firm and its remaining owners are not overly burdened with debt.
- Establish expectations for each incoming owner, constructively evaluate each other, and hold each other accountable.
- Encourage outgoing owners to transition out of a firm over time while remaining available as a resource.

Before offering ownership, be prepared to address a basic set of questions, starting with "Why should I become an owner, and what exactly does it mean?" Explain that ownership presents an opportunity to shape the firm's future and to have a seat at the decision-making table, to gain access to and offer input on key financial and operational aspects, to have a greater voice in choosing which projects to pursue and a more effective platform from which to market, and to have the potential for higher income in the form of higher salary, larger bonuses, profit sharing, and more job security.

CASE STUDY OF AN INTERNAL TRANSITION

The four owners of Integrated Design Associates valued collaboration above all else. This was reflected in how they involved clients in design decisions, how they governed the firm, and how they obtained new business. The owners could recall only once when a shareholder vote was actually taken, as the four owners and their five associates talked through every important issue until a strong consensus was reached. When hiring, it was not uncommon for prospects to be interviewed by half a dozen members of the firm, including the technical and support staff. Each of the principals was expected to allocate at least 20 percent of their time marketing the firm.

The firm had previously redeemed the shares of two prior owners and were nearing completion of the five-year buyout payments. In both cases, as specified in their shareholder agreement, 20 percent of the first two years of payments were withheld and paid after the former owners fulfilled their obligations to remain available in an advisory capacity.

Integrated Design Associates' ownership transition plan was developed 15 years before the oldest principal was due to retire. At the time, the ages of the owners were purposely staggered, with two in their late fifties, one in her mid-forties, and one in his late thirties. Their shareholders agreement valued the firm at book value plus a premium equal to 25 percent of the average net income for the preceding 3 years. This made the buy-in price affordable to incoming owners while still rewarding current owners for growing the firm and generating profits.

The principals sat down with each of the firm's associates, openly discussed the pros and cons of ownership, and developed a roadmap for each associate should he or she want to be offered a future ownership position. The firm also implemented a leadership training program to help identify other prospective owners and to train the next generation of leaders. They know that it will take at least five years of planning to allow the two owners in their late fifties to start phasing out of the firm.

Key Terms to Be Addressed in an Internal Transition Plan

Developing an effective internal transition plan is not overly complicated. There are, however, some key issues that need to be addressed in a transition plan:

- How will the firm be governed? Specifically, which decisions require unanimous approval by the owners, and which ones might require a supermajority or a simple majority? Over which decisions will the current owners want to maintain veto power?
- What are the expectations of the current and incoming owners? What are their roles and responsibilities, and what type of leadership skills are needed?
- How many shares, if any, should initially be granted to incoming owners?
- How is the share price calculated, and how will it be adjusted each year? What happens if the future owners cannot agree on a value?
- Should the incoming owners have an option and/or an obligation to purchase additional shares?
- What are the buy-in options? For example, in lieu of cash, shares can be acquired by foregoing salary increases and bonuses, from promissory notes (secured or unsecured), from guaranteed bank loans, from deferred compensation, or by guaranteeing outgoing owners a percentages of future profits.
- What are the buyback provisions? If somebody voluntarily resigns, are the value and terms different from involuntary resignations or from death or disability?
- What is the time frame for selling shares? Is it going to be done over one year, five years, ten years?
- How are profits distributed? What is the working definition of profits? With multiple shareholders, a formula or fallback option is needed for how the firm will categorize profits and cash reserves, along with a distribution schedule for those profits.
- What types of personal guarantees will an incoming owner assume?
- What liabilities will each incoming owner assume?
- What are the terms for noncompetition if an owner leaves? If an owner resigns, would they be entitled to compete against the firm or restricted from competing

against the firm, in designated markets, in specific regions, with identified clients, and for how long?

- What are the terms for nonsolicitation if an owner leaves? If an owner resigns, would they be entitled to solicit employees of the firm or restricted from soliciting, and for how long?

Potential Concerns of Prospective Firm Owners

- What does firm ownership really mean?
- What will be my role and responsibilities, and how do they differ from my current role?
- Are my visions of the firm's future compatible with those of the current owner(s)?
- Can I have a significant role in shaping the firm?
- What is the long-term succession plan and how do I fit into it?
- Will the current owners remain active long enough to mentor me?
- Who else is being offered an ownership position, either now or in the immediate future?
- Will being a minority shareholder limit my influence?
- Does firm ownership fit into my life and other interests at this point?
- What about my own financial security? Will I make more money?
- How much is the firm worth, and how do I know that the offering price is fair?
- Can I afford to buy in?
- What are the various options for purchasing my share of the firm?
- What is the firm's financial outlook?
- How do I know that the firm has really been profitable?
- What liabilities would I incur?
- What if I invest into buying into the firm and the firm has a bad year or a stretch of bad years?
- If it doesn't work, how do I get out?
- What if I decline?

Owners need to be candid about the risks, stress, and long hours that accompany ownership. It is an owner's responsibility to enable a prospect to make an informed choice. Make it clear that declining an offer for ownership is an acceptable alternative and that there will be no repercussions. Gracefully accepting a response of "No thank you, that is not for me" is better than having a valued employee leave the firm because their priorities and desires for ownership differ.

Criteria for Becoming a Principal/Owner

Every firm should develop a list of traits and criteria to consider for identifying and evaluating new owners. Here is a list to start the process:

- Shared values and belief in the firm's vision
- Ability to think strategically about the future
- Client-centric focus and ability to nurture client relationships
- Industry thought leader
- Design, technical, and/or management capabilities
- Passion for delivering high-quality services
- Commitment to assume broad firm-wide initiatives and leadership responsibilities
- Leadership, delegation, and team-building skills
- Interpersonal skills (ability to listen, participate in intellectually honest conversations, and act on constructive feedback)
- Decisiveness and confidence (taking ownership and reinforcing acceptance of decisions)
- Tolerance for and willingness to assume significant risks
- Trust and integrity
- Discretion and sound judgment

- Personal financial stability
- Ability to market services and close sales
- Contributions toward profitability and firm sustainability
- Willingness to dedicate the time needed to address the responsibilities of an owner

SELLING A FIRM

Selling a firm to an outside entity can require soul-searching, time, and strategic planning. While joining a thriving firm, gaining opportunities to work on different or more stimulating projects, and being relieved of the day-to-day financial responsibilities appeals to some, giving up a controlling interest in the firm and working for someone else can be a difficult choice for others.

The best mergers or acquisitions bring tangible gains to both parties and provide greater value to the marketplace than both firms provide as separate entities. If prospective clients cannot see the value of a merger and embrace it for the added depth, expertise, and/or stability it brings, then the merger will likely not achieve the goals set forth by both parties. In short, approach a merger or acquisition first and foremost from a strategic marketing perspective.

As a seller, the likelihood of attracting a desirable buyer is based on many factors. If a firm has a unique position in the marketplace or possesses special expertise, is sought out by clients in highly desirable market sectors, is in a region with a foreseeable market uptick, has outstanding leadership capabilities, and possesses a solid backlog of work, then the firm has a good chance of attracting a qualified buyer. On the other hand, if a firm is focused on a dwindling market sector, has only a small backlog, has no clear expertise that differentiates it from other firms in a particular market, is poorly led, and has a recent history of poor financial performance, attracting a buyer willing to pay anything more than a fire-sale price is unlikely. In either case, buyers will evaluate a seller based primarily on whether an acquisition will result in greater market share and higher profits, after amortizing the purchase price, than would purchasing a different firm or growing organically.

CASE STUDY OF EXTERNAL PURCHASE

GBTH Architects garnered a national reputation for planning and designing science and technology buildings, often teaming up with large firms across the country for highly sought-after commissions. The three owners were comfortable for years operating as a niche firm. They regularly spoke at conferences and symposiums that their clients attended, and authored articles in numerous trade publications. Although most of their teaming relationships were successful, the owners wanted to undertake much larger projects on their own. Even though they knew that even large projects would not require allocating more than five or six architects, they could not persuade clients to entrust a 25-person firm with projects that exceeded $15 to $20 million in construction costs.

The firm had been approached over the years by firms interested in acquiring them in order to gain a foothold into the growing science and technology building sector. GBTH Architects always politely declined, not wanting to give up their autonomy. As the years passed and GBTH Architects added to their portfolio, the principals' desires to work on larger, more complex projects increased. When they were approached by a well-respected firm with whom they had completed several projects as joint venture partners, they decided to explore a sale.

With the help of an outside adviser, they entered into a Letter of Intent that described the financial terms of the sale, the principals' respective roles and responsibilities in the acquiring firm, and, of most interest, how the combined firms could leverage GBTH Architects' expertise in over a dozen new locations. Two years later, the former principals of GBTH Architects were working on projects of a size and magnitude of complexity that they had only dreamed of doing as a smaller firm. Although they occasionally missed some of the aspects of being in charge of a 25-person firm—they were now part of a 450-person firm and had to contend with some of the bureaucracies inherent in larger organizations—they also felt that they were finally achieving their professional goals. And whenever any of the principals reflected about how their work lives changed, they were reminded of the day-to-day distractions they had had to attend to when running their own firm.

Strategic Rationale for Mergers and Acquisitions

There are multiple strategic reasons to investigate mergers and acquisitions; below are the most prevalent.

- Provide added value to clients.
- Acquire new areas of expertise and knowledge.
- Diversify into new markets.
- Service clients across broader geographic regions.
- Facilitate geographical expansion.
- Compete more effectively against firms with larger market penetration.
- Expand marketing networks (e.g., engineers, specialty consultants, contractors) and opportunities.
- Become viable for larger and more complex projects by increased bench strength.
- Leverage current leadership team, infrastructure, and intellectual capital.
- Expand leadership team and create more stability/redundancy in key positions.
- Enable key people to redefine their professional focus.
- Share project resources, knowledge base, intellectual capital, and best practices.
- Gain access to and/or strengthen marketing, management, design, and/or production capabilities.
- Share workload ("in-sourcing") and reduce staffing fluctuations.
- Obtain skilled staff and/or enlarge base for recruiting staff.
- Offer staff a wider variety of project choices (building types, sizes/complexity, location, expanded services).
- Provide greater economies of scale and reduce duplication of efforts.
- Eliminate each other as competition.
- Facilitate succession planning.
- Avoid the difficulties inherent in closing down a firm.

Identifying an Appropriate Buyer

The first and most important step in an acquisition or merger process is to develop a strategic profile of the type of firm that should be targeted. Start by creating a one- to two-page profile describing the types of firms that will most benefit from the merger or acquisition. Analyze this from several perspectives. Determine what type of firm will benefit from what the selling firm offers in terms of:

- Geographic reach
- Client types
- Services
- Building types
- Design capabilities
- Specialized expertise
- Leadership skills
- Staff skills
- Portfolio
- Reputation
- Project delivery
- Marketing skills and resources
- Technology

As a buyer or a seller, a firm owner might contact directly other firms that meet the profile, explain strategic goals, and why the specific contact is being made to determine if there is any interest in exploring a long-term relationship. After a nondisclosure agreement, which obligates each firm to maintain confidentiality and limit discussions to specific people on a need-to-know basis, is signed by both parties and outside advisers are engaged as appropriate, a series of meetings are conducted to discuss respective visions, potential synergies, leadership structure, governance, and, most important, firm cultures. The key to a successful integration after an acquisition or merger is cultural compatibility. The only way of determining whether this exists is to get the leadership teams together. Discretion is vital at this stage. The last thing wanted is for clients and employees to find out that a transaction is being contemplated before both parties are ready to disclose the decision.

Another approach for both buyers and sellers is to engage a consultant who specializes in mergers and acquisitions to serve as an adviser, advocate, and guide through the process. Consultants can conduct market studies, help develop profiles of target firms, create lists of candidates, contact identified firms, introduce the interested firms, facilitate discussions and decisions, recommend attorneys and tax advisors, and assist during due diligence and integration. Outside consultants often have the ability to reach a broader range of potential buyers, to provide unbiased assessment of specific buyers, and to offer advice about the current fair market value of similar transactions. In addition, hiring the proper consultant allows current owners to remain focused on running their business.

Regardless of whether a mergers and acquisitions consultant is engaged in the process, it is important to seek advice from an accountant fluent in tax ramifications and an attorney experienced in the legal intricacies of a merger or acquisition at appropriate stages of the process.

MERGER/ACQUISITION STEPS

- Develop a firm profile.
- Identify potential buying firms.
- Contact interested firms.
- Explore synergies and cultural compatibility.
- Discuss framework and initial terms.
- Undertake preliminary due diligence.
- Draft a Letter of Intent or Memorandum of Understanding.
- Develop drafts of Definitive Documents (purchase agreement, representations and warranties, employment agreements)
- Perform final due diligence.
- Finalize Definitive Documents.
- Execute pre-closing integration of firms.
- Close.
- Continue to integrate firms post-closing.

Due Diligence

Whether buying or selling a firm, conducting thorough due diligence of the other party is essential. While some due diligence items can be evaluated by a firm's principal or chief financial officer, don't hesitate to obtain outside help from a lawyer, accountant, and/or acquisition adviser to evaluate other items. The following is a list of typical due diligence items that should be reviewed by the firm's attorney:

1. Corporate documents:
    - Articles of incorporation and any amendments thereto
    - Bylaws and any amendments thereto
    - A list of the directors and officers
    - All fictitious business name statements filed and used
    - A certified copy of good standing from the state
    - A list of all licenses and permits held
    - Board of director minutes for the past two years
2. Shareholder information:
    - A list of all shareholders, including names, ages, number of shares held, and stock options held
    - Stock option plans in place
    - A list of all stock options that have been granted to any employee that have not been exercised
    - Shareholder agreements and buy-sell agreements currently in place
    - All stock redemption agreements entered into and which are still in place
3. Benefits
    - A summary list of all benefit plans, including pension, 401K, medical, dental, and life
    - A copy of all benefit plans and insurance policies offered to employees
4. Financial information:
    - Outstanding loans or lines of credit taken
    - Recent financial statements (audited, reviewed, or compiled)

- Current accounts receivable aging schedule
- Current accounts payable aging schedule
- Promissory notes given and/or held
- Security agreements for payment obligations that are still in force
- Recent federal tax filings and returns

5. Insurance and liability information:
   - Certificates of insurance for all general liability and errors and omissions policies held
   - All liens recorded against firm, including any Uniform Commercial Code (UCC) financing statements and tax liens
   - List of all insurance claims, lawsuits, mediation, arbitration, and settlement agreements in the past five years, including the date, summary, and resolution of the event

Integration Planning

When firms are acquired by an external group or merged with another firm, firm leaders should craft an integration plan during the due diligence process and start implementing the integration plan as soon as a letter of intent is signed. This integration plan should be reviewed at key milestones after the closing date to ensure that new information is incorporated and needed adjustments are made. An integration plan generally covers those areas that require attention and a commitment of resources during the first year following the merger or acquisition: strategic issues, including developing a mission statement and strategic summary about what the entities aim to accomplish by merging; organizational structure and governance;

SALE OPTIONS FOR THE SOLE PROPRIETOR

Sale options for a sole proprietor can be especially challenging. Frequently, these firms do not have an apparent internal buyer, the market for external buyers is limited, and traditional business sale transaction costs are high relative to the size of the business. A streamlined transaction is often more appropriate, as illustrated in this example:

- The seller sells the firm's intangible assets, including the firm's name, rights to the firm's portfolio, and client list to the buyer, but retains most of its hard assets, including its cash and accounts receivable. Sellers also keep their life insurance policy, which had built up a sizable cash surrender value, and their company-owned vehicle.
- The seller enters into a three-year employment agreement with the buyer that allows the hours allocated to the current business to ramp down while steadily increasing the hours with the new employer over the course of a year. This allows the seller to complete the work under contract and collect the outstanding fees. To motivate the seller to successfully transition their clients to the buyer, the employment agreement gives the seller a percentage of the net fees earned from the seller's existing client list for a period of three years.
- The buyer agrees to amend its professional liability coverage to retroactively cover the seller's prior acts. In exchange, the seller agrees to assume responsibility for any insurance deductibles related to the seller's prior acts.

This simplified framework brings advantages to both sides.

Sellers are able to:

1. Retain the cash and accounts receivable earned prior to the sale.
2. Finish outstanding work and collect fees for the work under contract.
3. Secure professional liability insurance coverage for the firm's projects after selling the firm.
4. Realize some value for the goodwill and transitioned client relationships.

Buyers have:

1. Reduced due diligence costs and risks associated with the seller's accounts receivable and unknowns associated with completing the seller's current projects.
2. Leveraged the seller's portfolio as the seller transitioned into full-time employment.
3. Created incentives for sellers to continue marketing to their network of clients on behalf of the buyer.

marketing and business development; financials, including cash flow and reinvestment planning; operations, including design methodology, project delivery, and technology; human resources, including leadership development and mentoring programs; risk management, including quality assurance and quality control; and facility integration. Special attention should be paid to areas where the firms most differed in approaches before the merger or acquisition.

WHY MERGER AND ACQUISITION DEALS FAIL

- Incompatible cultures
- No strategic marketing or operational synergies
- Inadequate time by key people to focus on crafting a mutually beneficial framework
- Inadequate participation by key stakeholders
- Seller's current owners not ready to relinquish control
- Different goals among seller's shareholders
- Weak incentives for key people to remain
- Unrealistic expectations by buyer and/or seller
- Seller's financials poorly organized or not credible
- Looming or undisclosed liabilities
- One or both parties inflexible on key terms
- Poor or inadequate advice
- Unanticipated issues by either party

VALUING A FIRM

The value of an architecture firm reflects a combination of (1) its current net worth, and (2) its ability to generate future profits. However, the valuation of a privately held architecture firm is not an exact science, even when using appropriate metrics. Unlike public companies with widely traded stock, there are few market mechanisms at work to define the value of architecture firms. In fact, many of the factors used to value an architecture firm—history of net fees and profitability, backlog, ability to obtain new business—differ substantially from those used to value asset-driven companies. By necessity, value judgments must be made when valuing an architecture firm, such as the quality and depth of staff, sophistication of management skills, marketing abilities, reputation, and industry outlook.

Valuation amounts also differ widely based on actual circumstances. For example, ownership transitions executed over several years with the current owners remaining are typically valued higher than transitions based on the current owners retiring or phasing out of the day-to-day operations, and highly strategic external acquisitions are typically valued higher than internal acquisitions. Stock purchases that include cash and accounts receivable assets are valued higher than asset purchases that do not include current assets or current liabilities. And acquisitions in which a majority of the acquisition price is allocated as other than goodwill for tax purposes, and thereby the buyer can expense it, are valued higher than acquisitions largely allocated as goodwill and which must be depreciated over many years.

Common Valuation Metrics for an Internal Sale

While calculating a firm's current net worth is relatively straightforward, adjustments need to be made for work in progress, assets that have been amortized or expensed for tax reasons but still have a remaining useful life, discretionary bonuses other than those considered part of employees' expected compensation packages, unusual or one-time expenditures, potential bad debts, and unusual liabilities that might not show up on the firm's balance sheet such as pending claims.

Calculating a firm's ability to generate future profits is not as straightforward. While some valuation consultants use the "discounted cash flow" method—a methodology that entails estimating future cash flow and discounting it to yield a present value—this tends to place undue weight on future revenue, much of which is speculative at the time the valuation is performed. Other consultants look at a firm's three- to five-year financial history to project future performance, usually giving more weight to recent years than prior years. Basing a valuation primarily on financial history is a sound practice during times of economic stability but somewhat inaccurate during times of rapid economic change.

An appropriate method relies on a combination of *quantitative* metrics to arrive at a valuation range and then looks at a firm's *qualitative* aspects to determine whether to recommend a value at the higher or the lower end of the range.

Appropriate metrics to arrive at a quantitative range include:

- *Net worth* (book value), adjusted to account for the fair market value of fixed assets, assets expensed for tax purposes, accrued assets and liabilities, and other assets or liabilities not reflected on a firm's balance sheet.
- *Net income*, adjusted to account for owner's market-rate salaries, discretionary bonuses, and unusual or one-time expenditures. Placing more weight on recent year's earnings tends to result in a better prediction of future results.
- *Net fees*, defined as gross revenue minus reimbursable expenses and revenue attributable to outside project consultants. Again, placing more weight on recent year's net fees tends to result in a better prediction of future fees.
- *Current backlog*, defined as the amount of unearned net fees remaining on projects under contract, with possible adjustments made for projects not yet funded or for fees based on additional approvals.

The relative priorities and multipliers applied to each of these metrics often differ, but they generally fall within a certain range. For example, some consultants value a firm between 1 and 1.5 times adjusted net worth for an internal transition. Other consultants value a firm between 3 and 5 times net income or apply a percentage—25 to 50 percent of their average earnings—to a firm's backlog.

Each of these metrics has limitations:

- *Adjusted net worth* measures the value of assets with adjustments for depreciation but makes no provision for the worth of the firm as a going concern.
- *Net fees and net income* measures the firm's ability to generate future fees and profits based on recent history but does not take into account significant changes that might occur.
- *Backlog* does not guarantee future profits.

However, together they provide a credible range for the value of the firm.

The art of valuing a firm is in narrowing these ranges to gain a more precise indication of a firm's value. To pinpoint a firm's precise value entails highly subjective judgments, an in-depth understanding of that firm's strengths and weaknesses, knowledge about how that firm compares to its competitors, and an ability to forecast how that firm will likely fare in the future.

To narrow a valuation range, rank a firm against a list of items that add or detract from a firm's value.

Items That Add Value:

- Ability to obtain business from new clients
- History of repeat clients
- Strong portfolio and marketing resources
- Market diversity
- Market penetration
- Intellectual capital
- Skills and experience of key staff
- Appropriate lengths of time that current owners can, and will, stay during a transition
- Quality and depth of future leaders
- Consistent profitability and growth
- Design and management skills
- Amount and quality of existing resources and assets
- Amount of backlog
- Lack of litigation history and/or current claims
- Strong programs and processes for quality assurance/quality control, staff development, orientation, recruiting, etc.

Items that Subtract from Value:

- Limited market focus, depth, or skills
- Preponderance of work coming from a single client/contract

- Lack of diversification
- Lack of strong repeat client base
- Little or no leadership to carry the firm forward
- Current owners want fast exit strategy
- Most if not all decisions centrally controlled, with no mentorship program in place to groom future leaders
- Little regard for staff development
- High turnover rate
- Undercapitalized and/or poor cash flow
- Financials not well organized or compliant with generally accepted accounting principles (GAAP)
- High marketing expenses and poor win rate, especially as it relates to design-build or design competitions
- High debt
- Work appears overbilled or over-accrued
- Little or no backlog, lack of growth history, poor profits
- History of claims
- Reliance on political contributions for client access
- Lack of strong strategic advantages

For many firms, an agreed-upon internal transition valuation methodology is described within a shareholder agreement. The methodology adopted often becomes baked into a firm's culture over time and should be reviewed every few years to ensure that it remains relevant and fair to all parties involved.

Common Valuation Metrics for an External Sale

Valuing a firm for an external sale is usually based on one or a combination of the following: (1) adjusted net worth with the same adjustments as made for an internal valuation; (2) a multiple of a firm's EBIDTA—Earnings Before Interest, Depreciation, Taxes, and Amortization—which has been a reliable metric in other industries and is now becoming common within the design industries; or (3) a discounted cash flow, which again entails a certain level of inaccuracy about future performance.

Valuation opinions predictably differ between a buyer and a seller and can best be resolved through candid discussions involving those who place importance on the strategic reasons for the acquisition and those who place importance on the seller's financial history. Although some rules of thumb can establish the proper range of valuation, the precise values can differ based on the motivations of buyers and sellers, their respective views about the market, and the terms negotiated between the parties.

For example, some buyers place higher values on opportunities to enter new markets, acquire specialized knowledge, or gain access to specific clients. Other buyers place greater importance on a seller's history of cash flow and profitability. Likewise, sellers often modify their asking price based on a variety of issues, such as the ability to retain their identity and day-to-day control, the amount of guaranteed payments versus earn-out payments, and the terms of their employment or consulting agreements after the sale is completed.

SUMMARY

Regardless of whether firm owners decide to pursue an internal transition or an external sale, they should start early and allow ample time. Anticipate that not everyone approached will be interested in assuming ownership or place the same financial value on the firm as the current owners. Think about professional goals—ownership transitions represent a unique opportunity for architects to redefine their professional life. Establish a realistic valuation that is easily measurable, understandable by all parties, and accounts for changes in the firm's profitability and future outlook. Above all, pay close attention to how the transition will promote or change the firm's current culture.

PART 2: FIRM MANAGEMENT

5.7 Small-Firm Collaboration

Linda Reeder, AIA, LEED AP

By collaborating with other architects, small firms can compete for and win a broader range of projects without expanding their offices or staffs. This article discusses the benefits and challenges of small-firm collaborations, different collaborative models, and the keys to successful collaboration among small architecture firms and other architects.

Architecture is by nature a collaborative enterprise; the skills and knowledge of different design disciplines, construction trades, and material suppliers are required to complete a building. While architects routinely collaborate with owners, engineers, and others, down economies make collaboration among architecture firms more attractive. Bringing specialized expertise onto a proposed project team can tip the balance in a competitive environment, and by working together architecture firms can meet fluctuating workloads while minimizing employee layoffs or unnecessary hiring in an unstable economic environment. In a profession that lost 28 percent of its positions from 2007 to 2011 (*The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics*, p. 5), competitive differentiation and staffing efficiency are key concerns.

▶ Navigating Economic Cycles (7.1) further discusses the construction industry's ups, downs, and impact on architects.

Small firms (fewer than 10 employees) made up more than 80 percent of all architecture firms in 2012, with about one-fourth of firms having only one employee (*The Business of Architecture* [AIA, 2012], p. 7). In spite of—or perhaps as a result of—the job losses in the profession, the number of single-person firms grew slightly from 2009 to 2012. These realities present both challenges and opportunities for small firms.

POTENTIAL BENEFITS OF COLLABORATION

Project Acquisition

▶ See Chapter 6, Marketing and Business Development, for more information on project acquisition.

In a slow economy with more firms pursuing fewer projects, building strong project teams is essential. Small firms may be able to improve their chances, or become eligible for work they wouldn't pursue alone, by teaming with other architects. While larger firms often have studios or departments focused on different project types, small firms by definition have fewer people and thus fewer areas of specialization. By teaming with carefully selected firms or individual architects, small firms can offer specific expertise targeted to a client's need. There are also opportunities to be the local associate for another firm. On publicly funded projects, small firms certified as a small, minority,

Linda Reeder is a sole practitioner and the 2013 chair of the AIA Small Project Practitioners Advisory Group. She is an associate professor at Central Connecticut State University, author of *Guide to Green Building Rating Systems* (Wiley, 2010), and associate editor of *The Architect's Handbook of Professional Practice,* 15th edition.

disadvantaged, veteran-owned, or woman-owned business may be attractive collaborators for firms lacking such designation.

Small firms can serve in different roles; the same firm may be a consultant on one project and the lead firm on another. For example, owing to its historic preservation and interior design expertise, Flesher + Foster (F+F) of Pacific Grove, California, served on teams as consultants and associated architects, but also capitalized on its local knowledge to be the prime architect in an affordable senior housing project. Former Principal Gretchen Flesher, AIA, says, “Flesher + Foster teamed up with Robert Herman, FAIA, of Herman & Coliver: Architecture (now Herman Coliver Locus Architecture, or HCLA), for the RFQ. HCLA is nationally recognized for numerous affordable and senior housing projects. We got the job due to our strong local reputation and the added expertise the project required.” Neither firm would have pursued the project alone; HCLA’s experience was with larger, urban developments, and while F+F had experience with the California Coastal Commission and local regulatory boards, they were short on specific project type experience.

In Middleburg, Virginia, two small local firms were among four firms invited to compete for a privately funded library project. Clites Architects, PC, and Turnure Architecture decided to join forces instead of competing against one another. Principals Tim Clites, AIA, and Bill Turnure, AIA, knew each other—and were known in their small community—through their volunteer work on the Middleburg historic commission. The other two invited firms had a local presence which was not based in Middleburg. Tim Clites says, “We won the project over more experienced firms with a history of library work. The committee was very focused on making the library expansion a ‘community effort’—from their fundraising efforts to their selection of professionals and contractors. By teaming up we made it especially positive to select us: they were getting two local firms for the same one firm fee. It was a good lesson to learn early in my new firm: Make it easy for the owner to get to YES.”

For publicly funded projects, Requests for Proposals (RFPs) may include incentives for including certified minority- or women-owned business enterprises (MBE and WBEs, respectively), firms owned by disabled veterans, or other disadvantaged business enterprises (DBEs) on the project team. Firms certified in the state or municipality may be invited to join a project team based on the advantage their certification brings.

► See the backgrounder, WBE/MBE/DBE/SBE Certification, that accompanies Regulation of Professional Practice (3.1) for a more detailed discussion of certified minority- or woman-owned enterprises, disadvantaged business enterprises, and small business enterprises.

Teaming agreements, or memorandums of understanding, define the roles, responsibilities, shared costs, exclusivity, confidentiality, and other terms as firms pursue work together. In addition to defining aspects of the project acquisition phase, teaming agreements identify the contractual relationship among parties if the project is awarded. Formally defining these details of collaboration can define expectations and prevent misunderstandings. “We have an open-door policy on how we bring work in. If another architect wants to collaborate with us on a proposal, or a specific project, we create a project specific agreement and work together until the project is complete,” says Buddy Poppitt, Principal of Hangar 41, LLC, in Denver. “We don’t have to lead the project, but the collaborative must be a good fit. That’s the most important thing about collaboration. You have to be on the same page when you start, have similar values, and the same expectations on the project.”

► Project Team Agreements (17.2) addresses agreements with consultants and establishment of joint ventures between firms.

Flexible Staffing

Teaming with other architects can help small firms take on projects that are larger than their current staff can produce, yet provide the flexibility to avoid a damaging cycle of hiring and laying off employees while waiting for the workload to stabilize. There is a range of possible structures for collaboration, from formal prime-consultant or joint venture agreements down to an independent contractor agreement for a single freelance architect.

Hiring one employee in a small firm increases the office size by a significant percentage, and depending on the firm's projected workload may not be a sustainable option. Firms can reduce their exposure by hiring an independent contractor to work as needed. There are positives and negatives for both parties in such an arrangement.

Potential Advantages Include:

- The firm has extra help with no strings attached should the workload decrease, and no overhead costs such as employee benefits or training.
- The firm may gain specialized expertise, depending on the individual contracted.
- The contract employee generates a fairly predictable revenue stream while pursuing other opportunities (which may include permanent full-time employment, building their own practice, or other contract work).
- The contract employee has more autonomy than a traditional employee in terms of setting their schedule and pay rate, choosing what projects to accept, etc.
- The parties may learn from each other.

EMPLOYEE OR INDEPENDENT CONTRACTOR?

Facts that provide evidence of the degree of control and independence fall into three categories:

- *Behavioral:* Does the company control or have the right to control what the worker does and how the worker does his or her job?
- *Financial:* Are the business aspects of the worker's job controlled by the payer? (These include things like how worker is paid, whether expenses are reimbursed, who provides tools/supplies, etc.)
- *Type of Relationship:* Are there written contracts or employee-type benefits (e.g., pension plan, insurance, vacation pay, etc.)? Will the relationship continue, and is the work performed a key aspect of the business?

Businesses must weigh all these factors when determining whether a worker is an employee or independent contractor. Some factors may indicate that the worker is an employee, while other factors indicate that the worker is an independent contractor. There is no "magic" or set number of factors that makes the worker an employee or an independent contractor, and no single factor stands alone in making this determination. Also, factors that are relevant in one situation may not be relevant in another.

The keys are to look at the entire relationship, consider the degree or extent of the right to direct and control, and finally, to document each of the factors used in coming up with the determination.

If, after reviewing the three categories of evidence, it is still unclear whether a worker is an employee or an independent contractor, *Form SS-8, Determination of Worker Status for Purposes of Federal Employment Taxes and Income Tax Withholding* (PDF) can be filed with the IRS. The form may be filed by either the business or the worker. The IRS will review the facts and circumstances and officially determine the worker's status.

Internal Revenue Service, reprinted from www.irs.gov

Disadvantages May Include:

- Because the firm has to make less of a commitment to an independent contractor than to an employee, the contractor may be less committed to the firm. This could result in contractors moving on to another opportunity before the firm wants their services to end. Contractor turnover can be disruptive, just as employee turnover is.

  If feasible, paying contractors a fee for the project rather than an hourly rate provides more security for both parties and a corresponding obligation to stay on until the project is completed. This arrangement will require more work up front in the agreement to define a scope of services. If a freelance architect is brought on to help with production rather than complete defined tasks, creating such an agreement might not be feasible.
- If a contractor is committed to the firm, they may miss out on other professional opportunities.
- The contractor may have professional obligations outside the firm, making it difficult for them to work additional hours if needed.
- There are tax implications if IRS rules are not followed correctly. Consult a tax adviser or the IRS to make sure an architect paid as an independent contractor cannot be classified as an employee.
- There is less stability for a contractor than for an employee.
- There may be challenges in developing and institutionalizing internal office standards, best practices, and other elements of a firm culture that require stability and long-term commitment from staff.
- If firms contract with experienced architects instead of training and mentoring interns, employment options for emerging professionals may narrow. This could have long-term implications for the profession.

Another option for managing staffing is to loan out or borrow employees from another firm. The AIA Colorado is one AIA component that facilitates an employee share network to help member firms balance workload and staffing. Informal arrangements also exist. Gerald Martin of Martin & Martin Architecture Inc. in Chesapeake, Virginia, says, "I was a 'lent' employee back in the [economic] correction in the '70s. I continue to use my peers' staffs from time to time. For me in the '70s it was great—I got to keep my check and benefits from my employer with no lapse in either, and I got to see firsthand how the other guys did it. On opening my own practice in '83, I used the same firms to which I had been lent/contracted to undertake much larger projects, and used these firms' employees to my complete satisfaction. I would not hesitate to use another's or to lend our staff."

Instead of lending employees, an entire architecture firm may step in behind the scenes to aid another with their workload. For example, James Hundt of Foresight Architects in Schenectady, New York, says, "At some times, we have provided drafting services for firms that couldn't keep up, and at other times we have subbed out drafting to drafting firms or contract drafters (sometimes former employees). Just like with any client, we negotiate scope, schedule, and fee ahead of time so that there are no unpleasant surprises. It has been a good way to balance the workload and has allowed us to keep valuable employees during slow times."

Learning Opportunities

Collaborating with other architects offers opportunities to learn from them, from design approaches to marketing to business strategies and practices. These opportunities can be particularly welcome to solo practitioners. Tim Clites, AIA, who teamed with another firm soon after starting his own, said that exchanging design critiques was one benefit of the collaboration. Leslie Saul, AIA, IIDA, of Leslie Saul & Associates in Cambridge, Massachusetts, said of her experience working with other architecture firms, "Solving problems for your peers is fun; I like teaching. Getting help in solving problems from your peers is fun; I like learning."

Gustavo Berenblum, AIA, who has worked for firms serving as executive architect, associate architect, and joint venture partner, said, "I've built a big part of my professional career collaborating with world-renowned firms to complete projects here in Miami. I have learned and grown immensely through these collaborations and I find myself thinking about it often. Personally, I find it extremely rewarding—usually architects compete with each other, but when you are on the same team, you learn a lot. Then you have different tools for thinking about things on your own projects. Furthermore, good collaborations make a project stronger, as it benefits from the talent and strengths of both firms and the synergy that is created between them."

In addition to learning through project collaboration, some architects join peer-to-peer groups to confidentially share and learn from the business experiences of similar firms in noncompeting markets. In 2012, the AIA was facilitating the formation of self-moderating peer-to-peer networks. The preliminary guidelines describe "a program developed for the architectural profession and its leaders who recognize the need to sharpen skills, share experiences, offer advice, and learn from their peers better ways to run a successful business. It helps tackle the day-to-day complexities of working in a time when the architecture industry is faced with many difficult challenges." There are also consulting companies that coordinate peer-to-peer roundtables, bringing together firms, organizing conference calls, and facilitating meetings. The representatives of participating firms share financial numbers, insurance information, and other practice data—"Everything you share with your partner," as one participant described it—in a confidential environment.

ELEMENTS OF SUCCESSFUL COLLABORATION

Profitability is an important measure of success. However, intangibles such as reputation, client satisfaction, and laying the groundwork for future project and firm successes are also important. Choosing the right collaborators, establishing effective communication, and clearly defining roles and responsibilities can increase the likelihood of a successful outcome. The following issues should be discussed when considering or establishing a collaborative endeavor:

- People
  - Role expectations
  - Skills/experience
  - Time expectations
  - Fee sharing
- Firms
  - Design and service quality
  - Noncompeting market positions
- Reputation
  - Commitment to the collaborative process

Technology
  - Design and production software capability
  - Preferred communication tools
- Processes
  - Decision making
  - Work coordination
  - Dispute resolution
  - Credit sharing and project promotional efforts

(List adapted from *The Jericho Principle: How Companies Use Strategic Collaboration to Find New Sources of Value* (Wiley, 2003) by Ralph Welborn and Vincent Kasten, p. 158)

Firms and People

Choosing appropriate collaborators is essential. The expertise each party brings to the project should be complementary and necessary. Each firm should have familiarity with the project type, the client, the locality, or another element that is crucial to acquiring and completing the work. Victor Latavish of Victor J. Lativish AIA Architect, a three-person firm in Naples, Florida, warns that firms should also take care in choosing collaborators who will not create unfriendly competition for future projects. His firm had a successful collaboration with Reynolds, Smith, and Hills (RS&H), a national AE firm with eight offices in Florida. Latavish invited RS&H to pursue a $12 million, 58,000 square foot Special Operations Building for the Collier County Sheriff's Office in Naples. Victor J. Lativish AIA Architect was the prime consultant and design architect, responsible for design, project management, and local construction contract administration. Charles Gutekunst, AIA, was the principal for RS&H, the architect of record in charge of construction documents.

Latavish chose RS&H to collaborate because:

- RS&H's expertise in schools demonstrated proficiency and showed capability in executing large projects with complex programs—a good fit for the project he was pursuing.
- RS&H's regional office did not do a lot of civic work, so he did not see them as a competitive threat to his firm, which focuses exclusively on civic and religious architecture.
- The principals had worked together at another firm in the past. This previous relationship made Latavish confident that the collaboration would be easy and successful.

Many small-firm practitioners have found that previously working together with an individual in other capacities—for example, as colleagues at another firm, as described above, or serving on the same community board, in Tim Clites and Bill Turnure's case—gave them the confidence that they could collaborate effectively.

At the same time, integrating new players into established collaborations can result in new perspectives and ideas. Sociologist Brian Uzzi studied Broadway musicals as a model of group creativity. He found that while creative teams who had collaborated before had more success than ones who had not, the most successful teams were a mix of old and new—people comfortable with one another who worked efficiently together, combined with unfamiliar people who brought new ideas or challenged old ways of thinking (Jonah Lehrer, "Groupthink," *The New Yorker*, January 30, 2012).

Treat others as you wish to be treated.

—The Golden Rule

The attitudes of the individuals are also significant. Trust and respect are crucial, which is part of the reason collaborations among familiar team members are more successful ("Eight Ways to Build Collaborative Teams" by Lynda Gratton and Tamara J. Erickson, in *Collaborating Effectively* [Harvard Business Review Press, 2011]). Regardless of the hierarchy of the contractual relationship—consultant or prime, design architect or architect of record—participants want their ideas to be heard, and their contributions acknowledged. Since collaborators are generally chosen because of the value they bring to the team, ill will and discord may result when their contributions are ignored. The design solution, technical aspects, or even project finances may be affected, as the party discounting the value of their collaborators' input is paying for contributions they do not value.

"While we are a woman-owned firm, we have eschewed getting certification," says Sara O'Neil-Manion, AIA, of O'Neil & Manion Architects P.A. in Bethesda, Maryland. "If people want to hire our firm, it is for our competence, not because of gender." The firm has been engaged in many successful collaborations. Numerous firms that have received MBE, WBE, or other certification have also collaborated successfully, particularly when valued for more than their certificate. One firm owner who has collaborated with several architects as a WBE firm describes both good and bad experiences. "Some firms are respectful of expertise, and some need a WBE and want the client to think they have expertise—but then do what they want to do."

EMOTIONAL INTELLIGENCE IN GROUPS

"Three conditions are essential to a group's effectiveness: trust among members, a sense of group identity, and a sense of group efficacy," researchers of group emotional intelligence have found. Norms that can support these behaviors include:

- Be self-aware as a group. Assess strengths and weaknesses; for example, encourage members to speak up if they think a meeting isn't being productive, or gently call out a member whose mood or attitude is negatively affecting the group.
- Create an affirming environment where members are supported and a positive attitude prevails—but allow the occasional break for moaning and complaining.
- Employ proactive problem-solving; instead of despairing at a setback, work together to overcome it.

"Building the Emotional Intelligence of Groups" by Vanessa Urch Druskat and Steven B. Wolff, in *Collaborating Across Silos* (Harvard Business Review Press, 2009), pp. 176–86.

Communication

While the diversity of knowledge and skills that dispersed team members bring is valuable, when collaborators are not co-located there is a potential loss of informal communication and bonding that can intensify conflicts. The Internet and related tools—web-based video conferences, ftp sites, e-mail, etc.—make virtual collaboration easier and affordable, but they do not replace face-to-face meetings. Isaac Kohane, a researcher at Harvard Medical School, reviewed 35,000 peer-reviewed papers and charted the locations of the coauthors. He found that the most cited (and therefore most influential) papers were coauthored by scientists working within 10 meters of each other. By contrast, the least cited papers were written by people more than a kilometer apart. Kohane concluded that frequent physical spontaneous interaction helps people work together effectively ("Groupthink," Lehrer).

Architects routinely and successfully work with engineers and other consultants with whom they do not share an office space, but in-person progress meetings contribute to this success. Researchers have found that "periodic face-to-face meetings of dispersed team members can be particularly effective for initiating and maintaining key social processes that will encourage informal communication, team identification, and cohesion." In their study of software developers, researchers found dispersed teams can outperform co-located ones because of their expertise, but the teams have to be set up and managed well to succeed. One suggestion is to hold extended project kickoff meetings so people share an understanding of the work and start to build some cohesion as a team. A team leader in the study recommended going out socially as a group before starting the collaboration ("How to Manage Virtual Teams" [*MIT Sloan Management Review*, 2009] by Frank Siebdrat, Martin Hoegl, and Holger Ernst).

HOW WELL-PREPARED ARE THE POTENTIAL COLLABORATORS TO COMMUNICATE EFFICIENTLY?

Factors to consider:

- Degree of shared experience
- Similarity of cultures, or understanding of cultural differences, or commitment to collaboration
- Similar measures of success that account for innovation and collaboration
- Business processes that can work together
- Compatible software applications and platforms
- Similar technologies
- Shared communication channels

Adapted from Welborn and Kasten, 2003

While Victor Latavish's team communicated and shared drawings via e-mail and an FTP site during their collaboration with RS&H, Latavish says, "Face to face does matter—we would still have in-person meetings, and we always brought hard copies of prints to look at." Determining the preferred methods of virtual communication and file sharing early is also helpful. In terms of information technology, "simplicity, ease of use, and familiarity are far more important than functional sophistication" ("Harnessing Your Staff's Informal Networks" by Richard McDermott and Douglas Archibald, in *Collaborating Effectively*, 2011).

Clearly Define Responsibilities

Defining roles clearly is important when working with other architecture firms, just as it is working with other disciplines. "Collaboration improves when the roles of the individual team members are clearly defined and well understood—when individuals feel that they can do a significant portion of their work independently," researchers have found (Gratton and Erickson, *Collaborating Across Silos*, 2009). Architects are accustomed to defining roles among different disciplines and can apply the same tools when working with other architects.

For example, of the affordable senior housing development collaboration between F+F and HCLA, Flesher says, "HCLA was involved in the programming, public workshops, early design proposals, approvals, specifications, value engineering, and general overview of the development of the project. F+F managed the project through a lengthy local and state approval process, design development, construction documents, consultant coordination, cost estimating/value engineering, and construction administration, and postoccupancy coordination. The team functioned well together with the bulk of the production work done in the F+F office and the coaching and expertise coming from Bob Herman of HCLA."

▶ Defining Project Services (15.1) and Services and Compensation (15.2) address the centrality of scope definition to effective agreements and the variables involved in determining compensation for architectural services.

BR Architects, Inc. of Richardson, Texas, regularly collaborates with other firms. Director of Architecture/Engineering Bradford Russell, AIA, PE, says that in these collaborations BR Architects is involved in general architectural document preparation and structural engineering, another firm does the interior architecture, and a third firm handles construction administration. "Everyone knows what their task is—we have not had problems with continuity," says Russell.

In addition to delegating tasks clearly among architecture firms, multi-architect teams must also make sure the client understands how the team works—that there is a single point of responsibility and communication for the owner (and who that is), and how they benefit from the skills of all.

Determining how a fee will be shared or how a consulting architect will be compensated will involve the same negotiations and considerations of value, effort, and risk as in any fee arrangement, with many team and project-specific elements affecting the outcome.

CHALLENGES FOR COLLABORATION

Anytime a firm tries new processes, including the intimate process of collaboration, there are unknowns and hence risks. One tool for assessing the pros and cons of a potential collaboration is the risk distribution scorecard in Figure 5.7. This tool assigns weight to each risk, allowing for a comparison of the overall collaborative risk to each party.

To use the scorecard, modify or supplement the risks listed and the number of firms per the specifics of the project. Then, for each risk and opportunity:

- Evaluate the importance to each firm: How significant is each risk or opportunity in terms of the future success of the firm? Rate each from 0 to 5, with 0 equal to no importance and 5 a matter of survival. These ratings are the Risk Importance (RI) or Opportunity Importance (OI).
- Evaluate the perceived likelihood of both risk and opportunity and rate them from 0 to 5, with 0 equal to no chance and 5 equal to a 100 percent certainty. These numbers are the Risk Likelihood (RL) or Opportunity Likelihood (OL).
- The value of the risk or opportunity can be assessed by multiplying the Risk or Opportunity Importance by the Risk or Opportunity Likelihood, respectively. The result is the Risk or Opportunity Value: that is, Value = Importance × Likelihood.

The distribution of risks and opportunities between or among architecture firms is a factor in determining the suitability of collaboration, but by no means the only factor.

	Firm A						Firm B						Balance	
													Risk	Opportunity
Risk element	**Risk** Importance (RI): 0-5 Likelihood (RL): 0-5 Value (RV) = RI x RL			**Opportunity** Importance (OI): 0-5 Likelihood (OL): 0-5 Value (OV) = OI x OL			**Risk** Importance (RI): 0-5 Likelihood (RL): 0-5 Value (RV) = RI x RL			**Opportunity** Importance (OI): 0-5 Likelihood (OL): 0-5 Value (OV) = OI x OL			**Firm A RV minus Firm B RV**	**Firm A OV minus Firm B OV**
	RI	**RL**	**RV**	**OI**	**OL**	**OV**	**RI**	**RL**	**RV**	**OI**	**OL**	**OV**		
Client														
	Loss of client, theft of client			*Client acquisition, client retention*			*Loss of client, theft of client*			*Client acquisition, client retention*				
Reputation														
	Diminished reputation			*Enhanced reputation*			*Diminished reputation*			*Enhanced reputation*				
Governance

FIGURE 5.7 Risk Distribution Scorecard

Biases of the Marketplace

A challenge to small-firm collaborations is the unease clients may have about hiring a team of architecture firms instead of one large firm. Many owners perceive it as less risky to hire one firm capable of doing all the work. Some architects respond to this concern by emphasizing the unique talents of the assembled team. "I tell clients I am finding the best people for each task—I'm not just using who's there," said Joe DeScipio of DeScipio and Associates Inc. in Elmhurst, Pennsylvania. DeScipio's firm completed a $2.1 million commercial renovation project in 2012 with no in-house staff other than himself. In addition to making the case that multi-architect teams represent the best-suited talent, rather than the talent at the next desk, small-firm alliances can also make the case that they will provide a high level of client service. Instead of working with employees at a large firm, owners will be served by multiple small-firm owners—committed, attentive, experienced small-firm owners. The client must understand and appreciate the value the collaboration brings to their project.

BR Architects Inc. has stopped pursuing public work collaboratively. "Cities are scared of this model—they like larger firms, and fee is not as big a concern," says Bradford Russell, AIA, P.E. However, his firm still competes for work for developers with collaborative teams. Collaborating firms "have to be someone our firm is familiar with, and we have to give a better fee as a team, which collaborating small firms can do and still make money" because of lower overhead, says Russell. Still, this approach became more challenging for his team during the economic downturn when large firms were cutting fees to compete for work they did not previously pursue.

LEADERSHIP FOR COLLABORATION

Senior managers and academics have debated which leadership style is most effective for leading complex teams:

- Task-oriented leadership, focused on clearly defining goals and roles
- Relationship-oriented leadership, focused on building trust and goodwill

A study of 55 teams found that "the most productive, innovative teams were typically led by people who were *both* task- and relationship-oriented." These "ambidextrous" leaders shifted styles over the course of the project, being very task-oriented at the beginning and then transitioning to a relationship-oriented style once goals and responsibilities had been defined and accepted. (Gratton and Erickson, *Collaborating Across Silos,* 2009)

Management Complications

The logistics of working with off-site architects may add to the time and costs of managing a project team. In addition, the firms' cultures and organizations may be quite different. These differences need to be recognized, understood, and accepted in order to fully capitalize on collaboration. For example, a large bureaucratic firm might make decisions formally and explicitly, while a small entrepreneurial firm makes decisions tacitly and informally. If these differences are not understood, the larger firm could view the smaller as reckless independents, while the smaller firm might view its larger partner as slow and inflexible (Doz and Hamel, 1998).

QUALITIES OF FIRMS THAT ARE AND ARE NOT ALLIANCE-READY

Unprepared
- Protective
- Imitative
- Define failure as money lost

Prepared
- Creative
- Innovative
- Define failure as money forgone

Excerpted from *Alliance Advantage: The Art of Creating Value through Partnering* (Harvard Business School Press, 1998) by Yves L. Doz and Gary Hamel.

Collaboration Gone Wrong

Collaborations involve sharing best practices, office processes, BIMs or drawing files, and more. When collaborating, there is some loss of control. While learning from and teaching peers can be useful and gratifying, if those peers become future competitors, the experience will have been a costly one. It is one reason to choose collaborators with care.

One small-firm practitioner tells of losing a market advantage with residential developers when the firm borrowed employees from a competing firm to help with construction documents. When the employees returned to their firm, they took the practitioner's design innovations with them. Competing developers adopted the designs, and their value was diminished.

Another potential risk is losing a client to a collaborator. This could happen with repeat work, or even in the absence of a teaming agreement at the conclusion of the marketing phase. To prevent this, choose collaborators with complementary, not competing, expertise, have a strong teaming agreement, and cultivate trust.

WHEN NOT TO COLLABORATE

Collaboration is not appropriate for every project, client, or firm. It is important to remember that the goal of collaboration is not collaboration—it is to be awarded a project, balance workload, increase profits, or otherwise benefit a firm. After identifying an opportunity for collaboration, account for the potential downsides of collaboration as well as the benefits. Consider the following:

To collaborate well is to know when not to do it.

—Morten T. Hansen, "When Internal Collaboration Is Bad for Your Company," in Collaborating Effectively (2011)

- *Opportunity costs*: Could the time spent pursuing a project collaboratively be better spent pursuing a more profitable (financially or otherwise) opportunity alone?
- *Collaboration costs*: These might include travel time to meet at the collaborator's office, additional time managing the project, or purchasing and learning compatible software. It could also include additional time required to create teaming, nondisclosure, or anti-poaching agreements.
- *Collaboration premium*: "A collaboration premium is the difference between the projected financial return and two often overlooked factors: opportunity cost and collaboration costs" (Hansen, *Collaborating Effectively*, p. 7).
- *Personality*: Not everyone is a good collaborator. Poor collaborators might have an oversized ego, or be unable to keep commitments and meet deadlines. They may simply not play well with others. Honestly assess the skills of the key people in a proposed collaboration before moving ahead. Researchers found that skills crucial to successful collaboration include "appreciating others, being able to engage in purposeful conversations, [and] productively and creatively resolving conflicts" (Gratton and Erickson, *Collaborating Effectively).*

WHEN CONSIDERING COLLABORATION...

...be able to answer the following questions:

- What is the value proposition of the collaboration—the value to be created?
- How will the rewards be shared?
- What are the risks, and how will the collaborators manage them?
- What are the possible disruptive impacts on the collaborative venture that need to be anticipated prior to its establishment?
- How do we build a collaborative mindset?

Adapted from Welborn and Kasten, 2003

CONCLUSION

In spite of the potential advantages, collaboration is not for every firm or every project. Some clients may prefer to hire a single firm instead of a team of two or more architecture firms. The disadvantages of some proposed collaborations may exceed the potential benefits, in terms of the risk of strengthening a future competitor, missing opportunities that could be pursued alone, or challenges in bringing together firms with different cultures or people with non-collaborative personalities.

There must be a compelling reason to collaborate, a reason that creates value for all participants. By collaborating with other architects, small firms can compete for and win a broader range of projects without expanding their offices or staffs. Firms can obtain specialized knowledge, access to clients, local expertise, or additional staffing capability through collaboration. In selecting collaborators, care must be taken to choose firms with complementary, not competing, expertise. Additional effort may be required to manage off-site architects; however, with proper communication tools and processes, including regular face-to-face meetings, a dispersed team can be as or more effective than a co-located team.

5.8 Practicing in a Global Market

Ronald Arthur Altoon, FAIA

Since the 1990s, global practice has touched a significant percentage of American architects. The context in which AIA members must navigate when seeking international design opportunities is fraught with challenges. As the rules of engagement change in global practice, the methodologies required to chart a successful course must also adapt.

GLOBAL ECONOMY/GLOBAL PRACTICE

We live in a global economy. American aircraft and automobiles are assembled with parts manufactured and shipped from countries around the world. Building products and assemblies are sourced from suppliers on every continent. More and more U.S.-based architecture firms are contemplating entering the global marketplace, either from a base at home or from an office abroad. Practice in a global market has evolved significantly since the turn of the century. As local architects in developing countries acquire skill sets approaching equivalency with First World architects, serving international clients from a U.S. domestic practice is becoming less practical and less competitive. Concurrently, more offshore clients demand daily interaction as a condition of engagement. The challenges implicit in starting up a domestic practice are similar abroad, but exponentially greater.

THE STRATEGIC DECISION TO ENTER GLOBAL PRACTICE

Determining whether the firm should consider practicing in a global marketplace demands careful self-evaluation. While many firms are well qualified in a particular market sector as leaders in their local, regional, or national practices, it takes special considerations to make the cultural leap required to apply those skills to practice abroad effectively and responsibly.

Ronald Arthur Altoon, as the 74th AIA president, negotiated accords with Russian, Chinese, Australian, and Japanese architectural associations, supporting global practice for AIA members. Founder of Altoon Partners—a Los Angeles, Amsterdam, and Shanghai firm with projects in 43 countries—he served six years as an International Union of Architects (UIA) Council Member, Region III.

Bring Needed Expertise

It is essential to determine whether the firm has the core competencies and capacity to deliver needed expertise in the country being considered. It is important to understand what established design capabilities are present in the locale, the relative openness of clients in the country to accept offshore advice, and whether there is a reasonable certainty that the firm's specific capabilities are coincidental with the country's needs. Generally, any practice will be evaluated against other firms, local and foreign, all vying for the same contracts. Without established core competencies, desire to practice abroad and passion for design are rarely sufficient to produce commissions overseas.

Bring Added Value

Another critical factor is the ability of the firm to demonstrate added value throughout the process of site planning, concept design, and evolving design services. In developing countries, often the U.S.-based architect brings a greater understanding of mature business objectives than local clients have had the time or experience to develop internally. This creates additional responsibilities for the architect. Thinking like an investor brings a fresh perspective to design decisions that can enlighten a client and cement a relationship for longer than one single commission.

Bring Proven Process

Western project management techniques will be useful to the practitioner abroad, up to a point. To appreciate some of the different conditions encountered abroad, refer to the AIA Contract Documents B161–2002 and B162–2002.

▶ AIA Documents Program (17.5) covers the International Family of AIA Contract Documents in greater detail.

However, it is important to understand that architects in every country practice according to their local methodology, and clients are accustomed to those methods. The disciplined, professional, and formal approach that U.S. architects espouse may find resistance from clients who want services delivered in less time, for lower fees, and with many out-of-sequence changes. It is important to remain flexible, but cognizant of the professional obligations that good management techniques require.

Beyond project management, the practice of process management often proves invaluable. Public sector agencies may not have the expertise to evaluate complex projects relative to best practices, particularly related to fire and life safety issues. Being willing to consider local codes and regulations, and to challenge them with strong, internationally accepted norms and practices, offers a valuable role for design firms. Learning about the nuances of the local approval process, and contributing to the discourse about the strategies to gain timely approvals, may resolve misunderstandings and save countless hours of redesign time and effort that offshore clients often consider as part of Basic Services.

Evaluation of the Firm

Understanding why the firm seeks access to offshore projects is perhaps the essential consideration. For some it may be to expand building type capabilities or to win larger-scale projects. For others, it is a question of stability, balancing economic fluctuations, or growing market sector experience that is unattainable domestically. In any case, recognizing that the consequences include managing a 24-hour-a-day global practice, it is critical to determine whether establishing a practice abroad fits within the firm's Strategic Plan.

Understanding the firm's true capabilities requires careful and candid self-examination, often best achieved with the assistance of a professional management facilitator. Even with this added perspective, identifying a firm's strengths—what it has to offer better than most others—is more challenging in the context of international competition. Equally daunting is accepting what the firm may need to overcome internally in order to succeed in the offshore enterprise. Researching the firm's domestic and international competition and assessing their comparative strengths will help to clarify the challenge. Importantly, having an established practice culture with defined and sustained core values provides a moral compass as the firm ventures into a new competitive environment that presents diverse ethical issues and values.

Identifying who in the firm is qualified to lead an overseas enterprise is best done by a comprehensive evaluation process. Beyond the firm's design reputation, the ability to build personal relationships is critical. Clients relate to people. Offshore, they often demand named partners, or very senior professionals at the least. The firm must determine who will be its face, who will be most effective in identifying prospective clients and creating opportunities, and who is most effective in presenting the firm's capabilities and is skilled in closing the deal. These may not be the same individual, and a firm is well advised to make a candid appraisal of the separate skills required. The "closer" is generally the person that the prospective client sees as being their architect, not necessarily the marketing person. Seniority may not make the case; the ability to connect with the client is more important.

Consider who best represents you, speaks with authority, can demonstrate needed expertise, and will be available throughout the entire process of design and construction. Determine who is most effective at communicating, negotiating, managing, designing, and collaborating. Be prepared to identify the individual or team that will ultimately commit to live overseas, and what level of authority will be entrusted to that individual or team, along with the considerable responsibility. Knowing that whoever leads the office needs the ability to secure and sustain client confidence will help to determine the most appropriate fit.

Additionally, the leader must be able to assure that the firm can maintain its practice culture. The ability to juggle time differences and distances, to extend practice values while sustaining good judgment, commitment to craft, and quality, are all important qualities for the person entrusted with representing the firm abroad.

Determining when the time is right to practice abroad is the result of a confluence of both internal and external forces. Internal considerations include the firm's domestic and international reputation, demonstrated leadership of the individual selected to assume responsibility for the venture, financial resources of the firm, and an ownership culture that provides commitment for an extended period of time. External influences may include domestic clients' desire to expand overseas or opportunities resulting from a stronger economy abroad. It may be several years before expectations are achieved. In addition, the firm's reputation should be evaluated in the context of the desired market to ascertain if the practice can secure a competitive advantage.

Knowing where to take the first step, and how to take the second, will be different for each firm. Conventional wisdom suggests selecting the first country based on existing relationships, an established support structure, and the ability to serve the client well. Expanding geographically from a foundation of success to contiguous or targeted countries, and prioritizing by highest probability of further success, provides an efficient platform for growth. Yet, some strategize target markets according to building type expertise, maturity of the country's economic development, or even language. Whatever the firm's approach, accessing clients in foreign cultures will be challenging.

Before deciding, the firm should assess the impact on existing leadership and staff of managing both offshore and existing

GETTING STARTED

Altoon Partners, a 32-person firm, broke into global practice in Asia through the personal relationship of a staff member, and in Europe via the recommendation of a former domestic client living in Hungary. With the opportunity at hand, country-specific research was conducted through:

- The World Bank
- U.S. Department of Commerce
- World Trade Organization
- U.S. Chamber of Commerce
- International Real Estate Organizations
- AIA International Committee
- Cultural sources
- Colleagues and friends
- Clients and consultants

Competing against much larger firms in the same market sector, Altoon Partners leveraged its limited assets to secure market share. Among those assets were its demonstrated expertise; design awards; books and articles written and published; leadership in the AIA at every level, at the International Union of Architects (UIA), and in international real estate organizations; and the firm's significant portfolio of constructed work.

Once a project was secured, recommendations from a practice consultant led to interviews with local firms to establish a long-term practice association. The division of responsibility was agreed upon, terms of engagement were established, and communications mechanisms confirmed. Fundamental to any relationship is an agreement on expectations, quality assurance, respect, and trust. The midsize U.S. firm became a large international firm through these associations, able to compete on equal footing for any size project.

client project workload at home. It is also critical to evaluate domestic client reaction to the firm's shift in focus. The full impact on personal lives and relationships of partners and staff involved needs consideration. Determining who will fill the leadership gap at home so as not to undermine the domestic practice culture will be critical.

BUILDING A STRONG PRACTICE FRAMEWORK: GETTING STARTED

Residency Requirement

It is certainly possible to open an offshore office with a local national citizen as the managing director. However, that decision may make the nurturance of a well-established practice culture more challenging. On the other hand, sending a representative of the firm's culture to promote consistency with design precepts and quality assurance brings special challenges, and some obstacles, that merit consideration at the outset and continued attention. Among these is meeting national residency requirements for the professionals in the local office. Obtaining a residency permit for the architects, their families, and children takes first priority. This confirms the right to live in a country for a defined period of time, often renewable, but also requires leaving the country in question for a period of time before reentering.

Legal Entity/Business License

Each country will have its own designations for professional business entities, and each will require a different process to attain legal standing. The right to establish a business may entail creating only a local office of an existing company, but could necessitate the creation of an entire new business entity in order to establish local banking relationships and to meet tax law requirements of both the country in question and the United States Treasury. Registration with the appropriate government agency may be required and should be thoroughly investigated at the onset. Whether it is a Wholly Owned Foreign Enterprise (WOFE) in China, a Besloten Vennootschap—a limited company—in the Netherlands, or a Russian Representative Company, the process is prescribed and the firm should seek legal counsel and the advice of a knowledgeable tax accountant so the process is handled efficiently and appropriately. In some countries a firm must register with the Chamber of Commerce or government agency in order to establish a business, hire staff, and provide professional services. It is important to ascertain the specific agency in each country.

Professional Licensure

Reciprocity to attain licensure in foreign countries can be a process as simple as submitting documentation of one's professional education, domestic licensure, and career experience, or one of significant challenge. Many countries consider a diploma from an accredited university architecture program evidence of qualification to practice. Others require an examination and/or interview process similar to the Architect Registration Examination (ARE) and several domestic registration boards. Whatever the local situation, it will affect the firm if it intends to provide professional service entirely on its own, without associating with a local Architect of Record. If, on the other hand, the firm determines its objective is to master plan and design projects in collaboration with a licensed individual or firm that will assume responsibility for contract documents and construction contract administration, a license to practice locally may not be required. This should be investigated thoroughly prior to the firm proceeding to identify the kind of services it will provide and how it will represent itself—as an architect or design consultant.

Since the disagreement over reciprocity issues occurred between European architectural licensing organizations and the National Council of Architectural Registration Boards (NCARB), as of 2012 it remains inconvenient to obtain a license to practice architecture in many European Union (EU) countries. The EU allows for cross-border practice for those holding a license in a member country that has signed the professional services portion of their treaty. For those countries that are not signatories to that agreement, reciprocity does not exist.

Title Act vs. Practice Act

In the United States there are both Title Acts and Practice Acts. A Title Act simply limits the right to use the term "architect" to those who have attained and maintained a license to practice architecture from one of the states or territories. A Practice Act limits the right to practice architecture to those who also maintain an active license. Some offshore countries offer only a Title Act, which effectively allows any individual to practice architecture as long as that person does not identify himself or herself as an architect. Using the title "architect" is a violation of the regulation and is punishable by law.

Liability and Errors and Omissions Insurance Issues

While the United States is generally considered the most litigious country in the world, liability for a firm's professional actions abroad remains an issue. Some countries have onerous reprimands, even prison sentences, for construction site calamities, building collapses, and loss of life by fire. Collaborating with a local architect who will assume the role of Architect of Record places the ultimate and final responsibility in the hands of a firm that has experience in local code requirements, means and methods of construction, and local customs and business practices, including local employment protocols and legal protections.

Continuing Education

Sending a member of a U.S. firm abroad to manage a local office does not relieve that person of the responsibility of meeting continuing education requirements of the AIA or any of the individual U.S. state licensing boards. Beyond the basic learning units, each state will have its own Health, Safety, and Welfare, Sustainable Design, and Universal Access provisions in its law that must be met periodically. Locating AIA accredited providers in more remote locations may create a challenge. Utilizing online learning opportunities can serve this purpose well for the overseas American staff.

Local or National Business Tax

Generally, tax treaties between the United States and most countries stipulate that an offshore U.S. national will not pay double tax. But determining where taxes will be paid is critical, as tax rates can be significantly higher or lower abroad, depending on the country in question. It may be necessary to provide additional compensation for U.S. nationals living abroad to bridge this gap.

For tax purposes, it may be more advantageous for the firm to establish a wholly owned local office as a separate business entity from the company in the United States. It may also be better to create a "branch office" of the same company. Taxes vary considerably, with some countries even imposing a value added tax (VAT) on professional services.

Legal Representation

Every country operates under its own system of laws and process of resolution of disputes. It is critical to understand the legal framework under which the practice will operate, and to engage a local attorney who can represent the interests of the firm. Many U.S. firms either have representation in a foreign country or have associated colleagues there who represent them.

Banking

Just as in creating a business entity, banking in each country will be subject to local regulations. For example, in Western Europe, banking is relatively organized and simple, but proof of a legal entity is generally necessary in order to open a bank account. Credit cards are rarely used in Europe, where debit cards prevail. Payments for services rendered are generally made directly by wire transfer to the architect's bank account.

In Russia, fee payments prior to construction can be arranged by wire transfer in U.S. dollars through an offshore bank to a U.S. bank. During construction, the Russian central bank makes payments only upon bodies of work that have signed "Acts of Acceptance," and generally pays to a Russian bank account in rubles.

In China, clients will pay in local currency into a Chinese bank account. It is possible to transfer funds out of the country to Hong Kong or other locations, with a percentage deducted as a service charge. It is possible to be paid in U.S. dollars, but this requires Chinese government approval of both the contract and the right to transfer.

Leasehold

Leasing office space will require the establishment of a legal entity signing the lease agreement. Terms are not inconsistent with those found in the United States, but one would be well advised to review the terms from a local legal and business basis. The rate, common area maintenance charges, taxes, and rate increase schedules should be included. Restrictions as to time of use, access, and any other use limitations should be well established at the onset.

Accounting

Understanding the tax codes of the countries where a firm has located offshore offices can be challenging. Frequently it is not possible to attain the information needed to coordinate the collation of revenue and expenses in order to file taxes in the United States by the filing deadline. U.S. tax filing extensions may become an annual occurrence. It is important to consult a domestic accounting firm for a recommendation for colleagues in the country who can best advise and represent your interests there.

When practicing abroad it is usually best to require that professional services fees be paid exclusive of all national and local taxes, levies, fees, exactions of any kind, and that such taxes are paid directly by the client within the countries where the firm is working. Be sure to stipulate in any agreements that fees are for professional services only, and any and all payments on behalf of the project to public agencies will be made by the client directly.

Human Resource Issues

In order to give full attention to the professional services requirements on projects, human resources issues regarding expatriate staff demand appropriate attention and resolution prior to initiating work. They include:

- Relocation costs for residence, vehicles, shipping, and storage
- Establishing residency
- Meeting qualifications for a work permit
- Tax equalization
- Selection of and admission to local schools for children
- Health care benefits
- Emergency services
- Holidays
- Vacations
- Annual trips home
- Continuing professional education
- Clear path for career advancement
- Meeting IDP/NCARB requirements
- Taking the ARE
- LEED AP, BREEAM, or other rating system examinations
- Communications protocols

Employment Issues for "Permanent" Employees or Contract Employees

American firms generally operate with a policy of "at will" employment, which provides maximum flexibility for the firm to adapt to changing market realities. Different operating principles exist in countries where more active social and employment guarantees exist. It is not uncommon for an employer to be required by the government to pay a separation stipend of up to two years' salary to dismiss an employee of the firm. As a consequence, many architects work on a contract basis. The contract has a job description, stipulated fee, and term of engagement. It can be extended, but only for limited occurrences. After that the individual must either be engaged as a full employee of the firm, subject to customary protections, or never be engaged again as a consultant. Contract employees are responsible for paying into their own pension and health care accounts.

Advancement for Local Nationals in the Overall Organization

A U.S. firm operating an offshore office may find it difficult to bring a foreign national into ownership in the overall firm. Depending on the American entity, partnership, LLP, corporation, or LLC, some U.S. states restrict firms from admitting into ownership any individual not licensed in the state. The internal conundrum of advancing one colleague over another, not by virtue of professional competency but by specific licensure requirements, can limit leadership growth and have a demoralizing impact within the offshore office.

Health Benefits

American health care insurance carriers may not recognize illnesses or emergency issues occurring offshore, necessitating local health insurance for employees, spouses, and children. In some countries, health care is a national right, paid for out of national income taxes. These costs, and who pays them, should be researched well in advance.

Vacations

Vacation time that is afforded to employees in the United States is at the discretion of the employer, and the number of hours accrued is often described in an employee manual. In many countries, however, the number of vacation days is mandated by the government, and often in excess of what is customary in the United States. This may be seen as part of the compensation package, and may have residual impact on domestic staff when they learn what their offshore colleagues are receiving.

Holidays

Beyond the customary American paid holidays, foreign countries generally have a number of additional days for specific events or cultural priorities. When assessing the cost of doing business in a foreign country, it is important to carefully research local holidays, festivals, etc., that will not only cause inefficiency with the local practice, but also create unanticipated days of non-communication between offices.

Maternity and Bereavement Leave

In many foreign countries, women are given significantly more maternity leave than is customary in the United States, with their positions guaranteed upon their return. In addition, the male spouse may claim paid paternity leave for a period of time as well. Marriage and bereavement leave is also afforded in some countries.

Software Licensing

In the United States it would be difficult to imagine having the firm raided by private sector individuals to assure compliance with licensing agreements for computer programs. Yet, in some foreign countries, an unexpected visit by a private company armed with a court-provided search warrant may result in confiscation of computer equipment and/or considerable fines due at the time an infraction is detected, or the practice might be shut down. Given the increasing acceptance of sharing software among staff, including the firm's private and even copyrighted materials, without permission, it is not unimaginable to find a firm incurring considerable unexpected and undeserved costs for such infractions. Policies and safeguards should be put in place, and an internal monitoring procedure should be established to protect the firm from actions of those who do not understand their ramifications.

Firms expend considerable resources to hire and train staff. The more experienced a professional becomes within the firm, the greater the expended investment. Continuing education, licensing and sustainable design exams, conferences, and other professional growth packages intended to make the individual more valuable to the firm mount over time. In many parts of the world a culture of professional migration exists, where an employee will leave one firm for another for a small increase in pay. It is important to ascertain as much as possible the longer-term goals of each member of staff, so as to gauge the extent of the investment in professional growth the firm will undertake.

Practicing Internationally from the United States

While many firms have established offices within regions where they are most active abroad, others continue to manage their international practice from their U.S.-based offices. In the early days, offshore clients accepted this arrangement, as they were pleased to have attracted architects with international reputations to design their projects. It offered them master plans and building designs that created a point of difference with those of their peers. But, with so many U.S. and European firms having established offices abroad, the opportunity for daily contact with their architect has made local presence a very compelling competitive argument for firms with local offices to foreign clients.

It has become increasingly difficult to provide architectural services from a distance, without the daily reconnaissance necessary as projects move through the process from master planning to design and into construction. Beyond the obvious inconvenience, some of the other challenges faced by domestic firms practicing abroad are daily communications across time zones with clients and their associated consultants, remote project management, identification and engagement of local consultants, availability of key staff for travel, costs associated with travel, and identifying local technical resources while in country. Additionally, a firm's ability to provide a comprehensive analysis of the contextual factors affecting project design—including site issues, political, social, and economic—will be limited by the infrequency of their visits.

Competing firms will identify the advantages of having local staff available to serve client needs. And in developing countries, where the architect is often requested to provide normal client-side services that are beyond the expertise of the client, project opportunities are often won by familiarity.

PROTOCOLS FOR A STRONG PRACTICE: OFFICE MANAGEMENT

Creating and Following an Entry Strategy

Before committing to opening a foreign office, it is critical to understand the full financial impact. An entry strategy identifies the goals of the endeavor; the human, financial, intellectual, and marketing resources pledged to achieve success; and a limit of what the firm is committing to invest. Without an absolute limit, the firm may extend an ill-advised overage that can damage the entire enterprise.

Exit Strategy

In addition, an exit strategy should be in place that establishes a time frame to meet practice expectations; defines financial limits that will not be exceeded; and delineates all tax, legal issues, and obligations that must be fulfilled in the event of closing a foreign office. These will include contractual responsibilities to clients and statutory obligations to staff.

Business Protocols

Myriad protocols are required to create the framework for a successful offshore practice. Reality may look very different on the ground than it does in theory.

Travel Protocols

It is customary for clients offshore to require that the architect include reimbursable expenses in the fee proposal. They intend to avoid the unpredictable, and quantify and control costs. It is incumbent upon the firm, then, to impose limits on all out-of-pocket costs it will incur. International air travel costs will be affected by pricing policies of individual carriers, as advance booking, demand, and class of service all are variables. It is advisable to define this in the employee manual and select a single individual who is responsible for making travel arrangements and will be accountable for adhering to the protocol. In-country domestic air travel can most often be purchased less expensively if reservations and payments are made locally. A responsible management individual, rather than the traveler, should be appointed to make all such arrangements for both the U.S. and local office staff, as well as for consultants traveling on behalf of a particular project. The firm should define limits on daily expenses for overnight accommodations, ground transportation, dining, miscellaneous travel expenses, and entertainment for all individuals.

Expatriate Staff Protocols

Given that staff will be working in another culture, it is important to provide guidelines that will clearly spell out project and process management protocols, limit financial expenditures and legal and accounting regulations, and establish a productive and comfortable working environment. These protocols for expatriate staff should be established in advance to limit misunderstandings. In addition, they should cover cultural awareness, education, trips home, and other issues that affect the personal well-being of staff.

Managing an Offshore Office

All the resources that would have been at hand at the home office will be less available in a satellite location. In time, resources will be developed locally. It is important to identify competent local engineering and design consultants that will understand the building type the firm will be designing from the perspective of the firm. Alternatively, encouraging domestic consultants to venture abroad, or working with those who already have international experience, simplifies this transition into global practice.

Collecting fees according to the contract schedule often requires thick skin. There will be a thousand reasons why a payment was withheld. Stopping work until contractually stipulated terms are respected often gets the client's attention. If paid in local currency, repatriation of fees may pose a challenge in some countries. Alternatively, getting paid in U.S. dollars in a neutral location, wired directly into the firm's bank account, allows for repatriation of fees without conflict, and for more efficient management of the practice abroad.

Communication with the home office across time zones can be effectively accomplished through several electronic means. E-mail, Skype, and online meeting software are among the available tools. But a firm can take advantage of time zone differences to increase daily productivity by collaborating between two offices. Jointly sharing projects can remove the sense of isolation and improve the culture of a single firm with multiple offices.

SUSTAINING A STRONG PRACTICE: GETTING BUSINESS

Design Competitions

In many countries within Europe, Asia, and the Middle East, design competitions are an integral part of the architect's process of gaining commissions. Sometimes this is policy dictated by the local government to promote access by the widest pool of design talent. In other instances, a design beauty contest is mandated by the client or by the municipality that will be entitling the property for development. Even in the instance where an architect may be preselected by a client where an existing relationship exists, the client may be required by a public agency to submit multiple schemes by separate architects. Rarely will the architect be adequately compensated for such work, and even if the client is successful in attaining the development rights, another architect may be designated for the ongoing design as a condition of the client attaining development rights. Firms should proceed with caution, and should determine the nature of the selection process with the client prior to assuming this risk.

Contracts

Once the commission is assured, offshore clients, particularly in the developing world, seek absolute certainty in owner-architect agreements that define the scope of work, deliverables, time schedule, compensation, payment schedules, and reimbursable expenses. For many foreign clients, Additional Services suggest that the architect did not fully assess the costs at the outset and are generally viewed negatively. It is important to be quite specific in defining Basic Services, what constitutes Additional Services and how they are different from Basic Services, as well as how Supplemental Services are distinct from both. Be sure that the client understands and can distinguish the differences between them.

It is rare to see an offshore client consider architecture fees calculated as a Percentage of the Construction Cost. They may not want the construction cost identified beyond their organization, or may not want to provide an incentive for the architect to overdesign a project to increase fees. Few will accept a Cost-Plus method of fee calculation because it is an open-ended approach, with no certainty. Flat fees, very often generated on a square meter–rate schedule basis, are understood, accepted, and very difficult to adjust once agreement has been reached. This does not imply that a competitive fee negotiation will not occur, but it does provide a framework within which to begin the discussion. There will almost always be a negotiation.

During fee negotiations the firm should calculate actual labor expenses to provide the deliverables wherever they are being provided, be it in the domestic or foreign location. Each will have different costs, direct and indirect, as influenced by local business conditions. Projecting fees into the future to account for inflation, salary increases, increased costs of business, currency fluctuations, inflation, and the like are important. Everything takes longer than anticipated, and fees should be determined in a manner that estimates the uncertainties.

Offshore fees are generally listed by both phase and stage, such as Phase 1: Schematic Design, Stage 1, Stage 2, and Stage 3. Include the number of meetings, together with the location of those meetings and who from the firm will attend, including consultants under the same contract. Determine the number of overseas or out-of-town trips, and who from the firm will be committed to make those trips.

Reimbursable expenses, or out-of-pocket costs, are somewhat unpredictable, and clients want the architect to bear the risk. Carefully evaluate the costs of airfares, hotels, meals, professional renderings and models, professional photography, printing, and binding of multiple copies of presentation documents as stipulated in the contract.

While the AIA has produced standard documents for use overseas, it is more likely that the client will translate the architect's proposal into a format that can be accepted by internal legal departments or, in some cases, by the government. Dual language agreements produced by the client should be checked carefully by the architect for compliance with the intent of the proposal, and for consistency between the two languages by a professional legal translator knowledgeable of technical terms as the local language usually prevails in the event of disputes. Clients will require a proposal, but there is no guarantee that the terms stipulated in an architect's proposal will be faithfully included in the contract provided by the client. Read everything carefully, and negotiate again until the contract reflects a fair interpretation of the architect's intent. A schedule of payments, including a nonrefundable mobilization payment applied against the last installment under the agreement, should be included.

In many cultures, negotiation only begins when the contract is signed. Articles of Acceptance is a commonly utilized document in many developing countries which concludes one stage or phase of a contract, and is necessary to be issued by the client in order to advance to the next stage or phase. However, a firm should be aware that it is often used as a tool to squeeze more out of the architect and their consultants than was negotiated for in the agreement. Inexperienced clients assume the architect will provide anything they need, despite the number of changes they make, even if out of sequence. Many firms report difficulty in collecting the last 15 percent of the fee. Plan ahead, seek a mobilization payment up front, and never put the firm in a position of risk or financial compromise.

► Negotiating Agreement (15.3) addresses the skill of negotiation in detail.

It is not uncommon to find clients cutting off design services earlier than the architect anticipated, even negotiated in the agreement. This limits the ability for the firm to provide quality assurance during subsequent design and construction phases. It is important to discuss this thoroughly with the client in advance and to address it in the contract. Additionally, local architects often attempt to renegotiate their scope of work during the process of design, as they are often well positioned with local officials, design institutes, and contractors. Creating an "associated architects" relationship, with a clear division of responsibilities that will transcend any particular project, is a useful way to avert this pitfall and to create a more collaborative working protocol.

Terms of Engagement

Defining the firm's terms of engagement before taking the decision to enter the challenging waters of international practice is not only common sense, it's practical. Tested suggestions include the following:

- *Never fall in love*. The architect who is too desirous of a particular commission will be put at a negotiating and collecting disadvantage. There is a reason why a client determines it is in their best interest to cross the world to engage an American architect. Maintain that advantage.
- *Get paid in advance*. In a foreign country there is little political leverage to help a firm recover costs once spent. There is a significantly reduced chance of legal justice for a foreign national in another country, and the legal costs and time are unpredictable. If a firm finds it is overextended, it may be advisable to withhold delivery of documents until all outstanding fees are collected.
- *Deliver on time*. There is rarely sufficient time to complete any phase of an assignment overseas based on U.S. practice standards. The firm that meets challenging time constraints can leverage the success to secure the next commission.
- *Exceed expectations*. If the firm is paid in advance, it is important for the client to appreciate that in return the architect has provided more than what was negotiated for in the contract. They will double-check the work product against the list of deliverables in the contract. Depending on the situation, it may also be beneficial to deliver the work product earlier than the anticipated date.
- *Add value*. Beyond producing a creative design that satisfies the program and fulfills the client's expectations, it is important to think like the investor and add greater than expected value. This may be measured in building cost, building efficiency, or the rental rates that result from a superior design product.

RECOMMENDATIONS

The playing field abroad is occasionally difficult to read. For private sector projects, the development process may be upset by frequently changing planning guidelines and building code adjustments applied retroactively. International code consultants are available to firms to advise on these matters. Means and methods of construction will require re-education for the U.S.-based practice. Keep an open mind.

Practice abroad brings special challenges but also offers opportunities for architects to bring their holistic skill sets to the process. In order to be effective within a foreign culture deploying a process that requires a comprehensive understanding of the place and the special nuances that define its unique difference, it is often the best place to begin.

Recommended Professional Practices

The obvious is not always obvious. When practicing in another country it is important that the firm appreciates that it is a privilege to be invited, rather than a favor that the firm is offering the client. Several practices are important to observe:

- *Respect the host country's history and culture*.
- *Appreciate the visible and invisible context*.
- *Be professional at all times*. Do not compromise your standards of practice.
- *Raise the bar of professional practice locally* by introducing best practices and new technologies, among other opportunities.
- *Be patient*. The common business practices by a client or public agency in the U.S. may still be maturing abroad, causing the architect to be asked to revisit design issues repeatedly to achieve a shared level of comfort.
- *Be flexible*. Practice methodology will most certainly be altered overseas. It is important to maintain focus on the desired outcome over the means of achieving it.
- *Bring value*. The expectation that the U.S. practitioner will bring unexpected and quantifiable value (revenue) to a project should be confirmed through the design process.
- *Bring vision*. Many see this as the creative century. Design is currency. Bold but practical design offers not only vision but also viability. Think globally, but design locally.
- *Build community*. In many developing countries the space between grand master plans and iconic building is ignored. Meeting building program objectives is only one obligation of the architect. But there is an opportunity to build social interaction and community through genuine engagement with local residents and practitioners.

Common Pitfalls

Architects are human, and occasionally bring attitudes that create unnecessary obstacles for themselves. It is difficult enough to practice abroad, so be careful to avoid the pitfalls below, many of which are corollaries to the recommended practices:

- *Do not bring preconceptions or biases*. Keep an open and inquisitive mind.
- *Do not be arrogant or disingenuous*. Clients are sensitive and deserve respect.
- *Do not be seduced by an opportunity*. Maintain balance by evaluating every prospective project on its merits, including business terms.
- *Do not forget the firm's terms of engagement*. They will keep the firm focused.
- *Do not undervalue the firm's contribution*. There is a reason the firm has been invited to submit a proposal.
- *Do not underestimate the competition*. U.S. and foreign firms sometimes apply different ethical standards abroad.
- *Do not limit the process by applying the firm's specific experience*. Apply knowledge and wisdom.
- *Do not compromise the firm's core values*. This is the most important element of a firm's culture.

CONCLUSION

There are certain challenges inherent in practice abroad, and several residual benefits. They should be anticipated, embraced, and mined to the benefit of the domestic practice as well.

Challenges of Practice in the Global Marketplace

When firm leaders are busy growing the practice abroad, the challenge of overcoming inconsistencies with staff at home and staff overseas exists for several reasons. Among these are logistics—time lost in transit, physical impact of multiple time zones, absence from the office, and family and personal needs. In addition, there are issues of design quality assurance and the understanding and acceptance of the quirks and benefits of the foreign venture to the owners and professional staff back home.

Clients Don't Know What They Don't Know

Practice abroad exposes the U.S. architect to three potential client experience climates: first world, developing economies, and third world. In Western and much of Central Europe, Japan, Korea, Hong Kong, Singapore, Australia, New Zealand, Canada, and parts of the Middle East, first world competencies exist. In the third world, most clients seeking U.S. design competencies understand that they need significant leadership from the design firm. But in developing economies, where fortunes have been made in export trade, manufacturing, or exclusive licensing of market activities, clients embarking on significant real estate ventures may not know what they don't know. They will not know whom to ask or trust, which puts the architect in a precarious position, since client direction may change with every new opinion. Caution is advised—securing written approvals at every stage of each phase of services will offer some, but not complete protection.

Benefits and Entrepreneurial Results

Benefits abound from global practice experiences for the firm sufficiently prepared to seize opportunities in a professional and cautious manner. Once the overseas practice is established and its workload is stable, the firm can use geographic distance to compensate for domestic recessions. It can facilitate the concept of a 24-hour office, which may bring production efficiencies to the firm, particularly for projects facing compressed design schedules. It can also create flexibility with staff assignments.

The firm may attract higher-level applicants and retain its strongest staff by offering international travel opportunities as well as offshore living and educational experiences, all of which may broaden and deepen the firm's competencies across the board. Global practice can enhance the firm's communications skills, encourage more strategic thinking, and produce more effective design decision making.

At the same time, the firm may be able achieve growth in its domestic portfolio by securing commissions abroad for which it would never have been considered at home, enabling it to then become competitive in new, more complex domestic markets. With the experience of practice abroad, the firm may be able to serve domestic clients as they seek to expand their operations in foreign markets.

In addition, with an offshore office the firm has an opportunity to associate with a foreign practice that brings the benefit of learning from peers who will see practice in their country from a different perspective. There is also the opportunity to form a long-term relationship that can foster more predictability in project delivery, greater efficiency, and improve the marketing of future projects.

Sustaining the Firm's Core Values in the Global Marketplace

Before venturing abroad, it is critical to commit to the firm's core values. Without confirming or establishing a firm's core values, it becomes more difficult for those entrusted to look after the firm's interests abroad to act in the firm's interests or have their performance measured effectively. Planting and growing the culture of sustaining the firm's core values overseas takes daily vigilance. The firm's reputation is at risk, and must be secured without question, or it will fall to the lowest common denominator. A firm normally takes years to confirm its reputation. Practice abroad, when approached thoughtfully, and when a firm maintains it core values in the effort, offers the opportunity to further enhance the reputation and the capabilities of a firm.

5.9 Developing and Managing Multiple-Office Firms

Deborah M. DeBernard, AIA, NCARB, Architect-AIBC, LEED BD+C

Although many architecture firms are single-office enterprises, there are numerous reasons for firm owners to explore the possibility of expanding into more than one office. However, multi-office firms can be a challenge to lead and manage. Savvy owners will thoughtfully craft a business plan, organizational model, and strategic plan that mitigate these challenges.

PART 2: FIRM MANAGEMENT

INTRODUCTION

The decision to expand to multiple offices is one that few firms choose. For some, staying in one office is a decision of conscience based on a belief that a single location brings the greatest benefits to clients and staff while providing the highest quality; others are fearful of the many challenges inherent in multiple locations; and some have never been presented with a convincing business opportunity. Yet there are many examples of thriving firms with multiple locations.

"Although the majority of architecture firms have one office, just over 10 percent have multiple offices. Approximately two-thirds of firms with 10 to 49 employees and one-quarter of firms with 50 or more employees have one office, and 43 percent of the firms with 100 or more employees have 5 or more offices. The majority of firms have offices that are located exclusively in the United States, with just 2 percent reporting that they have offices overseas," according to *The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics*.

▶ See Demographics of Practice: 2012 AIA Firm Survey (2.2) for the percentages of multiple-office firms in relation to firm size.

Although many architecture firms are single-office enterprises, there are numerous reasons for firm owners to explore the possibility of expanding into more than one office. Once that single-office barrier has been broken, architects can open more offices

Over her 28-year career Deborah M. DeBernard has held responsible positions in four multi-office national firms, including her current position as director of acquisitions for Dewberry. In each, she has been central to creating a strategy for success. DeBernard was the subject matter expert for "Leadership" for AIA's Soloso™ Editorial Control Review Board.

to create regional, national, or global practices. Reasons to expand into multiple locations include:

- Creating new opportunities for staff members as new leadership and project positions are created
- Diversifying the practice by including new geographies, markets, clients, staff, cultures, approaches, or ideas
- Taking advantage of the desire of a senior partner or key employee who wants to relocate
- Expanding the reputation of the firm's expertise by creating a broader platform for the firm to perform services
- Better serving a client who has projects in multiple regions
- Improving the potential for winning work by having a local presence in a growing area where projects are often awarded to local architects
- Increasing revenues while controlling overhead costs through the use of centralized human resources (HR), accounting, technology, marketing, legal, and risk management departments (and thereby increasing profits)
- Reducing risks on projects being performed outside the normal geographic "reach" by increasing local knowledge, improving opportunities to build relationships with the client, contractor, and others, or taking a prime role on the project

Steve McConnell, FAIA, LEED AP, Managing Partner at NBBJ (which has six domestic and four international offices) says, "Having multiple offices broadens our overall understanding, providing multiple perspectives of architecture and our client's business. The fresh eyes and experiences that come from opening a new office location infuse our practice with diverse viewpoints. This new way of thinking is often the springboard to an idea that differentiates us from our competition."

While some practitioners use their single-office status to control quality, design, and client relationships, others believe that there are means to prevent degradation while at the same time accommodating expansion. McConnell describes the framework that makes NBBJ's multi-office network a success as "one of high attention to culture and alignment, where all of our offices are fully integrated using one business model. NBBJ staff has a common framework for culture and value, while simultaneously respecting the differences that occur in multiple offices."

Moving into a multi-office business model is not for every firm. However, when single-office firms successfully expand into multi-office firms, they can create a momentum that brings benefits of greater stability, independence, and opportunities.

DISCUSSIONS ABOUT DEVELOPING A MULTI-OFFICE FIRM

Expansion often begins with a market analysis associated with a strategic planning session. This market analysis may indicate that the local market is declining or that other markets are expanding. This information may propel a firm to consider new geographies that are ripe with opportunities that match the existing skill set or market expertise of the firm. With a depth of experienced staff and portfolio in health care, for example, one might look for regions where health care spending is anticipated to grow. Targeting specific cities where industries are relocating, population is expanding beyond the national norm, or emerging business ventures are poised to succeed could serve as likely candidates for a branch office opened to serve a new geography. This type of expansion is aimed at bringing existing expertise to new clients that are located in a new area and generally requires relocating a key staff person.

Alternatively, the strategic hire of an architect already located in the targeted area can be the impetus for a new office location. In this example, the expertise of the strategic hire would not necessarily be limited to the current expertise of the firm. New markets in new geographies can be initiated simultaneously in this fashion.

Existing clients that have projects in multiple locations is another reason architects open new branches. In particular, existing domestic clients with an international reach may be the nexus of a jump from a national to an international practice.

General contractors involved in design-build project delivery, specialty MEP engineers, program managers, landscape architects, or other allied professionals can become strategic partners to a firm's expansion if they are located or regularly work in regions that have been targeted.

Large projects located outside of a firm's normal geography often serve as the starting point of a new office. William Hooper Jr., AIA, Principal at Gensler (which has 40 offices worldwide) explains, "In 2007 Gensler began to work with a client in Asia who was investing in both master-planning development and tall towers in the region, including China. That work became so large in scale and continuous in flow that Gensler and the client started discussions on more permanent collaborations. This resulted in the establishing of a new Gensler office in Southeast Asia, largely dedicated to the client. Similarly, Gensler was selected to provide design support to a major U.S. law firm on the design of its flagship office in the Midwest. From this highly successful relationship came requests for new work across the globe, from the Middle East, through Europe, to South America and Asia. With each of these projects came the parallel opportunity to form a local office with the staying power to remain viable after the initial design work was completed. This model provided a reliable underpinning for six to eight months of work, and the ability to become self-sufficient within 18 months."

Once a region or area is targeted, a detailed market analysis should take place that examines market need/trends, staff/recruiting availability, existing portfolio alignment with market needs, competition, costs, and alignment with a firm's mission and values. This analysis provides the factual foundation for better decision making.

MIAMI OFFICE CASE STUDY

Florida was one of the most affected states in the country from the 2008 housing crisis and mortgage crash. At the time, Florida's economy was not well diversified. Florida's economic structure was built upon the success of tourism and local construction. When the market collapsed and the recession occurred, tourism activity slowed tremendously, property values plummeted, and state revenues dramatically decreased. The construction industry encountered unemployment rates in excess of 14 percent in Florida, with local governments facing large budget deficits.

Ignacio Reyes, AIA, LEED AP, Corporate Director of Development and Vice President at Leo A Daly (which has 30 offices worldwide) explains, "For Leo A Daly, the issue was the decision to maintain an office in the most populated area of Florida, the city of Miami, during the challenging economic events of 2008 to 2011. With the economy damaged, local governments without resources, and the political climate dramatically altered, maintaining an architectural practice in South Florida was a daunting task. The process used in the decision to maintain operations (similar to opening a new office) in South Florida involved many factors, individuals at various levels within the organization, a solid understanding of current economic conditions as well as faith in the future of the area."

LOOKING EXTERNALLY

Reyes continues, "We approached the process starting with an inventory of the existing conditions of the marketplace. We reviewed the current census demographics to understand the existing population and their associated needs. We gathered the proposed or existing area economic trends in terms of active building markets over the last five years and the last twenty years. This process helped to build a solid basis of local area understanding and fundamentals. Demographics consistently pointed to an increasing elderly population whose survival rate continued to increase. The demographics alluded to a greater need for health care services for a longer period of time within this state."

The inventory process continued with the mapping of industry-related regulations for growth, such as the processes to approve new health care projects in South Florida, or how the legislature was appropriating funding for education and other general services. Getting an understanding of the current and likely political and regulatory realities was a crucial part of the analysis.

"Our inventory also outlined the existing local competition for architectural and interior design commissions, listing which firms might leverage themselves within our region or core service markets. This enabled us to look at our own strengths and weaknesses in comparison to potential competition. Then we looked at our ability to recruit highly trained, sought-after professionals from local institutions. We needed to know if the current marketplace would have high-quality graduates that would help support the mission of the office or whether the cost of living concerns would be detrimental

(continued)

to recruiting new talent. Our team had to be prepared with solutions to potential concerns for staff availability," says Reyes.

The next step was to understand the projected needs for the area in terms of planning, architecture, engineering, and interior design. For example, by 2010 the Miami hospitality market had experienced various developer foreclosures and deals that never went forward. By 2011, the market stabilized and an increasing amount of potential project opportunities led Reyes to believe that the market need would match up well with one of their core design services. In addition, financial banking institutions from foreign investors were acquiring wholesale office zones within Miami to position themselves as institutional leaders to Latin American markets. This prompted Reyes to believe that corporate commercial banking intuitions would continue to grow and that this asset class would provide both architectural and interior design opportunities for the Miami office in the future.

"We utilized every database and publically available dataset, searching for projections and forecasts to help confirm, verify, or even question the data and information we were getting from other, more traditional sources. We analyzed everything. And after a review of the conditions and market needs, we could see the greater Miami-Dade region becoming very active in the next 24 months in hospitality, interior corporate commercial projects, and continued long-term governmental service projects. With this information, we evaluated how these market trends and needs, combined with the statistical demographic data, aligned with the market sector specialization within Leo A Daly," says Reyes.

LOOKING INTERNALLY

Whether a firm is looking to maintain an existing branch office or opening a new office, a financial analysis determines the cost of such an endeavor, including

- Office purchase or lease
- Local incorporation or registration
- Equipment purchase or lease
- Overhead costs for start-up, insurance, hardware/software/licenses, maintenance, taxes, indirect travel, marketing materials, updated business cards/stationery, and technology
- Indirect salaries of personnel responsible for introducing the firm to the marketplace and developing new client relationships, including dues for local organizations
- Direct salaries of personnel responsible for executing the services
- Relocation and travel
- Public relations campaigns
- Communications and data transfer between offices
- Demand and consumption of senior management and corporate time for support activities

A cash-flow analysis including the costs and the expected revenue (weighted for likelihood of selection and start-up) from successful commissions provides a resource to determine when, if ever, the new office will become feasible. This projection should be as realistic (neither overly optimistic nor overly conservative) as possible, guarding against the temptation to believe that new commissions will be accurately predicted in terms of quantity, start-up time frame, or extent of services. Building a strong contingency into the plan will increase the probability of success.

Reyes describes a step often overlooked when the decision is made to expand into new geographies: "Our final step is to evaluate the region's trends, needs, and market alignment compared to the vision of the firm. We believe strongly in design excellence and in exceeding our client's expectations, from design solutions to service engagements. We ask ourselves whether being in a specific location would give us the ability to support our vision and whether we are willing to financially support the office until the office is financially viable. This process led us to the conclusion to maintain the Miami office through the difficult economic conditions in South Florida while repositioning our Miami staff to better align with the current and projected market conditions."

The basics of the internal and external analysis have to create a promising future, but the most important aspect remains the dedication and commitment of the leadership of the new enterprise. Dan Pleasant, PE, COO of Dewberry (which has 40 locations) explains, "A dedicated, energetic, positive, highly respected office leader who is responsible for successful operations is the single best indicator for us that a new office will thrive. We feel that this person must have a strong knowledge of our internal processes, existing good relationships with the key leaders including the corporate group, patience, internal advocacy, and the passion needed to make this a success." Firms that are able to capitalize on relocating a principal fitting this description have a very strong advantage.

ORGANIZATIONAL STRATEGY

Once the decision has been made to expand, firm leadership must turn to the question of organization. The chosen organization should support the culture and values of the firm, such as degree of transparency, information sharing, decision making, and ability to offer appropriate solutions to clients. Generally, these organizations will be either market-based, where individuals in multiple offices form a business unit around a market (e.g., higher education or health care) without regard to their physical location; or geography-based, where individuals located in a single office form a business unit and pursue work in any market based on the collective expertise within that single office.

Market-Based Organization

Dennis Petersen, P.E., President of Lockwood, Andrews & Newnam, Inc. (LAN, which has 14 offices) says, "There is but one reason to define an organizational structure—increase the odds of success, while remembering that an organizational structure is just a tool to sell more work and deliver quality products more efficiently. It is not the solution. With five market sectors across fourteen geographies, LAN consciously elected to organize around market-based profit centers. Our goal is to serve our clients with processes and expertise that are directly relevant to them. Simply, each market sector is designed to 'fluently speak the client's own language.' Technology, terminology, methodology, selection, pricing, contracting, project delivery, culture, and even acceptable dress codes can vary greatly by market sector. For example, a municipality, a transit agency, and the Corps of Engineers are all units of government, but very different in the selection and execution of projects. We believe it to be very difficult, if not impossible, to sell generic services into a specialized marketplace. To counteract that, we have built our market sectors as 'Centers of Excellence' amassed over multiple geographies."

Petersen believes the market-based organization provides many advantages:

- Experts can sell precisely what they know best to clients they understand—that equates to more wins.
- Workload balancing across geographic boundaries is simplified because all market sector staff is specialized in the same industry.
- Specialization generally equates to production efficiency.
- Cross-geography communication, innovation, and ideas flow more freely.
- Market sectors can choose to locate in geographies with the best potential for success, not where current offices are located.
- Supervision and mentorship are from leaders that understand the employee's marketplace, providing for more effective training.

Likewise, Moseley Architects (which has six offices), reevaluated its organizational structure in 2011 and felt that it could better serve clients by shifting to a market-sector focused organization rather than a geography-focused organization.

Jim McCalla, AIA, vice president of Moseley, explains, "We currently have six locations, and several of these locations serve the same sector and/or multiple sectors. Having restructured our organization to function by market sector, our leaders are better able to access market-specific knowledge and talent across the firm rather than concentrating on personnel who reside closest to the client/project. This allows us to work together regionally and provide the best, knowledge-based solutions to clients. The result is that every member of our organization is assigned to a specific sector and consequently focuses their professional development on becoming knowledgeable about the issues that affect that particular sector's design solutions/options."

From an operational and financial standpoint, the new approach benefits the firm by allocating resources, promoting camaraderie among like-minded designers, strengthening client relationships with in-house experts, and reducing duplicative efforts. McCalla says, "We have already begun to realize many of these goals and achieve additional benefits, including staff demonstrating increased ownership for projects within their sector. Historically, if a designer in our Charlotte office was working on a Richmond project, there was an 'outsourced' view from both offices. Now, every member of the sector is demonstrating the same level of effort and interest in their sector's projects regardless of their zip code. Additionally, sector leaders are conducting regular meetings with the entire sector, so staff in different locations are benefiting by regular communication with the firm's leaders. Staff feels engaged creatively and professionally, with an increased interest in their production from the firm's leaders—who in some instances are in another state."

Geography-Based Organization

A geographic-based profit center model can be very effective if (1) firms are providing similar services to one client base, (2) the offices are considered coequals, (3) leadership is balanced among the offices, and (4) high accountability is an important goal. Geography-based profit centers provide the strongest model for accountability, where every decision—from which office the firm leases, to client pursuit costs, to strategic hiring, to printing—is tracked against a single budget and plan. Disagreements about costs that are shared between profit centers, such as leases, fringe costs of personnel supporting multiple locations, and underutilized staff are minimized under this model. Communication is generally face-to-face, and a sense of team identity is easier to accomplish when all firm members are physically located together.

However, there are many details to work out in the development of geography-based multiple-office firms. There are no right answers to the following questions, yet each one of them needs appropriate consideration when setting up a geography-based business model. These considerations are:

- *Collaboration vs. competition*. Are offices expected to share information about their successes and failures, and to what level of detail? Can offices compete for the same projects? Are their specific marketing areas defined for each office? How can small offices invest in strategic initiatives that are difficult to fully support?
- *Working relationship*. When geography-based offices work together, what are the rules that determine the working relationship for establishing fees, sharing profits or losses, or determining appetite for risk with design-build or design competitions?
- *Harnessing and maximizing expertise*. Who determines the best use of subject matter experts when they have competing deadlines? How are costs for conference attendance or presentation events shared? How do all offices know and access the strengths and experience of the firm's experts?
- *Overhead costs*. Is the methodology for spreading shared overhead costs for corporate leadership, legal, risk management, human resources (HR), and accounting across each office by gross revenue, net revenue, total salaries, or direct salaries? What is the process for discussing, and who makes the final decision on changes affecting each office?
- *Staff leveling*. How do the offices communicate about staff who are over- or underutilized? What is the process for sharing staff across profit centers? What happens when shared projects performance suffers? Is there a difference between a short-term loan and a long-term loan? How are travel and other costs associated with staff sharing handled?

OPERATIONAL BUSINESS MODELS

Whether a market-based or geography-based organization, determining what services to offer and how to launch a new office will depend on availability of financial resources, comfort with risk-taking, leadership effectiveness, strategy, and vision for the future. New offices are often launched in "phases" where the risk of a full-service office start is mitigated by starting with a smaller effort:

- A phone number, a local address, and a strong communication connection back to the headquarters, where personnel respond to initiatives on demand. Care must be used not to overstate or misrepresent the capabilities of such an office.
- Staging one or more staff in a new office that is responsible for business development and marketing efforts, with all services performed in more established offices. Often this effort begins with staff working from their residence or from executive office space.

- A shared office with a strategic partner, allied professional, or client. These arrangements can be made with partners already established in the new geography or with those sharing the desire to move to a new geography.

Once underway, additional office(s) can function as a

- Project office, where all or nearly all staff is focused on a single client's project
- Satellite office, where most if not all decisions are made at headquarters with the branch office carrying out the plan
- Branch office, where the vision and strategy of the firm guides the decisions of the branch office but the responsibility for performance rests primarily with the individual office

Culture

With a small to medium single-office firm, ideas such as unity of purpose, cultural identity, decision making, authority, shared vision, and autonomy are inherently more consistent than with a multi-office firm. The direct, consistent communication possible when everyone is co-located makes each one of these concepts more manageable. If firms have not given enough consideration and definition to these ideas, tensions can arise as they grow and expand into new offices.

To ensure that the existing culture is understood and embraced by all offices, write a statement defining the goals, values, and vision of the firm that leaders, regardless of location, share and support. This is not a quick step but rather one that requires thought, rumination, reworking, and integration. The words on the paper will carry no value unless they are understood, felt, and embodied consistently by leaders in each of the locations. These leaders should reflect this culture with ease by using the vocabulary captured in the vision statement in everyday conversations and taking actions that demonstrate the described qualities in and out of the office.

Next, create an organization chart that serves as a communication and decision-making tool. It should be understood among the leaders of the firm who has authority to make decisions and at what level.

Then determine which services will be provided centrally and which will be provided in each office. While there is more than one solution, most multi-office firms provide centralized finance/accounting, HR/benefits, and legal support. The provision of centralized or decentralized marketing and information technology (IT) services is less consistent. Other aspects to consider are the offering of training, material and detail libraries, document retention, file management, quality assurance/quality control, and public relations. Once those centralized services are defined, it is important to understand how each of the components will work together. For example, while the basic training of project managers to understand project finances, setting project fees, costs-to-complete, and management of accounts receivables might be handled centrally, who is responsible for regular project management mentoring or corrective action? Likewise, the development of collateral materials that are needed to pursue emerging markets can be handled centrally, but the process of making assignments of a central marketing staff for competing marketing deadlines should be determined in advance.

Employee Handbook

Human resource needs increase when firms have multiple offices. Questions arise about how employees are treated in one location versus another. It may be common for offices in Arizona to have a four-day workweek in the summer as a means to reduce the need to cool the office, or for offices in large metropolitan areas to have very flexible start times as a means to mitigate commuting issues. Employment standards may also vary, such as how overtime is handled in California, where nonexempt employees shall not work more than 8 hours in any workday or more than 40 hours in any workweek unless they receive one and one-half times their regular rate of pay; whereas employers in Virginia need only adhere to the federal mandate to pay overtime for hours worked in excess of 40 hours per week. Consulting with a state's Industrial Relations Board or an attorney who specializes in labor/employee relations can yield these differences. Once known, an employee handbook can institutionalize these practices and become an easily accessible communications tool for all offices.

▶ Human Resources Management Overview (8.1) further addresses employee handbooks and includes a sample template.

Dave Francis, corporate director of HR at Dewberry, says that "an employee handbook is a key element to effective HR management. Employees and management at all levels are constantly seeking information and guidance on how to handle the situations they face in their professional lives. This need is heightened when offices grow and move into new locations with differing social norms. Well-defined company policies provide an opportunity for top management to convey company culture in the day-to-day operations of the business and how employee issues are to be handled. Make no mistake, you can never and should not endeavor to create a handbook that will address each and every situation that arises—it is just not possible. Focus on the issues that are most frequent and/or can cause the most difficulty. An employee handbook should evolve as experience clarifies the day-to-day needs of the organization."

Branding

A firm's brand is one of its most valuable assets. It conveys the firm's "corporate personality," combining business objectives with unique corporate culture in a manner that is appealing to clients. As firms take on new offices, it is important that the brand identity established for the original firm is strong enough to transcend the new geography so that it becomes a sales asset for all offices. Even firms that are long-established can benefit from a brand refresher as they expand their influence in new markets and locations.

In 2010, Dewberry undertook a branding exercise that was intended to help clients understand better the architectural, engineering, and consulting services offered by the firm. Dewberry director of communications Molly Wagner says, "It's tempting to jump into the fun stuff—the 'what'—a new color palette, new logo, new typeface. But it's important to stop and think through the reasons behind the branding effort; because by changing your brand you are changing how you will be perceived by your clients, teaming partners, and your current and future employees. When you sit down with the management of your firm to ask the 'why' questions, start with culture. Does the culture of your firm support the kind of changes you are contemplating? If you manage a dynamic, fluid organization, changing your visual identity may be readily embraced. If your firm is resistant to change, consider how altering your identity will impact your audiences, both internal and external. Taking the time to analyze what your culture will support will have a big impact on how employees embrace the change and share it with their clients and colleagues."

After interviewing clients, Wagner believed that it was important for the firm to know how Dewberry was perceived in the geographies surrounding its offices. In addition, she wanted to test whether all services offered were understood and what about the Dewberry brand was perceived consistently.

Wagner explains, "We found that our clients perceive us as highly committed to their success, high-performance, and knowledgeable. We also discovered that we needed to better promote our visionary solutions. This helped us develop a master branding document that provides the framework for external position statements and tailored messages for all disciplines. We then took a hard look at how the branding outcomes would be managed in the future. Our efforts produced more highly functioning electronic communications tools for our website, social media channels, and multimedia content delivery. We use these tools when we orient new employees, in our internal and external communications, and in our everyday language. The results of our branding exercise enabled us to successfully refine our messaging across our 40 locations."

▶ Public Relations and Communications (6.3) further discusses the importance of branding to growing a firm's business.

Managing brand components (e.g., a website, promotional materials) and driving consistency across multiple offices requires additional staff. "We created a new position within the communications department to develop relevant, up-to-date content for our website and social media channels, so that the new Dewberry story could be effectively and regularly broadcast," notes Wagner.

Standards and Templates

Standards and templates are useful tools in many firms, but they become increasingly important as a firm expands into multiple offices. Standards allow various offices to work together more easily, as each team works from a common platform where projects of all kinds can be worked on independently and then combined at appropriate times. Standards can apply to software platforms, hardware specifications, details, stationery, business cards, office furniture, supplies, presentations, project deliverables, title blocks, banners, jobsite signs, websites, social media, and more. Standards can create flexibility where parts can be assembled and reassembled to suit the need and create efficiency. This allows teams to spend time on their unique approach to solving a client's issues rather than, for example, creating new graphics each time a presentation is made. Producing common deliverables also helps clients intuitively understand that each of the components is being offered by a single firm with a consistent, credible message.

For multi-office firms, there may come a time when the firm outgrows a centralized marketing and graphics department's ability to produce all materials used in business development, marketing, presentations, banners, signs, website, and social media. At this point it becomes increasingly important that a graphic standard is in place to ensure that printed and multimedia materials have a cohesiveness that helps clients connect emotionally to the firm and the promise made through that identity.

Sian Imber, Corporate Director of Public Relations at Leo A Daly explains, "Visual consistency is the key to the success of a brand's graphic identity. Its impact depends on consistent use in many impressions over a long period of time. A successful logo, for example, becomes familiar by repetition and is not interpreted as a word but is read visually by the brain, evoking a complex set of associations more powerful than words. A brand's graphic identity is, however, rarely comprised of just a logo but an entire visual language whose usage is guided by a graphic identity manual and templates."

The graphic templates are carefully planned frameworks used to organize information in two or three dimensions. When used correctly, the template assures consistent good design while maintaining a cohesive visual language. Imber explains, "Templates guide the user on the appropriate options and placement for the corporate title, logo, approved typefaces including point size and style, and approved color palette, while also guiding additional content, including quantity and placement of copy, required ratio of white (or negative) space, headline style and hierarchy, image size, resolution requirements, and placement."

Imber recommends developing templates that are highly flexible, extremely efficient, and that allow for growth as new design elements are added. "Templates should serve as a guide for all users with varying degrees of graphics proficiency and provide a recipe for correct use. They also allow the user to focus on the content rather than the graphic representation of the message. An effective template saves time, guarantees visual consistency, ensures a professional end result, and prevents the proliferation of different logos, colors, typefaces, and layouts that bedevil architecture practices with multiple users, applications, and offices in several locations," says Imber.

MANAGING A MULTI-OFFICE FIRM

Strategic Planning

When offices in different locations are striving to work together effectively, strategic planning becomes even more important than it would be for a single-office firm. Strategic planning offers an opportunity for dialogue and consensus about the mission and vision for the firm, what preparations are needed for the future, how a firm will anticipate and manage change, how to align all stakeholders on strategy and tactics, and the means to streamline decision making.

► Strategic Planning for the Design Firm (5.3) discusses how a firm's leaders can envision the firm's future and implement strategies and action plans for positive results.

Multi-office firms require special treatment for inclusion of all stakeholders. "At Gensler, information and longer-term plans are developed from the multiple perspectives of the local office as well as from the region that encompasses the local office; and from the regional practice area (the area of design expertise that is unique and which provides support to a specific client base), which rolls up into a firm-wide practice area perspective. These two groups—'offices' and 'practice areas'—provide complementary perspectives on the market, clients' needs, and projections on the economic growth of the firm, serving to back check each other," says Bill Hooper.

Hooper continues, "Strategic planning within Gensler occurs continuously, but is examined in detail twice yearly, at the start of the fiscal year and the midpoint. It is at these points that the deep-dive into our sense of the market is conducted. The result serves to inform decisions on where to expend resources, where we need to reallocate staff, how our financial projections are tracking, and where new markets are evolving. Gensler recognizes that each office has a different profile of work and emphasis on particular aspects of design and architecture. Thus, the individual office is responsible for setting its own strategic path, while achieving the overarching goals that the firm has agreed upon. An office may be heavily dependent upon a local industry—such as financial services in New York, entertainment in Los Angeles, or automotive in Detroit—but is expected to achieve growth in these markets consistent with the firm-wide vision."

A firm-wide strategic vision should remain independent of the office's implementation strategy. In the case of Gensler, the firm identifies broad goals such as new markets ("non-U.S.-centric growth"), or expansion in staff ("grow to 6,000 employees in seven new geographic markets"), or new practice areas ("acquire or grow capacity for dominance in educational sports facilities"). The office's pursuit of these goals is supportive of the firm-wide strategic vision.

Knitting these two efforts requires regular communication. "Strategy is discussed on a weekly firm-wide phone call, starting every Monday at the same time, with a constant agenda (marketing, trends, and major announcements) and attended by representatives from every office, with participation ranging from late night in China to early morning in California. This is the single most vital moment of the firm and is indispensable for strategic sharing," says Hooper.

Inter-Office Tools

Even with a strong strategic planning process, many firms develop a territorial or silo-based attitude where the primary view is focused on the individual business unit—often at the expense of their colleagues' business unit and the overall performance of the firm.

Leo A Daly has developed two tools to enhance communication among business units and a "one company" attitude. Jay Brader, CPA, controller and vice president at Leo A Daly, explains, "When profit centers share the responsibility to pursue and potentially share work, the leader of the managing business unit prepares a Memorandum of Understanding (MOU) that states the expected split of work, scope of services, and responsibility for both the pursuit and when the project is awarded. The understanding can be amended as needed should the project be modified during the pursuit. This MOU determines the allocation of costs during the pursuit and forms the basis of the 'Fee Split Agreement' once the project is awarded. The MOU is agreed to and signed by all parties before consent is given to pursue a project. This avoids misunderstandings between profit centers and allows each profit center to accumulate their own costs and recognize revenue to match those costs during the course of the job."

The second tool is a Fee Split Agreement wherein collaborating business units memorialize their understanding of the basic element of the project and the working relationship. The fee split agreement contains guidance for this collaboration:

- Labor and expenses should be absorbed by the profit center that incurs them, avoiding disagreements on who will absorb each expense, especially those expenses which are unanticipated.
- The scope should be split based on the expertise that each profit center brings to the project.

- The profit centers should plan the project as a collaborative effort with the intent that the firm will be successful and all parties share in that success.
- All terms of the agreement should match the contract terms (billing methods, rates, multipliers, reimbursable expense definitions, markups, etc.).
- Billings and payments from the client should be allocated in a fair and equitable manner throughout the project so that no profit center's cash-flow metrics are unfairly compromised.

"With our many offices, we have found that it is important to deal with these issues before the project is pursued or started. These agreements do not need to be complicated. With effective leadership, a commitment to the firm's best interests, and an up-front understanding of each party's obligation, a high-quality project with great financial success can be achieved," says Brader.

Beyond specific project performance, business units within a firm can be further measured on other personal and business unit metrics. Setting the framework to ensure a balance between autonomy and accountability is important. This would include understanding how goals can be established that are simultaneously beneficial for individuals, business units, and the firm. Understanding how incentive compensation plans reward certain performance and behaviors, and matching those expectations against the firm's culture, will help align the efforts needed to run and sustain a business. Likewise, it is important to understand that incentive plans need to be paired with leaders who are intrinsically motivated to make appropriate decisions in light of the firm with a view to success by all.

Accountability

Once strategy, goals, and tactics are defined, accountability to those goals needs to be considered. Corporate leadership should be engaged and knowledgeable about the people, projects, and practices at each of the outlying offices. Beyond this, many firms establish a set of metrics aimed at measuring how business units are performing against budgets and other expectations.

Brad Wilson, a consultant with PSMJ Resources, Inc., states, "The key to getting real benefit from opening branch offices is establishing the expectations of the office (and the people in it) right away and putting measurements in place to assure accountability without creating unproductive competition between the offices. Simplicity pays dividends here, as it does in many other business practices. We believe that a firm needs only three measurements to track the relative success of its branch offices. We use two objective measurements to remove any bias for or against the branch offices by the firms' shareholders who are likely to manage one or more of those offices and one somewhat subjective measurement. The objective measurements are: revenue factor (or net payroll multiplier) and return on overhead. The subjective evaluation is cooperation with the other branch offices."

Wilson continues, "The revenue factor (also called yield on total payroll) measures the amount of fee revenue generated for each dollar or payroll spent. It is the best measurement of productivity available to an architecture firm. It is calculated by multiplying the direct labor multiplier within a firm's achieved hourly rates and the utilization rate based on payroll dollars. For example, if a branch office produces an average multiplier of 2.8 (net revenue divided by direct salaries) and their utilization rate is 65 percent (direct salaries divided by total salaries), the revenue factor is 1.82. The gold standard for this metric is 1.98 (3.0 multiplied by .66). By looking at both the multiplier and utilization within a single measurement, a firm balances the focus between achieving high fees and staying busy. Revenue factor has a more direct correlation to profitability than any other commonly used metric in the A/E industry."

The second objective metric is return on overhead (ROO). "Return on overhead is calculated by dividing the profits contributed by a branch office by the amount of overhead expense incurred at that office. Measuring ROO insures that branch offices stay 'lean' without under-investing in growth. The profit and the office overhead are measured without allocation of any corporate overhead. Even though ROO is much more variable, the highest performing firms typically have an ROO between 15 and 20 percent. Accountants have devised many ways to allocate corporate overhead to branch offices; however, none of them are universally accepted or work well for all types of overhead expenses. This can lead to unnecessary complexity and a lack of understanding by the branch office manager, who might then argue with the methods used in order to support a better financial picture for their office. Our mantra is 'just don't do it.' The use of ROO calculated for each office will give you the information needed to evaluate the office without the frustrations of allocating corporate overhead," says Wilson.

To prevent unhealthy competition between offices, PSMJ Resources, Inc., recommends a subjective cooperation measurement where branch office managers evaluate each other on how easy it is to do business with one another within five simple categories:

- Overall cooperation
- Borrowing or lending staff
- Selling work together
- Referring work to other branch offices
- Contributions to overall corporate priorities

"Those offices that are rated highest by their peers in these five ways are doing the best job of preventing silos from developing around the branch offices," explains Wilson.

Communication

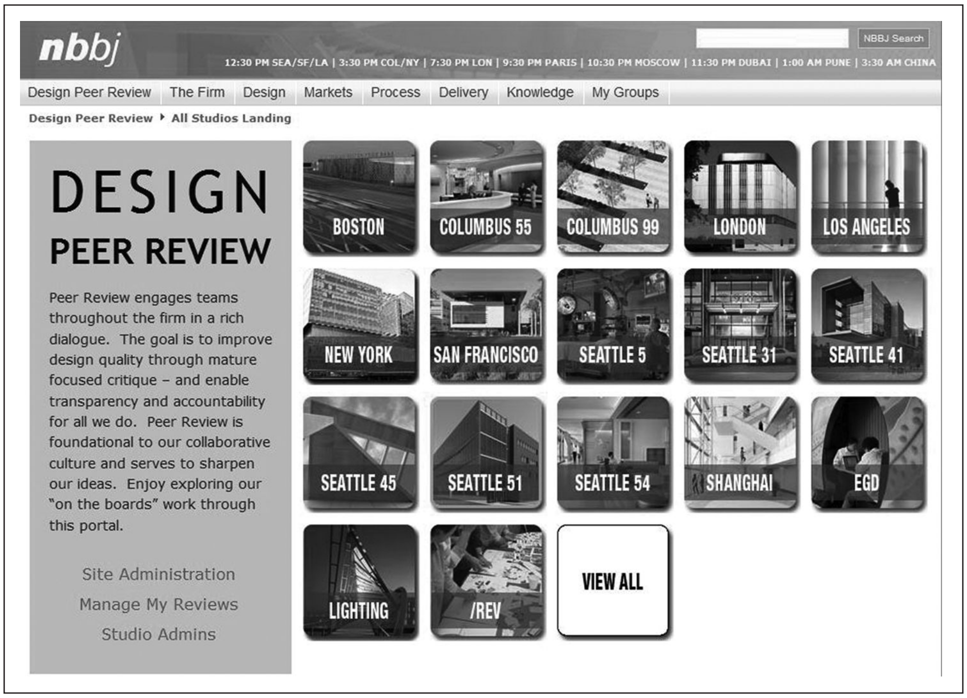
Relationships are more easily developed and sustained when they are based on mutual respect and trust. Building these qualities into the workplace is challenging in any environment, but especially so in firms with multiple offices. Therefore, when distance and time separates business leaders, it is essential to implement communication channels that build a sense of camaraderie. It is important to discuss, among other things: office-wide performance, marketing and business development collaboration, HR issues, technology advancements, training, sustainability initiatives, policies, individual accomplishments, and inspiration.

McConnell says that NBBJ strengthened its communications and decision-making processes by "allocating significant resources to bring leaders together throughout the year. We have created a multi-leader community within and among each office. Our studios, which have significant ownership and responsibility, benefit from having engaged leaders while still enjoying the freedom to be entrepreneurial. In addition, once a year we bring together 70+ designers from around the world to focus on an interdisciplinary, relevant, community-based issue. We find that gathering staff for all-day charrettes builds trust and encourages staff to follow the firm's ideals."

NBBJ also uses its intranet as a platform for inter-office discussions (Figure 5.8) where upward of 200 projects in concept phase or mid-schematic design are posted for peer review by anyone in the firm.

Many multi-office firms find technology helpful to bring staff together who are not co-located, including the use of video conferencing equipment, webinars, web-cams, instant messaging, common databases, common project sites, and virtual servers. Forming committees with representatives from each office who work on behalf of the firm on topics such as culture, BIM, standards, ideation, and sustainability is also a way to enhance a one-firm attitude.

Training programs or the provision of an intercompany blog can bring together staff who share common interests. Adopting volunteer projects with a national footprint (e.g., Red Cross, Girl Scouts, Habitat for Humanity), where offices can pool their resources for a firm-wide effort or hosting an intranet site for sharing of personal accomplishments, hobbies, or family activities all aid in building this intercompany trust. Nothing will serve a firm better than a staff that knows one another, respects one another, and is intrinsically motivated to make decisions based on the organization's goals.



NBBJ

FIGURE 5.8 **NBBJ Intranet Project Peer Review Site**

The culture created by the tone, nature, inclusiveness, and frequency of communication can be a major driver in the success or failure of managing multi-office firms.

Enhancements Through Technology

If the firm has chosen to execute a project using staff in multiple locations, technology can play a substantial role in producing projects successfully. However, it can also be quite challenging, as technology remains one of the most quickly evolving businesses but also one that can be tailored to every firm's requirements.

CIO and Vice President Stephen Held of Leo A Daly explains, "Each scenario warrants differing amounts of infrastructure based on the need being placed on the office location, such as:

- *Small office*: Local file server and network, broadband modem connections, firewall with virtual private network (VPN) tunnel capabilities
- *Small to medium office*: Local storage area network (SAN), T1 or Ethernet wide area network (WAN) connection
- *Medium to large office*: Larger local SAN; multiple T1, T3, or increased Ethernet connection; WAN accelerators

These guidelines should be modified based on the financial, user, and project tolerance experienced. For instance, a small office that is performing heavy production work may require faster connection speeds than a broadband modem can provide. It may be that a WAN accelerator will accomplish enough traffic optimization or that an investment in a T1/Ethernet needs to occur."

Held continues, "Once underway, the product of everyone's work ends up in files and software models that are often stored locally but are needed by team members in other locations. There are several ways to organize this effort:

- *Local/remote access.* Concentrate files in the location where most of the work and staff reside while allowing remote access into this location by others by leveraging remote desktop connections.
- *Split.* Structure the project work in a way that splits the effort and allows each of the locations to keep their work locally. At some point the work may need to be consolidated, but this allows the respective locations to work in an efficient environment.
- *Full collaboration.* As CAD progresses to 3D modeling and BIM coordination becomes critical, the major CAD software providers allow for a model to exist centrally, managing the changes as they occur while detecting any conflicting modification and caching files locally.

(continued)

- *Cloud*. While there are different variations, this hosted environment allows all participants to work collectively in one "virtual" space, thereby removing the need to move files. This can be hosted internally as a private cloud, outsourced, or a hybrid. This approach provides the most interactive and up-to-date versions of the model.

Other project files can be paired with a third-party solution (e.g., Newforma, ProjectWise, Bluebeam, Navisworks, Planwell, Double-take, Commvault) to produce similar results with non-model project files."

"Finally, optimizing software licensing can reduce expenses and maximize productivity and accessibility to standard programs. Network-based licensing, while often more per seat, costs less overall since it is measured by concurrent users, can be served everywhere from one location, and is often checked out for extended time away from the office. This approach allows the greatest ability to remain consistent across all office locations," explains Held.

A WORD OF CAUTION

Growing and expanding can be heady experiences. An early success can convince firm leaders that more of the same will bring endless benefits. However, growing into too many locations or too quickly is not recommended. Each new office requires time to be steeped in the cultures, values, and traditions of the original firm. It is easy to underestimate the time and dedication required to inculcate the strategies and practices for quality, decision making, professional development, client management, communications, and work sharing. A second or third office should not be contemplated until the first has matured.

Without this maturation, the new office leadership can become frustrated by the seeming micromanagement and interference of the original firm. Seen as "out of touch with the local environment," decisions intended to enhance the firm's brand or advantage the firm overall can be seen as misdirected or even self-serving. These seeds can be the impetus for disengagement, disenfranchisement, or leadership exodus.

WORKING TOWARD SUCCESS

Multi-office firms can be a challenge to lead and manage. What works for a small to medium office in a single location is generally not robust enough to handle the complexities of a multi-office firm. The inability to have spontaneous conversations, the difficulties of working on a project in more than one location, and the lack of team cohesion all contribute to this challenge. Minute issues, such as knowing whether employees work appropriate business hours, to major issues, such as overcoming an "us versus them" mentality, are challenges that nearly every firm faces during their expansion into the multi-office environment.

The savvy firm will sustain its cultural aspects that foster trust and respect, have engaged leadership, put a strategy in place, expect that all offices develop their business plans and tactics to support that strategy, seek out and hire staff who are intrinsically motivated to make decisions based on the firm's goals; hold each other accountable; communicate frequently; and use processes, standards, and technology appropriately to reinforce a productive, collaborative, and team-like experience.

BACKGROUNDER

DEVELOPING AND MANAGING A MIDSIZE MULTI-OFFICE FIRM: VIA ARCHITECTURE

Catherine Calvert, AIA, and Wolf Saar, AIA

VIA Architecture is a 40-person firm established in 1984 in Vancouver, British Columbia. Since 2001, VIA has operated a second office in Seattle, making the firm both a two-office practice and one that bridges an international border.

Catherine Calvert is Director of Community Sustainability at VIA Architecture. She provides leadership on issues of environmental sustainability and the incorporation of these principles in all project work and in the day-to-day practice of the firm. Wolf Saar is the Director of Practice for VIA Architecture. He is recognized for his leadership in the completion of a diverse portfolio of projects for private and public clients. Saar serves on the National AIA Contract Documents Committee and is past Treasurer of AIA Seattle.

ORGANIZATIONAL HISTORY

VIA Architecture's early focus was in two sectors: transit architecture, based on one partner's experience designing the SkyTrain rapid transit system, which opened for the Expo 86 World's Fair in Vancouver, British Columbia; and inner city planning and redevelopment, based on another partner's expertise. These came together as Vancouver's population and residential densities dramatically rose as a consequence of international exposure from Expo. In 1999, the firm was invited to work on the early planning of Seattle's Link Light Rail system owing to its specific expertise in transit design. In 2001, the firm formally opened a Seattle office in order to broaden its geographic base and offer services to a second market.

ORGANIZATIONAL CULTURE

VIA bases its business strategy on diversity:

- *Diversity of practice*, offering a full range of skills from urban and community planning through architectural design. This allows the firm to serve clients from the earliest stages of project evaluation through the detailed oversight of building construction.
- *Diversity of location*, with two primary markets: Vancouver's Lower Mainland and the Puget Sound region of Seattle, Washington. As markets fluctuate between architecture and planning opportunities, so do markets on either side of the border. This provides the practice some resilience to economic downturns in specific markets or areas of practice.
- *Diversity of market sectors*, which have evolved over time to include not only transit architecture and urban planning and design but also sustainable design, multifamily and mixed-use projects, hospitality work, design for seniors, and community architecture.
- *Diversity of client type* spanning the range of public, nonprofit, and private, as well as collaborations with other design professionals.

As a medium-size firm, VIA is able to be extremely nimble in its work flow from one project type to another, and attracts professionals that are skilled at wearing many hats and have expertise in multiple areas of practice. Work is shared frequently between the two offices, using the best available resources and expertise to complete project assignments. VIA's two studios are referred to internally as "one firm, two rooms" in order to reinforce the group's collective sense of identity and mission. An early decision was made to limit the future size of each studio to 30 staff members. This allows the firm to maintain a horizontal management structure, and support the development of deep and collaborative personal relationships between staff members and firm leadership. Overall firm management is provided by a six-person senior "Operations Committee" with representatives from both the Vancouver and Seattle offices. Monthly meetings address topics such as resourcing, business development, finances, and legal issues.

EXPANSION TO MULTIPLE OFFICES

Expansion to a second office was a decision made for several key reasons:

- *Capturing a new market.* As a firm with specific expertise in transit architecture, VIA was concerned that limiting its market to a single city would make the practice vulnerable to the broader political decisions made in the region around transportation projects. VIA was the Chief Architect for Vancouver's Millennium Line rapid transit line (planned, designed, and built from 1998 to 2002), developing in the process an innovative collaborative approach for project delivery. Further work of similar scale was not on the horizon in Vancouver at that time, but Seattle was in the early stages of planning its Link Light Rail system as well as a second rapid transit line, the Seattle Monorail Project. Expansion to the Seattle market appeared to be the best way to leverage VIA's knowledge in a new location.
- *Exportability of expertise.* VIA has specific expertise that has value in the broader geographic marketplace—first, transit design, which involves a depth of technical knowledge relating to corridor planning, systems integration, and functional design common to all types of transit systems. In addition to its U.S.-based work, this expertise has also led to opportunities for project work in Malaysia, Russia, China, and the Philippines. The second type of expertise evolved from Vancouver's increasing recognition as a leader in urban densification, livability, and sustainability. VIA's pioneering role in establishing Vancouver's inner city urbanism for False Creek North, Yaletown, and

(continued)

Coal Harbour, led to leadership of the planning for Southeast False Creek (awarded LEED-ND Platinum in 2009). This has positioned the firm well to market to other world cities seeking the same type of positive urban development growth models.

- *Strategic partnering.* VIA has used this strategy for over two decades, partnering specifically with large firms who bring complementary expertise in transit engineering design. VIA is able to bring value to large infrastructure projects by designing the areas of "human interface" or areas where large projects need to sensitively integrate into neighborhoods and communities. VIA initiated its work in the Seattle market on the basis of a strategic partnership with a large national engineering firm and a local architect. This teaming was essential to addressing the local context and meeting the client's specific needs. VIA acted as a strategic addition to both firms, bringing transit and specifically underground station experience to the project. This complemented both the local architect's recent experience with the client, and the engineering consortium's overall project management and coordination role. Our partnership rounded out the portfolio for all three firms and facilitated a mutual learning experience to develop a local approach to underground transit station design.
- *Local presence.* Working as a consultant from another city is an excellent way to test a new market, but to establish further credibility and deeper involvement in projects, the formation of a local office is often a necessary next step. In VIA's situation, expansion to a second office required that one of the two principals commit to relocation in order to provide the new office with the presence and authority of a senior staff member. Having a local presence is a more effective way to keep an "ear to the ground," develop relationships, and contribute directly to communities.

CHALLENGES OF MULTIPLE OFFICES

There are many considerations related to ensuring that a multiple-office firm can run smoothly as a single organization. Some of the challenges that VIA met during this expansion were:

- *Physical separation.* VIA invested in a variety of technologies to overcome the simple distance between collaborating teams. Smart Board technology, instant messaging, and videoconferencing are some of the approaches used to encourage communication between colleagues. To encourage face-to-face familiarity and reinforce relationship building, the entire staff meets at the annual picnic, which is held at a public park on the Canada–United States border.
- *Relocation vs. travel.* VIA has exchanged staff between offices to suit project needs ranging from day trips to months at a time. Each project must be considered separately, as is each staff member's personal situation and willingness to travel or relocate. Many people welcome the opportunity to immerse themselves in another culture, and it helps that both offices are in vital, interesting cities that are very different from one another.
- *Resource management.* VIA's Directors of Practice compare weekly projections about anticipated workload, managing the best fit between available skills and project needs. At times, decisions are made to prioritize in-person teams on fast-track projects in order to maximize efficiency. Matching staff resources with ongoing project needs is a continual balancing act that is made more complex by the addition of a second office.
- *Quality control.* Establishing company-wide standards for production and graphics is essential to reinforcing the firm's expectations of quality. These are developed by teams from both offices in order to create buy-in and keep staff aware of continued improvements and developments in software capability. VIA often uses staff from the other office to offer "fresh eyes" to documents and bring the broadest perspective to the documentation approach.
- *Shared production tools.* VIA is committed to the use of building information modeling, having been an early adopter of BIM software as far back as 1992. Setting up BIM models to have shared work sets can be particularly complex with remote users. VIA has explored a variety of solutions to this issue, including checking out work sets, cross-referencing linked models, and the use of remote workstations located in the other office that emulate a local user.
- *Business development.* Marketing VIA's services is carried out using a consistent approach to branding and firm identity, and the creation of the firm's portfolio featuring projects from both offices. Business development initiatives are discussed with teams from both offices on a weekly basis to provide perspective and brainstorming, including a standard Go/No Go checklist that filters potential projects by VIA's company-wide values and goals. Specific marketing efforts are tailored to suit the individual market as necessary to suit local needs and expertise.
- *Knowledge centers.* Over time, individuals in a firm develop deep knowledge bases in specialized areas of practice. It is essential that the firm actively encourages sharing of this knowledge through mentoring and collaboration within each office and across offices. In addition to a continuing education program led by individuals representing both studios, VIA holds a biweekly videoconference to share information ranging from the latest project work to the development of specific skills.

LOOKING AHEAD

As VIA continues its successful operation in the United States, it will consider how to expand further into the U.S. market, whether by establishing a third office in another state or by serving out-of-state projects from the established home base. The experience of the first expansion will serve the firm well for its continued growth.

5.10 Office Administration

Judy A. Beebe, CDFA; Diane M. Klug, CDFA;
and Gretchen L. Renz, CDFA

The goal of efficient office administration is to increase the amount of time that principals and project managers have available to devote to projects, thereby increasing firm productivity and profitability. Development of the people, procedures, places, and projects that encompass office administration improves the efficiency and quality of services of the entire firm.

ELEMENTS OF OFFICE ADMINISTRATION

Architectural office administration spans a full spectrum of practice areas. Administration has moved far beyond making sure the phones are answered and the bills get paid. As shown in Figure 5.9, design firms have to take into consideration such things as facilities management, marketing, finance, human resources, and project administration.

Support staff, whether it's an intern in a small office or an administrative assistant in any size firm, can add value by handling tasks that would otherwise have to be handled by the architect. Small firms with only front-desk support can find ways to balance the project workload to free up the architect's time for project strategy and design, and the cost benefit can easily be validated. Assume the architect spends 10 hours on administrative tasks at a billing rate of $100/hour. The same 10 hours can be reassigned to the administrative assistant at a billing rate of $50/hour. The amount of the project fee used for billable administrative tasks would be reduced by $500. This will allow more of the fee to be devoted to the project architect's time on project design and technical tasks.

With that in mind, the next section discusses the administrative roles and functions necessary for an architectural firm to thrive, as well as common administrative processes and procedures.

The return on investment of having an administrative assistant perform scheduling tasks, budget updates, invoicing, and RFI tracking at $22/hour rather than a project architect rate of $44/hour is clearly evident the first moment anyone looks at the bottom line of a project budget.

—Deborah A. Gill, CPA, CDFA, President (2012–2013), Society for Design Administration

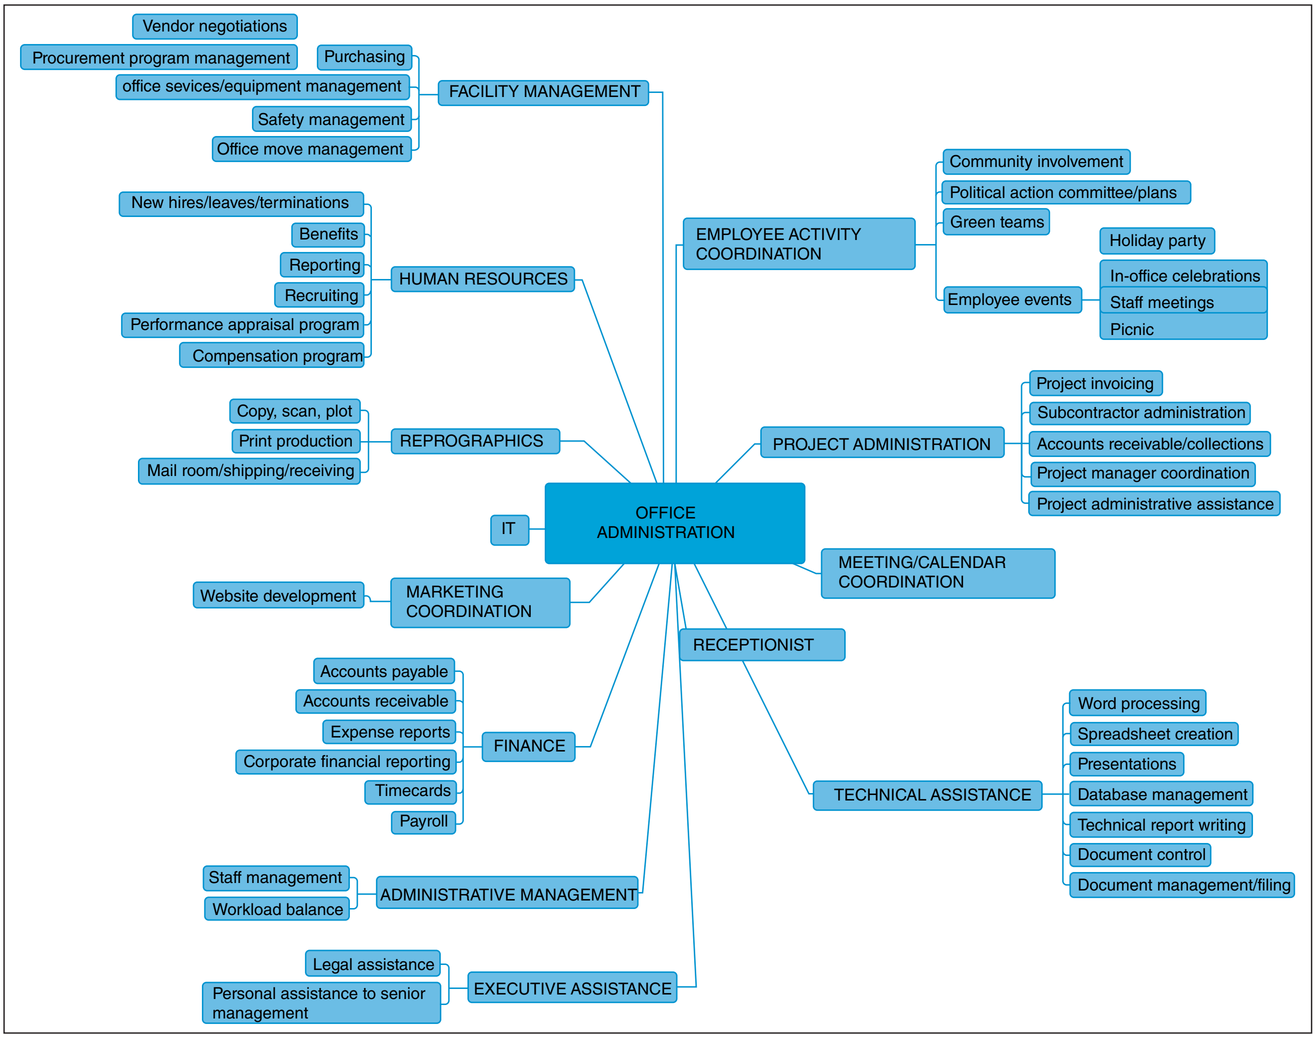
PART 2: FIRM MANAGEMENT

ADMINISTRATIVE ROLES AND FUNCTIONS

Small, midsize, and large firms need to make sure the administrative functions are executed effectively. The functions can be defined in terms of administrative roles.

- *Receptionist:* Creates a first, positive impression of the firm through interaction with clients, consultants, and vendors. Handles basic office tasks. Reports to Principal or Office Manager.
- *Administrative Assistant:* Provides specific office and project support. Reports to Principal, Project Manager, or Office Manager.
- *Marketing Coordinator/Assistant:* Prepares materials for proposals, brochures, and other public relations documents. Reports to Principal/Marketing Director or Marketing Manager.
- *Bookkeeper/Financial Assistant:* Processes accounts receivable, accounts payable, and payroll activities of the firm. Reports to Principal or Financial Manager.
- *Human Resources Assistant:* Assists with employee recruiting/hiring, benefits, and compensation. Reports to Principal or Human Resources Manager.

Judy Beebe is a certified design firm administrator with over 30 years' experience. A principal technical associate with Parsons Brinckerhoff, she works as the assistant to major project managers. Diane Klug is a principal technical associate and the lead facility/administration manager for Parsons Brinckerhoff's Central region. Gretchen Renz is the office manager for Bernardo|Wills Architects in Spokane, Washington.



Judy A. Beebe

FIGURE 5.9 Full Spectrum of Office Administration for Design Firms

- *Facility Manager:* Responsible for routine building maintenance and security, negotiating and securing vendor and service contracts, and ensuring the office common and public areas are maintained. Reports to Principal or Office Manager. In a smaller firm, an Office Manager is likely to take on this function.
- *Office Manager:* Oversees office operations and administrative functions; in smaller firms, may serve as any or all of the above positions. Reports to Principal.

Figure 5.10 outlines typical tasks for each administrative position defined above, and offers suggestions for the number and configuration of administrators needed by firm size.

As shown in Figure 5.10, small firms are likely to hire an office manager as the sole administrator—to provide administrative support to principals, who may complete many of the administrative functions themselves. As the firm grows, the office manager will oversee the administrative operations while providing support where needed.

Hiring Administrative Support

When should a firm hire administrative support? The decision will be influenced by factors such as the number of technical staff, forecasted workload balance, and the principal's need to focus on design or other billable tasks. Also consider:

- Is the technical staff's productivity continually halted to answer the phone, receive guests and deliveries, and handle routine office tasks?

Position

OFFICE MANAGER
Oversees administrative tasks and positions. Depending on firm size, may fill any of these positions at some time.

Key Tasks (including, but not limited to)

Receptionist	Administrative (or Project) Assistant	Marketing Coordinator/Assistant	Bookkeeper/Financial Assistant	Human Resources Assistant	Facility Manager
♦ Greet visitor; respond to routine telephone requests	♦ Produce correspondence, notes, specifications, spreadsheets, and reports	♦ Organize/systemize project information and images for marketing purposes	♦ Code and process staff time records	♦ Assist with development and implementation of policies relating to personnel	♦ Assist with vendor and supplier negotiations for goods and services
♦ Proofread/review documents for accuracy and format	♦ Set up and maintain project-specific filing system; archive project close-out files	♦ Participate in the development of brochure materials and presentations	♦ Track PTO, vacation, sick leave	♦ Maintain employee handbook	♦ Assist with research and purchasing of office equipment
♦ Create and send form letters and transmittals	♦ Track process for creating and obtaining executed consultant contracts	♦ Assist with research on current RFQ opportunities and leads	♦ Compute wages and submit payroll information to outside service or prepare paychecks	♦ Assist with enrollment and administration of employee benefit programs	♦ Maintain common and public areas
♦ Order supplies, maintain office equipment	♦ Monitor project time use and invoice status	♦ Maintain files of past SOQ submittals presentation materials	♦ Make payroll tax deposits and prepare quarterly reports	♦ Maintain documentation of employee countinuing education and licensing activities	♦ Coordinate work orders and maintenance requests
♦ Maintain office files	♦ Log RFIs, submittals, and construction job reports	♦ Assist with responses to Letters of Interest, RFQs, RFPs, and awards solicitations	♦ Code and input vendor invoices, issue payments once approved	♦ Assist with advertising or posting job openings, receiving and screening resumes, and arranging employment interviews	♦ Monitor recycling and other green programs
♦ Process incoming/outgoing mail and deliveries	♦ Provide a communication link between team and consultants	♦ Assist with website development and maintenance	♦ Prepare monthly invoices and project management reports	♦ Assist with compliance of federal, state, and local laws	♦ Assist with security and safety procedures; track access key and badge assignments
♦ Coordinate calendars and meeting schedules	♦ Develop QA/QC plan and procedures; monitor and track compliance	♦ Fill in AIA marketing forms	♦ Maintain accounting files	♦ Help develop performance appraisals; assist managers to schedule appraisals	♦ Assist with emergency preparedness and safety training
			♦ Credit card and checkbook reconciliation	♦ Assist with development of employment application and job descriptions	♦ Assist with coordination of office relocation and renovation projects
			♦ Prepare financial reports and records		

Firm Size

<10 Employees: One administrator (typically titled Office Manager) who serves as receptionist and administrative/project assistant, and provides support for marketing, finance, human resources, and facility operations.

11 to 30 Employees: Suggest two administrators—an office manager and receptionist/admin assistant—to provide support in all areas of office operations, including projects. As the firm grows toward the higher end of the staff range, a dedicated marketing coordinator or bookkeeper/financial assistant could be added.

31 to 80 Employees: Suggest four administrators—office manager, receptionist/admin assistant, bookkeeper/financial assistant, and marketing coordinator. As the firm grows toward the higher end of the staff range a dedicated human resources position would be beneficial.

81 to 200 Employees: Suggest six administrators—office manager, receptionist, admin/project assistants, bookkeeper/financial assistant, marketing coordinator, and human resources assistant. As the firm grows toward the higher end of the staff range additional administrators can be added to support expanded operations. A dedicated facility manager will be required for firms at the highest end of the scale.

>200 Employees: Suggest seven administrators—office manager, receptionist, admin/project assistants, bookkeeper/financial assistant, marketing coordinator, human resources assistant, and facility manager. Administrative roles may span across multiple offices; smaller branch offices may function as a small company (see <10 Employees) with support from headquarters.

Judy A. Beebe

FIGURE 5.10 Administrative Positions and Tasks

- Are the technical staff making good impressions for the firm when answering the phone and receiving guests?
- Are the documents generated by the firm lacking consistent format?
- Is the firm generating regular invoices, or do delays occur from lack of time or the burden of time and expense tracking?
- Are the marketing documents boilerplate information because there is no time to tailor the information to each request for qualifications?
- Are the principals spending more than 25 percent of their time researching and purchasing supplies/equipment, renewing business licenses and insurance, coordinating contract details, and other general office matters?
- Is the office no longer an orderly and productive environment?
- Are the firm's projects complex, with multiple agency partners, stakeholders, and subconsultants requiring coordinated support?

When hiring administrative support, it is advisable for firm leaders to look beyond immediate needs. Think about personnel skills and characteristics that will be required as the firm grows and more responsibilities, such as marketing production, benefits management, finances, and contract management, might be transferred to an administrator.

CERTIFIED DESIGN FIRM ADMINISTRATOR (CDFA)

The Certified Design Firm Administrator (CDFA) credential offered by the Society for Design Administration recognizes individuals who have demonstrated proficiency in these key areas:

Office administration: The knowledge and skills necessary to provide for efficient and productive office operations

Finance: Knowledge and skills encompassing all aspects of planning, recording, analyzing, and reporting the financial transactions of the firm

Marketing: Knowledge and skills necessary for business development, proposal generation, and contact management

Human resources: Knowledge and skills required to manage all aspects of human resources within the design firm, including economic, social, and legal considerations

Information technology: Knowledge and skills required to keep current with office technology, budget and plan for technology replacement, and maintain security of digital information

Project administration: Knowledge of all aspects of the planning, administration, and production of a project. Includes the skills administrators need to be a key part of the project management team

Eligibility is determined by a combination of design firm experience and formal education, followed by a written examination. In addition, administrators who have earned the CDFA credential are required to attend at least 18 hours of continuing education each year to maintain the credential.

Key Qualities

Previous design firm experience is an advantage when filling administrative positions. Even if the design firm experience is limited, it will provide a background into the language, process, and intensity specific to the industry. However, by no means should previous experience at a design firm be the sole factor in making a selection. Successful administrators come from varied education and experience backgrounds, but all possess several key qualities. They are organized, intellectually curious, independent, flexible, responsive, patient, trustworthy, discreet, thorough, loyal, helpful, practical, proactive, and respectful of others. These qualities, as much as the technical skills they possess, are critical for administrators to meet the demands of the practice.

Administrators must be technically proficient in software applications for communications, word processing, spreadsheet creation, presentations, and database management. Proficiency means tasks can be accomplished quickly and efficiently, in addition to being able to troubleshoot applications and share knowledge with other staff. Administrators should be quick learners, able to independently acquire skills from online tutorials, manuals, and other references. Microsoft Learning (www.microsoft.com/learning) has inexpensive, self-paced training available. Ideally, one or more administrative staff should be a certified Microsoft Office Specialist demonstrating validated proficiency using Microsoft Office applications.

Small-firm administrators in particular add value if they have an understanding of the practice areas outside of general office administration; specifically finance, human resources, marketing, and project administration. Administrators who join professional organizations and obtain industry certification demonstrate a level of expertise in those practice areas and can contribute to the firm's organizational growth and maturity through best practices of firm administration. The Society for Design Administration (SDA) offers professional credentials as a certified design firm administrator (CDFA) in those key areas. Other certifications such as the International Association of Administrative Professional's *Certified Administrative Professional* would also be appropriate.

Best Practices

Granting authority to administrators enables principals to focus their effort on securing projects and design. When the principal grants authority, administrators can then exercise independent judgment in office matters, without further input from the principal, ensuring that procedures are followed and policies are enforced. For example, the administrator could approve requests for leave of less than one day, approve expenditures or make purchases up to a set dollar amount, sign vendor agreements, and complete routine communications with clients and consultants.

As additional administrators are hired, cross-training should be considered. The tendency to allow administrators to become too specialized in their roles or too territorial of their tasks creates an information vacuum that isn't evident until the administrator takes an extended absence or leaves the firm. If that happens, staff members suddenly realize that no one knows how to process payroll, or how invoices are prepared, or where the letterhead is printed. Cross-training equips all administrators to deal with the unexpected, and allows work to be reassigned and shared during particularly busy times. Administrators can cross-train each other by working together on common tasks, trading tasks, or holding in-house training sessions.

Another method of ensuring that vital office information is available to all is to develop an electronic or hard copy desk-reference for each administrative position. As administrative roles are defined and procedures developed, administrators should document their daily routines and tasks, create shared contact lists for vendors, consultants, and clients, and detail the office standards and practices for reprographics and binding, purchasing, equipment maintenance, and other general office tasks.

Encouraging administrative staff to improve their skills through workshops, online training, and other continuing education, and providing the time and resources to do so, will directly benefit the firm. Administrators who stay up-to-date on new methods and trends in administration, on the latest software applications, and who improve their soft skills such as conflict resolution and interpersonal communication, add value to the firm's standards and practices.

PROCESSES AND PROCEDURES

Well-developed and clearly presented office standards and procedures are vital for effective office administration. Procedures increase productivity, save time and money, and reduce stress.

Best Practice Considerations

Firms develop specific practices based on their structure, values, mission, and culture. Start-up firms need to consider, and established firms need to periodically review, these organizational areas:

- First Impressions
  - Automated phone/messaging system: Will the firm hire a receptionist, have an automated system, or a combination of both? How will the phones be answered—what is the standard greeting?
  - How will guests be greeted? Will refreshments be offered to each guest? Only clients? Will guests be allowed to wander past the receptionist/lobby without escort?
- Basic Procedures
  - How will the administrator track who is in/out of the office? Will principals and technical staff be required to check in and out or otherwise be accounted for?

- Are phone messages, packages, and mail delivered throughout the office or left at a central location for pickup?
- How will office equipment (cameras, phones, measuring devices, laptops) be assigned and tracked? What is the procedure if equipment is lost, stolen, or broken? Who determines when and how to upgrade equipment?

- Document Management/Filing:
  - How will electronic and paper project files be established, organized, and stored? Will there be "official" files and "working" files?
  - How and when will electronic and paper files be purged? What documents are retained, and on what schedule?
  - How will financial, human resources, and company records be secured? Who will have access?
  - Will all filing be accomplished by administrative staff, or will technical staff/project managers be responsible for maintaining their own files?
  - Are e-mails printed and filed, or stored electronically? How are they sorted and searched?
- Mail/Shipping/Receiving:
  - Will ground and express shipping accounts be established or will a shipping service be used?
  - Will a postage meter be leased or stamps purchased?
  - Who will open the mail and how will it be routed? (Principals see all relevant mail first? Mail goes directly to addressee? How are magazines, catalogs, and product literature distributed?)
  - How is outgoing mail collected and processed, and by whom?
  - What are the criteria for overnight shipping?
- Office Supplies:
  - How will supplies be organized and stored? Are there any controls?
  - How much inventory will be maintained?
  - Who is responsible for determining when to order (e.g., person who takes the last pen lets the admin know, admin checks stock on a weekly basis, admin has standing order)?
  - What is standard desk setup? Are special orders allowed?
- Meeting/Calendar Coordination:
  - How will the master office calendar be compiled and distributed—Outlook, web-based scheduling such as Google Calendar, a manual system such as a central whiteboard or wall calendar?
  - What type of information goes on the calendar, and who sees it?
- Travel Arrangements:
  - Will travel be prepaid by firm or reimbursed?
  - May technical staff make their own arrangements, or are all arrangements made by admin staff? Is preapproval from a principal required?
  - What airfare, hotel, and rental car class is adhered to? Are there exceptions?
- Office Life/Staff Meetings, Staff Development, Staff Events:
  - Who organizes/tracks continuing education and staff development opportunities (in-house teaching, vendor lunch and learn sessions, conferences and seminars)?
  - What staff events will be held (all-staff/all-family holiday party, summer party, group outing)? Who organizes the events?
  - How often will all-staff meetings and team meetings be held? Who determines agenda and topics of discussion?
- Morale Building:
  - Will birthdays, milestones, and length of service/anniversaries be celebrated? In what way?
  - Are there bonus programs and recognition? How will these be promoted within the firm? How will the program be monitored?

Resources for developing firm practices and procedures are available from various sources, including the Internet. In particular, AIA and SDA have dedicated pages on practice management and best practices. By searching forums and related sites, principals and administrators can discover how other firms are answering these questions and tailor a procedure to fit their firm. See "For More Information" at the end of this section for additional resources.

Templates and Forms

Standardize routine tasks and frequently used forms and make them available to all staff. Procedures should be developed for:

- Proofreading and finalizing documents
- Ordering prints and copies
- Shipping and mailing
- Requesting office supplies
- Checking out vehicles and office/field equipment
- Scheduling meetings
- Reserving conference rooms
- Office safety/security (bomb threats, building evacuation)
- Assigning project numbers and project setup

Creating standard templates enables consistency in firm branding. Consider:

- Fax cover letters
- E-mail signatures
- Reimbursement requests
- Letters and memorandums
- Transmittal forms
- Fee proposals
- Reports
- Presentations
- Marketing materials

All staff should have easy access to documents and procedural manuals; store them in a directory or folder on the company intranet or server system and discuss them in new-employee orientation and staff meetings. By not having to create or search for the correct form, technical staff will spend less time and energy on routine administrative tasks.

Facilities

When the time has come to move the office, the new facility should be an attractive and well-managed place. The architect's office can be an effective, visible marketing tool, an employee morale booster, and a productivity enhancer.

In all sizes of firms, there are a number of facility areas the administrator can manage, track, and monitor to reduce the principal's time and effort spent on facility management.

Vendor Negotiations and Purchasing

Negotiate the commodities essential to the firm's daily operations. Negotiations should include services to be provided, delivery terms, automatic inventory tracking/restocking, and price. Some contracts are based on time and materials; others offer quantity discounts for frequently purchased items. Establish relationships and contracts with vendors to assure the level of service and product delivery meets the firm's needs.

Procurement of Services

Services are typically negotiated as ongoing contracts to provide inventory tracking/restocking or services on demand. Automatic inventory tracking/restocking services will visit the office at specified intervals to restock supplies and provide equipment maintenance or other services.

Other services are on demand or are maintenance agreements that provide negotiated rates for a service or repairs on equipment. This type of agreement can reduce downtime, critical for business operations when related to information technology (IT) or telecommunications. Most services are best handled through direct personal negotiation with a vendor representative.

Sample services commodities, often referred to as maintenance contracts, include:

- Janitorial
- Building maintenance
- Office supplies
- Catering services
- Coffee/water
- Reprographics (including in-house labor)
- Audiovisual
- IT (maintenance and support)
- Website development
- Off-site records/file storage
- Safety/supplies (automatic external defibrillator, first aid kit, safety training)
- Recycling services
- Telecommunications (phone system, voicemail, teleconferencing, web conferencing)
- Vehicle fleet service (leasing, maintenance, fuel cards)
- Security systems

Procurement of Products

Consider depreciation schedules when purchasing furniture, fixtures, and equipment. Consider whether products should be purchased, leased, or rented based on expected usage and financial considerations. The same products may be purchased directly from manufacturers or vendors that provide multiple-product catalog service. Many product procurements are handled online; however, in some cases, a discount may be obtained through direct personal negotiation with vendor representatives, particularly if the firm can guarantee a specific volume of purchasing.

Sample products commodities, those product purchases that should be negotiated for delivery terms and price, include:

- Office supplies
- Furniture
- Fixtures
- Reprographics equipment
- IT hardware/software
- Audiovisual equipment
- Telecommunication equipment (phone/voicemail system)
- Books/publications
- Postage/courier/express mail
- Printing (stationery, business cards, marketing materials)
- Promotional items, gifts, flowers
- Vehicles
- Signage

Building/Office Maintenance

Office space leases typically include building maintenance services. If the architect is the property owner, contracts are required for building maintenance issues.

- Maintaining Common and Public Areas. Assure employee comfort is maintained as a priority (HVAC, restroom plumbing, prompt light bulb replacements). Landscaping, elevator service, and parking lot upkeep are also important to keep up appearances.

- Work Orders and Maintenance Requests. Some building maintenance contracts include a requirement for work orders or maintenance requests to be completed online for tracking and quality assurance.
- Janitorial services for trash removal, restroom cleaning, and general office maintenance (vacuuming, dusting, window cleaning) are essential for a professional office environment.
- Greening Your Office. Sustainable operating practices should be the norm. Develop a recycling program and encourage staff participation. During purchasing, consider the use of sustainable and recycled content products such as office supplies, cleaning products, and lighting. Many firms are tracking their overall carbon footprint in the areas of office operations (utility usage, sustainable office environment, and product purchases) and practices (alternatives to employee travel utilizing technology, efficiency of fleet vehicles, automatic light sensors, HVAC timers, and rideshare/bike-to-work).

► See the backgrounder accompanying this article, A Case Study of Sustainable Business Practices, for more on operating sustainable offices.

Fleet Management

Whether the firm has one vehicle or a large fleet, management of vehicles is important. Procedures for timely handling of registration/licensing, violations, accidents, maintenance, and repairs should be in place. Establish policies for vehicle purchasing and termination, including employee purchases.

Security

Building/Office Security

Office security systems vary based on need, and office leases may include building security. Building security comes in several forms, from 24/7 on-site staffed security, to security systems/cameras, to the building's information desk that monitors visitors. There are sophisticated scanning systems, access cards/badges with photos, programmed badges, cipher/code locks, and key locks. Parking may also be restricted with these security system types.

At a minimum, firms large or small should establish procedures:

- Overnight/weekend security. Lock/unlock entry doors at specified times. Instruct employees to keep doors locked during non-business hours.
- Daytime security. Consider installation of doorbell, telephone, or intercom at locked entry doors for use when receptionist is not available or whenever considered necessary. In secured buildings, place a bell or telephone at the reception area. Assure appropriate instructional signage is in place for guests/deliveries.
- Employee security. Instruct employees to call 9-1-1 and/or provide appropriate building security contact information in the event of an emergency or any security issues. Instruct employees to verify identification before allowing office entry to non-uniformed or unsolicited service/delivery personnel.

Key and Badge Control

Office security systems can include a software program to assign a card/badge to an employee. In lieu of software programs, a simple spreadsheet will work. Whether it's a badge or key, access should be tracked and monitored to assure that badges/keys are collected and taken out of the system upon employee termination. Establish a policy for lost badges/keys.

Emergency Preparedness

First Aid Training

- The size of the office should determine whether or not automated External Defibrillator (AED) devices should be installed. Some buildings provide AEDs for tenant use; check prior to purchasing.
- AEDs should be placed in a central, accessible location. AED maintenance and annual training are required.

- Locate first aid kits in kitchen, copy room, or other common office space in marked cabinets.
- CPR and first aid training should be considered for an appropriate number of employees (typically 10 percent of total staff).
- The location of safety equipment and evacuation routes should be noted on floor plans and posted in common areas.

Safety Training

All firms should take steps to provide for the safety of their employees.

- Require all employees to participate in office evacuation drills and read/understand policies on accident/incident reporting.
- Require additional safety training for all employees who do field/site visits.
- Establish a rally point for employees to gather after office evacuations, and appoint someone to account for staff.
- Establish policies for handling and reporting specific types of incidents (workers compensation issues, vehicle accidents).
- Conduct annual office safety audits to limit employee accidents and workplace incidents. Check for potential safety hazards, including electrical (equipment, space heaters, power strips plugged into power strips), appropriate tools (hand carts, step ladders), and signage (at AED/first aid kit, exit doors, Material Safety Data Sheets).
- Establish tracking procedures to assure corrective actions from the office safety audits are handled in a timely manner. Online systems are available for recording safety incidents and accidents to allow tracking and reporting by categories.

SAFETY AUDITS

Annual office safety audits should be considered for all facilities. Categories for office safety audits include work environment, emergency precautions/first aid, fire protection, workspace ergonomics, office furniture/equipment, material/office supply handling, and electrical equipment. Develop and utilize a checklist to identify specific potential hazards, record observations, and implement corrective action steps, including person responsible and completion date, for prompt resolution.

Disaster Recovery

Establish a disaster recovery plan that outlines what should be done if the firm is unable to access its office space, and distribute it to key managers. The plan should include:

- An alternate business location, list of key clients, list of key vendors/service restoration contacts, employee contact information, and telephone tree for assigned contact
- An off-site records management/tracking program to archive/store business records and project files
- Backup IT capabilities and program documentation, including procedures for standard file naming conventions, specifics on saving electronic project-related materials and correspondence, and direction on saving copies of electronic files on the highest-level storage media
- The point person, with backup, responsible for initial contact with employees, clients, and vendors, along with media, website update, and press release assignments

▶ The Role of Architects in Disaster Response and Recovery (4.2) further discusses effectiveness in disaster response, recovery, rebuilding, and resilience to help shape truly sustainable communities.

Office Relocations/Renovations

Another key administrative function is in the area of office space. Whether moving employees and equipment internally, expanding space, downsizing, or relocating, coordination is critical. Administrators can assist with scheduling and coordination activities such as space needs assessment, site visits, layout/seating plans, mover procurement, in-house vendors (coffee, water, vending, reprographics), and coordination with and communication to staff and clients.

Real Estate Liaison

Due to the complexity and legal issues related to real estate transactions, a real estate professional and/or attorney should be involved in finalizing all real estate contract negotiations.

Move Team Coordination

All move activities need to be organized, no matter the size of the office. Establish a Move Team (with lead person) to assure successful coordination and to limit the number of staff involved in the move to decrease downtime and confusion.

Develop a Move Communications Plan and share it with staff. Include in the plan the move activity dates and schedule for milestone tasks such as construction deliverables; equipment, furniture, and printing orders; address change notifications for employees, postal service, clients, consultants, and vendors; and the Open House event.

Once the space needs are established, other items need to be addressed:

- Decide the layout for common areas and equipment placement. They may need to be located adjacent to building water/electrical or in central access areas. An architect (or outside architectural/interiors firm) may be assigned to handle this design and coordination, particularly if construction is involved.
- Establish contracts for installation of appropriate power/voice/data cabling, AV, IT, and telecom move/installation.
- Place orders for furniture modification and/or new furniture.
- Secure contractor/installation services for carpet, paint, and other finishes as required.
- Order corporate and name plate signage, as appropriate.
- Consider contracting with professional movers to assure employee safety, even for internal moves.

Technology offers opportunities to reduce overall office space needs and enable better use of collaborative spaces. Consider reducing file cabinet and storage needs by using electronic media storage or online resources. Backing up electronic data and archiving documents off-site should be considered. Consider the impact of telecommuting/remote work opportunities through virtual private network technology (cloud computing, remote access). The evolving technologies present increased opportunities to offer guest/shared spaces for improved collaboration by those not permanently located in an office.

PROJECTS

Support staff can manage the project's flow of information; maximize, streamline, and improve efficiencies; analyze, chart, summarize, and report data; and help improve the methods used to deliver projects.

Consider these project administrative tasks that can be delegated to support staff:

- Tracking subcontractors' task orders and contracts
- Creating/maintaining project implementation and management plans, and project procedures manuals associated with ISO 9000 procedures, safety, and communications
- Creating templates and the procedures for producing deliverables and work products
- Providing project scheduling and follow-up for key milestones
- Providing quality assurance review of reports/correspondence for grammar and formatting
- Creating/updating progress reports
- Taking meeting minutes
- Producing reports, spreadsheets, and presentations
- Taking photos and vehicle counts (field work)
- Creating/managing website

Best Practice Considerations

As soon as possible, put practices in place to standardize routine tasks in order to maximize project efficiencies. Experienced administrators understand the need to have protocols, processes, and tools in place to ensure the project work meets or exceeds the project schedule and client expectations. The assistant can develop control systems for monitoring and reporting deviations quickly so that corrective actions can be taken.

SERA Architects Inc. provides for dedicated administrative assistants based on the size and complexity of the project. The firm always has at least one project-oriented administrative assistant supporting multiple projects, generally covering one or more market sectors. Some of SERA's large projects have required a dedicated administrative assistant due to the number of parties involved, in which the admin is responsible for the complex meeting scheduling of multiple parties, often in multiple locations. Some of SERA's projects have required a lot of travel for meetings at the project site, and the project administrative assistant accompanied the team to provide on-site meeting support. SERA's project budgets have often supported a dedicated administrative assistant, primarily with their civic and institutional clients.

Support for Phase-Based Tasks

Administrative assistants can be brought on the project early in the process to assist with operational tasks. The project initiation phase requires a high level of effort for start-up tasks and procedures. Once established, some tasks, identified by an asterisk, will require monitoring and updating throughout the project.

- Project Initiation
  - Set up project numbers/system.
  - Coordinate Owner-Architect Agreement.
  - Establish invoicing and expense reporting procedures.
  - Establish progress reporting procedures.
  - Establish and set up project filing system,* including archiving procedures.
  - Process insurance requests and other consultant certifications.*
  - Coordinate Consultant Agreements.
  - Create the organization chart and the list of team contacts.*
- Schematic Design
  - Monitor the budget—actual and percent completes—and report concerns to Project Architect.*
  - Monitor the work products—schedule versus actual—and report concerns to Project Architect.*
  - Prepare and submit invoices.*
- Design Development
  - Create the table of contents based on the specification sections written and edited.
- Construction Documents
  - Word-process, reproduce, and assemble the specifications.
- Bidding and Negotiation
  - Publish or distribute bid advertisement.
  - Maintain Register of Bid Documents.
  - Distribute Bid Documents to bidders.
  - Coordinate and distribute Addenda.
  - Coordinate Construction Contracts.
- Construction Contract Administration
  - Coordinate and track Change Orders.
  - Track, log, and process RFIs.
  - Create and maintain the tracking log for Submittals and Shop Drawing Review.
- Project Close-out
  - Assist with preparing the Certificate of Substantial Completion.
  - Prepare and submit the Final Invoice.
  - Prepare the close-out paperwork.
  - Finalize the Agreements, including accounts payable/receivable to and from consultants.
  - Inventory and archive project files, including monitoring the destruction date of project files.

ADMINISTRATIVE SUPPORT FOR CONSTRUCTION PHASE SERVICES

Support staff can prepare Construction Phase Services forms that are not provided by the client or others:

- Proposal requests and change orders
- Daily inspection reports
- Letters of transmittal and incoming/outgoing correspondence log
- Noncompliance notice and log
- Environmental compliance assurance procedure
- Payment documentation log
- Photograph log

Contracts and Agreements

Administrative assistants can initiate and coordinate the contractual obligations of the project:

- Collect contact information from each party.
- Create draft contract for principal and/or project manager's review.
- Distribute draft contract to all parties for review.
- Incorporate all edits and comments; finalize documents.
- Distribute final document for signatures.
- Request proofs of insurance, monitor renewal dates, request updated certificates.
- Monitor and track contract changes.

Project Invoicing and Collections

Administrative assistants can track, monitor, and invoice direct expenses such as office long distance calls, cell phone usage, mileage, computer time, in-house print production, and models and renderings. Even if some of the direct expenses are not reimbursed by the client, tracking those expenses can be used over time for cost-estimating purposes for new projects.

Whether the firm uses its own invoicing format or the client specifies the format, the project assistant and its client counterpart should meet to discuss invoicing procedures (format, frequency, when payment is expected—e.g., 20 days from client receipt—and the steps to be taken if payment is not received within the agreed-upon schedule). Once the procedures are set, the project assistant should create a checklist to ensure compliance and accuracy before submitting invoices.

The same quality control practices that are in place for the architect's invoice should be in place for quality control of the subconsultant's invoice. Develop a checklist of items to review and apply it to the subconsultant's invoice before accepting the invoice for payment.

Monitor receipt and payment from the client. Within two to four days of submission, the project assistant should contact its client counterpart to confirm receipt of the invoice. If payment has not been received in a timely manner, the project assistant should check with its client counterpart whether the invoice has been processed and when payment is expected. If payment isn't received on the final payment date, the effort should be elevated to the project architect to personally contact the client to discuss the reason for delay.

While it is possible to track project resources and profitability manually using Excel spreadsheets, there comes a point where there are either too many active projects or too much information to keep manual reports up to date. Various project management software packages are available, based on the desired degree of interoperability between accounting, project management, and marketing. When selecting a software solution, consider one that will organize projects, contacts, time entries, expenses, and billing. Project management software is a significant investment in both time and money, so strategize what the software needs to accomplish and research the best fit.

▶ See Project Budgets, Work Planning, and Monitoring (10.3) and Financial Management Systems (7.3) for related information about systems to help achieve a firm's long-term financial goals.

Document Control

Organization of project documents is key throughout the project. Knowing where to find the most current version and knowing where the documents are in terms of the project's work flow is essential. Consider hard copies as well as electronic files and e-mails. Support staff can develop standards and protocols for file naming and electronic folder structure, as well as developing the framework for tracking documents. There are numerous software programs available to track documents and work flow. Various administrative forms, such as the simple yet effective RFI tracking spreadsheet shown in Figure 5.11, can be created in-house by a firm and are also available through the Society for Design Administration.

▶ Construction Phase Services (10.9) covers the architect's observation and reporting of the progress and quality of the work, and its conformance to the design intent expressed in the contract documents.

Quality Assurance/Quality Control

Firms with established quality processes and procedures that determine how its services will be provided, measured, and verified have a greater chance of project success than firms without established plans. The work breakdown structure should include a quality assurance/quality control (QA/QC) plan as a deliverable, as well as associated QA/QC tasks to implement the plan.

The administrative assistant or intern can assist with the quality control process: creating flowcharts depicting the overall process, tracking controlled documents/deliverables, and developing and administering the client feedback form. Ideally, integrated teams will work from the same QA/QC plan. For teams with multiple consultants, an alternative would be to allow the consultant the choice of following the prime consultant's quality procedures, or adhering to its own firm's procedures, with the understanding that the consultant may be audited by the prime, especially with regard to the quality assurance of its technical work products.

▶ Origins and Development of Quality Management (12.1) addresses systems that provide guidelines, support, and metrics to holistically support a firm's performance and advance the profession.

Bid Document Preparation and Control

As construction documents near completion, the administrative assistant will prepare a list of plan holders (bidding contractors, owner, regulatory agencies, and plan centers) to track the distribution of bid sets and addenda. The assistant should work closely with the architect to determine the parameters of the bid and get answers to essential questions such as:

- Who can request and receive plans (only generals, only preapproved generals, all subs, major subs, only designated plan centers)?
- How and when the bids will be opened?
- Deposit required; is it refundable?
- Date and time of any pre-bid walk through; is it mandatory?
- Plans, specs, and addenda distribution—electronic or hard copies, shipped, delivered, or pick-up required?
- What is the bid estimate range for the project?

Once the project has been advertised and bid documents are out, the assistant can field calls from interested generals, subconsultants, and suppliers. The assistant can collect and record all deposits, holding them for refund once the plans are returned.

As addenda are developed, the assistant can help organize the information, package the final addenda, and ensure it is distributed to each plan holder as required by the contract.

After bid opening, the assistant distributes bid results to interested parties, monitors the return of plans, specifications, and bid deposit refunds, and distributes plans to the successful contractor.

Some firms have left it to the project architect to be responsible for the success of their projects. But if the architect's desire is to focus on the firm's business development and the design process, the architect needs someone to focus on the administrative responsibilities. That's where support staff can add value—creating and monitoring the project controls and the procedures and systems it takes to ensure client and firm success.

► Bidding and Negotiation (10.8) provides an overview of construction procurement processes.

CONCLUSION

As the practice of architecture continues to evolve to meet the demands of our rapidly changing world, so will office administration. Administrators are taking on more responsibilities in the areas of marketing, finance, human resources, information technology, and project administration, and in many firms are playing a key role in controlling costs to enhance profitability. The return on investment is a key indicator of the value that administrators bring to the firm, the client, and the project.

Emerging trends in lean architecture and integrated project delivery require updated procedures for getting quality work done rapidly and consistently. As projects become more integrated and complex, methods for effective team collaboration and the sharing and tracking of documents must be developed, assessed, and refined. Administrators, and principals, should always be asking, "Is there a more efficient or effective way?"

A CASE STUDY OF SUSTAINABLE BUSINESS PRACTICES

Tina Keller, Assoc. AIA

For architects, designing green buildings is only one component of a truly sustainable practice. Successful firms are differentiating themselves by applying principles of sustainability to all aspects of business.

Tina Keller is Manager of Contracts and Administration for SERA Architects and is a founding member of the firm's Sustainable Action Committee. She is actively helping SERA fulfill its mission to be the most sustainable firm possible.

SERA Architects, a 114-person multidisciplinary firm based in Portland, Oregon, adopted sustainable business practices in an effort to "walk the talk" on sustainability.

DISCOVERY

SERA's path toward sustainable business practices began in 1996 when the firm hired a new design director, John Echlin, who had the vision to add sustainable design to its urban focus.

In 1999 Echlin attended a workshop on The Natural Step (TNS) presented by its founder, Karl-Henrik Robèrt—an event that is now seen as a seminal and transformative moment in Portland's evolution as a national hub for sustainability thought leadership. TNS is a not-for-profit organization founded in Sweden with the vision of creating a sustainable human society. Its stated mission is to promote understanding, competence, strategic planning, and above all, action towards sustainability. TNS provides a cohesive, scientific framework for progressive change that resonated with the leaders at SERA because of its empirical basis and applicability to all systems (both natural and man-made) at all scales (local, regional, and global).

(continued)

In 2001, all of SERA's principals underwent TNS training to become educated about sustainable business practices, and then invested in changing the firm's culture accordingly. Support from the firm's top leaders was key to undertaking a complete cultural transformation. SERA's reinvention included changing the firm's ownership structure via an Employee Stock Ownership Plan (ESOP). Being employee-owned directly reflects SERA's commitment to The Natural Step's premise that a sustainable society empowers people's capacity to meet their own needs. The ESOP empowers SERA staff in decision making, which has resulted in a greater level of engagement and entrepreneurial involvement, and has helped the firm attract multidisciplinary senior staff with professional expertise and personal passions for sustainability to accelerate the firm's transition.

A cross-section of SERA's staff completed the TNS training, and a phased approach was implemented to train all current and future staff members. The TNS training resulted in a shared firm-wide vision and goal for SERA to become a fully sustainable office.

DEVELOPMENT

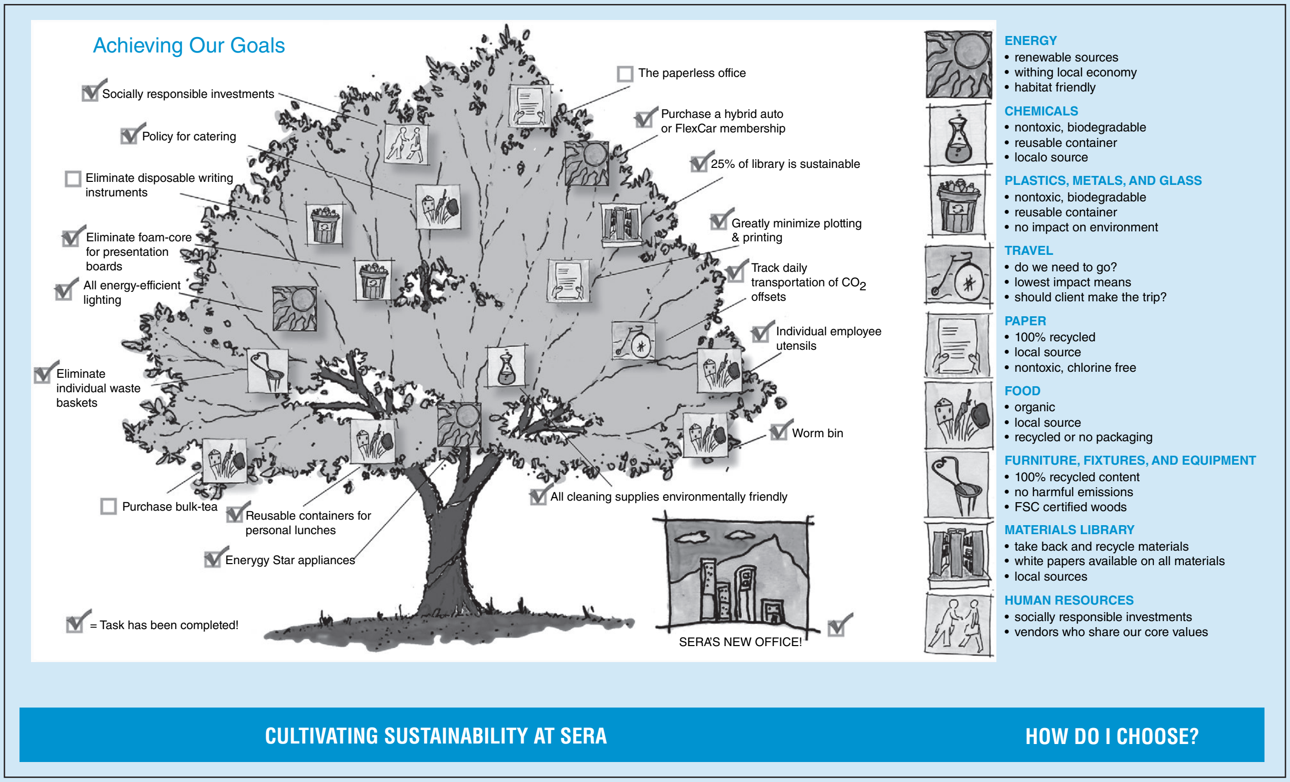
The concept of "backcasting" is central to The Natural Step's strategic approach for a sustainable society, and can be summarized as follows:

1. Imagine ideal and sustainable future conditions—begin with the end in mind.
2. Benchmark the present conditions—create an honest assessment of where you really are today.
3. Develop measurable and achievable steps from the present to the future conditions, adjusting course as needed due to growing understanding and competency, and ever-evolving present conditions.

Firm principal Clark Brockman paraphrases TNS' strategic approach this way: "Backcasting is much more effective than forecasting, which tends to have the effect of presenting a limited range of options, stifling creativity, and most important, projecting (sometimes in perpetuity) the problems of today into the future. Beginning with the end in mind is the only way to truly reimagine the future—otherwise we are simply trying to fix or repair the existing, default conditions."

Over a nine-month period from 2002 to 2003, SERA's backcasting team established a vision for a fully sustainable workplace, benchmarked the firm's existing conditions, and used TNS principles to chart a course toward a fully sustainable office. (See Figure 5.12.) The backcasting process produced some surprising results, such as the realization that SERA's largest environmental impact, by a factor of two, resulted from employees' commutes to and from work rather than more predictable (and visible) factors such as a design office's use of vast quantities of paper.

To manifest SERA's cultural transformation (and to make visible the team's nine months of work), the backcasting



SERA Architects

FIGURE 5.12 SERA's fully sustainable workplace encourages the same values from vendors and suppliers.

group came in over a weekend and initiated the following guerilla tactics:

- Removed all individual trash cans from people's desks (without removing any recycling containers)
- Established an expanded recycling center
- Provided individual utensil sets in handmade holders made from recycled fabric samples from the Interior Design library and reused utensils from Goodwill
- Provided recycled paper notebooks using recycled office paper

In 2003 and 2004, SERA implemented many "low-hanging fruit" changes to office practices guided by the backcasting process, but it was clear that SERA's leased office space of 35 years was proving to be a significant barrier to progress on the firm's path to sustainability. In 2004, SERA moved to newly remodeled office space located prominently on Portland's new downtown light-rail line. The new office piloted LEED's Commercial Interiors (CI) standard and received Gold level certification, incorporating sustainable design elements and business practices throughout the office.

In addition to using renewable and recycled materials in the office's design, SERA purchases 100 percent Clean Wind power from Portland General Electric and 100 percent carbon-offset natural gas from NW Natural Gas. Unlike a traditional tenant, SERA contracts directly for janitorial services focused on green housekeeping practices. SERA's commitment extends to owning its own high-performance mechanical units and installing electrical sub-meters to closely track actual energy usage.

The firm continued to grow, necessitating an expansion in 2006 that doubled the size of SERA's downtown office space. This project achieved LEED-CI Platinum certification, the highest level available from the U.S. Green Building Council.

RESULTS

SERA's decade-long focus on sustainable business practices accomplished a strategic cultural shift that is embedded at all levels in the firm's operations, products, services, and business planning. Reimagining the firm along sustainable principles resulted in large impacts both internally and externally:

- Firm staff and revenue growth
- Firm transition and rebranding
- Higher-profile design projects
- Dramatic shift in staff recruitment and retention
- Dramatic shift in client base to clients with shared values
- Expanded geographic reach, regionally, nationally, and internationally
- Recognized leadership in the field of sustainable design
- Participation in sustainability policy work locally, regionally, and nationally
- Influence of staff at home and in the community

SERA's architectural projects are designed to reflect best practices in sustainability. The firm's in-house Sustainability Resources Group (SuRG) offers clients integrated thinking and sophisticated early design tools. SERA's Urban Design & Planning Studio provides leadership in Civic Ecology and district-scale systems planning. The firm's employee-owners are active in shaping sustainable public policies, such as working with Oregon's political leaders to rewrite the State's Plumbing Code to allow reuse of graywater, and the State's Energy Code to include one of the country's first "Reach Codes," a set of optional standards to increase the energy efficiency of buildings above the mandatory statewide building code.

Members of the firm are routinely called on to talk to others about SERA's path toward sustainability and their evolving design practice. SERA has effectively influenced vendors, consultants, clients, and other businesses toward implementing more sustainable practices in their own workplaces, and on their projects.

From an operations perspective, SERA's attention to purchasing policies and waste reduction has impacted practices on local and national levels ranging from green reprographics to sustainable food catering services. SERA has encouraged its vendors to find new, more sustainable options for frequently used materials including job site signage and presentation boards, resulting in better solutions for the entire industry to adopt.

FUTURE

SERA's solid framework and shared mental model manifest as an ongoing commitment to become more sustainable through continuous learning and adaptation. New SERA sustainable initiatives include tracking energy use intensity at SERA's office, in SERA's projects, and at the homes of SERA's employees. The SERA Carbon-Neutral Initiative (SERACn) is modeled on existing international protocols to align with likely formats of eventual regulation, and the firm is an active participant in the AIA's 2030 Commitment. The firm holds an annual Sustainable Action Celebration attended by employees, clients, and guests to recognize SERA's progress and share successes so others can learn.

The TNS backcasting process and ongoing implementation work has created a cultural shift at SERA—and an understanding that the path to a sustainable office is just that, a path. SERA's shift toward sustainable business practices will never be declared complete; to do so would disregard the complexity of systems, practices, and interrelationships involved with a truly sustainable practice.

5.11 Knowledge Management

Doris S. Pulsifer

Knowledge Management provides architecture firms a method to foster, develop, and capitalize on its most valuable assets: creativity and invention.

INTRODUCTION

As a theory, Knowledge Management (KM) helps define a common approach for the business that is aligned with the goals and objectives of the firm. As a methodology, it provides a common set of tools that facilitates and promotes the creation, capturing, and sharing of the firm's intellectual capital. It is the convergence of economic, environmental, technology, and social drivers that support the need for a KM discipline in every architectural practice.

Globalization continues to expand economic opportunities while leveling environmental and social issues. The urgencies for a green infrastructure are a primary focus for federal and local governments. Understanding that the building sector is responsible for over 40 percent of all carbon emissions, advances in a sustainable practice are now core to the architecture industry. Although the core concepts of globalization and green technologies are not foreign to architectural practice, the rate at which these are shaping and directing the practice is.

The possibilities of technology, including the explosion of social networks and open source software/platforms, provide multiple opportunities for organizations to harvest internal and social knowledge. These opportunities can be scaled to meet the economic and strategic needs of any size organization. Technology provides great opportunities to promote and transform social networks into professional/learning environments regardless of location and time. It presents opportunities to capture and disseminate knowledge that was previously confined by space and time as well as the job-assigned responsibilities of the individual. On the other hand, the challenges of an increasingly mobile workforce and its communion with social networks require the creation of new information technology (IT) models.

ABOUT KNOWLEDGE MANAGEMENT

What Is KM? A Basic Definition

Knowledge Management is a systematic and strategic approach that promotes improvements in knowledge processes, the generation of knowledge products, and occurrence of invention. As a system, KM defines and integrates goals and practices, and provides the necessary tools to promote, capture, and disseminate the intellectual capital of an organization. As a practice, it monitors the processes through which an organization creates intellectual wealth.

To manage knowledge is to recognize and focus an organization on its mission and unique business proposition. Knowledge Management deals with the one un-substitutable asset of any company: its people. Knowledge Management is interested in all the elements that allow the individual to create value for the business.

Doris S. Pulsifer leads the Knowledge Management Department at Skidmore, Owings, and Merrill, LLP (SOM). She earned an M.S. in Architecture from the Illinois Institute of Technology, and a B.S. in Environmental Design from the University of Puerto Rico. Pulsifer holds certifications in Knowledge Management and Project Management.

KM focuses on the value and management of a firm's intellectual capital. The intellectual capital of an organization is assessed and harvested at three distinct and interrelated levels:

- *Individual*: Knowledge created and contributed by the individual is recognized and managed. Individuals will seek associations that satisfy their intellectual, professional, and social curiosities. By understanding these curiosities and supporting these associations, organizations can accomplish more, move faster, and solve problems that cannot be tackled with traditional approaches.
- *Organizational*: Organized, processed knowledge that is shared and used by the entire firm. It is the product of individual and collaborative efforts. It is used, proofed, and proven knowledge that is documented and standardized.
- *Social*: External ideas, community concerns, and regulations that inform, direct, and often elevate the knowledge of the organization and the individual. Social capital can set trends, offer challenges, and spark adaptations that trigger creativity and invention.

A KM practice must recognize, promote, balance, align, and harvest the activities at all three levels.

In Practice:
- Implement and support a community of learning that includes the sharing of design, research ideas, and brainstorming on office practices. (Individual)
- Define a set of activities that facilitates the evaluation of design and office practices to be formalized and collected as best practices. (Organizational)
- Organize the firm's knowledge. (Organizational)
- Make a social commitment part of the firm's mission: State the organization's social and civic responsibilities. (Social)
- Stay abreast of socioeconomic and political trends that impact architectural practice. (Social)

Knowledge Management as a practice has been on the rise in many industries and professional practices. At its core, KM provides tools that enhance and support all the functions of an organization. It facilitates the objectives of any team, department, organization, and industry. For any industry, the successful adoption of KM represents a leadership commitment and often a cultural change. For established firms, the adoption of KM is often slow, starting with a particular initiative or department, and then gradually spreading throughout the organization. Eventually KM becomes an integral part of the practice and operations. Newer firms can immediately capitalize on the implementation of a KM practice, as these do not need to rework established cultures and managerial practices.

Precedents: Theories That Shaped Knowledge Management

KM became a common topic by the mid-1980s. Many of the disciplines and practices that contributed to it, such as Total Quality Management, business process reengineering, organizational management, and so on, emerged in the early 1970s. Managerial and economic theories are constantly evolving to adapt and respond to a fast-changing global market, and these theories continue to shape and inform a Knowledge Management practice.

In the early 1980s, as a result of significant developments in technology, Knowledge Management was viewed by some solely as a technology effort, with ambitions that technology alone would promote and support the knowledge of an organization. Discussion and articles about knowledge workers and intellectual capital as a valued asset of an organization became more common. The connection and distinction between information and knowledge raised ideas and concepts that were augmented by the proliferation of the Internet. The realization of a global economy dominated by knowledge products now provides a new, clearer perspective on this differentiation.

In other forums, KM became and continues to be a philosophical debate about the meaning of knowledge and its intrinsic qualities. This debate is extremely relevant to understanding and properly implementing a knowledge management practice. Knowledge Management does not create knowledge; it promotes the individual thinking and creative processes, it identifies knowledge products, and shares them among the organization. KM is concerned with the message, company beliefs, practices, and rewards that gestate creative, intellectually challenging, collaborative, and productive environments.

In the United States, the architectural industry is now beginning to address the relevance and benefits of KM. The term is not commonly used, and very few architectural firms offer a position for a KM leader. The implementation of, and standardization on the use of technology and information management is not enough to define a KM practice. Although information management is a key component of KM, the practice and reach of KM is far more encompassing. Understanding knowledge at the enterprise level requires awareness and balance between:

- *Day-to-day tasks*: office operations, invoicing, payroll, etc.
- *Improvements to knowledge products*: presentation techniques, BIM standards, contract management, etc.
- *Fostering an environment for creativity*: design reviews of internal and external work, technology forums, material research, and so forth

KM seeks to promote, monitor, and balance all these activities to further the goals of the organization. All these components interact within the context of economic, social, and technology trends.

For architecture firms, the challenge of successfully adopting KM is to expand its definition and implementation beyond the project and the project team; to understand the interdependencies and need for integration among the various groups or departments of the business; and to not reduce KM to the use of technology and implementation of CAD/BIM standards.

All industries face challenges through the implementation of a KM practice. By understanding how other industries overcome these challenges and studying their successes, the architecture community can learn methods and proven strategies for the implementation of KM in its practice. For example, well-established architectural organizations may face resistance to changes on collaboration or documentation practices from its teams, due to their familiarity with older processes. A similar challenge has been faced by some companies in the airline industry, where the large size of the airline and longevity in the business makes for a slow KM adoption. Newer airlines tend to have faster successes because they are able to define and build a culture of knowledge from the ground-up. Specifically, they accomplish this by implementing technology platforms, business processes, and incentives that will guarantee the identification, collection, and sharing of corporate knowledge.

Multinational organizations can teach valuable lessons to geographically dispersed architecture practices and those seeking to extend its practice abroad. Civic agencies such as the United Nations exploit KM by adhering to its technology applications and idea-sharing principles. By providing incentive programs for groups to share successes and best practices, and implementing web-based portals and social networking tools, certain sectors of the UN are able to help governments in smaller countries solve a variety of socioeconomic challenges. Employing KM, the UN is able to provide advice and connect various segments of the population and even different governments so they can share their experiences and successes. In so doing, these countries are able to foster a culture of knowledge among their government groups and private institutions.

Organizations whose business nature is founded on the collection and sharing of knowledge can also teach the architecture industry lessons in adaptability and the need for constant reevaluation of business processes. Consulting firms have based their practice on KM principles. However, in today's global economy, the commercial aspects and competitive environment in which consulting firms operate makes it difficult to reconcile and benefit from the idea of knowledge as a common, shared resource. With the proliferation of information mechanisms, consulting firms are challenged to reevaluate their approach to knowledge management and sharing, to find ways in which their KM practice helps differentiate their practice and becomes an integral part of their value proposition.

The elements of KM already exist in most, if not all, established architecture firms. Most architecture firms invest in programs and/or technologies that support some or all of the elements of KM. Many architecture firms have an enterprise intranet (formal, and most common to older, larger organizations), wiki (informal and accessible to younger, smaller firms), or formal documentation. Its purpose is to promote standards and preferred practices proven by the group, tested and refined throughout its many projects, or under exploration and development. Most architecture firms have CAD libraries and drafting standards, and directory structure, with more or less information on who's who and how to contact an employee. All of these tools represent business and technology components that help define the framework of KM.

WHY KNOWLEDGE MANAGEMENT?

The Knowledge Economy

Most businesses compete based on knowledge. The rate and value of innovations continues to rise, and as a result, a Knowledge Management strategy is critical.

The concept of a knowledge economy summarizes the relevance of KM to architectural practice. In the knowledge economy the currency is knowledge. The processes and rules that governed an industrial economy are revisited as knowledge becomes an economic resource and knowledge products, expertise, and inventions surpasses the economic value of agricultural and manufacturing products. In the twenty-first century, the most valuable products are knowledge products.

Organizations are required to redefine their operational and strategic models in order to transcend and compete across local and international markets, economic backdrops, and community/government regulations. KM brings an organizational awareness that is relevant and applicable to all departments, disciplines, groups, and teams in an architecture firm. KM is not the focus of an organization's strategy and success. Rather, KM is an enabler, an augmenter that supports the unique values and assets of the organization. KM focuses on supporting the intellectual capital of the organization.

A knowledge economy requires business to diversify their financial strategy and constantly evaluate the effectiveness of its management strategies. An architecture firm seeking to open an office in a new location or to expand and develop new areas of expertise must seek fast, efficient methods to disseminate new knowledge across the organization and seek faster profits due to knowledge gains. This need for diversification and strategy management must also be applied internally, to core processes, by developing methods of collaboration between disciplines at early phases of the project and integrating support roles or groups such as marketing, IT, and accounting to the project throughout the entire project life cycle. Once again, by disseminating knowledge faster and managing knowledge profits effectively, architectural organizations improve the quality of service and eliminate redundancies in the design, management, and promotional processes.

Change in the Work Environment

Emerging platforms such as cloud computing, social network tools, open source, and collaborative environment provide diverse options to share and capitalize on knowledge. These platforms and trends have changed the focus of technology and the expectations of what technology should do for an organization.

In addition, the expanded markets have created an increasingly mobile workforce that challenges traditional business models and communication approaches. As the numbers of mobile users increase, so do the demands on and expectations for the mobility of the business. Web-based and mobile applications shift business protocols and technology focus. This introduces the need to differentiate the processes, accessibility, and tools that support generation (input) activities from those used for delivery or output.

Environments like FTPs, extranets, and VPNs are now subsets of a much larger and complex technology that changes the current setting in which the architectural, engineering and construction industries collaborate. The demand is for light web-apps and fast handheld access to business processes and data. CAD and BIM files do not easily satisfy this demand. High-performance processes such as renderings, energy analysis, and animations require high-end equipment for generation. However, to satisfy a fast-paced, mobile business, the product of these memory-intense processes must be light, portable, and comprehensive. KM practitioners need to evaluate the business processes to provide the right tool for the right task. The established IT models based on standardization of equipment and applications, and a three-year maturing cycle for technology, may no longer be valid.

Younger workers entering the architectural workplace expect all of these collaborative and high-performance technologies to be available within the business environment. They do not understand the unique and often limited definitions of collaboration within the architecture industry and may not be constrained by traditional business rules. Collaboration tasks have different needs and meanings depending on whether these are governed by intrinsic or explicit knowledge activities. Understanding these needs helps identify the correct technology to properly support the task. Interested groups and allies (social knowledge) champion some of these emerging platforms, which, although well developed, do pose challenges in a business environment. It is important to understand the expectations of a younger workforce because these will shape the technology environment in a firm, will drive IT budgets, and will impact standard business processes.

Technological Integration

The longevity and stability of construction and building methods led to the definition and implementation of drafting and construction standards. These standards have facilitated the creation of software applications to support the processes. The industry standards and various technology systems, although extremely important to regulate the practice, do not define a culture of knowledge.

In order to benefit from the identification, collection, and sharing of ideas and best practices, the basic infrastructure of any software system must facilitate the exchange of data and provide easy access to information and knowledge. The basic architecture of the multiple systems commercially available and in predominant use by the architecture and construction industry today tackle the various phases and tasks of the design/build process as isolated events and in a proprietary manner. Ultimately, the information and knowledge of the organization must be seamlessly collected from different systems, at different phases, and must remain available to the organization beyond the completion of any and all projects. Higher function knowledge (organizational knowledge) that derives from the integration and awareness of needs and contributions among the participating parties is often obstructed by the technology platforms in which these tools are built.

The Building Information Model (BIM) exacerbates the technology needs. With BIM, we see the need for reconciliation and integration of practices and standards among the architecture, engineering, and construction (AEC) industry. This reconciliation transcends the organization of the BIM model and the level of detail/nomenclature of the BIM components; it impacts the economic models that have been in place within the design/build umbrella for more than half a century.

Differing audiences do require different solutions.

DEFINING KNOWLEDGE

Intrinsic and Explicit Knowledge

Knowledge management is concerned with understanding the activities of the individuals that create and hold knowledge; about identifying, tracking, and monitoring the events and business activities where knowledge is shared or consumed; and about providing the necessary framework to facilitate the flow of knowledge—capturing and measuring it to support and inform the business strategies. Yet to manage these processes and activities, we must understand knowledge within the context of the organization.

Michael Polanyi, a Hungarian physical chemist, categorized knowledge as intrinsic (tacit) and explicit. Intrinsic knowledge is the result of someone's "thinking": a personal act that is influenced by education, cultural backgrounds, and previous personal experience. Intrinsic knowledge has much to do with intelligence, yet it is more than that.

Explicit knowledge is data connected, information analyzed, it is knowledge verbalized. Explicit knowledge is a byproduct of our intrinsic knowledge but does not encompass all of an individual's knowledge. Explicit knowledge is written, spoken, observed, and formalized for others to consume.

- *Intrinsic*: the act of realization (creation)
- *Explicit*: the act of (verbalizing) unveiling

Many other concepts can be attached to these types of knowledge. In architecture, the act of design can be equated to an intrinsic act, purely intrinsic knowledge. Then, to a certain extent, the act of generating the schematics and construction documents can be understood as explicit knowledge.

Intrinsic knowledge is personal, private. Explicit knowledge is collective, public. The ways in which expression of intrinsic to explicit knowledge is captured or facilitated is by itself a central, pivotal concept of knowledge management. To identify and provide the correct environment, tools, and forums for intrinsic knowledge to be formalized and shared across the enterprise is to capitalize on a firm's most precious assets: creativity and invention.

Knowledge in the Architectural Processes

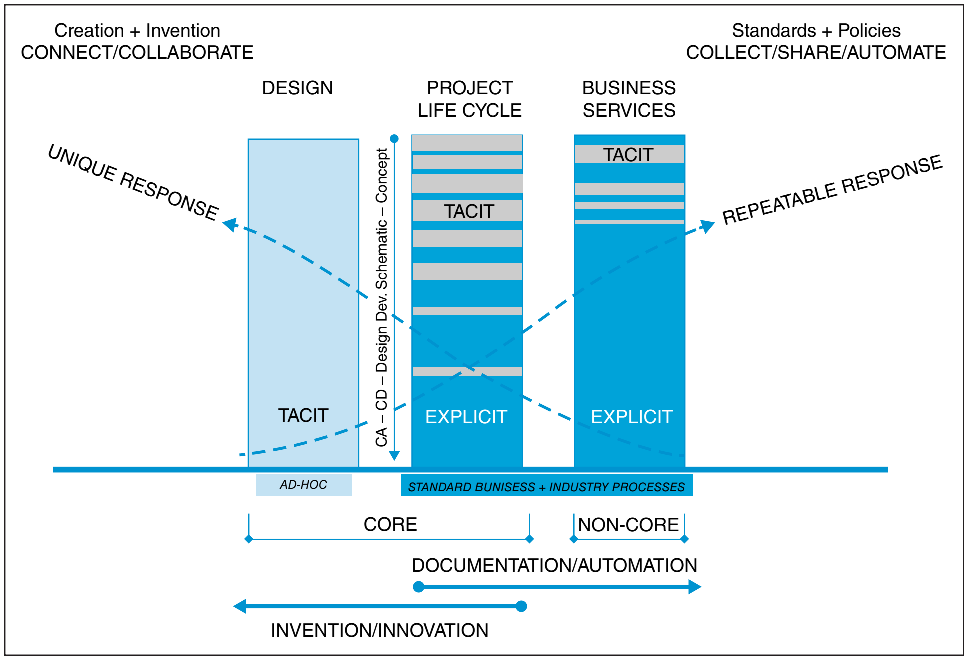
How to Analyze Business Processes to Properly Implement KM

When establishing a KM practice it is important to understand the interdependencies among disciplines (architecture, engineering, interiors, construction, etc.) and the various support arenas (HR, Marketing, Legal, Finance, IT, etc.) that are critical to operating an architecture firm. By understanding the needs, tasks, and goals of each discipline, KM prioritizes initiatives and identifies opportunities for collaboration so that the organization can benefit from these synergies. KM must also be constantly aligned with the business goals, which guide the strategies that then generate its core activity: the projects.

Because intrinsic knowledge is often viewed as the engine behind creativity and invention—activities recognized to be critical in the design industry—it is important to understand where each type of knowledge prevails and the importance of facilitating both in architectural practice.

At its most basic level, intrinsic knowledge can be paired with core functions (design, project life cycle) and explicit knowledge to non-core functions of an architecture firm (HR, Marketing, IT, Legal, Finance). (See Figure 5.13.) Where explicit knowledge accounts for over 80 percent of the business activities and supports a firm's comparative advantage, intrinsic-based activities represent the firm's competitive advantage and unique value proposition.

The business cannot survive on one set of these activities alone, since the mechanisms that promote, facilitate, and support each (intrinsic and explicit) are very different



Doris S. Pulsifer

FIGURE 5.13 Knowledge Management and Design Business Practices

in nature. For example, an online wizard that guides the creation of a new project number upon request is highly appropriate to support and expedite a financial process (an explicit knowledge–based activity); the creation of a project database where a designer can search through the firm's portfolio for project references based on ad hoc criteria is more adequate to support a design process (an intrinsic knowledge–based activity).

In general, process automations, online documentation, and standards tend to be more appropriate mechanisms to support explicit-based activities; while social networks, nonlinear relationship systems, and collaborative environments tend to facilitate intrinsic-based activities. The tools and identifiers to capture and facilitate the conversion of solutions created through intrinsic-based activities into explicit processes are much more difficult to tackle and cannot be relinquished to technology alone; the success for this transition relies on a "culture of knowledge." A culture of knowledge is an elusive term, a dynamic state that measures how well the organization supports the KM message, how the incentives and recognitions that encourage the individual to share its knowledge are defined, and how well the organization benefits from these efforts.

A first step in implementing KM is to understand all of the organization's business processes. Organizations must be aware of the objectives and work flows of all groups or departments, not just the design processes. A work flow allows KM practitioners to identify tasks dominated by intrinsic or explicit knowledge activities. Then processes can be tailored and tools selected that better support the knowledge type. Importantly, work flows allow for the identification of common or similar tasks and problems among groups or departments. Once the common tasks or issues are identified, efficiencies can be obtained by defining and implementing best practices across departments (organizational knowledge).

In large firms, a third step is to identify interdependencies among departments to streamline interdepartmental process. This is also applicable to smaller firms where the focus must be on identifying interdependencies with consultants and vendors to streamline external processes. It eliminates redundancies, duplicate efforts, and promotes organizational empathy. When individuals and groups understand the processes and needs of others, the tendencies and opportunities for collaboration flourish, and the organization as a whole benefits.

In Practice:

- Document work flows: Understand, at a high level what each group does.
- Find common tasks and hurdles among teams; standardize on best practices.
- Identify dependencies between teams; eliminate redundant tasks and streamline processes.
- Implement the best tools and methods to maximize the particular knowledge product—support the predominant knowledge type.
- Publish the work flows of all groups/teams—help create organizational empathy.
- Implement design reviews and encourage office-wide participation.
- Enforce postmortems at the end of a project, and after each project phase completion.
- Make the document and publishing of lessons learned required in your practice; consider the use of wikis to document lessons learned.

Elements of KM

How to Identify, Communicate, and Support the Core Elements of a KM Practice

The key elements of knowledge management are to

- Identify
- Connect
- Share
- Promote
- Capture
- Standardize
- Measure

These elements of KM should be present on all service and operational aspects of an architectural practice. Note that the key elements of KM are expressed as verbs. KM is an active, dynamic practice. It requires the participation of the entire organization, and constant actions that remind firm members of its goals and benefits. Knowledge is not static, and neither are the parameters of practice. Businesses are living organisms within complex, changing environments. To properly apply the elements of KM, the members of the organization must engage in dialogue, collaboration, and analysis.

Knowledge management shares and benefits from many other practices' basic concepts. KM methodology shares principles with other disciplines that are already operative in any design organization. A successful knowledge management practice requires a strong project, risk, and change management foundation. It is important to understand these theories to strengthen the understanding of KM.

In Practice:

- *Identify* important processes in the firm, and whether these are governed by intrinsic or explicit knowledge.
- *Connect* expert matters and business process regardless of role or assignments. Do not be limited to a group or previously defined job responsibilities (role) when composing a team or defining a business process.
- *Share* the knowledge generated through business key activities by creating and promoting events, processes, and systems that facilitate the dissemination of information.
- *Promote* creativity and ingenuity by publicly recognizing the efforts of the team or individuals in accomplishing KM goals; reinforce the practice of successful processes and invest in innovative strategies; engage on community programs (social knowledge).
- *Capture* business processes, design strategies, and project and office management techniques that reflect ingenuity and successful practices.

- *Standardize* best practices at all levels of the organization, from design to operational processes, by documenting, teaching, and making these part of the firm's guidelines. Make the documentation of best practices a mandate for every group and at every level.
- *Measure* success by assessing the accomplishments of your initiatives and projects based on defined firm-wide metrics; evaluate these metrics on an annual or semiannual basis to guarantee the alignment of your KM practice to the firm's business goals and mission.

Framework

A Solid Foundation

Most architecture firms, large and small, lack a framework that will allow them to capitalize on their knowledge assets and products. A framework is a combination of goals, roles, procedures, and technologies; it defines KM in the organization.

A KM framework is a tool used by all within the firm. It provides every group the understanding, purpose, and mechanisms to foster, capture, and disseminate their knowledge and accomplishments among their group as well as throughout the entire organization. Each group or discipline should operate on this framework to support its own tasks and needs.

The defined and documented framework guarantees that new hires will quickly learn and begin applying their firm's best practices, enabling them to focus much sooner on contributing their unique ideas and talents to the business. It also guarantees that the knowledge of the most senior, experienced architects and designers, the HR manager, or CAD gurus remains available to the organization even when that specific employee is busy on pressing, urgent tasks; traveling or in a different time zone; or leaves the firm. The framework facilitates the flow of information and knowledge among departments, groups, or teams; helps to eliminate duplicate efforts; and reduces errors. It also allows the business to centrally gather, measure, and analyze the success of their efforts. With this information, the leadership of an organization can shape and support its business strategy.

This framework constitutes an agreement upon which individuals and groups can create intellectual wealth for the organization.

In Practice:
- Define the KM framework, document it, and communicate it.
- Young and small firms can define KM as a virtual group—that is, promoting collaboration on knowledge initiatives through wikis, online meetings, and chat groups. A virtual group provides small firms the opportunity to expand their reach by including collaborators (external consultants) that might not be part of the firm.
- Rotate tasks and responsibilities for the implementation of KM among the members of the firm to benefit from new perspectives and to keep all members engaged.

IMPLEMENTING KNOWLEDGE MANAGEMENT

Defining the Framework

Apply a pliable approach to guide the implementation of a KM practice by breaking it into essential, manageable parts. A KM framework consists of a KM purpose; KM components; a technology platform; a budget; a measurement and analysis practice; and a re-contextualization policy.

A Purpose

Define the Objectives, Communicate the Message, and State a Commitment

Clearly define and communicate the meaning and goals of knowledge management within the organization. A clear definition of KM establishes a starting, gathering point for the organization. KM is not a solo effort; for it to be successful it must be understood, disseminated, fostered, implemented, expected and compensated, measured, aligned with business objectives, and constantly renewed.

The organization must have a shared definition of KM. This will provide the starting point for the necessary dialogue and collaboration. Through this dialogue, departments, groups, and teams can begin to identify shared needs and goals, and to define strategies that will benefit the organization as a whole.

A clearly communicated definition of knowledge management creates the necessary awareness and sense of urgency among the different disciplines, groups, and teams. This promotes participation and collaboration. It also emphasizes the role and value of each individual in contributing to the success of the firm (individual knowledge).

Architecture is an old profession. It tends to move very slowly in some areas despite its most marvelous, progressive creations and accomplishments. It is human nature to resist change. Almost every individual, group, discipline, and organization will resist change. Resistance to change is rooted in familiarity. This does not mean that change initiatives are wrong, but it does require understanding and attention to overcome. Any KM initiative must state its benefits to the individual, the department/discipline, and also to the organization. KM must identify and manage the obstacles for progress, and focus on the organization's goals.

Knowledge management must have the support of the leaders of the organization. A unified message from the leadership groups stating the imperative of KM is required, like a background song that must be played and replayed throughout the organization.

KM should not be approached as a fad or a one-time effort. The most critical, relevant action of the organization is the successful completion of its projects. KM must not stand in the way of this task but should support, enhance, expedite, and facilitate it. When defining KM in an architecture organization, the goals of the practice must be supported and the benefits of KM understood and communicated by its leaders.

In Practice:

- Make the firm's KM goals and objectives part of the company policies and guidelines handbook.
- Explain KM goals to every new hire, regardless of role.
- Make the participation and support of KM practices a key competency for evaluation during the annual employee appraisal process.
- Invest time and money in KM initiatives.
- Define a certain amount of learning hours per year for every employee.

The Components

Discrete, Prevailing Opportunities Throughout Your Organization

The components of KM are discrete points of opportunity throughout the organization. These components must be identified, understood, and monitored to define and prioritize the initiatives and projects that contribute to the creation of intellectual wealth within the organization. As stated before, a deep understanding of the architectural practice is required to identify these components. Below are some common KM components in an architectural practice:

- Key activities or tasks within the project life cycle that represent knowledge creation or knowledge collection points
- Repeatable business processes and activities that require and benefit from knowledge consumption
- Existing or potential groups that assess, validate, and promote best practices and standards within the organization
- Existing or potential information systems and technologies that promote the capturing, categorization, translation, and dissemination of knowledge

Technology Platform

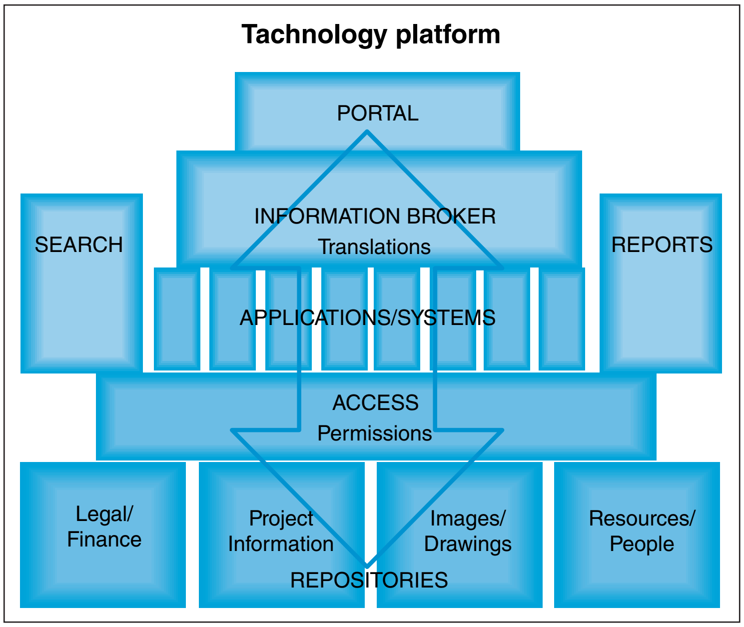
Guarantee Efficiencies and Continuity

There are multitudes of software applications for the AE market. An architecture firm can control and dictate the use and type of technologies only to a certain extent. Architecture is a collaborative practice by nature. It is common to host different and various processes, technologies, and electronic formats. Since the technology continues to evolve, it is also a common challenge to manage legacy data and incompatible, outdated formats.

A technology framework must articulate a sustainable strategy to capture, collect, translate, disseminate, and maintain the flow of knowledge through the organization. This framework must include and understand the applications and software tools used by the organization; the necessary access layers, including security constraints; the engines that will translate, locate, repurpose, and measure information; and the various repositories where information is collected. (See Figure 5.14.)

The strategy must focus on the mechanism, conventions, structures, and security that will allow the "right" information generated by the "right" group, process, or task to be accessed, repurposed, and made available for consumption by other groups in a nonproprietary mode, organized in a significant manner and at the "right" time. Thus, in addition to collection and repurposing strategies, it is also important to define the nomenclature or taxonomy of the business, a common data model, and security and confidentiality levels; and to understand how these parameters may change through the life of a project. It is equally important to identify the events and timelines required for the revision and/or decommission of information. This platform must be presented as guidelines and best practices to allow for the adoption and evolution of multiple and new technologies.

KM brings IT's focus back into the business. KM acts as a magnifying glass on the business's needs and how IT can best position itself to fulfill those needs. It switches the technology functions from back-end maintenance/support activities to front-end/business-critical activities. KM facilitates the reevaluation of IT efficiencies because it pairs and aligns the business needs with technology options, and it does this at the enterprise level. IT efficiencies can be formulated in terms of cost savings, productivity gains, and business intelligence. When IT switches from business continuity to business



Doris S. Pulsifer

FIGURE 5.14 Technology Platform

improvements, it becomes an enabler of creativity and invention and a key contributor to the organization.

In Practice:

- Apply the seven elements of KM to any IT initiative to incorporate technology into the organization strategic dialogue and planning.
- Define a security model to protect client confidentiality and intellectual property.
- Consider open-source technologies—these offer great opportunities to capture and disseminate knowledge within the firm at no cost; a wiki is a good tool to promote and facilitate collaboration on a variety of ideas among the firm.
- Evaluate cloud-based storage for project archive and retrieval.
- Evaluate cloud computing resources for application development and tool evaluation/experimentation.
- Evaluate scalable computing resources for computation intensive renderings and modeling tasks.

A Budget

A Scalable Commitment That Foresees and Informs on Business Needs

KM does not have to be a costly proposition. The cost of capturing and disseminating knowledge has diminished considerably in the past decades. KM is meant to be a multipronged, underground, and supporting platform; therefore it can be built gradually. It can tackle initiatives sequentially—first those with no cost, then progressively building the technology infrastructure to further elevate and promote knowledge management. However, whether an organization chooses a gradual approach or a more immediate implementation of KM practice, there is a cost associated with KM. The cost can be minimal, but it nevertheless represents the commitment of the organization's leadership to knowledge management. The definition of a KM budget must be addressed and must figure among all of the other organization expenses.

In practice, a KM budget may include the following:

- Work hours for KM leaders' time: full-time positions or hours allocated per month
- Learning hours: labor cost of the time allocated to each employee to attend continuing education sessions, whether these are offered by the firm or by an external organization outside the office
- Work hours for staff delivered training: time allocated to the preparation and delivery of in-house training
- Cost of lunches or beverages provided during internal seminars and presentations
- Cost of online webinars, courses, and virtual conferences
- Cost of printing learning material and documentation
- Cost of registration for external workshops or conferences
- Cost of consultants for the development or implementation of technologies and business processes

Measurements and Analysis

Monitoring Your KM Practice to Support Business Intelligence

The ability to capture, report on, cross-reference, and analyze success factors through all departments and groups at an enterprise level is extremely valuable, yet often untapped. Metrics and analysis are about understanding and documenting an organization's history and learning from it.

A measurement and analysis practice allows the business to stay lean and efficient in its knowledge management practice, to improve the effectiveness of its systems and procedures, and to define and identify business assets and opportunities for growth and profit. At a more granular level, measurement practices inform management groups how and where to focus their efforts to provide the most positive and immediate benefits to their staff, help support their departmental goals, and contribute to the mission of the firm. KM initiatives and practices require frequent measurement.

Measurement efforts are usually applied at the end of an initiative, a postmortem approach. However, the key performing factors (KPF) for measurement must be defined and communicated at the beginning of any initiative or project. In the same manner that an organization sets goals for a project and measures success against these, the organization must set measurement criteria that are applicable to all business endeavors. These organizational parameters not only benchmark successful implementations but also act as alerts to correct efforts in a timely manner and to capture the statistics and facts that will then be analyzed and constitute business intelligence.

In Practice:

- Define measures for success at every level of the organization.
- Teams, groups, and departments must evaluate, measure, and report against their performance once a year.
- Stay agile. Define initiatives with a long-term view. Implement them in sequential, short duration phases. Measure after each phase and correct long-term plans as needed.
- Projects must evaluate, measure, and report against the project goals at end of each phase.
- Individuals must evaluate and measure their performance against KM goals as part of their annual or semiannual appraisal process.
- Since KM is a firm-wide commitment, the firm must evaluate, measure, and report against the firm's mission and objectives to the entire organization at least once a year.

Re-Contextualization

Keeping KM Current

Knowledge management acts within a business to guarantee continuing profits due to knowledge gains; to constantly identify and exploit knowledge opportunities; and to actively define an environment conducive to creation and invention. To effectively accomplish this goal, KM practices must be evaluated and restated annually and as part of the business strategy.

In practice, conduct and publish an annual review of the KM framework:

- Review its parts to assess whether
  - The KM purpose is in alignment with the organization's mission statement and immediate goals.
  - New KM components have been identified, established components are properly supported, and completed/harvested opportunities have been documented and closed.
- Introduce new technologies in context with the business focus, abandon redundant systems, and tackle the impact of legacy systems and data before the technologies expire.
- Group KM budget items in three groups to validate re-contextualization: support for current, revenue-generating projects and initiatives (continuing profits); funding for new and potential initiatives (new knowledge products); and time and resources for research and development (creation and invention).
- Update the organization's taxonomy to keep analysis and reports current and attuned with the business language, its focus, concerns, and areas of growth.

CONCLUSION

Knowledge is an expression of the shared responsibilities for the collective well-being of humanity and the planet as a whole.

—Jeremy Rifkin

Economic conditions, environmental needs, technology, and social contexts drive the need for a highly specialized architecture practice. The more specialized the skills of the individual, the higher their value within the organization. At the same time, highly specialized individuals are more interdependent on others to accomplish the tasks of the group and the organization. Communication, collaboration, and knowledge sharing are the pillars of a highly specialized team. The complexity of the tasks and business environment provide the organization with unique, critical opportunities for sustainable growth and advancement. The intellectual gains of individuals and the knowledge products of the group will always seek excellence, promote collaboration, and propel the organization to gain intellectual advantage.

By implementing a knowledge management practice, architectural organizations can adapt more quickly, perform more efficiently and profitably, and contribute to a force that can positively alter the models of our businesses and of our industry.

5.12 Information Management and Services

Bradley C. Horst, AIA, NCARB

Once considered simply the cost of doing business, today robust information management practices and technology-based services stand at the strategic intersection for how we create, capture, and share design ideas throughout the architectural enterprise.

INFORMATION MANAGEMENT

Introduction

Information management: "The science that deals with definitions, uses, value and distribution of information that is processed by an organization, whether or not it is handled by a computer" (*McGraw-Hill Dictionary of Scientific & Technical Terms*, 6th edition, McGraw-Hill, 2003)—is changing dramatically within architectural practices. What was once considered simply the cost or by-product of doing business is increasingly seen as a strategic opportunity for firms to differentiate their efforts in a competitive marketplace. Information management is now at the forefront for how architects think about design solutions in new and more comprehensive ways, during early design and throughout the full life cycle of the project.

With more than 20 years of experience in the AEC industry, Brad Horst is an integral part of EYP Inc.'s management team. He is responsible for driving the technical and strategic vision of the firm's IT organization, and works closely with project teams and clients to drive innovative project outcomes.

Good information management helps architects to do the following:

- Learn from previous projects.
- Automate core business processes, thereby allowing firms to spend more time on higher-value tasks.
- Facilitate the ability to introduce new value and more meaningful insight into design thinking.
- Collaborate and share with internal and external partners in a more seamless and productive way.
- Remain fully engaged with building owners, consultants, and key project stakeholders throughout the duration of the building project life cycle.
- Mitigate risk and drive greater rewards for project stakeholders.

Arguably, information is one of the most valuable commodities in the business world today. But it's not just about information in its generic form as much as it is about how to create, capture, and share the appropriate information with the right people at the right time. Therein lie the challenge and the opportunity with information management: to identify where information management intersects and supports information services (or an information system) and business strategy. With this in mind, it is increasingly clear that architects need new, more predictable ways of working with the information needed to effectively manage business processes today.

For the purposes of this discussion, information management and information services are fundamentally envisioned as a digital process. What once filled cabinets and flat files full of paper can now fit on a USB stick or "thumb" drive. As compared to paper-based information, digital information is easily, quickly, and inexpensively transferred, and enables usage by others.

Of course, the desired benefits of digital information management come at a cost: the cost of providing a well-organized and well-executed strategy information management strategy within a firm. Computers are good at amplifying one's efforts, both good and bad. Therefore, it's very important to have an information management strategy that supports the firm's goals. What follows is a high level look at the role of digital information management for architects, and how a carefully tuned information management and information services approach can support the evolution of professional services over time.

Content Structures

► See Construction Drawings (10.6) for more on CAD and BIM guidelines.

The good news is that architects don't need to begin from scratch when thinking about an appropriate information management strategy. In fact, central to an information management strategy that promotes robust sharing is a strategy built on well-documented industry standards and best practices.

For example, following the introduction of sophisticated Computer-Aided Design (CAD) applications, the National Institute of Building Sciences (NIBS) buildingSMART alliance offered the United States National CAD Standard, NCS Version 5. NCS offers well-thought-out guidance and recommendations on CAD-related topics such as drawing file naming conventions, CAD Layer Guidelines, the Uniform Drawing System, and a host of other key information management topics that are important to a successful CAD implementation.

With the introduction of Building Information Modeling (BIM) software applications, NIBS buildingSMART alliance offered information management recommendations for three-dimensional digital representations of the physical and functional characteristics of a building. "NBIM-US V2 covers the full life cycle of buildings—from planning, design and construction to operations and sustainment." Among other topics, NBIMS-US offers clear "Content Level" guidelines for determining the appropriate amount of building modeling necessary to support the particular design service being offered.

Finally, in 2012 the NIBS buildingSMART alliance released their Construction Operations Building information exchange (COBie) standard for industry review. A document that will ultimately be included in the National BIM Standard-United States (NBIM-US) document, "COBie identifies the minimum requirements for what digital data should be collected during design and construction so that the information is available later to manage assets throughout the life of the building." The COBie standard will become increasingly more important to facility owners and designers as we continue to look for greater building efficiencies beyond the initial building design and construction effort.

The standards and best practices like those offered by the NIBS buildingSMART alliance documents mentioned above should provide most firms with a great foundation for their CAD- and BIM-related standardization efforts. While some firms will use these standards as a starting point for what ultimately evolves into their own custom design and delivery standards, other firms might find that the standards offered provide what they need with little to no modification.

Careful consideration should be given to the amount of time and energy given to any standardization effort. The desired customization should help drive significant market differentiation and/or superior project results for the firm. Also, consider that often the more custom the solution, the less compatible your standard may be within the broader collaborative marketplace.

A firm's success in implementing building-specific standards is often directly impacted by the leadership team's ability and willingness to fully support such an effort. Regardless of firm size or technology support structure, IT leaders (whomever they may be) ultimately need to partner closely with the firm's practice-based Subject Matter Experts (SMEs) in order achieve optimal IT integration results. SMEs may be the very same people who will ultimately be responsible for applying the newly established standards within their own projects; therefore, their involvement from the beginning helps to drive a sense of collective ownership and accountability from day one. Depending on the size and organizational model of the firm, SME leadership candidates could include the firm's chief operations officer, director of architecture, director of engineering, director of project delivery, or director of technical services. In other cases, technology leadership may include external parties, or the technology leader and SME may be the same individual.

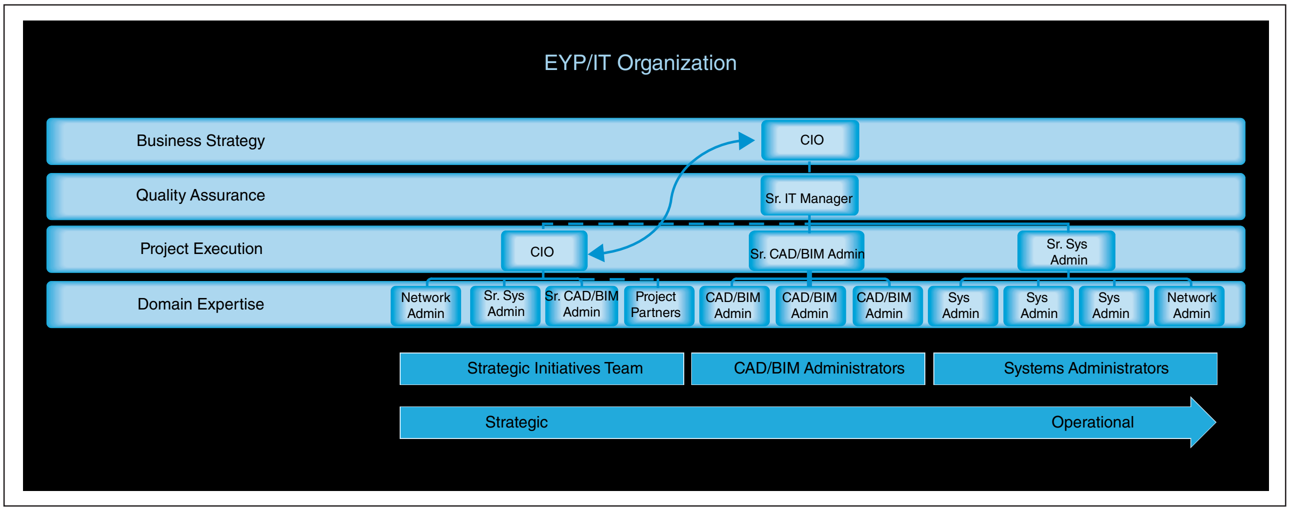
There are many other practice-centric systems, procedures, and tasks that also require careful information design consideration beyond the context of CAD and BIM. In the midsize to larger firms, these efforts are often led by the firm's chief information officer, chief technology officer, or director of information technology. In smaller firms, these efforts might be driven by one of the firm's internal leaders, who in turn may seek additional assistance and expertise from external IT consultants. In other cases, some firms may have someone internal that spends half of their time on IT, and the other half on project work. Regardless of the structure of the available resource pool, there is increasingly a focus on the underlying information strategy and supporting information fabric that helps to make CAD, BIM, Project Information Management (PIM), Digital Asset Management (DAM), Enterprise Resource Planning (ERP), communications, and knowledge management systems all work together in a more cohesive and understandable fashion. Collectively, these systems can combine to create and support a digital fabric that supports a firm's ability to design and deliver projects effectively, and to share and collaborate in more meaningful ways.

What does an IT team look like within a smaller organization? If the firm is reasonably dependent on digital design and production, the firm could have a full time IT manager or director of IT, and a CAD/BIM manager. In some cases the CAD/BIM manager or IT manager might also serve as the network administrator. In other cases, the firm might have one or two internal practitioners manage a combination of external consultants to perform day-to-day IT tasks, thus allowing the practitioners to spend the majority of their time on billable project work. The specific configuration of IT

IT ORGANIZATIONAL CASE STUDY: LARGE FIRM

Figure 5.15 shows the IT organizational structure in use at EYP Inc., a 300-person firm with six offices. Key features of this organizational approach included the following:

- The CIO not only leads the overall IT strategic effortt but is also directly involved in incubating key project initiatives that directly support the corporate strategy.
- The senior IT manager is assigned the tasks ofoverall quality assurance as a way to ensure purchasing and configuration consistency across office locations.
- Two clearly defined positions make up the bulk of the IT organization: the system administrator and the CAD/BIM administrator. The primary benefit of clearly defining these roles is to facilitate the users' ability to direct their IT support needs with greater efficiency.



Brad Horst, EYP Inc.

FIGURE 5.15 Sample IT Organization for a Large Firm

skills and required work effort varies from firm to firm and is dictated by the firm's size, configuration, and expectations around information management and services.

What does an IT team look like for a medium or large firm? Depending on the size, geographic distribution, and the structure of the firm's professional services model, IT might consist of a wider array and combination of positions, including chief information officer, chief technology officer, director of IT, CAD manager, BIM manager, virtual design and construction administrator, system administrator, network administrator, IT manager, database designer, software developer, knowledge manager, web designer, and/or digital project administrator, just to name a few. In some cases, what was once considered a CAD/BIM manager's role on a project team is becoming more of a digital project administration role, as the need to better manage ever more digital information at the project level expands.

Content Systems

Key components of an information management environment include a sophisticated array of environmentally controlled IT rooms, racks of network storage arrays, application servers, web servers, switches, routers, and monitoring and management devices, as well as Internet connections, remote access gateways, Wireless Access Points (WAPS), and security equipment. While larger offices may require any combination of, or even all of, these systems to maintain an appropriate multi-office IT fabric, small or midsize firms may only need one or two well-positioned centralized servers connected via a lighter footprint of networked devices. In the case of the individual practitioner, a stand-alone laptop or desktop system along with a residential-grade Internet connection may be all that's needed to support the practice.

Backup, disaster recovery, and business continuity plans also play an important role in this equation. In the same fashion that network infrastructure is needed to drive the delivery of a rich assortment of informational needs, so is the need to protect these efforts with the appropriate backup and recovery infrastructure and procedures. As the saying goes, "time is money," and architects are all paid for the value of their ideas and expertise, much of which is represented in the form of digital information. Therefore, it makes sense to take intentional steps to preserve the very assets you have paid yourself or your staff to create. Similarly, given that informational assets hold the potential to grow and evolve over time, much as a financial investment compounds with interest over time, then again it would make sense to preserve these valuable digital corporate assets so that future value can be accessed when necessary.

The following considerations may inform the need to save and protect corporate information, as well as provide insight into what, how, and how long it should be saved.

- State record retention requirements
- Internal knowledge management considerations
- Iterative design and analysis
- Management and mitigation of risk
- Financial performance reporting
- Protection of labor efforts
- Automation of business processes and procedures
- Document control and change management
- Downstream design, build, operate, manage, and analyze opportunities

The need to proactively manage backup and recovery should resonate with most firms regardless of size or configuration. That said, the scale of the effort will vary by location, as will the choice of media and means necessary to fully protect specific asset types.

Backup and recovery systems come in variety of shapes and sizes—everything from nightly tape backups, to CDs and DVDs, to automated disk array snapshots, to off-site paper and digital media storage facilities. The form of information to be protected can vary greatly as well. Firms working with very large files may have electronic drawing files, virtual building models, and large graphic images. Information may come in the form of paper ranging in size from the smallest napkin sketches to full size foam-core presentation boards, to large sets of 36″ × 48″ printed drawings. Some firms are increasingly using database-driven applications that offer sophisticated data aggregation routines and downstream analytics that can deliver performance results to mobile devices and custom websites, for example. The range of available record-keeping and preservation techniques and the options for backup and recovery are vast. By bringing together IT expertise and practice expertise, the right solution can be designed and implemented so that information efforts are preserved for when and where they are needed.

Extending the discussion beyond centralized systems and backup and recovery infrastructure, the IT fabric connects well beyond the server room via a complex assemblage of cabling infrastructure. It connects each user's desk and common office work areas into a unified network. End-user devices like workstations, laptops, mobile devices, projectors, digital cameras, plotters, scanners, printers, large screen TVs, videoconferencing equipment, telephones, smartphones, and other collaboration equipment are all designed to leverage the available resources on a network. Collectively, all of these components make up the foundational fabric upon which information management is built and information services are delivered—a fabric that is typically designed, executed, and managed by a firm's internal IT leaders and/or external IT consultants. Consistent with the philosophy of using industry standards for structuring drawing and virtual model information, so too is the case for managing a highly integrated IT infrastructure. Consistent standards, procedures, and best practices are the very devices and mechanisms that will help to deliver a well-thought-out and stable IT infrastructure that in turn will support the firm's strategic and information management needs.

The need for consistent standards and best practices and procedures extends into the structure of project numbering systems, folder structures, and document control systems as well. A well-thought-out system will not only offer quick and accurate discovery of information throughout a network but can also lay the groundwork for further downstream integration across various enterprise content management systems. With the right planning, it is possible to set up information management structures that allow for ready access to an array of project information such as drawings, models, images, financial information, and document controls from anywhere in the organization in an aggregated form, with the simple click of a button. In this case, preplanning is everything.

For example, when considering the status of any project effort, information from multiple content management systems should be leveraged to create a more complete view of the project's actual status. The financial system (or Enterprise Resource Planning system—ERP) can be used to report on a project's financial position, while the firm's Project Information Management (PIM) system is more apt to report on the status of outstanding RFPs and submittals for the same project. Both forms of information are necessary for creating an accurate view of the project's actual status. If there is no longer any budget remaining on the project, and yet the project has an unusual number of outstanding RFIs and submittals, then perhaps there is a problem with this project that is in or even beyond the project team's control. This is but one example of how information aggregation becomes more important as the need for the delivery of the firm's information becomes more immediate, more strategic, and more available to an increasingly broader audience.

One approach to managing consistency across project records is to use the same organizational structure across all systems regardless of paper or digital format. For example, when creating a project network folder structure, consider using the same project folder organizational structure used for the paper-based folders. As another example, the project numbering system that is used in the accounting system might also be used to identify the very same project on the file server. Furthermore, the same project numbering system could also potentially be used to structure your Digital Asset Management (DAM) image library or for your project document control system. These are just a few best practice ideas and techniques that can help to make your network environment more manageable, more nimble, and better able to accommodate the firm's information management needs over time.

Careful selection of applications can also lead to better integration, collaboration, and adoption over both the short and long term. It's important to identify applications that are designed to seamlessly share content with other related applications. With regard to file-based applications like CAD and BIM, common exchange file formats to consider include .DXF, .DWG, .RVT, .DGN, .IFC, .PLN, .VWX, and .SKP, among others. When considering database-driven applications, Structured Query Language (SQL) is a common format that allows database-driven applications to exchange and share information, often in real time. For image files, common file formats might include .TIF, .JPG, .GIF, .PNG, .EPS, or Portable Document Format (PDF). The pipeline that describes how information can be shared across the multitude of applications required of a design organization can be very complex. While the listing above illustrates common formats for CAD, BIM, databases, and image files, this is a small sample of the possible file formats that a firm might be asked to use in order to facilitate highly collaborative project work efforts.

Finally, applications that support network username and password integration, or single-sign-on methods, are often desirable. The fewer the network passwords that users need to manage, the faster the ability to gain access to the information when it is needed. Ultimately, the primary objective for using any application or integration-based standard exchange format is to minimize barriers to adoption, maximize knowledge transfer, determine new and fresh business and design insights, and/or minimize rework and loss of content as information is shared and passed from one party to the next.

Authors and Consumers

While this discussion has so far focused on information management from the standpoint of those who primarily create information (the authors), those who need to find and view information (the consumers) are equally important. It's important to recognize that all applications cannot be all things to all people. Off-the-shelf applications are often designed with particular types of user communities, or particular "personas," in mind. This helps software developers focus their development and marketing efforts in the appropriate manner. Consequently, as software applications become more specific to the industry they serve, one might also anticipate a more selective approach to which user community they wish to directly serve.

For example, an enterprise resource planning system may likely be designed primarily for those in the finance department—those who would use the system as a part of their normal daily routine. But financial information has a broad consuming audience that extends well beyond the finance department; therefore, it is important to also consider how the more casual users would go about finding the information necessary to support their business efforts. A firm's comptroller might require granular project information describing when, where, and for how long a particular project team member has spent time on a project in order to support an external financial audit effort. By contrast, a project manager might only need a higher-level view that provides financial performance insight into only the projects that they are responsible for managing. Similarly, the firm's senior leaders might only wish to see overall firm-wide analytics that offer revenue projection information from a firm-wide point of view.

In the case of a small firm, this may be a trivial matter, as the same person or persons might hold both the author and consumer role. In larger, more distributed organizations, the information management environment may need to incorporate web-based dashboard systems and/or automatically deliver custom reports to compensate for off-the-shelf software. Mobile devices (consumer devices) are increasingly becoming practical candidates for delivering corporate information in a private and highly efficient manner as well. The point is, part of the consideration for designing and implementing an information management strategy is to ensure that IT applications and services are capable of delivering the information you need. Given the broad range of types of users throughout our organizations, it would be most unusual to find a single off-the-shelf application that would adequately provide for each user's specific informational consumption needs. However, by carefully selecting and combining specific applications, protocols, and information services that are designed to work together, the combination of desktop applications and database-driven services can provide the right level of information to the right user at the right place at the right time.

INFORMATION SERVICES

New Opportunities

Traditionally, architects have been viewed almost exclusively as the designers of our built environment. Looking forward, that perception will change as the industry acknowledges that the initial building design is simply step one of a much more comprehensive effort to drive value, efficiency, and return on investment from deep within the "design, build, operate, manage, analyze" life cycle inherent in every project. We see examples where once only design services were being offered, but that now design/build services or even design/build/operate/manage services become practical considerations for the very same architects and designers. This trend is reinforced by the fact that leading AEC software solution providers are beginning to position their products around a more complete building life cycle strategy as they continue to respond to industry demands.

The new digital world, combined with the building life cycle dynamic, is helping fuel new opportunities to extend the range of professional services offerings for those with an entrepreneurial spirit. One of the key value propositions for both Building Information Modeling (BIM) and Integrated Project Delivery (IPD) is the opportunity for cross-functional teams to work more closely throughout the project life cycle in the hope that better design solutions and greater efficiencies can be realized. A dynamic such as this is catalyzed by the free exchange of rich digital information and by BIM's ability to collect, structure, and share increasingly greater levels of project information throughout all phases of a project.

The need to drive more value using digital means requires an evolution in how we work and collaborate with project team members both inside and outside of our respective organizations. In the case of BIM, project participants contribute their content to a single building model or series of connected "federated" models such that all participants can benefit from the work efforts of the entire project team. Rich information about a building is encapsulated in a virtual model and can be digitally shared virtually in real time with all project stakeholders. While the barriers of collaboration have been effectively removed, the need for new techniques for sharing and discussion is very real. In response, information is being shared more readily using large TV displays within ad hoc teaming rooms, and virtual collaboration spaces are being constructed on the fly using web-based desktop sharing services. The old paradigm of physically working next to one's team members is quickly being replaced by real-time virtual teaming that can happen with ease across studios, buildings, states, and even countries and time zones.

The idea of project partnering takes on a whole new meaning as firms realize that they can, technically speaking, work on any project anywhere in the world, and can partner with anyone, anywhere, in the very same digitally seamless fashion. Project teams can be designed with a more specific mix of expertise in mind, and they can scale up or down on an as-needed basis given the newfound opportunities available through virtual project partnering. Where once physical boundaries defined the logical perimeter of your organization, now digital informational boundaries can extend and contract on demand. We live in a global marketplace with a global economy, and with a global workforce competing for the same global resources. Projects that once seemed beyond one's reach perhaps now offer new commission opportunities.

Cloud, Mobile, Social

Information management and information services are redefining the boundaries and capabilities of our organizations and informing how we will practice architecture going forward. To further leverage these capabilities, architects must use information in increasingly more value-added ways.

It was once considered a differentiator when only the largest firms could afford the most sophisticated tools and technologies to drive their practices. This is no longer the case given the introduction of cloud, mobile, and social technologies. Cloud computing leverages the significant resources of large distributed data centers to deliver information services in smaller robust increments and for less cost, all the while preserving the ability to scale those services as business demands dictate. With cloud-hosted solutions, new servers and services can be activated and made available in a fraction of the time of a comparable on-premise server solution.

With this new capability, it's perfectly reasonable to think that by using a cloud-hosted approach, a single practitioner could have as robust an information management infrastructure as the largest organization. Further, the cloud-based infrastructure would be well positioned to scale from one or several users to hundreds or thousands of users, with little effort required of the paying customer. That said, in spite of the various cloud-based configuration scenarios like public cloud, private cloud, and even hybrid cloud, there may still be cases where it makes more sense to host certain servers within the walls of your own organization. For example, certain restrictive project types insist that digital information never leave the firm's private network except through a means specifically identified by the owner.

Cloud computing potentially offers new opportunities to provide a vast array of informational services for external clients. For example, facilities management tasks, space planning services, energy management and monitoring, digital asset management, performative analysis, or even project portal collaboration sites become possible cloud-based options and hold the potential for new services opportunities. With the introduction of nimble, scalable cloud-based information services and solutions, the barriers to adoption of new hosted information technology solutions are potentially reduced. Still, the typical concerns are always there. Where is the information? What is the information? How does one access the information? How can the information be aggregated from multiple sources to create new insights into project work both for internal and external benefit? All are important questions to ask when thinking about cloud, mobile, and social solutions.

► Emerging Technology in Practice (11.6) discusses key drivers for technology development and adoption and describes several emerging technologies and their value to firms and projects.

With regard to mobile computing specifically, few can argue the significant benefit and convenience of PDAs, smartphones, and tablet devices. They provide quick and efficient access to information when and where it is needed. They are portable and well connected. And yet, what makes mobile computing so desirable is the rich information that they provide access to at a moment's notice. Strict information management and standardized practices help to make this happen in a seamless fashion.

While in 2012 many practitioners used nonproprietary information on their mobile devices, the need to have access to confidential corporate information on these devices will continue to grow. Certain AEC software vendors are ahead of the curve with regard to delivering corporate content to mobile devices, with most others in hot pursuit. By introducing mobile devices into the workforce, the perimeter of the organization is extended well beyond the physical walls. This enables the workforce to operate in a disparate fashion from virtually any location: the client's office, the job site, from home during a snow day, and so forth.

Social networking is about being a part of the community, a part of the conversation, from anywhere, at any time. The beauty of social networking is that, again, the barriers to adoption are minimal. With relative ease, architects and others can freely share thoughts with a global community, for virtually no cost. The key question is, what do you want to share or what should you share? Depending on whether the social site is for personal use or for business use, the answers might be totally different…or are they?

One can imagine how, over time, activities on social networking sites may begin to formulate a sort of virtual persona that informs how others view someone's online activities; a representation that is persistent and available to anyone, anywhere. With that in mind, for organizations it's important to once again have a good information management handle on what should be shared, how staff should talk about project work, and who within the organization is telling the story on the firm's behalf. Good information management practices will help provide ready access to the appropriate content that can then be leveraged in an online social networking context. Always keep in mind that once the message is out on the Internet, it can be very difficult to retract.

Invest and Divest

Given every organization's limited supply of time and resources, it is always good practice to make every attempt to focus efforts in areas that will deliver the greatest results and to champion initiatives that can ultimately become a normal part of how to deliver services. In addition to identifying the right initiatives in which to invest, care should be given to identifying proportionate areas where you should divest on a regular basis. For example, if a firm is in the process of moving to a new page publishing application and off of a legacy page publishing application, then the faster the transition the better. Managing two or more information management systems that perform essentially the same task will consume significant resources directly or indirectly as team members struggle with application version control, document version control, duplication of information, translations from one system to the other, and learning curve issues related to the differing applications. Standardizing on a single platform helps to build information and workforce consistency and also promotes better work-sharing and clarity throughout the organization.

Driving Enterprise Adoption

Understanding the adoption cycles for how new standards, procedures, and technologies are introduced into the workplace can be extremely important when delivering a successful information management infrastructure environment. Acknowledging that different people change, adjust, and adopt in different ways, for different reasons, and at a different pace helps one to plan an appropriate strategy for driving adoption for any initiative.

With almost any new initiative, a tried and tested approach to driving adoption throughout an organization is to first identify a small group of champions that will have a vested interest in the success of the initiative. With regard to information- or technology-based initiatives, often this group is very facile in adopting new tools and techniques. Bring your champions onboard early and give them a visible stake in the project's success. Then, help them build out their project teams for making the initiative a reality. When possible, structure the champions' and their support teams' effort around a particular architectural project or series of projects to give it relevance. Monitor their success on a regular basis, and ensure that the resources are available to deliver their success at all costs. The goal is to have these initial champions and their team members move on to new projects, with each forming even more teams that will soon be capable and ready to implement the new initiative within their own project work. As this type of practice is replicated over time and new teams are created from previous team members, the knowledge transfer will continue to expand and soon the entire organization will be well equipped to fully adopt the new initiative for every new project going forward.

In Geoffrey Moore's book *Crossing the Chasm: Marketing and Selling Disruptive Products to Mainstream Customers*, Moore talks in great detail about the different types of technology adopter segments and discusses approaches that one might take when driving adoption into that particular user segment. While Moore's book is often seen as a conceptual roadmap for software organizations introducing new technology products into the mass marketplace, much of what is discussed in *Crossing the Chasm* also resonates for architectural firms, given the challenges that practitioners face when introducing new ways of working, new technologies, and new information strategies.

CONCLUSION

Many firms have a specific vision for design and a particular approach for how they choose to deliver professional design services. They wish to be viewed by customers and the marketplace in a very particular way. Each professional services practice requires an information management strategy that supports and amplifies the differentiating aspects of the organization. As such, it is important that those who lead key aspects of information management and information services design have direct and regular access to the topmost levels of the organization such that they can contribute and provide the appropriate information management response as the firm evolves.

Some might view the design and execution of an information management environment as closely resembling the approach that an architect would take when resolving architectural problems. An information management exercise might begin by first capturing a clear understanding of the various end user and program requirements. Once these requirements are well understood, one can begin to design the system or series of systems that address these requirements, while taking into account optimal forms of efficiency, aesthetics, durability, costs, and usability. As the design intent becomes clear, begin molding the implementation and execution strategy, taking care to include how to market these systems to your internal user base.

Ultimately, as information systems are increasingly central to how practices are run, the information system design will have a direct impact on the success or failure in the firm's ability to design and deliver superior project results. What is needed to collaborate effectively? What is the most desirable way to work? Will these systems amplify staff efforts in a positive way? Does the investment directly support the firm's mission? Is the investment appropriate given the anticipated return on investment?

This article thus concludes with some of the same questions that introduced the topic. As the industry continues to change, so will the questions that must be asked, and the conclusions that will be drawn. Each firm will likely have a different approach to running a practice, and as such, each firm will require a tailored response to what is necessary to drive their digital information management and information services needs.

Crossing the Chasm: Marketing and Selling Disruptive Products to Mainstream Customers (HarperCollins, 2002) by Geoffrey A. Moore.

CHAPTER 6

Marketing and Business Development

6.1 Marketing Architectural Services

David Koren, Assoc. AIA, FSMPS, CPSM

To build a successful architecture practice, pay close attention to everything the firm does to attract new business and retain existing clients. A strategic approach to marketing enables a firm to allocate resources to support activities that serve the growth of the practice. This article provides an overview of how architecture firms secure work.

INTRODUCTION

Marketing is the process of bringing new business to a firm in order to sustain and grow the practice. Marketing is much more than proposals and presentations; it involves everything that helps to spread the word about a firm, communicate with prospective and existing clients, and get the work in the door—including correspondence, the firm's website, the quality of the firm's design work, the firm's reputation, even the way the receptionist answers the phone. No matter what role an individual plays in a firm, and no matter how large or small a firm is, every employee has an

David Koren is associate principal and director of marketing for Perkins Eastman, where he is responsible for developing marketing strategy, leading business development efforts, and supervising the firm's marketing staff. He is a past president of the NYC Chapter of the Society for Marketing Professional Services, and author of *Architect's Essentials of Marketing* (Wiley, 2004).

important part in the marketing process by working to satisfy the needs of existing clients and attract new clients to the firm.

Many firms approach marketing in a somewhat haphazard way, but it is important to market thoughtfully and strategically in order to allocate resources efficiently and effectively attract and retain clients. This article and the four that follow discuss marketing-related topics including the basic principles of marketing an architecture firm, the strategic process, research, brand strategy, budgeting for marketing, website development, media relations, business development, networking, social media, the sales process, positioning, targeting new clients, and lead development and tracking.

The topics discussed in this chapter apply to firms of every size. Whether the firm is a sole practitioner or a very large firm, the basic process and principles of marketing are the same, and are vital to the success and growth of the practice.

MARKETING ARCHITECTURAL SERVICES

Marketing architectural services is different from marketing other services or marketing a product. Architecture involves a complex mix of creative and technical skills. In the marketing process, convincing prospective clients of a firm's creative and problem-solving ability, attention-to-detail and follow-through, and passion for the project can all be vitally important. Because what the client or potential client is actually buying is the individual expertise and ability of the team members, differentiating a firm from the competition happens on an individual and personal level.

While it is easy to believe that a prospective client's decision of which firm to hire is rational (that they will hire the firm that has the best experience, capabilities, and fee), the fact is that the prospective client is a person or a group of people, and which firm they choose will also be based on emotional factors. People tend to select people whom they like and trust, people whom they believe will be good to work with and will help them achieve their desired results.

In building credibility with prospective clients and conveying that the firm is the right one for a specific project, the firm's portfolio of prior work is important, but the portfolio will not win the job on its own. The portfolio lets the prospective client know that the firm has done this kind of work before and is capable of doing it for them. From there, the prospective client will make a personal and emotional decision among similarly qualified firms. All the facts about the firm that a prospective client has gathered along the way—including project experience, the quality of work, fee, etc.—serve to reinforce and justify the decision of whom to hire.

► Networking and Business Development (6.4) includes further discussion on reaching prospective clients.

While the marketing efforts of many architecture firms are focused on winning work from new clients, it is important not to forget about existing clients. It is generally much easier and less expensive to win new work from an existing client than from a new one. If a firm has worked for a client and has done a good job, the client has no reason not to hire the same firm again. A firm's first priority in marketing is to keep existing clients happy. If existing clients are happy, they will not only hire the same firm again, they will also recommend that firm to other people they know who may be considering an architectural project. No recommendation is more valuable than the endorsement of a satisfied client.

In marketing an architecture firm, relationships are everything—with clients and with other third-party influencers in the marketplace such as contractors, consultants, real estate brokers, and so forth. People talk, and the relationships that individuals in the firm have will influence the way that others perceive the firm: Positive relationships can help, and negative relationships can hurt. When pursuing work with a new client, it is vital that members of the firm build a relationship with the individuals involved in making the purchase decision. Without some kind of relationship, some kind of natural affinity that helps the client to like and trust the key individuals from the firm who will be servicing the project, it is unlikely that the firm will prevail in a competitive environment. Unfortunately, if a firm enters the selection process without an existing relationship with the prospective client, it is probably already too late—one of the competitors is probably way ahead, and now has the "inside track" with the potential client.

THE PURCHASE DECISION

To many architects and other professionals, "sales" is a dirty word. The idea that they would have to "sell" something makes them break out in a rash. Many people hate to sell. "Business development" has a much better ring to it than "sales." It sounds professional; it sounds like there is an established process for bringing work in.

From the architect's perspective, the business development process is about convincing the prospective client that the firm is the best firm for the job. The conventional selection process is often conceived and explained as very straightforward and linear—moving from hearing about a project to getting more information to presenting qualifications, a proposal, and a presentation; and then, if all goes well, entering negotiations and winning the project.

Instead of a straight line, if we think of this process from the client's perspective, it looks more like a funnel: Many firms are qualified, fewer will be invited to submit a proposal, fewer still will be asked to present, and only one firm will be selected.

Of course, the competitive landscape and selection process vary based on the client's industry. In more public selection environments, such as in government facilities or schools, an opportunity will likely be publicly advertised, resulting in a large number of competitors. When the client is a private company or institution, such as a developer or a corporation, there may be fewer competitors from the outset, possibly an invited list of firms known to have expertise in the specific facility type being planned. And when the client is an individual or a closely held corporation with whom the firm has a long-standing relationship, the firm may have the privilege of being the only firm under consideration.

Before entering any selection process, it is important to understand who the client is, what their priorities are, and what the competitive landscape is. Does anyone in the firm know the client personally? Is it possible to meet with the individual or individuals who will be making the decision? Are the client's objectives and concerns for this project clear to the proposing team? How important is the architect's fee in their selection decision? At what point in the process will fee be discussed? How many firms will be considered? How relevant is the firm's previous experience to the project in question?

► Qualifications, Proposals, and Interviews (6.5) further addresses the go/no-go decision.

Once enough information has been gathered about the project, the client, their objectives and concerns, and the competitive landscape, a decision can then be made about whether to pursue the project or not. This is commonly called the "go/no-go decision."

Once a decision has been made to "go," all efforts should be geared toward addressing the client's specific questions and concerns about the project. The goal in the process of preparing qualifications, developing a proposal, and presenting to the client should be to position the firm not only as qualified and capable but also as the best firm for the project, the firm best able to deliver a project that meets the client's objectives.

THE IMPORTANCE OF GOOD DECISION MAKING

Pursuing new work can be expensive. Depending on the size of the potential project and the amount of effort put into the pursuit, it is possible to spend a great deal of time as well as significant financial resources on printing, binding, models, renderings, travel, meals, client entertainment, etc. Resources, in terms of time and money, are always finite, even in a large firm. Pursuing one major opportunity may mean that there are fewer resources to pursue other opportunities. This is why it is absolutely critical that good decisions are made about which clients and opportunities to chase, and which to decline.

Being strategic, by definition, means saying no to some opportunities. If a firm pursues every opportunity that appears, this is not acting strategically, or even with a strategy in mind. By developing a strategic approach to marketing and by allocating resources intelligently, focusing on the key opportunities that the leaders of the firm really want and believe they can win, the key individuals in the firm can take more control over their destiny as professionals.

▶ See Developing Marketing Strategy (6.2) for a more detailed discussion of strategic approaches to marketing.

In order to make good decisions about where to put limited resources, it is important to understand the client and the competitive environment, and to approach decision making in an objective frame of mind. Research about the client and the project should be conducted in as dispassionate a way as possible. Then, it is important for the individuals leading the pursuit to try to assess the situation from an objective perspective, asking questions such as, "If I were this client, would I hire my firm for this project? If I were this client, and I could hire any firm at all, whom would I pick? Which firm is the absolute best choice for this project? Who has the most experience in this project type? Who has the best press in this area? Which firm feels like the right choice?" It may be helpful to have a conversation with a friend, associate, advisor, or mentor who knows the industry well to ask these questions and gain the benefit of a broader perspective.

Architects often learn about a new opportunity and respond with, "We can do that!" no matter what the project type is or whether they have designed something similar before. But unless no one has ever done a project like this before, the client is likely to hire the firm with the most experience, or at least a firm who has done enough similar projects to convince the client that they are intimately familiar with this type of project. There is usually no point for the client in taking a risk on a less experienced firm.

That said, the value of a relationship with the client cannot be overstated. If a firm's leader has a strong existing personal relationship with a decision maker, they may be able to overcome concerns about inexperience relative to the competition. Clients hire design consultants they like, trust, and want to work with. And that will be easiest to gauge if they have worked with a firm before.

Because of this, when determining how to prioritize efforts, what to pursue, what to decline, and how to spend resources, it is vitally important not to take existing clients for granted, or prioritize gaining new clients over keeping existing clients happy. A firm is far more likely to be awarded work from people who already know the firm, and like and trust its principals, than they are from people they have not met or barely know. It is vitally important to spend enough time and attention on the relationships the firm already has, and not to spend too much time courting new clients at the expense of those existing relationships.

HOW PASSION FITS IN

One often-overlooked factor that can distinguish a firm from the competition is its passion for the project. Because what is being sold is the promise of future performance and the firm's abilities to deliver on that promise, enthusiasm for a project can make a huge difference in influencing a potential client to hire the firm. It is important to find ways to demonstrate how much key individuals in the firm want to do the project, in a way that is natural and proportionate to the project. For example, on a very important project, it may be perfectly appropriate to say, "This is the most exciting project that has happened in this city in years, and we are very excited at the opportunity to work with you on it!" but if the project is small or not very exciting, the passion of, "We really want to work with you!" may be all that can be mustered. It is important for the firm's principals to decide why they want to do this project and then figure out how to express this passion to the client. In a close race between competitors, enthusiasm can be the factor that wins the job for one team over another.

That said, passion can also get in the way of objective decision making. It is too easy to take the attitude that, "This project is important and we really want to win it, so the facts aren't really important here. We're going after it full-on no matter what." It is critical to step back and consider the possibility that the firm may lose the project and really evaluate objectively whether the pursuit makes sense. The firm may decide to pursue it anyway. But at least then the firm's principals are entering the process with their eyes open, and making good decisions about how they are prioritizing their time, and how much energy they are devoting to this pursuit at the expense of other activities.

THE MARKETING TEAM

Described throughout this chapter are important activities related to marketing the architecture firm. A challenge for each firm lies in determining which of the activities described are reasonable and necessary for this firm and how much help is required to do it. There is some rough correlation between the size of a firm and the number of marketing staff. Generally, firms hire their first full-time marketer when they have 25 to 35 staff members, and their second when they have around 65 to 70. From there, the ratio of marketers to staff is about 1 to 50, or a little lower. It depends, of course, on how diverse the practice is, how effective their marketing efforts are, and how hard the firm is pushing into new markets.

For a sole practitioner or a firm with fewer than 25 people, it is important to be creative about how to address marketing needs. A firm may decide to hire a marketing consultant to help, or may find one employee—either an architect or an administrative staff member—to be a part-time marketer. In either case, it is critical to be very clear about the required tasks and expectations in order to provide the necessary guidance for the part-time marketer.

Firms follow different strategies for hiring marketers and building their marketing team, depending on their specific objectives and requirements. For some firms, media relations are critical, and their first hire may be an in-house media relations director. Other firms may use a consultant for media relations, but start their marketing team with a marketing director and later add a coordinator.

Architectural marketing is still a relatively new field, so the profession of architectural marketing is still in the process of formation. Most currently practicing professional architectural marketers grew into their roles from some other field. While most have college degrees, very few studied architecture or marketing; many are artists or writers or architectural historians. They tend to learn what they know about marketing on the job, mentored by other marketers or learning on their own through trial and error. Successful architectural marketers share many attributes: They tend to be flexible, creative, smart, and have excellent interpersonal skills, both in terms of communication and their ability to collaborate.

Though there is not much applicable formal education available for architectural marketers, a rough career path has evolved over time. It is increasingly common to find architecture firms that recognize their marketers as integral to their operations and give them increasing responsibility with the firm. The sidebar outlines the most common titles for architectural marketers and a brief description of what they do.

► Office Administration (5.10) covers marketing and other administrative positions in detail.

It is important to note that marketing for architects is a tough job. Burnout is a frequent problem. Marketers are often under the gun, working on deadline, pushing to get something out the door. It is not uncommon for marketers to work a significant amount of overtime. As a result, many marketers leave the industry after a year or two, and less than half stay for more than five years. As an architect, it is important to recognize the challenges that architectural marketers face and to support them. If a firm has a good marketing staff, it is important to do whatever is possible to retain them for as long as possible.

Aside from the workload, another key factor that drives turnover is how the firm's leadership treat the marketing staff and how they are as professionals to work with. Marketers take responsibility for meeting deadlines and getting proposals, presentations,

COMMON TITLES AND ROLES FOR ARCHITECTURAL MARKETERS

Marketing Director

- Directs the marketing effort for the firm
- Reports directly to firm principals
- Leads the marketing team
- Has responsibility for creating and implementing the marketing plan and marketing budget

Marketing Manager

- May or may not supervise other marketing staff
- Manages the preparation of proposals, presentations, awards submissions, and other marketing materials

Marketing Coordinator

- Prepares proposals, presentations, awards submissions, and other marketing materials
- Works with the firm's staff to gather data and create materials

Media Relations

- Represents the firm to the media
- Is responsible for creating and implementing the firm's media strategy
- Maintains relationships with editors, reporters, and other representatives of the media

Business Developer

- Makes contact with potential clients and sets up meetings for the firm's principals
- May be an industry specialist, with established existing relationships in a given industry that can help open doors

qualifications, and awards submissions done on time. Do the leaders of the firm support this or do they frustrate it? When the marketer says they need something by Thursday, does the principal-in-charge hand it in on Friday? When the firm receives an RFP or other important communication from a prospective client, is it sent to the marketer right away or does the principal who received it hang onto it for a while? Does the marketer feel as if they know what is going on, or that they only get selected information? The marketer generally wants to be a partner to the firm's leadership in building the business of the firm. The closer they can come to that aspiration, the longer they will likely stay with the firm.

Marketing Consultants

Whether or not a firm has marketing staff, there are times when it may make sense to hire a consultant. Marketing staff may have certain expertise in one area or another, but it is unreasonable to expect the marketing staff to be experts in everything. Sometimes it may be necessary to call in an expert consultant to help with a specific problem, exercise, or long-term initiative.

There are quite a few consultants out there who specialize in marketing-related areas and who are familiar with the business of architecture. A firm may hire consultants on a temporary or contract basis to help with strategic marketing initiatives, branding, business development, graphic design, web design, writing, media or public relations, photography, videography, presentation training, sales training, or other areas. The relationship that a firm generally has with a consultant is very different from the relationship that it has with an employee or staff member. There are real advantages to hiring a consultant to help rather than counting on permanent staff, especially in a smaller firm. These advantages include being able to get the right person for the right job, making less commitment than with permanent staff, having more leverage, and being able to try out different professionals who provide the same or similar services.

MARKETING SYSTEMS

The technological systems that architecture firms use in the process of marketing their services have evolved rapidly in recent years. Knowledge management is vital to the success of a firm's marketing efforts and growing its business. Knowledge management

▶ See Knowledge Management (5.11) and Information Management and Services (5.12) for related information on knowledge and information management systems.

includes all the systems—whether electronic, physical, or procedural—that enable staff to easily store, find, and utilize valuable information. Databases and filing systems can help, but it is unreasonable to start with a filing system or database and expect organization to be the natural result. Each firm has to begin with an organization system that feels natural, then add and build systems to formalize the organization and communicate how information is to be captured and shared.

Some firms have cultures that more effectively support knowledge management than others. Knowledge management requires people to be comfortable freely sharing information with each other. If a firm has a culture in which, for whatever reason, people with knowledge are regarded as more important than those without it, and where people are not comfortable sharing their information, it is going to be very difficult to institute an effective knowledge-sharing system. Real estate brokers are notoriously bad at institutional knowledge management, because the professional success of a broker is predicated on the broker having information that his or her colleagues do not have.

For firms that get it right, knowledge management can be a true differentiator, demonstrating a clear difference between a firm and its competition. When a client asks a question to which an architect does not personally know the answer, whether it is about one of the firm's past projects or which audiovisual consultants they work with, how long does it take to find the answer? Does the architect need to ask a person, or can the answer be found in some easy-to-use electronic or physical resource? If the architect can find the right information quickly, they will look much smarter to the client.

Think about all the different kinds of information a company needs to capture and maintain—on projects as well as in areas related to finance, legal issues, human resources, and marketing. Categories of information necessary for marketing and for which firms often implement knowledge management systems include research, leads, people, projects, and staff.

Research: Trends, Articles, White Papers, Thought-Leadership

Many professionals are conducting informal research all the time, through the articles that they read and the formal and informal conversations they have with fellow professionals. Research is in many cases difficult to store and track because it can often be free-form information. It does not usually fit into a database, because the information generally is not easily separated into neat fields that can be searched later. Research information can also appear in lots of different formats, some of which are on paper: newspaper and magazine articles, white papers, reports, notes, etc.

To support a firm's marketing efforts, it is important to create a system for storing research and other information that relates to the work of the firm. Start with an empty physical file and an empty electronic file. Fill each with appropriate information such as articles, web links, and other information. Segment and organize the information in ways that are logical, forming a system for organization and retrieval. It may be advantageous to explore link-sharing and notetaking/sharing tools. Link-sharing tools like Delicious allow tagging, indexing, and sharing an infinite number of links on the Internet. Notetaking/sharing tools like Evernote enable the collection and sharing of notes and other content. Tools like these can help a lot in the collection, tagging, and sharing of a tremendous amount of online and offline information.

Leads: Managing Information down the Marketing Pipeline

In order to manage the business development process, it is important to find a way to track opportunities as they develop from leads to prospects, and then to projects. Some firms use customizable off-the-shelf systems to do this, while others develop their own systems. Lead-tracking software applications are commonly referred to as client (or customer) relationship management systems, or CRMs. Some providers refer to their systems as "sales automation software."

There are many systems out there, none of which are specifically designed just for architects. However, a few are specific to the broader industry and are used by architects, engineers, construction firms, and related consultants. Deltek and Cosential are two industry-specific providers of lead-tracking and other software. There is a much wider choice of CRM software that is not specific to the industry, but the challenge with using sales automation software that is not industry-specific (such as Saleslogix or Salesforce.com) is that this software will need to be customized to track information that is important to architects (such as project size, facility type, construction cost, etc.).

Some firms have built their own systems using an off-the-shelf database system. In these cases, the cost of building a system may actually be greater than the cost of buying an off-the-shelf system, when staff time, bug fixing, and other factors are considered. Many firms that build their own systems eventually migrate to one of the commercially available systems.

Many firms structure their lead-tracking process around weekly business development reports and meetings. The meeting provides an incentive for key business developers to update their information on the reports, and provides a forum for discussing important leads and issues related to business development.

People: Clients and Contacts

Lead-tracking software is generally able to store and share information on contacts as well as information on opportunities. It is critical to have an effective system for collecting, updating, and sharing contact information on clients and other people that the members of the firm have relationships with. Make sure the contact management software that is selected enables the firm to do all the things that it needs to with contact information. If the firm is planning to create a series of e-mail blasts or a printed client newsletter, it is important to make sure that the contact management software is able to create and manipulate mailing lists with the contacts that it stores.

Many firms have the challenge of integrating multiple contact management systems into one. Each partner or principal wants to maintain their own contact database in Microsoft Outlook or some similar address book system. When it comes time to do a mailing, all of the different address books have to be integrated and sorted to prepare the mailing. Therefore, a much better choice is a scalable, integrated contact management system that everyone can use from the start. Ideally, it is of course best to avoid maintaining duplicate information in more than one system, if at all possible.

Projects: Past Experience

When a firm is pursuing a new project, it is important to identify the firm's previous experience that is most relevant, and then to prepare qualifications to represent this experience. If the firm is small or is a new firm without a significant portfolio, this will be a somewhat easier task than if it is a large firm or a firm with a long history. But whatever the size of the firm, it is critical for the firm to institute some sort of system for tracking project information.

There are several choices for how to track information on projects: Use an off-the-shelf system created for our industry, create a proprietary database system, or use a file system that is key-worded for attributes that can be searched on later.

The file system is the simplest to start, and if it is set up right, it can easily be converted to a database later. Create a basic form (see Table 6.1, for example) for information on projects, fill out the form for each project (one file per project), and store all the files in the same folder. Make the form using a two-column table, with questions/

TABLE 6.1 Sample Project Information Form

Client name:
Project name:
Project location:
Project size (in sf, sm, acres, hectares, etc.):
Other key quantities (number of keys for hotels, number of beds for hospitals, number of units for apartment buildings, etc.):
Services provided (architecture, interior design, planning, etc.):
Project budget (construction cost):
Project fee (if a public project):
Firm team members who worked on the project:
Consulting team (firm name and discipline):
Project start date:
Construction start date:
Project completion date:
Project description (100–150 words):
Sustainability factors (LEED certification, etc.):
Client contact:
OK to use as reference? (Y/N):

categories down the left (project size, facility type, etc.) and answers on the right side. Then, when an opportunity comes up and relevant projects need to be identified, use your computer's search feature to look for any files in the folder that contain certain text (such as "laboratory" or "Rhode Island") to find the appropriate projects.

One of the greatest challenges of collecting project information is deciding when to collect it and who should collect it. Often a marketing coordinator who is not directly involved in the project is entrusted with the responsibility to gather project information. The marketing coordinator then has to track down this information from the project team. As this is usually a secondary responsibility of the marketing coordinator, the information may not get collected consistently, but will be done instead when the information is required for a specific proposal. It would be far better to create a system wherein the project manager could provide and update project information throughout the development of the project.

Project information is more than just data, however. It is important to capture images, plans, and other assorted files for use in marketing later. As a specific design project proceeds, be conscientious about the materials that are created for the project, and organize them in a logical way that makes it easy to find them later. Everything that is created as part of the project process may be useful later in trying to win the next project. Store site photos, "before" photos, renderings, sketches, construction snapshots, team photos, and so on in one place.

When the project is finished and documented through snapshots or professional photographs, store those with other project documents in a physical project file, as well as in an electronic project file.

There has been a lot of innovation in image database or gallery applications, like Extensis Portfolio. These systems enable the tagging or keywording of thousands of images, and, depending on the system, may enable the images to be exported in a wide variety of ways, or to be displayed in galleries on the firm's website.

Staff: Resumes and Statistics on the Firm's Staff

Like project information, readily accessible information on the firm's staff is vitally important when pursuing a project. It may be important to know which architects are registered in a certain state, or speak a certain language, or have worked on laboratory projects. Resumes, of course, are the primary place where this information exists, and it is worth putting in the effort to make sure that resume files include all the information that may be needed later on any individual staff person. In some cases, however, it may make sense to create or use a database for tracking information on staff members. Both Deltek and Cosential have portions of their software packages designed to track staff information. When creating a custom project information database, it makes sense to consider adding staff information to this database, so that it is possible to track who worked on which projects.

THE REST OF THE CHAPTER

The following four articles in this chapter contain additional critical information on how to market architectural services to prospective clients.

Developing Marketing Strategy

This article describes the process of developing a marketing strategy for an architecture firm, including an overview of how research in a number of different areas informs the planning process, analytical techniques to evaluate a firm's opportunities, developing action plans to prioritize marketing activities in specific markets, and using the marketing plan as a tool to audit the firm's performance over time.

Public Relations and Communications

This article describes the process and tools of developing a communications plan, including utilizing tools such as website design, social media, media relations, design awards, promotional materials, advertising, and crisis communications to spread the firm's message to all of its audiences. A backgrounder on commissioning architectural photography accompanies this article.

Networking and Business Development

This article focuses on how to build business through personal relationships, which all professionals develop over time, intentionally or unintentionally, through networking. Key topics in this section include developing a sales plan, growing a network, networking events, networking via social media, and the role of trust in networking.

Qualifications, Proposals, and Interviews

This section describes the process of responding to a specific opportunity through the process of preparing a qualifications document, a proposal, and a presentation. Specific topics that are discussed include the go/no-go process, reading the RFP, how to organize and run a strategy session, crafting a response to an RFP, coordinating with subconsultants, how to prepare for an interview, researching the client and competition, and what to do to follow up after the interview.

CONCLUSION

This chapter is a very high-level overview of key topics in the marketing process, from strategy, to public relations, to business development and networking, to the sales process. This is ideally an integrated part of the way that every architecture firm operates on an ongoing and continuous basis, as a practice grows over time.

It is important to bear in mind that the common practice in marketing changes over time with evolutions in social trends and the development of new technology. It is important to view each new marketing activity as an experiment, so that those involved can learn from it, getting better and more practiced over time, continually improving in their ability to communicate with potential clients in order to bring more work to the firm.

6.2 Developing Marketing Strategy

Ted Sive, FSMPS

This article presents a defined and specific approach for developing marketing strategy, combining internal and external research, analysis, and rigorous choice. The process puts marketing plans—including business development and sales, public relations and messaging, proposals, and more—in the context of broader firm strategy and business planning, including firm systems, tools, finances, and human relations.

THE ESSENCE OF MARKETING AND STRATEGY

Strategic planning—including marketing planning—should be one of the most exciting things leaders of architecture firms do. Building a plan is the opportunity to discover what firm leaders want and why, to envision and articulate the desired future, and to motivate specific action. The process should be engaging and productive—an opportunity to recharge passion for architecture and practice. The plan, whether for a sole practitioner or a global leader, should be an action road map that is understandable, breakable into doable pieces, scalable with growth, and modifiable to evolving conditions.

▶ Strategic Planning for the Design Firm (5.3) presents a broad discussion of firm strategy.

The focus of this article is squarely marketing strategy: creating succinct targets for market types, business development, public relations, and more, based on sound research and analysis. Because the definitions of strategy and marketing are frequently mixed and misunderstood and the overall process is feared, what follows defines *marketing process* within the broader context of *firm strategy*. The entire strategic process is mapped out, with significant detail and examples for the more marketing-focused components.

At the most basic level, a strategy is a plan to achieve a specific goal. What does the firm want to be? How does it get there? A strategic plan connects personal and firm passion and abilities to the "real world," and maps the most effective way to reach desired goals. Crucially, it's as much a determination of what the firm is *not* going to do (such as the types of opportunities not to pursue), as what the firm *will* do. The firm may be interested in all sorts of creative and technical challenges, but it can't be all things to all people, and clients almost always want specialized expertise. This is especially critical in marketing strategy, because the most successful marketing links specific firm skills and desire to a very specific client or market, sales targets, and public messaging.

PITFALLS AND OPPORTUNITIES

The most successful strategic efforts build upon the following dynamics:

Strategy is always a work in progress; the most strategic firms are rigorous in their process, yet flexible. All plans become outdated the moment they're finalized. Conditions change constantly and unpredictably. Perhaps the economy reduces capital for sustainable resorts, a competitor loses their lead laboratory designer, the office market gets a little healthier, or a friend offers special consideration in a coveted project type in which the firm doesn't have experience. Developments like these demand strategic flexibility with

---

Ted Sive is a frequent speaker, industry pundit, and consultant to AEC firms. Sought after for his skills as a facilitator, coach, and trainer, Sive helps firms from established leaders to start-ups form business strategy, develop brand, and improve marketing communications.

(1) mastering the *process* so that re-analysis and change can be quick and effective, and (2) a *plan* that can be easily accessed, updated, and woven efficiently into the practicalities of firm decisions and management.

Retreats (advances?) are terrific opportunities for creativity and enthusiasm, for taking out the proverbial "blank slate." But good strategic planning requires good information and forethought. Rather than one multiday retreat with limited preparation, it's usually better to distribute the key steps over time, with research and communication between. This allows for reflection, processing, and smart decision making. The strategic planning steps are described later in this article.

Strategic planning is a powerful opportunity to leverage multiple voices and audiences in the firm and build internal excitement and energy. Different voices have different ideas and ownership in the plan; a successful effort carefully sequences activities to engage all stakeholders, while maintaining leaders' decision-making and process control. Participation of the "troops" can include (among other activities) research, creative visioning exercises, or weaving a specific "high-level" idea into day-to-day and project management realities. Successful firms use strategic planning as a major opportunity to reach out to staff and show strong leadership, communication, and inclusiveness.

Strategy isn't a separate activity, it underlies everything. A good strategic plan should weave into the day-to-day activities of everyone in the firm, and help allocate scarce resources. Strategy is the all-the-time baseline, the tool deciding the most important thing to do or say, whether writing a press release, developing a concept design, or hiring/training staff. Example components:

- A one-page, highly formatted "so cool employees will post it at their desk" declaration of mission, vision, and values (MVV)
- A one-page dashboard tracking key activities and goals
- A detailed market-specific plan to chart the multiple efforts required to enter a new market or keep an existing one
- A short action plan detailing the most important and powerful design focus, technical resource development, or brand-building efforts

The approach for the firm should target both summary and detailed strategic documents, and weave strategic initiatives into existing company tools and processes. While a strategic plan may be dozens of pages, specific parts should live strongly on their own, and be easily revised and edited. For example, a "Health Care Market Plan" will include significant detail on targeted clients, conferences to attend, papers to write, and research and networking activities, and should guide the day-to-day activities of marketing staff and key health care marketers. It should also include targeted clients and influencers, but if the firm has a good working customer relationship management (CRM) database, don't re-create the data, use the CRM system to identify targets. This "Health Care Market Plan" might target the potential future purchase of a small specialty firm in a new geography, but leave plans for the integration of that purchased firm, in terms of leadership or staffing or systems, to the more *operational* sections of the firm's strategic plan.

CREATING AND LIVING STRATEGY

The "Creating and Living" theme and eight steps of strategic planning that follow are based on organizational concepts and terminology jointly developed by Ted Sive, FSMPS, and Bill Strong, SMPS. The eight steps are: Discover Potential; Analyze Opportunity; Synthesize Direction; Declare Soul; Structure Enterprise; Connect Clients; Channel Aspirations; and Audit Performance.

The balance of this article describes an eight-step program in two overlapping phases: *creating the plan* (including research, analysis, and perhaps a retreat), and *living the plan* (carrying through strategic goals throughout the operational and marketing inner-workings of a firm). The components of the "living" phase are also in essence the table of contents for a strategic plan.

While the emphasis of this article is marketing strategy (choosing clients, markets, project types, publication goals, business development methods, and more), that marketing strategy must be developed within the context of overall firm strategy, which includes core mission and vision, theories of architectural practice, and operational tenets and aspirations. This paper describes a road map for the entire process, focused in the marketing realm. While this process—or formula—works for firms of all sizes, clearly there will be wide variation in areas of focus and quantity of work. And last, while the diagram presents a lineal progression, with information and discovery leading nicely to decisions and further planning, strategy in any firm evolves over time, and many of these activities can happen out of sequence.

Discover Potential

For any firm of any size in any economy, there's a wealth of potential. The old aphorism that we're just specks of sand in the universe reminds us of that infinite potential. The goal here is to consider "What can we be?" "How might we grow and expand?" Look around and ask "What don't we know, and how can we learn it?"

In discovering potential, the point is to gather data, objective and subjective, internal and external. This can be organized into five dimensions or root forces that drive architecture firms. Each is an area of specific research:

1. Passion
2. Markets
3. Perceptions
4. Competition
5. Trends

Passion

What are the firm's people most passionate about, individually and collectively as a firm? What drives people's work as professionals? Why did they become architects? What have firm members learned and experienced, and how has it changed them? While this is not a research topic in the traditional sense, thinking of it as research reinforces that concept of diving into and uncovering previously unknown facts. Find some way—leading a discussion, interviewing each other, throwing a "beer Friday"—to articulate passions. Broadly, there are two groups to consider:

- *Leadership*. Being an owner or principal is first and foremost leadership; leaders drive the firm, and their visions and desires are key. Leaders have the job of inspiring others, yet that comes after honestly assessing what is individually and mutually desired.
- *Talent*. Any firm larger than one person involves important differences in outlook, reaction, and capability; during strategic planning leaders must work to discover the staff's perceptions, views, meanings, and excitement. This is particularly true with societal and business trends toward empowerment, most notably with Generation Y.

Markets

Any strategic plan must reflect the real world outside the firm. This means researching the world of clients, how they consider and interact with architects, and what affects their buying choices. Along with accumulating and continuously updating information about clients and potential clients, architects must also consciously work to understand clients by thinking in their language and "walking a mile in their shoes."

The following is a generic list of topic categories and questions to consider when conducting market research. Start with this list and edit to the particulars of the markets being considered.

UNDERSTAND THE DIFFERENCE BETWEEN MARKETS, PRODUCTS, AND SERVICES

A critical step in research is defining markets correctly. A frequent mistake is defining markets only by how the firm sees them (and possibly as firm studios are structured), instead of defining markets by *how clients see and define themselves*. While the definitions can be gray and overlapping, understanding the difference between market, product, and service is fundamental to discovering useful information.

MARKET

A market is a collection of similar companies or institutions with specific facility needs, defined as clients see themselves. A facility manager for a school district typically identifies with the public K–12 market, not the "education" market, as that includes other, very different buyers, such as private universities. When markets are correctly differentiated, actions can be based on what is important to a type of client. A helpful guide for defining markets is to consider the professional organizations or networking venues clients use. For instance, many K–12 buyers attend Council of Educational Facility Planners International (CEFPI) conferences, while their university counterparts attend the Society of College and University Planners (SCUP) events.

PRODUCT

A product is a specific type of built environment that clients need. Continuing the example, K–12 clients buy a variety of buildings, from elementary schools to vehicle fleet maintenance facilities and performing arts centers—three distinct product types within one market. Some product types overlap markets; for example, some high school libraries or athletic facilities are just as elaborate as some university or city versions.

SERVICE

A service is how professionals describe an intellectual, design, and/or technical deliverable. In working for that K–12 client, an architecture firm might perform facility condition surveys, conceptual design, "full" architectural services, public outreach, and/or construction management. These are five distinct services offered to a specific market.

Honing a list of markets, product types, and services is a good first step for architecture firms. This helps all staff understand clients and market the firm more cogently, and sets those responsible for market research on a clearer path.

Market Definition
- What is the market, as clients define it?
- What geographic area will be the focus?

Clients
- Location?
- Size and growth potential (personnel, company revenue, ambition)?
- Design and construction needs: What services and products do they buy? What delivery methods do they use?
- Competition/influencers: Who works with them (architects, engineers, contractors, other)? How do they grade and select competing architects?

Dynamics
- What is the overall market size, currently and in the future?
- What are the economic drivers for this market?
- What broader social, demographic, and other trends might influence this market?
- Are there trends in the types of projects within the market? For example, is educational philosophy driving a substantial change in building form?

Networking and Organizations
- Where do the clients and influencers congregate (market sector conferences, associations, social networking)?

Market Research Sources and Examples
- Client organization websites and trade journals (Urban Land Institute [ULI], National Association of Industrial and Office Properties [NAIOP], CEFPI)

- In-person interviews with existing customers
- Conversations with subconsultants, contractors, and subcontractors
- Data and reports from AEC organizations (Associated General Contractors [AGC], AIA)
- Specialized AEC data sources (McGraw-Hill, AIA, PSMJ Resources, Design Intelligence, commercial brokerages)
- Local business and/or specialty media (business journal analyses of largest, fastest-growing, etc., businesses)

Perceptions

It's an old joke: "So, enough about me. What do *you* think…of me?" In this dimension of research, firms learn about themselves from an outside perspective. With better understanding of how the firm is perceived, both on its own and as compared to the competition, comes a better ability to solve deficiencies and identify opportunities. Opportunities include gaining brand awareness, growing into different product types with existing clients, or improving a capability. Remember, what the client thinks (perception) equals reality.

In the "Connect Clients" section later in this article, the value and process of project reconnaissance is considered. These are questions specific to projects (response time to requests, availability of key personnel, listening skills, construction document quality, and many more). These surveys are a hugely valuable component of client care, different from the firm perception surveys that are very information-focused for strategic planning.

Topics

A perception survey asks clients, "How do you see us?" This can include:

- Client's definition of the firm's client service and "brand"
- Firm strengths and weaknesses in design, technical, management, communication, and other aspects
- Identification of competition, and comparison to them
- Suggestions for process improvement
- Perspectives on or identification of clients similar to themselves, including the client's competitors
- Perspectives on future trends in that client's market (anything from product delivery models to growth potential)

Pointers

- The best questions are open-ended (*not* yes or no, and only occasionally multiple choice). This leads to a real conversation with the client and to learning what the client feels is important, in their language.
- Surveys can be conducted by firm personnel, which builds relationships and can start with a helpful familiarity, or by an external consultant, which generally leads to more frank responses and a clearer "big picture."
- Remember that *clients* are sometimes different from *owners/users*; for example, the client might be a developer who is building a turnkey project for a corporate owner, or a third-party owner representation firm.
- Many clients have different levels of decision makers—perhaps there is a day-to-day project manager, the executive, and even a building committee. Each might have different priorities. It is important to determine who makes the real decisions, and who is accessible.
- Focus on how the firm can help the client, not on potential upcoming projects. The goal is to understand their perceptions so that better service can be provided, not to make short-term gains.
- Surveys can be expanded to include collaborators, subconsultants, and others with knowledgeable perspectives.

Competition

Clients are buyers. Buyers have choice, and they always—implicitly or explicitly, consciously or unconsciously—compare and contrast among firms. Competitor analysis is an underused strategic tool, and another excellent way of discovering potential and possibilities, while also building "client-thinking" skills. Following is a list of characteristics to consider; it is important to see the competition from both the framework of what is known, on speculations, and on the perceptions of shared clients—these may not be the same. Again, client perceptions are "reality."

Analysis Categories, per Competitor

- Markets they work in
- Products they design
- Services they offer
- Geographies and office locations
- Leaders and key business developers
- Marketplace perceptions (brand)
- Key clients and projects

A QUICK AND SUBSTANTIVE START TO COMPETITOR ANALYSIS

Creating a competitor analysis is an excellent way to reach out to "talent" in the firm and involve them in strategic planning. Bring staff together for a focused discussion of their perceptions of competing firms.

It helps staff think strategically. Architects, as a result of passion for design and often broad interests, sometimes develop "rose-colored" and limited views of competing firms. Real differences in skill and resume can be minimized or misunderstood. Forcing a group to think like clients draws out the real differences between firms, and helps marketers to think like clients.

A little time can unearth a lot of information. With limited preparation to create a matrix and organize discussion, a focused meeting of even 60 to 90 minutes can yield a lot of data. Different staff will have different views into the competition, perhaps from working there, or from peers, subconsultants, and others.

Trends

The last dimension of research is the industry itself: What are the important trends in the world of AEC and real estate?

Topics

- *Teaming and delivery methods*: How are they evolving and affecting the process of how the firm works in the broader industry?
- *Technology*: How is new technology affecting practice?
- *Society and cultural trends*: How are broader trends, such as demographics, affecting the business of architecture and related professions?

Pointers

- Industry publications and conferences are full of research and prognostication on these topics.
- An internal brown-bag lunch is productive for drawing in a variety of perspectives and inputs.

Analyze Opportunity

Research during the "Discover Possibility" step will yield a ton of information. In "Analyze Opportunity," begin with that information and answer the question, "What does it mean for the firm?" The analysis can be broken into two categories of opportunity: *possibilities* (such as taking expertise in urban housing from one city to another, or leveraging a new hire's resume to enter hotel design) and *obstructions* (such as a new competitor, or the need to strengthen "augmented reality" visualization expertise for technology clients).

Analyses to Consider:

- What characterizes clients in a specific market? How do they fit the firm's mission, vision, and values (MVV)?
- What is the firm's market share?
- What characterizes or differentiates the firm's existing or potential future work in the market?
- What and where are the opportunities and risk/reward of geographic or market expansion?
- How does the firm compare to the competition, and what risks and opportunities does that identify?
- What specific expertise is required to pursue a specific goal, and what does the firm have/not have (gap analysis)?

RETREAT EVALUATION TECHNIQUES

Described below are four analytical techniques to analyze opportunity and uncover potential paths. Each can be used individually, and is particularly effective for group work.

SWOT

Perhaps the most well-known tool is a SWOT (strengths, weaknesses, opportunities, and threats) analysis. Create a document with four quadrants, and populate each quadrant as a group per the specific market or topic:

- *Strengths* of the firm and individuals per the specific market or topic
- *Weaknesses* of the firm and individuals per the specific market or topic
- *Opportunities* involving clients, projects, technical skills, people, etc., for the firm
- *Threats* that might potentially have a negative impact on the firm

STOP/START/CONTINUE

A variation on SWOT, Stop/Start/Continue (SSC) fosters brainstorming but may get more quickly to participants' beliefs and opinions already present, with discussion around:

- What the firm should stop doing
- What the firm should start doing
- What the firm should continue doing

SCENARIO DEVELOPMENT

A bit more complex in structure than a SWOT or SSC, Scenario Development splits a large group into smaller ones, and asks each group a similar set of questions to be answered specifically for that group's scenario. For example, the group might come up with these potential "ten-year future" themes:

- More competition from large firms with broad interdisciplinary (such as mechanical and structural) services
- A key client wanting more "boutique" specialties
- National retail clients wanting one firm to do work everywhere
- 30 percent adoption of the Living Building Challenge in the university market

The group would then split into four, each addressing one of the above themes and answering questions such as the following, starting with the assumption that the scenario is true:

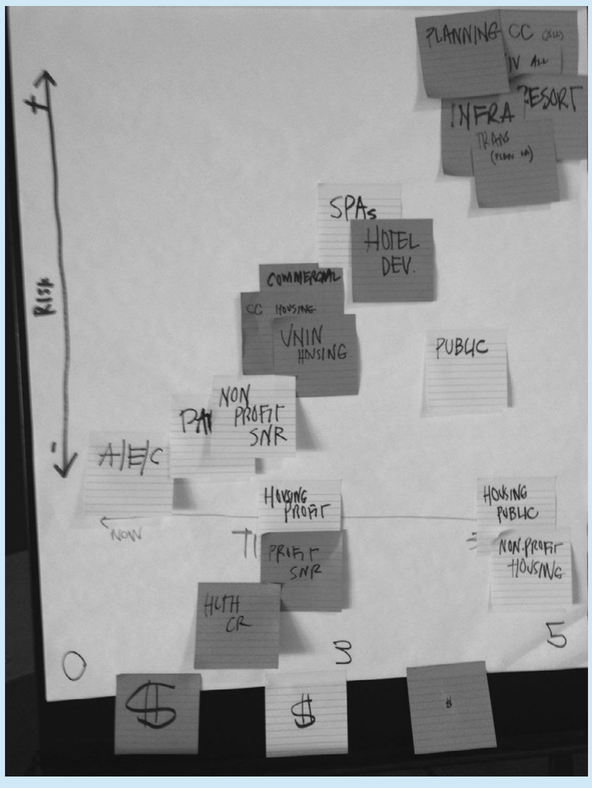
- What technical resources might be demanded?
- How might the firm add resources in-house, or team with other firms?
- What will be the procurement methodology?
- What would be good upstream business development opportunities to start developing relationships now?

After each group reports back, the whole group can then look for "killer ideas" or strong themes that resonate across more than one scenario.

QUICK HIT RETURN ON INVESTMENT (ROI) ANALYSIS

The last technique focuses on financial return. Given a set of potential markets, products, or services, the group works to answer what kind of return a set amount of marketing investment ($50,000 in labor and expenses, for example) might provide, and/or the chance of success relative to time horizon. A sample matrix graphs market options in three dimensions: financial return, risk, and timeline.

Figure 6.1 is a Quick Hit ROI from an architecture firm analyzing $50,000 in marketing investment. The X-axis is time, one year to five years; the Y-axis is amount of risk; and the color of each note indicates the likely return—green: $1,000,000, blue: $500,000, and red: $100,000.



Ted Sive

FIGURE 6.1 Quick Hit ROI

Synthesize Direction

This step is often the hardest: choosing the key focuses that will drive the firm for the term of the strategic plan. These include *operational* improvements and additions; *marketing* choices of specific markets, product types, and services to pursue; and an *action plan*, with key must-do activities. All of this is inexorably tied to choosing what the firm will pursue, making only as many choices as the firm can fund. To complete the resource-loading aspect of strategic planning, a high-level *budget* and *timeline* are developed. These illustrate the firm's financial commitments to specific initiatives, and the sequence and timing. Synthesize Direction is analogous to Conceptual Design. Determine the key big-picture goals for each category, including the fundamental "design" of the firm, each of which will be further developed in the plan itself, much as Design Development furthers basic design concepts.

Focusing on the marketing components, the firm needs to choose which markets are active, growth, and reactive.

Active Markets

An active market is one where the firm wants to maintain an established and significant market share (defined as the percentage of a market the firm typically performs). Maintaining an active market is a high bar in and of itself, with activities including the following:

- Maintaining existing relationships
- Forming new relationships as decision makers and the clients themselves change and move on
- Attending conferences to maintain market knowledge and visibility
- Keeping close attention to client care on existing projects to foster repeat work
- Preparing qualifications statements and proposals, typically in response to RFQs and RFPs

Growth Markets

A growth market is one with the opportunity to significantly increase the firm's market share, with significant opportunity to gain new clients and/or projects, while staying consistent with the MVV. Growth market activities include all the activities in active markets noted above, plus:

- Building alliances with potential new team members (e.g., specialty consultants)
- Performing research and development to maximize skill sets and find creative ways to add value and gain competitive advantage
- Growing internal skills special to technical/design challenges of the market
- Potentially accepting less profit as investment in growing internal skills or more aggressively marketing the target)
- Hiring strategic talent

Reactive Markets

Choosing reactive markets is that important, difficult choice to "not do," resulting in little or no proactive pursuit. Opportunities that do come along might still be considered, subject to a rigorous go/no-go evaluation (see below), with pursuit only if there is no opportunity lost in active or growth markets, or other strategic endeavors of the firm.

RESOURCE LOADING

An excellent tool for forcing strong decision making on "doing" and "not doing" is to inject resource modeling into strategic decisions. While a strategic plan informs the "how" of day-to-day activities (the tasks that need to happen no matter what, such as designing and managing projects), a strategic plan is also fundamentally about the special and unique and specific activities the firm wants to undertake. For these activities, there are three basic "pots"—staff time, direct cost, and schedule. Resource modeling is applying strong business rigor to make choices based on what can and should be invested in these pots.

For example, one simple tool is determining how much of the current marketing budget is required to maintain the current quantity of work in pursuit of current markets with current methods. The rest of the budget, and perhaps an addition, equals the available budget for new strategic marketing initiatives, for the growth markets or additional pursuit of the active markets as defined above. As alternatives are evaluated, estimate costs erring on the high side.

Declare Soul

This is the "heart" of any strategic plan, the firm's inspiration and essence. There may be a clearly articulated MVV already. If not, or if they need to be rethought or confirmed, now is the time. This is where the planning process ends, and the strategic plan begins "living." Following are the three "animating principles" for a professional service firm, of why the firm exists and why it matters:

Mission: The firm's *purpose*—why it exists and its function in the greater world

Vision: The firm's *destination*—where the firm will be in a given amount of years, stated at least in part in objectively measurable accomplishments

Values: The firm's *interaction*—how the firm works with clients and collaborators, as well as internally

Structure Enterprise

To enact and live its soul, a firm needs structure—how it is organized, specific roles, what tools are used, how they are used, etc. Structure Enterprise guides this structure, including critical highlights and direction of how to enable strategy in the "everyday." In the case of big, visionary goals, this may really change the "how" of the firm's daily work.

Leadership

Organization and Communication

A fundamental job responsibility of firm leaders is living and leading strategy. Who are those people, and what are their roles? An organization chart not only indicates decision-making authority, but also empowers the strategy of "how" a firm wants to conduct work. If increasing design skill and recognition is a key strategy, who is responsible for this, and where do they live and interact with others? What is the person's job description?

Transition

▶ See Ownership Transitions (5.6) for a detailed discussion of transition planning.

As a strategic plan will cover a number of years, firms should consider not just the present structure, but also the future. Who will the leaders be in 10 years? Will they come internally or externally? Will ownership be important for those leaders, and how will they obtain it? (The most successful long-term strategic efforts closely link ownership transition plans with core strategy.)

Talent

▶ The Human Resources Management Overview (8.1) addresses the many aspects of an architecture firm's staff management.

Human Resources

The talent in an architecture firm lives the strategy in day-to-day projects and work pursuits. What skills need to be developed? How will new staff be indoctrinated in the firm's MVV and key tools? Do specific capabilities need to be hired?

Tools

▶ Chapter 12, Quality Management, covers quality control methods and issues.

▶ Chapter 10, Design Project Management, addresses management of architectural projects in detail.

▶ See Chapter 11, Technology in Practice, for a specific treatment of technology use and management.

In executing projects, leadership and talent use tools to carry out the work. To move strategy into the day-to-day, firms should ask: What are the key tools in the firm, and do they help or hinder the firm's goals? What would benefit from focused development and resources?

Design: definition and tools for architectural design processes

Technical: building systems and information resources, construction document quality control

Process: project management tools and standards

Information technology: CAD, BIM, the electronic flow of information, knowledge capture for firm expertise

Financial Management: project and firm financial tools and processes

Connect Clients

Structure Enterprise focuses on a firm's internal structure and tools—the firm's *operational plan*. Balancing that and focusing externally is the firm's *marketing plan*, the core of how the firm's soul intends to connect with clients and the world outside. Following are the key components of a marketing plan.

▶ Financial Management Overview (7.2), introduces a detailed series of articles on financial indicators, systems, processes, and planning in architecture firms.

Brand

A firm's brand is the sum total of external understanding and perceptions of a firm. The brand components of a marketing plan are the tools a firm uses to shape those perceptions. Perhaps the most important tool is a brand statement, a 300- to 500-word summary for the essence of the firm, how it is distinguished from competitors, and the value that it brings to clients. In many ways a brand statement is an external retelling of the MVV. Other brand components include the firm's name, logo, iconography, tag line, and visual imagery.

Markets

On one sheet of paper, distill the key markets the firm works in, and whether those markets are growth, active, or reactive, as defined above.

Go/No-Go

This is a tool to determine whether a firm should pursue a specific client or project. The model should be personalized for a firm's truly important considerations, including fundamental firm strategies, specific resources needed, the deadline for the pursuit, the time frame of the work itself, and the risk/reward ratio. Some criteria might be required (e.g., "Do we have an existing relationship?"), while most would be part of a point system, with a minimum number of points required to proceed.

▶ See Qualifications, Proposals, and Interviews (6.5) for further discussion of the go/no-go decision.

Public Relations

The firm's public relations strategy is the key effort to influence what the broader range of potential customers, stakeholders, and the general public think about the firm. These plans may be for the firm as a whole, and/or specific to the Growth and Active targets for the firm.

▶ Public Relations and Communications (6.3) includes a detailed discussion of media outreach.

MARKET TRANSCENDENT VS. MARKET FOCUSED STRATEGY

The architecture field has many examples of firms that have grown and prospered with a very strong market focus. WATG has built an internationally recognized practice and clear standing among market leaders based on laser focus on hospitality design. While almost all firms benefit from a disciplined approach with market-based planning regardless of size, location, specialty, or design ability, some firms' marketing strategy can transcend market delineations. These firms manage to sell something different, or that cannot be seen through the lens of market-specific expertise.

This transcendence can be a product or service type as described above. For example, a decade ago "sustainability consulting" was a differentiating service, and a number of architecture firms (Mithun in Seattle, for example) grew their practices across multiple markets with this service. Other firms are experts in particular product types, such as vehicle maintenance facilities. Many firms have similar differentiators, yet still market-based planning and understanding their clients is the most effective start for strategic planning.

Only a few firms really transcend market focus. This ability is usually the result of a strong design or service attribute that allows them to pursue and win clients in many markets and geographies. Kieran Timberlake of Philadelphia, recipient of the 2008 AIA Firm Award, has built an international reputation significantly rooted in their research-based practice, including the study and development of new products, assemblies, and delivery methods, such as the use of prefabrication. In 2010 they were awarded the billion-dollar U.S. embassy in London, a project far beyond their previous project size or type. Miller Hull, the Seattle-based 2004 AIA Firm Award recipient, developed a very strong reputation for environmentally sensitive and context-driven design long before "sustainability" became common lexicon. That work, for a still modest-sized firm, launched the firm into public works and research facilities, and even very large projects such as a half-billion dollar border crossing station between Tijuana and San Diego at San Ysidro.

▶ Networking and Business Development (6.4) addresses relationship marketing.

Business Development

Firms are hired by individuals and teams who are mostly hiring other individuals and teams. Interpersonal relationships—the one-on-ones between architects and clients and influencers—are the building blocks. Business development is about targeting those individuals and organizations, specific tools, and the actual personal connections involved to build and maintain relationships. Remember that these one-on-ones are not limited to firm leadership, but also management and design talent.

Client Care

Client care is about performing work and relating to existing clients, which should be tightly intertwined with the marketing plan. The best marketing is to keep current clients, which is aided by "living" the firm's strategy on each project. Good client care is about building strong working relationships and understanding how clients grade project performance, then making sure the firm performs at an outstanding level on each project.

COMPONENTS OF A MARKET SECTOR–FOCUSED MARKETING PLAN

1. Market definition
2. Focus
   - What cross-section of Market, Service, and Product is the firm targeting?
3. Market share
   - Estimate of market size and revenue goal
   - Geographic definition
4. Clients and influencers
   - Core existing and responsibility
   - Targeted new and responsibility
   - "Considered, less focus" (list of clients of potential interest, certainly to respond to, but not top targets)
5. Brand and public relations
   - Any key market-specific messaging needed? (desired press/media, advertising, website or collateral brochure development, etc.)
   - Organizations/conferences/speaking/memberships
   - Targeted activities
   - Monitor only
6. Budget and schedule
   - Labor: marketing staff percentage of time
   - Labor: technical/management/design staff percentage of time
   - Expenses: conferences, training, press activities, social media campaign
   - Operational needs: training, tool development, etc.
7. Monitoring
   - Tools and check-in schedule

"BUSINESS DEVELOPMENT" OR "CLIENT CARE"?

Another area of confusion in both terminology and definition is in "Business Development" (BD) and "Continuous Client Care" (CCC). While there is a significant overlay of activities, "business development" as used in this article defines forming and maintaining person-to-person relationships with the specific goal of obtaining future projects. "Client care" is used here to describe a range of activities undertaken with existing clients on current jobs to create more effective working relationships, successful and profitable work, and greater likelihood of repeat work.

Both BD and CCC benefit from

- Education, training, and discovery regarding the differences between individuals, what they enjoy and don't enjoy; how they process information, make decisions, and act under stress; and what their jobs specifically demand in terms of information and process

CCC programs build on this and can include

- Starting projects with discussions or workshops to establish team communication guidelines and process (this is similar to much of the content of "partnering" sessions)
- Creating and implementing a firm-wide process for regular and formal project check-ins with the clients, both during and after the project
- Techniques and activities for building teamwork on a diverse project team

Channel Aspiration

The details and specifics of the operations plan and marketing plan address the totality of the firm and how strategy is being executed. this step is about the action plan, where the goal is to highlight the most crucial deliverable components and inspire everyone in the firm to live the plan daily. The action plan is composed of two components: energy and specificity.

- *Energy*: The people in the firm fuel the strategy. Most people, most of the time, want to feel part of something bigger and visionary—this might be especially true for architects, many of whom are drawn to the industry by passionate interest in design, buildings, or social change. Another way to define *energy* is inspiration, and part of the strategic plan should be tools to communicate with and energize the staff.
- *Specificity*: Specificity is another form of fuel. A key component of a strategic plan is a list of the *most important* activities to build and maintain the firm's unique vision. While enterprise and marketing plans generally have fixed components with only some information that changes from time to time, the action plan is a few pages, and very current, comprising specific deliverables with specific due dates.

An effective action plan format ties very specific assignments of who is doing what task when, to the "bigger picture" tactics and goals. Table 6.2 shows an example of one from "Acme Architects."

TABLE 6.2 ACME Architects Action Plan

	Goal(s)	Strategy	Task	Lead	Date(s)
	HR/Communications				
A	Increase staff retention Key Performance indicators	Celebrate promotions.	Clarify process for communicating promotions (including quarterly and e-mail).	SM, JA	6/30
		Increase senior leadership visits to field.	Suggestions for senior leadership visits to field (especially projects not "theirs").	JB	5/31
		More closely support/monitor employees during their first nine months.	Define process for RMT checking in on new employees (so they're not isolated).	PO	6/30
	Operations				
B	Increase revenues and early "upstream" exposure to clients.	Establish service department.	Develop plan for service offering and operational structure.	JA	6/1
			Distribute and comment.		7/1
			Approve.		
C	Build company "lessons-learned" knowledge.	Expand on project recap/report (from retreat) and complete as projects close-out.	Develop standard format/ form.	KG	✓
			Communicate with Project Managers and others.		6/31
			Monitor with project close-outs.		
	Marketing				
D	Increase interview hit rate.	Conduct presentation skills training.	Work with consultant to develop training and practicing needs.	PO	
			Identify external providers and internal resources.		
			Identify participants and schedule training.		6/30/07
			Training complete.		

PART 2: FIRM MANAGEMENT

Audit Performance

Just like a routine physical with the doctor, the firm stays healthy and identifies challenges through honest self-analysis, ideally before issues become "diseases." The goal is to put in place a set of measures and a regular check-in process, to continually ask, "How are we doing on our strategy?" An audit performance report card will measure key performance indicators (KPIs) addressing the four key components of strategy (as noted below). KPI audit and analyses may lead to adjustments and refocuses. Client targets may be altered (perhaps due to unforeseen market changes) or operational efforts doubled (such as bringing in a BIM consultant to help create a firm-wide BIM education series). An additional benefit of auditing is that it really begins the next strategic planning cycle, since evaluation of KPIs can generate the next round of "Discovering Potential."

Perhaps most important is creating and testing KPIs so that what is being measured is significant and indicative of what the firm leaders see as measurements of success. Don't just rely on traditional or accepted measures; for example, focusing too much on financials rather than whether the firm is truly living its strategy.

Objective measures of *soul*, how the firm is living its mission/vision/values, may seem counterintuitive: How can an objective formula measure something that is inherently subjective? For one firm a core value is "distinct solutions" for every project, and they measure it by asking at project close-out, "What appears in the project that never has previously in one of our designs?" While this objective approach doesn't fully address success to an MVV component, the value of the measure is as much in the *discussion*—really forcing participants to define what is meant by value, and measuring not so much for the statistic but for the rigor of testing and verifying, and for continuing the discussion.

Operational plan metrics are the more traditionally understood KPIs. The following is a limited list of examples:

- Project profitability
- Company-wide overhead rate
- Staff utilization
- Employee turnover
- Revit utilization (or transition into any new process or paradigm)

Following is a range of *marketing plan* metrics:

- Market share (firm's portion of total fees in a defined market)
- Total net fees and profit per market and trends over time
- Proposal short-list rate (short lists/total competitive pursuits)
- Interview selection rate (selections/total short lists)
- Direct award work (percentage of new work fees acquired without any competition)
- Marketing budget vs. actual
- Significant new client contacts (new relationships with real potential jobs current vs. last period)
- Public relations (PR) targets and results (number of mentions, placements, articles)

Since the *action plan* includes specific details of "who is doing what task when," auditing is a simple review of those tasks.

Quarterly check-ins are excellent forums for leadership to gather, remind themselves of key strategic goals, and review these KPIs.

CONCLUSION

There's an ongoing conundrum with strategic and marketing planning: while it is important to understand the whole process, it's also important that strategic planning doesn't bog down in that process. Here are some pointers to effectively adapt what's described in this article:

- First, use this model and terminology to define the process.
- Next, use the process diagram to assess what information and tools are already available and what might need to be created.
- Potentially, start with some easy activities to build commitment and excitement.
- Look for ways to pull in different voices for broad buy-in and wider views.
- Don't worry about being "done" with all the components of the plan: Understand the process so it's clear what was completed and what wasn't.
- Consider content more important than graphics.
- Finally, be realistic in the schedule. Keep the process tight to maintain momentum and build excitement, while allowing time for research, reflection, and reasoned decision making.

6.3 Public Relations and Communications

Michael J. Reilly, FSMPS

Communicating a firm's distinctive value, experience, and personality in a memorable way is essential to growing the business. Armed with the right strategy and message, design professionals can (1) chose the communications channels best matched to their target audience, and (2) create marketing content to attract, inspire, and converse with the right clients.

Communicating with client audiences was once a straightforward process with just a few options to promote a company's message, ideas, and experience. To reach prospects and clients, "outbound" marketing pieces—newsletters, postcards, brochures, press releases, and white papers—were produced and sent. Ads and directory listings were placed in client-read publications. Then e-mail marketing arrived to add another communications vehicle, followed by a new set of digital channels including online video, blogging, micro-blogging, webcasts, e-books, and the 24/7 online dialogue of social media engagement.

With an ever-growing array of options for communicating, and fast-changing client preferences for receiving a firm's messages, a strategic and planned approach to

Michael J. Reilly is principal consultant with Reilly Communications, a public relations and content marketing firm based in Boston. He is a past national president of the Society for Marketing Professional Services, an adjunct professor at Boston University, and a recipient of the Weld Coxe Marketing Achievement Award.

public relations and marketing communications is needed for architects seeking to set their practice apart from the competition.

DEVELOPING A COMMUNICATIONS PLAN

For the same reasons a building is designed before it is built, investing some time in developing a communications plan will provide multiple benefits and avoid confusion over the firm's message.

Besides the obvious benefits of setting priorities and gaining consensus, planning for communications and PR can provide unexpected gains. For example, while brainstorming how to publicize expertise in designing college dining facilities, someone may see the opportunity for a stronger promotion campaign if research is conducted with students whose dining fees pay for campus food services. Another firm with mission critical facility experience may seize the opportunity for mutual benefit by teaming with a client to pursue speaking appearances on data center planning.

The secret is to keep the planning part simple. One or two pages, done with precision and purpose, can be more valuable than the big three-ring binder on the shelf. Build the exercise around a few vital questions. Work together as a group to answer the questions and explore options. If a marketing and business development plan is in place, use the work already done on that plan to inform decisions on communication and promotion objectives. Questions to get started include the following:

- How does the firm want to be perceived? What does it want to be known for?
- What values, attributes, and specific personality fit the firm the best? Make a list of the words describing these characteristics.
- What type of work does the firm leaders and staff love to work on—and want more opportunities in?
- Is there sufficient growth in this market type in the next two to three years?
- What is it that the firm leaders do, know, or hear from clients that is valuable to share? Is this any different from what the firm's competitors do/know/hear?
- How do clients in the firm's market learn about architects, capital expansion, and buildings? What organizations do they rely on, which publications are they reading, and what online resources have their attention?
- What are the opportunities to communicate knowledge of innovations, cost strategies, design, and technology to help position the firm as a provider of choice for architecture and planning?
- Do the firm's current tools—website, social media pages—tell the right story?
- What are the stories the firm tells when citing examples of its work and success as a firm? What do these stories tell the firm about its message and about what makes it different?

Take the time to work through these strategic questions. For many firms, some primary or secondary research is needed before they can be answered. Client research, conducted by firm staff or an outside consultant, will provide powerful insights on the true strengths and outside perceptions of the firm.

Put Actions and Assignments in Writing

Once the marketplace and strategy questions are answered, and competitive advantages in key client markets are identified, it's time to define tactics. Map out the specific topics, audiences, and communications vehicles to integrate into a marketing program. Use an easily shared tool to list these and to assign responsibilities. Table 6.3 shows an example of a basic spreadsheet tool for planning and tracking communications activity.

TABLE 6.3 Basic Spreadsheet Tool

Client Market	Topic/Expertise	Opportunities/Actions	Person Responsible and Timetable
55+ residential development	Designing for empty nesters	Interview clients on trends and in-demand features/amenities. Review secondary research on buyer preferences and behavior. Blend this research with our design experiences into a how-to article and presentation.	Peter D to lead client survey and secondary research (by 9/30) Marketing team to identify social media, speaking, and print publications to target (by 9/30) Joan M to write initial article with help from PR consultant (by 11/1)

Set specific goals and measure results, preferably every quarter. Examples of specific goals for a communications and public relations:

- Make two speaking appearances at national health care conferences in the next year.
- Research marketplace trends; write and publish one regional and one national article on "Design for Empty Nesters" in the next 18 months.
- Support/communicate publishing and speaking with social media postings online via Twitter, LinkedIn, and YouTube.
- Create two-minute online video on low-cost, high-impact renovations for commercial properties.

Fundamental to communications planning is identifying what makes the firm distinctive, and how to express these qualities to differentiate it from the competition. Business strategist and author Scott McKain summarizes the differentiation quandary this way: "In professional services, the clients making the decision are not making it very often. What do they need to know about your company? If you can't talk about the distinctive parts of your service, the client has to decide on price" ("A Conversation with Scott McKain," *SMPS Marketer*, June 2011, interview by Mike Reilly). Showing a firm's distinctiveness and value provides all clients, experienced or not, with the information needed to make an informed choice.

WEBSITE CONTENT AND DESIGN

The single most important source of information and inspiration for clients is the firm's website. What was once designed and produced as an online brochure is evolving into something much different. The best websites integrate social media content, video, and blogs. This integration of social media channels into the company website is changing and building upon past conventions, making websites more dynamic and helping them earn higher search engine rankings on Google, Bing, Firefox, and other search engines.

Outside-In Thinking

When determining what should be included on the firm's website, the best starting point is to ask, "If I am a client searching for an architect, what would I want to know?" (See Table 6.4.) By taking this outside-in approach, interesting and valuable content ideas for the site will rise to the top. When replacing or upgrading a firm's site, think of the task as similar to putting together a great meal for cherished guests. Each element (or course) should work together to enhance the experience.

Keywords: Optimize Websites for Search Engines

An entire body of knowledge exists around boosting website success with Google and other search engines. The most important step is keyword use. A keyword is a word or series of words that a client might type into their search engine when seeking

TABLE 6.4 Key Features and Considerations for Website Planning

About the Firm	Be factual, brief, and avoid clichés. Retire descriptions such as "client-driven" and "market-focused" in favor of authentic information about the firm.
Staff	Websites should celebrate the firm's creative talent. Clients relate to people rather than things. Showcase company culture, including community engagement, mentoring, and teaching.
Portfolio	Select a cross-section of design work; include client testimonials when feasible. Be careful not to slow down load time with image-rich pages.
News	News is one of the most visited pages; site visitors want to see anything new and newsworthy. Write news items in straightforward, objective style.
Blog	Blogs are an excellent thought-leadership tool and search engine optimization strategy, yet not for everyone because of time commitment to regularly update.
Knowledge	If blogging is too demanding to pull off, a knowledge center page with advisory pieces, published articles, and best practices is a smart option.
Social	Integrating social networks with the website helps increase followers to Twitter, LinkedIn, and Facebook and makes it easier for clients to find the firm. Social tools also help drive traffic to the main site.
Careers	Describe for potential employees what is appealing about working at the firm. List open positions and update listings frequently.
Community	Philanthropy and community engagement activities show the flip side of design excellence. If the firm has a community story to tell, why not tell it?
Contact	List a real person and his or her e-mail address; people are reluctant to use a generic "info@" address. Be sure to include the company phone number(s) in an easy-to-find location.

architectural services. These keywords are not the company name, rather what the firm is and what it does.

For example, if a firm's design specialty is laboratory renovation, use "laboratory renovation" on the site and in the captions of images placed on the site. Words like "architecture" or "renovation" or "planning" are too general and prevalent to be factored into search engine rankings. The more often a word is searched on, the more

ADVICE ON WEBSITE CONTENT, NAVIGATION, AND DESIGN

Mark Guarino of Guarino Design in Cambridge, Massachusetts, knows websites. Trained as an architect and working as a graphic designer, he has designed sites for several design firms and other professional service companies. He shares his insights on the ever-changing nature of websites:

On content: "Most clients are often more interested in the process behind a great project rather than seeing only beautiful photos of the finished work. Fortunately, today's websites are flexible in design, able to accommodate a variety of formats and features showing a firm's work and personality. A video walkthrough of a new construction site or an e-Paper feature showing a firm's thought leadership are two examples of the ease of adding content. The content management tools support these updates, and integrate well with social media."

On design: "Web design is no longer about creating static, structured designs. Instead, we are adapting websites to be interactive with the devices displaying the site, smartphones and tablets especially. This has changed the programming side of web production, and made a lot of existing sites obsolete. It's no longer an online brochure, it's a platform for online dialogue."

On navigation: "While content and features change, we still have a standard set of navigation headings that people are familiar with and expect to see. If you try to be different by introducing something new, you make it harder on any visitor. Stick with the familiar headings: About Us, Portfolio, News, Contact Information."

Guarino advises against loading too much information onto the site. He often encounters clients determined to include every project. "Be selective," he says. "With digital communication, less is more."

competitive it is. Look for less competitive keywords that describe the firm's expertise: *urban planning*, *theater design*, and *multifamily housing* are examples of specific keywords.

There are a number of different tools that can be used to determine the competitiveness of a specific keyword as well as suggest keywords. These tools include the Google Keyword Tool or Internet marketing firm HubSpot's *Suggest Keywords* feature in its software's Keyword Grader tool. To optimize the images on the site and have them appear in Google images searches, caption the images and use keywords in the captions.

According to search engine optimization experts, the best advice to improve a website's ranking is to regularly create and publish new content. Google's web crawlers reward fresh material postings and are programmed to reward websites that update postings frequently. Blogs and other social media integrated with the firm's website are ideal for providing such new material on an ongoing basis.

SOCIAL MEDIA AND DIGITAL COMMUNICATION

When social media content first began to show up on YouTube, LinkedIn, and blogger sites, some wondered how important social media would become for clients. It did not take long to realize that social media communications done right—interactive, entertaining, and educational—provide an opportunity to influence new and existing clients. (See Table 6.5.)

A second and equally important opportunity social media offers is inbound marketing. Inbound marketing is based on the premise of drawing clients into a dialogue, helping them with information they can use, creating content they value, and building credibility for the firm by showing an advanced understanding of client needs and problems.

The term "inbound marketing" was coined by Brian Halligan of HubSpot in 2005. The concept behind it was explored and advanced by Seth Godin in his book, *Permission Marketing: Turning Strangers into Friends, and Friends into Customers* (Simon & Schuster, 1999). Both intended to contrast the more interactive and content-rich marketing activities with long-established, conventional outbound marketing methods such as cold calling, advertising, newsletters, brochures, and mailers. The message and content of purely outbound tools focus on the features of the company (*Hey, look at me!*) instead of providing information of importance to the client. These methods require an interruption to be seen or heard, rarely justifying the interruption with any value. Consequently, clients tune them out.

The emergence of social media and inbound marketing methods can be expressed as a *pull* strategy, as compared to the *push* of outbound methods. Social media tools allow clients to connect to firms on their terms, and at their option. Two things make social media and inbound marketing particularly applicable to architects:

1. *Design is a consultative business*. Integrating digital communication tools and using them to converse online with clients and prospects is a natural extension of the advisory skills used every day by architects. Presenting creative options to a client, teaching young staff members, and sharing insights with engineers and builders require a similar shade of the critical thinking needed to create lively online content for blogs.
2. *Clients are using the web to find experts*. Clients manage projects involving high dollar value, long buyer research cycles, and knowledge-based service delivery. As explained by Halligan, "In these areas, prospects are more likely to get informed (through social media) and hire someone who demonstrates expertise."

Social Tools

The fundamental shift from strictly promotional communications to a more educational and helpful dialogue is occurring for three main reasons:

- Traditional marketing methods based on promotion (all about us) are expensive to produce and increasingly ineffective.

- Clients are seeking information on the Internet early in the process of short listing and selecting architects. Conventional websites are part of this online presence, yet proving firm expertise with relevant online content in addition to the website is an effective strategy for being found.
- As generational patterns evolve, a demographic shift is taking shape within the decision-making process. Building trust online and in-person is increasingly expected, sought, and valued.

The conversation on social media is shifting from questions about business value, client use, and return on investment to mastering and managing its implementation. Identifying who participates, and how much oversight there is on individual postings, is a frequent dilemma. Many firms are also challenged to find the time to create content and keep up an online dialogue. (Is there any marketing or business development action where time is not the big challenge?)

In response, architecture firm leaders are implementing a long-term social media strategy. They are nurturing in-house correspondents, developing new resources inside and outside the firm, and producing engaging social content.

TABLE 6.5 Social Media Advantages and Challenges

Tool or Site	Advantages	Challenges
Twitter	Immediacy, simplicity of use, transparency, popularity Potential reach is unlimited Particularly valuable to follow (and be followed) by editors and online journalists/bloggers	Need to decide on an individual or firm voice and be consistent Requires ongoing monitoring to ensure fast response to tweets Creating a strategy for what is appropriate content for Twitter
YouTube and Vimeo	Video is the fastest-growing source of information on the web Ability to visually capture the personality, culture, and cool stories of a design firm Capability to set up a distinct channel for the firm and direct web traffic to and from it	Determining the level of video and studio production for the audience Keeping videos short enough for online viewer to stay with Choosing the right individual(s) to feature in on-camera roles
LinkedIn Groups	Ability to join and become a contributor to LinkedIn groups within a firm's client work sectors Ease of finding individual clients and decision makers, and ease of them finding the firm Ease of extending personal network and staying in touch with past clients	Assigning responsibility for tracking LinkedIn activity in key groups Following the high volume of updates and postings Educating all staff on how to use LinkedIn for business purposes
Company Blog	Ideal method of establishing and reinforcing thought leader position Ability to easily link audiences to blog from other social media Ease of posting video and images within blog Opportunity for comments and dialogue	Maintaining frequent postings to keep it from becoming a negative Keeping a consistent voice and style Avoiding all-about-us syndrome
Facebook	Ease of posting images and updates Large volume of users and interconnectivity across Facebook platform Potential home base for internal communications and info sharing among staff of firm	Better suited for consumer-based companies than professional services Need to monitor and quickly respond to messages Need to regularly update

Media Relations and Getting Published

Adoption of social media and access to social channels for self-publishing provides new depth to public relations. Regardless of their size, firms are in an era that offers many options for communicating their stories. Working with editors, reporters, and broadcasters to earn coverage in magazines, newspapers, and journals (and their online outlets) is an ongoing activity performed by the marketing team and firm principals, sometimes in collaboration with a public relations firm.

Earning coverage and building a relationship with the press requires two things: (1) a targeted approach to the media, and (2) a compelling story to tell. Here are four steps to take to increase success in gaining the respect and attention of the media.

Public Relations Planning

- *Start with two questions.* "Where are we looking to grow revenue in the next twelve to twenty-four months?" "Which markets are on the rise?" Focus the PR time there. Not only are editors more interested in growth sectors, there will simply be more stories and PR opportunities attached to any sector where clients are spending money.
- *Be selective.* Tie PR actions closely to marketing goals and objectives. Trying to cover too many areas—and trying to keep everyone happy at once—is nearly impossible.
- *Go beyond project PR.* Zero in on specific topic areas where the firm can show expertise. Editors are more interested in trends, topics, business change, and economic impact than they are in projects. Telling the "back" story behind the project success increases the odds.
- *Cross-pollinate.* When planning, take the opportunity to repackage the stories and topics developed for media outreach with social media publishing. The summary of the firm's best thinking on zero-energy buildings submitted to a client publication can be put to work right now as a blog post.

Targeting

- *Build a media list.* Contact information for target publications can often be found in the "About Us" or "Contact" pages of their websites. A better source is one of the commercial media directories. Like most other fields, journalism has a high rate of staff movement, so verify names, titles, and contact information using LinkedIn, Twitter, or web searches.

If the budget for purchasing a list is limited, check the local library to see if they have online access to a media directory. There are some free online resources, including Yahoo's media and news directory.

- *Review editorial calendars.* Each publication provides a calendar of the topics and feature sections they are planning to cover in each issue during the calendar year. Look for topics related to the firm's work and clients.
- *Read the magazines.* It sounds simple, but a frequent complaint of journalists is being sent pitches and news releases that are not related to what they cover. Take the time to learn how or where a story may (or may not) fit. Each magazine has its own philosophy for considering stories. They may have different slots within the publication: guest editorials, case studies, news sections, and feature pages.
- *Review past coverage on the topic.* Find out what reporter or editor writes on the firm's business or clients, and understand in advance the publication's expectations for article and author submissions. Take the time to learn how to fit the pitch into the unique needs of the target publication, broadcast outlet, or blog.

Yahoo Media Pages: http://dir.yahoo.com/News_and_Media.

Burrelle's Luce Media Directories: http://www.burrellesluce.com/.

The A/E/C Publicity Directory: http://www.fuessler.com/pub.html.

Gebbie All-in-One Directory: http://www.gebbie.com/.

Thomson Reuters MyMediaInfo: https://mymediainfo.com/index.html/.

Each publication has a unique purpose and focus, and most of their stories relate to that editorial focus. For example, *Urban Land* magazine covers development economics and commercial real estate trends throughout the world. A local retail project debut, unless it includes a first-ever application of a new idea, will not be relevant to their editor. It will be relevant to the community press outlets, however.

With any target publication, research whether a particular target publishes news release information, whether they accept contributed articles, how long the publication lead times are, etc. Of central importance is learning who among the editors, reporters, and broadcasters covers the particular beat/topic the firm is pitching.

Last, validate the research by finding out what publications the firm's clients read and follow online. Each market sector offers several trade and professional journals, association newsletters, online and print magazines, blogs, and news sites. Ask clients, and in-house client ambassadors, which publications are most read and respected.

Contacting the Media

Because so much of what journalists see from those who pitch them is poorly conceived and poorly targeted, taking time for due diligence will open up opportunities that others will likely miss. A thoughtful approach, informed by front end planning and targeting research, provides an enormous advantage when contacting the press.

When asked for advice for marketing professionals who want to land their firm on the pages of his monthly magazine, *ARCHITECT* editor-in-chief Ned Cramer was quick to suggest taking a deeper view: "We are obviously interested in design quality, but we are more interested in how a firm was able to achieve it. We like to see something remarkable on the process behind projects, the collaboration, technology and teamwork. How the architect arrived at the solution is more exciting than to just see the solution alone as an image. It's about the storytelling process, getting beneath the surface. Focus on the back story."

- *Calling vs. e-mailing*. Most daily journalists are under time pressures that make it difficult to spend a lot of time fielding calls. E-mail, perhaps followed by a brief call to see if the suggestion is appropriate, works well. Editors with monthly publications are more open to a phone call. Always ask up front if they have time for a brief conversation. If not, schedule another time with them for the call.
- *Brevity works best*. The volume of e-mails and phone messages editors receive can overwhelm their ability to review and respond. The best advice: get the message across quickly. If they are interested, there will be ample opportunity to send additional information. A well-composed paragraph or two, accompanied by a low-resolution photo, will in most cases provide enough information.
- *Try to build a relationship first*. Know their preferences and what they write about. Follow them on Twitter. Try to meet face-to-face. When talking with a journalist, ask for their advice on developing the story idea. Be patient—the topic may not fit their needs today, but may be perfect a few months later.
- *Be honest*. Identify potential problems up front. If client approval for publication will be slow in coming, or there is a community issue such as NIMBY, make sure the editor knows. Waiting to reveal bad news can jeopardize the current story, and undermine the goodwill needed to get the next story published.
- *Discuss expectations and exclusives*. If a story is being pitched to multiple publications, let the editor know. The weekly *Boston Business Journal* has little interest in a story that may land on the business pages of the daily *Boston Globe*. Most editors want to be the first with any story, so a candid discussion on exclusivity helps everyone.

Following Up

One of the questions most often asked about media relations is how to follow up on pitches and press releases sent via e-mail. While each situation presents a set of unique conditions depending on the relationship, there are some basic guidelines to follow.

Never call an editor and ask, "Did you get my press release?" If it didn't bounce back, they got it. With feature article pitches, a brief e-mail or phone call two to three weeks after sending the pitch is appropriate, and is a courtesy to the editor who may have lost track of the pitch. Keep the follow-up short, and acknowledge their busy schedule in all communications.

Do not conclude that there is zero interest just because there is no response. It may be simply a back burner topic for the target journalist at this time. Look to connect by phone or e-mail before drawing any conclusions.

If there is no interest, thank the editor for taking a look and ask what kind of stories he or she is seeking at this time. Asking questions is the absolute best PR tactic. If there is interest, learn what the ground rules are for publication. Do they need an exclusive? How likely is it that the firm and client will be named in the article? What do they need for images, and when?

TRANSLATING PROJECTS INTO COMPELLING STORIES

My uncle Bill knew how to tell a great story. His secret: an instinctive ability to zero in on precisely what his audience most wanted to know. By drawing you into the story and relating the narrative through your experience, he made it personal and memorable. These same skills can be put to work when we communicate about projects.

Keep in mind the one irrefutable fact about the projects you communicate in presentations, proposals, websites, and articles: The audience isn't necessarily interested in someone else's story. They are far more interested in their story. So we all need to be more like Uncle Bill and make it theirs by keeping it personal, brief, and entertaining.

Three suggestions to translate a project into an effective story:

- *Find the conflict.* At the heart of every famous story in literature is controversy. For design firms, the conflict is most often rooted in the overarching problem the client faced, the doubts about a proposed solution, or the risk faced by the team if a project failed. Solutions are only meaningful when the stakes are high.
- *Import the voice of the client.* Without the client's perspective, a project story is one-dimensional. It's me telling you what a great job I did. Use the client to elevate the urgency faced. Ask the client to say how your firm's accomplishment helped them improve their business, change their culture, or fulfill their larger mission.
- *Start at the end.* Instead of recounting the experience from initial engagement through project closeout, start with the outcome. "Here's what we learned on that project" is an inviting way to begin the conversation.

Design Awards

For design firms, winning awards positions the company as an innovator, expert, and problem solver. Awards for architecture advance the firm's design standing, differentiate, and foster recruitment. A coveted award win also boosts morale, thrills clients, and recognizes the often unheralded role of the architect in the success of a project.

But first the firm has to win. The first and most important action to take is to decide whether the award is winnable. A rational, researched go/no-go process is essential. It should be just as thorough as the one used to decide on project pursuits.

Scrutinize the criteria to make certain the project matches up and will earn high scores across the board. Look at last year's winners and compare them to the proposed entry. Will there be a single winner in each category or multiple winners recognized? Review the jury names if available. Are these jurors, based on their background, knowledge level, and pedigree, more or less likely to fall in love with the entry? Last, consider whether winning this particular award advances the strategy and standing of the firm. Would winning help the firm's business development efforts by increasing reputation?

If the award is winnable and fits a strategic purpose, it's time to get to work on creating the best award entry possible. Suggested approaches and actions that will help separate a firm's entry submission from the competition:

- *Find the big idea.* To rise above the competition, an award entry needs to answer one tough question. "Why should others care about this?" Start the process off by answering that inevitable jury question. Quiz the client about the value—the *real* value—that the design or team delivered. Identify and quantify all measurable benefits: to the community, to the environment, to the profession. Make sure the entry is memorable.
- *Reach out to insiders.* Talking with past jurors and past winners will offer valuable insights and help plan the approach and format. Ask for their advice on what makes the difference between winning and losing, and what mistakes should be avoided. Ask the sponsoring association staff or publication editors if it is possible to review past winning submissions. Most people are willing to help, but have to be asked.

▶ See the backgrounder accompanying this article, Commissioning Architectural Photography, for a detailed discussion of how to get great images.

▶ Qualifications, Proposals, and Interviews (6.5) addresses preparation for proposals and other competitive processes.

- *Invest in photography*. Great photography is often the most important factor in winning awards. Award competitions exist to provide compelling content for a magazine, or to enliven an awards dinner during an annual conference. Images help tell the story to the jury and to subsequent audiences, especially for complex planning, architecture, and construction outcomes. This is a visual age, and every contemporary audience is visually sophisticated.
- *Plug the gaps*. Every award entry has a weak link. It may be the graphics and the illustrations on hand. Often it's the writing to support the project's goal, big idea, obstacles overcome, and impact delivered. If the goal is to win, these weaknesses have to be addressed. Bring in graphic design, illustration, or communications help to work on the entry materials and plug the gaps.
- *Energize the "voice" of the entry*. Most award text is written like a history book. Though factual, this plain style of writing can be fatal in a jury room. If the entry reads the same as the others—with no distinct voice or differentiation—it's easy for the jury to dismiss it. Energize the package by using interesting quotes from clients, team members, end users, etc. Frame the message by providing some tangible research data or excerpting a news article supporting the firm's message. Use active verbs. Edit, rewrite, and polish until the piece comes to life.
- *Make it user-friendly*. Make it easy for any reviewer to quickly find and align entry responses to selection criteria. Draft a simulated score sheet based on the criteria provided in the call for entries. Leave plenty of white space, use inviting and elegant packaging, and introduce bright graphic elements as a navigation device throughout. Before submitting the entry, enlist an objective and trusted reviewer to test how effective and accessible it is.
- *Hire a proofreader*. Typos, font use errors, or grammar miscues can sink even the strongest entries.

One last word of caution: Start early. Allowing adequate time to strengthen the entry, polish the text, produce better visuals, and secure client quotes will often mean the difference between disappointment and celebration.

Marketing Communications and Promotion

Firm promotion encompasses an array of external communication formats, with the shared purpose of reaching a client audience to educate, inform, persuade, entertain, and inspire (see Table 6.6). These can be either analog or digital communications, or some combination of the two.

The goal with these campaigns should be to avoid the "all about us" trap and create promotions that tackle client issues, needs, and challenges. When based in the client's

TABLE 6.6 External Communication Formats

Promotion	Advantages	Challenges
Postcard mailers	Easy and inexpensive to produce Work well as a campaign series Less likely to be left unread in the recipient's inbox; simple to read Easy to track delivery rate through tracking returned cards	Message needs to be succinct Not a distinctive or memorable format in most cases; can be seen as bland No interactive component unless offering an incentive to reply
Client research and surveys	Multiple uses for acquired research; use across several channels and forums Effective with clients, especially in research-based sectors including education, health care, technology Opportunity to partner with clients on the research or at least as participants in the research	Commitment of time and careful thought into objectives and desired research findings Creating a survey or questionnaire tool that is long enough to capture meaningful data but short enough to encourage participation Choosing the best method for information gathering; building a sufficient size of the sample pool

Promotion	Advantages	Challenges
White paper	Works well for research and other substantial content Ability to format for digital viewing Ability to offer paper for download via the firm website; capture leads by having visitors sign in with contact information	Requires a big investment of time to research and write; needs research Frequently used format in B-to-B marketing; may be seen as a commodity
E-mail campaign	Easy to manage using e-mail services such as Emma, Constant Contact, MailChimp, and iContact Ability to segment clients into specific sectors and customize Integrates well with social media Efficient tracking of data via bounce-backs of e-mails sent	Most effective when focus is on the client's world and solutions offered; too often it's seen as spam because of a purely promotional message Need to have a quality list; list needs to be segmented by client type Campaign e-mails need to reflect a memorable theme or big idea to work
Brochure	Helpful overview for clients of firm capabilities and experience Ability to hand over impressive printed piece to client at a conference or after an interview Digital printing allows for small quantities to be printed	Often replicate the information on the company website Time-consuming to plan, design, and produce Can be of low value to client if the content and message is primarily about the firm and its projects
E-paper or e-book Market-specific brochure or book	Ability to combine images and text in a flexible, modular piece Opportunity to showcase a deep expertise with a particular building type, technology, or process Well suited to use across channels and easy for others to forward to colleagues Opportunity to team with clients on content within the piece	Requires a high standard of visual appeal and graphic impact Requires a deep knowledge base in the subject area; not the right tool for every firm

world and providing value to encourage a conversation or an opportunity, their effectiveness is clear.

SPEAKING TO CLIENT AUDIENCES

One of the most effective ways to prove expertise and expand reputation beyond the region is to speak in front of client audiences. In addition to the opportunity to impress a group of clients, the entire firm benefits by virtue of the selection to speak and its implied endorsement of the firm and the speaker on the program. Here are a few steps to increase the odds of selection as a conference speaker:

- *Find the right podium*. Conference organizers post a call for speakers on their websites anywhere from 6 to 12 months in advance. To research possible audiences for a topic or specialty area, an excellent search engine is available at www.asaenet.org. Maintained by the American Society of Association Executives, the site provides a searchable database of professional associations and trade groups by keyword. Click on the "Community" tab on the ASAE home page and select the "Gateway to Associations" option.
- *Nail the topic*. Once a target audience is selected, look at the conference theme and take the time to talk with conference organizers. Ask questions: What sessions drew the largest audiences last year? Do they have member data available to help identify topics? Are panel programs or lecture formats preferred? Ask if joining is required in order to be considered to speak. A little detective work goes a long way.
- *Present with a client.* Most client associations value the experience of the end user or owner, making chances for selection much greater when the client is part of the presentation. Teaming with a client will also offer an additional reason to spend time with a favorite client.

- *Stand out.* To rocket past the competing speaker proposals, the proposal has to sizzle. Picture the selection committee plowing through dozens of speaker applications. Use active verbs and lively descriptions that will translate to a powerful conference brochure or print mailer. Get help from the marketing team or copywriter to help the package and session summary stand out.
- *Go the extra mile*. Before submitting, enlist the help of a third party—a client or a colleague—to review the draft proposal. A candid opinion on the session's relevance to the target audience is helpful. Other ideas to elevate a proposal: Add an appendix with relevant news clips and published articles on the subject or project; if available, include testimonial letters verifying speaking skills.

ADVERTISING

For design firms seeking to influence a broader audience or enter a new geographic market, intelligent use of advertising can advance marketing and sales objectives. By adopting a smart ad strategy, and communicating a firm's distinct value through a well-conceived message, advertising can be a good investment.

Given the high cost, firms should have a clear objective and strategy behind any ad buy. Resist purchasing ads in response to a one-time bargain opportunity, or as a reaction to what competitors are doing. The key to advertising strategy is to be highly selective in choosing the outlet. Once selected, stick with it and repeat ads as frequently as possible to achieve the highest impact. One-time ads are easily forgotten; to be effective, repetition is key. Be strategic and follow a few lessons learned by others:

- Before committing, make sure the ad placement aligns with growth objectives for the target audience. It is better to focus on the so-called "vertical" ad vehicles—the trade and professional publications with a verifiable readership consisting of real clients and prospects. Resist the temptation to display ads in more "horizontal" publications, which reach people who are not in a position to hire or recommend architects.
- With the competition for advertisers greater now than ever, look for an ad placement that offers value-added benefits beyond just the ad itself. Keep in mind that publishers and client associations are producing trade shows, hosting awards programs, maintaining high-volume websites, and managing subscriber or member databases. This valuable mix of products and services allows the potential advertiser to be creative in negotiating a partnership deal as part of the ad contract.
- Underwriting in partnership with the local public radio station can be helpful in reaching decision makers and keeping the firm name front and center with a large audience of existing and past clients.

COMMUNICATING IN SPECIAL SITUATIONS

The flip side to ongoing and planned communications is the special or often unexpected event requiring outreach to clients, employees, and the public. Although it is difficult to prepare for every potential circumstance, some thought and scenario planning can be helpful.

- *Crisis communications*. Events from natural disasters taking down office operations to an incident of workplace violence can overwhelm even the most experienced company. The best defense against being caught unprepared is to develop a crisis communications plan that covers a number of potential scenarios: accidents, lawsuits, negative press, employee wrongdoing, and others. An important element of the plan is a clear chain of communication to quickly put the key firm leadership in touch with each other and with staff. Assigning a single point of contact for communicating with the press, and having a playbook for that response, is crucial.
- *Mergers and acquisitions.* Even though mergers and acquisitions have a far greater lead time than other events in this group, the risk of miscommunication is high. A plan for communicating the merger, including exact language on the impact on employees,

the continuing operations and service for clients, and the plan for any change in name, needs to be carefully worked out and agreed upon by the two parties. A news release and internal announcement, prepared in advance and containing the facts of the merger or acquisition, is a key part of this planning. Anticipate every possible question that a reporter, client, or employee could ask, and prepare the answers in advance.

- *Firm omitted from story on project design or construction*. This familiar scenario is repeated all too often in the mainstream and business press. Unfortunately, the name of the architect is frequently omitted from a new project story, even when one of the firm's renderings is used as the lead visual in the story. And once the story is published, there is little a firm can do to correct the oversight. One option is to write a letter to the editor, not to complain but to praise. Compliment the coverage of the project, mention something else of interest that was not in the story, and identify the project design team. The best action is to try to prevent the omission from happening before anything is published. Include a clause in the client contract that any use of project renderings and images be credited. Talk with the client in advance of any project milestone, and ask that they include the firm in any of their press releases and announcements. Do the same with the builder and other project team members, and pledge to include them in return.
- *Negative review of design work*. Whether appearing in the metro daily newspaper or in an online blog, the negative review is a painful and unexpected jolt. Deciding on whether to respond will be based on what the criticism is, whether the review information is correct or not, and how damaging the review is to the reputation and integrity of the firm. A letter to the editor (in the case of traditional media) will help to correct any errors or misconstrued reports in the review. A reply to an online review, pointing out anything that was missed or incorrectly stated, can help to mitigate the damage. Two things to keep in mind: Never counter a bad review by saying the design was what the client asked for. Maintaining loyalty to the client, even if the criticism is aimed at something they insisted on, is essential. Second, realize that there are times when it's best to stay silent, and let others debate the design. Some of the best architecture ever built was met with harsh reviews when first seen.

CONCLUSION

Design practices are built on reputation. For architects, the value of communications and public relations is to strengthen professional reputation and advance a relationship with existing and prospective clients. A thoughtful, consistent communications effort accomplishes this by informing, educating, and inspiring. The mission is to convert audiences to clients.

It takes an investment of time and resources to be successful in this mission. When starting or restarting a communications initiative, avoid trying to accomplish too many actions at once. Start with practical and affordable first steps. Choose areas best suited to the firm's strengths, and best matched with the clients the firm needs to reach.

By focusing the activity and measuring results, the firm will gain experience and prepare for even more success at the next level of engagement. As everyone in the design profession knows, great achievement starts with taking that first imaginative step.

BACKGROUNDER

COMMISSIONING ARCHITECTURAL PHOTOGRAPHY: COMMUNICATING (VISUAL) VALUE

David Seide

This backgrounder will inform the architect about how to select a photographer. It will review the nuts and bolts of how an assignment estimate is formulated, including some possible cost controlling options. Finally, it will begin to suggest possible working scenarios in light of new technologies and collaborative possibilities.

Originally from Niagara Falls, New York, David Seide combines his degree in architecture from the University of Illinois with his passion for photography. His Chicago studio, Defined Space, creates distinct images of architecture that represent his clients' conceptual designs.

Shy of actually visiting a site, photography (and more recently videography) is a primary means of perceiving a place and defining what we know of it.

SELECTING A PROFESSIONAL PHOTOGRAPHER

Know Thyself

The approach to finding and commissioning a photographer is the same as for finding an ideal client. Since the photographer will be visually representing and communicating the firm's expertise, aim to hire based on what the firm represents—its identity, mission, values, and goals.

Identify Needs and Objectives

Identify what the firm wishes to accomplish with the photographs and what will be considered a "successful" photography assignment.

These goals should be in sync with the firm's communication plan. Think about how (on a mobile device, in print, etc.) and where (in an office, on the fly, etc.) the photographs will be viewed, and who the audience (potential clients, peers, etc.) will be. Strategically plan the objectives to be achieved.

A great photograph is one that's not only beautiful aesthetically but also illustrates the conceptual intent of the design. If the photographer and the firm are in sync, this quality will be evident within every photograph. A haunting example of this can be seen in Figure 6.2, a photograph of the entry to the Illinois Holocaust Museum & Education Center (designed by Stanley Tigerman) as a "guard" is directing a "visitor."

Consider Approach

Most photographers have a specific approach they prefer to follow. Some will jump right in, while others may want a meeting, a walk-through, or some time to "scout." Finding someone who "gets you" and is in tune with the firm's modus operandi is the foundation for a successful relationship. The variables that will need to be considered include experience, style, cost, and chemistry.

David Seide/DefinedSpace.com

FIGURE 6.2 Entry to the Illinois Holocaust Museum & Education Center, Skokie, Illinois

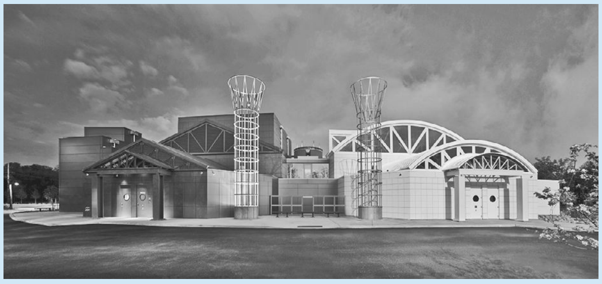
Visual Communication

Each visual representation should elucidate the project, help define the firm's identity, and position the firm's brand.

An example, shown in Figure 6.3, of the Illinois Holocaust Museum & Education Center combines three different photographs (from three different days, times, and weather conditions) to tell a unique story of that place. By combining a dusk (left) with an early morning (middle) and a bright sunny day (right), the photocomposition tells a complete narrative in one image.

Research the Candidates and Commission a Photographer

Just as each architecture firm is unique, so too are photographers. Look for someone who has the technical skills, creative capacity, and business acumen to do the job. Ask about their experience. Get a sense of their passion and enthusiasm for the assignment. Review their website or portfolio. Meet them in person.



David Seide/DefinedSpace.com

FIGURE 6.3 IHMEC Cover

ESTABLISHING THE ASSIGNMENT PARAMETERS

Assignment Description

Start by identifying the site location; a site plan can be very helpful. Next, describe the project. Is it new construction, a rehab, or an addition?

Specify the quantity of photographs to receive: exteriors, interiors, and perhaps aerials. It is helpful to supply floor plans and any sketches or renderings, so that the photographer can visualize the setting.

Time Frame

It's always best to plan for photography well in advance. The photographer will take into account not only the ideal time of day but also the most opportune time of year.

Budget and Controlling Costs

It's best to view photography as an investment instead of an expense. Still, cost is often a factor, and the most obvious means of controlling cost is by keeping the number of views as few as possible. A scout of the project often helps accomplish this—spend some time in and around the site, scoping out vantage points, looking at compositional elements, and taking into account the design solutions that were used to achieve the concepts and goals of the project. The images that come out of the scout can be discussed, tweaked, and consolidated into a final list. This efficient plan of attack crystallizes the focus of an assignment and allows the photographs to tell a complete and succinct story. Keep in mind that "photography by the pound" or a shotgun approach often waters down the story. The Miesian philosophy "less is more" holds true for photography.

From owner to architect, contractors to consultants, product manufacturers to suppliers, everyone will want use of the photographs. By sharing the costs of a photographic assignment, expenses can be spread out, making it less expensive for all those that participate.

LICENSING AND RIGHTS GRANTED (AKA COPYRIGHT)

Much like an architect's drawings, a photographer's images are considered intellectual property and are protected by copyright. The value of each photograph is commensurate with the value it brings to the user.

Pricing a License

To use a photograph, one must be granted a right to its copyright (limited or otherwise) in the form of a license. Photographers consider the following factors when calculating a licensing fee:

- *Category*: how it will be used (editorial, commercially, etc.)
- *Placement*: where it will be used (in print, online, etc.)
- *Frequency*: how often will it be seen (quantity of press run or page hits)
- *Duration*: how long will it be used (once, monthly, yearly, in an archive)

Most architectural photography licenses include a "rights package" or "bundle of rights." A good resource to further understand this is the Picture Licensing Universal System (PLUS).

Traditionally, design firms want to use the photographs for the following:

- *Trade collateral*: brochures, direct mail campaigns, leave-behinds
- *Corporate communications*: portfolios, A/V presentations, trade show displays, annual reports, newsletters, wall décor
- *In-house desktop publishing*
- *Public relations*: corporate promotion, press kits, design competitions
- *Electronic*: home website

Work with the photographer to establish a boilerplate of rights (license) that works best for the firm.

Usage: Traditional (Portfolio), Social Media, Editorial

What was once a print portfolio has evolved into electronic formats viewed around the world on handheld devices, social networking sites, and industry-related news outlets. Traditionally, rights for using photographs for promotion (a firm's Facebook or LinkedIn page) are included. However, sharing sites such as Photobucket, Twitter, FlickR, or YouTube are typically not included. Read each site's terms of service to be certain of user rights. Rights to use photographs by a third party are also typically not included. Photographs cannot be duplicated without the photographer's permission or authority. Third parties can (legally) be included in the estimate before the photography commences or afterward and license their use as stock.

Editorial use continues to be a touchy subject. The publication knows that both the firm and the photographer want to get published. However, neither a photographer nor an architect should be expected to subsidize a for-profit publication.

Creative Negotiating: "Elegant Options"

If budgets are crunched, try to identify shared interests and work together for mutual gain. Look for alternatives that offer value but are not necessarily money-based (e.g., additional work, web links, print overages, trade of services, etc.). Use creative problem-solving skills to come up with elegant options.

Photo Credit or Attribution

Just as architects like their firm to be mentioned when a building is referenced, so, too, do photographers want their work to be recognized. It is important for attribution to be present.

(continued)

The Fine Print (Terms and Conditions)

Read these carefully, as they are set up to safeguard both the client and the photographer. If unclear about certain terminology or if you wish to have something changed, be sure to discuss these issues before photography commences. Many items can be negotiated.

One item of note is client representation: The client is responsible for sending an authorized representative to the assignment. If no representative is present, the client must accept the photographer's interpretation as to the execution of the photography.

NEW OR VALUE-ADDED SERVICES

Certain viewing technologies are developing in parallel with construction techniques, and we are beginning to see them used. For buildings with moving parts (for example, retractable roofs or weather/light-sensitive skins), video is a natural medium. A skilled photographer may be able to produce clips that can add even more visual interest or understanding to the project, website, or digital portfolio. Incorporating these in a multimedia presentation can have a huge "wow" factor when pitching new business or showcasing a particular project. The production expenses for a video assignment can be considerable, but so can the payoff.

6.4 Networking and Business Development

Karen Compton, CPSM

Networking transcends relationship development and seeks to create a level of trust among prospects, clients, and business partners. This section correlates the firm's business development (sales) plan to networking responsibilities each person has within the organization and explains how to measure the firm's return on investment for these efforts.

INTRODUCTION

Networking is the most direct and effective means of developing business in the twenty-first-century economy. Yet it is the least understood and practiced tool of the design and construction industry. Most view networking as the dreaded task of talking to people about what work they have coming up. The truth is that effective networking is born out of a greater understanding of purpose. It is based on a clear definition of one's business goals, sales (revenue) needs, and the roles and responsibilities each organizational member plays in reaching them.

In fact, networking is a tool much like advertising, conference attendance, or publications, used to further advance a business objective or sales strategy. Without a clear sales plan, it is difficult to select the right tool to achieve the objective, leaving many to question the value of networking. This is often the case as receipts for meals, receptions, and conference events mount with no resultant new work or increase in potential for defined project opportunities.

Karen Compton is the principal of A3K Consulting, a California-based business development and strategic planning firm specializing in the built environment. She has more than 14 years' experience as a business development professional in the fields of architecture, engineering, and construction.

Without a clearly defined sales plan to support business objectives, networking is little more than business-financed socializing. What, then, is a sales plan? And, more important, how does networking support sales plan objectives?

ESSENTIAL ELEMENTS OF THE SALES PLAN

The basic sales plan has four essential elements:

- Sales goals
- Competitive analysis
- Market analysis (economics of the markets served)
- Marketing/communications plan

Sales Goals

It is insufficient to say, "We must win work." The vague imperative begs the questions, "How will we win work?" "When do we need to win the work?" and "Where will we go to define the work?" More important, it dooms business development/marketing efforts to failure, as it offers no clarity as to how success or failure will be measured. Sales goals, also referred to as business development goals, must set in "SMART" terms. SMART stands for "Specific, Measurable, Achievable, Realistic, and Timely." These attributes provide those supporting business development/sales with an understanding of the desired outcomes and how they will be measured.

Specific

Specific sales goals are those that seek to define a project type or project opportunity within a specific market sector. An example of a specific project goal would be a new 30,000 square foot (sf) classroom building or a 35,000 sf classroom remodel for ABC City College. Although some may argue that this is often difficult to do, having specific goals will facilitate effective networking.

Whether developing business from new client sources or from new opportunities with an existing client base, it is important to make the distinction between a prospect and a target. Many focus their networking efforts on prospects—clients that may have future work that can potentially be acquired and thereby generate revenue. By concentrating networking efforts on prospects, significant business development costs may be incurred with very little return on investment earned for the effort. Effective networking puts attention on *targets*: specific project types (i.e., classrooms, corporate yards, or utility infrastructure). By focusing networking efforts on targets, business development/sales efforts can develop questions and gather information critical to winning a specific project.

Measureable

Quantifiable goals are those that enable measurement of the outcome of a business development effort: for example, a new 30,000 square foot classroom building with a gross fee of $535,000 or a 35,000 square foot classroom remodel for ABC City College with a gross fee of $585,000.

Achievable

Specific goals must be within the size, scope, and capabilities of a given firm. That is not to say that a firm cannot reach to pursue larger and more complex projects. However, networking is effective when it concentrates discussions and pursues information on specific projects that are achievable. In the competitive industry of design and construction, few clients and colleagues want to waste time discussing or exchanging information on projects that exceed a firm's capabilities.

Realistic

There is nothing less motivating than establishing a sales goal that is unrealistic. Technical professionals such as architects, job captains, and project managers want their networking and sales development efforts to be successful. Setting unrealistic goals (i.e., $2,000,000 per year in new fees when the firm has never grossed more than $1,000,000 in a year) is not only unrealistic; it is demoralizing when the goal is not achieved.

Timely

Sales goals must have a timeline in order to support a firm's business objectives. Timeliness may be expressed in terms of month, quarter, or year. For example, a firm that requires $250,000 per month to meet payroll or $350,000 per month to achieve profitability needs to meet sales objectives on a monthly basis. Time parameters do more than provide a constructive basis for networking. Time frames provide a means of accountability by and between those involved in sales/business development and the achievement of the sales objective.

The concept of SMART goals is applicable to the pursuit of new sales as well as existing client sales and is an effective means of engaging other leaders (e.g., project managers, technical professionals) in the process of sales and business development.

Competitive Analysis

While information about the competition is readily available online—their size, services, and expertise—nothing substitutes for secondary research (questions and feedback) on users or clients. The ability to win work is directly proportionate to the amount of information available to develop a proposal and prepare for an interview. While networking is critical to gathering information, its usefulness is not limited to projects. Networking can also be critical to understanding the competition.

The objective is to understand the competition in a way that a firm would know itself, to improve proposals and project delivery. These are questions best asked of clients and others who have worked with the competition. In the pursuit of this type of knowledge, an adversarial posture will inhibit the free flow of information. It is imperative to listen and learn, not to defend or become combative. These are some effective open-ended questions:

- "I notice you've used XYZ firm. I'd like to understand what you feel they do well?"
- "We'd like to be able to add value, where do you see they are able to add value?"
- "Do you perceive that they have strength in a particular area?"

Market Analysis

It is important to understand the economics of a market sector. This information paints a picture of the sectors' available funds and level of interest in investing in design and construction. While terms like the "Billing Index" and GDP are all terms associated with the macro-economy, it is the micro-economy that is a direct indicator of architectural firms. Sources of information such as local economic development corporations, annual reports, capital improvement plans, and programs for institutions, legislative allocation, or bond funding all give rise to a clearer picture of how a market sector such as education, health care, or housing may behave.

But even these sources grow stagnant, once printed. Peer-to-peer networking about the market, its behavior, and trends gives clarity of direction. This must extend beyond "How's it going?" and "Are you guys busy?" conversations. For a firm to thrive, it must note the presence of funding and investment available for clients to make a decision to engage an architect.

Marketing/Communications Plan

Having identified sales goals and having understood the competition and the market in which the firm operates, the Marketing Communications Plan serves as the vehicle to tie those elements together. It defines what types of activities the firm will undertake and how it will use data and information previously analyzed. A typical plan includes the following:

- Win-loss data
- Market sector priorities
- Roles and responsibilities
- Conferences
- Public relations
- Advertising
- Budget

Win-Loss Data

Many firms track their "hit rate." The "hit rate" can be expressed as the number of proposal pursuits won relative to the number of total pursuits. While many firms do this type of analysis, they stop short of looking at other key performance indicators (KPIs), such as the number of proposal pursuits short-listed relative to the number won; and the number of proposal pursuits interviewed relative to the number won. Each expression tells a different story. A low percentage of proposal pursuits short-listed suggests that the written document is not competitive and should be reevaluated for its ability to craft a compelling story. A low percentage of proposal pursuits resulting in an interview relative to the total suggest that the interview skills of the team should be reevaluated.

Market Sector Priorities

While there are firms that claim to be able to service 13 market sectors, all equally well, the truth is that none of us are equally good at all things. Therefore, it is necessary to be honest about what a firm is good at, and utilize time wisely. There is only so much time in a day. Rank the markets the firm services from 1 to 10 based on experience, portfolio, staff, and references. If references are weak or poor due to a past performance issue, address this and shift priorities and networking strategy. Pursuing all markets is likely to waste valuable time.

Roles/Responsibilities

Accountability. Everyone wants it. No one wants to be part of it. But here is where it all comes together. *Who* has the responsibility for certain client types or client relationships is just as important as *what* they are to do. Both must be defined. More important, everyone must agree to the rules of engagement before the game. What is each person accountable for? Leaders within organizations have varying roles involving new sales. The best practice is to agree on these roles upfront. Will the partners look at only what a person brings in the door as new work? Or will they look at new relationships or new contacts? Finally, there has to be someone who directs the game. While everyone can play, there can only be one coach. Therefore, one person must be responsible for knowing everyone's roles and responsibilities, and have the authority to hold them accountable for achievement.

Conferences

Distinguish between continuing education conferences and networking opportunities. A room dominated by professional peers is likely to be for continuing education or a nice cocktail party. A room dominated by potential clients is likely to be for networking. Here are the conference rules:

- Identify conferences and events that clients from the firm's market sector(s) attend.
- Identify workshop topics or sessions that they are likely to attend and attend those, as an opportunity to network.
- Limit booth participation so that it is possible to network throughout the conference. An unmanned booth is deadly, but a staffed booth is costly if clients don't come by.
- Know who is attending the conference before going. Get a conference attendee list and identify key people to meet for achievement of sales goals.

▶ Public Relations and Communications (6.3) addresses the specifics of public relations, including the total communications plan, website content and design, social media communication, media relations, and advertising.

Public Relations

Most firms can't afford or don't have public or media relations. This is the function that controls the firm's messaging to the mainstream (i.e., print and social media). Public relations are not to be undertaken lightly. Skills and expertise, as well as relationships in this field, are unique to the media and print world. That being said, if a practice is able to afford a public relations company, the PR professionals must have a copy of the firm's business development and networking plan. This is necessary in order for them to develop a consistent and cogent message about the firm's business goals and objectives, as well as its design work. As part of the marketing and communications plan it is important to state goals, objectives, targets, and cost.

Advertising

Like public relations, advertising isn't something that many firms can afford. Advertising takes many forms (e.g., conference booths, trade publications, and display ads). It is important to understand the goal of the advertisement. Most ads are designed to heighten awareness, not increase sales. That said, it is important to view this tool as a small arrow in the quiver and not the bow itself.

Budget

For each of these tools, develop a zero-based budget. A zero-based budget is one in which each line item must be justified and allocated. It is not a carryover from the previous year with an "escalation" for the cost of living. Rather, it is a thoughtful analysis of the funds needed to accomplish each line item in the marketing/communications plan. More important, it should reflect a reconciliation of what is needed (zero-based) versus what funds are available. For most of us, the budget required rarely meets the budget we have. That said, the budget should reflect the trade-offs (compromises) of the budget plan.

TRUST AND THE PURSUIT OF NETWORKING

While professional networking goals are often based on finding out about a particular project opportunity, the ability to achieve that objective requires developing trust. Networking must be done with the sincere effort to first identify the client's needs, issues, and concerns; then to ascertain where, if at all, a firm fits within the context of addressing those needs. Developing trust takes time and, as a result, so does networking. Some best practices to help build trust with potential clients and with peer-to-peer associates:

- *Extend beyond oneself*. Trust begins with putting others first. Open and direct communication, be it peer-to-peer or professional-to-client, begins with an understanding of what challenges and opportunities are being faced. In some cases, those issues are facility- or building-related. That might lead to an opportunity to build trust by offering knowledge or a resource that could help.
- *Share information*. Effective networkers share knowledge freely and openly with others who require the information. This practice is comparable to making bank deposits. Sharing information is like depositing credits into a bank account. Making a withdrawal at some later point is possible because there are credits upon which to draw. At the time a deposit is made, it may be unclear when the withdrawal will be required. When information and knowledge are shared and "deposits" made with many individuals and a broad spectrum of professionals (in, out, or tangential to the industry), timely, significant, and meaningful "withdrawals" are available at a future date.
- *Be credible*. Although networking is perceived as the ability to connect with people and engage, its success hinges on credibility. To network effectively, demonstrate expertise, but also be conversant in subjects that interest other people. This is not a one-sided approach. People network with those whom they consider to have valuable and credible information, so develop and maintain a professional knowledge base while simultaneously gaining knowledge of others' practices and businesses.

- *Have integrity*. Such a simple word, but it is *the* cornerstone of relationship management and development. It begins with a simple idea: Keep promises made and respect the confidentiality of information shared. If an information source is confidential or sensitive, guard it with fortitude. In addition, and equally as important, be responsive to those who reach out for information. It is critical that we respond to colleagues and peers' requests for information in a timely manner. For principals and partners this is often difficult but still important. Timely response is key to establishing integrity in the marketplace.
- *Listen, don't speak*. The final tenet of trust building is listening. It is a true fact that if the mouth is engaged the ears don't hear. Those who network want to speak, but they also want to be heard. Those who listen are often the ones whom clients and peers trust most. Ask questions and seek clarification in the pursuit of a personable engagement between two individuals.

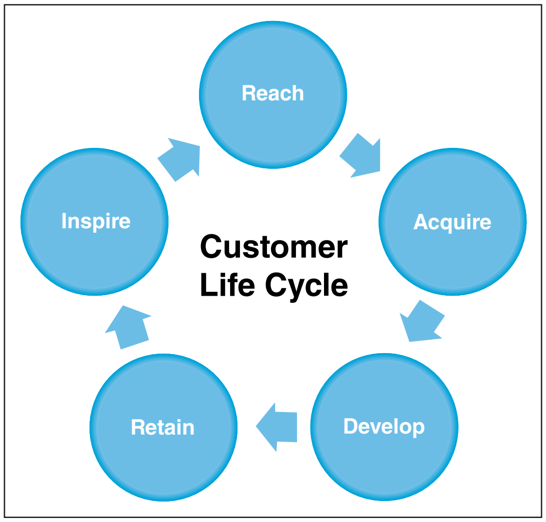
If the objective of networking is to develop trust and good relationships, not just to find project opportunities, then participation will not be perceived as one-sided. The resultant networking will be more effective. However, it is often difficult for the principal(s) or the partner(s) to be the sole networkers for their firm. The role and responsibility of networking can and must be shared and distributed throughout the organization.

MULTILEVEL MARKETING

Introduced in the 1960s through product-based retailers such as Amway and AVON, multilevel marketing is the process of expanding a sales force by developing and creating a "down line" of individuals to foster relationships at various levels within an organization. In its full concept, multilevel marketing (MLM) extends compensation and rewards to "down-line" team members through a hierarchy of compensation.

On its surface, MLM is the means by which most architecture firms develop work. Technical and/or business development staffs are tasked with developing trust-based relationships at various levels within a potential client group or organization (see Figure 6.4).

The most effective efforts are those in which staff work across peer-to-peer lines to establish relationships and open lines of communication. In this scenario, firm leaders (e.g., partners, principals) are tasked with developing relationships and networking with different levels of individual than midlevel staff persons (e.g., designers, architects, and job captains). People are most comfortable in engaging with people who are most like them. It may be intimidating for a project architect to engage with a campus president or the executive of a major corporation. Their knowledge base and perspectives about design and delivery may be widely different.



Karen Compton

FIGURE 6.4 Client Life Cycle

PART 2: FIRM MANAGEMENT

To be effective at MLM, one must first understand the client life cycle. The client life cycle consists of four phases:

- *Reach*. Reach seeks to expand beyond the core of a firm and utilize individuals to reach its clients through a personal network of colleagues, friends, and associates. In architecture practices, project architects, managers, administrators, and interns are used in this way. However, most stop short of developing a cohesive strategy that pairs individuals with their client equivalents. As a result, many struggle to develop both business and trust relationships and are eventually viewed as "unsuccessful."
- *Acquire*. This is the second and perhaps most important phase. Many have misinterpreted this step as acquiring business, but that comes much later. This acquisition is of knowledge—knowledge of the client's business, *not* just their project issues. Many invest an inordinate amount of time in understanding the client's *project* needs but stop short before seeking to understand the client's business: what they do, how they do it, and where the challenges and opportunities are to improve it. Instead, the focus is on the "solution" and the "idea" without truly understanding the client's problem—lack of funding, low enrollment, etc. As design professionals, it is important to seek understanding of trends, demographics, and legislation that might affect clients. This will help to achieve the ultimate reward: trust.
- *Develop*. Developing a network of peers, colleagues, and cohorts is something that requires an investment of time. Enduring relationships are built over time and with a commitment to remain in contact even where there is no real and present need.
- *Retain*. Finally, retention is key to not just a long-lasting network but a deep one. It is not uncommon to lose track of people when they leave employers and to become dismissive of lower-level staff when they leave an office or institution. Be aware that today's staff person is likely to be tomorrow's leader; and yesterday's colleague is often tomorrow's decision maker. The client life cycle values relationships at all levels.

Most architects entered design school because of love for the creative process and its output, not because of a passion for networking. As a result, it is important to structure preliminary networking activities with respect to the levels at which staff (technical, mid-management, and principal) are able to engage. This is particularly important for firms seeking to develop their midlevel managers as future firm leaders. Networking objectives must be structured for success. If not, the perceived failure in relationship management, trust building, and networking will result in disengaged staff.

DEVELOPING CLIENT INTELLIGENCE: STEINBERG ARCHITECTS

In 2004, California-based Steinberg Architects had two offices—one in northern and the other in southern California. As a midsize architecture practice, at the time, the northern California office had 40+ staff, and the newer office in southern California had a small team of 10 and a goal to develop a presence in the region.

The firm's experience had historically been in the K–12 schools and housing, but California was preparing to do a significant number of community college projects, and the firm saw the opportunity to leverage its K–12 experience into community college work. The question became, "How?" The firm set out to define a client-specific plan for community college work. The projects would be financed through bond sales at the community college district level. While previous bond sales had been through the state, the fact that bond sales would be authorized at the local level shifted decision making to local jurisdictions.

Based on that information, the firm's business development consultant sought to identify specific community colleges that had project types that complemented the work the firm had done in the K–12 field. While there were a diverse number of building types (e.g., gyms, classrooms, student services buildings), the firm settled on the primary pursuit of classroom and gymnasium facilities. Moreover, the consultant identified a service area that would focus the firm's efforts.

Working with the firm principals, a specific goal was set: to secure two new classroom buildings with a minimal fee from within the largest community college district within southern California. Each of the office principals was given the task of developing, establishing, or leveraging relationships with college presidents and user-group staff. The business development consultant was tasked with developing relationships with facilities managers, O&M directors, and business managers in order to develop a rounded and high-level understanding of the college and the facility issues. The division of roles and responsibilities under this scenario mirrored the structure of MLM.

Where were these client-related people to be found? Through a network. The business development consultant contacted engineers, contractors, and other design associates known to have done work in the education area and asked questions about the decision makers, issues, and challenges associated with each of the targeted campuses. In some cases, no one knew anything, and in other instances, colleagues knew details of what the challenges were on campus, the decision-making group(s), and what the topic(s) of conversation should be focused on when meeting opportunities arose. They provided valuable anecdotal information relative to the competition and key to the campus and its decision-making base.

In the fall of 2004, the firm participated in two targeted community college conferences aimed at facilities managers and presidents in an attempt to better understand governance, decision making, bond funding, and needs and challenges the campus faced in their lack of understanding about the design, construction, and management process. They were not there as presenters; rather they were there in an attempt to understand the client's core business to offer specific solutions. This incubator-setting of clients served as the backdrop for firms seeking and sharing information about campus facility developments and opportunities.

Armed with a division of roles and responsibilities, and an understanding of the competition, campus issues, and process, the business development consultant and office principals went on to set client-specific meetings to discuss what they had learned and to ask project-specific questions in anticipation of an RFP expected in the winter of the following year.

Although unsuccessful in its first attempts at community college work, the firm did go on to propose and secure its first classroom building project in 2005. Their proposals and interviews reflected an intimate understanding of the governance and finance processes, and deep understanding of the campus's issues and challenges, not just from a facility point of view but also from a service delivery point of view. Winning submissions would later show campuses how the firm could increase efficiency, enrollment, and capacity, aspects that were not addressed in the RFP document issued by the campus but were critical to the campus's core business.

TEAMING, ALLIANCES, AND PARTNERSHIPS

As previously stated, networking extends beyond identifying a specific project opportunity and exchanging information relative to that project. Networking encompasses the need to identify and develop trusted associates with whom work can be shared. Teaming is one common scenario, with the Design Architect/Executive Architect relationship a prime example. Under this setup, the relationship develops in response to a particular project and is identified as a team. The "team" is usually an outgrowth of the acknowledged constraints and opportunities of a project, such as the location of the site relative to each party, or of the strengths and weaknesses of each team member.

Alliances take a slightly different shape. Alliances are often the result of two firms that come together on a short-term basis or in response to a particular project or building type. The relationship is often seen as mutually exclusive between two firms, and can provide benefits to the client that may not be realized through a team association. A common example of an alliance is that between a funding source (such as a public-private partnership) and a design builder, who together are able to provide a comprehensive turnkey solution.

Partnerships often, but not always, take a legal configuration. Like alliances, partnerships often provide clients with benefits that may not be realized through a teaming association. Under such configurations, architects, clients, and other associates might share in the financial or performance risk and reward of a project.

A working knowledge of these terms and conditions is important in the development of a network. Networking or relationship building extends to the pursuit of partners and associates with which to execute projects and deliver service. It is important to understand the difference in arrangements or association and to understand the business of potential partners. This is often referred to as Business-to-Business (B2B) networking.

▶ Project Team Agreements (17.2) and Small-Firm Collaboration (5.7) further discuss teaming and other collaborative arrangements.

The goals and objectives of B2B networking are slightly different from Business to Client (B2C) networking. Through B2B networking, the objective is to:

Discuss, if given the right opportunity, how two firms might work together. Whether choosing to be team members, alliance partners, a legal joint venture, or any other structure, the arrangement is nothing more than a by-product of a common understanding. Informative discussions that spring from networking opportunities should take place absent the pressure of an RFP or RFQ response. When facing a deadline, it is often challenging to think clearly about the division of work, the sharing of risk, the strengths (and weaknesses) of each firm's staff, and the relationship with similar or complementary client bases.

Develop a mutual understanding of each firm's portfolio and strengths. Dynamic shifts in the national and construction industry economy can lead enemies to become "frenemies." Under such conditions, firms should be willing to explore what might be gained by an alliance with another firm to broaden those strengths and deepen the value of the portfolio. This discussion, however, must transcend each party's self-interest and view the association through the eye of the client. Clients are becoming more sophisticated in their view of the design industry. They look at teams and alliances through a narrower lens than practicing professionals. That lens looks at the value they as the client gain, the cost that they save, and the risk that they mitigate. B2B discussions must be able to answer those questions.

Explore project synergies. Rarely does a client need a bigger horse—meaning two firms coming together that do the same type of work and provide the same level of service. Often a client needs and values a horse of a different color—meaning two firms that serve the same markets but provide different or complementary services. One example might be programming expertise matched with excellence in architectural design. Another could be a team that leverages expertise in design of a certain building type into another sector, such as a military housing firm that may want to enter the student housing market. Both scenarios are viable and should be fully explored in any B2B discussion.

B2C networking has a different set of objectives. Under B2C networking, the goals are to:

Understand a client's business challenges. This is Rule #1. Before the firm can help someone, it must first understand the challenges—not only from a facility stand point but also from a business standpoint (i.e., funding, politics, governance, etc.) In asking clients about their business challenges or problems, accept that being able to solve all of them is unlikely. However, an effective B2B networker will be able to provide a cadre of resources in other business or practice areas such as banking, legal, or real estate to address concerns and problems. Remember, this isn't about finding opportunities, it's about building trust.

Deliver. Rule #2 is simple: Deliver on the promise to find a resource(s), to tap into a network of friends, colleagues, and associates to find the right answer, or put the client on a path to resolution. While the goal, as firms, is to find and mine opportunities, the real purpose is to build business, both current and future.

If only one question is asked of the client, ask them this: "What keeps you awake at night?" The answers might surprise and enlighten. While it may be facility needs, design requirements, budget and schedule constraints, or myriad other issues that can be addressed by design professionals, the issues may be far more personal: new division head, no resources, etc. These are the real issues that, unless they are addressed or on a path toward resolution, may dim the promise of project opportunities.

Get the specifics. It is insufficient to ask, "What projects do you have coming up?" and then make the quantum leap to developing a winning team and proposal. Ask probing questions of the client about:

- Building context, including design standards and guidelines
- Program
- Users or stakeholder groups

- Budget
- Acoustics, AV, and networking requirements
- Security and accessibility
- Energy and other sustainability goals
- Timing
- Delivery method (design, design-build, etc.)
- Preferences, if any, for engineers or interiors firms
- Preferences, if any, for design platforms such as BIM, REVIT, or AutoCAD
- Minority, small business, or disadvantaged enterprise goals

Suffice it to say, the more information gathered about a project or project opportunity, the better prepared the firm will be to respond to the request for proposal or request for qualifications.

▶ See Qualifications, Proposals, and Interviews (6.5) for related information about responses to RFPs and RFQs.

Define the selection process. In much the same way that the specifics of the project opportunity need to be defined, it is important to develop an understanding of

- Decision makers
- Qualifications-based selection
- Negotiated procurement
- Dual envelope selection

Under the provisions of the Brooks Architect/Engineer Act (40 U.S.C. 541 et seq.), professional services, including architecture, should be negotiated and based on qualifications, not price. However, many clients are not required to follow this practice. This is especially true of smaller institutional clients and private sector projects, such as residential.

TECHNOLOGY AND NETWORKING

Social networking is the modern-day "virtual cocktail party," where information is shared, posted, or exchanged in a virtual world. As stated by Erik Qualman, founder of Socialnomics, which provides data, statistics, and studies on social networking, "We don't have a choice on whether we *do* social media, the question is how *well* we do it." Without boundaries, social networking can add up to lost time and decreased productivity for any firm. It is important that the firm have an acceptable use policy (AUP). An AUP has several key elements:

Responsibility for content and enforcement. First and foremost, the responsibility for any content developed belongs to the firm, not the individual. It is important to make that distinction since ramifications resulting from content that might be seen as erroneous, slanderous, sensitive, or defamatory are viewed as the legal responsibility of the firm. Because content is the responsibility of the firm, so too is the enforcement of the terms and conditions of its use, including the use of email, blogging, network resources, "netiquette," duration of use, access to other sites, and the posting or reposting of content.

Whether enforcement is the responsibility of the information technology director, the operations manager, or the principal in a small firm, enforcement of the policy must be consistent with clear consequences for failure to comply. It is no longer a question of whether there will be breaches of an information technology policy; it's a question of when. Acceptable behaviors and consequences for noncompliance must be clearly defined before embarking on this brave new (and ever changing) world.

Security policies. While handling of confidential information, password management, and viruses are often addressed as adjuncts to information technology policy, it is important to remember that what is posted, shared, or exchanged via social networking or electronic media exists somewhere in perpetuity. Confidential information, or even information that may be considered sensitive, should never be exchanged or shared via a social networking site or other electronic platform. Save those issues for face-to-face meetings.

Content ownership. The AUP must delineate the ownership of content that is developed. Content developed at work and for the purposes of promoting the firm is often the intellectual property of the firm. However, limited rights of usage and/or acknowledgement of authorship should be given to potential staff contributors and those involved in social networking via blogging or other formats.

Copyright and plagiarism. While the issue of copyright and plagiarism is largely associated with written content such as articles, blogs, and posts, all AUPs should acknowledge the laws of copyright and strongly discourage the use or representation of another's materials or ideas as one's own. Plagiarism, as defined by plagiarism.com, includes:

- Turning in someone else's work as one's own
- Copying words or ideas from someone else without giving credit
- Failing to put a quotation in quotation marks
- Giving incorrect information about the source of a quotation
- Changing words but copying the sentence structure of a source without giving credit
- Copying so many words or ideas from a source that it makes up the majority of the work, whether credit is given or not

► See the backgrounder Copyright Law for Architects (5.1) for a more detailed discussion of related legal issues.

While plagiarism is a moral issue, copyright infringement is a legal one and hefty fines may be imposed on those found in violation. Develop policies mindfully. If there is concern about the parameters of copyright, consult with an attorney on the subject.

Restrictions. Any policy regarding Internet and specifically social networking sites must address the issue of content restrictions. Content should be limited to the exchange of technical or practice-based information and should limit personal use or representation of the content as belonging to anyone else other than the firm. It should expressly disallow personal or adult content, as defined by the firm.

NETWORKING EVENTS

It is impossible to network only through social and Internet-based applications. At some point, it is necessary to leave the office and meet and talk to people, be they businesses (Bs) or clients (Cs). Before charting the course, define the places to network. For B2B networking, peer-to-peer conferences are very effective as sources for developing intelligence on competitors or the market. These may include the AIA National Convention, brokers conferences, developer conferences, and other events. There are many options, but for those just starting out, focus on conferences that provide the least intimidating environment. Local or regional business meetings such as chambers of commerce, Kiwanis, Rotary, or Lions Club are a good start for beginning networkers. For intermediate networkers, national or business-led forums are wonderful options.

For B2C networking, select trade shows and conferences that clients of the firm attend. It is unproductive to attend a B2C networking event where the only attendees are other architects. Understand the reason for attending specific conferences or workshops and be discerning. Continuing education *is not* an objective in the world of networking. It's a lucky by-product, perhaps. Be clear that the prime objective in attending such a conference is to *win new work*, not advance professional education. Try to secure a list of conference attendees prior to the event, and determine whom to meet and why. If unable to do that, based on the business development plan objectives previously discussed, then do the following:

- Determine the types of people or professionals to meet.
- Have a short set of questions ready.
- Bring plenty of business cards.
- If technology is enabled, and the venue is appropriate, be able and willing to go online via iPad or smartphone and talk about experiences and observations.
- Do not push firm brochures on people; save that for the follow-up.

CONCLUSION

Effective networking requires a clear plan and strategy in order to accomplish a specific objective. In the absence of a plan, most principals, partners, and leaders try to network, only to be met with frustration and increased overhead costs. The sales plan is not intended to provide undue structure. Rather, it is intended to be a road map by which to manage overhead cost and increase productivity.

Every product-based company has a defined sales plan. Such a plan attempts to define its consumers, their buying patterns, and price point. It also defines the competition, the demand for their product, and, more important, how they are going to communicate about it—to sell it or to improve it. Architecture should be no different. Yet, in the twenty-first century architects know less about their clients than they should; and often use an incomplete set of tools to develop relationships, build trust, and yes, find new opportunities.

Networking is a valuable tool in a kit that is developed through patience. Networking, even when effective, does not produce results overnight. The time horizon may vary from a few months to a couple of years, depending on the depth and breadth of information to be shared. In retrospect, the time horizon, while long to some, is not unrealistic given the time required to develop trust and foster integrity in the pursuit of new opportunities. As a result, it is imperative that every person within the practice involved in networking knows their role and is committed to the pursuit. Each must be open to the demands of trust, integrity, and information sharing and not selfishly invested in "what's in it for me." Finally, networking events and situations should be chosen that are reflective of the skills and ability of the networker. Failure, or the perception of it, is common for the first-time networker. Accept it. Embrace it. And use each opportunity to explore challenges and potential solutions. The opportunity for success arises not from pursuing the narrow goal to "win new work," but from mastering networking as a critical business skill.

6.5 Qualifications, Proposals, and Interviews

Sally A. Handley, FSMPS

Responding to RFPs and preparing for short-list interviews are two of the most important marketing functions. A thoughtful approach along with advance planning and organization can help minimize the effort and maximize a firm's hit rate.

Spotting a publicly advertised request for proposal (RFP) for a project that firm leaders or marketers have been tracking, or receiving an RFP from a long-pursued prospective client, can be cause for celebration. At long last, there is a feeling that the firm's long-range marketing efforts are paying off. But euphoria can quickly turn to panic as the RFP is reviewed and the magnitude of the task ahead is understood. In firms both large and small, the proposal process can often be chaotic and overwhelming.

Sally A. Handley is a writing and marketing consultant with over 30 years' experience in the AEC industry. She is the author of *Marketing Metrics De-Mystified: Methods for Measuring ROI and Evaluating Your Marketing Effort* (2007) and *When Can You Start? The AEC Guide to Recruiting, Managing and Retaining a Marketing Coordinator* (2009).

There are three basic steps every firm can take to reduce the anxiety surrounding the proposal process: The first is to take a good, hard look at the RFP and determine the likelihood of winning the project. The second is to approach the proposal with the same degree of organization with which a design project is approached. Finally, and most important, procedures and processes must be developed to organize the information most commonly asked for in client RFPs.

THE GO/NO-GO POLICY

Frequently firms respond to too many proposals without really considering how realistic their chances are for winning. The more proposals prepared, the more diluted the proposal effort becomes, because time is finite, and even if people work 24/7, the more proposals put out, the less time there is to spend on each one. The secret to a successful proposal effort starts with a good go/no-go policy. Pursuing work that the firm is not qualified for and is unlikely to win is self-defeating and diverts time and money that can be better spent on marketing activities that are more likely to result in jobs won.

There are many ways to approach a go/no-go policy. One size does not fit all. Some firms focus on whether or not a project has the potential to yield a profit. Others focus on a project's potential for publicity that can increase name recognition and identity. Whatever approach is used, policy guidelines should be summarized in writing and a scoring system should be used to give the policy teeth. Here are some sample questions that cover the issues firms should be considering before beginning the proposal effort:

- Does the project fall under our mission?
- Is the project in a target market sector?
- Is the project in our geographic range?
- Is the project the appropriate size?
- Is the budget realistic? Funded?
- What is the potential for profit?
- What is the client's reputation and payment schedule?
- Who is our competition?
- How were we selected to receive the RFP?
- Can we demonstrate relevant experience?
- Can we provide a truly responsive proposal in the time frame?

Firms can develop their own scoring scheme. Three or more noes to the first six questions is a likely no-go. The last four questions require more analysis.

There may be overriding reasons why the firm might say yes to a project that doesn't pass the go/no-go test. For example, the client may have lots of profitable work and a reputation as a great client. Often firms may be asked to propose on a project smaller than their no-go minimum. Clearly, this is a test opportunity that most firms may not want to pass up.

This detailed approach to judging whether or not an RFP is a go or no-go reduces long-shot proposal efforts that actually diminish the effectiveness of an overall marketing effort. If a go/no-go sheet is developed and completed each time a proposal is completed, a chart can be created that demonstrates over time where marketing hours and dollars are being spent with no return, and where dollars spent are winning work.

THE PROPOSAL PROCESS

Reading the RFP

In order to complete the go/no-go assessment, be sure to read the entire RFP. This may sound obvious, but all too often in a hectic-paced environment, it is tempting to cut to the chase and just read what needs to be done, skipping the full scope of services and going right to project description, the proposal requirements section, and the due date. A thorough reading of the RFP is a must. It's possible to discover that the firm doesn't qualify to respond because of certain requirements.

Taking time to read the project description and scope of services, as well as the extraneous requirements that don't always appear on the requirements page, will actually save time and result in a much better proposal. There is nothing worse than finding at the end of the proposal process that a lengthy form mentioned elsewhere in the RFP was overlooked. Also, there may be specialty subconsultant requirements that have to be met. These are issues no one wants to deal with after they are nearly done with the RFP response, a day or two before it is due.

The Strategy Session

Both small-firm practitioners and principals in large firms need to conduct a brief strategy session to get the proposal off to a good start. The purpose of the strategy session is to determine answers to the following questions:

1. What is known about the client?
2. What is known about the project?
2. Who is the competition?
3. Why should the client choose us for this project?

No matter the firm or staff size, these questions need to be answered in order to develop a proposal that demonstrates understanding of the project and the client. Knowing who else received the client RFP, or which firms are most likely to respond to a publicly advertised RFP, is important in order to understand the context in which the firm is competing. Finally, a compelling argument for why the client should select the firm must be articulated clearly and concisely.

Relevant project experience is a key element of any argument for why a firm should be selected. Projects that illustrate a firm's capabilities, but that are not similar in size or scope to the project being proposed on, may not be relevant. Clients want to know that the design firms they select have experience with similar projects and understand the issues and nuances of a particular project type. Clients renovating a vehicle maintenance facility may not be impressed by a design portfolio consisting of renovations to office buildings or schools, even if those projects won awards. The Relevance Formula in the accompanying sidebar provides guidelines for determining what is most relevant to a client and how to order relevant projects in a proposal.

If a team is working together to produce a proposal, all of the key individuals involved need to participate in the strategy session. Depending on the firm size, these might include the principal-in-charge, the project architect, the project manager, the proposal manager, and/or marketing coordinator. The proposal manager or the marketing coordinator should be assigned the task of taking notes that will be distributed to anyone involved in preparing the proposal. Additional tasks to be completed during the strategy session include the following:

1. If it hasn't already been done, designate the principal-in-charge and the project manager.
2. Create a checklist, schedule, and budget.

THE RELEVANCE FORMULA

This is a formula for determining the relevance of past project experience to a current proposal. The project might match each one of these criteria:

- *Client*: It's the same client.
- *Service*: The same service was performed.
- *Market sector*: The client was in the same market sector—for example, transportation or pharmaceutical.
- *Facility (if applicable)*: The project type is the same—for example, a bridge or laboratory.
- *Attributes*: Special attributes, requirements, or situations are the same. For example, the project must be LEED Silver or BSL-3.
- *Location*: The assignment or client is in the same location (city, county, state, or region).

An appropriate order can then be built based on the projects that have the best mix of criteria matches.

Here it is: This is the formula, in order from best to worst projects to use:

- Client, service, market sector, facility, attributes, location
- Client, service, market sector, facility, attributes
- Client, service, market sector, attributes
- Service, market sector, facility, attributes, location
- Service, market sector, facility, attributes
- Service, market sector, attributes
- Client, service, market sector, facility, location
- Client, service, market sector, facility
- Service, market sector, facility, location
- Service, market sector, facility
- Service, market sector
- Service, location
- Service

By applying this formula, the right projects will be in the right order every time.

From *Proposal Development Secrets: Win More, Work Smarter, and Get Home on Time* (Amazon Kindle edition, Feb. 9, 2012) by Matt Handal, reprinted with permission.

▶ The backgrounder WBE/MBE/DBE/SBE Certification (3.1), addresses qualification for certification as a small business or as a woman- or minority-owned firm.

PART 2: FIRM MANAGEMENT

3. Select subconsultants who will constitute the project team. (Be sure to review any requirements, such as MWBE (Minority/Women-owned Business Enterprise) goals or specialty consultants, needed for the project team to be compliant.)
4. For large projects, define responsibilities and how the team will interact, and create an organization chart.

During the strategy session, the note taker also wants to compile a list of questions that come up. Note any RFP requirements that are vague or about which there is uncertainty and clarification is needed. Every RFP has a point of contact or a specific procedure for asking questions. When the questions are compiled into a single list, one member of the proposal team should call the point-of-contact to get answers.

Often clients hold pre-proposer conferences and/or walk-throughs of the project site in order to make clear their project goals and answer questions. A member of the proposal team should always attend. Ideally, the project manager is the right person to attend. When that is not possible, the proposal manager or marketing coordinator may attend. Although not always technically oriented, marketers often are adept at discerning client concerns underlying the technical challenges.

Following the strategy session, the designated note taker needs to compile a checklist. The checklist should include deliverables, responsible individuals, deadlines, and packaging and delivery method. Table 6.7 is a standard checklist that is a start and can be altered for each proposal. Circulate the checklist immediately, and post it to a central spot for team access. The checklist is a dynamic document and may change based on information obtained throughout the proposal process. Everyone needs to be notified when changes are made.

Whether or not there is an individual on staff with the title of Proposal Manager, one individual needs to be designated the proposal manager, champion, or advocate for any given proposal. This individual is the keeper of the checklist and the individual who monitors daily the status of all deliverables. It is best if this individual is not a principal, who is most likely to have client- and project-related responsibilities that will take priority over the proposal process.

For sole practitioners, the checklist is a must. Any amount of time set aside to work on the proposal should begin with a review of the checklist. The valuable tool keeps the process organized, ensuring that long lead items don't get lost in the process. (See Table 6.7.)

Subconsultants

The value of long-standing relationships notwithstanding, subconsultant selection should not be something done on autopilot. Subconsultants should be selected based on their ability to enhance the chances of winning a project. Sometimes that means reaching out to new firms that have specialized experience with the project type or client being pursued. In addition, there must always be a good faith effort to comply with client MWBE requirements.

Optimally, meeting subconsultants is something done on an ongoing basis, so as not to have to scramble to locate the appropriate MWBE or specialty subconsultant for the first time during the proposal process. Pre-proposer conferences, which generally make attendee lists available, are an excellent way to meet potential team members already pursuing the project. Keeping a database of firms cross-referenced by their disciplines, client connections, and certifications will make subconsultant selection much easier at proposal time.

As soon as possible after subconsultants have been selected, notify them of the intention to include them on the project team. Determine exactly what subconsultants need to provide, the format in which their qualifications are to be prepared, and the deadline for receipt. The proposal manager or coordinator should be in charge of this effort, and the point of contact for any questions the subconsultant might have.

How Subconsultants Can Enhance Your Chances of Winning

When the firm I worked for decided to pursue an on-call contract with the Veteran's Administration, we realized that we needed to be strategic in selecting subconsultants for our team. We had plenty of experience with on-call work for government agencies, but no experience with the VA.

First, we contacted the subconsultants we worked with most frequently to see if they had VA experience. We invited those who did to join our team. Next, we reviewed the qualifications of other firms we had in our database to see if they had VA experience. We assembled a subconsultant team composed entirely of firms who had successfully worked for the VA.

Next, we interviewed each subconsultant to determine the VA's hot-button issues. Every subconsultant was happy to share with us the things that were most important on VA jobs on which they had previously worked. For example, noise abatement during construction was understandably a major concern at VA hospitals. We made sure to emphasize our understanding of and sensitivity to the issues that would be of concern to the VA on any project awarded under the on-call contract. We were short-listed, and subsequently won the contract.

The Mock-Up or Dummy Copy

A good practice throughout the proposal production process is to create a physical mock-up of the proposal. As the various elements are completed, insert them into the mock-up copy. Use colored paper to indicate outstanding items still to be inserted. This simple practice gives everyone a good idea of the status of the proposal. In addition, proofreading the printed page yields better results than proofreading on a computer screen.

While some clients request digital copies, multiple hard-copy submissions remain the norm. The mock-up copy can facilitate the actual, physical production of the proposal. As sections of the proposal inserted into the mock-up are judged final, copies can be printed and collated. For obvious reasons, it is preferable to print completed sections as they are finalized, rather than leave all printing to the end.

Crafting a Responsive Proposal

Of utmost importance is making sure that the proposal is responsive to all of the requirements. The RFP process is highly competitive, particularly in the institutional and public sectors. Clients who receive many responses to proposals start by looking for nonresponsive proposals in order to narrow down the field for serious consideration.

If the proposal is being prepared by one person working alone, the proposal must be read cover to cover, highlighting every item required by the client, even those that fall outside the "proposal format" section of the RFP. If there is a marketing staff, it is the responsibility of the proposal manager or marketing coordinator to make sure all required elements are on the checklist.

Additional Solicitation Requirements

Government forms, schedules, licensing, and insurance requirements should be gotten out of the way early. Lead time for obtaining certain certificates can be lengthy, so, as tempting as it is to let these go until the end, it is not advisable.

Writing Persuasive Proposal Content

In the case of proposals and requests for qualifications, there is a great deal of information provided by the client in the form of the RFP requirements. If the process begins by jumping to the proposal requirements section, the most important step in persuasive writing will be skipped—understanding the client that the proposal is trying persuade! Start looking at the RFP as the best source of information about the client.

Search the RFP for clues about the issues most important to the client. Do they want an iconic building that makes a statement about them and their business? Are they committed to sustainability and desirous of a building that will not adversely impact their environment? Are they concerned about neighborhood resistance to their facility? Do they want a new addition to blend seamlessly with adjacent buildings? Are they a government agency committed to design excellence for public buildings?

Next, verify how the firm will be evaluated. The criteria that will be used to judge proposals are almost always provided in client documents, and can be a key to client hot buttons. Consider changing the focus from the proposal requirements to the evaluation criteria. Make a thorough review of the criteria a significant part of the preparation process. Print it out, maybe even blow it up and pin it somewhere in view. While completing all of the required proposal elements is very important, paying equal attention to the evaluation criteria is just as important.

Suppose the evaluation criteria look like what are shown in Table 6.8.

Now let's jump ahead and suppose the RFP has been read thoroughly, questions have been answered by the point-of-contact, and the walk-through has been completed. Additionally, at the walk-through a subconsultant confides that the last project done for this client had huge cost overruns because the project manager was inexperienced. This warrants a look at the evaluation criteria one more time. Eighty points are devoted to the firm's experience, the experience of the project manager, and the management plan. This further confirms that effective management is a hot-button issue for the client.

The next step is to write a statement of purpose, indicating what must be communicated in this proposal. Don't overthink this and get into analysis paralysis. Just quickly either jot it down or type it. For the example above, the purpose statement may be as simple as: "In addition to our firm's experience with all the elements of the proposed project, we also need to show that our project manager has experience with all or most of the elements of this project and demonstrate that s/he has a track record for controlling costs and completing projects on or near original estimates."

TABLE 6.8 Proposal Element Evaluation Criteria

Evaluation Criteria	Points
Required experience	35
Quality of key personnel	35
Quality of management plan	10
Overall firm capability	20
TOTAL POSSIBLE SCORE	100

Once a statement of purpose is written, everything that goes into the proposal is there because it will help accomplish that purpose. Every project example, every staff resume, and every question answered must fulfill the purpose; otherwise it is at best filler and at worst a distraction. Remember, every word written must add to the argument.

Next, create a working outline or table of contents (TOC). The TOC may change throughout the proposal writing process, but it's best to start with a solid outline. In some instances, the client may have very specific guidelines for the TOC, and that makes the job easier. If not, consider organizing the proposal according to the evaluation criteria.

Proposal Content: Less Is More

In a letter to a friend, seventeenth-century French philosopher and mathematician Blaise Pascal wrote, "I have made this letter longer than usual, only because I have not had time to make it shorter." Proposal writers frequently make the mistake of thinking that, in order to be effective, proposals need to be lengthy. The fact is that reviewers of submissions spend approximately 18 minutes reviewing a proposal! That is the reason proposal advertisements often limit the number of pages, sometimes even cautioning that elaborate submissions will be rejected.

Clients want an RFP that tells them what they need to know in order to make a decision. They ask specific questions and they want succinct answers, not every piece of boilerplate ever written at a firm. In order to write a persuasive proposal, tailor the boilerplate to the client. Clearly and succinctly demonstrate that the audience is known and their special needs and requirements are understood—that there is sensitivity to their hot-button issues.

Avoiding Jargon

In his classic *Writing for Design Professionals*, Stephen Kliment, former editor in chief of *Architectural Record*, cautions writers to avoid technical jargon and "designer babble" that can actually make it more difficult for the reader or reviewer of the proposal. Technical professionals sometimes forget that even the most knowledgeable clients are not necessarily technical. If technical details are going to be included, make clear to the reader the *benefit* of the technical information. Here's a description that does this very well:

> Established to promote greater public understanding of the United States Constitution, the National Constitution Center is a structure of complex geometries articulated in limestone, granite, and glass. The architect's sophisticated design relies on an elaborate frame of interconnected steel systems designed to achieve the building's bold structural form. Long-span, column-free solutions and special connection details accommodate the building's vast, open spaces.

The last sentence does an especially good job of explaining the benefit of the technical design without jargon that loses the reader.

How Long Should *X* Be?

Once someone asked me how long the cover letter should be. When I said one page, the individual proceeded to tell me there was no executive summary in the RFP to which they were responding, and they felt they needed to put more of their persuasive argument in the letter. My response: "Then by all means, make your cover letter longer."

Remember, while there are general guidelines for writing proposals, there is no *one* right way to do this. I recall being asked to work on a proposal for a new branch office my firm had acquired. Our main office had significant experience in designing parking garages, and the branch office had tried two or three times to win parking projects at a local university hospital. A firm they were teaming with had spoken to the client contact at the university hospital and reported to us that the client said they just didn't know who we are. I asked to look at the previous proposals that had been sent and saw that our branch office had not really done a good job of explaining the "new identity."

Hence, my mission was to make it clear who this new firm was. If we didn't reach the short list, at least the client would know who we were going forward. I wrote a three-page letter describing our firm, the services we provided, the relationship of the branch office to the main office, and who from the main office would be working on the project. We got short-listed. The point is that I understood my client's hot button: They didn't know us, and nothing we had previously sent clearly explained how the experience from the main office was going to be tapped for their local work. Now they understood. I violated the one-page guideline, but I knew my audience and what was needed to persuade them to consider us.

STEPHEN KLIMENT'S PRINCIPLES FOR WRITING IMPACT

1. Write as you would talk.
2. Keep sentences short.
3. Shun jargon or "designer babble."
4. Be specific.
5. Keep it simple.
6. Use the active form or voice.
7. Don't forget people.
8. Know what you want to say.

THE NON-RFP PROPOSAL GUIDELINES

Not all clients have a formal RFP process. Residential clients and small businesses may ask for a proposal, providing little by way of guidelines or requirements. At a minimum, provide a fee proposal that includes the following elements:

1. *Description of the project*: This demonstrates understanding of the client's goals.
2. *Scope of services*: This explains to the client the services provided in order to achieve the client's goals.
3. *Additional services*: This explains services not provided within the basic fee, but that could be provided if desired by the client.
4. *Proposed schedule*: This provides the client with a description of the phases of the project, and an idea of how long the project will take.
5. *Fee*: This, of course, states the compensation for the services provided, and can include the costs of additional services.

Consider including some promotional materials, such as a brochure. Also provide a resume and a list of similar projects, and/or project sheets that include photo examples and key facts about the project.

BOILERPLATE CHECKLIST

The following standard items are often requested in standard proposals. Every firm should have these basic write-ups that can be edited for specific proposals:

- *Firm profile*: One-page overview of the firm
- *Computer capabilities*: Description of equipment, number of computers, programs used, CAD capabilities
- *Project management*: Step-by-step description of how the firm manages a project
- *Current workload*: List of projects and percentage complete or project completion dates
- *Quality assurance program*: Description of how the firm checks its designs and fosters the quality of its work
- *Project roles*: Description of the responsibilities of anyone working on a job, such as partner-in-charge, project manager, etc.
- *Design philosophy*
- *Project approach*
- *Resumes*
- *Project lists*: By type
- *References*
- *Awards list*
- *Affirmative action policy or EEO statement*: Usually for public projects only
- *Claims history*: Clients want to know a firm's errors and omissions exposure.

Quality Control: Assessing the Proposal

The schedule set in the strategy session should always include enough time for a thorough proofread and final edit. When all the checklist items are complete, and the proposal is assembled, ask the following questions:

- Does this proposal demonstrate an understanding of the project?
- Have we identified potential problems?
- Are our project examples truly relevant?
- Do resumes show relevant projects?
- Have we clearly established our technical expertise?
- Have we demonstrated that we have the capacity to handle the project and meet the schedule?
- Have we provided all of the information and documentation required?
- Is the proposal easy to read and easy for the client to locate the most important information?

Part of quality control is allowing enough time for proofing, printing, binding, production, and delivery of the final package. It doesn't matter how good the content is if there isn't enough time to create a high-quality deliverable. Just like a schedule for a project deadline needs to allow adequate time for drawing coordination and printing, so does a marketing proposal schedule. Be sure to factor this in to the original proposal schedule at the beginning of the process.

QUALIFICATIONS: ORGANIZING STANDARD PROPOSAL ELEMENTS AND BOILERPLATE

Ironically, this step really should precede the previous two, because an organized database of the firm's qualifications—that is, of the types of information and standard write-ups (boilerplate) asked for in a proposal—is the key to an efficient proposal effort.

The preceding sample proposal checklist contains the most commonly required elements in any RFP. While each client, project, and proposal is unique, most RFPs request some form of the same basic information. Many firms start each new proposal by using the last proposal submitted as a template. The limitations of that approach to proposal writing become clear when hours are wasted searching for a proposal that predates the most recent one because it contains a perfectly crafted response to the same question asked in a current RFP.

One of the keys to an efficient proposal process is the organization of the firm's qualifications—information that is asked for repeatedly. Designate a folder "Boilerplate Library." The Boilerplate Checklist (sidebar) contains a basic list of the standard documents that should be included. Create subfolders for items such as Project Approaches. While each project approach must be tailored to the project currently being pursued, previously written project approaches may contain introductions or paragraphs that can be incorporated into current proposals. For example, the approach to historic restoration will probably always start with a site visit and review of existing documents.

The time invested in developing a well-organized boilerplate library of the firm's qualifications will yield tremendous time savings in the future. The added benefit is that the time can be used to better research the client's needs and tailor the boilerplate to prepare a truly responsive proposal.

THE SHORT-LIST INTERVIEW

Every planning session, every market research question, every networking event, every cold call, every letter written, every trade show attended, every piece of communication sent, especially the proposal, is intended to get the firm in front of the client for a real opportunity to win a project. The joy of being short-listed is frequently short-lived, however, because the time frame is often less than a week, and the interviews never seem to be scheduled at a "good" time—that is, a time that is convenient for everyone who must participate. Particularly when there are project deadlines in-house, key staff members may be tempted to say, "I don't have time to participate in a strategy session or to practice or rehearse." All of the marketing hours and dollars expended thus far are wasted if the key players don't make preparation for the short-list interview a high priority. For small-firm practitioners working without a marketing department, this is no different. Remember, getting new work is as important as executing the work already acquired.

Begin by taking the same exact approach as the proposal. Let everyone who will participate, including consultants and those who will assist in preparation, know the time and date of the interview. Circulate copies of pertinent material, and hold a strategy session. Who needs to attend? The partner-in-charge, the project architect/manager, key consultants, the marketing coordinator, and/or manager.

Start by reviewing the proposal submitted—after all, it is what got the firm short-listed. Ask again: What does everyone know about the client? The project? What is not yet known? Why do the same questions need to asked? Because much could have changed since the RFP response was submitted, both with the client and with the firm. Everything needs to be seen with fresh eyes. Possibly someone in the firm or one of the consultants on the team may have new information that may be valuable. Perhaps the client, or the project, has been in the news, and this information provides additional insight into the client that can be used to prepare for the interview.

At a minimum, learn who is on the selection committee, who the competition is, and the physical conditions of the interview room. If this information is not provided by the client, a call should be made to the point-of-contact to ask questions. Not all clients are willing to provide the names of the selection committee or the other short-listed firms, but it is always worthwhile to ask. Subconsultants are often on more than one team and often are willing to share the names of the teams they are on, even if the client won't.

Why Us?

Review the key reasons in the proposal submission for why the client should select the firm's team. Have these changed? Has the intelligence and reconnaissance revealed information that requires an amendment to the original "why us" statement? Whether or not the statement changes, make sure that the key points being used to make advance the firm's argument are crystal clear to everyone going to the interview—everyone in-house and every subconsultant. Every individual's presentation should support the overall strategy.

At this point, in larger firms there should be a reassessment of principal-in-charge and project architect/manager designations. Sometimes there is a significant lag between submitting a proposal and making the short list. The workload of the individuals submitted in the proposal may have changed drastically, and they may no longer be available to work on the project. The number-one complaint of clients is that the individuals who attend the interview are not the ones assigned to work on the project. The short-list interview is the last opportunity to make a change to proposed project staffing.

The same holds true for subconsultants. Perhaps there have been performance problems with a subconsultant on a project since the proposal was submitted, and this has caused second thoughts about working with them again. In addition, there may be a need for a specialty consultant that was not originally on the team. This is the time to let the client know of any project team changes.

Once the team is finalized, especially for large projects, create an organization chart that clearly defines responsibilities. Clients want to know how team members will interact with them and with each other. Most important, they want to know who their day-to-day contact will be, whom they will contact when they have a question or problem—in other words, who's in charge?

Whoever is in charge of the project must also be in charge of the interview, and this needs to be completely clear to everyone attending the interview. Usually the partner-in-charge (PIC) from the architecture firm leads the interview, but it could also be handled by the project manager (PM). There may be good reasons why the PM is the right one to lead, particularly if project management is a client hot-button issue. Also, the PM may be the right person to lead the interview because of a previous working relationship with the client.

The interview is a good opportunity for the PIC or the PM to demonstrate leadership of the project team. The interview leader opens and closes the presentation. Questions not directed at individuals by the selection committee should be fielded by the PIC or PM, who will answer the question or direct the question to the appropriate individual on the team.

MESSAGES FOR ACQUIRING PROJECTS

Depending on the circumstances, the client may perceive you—or you may want the client to perceive you—as large or small, local or out-of-town, or expert or novice at the project type. Working within the bounds of honesty, of course, here are some of the messages firms use to relate their capabilities to the circumstances at hand.

SMALL FIRM

- Today's fast-breaking technology demands a generalist overview and one-point responsibility—that's me.
- We are not encumbered by in-house engineers who try to be experts on every project type. We assemble the best team we can from consultants who are truly expert for your unique project. Most of the nationally recognized designers agree with us—they don't have engineers in-house.
- Your project is a big one to us. It means a lot and will merit our day-to-day attention at the top. It won't be relegated to lower echelons. In our firm the same architect [me] personally controls [design, specs, other elements of the process].
- Just as in your business, in architecture it all comes down to people. You want to deal with the people who make the professional judgments—not with computers or technicians.
- Your job means so much to us, you can be assured we won't be shifting personnel.
- We are a close-knit office—overview and coordination of all aspects of a project are automatic. Everybody in the office overhears everything—there is no compartmentalization. It's all one-on-one.
- Like you, contractors want to deal with and tend to pay more attention to the head of the firm.
- There is a limit to the number of people who can effectively work on a project. Regardless of firm size, it always comes down to the project team. We are just that—a team—and plenty big enough.

LARGE FIRM

- To be a "master builder" is impossible in today's industry. A team of specialists is required.
- We have in-house capability and therefore have tested relationships and teamwork among well-qualified specialists. We stress coordination. We don't expect you to fund the organizational learning curve of our experts. You'll get a dedicated team to see your project through.

- There is a reason we are the size we are—we have to pay attention to service and responsiveness. You'll get a project manager assigned 100 percent to your project, with oversight by a partner.
- Technology is moving so fast, it takes a firm our size to afford [CAD, quality control systems, continuing education, and so on—if true].
- We have staff depth and plenty of second opinions to ensure the quality of professional judgments.
- We can ride out stop-and-go on a project when necessary.
- We don't depend on outside consultants, so coordination is built in—it's automatic.
- [Construction administration, specs, design, project management, etc.] is a discipline all its own—it deserves an expert such as ours.

LOCAL

- We are here for the long haul. We have a personal stake in the community as well as a professional one. We intend to live with the results just as you do.
- We are here whenever we are needed—we are only [xx] minutes from you, [xx] minutes from the site. We'll know when to be on the job, without you or the contractor having to call us.
- Fees spent locally get re-spent seven times locally. Keep the money in our own town.
- Even if we end up with an out-of-town contractor, most of the actual work will be done by local people. If they cheat you, they will have to work with us for years to come. We keep score—and they know it.

OUT-OF-TOWN

- We are purely professional—no local bias or pressures to use anything or anybody on your project other than what's best for it. If it meets your needs and wishes, we will fight to get it for you. You wouldn't be talking to us if we weren't specially qualified.
- In an information society, there's no such thing as "remote." Here is how we plan to manage project communication and coordination.
- The fee for architecture services is about one-tenth of 1 percent of the life cost of the project. Pick the best.
- We offer fresh eyes, new ideas, and objective evaluation of the performance of the contractor and all the subs. And we have a basis for comparing their work to the best work in other localities.

VERY LITTLE EXPERIENCE

- The late William W. Caudill, FAIA, said, "An architect who claims to have done ten schools may really have only done one school ten times." We have no preconceptions. We'll be working to answer your needs as you define them.
- We'll be looking for breakthroughs. Your project and site offer unique opportunities. You deserve more than a cookbook solution.
- Let's talk about what's unique about your project and how we would approach the design.
- No assembly line with us. We work hard at staying generalists. Similar but different project types keep us from getting stale. Here are examples of different projects we have done that had similar concerns—and how doing them has given us the diverse experience to qualify us to do well with your project.
- We do lots of different project types—which keeps us enthusiastic and growing professionally. Nothing is by rote or done without our full, professional attention. We *have* to pay attention.

A LOT OF EXPERIENCE

- Everybody likes a winner—which is why we are consistently selected for projects like yours. You have a lot at stake here. We have a demonstrated track record.
- We have no learning curve on this and won't ask you to pay our tuition. Instead of spending time learning the project type, we can focus on your specific needs.
- Let me show you all of the projects like yours that we have done. You'll want to talk to our other clients for this type of project. Here is a list of references.
- Because your project type is one we like and work with a lot, we naturally research it and continually stay abreast of the latest advances in design and technology relevant to it. We've got a head start on anybody else you'll talk to.
- Though we are proud of our design, it's still only 15 to 20 percent of the service we provide. You want experts on the technical aspects—people who've been there and have seen all the variations. We have a lot.

James R. Franklin, FAIA, Current Practices in Small Firm Management

PART 2: FIRM MANAGEMENT

The Agenda

Be sure to check whether or not the client already has an agenda for the interview, and be sure to share that agenda with all participants. Does the one-hour interview consist of a 45 minute presentation and a 15 minute Q&A, or are there 30 minutes for presenting and 30 for Q&A? The ability to present within the time frame provided is the client's first opportunity to observe how well directions are followed, as well as the leader's time management skills.

Prepare an outline with the name of each presenter that will be given to the client at the start of the interview. Prepare a second version with the number of minutes each participant has for his/her presentation. Distribute the second version to each participant. The principal-in-charge or the project manager should discuss with each participant his/her vision for the content of the individual's portion of the presentation. Everyone should be advised to prepare a bullet-point list that can be referred to at the actual presentation, not a document to be read. The goal is that the presentation be as conversational as possible.

The Checklist

Similar to the proposal preparation process, create a checklist and schedule for the short-list interview at the strategy session (see Table 6.9). For interviews for large projects, this may require air travel, models, video presentations, etc. There may also be a need to develop a budget. In addition to expenses, the hours spent by key staff can quickly add up, something often not considered at the proposal stage.

Deadlines are crucial because of the very tight turnaround time for short-list interview preparation. There is no margin for error. Similar to the proposal process, this interview process needs a manager or champion. This is the keeper of the checklist and the individual who monitors daily the status of all deliverables. Again, it is best if this individual is not a principal, but rather someone for whom the short-list interview becomes his/her short-term highest priority. Principals of smaller firms may want to assign an administrator or even a staff member to manage this process.

The Leave-Behind

There is no one answer to what should go into the leave-behind. Every presentation is unique, and the decision on what to include should be based on this particular project. Was the site visited and photos taken? Should they be included in a leave-behind? Is there a team member whose material was not in the original submission? Is the team especially complex? Perhaps the organization chart should be included.

There are two things, however, that most presentation coaches seem to agree on. First, creating a leave-behind that consists of what was already in the proposal is redundant and serves little purpose. Second, the leave-behind should be exactly that—something *left behind.* It should not be distributed to the selection committee during the presentation, because all eyes and attention should be on the presenters.

Planning the Presentation

Crafting an opener that grabs the selection committee's interest is key to getting the interview off to a good, memorable start. Most speakers begin the interview saying something like this: "Good afternoon. I'm John Doe, principal of Doe Enterprises.

TABLE 6.9 Sample Interview Checklist

Deliverables	Who's Responsible	Due Date
Agenda		
Visuals		
Key points for PPT or boards		
Leave-behind		
Schedule		
Fee proposal		
Travel arrangements/reservations		
Rehearsal scheduling		

We want to thank you for this opportunity to present to you this morning. Blah, blah, blah." Imagine if, instead of sounding just like everyone else, the interview started with an attention-getting opening such as: "Educating young people is your most important mission. Designing the buildings that make that possible is ours." That opener is far more likely to get the selection committee's attention than the generic opener.

Management consultant to the AEC industry and president of The Clayton Consulting Group, Dr. Janet A. Sanders, says: "Telling got you to the presentation; *selling* is what will win it. You're not giving the client a reason to select you if you're saying the same thing as everyone else."

Simply recounting credentials is not a good proposal strategy. Stress that what the team will design will serve the client's best interest. At the end of the interview, the client needs to feel that all their problems will be over if they select the firm. "Emphasize what you're going to do *for them*, rather than what you do in general," Sanders further advises.

Throughout the interview, focus on the strategic selling points—the "why us." Use a problem-solving approach, not a past performance review. The project examples shown at the interview should very specifically relate to the client's projects. They should be examples of how the team solved problems that were similar to the client's problem. The ultimate criterion for what is said in the presentation is: What does the client want and what will best advance the overall proposal strategy?

Rehearsal

Once the presentation outline is in place, and participants know their assignments, a rehearsal should be scheduled. For anyone who thinks this is an unnecessary use of otherwise billable time, consider the following words of former New York Knick and New Jersey senator Bill Bradley: "Just remember, when you're not practicing, someone, somewhere is. And when you meet them, they will win."

Rehearsals are an essential part of interview preparation, *and* the entire presentation team must rehearse together. The "I'll rehearse in the car" ploy is simply not an option. Every member of the team needs to hear what the others are saying. Otherwise, there is a risk of redundancies or contradictions during the interview that can make the team appear uncoordinated and unprepared.

The rehearsal session also allows everyone to get familiar with the "props." Have the subconsultants seen what will appear on the screen when they are speaking? If boards are being used, who is handling them? Who is handling the LCD projector? Are participants advancing their own slides? These are just a few of the questions the team does not want to face in the presentation venue minutes before the start. The natural nervousness that anyone about to make a presentation feels can be minimized if all of the physical logistics are worked out in advance through a rehearsal.

Finally, another key reason why the presentation team should rehearse together is to brainstorm possible questions in advance of the Q&A session. To a fault, most professionals know their weaknesses, and know the questions that would be difficult to answer. Don't go into the interview hoping the client will not ask the difficult questions. Go to the interview with prepared answers.

WHY PRESENTERS MUST REHEARSE TOGETHER!

When a newly acquired branch office got short-listed for a parking project in their hometown, they needed to rely heavily on their new parent company to prepare the presentation. While the parent company had extensive, relevant parking garage design experience, the branch office had none. The project manager from the home office took the lead in preparing the presentation. He conferred with the branch office principal by phone. Because the principal was well known by the client, the project manager suggested that the principal open the presentation with a brief firm overview.

The day of the interview, the project manager's flight arrived with only enough time to go directly to the presentation site. Much to his dismay, the principal began the interview by saying, "We don't really do parking garages." Needless to say, the firm was not awarded the project.

When the project manager asked the principal to provide the firm overview, he *assumed* that he would explain the new relationship between the branch office and the parent company. Even one rehearsal would have revealed that the principal was not really comfortable speaking on behalf of the parent company of which he was now a part.

Coaching the Presenters

The rehearsal should be observed by at least one individual not involved in the presentation. This individual should watch the clock to make sure everyone completes his/her assignment within the allotted time. The observer also should take notes of nervous habits and general observations.

As previously mentioned, presenters should refer to bullet-point outlines at the interview, and should have been already told that reading their portion of the presentation would not be permitted. Carol Doscher, presentation trainer and president of Graceworks, says, "It's the human connection that will put your presentation on top." Selection committee members are making a decision about whom they will be working with for the next few months, or even years. They do not want to be read to. The interview team needs to connect with the selection committee on both a professional and a personal level.

Not all professionals are good presenters. Preparation and rehearsal go a long way toward increasing the comfort level of all presenters, but, for some, that is not enough. Professional training may be the answer for individuals who are not good presenters, but who are key staff members whose participation in interviews is essential for success. Principals of small firms should also rehearse and seek feedback, perhaps from a staff member or someone from an office down the hall. When needed, coaching for a sole-proprietor principal is even more critical, since it will be the same person presenting the same capabilities at every interview.

After the Interview

A thank-you letter to the selection committee should be sent after the interview. The follow-up letter can serve several purposes: First, it is the last opportunity to restate interest in the project. Second, it allows a restatement of the team's strengths. Third, it affords a chance to address a point that may have inadvertently been omitted during the presentation, or that came up during the Q&A.

In the best of all possible worlds, the firm will be notified soon after the interview that the team has won the project. If, however, the firm did not get selected, call the point-of-contact to get a debrief. It is preferable for a person who did not attend the interview to make the call because s/he is more likely to get an honest response. The caller should ask for genuine candor and honesty from the client. This is especially important for sole proprietors, who, of course, will need to conduct the debrief themselves.

Some clients are experienced with debriefs and may already have a format they follow, which usually includes a review of the score sheet or selection committee comments. For the clients who do not, have a clear agenda for the call that includes four key areas: (1) technical competence, (2) communication, (3) the team organization and approach, and (4) future projects.

Be prepared with specific questions, such as the following:

- Did the selection committee feel that we clearly conveyed our technical ability to accomplish the project?
- Did we clearly communicate our project approach and our interest in the project?
- Was the selection committee satisfied with our team? With our proposed approach?

The caller should take notes and make no comments in response to the debriefer's answers. This is not the time to debate or refute the client's take on the interview. Doing so could cause the debriefer to stop being candid, or even terminate the call. Questions to clarify an unclear answer are acceptable. End the call by thanking the debriefer and by expressing interest in future opportunities.

CONCLUSION

On the topic of preparation, Abraham Lincoln said, "Give me six hours to chop down a tree, and I will spend the first four sharpening the axe." There really is no secret to the preparation of successful proposals and presentations. They simply require a strategic approach, a planned process, and a database of information organized for easy access—in other words, a sharp axe.

CHAPTER 7

Financial Management

7.1 Navigating Economic Cycles

Kermit Baker, Ph.D., Hon. AIA

Architects serve an extremely cyclical sector of our economy. To thrive, therefore, they need to be able to adjust to the regular ups and downs of the construction industry.

THE IMPORTANCE OF UNDERSTANDING ECONOMIC CYCLES

Whether architects like it or not, they are extremely exposed to economic cycles. Since architects receive most of their revenue from services provided to the construction sector of the economy, and since the construction industry is one of the most cyclical industries in the economy, architects are vulnerable to the regular ebb and flow of activity in the economy.

The impact of the economy on architecture practice has been particularly apparent with recent cycles. The past national economic expansion that began in late 2001 reached a peak at the end of 2007. The tail end of that expansion saw healthy growth in the economy, and with it even stronger growth in most nonresidential construction sectors. However, at this phase of the upturn, the overall construction sector was seeing more modest growth. The housing market peaked much earlier in the cycle—the beginning of 2006 was the high-water mark of the cycle for home building—and declines after that offset gains in the nonresidential construction sector over the 2006–2008 period.

Kermit Baker is the chief economist for the American Institute of Architects in Washington, D.C. In this capacity, he analyzes business and construction trends for the U.S. economy and examines their impact on AIA members and the architecture profession.

Once the downturn hit in early 2008, the construction sector of the economy experienced steep declines. And even though overall economic output began recovering nationally by the middle of 2009, construction activity continued to spiral downward. Total construction spending levels, which exceeded $1 trillion in 2008, fell to under $800 billion by 2011.

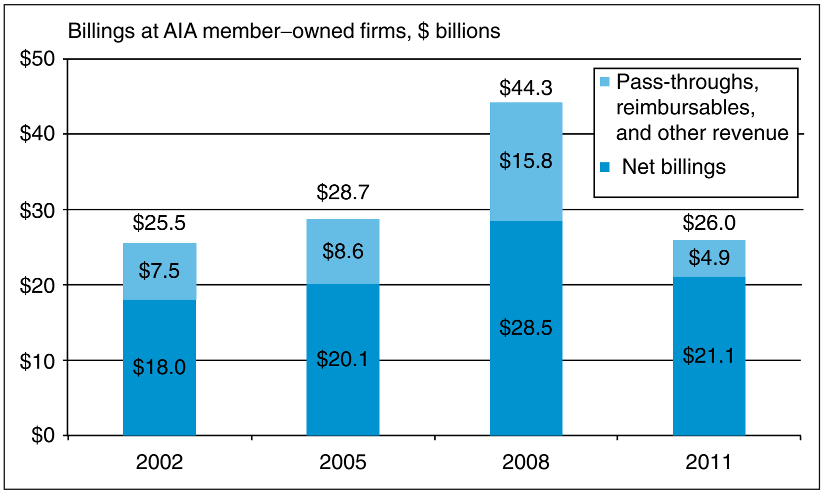
With less construction came less building design. In addition, there were efforts by owners and developers to more aggressively manage design and construction costs of the projects that were built, creating pressure on design fees and construction bids. As a result, gross revenue at architecture firms declined from over $44 billion in 2008 to $26 billion by 2011, a 40 percent decline over this three-year period (Figure 7.1).

This decline in revenue was also felt in employment—in the economy, in the broader construction sector, and at architecture firms. Such a significant reduction in firm revenue produced a comparable reduction in employment. Nationally, the decline in overall business payrolls throughout the economy over this period was one of the steepest since the Great Depression. From its high in early 2008 to its low in early 2010, almost 8.8 million payroll positions, or 6.4 percent of the workforce, disappeared. However, by the end of 2011, over a third of these losses had been recovered.

Construction, being a more cyclical sector of the economy, saw even steeper losses proportionately. Construction payrolls peaked in early 2007 due to the housing downturn, and steadily declined through midyear 2011. Since that time, there has been hardly any recovery. Between 2007 and 2011, payrolls in this industry declined by over 2.1 million—almost 28 percent—double the number of construction positions added during the 2003–2007 upturn.

Positions at architecture firms have generally followed the path of the broader construction industry. Due to the heavy reliance of architecture firm revenue on nonresidential construction activity, payroll positions continued to grow through midyear 2008. They then dropped sharply through early 2011, and have hardly recovered since that point. Between 2007 and 2011, over 28 percent of positions at architecture firms disappeared, a share that greatly exceeded the gains during the prior upturn (Figure 7.2).

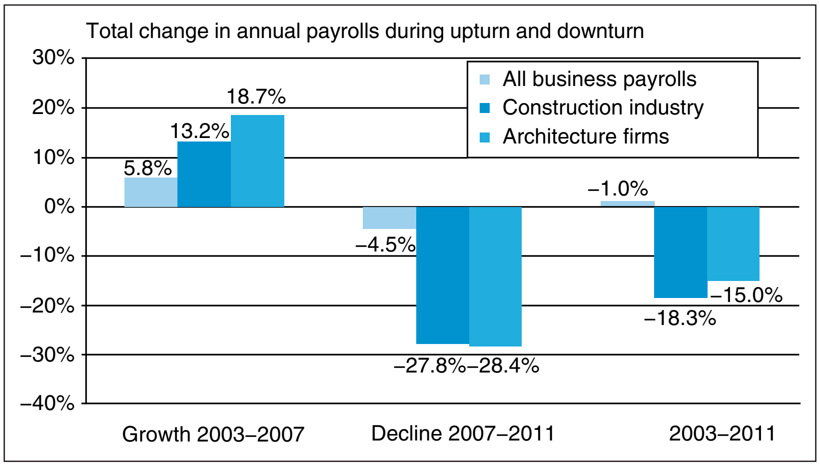
This dramatic upheaval at architecture firms has had dramatic implications on professional practice. One change is the mix of projects at firms. Surveys of architecture firm activity over the past decade show that there has been considerable fluctuation in



The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 7.1 Architecture Firms' Gross Billings Reflect the Cyclical Nature of Construction

PART 2: FIRM MANAGEMENT



U.S. Department of Labor

FIGURE 7.2 Employment at Architecture Firms Is Still Below Levels When Last Upturn Began

the share of project activity across the major construction sectors. Residential projects tend to increase early in a cycle, commercial/industrial projects in mid-cycle, and institutional projects later in the cycle.

Billings for residential projects averaged 14 percent of total firm billings over this past decade, commercial/industrial 27 percent, institutional 53 percent, with the remaining 6 percent divided between other construction and non-construction activities. By 2011, residential billings had returned to their decade average, having grown to 18 percent in 2005 during the peak of the housing market, and fallen to 11 percent in 2008 as the housing market was crashing while the nonresidential construction sector was just beginning to peak. Even though housing remained relatively weak through 2011, multifamily activity—a critical residential sector for architecture firms—was building momentum, and was a growing share of design activity for residential projects.

Commercial/industrial design activity tends to be extremely volatile over the cycle. Activity fell off sharply with the overall economic downturn, and was still near its bottom in 2011. As a result, the share of design billings from this sector was below its decade average that year. Institutional activity tends to be more stable over the cycle. This means that shares are generally a bit lower during upturns and higher during downturns. By 2011, the institutional share was near its decade high, mostly because other sectors had fallen off more dramatically (Figure 7.3).

The overall decline in project activity during the downturn, coupled with the changing mix of projects, produced an expansion of services that the typical firm offered to its clients. During upturns, larger firms typically continue to offer a full range of design services to clients, while smaller firms often niche their services in a smaller number of specialties. During downturns, firms of all sizes tend to investigate new areas in the process of looking for new work. So, even though firms had fewer employees on average in 2011 than during the boom years, higher shares responded that they offered such services as sustainable design, planning, interior design, and space planning than in prior years. A related secular trend is that a growing share of firms categorizes themselves as multiple-discipline design firms, up almost 10 percentage points over the past decade.

The share of payroll positions lost during this downturn has been proportionately greater than the share of architecture firms closed. As a result, architecture firms have shrunk: The average number of payroll employees at a typical firm declined from 10.3

Share of gross billings at architecture firms by type of construction

	2002	2005	2008	2011	Avg. over past decade
Residential *	12%	18%	11%	14%	14%
Commerical **	28%	27%	29%	24%	27%
Institutional ***	52%	49%	53%	58%	53%
Other construction	5%	4%	6%	2%	4%
Nonconstruction	3%	2%	1%	2%	2%

Notes:
* includes single-family and multifamily construction, and home improvements
** includes office, retail and other commercial, hotel/hospitality, manufacturing, and distribution facilities
*** includes education, health care, justice, other government, religious, cultural, recreational, and transportation facilities

The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

FIGURE 7.3 Depending on the Stage of the Cycle, Construction Shares Can Vary Significantly

in 2008 to 8.8 in 2011. Currently, according to AIA estimates, almost a quarter of architecture firms nationally are sole practitioners, and over 60 percent have fewer than 5 employees on their payrolls. In contrast, only 1.4 percent of offices have 100 or more employees. In 2008, 51 percent of firm offices had fewer than 5 employees, while 2 percent had 100 or more.

Even though firm counts are heavily weighted toward smaller businesses, a large share of design professionals works in a larger-firm environment. Firm locations with 100 or more employees account for over 20 percent of all staff at architecture firms nationally, and 50+ person firms account for over a third of all employment. Since revenue per employee tends to be higher at larger firms, 100+ person firms account for over one-quarter of professional fees generated nationally, while 50+ person firms account for well over 40 percent.

Net revenue per employee averages almost twice as much at larger firms than it does at smaller firms, in part reflecting the greater use of part-time staff at smaller firms, but also likely reflecting higher chargeability rates at larger firms, as well as higher levels of staff productivity due to generally greater levels of capital investments (Figure 7.4).

Like previous recessions, this downturn has produced greater fragmentation at architecture firms. Firm layoffs have pushed down average firm sizes, and unemployed architects are a common source of new start-ups. Due to the ongoing "feast or famine" in project revenue for architecture firms, there are unusually high shares of start-ups and failures in the profession, reflected in the low average age of firms.

According to *The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics*, over a third of firms nationally were founded since 2000, and 60 percent were founded since the last significant downturn in the profession in 1990. Only 10 percent of firms at present were in existence prior to 1970. In an era where access to credit is very difficult (particularly for businesses without a long track record), where repeat

Share of total firms, staff, and gross billings in the profession by firm size, 2012

Firm size (#emp.)	Share of Firms	Share of Staff	Share of Billings	Net Revenue per Employee
1	26%	3%	2%	$70,000
2 to 4	37%	12%	8%	$74,000
5 to 9	18%	13%	11%	$95,000
10 to 19	10%	15%	14%	$113,000
20 to 49	6%	20%	22%	$132,000
50 to 99	2%	15%	16%	$136,000
100 or more	1%	22%	27%	$138,000
All-firm average				$86,000

The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics

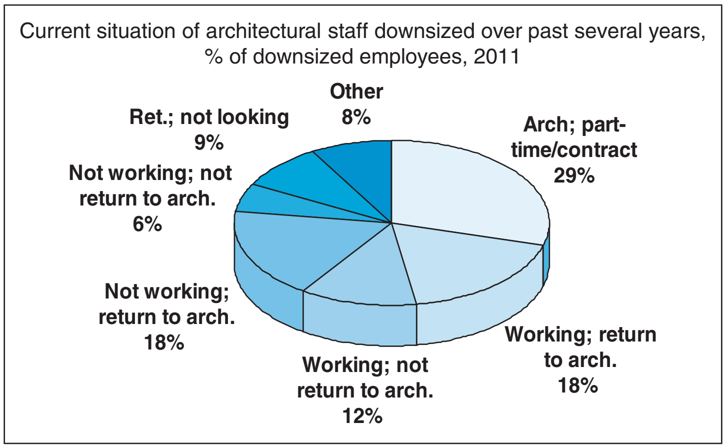
FIGURE 7.4 Even with Benefits to Scale in the Profession, Most Architecture Firms Remain Small

clients and established institutional relationships are important sources of new project activity, and where staff development (including formal intern development programs) extends for many years, high levels of staff turnover and business failures can have a devastating long-term effect on the profession.

The general downsizing of firms has also produced a change in their staff composition. In the AIA *Business of Architecture 2009* report (reflecting staff composition at the beginning of that year), 60 percent of payroll positions were architecture positions (including interns and students), 21 percent were other design professionals—with engineers and interior designers accounting for the largest shares—while the remaining 19 percent were technical and support staff. By the beginning of 2012, there were some significant changes to this composition. The largest share of losses was among the technical and nontechnical staff, positions that generally were not directly billable on projects. Architecture staff positions increased their share somewhat over this period, while the share of other design professionals remained essentially unchanged.

These summaries of payroll staff composition may somewhat overstate the actual changes in staff composition that occurred over this period. Many firms replaced or converted payroll positions to contract positions. Contract positions generally don't offer benefits and typically limit the number of hours worked to the immediate project needs. In other cases, full-time workers were cut back to part-time, or full-time positions were replaced with part-time positions. Many of these part-time and contract positions may be converted to full-time when workloads recover.

Regardless, many architecture positions were lost during the Great Recession beginning in early 2008, and many occupying these positions may never return to practice architecture. A survey conducted by the AIA in late 2011 asked architects their sense of what had happened to full-time architectural staff that had been downsized during the recession, and to speculate what would likely happen to these former employees in the future. Their sense was that about 30 percent of these former employees were still working at architecture firms on a part-time or contract basis, about 30 percent were working outside the profession, and the remaining 40 percent were not employed as of that point, including some who had retired or had returned for additional schooling. Looking to the future, this group estimated that about 40 percent of these downsized workers would never return to architecture practice (Figure 7.5).



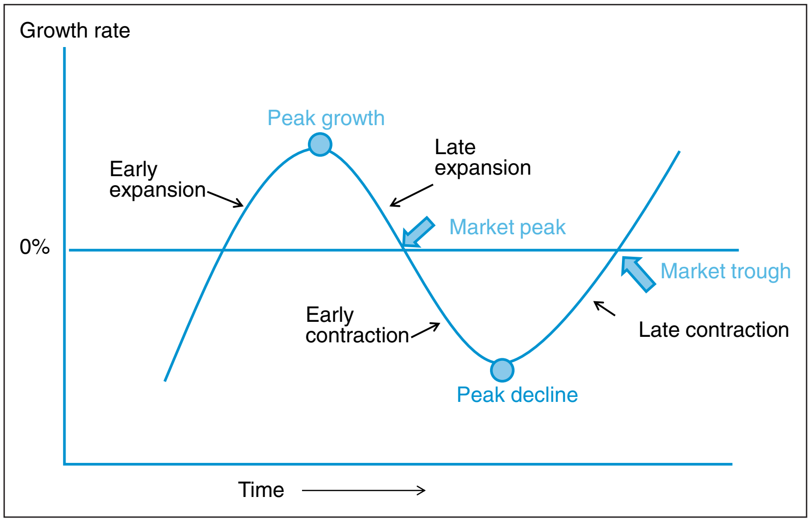
The American Institute of Architects Work-on-the-Boards Survey, October 2011

FIGURE 7.5 A Significant Share of Downsized Workers Are Not Likely to Return to Profession after Great Recession

UNDERSTANDING AND INTERPRETING ECONOMIC CYCLES

The business cycle comprises the up-and-down movements in activity in an economy. It generally is not a regular, predictable, or repeating phenomenon, and is commonly identified as a sequence of four phases with four distinctive points that serve as metrics for defining them (Figure 7.6):

- *Early expansion:* The period of acceleration in the pace of economic activity. This is the phase in the cycle when the economy is recovering from the last downturn and expanding into a period of new growth.
- *Peak growth:* The point where the rate of growth reaches its high point for that cycle.
- *Late expansion:* After the economy reaches a point of peak growth, growth begins to slow.
- *Market peak:* The time when actual economic output (not the rate of growth) is at its peak for that cycle.
- *Early contraction:* The phase immediately after the market peak when the slow growth transitions to a period of accelerating decline.
- *Peak decline:* The lower turning point of a business cycle, where the rate of decline is at its steepest.
- *Late contraction:* The period when the pace of decline begins to slow.
- *Market trough:* The time when economic output is at its lowest point for that cycle.



Kermit Baker, Ph.D., Hon. AIA

FIGURE 7.6 Phases of the Business Cycle

All industries are subject to business cycles, but some are more influenced by them than others. Consumer staples such as food and clothing or inexpensive consumer products tend to have fairly stable levels of activity across the business cycle. They are less influenced by changes in consumer income, or concern about future earnings.

Industries that rely on major expenditures (e.g., cars and homes) or involve large investments (e.g., buildings and public works projects) tend to have more pronounced business cycles. Households and businesses tend to put off these purchases if they are concerned about business conditions and move ahead with them with they are more comfortable with the economic outlook. This often creates a boom or bust in the production of these products, which contributes to the development of business cycles.

The construction industry is one of the most cyclical sectors in the economy. When economic conditions are unfavorable to some industries, they are often unfavorable to others, so fewer construction projects are undertaken. Conversely, when conditions are favorable to some, they are likely to be favorable to others, so a lot of projects that may have been on hold for a while are undertaken.

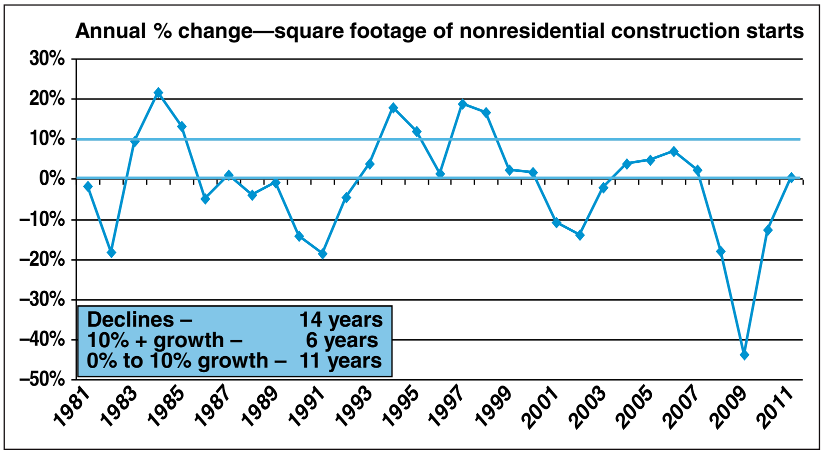
This pattern is easy to observe when looking at the change in construction activity over the past several decades. As shown in Figure 7.7, changes in the levels of construction activity from McGraw-Hill Construction data show the major cyclical upturns and downturns over the past several decades. There was a strong upturn in the early to mid-1980s, in part generated by tax code changes that encouraged business investment, including investment in structures. This period of healthy growth was followed by a fairly significant downturn in the early 1990s brought on in part by the collapse of the savings and loan system in the country. With weakness in these institutions, there were problems with financing residential and nonresidential construction, as well as with long-term loans to finance their acquisition.

The mid-1990s ushered in an extended period of strong growth in construction activity. A technology boom helped moderate the rate of inflation yet produce strong job growth, which provided a supportive economic environment for construction activity. As a result, there were eight straight years of gains in nonresidential construction activity, four of them at a double-digit pace. The 2001 to 2003 construction downturn that resulted from the bursting of the tech bubble was fairly mild, particularly in comparison with the magnitude of the preceding upturn.

Coming out of the early 2000s downturn was a fairly modest construction upturn from 2004 through 2007. No year over this period saw construction activity increase at a double-digit pace. The downturn following such a modest upturn would also be expected to be fairly restrained. Instead, with the rapid decline in house prices nationally, there was a near meltdown of the international financial system that produced the worst economic downturn since the 1930s Great Depression. It's fair to assume that had the nonresidential construction markets been more overbuilt leading into the downturn, the Great Recession would have been even more dire for the nonresidential construction industry.

This review of recent cycles in nonresidential construction activity underscores one of the critical challenges for architecture firms: namely the chronic volatility in project activity in the profession, typically producing very uneven revenue streams. Since changes in construction activity can be assumed to generate comparable changes in design activity at architecture firms, it's no surprise that managing an architecture firm is a terribly challenging undertaking. Looking over the 31 years of construction activity from 1980 through 2011, there are three major expansions and at least parts of four major contractions. Architecture firms are constantly managing through changes in business conditions, changes that create a number of challenges.

Declines in activity present obvious challenges: potential staffing reductions, overhead adjustments, increased marketing initiatives, and potential credit issues. These periods unfortunately are not rare. Over this 31-year period, there were 14 years where



McGraw-Hill Construction

FIGURE 7.7 Most Years, Nonresidential Construction Sees Either Strong Growth or Strong Declines

construction activity declined. Eight of these 14 yearly declines were 10 percent or greater, which present serious challenges for an architecture firm.

However, there are also challenges during the years where construction activity was increasing. For almost a third of these growth years, construction activity increased by 10 percent or more. Such rapid growth presents challenges for firms in terms of hiring and training staff and meeting project deadlines. Such challenges may be more desirable than those associated with downturns, but they remain challenges nonetheless. Combining the two categories—years with declines and years with strong growth—indicates that almost two-thirds of the years over this 31-year period presented challenges for architecture firms. Thus, for any architecture firm, being in a period with distinct challenges is significantly more likely than being in a period without them (Figure 7.7).

All of this points to the need for architecture firms to monitor business conditions closely, so that they can anticipate a movement in the business cycle and begin to implement adjustments in advance of conditions actually changing. Economic indicators to monitor business conditions should relate to the market area served by the firm; firms that serve a local market should monitor local indicators; regional firms should monitor regional indicators; and so forth. Some of the best economic indicators to monitor include the following:

- *Employment*. Changes in employment are probably the best single indicator of the economic health of an area. Job growth generates other forms of economic activity, including construction.
- *Consumer confidence*. How comfortable consumers are with the economic environment is critical to their willingness to spend, which in turn drives economic growth and construction activity.
- *Financial indicators*. Interest rates, lending standards, and the volume of construction and mortgage loans are key to determining whether an owner or developer will proceed on a construction project.
- *Housing indicators*. While directly important to many architects, the condition of the housing market is a key leading indicator for the broader economy as well as for the nonresidential construction sector.

However, an economic indicator that is closely connected to an industry will provide more precise information on likely future trends for that industry. For that reason, in 1995 the American Institute of Architects launched a monthly survey of design activity at architecture firms, now known as the Architecture Billings Index (ABI), to track business conditions across the profession.

Using the ABI to Anticipate and Interpret Cycles

Beginning in late 1995, the AIA assembled a national panel of architecture firms to participate in an ongoing survey to measure their business conditions. The principal purpose was to develop a database of national and regional business trends at architecture firms so that an individual firm would have a better sense of how business at that firm compared with its peers.

Architects are well positioned to report on the direction of the construction industry. Although decisions to build a nonresidential structure are made by hundreds of thousands of private businesses, nonprofit institutions, and government agencies, the first comprehensive indication of planned development typically shows up on an architect's drafting board. Surveys conducted by the AIA of its member firms, and information from McGraw-Hill Construction, indicate that about 75 percent of nonresidential buildings are designed by architects. A greater share of nonresidential activity is reviewed and approved by architects, but without complete design involvement.

The ABI survey is conducted monthly across a national panel of architecture firms. Currently, about 750 architecture firms actively participate in this program. Firms included in this survey provide architectural services as their principal design service offered. Firms may also provide engineering, interior design, landscape architecture, planning, urban design, or related services. Most firms additionally provide pre-design or construction-phase services (e.g., construction management) in addition to their architectural design services.

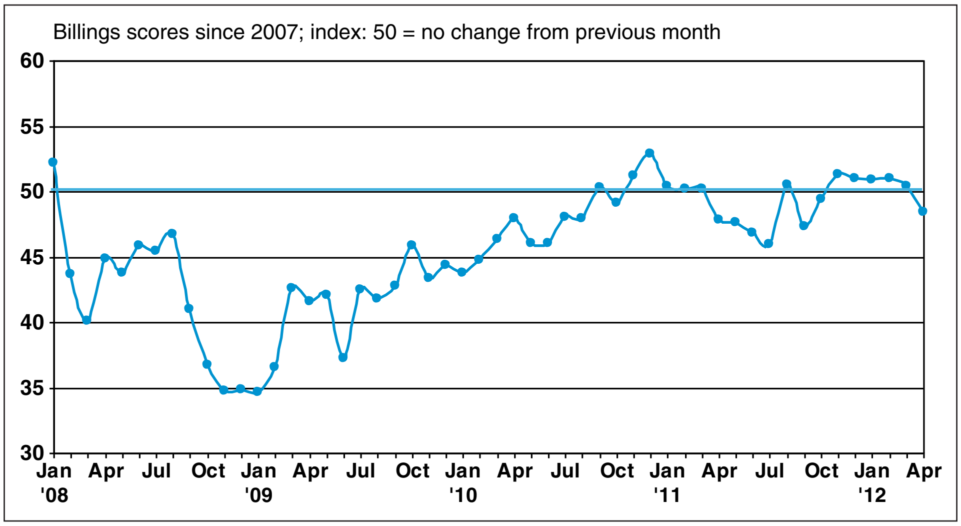
Firms that participate in the survey also provide the AIA with information on key firm characteristics, such as annual billings, construction sectors served, and number of employees. On the first business day of each month, participating firms are e-mailed a link to an electronic questionnaire. That questionnaire asks respondents to report firm billings for the just-completed month as compared to the previous month, as well as inquiries for new work over the same period. If a firm doesn't bill monthly, it is requested to estimate the work that will be billed for that period.

Firms are asked to report whether billings during the previous month significantly increased (5 percent or more), remained about the same, or significantly decreased (5 percent or more). The ABI is computed as a diffusion index, with the monthly score calculated as the percentage of firms reporting a significant increase plus half the percentage of firms reporting no change. Comparisons are always to the previous month. Diffusion indexes, centered at a score of 50, are frequently used to measure change in economic activity.

If an equal share of firms report an increase as report a decrease, the score for that month will be 50. A score above 50 indicates that firms in aggregate are reporting an increase in activity that month compared to the previous month, while a score below 50 indicates that firms are reporting a decrease in activity.

Certain months of the year—December is typically one of them—are slower at architecture firms due to holidays, weather, and other factors. Other months may show almost uniformly stronger business conditions for just the opposite reasons. To allow for meaningful comparisons among months, the monthly responses are seasonally adjusted using the Census Bureau's X-12 program. The seasonal adjustment process regulates the ABI score each month based on typical scores for that month in prior years. So, for example, even though December scores may be weaker than November scores, the seasonal adjustment process compares this weakness to prior years to determine if the decline is stronger or weaker than it has been previously.

Since architecture firms design the overwhelming majority of nonresidential buildings in the United States, we would expect a relatively consistent relationship between architectural design activities and nonresidential building construction. However, this relationship does vary from project to project. A recent AIA survey of architecture firms determined that the average time between the award of a design contract and the award of a construction contract for that facility was about a year.



AIA Architecture Billings Index

FIGURE 7.8 Architecture Billings Anticipate Future Construction Trends

However, there is considerable variation from project to project. According to the aforementioned survey, for commercial/industrial projects the design phase up through contract award was less than six months for 40 percent of the projects, while for more than a quarter of projects this period extended beyond a year. Size and complexity of a project are key reasons for variation in design time, but three other factors also influence design time. Client decision making—and whether these decisions need single or multiple approvals—frequently influences the length of the design phase. Financing and funding for the project also can be a factor. Finally, regulatory approvals—land entitlement, special use permits, zoning, environmental issues, and historical considerations—also influence the length of the design phase.

The ABI is designed to mimic the business cycle for design activity. The ABI scores are centered on 50, so a score above 50 indicates an increase in design activity, and a score below indicates a decrease. During the early phase of a recovery, we would expect to see scores accelerate to the mid-50s to even 60 range. During the late expansion, scores would likely settle back to the low 50 range. Moving into a contraction, scores would likely drop quite quickly to the mid-to-low 40s, before heading back up to the upper 40s as the market moved into the late contraction phase. This allows the user to anticipate the direction that scores are moving, and therefore the future direction of design activity (Figure 7.8).

IMPLICATIONS OF CYCLES ON THE FUTURE OF PRACTICE

Economic cycles are the most powerful business force facing the architecture profession. Successful firms learn how to manage their practice through cycles to minimize the long-term negative impact. Traditionally, diversification has been a strategy to allow firms to achieve more stable revenue across cycles. Firm diversification may take on one or more of the following three dimensions: geographic, building type, or services.

Geographic Diversification

Most small and midsize architecture firms serve a fairly focused geographic area. Urban firms may serve an entire metropolitan area, or a portion of the metropolitan area. Others may focus their practice in a single town or county, or portion of a state.

Typically, the economic base of the markets served is relatively homogeneous, meaning that the economic health of these markets rises or falls with the performance of a relatively small slice of the economy. Typically, the big industries in these areas, such as a college or university, a hospital, an insurance company, a manufacturing facility, a government installation, or something similar, will largely determine the health of the local economy. By serving a larger geographic area, a firm can broaden the economic base on which it is dependent. While one sector of the economy may be dealing with difficult issues, it is much less common for several sectors of the economy to be moving through the same stage of the economic cycle.

Some firms have taken geographic diversification one step further, into international markets. Even though the world economy is much more interconnected now than it was in the past—analysts refer to the world being "flat"—pursuing international projects does typically offer diversification opportunities for firms. For example, annual economic growth in China has been averaging close to double digits for many years, whereas growth for many developed countries has averaged in the low single digits annually. Countries with stronger growth would be expected to have a more vibrant construction industry to support that growth, and therefore diversifying a practice to include projects in rapidly developing areas should help to hedge against a domestic slowdown.

▶ Practicing in a Global Market (5.8) further discusses the context, methodologies, and rules of engagement involved in pursuing international design opportunities.

Building Type Diversification

As with geographical areas served, most small and midsize firms focus their practice on a few building types, such as single-family homes, offices, hotels, schools, or medical facilities. Generally, building cycles for major construction sectors occur at different phases of the broader economic cycle. Housing cycles generally unfold early in an economic cycle, followed 12 to 18 months later by commercial/industrial cycles, followed in turn 6 to 9 months later by institutional cycles.

The risks of concentrating a practice on a limited number of building types can be almost as great as geographical concentration; weakness in certain sectors of the economy can affect demand for some facilities more than others. High mortgage rates can limit demand for new homes. High energy costs can limit travel, and therefore demand for hotels. Diversification can provide design opportunities in a sector of the economy when another sector is weak.

Service Diversification

While most architecture firms offer standard architectural design services, fewer offer related design services or expanded design services. According to *The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics*, only about one-half of architecture firms offered interior design, space planning, planning, or sustainable design services. About a quarter offered historic preservation, design-build, or construction management services. Fewer yet offered landscape architecture or engineering services.

A broader service package generally opens up more design opportunities and allows a firm to compete for a broader range of projects. Also, a broader service package—or a concentration in more specialized services—allows a firm to partner with other firms on a broader range of projects.

The historical concentration of architecture firms generally means that firms need to grow more than may be desirable during upturns, and go through a painful downsizing process during downturns. For example, between the beginning of 2009 and 2012, the AIA estimates that there was a net loss of about 6 percent of all AIA member–owned architecture firms nationally. While this marks a fairly significant decline in the number of firms, it marks an even more significant decline in the distribution of firms. The number of 100+ person firms declined by over 20 percent, while the number of other midsize and larger firms declined by more than 10 percent. Conversely, the number of sole practitioners increased, accounting for over a quarter of all firms (Figure 7.9).

While most firms downsized during the construction downturn precipitated by the 2008–2009 Great Recession, others went out of business. Some architects who were

Number of AIA member firms

Firm size (# employees)	Number of firms 2009	Number of firms 2012	Change: 2009 to 2012
1	4,501	4,636	135
2 to 4	6,867	6,450	–417
5 to 9	3,475	3,115	–360
10 to 19	2,011	1,727	–284
20 to 49	1,167	1,018	–149
50 to 99	396	348	–48
100 or more	312	237	–75
Total	18,729	17,532	–1,197

The Business of Architecture: AIA Survey Report on Firm Characteristics, *2009 and 2012*

FIGURE 7.9 During This Downturn, Firms That Have Survived Have Gotten Smaller

laid off started their own practices. The net result is that some older firms ceased operations, while some new firms started up. This process reduces the age of the average architecture firm in the United States. By early 2012, well over a third of all architecture firms in the United States had been founded since 2000, and over 60 percent had been founded since 1990, according to *The Business of Architecture: 2012 AIA Survey Report on Firm Characteristics*. Only about one in five firms—mostly larger firms—had been in existence since 1970.

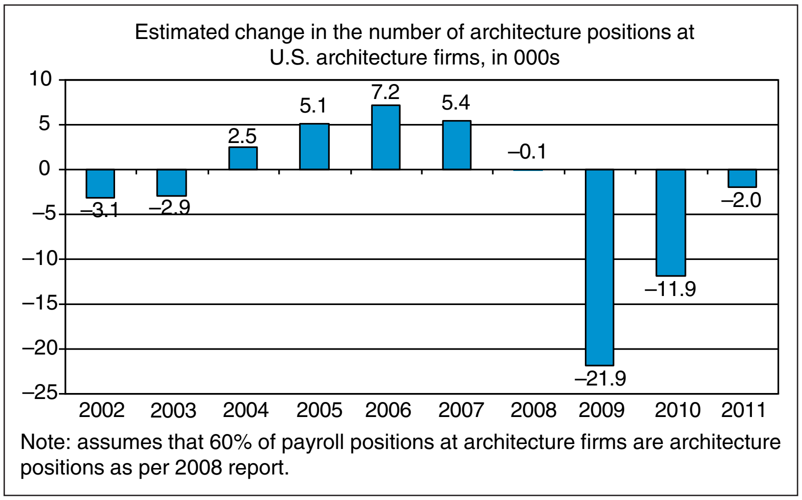
IMPACT ON ARCHITECTS

The dynamic of architecture firm structure during downturns—most firms reducing staff, some firms disappearing, and new firms starting up—is even more dramatic for architecture staff positions. The AIA estimates that there were almost 110,000 architecture positions nationally (licensed and unlicensed graduates) in 2003 at the end of the construction downturn following the 2001 economic recession, growing to almost 130,000 positions at the peak of the construction expansion in 2007–2008, and then falling to almost 90,000 at the low point of the construction cycle following the 2008–2009 national economic recession.

These figures suggest very rapid growth in the number of architecture positions during construction expansions and very steep losses during downturns. During the mid-decade upturn, the AIA estimates that there were over 20,000 architectural positions added nationally, generating close to a 20 percent increase in architectural positions. During the construction downturn following the Great Recession, however, between 35,000 and 40,000 payroll architecture positions were eliminated (Figure 7.10).

While recent cycles have been more extreme, even normal cycles overwhelm the ability of the profession to adjust to changes in workloads. During upturns, there generally are not enough recent graduates of architecture programs to meet the growing staffing needs. Some firms outsource design work in an effort to meet project deadlines. Other firms may provide incentives to keep staff in the workforce, including older staff who may have been considering retirement. During downturns, in addition to staff layoffs, firms may freeze or even reduce compensation, furlough employees through unpaid time off, or convert some full-time employees to part-time status. Firms may convert some payroll employees to contract status, so that they only work when there is billable project activity.

Historically, less-experienced architecture staff has disproportionately served as a balance wheel during periods of expansion as well as downsizing. These are the



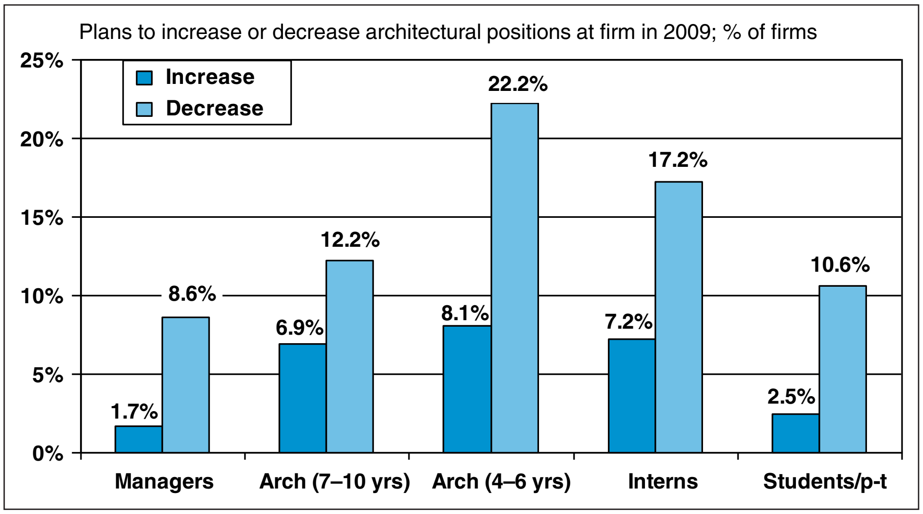
AIA estimates from U.S. Department of Labor and AIA Business of Architecture *report, 2009*

FIGURE 7.10 During Upturns, There Is Insufficient Architecture Staff; During Downturns, an Excess

positions that may be easier and more affordable to fill during upturns, and candidates may be easier to train in the firm's area of specialization. They also may have more current technical skills to operate the newest design software.

By the same token, less-experienced staff has often been the first to get laid off during business downturns. More-experienced staff may have more ability to generate new project revenue during lean times. Also, experienced staff is likely to be more familiar with firm operations, and therefore more difficult to replace during the next upturn.

A survey of architecture firms conducted by the AIA in early 2009 demonstrates the volatility of less-experienced positions at architecture firms. This survey was conducted during the heart of the downturn, and asked firms about positions that they would be adding or eliminating over the coming year. Many firms were expecting to reduce their staff size during the year, and less-experienced architectural positions (4–6 years) and interns were the most commonly selected as targets for downsizing. However, a few firms were planning on adding staff that year, and again the positions most commonly mentioned for addition were less-experienced staff and interns (Figure 7.11).



AIA Work-on-the-Boards Survey, January 2009

FIGURE 7.11 Younger Architectural Staff Are Most Likely To Be Added and Eliminated During Cycles

CONCLUSION

Economic cycles dramatically influence the financial condition of architecture firms and the staff employed by them. However, the ultimate health of the industry will be determined by the underlying growth of the construction industry, rather than merely how design activity cycles around that underlying growth trend. Here the outlook is more positive. According to information from McGraw-Hill Construction, the U.S. construction industry has added an average of 1.3 billion square feet of nonresidential building per year since 1980. Current construction levels in 2010 and 2011 were less than half this pace, so the prospects for strong growth in the years ahead—even during cyclical downturns—are very promising.

7.2 Financial Management Overview

Steve L. Wintner, AIA Emeritus

Financial Management involves the ongoing monitoring of a firm's financial resources to allow firm principal(s) to exercise sound business judgment in response to developing trends.

INTRODUCTION

The basic knowledge needed for the financial management of a professional design firm includes a clear understanding of the component parts of each of the two primary financial reports—the Profit-Loss Statement and the Balance Sheet—and how to interpret these reports. Knowing how to calculate the seven key financial performance indicators of the profit-loss statement and the four key financial performance indicators of the balance sheet will facilitate a firm leader's response to developing trends, whether positive or negative. An in-depth knowledge of accounting is not required to develop the skills to learn any of the above.

Two essential components of a financial management system are the Annual Budget and the Profit Plan. These two components are closely interrelated, and decisions

---

Steve L. Wintner is the founder and principal of Management Consulting Services, a Houston-based firm specializing in design firm management. Wintner has more than 35 years of experience in design firm management and is the coauthor of Financial Management for Design Professionals: The Path to Profitability (Kaplan Publishing, 2006).

▶ Developing Annual Budgets and Profit Planning (7.4) covers budgeting as integral to the strategic planning process.

about elements of one component will likely have an impact on the other component. For example, overhead projections made for the profit plan will play a key role in the development of the annual budget. Therefore, it is important that these two components be developed concurrently.

Since these two components are developed for each new coming year, it would be advantageous for their development to begin before the coming year commences. Even if the final results of the current year are not yet available, it is acceptable, as a place to begin, to use the data from the latest of a firm's 4th-quarter accrual-basis financial reports and their calculated key indicators. Once the final, previous year-end data is available, adjustments for the coming year can be made to the budget and profit plan and their key indicators. Getting an early start will enable firm leaders to respond more effectively to new opportunities using the most current data. These two components, when fully developed, provide a basis for comparing the anticipated financial performance of a firm with its actual financial performance in the periodic monitoring of its accrual-basis profit-loss statement.

Distinctions Between Accounting Reports and Financial Management Reports

A comprehensive financial management system is based on a firm's accounting system, but there are distinctions between their respective reports.

Accounting reports and their generated data are the responsibility and realm of a firm's accounting personnel and its outside tax consultant. Financial management

GLOSSARY OF KEY ACCOUNTING TERMINOLOGY

- **Accrual-basis accounting (modified):** Revenue earned and billed from fees and expenses, including outside project consultant fees and expenses, plus all other direct and indirect expenses *incurred*. This means revenue is based only on invoiced fee and expense amounts sent and/or received. Most firms use this modified accrual-basis for their profit-loss statement and balance sheet development.
- **Cash-basis accounting:** Income *received* and all salaries and expenses *paid* (a checkbook approach). This is the basis most commonly used for filing and paying quarterly and year-end taxes.
- **Net operating revenue (NOR; aka "net revenue"):** Represents the net dollars remaining after deducting the invoiced consultant's fees and expenses, and all reimbursable and non-reimbursable project-related expenses.
- **Direct labor:** Same as direct salary. Represents time *charged* to projects, whether invoiced or not (by everyone, including principals).
- **Indirect labor:** Same as indirect salary. Time charged to non-project-related activities (by everyone, including principals). Note: Indirect labor is included in the calculation of total indirect expenses.
- **Reimbursable expenses:** Project-related expenses that are invoiced to the client in addition to fees. These would also include a markup percentage on those expenses. The markup dollars are a form of revenue and are included in net operating revenue.
- **Direct expense:** Project-related expenses for a firm and its outside consultants that are not reimbursable, plus project-related expenses included in all lump sum fee contracts.
- **Indirect expense:** General and administrative non-project-related operating expenses (total indirect expenses includes indirect labor).
- **Overhead rate:** The ratio of total indirect expenses to total direct labor.
- **Break-even rate:** The overhead rate plus the unit cost of 1.00 for an hour of salary (example: overhead rate of 1.30 + 1.00 = break-even rate of 2.30). This means for every $1.00 of salary the firm must recapture $2.30 just to break even.
- **Utilization rate:** Direct labor expressed as a percentage of total labor. (For individual rates, use hours; for a firm rate, use dollars.)
- **Hourly billing rate:** The dollar amount charged to a client relative to one hour of direct labor.
- **Net multiplier:** The net multiplier is the ratio of net operating revenue (NOR) to total direct labor. The measure of return on every dollar of direct labor.
- **Net profit:** The dollars remaining after deducting all direct and indirect labor and indirect expenses, before any distributions are made or tax is paid.
- **Current earnings:** The net dollar amount after all distributions are made and all applicable taxes have been deducted.

reports are the responsibility and realm of firm leaders, even though others might develop and compile these reports. While the basis (timesheets, incoming payments, and outgoing invoices) of the financial data is essentially the same for the accounting and financial reports, each report type is formatted differently to suit their respective purposes and use by each party.

Accounting reports focus primarily on cash-flow management, accounts payable, and defining the firm's quarterly and annual tax liability, which are identified in the *cash-basis* reports. A firm leader's focus will be on reviewing and monitoring the key indicators from the financial data provided in the *accrual-basis* reports. Both reports facilitate making sound business decisions to enhance a firm's effectiveness, efficiency, profitability, and the achievement of its professional goals.

An understanding of the following basic accounting terms is also necessary for skillful financial management.

FINANCIAL PLANNING

Applications of the Cash-Basis and Accrual-Basis Reports

Depending on the size of a firm, one or both types of reports may be used. The accounting process for most sole proprietors (those without any paid staff) would be on a checkbook-like basis (dollars received, dollars paid) and therefore would likely use only the cash-basis report. Almost all other size firms with employees would use both types of reports.

The cash-basis profit-loss statement indicates only the income received and the amounts paid out for expenses to others within a specific accounting period. Because certain expenses, such as salaries and most vendor invoices, are paid shortly after the obligation is incurred, and income from invoices may not be received for 30 to 120 calendar days, or more, after the work is actually done, there is no timing correlation between income received and expenses paid. The cash-basis profit-loss statement establishes a firm's cash-flow management effectiveness and its tax liability, not its net profit.

Nonpayment of invoices in excess of 30 days is problematic and needs to be resolved as quickly as possible. Payment on invoiced project amounts ideally should be received from the client within 30 days from the date of the invoice and certainly not later than 60 days.

Unlike the cash-basis profit-loss statement, the accrual-basis profit-loss statement does not consider the actual receipt or payment of any money. Rather, the accrual report reflects the invoices sent to clients for monthly revenue earnings, based on hours worked and expenses incurred to complete that work, in a given accounting period. The accrual basis profit-loss statement establishes the net profit for a firm and the calculation of its seven relevant key financial performance indicators.

These two reports do, however, have a connection. For example, consider the relationship between cash available on-hand and the distribution of any net profit. Ultimately, the availability of cash-on-hand will have a significant impact on the decisions made about the size and timing of net profit distributions.

Since the accrual-basis profit-loss statement defines net profit and the cash-basis profit-loss statement (aka the "income statement") defines available cash, both types of reports will need to be consulted before any decision about the distribution of net profit can be made. With this in mind, it is easy to understand the importance of maintaining a "healthy" cash-on-hand balance throughout the year.

For the sake of this article and in general, the "modified" accrual-basis is the industry-accepted method employed for the accrual-basis profit-loss statement. The modified version records only the revenue from fees and expenses that have been invoiced to clients. It would also include the fee and expense amounts invoiced to the firm by outside project consultants and other vendor and general expense amounts that were incurred in a specific accounting period. It does not include the value of earned fees unbilled ("work-in-progress").

Introduction to the Mattox Format

The use of conventional accounting formats, while perfectly acceptable, nevertheless do not allow for an easy calculation of the seven key financial performance indicators for the profit-loss statement. As an alternative to conventional accounting formats, there is a unique format that was developed by Robert F. Mattox, FAIA, (retired) designed to facilitate easy understanding of financial performance indicators.

CASH-BASIS AND ACCRUAL-BASIS REPORT DIFFERENCES

This example illustrates the differences between the cash-basis and the accrual-basis reports.

The cash-basis accounting for this firm recorded a net cash income of $21,000 for the current month. However, much of this income comes from the collection of months of previous invoices that were not paid until the current month. The accrual-basis accounting for this same firm indicates a net profit of $18,000, on the current month's invoices of $100,000.

Since net cash income and net profit are generated by different monetary resources, it is not appropriate or realistic to compare the actual income ($ received) in the cash-basis report to the earned "net profit" (based on dollars invoiced) in the accrual-basis report.

The cash-basis report indicates income received and payments made. For this reason, only the cash-basis profit-loss report is to be used to determine the firm's quarterly and annual tax liability.

The modified accrual-basis report provides an accurate snapshot of a given accounting period, generally one month and the year-to-date. It records only the invoiced amounts sent to clients for the firm. This report does not indicate any actual income received or payments made.

Current Month—Cash Basis	
Income received for previous invoices (for fees and expenses):	$70,000.00
Current month invoices (for fees and expenses):	$5,000.00
Total Current Month Income:	**$75,000.00**
Total salaries paid:	–$45,000.00
Total expenses paid:	–$9,000.00
Current Month Net Cash Income:	**$21,000.00**
Current Month—Modified Accrual Basis	
Net operating revenue earned (for invoices sent):	$100,000.00
Direct labor expenses incurred:	$32,000.00
Indirect expenses incurred (labor and expenses):	$50,000.00
Total labor and expenses incurred:	$82,000.00
Current Month Net Profit:	**$18,000.00**

While conventional accounting systems are capable of providing these same performance indicators, the results will be more laborious to calculate and will not necessarily provide as accurate a result for some of these key indicators. The reason for this is that conventional accounting systems are set up with certain data shown in portions of the report that make it necessary to extrapolate and reorganize these data to allow for the calculation of these seven key financial performance indicators.

AN INTRODUCTION TO THE MATTOX FORMAT

In the late 1970s, Robert F. Mattox, FAIA, (retired) developed an alternative to conventional accounting formats, particularly designed for use by professional design firms. The AIA Press first published this format in 1978 and 1980 in the two manuals authored by Mattox, titled "Standardized Accounting for Architects" and "Financial Management for Architects." Identified herein as the Mattox Format, this system was developed to enable design professionals to quickly ascertain firm profitability and measure its performance with key financial indicators. While the Mattox Format differs somewhat from a conventional accounting format, it is entirely consistent with generally accepted accounting principles (GAAP).

The significant difference between the Mattox Format and a conventional accounting system is the structure of its chart of accounts and the format of the major components of the profit-loss statement and the balance sheet, based on their respective chart of accounts.

For the profit-loss statement, the Mattox Format comprises four major components: revenue, direct labor, indirect expenses, and miscellaneous revenue and expenses. Together, these four components will provide a firm's true overhead rate, net profit, and five other key financial performance indicators.

Although the Maddox Format is not widely known or recognized by accounting professionals, the method has proven to be beneficial to many professional design firms. The Mattox Format is currently only available in one of the three integrated accounting software systems developed for professional design firms.

Performance Goals

Every professional design firm would do well to establish specific goals for its financial performance for each coming year. In order to provide a realistic set of performance goals, these goals need to be reviewed and modified to suit the current status of the firm's finances and the current and anticipated condition of the market for the firm's services.

Because each firm is unique, these goals will vary from firm to firm. For many firms these goals are based on established mission and vision statements.

Among the financial performance goals to consider are the following:

- Projected net billing and revenue
- Project consultant fees (as a percentage of total billing)
- Project-related expenses
- Staff size and salary expense
- Overhead expense and break-even rates (as a percentage of direct labor)
- Net profit (as a percentage of net operating revenue)

Included in these goals will also be the development of a competitive hourly billing rate for every member of the firm and their respective, targeted utilization rates for the coming year.

It is recommended that every firm establish these performance goals before the start of the coming year. Once established, these performance goals will provide firm members with an opportunity to be as efficient and effective as possible through regular monitoring of daily project activities and the accurate tracking of time spent each day on projects.

▶ See the backgrounder accompanying this article, Key Financial Performance Indicators, for more on financial ratios.

Projected Net Billing and Revenue

Financial planning begins with the projection of what the firm principal(s) believe to be a reasonable expectation of how much net billing (fees billed exclusive of expenses and consultants) and revenue the firm can create for the coming year. This would entail identifying current projects under contract that will carry over into the coming year and the balance of fees remaining to be billed on those projects in the coming year. This is commonly referred to as "backlog." Most firms maintain an ongoing backlog report to facilitate this process. Then, taking into consideration all outstanding project proposals and categorizing them as either a "prospect" (better than a 50 percent chance of being awarded) or a "suspect" (less than a 50 percent chance of being awarded) it is possible to assign a percentage of them being awarded to the firm and calculating their respective projected fee values. In addition, a firm's marketing plan will identify potential new prospects and suspects, based on the current and anticipated market conditions and the opportunities to submit future proposals for these yet to be identified new projects. With these resources identified, a realistic, conservative net billing and revenue projection goal for the coming year can be established within the profit plan.

Project Consultant Fees (as a Percentage of Total Billing)

A firm's total revenue generally also includes other fees to be billed in addition to their own. Most common among these are the fees for project consultants.

Refer to industry guidelines for what would be an appropriate percentage of a firm's total billings allocated to the fees of their project consultants. It is also advisable for each new prospective project, prior to submitting a fee proposal, to send a comprehensive request for proposal (RFP) to each of the required project consultants to be retained. Then, adding the project consultant's proposed fees to the firm's calculated net fee, the total fee can be established and the actual percentage of the total fee allocated to the project consultants can be determined. This percentage would then be compared to what the industry guidelines suggest to be reasonable and fair.

This process will enhance a firm's ability to be more responsive to an existing or new client's request for a fee proposal for future work and result in the potential for increased profitability.

Project-Related Expenses

Each project, based on the fee basis stipulated in the contract, will have expenses that can be invoiced and subsequently reimbursed or expenses that will be a part of the total fee, as in a lump sum fee basis and not individually reimbursed. In addition, even for those projects that have reimbursable expenses, there likely will be other expenses that will be non-reimbursable (e.g., in-house reproduction expenses for coordination, local mileage, unauthorized overtime, etc.). Because these common, project-related, non-reimbursable expenses reduce a project's profitability, they should be identified as a part of the fee-setting process and a unit cost established for each such expense. Doing so will result in establishing a more accurate net operating revenue and net profit for the prospective project.

Staff Size and Salary Expense

One of the performance goals to consider is a strategic plan for the staff size of a firm. The impact of the market and its economic condition will almost always play a role in establishing the number of employees in a firm. The great majority of firms in the United States are considered to be small firms. "Small," in this reference, is defined as fewer than 10 people, including the principal(s).

Regardless of a firm's staff size, it is still important to plan for the annual cost of its employees and principals. Proportionally, annual salaries are the single largest expense for any firm. For most firms, approximately two-thirds of their total annual salaries will be project-related and will be the primary source of a firm's generated revenue and income.

Of critical importance is the balance between staff size and the available project work. This balance is reflected in one of the seven P-L statement indicators: the ratio of the total direct labor expense to net operating revenue (net multiplier). To best reflect this balance, the total direct labor should be in the range of 28 to 32 percent of net operating revenue. If the ratio is considerably lower than 28 percent, it is a possible indication that there are insufficient hours being charged to project-related assignments. This might be the result of a reduction in project workload caused by a client stop-work order, or something affecting the entire industry like an economic slow-down. Whatever the reason, there will be times when the project workload is insufficient to allow staff to charge their "normal" number of direct hours (based on their respective, targeted utilization rates) and this will reduce the percentage of direct hours to NOR.

If the ratio is considerably higher than 32 percent, there are several possible explanations:

1. Hours in excess of those budgeted or allocated are being charged to project-related activities. Potential negative impact is that a project's total fee is being used too quickly and profit is being consumed to cover these additional hours.
2. A large volume of overtime hours are being charged to project-related activities. This would be added to the project fee if the client authorized and was paying for these overtime hours at regular or premium billing rates. If not, since firms usually do not pay overtime for salaried professional staff, these overtime hours, while still charged to the project, would not have any cost related to them. They are charged as hours with a zero-cost impact on the project budget or overhead burden. While these hours do not increase direct labor expense (in dollars), they should be recorded for an accurate measure of direct hours required for project completion. This is important for establishing reliable historical data on how many hours it actually takes to complete a certain project type.
3. A business decision was made to spend the hours to "catch up" with the project schedule. If no compensation is made for these hours, it is the same as the situation described in number 2 above: zero-cost. If compensation is being provided, it is similar to number 1 above: potential fee drain and profit loss.

For any and all of these above reasons, it is essential that the project hours charged are accurately and timely entered on each respective employee's daily timesheet.

▶ For related information, see "Recording Direct and Indirect Time" in Financial Management Systems (7.3).

Overhead Rate and Break-Even Rate (as a Percentage of Direct Labor)

The overhead rate and the break-even rate are inextricably related:

- *The overhead rate* comprises two components: indirect labor and general and administrative (G&A) expenses. Even though many G&A expenses are common to most firms, what these expenses specifically include will be a reflection of a firm's uniqueness in its operations and the types of discretionary benefits it offers its employees. Refer to the sample accrual profit-loss statement and the most common G&A expenses.
- *The break-even rate* is equal to the overhead rate plus an assigned unit cost of 1.0 for hourly salaries. A firm with an overhead rate of 1.30 would have a corresponding break-even rate of 2.30 (1.30 + 1.0).

Once a firm's overhead rate has been established, the break-even rate for every employee can also be calculated, based on their respective hourly salary rate.

> *Example:* For an employee who is paid a salary equal to $20 per hour ($41,600/2,080 hours) in a firm with an overhead rate of 1.30, the break-even rate for such an employee would be: $20.00 × 2.30 = $46.00 per hour.

That means for the firm to break even on this particular employee's hourly salary and their respective portion of the firm's overhead cost, the hourly billing rate for their direct labor can be no less than $46.00 per hour. To include profit at a targeted percentage of 20 percent, divide the break-even rate by 80 percent (the complement of 20%). This will establish an hourly billing rate of $57.50 ($46.00 ÷ 80% = $57.50; to check: $57.50 × 20% = $11.50 + $46.00 = $57.50).

Net Profit

On the accrual profit-loss statement, the net profit is considered to be a firm's "bottom line." It is the total dollars earned after all salaries and expenses have been deducted (regardless of payment) from the net operating revenue. The only thing remaining at this point, if a profit was earned, is the decision about its distribution to the staff and principal(s).

The need to define the actual available cash-on-hand that would cover such distributions was previously discussed. There are examples of firms that, in spite of having earned a net profit, did not have adequate available cash-on-hand to make the distributions they deemed appropriate. To supplement their available cash-on-hand and pay for these distributions, the principal(s) sometimes decide to tap into the firm's line of credit. In the case of firms that do not have a line of credit, some have been known to apply for a loan. While these are individual business decisions, they need to be considered carefully as to the wisdom and soundness of this course of action. If the firm is extremely well-managed, the repercussion of such decisions might never be negatively experienced, but for most, taking on debt to pay bonuses is a decision laden with risk.

Sometimes a firm has available cash-on-hand, but does not have any earned net profit at the end of the year. In this scenario, some may decide to go ahead and make modest distributions. Again, this is a business decision, but not necessarily a prudent one.

Planning for profitability and its eventual distribution is a process to engage in before the start of each coming year to provide a firm with the best advantage to succeed.

PROJECT CONTRACT–RELATED FINANCIAL MANAGEMENT ISSUES

Most project contracts contain information that will require a keen awareness of its impact on potential project profitability and the periodic monitoring of a project's progress. Among the information to review and monitor carefully is the fee basis type, the basic scope of services, scheduled invoices, and other opportunities that might lead to supplemental/additional services, revenue, and income.

Fee Basis Types

Every project will have a designated type of fee basis. There are several types, and each basis has its own nuances and financial management implications. The following are the most common types:

- Stipulated lump sum
- Fixed fee + expenses (with or without a cap limit on expenses)
- Percentage of construction cost
- Hourly to a maximum + expenses
- Hourly—open-ended (no established maximum) + expenses
- Fee per unit/sf (mostly used on residential projects) + expenses

▶ Services and Compensation (15.2) covers the variables to be considered when determining the amount to charge for architectural services as well as methods of compensation and strategies for getting paid.

▶ For more information on the go/no-go decision process, see Qualifications, Proposals, and Interviews (6.5).

For most project contracts the client will stipulate the type of fee basis. Public sector (government, institutional) projects will almost always be on a stipulated lump sum or a percentage of construction cost fee basis. Private sector projects could be any one of the above types, depending on the client and the project type.

Regardless of the fee basis type stipulated, each type affords a certain number of benefits and disadvantages, all of which need to be considered as one part of a "go/no-go" decision to respond to a RFP.

Scope of Services

The scope of services is a portion of the project contract that bears careful scrutiny. The scope of services in many project contracts is not clearly defined, which leaves too much to interpretation by the reader. This can lead to disastrous results for the architect, primarily in the area of lost revenue and subsequent lost income.

▶ Defining Project Services (15.1) addresses the centrality of scope definition to developing effective agreements for professional design services.

▶ See Risk Management Strategies (16.1), Insurance Coverage for Business and Professional Liability (16.2), and Owner-Generated Agreements (17.3) for related information concerning risk management.

To keep this from happening, it is advisable to have at least two senior members of the firm read and review the scope of services requirements to ascertain if any portions are unclear. There may be a need to stipulate the number included of a certain kind of meeting or the number of design scenarios per design phase to be prepared for client approval. Anything that is left open-ended and subject to interpretation may lead to a "bottomless pit" of expectations by a client.

In addition to the above, certain words that are used in contracts with owners are likely to result in a difference of interpretation of what the client was requiring, or what the legal implications might be, and/or how the requirement might affect the professional liability insurance carried by the firm. The most detrimental example is the words used in the indemnification clause of the contract. It is advisable to have a firm's legal counsel and their professional liability insurance carrier's representative review the contract to avoid any potentially expensive surprises.

CONCLUSION

Since each professional design firm is unique, so will be its respective operational policies and procedures. Therefore, prior to adopting any of the contents of this article, it is recommended that firm leaders seek professional input from trusted outside sources familiar with the firm. At a minimum, firm leaders are urged to review and discuss this article with accounting advisers, both in-house and outside. Once discussed, any decisions to adopt specific changes to their current accounting system should be implemented by the accounting staff and as much outside professional guidance as is available.

As a summation, the following are the main points of each of the major subtopics in this article:

- *Accounting and financial management reports:* The essential distinction between accounting reports and financial management reports relates to the parties for whom these reports are created. Accounting reports serve to identify the external realm of a firm's financial performance as it relates to tax liability. Financial management reports serve to facilitate the internal decision-making process by a firm's leader(s).

- *Cash-basis and accrual-basis reports:* The two types of financial reports—cash basis and accrual basis—respectively serve a firm's accounting and financial management needs. These reports are interrelated in that they share the same data for time and money, but organize these data in different formats and with a different focus and purpose. In accounting parlance, the use of these two types of reports is referred to as "double-entry bookkeeping."
- *The Mattox Format:* This article introduces a different approach to the accounting process and the concepts of financial management for professional service firms. The Mattox Format is a proven viable alternative methodology to what is generally commercially available for AE financial software systems. The Mattox Format has a 30-plus-year legacy since its introduction in the late 1970s and early 1980s by its designer and developer, Robert F. Mattox, FAIA (retired).
- *Performance goals:* With planning and monitoring as two critical elements in any successful business operation, it is essential that a set of performance goals be established and reevaluated on an annual basis to allow for developing trends, operational and policy changes, and to remain competitive and profitable.

BACKGROUNDER

KEY FINANCIAL PERFORMANCE INDICATORS (METRICS)

Steve L. Wintner, AIA Emeritus

The profit-loss statement and the balance sheet each have a relevant number of key financial performance indicators that provide firm leaders with valuable metrics to assist them in understanding their firm's financial condition and guide them in making sound business decisions.

THE PROFIT-LOSS STATEMENT

The profit-loss statement includes the following seven indicators to calculate from each month's financial report (in no particular order):

1. ***Utilization rate:*** Measures the overall efficiency and effective use of labor, not a measure of productivity. This also is not a measure of the number of hours billed, only hours charged to projects.

   Formula: direct labor hours ÷ total labor hours × 100 (as a %)
   Example: 32 hours ÷ 40 hours = 80%
   Target: Entire firm: 60–65%
   Professional-technical staff, including principals: 75–85%

2. ***Overhead rate:*** Measures the cost of operations not directly attributed to projects.

   Formula: total indirect expenses ÷ total direct labor (in $$$)
   Example: $308,241 ÷ $200,914 = 1.53 (for an hourly salary of $10/hr., the overhead cost would be 1.53 × $10 = $15.30)
   Target: 1.30 to 1.50 of total direct labor

3. ***Break-even rate:*** Measures the total cost of operations for every dollar spent on direct labor.

   Formula: overhead rate + 1.00 (represents the unit of cost for an hour of salary)
   Example: 1.53 + 1.00 = 2.53 (for an hourly salary of $10, the break-even cost would be 2.53 × $10 = $25.30)
   Target: 2.30 to 2.50 of total direct labor

4. ***Net multiplier:*** Measures the revenue generated for every dollar spent on direct labor. This indicator must be greater than break-even rate for a net profit to be realized.

   Formula: net operating revenue ÷ total direct labor (in $$$)
   Example: $622,207 ÷ 200,914 = 3.1
   Target: Greater than break-even rate (industry benchmark: 3.0+)

(continued)

5. ***Profit-to-earnings ratio:*** Measures the firm's effectiveness in generating a net profit (as a %).

   Formula: net profit (before distributions and tax) ÷ net operating revenue
   Example: $108,817 ÷ $622,207 = 17.49%
   Target: Equal to or greater than the anticipated net profit in the annual profit plan (20% or greater)
6. ***Net revenue per employee:*** Measures the revenue earnings for each employee. Based on targeted net profit, this indicator contributes to the establishing of the net operating revenue in the coming year's annual budget.

   Formula: annual net operating revenue ÷ total number of employees
   Example: $622,207 ÷ 6 employees = $103,701 per employee
   Target: In excess of $100,000.00 per employee
7. ***Aged accounts receivable:*** Measures the average time interval in days between the date of outstanding invoices and the date payment is received.

   Formula: average annual accounts receivable ÷ (net operating revenue ÷ 365 days) = calendar days before payment is received
   Example: $245,090 ÷ ($622,207 ÷ 365 = 1,705) = 144 calendar days
   Target: 60–90 calendar days (Anything over 90 days means the firm is "lending" money to client at zero cost.)

THE BALANCE SHEET

The balance sheet includes the following four indicators to calculate from each month's financial report (in no particular order):

1. ***Solvency:*** Measures a firm's ability to pay current debt. This is also known as the "current ratio."

   Formula: total current assets ÷ total current liabilities
   Example: $521,667 ÷ $218,658 = 2.39
   Target ratio: Min. 1.5 to 1.0
2. ***Liquidity:*** Measures a firm's ability to convert assets to cash. This is also known as the "quick ratio."

   Formula: (cash + accounts receivable + revenue earned, not billed ["work in progress"]) ÷ total current liabilities
   Example: $518,194 ÷ $218,658 = 2.37
   Target ratio: Min. 1.0 to 1.0
3. ***Leverage:*** Measures a firm's ability to manage debt effectively. This is also known as "debt–to-equity" (as a %).

   Formula: total liabilities ÷ total equity × 100 (as a %)
   Example: $280,738 ÷ $949,451 = 29.57%
   Target: Less than 35%
4. ***Return on equity:*** Measures the accumulated amount of money returned on a stockholder's investment for their risk and efforts.

   Formula: (total net operating revenue – total expenses) ÷ total equity × 100 (as a %)
   Example: ($622,207 – $509,156) ÷ $949,451 × 100 = 11.9%
   Target: Equal to or greater than the anticipated net profit in the annual profit plan (20% or greater)

7.3 Financial Management Systems

Steve L. Wintner, AIA Emeritus

The primary function of financial management systems is to provide firms with numerous effective financial and project reports and supporting techniques to enhance the achievement of a firm's long-term financial goals.

INTRODUCTION

To ensure the financial success of any firm with at least one or more employees, it is essential to have a comprehensive financial management system that includes a number of types of reports and resources. These reports and resources will facilitate a firm leader's ability to manage the financial operations of the firm. Every firm leader needs to understand and be responsible for this process of management. This is one responsibility that is not to be delegated to anyone lacking this understanding and knowledge.

Steve L. Wintner is the founder and principal of Management Consulting Services, a Houston-based firm specializing in design firm management. Wintner has more than 35 years of experience in design firm management and is the coauthor of *Financial Management for Design Professionals: The Path to Profitability* (Kaplan Publishing, December 2006).

The reports and resources providing basic information as a part of this financial system include the chart of accounts, the annual budget, the profit plan, daily timesheets, project contracts, financial management reports, key financial performance indicators, and project reports.

CHART OF ACCOUNTS

The development of a chart of accounts is the foundation of every accounting system and its means of organizing a firm's financial data. The chart of accounts, reflecting the Mattox Format, represents sets of properly organized, multi-tiered, interrelated, numeric codes and/or account numbers. Each one serves as the repository and record for every dollar received, paid, and billed by a firm as shown on a profit-loss statement and balance sheet.

▶ Financial Management Overview (7.2) further describes the Mattox Format.

The hierarchy of the numeric codes and/or account numbers starts with a "major" code or account and then is further defined by a series of sub-codes or accounts. Most comprehensive AE accounting software systems provide for a four-digit numeric code and/or account number. Each account number and designation will match a firm's general ledger listing of the income, expense, and asset accounts. It is recommended to seek the guidance of an outside consultant (management, software representative, and accounting) to assist with establishing these numeric codes and/or account numbers, especially if applying the Mattox Format (see Table 7.1).

A "master" chart of accounts is developed for the profit-loss statement and the balance sheet. The accounting software will provide a means for switching between the cash-basis and accrual-basis reports for these two documents and their respective numeric codes and/or account numbers.

MATTOX FORMAT FOR THE CHART OF ACCOUNTS

The following is a sample of the structure for the chart of accounts in the Mattox Format for the accrual-basis profit-loss statement and the balance sheet. Only major headings are shown in most accounts; for more detailed information, see "7.4 Developing Annual Budgets and Profit Planning."

TABLE 7.1 Chart of Accounts

Account ID	Account Description	Account Group	Notes
4100	Fees Billed	Fees Billed	Positive dollars
4110	Architect Fees Billed	Fees Billed	
4120	Consultants Fees Billed	Fees Billed	
4130	Markup on consultant fees billed	Fees billed	
4150	Reimbursable Expenses Billed	Reimbursable Expenses Billed	Positive dollars
4170	Outside Consultants' fee invoices rec'd	Outside Consultants	Negative dollars
4190	Project-Related Expenses (reimb.+ non-r.)	Project-Related Expense	Negative dollars
A.	Total Net Operating Revenue (NOR)		Baseline at 100%
5110	Direct Labor: Principal	Direct Labor Expense	
5120	Direct Labor: Professional-Technical	Direct Labor Expense	
5130	Direct Labor: Administrative	Direct Labor Expense	
5140	Direct Labor: Contract	Direct Labor Expense	

(continued)

TABLE 7.1 (continued)

Account ID	Account Description	Account Group	Notes
B.	Total Direct Labor Expense (TDL)		
6110	Indirect Labor: Principal	Indirect Labor Expense	
6120	Indirect Labor: Professional/Technical	Indirect Labor Expense	
6130	Indirect Labor: Administrative	Indirect Labor Expense	
6140	Indirect Labor: Temporary	Indirect Labor Expense	
6200	Payroll Taxes & Nondiscretionary Benefits	Payroll Taxes & Nondiscretionary Benefits	
6300	Discretionary Benefits & Professional Development	Discretionary Benefits & Professional Development	
6400	Office Lease & Facility Expense	Lease & Facility Expense	
6500	General Office Expenses	General Office Expenses	
6600	Business Insurance	Business Insurance	
6700	Auto Expense	Auto Expense	
6800	Bank Charges	Bank Charges	
6900	Professional Services	Professional Services	
7100	Depreciation/Amortization Expense	Depreciation/Amortization Expense	
7300	Tax Expense	Tax Expense	
7400	Marketing & Business Development	Marketing & Business Development	
C.	Total Indirect Expenses		
D.	Total Expenses (Direct + Indirect) (B + C)		
E.	Profit or <Loss> from Operations (A – D)		
8100	Miscellaneous Revenue	Misc. revenue	
8500	Miscellaneous <Expense>	Misc. <expense>	
F.	Total Miscellaneous Revenue/<Expense>		
G.	Net Profit (before distributions & taxes) (E – F)		The "bottom line"

9120	Professional/Technical: Accrued Bonus	Distributions	
9130	Administrative: Accrued Bonus	Distributions	
9140	Temporary Accrued Bonus	Distributions	
9210	Principal: Paid Bonus/Draw	Distributions	
9220	Professional/Technical: Paid Bonus	Distributions	
9230	Administrative: Paid Bonus	Distributions	
9240	Temporary Paid Bonus	Distributions	
H.	Total <Distributions>		
I.	Current Earnings (G – H)		

Note: Only Account Descriptions with shaded background will print on the P-L statement.

ANNUAL BUDGET

The chart of accounts and the annual budget are interrelated resources. Each chart of accounts numeric code and/or account number represents a specific type of financial data that corresponds to a specific annual budget line item.

▶ Developing Annual Budgets and Profit Planning (7.5) covers budgeting as an integral part of a firm's strategic planning process.

PROFIT PLAN

The "bottom line" of the accrual-basis profit-loss statement is the line item identified as "net profit." In order to arrive at a desired net profit at the end of each year, it would be a sound business decision to plan in advance for that to happen. The profit planning process entails a number of significant components, each one having an impact on establishing a certain number of parameters to be achieved. The achievement of each of these parameters helps to enhance the chances that a year-end, targeted net profit would be realized.

RECORDING DIRECT AND INDIRECT TIME

Are timesheets generally treated as though they are *one of the most important financial resources of every professional design firm*? Sadly, the answer is a resounding "No!" Yet this is the only "commodity" that firms "sell" to their clients. Unfortunately, timesheets are seen by many employees as some form of diabolical, arbitrary ritual created by their bosses. At the same time, principals are often the worst offenders in terms of not filling out their timesheets in a timely and accurate manner.

Clearly, few firm leaders and staff recognize that the timesheet is, in fact, *one of the most important financial resources of every professional design firm*. Here are some facts that confirm this assertion.

The time reflected on a timesheet becomes the single most significant component of the accounting data-entry process. This is true because the hours charged to projects become the basis for the decision of how much to invoice for each project and subsequently, affect a project's eventual profit or loss. The amount invoiced and payment received is the lifeblood of every firm. In addition, timesheets allow for tracking of effort spent on each project, which is critical to comparing project progress to the project budget and to allow timely adjustments as appropriate.

Time spent on every project should be aligned with the allocated number of hours budgeted for each phase and task. Without timely, accurately completed timesheets, there is a real possibility of a disparity between the time spent and the dollars billed. Ideally, the fee amount value of each project invoice will be determined by the hours spent on each project each month. With untimely, inaccurate timesheets, there is a potential for a reduction of the targeted project profit.

On a firm-wide basis, the total hours charged to projects is the denominator used in the calculation of a firm's net multiplier and overhead rate. The calculated overhead rate can then be extended to reflect the corresponding break-even rate, both of which are essential elements of developing hourly break-even rates for every employee. Further, this data provides historical information for project fee budgets during the fee-setting process, in response to a client's request for proposal (RFP).

If the time entered on a timesheet is at best just an approximation, then the data-entry process compounds the problem by the incorporation of this unfortunate estimate of hours in the development of project, accounting, and financial management reports.

The resulting totals and indicators will then provide misleading, erroneous information to the project managers and firm leaders. This is further compounded and harmful to the financial well-being of a firm when multiples of these guessed-at hours charged to projects on numerous timesheets become the basis of future overhead rates used in the fee-setting process for new projects. Measured over multiple active projects for a firm, it is easy to comprehend the increased magnitude of the problem and its potentially negative impact on each project and, overall, on a firm's annual profitability.

Obviously, none of this is done with malice, just a lack of understanding about the true nature of what a timesheet represents in the total process of the financial management of a firm. With less than an hour's worth of training, every member of the firm can develop a better daily timesheet completion discipline. This would go a long way to enhancing a firm's efficiency, effectiveness, and profitability. These kinds of "savings" in lost revenue could mean the difference of a year-end net profit vs. a net loss. As such, it might also mean the difference in whether or not there will be a distribution of year-end bonuses and/or salary increases. All this exposure to undesirable outcomes results from a lack of understanding about the true nature of a timesheet and its critical role in every professional design firm's long-term success.

The following are some simple techniques to adopt as a discipline for the completion of a timely and accurate timesheet.

- Develop a personal log and record the time spent before you start a different task, or phase.
- Record time in not less than 15-minute increments.
- Twice a day, enter on the timesheet the time spent in the morning, just before taking a lunch break, and again in the afternoon (evening), just before leaving the office for the day.
- All authorized overtime hours spent are to be recorded. The local or state agency that governs the state labor standards and the terms of the project contract will be the determining factors in the hours having any cost to the project. Regardless of any cost impact, the hours must be reflected on the project reports. In any scenario, overtime hours do not incur the cost of any overhead burden. The overhead burden is only applied to the first 40 hours per week. Therefore, any overtime to be charged to a client, in accordance with the state labor standards and the project contract, will likely be at a lower hourly rate than the regular hourly billing rate, due to the absence of the overhead cost burden.

FINANCIAL REPORTS

The focus of this portion of the article will be an overview of the two most common financial reports: the profit-loss statement and the balance sheet. For the purposes of this discussion, the reference to the profit-loss statement and the balance sheet is to the accrual-basis report for each.

The profit-loss statement and the balance sheet reports are developed at least once on a monthly basis. Each report provides firm leaders with different types of financial information for uniquely different purposes.

The P-L statement reflects the results of a firm's operations in terms of its revenue, direct labor, indirect labor, indirect expenses, and net profit for a given accounting period (generally the current month and the year to date).

The balance sheet provides a description of a firm's current financial condition for any given accounting period, even as short as a single day, of its assets, liabilities, and equity.

In the review of each report, there are specific line items that are more significant than others and will provide tell-tale trends of how the firm is doing financially. Together, these two reports describe a complete picture of a firm's current financial status.

Profit-Loss Statement (P-L)

The P-L statement is the financial management report that will provide firm leaders with 7 of the 11 total key financial performance indicators.

On the P-L, the four most significant line items are these:

- Net operating revenue (dollars available for supporting daily operations and the baseline 100 percent value of the rest of every line item in the report)
- Total direct labor, as a percentage of net operating revenue

- Total expenses
- Net profit (before distributions and tax and referred to as the "bottom line")

Developing an annual budget for these line items and their respective subcategories is advisable.

The Key Financial Performance Indicators backgrounder article explains what to look for and how to interpret the implications of the developing trends for each of these line items. This understanding is essential to making sound business decisions to offset negative trends and to repeat activities that produce positive trends.

▶ For more information on financial ratios useful to financial management, see the backgrounder Key Financial Performance Indicators that accompanies Financial Management Overview (7.1).

"Executive Summary" Format

The P-L statement that is provided to a firm leader needs to incorporate the same three "Cs" that are taught regarding the quality of construction documents: information that is "clear, concise, correct"—for all the same reasons and then some.

A firm leader's time is of the highest value to the firm and its clients and therefore needs to be spent doing only the things that only they can do. As stated early on in this section, the management of a firm's financial operations should not be delegated to just anyone. The reading, review, and interpretation of the P-L are the first and most important aspects of managing a firm's financial operations.

To make this process as effective and efficient as possible for the firm leaders, it is essential to create a single-page "executive summary" of the P-L. This condensed version includes every part of the full P-L, but not in detail. The chart of accounts numeric codes or account names should be condensed into a limited number of relevant line items for each of the four component sections of the statement. This will allow for the report to fit on just one page.

Mattox Format P-L Statement

The Mattox Format for the P-L statement includes the following four vertical component (row) sections (see Table 7.2):

- Revenue
- Direct Labor (Salary) Expense
- Indirect Expenses
- Miscellaneous Revenue and Expense

Each of these four components has a group of line items that serve as a major description for its respective component. Each of these line items has, in turn, a limited number of subcategory line items for each description. The subcategory line items are up to the discretion of the firm leader(s), who can decide what line items they want to review for each major category. Awareness is required to maintain the single-page format. In the event that any subcategory line item comes into question, all of the supporting financial details are available from the firm's accounting system.

The Mattox Format also includes six columns for component sections:

- Current Month
- Percent for Current Month
- Year-to-Date (YTD)
- Percent for YTD
- YTD Annual Budget
- Percent for YTD Annual Budget

Each of these six columns reveals a specific detail about the firm's current and cumulative (YTD) quantitative data in dollars and percentages.

Together, these horizontal and vertical components provide a very comprehensive summary of the firm's financial activity for the current month, the year-to-date, and a comparison to the corresponding year-to-date annual budget.

MATTOX FORMAT FOR THE PROFIT-LOSS STATEMENT

TABLE 7.2 Sample Profit-Loss Statement in the Mattox Format

Sample/Example—Accrual Basis, Actuals

	Profit-Loss Statement	**Current Month**	**%**	**Year-to-Date**	**%**	**Year-to-Date Budget**	**%**
	Revenue						
	Fees Billed (incl. consultants + markup)	93,599	142.22	1,113,654	141.02	1,184,738	142.28
	Reimbursable Billed (incl. markup)	13,248	20.13	164,981	20.89	177,399	21.31
	Outside Consultants	(25,417)	(38.62)	(305,007)	(38.62)	(327,964)	(39.39)

	Administrative: Paid Bonus	(1,500)	(0.48)	(3,000)	(0.38)	–4,000	(0.48)
	Temporary: Paid Bonus	(500)	0.00	(500)	0.78	0	0.00
H	**Total Distributions**	(59,500)	(12.4)	(128,500)	(16.21)	(164,000)	(16.81)
	Provision for Income Tax***	0	0.00	(1,054)	(0.13)	(1,526)	(0.18)
I	**Current Earnings (G – H)**			5,975	0.76	8,650	1.04

**This is an optional line item. If used, it must be added to both the direct and indirect labor line items to calculate total salaries.*

***This does not apply to S-corps, LLPs, partnerships, or sole proprietors. Discuss with your tax consultant.*

****The provision for income tax is determined by the cash-basis income statement. The numbers are entered here only after being determined by the firm's accounting person.*

Revenue Component of P-L

The Revenue component establishes the baseline value for the net operating revenue (NOR) at 100 percent. Every other line item in the P-L is a corresponding percentage of the NOR.

The Revenue section is further divided into four sub-major line items: Fees Billed, Reimbursable Expenses Billed, Outside (Project) Consultants (O-C), and Project-Related Expenses. Each of these sub-major line items is further defined by a number of sub-categories.

1. Fees Billed for:
   a. Architect
   b. Outside Consultants
   c. Markup on O-C fees to be billed
   Fees Billed are shown as positive dollar amounts.
2. Reimbursable Expenses Billed for:
   a. Architect
   b. Outside Consultants (equal to the invoice amounts received from the O-C for the billing period)
   c. Markup on all expenses to be billed
   Reimbursable expenses billed are shown as positive dollar amounts.

3. Outside Consultants:
   Equal to the fee invoice amounts received from the O-C for the billing period
   Outside Consultants is shown as a negative dollar amount (debit to Net Operating Revenue).
4. Project-Related Expenses (for the following five types):
   a. Architect's reimbursable expenses, markup not included
   b. O-C reimbursable expenses (amount invoiced to architect), markup not included
   c. Project-related expenses included in all of the lump sum fee projects billed
   d. Project-related non-reimbursable expenses for the firm that are not allowed by clients, per the contracts
   e. Project-related reimbursable expenses that exceed any contract-stipulated maximum

   Project-Related Expenses are shown as negative dollar amounts (debit to Net Operating Revenue).

Notes:

Items 4a + 4b equal items 2a + 2b less markup.

Items 3 and 4b represent the dollar values of the invoiced amounts received from the O-C for the billing period.

Balance Sheet

The balance sheet is the second of the two primary financial management reports and represents an opportunity to look at the firm's financial condition at any time. Because the report is updated every time financial data is entered into the accounting system, it is capable of providing an "instant snapshot" of the firm's financial condition.

On the balance sheet, the four most significant line items are these:

- *Current Assets:* Those easily converted to real dollars
- *Current Liabilities:* Items that must be paid within the current 12-month period, irrespective of the calendar year, that diminish the value of a firm's retained earnings and thereby reduce equity
- *Long-term Liabilities:* Items that must be paid beyond the current 12-month period and diminish the impact of the value of a firm's retained earnings (and thereby reduce equity)
- *Equity:* The value of shares of stock, invested capital by shareholders, and the firm's cumulative retained earnings (or loss)
- Current Assets (Cash-on-Hand, Accounts Receivable, and Fees Earned Unbilled [Work-in-Progress, or WIP]) are line items that need careful, regular scrutiny to ensure that the firm is maintaining a proper margin over its liabilities. The Current Liabilities to monitor and manage are Accounts Payables and Short-Term Notes Payable. Equity will reflect the cumulative Earnings (or Loss) over the life of a firm, based on each year's Current Earnings (or Loss) from the year-end P-L reports.

The term "Balance" reflects that Total Liabilities and Total Equity always equal the Total Assets. This report will provide the remaining 4 of the 11 total key financial performance indicators.

"Executive Summary" Format

The balance sheet is less complex in its format than the P-L statement. Because this report is in a state of almost constant change, only a single column of figures is required. If a firm leader desires, the subtotals and totals for each section can be offset from the body of line item figures. Like the P-L, maintaining the single-page Executive Summary format is also an important consideration.

The balance sheet and the profit-loss statement share certain financial data. Among these are:

- *From the profit-loss statement to the balance sheet:* Bad Debt, Current Earnings, and Accrued Bonus
- *From the balance sheet to the profit-loss statement:* Accumulated Depreciation/Amortization

Balance Sheet Components and Line Items

There are two key words on the balance sheet that require a definition to clearly understand their respective meanings. The words "current" and "long-term" are referred to in connection with all three of the major components: assets, liabilities, and equity. These words occur throughout the balance sheet, both as major components as well as a number of different line items.

Each time these words occur, they carry the same meaning. "Current" is the current 12-month period, irrespective of the calendar year, and "long-term" is any time frame beyond the current 12-month period.

Specific examples:

- "Notes Payable—Current Portion" in Current Liabilities
- "Notes Payable—Long-Term Portion" in Long-Term Liabilities

Mattox Format Balance Sheet

The Mattox Format for the balance sheet consists of five vertical component (row) sections, which include: two groups of Assets (Current and Long-Term), two groups of Liabilities (Current and Long-Term), and a single Equity component (see Table 7.3). The differences between the Mattox Format and a conventional balance sheet are related to subcategory line items and are minimal.

Like the P-L Statement, each of these five component sections is further divided into a group of line items that serve as a major description for the component. Each of these major descriptions has a limited number of subcategory line items for each description. These subcategory line items, unlike the P-L statement subcategory line items, are not discretionary. They represent essential data that need to be shown to allow the report to be effectively reviewed and understood. In the event that any subcategory line item comes into question, all of the supporting financial details are available from the firm's accounting system.

FREQUENCY OF DISTRIBUTION FOR FINANCIAL REPORTS

The frequency of distribution for the Executive Summaries of the two financial reports is a decision to be made by the firm leaders and, in many situations, is a function of the size and complexity of the firm. In general, however, even in small firms, most firm leaders will expect to receive an updated set of financial reports on a monthly (30-day)

MATTOX FORMAT FOR THE BALANCE SHEET

The following is a sample of the balance sheet in the Mattox Format.

TABLE 7.3 Balance Sheet

	Current Assets	
	Cash (Checking, MMF, CDs, etc.)	$56,768
	Accounts Receivable	245,090
	Allowance for Bad Debt	**(3,115)**
	Fees Earned Unbilled (Work-In-Progress)	16,336
	Prepaid Expenses/Insurance	4,588
	Other Current Assets (Lease Security Deposit, etc.)	2,000
A.	**Total Current Assets**	**$321,667**
	Fixed Assets	
	Furniture & Equipment	$68,058
	Leasehold Improvements	20,465
	Company-Owned Autos	28,788
	Property and Buildings	103,436
	Accumulated Depreciation/Amortization	**(12,225)**
B.	**Total Fixed Assets**	**$208,522**
C.	**Total Assets (A + B)**	**$530,189**
	Current Liabilities	
	Notes Payable—Current 12 Months	$16,140
	Accounts Payable	49,788
	Fees Billed Unearned	15,750
	Retainers/Initial Payments Unearned	7,500
	Accrued Payroll Taxes (Employer's Portion)	4,128
	Federal Income Taxes—Withheld	3,644
	Accrued Vacation	4,663
	Accrued Bonus	107,500
	Other Current Liabilities	$9,545
D.	**Total Current Liabilities**	**$218,658**
	Long-Term Liabilities	
	Balance of Notes Payable (not incl. Current Installments)	$51,340
	Other Long-Term Liabilities (Beyond Current 12 Months)	10,740
E.	**Total Long-Term Liabilities**	**$62,080**
F.	**Total Liabilities (D + E)**	**$280,738**
	Stockholder's Equity	
	Common Stock (Par Value)	$1,000
	Additional Paid-In Capital	80,000
	Current Earnings (at end of Current Yr.)	9,619
	Previous Cumulative Retained Earnings	158,832
G.	**Total Stockholder's Equity**	**$249,451**
H.	**Total Liabilities & Equity (F + G)**	**$530,189**
	Note: Total Liabilities & Equity always equals Total Assets (H = C)	

basis, if not more frequently. This timing rarely occurs at the end of a calendar month. Rather, it is related to the completion of the accurate entry of all of the relevant, current financial data into the accounting system. Firm leaders need these data as quickly as possible to allow them to have the best opportunity to respond in a timely manner to developing trends. Obviously, those firms with an integrated, computerized accounting system will have a distinct advantage over those using less-sophisticated software.

In addition to the firm leader(s), there may also be a need to provide a current report to governmental agencies, insurance companies, banks, and perhaps even new prospective clients.

Having accurately completed daily timesheets once again becomes a key factor in the efficiency and accuracy of the accounting systems data-entry process and its final, monthly distributed reports.

CONCLUSION

In general, any well-designed and properly integrated financial management system will enhance a firm's opportunities for financial success. To do so requires the development of a number of properly formatted reports and data-tracking components for use in these reports. The regular, periodic monitoring of these reports will facilitate the necessary adjustments to maintain a firm's financial success.

Prior to adopting any of the contents of this article it is recommended that each firm seek professional input from trusted outside sources familiar with the firm. At a minimum, firm leaders are urged to review and discuss this article with accounting advisers, both in-house and outside. Once discussed, any decisions to adopt specific changes to their current accounting system will need to be implemented with its accounting staff and as much outside professional guidance as is available.

7.4 Developing Annual Budgets and Profit Planning

Steve L. Wintner, AIA Emeritus

Developing an annual budget is an integral part of a firm's strategic planning process. When developed in concert with the profit plan, an annual budget is an essential resource that will allow firm leaders to compare a firm's actual year-to-date (YTD) financial performance to its YTD annual budget.

DEVELOPING ANNUAL BUDGETS

Introduction

The annual budget, developed concurrently with the profit plan, affords firm leaders the best possible method of establishing guidelines for the firm's operations and financial effectiveness over the course of the coming year.

The annual budget utilizes numerous financial components that are developed by the profit plan. For this reason, among many others, it is important that these

Steve L. Wintner is the founder and principal of Management Consulting Services, a Houston-based firm specializing in design firm management. Wintner has more than 35 years of experience in design firm management and is the coauthor of *Financial Management for Design Professionals: The Path to Profitability* (Kaplan Publishing, 2006).

two financial "tools" be developed concurrently to ensure the seamless sharing of essential data needed by both.

The chart of accounts provides a foundational format for the annual budget, in that the budget will, in its most detailed form, utilize most, if not all, of the established major and subaccount line items. In fact, it would be advisable to use the chart of accounts as the primary organizing element for the annual budget. A detailed explanation and example follows.

Because the development of the annual budget, like the profit plan, is an annually recurring process, it is advisable to begin its development in the latter stages of the fourth quarter of the preceding year. Mid-October, for those who have never developed an annual budget before, would not be too early to start the process. Starting early will allow sufficient time to thoroughly and methodically go through each step without the pressure of the coming year commencing before the budget is completed and can be approved.

▶ For details of the chart of accounts, see Financial Management Systems (7.3).

Annual Budget

The annual budget, when properly developed, will include the chart of account numbers and data from the profit plan. In its initial format, the annual budget will resemble an expanded version of the profit-loss statement (P-L). This expanded version (Tables 7.4–7.7) includes both fixed and variable expenses. This format allows for every known or anticipated expense to be included. This level of detail ensures a greater possibility of capturing the expenditures for the coming year. Once this level of budget is as complete as possible, it would be reviewed by the appropriate firm leaders to make any final adjustments and to reach consensus on its approval.

Once approved, the fixed and variable indirect expenses for the same major account numbers can then be combined in a "collapsed" version (Table 7.8) of the completed, expanded version.

The major accounts shown in this collapsed version would then be used to develop the approved final annual budget version (Table 7.9). The approved final annual budget would also be used as the basis for a third set of figures (dollars and percentages) being added to the monthly P-L format, representing the YTD annual budget for each of the respective P-L line items. The purpose and benefit of including a YTD budget in the monthly P-L is to provide a comparison with the firm's actual YTD financial performance.

Refer to the Financial Management Systems article (7.3) to see an example for the Profit-Loss statement with the YTD budget included.

The annual budget, combined with the projections for revenue, direct expenses, and indirect expenses developed in the profit plan, creates a strategic financial plan illustrating the optimum results anticipated for the coming year. Reviewing the P-L every month on a line-by-line basis will indicate how the firm is doing compared to the respective YTD budget. This will help firm leaders become better stewards of their financial resources. It will also facilitate sound business decisions in response to negative or positive trends that develop over the course of each succeeding month.

Without the budget in the P-L, the YTD actual figures represent only numbers and percentages "in a vacuum." There isn't any relevant basis for evaluating these results, other than how they might compare to the empirical standards of the design industry. That will not provide greater relevance, meaning, and impact than seeing the actual results side-by-side with its respective YTD budget.

Annual Budget Format and Components

The annual budget is formatted in four primary sections: Revenue, Fixed Expenses, Variable Expenses, and Miscellaneous Revenue and Expense. Each section, with its own components, is similar to Mattox Format of the profit-loss statement.

- *Section One: Revenue*. Includes the exact same four components as the P-L: Fees Billed, Reimbursable Expenses Billed, Outside Consultants, and Project-Related Expenses

PART 2: FIRM MANAGEMENT

- *Section Two: Fixed Expenses*. Includes Direct Labor Expenses and certain fixed Indirect Expenses
- *Section Three: Variable Expenses*. Includes only variable Indirect Expenses
- *Section Four: Miscellaneous Revenue and Expense*. Includes line items for each of the above two categories

The accumulation of all of these line items will culminate in the determination of the projected net profit/(loss).

Initially, the annual budget is best formatted as a 13-column document, with one column per month and the last column as the Total for the year. This allows the designation of expenses to be shown for each line item, in respective months, rather than just a single total amount for the year. This will accommodate certain expenses that occur periodically, rather than monthly.

Section One: Revenue

In Section One, the four Revenue line items (Fees Billed, Reimbursable Expenses Billed, Outside Consultants, and Project-Related Expenses) will be determined by the projections developed in the Profit Plan. Also, refer to the "Revenue Component of the P-L" section of the Financial Management Systems article (7.3) to see the breakdown for each of these four major account items.

In budgeting for revenue, keep in mind that some of this revenue will come from available backlog remaining at the end of the year. This is revenue that has already been "captured" by signed contracts for existing, active projects and will likely be billed to clients in the coming year. Therefore, the projected revenue needed for the coming year, anticipated to be generated by new project contracts, will be reduced by the amount of the applicable backlog. Once the revenue amount is determined, it could also serve as a minimum target for the coming year's marketing plan.

Section Two: Fixed Expenses

In Section Two, the Fixed Expenses, consisting of Direct Labor Expense and the fixed portion of Indirect Expenses, are also determined by the projections developed in the profit plan.

Fixed expenses will obviously be easier to determine than variable expenses (see Table 7.5). Generally, these will include

- Direct and Indirect Labor (as established in the profit plan)
- Payroll Benefits (mandatory and customary)
- Nondiscretionary Benefits (pensions, IRAs, professional dues, and licenses)

TABLE 7.4 Annual Budget Revenue Component

Account No.	Revenue	January	February	March	April	May	June	July	August	September	October	November	December	Totals	Percentage
4100	**Revenue**														
4110	Fees Billed	$0	$0	$0	$0	$0	$0	$0	$0	$0	$0	$0	$0	**$0.**	
4150	Reimbursable Expenses Billed	$0	$0	$0	$0	$0	$0	$0	$0	$0	$0	$0	$0	**$0.**	
4170	Outside Consultants	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	**–$0.**	
4190	Project-Related Expenses	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	–$0	**–$0.**	
A.	**Total Net Operating Revenue**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0**	**$0.**	**100%**

- Office Lease & Facility Expense (rent, utilities, security, and maintenance service)
- Office Expenses (telephone systems, Internet, website hosting)
- Business Insurance (professional liability, general liability, auto liability)
- Auto Expenses (lease payments, registration, licenses)
- Tax Expenses (franchise, business margin, local property)

Every firm is unique, and it is advisable to discuss all possible qualified expenses in this category with the firm's legal, tax, and management consultants. Respectively, they would identify the impact created on some of these expenses by the firm's legal structure, its geographic location, and any local, state, and federal governmental regulations imposed by these jurisdictions.

It is important to be aware that some of the above expenses might also include a variable component.

TABLE 7.5 Annual Budget–Fixed Expenses Component

Account No.	Fixed Expenses	January	February	March	April	May	June	July	August	September	October	November	December	Totals	Percentage
5100	**Direct Labor (Salary)**

Section Three: Variable Expenses

In Section Three, the Variable Expenses consist of a firm's remaining Indirect Expenses. Some of these variable expenses will also have a fixed component to them, as noted in Section Two above. Only the variable portions of such expenses are to be included in this section. However, the total budgeted line item for these expenses will need to include its respective fixed component. (See Table 7.6.)

It will likely be more difficult to determine the dollar value of some of these variable expenses. Using the average of the prior three years of expenses in each of the line item categories will help to identify an appropriate amount to budget.

For start-up firms without any past history, it will be even more difficult. Initially, a "best guess" might have to suffice for some line items. Careful monitoring each month would be advisable to observe any significant trending upward or downward to determine any effect these best-guess budgeted amounts might have on the firm's net profit-loss.

TABLE 7.6 Annual Budget—Variable Expenses Component

Account No.	Variable Expenses	January	February	March	April	May	June	July	August	September	October	November	December	Totals	Percentage
6300	**Discretionary Benefits & Professional Development**

Section Four: Miscellaneous Revenue and Expense

In Section Four, each of the two components, Miscellaneous Revenue and Expense, will comprise line items that relate to the daily operations of the firm. Some of them are project-related while others are not. (See Table 7.7.)

Miscellaneous Revenue might include any interest earned on funds placed in financial instruments, investments, or other such accounts. This component would also include any gain on assets, as established by the firm's accounting people. On occasion, this could also include amounts collected and not refunded for unreturned and/or damaged, distributed project bid documents. There might also be other, small incidental revenue items that are not specifically included in any of the usual P-L revenue line items.

Miscellaneous Expense might include the write-off as bad debt of any invoiced project amount that is likely to be unpaid. This component would also include any loss on assets, as established by the firm's accounting people. There might also be other, small incidental expenses that are not specifically included in any of the usual P-L Indirect Expense line items.

TABLE 7.7 Annual Budget—Miscellaneous Revenue/Expense Component

Table 7.9 illustrates the approved, final version of the annual budget, including the major accounts and the desired and/or appropriate subaccounts from the collapsed version of the combined fixed and variable expenses in each of their respective major accounts.

Once the approved final annual budget has been developed, it would then be used to create a monthly year-to-date (YTD) pair of columns (for $ and %) in the monthly P-L format, representing the YTD annual budget for each of the respective P-L line items.

Conclusion: Annual Budgets

Once all of the budgeted line items for the coming year have been identified and the expanded format completed it should be reviewed by the appropriate firm leaders and approved. The collapsed version can then be developed, as shown above in Table 7.8, which will then facilitate creating the final format of the approved annual budget.

It is important to note that the annual budget, once it has been approved for the coming year, should never be altered in any way. This would destroy the integrity of the budget and eliminate the comparison benefit mentioned earlier.

However, during the course of the year, certain unforeseen situations could develop that would alter some of the budgeted line items. If that were to occur, a separate, new document will need to be developed to reflect these changes. This document can be created by copying the approved budget, making the new, forecasted changes, and then saving it with a different title.

This new document could be referred to as the "forecast plan." The forecast plan and the annual budget could then be compared each month to see the variances of both to the YTD actuals.

PROFIT PLANNING

Introduction to Profit Planning

Profit planning for every architecture firm is essential in providing a forecast of a firm's revenue-generating capability and the net profit it can anticipate earning from that revenue.

▶ For definitions of terms used in this article, see "Key Accounting Terminology" in Financial Management Overview (7.2).

Developing a profit plan is a firm's best approach to understanding what is financially possible for the coming year. Because the profit plan is a form of budgeting, it shares many of the same considerations as the annual budget. The profit plan, like the annual budget, needs to be developed in advance of the coming year. The current year's activity for revenues and expenses are important to consider in developing the projected new revenue and expense amounts. Also taken into account are any known future events, market conditions, or other situations that might impact these amounts. In addition, other important factors to consider include the firm's backlog and the anticipated award of any new projects and fees for the coming year.

Backlog, which is defined as current project revenue not yet earned or invoiced, will affect the firm's projected revenue. For example, imagine that a firm's profit plan for the coming year indicates the potential for generating net operating revenue of $1.1 million, based on a target net profit of 20 percent. If the firm's backlog is $350,000.00 total, the firm will need to assess if it has the capability to secure the additional $750,000 in net operating revenue in order to meet its revenue and net profit projections.

Once established, the projected Revenue and Expenses (Direct and Indirect) will also be used in the development of the annual budget.

Profit Plan

The profit plan, when fully developed, provides critical data essential for many decisions related to the firm's operations and projects.

Because the profit plan is a projection of what might be, the process of developing this data will entail a certain amount of "educated" guesswork. Nevertheless, there are a number of component parts of the profit plan that can be developed based on known factors. Among these are the annual salary adjustments often given to every employee of the firm. In addition, adjusted utilization rates can be established for each employee, using the current year's performance as a guideline and taking into consideration any anticipated changes in an employee's duties and responsibilities for the coming year.

The projected direct and indirect expenses will allow for the calculation of the overhead rate and the break-even multiplier. With these metrics an hourly billing rate for every employee can be calculated. These metrics in turn would be used to develop new project fee budgets, their estimated fee billings, and potential profitability.

Profit Plan Format, Components, and Applications

The profit plan presented below is formatted in three primary sections, each one with its own components:

- *Top section*. "Revenue Projection" identifies the Utilization Rate and the Total Labor and its two components: Direct and Indirect Labor. Finally, the "Projected Billing" for each employee can be calculated.
- *Middle section*. "Projected P-L Summary" calculates the projected Net Operating Revenue and Net Profit Dollars and Percent.
- *Bottom section*. "Alternate Method to Check Net Operating Revenue and Profit Goal." This section also includes "Calculating Multipliers" and the "Development of Hourly Billing Rates" for every employee. The reference to Top, Middle, and Bottom is from the arrangement on a spreadsheet, where results from one section can be linked to cells in other sections. For ease of understanding and readability, the three sections are shown separately.

Profit Plan—Top Section

In the top section, the projected billing for each employee is determined by factoring each employee's anticipated utilization rate and calculated hourly billing rate. (See Table 7.10.) Arriving at a realistic utilization rate for each employee will require defining their roles, responsibilities and duties for the coming year and relevant historical data related to their respective, past performances. Generally, the less experienced staff will have the highest utilization rates, while the opposite is true for the more experienced staff and principals. Once defined, the utilization rate will establish each employee's direct labor and indirect labor, from which the total direct and indirect labor costs can be calculated. Using total direct labor and total labor costs, the firm's utilization rate can also be calculated:

Total Direct Labor ($262,754) ÷ Total Labor ($407,845) = 64.42%

TABLE 7.10 Profit Plan—Top Section

Revenue Projection							
Employee	**Hourly Rate**	**Util. Rate**	**Total Labor**	**Direct Labor**	**Indirect Labor**	**Billing Rate**	**Projected Billing**
Principal							
D. Dowright	$45.67	35%	$95,000	$33,250	$61,750	$140	$101,920
S. Taypositive	$45.67	65%	$95,000	$61,750	$33,250	$140	$189,280
Subtotal			**$190,000**	**$95,000**	**$95,000**		**$291,200**
Professional/ Technical Staff							
N. Desmond	$32.75	75%	$68,120	$51,090	$17,030	$105	$163,800
T. Rex	$24.38	83%	$50,710	$42,089	$8,621	$85	$146,744
E. Zeduzit	$18.18	89%	$37,815	$33,655	$4,160	$70	$129,584
Subtotal			**$156,645**	**$126,834**	**$29,810**		**$440,128**
Admin. Staff							
M. Adonna	$15.00	35%	$31,200	$10,920	$20,280	$50	$ 36,400
Subtotal			**$31,200**	**$10,920**	**$20,280**		**$ 36,400**
Contract Labor							
Outsource Tech.	$40.00	100%	$30,000	$30,000	$0	$75	$56,250
Subtotal			**$30,000**	**$30,000**	**$0**		**$56,250**
Totals			**$407,845**	**$262,754**	**$145,090**		**$823,978**

PART 2: FIRM MANAGEMENT

The projected billing for each employee is achieved only after the hourly billing rates are calculated in the bottom section. Then, using the respective hourly billing rate and multiplying it by the respective total number of direct labor hours (2,080 hours × Utilization Rate), the projected billing amounts can be determined.

Example (from the profit plan) using the data for employee "T. Rex":

Hourly Billing Rate ($85.00) × 1,726.4 (2,080 hours × 83%) = $146,744

Profit Plan—Middle Section

The middle section components can then be developed using the data in the top section. (See Table 7.11.) Perhaps the most difficult items to develop in this section are projections for the outside consultant's fees to be billed, as a percentage of total fees billed. Some of the indirect expenses (marketing, repair and maintenance, legal, accounting, management, and other business consultant fees) will also have to be estimated. Refer to the sidebar on indirect operating and general and administrative expenses at the end of this article.

A reasonable approach for beginning the process of developing some of these projections is to use an average of expenditures over the last three years and factoring up or down to suit based on anticipated market conditions.

Industry guidelines to consider:

- Outside Consultant Fees in the range of 26 to 35 percent of the Total Fees Billed
- Marketing Expenses in the range of 3 to 5 percent of Net Operating Revenue

With the figures shown in the profit plan, the outside consultant fees were calculated to be approximately 27 percent of the total fees billed ($1,184,738), shown as –$327,964. If the mark-up were not considered, $1,184,738 – $32,796 = $1,151,942, it

TABLE 7.11 Profit Plan—Middle Section

Projected Revenue (from Top Section)	**Architect**		**Consultants**		**Total**
Fees Billed (incl. consultants + markup)	$823,978	+	$360,760	=	**$1,184,738**
Reimbursable Expenses (incl. markup)	$161,272	+	$ 16,127 (mark-up)	=	**$177,399**
Outside Consultants (not incl. markup)	($360,760)	–	($ 32,796)	=	**($327,964)**
Project-Related Expenses (reimb.+ non-reimb.)	$161,272 (reimbursable)	+	$ 40,245 (direct [n-r])	=	**($201,517)**
Net Operating Revenue (NOR)					**$832,656**
Projected Direct Labor Expense					**($262,754)**
Total Direct Labor (Salary) Expenses: Approx. 28–32% × Net Operating Revenue					
Projected Indirect Labor & Expenses					**($403,838)**
Total Indirect Expenses: Approx. 48–52% × Net Operating Revenue					
Total Miscellaneous Revenue/Expenses (est. allowance)					**$8,112**
Net Profit Before Distribution & Tax					**$174,176**
Approx. 20% × Net Operating Revenue					

would be approximately 28 percent. The amount is shown as a negative number (as a debit to revenue) because these fees are to be paid to the consultants and are not included in the net operating revenue.

Project-Related Expenses is a combination of the total value of five possible subcategories of expenses:

1. Reimbursable expenses for Architect, not including markup
2. Reimbursable expenses for Outside Consultants, not including markup
3. Project expenses for the architect included in all lump sum fees billed by Architect
4. Non-reimbursable project expenses for Architect, per contract
5. Reimbursable project expenses for Architect that exceed any contract stipulated maximum

The total amount shown is also a negative number (as a debit to revenue), as the majority of these expenses will be paid to a consultant and/or vendor.

With all of the components of net operating revenue identified, the projected net profit can be calculated.

NOR – Total Direct Labor – Total Indirect Expenses
+ (or –) Total Miscellaneous Revenue or Expense = Net Profit

$832,656 – $262,754 – $403,838 + $8,112 = $174,176

Once net operating revenue (NOR) and total direct labor (TDL) are calculated, two other critically important key financial performance indicators can then be calculated:

1. Net multiplier (measures the return on every dollar of direct labor)

   NOR ($832,656) ÷ TDL ($262,754) = Net Multiplier (3.17)

2. Percentage of TDL to NOR (measures the balance between workload and number of staff (target range: 28–32%)

   TDL ($262,754) ÷ NOR ($832,656) = 31.6%

► For more information about these ratios, see the backgrounder Key Financial Performance Indicators accompanying Financial Management Overview (7.2).

Profit Plan—Bottom Section

The bottom section provides an alternate method of calculating a targeted set of goals for the NOR and net profit to compare with the above projected NOR and net profit goals. These alternate calculations for the targeted break-even and net multipliers are based on a different set of parameters, except for the three projected labor values (total, direct, and indirect) from Table 7.4.

The value shown below for total indirect expenses ($394,130) is based on an overhead rate estimated at 1.5 × TDL, resulting in the targeted break-even multiplier of 2.5 × TDL. Adding the targeted net profit results in the targeted net multiplier.

Total Direct Labor (TDL) Multiple:

TDL ÷ TDL: $262,754 ÷ $262,754 = 1.00

Targeted Indirect Expense Multiple (Overhead Rate):

Total Indirect Expense ÷ TDL: $394,130 ÷ $262,754 = 1.50

Targeted Break-Even Multiplier (B-E Multiplier):

1.50 + 1.00 = 2.50

Targeted Net Profit (20%) Multiplier:

B-E Multiplier ÷ .80* – B-E Multiplier

2.50 ÷ .80 – 2.50 = 0.63

* = To calculate the Targeted Net Profit Multiplier, divide using the complement (.80) of the Targeted Net Profit percentage (20%).

Targeted Net Multiplier:

$$2.50 + 0.63 = 3.13$$

The Direct Labor (Salary) Expense dollars shown in Table 7.12 are the same dollars as in the top section from Table 7.10. The $262,754 is arrived at by multiplying the Total Labor ($407,845) by the average Utilization Rate (0.6442), resulting in the Total Direct (Salary) expense. Similarly, the Indirect Labor (Salary) Expense is the top-section Total Labor from Table 7.10, minus the Total Direct Labor (Salary) Expense. The Office Expenses value is the remaining amount in the calculated $394,130 Indirect Expenses line item.

Using the targeted net multiplier, each employee's hourly billing rate can then be calculated (hourly salary × 3.13).

Example: for an hourly salary of $20.00:

$20 × 3.13 = Hourly Billing Rate of $62.60,
including profit of $12.50 ($62.50 × 0.20)

To check using an alternate approach:

Hourly Salary ($20) × B-E Multiplier (2.50) ÷ 0.80* = $62.50 (Hourly Billing Rate)

* = Divide, using the complement of the Targeted Net Profit percentage (0.80) to calculate the Hourly Billing Rate.

If you multiplied by 0.20, that would be a markup of only $10 and reduce the profit percentage, as shown in the following calculations:

Hourly Salary ($20) × B-E Multiplier (2.50) × 0.20
= $10 ($2.50, or 20% less profit on the targeted 20% profit)

Looking at the calculated hourly billing rates, there is a potential for developing an incremental increase in the profit percentage for each non-principal employee's hourly billing rate. In general, the non-principal employees spend a greater percentage of the total charged project hours than do principals. It is therefore possible to take each of

TABLE 7.12 Profit Plan—Bottom Section

Alternate Method (to check Projected NOR & Profit Goal)				
Direct Labor (Salary) Expense	$407,845 × 0.6442		$262,754	
Indirect Expenses				
Indirect Labor (Salary)	$407,845 × 0.3558	$145,090		
Payroll Taxes & Benefits	Est. at 25% × Total Salary	$101,961		
Office Expenses		$147,079		
Total Indirect Expenses	Est. at 1.5 × Direct Labor		$394,130	
Miscellaneous Revenue/Expense	From Table 7.11	$8,112		
Total Indirect Expenses			$656,884	
Profit Goal @ 20%	Total Expenses ÷ 80% – Total Expenses		$164,221	
Net Operating Revenue Goal			$821,105	
Calculating Multipliers				
To Pay For Direct Labor (Salary) Expense				1.00
To Pay For Indirect Expenses: (Indirect Expense ÷ Total Direct Labor)				1.50
Equals Break-Even Multiplier (B-E Multiplier)				**2.50**
To include 20% Profit: (B-E Multiplier ÷ .80 – B-E Multiplier)				0.63
Equals Planned Net Multiplier (with 20% Profit):				**3.13**

TABLE 7.13 Determine Minimum Billing Rates

	Hourly Salary		Planned Net Multiplier		Billing Rate	To Increase Profit	Adjusted Billing Rates
Use Planned Net Multiplier × Hourly Salaries to Set Minimum Hourly Billing Rates							
D. Dowright	$45.67	×	3.13	=	$142.95	Round down to:	$140
S. Taypositive	$45.67	×	3.13	=	$142.95	Round down to:	$140
N. Desmond	$32.75	×	3.13	=	$102.51	Round up to:	$105
T. Rex	$24.38	×	3.13	=	$76.31	Round up to:	$85
E. Zeduzit	$18.18	×	3.13	=	$56.90	Round up to:	$70
M. Adonna	$15.00	×	3.13	=	$46.95	Round up to:	$50

these employee hourly billing rates and raise them to a higher amount and still maintain a competitive set of billing rates, all with more than a 20 percent profit.

Example (from the profit plan) using the data for employee T. Rex (Table 7.13):

Hourly Salary ($24.38) × Net Multiplier (3.13) = Hourly Billing Rate ($76.31)

If the $76.31 were rounded up to an hourly billing rate of $85.00, the profit would be increased by $8.69 to $24.05, for a profit percentage of 28.29 percent.

Conversely, if the principal's rates were rounded down, the firm's net profit percentage could be increased considerably without any additional cost to the firm or loss of competitive edge.

Conclusion: Profit Planning

The responsibility for earning a profit belongs to every employee of a firm. The most advantageous method for ensuring this will happen is to develop some form of profit planning at, or before, the start of each new calendar year. The most effective tool for this type of planning is the profit plan. The profit plan develops a projection for each of the four primary components that affect profitability: revenue, direct labor, indirect labor, and indirect expenses.

The development of each these primary components requires a review of a firm's past performance for the previous three years and an understanding of developing trends in the market for the coming year.

Projected revenue is best developed using current and/or projected salaries, targeted utilization rates, and the hourly billing rates for each employee and principal.

Projected direct and indirect labor are calculated using the same current and/or projected salaries and the targeted utilization rates for each employee and principal.

The projected indirect expenses are the most challenging of the four components to develop because this component contains so many different fixed and variable subcategories. In general, if direct labor is 28–32 percent of the NOR and the targeted total net profit is approximately 20 percent of NOR, then the total indirect expenses (including indirect labor) would be approximately 48–52 percent. This is a reasonable basis for establishing a projected value for this component. This projection can then be compared with the value calculated for a targeted overhead rate of no more than 1.5 times total direct labor.

With each of these four components projected, a targeted net profit can be established. This targeted profit value is then applied to the fee budget for every new project started in the coming year and communicated to every employee as a focus for their project activities.

CHAPTER 8

Human Resources

8.1 Human Resources Management Overview

Barbara Irwin

This overview provides a snapshot of the most important characteristics of human resources management in an architecture firm. Whether a sole proprietorship or a firm of 5, 10, or 50 employees, it is important to have a human resources infrastructure in place that aligns with the firm's business philosophy, vision, and values.

THE FUNCTION OF HUMAN RESOURCES IN ARCHITECTURAL PRACTICE

To best use a firm's talent, it is necessary to understand the function of human resources (HR) within architectural practice. While architects focus most of their energy on being creative, productive, and serving the clients' needs, success does not happen without giving attention to the people doing the work. It is necessary to have infrastructure in place to ensure that the HR details of a successful operation are implemented. Even in a firm with only one employee, HR issues must be given attention. From the basics of personnel selection to more complex HR programs that are aligned with the firm's strategic goals, a clear understanding of what is involved in attending to people is critical.

A well-defined and developed understanding of the HR function will help firm leaders select the individuals that will contribute fully to the firm, be aligned with

Barbara Irwin is the president and founder of HR Advisors Group, a human resources consulting firm serving the architecture, engineering, and construction industries. She has been in the field of HR management and organizational development since 1987.

its culture and mission, and potentially lead the organization into the future. Recruiting talent, completing reference checks on potential candidates, and preparing clear offer letters are all necessary steps to building a strong staff. In addition, HR processes include identifying programs that ensure the talent selected continues to develop professionally and establishes a commitment to the firm and its vision.

In a perfect world, once the talent is in place there is a successful relationship between employee and employer. However, this is not always the case. Much like creating a design for a client, handling people can require adjustments to make a perfect fit. A well-operated HR function will develop performance management measures that protect the firm's investment in talent, support the employer and the employee when a sensitive situation occurs, and prepare an exit strategy addressing any type of employee separation from the organization. Developing an HR toolkit will assist in creating and implementing the appropriate programs for firm staff.

Value of Human Resource Management

As the U.S. workforce continues to change, focusing on future leaders, generational differences, baby boomers retiring, and many other similar issues, architecture firms will increasingly depend on human resources knowledge and processes. Whether in a small firm or a firm with 20+, 50+, or 100+ employees, human resource management is critical to the success of the firm. HR adds value to an organization by creating programs that meet the needs of all staff, such as benefit programs, training and development, and onboarding processes. These programs will help the organization retain its most talented and effective people, and keep in-house the firm's investment in their development.

Focusing on tactical human resources means putting together the appropriate processes and procedures. An example of tactical HR is the creation of a process that can assist in orienting new staff in a consistent manner. Transactional human resources refer to all of the various administrative tasks related to a particular process. For instance, when a firm hires a new employee, there are insurance documents, tax documents, enrollment forms, etc., that need to be completed.

WORLD-CLASS HUMAN RESOURCE FUNCTION

- View the transactional aspects of HR as important, but not a core competency.
- Outsource administrative and transactional HR work to focus on strategic HR work and reduce costs.
- Make significant investments to attract and retain top talent using effective employee recruitment and training programs.
- Use emerging technologies to facilitate integration with employees, customers, and suppliers.
- Install web-based self-service for greater personalization and more efficient integration.
- Recognize the importance of consistent data availability for faster, more informed decision making and improved service levels.

Source: Society of Human Resources Management (SHRM), 2011

With changing laws and regulations, a firm's HR management processes must continue to provide transactional and tactical support, in addition to continuously staying abreast with guidelines that affect a firm's legal obligations. However, knowledge about human resources can provide much more to the success and growth of an organization. Just as the people charged with the responsibility for finance and marketing provide insight to an organization, those responsible for HR bring their own unique and necessary perspective to the organization.

Human Resource Management as a Strategic Issue

As a strategic component in architecture firms, HR can provide input on the growth of an organization in terms of the people that power it. Strategic input means, for example, determining whether the right programs are in place, understanding HR trends in the industry, and identifying firm capabilities that need to be strengthened. A strategic HR function will foster a true understanding in the firm of what employees are looking for in a professional environment. Conducting employee surveys and addressing issues identified in the results lets employees know that the organization is truly listening and working to provide an environment conducive to creative

TABLE 8.1 HR Responsibilities

HR Component	0–20 Employees	50+ Employees	100+ Employees
Recruitment & Selection	Owner/Managing Principal and/or Hiring Manager, External Recruiter	Hiring Managers, Principals, External Recruiters	HR and Department Manager
Onboarding	Owner/Managing Principal and/or Office Administrator (complete forms, etc.)	Office Administrator (complete forms, etc.)	HR and Department Manager
Performance Management	Individual Managers (may be formal or informal)	Individual Managers (formal)	HR and Department Manager
HR & Legal Compliance (Policies and Procedures)	Owner and/or Managing Principal, legal counsel	Office Administrator and Owner/President/CEO, legal counsel	HR, legal counsel
Employee Relations	Individual Manager	Individual Manager, Managing Principal, CEO/President	HR
Rewards and Recognition: Compensation, Benefits, Incentive Compensation Plan	Owner/Managing Principal and Benefits Broker	Owner/President/CEO, Benefits Broker	HR and Owner/Managing Principal and Benefits Broker
Training & Development	Principals, informal, on as-needed or requested basis	Owner/Managing Principals, informal and/or formal (internal and external resources)	HR, Owner/Managing Principals, (internal and external resources)
Leadership Development	Owner/Managing Principal	Owner/Managing Principal, other Principals, external consultants	HR, Owner/Managing Principals, (internal and external resources)

engagement. Providing employees with the most up-to-date technology available to enhance innovation in design is an example of the kinds of actions that help prevent talented employees from looking elsewhere for opportunities.

Many firms go through a strategic planning process. It is advisable to include HR management as an important component of the strategy. Strategic issues such as looking at new market sectors, for example, may involve hiring new talent and a number of other human resource–related issues. In larger firms, involving the HR director during strategic business planning increases the likelihood that there will be consideration of the investment needed to attract the best and brightest as workload increases. Similarly, if those responsible for researching possible hires know when staff demands are expected to increase, early identification of the most talented prospects can be accomplished. Offers can then be made quickly, so that there is little lag time between an identified need and the start date of a new hire. Positioning the HR function as a strategic partner helps firms plan their business strategy and sees that they have the right personnel infrastructure in place to move forward.

▶ Strategic Planning for the Design Firm (5.3) addresses how firm leaders can envision the future of their firms and implement strategies and action plans for positive results.

Responsibility for the various components of HR can shift according to the size of the firm as demonstrated in the HR responsibilities chart (Table 8.1).

THE MAJOR COMPONENTS OF HUMAN RESOURCE MANAGEMENT

The following are nine major components in a strategic and operational human resources function. Each component affects the success of a firm. Administration of the necessary requirements and regulations for each and seeing that they align with the strategic plan for the firm will be handled by the individual responsible for human resources (human resources manager, managing principal, CEO, etc.).

- Recruitment and Selection
- Onboarding

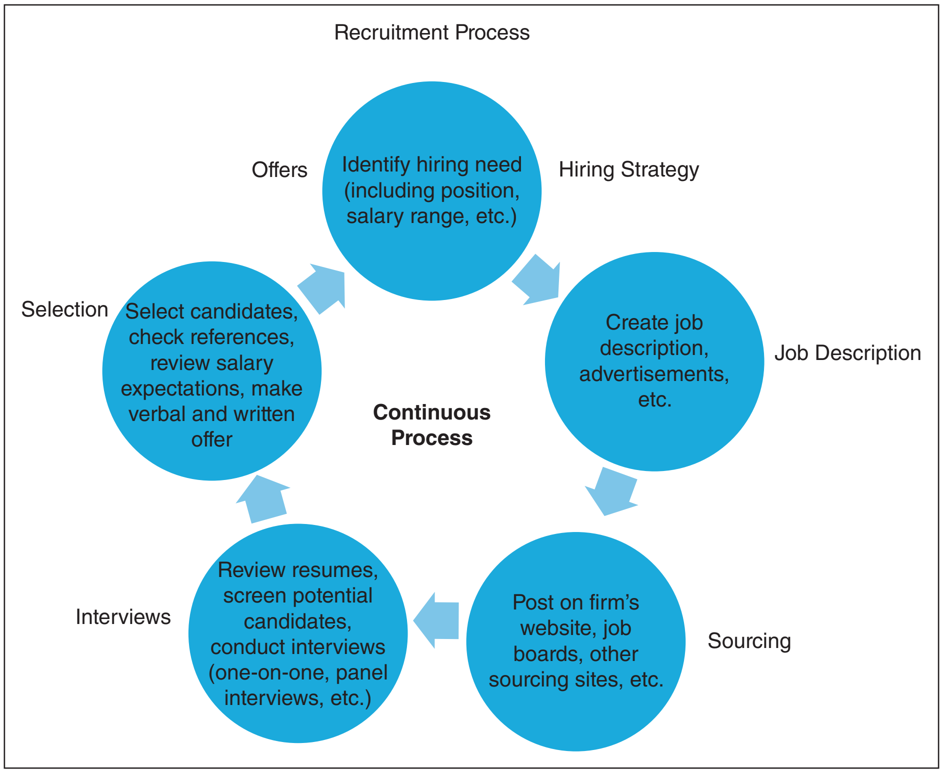
- Performance Management
- Legal Compliance
- Employee Relations
- Rewards and Recognition
- Training and Professional Development
- Leadership Development
- Retention Programs

Recruitment and Selection

Recruitment activities are cyclical in the design industry, as is the need for talent. When the economy is booming, so is the demand for talent; when the economy is slow or stagnant, recruitment tends to decrease. However, slow economic times are good for recruiting strategically. By examining what other market sectors or business models a firm is exploring, it is possible to identify what type of talent will be needed as the business changes. A solid recruitment and selection program will assist the firm as it ramps up for new projects and economic shifts.

Any firm, regardless of purpose, is only as good as its people. As leadership works with clients to deliver the creativity and quality of the firm's services, the need for additional creative and talented staff may grow. A strategic HR leader will make certain that the recruitment and selection of additional staff lives up to the reputation of the firm (hopefully, stellar) and the reputation of its people. In larger firms, HR will handle the details of the recruitment and selection process to the point where leadership makes the final selection. This removes the burden of finding the right people from firm leadership so that they may focus on excellent client service and project delivery, thereby continuing to expand the reputation of the firm. Even in smaller firms, administrative assistance in the recruiting and hiring process is advisable. (See Figure 8.1.)

▶ Recruiting and Hiring: Strategies and Methodology (8.3) discusses how to attract and retain top talent by combining effective research and strategies with technological and social media tools.



Barbara Irwin

FIGURE 8.1 **Recruiting Process**

Onboarding

Many studies have shown that when an employee establishes a connection with the people, work, and culture within the first six months, the chances of long-term retention improve. According to Shawn Abraham, Corporate Recruiter from The Structural Group, an individual's first impression can be lasting, so it is critical for companies to take a proactive approach toward easing their transition. A correct onboarding can make this outcome more likely, and senior management, in conjunction with HR leadership, should be involved in the design of an effective program.

Although an onboarding program in larger firms is typically coordinated by HR, it involves the entire organization. The following components and timeline are critical to any successful onboarding program (see Table 8.2):

- Preparation prior to new employee start:
  - Identify workspace
  - Provide necessary supplies
  - Provide computer and phone
  - Prepare onboarding packet
- Welcome and greeting by top leadership
- History of the firm
- Sharing of the organizational mission and vision
- Tour of the facility
- Transactional activities associated with new hire and benefits
- Introduce a peer partner (aka buddy) to assist new employee in assimilation into the organization
- Lunch with a member of organization (should be established prior to start date)

Performance Management

Performance management encompasses every aspect of the manager/employee relationship with respect to job performance. It entails discussions with a firm leader to help guide an employee's performance and encourage ongoing communications between the employee and supervisor. It also includes a structured performance appraisal/assessment program that is applied consistently throughout the organization.

Performance management programs usually involve periodic feedback (both formally and informally) throughout the year. Most architecture firms, big or small, have some type of communication mechanism in place to see that supervisors and/or managers are providing feedback on the employee's work performance. A typical performance management program would include an annual performance appraisal program. (See Table 8.3.) This provides an opportunity for the manager to assess the employee's performance, identify strengths and opportunities, and create goals and objectives for the upcoming year.

TABLE 8.2 Sample Onboarding Program

Prior to First Day	First Day	First Week	60–90 Days	6 Months & Ongoing
Identify workspace	Welcome and greeting	History of firm	Supervisor "check-in"	Identify training opportunities
Provide supplies	Tour of facilities	Partner with mentor or buddy (peer)	Encourage job shadowing	Seek feedback on onboarding process
Prepare new-hire packet	Lunch with supervisor	Benefits orientation Establish employee goals

List the project/work goals and objectives that you and your supervisor agree should be accomplished over the next reviewing period. These goals and objectives should be specific, measurable, attainable, relevant, and timely ("SMART").

A comprehensive performance appraisal will include input from the manager, the employee, and peers or coworkers of the employee. This 360-degree program provides the employee with the necessary information to analyze their performance with an eye toward career advancement and contribution to the organization. This wide-ranging form of appraisal will also help managers identify areas in need of performance coaching and career development coaching.

The manager appraisal gives an opportunity to formalize the observations that the manager has made on the employee's performance throughout the year. Although this may be the first time that this information has been officially recorded, it should not be the first time that the employee is hearing input from the manager. It is important to remember that effective "performance management" does not happen with input just at review time. Timely input from a manager allows employees to plan for and to gauge their own professional growth and development.

This informal input of information from the manager helps the employee recognize what the firm's expectations are and how they are meeting those expectations. This information is then the foundation for the goals that the employee will set for professional development and the goals that are set by the firm for performance management. A performance review appraisal typically consists of evaluating performance on core competencies or areas of an individual's work attributes, key accomplishments, and goals and objectives.

Setting the goals is only the first step in planning for professional development and identifying career development opportunities. It is the shared responsibility of both the manager and the employee to explore the opportunities that will assist the employee in continuing in their professional development and assist the firm in identifying career opportunities for the employee that will fit with the strategic plan of the organization. (See Table 8.4.)

Legal Compliance

Human resource management requires staying up to date in the area of employment laws, legislation, and compliance. Employers need to ensure that they are following the various federal, state, and local laws, which depend on many factors, including the size

TABLE 8.4 Performance Management Steps

Supervisor's Appraisal	• Supervisor provides constructive feedback on employee's performance during previous review period • Identifies strengths and opportunities in employee's work • Provides recommendations on improvements • Recognizes employee's contributions to the overall success of the project, department, firm
Self-Appraisal	• Employee objectively assesses his/her performance during the previous review period • Identifies strengths and opportunities in his/her work • Identifies ways in which to change performance deficiencies and areas where improvement is needed
Goal Setting and Development	• Employee and supervisor identify work objectives/goals for the upcoming review period (specific task, initiative, work product, project, etc.) • Establish SMART goals (Specific, Manageable, Attainable, Realistic, Timely) • Assess goals during next review period to determine success • Employee and supervisor identify professional development opportunities for the upcoming review period (seminar, workshop, project opportunity, etc.)
Performance Coaching	• Supervisor coaches employee on his/her career in respect to work performance • Uses coaching as a communication vehicle for continuous development for staff • Identifies performance deficiencies (if any) and provides recommendations for improvement • Uses performance coaching throughout the year

of the firm. There are different laws or variations of the laws for firms with fewer than 20 employees, over 50 employees, etc. In addition, if a firm is a federal contractor, there are further laws that need to be adhered to if the contract is over $50,000 and over 50 employees. Table 8.5 provides a breakdown of some of the most critical laws with which firms need to comply.

TABLE 8.5 General Compliance

Regulation	Definition	Compliance
All Employers		
Equal Pay Act	Prohibits wage discrimination by requiring equal pay for equal work	All employers
OSHA	Requires employers to provide a workplace free of recognized hazards	All employers
I-9 Employee Eligibility Verification	Verifies: Identity Right to work in the United States	All employers Must be completed within three days of hire Employer must retain I-9 for at least three years (and at least one year after termination)
Fair Labor Standards Act (FLSA)	Regulates: Employee overtime status and overtime pay Minimum wage Record keeping Child labor	All private sector employers with $500,000+ annual volume of sales and/or All federal, state, and local government personnel (except for military)
Personnel Files	Employment records maintained for each employee of the company. May include application, resume, performance management documentation, agreements, and acknowledgment forms	Any personnel or employment record must be preserved for two years. If the contractor has fewer than 150 employees or does not have a federal contract for at least $150,000, then the retention period is one year
Health Insurance Portability and Accountability Act (HIPAA)	Privacy regulation governing individually identifiable health information	All health plans, health care providers, and health care clearinghouses
American Recovery and Reinvestment Act (ARRA) of 2009	Provides: Tax cuts for families and businesses Funding for entitlement programs, such as unemployment benefits Funding for federal contracts, grants, and loans	Strict reporting on use of ARRA funds
Employee Retirement Income Security Act (ERISA)	Sets minimum standards for pension plans to include participation, vesting, benefit accrual, and funding	All private employers with a pension plan program
Employers with 15+ Employees		
Consolidated Omnibus Budget Reconciliation Act of 1986 (COBRA)	Requires employers to continue group medical coverage if employment is terminated or hours are reduced	All private employers, state and local government, and education institutes with 15+ employees
Civil Rights Act, Title VII	Prohibits discrimination or segregation based on race, color, national origin, religion, and gender in all terms of employment	All private employers, state, local, and federal local government, and education institutes with 15+ employees
Americans with Disabilities Act (ADA)	Prohibits discrimination against a qualified individual with a disability	All private employers, state, local, and federal government, and education institutes with 15+ employees
Employers with 20+ Employees		
Age Discrimination in Employment Act (ADEA)	Prohibits discrimination in employment for persons age 40 and over	All private employers with 20+ employees, unions with 25+ members, state, local and federal governments, and employment agencies

(continued)

TABLE 8.5 ***(Continued)***

Regulation	Definition	Compliance
Employers with 50+ Employees Family Medical Leave Act (FMLA)	Allows employees to take up to 12 weeks of unpaid leave during any 12-month period to care for family members or because of a serious health condition of the employee	50+ employees Public agencies, including state, local, and federal employers, and local education agencies Private sector employers who employ 50+ employees for at least 20 workweeks in the current or preceding calendar year
Affirmative Action Plan	Program in which employers take positive steps to correct underrepresentation of protected groups	All government contractors with 50+ employees and $50,000+ in federal government contracts
EEO Reporting	Requires employers to maintain EEO records	100+ employees and federal contractors with 50+ employees and federal contracts of $50,000+
Annual Report (Form 5500)	Annual report detailing financial records of benefit plans	Pension, welfare, and fringe benefit plans with 100+ participants Must be filed with IRS seven months after the end of plan year and retained for six years

► For related information, see the backgrounder accompanying this article, Architects as Employers: Legal Requirements.

Employee Relations

Employee relations are an important aspect of HR. This entails providing consistent messages to staff, which is imperative to see that all employees are treated in an equitable manner. Sensitive issues arise in the workforce on a regular basis. An example might be one in which an employee approaches a member of the management team about another manager who is making inappropriate comments, either directly to the employee or in the office at large. Because in most firms all members of the management team are in close working relationships, this can be an awkward situation for all parties involved.

To provide every employee with a comfortable working environment, it is critical that the manager who is approached knows how to deal with this situation in a confidential and efficient manner. Because the decision on this issue will have an immediate impact not only on this employee but also on other members of the firm, it is important to handle a situation such as this in a professional and unbiased manner. Such issues must be handled with a consistent and compassionate process so that if such a situation occurs in the future, management has a clear process in place that assures equitable and fair treatment.

The first step in equitably dealing with employee relations is to put in place the right policies and procedures to communicate and enforce expected and acceptable behaviors at work. The best way to guarantee this unbiased treatment and to provide employees with a clear understanding of the policies and procedures is to produce a comprehensive employee handbook. See the sidebar for an example of a table of contents from a standard employee handbook. This document outlines management's expectations and employee and management responsibilities. Creating a comprehensive handbook will eliminate any uncertainty among staff and provide management with a "go to" resource to explain to staff why one policy or another is in place.

Even with the necessary tools in place to ensure equity, problems will still arise. An employee may not be happy with management's decision on a specific situation, and this may lead the employee to take legal action against the firm. HR input into such sensitive matters as discrimination or sexual harassment will help leadership keep the

SAMPLE: EMPLOYEE HANDBOOK—TABLE OF CONTENTS

Section 1: Introduction
- Preface/welcome
- About this handbook/purpose of the handbook
- Mission and values
- Brief history of the company
- At-will employment
- Changes in policy statement

Section 2: Equal Employment Opportunity
- EEO policy

Section 3: Employment Status
- Definitions of employee classifications
  - Exempt
  - Nonexempt
- Employment categories
  - Regular full-time
  - Regular part-time
  - Temporary
  - Contractor status

Section 4: Employee Policies
- Employment applications
- Personnel data changes
- Disability accommodation
- Immigration law compliance
- Employment termination
- Exit interviews
- Return of company property
- Outside employment
- Confidentiality and nondisclosure
- Proprietary information
- Employment of relatives
- Personnel file
- Medical records
- Disclosure or release of employee information
- Employee reference requests
- Credit investigation
- Criminal background investigation
- Driver's license and driving record
- Health examinations
- Unauthorized copying of computer software

Section 5: Scheduling
- Attendance/punctuality
- Job abandonment
- Inclement weather/emergency closings
- Company and department meetings
- Meal periods
- Alternate work schedules
- Telecommuting

Section 6: Standards of Conduct
- Professional conduct
- Personal appearance
- Nondiscrimination and anti-harassment
- Possession of weapons in the workplace
- Workplace violence prevention
- Drug and alcohol use

Section 7: Performance Management
- Performance management
- Philosophy of company
- Employee performance review/promotions
- Employee development
- New hire orientation

Section 8: Compensation
- Your salary
- Bonus opportunities
- Timekeeping
- Overtime
- Paydays
- Deductions from paycheck
- Administrative pay corrections
- Wage garnishments
- Work performed on company holidays

Section 9: Employee Benefits
- Listing of benefits
- Group insurance
- Health Insurance Portability and Accountability Act (HIPAA)
- Social Security/Medicare
- Worker's compensation
- Paid leave benefits
- Retirement plans
- Professional membership dues
- Tuition reimbursement
- Educational assistance
- Leave without pay
- Jury duty
- Witness duty
- Voting
- Military leave
- Bereavement

Section 10: Workplace Policies
- Telephone use
- Voicemail and electronic mail usage
- Use of company property
- Internet policy

Section 11: Company Expenses
- Supplies, expenditures, and obligating the company
- Expense reimbursement
- Travel/entertainment procedures

Section 12: Communication
- Philosophy on employee communication
- Regular staff meetings
- Bulletin boards
- Procedure for handling complaints/open door policy
- Suggestions
- Customer relations

Section 13: Workplace Environment
- General employee safety
- Premises security
- Smoke-free environment
- Monitoring and searches

Section 14: Closing
- Acknowledgment and receipt of handbook

response to such issues fair and consistent. Therefore, if a firm does not have an HR professional, hiring an external HR or legal consultant for guidance on how to proceed will assist the firm in minimizing the risk to the organization.

Rewards and Recognition

When most individuals see the words "rewards and recognition," the quantitative awards come to mind. However, rewards and recognition take many forms, such as an annual firm retreat acknowledging staff for a job well done, team and individual awards for projects and/or client successes, and various communication vehicles acknowledging individuals' hard work and effort going into a project.

There are many qualitative and quantitative examples of how firms acknowledge their staffs for successful performance. Spot awards, pay-for-performance awards, annual bonuses, employee-of-the-month awards, and team awards are just a few examples of how firms can provide recognition for a job well done. There are also many external awards that firms can receive as recognition for these efforts, such as the AIA Firm of the Year Award and Best Firms Contests that many areas conduct.

▶ Compensation Strategy and Philosophy (8.2) explores a holistic compensation approach encompassing a firm's strategy, values, goals, firm culture, and market position.

Every firm has a compensation philosophy, whether formal or informal. The establishment of base pay salaries, incentive plans (bonuses), and awards is common in the professional services industries. The challenge for any firm is finding a formula that works for a particular firm, based on variables such as firm location, culture, and management approach.

For example, a firm may have a compensation plan for new-hire salaries in the form of salary ranges within each position and level. Some firms may have a more informal plan that will focus on the market demand for individual positions and salaries.

Bonus or incentive compensation plans are another example of a quantitative award program. This type of program identifies and rewards individuals in the firm who have performed above and beyond the typical duties of their positions. Many firms identify a specific time of year for this program (end of the year or the end of a quarter). Some firms provide measurable expectations such as meeting utilization rate target or client's tangible satisfaction on a project. Other firms identify and reward individuals based on the performance of a department or studio, or the profitability of the firm as a whole.

The most important issues with any recognition and reward program are that it is communicated in advance, is fair, is clearly understood, is meaningful to employees, and is challenging, yet attainable.

For an effective compensation program, employees need to understand that in any given year, bonuses and salary increases may be nonexistent because of low profitability of the firm, due to economic conditions, or other reasons. This area is an opportunity for management to continually improve their communications and, ultimately, relationship to staff.

Training and Development

▶ Professional Development and Mentoring (8.4) covers training, mentoring, and appraisal programs that can support a firm's strategic plan.

An effective training and development program that focuses on the development of staff serves a twofold purpose in a successful architecture firm: It ensures that employees are kept abreast of the changing trends and regulations in the field of architecture, and it attracts and retains the high-quality talent who strive to keep their skills finely tuned. Employees look for continuous development to enhance their careers, as cited in the 2007 Future Leaders Survey conducted by HR Advisors Group. A strategic HR function will work with leadership to find external training opportunities for staff and develop internal, less formal training programs that are supported by the in-house talent. Human resources will also keep abreast of certification and licensure issues pertinent to the members of the firm and help individuals track the renewal requirements necessary to remain in compliance with state licenses. For instance, HR can help identify opportunities to complete the HSW and SD continuing education hours required of AIA members and sometimes mandated by state licensing boards.

Leadership Development

As a firm's leaders transition from practice to retirement, it is critical for the firm to focus on developing both technical and leadership skills in their staff. Many firms have informal practices for focusing on leadership development and on mentoring potential talent for the future of their firms. Other firms have more structured learning centers where programs are created to assist individuals in their leadership abilities. Firms such as Gensler provide leadership development programs like its NextGen Program to up-and-coming young talent within the firm. Other firms create programs focusing on the employee's development and organization's commitment to an employee's career development and growth. It is important to support staff in training and development, as the firm will reap the benefits long-term.

Training and Development Programs
- Technical training
- Project management training
- Leadership/management training
- Safety/legal/risk management
- Company orientation
- Health/wellness

Delivery Options
- Outside training seminars or classes
- In-house training by firm employees
- In-house training by outside consultants
- Reference books or materials for self-study
- Online training
- User groups or round-table discussions
- Other

HUMAN RESOURCE MANAGEMENT IN SMALLER FIRMS

According to numerous studies completed by the Society for Human Resources Management (SHRM), the standard for HR is a ratio of one exempt/professional level HR professional to approximately 75 to 100 employees. Nevertheless, it is important for leaders of smaller firms to keep up to date with the latest trends in human resources, which will help the firm attract and retain staff. External recruiters, benefits brokers, and attorneys can assist smaller-firm principals and administrators in the transactional aspects of HR for smaller firms.

▶ Leader Effectiveness (5.5) presents a model of leadership development for architecture firms.

There are some basic elements to an HR function that all firms, regardless of size, should strive to include in its organizational processes and procedures. These include:

- Job applications that are consistent and professional
- Benefit and compensation plans that are competitive and equitable
- Consistent process for all procedures (e.g., orientation to the firm, communications regarding salary increases, adjustments, and promotions, exit strategy, employee feedback)
- Employee handbook detailing organizational expectations, benefits, payroll, etc.
- Training and development opportunities (e.g., AIA CEU credits allowance or reimbursement to employees)
- Performance evaluations that are consistent and timely

Every organization should have an employee handbook in place whether it has 5 employees, 20 employees, 50 employees, or beyond. An extensive table of contents for a larger firm is included in this article. However, an employee handbook in a smaller firm should include these key elements:

- Introduction
- Employment policies (including federal, state, and local employment law requirements)
- Scheduling and attendance
- Compensation and benefits

LUCKETT & FARLEY LEADERSHIP INSTITUTE

In 2011, Luckett & Farley, a midsize AE firm, held its first Leadership Institute classes. The principals wanted to make sure they would be able to leave the firm in capable hands, so the Leadership Institute was launched.

Classes were held once a month over an eight-month period. An outside consultant was hired as the instructor. The curriculum covered topics such as emotional intelligence, collaboration and trust, and leadership excellence. In addition, understanding firm vision/values/culture; building strategic relationships; engaging in crucial, critical, or candid conversations; mastering conflict; and conducting facilitation were taught. Systems Thinking for Leaders was introduced, and each participant developed an individual roadmap to becoming a successful leader.

The goal of the firm is to have every employee go through the Leadership Institute. Although this is not a small investment, the organization believes everyone has a role to play in leadership. As a result, all staff members have the opportunity to develop confidence in their leadership ability.

Michelle Smith, PHR, Luckett & Farley Architects, Engineers, and Construction Managers Inc.

- Standards of conduct
- Workplace policies and expenses
- Acknowledgment of receipt of employee handbook

The key is to provide details and consistency in practice so that if an issue ever arises, the firm can look to what is formally in place as a guide.

BEST PRACTICES TO ATTRACT AND RETAIN TALENT

If you take care of your people, they'll take care of you. If you don't take care of your people, they'll take care of you.

—(Author unknown)

Identifying what separates a firm from the competition and what works well from an HR perspective will help to attract and retain talent. This is also important to ensure that when talent has been found and trained, they will not be driven to look elsewhere for advancement. These best practices include focusing on work-life balance, developing future leaders and technically proficient professionals, and supplying employees with transparent career paths and professional enrichment opportunities.

It is also critical for firm leaders to listen to their workforce. Given the opportunity, employees enthusiastically respond to sharing their ideas and desires for a cooperative workplace. Periodic employee surveys and focus group discussions will help HR staff and firm leadership to develop the new programs and policies that are effective in retaining and developing talent.

Work-Life Balance

Work-life balance is a top priority in twenty-first-century American culture. A February 2012 SHRM online study of U.S. workers found that the work-life balance is preferred over growth opportunity, camaraderie with coworkers, and a strong supervisor relationship.

An increasing number of firms are seeking to implement policies and programs that increase productivity while also promoting personal well-being and work-life balance for their employees. Employers who implement work-life balance programs can expect to find a reduction in turnover, increase in employee satisfaction and commitment, and less unscheduled absenteeism. Firms can offer a range of programs and initiatives, such as a wellness program, on-site child care, and parental leave. Other options include flexible scheduling, seasonal hours, and/or teleworking.

Telework

A growing number of firms are embracing the concept of telework. Telework simply means working from a remote location, typically a home office, while linked electronically to the firm.

In a 2010 Employee Benefits Survey conducted by the Society of Human Resource Management (SHRM), 55 percent of employers offer telecommuting as either a part-time or full-time option for their employees. Employers are shifting their focus from where, when, and how work gets done to the results and business impact of the work.

As an instrument in a firm's toolbox, teleworking can be beneficial in many ways. The following are among the benefits a firm may gain by allowing employees to telework:

- Save on office space, parking, equipment, and related costs.
- Reduce absenteeism and downtime due to weather, traffic, emergencies, etc.
- Create a performance-based environment that enables better work.
- Increase work satisfaction and commitment to the firm.
- Attract and retain employees and expand pool for talent recruitment.
- Demonstrate the firm's concern for the environment.

For a firm to be successful in administering a teleworking program, it must also consider the challenges of such a program. Strong supervision, norms of behavior, and regular communication are crucial. Other considerations may be security, tax and zoning, and insurance and liability under state law. A formal program should be put in place and assessed regularly to ensure it is beneficial to both the employee and the firm.

Diversity

Diversity as a concept focuses on a broader set of attributes than race and gender. In the context of the workplace, valuing diversity means creating a workplace that respects and includes differences, recognizing the unique contributions that individuals with many types of differences can make, and creating a work environment that maximizes the potential of all employees.

Embracing the diversity of today's population in the workplace goes well beyond compliance and an affirmative action plan that focuses on gender, ethnicity, generational diversity, and sexual preferences. In a creative environment the experience that the diverse workforce brings to the table enables a firm to provide a broader approach to projects. A successful architecture firm will use this diversity to bring a synergy of collaboration to the organization, which will enrich its creativity and provide its clients with a wider array of innovative and exciting ideas.

▶ See Diversity and Practice Management (2.1) regarding the contribution a diverse workforce makes toward maintaining a successful business and a competitive edge.

Generational Issues

Today's workforce consists of four generations: the Traditionals, the Boomers, Generation X, and Generation Y. Each generation has different skills and priorities. It is important for organizations to tap into generational differences, expertise, and work/life balance expectations. The "one size fits all" approach is outdated and ineffective in today's multigenerational culture.

Understanding generational differences in approaches to work will reap many benefits for architecture firms of any size, market sector, or specialty. Understanding the generational diversity and differences will benefit organizations by enhancing communications and productivity. In addition, it will portray to the staff a commitment to meeting employee needs.

In order to optimize productivity and organizational effectiveness, firms need to be innovative in finding ways to customize their workforce programs. Tailoring practices and policies to individuals and groups of employees throughout an organization will allow employees to utilize their skills and talents in an atmosphere that best suits their lifestyle, and as a result will increase employee engagement within the firm.

According to a major survey of 4,364 Millennials in 2011 by Pricewaterhouse Coopers (PwC), nearly a quarter (22 percent) of respondents rate training and development as their number-one benefit. Work/life balance follows, with 19 percent claiming it as most important, while cash bonuses rank third at 14 percent. The survey, *Millennials at Work*, *Reshaping the Workplace*, also showed that 72 percent of Millennials have had to make some sort of compromise in terms of location, salary, or industry to get a job.

Millennials Want More than Just a Job

Jon Andrews, a partner at PwC says, "Millennials want more than 'just a job.'" They expect rapid progression, a varied and interesting career, and constant feedback. "What they want might shift as they move through different stages of life and their commitments change, but this group is characterized by their ambition and optimism as they look at more than money when there's a job offer on the table," Andrews says. "There are significant implications for employers as they need to adapt to ensure they remain attractive to this new workforce."

So, to better understand this future generation, firms need to recognize that the roles and responsibilities for employees are critical for the long-term success of not only the firm but also the individual employee. Keeping employees engaged and energized by providing them with meaningful goals and objectives and keeping them involved in various projects will create a win/win for all.

Time-honored practices such as traditional mentoring programs share best practices in the industry and institutional knowledge that is invaluable to new employees in the workforce. Utilizing newer "reverse mentoring" programs that allow Gen X and Y employees to share their insights and experiences with newer technology helps to build a sense of sharing and belonging for more recent members of the workforce while at the same time providing guidance to the more seasoned professionals in new arenas. Both practices help to build a more unified and productive workforce.

CONCLUSION

Keeping abreast of the ever-changing human resources issues, trends, and programs, and aligning those programs to overall business strategy is critical to the success of an architecture firm of any size. Acknowledging that today's workforce needs are numerous, it is important for firms to think and act progressively and proactively and to find innovative opportunities to attract and retain talent. Developing human resources programs, focusing on the importance of staff, and finding ways to engage and develop staff, as well as instituting policies and practices such as telecommuting and flexible hours, will help employees maintain a productive and satisfying work-life balance. These types of programs increase the retention of staff and thereby reduce the amount of overhead incurred when hiring new talent. Putting transactional and tactical human resources in place will allow firms to focus on the strategic aspects of human resources and their impact on fostering and sustaining the success of the firm.

BACKGROUNDER

ARCHITECTS AS EMPLOYERS: LEGAL REQUIREMENTS

Patrick Bannon, Esq.

This is an update of a backgrounder first published in the 14th edition of the Handbook by James J. O'Brien.

Patrick Bannon is a partner in the Labor & Employment group of McCarter & English, LLP. He represents employers in court and helps them comply with employment laws and avoid litigation with their employees.

A wide range of federal and state statutes, regulations, administrative orders, and case law governs employment relationships. While most states still adhere to the basic rule that employment is "at-will"—a legal term meaning that, in the absence of a contract providing otherwise, an employee's employment may be terminated at any time, for any reason, with or without notice—in fact, there are many exceptions to the at-will concept. A brief overview of some federal and state laws governing employment follows. The body of law governing employment tends to be complex and very dependent on individual circumstances. In addition, this brief overview does not come close to covering all the legal rules and potential pitfalls that apply to the employment relationship. For these reasons, this summary should not be considered a substitute for competent legal advice.

INTERVIEWING AND HIRING

The *Fair Credit Reporting Act* requires employers who wish to use third parties to obtain background checks of applicants or employees, including credit verification, criminal history, and education verification, to follow certain rules governing the use of the information, and requires specific notice and disclosure to the affected applicant or employee. In addition, the federal Equal Employment Opportunity Commission takes the position that using criminal history that is not relevant to an employee's fitness for a job could violate laws prohibiting discrimination based on race and national origin. Some states have their own laws restricting the use of criminal history and other background information in hiring decisions.

The *Drug-Free Workplace Act* requires federal government contractors to have programs to ensure a drug-free workplace. The federal government also requires drug testing in some instances; for example, for certain employees of defense contractors. Many states and some local jurisdictions have their own laws addressing drug testing of employees or applicants for employment, and these vary widely.

The *Employee Polygraph Protection Act* restricts the use of lie detectors in most hiring and employment situations. Many states also regulate the use of polygraphs in employment.

The *Immigration Reform and Control Act* requires verification of authorization of new hires to lawfully accept employment in the United States and the maintenance of I-9 forms by the employer. The act also prohibits discrimination on the basis of national origin.

Other Selection Criteria

Federal or state laws may regulate checks concerning applicants and employees. These include criminal background checks, medical exams, interview and employment application questions, and pre-employment testing.

WAGES AND BENEFITS

The *Fair Labor Standards Act* governs minimum wage and overtime requirements and defines classes of employees who may be treated as exempt from these requirements. While paying an employee on a salary basis meets one of the standards for exempt treatment, it is not the only standard, and even employees who are paid a salary may be entitled to overtime pay for time worked over 40 hours per week if their duties do not qualify as exempt. Mistaken treatment of employees as exempt is common. Employees whose primary duty does not require an advanced degree or professional license, designers who are primarily responsible for discrete tasks, and nonprofessional support staff are examples of frequently misclassified employees. Many states and municipalities have analogous laws. Construction work of certain types on federal contracts may be subject to provisions of the Davis-Bacon Act, requiring payment of wages at a special local prevailing wage that is often much higher than ordinary minimum wage.

The *Employee Retirement Income Securities Act* governs the duties and responsibilities of employers regarding certain benefit plans, including retirement plans but potentially applying to many of an employer's benefits. It requires extensive disclosure to plan participants.

The *Family and Medical Leave Act* requires that most employers of 50 or more persons provide eligible employees with up to 12 weeks per year of unpaid leave due to a serious health condition of the employee; the arrival of a child, whether by birth, adoption, or through foster care; the illness of an employee's spouse, parent, or child; or certain needs of immediate family who are on active duty in the armed services. Eligible employees may also take up to 26 weeks of leave to care for a service member who suffered a serious illness or injury in the line of duty. The law provides this leave to most employees who have worked for an employer for at least one year and for 1,250 hours over the previous 12 months. Some states also provide for family and medical leave, and the employee may be entitled to benefits under both federal and state provisions.

The *Health Insurance Portability and Privacy Act* governs privacy and security of employee health data and requires employers to issue certificates verifying insurance coverage.

The *Patient Protection and Affordable Care Act of 2010* includes a variety of provisions affecting employer-sponsored health insurance, including a January 1, 2014, requirement that firms with 50 or more full-time employees offer health insurance or pay a fee. A few states also have laws penalizing employers who do not offer health insurance.

EMPLOYMENT TAXES AND WITHHOLDING

The Internal Revenue Code mandates withholding of taxes from employees' pay and forwarding the amounts withheld to the Internal Revenue Service. Employers are subject to various liabilities, including attachment, for failure to comply. States have analogous withholding requirements, as do many local jurisdictions.

The *Social Security Act* requires withholding contributions from employees' pay and forwarding these amounts, as well as employer contributions on behalf of employees, to the Social Security system.

Unemployment insurance requires employers to make payments for federal unemployment benefits. State statutes also govern payments to certain employees who have been terminated or laid off.

TERMS AND CONDITIONS OF EMPLOYMENT

A number of federal laws and some state statutes govern the terms and conditions under which individuals are hired and employed.

Discrimination

Title VII of the *Civil Rights Act of 1964* applies to employers with 15 or more employees, and the *Civil Rights Act of 1866* applies to all employers. These acts prohibit discrimination

(continued)

on the basis of race, color, sex, pregnancy, religion, and national origin. Executive Order 11246 applies to federal contractors and, depending on the dollar amount of a private employer's contract with the government, imposes certain requirements, such as implementing an affirmative action plan designed to improve employment opportunities for minorities and women. Most states and many local jurisdictions also prohibit discrimination based on the characteristics protected by federal law, and some also forbid discrimination based on sexual orientation.

Sexual harassment has been interpreted by the courts to be a form of sex discrimination prohibited by law. Court decisions on this issue have led to great potential liability for employers, and every employer should adopt a strict policy outlawing such discrimination, conduct workplace training, and have procedures in place to address any complaints of sexual harassment. The laws of some states now mandate that certain employers conduct sexual harassment training.

The *Americans with Disabilities Act* prohibits discrimination against a qualified person with a disability who can perform the essential functions of a job, and in some cases requires an employer to provide reasonable accommodations in order to permit the disabled person to perform those functions. Whether an employee's physical or mental condition counts as a disability under the ADA is often hard to determine, despite recent efforts to clarify the law. Employers who have certain relationships with the federal government are required under the *Rehabilitation Act of 1973* not to discriminate against handicapped individuals, and some employers are required to prepare affirmative action plans. Many states have analogous statutes applying to private employers.

The *Age Discrimination in Employment Act* prohibits discrimination on the basis of age by employers who employ 20 or more employees. Persons in this protected category are those age 40 and over. The act also governs certain aspects of the operation of retirement plans and sets standards for severance agreements in certain situations.

The *Equal Pay Act* prohibits most employers from engaging in wage discrimination based on gender for work involving equal skill, effort, and responsibility, unless the differential in pay is based on a lawful factor other than gender. Many states have analogous laws, and some have adopted the comparable-worth concept, applying to jobs that are similar but not identical.

The *Genetic Information Nondiscrimination Act* prohibits employers from requesting or using employee genetic information, including family medical history.

Veterans' Employment Rights

These rights are governed by the *Uniformed Service Employment and Reemployment Rights Act,* which covers all private employers and prohibits discrimination because of application to or membership in a uniformed service. It requires posting in the workplace of notices explaining employees' rights under the law and reinstatement to the veteran's former position upon return from military training or service; and bars discrimination relative to hiring, retention, promotion, or other employment benefits. The *Vietnam Veteran Readjustment Act* applies to certain government contractors and prohibits discrimination against Vietnam-era veterans and disabled veterans.

Rights to Organize

The *National Labor Relations Act* protects the right of employees to organize and to form or join labor unions, the right to engage in concerted activity, and the right to bargain collectively. In recent years, the federal agency that enforces this law has sought to apply it to nonunion employers in a variety of contexts, seeking to protect employees who disclose their compensation, discuss ongoing workplace investigations, or use social media to criticize their employers.

Workers' Compensation Laws

Almost every state requires employers to carry workers' compensation insurance (or to offer the option to employees), to provide benefits, and not to discriminate on the basis of claims. In some states an employer who fails to carry such insurance is liable for injuries to employees, is deprived of certain defenses normally recognized in comparable circumstances, and can even be criminally prosecuted. Variations from state to state are often important.

The *Occupational Safety and Health Act* regulates employee health and safety and requires a safe workplace. The Department of Labor publishes specific regulations on certain workplace hazards, especially in construction. Under an approved state plan, states may regulate in this area. The act also regulates office workers as to fire protection and injury records, and imposes a "general duty" to provide a safe workplace.

The *Jury Service and Selection Act* bars an employer from discharging an employee for serving on a federal jury, and requires that leave be given for service. Nearly all states also require that employees be given time off to perform jury duty without being penalized.

Employment Contracts

Contracts can be found to exist even when an employer did not intend to be contractually bound. In fact, all employment relationships are properly understood as contractual. However, most firms prefer to retain the right to part ways with their employees at will. To preserve this right, care must be taken in drafting offer letters, policies, and handbooks to avoid creating an explicit or implied commitment where none was intended. In addition, in most states, noncompete and nonsolicit agreements with employees can be enforceable in appropriate circumstances if properly drafted, helping architecture firms to protect their practices from unfair competition or raiding of employees or clients. It should be noted that case law in this area is changing rapidly, and varies by state.

Posting of Notices

Many federal and state statutes require that notices advising employees of their rights be posted so that employees can see them.

TERMINATION OF EMPLOYMENT

The *Workers' Adjustment and Retraining Notification Act* requires that employers with 100 or more employees give 60 days' written notice to the employees and the local government in the event of a mass layoff (50 or more employees if the layoff is at least one-third of the workforce) or plant closing. Many states also have laws governing mass layoffs and plant closings.

The *Consolidated Omnibus Budget Reconciliation Act of 1986* (COBRA) requires that employees be given notice of the right to extend group health benefits coverage after termination and at the time of other qualifying events. COBRA applies to employers with 20 or more employees, although some of COBRA's provisions, and some states' analogous laws, can apply to smaller employers as well.

EMPLOYMENT RECORDS

Retention of employment records, as well as access to them, are regulated by government statutes.

Retention

Many federal and state laws require retention of employment-related records. The length of time these records must be kept can vary widely, from as few as 90 days to as many as 30 years beyond the termination of employment. Most statutes also require that all records be retained once a charge or claim has been filed, and kept until its final disposition. Employers should check with legal counsel regarding specific records.

Access

Third-party access to employment-related records is governed by statutory authority in the case of governmental agencies, and can be restricted by privacy rights granted to employees by state law in the case of disclosure to others. Various states require that employees and former employees be granted access to personnel files regarding their own employment, while other states continue to recognize that such files are the property of the employer and that the employee has no inherent right of access to them.

8.2 Compensation Strategy and Philosophy

Steven J. Isaacs, PE, Assoc. AIA

Compensation requires a holistic approach encompassing the firm's strategy, values, goals, firm culture, and position in serving the needs of the marketplace. The expression of compensation strategy should be driven by elements unique to each firm: customer service, operations, finance, and human resources.

Success for the architecture firm depends on the talent and work of its staff. This means attracting people to the firm, motivating them in their work, and retaining them, with their abilities and knowledge, for the firm's long-term health. Compensation is a key element in this relationship. As a firm grows and becomes more complex, several interconnected issues come into play: What is the firm's position in the marketplace? How does the firm create a compensation strategy? Will the firm choose a low base salary with high incentives, or a high base salary with lower or no incentives? How the compensation strategy is constituted is directly related to the firm's business strategy, philosophy, and culture.

FIRM STRATEGY, PHILOSOPHY, AND CULTURE

Architecture as a creative process is conducted at a high level of intellectual complexity requiring the work of individuals and high-functioning teams, so the importance of having the right people in the firm cannot be overstated. Every person who comes into

Steven J. Isaacs, AE division manager at FMI Corporation, helps firms improve their practice in the areas of long-term planning, operations, and overall organization. Isaacs is the author of "Negotiate with Confidence: Filed-tested Ways to Get the Value You Deserve," published in January 2013. Sal DiFonzo, CCP, CBP, CSCP managing director, compensation, FMI Corporation, contributed to this article.

a firm brings unique abilities, perspectives, and potential. Finding the right people with the talents that fit a firm's chosen work, culture, goals, and strategy is at the heart of building a successful architecture practice.

The right compensation strategy can help attract people who are a good match for the firm. Once those people have been found, hired, trained, and integrated into the firm, losing them is extremely costly. A 2010 study by PwC (PricewaterhouseCoopers) reveals that the cost of replacing a competent staff member is roughly equal to a year of that person's salary; therefore, strong employee engagement practices and long-term retention are highly desirable objectives for most firms. Compensation is an important factor in the complex equation that comprises the career contentment and job satisfaction that lead to long-term retention.

A firm's compensation strategy also reflects its attitude toward itself, its position in the marketplace, its approach to clients and projects, and its involvement in the community. Details of compensation strategies are generally private, yet a firm's approach to compensation is often widely known—especially in this high-communications era—and becomes part of the firm's overall reputation.

That reputation, or brand image, is a key element in attracting appropriate staff, clients, and projects to the firm. A firm with a compensation strategy that clashes with its desired reputation may not obtain the optimum market position it is seeking. For example, a firm that specializes in low-cost, rapid-deployment warehouses could unwittingly gain a reputation among clients for being "too expensive" if word gets out that it pays above-market salaries to staff. An approach more aligned with this firm's strategy could be to balance more moderate salaries with an incentive program.

Evaluate Strategy and Culture

The first step in developing a compensation strategy is to review the firm's values, vision, and goals. Many of these questions are revisited regularly during the strategic planning process. Among the questions the firm should consider are these:

- What are our core values?
- Why do we want to work together?
- What business are we in?
- Who are our customers?
- How will we get their business?
- What key competencies do we need to serve our customers?
- What jobs/roles comprise those competencies?
- How many people do we need in those roles?
- What are the core competencies of our staff?
- Who will lead the firm forward in the future?

► Strategic Planning for the Design Firm (5.3) discusses how firm leaders can envision the future of their firms and then implement strategies and action plans that will achieve positive results.

The second step is to determine the firm's culture, which tends to derive from the firm's values, vision, and leadership. Cultural attributes are expressed in unique ways within every firm, and can be so ingrained that it is difficult to observe them objectively.

One useful tool for looking at firm culture is found in the work of University of Michigan professors Kim Cameron and Robert Quinn, whose book on *Diagnosing and Changing Organizational Culture* offers four simply defined categories:

- *Collaborate (Clan) culture*. The Collaborate culture is an open and friendly place to work where people share a lot of themselves. It is like an extended family. Leaders are considered to be mentors or even parental figures. Group loyalty and sense of tradition are strong. The organization places a premium on teamwork, participation, and consensus.
- *Create (Adhocracy) culture.* The Create culture is a dynamic, entrepreneurial, and creative place to work. Innovation and risk-taking are embraced by employees and leaders. A commitment to experimentation and thinking differently are what unify the organization. Leaders strive to be on the cutting edge. Individual initiative and freedom are encouraged.

- *Control (Hierarchy) culture*. The Control culture is a highly structured and formal place to work. Rules and procedures govern behavior. Maintaining a smooth-running organization is most critical. Stability, performance, and efficient operations are the long-term goals. Success means dependable delivery, smooth scheduling, and low cost. Management wants security and predictability.
- *Compete (Market) culture*. The Compete culture is a results-driven organization focused on job completion. People are competitive and goal-oriented. Leaders are demanding, hard-driving, and productive. The emphasis on winning unifies the organization. Success means market share and penetration. Competitive pricing and market leadership are important.

Many firm cultures can be understood as a balance between varying combinations of these four categories.

Determine a Compensation Philosophy

Having determined with clarity the firm's strategy and culture, the competencies needed to serve clients, and the roles needing to be filled within those competencies, the firm must now determine a philosophy about compensation. The firm's approach to compensation, benefits, and incentives should reinforce the firm's vision, values, and strategic objectives.

This alignment is brought about by directly rewarding the behaviors that the firm desires in order to advance its objectives. If the firm's objective is to maximize profit, then the compensation plan must reward profit-maximizing activities, such as business development, project management practices that enhance project profitability, and innovations that reduce overhead. By comparison, if the firm's strategy is to become a regional leader in energy-efficient design, then compensation should seek to encourage a focus on design practices that promote energy efficiency, and business development that brings in regional clients.

Compensation must also align with where the firm wants to be in the market:

- *Above market rate:* Firms may choose to offer a higher than market compensation package to attract the necessary talent for their strategic approach. Many small firms use this approach, as they may not have the ability to offer as wide a range of additional benefits as larger firms.
- *At market rate:* Market rates for compensation vary somewhat from region to region, but tend to fall into similar proportions for peer positions. Most firms choose to compensate staff in ways that are similar to other firms, with benchmarks easily available through annual surveys and on the Internet.
- *Below market rate:* The firm's chosen business focus and culture demand a highly competitive pricing structure, with lower compensation playing a part in creating that competitive pricing.

CASE STUDY: WHEN COMPENSATION IS OUT OF ALIGNMENT WITH FIRM STRATEGY AND VISION

An architecture firm had a successful, wholly owned subsidiary in construction management. During the firm's long-term strategic planning process to set future direction, it became clear that their highest goal was to become a nationally recognized design firm. At the same time, the highest rewards in the firm were all going to the construction management division, because it was the most profitable. While the CM division's contributions to design were limited, it was taking in the most compensation because the compensation plan was structured to reward profit. This created a high amount of tension between the divisions and increased employee dissatisfaction. With the firm's future vision squarely focused on design, the firm had to develop a compensation strategy that rewarded design over pure profit. This direction meant that the CM division would in the future have little opportunity to advance their compensation or win bonuses. The firm and the CM division chose to part ways and spin off the construction management division as a separate firm.

CONSIDERATIONS FOR THOSE SEEKING TO BE HIRED

For architects and recent graduates who are seeking positions in firms, considerations include the following:

- Does the firm do the kind of work you are interested in or passionate about?
- Will your skill set be expanded through your experience at this firm?
- Is there a specific mentor at this firm you seek to work with?
- Does the firm offer the career paths or opportunities for growth that fit with your long-term goals?
- Are the firm's culture and values in alignment with your personal values and goals—that is, will you feel comfortable there?
- How is the compensation structured, and does it align with your needs and goals?

Evaluate How to Attract Talent

Compensation packages are key to the firm's recruiting process, the individual professional's interest in a firm, and their acceptance of employment. An architecture firm's staffing strategy plan should include where the firm will find and recruit talented individuals, and how to attract them.

An important consideration for a firm's leaders as part of this plan is the firm's overall brand image and reputation in the marketplace. Compensation practices will help attract people who will fit with the firm's culture and vision. In other words, marketing and branding efforts attract more than just clients, they also support a recruiting program. Depending on the firm's size, it may have human resources professionals to guide recruiting strategy and efforts.

THE FUNCTION OF COMPENSATION IN AN ARCHITECTURE FIRM

A rewards system comprises multiple elements, including these:

- Compensation
- Benefits
- Work-life
- Performance management and recognition
- Talent development

► Professional Development and Mentoring (8.4) and Intern Development (3.2) further discuss training, mentoring, and appraisal programs that support both employees and the firm's strategic plan.

Architecture firm staff members usually have strong expectations that compensation plans will be well-defined and offer clarity about how compensation is tied to both their job function and their performance. Most firms have specific tiers that identify this correlation of function to compensation, often with several sub-tiers per function. These sub-tiers allow for graduated promotion based on a staff person's ability to perform in a new function. Compensation packages can be designed in ways that allow the firm to meet the needs of most staff as well as rewarding star performers. "Pay your stars," advises the director of human resources at a large international firm. She explained that many firms are moving to plans that offer tiered base pay levels tied to function, with incentive compensation as the way to both encourage desired behaviors throughout the firm and reward the top performers.

Definition of Compensation

Compensation in its most basic definition is the exchange of money or something of value for a service. Employees typically exchange their time, knowledge, and talents for a combination of financial and nonfinancial rewards from the firm.

Every individual has both common and unique motivations, and a means of understanding those motivations can help in structuring compensation packages. Psychology offers a range of theories about motivation, but one of the most familiar is Abraham Maslow's Hierarchy of Needs. His work posits that human needs can be seen as a scale that ascends through five key areas: physiological needs (food, water, sleep), safety and security needs (shelter, safety), the need for belonging (family, friends, community), esteem and achievement (recognition of accomplishments, respect of others), and culminating in the most complex needs for self-actualization, comprising creativity, morality, problem-solving, and the like.

Such models oversimplify human motivations and needs, but also make them easier to grasp and work with; they can be helpful for looking at the firm's relationship with staff and seeing that the range of needs being met is at a level that helps support the desired relationship with an individual. That relationship may begin at the basic exchange of wage for time and knowledge, but nearly everyone would also like to know they are safe in the workplace, and to have a sense of community with their colleagues. A highly trained architect will also want recognition of achievements, challenging responsibilities, and the freedom to use a high level of creativity to solve complex design problems.

Are Architects Different?

The importance of these three latter points—recognition, challenging responsibilities, the freedom to be creative—to the career contentment and job satisfaction of architects was notably examined by Judith R. Blau in her 1984 landmark work, *Architects and Firms: A Sociological Perspective on Architecture Firms.* According to Blau, "Just as architecture is not mere building, architects are not mere professionals." Her survey of 422 architects revealed that architects see, in themselves and their work, a combination of art, science, creativity, technical responsibility, and diversity of problems to be solved which sets them apart as unique. They also emphasize the highly individual nature of idea development and creativity, characteristics that are emphasized in popular culture to the point of eccentricity. Anyone who practices architecture knows that individual creativity must be balanced with the efforts of a team, sometimes comprising hundreds of people. Blau lists four specific factors that contribute to career contentment and job satisfaction for architects, and says that her study shows that these factors operate regardless of firm size or characteristics:

- Current responsibility for many different tasks
- Having had some responsibility on an award-winning project
- Exercising much power within the firm
- Working on many different types of projects

These expectations for challenging responsibility, recognition, and creativity have an important role in hiring, retaining, and working with architects.

Demographic Factors: Age, Culture, Gender

The components of compensation packages should consider the needs of the range of staff the firm will be employing. For example, employees have different needs at different stages of their lives. These generational differences can affect an individual:

- Staff who are entering the prime earning years of their careers will be seeking strong retirement plans (IRAs, 401(k)s, etc.), as do members of the large baby boom generation, whose first members turned 65 in 2011 and who will successively reach retirement age through 2030. Many plan to continue—or must continue due to recessionary losses of savings—working well into their seventies before retiring.
- Younger staff may be more interested in flexible time, the ability to work from home, having the latest technology and equipment on their desks, and the ability to use paid time for pro bono, sustainable, or community projects. HR directors at architecture firms generally say that time off and flexible time were among the most desired perks, regardless of age.
- Staff members with children have demands on their time related to athletics, tutoring, school events, and the like. Also consider how these activities affect single staffers (who are sometimes left holding down the fort during Little League season), and offer them comparable options.

- All staff want clear career paths and learning opportunities, and several HR directors shared the insight that the Millennial generation especially craves a learning career path with specifics about how they can climb the tiers. They thrive on frequent promotion, so designing job functions with many opportunities to level up will keep them engaged.

In an increasingly globalized marketplace, staff may come from anywhere in the world, bringing different expectations of their employment conditions with them. It can be important to the hiring process and compensation negotiations—as well as retention for the long term—to do some research. Understanding how compensation is treated in the candidate's culture, styles of negotiation, and employment expectations are highly relevant. The candidate may need to be coached through the differences to prevent either too-high or too-low expectations, or the loss of a promising candidate through misunderstanding.

Gender bias in pay is an unethical practice and should never occur. Failure to pay female staff equitably with male staff will damage the firm's reputation, and open it to legal risks.

A key purpose of defining compensation plans with pay tied to function is to prevent bias, favoritism, nepotism, and the like. Individuals who perform at the highest levels can be rewarded through incentive systems.

The Four Functions of Compensation

From the firm's perspective, the compensation plan accomplishes four actions, as shown in Figure 8.2:

- *Attracts.* Helps brings the firm to the attention of talented individuals and attracts them onto the team
- *Retains.* Plays a key role in the long-term engagement and retention of valuable employees
- *Motivates.* Offers incentives that motivate employees to higher performance
- *Rewards.* Provides additional compensation beyond salary for recognition of outstanding contributions, which boosts all three of the functions above

Attract

Firms currently face many challenges in recruiting, including demographics, competition for talent, and the ups and downs of economic cycles.

Attract. Retain. Motivate.

Total Rewards Element	Goal		
	Attract	Retain	Motivate
Base pay	High	Medium	Low
Short-term variable pay	Low	Medium to High	High
Long-term, qualified deferred compensation	Low	Medium	Low
Long-term, nonqualified deferred compensation	Low	High	High (2)
Perks	Medium	Low	Medium (1)
Recognition	Low	High	Medium
Performance management	Low	Medium	High
Work/Life programs	Medium	Medium	Low
Career pathing	High	High	Medium
Training	High	Medium	Low
Benefits	Medium	Medium	Low

(1) If tied to performance (2) If long-term incentive compensation is used

FMI Corporation

FIGURE 8.2 **Attract-Retain-Motivate**

Demographics

Many boomers were substantially affected by the Great Recession, and now expect to continue working longer to make up for their financial losses. The Conference Board reported in a study issued May 2011 ("U.S. Workers Delaying Retirement: What Businesses Can Learn from the Trends of Why, Why and Where") that the Great Recession resulted in "significant cuts to households' net worth," thereby forcing many to delay retirement. Among those groups with the highest number of people projecting they will retire later are managers with a college degree and those in the construction industry—the first group, because they have higher expectations for retirement years and therefore plan to accumulate more retirement funds before taking that step, and the second group (which presumably includes architecture and engineering), due to the tremendous impact of the Great Recession on the AEC sector's financial well-being.

Accordingly, those who are actively building or rebuilding their retirement savings will be more attracted to compensation packages with strong retirement features.

The War for Talent

Competition for the best and brightest talent is a perpetual challenge in the design professions, and attractive compensation packages can help bring top talent to the firm. American firms now compete for such talented individuals with firms from around the world, as well as other industries who find the creativity of design thinkers to be of benefit. The U.S. Bureau of Labor Statistics projects a need for 27,900 new architects to enter the industry between 2010 and 2020, and says that "employment of architects is projected to grow 24 percent from 2010 to 2020, faster than the average for all occupations."

Dealing with Economic Cycles

Architecture firms are highly subject to economic cycles, as workloads rise and fall with the clients' needs and ability to fund projects. This tends to result in hiring and layoff cycles at architecture firms. During a slow job market, firms may be tempted to make below-market-rate offers to new employees to keep overhead costs down. This practice can backfire over time, leading to higher turnover and staff dissatisfaction, and potentially harming the firm's reputation as a desirable workplace when times are busier and staffing needs become urgent.

Retain

While there are many ways to compose talented teams, for architecture firms the core is still built on having a talented in-house staff. These employees represent a significant investment in recruiting costs, in integrating them into the firm, in training and professional development, and in their accumulated knowledge, skills, and experience over time. A widespread figure used as a rule of thumb is that it costs 150 percent of a staff member's annual wage to replace him or her. Clearly there is a huge financial advantage in having a 2 percent annual turnover versus a 20 percent annual turnover.

The causes of employee turnover can be difficult to pin down. In exit interviews people often say they "received a better offer," which implies that they are leaving for higher pay. In 2005 Leigh Branham published his authoritative study, *The 7 Hidden Reasons Employees Leave*. In partnership with the Saratoga Institute, Branham studied 19,700 post-exit interviews and 3,179 verbatim comments. His analysis identified seven key reasons employees leave:

- The job or work environment was not as promised or expected.
- The job did not fit or provide enough challenge.
- They didn't receive enough coaching or performance feedback.
- They didn't see opportunity for career growth or advancement.
- They didn't feel valued or recognized for their contributions.
- They had become burned out from stress and overwork.
- They had lost trust and confidence in the company's leaders.

Only 12 percent reported that money was their main reason for leaving. The popular saying is that "People leave their bosses, not their jobs." The seven items identified here certainly support that folk wisdom.

Branham's most recent study of America's "Best Places to Work" has revealed six drivers of employee engagement:

- Caring, competent, and engaging senior leaders
- Effective managers who keep employees aligned and engaged
- Effective teamwork at all levels
- Job enrichment and professional growth
- Valuing employee contributions
- Concern for employee well-being

All of these drivers are primarily cultural, not monetary. Retaining talented staff members for the long term goes beyond the mechanics of pay rates, and must be part of an overall approach to human resources strategy.

Motivate

Along with the complex personal and cultural concerns that affect employee engagement and retention, compensation remains a strong motivator for most people—it is one of the primary drivers for why they work in the first place.

For compensation to motivate effectively, the firm must define the behavior it expects to encourage or reinforce, beginning with a clear job description.

Incentive compensation programs can be powerful motivators. They are most effective if they are well defined and communicated regularly. The steps in creating an incentive plan are described in the financial rewards section that follows.

Rewards

Rewards include base compensation, incentive compensation, bonuses, and nonfinancial rewards. Rewards are provided in recognition of meeting specific goals, from daily work to exceptional performance. For any system of rewards to be effective, it must reflect internal equity and parity among peers and within the hierarchy, and be in alignment with the firm's vision, values, and culture.

Creating a Financial Rewards System

Base Compensation

The importance of calibrating base pay cannot be overestimated. Pay too much, and the firm will increase its fixed costs unnecessarily. Pay too little, and the firm will not be able to attract qualified talent and will waste time interviewing and screening inappropriate candidates. Market data is key to setting appropriate base pay levels (see the "External Benchmarking" section). An offer is based on a combination of firm compensation strategy, job requirements, market pay rates, and the individual's personal salary history. It is not inappropriate to ask a candidate to provide evidence that justifies a high salary claim, but it is unwise to take advantage and perpetuate a below-market salary because of market conditions or opportunism.

If the firm's compensation strategy is to pay below-market salaries and above-market incentives to be competitive, then offering below-market salaries may work. Paying less than known market rates is a short-term strategy that is likely to result in high turnover. At the other extreme, continually hiring new candidates above existing staff members' pay rates will create animosity. The entire compensation system must balance both external equity to attract new candidates and internal equity to retain existing, experienced staff.

Incentive Compensation

An incentive compensation plan is a short- or long-term pay system that rewards participants based on the achievement of critical performance goals aligned with the goals, objectives, and strategy of the company. Short-term incentive compensation plans have three levels of performance measures (see Figure 8.3):

- Company level: financial measures
- Business unit, group, or team: typically these are quantitative measures
- Individual

Funding mechanisms for the plan may be top-down, with a formula-based funding pool, or bottom-up, with labor market pricing determining the target incentives. Incentive plans have several objectives:

- Motivate and energize employees to achieve company objectives
- Reinforce and communicate company strategy
- Attract, motivate, and retain top staff
- Provide adequate financial returns for a reasonable cost
- Serve as an employment agreement between the employee and the company

A well-designed incentive compensation plan can help the firm in two ways:

- Positively reinforce middle-level performers, who are the majority of the firm, to achieve incrementally higher performance
- Provide meaningful pay differentials between high-level and low-level performers

However, such incentive plans are not effective at changing already high-level performers into even higher-level performers, nor can they transform the behavior of the lowest-level performers.

Creating an Incentive Plan

Good incentive compensation plans have three key principles:

1. If you can't measure it, it doesn't go in the plan.
2. Use no more than three performance measures.
3. No less than 20 percent weight should be given to any single measure.

Payment Limitations

The design team must consider whether or not to cap the incentive plan to protect the firm's interests. As a guideline, general incentive plans should be capped. Professional staff that do not carry ownership risk should have clearly defined target and upside opportunities. However, overachievement is a function of performance and goal setting, so having a capped plan prevents overpayments in situations when the forecast is unable to predict windfall events. This general incentive plan is different from shareholder distributions for owners. Owners typically carry more risk by contributing their own capital to the business, providing personal guarantees, and underwriting insurance certificates/bonds. While owners may also participate in a general incentive plan or executive short-term incentive plan, profit distributions are typically uncapped to reflect the amount of risk in funding and managing the business.

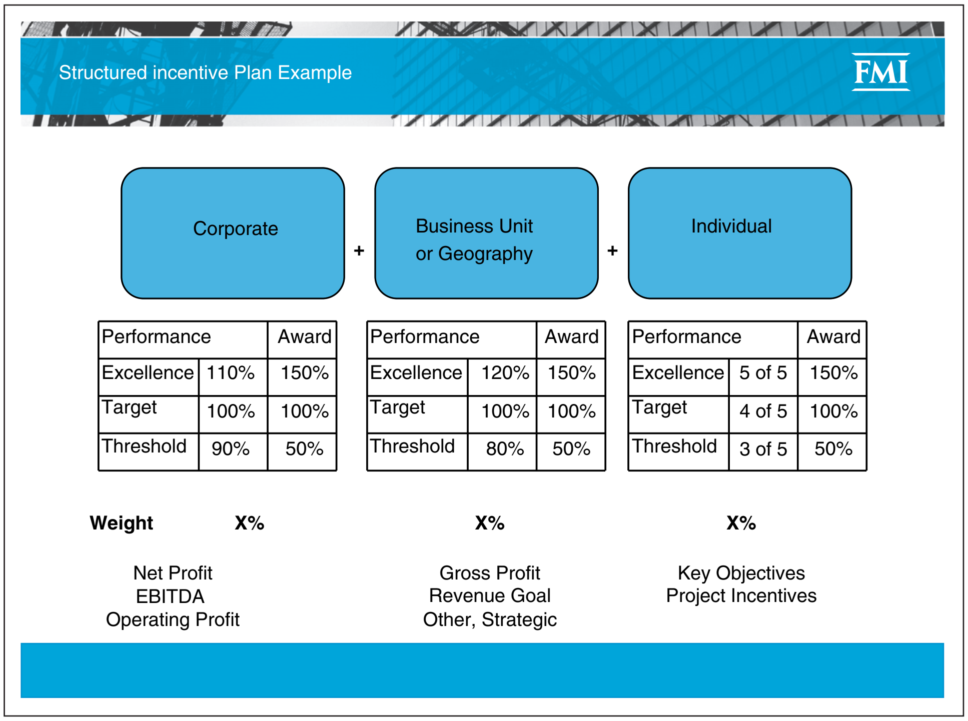
Formulaic or Discretionary

Under *formulaic plans*, employees earn incentives that are part of the plan formula only. There is no discretionary adjustment to the calculation, and it reinforces a culture of fairness.

Under *discretionary plans*, managers have some latitude to adjust the final payment. It should be based on the individual performance section of the plan only; it recognizes that certain individuals contribute more than others.

Key elements in the incentive plan include:

- Plan objectives
- Eligibility



FMI Corporation

FIGURE 8.3 Structured Incentive Plan Example

- Target opportunity
- Performance measures and weights
- Performance standards
- Performance period and payment frequency
- Payment limitations
- Terms and conditions

Nonfinancial Rewards

The range of nonfinancial rewards a firm may offer employees is extensive and may include commonly expected perquisites such as:

- Educational and learning programs
- Health care
- Retirement savings plans
- Profit sharing
- Paid time off, including sick and vacation time
- Maternity and paternity leave
- Vehicle or transportation compensation

Less traditional options include:

- Opportunities for community service
- Health club membership
- Child care assistance
- Various services delivered to the office, such as dry cleaning

Developing a mix of these rewards depends on the firm's resources, and what fits well with the compensation strategy. Firms in large urban centers will be expected to provide a wider range of benefits, and may offer such lighthearted perks as ping-pong tables or dartboards. Nonfinancial benefits may also have regional or local characteristics; for example, it may be expected by local business customs that executives participate actively in the country club.

EMPLOYEE BENEFIT PROGRAMS

Ann Casso, Executive Director of AIA Trust

TheAIATrust.com offers a wide variety of individual and employee benefits to AIA members—as well as a wide range of risk management resources, from information on starting a new firm to retirement planning. The AIA Trust is governed by AIA Members dedicated to providing programs for AIA Members to run their architecture firms successfully.

Employee benefit programs are important for many reasons. In some cases, they may be a necessity for various insurance coverages. They boost employee morale and motivation, which translates to better performance and higher productivity on the job. They improve employee retention, helping a firm to keep its best workers and avoid recruiting/retraining costs. And, they help firms to attract the top employees.

It's important for firm owners and managers to be well acquainted with the types of benefit programs available to themselves and employees, and the regulations governing them. With the implementation of the Patient Protection and Affordable Care Act (PPACA), an aging population, health care technology advances, and increasing health care costs, there are many potential ramifications for employers. In addition, architects need to consider planning earlier for retirement savings and saving longer. Increasing retirement age, longer life span, and a larger number of people at retirement age mean that substantial retirement savings will be needed in order not to work well beyond normal retirement age or outlive one's retirement savings.

HEALTH INSURANCE

The best approach to finding health insurance to suit a firm's needs and budget is to find a good insurance broker familiar with the local market, including carriers, plans, and issues regarding small employers. The AIA Trust offers an online brokerage service for AIA members to find individual or small group coverage. Various options and programs should be discussed with the broker, who is paid on commission so there is no up-front expense.

In general, there are three distinct markets within health insurance: individual, small group, and large group coverage. The types of health insurance plans available in the marketplace continue to change, ranging from indemnity plans to Preferred Provider Organizations (PPOs) and Health Maintenance Organizations (HMOs) to consumer-directed plans. In addition, national health care legislation has created State Health Insurance Exchanges, which may make access to health insurance more affordable to sole proprietors and small-firm owners. For information on the major impacts and the most significant requirements of the Affordable Care Act for employers, the AIA Trust created a short webinar: http://www.theaiatrust.com/members/webinars/PPACA.swf.

INCOME PROTECTION AND REPLACEMENT BENEFITS

Life insurance provides benefits in the event of the death of the insured and serves as income protection for the spouse or other employee beneficiaries. Group term life is commonly provided to all employees as a fixed-dollar amount per employee or as a multiple of salary.

Key person insurance is a potential source of protection for the firm in the event of the death of the owner or a principal, and for that reason, it is referred to as "key man" or "key person" insurance. Life insurance may be used for this purpose, but an actual key person policy usually includes disability benefits as well as death benefits. Key person insurance does not indemnify the actual losses incurred but compensates with a fixed monetary amount.

Disability benefits may be provided in several forms. Short-term disability insurance protects against absence from work of short duration, typically up to six months, though most employers self-insure against short-term disabilities through sick leave. Long-term disability benefits protect against extended disabilities, often until the employee recovers or reaches age 65. For architects, it is important that the test of disability be their ability to practice their own chosen profession—the test used in the AIA Trust policy.

Business overhead expense (BOE) disability benefits are similar to long-term disability benefits except that BOE protects business-related expenses (e.g., rent, mortgage interest, utilities, and employee salaries) in the event of total disability of a business owner for up to 24 months to help the owner maintain business viability.

RETIREMENT BENEFITS

Retirement plans take different forms with many variations and options, and all plans must conform to IRS regulations, which may change annually. Employers may consider, depending on the type of plan, whether the plan will be employee-only contributions or whether to contribute as an employee benefit with an appropriate vesting schedule. Retirement plans are important for the firm owner as well as for an employee recruitment and retention tool. Defined contribution plans and pension plans are increasingly rare, while profit-sharing plans allow flexibility with a variable contribution annually. Traditional, Simple, Safe Harbor, and Owners 401(k) plans each have different characteristics to address firms' specific needs. The key for firms as well as for individuals is to start a retirement plan early. More information on retirement planning can be found at TheAIATrust.com

TACTICS AND STRATEGIES

Additional Key Components to Consider

Finding a good balance of salary, bonuses, incentives, and benefits for your firm helps establish stability for your staff, with the attraction of rewards for excellent work and incentives that draw high achievers to focus on strategic goals.

Other components of employment packages can include vacation time, paid time off, flexible schedules, health care benefits, retirement plans, profit sharing, and miscellaneous benefits such as public transportation reimbursement.

The plan should address all components in a unified, comprehensive way and describe them with accuracy.

Bonuses

Bonuses as part of the strategic compensation plan can help a firm share profits, reward individual accomplishments or contributions to the firm, or motivate desired actions that are not included in the incentive plan—for example, a referral bonus for bringing a talented individual to join the firm. Bonuses can also help reinforce firm culture; for instance, annual holiday bonuses help make it clear that staff are appreciated and valued. Types of bonuses include:

- *Profit sharing*: The firm may set aside a percentage of salary for employees based on the firm's overall profitability, or the profitability of a particular division or office.
- *Milestone bonuses*: A bonus typically offered for completing a major project milestone early.
- *Achievement bonuses*: Small bonuses typically awarded on the spot by an immediate supervisor for an achievement that deserves extra recognition.
- *Referral bonuses*: For bringing talented individuals to the firm; as an alternative to paying a 20 to 30 percent fee to a recruiter, a firm can pay that fee to its own staff and increase the incentive to help bring in top talent.
- *Retention bonuses*: Sometimes offered during a merger or acquisition as an incentive for key staff to stay on.
- *Holiday bonuses*: Holiday bonuses should be clearly distinguished from profit-sharing structures to avoid confusion. They are a thank-you from the firm, and can range from a small gift to a month's salary to extra paid time off.

The firm may come up with a variety of creative bonuses that help reinforce culture, drive desired behavior, and reward achievements. The size, degree of structure, and amount of bonuses vary from firm to firm and may be influenced by local/regional expectations, the size of the firm, and the goals of the plan.

Communication

Communicating a firm's compensation and incentive plans to staff members is important: The role of compensation in recruiting, motivating, and retaining staff makes it crucial that all understand the plan clearly. Communication is particularly important to the success of incentive compensation plans. Many discretionary plans have no documentation or structure, and are often not effective as a result. Making the compensation plan public and reminding staff to review it also helps promote the feeling of equity in the firm.

How often firm leaders communicate both the plan and the business results of the firm can have a direct impact on incentive results. Some mechanisms for communication might include:

- Publishing quarterly results to provide a feedback loop and motivate participants throughout the year
- Directing managers to have one-on-one meetings with subordinates regularly

- Presenting the plan to the staff along with the annual strategic plan or similar documents to reinforce awareness
- Reminding staff regularly that compensation plans are outlined in the employee handbook

For smaller firms, this process is often less formal but no less important. Communicating financial results and the impact they may have on compensation including raises and bonuses is critical to the establishment of trust and positive morale.

External Benchmarking

Benchmarking the firm against peers in the industry and the general marketplace is a useful practice for determining base compensation rates. It indicates how similar firms structure benefits offerings and provides useful data and practices. Comparing several different sources of information is recommended to verify the benchmarks being offered.

Sources of Information

Salary data for 2012 are provided in Table 8.6:

TABLE 8.6 U.S. Architect Salaries 2012

Employee Classification	Low Salary	Median (Midpoint) Salary	High Salary	Job Description
Architect 1	$44,100	$57,400	$70,800	These are entry-level jobs for graduates in architecture. Under close supervision, does routine architecture requiring knowledge and application of basic architectural principles and concepts. Using prescribed methods and standards, does specific and limited architecture involving interior space layouts and exterior appearance.
Architect 2	$51,400	$67,800	$84,200	Under general supervision, evaluates, selects, and applies standard architectural techniques, procedures, and standards. Analyzes proposals and vendor submittals. Assignments are generally well defined. With additional specialized experience, may do parts of larger and more complex architecture. Normally requires at least 2 years' experience, with typical architectural experience from 3 to 7 years.
Architect 3	$60,600	$80,800	$101,000	Under general supervision, performs all conventional architectural design and development. Plans and conducts architecture requiring more advanced techniques. May technically guide and supervise designers/drafters and less-experienced architects. Requires at least 4 years' experience, with typical experience from 6 to 10 years.
Architect 4	$70,400	$93,500	$116,500	With minimal supervision, independently applies architectural concepts and designs for interior layout and design and exterior appearance. May technically guide and supervise designers/drafters and less-experienced architects. Requires at least 7 years' experience, with typical experience from 10 to 15 years.
Architect 5	$85,000	$111,200	$137,300	With very limited supervision, is an architectural project manager on small to medium projects, a supervisory architect for a small group of architects and designers/drafters, or a senior architect responsible for a specific architectural area. Reviews and approves conceptual designs. Directs development of new methods or techniques. Normally requires at least 10 years' experience, with typical experience ranging from 14 to 20 years.
Architect 6	$96,300	$128,100	$159,800	With supervision through general directives, is an architectural project manager on medium to large projects, a supervisory architect for a major group of architects and designers/drafters, or a senior architect responsible for architecture by a firm. Reviews and approves conceptual designs. Directs development of new methods or techniques. Normally requires at least 15 years' experience, with typical experience from 19 to 25 years.

FMI Corporation 2012 Compensation Survey

Regional Variations in Salary

Compensation amounts vary from region to region. These variations fluctuate from year to year depending on local economic conditions, but in general, salaries tend to be higher in major urban settings and more moderate in second- and third-tier cities.

Up-to-date data on regional salary variations are easily found using online tools such as CNN Money's Cost of Living Calculator (http://cgi.money.cnn.com/tools/costofliving/costofliving.html). Such calculators track differences in the cost of living between states and cities, and can offer the most current data available. Some calculators detail specific differences that affect the cost of living, such as housing, utilities, and groceries.

Salaries and benefits also vary with the size of the firm, with larger firms tending to offer higher compensation packages. Smaller firms may seek strategies that are less reliant on high-end salaries, such as offering opportunities for greater responsibility.

A wide variety of salary benchmarking sources for the architecture profession are available. The AIA conducts a salary survey every three years, with the report available from the AIA Store website (http://www.aia.org/store).

Many organizations and industry media offer salary and benefits data, some on an annual basis, and several of these are broken down by region. Information is also available from professional human resources consultants. A list of resources can be found below.

Salary Surveys for Architecture

- *Architect* Magazine Online: http://www.architectmagazine.com/business/salary-survey/.
- American Institute of Architects: The AIA periodically conducts compensation surveys. http://www.aia.org.
- Design Intelligence: Conducts compensation surveys in the design industry annually. http://www.di.net.
- U.S. Department of Labor, Bureau of Labor Statistics: http://www.bls.gov/ooh/architecture-and-engineering/architects.htm.
- ZweigWhite: Conducts compensation surveys in the design industry annually. http://www.zweigwhite.com.

CONCLUSION

A firm's compensation plan must reflect the firm's strategy, goals, and culture to effectively attract the appropriate talent and see that those individuals engage with the firm for the long term. A tiered compensation plan tied to job function provides clarity, helps establish career paths, and reduces risk.

Incentive compensation plans help firms reward top performers, offer staff clear goals, and encourage desirable actions.

Many factors are involved in compensation, from salary to nonfinancial perks, and each should be considered carefully as the plan is formed and periodically updated. Compensation should be equitable and communicated to all employees regularly.

Periodic benchmarking of compensation can be helpful in determining how competitive the firm's plan is compared to competitors for the same talent pool.

8.3 Recruiting and Hiring: Strategies and Methodology

Kerry B. Harding

To remain competitive in today's global practice arena, firms of all sizes need to be more savvy than ever to attract and retain top talent. Combining effective research and strategies with technological and social media tools will enable firms to successfully compete in recruiting and hiring the best candidates.

RECRUITMENT: THE KEYSTONE OF THE DESIGN PRACTICE

Finding qualified employees can be the most difficult and time-consuming function of human resources and for firm leaders. Recruitment, the "marketing" function of human resources, requires finding quality candidates that fit the organization's culture and will remain with the firm over time. This is important considering that the average cost of turnover is 50 to 150 percent of an employee's salary. Recruitment plays an integral part in getting the employee started on the right foot, which is key for increased retention. Following are some of the goals of recruitment efforts:

- Determine the firm's present and future requirements through human resource planning and job analysis activities.
- Increase the pool of job candidates at minimum cost.
- Increase the success rate of the selection process by reducing visibly under- or over-qualified applicants.
- Reduce the probability that applicants, once hired, will leave the firm after a short period.
- Meet the firm's legal and social obligations regarding workforce composition.
- Identify potential candidates to fill projected vacancies due to attrition, promotion, expansion, and retirement.
- Evaluate the effectiveness of recruiting techniques and sources for all types of applicants.

Recruitment represents the first contact that a firm makes with prospective employees. Through this process, professionals come to know a firm and decide whether they wish to work there. There are only two types of firm reputations: those where people want to go, and those where people want to leave. Recruitment activities include:

- Determining the best strategies for finding candidates and creating attention-grabbing job advertisements
- Reviewing (screening) the applicants' resumes and phone interviewing the top candidates
- Participating in face-to-face interviews

Kerry B. Harding, A former practicing architect, is president and chief recruiting officer of The Talent Bank, Inc., an executive search firm founded in 1984 that specializes exclusively in recruiting and strategic human resource consulting for the architecture profession.

- Conducting reference checks, background checks, and employment testing
- Partnering to make a hiring decision and extend offers to candidates to "seal the deal"
- Developing and facilitating new employee orientation
- Drafting press releases and media plans to announce strategic new hires

The financial crash of 2008 resulted in sweeping project postponements and cancellations. Fallout from this situation caused downsizing across the board. It was only through salary reductions, benefit cutbacks, and eliminating bonuses and raises that many firms were able to keep afloat. Faced with a lack of opportunities, anecdotal evidence shows that architectural design graduates migrated to other fields interested in their computer skills as well as their creative thinking and problem-solving abilities.

DEVELOPING THE RECRUITMENT PLAN

A strategic recruitment plan outlines the methods the firm will use to solicit qualified applications for its open position(s). It includes three key components:

- *Internal distribution*: Send a thoughtful e-mail to the firm's staff including a brief yet appealing description of the role as well as a full job posting attached or included in the body. This e-mail provides the opportunity for qualified internal candidates to apply for the position. Firm colleagues are also good sources of referral candidates because they know the firm and what it takes to succeed there.
- *Constituent distribution*: Next, share the job description with the firm's constituents—consultants, vendors, financial institutions, etc. Post the job on an appropriate section of the firm's website and include information about the position in any newsletters or other external communications. If this is a new position, use it as an opportunity to highlight the firm's growth and development. If appropriate, contact board members, partners, and other contacts; one never knows who may be the source of a great referral.
- *External posting*: Broaden the firm's reach beyond its inner circles by advertising externally. Gone are the days of placing an effective want ad in the local newspaper; it is now more cost-effective to post positions on multiple online job boards. To determine how to spend recruiting dollars most efficiently, research the relevant job boards or publications where similar postings are likely to be found. Ask staff who have similar roles where they would look for jobs. Find out what professional associations people in the field belong to and see if they have a job board or listserv. Remember when evaluating posting channels to consider both flow and quality; usually, those hiring would rather have a smaller pool of qualified candidates than a larger pool of unqualified candidates.

Job Descriptions

The next important step is developing an accurate job description, on which all parties concerned have agreed. A job description typically consists of six major components:

1. Essential job functions
2. Knowledge and critical skills
3. Physical demands
4. Environmental factors
5. Roles of the Americans with Disabilities Act (ADA) and other federal laws
6. Explanatory information that may be necessary to clarify job duties or responsibilities

RELEVANT HIRING RULES AND OTHER REGULATIONS

Firm principals question what rules and regulations govern policies on developing job descriptions. Though other federal and state requirements may exist, employers are often concerned with whether Title I of the Americans with Disabilities Act (ADA) requires employers to complete job descriptions. According to the enforcing agency for the ADA, the Equal Employment Opportunity Commission (EEOC), the ADA does not require an employer to develop or maintain job descriptions. A written job description that is prepared before advertising or interviewing applicants for a job will be considered as evidence in determining essential functions along with other relevant factors. However, the job description will not be given greater weight than other relevant evidence.

Employers should develop job descriptions that clearly define essential functions of every job before advertising the job or interviewing applicants. A job description should have clear, concise, nontechnical language, and avoid unnecessary words. The desired outcome of the work should be described, rather than the method for accomplishing that outcome. Writers should avoid using gender-specific language, jargon, technical language, proprietary names (Xerox), and ambiguity. Employers should let individuals read their job descriptions, voice any concerns, and sign their descriptions.

Job descriptions should be accurate. Within the actual job description, an employer could include the following, adaptable as needed to firm size and organizational structure:

- Job title (job code number if applicable)
- Relationships to other jobs
- A brief summary of job functions
- Duties and responsibilities
- The quality and quantity of work expected from an individual holding the position
- Information on the accountability for results
- A statement that when duties and responsibilities change and develop, the job description will be reviewed and subject to changes of business necessity

▶ See the backgrounder Architects as Employers: Legal Requirements (8.1) regarding the wide range of federal and state statutes, regulations, administrative orders, and case law that govern employment relationships.

Detail Qualifications

When detailing qualifications on job descriptions, firms typically require certain knowledge, skills, aptitude, training, and previous experience.

Maintain Consistency

Internal consistency is important when developing an overall bank of firm job descriptions. The firm may want to select specific formats, fonts, logos, and other elements to streamline and standardize their appearance.

Sell the Sizzle

One of the most important things to remember about writing job descriptions is that they are a two-way street. As a baseline, they need to be sufficiently comprehensive that potential applicants clearly understand whether or not they are qualified for the position. Equally important is that the description be written in such a way as to sufficiently entice potential applicants to actually submit their credentials. To accomplish this, someone in the firm's marketing or public relations arena should review job descriptions to see that they adequately reflect the firm's brand and culture.

Beyond the Job Description

Recruiting's most difficult challenge is finding those individuals who match the job description and bring something extra to the firm that indicates they have leadership potential. People who hire others become more adept at identifying these individuals through gut instinct. For others, the process is a bit more elusive. There are six common traits that distinguish top performers:

- *Self-management*. Employees who can effectively regulate their own work agenda and work independently do wonders for firm productivity. While all employees need basic direction and tasks, the best can take direction and run with it. Top employees have the ability to leverage what they know and effectively manage themselves.
- *Accountability*. In a productive firm, employees should be expected to create results from the task at hand. Top employees take this concept to the next level. They have a sense of responsibility for their tasks.
- *Initiative*. Top employees rise above the rest through their own initiative. Whether assuming leadership responsibilities or pitching ideas, action-oriented employees thrive on taking calculated risk. Where initiative really matters is when people already have the basics well covered.

- *Humility*. Nobody enjoys working with arrogant know-it-alls. Top employees own up that they don't know what they don't know. They reach out for training and mentoring.
- *Vision*. Visionary employees see beyond the basic job description. While they have personal ambitions, their main interests are growing and improving their firm. Top employees see the big picture instead of fulfilling only expected requirements.
- *Values*. It's in every firm's best interest to have employees who value integrity, honesty, and respect. Top employees uphold basic principles, creating a standard for a comfortable, ethical work environment.

Finding Candidates

Known also as "sourcing," how does one proactively identify people who are either (a) not actively looking for job opportunities (passive candidates) or (b) candidates who are actively searching for job opportunities (active candidates)?

Though there has been much debate within the recruitment community as to how to accurately define an "active candidate" versus a "passive candidate," typically either term is irrelevant, as the status of any particular candidate can change from moment to moment or with a simple phone call from a recruiter that happens to present a job opportunity. The status of being an active or passive candidate is fluid and changes depending on the circumstances, including the position being offered. Activities related to sourcing in recruiting can be categorized into "push activities" and "pull activities":

- *Push activities* are activities undertaken to reach out to the target audience such as campus recruiting, reaching out to individuals discovered through such vehicles as LinkedIn and Facebook, responding to employee referrals, and searching resume databases such as Monster.com, CareerBuilder.com, Indeed.com, Hotjobs.com, Simplyhired.com, and other Internet databases for a match to specific position criteria.
- *Pull activities* are activities that result in applicants coming to know of an opportunity on their own. Pull activities may include advertising on a profession-related job board such as Architect, AIA Jobs, or one of the many other design firm–related job boards with a registration process, posting on job portals, etc.

Employee Referrals

Employees can develop good prospects within their networks of friends, former classmates, and professional associates by acquainting them with the advantages of the company, furnishing them with an introduction, and encouraging them to apply, which enables the firm to reach qualified applicants at relatively low cost. Employees bring referrals to the firm that they feel will be a good fit, based on their own experience. The firm can be more assured of the candidate's reliability and character.

Former Employees

Many employees leave firms on good terms due to circumstances unrelated to workplace culture and compensation issues. Some firms adopt an "out-of-sight, out-of-mind" attitude, refusing to even consider hiring back a former employee, even if their original departure was not desired by either side. Other firms specifically target former employees, known as "boomerangs," because they know the firm, its culture, and procedures and can come in and hit the ground running. In the end, they are less likely to leave a second time after returning to the fold.

Advertising

Recruitment advertising has evolved dramatically in recent years to accommodate new technologies like social media, mobile recruiting, and niche job boards. Thus, it has become increasingly important for HR recruitment professionals and firm leaders to keep abreast of what avenues will help them be most effective in their recruiting. Internet ad specialist Indeed.com identified the Four As of Recruitment Advertising:

- *Assign*: Make someone in the firm responsible for tracking and measuring the effectiveness of every dollar spent on recruitment advertising.
- *Automate*: Implement automated candidate source tracking with the firm's applicant tracking system or career site vendor.
- *Analyze*: Review the firm's cost-per-applicant and cost-per-hire data to determine which sources perform the best.
- *Adjust*: Optimize the firm's recruitment advertising investments by shifting budget to sites and sources that deliver the best return on investment.

Campus Recruiting

Economic and demographic trends continue to affect the job market and how employers develop and manage their campus recruitment programs. In a competitive environment, maintaining campus relations is crucial to the success of campus recruiting. To do this, firms must build relationships with faculty, administrators, career center staff, and students.

Along with on-campus recruiting tools, such as career fairs and interviews, employers can also work education programs into their college recruitment efforts. These include internships and co-op programs. Employers have consistently rated these as some of the most effective college recruitment methods. Some firms sponsor student design competitions, scholarship programs, and research fellowships for the brightest talent to self-select. Other firms encourage staff to participate in education—teaching and on juries—to identify and recruit talent.

What can traditional architecture practices do to woo the young graduate? "Show us the big picture," says one respondent. "Help us to understand how what we're doing fits in. Lay out a plan that shows how we're going to learn what we need to grow and succeed—and be a little bit more flexible. We've met deadlines all on our own for five years without someone standing over us with a whip. Give us some flexibility." While that is good advice, and certainly doable, how does the firm respond to the enormous salary gap between what architecture firms can offer, and what is available from the entertainment and consulting arenas? Says one candidate from a top design school, "If you can get me excited about your vision, I'm willing to work for less money, if it's also mine."

MANAGING THE RECRUITMENT PROCESS

Many firms maintain ongoing recruitment activities for a variety of ongoing hiring needs such as drafters, project architects, project managers, or marketing coordinators. In addition to these lower-level positions, other firms also identify long-term strategic hiring needs to anticipate promotions, retirement, and geographic expansion.

The Reference Check: Confirming Credentials

Standardize reference checks so that the same information is obtained about every candidate. Verify the facts of a prospective employee's previous work, including dates of employment and job titles as well as educational credentials and architectural registrations.

If a reference can't be reached, call back instead of leaving a detailed message to respect both the candidate's and the reference's privacy. If you must leave a message, be as general as possible, giving your name and a number at which to return your call.

Give your name, the company, and the purpose of the call. Explain a little bit about the vacant position and ask whether the candidate's qualifications fit the job, allowing them to elaborate as they see fit.

AVOIDING HIRING LITIGATION

We live in an increasingly litigious society. If proper interview protocols aren't followed, candidates who might be otherwise unqualified or unsuitable for a particular position may retaliate through legal channels. Following these three basic rules should help avoid legal trouble:

Don't ask about anything that the law prohibits. The best way to avoid improper questions is to do some preparation. Before the interview, create two lists: one of all the tasks that the applicant will have to perform as part of the job, and the other of all the skills and experience required for the position. This will help you focus on what you really need to find out: whether the applicant can do the job.

Don't probe into private areas. To avoid questions that violate an applicant's privacy, good taste is your best guide. The same rules of polite conversation—no sex, religion, or politics—are good general guidelines to apply.

Don't say anything false or misleading. To avoid making inflated promises, simply tell the truth. Job applicants are trying to figure out whether the job fits with their own career goals, skills, and work-life balance requirements. Here are a few rules that will help you avoid common promise pitfalls:

- *Don't make predictions about the firm's future*. If the applicant asks about the firm's backlog or lack thereof, stick to the facts. If you make any statements about what the future might bring, clearly identify them as hopes, not predictions. For example, you might say "our business has doubled in each of the last three years, and we're hoping that growth trend will continue," but you shouldn't say "we'll be the number one on the ENR 500 by next year."
- *Don't say anything that might limit your right to make future staffing decisions in the future*. If you tell an applicant that you never lay off people during economic downturns, this can limit your ability to terminate that person if he or she accepts the job. Similarly, if you promise regular pay increases and/or bonuses, the employee could hold you to that promise, even if the firm's financial position or the employee's performance doesn't warrant a raise.
- *If layoffs are likely, say so*. If the firm is considering staff reductions and there is even a remote chance that the applicant you are interviewing might lose that new job as a result, disclose this before the applicant accepts the job. Otherwise, you may find yourself slapped with a lawsuit, especially if the employee left a secure job elsewhere to come work for you. Of course, this strategy might make it difficult to find new employees, but it isn't legal to hire people on false pretenses.
- *Accurately describe the position*. Don't exaggerate the job requirements to land a great candidate, or offer them one job and place them in another. In addition to leaving, resulting in costly turnover, an employee who accepts a job based on statements that turn out to be false could have grounds for a lawsuit after they leave.

Ask for specifics about the candidate's work responsibilities and how those responsibilities were fulfilled. Using a summary statement may make it easier for a reference to overcome any hesitation to fully respond to further questions.

Thank the contact and ask permission to call again if there are further questions.

Legal Aspects of Reference Checking

One of the first things firm representatives will discover about employment reference checking is that it is more easily said than done. Employers who will freely provide information in response to a reference check are the exception. Based on the advice of legal counsel, many employers have adopted policies to protect themselves from costly litigation from former employees. In the course of conducting reference checks, firm representatives will encounter policies such as these:

- *No comment:* These employers will not provide any information about previous employees.
- *Factual information only:* These employers will provide only basic factual information about former employees such as dates of employment, position title, last salary, and eligibility for re-hire. The company may or may not require a waiver to release this information.
- *"900" numbers:* Many large firms have installed "900" telephone numbers that will provide computerized voice response to employment reference and verification inquiries.

The legal concepts associated with employment reference checking include the following:

- *Defamation of character:* Communicating to another person information that is false and injurious to the reputation of an employee or former employee.
- *Qualified privilege:* An exchange of information between employers who have a common interest in hiring qualified applicants regarding the previous work history of an employee. The employer providing the information is protected from suits for defamation if the statements regarding an applicant's previous work history are made in good faith to persons having a legitimate need to know.
- *Negligent hiring:* Failure by a prospective employer to adequately check references or to gather information relevant to the hiring decision. If a prospective employer knew or should have known, based on a reasonable inquiry into an applicant's background, that the person was not suitable for the position and subsequently places a dangerous or unqualified individual in a position where they can harm coworkers or third parties, the employer can be held liable for the employee's acts.
- *Negligent referral:* The act of failing to disclose certain types of information. Failing to provide negative information in response to specific questions from one employer could be grounds for substituting or transferring liability to the other employer.

An employer who refuses to provide references may believe that this is the safest approach to take with regard to reference checking. However, this approach is not risk-free. Failing to provide negative information in response to specific questions could be grounds for substituting or transferring a company's liability to the individual who withheld the information. The legal argument could be easily made that had the negative information been provided when requested, the company would not have hired the applicant. This argument would be especially convincing if the information withheld is so negative that the applicant would not have been hired had the other employer known about it.

Offer Presentation

Presenting the Offer

Put the job offer together. Review the company's budget and compensation packages for similar positions. Compare the candidate's current benefits package to the company's standard employee benefits. Include whether the company will offer additional incentives such as a signing bonus, additional vacation days, or waiving the waiting period for insurance and retirement benefits.

Telephone the chosen candidate. Tell the candidate they impressed you at the interview and you feel they would fit well with the firm's culture. Provide the candidate with an overview of the firm's philosophy and why they, specifically, were selected. Explain that the firm would like to extend a job offer.

Discuss the details of the offer. Share the starting salary for the position and any additional terms that have been previously discussed and agreed to. Include information about other company benefits, such as flextime, tuition reimbursement, and paid training opportunities. If the firm requires the signature of a non-compete or other type of employment agreement, this should have been discussed prior to presenting the offer. Ask the candidate if there are

TYPICAL JOB OFFER COMPONENTS

Depending on the firm and the position, here are typical aspects of the job offer letter that should be included:

- Job title
- Reporting structure
- Main form of compensation and frequency of payment, such as base salary, hourly rate, etc.
- Other compensation details if applicable, such as bonus, stock options, overtime rate, etc.
- Start date
- Vacation time and paid holiday schedule
- Work schedule
- Benefits plan
- Expenses plan
- Technology provided
- Association/professional society dues
- Architectural registration fee policy
- Date and frequency of salary/job review

Here are a few other offer components that might appear in a candidate's job offer:

- *Non-compete agreement*: a document that limits the candidate's ability to work for a competitor or within the industry for a specified period of time should they leave the firm
- *Nondisclosure agreement*: a document that prevents the candidate from discussing aspects of the firm and job with anyone outside the firm
- *Probation period*: a period of time during which the employer can terminate someone without cause and may decline to pay benefits

any concerns that prevent them from accepting the offer as it has been communicated. All too often, firms spend abundant staff time and resources to get a candidate to this point, only to discover the entire process has merely been to get leverage for the candidate to negotiate a better compensation package at their current employer.

Give the candidate a specific time deadline to respond—no less than 48 hours, no more than a week. The candidate must know how long they have to make a final decision. Explain the process for accepting the position and whether the candidate can respond by telephone or if they must respond in writing. Ask the candidate for questions and provide answers. If you don't know the answer, research it and respond within 24 hours. *Send the letter via overnight delivery to the candidate confirming the offer you stated on the phone*. Include compensation and benefit information in the letter. Request that the candidate sign and return the letter within three days.

NONRESIDENT WORKERS

In periods of extreme candidate shortages or for positions requiring extraordinary technical, geographic, or market sector experience, some firms turn to employer-sponsored immigrant visas to be able to hire workers who are not yet authorized to work in the United States. There are a variety of visa types, and each requires complicated paperwork and procedural compliance:

- *EB-1 Foreign Nationals of Extraordinary Ability, Outstanding Professors and Researchers, and Multinational Executives and Managers*. Individuals in this category can petition for permanent residency without having to go through the time-consuming labor certification process.
- *EB-2 Workers with Advanced Degrees or Exceptional Ability in the Sciences, Arts, or Business*. Visa holders in this category normally must have a job offer, and the potential employer must complete the labor certification process. The labor certification involves a testing of the job market to demonstrate that the potential visa holder is not taking a job away from a U.S. worker. In cases where an individual can show that their entry is in the national interest, the job offer and labor certification requirements can be waived.
- *EB-3 Skilled Workers and Professionals*. Visa holders in this category normally must have a job offer, and the potential employer must complete the labor certification process.
- *EB-5 Investor/Employment Creation Visas*. Under the 1990 Immigration Act, Congress has set aside up to 10,000 visas per year for alien investors in new commercial enterprises who create employment for 10 individuals. There are two groups of investors under the program: those who invest at least $500,000 in "targeted employment areas" (rural areas or areas experiencing unemployment of at least 150 percent of the national average rate), and those who invest $1,000,000 anywhere else. No fewer than 3,000 of the annual allotment of visas must go to targeted employment areas.
- *H-1B Specialty Occupation (Professionals) Visas*. Professional workers with at least a bachelor's degree (or its equivalent work experience) may be eligible for a nonimmigrant visa if their employers can demonstrate that they are to be paid at least the prevailing wage for the position.

For additional information and forms, contact the U.S. Citizenship and Immigration Services website at http://www.uscis.gov.

THE ONBOARDING PROCESS

Onboarding, also known as *organizational socialization*, refers to the mechanism through which new firm employees acquire the necessary knowledge, skills, and behaviors to become effective firm members and insiders. Tactics used in this process in larger firms include formal meetings, lectures, videos, printed materials, or computer-based orientations to introduce newcomers to their new jobs and organizations. These socialization techniques lead to positive outcomes for new employees such as higher job satisfaction, better job performance, greater firm commitment, and reduction in stress and intent to quit. These outcomes are particularly important to a firm looking to retain a competitive advantage in an increasingly mobile and globalized workforce. To increase an onboarding program's success, it is important for a firm to monitor how well their new hires are adjusting to their new roles, responsibilities, peers, supervisors, and the firm at large. The benefits of an effective onboarding system include the following:

- *Role clarity* describes a new employee's understanding of his or her job responsibilities and firm role. One of the goals of an onboarding process is to aid newcomers in reducing uncertainty so that it is easier for them to get their jobs done correctly and efficiently. A strong onboarding program produces employees who are especially productive because they know exactly what is expected of them in their job tasks and firm role.
- *Self-efficacy* is the degree to which new employees feel capable of successfully completing their assigned job tasks and fulfilling their responsibilities. It makes logical sense that employees who feel as though they can get the job done would fare better than those who feel overwhelmed in their new positions, and unsurprisingly, researchers have found that job satisfaction, firm commitment, and turnover are all correlated with feelings of self-efficacy.
- *Social acceptance* gives new employees the support needed to be successful. While role clarity and self-efficacy are important to a newcomer's ability to meet the requirements of a job, the feeling of "fitting in" can do a lot for one's perception of the work environment and has been demonstrated to increase commitment to a firm and decrease turnover. If an employee feels well-received by their peers, a personal investment in the firm develops, and leaving becomes less likely.

Knowledge of Firm Culture

Knowledge of firm culture refers to how well a new employee understands a firm's values, goals, roles, norms, and overall organizational environment. Overall, knowledge of organizational culture has been linked to increased satisfaction and commitment, as well as decreased turnover.

Employee engagement begins with onboarding. And onboarding begins *before* your new employees arrive at the office on day one. A new hire's experience on their first day sets the stage (and their mind-set) for the rest of their employment. To ensure a positive first-day experience for new employees (contingent or full-time), and to lay the groundwork for an effective onboarding process, consider these best practices.

1. *Engage employees frequently*. It's important to make a good first impression with new hires. Hiring managers should reach out and introduce themselves to their new employees via phone or e-mail well before the employee's start day. Also, send the employee any relevant websites, Intranets, or forms they will have to fill out in advance, so they don't spend their first day filling out paperwork.
2. *Use technology to streamline the process*. If it's not possible to have new hires complete all paperwork prior to their first day, make the forms available online, so employees can complete this portion of the onboarding process more quickly.
3. *Get the managers involved and keep them involved*. Train managers how to handle the onboarding process effectively. Give them a comprehensive checklist to help them walk new hires through the process. Managers should make employees feel like they are contributing and adding value to the organization as early as possible in their employment.
4. *Create a strong mentor system from the beginning*. Relationships are key to making employees feel welcome and valued. If a new employee will be working in-house, arrange a comprehensive tour on day one. Assign the new hire a mentor or buddy to help them settle in, and introduce them prior to the start of the engagement. Also make sure that the employee's first few weeks are populated with meet-and-greets with key leadership, clients, and business partners. If your new employee is going to make an impact, they need to know who the players are.
5. *Educate new employees about the firm's cultural values*. Introduce new hires to the company's cultural values and weave those values into conversations, one-on-ones, and team meetings. Again, start this early and continue consistently throughout the employee's engagement.

6. *Establish clear performance expectations to engage employees*. Give employees their job descriptions and written outlines of their performance objectives upfront. Schedule regular performance conversations to formally discuss how they are measuring up to those objectives. Don't reserve feedback just for scheduled performance discussions—make it a frequent, spontaneous event.

While these practices are applicable mostly to larger firms, small and midsize firms can be less formal and perhaps more personable. Nevertheless, the key components of onboarding, including orientation, job expectations, and meeting key personnel, will still be essential.

Effective onboarding can enhance employee engagement, increase productivity, and ultimately lead to higher rates of retention. Don't take the standard sink-or-swim approach to onboarding new hires that fails so many firms. Start early and touch base often to give employees the kind of employment experience they won't want to leave.

THE BEST RECRUITMENT TOOL: TURNOVER REDUCTION

In any firm, even the best ones, people leave for reasons over which the firm has no control: A spouse gets a different job in another part of the country, or the employee moves to be nearer to family members or to lessen a commute. There's an adage in the business world that says, "Employees don't quit their companies, they quit their bosses." All too often, however, most people leave their jobs because of decisions "management" makes that directly affect them in adverse ways:

- Layoffs or downsizing that heap additional tasks, duties, and responsibilities on the employee, resulting in significantly longer workweeks to get the job requirements accomplished
- Cutbacks in administrative and overhead support, forcing professionals to spend a significant amount of their time performing clerical tasks
- Freezing raises and bonuses because of internal financial stress, especially if employees can earn significantly more money by going to work for a competitor
- Excluding staff from the decision-making process about decisions that directly affect their jobs and responsibilities
- Reorganizing staffing assignments, job descriptions, and reporting structures, creating a sense of uncertainty and discontent
- Failing to clarify goals, decisions, and expectations of projects or tasks, resulting in unacceptable work product and decreased employee morale and self-esteem
- Perceived or real favoritism that gives certain staff lighter workloads, better benefits, or more social involvement with superiors
- Relocating firm offices, forcing employees to significantly increase their commuting time and/or expense
- Promoting unqualified candidates to supervisory roles over those who are more experienced and/or better qualified
- Fostering a culture of internal competitiveness that sabotages collaboration and teamwork for the firm's greater good

At a general level, firm leaders can create an environment conducive to retaining top talent in the following ways:

- *Train effective managers*. If managers contribute to a lack of clarity about expectations, performance, feedback, or compensation, employees will feel undervalued and frustrated.
- *Encourage feedback*. Whether it is through an anonymous suggestion box or an organized feedback program, the ability of employees to speak their minds about anything related to the firm enables them to feel they have a say in their destiny and may result in some great ideas for the firm.
- *Encourage participation*. In one firm, an internal proposal specialist asked to go along on a client call where she knew the client. That established relationship enabled the firm to obtain much more information about the client's needs and eventually to win the project.

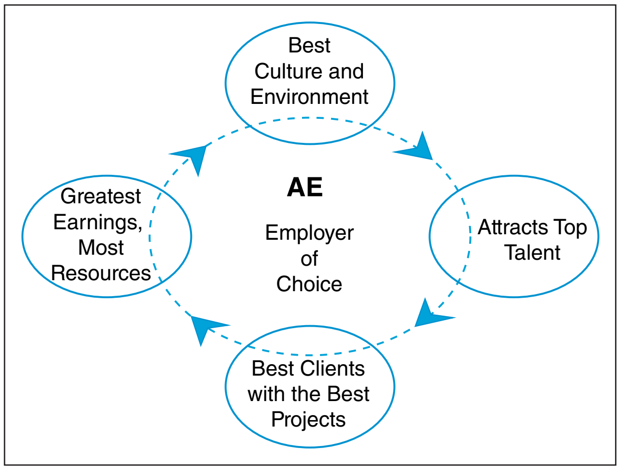
- *Encourage fairness*. If people observe preferential treatment due to religion, race, fraternity or sorority affiliation, or alma mater, for example, they will look for someplace that's a better fit.
- *Make people feel valued*. Someone in the firm should know about and recognize personal milestones—marriages, births, marathon races, charity events, illnesses. Acknowledging such things goes a long way in ensuring employee retention, especially in recessionary times when salary increases are rare.

CASE STUDY: CREATING A PEOPLE-CENTERED ORGANIZATION

By Michelle Smith, PHR, Luckett & Farley Architects, Engineers, and Construction Managers Inc.

Luckett & Farley is a midsize AE firm located in Louisville, Kentucky. "The Shift: A/E Employer of Choice Continuum" is used to foster a culture that makes the firm a great place to work, which is core to the mission of the firm.

There are four components to the continuum, as shown in Figure 8.4.



Luckett & Farley Architects

FIGURE 8.4 A/E Employer of Choice Continuum

At Luckett & Farley, we believe that if we create a better environment and culture, and reward structure than our competitor can or will provide to their employees, then we will attract and retain the most talented people. And they will attract the best clients. The best clients will offer the best projects and produce the highest profits. The profits will allow us to reward talented and hard-working employees, improve the firm's physical environment, and advance excellence in project delivery.

Since 2005, the firm has invested significant resources in making sure we have the best employees. Because of our commitment to this objective, we have attracted the attention of electrical engineers from Idaho, structural engineers from California, and mechanical engineers from Texas and Alaska. These people came to us for various reasons, but all of them had offers from several competitors and chose Luckett & Farley because of our culture and commitment to the "A/E Employer of Choice Continuum."

In addition to attracting top talent, in 2012 Luckett & Farley was named "Best Place to Work in Kentucky" for the fourth consecutive year. Many other local awards from newspapers and business magazines have recognized our firm for meeting the challenge of creating a better workplace environment.

CONCLUSION

In recruiting and hiring, finding the optimal combination of knowledge, creativity, personality, and technological skill must, by necessity, be a somewhat ambiguous process. Yet within the architectural arena, there exists an opportunity gap that can only be narrowed through honest, ongoing collaboration between the academic community that prepares graduates and the professional world to which they are then entrusted. While there are conflicting opinions about the concept of creating stars within the architectural arena, all parties agree on one thing: Like eagles, stars don't flock. They have to be identified one at a time.

BACKGROUNDER

SOCIAL NETWORKING IN RECRUITING ACTIVITIES

Mike Plotnick

Interactive online communities are broadening the architectural recruiting process by providing diverse opportunities to connect with candidates before, during, and after formal searches.

Mike Plotnick is principal of Plotlines LLC, a communications consulting firm. He formerly served as communications manager at HOK, where he led the firm's public relations and social media programs.

INTRODUCTION

Social networking plays an increasingly important role in architectural recruiting. As interactive online platforms such as LinkedIn, Facebook, and Twitter continue to grow in popularity and influence, these communities provide fertile opportunities to connect with potential candidates at every stage of the hiring process.

Although the economic downturn that began in 2008 necessitated a dramatic shift away from active recruiting for most firms, the emergence of mainstream online communities during this same period began to profoundly change the way individuals learn about and interact with potential employers.

Once limited primarily to social and entertainment activities, these platforms evolved into dynamic communities where a critical mass of people congregate, interact, gather information, and make important life decisions. Accordingly, they emerged as logical venues for architectural practices to identify, learn about, and communicate with candidates at all levels.

Regardless of whether or not a firm chooses to actively engage with potential employees via social media, potential employees are actively using these online communities to evaluate a firm's projects, people, culture, and reputation. Beyond the quality and impact of a practice's design work, individuals may be assessing its commitment to social responsibility, workplace culture, flexibility, and other intangibles.

By conducting a simple web search, architects can access diverse information about a firm, including a combination of company-sanctioned resources and those that originate from outside the firm. The most influential sources of information about a firm may, in fact, reside outside the confines of its corporate website. And the firm usually has limited control over the development and sharing of this information.

In this respect, everything that encompasses a firm's online presence—from an online portfolio to rumors posted in an informal chat room—plays an indirect role in recruiting efforts and helps shape opinions about that firm as a potential employer.

As practices adapt to the complexities of this new fragmented media landscape, they are challenged to determine if and how their traditional recruitment strategies should be modified. Firms that require candidates to follow a rigid application and hiring process, for example, may choose to rethink that process or expand it to encompass less formal ways of interacting with prospective employees.

Ultimately, firms that are willing to engage with architects in the communities that those individuals trust will be better positioned to compete for top talent—particularly as the economy improves and recruiting efforts intensify.

INTEGRATING SOCIAL NETWORKING INTO RECRUITMENT ACTIVITIES

Social networking can complement a practice's existing recruiting initiatives by expanding the reach and effectiveness of direct and indirect strategies. Most social platforms are free or extremely affordable, enabling firms to experiment with and adapt their approach to identifying and evaluating candidates.

In a broader context, social networking also provides opportunities for firms to position themselves as thought leaders in specific areas of expertise. Actively participating in online discussion forums, for example, contributes to a public, searchable record of a firm's perspectives on issues of importance to their future. Job candidates with a similar expertise or interest are likely to discover this activity during their online research.

The growing popularity and accessibility of social communities has opened up numerous opportunities for architectural practices to broaden their recruitment activities.

Identifying Candidates

Formal job postings can be shared on industry job boards, within specialized architectural communities, and on the firm's own social media pages and profiles (if they exist).

For positions that require candidates to have highly specialized skills or experience, firms can conduct strategic outreach via message boards, LinkedIn groups, or industry communities.

Evaluating Candidates

Search engines and other online tools can quickly uncover details about a specific candidate's professional achievements, reputation, and online influence.

A growing number of architects are creating their own websites or online portfolios to showcase their achievements and work. These resources also can illuminate a candidate's creativity and initiative.

Engaging with Candidates

Through the creation of affinity groups, such as fan pages, alumni groups, or student communities, a firm can invite interested individuals to formally connect and interact.

Active participation in industry forums, such as LinkedIn groups, can publicly demonstrate leadership and enthusiasm for specific industry trends, areas of expertise, or the profession at large.

BENCHMARKING AND SHARING IDEAS

A firm can easily follow the activities of its peers and competitors on their own social media profiles and through their participation in user groups or forums. Additionally, the activities and interactions of specific firms will be reflected in comments shared in various communities.

Because social forums encourage informal networking without recognition of conventional business boundaries, they are ideal communities for sharing ideas and experiences.

DETERRENTS TO QUICKER ADOPTION

Several challenges and perceived risks have limited the widespread adoption of social networking tools for architectural recruiting, including the following:

- Lack of resources and time to devote to building and sustaining efforts
- Difficulty in managing and controlling online activities and interactions
- Fear that allowing employees to actively engage in social communities may make them easy targets for poaching by other firms
- Traditional recruiting efforts generate plenty of qualified candidates for available positions, particularly during a weak economic period

While these issues reflect legitimate concerns, they don't negate the reality that social networking is quickly evolving into a preferred method for individuals to network and pursue jobs. The growing number of architects who choose to develop online resumes, portfolios, and personal websites is a testament to this fact.

Although no one can accurately predict the future role of social networking, online communities are expected to continue growing, diversifying, and influencing the decisions of current and potential employees.

Architecture firms can choose to ignore these trends or downplay their significance, but in doing so they risk missing significant opportunities to connect with qualified architects.

PART 2: FIRM MANAGEMENT

8.4 Professional Development and Mentoring

Deborah M. DeBernard, AIA, NCARB, Architect-AIBC, LEED BD+C

Firm owners concerned with building a strong future and providing a financial vehicle for firm continuity should understand the importance of finding, developing, and retaining staff that supports the firm's strategy and vision. Professional training, mentoring, and appraisal programs developed to support the strategic plan can help meet these goals.

Deborah DeBernard, with Dr. Tamara Moerer, developed The Leadership Institute, a year-long emerging leadership training program at Leo A Daly. She has held various positions including chief operations officer and head of human resources, legal, and information technology; and has developed training programs for emerging leaders, project managers, supervisors, technical, and support staff.

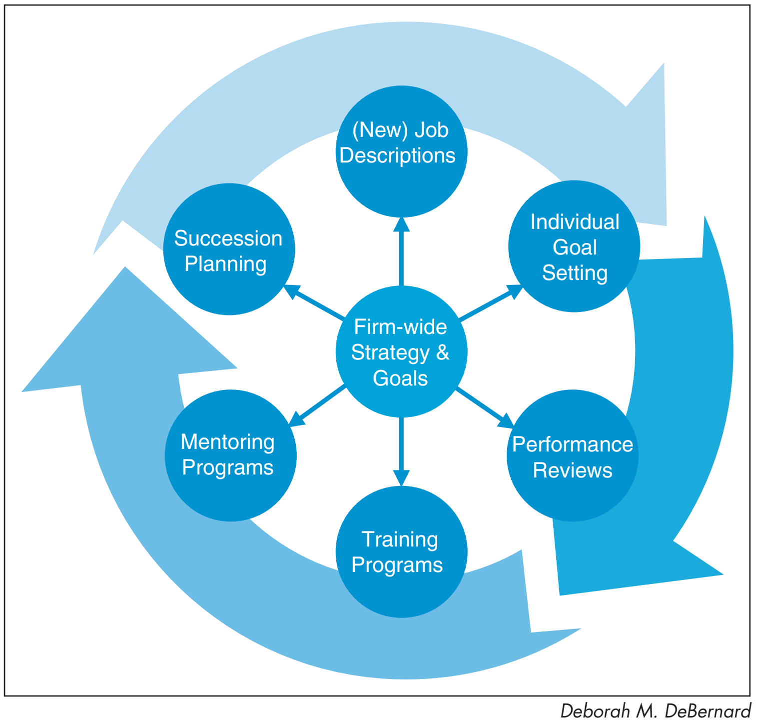
INTRODUCTION

▶ AIA Continuing Education System (3.4) discusses the AIA/CES program as a primary source of education specifically targeted to architects.

Architecture firm owners concerned with building a strong future, growing their firm, and providing a financial vehicle for firm continuity should understand the relevance and importance of finding, developing, and retaining staff that supports the firm's strategy and vision. Building internal capabilities for short-term and long-term goals requires a dedication to professional development. All architects should recognize that career development and lifelong learning are professional requirements that at a minimum will sustain an individual's career and with passion can produce firms that are innovative and well prepared for the future.

Completion of a university architecture degree program and the Intern Development Program (IDP) are the mere beginnings of what is required to advance over a lifetime in architecture. What starts with an exploration of new building materials, systems, and construction techniques soon becomes a study of business practices, risk mitigation, new building types, expanded services, and leadership skills along the path of one's career in architecture.

This professional development comes in many forms, beginning with an understanding of the specific position requirements, goal setting for individuals, providing feedback through performance evaluations, bridging knowledge gaps and accelerating growth through training programs, and shaping future leaders through mentoring programs and succession plans that identify career paths—all within the context of the firm's strategy and goals. This cycle is repeated (often) as professionals take on new positions along their career path. (See Figure 8.5.)



Deborah M. DeBernard

FIGURE 8.5 Professional Development Cycle

PROFESSIONAL DEVELOPMENT PROGRAMS

Regardless of size, most firms provide some training to employees. This can range from formal, robust firm-wide programs, often referred to as "Firm X University," to support in-office vendor presentations. Many firms offer training targeting particular areas of responsibility, employees with high potential, or skills for high-risk portions of projects, such as the following:

- Emerging leader training to groom employees with high potential to become future leaders of the firm. Topics may include self-assessment, attributes of leaders, leadership styles, strategic thinking, business development, negotiation skills, change management, risk management, financial management, legal issues, decision making, consensus building, and team building.
- Supervisor training to prepare and improve the abilities of employees who manage others. Topics may include linking goals to efforts, management principles, performance appraisals, communication, goal setting and prioritization, delegation skills, improving staff productivity, conflict resolution, and employee relations.
- Project manager training to prepare and improve the abilities of employees who manage projects and project teams. Topics may include leadership, risk management, quality assurance/quality control (QA/QC) principles, financial management, improving repeat business, contracts, team building, negotiation, communication, and project planning.
- Construction contract administration training to prepare employees to take active roles during the construction phase of a project. Topics may include QA/QC principles, contracts, RFI management, site practices, role of the construction schedule, conflict resolution, valuing the work, retaining documents, and closeout procedures.
- Business skills training to help employees succeed in the business of architecture. Topics may include strategic planning, business/financial planning, goal setting, time management, communications, networking, problem solving, collaboration, client relations, and meeting management.
- Presentation skills training to prepare and improve the abilities of employees to make presentations to clients, colleagues, consultants, and others. Topics may include presentation organization, visual aids, making persuasive arguments, engaging an audience, and preparing leave-behind materials.
- Writing skills training to improve the abilities of employees to effectively use written correspondence in many settings. Topics may include choosing the appropriate format, grammar, language, formatting, technical writing, specifications, proposals, persuasive communication, and contracts.

Whether providing an all-encompassing program or supporting single-topic presentations, it is essential to think about a training program in the context of the firm's goals and strategic plan. For example, if a firm has committed to increasing sustainable practices, selecting vendors to present to staff whose products align with this goal is useful. If one goal is to improve project documentation, partnering with subconsultants (e.g., MEP, civil engineering, lighting design) or general contractors to provide their insight to staff on a set of construction documents may prove valuable. Many firms offer incentives to employees who lead educational efforts within their firms as a way to encourage the active sharing of years of experience, case studies, and lessons learned.

► See the backgrounder accompanying this article, Professional Development: The View from Small Firms, for related information.

LEADERSHIP DEVELOPMENT AT LEO A DALY

LEADERSHIP INSTITUTE BACKGROUND

Recognizing the critical role that succession planning has for the long-term health of the organization, Leo A Daly set out to create an annual leadership development program that would help shape the career paths of architects, engineers, planners, interior designers, finance managers, marketing professionals, and information technology (IT) staff who had been identified as potential leaders. Deborah DeBernard, AIA, then Leo A Daly COO, and Tamara Moerer, Ph.D., CEO of The Image Business, were selected to design a course to address the firm's goals. Dr. Moerer's background as a businesswoman and as a graduate professor of organizational leadership not only qualified her for this consultant position but also made her the perfect partner to DeBernard's leadership experience and knowledge of the firm's inner workings. "The course is designed to significantly enhance the

(continued)

leadership development of the Leo A Daly 'rising stars' through a rigorous curriculum and real-world exercises, and to positively affect the retention of the firm's talent pool. Though management principles are interwoven into the curriculum, the focus is on effective leadership applications," explains Moerer.

Dubbed the "Leadership Institute" (LI), this intense year-long program is tailored for 10 to 12 emerging leaders who are hand-selected through a competitive application process. The application package includes past experience, education, leadership outside the firm, community involvement, and letters of recommendation. LI is open to all employees who have been recommended by their business unit leader for their potential to play a key role in the future of the firm, and have been employed by the firm for at least two years. All firm leaders, as well as past LI class members, are expected to encourage employees who show leadership potential to apply for the limited class spots. The LI Selection Committee uses great care to assemble a qualified and diverse class representing the many disciplines and office locations of the firm.

The course begins with an orientation meeting where a facilitated conversation takes place to articulate everyone's reasons for applying, expectations of the participants, expectations the firm has of the participants, logistics, and the complete list of homework assignments. Throughout the year participants are given assessment tests, reading assignments, and writing assignments targeted to the theme of each of the four in-person meetings as well as the three video conference sessions held between each of the formal meetings. Clearly expressing the firm's expectations has proven valuable to help reinforce the need for each participant to come prepared for the in-depth discussions, exercises, and assignments.

EXPECTATIONS OF THE LEADERSHIP INSTITUTE PARTICIPANTS

- Attend all sessions and participate fully in them.
- Expect excellence in everything.
- Be thoughtful and creative in discussions.
- Be willing to discover your full leadership potential.
- Be willing to be vulnerable.
- Leave "politics and personal agendas" at the door.
- Commit to applying lessons learned as we go.
- Complete all assignments.
- Be active in communication and presentations.
- Leo A Daly is investing in you—rise to the challenge.
- Be respectful and courteous.
- Practice becoming a lifelong learner of leadership skills.

To reinforce a culture of community service, each of the formal meetings begins on a Thursday evening where participants and presenters gather to participate in volunteer work such as helping in a local soup kitchen. The following morning, the session opens with an "ice breaker" designed to introduce the session theme as well as help everyone mentally prepare for the forthcoming discussions.

Each session is led by a pair of in-house "session champions" selected for their leadership skills reputation and their key role in the strategic planning of the firm. They are assisted by several in-house and outside subject matter experts who present their topic and become an ongoing resource to the class. In addition, Moerer and DeBernard have served as facilitators, mentors, and devil's advocates to spur thoughtful discussion and decisions by all.

The formal sessions are highly interactive with considerable dialogue, exercises, small breakout sessions, and presentations by the participants. The sessions are concluded on Saturday with a reflection of the material just presented, an evaluation of the current session, and a reminder of the homework assignments for the next video conference and formal session.

The interim video conferences are facilitated by an LI graduate from a prior year who is asked to lead a discussion on a business book, much as one would in a book club. This session is attended by the participants and the LI graduates only, giving much-needed time for the LI class to bond as a group and providing an occasion to ask the LI graduates questions about their experiences. It also provides the firm an opportunity to recognize LI graduates while asking them to exercise some of their newly honed leadership skills.

LEADERSHIP INSTITUTE CURRICULUM

The LI curriculum is designed to promote future firm leaders, discipline leaders, and team leaders. It begins with a series of self-assessments, communication tools, descriptions of what is means to be a leader, and leadership styles; followed by a history of the firm and various discussions ranging from strategic thinking, business development, public relations, and the power of persuasion to legal issues, business planning, and financial aspects of the firm. The course exposes participants to the inner workings of the firm, corporate and business unit leaders, and helps prepare participants for these positions. Dr. Moerer explains, "What is learned in the Leo A Daly Institute on the weekend can be applied to all the offices on Monday morning. The course design incorporates the Leo A Daly culture, management principles, and leadership philosophy and vision."

The course culminates with a probing session about how the participants see themselves as leaders and challenges them to continue their leadership journey with the development of a written plan for themselves reaching out one to five years and beyond. Each is also asked to establish a relationship with two mentors who will guide them throughout their career. This final session is held jointly with the firm's annual management meeting, where LI participants attend some of the management meeting and graduate in front of the assembled firm-wide leaders.

A written assessment of each candidate is prepared for the business unit leader who provided the initial recommendation. This helps these office leaders and supervisors to understand how the LI graduate did during the course, what strengths or weaknesses were identified, what recommendations the LI program managers have for their continuing development, and how they are viewed as fitting into needed future leadership roles.

Following graduation from the Leadership Institute, participants are invited to join the Futures Council, whose members lead initiatives for the firm, such as the development of a mentorship program or serving on a committee designed to improve working relationships between business units. In this role, they stay connected to strategic firm-wide issues and are advisors to the executive vice president.

The program has enjoyed continuous improvements, reacting to formal and informal feedback and the roles that Moerer and DeBernard have played as strategists and change agents for The Leadership Institute. From 2008 through 2012, 42 new leaders have graduated, greatly increasing the options for succession planning throughout the firm.

Sources for Training Materials

Sources for course materials that are developed specifically for one's firm can be abundant when they include the valuable experience of senior staff, allied firms, consultants, and construction partners. Courses developed by third parties expressly for the AEC community include conferences, "boot camps," online programs, vendor "lunch and learn" sessions, and AIA component continuing education programs. The AIA also has mature knowledge communities that can provide information and resources on particular topics such as practice management, project delivery, construction contract administration, and design, or for particular market segments such as health care, justice, and retail.

MENTORING

Training is important for developing skills that aid professionals in their professional growth, but a structured mentoring program supported by firm leadership will increase the speed at which new employees become productive team members who can support the strategic plans of the firm. Mentorship will also provide a vehicle for frequent and meaningful feedback, foster working relationships, improve recruiting success, provide the foundation for a succession plan, and ensure that a sense of professional stewardship becomes an integral part of the culture of the office. The benefits of building a firm through the professional development of staff, who work together toward the firm's strategic goals, cannot be overstated. The mentoring program helps a firm achieve its vision by supporting the following:

- Long-range strategic and business plan goals
- Values and culture
- Excellent client service
- Repositioning the firm to target markets or services
- Project performance and work quality improvement
- Succession planning
- Recruitment and retention of staff
- Increasing the number of licensed staff members
- Increasing staff recognition and personal satisfaction

A successful program begins with the commitment of firm leadership and a supportive culture that recognizes the importance of tying the mentorship program to the strategic goals of the firm. If the principals do not value mentoring, support it with words only, or allocate insufficient time and money, the program is likely to fail no matter how well intentioned. At a minimum, mentoring programs need the following:

- Definition of what is expected and how much time is required
- Communication to all firm members about the program
- Process to identify and match mentors and mentees

- Agreement from mentors and mentees on their respective responsibilities
- Training for participants
- Mechanisms for documenting and evaluating the experience and outcomes

Mentoring is often seen as a broad term encompassing supervisors, office or firm leaders, and outside resources, including respected family members. Many professionals recall numerous people throughout their career who provided valuable advice and knowledge on topics ranging from "How do I organize a sheet of details?" to "What do I need to do to become a project manager?" to "Should I change jobs?" Each of these questions requires an answer from a different source, ranging from a "buddy" to a supervisor to a trusted advisor, *and* not all of this falls under mentoring.

Mentoring Is Not...

Mentoring is not a human resources (HR) or onboarding program where a new employee can get answers to the basics such as normal work hours, pay dates, office or field attire, lunch protocol, supplies, computer login, e-mail, telephone, and the other issues that need immediate resolution in order for a new employee to perform their assigned work.

Likewise, it is not a job skills training program where an intern begins their path of understanding of how a building goes together, how to use the detail library, what to do on a job site visit, or how to write specifications.

Last, it is not a computer-training course where staff is trained for CADD/BIM software, using tablets in the field, inserting video into MS PowerPoint presentations, or maximizing the use of rendering packages.

Mentoring Is...

Mentoring is a program able to make sense of the firm's strategic plans, demands of work, financial pressures of projects, firm organization, and the challenging balance between work and personal matters. It is the place where mentors can offer advice on how to connect to the firm's big-picture goals, the importance of becoming licensed, why project assignments make sense, how to prepare for the next assignment/position, why the firm is organized the way it is, who are the best resources that can help with various situations, how to handle disappointments and successes, and the myriad issues that come up throughout a professional career. Over the years, one would be advised to have several mentors both inside and outside one's firm.

The Mentor Program

There are two common types of mentoring programs:

- *Informal*, where pairs spontaneously find each other through personal choice, individual circumstances, and personality. The learning experience is based on the situation.
- *Formal*, where individuals who can benefit from mentoring are identified and paired with others who have the appropriate experience and expertise. This is a management-supported program structured with formal commitments from both parties, planned learning opportunities, and an evaluation and feedback process.

The first step is to define the goal of the program by examining the strategic plan for the firm. Goals can be articulated by asking questions such as these:

- Are the firm's values known and shared by most employees?
- Has the firm identified the future leaders for all aspects of the firm, and are they on a path for leadership?
- How can the firm maintain a high percentage of repeat clients?
- Are recruiting, retention, and employee engagement a problem?
- Is quality or project delivery an issue?

TABLE 8.7 Mentoring Program Learning Objectives—Sample

Experience Level	Objectives
0–5 years	Complete IDP and registration process; understand firm culture, organization, and processes; work well in a team environment; communicate well with team members and supervisors; understand basic project approach
6–10 years	Demonstrate firm values; actively engage in achieving firm goals; lead small team; communicate well with team members, supervisors, firm leaders, and clients; take initiative on small but strategic efforts
11+ years	Continually reinforce firm's culture and values, be a role model and mentor for junior staff, play a role in developing both strategic and tactical goals for the firm, resolve conflict effectively, lead large teams, present effectively, take initiative on large strategic projects

- How would a mentoring program affect the way participants approach projects?
- How would a mentoring program fit into other training and orientation programs?

The answers to these questions will be a guide in designing a mentoring program that helps to improve areas of weakness and strengthen the transfer of the firm's tacit knowledge.

Next, identify the target audience and the associated objectives. While interns and junior staff are the natural target of many mentoring programs, a firm should plan to include more senior staff to help groom them for management and leadership positions in the firm. Different objectives can be assigned to various target audiences based on experience levels. (See Table 8.7.)

Who Can Be a Mentor?

Mentoring programs pair at least two people: a mentor who is a trusted, influential leader or expert, a good role model who inspires learning and invests time coaching others; and a mentee who is an interested participant with high potential, in good standing in the firm, and looking for self-improvement.

Mentors should be professionals who are acknowledged to possess competencies and expertise within the firm's strategic objectives. They should be strong champions of the firm's values, patient, teachers, listeners, relationship builders, positive, able to keep confidences, and willing to commit the time (sometimes extensive) required of a mentoring relationship. Potential mentors should evaluate what knowledge and experience they can offer in a mentoring relationship and whether they have the ability to provide honest, sometimes difficult, feedback to mentees about the alignment of a mentee's goals with the firm's goals.

Many architects have had a mentor who provided advice and career development counseling, someone who they admired or whose words, thoughts, or actions they emulated. Before volunteering, a mentor should consider these questions:

- What were some of the challenges faced in your career, and how did you overcome them?
- What educator or professional had a profound influence on your career?
- What did you admire about them?
- How did you learn from their examples?
- What valuable advice have you received during your career?
- How did this advice help shape your career decisions?
- What strategies did you implement to complete your internship and the Architect Registration Examination (ARE)?
- Do you model the behavior of mentors you have encountered in your professional and personal life?
- What can you learn from a mentee to support your lifelong learning commitment?

A mentor to someone going through the Intern Development Program (IDP) also needs special knowledge about IDP requirements.

▶ Intern Development (3.2) discusses the Intern Development Program (IDP) as an important component of the licensure process.

The Mentee

A mentee should be motivated, receptive to constructive feedback, willing to make mistakes and learn from them, and appreciative of the mentoring relationship. Regardless of experience level, a mentee should take time to determine career development goals. Write down the answers to the following questions, and bring them to the initial mentor-mentee meeting:

- What are your strengths?
- What do you enjoy in your current position?
- What do you find challenging in your current position?
- In what areas do you require further experience and development?
- What do you want to achieve this year, next year, and the following year? What are your career goals?
- What is your plan for achieving these goals?
- What steps have you taken already to achieve these goals?
- How much time will you need to achieve these goals?
- What resources will you need to achieve these goals?
- Whom can you ask for help to achieve these goals?
- How can you overcome challenges?
- How do you hope your mentor can help you overcome your challenges?
- What do you hope to gain from a mentoring relationship?
- What specific career development guidance are you seeking?

Mentor-Mentee Matching

The best mentor-mentee relationships are those that develop because of a natural affinity between two people, but formal mentor-mentee matching can be effectively done in various ways. The more important a firm considers the role of mentoring, the more importance will be placed on making and maintaining the match. Office leadership and HR can be involved in the process to determine both mentees and mentors and the match between, or mentoring can be a requirement of senior staff who then seek out a mentee—or there is the novel approach used by the Minneapolis office of Leo A Daly, likened to "speed dating."

MENTOR AND MENTEE MATCHMAKING

The Minneapolis office of Leo A Daly created an in-house mentorship program to further career development within the office. Mary Erickson, Senior Associate, Finance Manager at Leo A Daly, Minneapolis, explains, "Our program goal is to gain personal development and professional growth through the guidance of others. We want both the mentor and mentee to have a renewed interest and motivation in their work through the mentoring relationship."

"Our experience shows us that every mentoring relationship is unique because each person's experiences, personality, and professional and personal development vary. Successful mentoring involves a dynamic process where each person learns to respect and trust the other's commitment, expertise, and individuality," says Erickson.

With the support of the leadership of her office and the firm, Erickson formed a committee that created a mentorship program. Although only three years old, the program has already shown many benefits, including these:

- Strengthening corporate and office culture
- Improving job progression and succession planning
- Positively affecting retention
- Leveraging talent throughout the office
- Increasing "workplace satisfaction" of employees involved in mentoring
- Uncovering latent talent
- Improving communication within the company and office, particularly nonhierarchical

The program consists of two enrollment sessions per year. Each session involves the following components:

- *Call for mentors and mentees.* Before each session, individuals are asked to volunteer as a mentor or mentee. The mentors and mentees fill out a questionnaire to describe their interests and preferences.
- *Meet and greet.* The "meet and greet" is a round-robin type of event modeled after "speed dating" and an opportunity for the mentors and mentees to select a pairing. Each mentor completes a short biography which is distributed to the mentees beforehand. At the event, the mentees rotate around the room meeting with each mentor for four minutes. Everyone has a chance to ask questions and

determine the best fit for the mentoring relationship. This event has been well received and is a favorite of both the mentors and mentees.

- *Program kickoff*. The program is kicked off by the announcing of the mentoring pairs. Each learns more about the program, their roles and responsibilities, and the group events and activities. Personality assessments, such as the Leadership Q (see the "For More Information" section at the end of the article) are completed by both the mentor and mentee to help provide additional insight for relationship building.
- *Side-by-side mentoring*. Because the emphasis is on both the mentor and mentee experience, the program details are determined primarily by each mentoring pair based on what works best for them and what they hope to gain from their relationship. Erickson believes that side-by-side mentoring shows the participants that both the mentor and the mentee are valued and that the office is committed to providing opportunities for both to remain and grow within the firm.
- *Scheduled events*. Throughout the session there are several scheduled group events, which foster a sense of ownership and belonging and provide informal support for mentors and mentees. The events consist of learning opportunities or social networking activities such as the popular "fireside chat," which involves two to three invited speakers sharing stories from their careers and answering questions from the program participants.
- *Program conclusion*. This event celebrates and formally wraps up the current mentorship session. However, the program participants are strongly encouraged to continue their relationship after the formal session concludes.

"Our program supports the idea that a mentoring relationship is a partnership, with both people showing respect and support for each other. We are finding that mentoring enriches those who receive and fulfills those who give," explains Erickson.

Time commitments for the mentor and mentee should be understood and accepted by both. Ideally, a mentoring relationship should last for the duration of a mentee's career, but the formal program should last at least a year, and should have a series of regular (perhaps monthly) meetings for the mentor and mentee, as well as status and evaluative meetings (perhaps quarterly) for the mentoring program manager and office leadership to gauge progress toward the goals and objectives.

Mentorship Preparation

Once the goals, objectives, and participants are identified, it is time to start preparing the participants. The goal of this preparation is to define what mentoring is and what it is not, to set and record the expectation for mentors and mentees at the beginning of the program, and to establish the schedule for the first meeting of the mentor and mentee. However, the most important aspect is to confirm that both parties are able to make the commitment necessary for a successful mentoring relationship.

Mentees' expectations of mentors might include:

- Helping to understand the firm's goals and how to support those goals
- Helping to understand the firm's culture
- Identifying areas for growth and development
- Demonstrating a genuine interest in the mentee
- Encouraging exploration of new ideas
- Being an active listener
- Providing appropriate and timely counsel
- Building the mentee's ability to more effectively manage their time

Mentors' expectations for mentees might include:

- Appreciation of the firm's strategic goals
- Support the firm's culture and values
- Being hungry for new challenges
- Being open to learning and change
- Being willing to take a risk
- Gaining new skills and work habits

- Soliciting and accepting constructive feedback
- Acting on the mentor's suggestions and advice
- Prizing the value of the mentor's work experience
- Appreciating access to the mentor's network

The First Mentoring Meeting

The first meeting between mentor and mentee should begin with defining the goals the mentee and mentor have for the mentoring relationship. These goals should be seen within the context of the firm's strategy and aligned accordingly. Goals must be:

- *Written*: The process of thinking about and documenting a goal requires focus and is the first step toward achievement.
- *Specific*: Form a clear statement of what you want to accomplish. If your goal is unclear, it will be difficult to reach. For example, an unclear goal is to learn about project management. A specific goal is to learn three project management strategies for handling client conflicts regarding fee collection.
- *Challenging*: Provide some personal "stretch."
- *Measurable*: Include a defined measure of success, a "complete by" date, and how achieving this goal will apply to your professional growth.

Discussions should continue as mentor and mentees share resumes and background specifics such as prior work experiences, why they choose to work for this firm, what they like and don't like about their current work assignments, and other areas of interest. They should also agree in the first meeting on how often and when they will get together for subsequent discussions, including some special meetings for the entire mentoring group coming together to hear from firm leaders describing their career paths and best/worst days; or attendance at part of the annual strategic planning session. If the firm has a culture that strongly supports mentoring, these special events will be meaningful and plentiful. Some firms use a mentoring agreement form to document the goals and schedule.

MENTORING PROGRAM AGREEMENT FORM

Personal Development Plan (to be completed by Mentee)

Learning Objectives: Please check all that apply. Space is provided to add additional information.

- ☐ Licensure
- ☐ Career Development (explain) ______________________
- ☐ Other (explain) ______________________

Critical Dates (to be completed by Mentor and Mentee at first meeting)

Mentoring pairs agree to meet at least once each month for a 12-month mentoring period. Pairs are encouraged to meet more frequently to maximize program objectives. Mentee is responsible for leading at least one meeting. Periodically, mentees and mentors will provide feedback on mentoring program.

Start date:

End date:

Mentor/Mentee training (meeting set by Mentoring Program Manager):

Mentoring Program Evaluation Meeting (meeting set by Mentoring Program Manager):

We, the undersigned, agree and commit to the effort required to participate in this Mentoring Agreement. We further agree to meet the expectations of the mentorship program.

Jane Doe, Mentor Date Joe Smith, Mentee Date

Subsequent Mentoring Meetings

In subsequent meetings, a mentee should share successes and challenges faced on projects and in the office, ask about issues affecting the firm, share insights from their perspective, gain help on setting priorities, discuss issues facing the leadership and the profession, ask for suggestions for additional training and education, and confirm progress toward goals. A mentor is expected to frame the conversation in light of the firm's strategic goals with a view toward discovering how the mentee can fit within this context. A mentor is expected to listen well and offer advice or suggestions to questions without solving problems directly for the mentee.

Evaluating the Mentorship Program

The mentoring program should be evaluated regularly and systematically to ensure that the firm's strategic goals are being served, that mentoring is strongly supported by the firm's culture, that the mentoring matches are effective, and that individuals are able to see how they fit into the future development of the firm. Ideally, the firm's culture encourages open, constructive, and candid discussions where the program can be continually improved. A confidential online evaluation form is another effective way for participants to voice their opinions and observations about what is working and what is not. Periodically gathering all mentees to discuss progress, reinforce the firm's culture, and broaden the mentoring experience can help keep mentees engaged and surface the successes and failures of the program. Likewise, a separate session can be conducted for mentors to express their positive and negative experiences. The mentoring program manager is responsible for capturing input, reporting what is learned to each group and to firm leaders, intervening in mentoring relationships that are not working, and using all feedback tools to improve the program where needed. The mentoring program manager could be someone internal to the firm or a consultant who specializes in mentoring programs within the AE community.

A final evaluation of the program should be conducted at the end of the stated program period. This evaluation should provide open-ended questions that ask for suggestions and feedback for improving the program.

MENTORING PROGRAM EVALUATION FORM

To be completed by Mentor for each Mentee

Mentor's name: ______________________________

Mentee's name: ______________________________

Dates of mentoring relationship: __________________

1. Is the mentoring program achieving the learning objective established with your mentee?
   - ☐ Yes
   - ☐ No
   - ☐ Other (explain)
2. Evaluate each of the following (circle your response):

	Poor		Good		Excellent
Quality of meetings with mentee	1	2	3	4	5
Quality of program	1	2	3	4	5
Relationship with mentee	1	2	3	4	5
Commitment of mentee	1	2	3	4	5
Value of this experience	1	2	3	4	5

3. What were the two most important elements of this program for you?
4. What have you learned from participating in the program?
5. What most needs improvement in this program?
6. Would you participate again?
   - ☐ Yes
   - ☐ No
7. Who would you recommend as a mentor?

   ____

   As a mentee? ____________________
8. Would you like a personal conference with the program manager to discuss any issues?
   - ☐ Yes
   - ☐ No

Success Formula for Mentoring

Regardless of the size of a firm, there are key elements the mentoring program must have to succeed:

- Support by office leadership
- Clear program goals aligned with the firm's strategy and business goals
- Mentees chosen based on high potential, interest, and commitment
- Mentors selected based on willingness and ability to mentor
- Thoughtful pairing of mentors and mentees
- Preparation to align mentee and mentor expectations of each other
- Clear and agreed-upon goals for each mentoring pair
- Regular mentoring sessions
- Evaluation of mentoring relationships, with early intervention if needed
- Follow-through on improvement suggestions, broad communication about the program successes, and continuing high standards

The quality of the architecture profession and the continuation of most firms are dependent on providing strong and effective mentoring to new and rising professionals. Whether a formal or informal program is chosen, mentoring is critical to the long-term success of architecture firms. This important need is growing more and more acute as many firm owners today plan for their retirement.

APPRAISALS AND EVALUATIONS

Feedback is integral to growth and improvement. A primary tool for professional feedback is a performance appraisal. Regular performance appraisals and professional development discussions offer both the firm and the employee opportunities to take stock, assess the relationship, and make plans for continued improvement. Properly approached and carried out, performance appraisals provide the means to align staff activities with the firm's goals, challenge staff, provide recognition, create a communication link between supervisors and those they manage, and ensure that everyone has a common understanding of the requirements of the position.

The performance appraisal process begins by understanding the firm's strategy and culture. Once a supervisor understands the overall strategy of the firm, what the firm values and why, and what the firm requires for its long-term health, they can provide the everyday praise and constructive criticism that forms the backbone of a formal appraisal. Providing feedback to staff members, both positive and negative, on a regular basis increases the likelihood that staff knows and understands what is required of them to succeed. Unfortunately, feedback of any kind is often neglected. It can be difficult to tell an employee that performance on a given task has been unsatisfactory. Rather than using such situations as a learning experience, a supervisor may delay discussing an employee's performance until an accumulation of incidents results in dismissal.

Performance appraisals *should* be seen as an important responsibility that a supervisor has to an employee to help them gain confidence that the professional choices made so far are serving an individual well (or not), that there is a path in the organization that holds promise for an individual (or not), and that there are specific ways of improving and progressing in one's career (or not). Having a frank discussion with an employee about the pluses and minuses of their performance is a privilege that supervisors should exercise to help grow the profession, help the firm achieve its goals, develop strong architectural skills in others, and match individuals with career paths that take advantage of their innate strengths.

In general, the appraisal process is one part of career planning for the employee and implementation of the firm's strategic plan. The purpose of a formal appraisal is to improve performance by recording the strengths and weaknesses of a member of the firm; it is used to establish a plan for improvement or a path for accelerating growth.

More specifically, appraisals are an opportunity for both parties to communicate goals, expectations, opportunities for improvement, and progress. They help the firm identify and determine ways to develop management potential. They can become part of the process of determining promotions and, when necessary, layoffs. It is also an opportunity for employees to evaluate their managers and the firm in general, providing healthy and innovative two-way input for the firm's management.

Performance appraisals can achieve much, including:

- Communication of the firm's goals and priorities
- Clarification of an employee's roles, responsibilities, and expectations
- Encouragement and support of communication between managers and employees in both directions
- Recognition of accomplishments and needed improvements
- Identification of training and development needs along with plans to address them
- Sharing of input or feedback from others
- Setting of new annual goals and objectives
- Ability to serve as a basis for salary and promotion decisions
- Establishment of long-term professional goals and a path to achieve them
- Protection of the firm against potential employment litigation

What Is a Performance Appraisal?

Performance appraisal and professional development are two different processes. However, they are often conducted together, much to the confusion of staff members. It is important to be clear with staff about which process is being attempted, or if both processes are combined.

A performance appraisal or review looks backward at how an employee performed their work over the past evaluation period. The appraisal has two parts: the evaluation or judgment of the employee's past performance, usually measured against job descriptions or responsibilities; and second, the feedback provided to the employee about the evaluation.

Professional development looks forward at an employee's future goals and opportunities to grow along a career path. It can be used to correct minor deficiencies, set new goals, define new learning programs, and show staff how they might advance and grow within the profession.

Another area of discussion is whether the performance appraisal should contain a discussion about an employee's salary and promotions, or be limited to performance aspects only. One camp will argue that linking an appraisal with a salary review reduces the opportunity for a constructive review, as it is perceived as too narrowly focused, judgmental, and punitive. The other camp will argue that there should be a direct connection between performance and compensation so employees see that better performance results in higher pay and consideration for a promotion. The issue is most important when an employee is unaware of or in denial about their shortcomings at work. In this case, supervisors need to prepare for a (sometimes lengthy) constructive discussion about these shortcomings and when relevant, connect them to the decision for denying a raise or promotion.

Whatever a firm chooses to include in their performance appraisal process should be clearly communicated in advance to all employees to avoid poor alignment between expectations and reality. Likewise, it is important for the firm to spell out how the review process is related to the salary review program.

The best appraisals are those that:

- Determine whether the efforts of the employee are aligned with the goals, strategies, and tactics of the firm through a clear dialogue that defines what the employer wants the employee to do.
- Determine whether there are any performance gaps or areas where an employee has met or exceeded expectations through a discussion of how well an employee has performed. This discussion covers successes and failures, good outcomes, and mistakes.

- Describe how an employee can improve areas needing attention or accelerate their development.
- Are based on job performance and behavior using facts, specific examples, and quantifiable results rather than opinions, hunches, or generalizations.
- Are seen as constructive—where the reviewer serves also as a coach and counselor, not merely as a judge.
- Are based on information that is familiar to an employee, gleaned from the regular and consistent feedback given by their supervisor over the entire performance period. Nothing in the review should surprise an employee or be seen as new information.
- Reflect the work of the entire review period, not simply the current assignment(s).

Timing and Frequency of Appraisals

To be effective, appraisals and professional development planning should be done at regular intervals. Many firms conduct reviews once a year, although some management consultants recommend semiannual or even quarterly reviews. One approach is to review everyone during the same time period. Another approach sets review dates to align with the anniversary date of employment. There are advantages and disadvantages to both. Reviewing everyone in the firm in the same time frame allows for assessment of the full staff relative to each other, consistent messaging about the process, and an easy application of any salary adjustments to the business plan. Reviewing staff on the anniversary of their employment allows for better integration of the time to review employees with other supervisory responsibilities over the course of a year rather than all at once, and permits a ready means of marking the employee's hiring anniversary. Whichever approach is used, the emphasis should be on providing continuous feedback to staff on the progress of their career.

Performance Goals

Human resource director at Dewberry, Dave Francis, recommends establishing performance goals for each individual in the firm. "If you have a new employee, you should sit down with the employee within the first thirty days to create performance goals and objectives. It is very important that employees get off to a good start and understand what is expected of them in their new role. Goals and objectives should be developed jointly by the supervisor and employee and they should be SMART," said Francis.

The acronym SMART is used to set performance goals that are:

- **S**pecific
- **M**easurable
- **A**ttainable
- **R**elevant
- **T**ime-bound

During the performance appraisal, a supervisor is asked to give a description of the results achieved. Francis explains, "For each performance goal, a supervisor writes a description of how well the employee met the goal. Did they complete it fully? Was it on time and within budget? Were the clients satisfied with the results? Did they complete it in a way that exceeded what was required, or did they fall short of the goal? Examples are important, especially if you are giving someone a particularly high or low rating. Pay attention to the descriptors of the ratings, and make sure that the examples you are providing match the level of your rating. This description covers *what* an employee achieved during the evaluation period."

Equally important to *what* an employee accomplished can be *how* the results were achieved. Each firm should develop its own evaluation criteria that directly express its values, goals, objectives, and priorities. Criteria should relate to work requirements and not to an employee's personality traits. Evaluation criteria factors might include the following:

- Quality of work
- Creativity
- Embodiment of the firm's values and culture
- Communication skills
- Degree of initiative
- Staff relations
- Emotional maturity
- Potential for growth or leadership
- Adaptability to change
- Client relations
- Mentoring of others

The Appraisal Form

Some firms use appraisal forms that are unstructured, with only the barest of guidance to supervisors. These systems can be nothing more than a paper identifying the employee and a few fields to capture free-flowing ideas that summarize the past performance period and agreed-to actions for the next performance period. Other firms use a highly structured form that charts a path from firm-wide strategic goals, through tactics to the specific goals for each employee, so the individual can see exactly how their actions and results fit into the overall performance of the firm. The middle ground can be described as a rating system with a multipart scale ranging from "unsatisfactory" to "outstanding" for specific performance areas. Most rating systems approaches encourage or require additional comments for ratings at either end of the scale. Other forms may use essays (open-ended questions about performance), discussion of critical incidents (specific examples of commendable or poor performance based on a log of recorded incidents), or results-oriented evaluations (comparing results with goals established earlier).

Whatever system is chosen, it should be common for every employee, provide meaningful feedback, and be fairly consistent through time so that a collection of appraisals conveys a recognizable pattern or trend for the employee.

Appraisal Process

The appraisal process begins by assigning a reviewer to an appraisal assignment. In the case where multiple persons are assigned to contribute to an appraisal, it is recommended to have one person who is responsible for summarizing or incorporating all comments.

Step One: Many firms will then ask an employee to prepare a self-assessment. This self-assessment can mimic the evaluation format being used by the supervisor (e.g., rating scale, open-ended questions, forced-choice, etc.) or can be any combination.

Step Two: Once that self-evaluation is complete and reviewed by the supervisor, the supervisor's appraisal is written and usually reviewed and/or approved by office leadership. Francis adds, "This final review is intended to determine whether the performance appraisal is specific, whether the goals and objectives are clear, and if the employee will get a clear picture of what is expected for success. Approvers will want to confirm that the appraisal lends itself to a quality discussion and clear performance expectations, and if improvements are needed that a draft plan is provided. If an approver does not feel the appraisal is an accurate representation of the employee's performance or has questions about the consistency of the language and the ratings given, it should be sent back with a request for additional information. If an employee is given a particularly high or particularly low rating, clear justification should be provided. This is an opportunity to check for sufficient documentation, which is important for both recognition and reward as well as when there are performance issues."

Step Three: The next step is a meeting to discuss both evaluations prepared in steps one and two, set goals for the coming evaluation period, determine a course of action for any needed improvements or training, and sign or acknowledge the appraisal for storage in a personnel file.

Performance appraisal forms are merely vehicles to aid the actual performance discussion. The face-to-face session is the most important part of the process. Many supervisors plan on one to two hours for this meeting.

Like employment interviews, good performance reviews are a two-way street. Both the employee and the supervisor should come prepared with their understanding of the position responsibilities, goals, evaluation of performance based on the firm's appraisal program, and a list of specific topics to discuss. Comparing these materials is a good place to start the review. The comparison may reveal differing perceptions or even misunderstandings about the employee's performance goals and achievements. It can also provide an informed basis for discussion and goal-setting for the next appraisal period.

Performance Issues

If there are performance issues, the annual performance review can be seen as an opportunity to manage the responsibility that every supervisor has to address performance problems and set expectations for future performance. However, the best time to manage a performance issue is when the issue arises. Note that the first time a performance issue arises, managers should follow any coaching or disciplinary procedures outlined in their HR manual. The annual performance review can then serve as a checkpoint within a performance improvement plan. Regardless of when performance issues are brought to an employee's attention—even if the conversation is uncomfortable—remember that *no one* is well served by supervisors glossing over or ignoring performance issues.

In a face-to-face review where performance issues are present, a manager should explain the issue, making sure the firm's expectations are clear, get the employee's view, and ask the employee for their ideas for improvement. This should be followed by the development of an improvement plan that describes how the employee should go about correcting the deficiency, what support the firm will provide, what the employee should expect to be doing on their own time to gain improvements, consequences for continually underperforming, and when the next review will be to track progress against the plan. The manager should retain documentation of the discussion. This should not be seen as punitive but rather as an opportunity to improve performance.

If the problem remains or recurs, another discussion should take place. Document this meeting and send copies to the employee and their personnel file. It is best to have the employee sign the written document to acknowledge it has been received. This document should cover the following:

- What performance standards are not being met
- What has been done to assist the employee to date
- Dates of any previous performance discussions
- What expectations must be met to turn around the employee's performance
- A reasonable time frame within which change must occur
- The consequences of failure to meet the performance standard

COACHING TIP

Be courteous and respectful when you assume the coaching role. Use active listening techniques, communicate effectively, and attend to the nonverbal cues being used—both the employee's and your own. Avoid jumping to conclusions, and instead focus on helping the employee solve the problem rather than solving it for them. Be open to new information, negotiate when possible, and be firm when necessary. It is always desirable to reach a consensus, although it may not be possible in all situations. Set up a review time for later and follow through on all commitments. Document the exchange for a personnel file.

Discussions of unsatisfactory performance should be clearly documented in an employee's personnel file. A chronological record of unsatisfactory work is a useful defense against unjustified claims of discrimination or wrongful discharge following an employee's demotion or termination. However, be careful not to use the annual performance appraisal only as a documentation opportunity for poor performance. If this process becomes known as a dismissal tool, an environment of distrust can develop. Use the annual review process to reflect positive achievements and successes as well as poor performance.

PERFORMANCE IMPROVEMENT PLAN

Date: ________________________

Employee Name: ________________________

Manager Name: ________________________

Over the past [period of time], your performance has been below expectations. [If there have been past discussions with the employee regarding their poor performance, indicate this and the dates of the prior discussions. If the firm has tried to assist the employee in improving performance, indicate this.]

[Describe specifics of poor performance.]

Based on this information, you are being placed on a [indicate time frame] performance improvement plan. It is imperative that you improve your performance as outlined below. Failure to show immediate improvement may result in further disciplinary action up to and including termination of your employment.

In order to assist you in improving your performance, we have outlined an improvement plan.

[List specific action items that the employee must accomplish to improve his or her performance.]

[Insert employee name], it is our goal to assist you in improving your performance. We fully expect that you can make these adjustments.

Please sign below indicating you have read and received this memo.

Employee Name Date

CONCLUSION

Architecture is a profession learned over a lifetime, in which the details of design, construction, management, and leadership are garnered and honed through project involvement, client meetings, staff discussions, and consultant relationships. The use of training courses, mentoring programs, and appraisal systems is important in this learning process. Each of these tools can add positively to the development of individuals, set up new challenges, and allow for the continuity of the firms and the profession.

PROFESSIONAL DEVELOPMENT: THE VIEW FROM SMALL FIRMS

Jane Frederick, FAIA, LEED AP

Sole proprietors and small firms of fewer than 10 employees have unique challenges in professional development and mentoring. This article visits several small firms to explore how they approach mentoring and professional development.

Jane Frederick has been a small-firm owner since 1985, and was the 2012 chair of the AIA Small Firm Round Table. She practices residential architecture with her husband, Michael Frederick, AIA, in the Beaufort, South Carolina, firm Frederick + Frederick Architects.

Small firms might struggle to find enough time and money for mentoring and professional development for both the firm owners and their employees. Their challenge is to prioritize the available resources and decide whether to spend the money to go to a conference, for instance, or spend the time volunteering on a community planning board.

PROFESSIONAL DEVELOPMENT

Compared to a large firm where mentoring is institutionalized, mentoring emerging professionals in small firms is often less formal, even less recognizable, but usually very successful because interns working in a small office are exposed to all aspects of the profession. This is an important difference from larger firms. For instance, a former head of design in a large firm said that he did not know what happened to projects once design was finished and had never seen shop drawings until he moved to a small firm. Small firms can provide exposure to all phases of a project in a condensed period of time, as projects are generally smaller-scale and faster-paced. These experiences are invaluable to interns as they prepare for the architectural registration exam, licensure, and practice.

The continuing education challenge for small firms is to find really useful information at the right price. Lunch-and-learns sponsored by vendors can be tailored to specific needs or projects. Jeffery Rosenblum, FAIA, of Rosenblum Coe, a firm of seven people in Charleston, South Carolina, commented on the difficulty his firm was having finding the right sustainable adhesive for vinyl floors installed on a concrete slab. A product that he was interested in using was not available in his market, so he called the manufacturer for a lunch-and-learn to introduce the product to Charleston.

The AIA Webinars are the go-to source for continuing education for Lisa Stacholy, AIA, a sole practitioner with LKS Architects in Atlanta. For John Black, AIA, a partner in the two-person Honolulu firm Lapis Design, traveling to the mainland and participating in an AIA Knowledge Community symposium makes his AIA dues a wise investment.

John remarked, “The AIA Custom Residential Architect Network (CRAN) symposium is an opportunity to network with residential architects from around the country, attend seminars that are both entertaining and enlightening, visit great examples of vernacular architecture, and spend fun-filled evenings at local restaurants. The CRAN symposiums have provided me with more meaningful insights and valuable contacts than all of the architectural conventions that I’ve attended over the past 25 years.”

MENTORING EMPLOYEES

Small firms are also challenged to financially support the expense for interns to progress through the licensure process. There are several examples of how firms meet this need.

The philosophy of Van Pond, AIA, principal of the three-person Nashville, Tennessee, firm Van Pond Architects, is to treat his young employees how he wanted to be treated when he was an intern. Pond pays for his employees’ AIA dues, continuing education costs, and convention attendance costs, among other things. The employees earn two weeks of vacation a year, and the office is closed between Christmas and New Year’s. The firm’s structure is to work 41-hour weeks, which pays for the week during the holidays. The additional 10 hours are used for community and AIA volunteering, in the spirit of the Volunteer State.

Jean Dufresne, AIA, principal of Space Architects + Planners, a nine-person firm in Chicago, has a formal mentoring system. As with most small-firm principals, licensure of employees is important to Dufresne; his firm only hires emerging professionals who are interested in getting licensed. To that end, the firm supports the interns by paying for study materials, reimbursing test fees upon passing, and paying for licensing fees, IDP fees, and AIA membership. The firm offers regular lunch-and-learns and has a rigorous annual personal goal-setting requirement that must be quantifiable and measurable. The employees are reviewed quarterly, and the entire staff participates in an annual 360-degree review.

“Our firm pays half of the test fees upon passing each section, and after the intern passes the final exam we pay the balance of the fees plus a passing bonus,” said Rosenblum. He believes that this method creates an incentive for the interns to complete the exam faster and more effectively.

Stacholy mentors emerging professionals while they are still students. Georgia Institute of Technology has a program whereby local architects can hire students for a semester. Stacholy pays Georgia Tech, and the student works 13 hours per week learning from Stacholy.

MENTORS FOR PRINCIPALS

The need for mentoring is not limited to interns. Firm owners and senior architects need to find a source for their continuing development. Participating in the American Institute of

Architects, both in Knowledge Communities and in elected positions at the state and national level, is a primary source for mentoring for small-firm principals. Colleagues from other geographical areas who are not competitors are a wonderful resource. Rosenblum, a class of 2006 AIA National Board member, said that he is still in daily contact with board colleagues and that he has found firms to team with on projects through his AIA contacts. Stacholy has also developed mentors through the AIA Small Project Practitioners Knowledge Community. Stacholy says she identifies potential mentors by what they are doing and then approaches them to ask, "How are you doing x, y, or z?"

As a principal in a bigger small firm, Dufresne helps mentor his Chicago peers and extends resources into the architectural community. When Space Architects + Planners schedules a lunch-and-learn, they invite local sole practitioners to join the meeting held at either their office or the local AIA office. They also share their library with their peers, including resources that would be extremely expensive for a one-person shop.

Likewise, finding mentors outside of the architecture field is critical to expand a firm leader's realm of influence. Rosenblum has participated in a daily breakfast group for over 30 years; this group is able to mentor one another, offer advice, and provide a sounding board for issues and new ideas. Dufresne stressed the importance of community opportunities. While serving on the Chicago Association of Realtors' Commercial Committee, Dufresne suggested that the Chicago Zoning Commissioner would be a good speaker. As a small-firm owner, it would have been difficult for him to get time with the commissioner alone, but it was easy when Dufresne invited the commissioner to speak before a large group of city stakeholders.

CONCLUSION

Small firms need to be creative in solving the dilemma of limited resources for professional development and mentoring opportunities. There are resources available in most communities, such as SCORE, a network of retired executives that offer mentoring and confidential business counseling. The Small Business Administration has an abundance of information, as do local chambers of commerce. The American Institute of Architects, from the local component to the national component, has a wealth of information and opportunities to connect architects to knowledge, a mentor, and networking with peers.

PART 3

PROJECT DELIVERY

Architecture is a project-based endeavor, and architectural practice centers on project delivery. Project delivery methods change in response to economic trends, environmental concerns, and technological advances. Skill in project management and leadership increases in importance as projects become more complex and more integrated. Research in practice, quality management, use of technology, and understanding of the regulatory environment are ways in which architects manage complexity and improve effectiveness.

CHAPTER 9

Design Project Delivery

9.1 Project Delivery Methods

Phillip G. Bernstein, FAIA

The organization, strategy, and responsibilities of the key players in the building process—including the owner, architect, and contractor—comprise the project delivery method for the project. Multiple models are available, and can be chosen based on which project variables—cost, schedule, building quality, risks, and capabilities—are driving the project.

INTRODUCTION

A completed building results from a complex sequence of decisions made by the many participants in the design and construction process. For a project to run smoothly, someone must define responsibilities, organize and integrate the work of the participants, and manage the process by which the project is developed and delivered to the owner. The architect, who is deeply involved in most projects from inception to completion, may assume this role as the first construction professional hired by the owner, although this position is increasingly being assumed by construction managers and advisors. Nonetheless, the owner relies on the architect's expertise about delivery decisions, and the architect should help to determine which delivery method best suits the owner's needs. Since the project delivery model can dramatically affect the results of a

Phillip G. Bernstein is vice president for strategic industry relations of Autodesk Inc. and a former principal with Pelli Clarke Pelli Architects. Bernstein teaches at the Yale School of Architecture and lectures and writes extensively on project delivery and technology issues. He is former chair of the AIA Contract Documents Committee.

building project, an understanding of delivery approach options is central to the successful practice of architecture.

Most delivery methods have evolved primarily in response to different roles assumed by the entity that constructs a building and the relationship of that entity to the architect. The roles and responsibilities of this player, variously known as the "contractor," the "GC," the "construction manager," or the "design-builder," can vary greatly in different delivery methods, and the information provided by the design team must be calibrated accordingly. In most variations of project delivery models, the roles and responsibilities of the architect are similar, but the participation of the builder varies greatly.

Up through the late 1970s, most projects were built under what was then known as a "traditional" delivery approach. Now termed as "design-bid-build," this approach assigns each player a clear, well-defined role. The owner hires and pays the architect to provide design services; the architect develops and places a set of contract documents into the construction marketplace for competitive bid; the general contractor assembles a collection of sub-trades and submitted bids for the project; and, in most cases, the lowest general contractor bidder is awarded the project. The contract for construction between the owner and the contractor incorporates the architect's construction documents (including the drawings and specifications) plus an agreement to build the design for the bid price, which is the basis for the contractor's selection.

Variations in project delivery approaches in the design and construction industry appeared in response to the desire by owners to optimize specific outcomes beyond lowest first cost. For example, the high cost of borrowed money during the credit crunch of the late 1970s accelerated typical construction schedules, catalyzed the creation of construction management, and gave rise to the increased use of fast-tracked schedules. The need for speedier project completion required not a single construction sequence but multiple individual packages that were bid as their design was completed, resulting in the asynchronous construction of individual project pieces in the field. In response, some general contractors marketed their services as "construction managers" adept at controlling these complex projects.

The liability crisis of the 1980s—characterized by an explosion of lawsuits—pushed architects further from job site responsibilities and pressed new risks on contractors, who in most cases were willing to assume such responsibilities in exchange for ever-larger pieces of the overall design-construction fee. As projects became more complex and failures became more dangerous and expensive, owners needed in-depth construction advice during design that architects were unwilling or hesitant to provide. Frequent and acrimonious disputes between architects and contractors, often fought out in court, led owners to consolidate design and construction responsibilities under a single entity. Large construction projects like hospital and airport renovations, which needed to operate during construction, required sophisticated management and construction planning beyond the capabilities or interests of architects and created new roles for professional program managers.

The building enterprise has evolved to include an even broader set of constraints and expectations that involve increasingly complex building forms, prefabricated construction subassemblies like curtain walls, integrated building control systems, and rapidly accelerating requirements for sustainable design. Building professionals have also realized that, despite extensive experimentation with delivery approaches, the outcomes of most construction projects remain unpredictable at best, and that traditional roles and responsibilities of the players bear further scrutiny. A new class of delivery models known today as "integrated project delivery" has emerged, which posits closer collaboration and open sharing of information between the key constituents of the building enterprise, underpinned by the power of Internet-based digital design information and technology that uses "building information modeling."

All in all, projects are ever faster, riskier, and involve far more participants than those of even 20 years ago. Choosing an appropriate delivery model is often the key to success—or the source of failure.

PLAYERS IN THE PROJECT DELIVERY PROCESS

Regardless of how they are structured, all delivery methods involve three elemental parties: owner, architect, and contractor. Their discrete roles, expertise, and expectations are described in Figure 9.1.

The Owner

The owner (or client) initiating a building enterprise is usually the eventual owner or operator of the finished building. The owner can be an individual, organization, or other entity that has initiated a design project. For purposes of understanding delivery methods, the owner is the entity that holds one or more contracts with the architect and contractor and is responsible for making payment to these participants. The owner is also responsible for paying for the construction of the building.

An owner's expertise in design and construction can vary widely, usually in proportion to the breadth and complexity of projects the individual or company has undertaken. Owners generally have similarly broad expectations of the other players in the process.

The Architect

The architect is the licensed design professional who, acting as an agent for the owner by providing architectural expertise, generates a design concept for the project. While the specific role of the architect varies greatly according to delivery method, it is the architect who designs, documents, and administers the contract(s) for construction of the project. The "architect" can be an individual or a firm and may contract with consultants such as engineers who augment and support the design effort. In all delivery methods, the architect generates documents that describe the design intent. The contractor uses these documents to build the building.

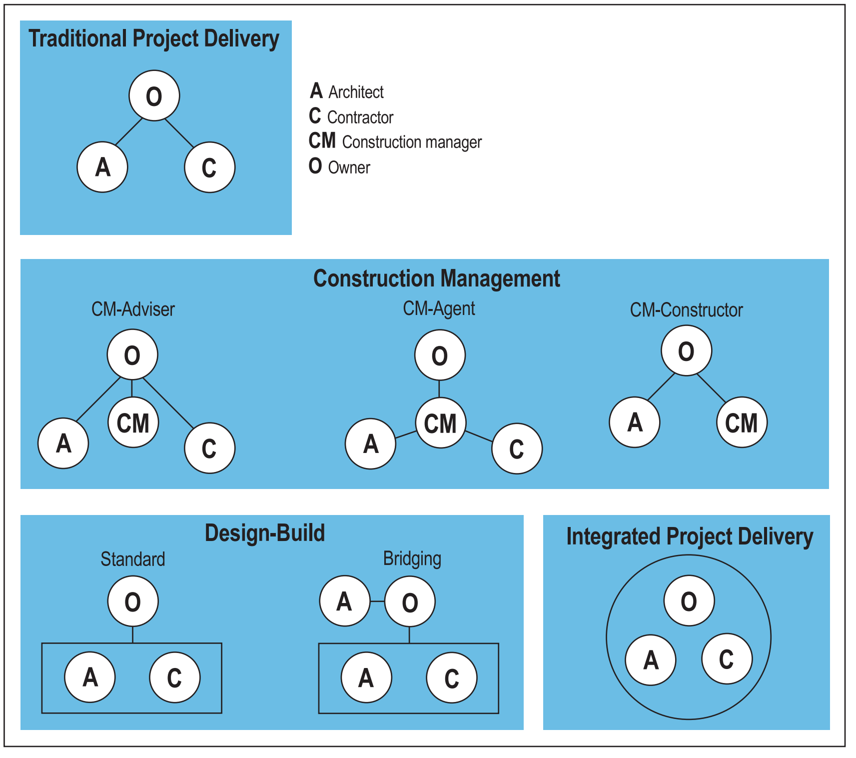

FIGURE 9.1 Relationships of Project Participants

Design Team Consultants

While architects are broadly experienced in the various subdisciplines necessary to complete a project, they typically contract with a wide array of specialty engineers and other consultants, depending on the scope of the project. On all but the most straightforward projects (like small private residences) the architect will subcontract responsibilities for structural and mechanical/electrical/plumbing engineering, and may require other services from additional engineers (such as geotechnical engineering) or special consultants (such as lighting, acoustics, or code/life safety for complex projects). In addition, the owner may bring specific consultants to a project to augment the overall project team, most commonly constructability assistance by construction managers, attorneys, or other consultants. It is important to understand and define the role of every consultant on a project.

▶ Project Team Agreements (17.2) further discusses the agreements that result when architects form teams to pursue projects, engage consultants, or establish joint ventures with other firms.

The Contractor

The contractor is responsible for the actual construction of the project. Typically known as the "contractor" or "general contractor," the contractor's team may include a variety of subcontractors, suppliers, and fabricators who together execute the design intent of the architect's documents. The contractor typically agrees, at a prearranged point in the design process, to construct the project for an agreed-upon sum. The determination of that moment and the resulting responsibilities of the contractor is one of the key differentiators of various delivery methods.

PROGRAM MANAGEMENT

Some large, complex projects have multiple building elements and complicated sequencing. One example is construction of a new airport terminal, with associated roadways, garages, and airfield, adjacent to existing facilities that must be kept in continuous operation. For such projects, an owner may elect to hire a "program manager" to oversee and coordinate the project. Program managers support the owner's interests and, for all practical purposes, *are* the owner in some cases. Such services are usually provided by large construction management entities; however, some architects have now begun to provide program management services.

Subcontractors, Fabricators, and Suppliers

Like the architect, the contractor requires an array of subcontractors to complete a building project. Since most contractors do not self-perform the vast majority of the work, they contract with (thus the term "contractor") necessary companies, tradespersons, suppliers, and fabricators that are then coordinated by the contractor to achieve the built project. Typical subcontractors might include structural steel assembly, sheet metal and systems installers, curtain wall suppliers/installers, sheetrock and interior finishes subcontractors, and electrical subcontractors. Larger projects can have tens or, in the largest project, hundreds of such participants.

Other Participants

Although different in each project, other key players in the process must have explicit relationships to project. Regulatory agencies (like building or zoning officials), external constituents (like local property owners), lending entities (like banks), and even local community groups may affect the project and should be understood in the context of the overall project structure. And while having no defined role in a project structure, the architect's obligation to protect the public's health and safety makes all users of a project—whether affiliated with the client or just walking through the halls—an implicit "client" of the job.

KEY VARIABLES AFFECTING DELIVERY CHOICE

Once only the cost of construction drove the delivery approach of every project: With little exception, the contractor submitting the lowest bid was selected. Other methods have emerged to optimize, other key variables to drive the selection of a delivery approach. These include construction cost, schedule, quality, risk, and owner capabilities. A correlation of driving selection factors for various delivery methods can be found in Figure 9.2.

Construction Cost

As the owner's greatest financial obligation for a project, construction cost is frequently the central concern of design and construction. Buildings are very expensive, and

		Driving Factor: Cost	Quality	Time	Scope	Risk	Construction Cost Determined	Number of Construction Contracts
Traditional	Design-bid-build	■				□	After design	One
	Negotiated select team	□	■				After design	One
	Cost plus fixed fee				■		At completion	One
Construction Management	CM-adviser		□			■	N/A	Many
	CM-agent			□		■	At completion	Many
	CM-constructor	□		■		□	After design	One
Design-Build	Standard	□				■	Before design	One
	Bridging		□			■	After design	One

■ Primary driver
□ Secondary driver

FIGURE 9.2 Characteristics of Project Delivery Methods

owners rarely have infinite funds with which to pay for them. Fixed budgets create clear and definite obligations for the architect and the contractor. Meeting those budgets is a high priority for every member of the project team.

Schedule

Most projects include a time frame in which the project must be complete and ready to occupy. When a building's primary function is critical to an owner's mission, meeting a precise schedule may be the most important consideration in determining how a project will be built. Examples of such situations include academic projects, which must be synchronized with the academic calendar, or performing arts centers that schedule events years in advance. Schedule compliance (and acceleration) is critical when interest rates are very high and capital for building is scarce, as even small delays raise the cost of construction financing dramatically. Orchestrating the design process with a specific schedule may include not just meeting a final deadline but also choreographing design deliverables with intermediate approvals and construction milestones.

Building Quality

▶ Bidding and Negotiation (10.8) covers the processes involved in selecting a contractor.

The demand for particular standards of performance in systems, finishes, enclosures, and other building elements is directly related to decisions about schedule and construction cost. The architect typically establishes a clear relationship between a project's level of quality, budget, and program, where an increase in one parameter may imply a change in another. An owner may be willing to accept lower levels of quality to save construction cost or to allow a project to be completed in a shorter period of time. Conversely, projects with long anticipated life spans (e.g., civic or institutional buildings) may emphasize levels of quality for which construction costs and schedules must be calibrated accordingly. Sustainable design considerations—a building's relationship to the environment, particularly its long-term use of energy and indoor environmental performance—are a significant component of its planned quality. Establishing a common understanding among project participants about all such levels of quality is critical to successful delivery.

Project Scope

Rarely is the project scope completely understood or precisely fixed during the course of a project. A building's characteristics are never completely resolved until its completion. Until that time, its scope—the combined characteristics of size and quality—may be indeterminate and the services provided by the architect must acknowledge this inherent ambiguity. The project's scope is successively refined during design, and subsequently during preparation of shop drawings and then in actual construction. Changing conditions, usually comprised of changing owner demands, market conditions for materials and construction trades, and even unexpected site or existing conditions on the project site, will affect the project scope as it unfolds. Delivery models should explicitly acknowledge the relative fixity of the project scope.

▶ Defining Project Services (15.1) addresses the centrality of scope definition to developing effective agreements for professional design services.

Risk

Risk is perhaps the most intractable variable in the building process. Players in the project make their best efforts to manage, reduce, or transfer their exposure to liability as the project unfolds. Key risk considerations include the following:

- *For the owner:* Can the project accomplish its goals within the constraints of time and budget? Does the owner have the capability to understand the project and support the decisions necessary to complete it?
- *For the architect and the architect's consultants*: Can the project be accomplished within the standard of care at an acceptable level of quality, within the owner's parameters, the architect's own capabilities and skill, and the strictures of the fee?
- *For the contractor and the contractor's subcontractors:* Is it possible to complete the project within a contractually stipulated time frame and/or cost, given market conditions, availability of subcontractors, and the contractor's experience and capabilities?

▶ Risk Management Strategies (16.1) discusses how to first know one's risks, and then how to manage them.

Client Capabilities

The internal capabilities of a client organization can significantly affect the roles the client, architect, and general contractor play. The degree to which design, documentation, construction administration, and management are outsourced, as well as the relative importance that each team member plays, frequently depends on the strengths, weaknesses, and preconceived notions of the owner. Owners may have substantial construction experience and in-house capabilities to understand and participate in a project, or may be embarking on their very first project as a client. Their preconceived notions may also affect the roles and responsibilities of the project participants. Each has a different relationship to delivery approach.

Project Team Capabilities

While any architect who participates in a project must meet the standard of care, levels of experience and capabilities of the team may vary by project type. Teams with greater degrees of experience and confidence in a particular type of project may be more comfortable with more complex, aggressive, or experimental delivery models. Generally speaking, teams with less experience should adhere to well-understood, standard models and associated typical contracts.

METHODS OF PROJECT DELIVERY

The relationships and responsibilities of the players and how they will share information, combined with an explicit understanding of construction cost, schedule, level of quality, and resulting allocation of risk, together define the project delivery method. The characteristics that identify a delivery method can be defined by answering questions for the following issues:

- *Driving factor*: What is the most important outcome driving the project for the owner—cost, risk, quality, or schedule?
- *Architect's role*: What are the responsibilities of the architect, and how do these apply to each successive design and construction phase of the project?

- *Contractor's role*: Who is responsible for building the project, and when in the process is that player selected?
- *Establishment of construction cost*: When is the actual cost of construction definitively established contractually between the owner and the contractor?
- *Number and type of design and construction contracts*: How many individual contracts for design and construction are necessary to accomplish the project?

▶ Integrated Project Delivery Overview (9.3) details methods that enable project stakeholders to share, to varying degrees, the risks and rewards involved in design and construction.

Answers to these key questions, combined with an explicit strategy about cost, quality, schedule, and risk, provide the information necessary to select and implement a project delivery approach.

Delivery models are typically based on one of three typologies: design-bid-build, construction management, or design-build. A fourth typology, integrated project delivery, is now evolving and discussed elsewhere in the Handbook.

Design-Bid-Build

Once known as the traditional approach, this delivery method involves a linear design sequence that results in a set of construction contract documents against which contractors submit fixed price bids. In design-bid-build approaches, the lowest-bidding contractor whose proposal responds to the requirements of the contract documents is usually selected to build the project. Many projects in the United States are constructed under this approach, and many of the business models that drive the construction industry, including contracts, fees, and risk management strategies, are derived from the design-bid-build method.

A variation of design-bid-build is the "negotiated select team" approach, in which the contractor is selected early in the design process and certain contract terms (such as overhead and profit multipliers) for the contractor are determined prior to completion of the construction documents. Subcontractors are then selected and the final contractor team is assembled once the construction documents are complete. The final contract amount for construction is determined based on the final documents and calculated using the pre-negotiated terms. Selected portions of the building that may be particularly difficult to fabricate or construct may be accelerated under "negotiated select team."

Another variation of design-bid-build method is known as "cost plus fixed fee." In this approach the contractor is selected at the completion of contract documents, but the scope of construction is unpredictable (due in part to unknown factors such as existing conditions). Under a cost plus fixed fee contract, the contractor is paid actual labor and material costs plus overhead for construction for coordination of trades on the site plus a fee that represents a fixed amount of profit that does not vary according to the total project cost, disconnecting the contractor's profit from any increase in project costs. Added incentives may be added to the fee if the project finishes early or under the original budget.

Construction Management

▶ See The Architect's Role in Construction Manager-Constructor Project Delivery (9.2) for more about CM project delivery.

Owners have increasingly demanded detailed construction and technical advice earlier and earlier in the design process. The building community has accommodated this need by creating the field of construction management. The construction manager (CM) can play one of three roles:

- *CM Adviser*: The CM as adviser acts only as a constructability and cost management consultant to the owner during the design and construction process, but will not build the building. CM-adviser projects can be delivered under any of the methods previously described.
- *CM-Agent (CM-A)*: The CM as agent provides early consulting and may act on behalf of the owner in assembling and coordinating the construction trades prior to and during construction. CM-agents typically provide their services for a fixed fee

and assume no risk for the actual construction costs themselves but pass on both savings and overruns directly to the owner.

- *CM-Contractor (CM-C)*: The constructability and cost adviser role of the contractor during the project's design phase transitions at a predetermined moment to the traditional role of design-bid-build contractor for the project. CM methods of delivery frequently include the use of a "guaranteed maximum price," or "GMP," which is a commitment by the CM-C to build the project for a specified price based on early design documents (typically those available at the end of design development). This places the CM-C at risk for the construction cost of the project. An inherent difficulty in CM-C arrangements stems from the CM's dual role as contractor and estimator, as cost decisions made early in design directly affect the CM's cost (and profitability) later in construction. Owners considering this approach should be aware of this fact.

In general, the construction management industry presents itself to owners as an essential project contributor when complexity, schedule, or commitment to budget objectives are critical. Because it is rare that one or more of these issues are not important to a project's success, construction managers are involved in many large building projects. However, architects with sufficient experience (and willingness to expand their work) are increasingly offering construction management services.

GUARANTEED MAXIMUM PRICE (GMP) APPROACHES TO CONSTRUCTION MANAGEMENT

In the past, the establishment of a guaranteed maximum price (GMP) suggested a commitment by the owner and CM-contractor to a construction cost based on partially complete design documents. The price established was understood to account for the "risk" inherent in using these documents. Many CM-based projects now invoke a GMP as an evolving cost target for the project but sustain it through the completion of construction to maintain flexibility with the owner about the final cost of a project. It might be argued that a GMP, carefully developed and refined based on construction documents, is actually a "hard bid." Care should be taken to understand and define this term when it is used to describe construction cost commitments after the design development phase.

► For more on architects as constructors, see Architect-Led Design-Build (9.5) and the accompanying backgrounder, Architect-Led Design-Build and Architect as Construction Manager for Small Firms and Small Projects.

► Contractor-Led Design-Build (9.4) further discusses traditional design-build project delivery.

Design-Build

This delivery method provides the owner a single-point responsibility for both design and construction. The design-build method sprang from clients' growing dissatisfaction with the inherent tensions and conflicts of delivery approaches that place architects and contractors in adversarial roles. Under design-build, a single contract is established between the owner and the design-build entity having both design and construction capabilities. Typically, that entity is a contractor with the architect as a subconsultant for design services. This contract typically includes a fixed price for both design services and construction cost. Design-build approaches require an explicit determination of the roles and responsibilities of the design-build team.

An interesting issue in design-build projects is the mechanism by which the owner establishes and enforces the performance and quality parameters of the project, a role typically assumed by the architect as an agent for the owner separate from the contractor. A variation on the consolidated approach of design-build is "bridged design-build," which is derived from project teams that include both a design architect (who establishes the design concept) and a production architect (who determines technical criteria and generates the construction contract documents).

These two architects work in concert to develop and execute the design, as follows. The first is a design architect who prepares a preliminary design for a building and establishes, typically through a performance

DESIGN SEQUENCE

The typical phasing of a design-to-build process includes standard phases of design resulting in a single package of construction documents. The emergence of fast-tracked construction in the 1970s changed this approach. Most projects today, however, are under significant schedule pressure, and the typical linearity of design phases—SD, DD, CD—is fast giving way to hybridized approaches where bid packages for individual building components are generated based on their schedule requirements or other market constraints. Irrespective of delivery model, projects rarely operate in a strictly linear fashion. There is some speculation that, as integrated project delivery methods and digital design technology become better understood and adapted, typical design phasing may give way to new definitions of design deliverables and project sequencing and phasing.

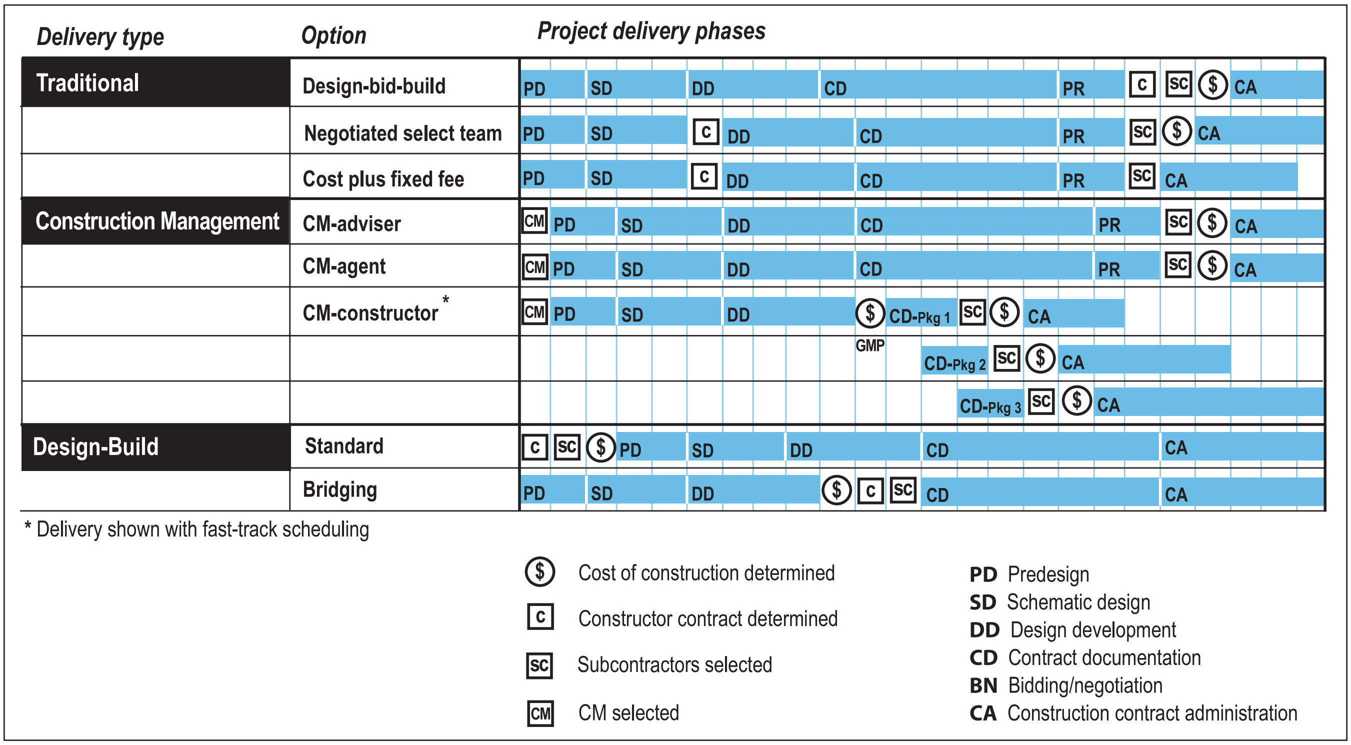

FIGURE 9.3 **Sequences and Key Decisions by Project Delivery Method**

specification, detailed criteria to which the ultimate design must conform. The completed design concept and criteria package (typically based on design development drawings and specifications) are then issued to design-build teams that offer both technical architectural and construction capabilities who bid on the work.

The "bridge" between concept and technical design is the juncture at which design-build teams bid on a project, and a team is selected based on the consolidated costs of technical documents and construction. The design architect remains in an advisory role to the owner, reviewing and critiquing the evolving design and construction based on the design and criteria package. The technical architect who is part of the design-build team provides detailed technical documentation for construction. This approach takes maximum advantage of a traditional architect-owner relationship with the participation of the design architect and simplifies the contractual responsibilities of the design-build approach. It might not be suited, however, to projects that require extensive interaction between the architect and owner during the entire design and construction process, since a portion of the design team is contractually tied to the building contractor.

OTHER DELIVERY MODELS

The construction industry is increasingly coming to grips with the challenges of delivering results with predictable outcomes. Too often projects fail to meet expectations of budget, schedule, or quality, three factors the architects must carefully balance as they guide the owner through the design and construction process. The project delivery models described above, and in more detail in other articles in this chapter, have evolved in part as attempts to address these challenges, each optimizing a different project variable or player capability to yield better results.

Some interesting variants are emerging worldwide that exhibit "integrated" characteristics but don't follow the exact strictures of IPD as commonly defined. Among them are privately financed initiatives and project alliances.

Privately Financed Initiatives

In Great Britain, consolidated design, construction, development, and building operation teams compete to deliver and operate completed buildings for extended periods as long as 50 years. The architect is one member of such teams. Owners pay a yearly fee in exchange for the use of these buildings. Many health care projects in the United Kingdom are using this model, notably when the government's Health Services does not wish to spend capital on building construction and operation. The *build-operate-transfer* model in Canada is a similar model. In the United States, developers are creating "lease-leaseback" arrangements, where projects are delivered for a client by a third party and then leased back to the client for a set period, with ownership reverting to the original client after an extended period, often 99 years. There are other variations on private-finance schemes, where private funds for construction of private projects have evolved as alternative financing strategies for projects; such schemes are sometimes, but not always, accompanied by consolidated design-deliver-operate project teams.

Design Assist

The increasing technical complexity of many projects, particularly those with high-performance enclosure or mechanical systems, demands the early involvement of key subcontractors and fabricators during the design phase. A new model called "design assist" has evolved accordingly, in which shop drawings generated by these subcontractors are incorporated directly in the architect's construction documents, and the architect is not required to document those systems as traditional "design intent" deliverables. This model purportedly creates more accurate and efficient working drawings, as well as improved cost control and construction operations.

Project Alliance Models

In Australia, the industry is experimenting with a radical delivery model called Project Alliance in which the entire project team—designers, contractors, and subcontractors—are bound together in a single contract that holds each jointly responsible for the project and rewards all for its success. Of interest in the Alliance model is the requirement that each project member fully support the efforts of the other, since their financial success is tied to mutual cooperation. The owner in these projects establishes measurements of this success—budget, cost, or quality, for example—and rewards the entire team based on how well these aims are achieved. Principles of Project Alliance have strongly influenced the development of Integrated Project Delivery (IPD) here in the United States.

CONCLUSION

Like many professionals anticipating the challenges of practice today, architects face increasingly complex decisions that drive the very basis of how projects will be designed and built. Advising owners intelligently about delivery options requires an understanding of the players in the building process and their roles, the key variables that affect the choice of delivery method, and, finally, the range of choices available in the current design and construction marketplace.

▶ Emerging Issues in Project Delivery (9.7) covers particular project-delivery issues that have arisen in relation to building information modeling (BIM), IPD, and sustainable design.

The other articles in this chapter illuminate in detail the methods of project delivery in common use as of 2012, and methods that are emerging as more frequent choices by owners, architects, and contractors. These include construction management, integrated project delivery, design-build—both architect- and contractor-led—and architect as developer.

A new generation of delivery models based on principles of integration is coming into view. To maintain a central role in the building enterprise, architects must strive to understand, master, participate in fully, and, when necessary, invent such methods. The chapter concludes with an article detailing these emerging trends and methods.

PART 3: PROJECT DELIVERY

BACKGROUNDER

THE NEED FOR INTEGRATED PROJECT LEADERS

Barbara J. Jackson, Ph.D., DBIA

Leading integrated projects and teams requires a unique set of skills and talents. Being an architect, contractor, or engineer does not qualify or prepare a person for leading integrated projects. In addition to discipline expertise, Integrated Project Leaders (IPLs) must possess a disposition for collaboration across disciplines, demonstrating appreciation, enthusiasm, and empathy for what others contribute.

Barbara Jackson is a professor of Construction Management in the College of Architecture and Environmental Design at Cal Poly State University. She also serves as director of the Center for Integrated Project Leadership for the Built Environment and is author of *Design-Build Essentials* (Delmar Cengage Learning, 2010).

THE LEADERSHIP IMPERATIVE

The one common denominator among all integrated project delivery approaches is the expectation for the team—owner, architect, and contractor, and others as assigned—to act "as one," thus capturing the collective knowledge and expertise of the multidiscipline perspective to deliver comprehensive, integrated solutions. Given our industry's historical segregated services mentality and isolated operational model, achieving such a collaborative, interdisciplinary teaming arrangement is a tall order, and certainly one that is not going to happen by accident. It takes a unique leader with unique leadership skills to elicit such results. Unfortunately, these required leadership skills are not readily taught in architecture, engineering, or construction management schools, and yet architects, engineers, and contractors are typically the individuals who are charged with leading these integrated project approaches.

Being well trained in the disciplines of architecture, engineering, or construction project management does not usually properly prepare a design or construction professional for the task of leading a multidiscipline team of individuals with different skills and motivations. The challenge is, when bringing this diverse group together to work on an integrated project solution, if each team member only contributes their single-discipline perspectives, it's very difficult for them to view solutions from an interdisciplinary viewpoint.

What tends to happen on many projects is that each individual discipline presses for its own point of view. Architects press for enhanced design, contractors press for budgets and schedules, and each party may feel threatened by the other's point of view. While the discipline that is "leading" the team is most likely to succeed in forwarding its approach, the fact remains that the owner wants it all—an integrated solution that enhances design as well as the budget and schedule. An Integrated Project Leader (IPL) must rise above any single discipline perspective and develop a disposition for collaboration across disciplines, demonstrating appreciation, enthusiasm, and empathy for what others contribute.

THE INTEGRATED PROJECT LEADER

Most would agree that the true leader of the project is always the owner, who sets the goals, objectives, and purpose for their projects. But from a practical perspective, the owner doesn't lead, coordinate, monitor, and manage the design and construction efforts that deliver the intended and expected goals, objectives, and purpose for the project. As more projects are executed as integrated efforts between designers and builders, the question of who is best suited to lead the integrated project must be considered. Should it be the architect? Should it be the contractor? The most accurate answer is probably neither, if their discipline expertise is all that they can bring to the leadership challenge.

It is common wisdom within the construction industry, in 2012, that there exists generally significant skepticism and distrust between the design and construction disciples. Both are skeptical that the other has adequate understanding, knowledge, or appreciation of elements and issues associated with their contributions, and each therefore lacks trust that a project leader of the other discipline will give them proper consideration. Anecdotally, both parties, when working together on teams, have voiced these very concerns regardless of the contract model, and whether in separate firms or integrated firms.

Successful leadership of any integrated approach to project delivery requires a new mental model for working together collectively and collaboratively. Integrated projects require individuals who can rise above their discipline bias and become the integrated project leaders that owners will need to fully leverage the collective ability of their multidisciplinary team. The integrated project leader must create an environment in which every participating party succeeds, and a comprehensive, integrated solution is achieved. In addition to managing the distinct design and construction functions as an integrated process, which poses a substantial challenge in itself, the IPL must also create and manage a teaming culture that produces the results the owner is looking for.

The IPL must create an environment in which each team member feels valued, appreciated, recognized, and successful. This is a critical task for an IPL, because if the leader can change the experience for the individual team members, then their beliefs about the people and the process will change. If their beliefs change, then their actions and behaviors will change. And if their actions change, then the results will change. This change in experiences, beliefs, actions, and results is at the heart of any integrated project approach and therefore is at the heart of successful integrated project leadership.

An integrated project leader requires certain affective skills and talents that are not typically taught as part of any architecture, engineering, or construction management program. Nevertheless, IPLs can and do come from any of the AEC disciplines. However, there do appear to be some common traits among successful integrated project leaders:

- They listen and inquire first, and then ask direct questions that get at the facts of an issue, void of judgment or opinion.
- They are proactive in everything they do. They focus on getting in front of situations before they become problems.
- They address upsets and issues head-on and immediately. They do not let issues fester and get out of hand.
- They are highly engaged with the team and manage from the middle and not from the edges.
- They prefer dialogue to debate, understanding and appreciating the values and rationale beneath an opinion instead of arguing over competing opinions.
- They offer comprehensive, well-thought-out answers rather than rash, reactionary comments.
- They are highly skilled in facilitation methods that lead to the synthesis of multiple perspectives into a shared understanding that all can buy into.
- They do not command or direct but rather respectfully elicit the insights, creativity, and wisdom of others before making decisions.
- They are informed by their own discipline expertise but clearly recognize the limited perspective it presents in achieving a comprehensive, integrated solution.
- They have focus that goes beyond the owner's program, product, or process. They focus on the owner's "purpose" for the project when making all decisions.

CONCLUSION

Those who come by the talents and skills needed to be an effective integrated project leader naturally seem to be few and far between. With the upsurge in the use of project delivery methods such as design-build, CM-constructor, and integrated project delivery, there are clearly not enough IPLs to go around.

The first challenge for the industry is to recognize the need for uniquely trained and prepared individuals who have the skills and talents necessary to become effective IPLs. The second challenge is to clearly recognize that the talent for leading integrated project teams is not associated with any given discipline, but is instead available across all the disciplines of the built environment. The opportunity is to nurture, develop, and respect this skill set wherever it is found. Third, to recognize the need for specialized training in project leadership and the void in these educational offerings at most schools of architecture, engineering, and construction management and in existing continuing education programs. Meeting these challenges is essential to make ready a new generation of integrated project leaders to serve the AEC industry, and its clients, in successfully practicing an integrated project approach and delivering on its promise of superior results.

9.2 The Architect's Role in Construction Manager-Constructor Project Delivery

Mark Hesselgrave, Architect

The construction manager has become an integral part of many project teams. When the CM is also the constructor, the architect can best serve the owner and the architecture profession by understanding and helping to define roles and responsibilities of all participants in a CM-constructor project.

Building projects are increasingly complex and demanding. In all but the smallest projects, employing some variant of construction management has become a common method of project delivery. With CM involvement, the project team can gain important insights into construction cost and schedule crucial to the success of the project. To achieve the best results for the project, the architect's responsibilities will shift to align with the tasks assigned to the CM.

CONSTRUCTION MANAGEMENT PROJECT DELIVERY

▶ See Project Delivery Methods (9.1) for an overview of the types of construction management.

The title "CM" has become the generic label for any individual or group managing a project during the construction phase. However, there are numerous variants of construction manager, and the Handbook describes the distinction between those different forms. This chapter focuses on the CM-constructor.

The *CM-constructor* (CMc), also called CM-at-risk, places the CM in a role similar to that of the traditional general contractor. Capable of providing valuable pre-construction services of cost estimation and scheduling while the architect is developing the design and its deliverables, the CMc shifts focus to building the project at some point prior to construction. In the simplest terms, they are bound to the contract documents, the cost estimate, and the schedule that they themselves help establish. In many ways, the CMc is a mirror image of the *design-bid-build* (DBB) method of delivery, with all the dangers and conflict that accompany it. However, there are important distinctions, described below.

DESIGN-BID-BUILD VERSUS CMc

DBB was conceived as a way of introducing competition between numerous trades so that the owner would realize a cost benefit. Building conventions were well understood and universally practiced, so an owner could be reasonably confident that they would receive the same product from a variety of bidders; the competitive bid gave that product to them at the lowest competitive cost. Over time, changes in construction methods as well as financial management moved faster than convention could accommodate. The AE documents rather than building conventions became the primary determinant of scope; if not shown in the documents, a given component wasn't provided. DBB no longer yielded desired results for owners. Expanding supplies of "equal" products that did not truly perform as equals fueled the deterioration of building quality, as did cost-cutting shortcuts in construction means and methods. Gradually, construction management was developed as a way to address specific weaknesses of design-bid-build.

Mark Hesselgrave is an architect providing consulting services in project management and architectural technology. He is a former senior associate with Pelli Clarke Pelli Architects, and acted as project manager on many of the firm's full-service projects.

Conflict Resolution

The traditional design-bid-build delivery is a process fraught with conflict. The stage is set when contractors vie against one another to win the bid. Aggressive bids may allow for only the slimmest profit margins, leaving the contractor to fight any decisions that could turn profit into loss. Further, competitive bidding encourages a contractor to take the most economical approach that can be interpreted from the documents. When that interpretation does not align with the design intent, conflict can ensue.

Some owners, as well as architects, think that this conflict is good. Their view is that the documents are tested against precedent and reasonable expectation in a trial of constructability. When things don't go smoothly, both parties—builder on one side, designer on the other—argue their case. The conflict keeps both parties honest. At least, it does so in theory. In practice, owners have seen project teams dissolve into a sea of excuses and incrimination, leaving no one to deliver the owner's project. With a CM as constructor, the old divisions established in a traditional project delivery are unbound. When successful, the owner-architect-CM relationship will create a team that works toward consensus rather than as adversaries, allowing them to concentrate their full attention on delivering the project.

Construction Experience

Construction managers are expected to have experience building buildings, but buildings are not widgets. Every project is unique, built without benefit of a prototype. Still, there are ways of executing specific project types that are best learned through experience. For example, a basic office building requires the CMc to coordinate essential trades such as electrical, mechanical, concrete, steel, etc. The most critical skill may be the ability to accelerate the schedule. CMc involvement in the design phases can help the team organize bid documents for multiple packages.

More complex projects, like performing arts buildings, have different requirements. Not only are there more demands on the essential trades to meet acoustic criteria, there are also added designers and trades that need to be coordinated. The complexity rises geometrically. Therefore, prior experience with projects similar in size and function to the one proposed can be of great benefit in both design and construction phases. A CMc who is actively building similar projects can offer advice to the AE team during the design phase, and will be able to anticipate critical activities during construction.

While "prior experience" could be applied as criteria for a design-bid-build project as well as a CMc project, the effect would not be the same. Early involvement in the project helps the CMc to understand design intent to ensure that the scope is fully realized. The exchange of insight between architect and CM during design is one of the primary benefits of a CMc arrangement.

Cost Analysis

Most projects must adhere to a budget, and the budget is best established no later than the schematic design phase. Cost estimates performed at design milestones track the construction cost; the subcontractor bids test whether the estimates were accurate. An independent cost estimator can provide this service to the team, and can do so without bias. Another approach is to employ the constructor as the estimator. The CMc can advise on current market conditions and labor costs to help the AE team design cost-effective building options.

Schedule and Coordination

Under DBB, a single package of documents is delivered to bidders, with the package coordinated by the AE team. This is the simplest method of delivery, but not the fastest. To deliver a project quickly, document "bid packages" are released depending on their place in the overall schedule. Unfortunately, multiple bid packages released over time add uncertainty and may require changes as the documents progress. A CMc is charged with the responsibility for seeing bidders receive the appropriate information at any given time, and that the work is coordinated as it proceeds.

Matters of construction experience, cost estimation expertise, scheduling, and construction coordination expertise are discussed further below, and are essential considerations when selecting the CMc.

SELECTING THE CMc

Selecting the right CMc for a project is an important task, and the owner may ask the architect for advice and guidelines. The architect's experience on previous projects can inform the owner not only about qualifications of specific firms but also about the scope of work that should be requested when soliciting qualifications. Most importantly, the CMc will be part of a team, and the involvement of the AE team in the selection process may help promote team harmony.

Why CMc Delivery?

Before launching into the selection of a construction manager, it is important to understand what is motivating the client to do a CMc project. Is the schedule for completion aggressive? Is the cost critical? Is the scope unknown? Any of these factors could lead to the decision to choose CMc delivery.

With the driving factors known, the owner should include in the RFP a detailed description of the CM's expected scope of services.

Define the Scope of Work

The AIA Contract Document A133™–2009 can be seen as the base agreement between Owner and CMc. Although this may not be the agreement those parties use, the architect should study that document to understand not only the responsibilities of each party but also matters of payment, dispute resolution, and how the cost of work is to be established.

▶ See The AIA Documents Program (17.5) for more detail on the CM family of AIA Contract Documents.

The scope of work expected of the CMc should be clearly defined in the request for qualifications/proposal. A detailed description of the project, including size, program, and materials, to the extent that they can be defined, should be included. In addition to the description of the project, AIA Document A133™–2009 can be used to set out contractual requirements for the scope of work that can be expected. The owner should make any adjustments necessary to align that agreement with their specific project, and, if necessary, any general conditions of the owner's contract for construction. In the best case, the architect will meet with the owner and discuss the scope before it is released. That way, the owner can avoid contradictions between architect and CMc agreements. Also, the architect can suggest language that may clarify what, in their experience, may have been sticking points in the past.

Basic services for the CMc might include the following:

- Preconstruction phase:
  - Perform a preliminary evaluation of program, schedule, and budget.
  - Maintain ongoing consultation on matters pertaining to construction, constructability, and materials and labor availability.
  - Prepare and periodically update the project schedule.
  - Provide recommendations for phased construction.
  - Provide preliminary cost estimates. As the design develops, the estimates will be updated with increasing detail until a guaranteed maximum price can be established.
  - Develop subcontractors and suppliers' interest in the project. Where demanded by schedule and market conditions, pre-purchase materials for the project.
- Guaranteed maximum price: When mutually agreed by owner, architect, and CMc, the CMc will prepare a guaranteed maximum price (GMP) proposal. The GMP will be the sum of the CMc's estimate of the cost of the work, including contingencies and the CM's fee.

- Construction phase:
  - Solicit and obtain bids from subcontractors for the work. Review with the owner and architect to determine which bids should be accepted.
  - Administer the work of subcontractors in accordance with the contract documents.
  - Schedule and conduct meetings to discuss procedures, progress, coordination, scheduling, and status of the work. The CMc will prepare and distribute minutes to the owner and architect.
    - The owner's representative and the architect should also attend these meetings on a regular basis. The CM's ability to direct the subcontractors often relies on the involvement of the design team to clarify the documents and their intent.
  - Maintain a schedule of the work, including submittals to the architect.
  - Track the cost of work measured against the GMP.

This list paraphrases the scope found in AIA Document A133™–2009. It is only the starting point. Discuss with the owner how best to serve their project. Once a CMc is selected, they too may have suggestions for their scope.

Interviews

A successful team is not determined by technical qualifications alone. Team chemistry greatly affects the ability of professionals to work together toward a common goal. The CMc selection process should include an interview where the CM presents their qualifications and their team. The architect should request to be a part of those interviews. Though it should not be the primary measure, good team relationships will influence project's success.

SAMPLE: CONSTRUCTION MANAGEMENT SERVICES

- **Team meeting leadership**. Lead regularly scheduled project meetings with members of the project delivery team for the purpose of continually assessing project status, and coordinating design and budget issues. Prepare and distribute minutes of all such meetings.
- **Action log**. Maintain the project team action log to drive and track outstanding issues and ensure timely completion.
- **Decision-making process**. Coordinate interaction and decision making among USD 443 architects, engineers, user groups, and others necessary to project decision making. Meet regularly with USD 443 to continually address key decisions required and other project issues. Includes coordination and assistance with contract negotiations for construction services.
- **Code official review**. Participate in review meetings by AE team with building official to develop a permit procedure for project.
- **Owner purchasing**. Work with USD 443 to incorporate, where possible and appropriate, to aggregate cost with other USD 443 projects and assist and advise the owner regarding owner-purchased items.
- **Cost control**. Provide an overall cost control system for the project, including monthly reconciliation with USD 443. Maintain a parallel record of project costs for review by USD 443 to serve as a permanent record. Develop and update a cash flow forecast for the duration of the project.
- **Department interface**. Coordinate interface with key USD 443 departments, including engineering, telecommunications, security, etc., to encourage participation with the project design team.
- **Documents review**. Review all design phase documents and comment on constructability, coordination, and value engineering (VE) issues. Coordinate all value engineering efforts on USD 443's behalf including facilitation of work sessions with the project design team, evaluation of proposed constructability/VE items, etc. Monitor completion of design documents to ensure constructability/VE items are incorporated as the project progresses.
- **Presentations**. Participate in other presentations, as necessary, to provide updates as to the project status. Such other presentations may include the USD 443 board or presentations to local governmental agencies.
- **Design process documents**. Monitor design documents relative to compliance with the approved functional program and USD 443 project objectives. Perform periodic drawing reviews to track status of the design progress and inclusion of VE objectives.
- **Conflicts and disputes**. Assist in the resolution of all project-related conflicts and disputes including coordination with USD 443 legal counsel, as required.

DEFINING TEAM ROLES

In the traditional design-bid-build project delivery method, there is a clear line demarking the roles of designer and builder. While the project design is under way and documents are being prepared, management of the project is the responsibility of the architect. After the documents have been bid and a general contractor selected, management of the project passes to the contractor, although the architect remains the manager of the design team.

When both architect and construction manager are on the job, there can be some conflict as to who's running the show. Both are experienced in leadership roles, and both have significant liability for their team's performance. Taking the time early in the project to clearly establish the team members' roles can improve communication and help avoid frustration. As the architect and CM have no contractual relationship, the owner must be a party to establishing team roles. Therefore, the owner/architect agreement must be aligned with the owner/CMc agreement.

The architect should consider amending their contract to align with the owner's contract with the CM and their expectations. Included in both contracts should be a matrix or narrative description that clearly and concisely defines team roles. As always with contracts, obtain appropriate legal advice and consult with the firm's professional liability insurance provider.

Once team roles are established and documented, this documentation can be referenced throughout the project. For the CMc, two responsibilities will overshadow all others: construction schedule and construction cost. When construction begins, the architect too will be driven by schedule and cost. How those factors are defined and monitored are of crucial interest to the design team. Still, before construction starts, the CMc will make their presence known in the design phase, sometimes to the architect's chagrin.

DEVELOPING THE DESIGN

The AE team has primary responsibility for the design phase. The owner looks to them to set the schedule and to coordinate the work. At the same time, CMc input into matters of construction can help the team make informed decisions as the design develops.

Constructability Expertise

The design team should draw on the CMc's expertise in understanding the realities of actually building the design as it evolves; in other words, the design's *constructability*, which might include the following:

- *Local building conventions.* An architect may be aware of local building conventions and design standards, but not know the details of current market conditions and how they affect the local labor force. For example, while stucco might be a cost-saving alternative for exterior finish in California, the scarcity of qualified installers in Connecticut could raise the price dramatically.
- *Building systems.* While the project engineers are experts in designing building systems, current market conditions will impact the cost of the components specified. The CMc can advise the team as to which system will be most cost-effective at the time of construction. For example, the structural frame is often subject to this analysis; concrete is weighed against steel to determine which system is preferred when measured in terms of cost and schedule.
- *Site selection.* Drawing on their experience of coordinating the workforce, the CMc can offer their analysis of potential building sites. Constrained sites can be evaluated for the cost of material delivery, staging, laydown, and workforce deployment.
- *Scope limitations.* The CMc can provide oversight on the overall project scope as it develops, warning the team if it seems to be growing beyond budget or schedule

limitations. The architect will need to assert their design authority if they feel that scope is being restricted without fair consideration of the owner's program.

Specifications

Final construction documents are comprised of drawings and specifications. During the early phases of design, SD and DD, the architect depends heavily on drawings to convey design intent to the owner. Unfortunately, as clear as the drawings may seem to the architect, they do not define the scope of construction in enough granular detail to ensure accurate pricing from the CMc. Product data, material properties, testing requirements, and quality assurance are some of the details that are too cumbersome to include in drawings. The design team must use additional tools to describe the building, pointing to the importance of specifications to establish design intent for the CMc early in the process.

- *Outline specifications* are a simple way to define building components at the schematic level. Generally organized by CSI division, the outline should include material descriptions and quality level, as well as actual proposed product data whenever possible. Periodic expansion and updating of the outline will ensure that the design intent is well described and accurately priced.
- *Performance specifications* describe products by how they are to perform rather than narrowly defining a manufacturer or material. This approach works well for technically driven subcontracts, such as air handlers, chillers, transformers, and other mechanical or electrical equipment. With a performance specification, the CMc can obtain pricing from contractors who specialize in the work described.
- *Narrative specifications* describe work in words rather than in drawings or in the more technical language of the CSI format. The narrative can describe finishes in the various rooms of the building without providing a complete room finish schedule. The descriptions can be easily revised, but the narrative provides enough information to compile an early cost estimate.

The project team must agree on when the method of specification is adequate to meet the level of estimate required of the CMc for each phase of the project. Similarly, the CMc should commit to incorporating the information delivered by the preliminary specifications. Just as with the final documents, *all* design documents—drawings and specifications—make up the design intent, and should be priced accordingly.

► See Construction Specifications (10.7) for more detail on specifications in traditional project delivery.

LEED Certification

It is critical to have CMc involvement in early design phases to meet LEED goals. LEED scoring requires certain construction practices if a particular point is to be gained. Equally important to the project is the cost benefit of obtaining a particular LEED point. The CMc will incorporate the cost of the LEED measures proposed by the team so that the project budget reflects the design intent.

Checking the Documents

As noted above, construction documents are by definition not prescriptive construction instructions, and at early design phases the project scope is only vaguely defined. Therefore, it's important that the architect establish the level of scope information that CM can expect for each milestone so that the CMc's advice can be calibrated accordingly. Once set, the architect can tailor their deliveries to that level, and the CMc will have the information they need to provide cost estimation and scheduling services appropriate to the phase. In addition, the scope definition by phase can act as a check list for the design team.

The CMc can also provide, as part of their work, periodic document check to augment the architect's quality management procedures. With their knowledge of construction services and their understanding of contractors' expectations, the CMc

CMc involvement in quality control should not be a substitute for the design team's own quality management plan. Rather, it is a value-added service.

provides insight into how the design documents will be read in the field. Any perceived gaps in scope can be filled before final documents are released for bid.

▶ See Chapter 12, Quality Management, for more on quality management processes in practice.

Conflicting or uncoordinated scope can be as damaging to cost and schedule as missing scope. The CMc can also be asked to verify that drawings are coordinated internally and with other consultants' drawings. Well-coordinated documents with adequate scope definition will go far toward meeting the design team's best contribution to meeting the project schedule.

PROJECT SCHEDULE

In the traditional design-bid-build project delivery method, responsibilities for schedule are clear. The design team is tasked with delivering a set of documents by a certain date, after which the documents are printed and issued to general contractors. The burden of schedule then shifts to the selected contractor. The design team still has schedule performance obligations, as the designers are required to turn around shop drawings and clarifications in a specific time allotted by the general conditions. But beyond that, the design team has little or no ability to affect the schedule. Similarly, prior to bid, the general contractor has no input on the design project schedule, since it is not chosen nor involved in the project until after the completion of the documents. Such is not the case when the CMc is involved.

Under CMc project delivery, the CMc has the responsibility for developing and coordinating the overall project schedule, including design phases, owner decision milestones, and work periods that include design and drawing time. The consolidated schedule is assembled, tracked, and maintained by the CMc for the duration of the project. Since many owners choose the CMc delivery method specifically to drive the project to a schedule, what unique skill does the CMc bring to a project to achieve that goal? In short, they bring the ability to accelerate the project delivery schedule.

Fast Track Schedule

Fast track is a method of delivery that allows AE documents to be issued in multiple stages, or bid packages. While this strategy can be complex and therefore challenging, it can be of great benefit to the owner who wants to compress the project schedule. Rather than wait for a completed set of construction documents, work can begin with partial documents for the trades along the critical path. Fast track delivery has become very common in commercial and institutional projects with accelerated schedules. Unfortunately, the risks involved in that method are not always well understood by the parties involved.

The team must have a clear understanding of how the scope definition should proceed to best allow for accurate cost estimation and, if anticipated, phased bid packages. This approach may be antithetical to the creation of a cohesive design whole, but the need cannot be ignored. The architect must maintain a coherent approach to the design even as pieces of the project are developed asynchronously in fast-tracked packages. For example, if the estimator needs details of a copper roof early in design development, the architect will need to provide them, even if they normally would not have resolved that portion of the design until much later in their process. Or if curtain wall details must be delivered months before floor plans are finalized, the team must work toward that goal. It is critical that the structure, schedule, and milestones for individual bid packaging requirements be established at the outset and properly reflected in the architect's scope of service and fees. An unclear packaging strategy will subject the design team to starts and stops that will compromise the quality of the documents, and project schedule and cost will suffer.

The CM will include the design team's schedule in their project schedule. It is important that the team not accept an unrealistic time frame that conflicts with their professional duties.

The architect must have a clear rationale for the design components of the schedule and be prepared to explain their schedule requirements. While there is no benefit to the CMc in a lengthy design period, the architect must be given sufficient time to complete their work. The CMc may pressure the architect to accept a shorter design or documentation period. Be wary of such pressures.

Bid Packaging

Traditional DBB allows for the straightforward production of documents, giving the design team the opportunity to coordinate documents fully before releasing them to bid. CMc with fast-track delivery introduces complexities that go far beyond producing the documents. Rather than a single set of documents, a number of sets, or bid packages, must be assembled and issued over a period of time.

Obviously, the work to customize the drawing set and release it a number of different times and ways exceeds the normal basic services that an architect provides. If it is known from the outset that the construction delivery will involve the production of multiple bid packages, make sure that the owner/architect agreement reflects that work. If multiple bid-package delivery is introduced later in the design process, the architect must negotiate with the owner to modify the contract.

Even if the design team expects and produces unique packages for each bid, there will be areas where two or more bid packages overlap. The danger of redundancy or conflict increases when the same (but revised) drawings are issued at two different times to two different contractors. It is critical that the management team know which drawings on the job are current and who is involved with the work. Both the architect and the CMc should establish document tracking procedures that will ensure that only current drawings are on site, and that all contractors have received them.

As part of bid packaging, the CMc will include a written scope of work to accompany the design team's documents. This document in effect modifies the construction documents. While it is tempting to the designer to stand with the documents alone, that will do the project no good when the work is in progress and a piece of scope is missing. Therefore, the design team should include in their agreement time to review the CMc's scope descriptions prior to their release for bid. The architect should provide a written report on the bid package scope, noting in particular areas where the scope description doesn't appear to align with the design documents.

Release of early bid packages comes with the risk of subsequent changes that will be required when the design is further developed. As there is no fixed document set until all packages are bid, the architect may be responsible for ongoing document coordination with "as bid" conditions. Furthermore, the bid must align with the documents' intent, or a change order with accompanying additional services is in order. It should be clearly defined in the owner/CMc agreement that any deviation between the winning bid scope and the design documents be communicated—in writing—to the design team.

▶ See Bidding and Negotiation (10.8) for more detail on construction procurement in traditional project delivery.

CONSTRUCTION COST

An architect's ability to accurately estimate construction cost is limited. At best, a firm may have in-house expertise in quantifying materials, which the architect can then extrapolate into material cost for a building. Determining labor cost is a different matter. Special expertise is needed to analyze local market conditions, not only for payroll but also for production capabilities. For this expertise, owners turn to an independent cost estimator or, very often, the CMc.

CMc as Chief Estimator

Over the last few decades, owners have increasingly turned to construction managers for cost estimation services. The reasoning is as follows:

- The CM is experienced in the valuation of construction processes and materials.
- The CM is already providing other preconstruction services.

- The CM has business relations with subcontractors that can assist in fine-tuning an estimate.
- Where the CM is constructor, they will have an incentive to provide an accurate estimate.

While these arguments are valid, they don't take into account the specific cost management challenges with the CM as constructor. Such challenges include the conceptual mind-set of the design team as opposed to a more linear ideation of the builder; more important, there is an underlying conflict of interest inherent in this system of cost estimator as constructor.

A project cost estimate in a CMc project becomes, rightly or wrongly, a key measure of the CM's competence. Thus the temptation can arise, even unconsciously, to inflate line item values to ensure that the estimate "looks good" when measured against the bid values. Conversely, the CMc may artificially lower the estimate in response to owner pressure, confident that they will find cost savings during the course of bidding and negotiation that will bring cost of construction down. As a result of these manipulations, the project can suffer in one or more ways:

- Scope that should have been included in the project is cut due to cost, albeit artificially inflated.
- The inflated estimate is leaked to bidders, who then raise their bid in response, thinking that perhaps they are missing some scope.
- The suppressed estimate goes to bid, and when the numbers come in the extent of the budget shortfall is revealed, leading to a delayed start while the team scrambles to reduce cost.

A conflict also arises for the CMc after the bids come in. If the bids exceed their estimate, a misguided CM may make behind-the-scenes side agreements with subcontractors in an attempt to bring the bid down. Loss of project quality and divergence from the design intent are the usual consequences of these deals.

Internal conflict need not result from CMc estimation. Contingencies can guard the budget against indeterminate costs. Still, the system suffers from lack of precision, with the worst culprit central to the estimate: the guaranteed maximum price.

Guaranteed Maximum Price

The guaranteed maximum price (GMP) is the amount that the CMc sets for the cost of construction based on in-progress documents provided by the architects and engineers. It is designed to allow the CMc to commit to a price while the design—often during a fast-tracked process—is still underway, giving the owner price certainty. The CMc brings the estimate to a level that aligns with the design, anticipating all materials and labor needed to complete the building, even if those pieces are not yet shown in the documents. The closer the documents are to completion, the less anticipation will be required, and the more closely the GMP will align with the final bid. Once set, the CMc "guarantees" that this cost will not be exceeded. The moment when the GMP is "set" is thus critical.

Two competing interests are in play. The first is the desire to establish the GMP as early as possible. This locks the construction cost down so that the owner is sure their budget is met. However, when the GMP is set early, it must be based on assumptions for scope not yet defined in the documents, as well as projections of future costs of material and labor when the project finally does bid. Therefore, the CMc may push GMP close to, if not into, the bid period so that the owner's budget is set to actual construction costs. At that point, the at-risk component of the CMc's work is minimized.

No matter when the GMP is established, the CMc runs the risk of the estimate not meeting the as-bid amount. If the owner's budget is exceeded, there must be strategies in place to reduce the construction cost while allowing the project to proceed.

Value engineering (VE) is a critical service that the CMc provides. When correctly done, the VE process introduces materials and products that will achieve the design intent at a lower cost.

Cost-cutting suggestions should not be confused with value engineering. The CMc may combine the two, but where VE achieves the same intent at a lower cost, cost-cutting will change the original design to something the CMc hopes is similar but costs less.

The CMc is charged with the task of holding the GMP as construction proceeds. With an accelerated construction start combined with multiple bid packages, the bid documents can become dangerously unraveled, with later releases diverging from early ones. Ensuring that the GMP represents the documents, and vice versa, is a crucial part of the CMc delivery.

CMc DURING CONSTRUCTION

Releasing design documents in multiple bid packages often leads to changes in work "as bid" when the design is further developed. Another force is cost; as-bid packages come in and are compared to the estimate, the CMc will get a better idea as to whether the budget will be met. If bids come in high on early packages, the design team may need to scramble in an attempt to cut costs. It is very difficult to cut costs so late in the bid process, but the team must be prepared to try. Again, meticulous tracking of documents will help ensure that only the most current design is in the field.

Construction Phase Services

An architect's responsibilities in a CMc project parallel those in a traditionally delivered project, with specific changes that anticipate the unique role of the CMc, particularly with regard to fast-tracked projects and the GMP. The architect's contract and scope must anticipate the additional complexity and risk of both approaches and fees should anticipate additional effort by the architect during a CMc project. Owners often find this idea counterintuitive, assuming that the CMc is providing services during construction that might have otherwise been performed by the architect, but quite the opposite is the case. CMc projects are often more complicated, and that means more work for the architect.

A typical example is cost management during a CMc project. Should the cost of the job begin to drift above the budget, the CMc may use various maneuvers to meet budget. "Value engineering," cost-cutting, and bid scope descriptions are ways that the CMc may stray well into the design team's territory during construction. If the team collaborates, changes can often be made and the design intent maintained. However, unilateral changes by the CMc often compromise that intent, and the architect needs to continue to act on behalf of the owner to see that the project is constructed in accordance with the contract documents.

CHOOSING CMc PROJECT DELIVERY

An experienced and reliable CMc can provide real value to a properly configured and staffed project. Such benefits might include the following:

- Up-to-date cost estimates with real-world numbers that reflect the CMc's insight about market conditions.
- Constructability advice that can reduce requests for information during construction.
- Document review to help reduce change orders during construction.
- Advice on packaging documents for multiple bids to make the AE team's work more efficient.
- With multiple bid packages, the ability to deliver a project much more quickly than would otherwise be possible. This is one of the CMc's greatest contributions to the owner.

But experience suggests that the architect should be aware of the following potential pitfalls with a CMc delivery model that is not operating smoothly:

- CMc proposal of an unrealistically fast schedule in order to reflect the owner's deadlines
- Unfamiliarity with the building type retarding realistic constructability analysis during design
- Cost estimates that are not based on careful design documents
- Adjustments to the GMP that don't reflect agreed-upon design intent
- Lack of coordination between fast-tracked bid packages
- Undocumented subcontractor direction, before or after bids, not aligned with design intent
- Lack of adherence to the GMP without ramifications

THE FUTURE OF CMc DELIVERY

CMc delivery is used in a substantial number of projects, particularly those where schedule challenges are paramount or the owner has a consistent business relationship with a builder with whom there is confidence in a CM approach. The advent of building information modeling (BIM), combined with integrated project delivery (IPD) methods will affect the processes and procedures of CMc. Since BIM is likely to become the basis of design process for future buildings, the entity that develops and manages the model can capitalize on their skill set in providing services to the owner. Collaboration on building projects will be based on shared access to the building model and transparent construction costs. This is an opportunity for architects and construction managers to work together toward the best possible projects for their clients. As that approach matures, architects can assist the owner in selecting a CMc that will provide the benefits of a CMc delivery, while avoiding the pitfalls.

9.3 Integrated Project Delivery Overview

Randy Deutsch, AIA

Integrated project delivery (IPD) methods enable project stakeholders to work together in a unified effort that shares, to varying degrees, the risks and rewards involved in design and construction. This article describes IPD as it is understood and practiced in 2012.
