Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). **Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone and is used to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

MECASERMIN

(Recombinant human insulin-like growth factor-I; rhIGF-I)

Cautions correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions)

Contra-indications evidence of tumour activity (discontinue treatment)

Pregnancy avoid unless essential; contraception advised in women of child-bearing potential

Breast-feeding avoid

Side-effects headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia; visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

Indication and dose

Growth failure in children with severe primary insulin-like growth factor-I deficiency

• **By subcutaneous injection**

Child 2–18 years initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year

Counselling Dose should be administered just before or after food; do not increase dose if a dose is missed

Note Reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

Increlex[®] (Ipsen) (POM)

Injection, mecasermin 10 mg/mL, net price 4-mL vial = £605.00. Counselling, administration

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

7.1 Drugs used in obstetrics

This section is not included in *BNF for Children*. See BNF for management of obstetrics.

For the management of ductus arteriosus, see section 2.14.

7.2 Treatment of vaginal and vulval conditions

7.2.1 Preparations for vaginal and vulval changes

7.2.2 Vaginal and vulval infections

Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations (section 13.2.2) applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection (section 5.1) or threadworm infestation (section 5.5.1). Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults, see BNF section 7.2.2.

7.2.1 Preparations for vaginal and vulval changes

Topical oestrogen creams containing **estriol** 0.01% (*Gynest*[®]) are used in the treatment of labial adhesions (for details of preparation, see BNF section 7.2.1); treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

7.2.2 Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. *Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis*, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole, econazole, fenticonazole, and miconazole) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole (section 5.2.1) may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as anti-bacterial therapy, pregnancy, diabetes mellitus, and possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens suitable for older children [all unlicensed] include:

- initially, fluconazole (section 5.2.1) 150 mg by mouth every 72 hours for 3 doses, then 150 mg once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then clotrimazole 500-mg pessary once every week for 6 months.

PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS

Cautions avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

Pregnancy see notes above

Side-effects occasional local irritation

Licensed use consult product literature for individual preparations

Indication and dose

See notes above and under preparations below

Clotrimazole (Non-proprietary)

Cream (topical), clotrimazole 1%, net price 20 g = £1.52, 50 g = £4.12

Condoms effect on latex condoms and diaphragms not yet known

Dose

Apply to anogenital area 2–3 times daily

Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £3.13

Dose

Insert 1 pessary at night as a single dose; can be repeated once if necessary

Canesten® (Bayer Consumer Care)

Cream (topical), clotrimazole 1%, net price 20 g = £2.14; 50 g = £3.50

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose

Apply to anogenital area 2–3 times daily

Thrush Cream (topical), clotrimazole 2%, net price 20 g = £3.99

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose

Apply to anogenital area 2–3 times daily

Intravaginal cream (10% VC®) (PoM), clotrimazole 10%, net price 5-g applicator pack = £4.50

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose

Insert 5 g at night as a single dose; may be repeated once if necessary

Note Brands for sale to the public include *Canesten® Internal Cream*

Cream Combi, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £6.81

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose

See under individual components

Pessaries, clotrimazole 200 mg, 3 pessaries with applicator = £3.63

Condoms damages latex condoms and diaphragms

Dose

Insert 200 mg for 3 nights; course may be repeated once if necessary

Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £2.00

Excipients none as listed in section 13.1.3

Condoms damages latex condoms and diaphragms

Dose

Insert 1 pessary at night as a single dose; may be repeated once if necessary

Combi, clotrimazole 500-mg pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £5.21

Condoms damages latex condoms and diaphragms

Dose

See under individual components

Gyno-Daktarin® (Janssen) (P_M)

Ovule (= vaginal capsule) (*Gyno-Daktarin 1®*), miconazole nitrate 1.2 g in a fatty basis, net price 1 ovule = £2.94

Excipients include hydroxybenzoates (parabens)

Condoms damages latex condoms and diaphragms

Dose

Insert 1 ovule at night as a single dose; can be repeated once if necessary

Gyno-Pevaryl® (Janssen) (P_M)

Pessaries, econazole nitrate 150 mg, net price 3 pessaries = £2.78

Excipients none as listed in section 13.1.3

Condoms damages latex condoms and diaphragms

Dose

Insert 1 pessary for 3 nights; course can be repeated once if necessary

Pessary (*Gyno-Pevaryl 1®*), econazole nitrate 150 mg, formulated for single-dose therapy, net price 1 pessary with applicator = £2.95

Excipients none as listed in section 13.1.3

Condoms damages latex condoms and diaphragms

Dose

Insert 1 pessary at night as a single dose; can be repeated once if necessary

Gynoxin® (Recordati) (P_M)

Intravaginal cream, fenticonazole nitrate 2%, net price 30 g with applicator = £3.74

Excipients include cetyl alcohol, hydrogenated wool fat, propylene glycol

Condoms damages latex condoms and diaphragms

Dose

Insert 5-g applicatorful intravaginally twice daily for 3 days

Vaginal capsule, fenticonazole nitrate 200 mg, net price 3 vaginal capsules = £2.42

Excipients include hydroxybenzoates (parabens)

Condoms damages latex condoms and diaphragms

Dose

Insert 1 vaginal capsule at night for 3 nights

Vaginal capsule, fenticonazole nitrate 600 mg, net price 1 vaginal capsule = £2.62

Excipients include hydroxybenzoates (parabens)

Condoms damages latex condoms and diaphragms

Dose

Insert 1 vaginal capsule at night as a single dose

Nizoral® (Janssen) (P_M)

Cream (topical), ketoconazole 2%, net price 30 g = £3.40

Excipients include polysorbates, propylene glycol, stearyl alcohol

Condoms effect on latex condoms and diaphragms not yet known

Dose

Apply to anogenital area once or twice daily

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole (section 5.1.11) or tinidazole (section 5.4.2).

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

The antiviral drugs aciclovir, famciclovir, and valaciclovir can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3 for systemic preparations, and section 13.10.3 for topical preparations.

PREPARATIONS FOR OTHER VAGINAL INFECTIONS

Cautions avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative.

Dalacin® (Pharmacia) (P_M)

Cream, clindamycin 2% (as phosphate), net price 40-g pack with 7 applicators = £10.86

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

Condoms damages latex condoms and diaphragms

Side-effects irritation, cervicitis and vaginitis; poorly absorbed into the blood—low risk of systemic effects, see section 5.1.6

Licensed use not licensed for use in children under 12 years

Dose

Bacterial vaginosis

Insert 5-g applicatorful at night for 3–7 nights

Zidoval® (Meda) (P_M)

Vaginal gel, metronidazole 0.75%, net price 40-g pack with 5 applicators = £4.31

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Side-effects local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort

Licensed use not licensed for use in children under 18 years

Note Not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects

Dose

Bacterial vaginosis

Insert 5-g applicatorful at night for 5 nights

7.3 Contraceptives

- 7.3.1 Combined hormonal contraceptives
- 7.3.2 Progestogen-only contraceptives
- 7.3.3 Spermicidal contraceptives
- 7.3.4 Contraceptive devices
- 7.3.5 Emergency contraception

The Fraser Guidelines¹ should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is prelubricated but does not contain a spermicide.

Choice The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol valerate are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. *Phased* preparations are generally reserved for women who *either* do not have withdrawal bleeding *or* who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, weight gain, breast symptoms, and breakthrough bleeding) with other progestogens. However, women should be advised that desogestrel and gestodene have also been associated with an increased risk of *venous thromboembolism*. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*®).

The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

7.3.1 Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- reduced risk of symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease (particularly during the first year) in users of oral contraceptives, but this risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors for venous thromboembolism, such as obesity.

The incidence of venous thromboembolism in healthy, non-pregnant women who are not taking an oral contraceptive is about 5–10 cases per 100 000 women per year. For those using combined oral contraceptives containing second-generation progestogens, such as levonorgestrel, this incidence is about 15 per 100 000 women per year of use. The risk of venous thromboembolism with transdermal patches may be slightly increased compared with combined oral contraceptives that contain levonorgestrel. Some studies have reported a greater risk of venous thromboembolism in women using combined oral contraceptives containing the third-generation progestogens desogestrel and gestodene; the incidence in these women is about 25 per 100 000 women per year of use. The absolute risk of venous thromboembolism in women using combined oral contraceptives containing these third-generation

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at www.dh.gov.uk

progestogens is very small and well below the risk associated with pregnancy. The risk of venous thromboembolism in women using a combined oral contraceptive containing drospirenone may be between that associated with combined oral contraceptives containing second-generation progestogens and combined oral contraceptives containing third-generation progestogens. The risk of venous thromboembolism associated with vaginal ring use compared to the risk with other combined hormonal contraceptives is unknown.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Travel Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 5 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late; for women taking *Qlaira*®, see below. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

A missed pill for a woman taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If intercourse has occurred during this extended patch-free interval, a possibility of fertilisation should be considered. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- if ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- if ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if the removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of

persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days (9 days for *Qlaira*®) after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Interactions The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives (section 7.3.2.1), contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. **carbamazepine**, **modafinil**, **nelfinavir**, **nevirapine**, **oxcarbazepine**, **phenytoin**, **phenobarbital**, **primidone**, **ritonavir**, **St John's Wort**, **topiramate**, and, above all, **rifabutin** and **rifampicin**). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives (p. 404), intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a *short course (2 months or less) of an enzyme-inducing drug* (except rifampicin or rifabutin—see below), continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms daily and use a 'tricycling' regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option is to follow the advice for long-term courses below.
- For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.
- For a *long-term course (over 2 months) of an enzyme-inducing drug* (except rifampicin or rifabutin—see below), adjust the dose of combined oral contraceptive to provide at least ethinylestradiol 50 micrograms daily [unlicensed use] and use a 'tricycling' regimen (as above); continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For any course of **rifampicin** or **rifabutin**, an alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs. Since enzyme activity does not return to normal for several weeks after stopping an enzyme-inducing drug, appropriate contraceptive measures are required for 4 to 8 weeks after stopping.

Latest recommendations are that no additional contraceptive precautions are required when *combined* oral contraceptives are used with antibacterials that do not induce liver enzymes (e.g. ampicillin, doxycycline), unless diarrhoea or vomiting occur (see above)

It is also recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel; however, there is a lack of evidence to support this interaction.

For information on interactions of oral progestogen-only contraceptives, see also p. 403; for information on interactions of parenteral progestogen-only contraceptives, see also p. 404; for information on interactions of the intra-uterine progestogen-only device, see also p. 405; for information on interactions of hormonal emergency contraception, see also p. 408.

Surgery Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation, as above. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately Combined hormonal contraceptives should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or

weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;

- hepatitis, jaundice, liver enlargement;
- very high blood pressure;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below).

COMBINED HORMONAL CONTRACEPTIVES

Cautions see notes above; also risk factors for venous thromboembolism (see below and also notes above), arterial disease and migraine, see below; personal or family history of hypertriglyceridaemia (increased risk of pancreatitis); hyperprolactinaemia (seek specialist advice); history of severe depression especially if induced by hormonal contraceptive; undiagnosed breast mass; gene mutations associated with breast cancer (e.g. BRCA 1); sickle-cell disease; inflammatory bowel disease including Crohn's disease; reduced efficacy of contraceptive patch in women with body-weight ≥ 90 kg; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) —seek specialist advice; **interactions:** see above and Appendix 1 (oestrogens, progestogens)

Risk factors for venous thromboembolism See also notes above. Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- *obesity*—caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative;
- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *smoking*.

Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension* (avoid if blood pressure very high);
- *smoking* (avoid if smoking 40 or more cigarettes daily);
- *obesity*—caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative;
- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason to stop immediately in notes above)

Contra-indications see notes above; also personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus;

sclerosing treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus; acute porphyria (section 9.8.2); gallstones; history of haemolytic uraemic syndrome or history during pregnancy of pruritus, cholestatic jaundice, chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

Hepatic impairment avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

Pregnancy not known to be harmful

Breast-feeding avoid until weaning or for 6 months after birth (adverse effects on lactation)

Side-effects see notes above; also nausea, vomiting, abdominal cramps, changes in body-weight, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, 'spotting' in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion; contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches and vaginal rings is not yet known

Note The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

Licensed use consult product literature for the licensing status of individual preparations

Indication and dose

Contraception, menstrual symptoms (section 6.4.1.2)

• By mouth

Each tablet should be taken at approximately same time each day; if delayed contraceptive protection may be lost (see Missed Pill, above)

21-day combined (monophasic) preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); first course usually started on day 1 of cycle—if starting on day 4 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

Every day (ED) combined (monophasic) preparations, 1 active tablet starting on day 1 of cycle (see also under preparations below)—if starting on

day 4 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; withdrawal bleeding occurs when *inactive* tablets being taken; subsequent courses repeated without interval

Phasic preparations, see under individual preparations below

Changing to combined preparation containing different progestogen *21-day combined preparations*: continue current pack until last tablet and start first tablet of new brand the next day. If a 7-day break is taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days (9 days for *Qlaira*®) of taking the new brand
Every Day (ED) combined preparations: start the new brand (first tablet of a 21-day preparation or the first active tablet of an ED preparation) the day after taking the last active tablet of previous brand (omitting the inactive tablets)

Changing from progestogen-only tablet Start on day 1 of menstruation or any day if amenorrhoea present and pregnancy has been excluded

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®)

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®)

After abortion or miscarriage Start same day

• By transdermal application

Apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle

Note If first patch applied later than day 1, additional precautions (barrier methods) should be used for the next 7 days

Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

Changing from progestogen-only method From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be started on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch

• By vagina

Insert ring into vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

Note If first ring inserted later than day 1, additional precautions (barrier methods) should be used for the next 7 days

Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-

free, patch-free, or placebo-tablet interval. If previous contraceptive used correctly and pregnancy unlikely, can switch to ring on any day of cycle

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when injection next due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

After first trimester abortion Start immediately

After childbirth (not breast-feeding) or second trimester abortion Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion additional precautions (barrier methods) should be used for first 7 days

Oral (low and standard strength)

For information on these preparations, see Combined Oral Contraceptives table, p. 401

Transdermal (standard strength)

▲ Ethinylestradiol with Norelgestromin

See Risk of Venous Thromboembolism (in notes above) before prescribing

Evra® (Janssen) (POM)

Patches, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9-patch pack = £16.70. Counselling, administration

Dose

1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Note Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives

Vaginal (low strength)

▲ Ethinylestradiol with Etonogestrel

See Risk of Venous Thromboembolism (in notes above) before prescribing

NuvaRing® (Organon) ▼ (POM)

Vaginal ring, releasing ethinylestradiol approx. 15 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration

Dose

1 ring to be inserted into the vagina for 3 weeks, removed on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Counselling The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 397

Combined Oral Contraceptives

See Risk of Venous Thromboembolism (in notes above) before prescribing

Type of preparation	Oestrogen content	Progestogen content	Tablets per cycle	Brand	Price, 3-cycle pack (unless stated)	Manufacturer

1. Dose 1 tablet daily for 21 days starting on day 1 of cycle; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

2. Dose 1 tablet daily for 28 days, starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting routines see under Dose above

7.3.2 Progestogen-only contraceptives

- 7.3.2.1 Oral progestogen-only contraceptives
- 7.3.2.2 Parenteral progestogen-only contraceptives
- 7.3.2.3 Intra-uterine progestogen-only device

7.3.2.1 Oral progestogen-only contraceptives

Oral progestogen-only preparations may offer a suitable alternative when oestrogens are contra-indicated (including those patients with venous thrombosis or a past history or predisposition to venous thrombosis), but have a higher failure rate than combined preparations. They are suitable for heavy smokers, and for those with hypertension, valvular heart disease, diabetes mellitus, and migraine. Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

Interactions Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 398 and Appendix 1 (progestogens). For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

Surgery All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined oral contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for *Cerazette*[®]) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Start any time after 3 weeks postpartum (increased risk of breakthrough bleeding if started earlier).

Missed pill The following advice is now recommended by family planning organisations:

'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for *Cerazette*[®]) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 408) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for *Cerazette*[®]) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for *Cerazette*[®]) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

ORAL PROGESTOGEN-ONLY CONTRACEPTIVES

(Progestogen-only pill, 'POP')

Cautions arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies; functional ovarian cysts; history of jaundice in pregnancy; **interactions:** see notes above and Appendix 1 (progestogens)

Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

Contra-indications undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Hepatic impairment caution in active liver disease; and recurrent cholestatic jaundice, avoid in liver tumour

Pregnancy not known to be harmful

Breast-feeding progestogen-only contraceptives do not affect lactation; see also After Childbirth above

Side-effects menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, weight changes, changes in libido

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits

Licensed use consult product literature for the licensing status of individual preparations

Indication and dose**Contraception****• By mouth**

1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for *Cerazette*®) or more it should be regarded as a 'missed pill', see notes above

Cerazette® (Organon) (POM)

Tablets, f/c, desogestrel 75 micrograms, net price 3 × 28-tab pack = £8.68

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated

Femulen® (Pharmacia) (POM)

Tablets, etynodiol diacetate 500 micrograms, net price 3 × 28-tab pack = £3.31

Micronor® (Janssen) (POM)

Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £1.66

Norgeston® (Bayer Schering) (POM)

Tablets, s/c, levonorgestrel 30 micrograms, net price 35-tab pack = 92p

Noriday® (Pharmacia) (POM)

Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £2.10

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The reduction in bone mineral density occurs in the first 2–3 years of use and then stabilises. See also below.

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristeral*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients, however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant. *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

Implanon®, also an etonogestrel-releasing implant, has been discontinued (October 2010), but some women may have the implant in place until 2013.

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

Interactions Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone and medroxyprogesterone acetate intramuscular injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

7.3.2.2 Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (*Depo-Provera*®) is a long-acting progestogen given by intramuscular injection; it is as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Heavy bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after the birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of heavy or prolonged bleeding may be increased). The manufacturer advises that in women who are breast-feeding, the first dose should be delayed until 6 weeks after the birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

PARENTERAL PROGESTOGEN-ONLY CONTRACEPTIVES

Cautions see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of pruritus or of deterioration of otosclerosis, disturbances of lipid metabolism; **interactions**: see notes above and Appendix 1 (progestogens)

Counselling Full counselling backed by *patient information leaflet* required before administration

Contra-indications see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Hepatic impairment see Oral Progestogen-only Contraceptives, section 7.3.2.1

Pregnancy not known to be harmful; for *Implanon*® or *Nexplanon*® if pregnancy occurs remove implant

Breast-feeding progestogen-only contraceptives do not affect lactation; see also notes above

Side-effects see notes above; injection-site reactions

Cervical cancer Use of injectable progestogen-only contraceptives is associated with a small increased risk of cervical cancer; this increased risk may be similar to that seen with combined oral contraceptives, see p. 399. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Licensed use consult product literature for the licensing status of individual preparations

Indication and dose

Contraception see also notes above and under preparations (roles vary according to preparation)

For dose see under preparations

Injectable preparations

Depo-Provera® (Pfizer) [PAM]

Injection (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL pre-filled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

Dose

• By deep intramuscular injection

150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks and 5 days, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

Noristerat® (Bayer Schering) [PAM]

Injection (oily), norethisterone enantate 200 mg/mL, net price 1-mL amp = £3.38. Counselling, see patient information leaflet

Dose

• By deep intramuscular injection

Given very slowly into *gluteal muscle*, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks); may be repeated once after 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

Implants

Nexplanon® (Organon) [PAM]

Implant, containing etonogestrel 68 mg in radiopaque flexible rod, net price = £79.46. Counselling, see patient information leaflet

Dose

• By subdermal implantation

No hormonal contraceptive use in previous month, 1 implant inserted during first 5 days of cycle; postpartum, 1 implant inserted 21–28 days after delivery; in breastfeeding mothers, 1 implant inserted after 28 days postpartum; abortion or miscarriage in the second trimester, 1 implant inserted 21–28 days after abortion or miscarriage; abortion or miscarriage in first trimester, 1 implant inserted within 5 days; changing from other hormonal contraceptive, consult product literature; remove implant within 3 years of insertion

7.3.2.3 Intra-uterine progestogen-only device

The progestogen-only intra-uterine system, *Mirena*®, releases **levonorgestrel** directly into the uterine cavity. It is used as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

Cautions and contra-indications Generally the cautions and contra-indications for the progestogen-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4). Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

Side-effects Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM

Cautions see notes above; history of depression; advanced uterine atrophy; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; not suitable for emergency contraception; **interactions:** see notes above and Appendix 1 (progestogens)

Contra-indications see notes above

Hepatic impairment see Oral Progestogen-only Contraceptives, section 7.3.2.1

Pregnancy avoid; if pregnancy occurs remove system

Breast-feeding progestogen-only contraceptives do not affect lactation

Side-effects see notes above; also abdominal pain, expulsion; peripheral oedema; depression (sometimes severe), nervousness; salpingitis, and pelvic inflammatory disease; pelvic pain, back pain; rarely uterine perforation, hirsutism, hair loss, pruritus, migraine, rash

Licensed use not licensed for use in women under 18 years

Indication and dose

See under preparation

Mirena® (Bayer Schering) (FOM)

Intra-uterine system, T-shaped plastic frame (impregnated with barium sulphate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours, net price = £85.66. Counselling, see patient information leaflet

Dose

Contraception and menorrhagia

Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain the woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Note When system is removed (and not immediately replaced) and pregnancy is not desired, remove during first few days of menstruation, otherwise additional contraceptive measures required for at least 7 days before removal

Prevention of endometrial hyperplasia during oestrogen replacement therapy

Insert during last days of menstruation or withdrawal bleeding or anytime if amenorrhoeic; effective for 4 years

7.3.3 Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Gygel® (Marlborough)

Gel, nonoxinol '9' 2%, net price 30 g = £4.25

Excipients include hydroxybenzoates (parabens), propylene glycol, sorbic acid

Condoms No evidence of harm to latex condoms and diaphragms

Pregnancy toxicity in animal studies

Breast-feeding present in milk in animal studies

7.3.4 Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years (see below). The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms.

Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

A frameless, copper-bearing intra-uterine device (*GyneFix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus. The intra-uterine devices *Multiload*® *Cu250* and *Multiload*® *Cu250 Short* (Organon) have been discontinued, but some women may have the devices in place until 2011.

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and*

should provide full counselling, backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation. The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women under 25 years are at a higher risk of sexually transmitted infections, and pre-insertion screening (for chlamydia, and depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

INTRA-UTERINE CONTRACEPTIVE DEVICES

Cautions see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to see doctor promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible)

Contra-indications severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; *copper devices*: copper allergy, Wilson's disease, medical diathermy

Pregnancy remove device; if pregnancy occurs, increased likelihood that it may be ectopic

Breast-feeding not known to be harmful

Side-effects uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; *on insertion*: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

Indication and dose

See notes above

Cu-Safe® T300 (Williams)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.11

For uterine length over 5 cm; replacement every 5 years (see also notes above)

Flexi-T 300® (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47

For uterine length over 5 cm; replacement every 5 years (see also notes above)

Flexi-T® + 380 (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06

For uterine length over 6 cm; replacement every 5 years (see also notes above)

GyneFix® (Williams)

Intra-uterine device, 6 copper sleeves with surface area of 330 mm² on polypropylene thread, net price = £26.64

Suitable for all uterine sizes; replacement every 5 years

Load® 375 (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.52

For uterine length over 7 cm; replacement every 5 years (see also notes above)

Mini TT 380® Slimline (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For minimum uterine length 5 cm; replacement every 5 years (see also notes above)

Multiload® Cu375 (Organon)

Intra-uterine device, as *Load® 375*, with copper surface area approx. 375 mm² and vertical stem length 3.5 cm, net price = £9.24

For uterine length 6–9 cm; replacement every 5 years (see also notes above)

Multi-Safe® 375 (Williams)

Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80

For uterine length 6–9 cm; replacement every 5 years (see also notes above)

MultiSafe® 375 Short Stem (Williams)

Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80

For uterine length 5–7 cm; replacement every 5 years (see also notes above)

Neo-Safe® T380 (Williams)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £13.80

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Nova-T® 380 (Bayer Schering)

Intra-uterine device, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £12.97

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

T-Safe® 380A Quickload (Williams)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar on the distal portion of each arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £10.29; available with a capsule loading device (*T-Safe® CU 380A*), net price £10.29

For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

TT 380® Slimline (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

UT 380 Short® (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22

For uterine length 5–7 cm; replacement every 5 years (see also notes above)

UT 380 Standard® (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Other contraceptive devices**▀ Rubber contraceptive caps****Type A Contraceptive Pessary**

Opaque rubber, sizes 1 (50 mm), 2 (55 mm), 3 (60 mm), 4 (65 mm), 5 (75 mm), net price = £6.85

Type B Contraceptive Pessary

Opaque rubber, sizes 22 to 31 mm (rising in steps of 3 mm), net price = £8.46

Type C Contraceptive Pessary

Opaque rubber, sizes 1 to 3 (42, 48, and 54 mm), net price = £7.26

▀ Silicone contraceptive caps**Silicone Contraceptive Pessary**

Silicone, sizes 22, 26, and 30 mm, net price = £15.00

Brands include *FemCap®*

▀ Rubber contraceptive diaphragms**Type A Diaphragm with Flat Metal Spring**

Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £5.78

Brands include *Reflexions®*

Type B Diaphragm with Coiled Metal Spring

Opaque rubber with coiled metal spring, sizes 60–100 mm (rising in steps of 5 mm), net price = £6.79

Type C Arcing Spring Diaphragm

Opaque rubber with arcing spring, sizes 60–95 mm (rising in steps of 5 mm), net price = £7.72

▀ Silicone contraceptive diaphragms**Type B Diaphragm with Coiled Metal Spring**

Silicone with coiled metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35

Brands include *Milex Omniflex®*

Type C Arching Spring diaphragm

Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35

Brands include *Milex Arcing Style®, Ortho All-Flex®*

7.3.5 Emergency contraception**Hormonal methods**

Hormonal emergency contraceptives include **levonorgestrel** and **ulipristal**; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 120 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel but its efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given. If an anti-emetic is required domperidone is preferred.

When prescribing hormonal emergency contraception the doctor should explain:

- that the next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- the need to return promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy (and also in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned).

Interactions The effectiveness of levonorgestrel, and possibly ulipristal is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead or the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise

women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

LEVONORGESTREL

Cautions see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; **interactions:** see notes above and Appendix 1 (progestogens)

Contra-indications acute porphyria (section 9.8.2)

Pregnancy not known to be harmful

Breast-feeding progestogen-only contraceptives do not affect lactation

Side-effects menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

Licensed use consult product literature

Indication and dose

Emergency contraception

• By mouth

1.5 mg as a single dose as soon as possible after coitus (preferably within 12 hours but no later than after 72 hours)

1 Levonelle® One Step (Bayer Schering)

Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society

Levonelle® 1500 (Bayer Schering) (POM)

Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20

ULIPRISTAL ACETATE

Cautions see notes above; uncontrolled severe asthma; effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required; repeated use within a menstrual cycle; **interactions:** see notes above and Appendix 1 (ulipristal)

Hepatic impairment manufacturer advises avoid in severe impairment—no information available

Pregnancy limited information available

Breast-feeding manufacturer advises avoid for at least 36 hours—no information available

Side-effects gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, and abdominal pain); dizziness, fatigue, headache; menstrual irregularities (see notes above); back pain, muscle spasms; *less commonly* tremor, hot flushes, uterine spasm, breast tenderness, dry mouth, blurred vision, pruritus, and rash

Indication and dose

Emergency contraception

• By mouth

30 mg as a single dose as soon as possible after coitus, but no later than after 120 hours

ellaOne® (HRA Pharma) ▼ (POM)

Tablets, ulipristal acetate 30 mg, net price 1-tab pack = £16.95

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception, see also notes above. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

7.4.3 Drugs used in urological pain

7.4.4 Bladder instillations and urological surgery

7.4.5 Drugs for erectile dysfunction

For drugs used in the treatment of urinary-tract infections see section 5.1.13.

7.4.1 Drugs for urinary retention

Acute retention is painful and is treated by catheterisation.

Chronic retention is painless and often long-standing. Clean intermittent catheterisation may be considered. After the cause has been established and treated, drugs may be required to increase detrusor muscle tone.

Alpha-blockers such as doxazosin and tamsulosin can be used in some cases of dysfunctional voiding.

Alpha-blockers

The selective alpha-blockers **doxazosin** and **tamsulosin** can be used to improve bladder emptying in children with dysfunctional voiding where the post-void residual urine volume is significant; treatment should be under specialist advice only. Alpha-blockers can reduce blood pressure rapidly after the first dose and should be introduced with caution.

DOXAZOSIN

Cautions see under Doxazosin (section 2.5.4)

Contra-indications see under Doxazosin (section 2.5.4)

Hepatic impairment see under Doxazosin (section 2.5.4)

Pregnancy see under Doxazosin (section 2.5.4)

Breast-feeding see under Doxazosin (section 2.5.4)

Side-effects see under Doxazosin (section 2.5.4)

Licensed use not licensed for use in children

Indication and dose

Dysfunctional voiding (see notes above)

- **By mouth**

Child 4–12 years initially 0.5 mg daily increased at monthly intervals according to response; maximum 2 mg daily

Child 12–18 years initially 1 mg daily, dose may be doubled at intervals of 1 month according to response; usual maintenance 2–4 mg daily; max. 8 mg daily

Hypertension section 2.5.4

Preparations

Section 2.5.4

TAMSULOSIN HYDROCHLORIDE

Cautions care with initial dose (postural hypotension); cataract surgery (risk of intra-operative floppy iris syndrome); **interactions:** Appendix 1 (alpha-blockers)

Driving May affect performance of skilled tasks e.g. driving

Contra-indications history of postural hypotension

Hepatic impairment avoid in severe impairment

Renal impairment use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Side-effects dizziness, headache, asthenia; abnormal ejaculation; *less commonly* nausea, vomiting, constipation, diarrhoea, palpitation, postural hypotension, syncope, rhinitis, rash, pruritus, and urticaria; *very rarely* angioedema and priapism; also drowsiness, blurred vision, dry mouth, and oedema; *also reported* intra-operative floppy iris syndrome

Licensed use not licensed for use in children

Indication and dose

Dysfunctional voiding (see notes above)

- **By mouth**

Child 12–18 years 400 micrograms once daily

Tamsulosin hydrochloride (Non-proprietary) (POM)

Capsules, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £4.62. Label: 25, counselling, driving

Brands include *Bazetham*[®] MR, *Contiflo*[®] XL, *Diffundox*[®] XL, *Pinexel*[®] PR, *Stronazon*[®] MR, *Tabphyn*[®] MR

Flomaxtra[®] XL (Astellas) (POM)

Tablets, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-tab pack = £10.47. Label: 25, counselling, driving

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

Urinary incontinence

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; **oxy-**

butynin also has a direct relaxant effect on urinary smooth muscle. Oxybutynin can be considered first for children under 12 years. Side-effects limit the use of oxybutynin, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin can be given by intravesicular instillation. **Tolterodine** is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin. Modified-release preparations of oxybutynin and tolterodine are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled (see p. 411).

Cautions Antimuscarinic drugs should be used with caution in autonomic neuropathy and in children susceptible to angle-closure glaucoma. Antimuscarinics can worsen hyperthyroidism, congestive heart failure, arrhythmias, and tachycardia. For **interactions**, see Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinic drugs should be avoided in myasthenia gravis, significant bladder out-flow obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

Side-effects Side-effects of antimuscarinic drugs include dry mouth, gastro-intestinal disturbances including constipation, blurred vision, dry eyes, drowsiness, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arrhythmias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsions may occur. Antimuscarinic drugs may reduce sweating leading to heat sensations and fainting in hot environments or in patients with fever, and *very rarely* may precipitate angle-closure glaucoma.

OXYBUTYNYN HYDROCHLORIDE

Cautions see notes above; acute porphyria (section 9.8.2)

Contra-indications see notes above

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises avoid unless essential—*toxicity in animal studies*

Breast-feeding manufacturer advises avoid—*present in milk in animal studies*

Side-effects see notes above; also dizziness; *less commonly* anorexia, facial flushing; *rarely* night terrors

Licensed use not licensed for use in children under 5 years; intravesicular instillation not licensed for use in children

Indication and dose

Urinary frequency, urgency and incontinence, neurogenic bladder instability

- **By mouth**

Child 2–5 years 1.25–2.5 mg 2–3 times daily;

Child 5–12 years 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily

Child 12–18 years 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily

• **By intravesical instillation**

Child 2–18 years 5 mg 2–3 times daily

Nocturnal enuresis associated with overactive bladder

• **By mouth**

Child 5–18 years 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

Oxybutynin Hydrochloride (Non-proprietary) (POM)

Tablets, oxybutynin hydrochloride 2.5 mg, net price 56-tab pack = £6.58; 3 mg, 56-tab pack = £9.15; 5 mg, 56-tab pack = £5.53, 84-tab pack = £12.50. Label: 3

Intravesical instillation, oxybutynin (as hydrochloride) 5 mg/30 mL.

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Cystrin® (Winthrop) (POM)

Tablets, oxybutynin hydrochloride 5 mg (scored), net price 84-tab pack = £21.99. Label: 3

Ditropan® (Sanofi-Aventis) (POM)

Tablets, both blue, scored, oxybutynin hydrochloride 2.5 mg, net price 84-tab pack = £6.59; 5 mg, 84-tab pack = £12.82. Label: 3

▲ **Modified release**

Lyrinel® XL (Janssen) (POM)

Tablets, m/r, oxybutynin hydrochloride 5 mg (yellow), net price 30-tab pack = £10.81; 10 mg (pink), 30-tab pack = £21.62. Label: 3, 25

Dose

Neurogenic bladder instability

• **By mouth**

Child 6–18 years initially 5 mg once daily adjusted according to response in steps of 5 mg at weekly intervals; max. 15 mg once daily

Note Children taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*® XL

TOLTERODINE TARTRATE

Cautions see notes above; history of QT-interval prolongation; concomitant use with other drugs known to prolong QT interval

Contra-indications see notes above

Hepatic impairment reduce dose; avoid *Detrusitol*® XL

Renal impairment reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; avoid *Detrusitol*® XL if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid—toxicity in animal studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, vertigo, weight gain; flushing also reported

Licensed use not licensed for use in children

Indication and dose

Urinary frequency, urgency, incontinence

• **By mouth**

Child 2–18 years 1 mg once daily, increased according to response; max. 2 mg twice daily

Nocturnal enuresis associated with overactive bladder

• **By mouth**

Child 5–18 years 1 mg once daily at bedtime, increased according to response; max. 2 mg twice daily

Detrusitol® (Pharmacia) (POM)

Tablets, f/c, tolterodine tartrate 1 mg, net price 56-tab pack = £29.03; 2 mg, 56-tab pack = £30.56

▲ **Modified release**

Detrusitol® XL (Pharmacia) (POM)

Capsules, blue, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 25

Note Children stabilised on immediate-release tolterodine 2 mg twice daily may be transferred to *Detrusitol*® XL 4 mg once daily

Nocturnal enuresis

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An **enuresis alarm** should be first-line treatment for motivated, well supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with **desmopressin** (see below), or desmopressin alone if the alarm is no longer appropriate or desirable.

Desmopressin (section 6.5.2), an analogue of vasopressin, is given by oral or by sublingual administration; it should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Desmopressin should be withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. Particular care is needed to avoid fluid overload by restricting fluid intake from

1 hour before taking desmopressin until 8 hours after. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with antimuscarinic drugs (see Urinary incontinence, p. 410) in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant **imipramine** (section 4.3.1) may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully reassessed; toxicity following overdosage with tricyclics is of particular concern.

7.4.3 Drugs used in urological pain

Lidocaine gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation (section 15.2).

Alkalinisation of urine

Alkalinisation of urine can be undertaken with **potassium citrate**. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections.

POTASSIUM CITRATE

Cautions cardiac disease; **interactions:** Appendix 1 (potassium salts)

Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

Side-effects hyperkalaemia on prolonged high dosage, mild diuresis

Indication and dose

Relief of discomfort in mild urinary-tract infections, alkalinisation of urine for dose see preparations below

Potassium Citrate Mixture BP (Potassium Citrate Oral Solution)

Oral solution, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL. Label: 27

Dose

- By mouth

Child 1–6 years 5 mL 3 times daily well diluted with water

Child 6–18 years 10 mL 3 times daily well diluted with water

Note Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

7.4.4 Bladder instillations and urological surgery

Bladder infection Various solutions are available as irrigations or washouts.

Aqueous **chlorhexidine** (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used, but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile **sodium chloride solution 0.9%** (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots Clot retention is usually treated by irrigation with sterile **sodium chloride solution 0.9%** but sterile **sodium citrate solution for bladder irrigation 3%** may also be helpful.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

CATHETER PATENCY SOLUTIONS

Chlorhexidine 0.02%

Brands include *Uro-Tainer Chlorhexidine*[®], 100-mL sachet = £2.60

Sodium chloride 0.9%

Brands include *OptiFlo S*[®], 50- and 100-mL sachets = £3.20; *Uriflex S*[®], 100-mL sachet = £2.40; *Uriflex SP*[®], with integral drug additive port, 100-mL sachet = £2.40; *Uro-Tainer Sodium Chloride*[®], 50- and 100-mL sachets = £3.25; *Uro-Tainer M*[®], with integral drug additive port, 50- and 100-mL sachets = £2.90

Solution G

Citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include *OptiFlo G*[®], 50- and 100-mL sachets = £3.40; *Uriflex G*[®], 100-mL sachet = £2.40; *Uro-Tainer*[®] *Twin Suby G*, 2 × 30-mL = £4.46

Solution R

Citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include *OptiFlo R*[®], 50- and 100-mL sachets = £3.40; *Uriflex R*[®], 100-mL sachet = £2.40; *Uro-Tainer*[®] *Twin Solutio R*, 2 × 30-mL = £4.46

7.4.5 Drugs for erectile dysfunction

This section is not included in *BNF for Children*. Adolescents presenting with erectile dysfunction should be referred to a specialist.

8 Malignant disease and immunosuppression

8.1 Cytotoxic drugs	414
8.1.1 Alkylating drugs	419
8.1.2 Cytotoxic antibiotics	421
8.1.3 Antimetabolites	423
8.1.4 Vinca alkaloids and etoposide	426
8.1.5 Other antineoplastic drugs	427
8.2 Drugs affecting the immune response	431
8.2.1 Antiproliferative immunosuppressants	431
8.2.2 Corticosteroids and other immunosuppressants	433
8.2.3 Rituximab and alemtuzumab	438
8.2.4 Other immunomodulating drugs	439
8.3 Sex hormones and hormone antagonists in malignant disease	441

8.1 Cytotoxic drugs

8.1.1 Alkylating drugs	
8.1.2 Cytotoxic antibiotics	
8.1.3 Antimetabolites	
8.1.4 Vinca alkaloids and etoposide	
8.1.5 Other antineoplastic drugs	

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics;
- Reconstitution should be carried out in designated pharmacy areas;
- Protective clothing (including gloves, gowns, and masks) should be worn;
- The eyes should be protected and means of first aid should be specified;
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
- Staff exposure to cytotoxic drugs should be monitored.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:

Department of Health
PO Box 777
London SE1 6XH
Fax: 01623 724524
www.dh.gov.uk

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is co-ordinated by a multi-disciplinary team;
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan;
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration;
- Oral cytotoxic medicines should be dispensed with clear directions for use.

Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients and their carers should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital

Doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Side-effects of cytotoxic drugs and their management

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and treatment protocols should be consulted for full details of side-effects of individual drugs.

Side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that children, their carers, and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs A number of cytotoxic drugs will cause severe local tissue irritation and necrosis if leakage into the extravascular compartment occurs. For information on the prevention and management of extravasation injury, see section 10.3.

Gastro-intestinal effects Management of gastro-intestinal effects of cytotoxic drugs includes the use of antacids, H₂-receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

Oral mucositis Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements (section 9.5.3) can be used on the advice of the child's dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia (section 4.7.2). Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole (section 5.2), is effective.

Nausea and vomiting Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the

symptoms vary according to the dose, to other drugs administered, and to the individual's susceptibility to metogenetic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide, low doses of methotrexate, the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—carboplatin, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate.

Highly emetogenic treatment—cisplatin, dacarbazine, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

Prevention of acute symptoms For patients at *low risk of emesis*, pretreatment with metoclopramide (or less commonly domperidone) continued for up to 24 hours after chemotherapy, is often effective (section 4.6); a 5HT₃-receptor antagonist (section 4.6) may also be of benefit.

For patients at *high risk of emesis* or when other treatment is inadequate, a 5HT₃-receptor antagonist (section 4.6) is often highly effective. The addition of dexamethasone and other anti-emetics may also be required.

Prevention of delayed symptoms Dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide. The 5HT₃-receptor antagonists may have a role in preventing uncontrolled symptoms.

Prevention of anticipatory symptoms Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesiac, sedative, and anxiolytic effects.

Bone-marrow suppression All cytotoxic drugs except vincristine and bleomycin cause bone-marrow depression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors (section 9.1.6); their use should be reserved for children who have previously experienced severe neutropenia.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens (Table 1, section 5.1). Appropriate bacteriological investigations should be conducted as soon as possible. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment (section 5.2) may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella-zoster immunoglobulin (section 14.5.2) is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis (section 5.3.2.1) can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella-zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin (section 14.5.1) should be given.

For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1.

Alopecia Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

Pregnancy and reproductive function Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Regimens that do not contain an alkylating drug may have less effect on fertility, but those with an alkylating drug carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Long-term and delayed toxicity Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin or nephrotoxicity with cisplatin and ifosfamide). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

Thromboembolism Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Tumour lysis syndrome Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Drugs for cytotoxic-induced side-effects

Anthracycline-induced cardiotoxicity

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Dexrazoxane, an iron chelator, is licensed in adults for the prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic cancer patients who have previously received anthracycline therapy. In practice, dexrazoxane is used for any patient receiving anthracycline therapy with evidence of subclinical cardiotoxicity thought to be secondary to anthracycline therapy, or for those children at risk of anthracycline-induced cardiotoxicity. Children receiving dexrazoxane should continue to be monitored for cardiac toxicity. The myelosuppressive effects of dexrazoxane may be additive to those of chemotherapy.

DEXRAZOXANE

Cautions see notes above; monitor full blood count

Hepatic impairment monitor liver function

Renal impairment use with caution—risk of accumulation; manufacturer of *Cardioxane*[®] advises reduce dose by 50% if creatinine clearance less than 40 mL/minute/1.73 m²

Pregnancy avoid unless essential (toxicity in *animal* studies); ensure effective contraception during and for 3 months after treatment in men and women

Breast-feeding discontinue breast-feeding

Side-effects nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, stomatitis, dry mouth, anorexia; dyspnoea; dizziness, syncope, asthenia, paraesthesia, tremor, fatigue, drowsiness; pyrexia; vaginal haemorrhage; myalgia; blood disorders (including anaemia, leucopenia, neutropenia, and thrombocytopenia); alopecia, pruritus; peripheral oedema, injection-site reactions including phlebitis; *also reported* secondary malignancies

Indication and dose

Prevention of anthracycline-induced cardiotoxicity (see notes above)

- **By intravenous infusion, 30 minutes prior to anthracycline administration**

10–20 times the doxorubicin-equivalent dose (depending on treatment protocol) or 10 times the epirubicin-equivalent dose

Administration for *intravenous infusion* reconstitute each vial with 25 mL Water for Injections then dilute contents of each vial with 25–100 mL Compound Sodium Lactate; give over 15 minutes

Cardioxane[®] (Novartis) ▼ (P_M)

Intravenous infusion, powder for reconstitution, dexrazoxane (as hydrochloride), net price 500-mg vial = £156.57

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure.

Allopurinol is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine or azathioprine should be reduced if allopurinol is given concomitantly (see Appendix 1).

Rasburicase is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma uric acid and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

ALLOPURINOL

Cautions ensure adequate fluid intake; for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy; **interactions:** Appendix 1 (allopurinol)

Hepatic impairment reduce dose, monitor hepatic function

Renal impairment manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre

Pregnancy toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child

Breast-feeding present in milk—not known to be harmful

Side-effects rashes (**withdraw** therapy; if rash mild re-introduce cautiously but **discontinue** immediately if recurrence—hypersensitivity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Stevens-Johnson or toxic epidermal necrolysis, vasculitis, hepatitis, renal impairment, and *very rarely* seizures); gastro-intestinal disorders; *rarely* malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatotoxicity, paraesthesia and neuropathy, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

Indication and dose

Prophylaxis of hyperuricaemia associated with cancer chemotherapy, prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g. Lesch-Nyhan syndrome

- **By mouth**

Child 1 month–15 years 10–20 mg/kg daily (max. 400 mg daily), preferably after food

Child 15–18 years initially 100 mg daily, increased according to response; max. 900 mg daily (doses over 300 mg daily given in divided doses); preferably after food

Allopurinol (Non-proprietary) (P_M)

Tablets, allopurinol 100 mg, net price 28-tab pack = £1.18; 300 mg, 28-tab pack = £1.32. Label: 8, 21, 27
Brands include *Caplenal*[®], *Cosuric*[®], *Rimapurinol*[®]

Zyloric[®] (Aspen) (P_M)

Tablets, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Label: 8, 21, 27

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

RASBURICASE

Cautions monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature

Contra-indications G6PD deficiency (section 9.1.5)

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects fever; nausea, vomiting; less frequently diarrhoea, headache, hypersensitivity reactions (including rash, bronchospasm and anaphylaxis); haemolytic anaemia, methaemoglobinaemia

Licensed use not licensed for use in children

Indication and dose

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

- **By intravenous infusion**

Consult local treatment protocol for details

Fasturtec® (Sanofi-Aventis) (POM)

Intravenous infusion, powder for reconstitution, rasburicase, net price 1.5-mg vial (with solvent) = £57.88; 7.5-mg vial (with solvent) = £241.20

Methotrexate-induced mucositis and myelosuppression

Folinic acid (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

The calcium salt of **levofolinic acid**, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre).

In the treatment of methotrexate overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

FOLINIC ACID

Cautions avoid simultaneous administration of methotrexate; **not** indicated for pernicious anaemia or other megaloblastic anaemias due to vitamin B₁₂ deficiency; **interactions:** Appendix 1 (folates)

Safe Practice

Intrathecal injection **contra-indicated**

Pregnancy not known to be harmful; benefit outweighs risk

Breast-feeding presence in milk unknown but benefit outweighs risk

Side-effects rarely pyrexia after parenteral use; gastro-intestinal disturbances, insomnia, agitation, and depression after high doses

Licensed use consult product literature for licensing status of individual preparations

Indication and dose

See under preparation

Calcium folinate

(Calcium leucovorin)

Calcium Folate (Non-proprietary) (POM)

Tablets, scored, folinic acid (as calcium salt) 15 mg, net price 10-tab pack = £39.20, 30-tab pack = £85.74
Brands include *Refolinon*®

Note Not all strengths and pack sizes are available from all manufacturers

Injection, folinic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £4.62; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £35.09, 30-mL vial = £94.69, 35-mL vial = £90.98

Brands include *Refolinon*®

Note Not all strengths and pack sizes are available from all manufacturers

Injection, powder for reconstitution, folinic acid (as calcium salt), net price 15-mg vial = £4.46; 30-mg vial = £8.36

Dose

Reduction of methotrexate-induced toxicity

- **By mouth, by intravenous injection or by intravenous infusion**

See notes above. Consult local treatment protocol for details

Methotrexate overdose

- **By intravenous injection or by intravenous infusion**

See notes above. Consult local treatment protocol for details

Megaloblastic anaemia due to folate deficiency

- **By mouth**

Child up to 12 years 250 microgram/kg once daily

Child 12–18 years 15 mg once daily

Metabolic disorders leading to folate deficiency

- **By mouth or by intravenous infusion**

Child up to 18 years 15 mg once daily; larger doses may be required in older children

Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

- **By mouth**

Neonate 5 mg 3 times a week (increased up to 20 mg 3 times a week if neutropenic)

Child 1 month–1 year 10 mg 3 times a week

Disodium folinate

Sodiofolin® (Medac) (POM)

Injection, folinic acid (as disodium salt) 50 mg/mL, net price 2-mL vial = £35.09, 8-mL vial = £126.25, 18-mL vial = £284.07

Dose

Antidote to methotrexate

- **By intravenous injection or by intravenous infusion**

Consult local treatment protocols for details

LEVOFOLINIC ACID

Note Levofolinic acid is an isomer of folinic acid

Cautions see Folinic acid

Safe Practice

Intrathecal injection **contra-indicated**

Pregnancy see Folinic acid

Breast-feeding see Folinic acid

Side-effects see Folinic acid

Indication and dose**Reduction of methotrexate-induced toxicity**

- By intramuscular injection or by intravenous injection or by intravenous infusion

See notes above. Consult local treatment protocol for details

Methotrexate overdose

- By intramuscular injection or by intravenous injection or by intravenous infusion

See notes above. Consult local treatment protocol for details

▲ **Calcium levofolinate**

(Calcium levoleucovorin)

Calcium Levofolinate (Non-proprietary)

Injection, levofolinic acid (as calcium salt) 10 mg/mL, net price 17.5-mL vial = £84.63

Isovorin® (Wyeth) (POM)

Injection, levofolinic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

▲ **Disodium levofolinate**

Levofolinic Acid (Non-proprietary) (POM)

Injection, levofolinic acid (as disodium salt) 50 mg/mL, net price 1-mL vial = £24.70, 4-mL vial = £80.40

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna reacts specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine. For the role of nebulised mesna as a mucolytic in cystic fibrosis, see section 3.7.

MESNA

Contra-indications hypersensitivity to thiol-containing compounds

Pregnancy not known to be harmful

Side-effects nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; rarely hypersensitivity reactions (more common in patients with auto-immune disorders)

Licensed use not licensed for use in children

Indication and dose**Urothelial toxicity following oxazaphosphorine therapy**

- By intravenous injection or by continuous intravenous infusion

See notes above. Consult local treatment protocol for details

Mucolytic in cystic fibrosis section 3.7**Mesna** (Non-proprietary) (POM)

Tablets, f/c, mesna 400 mg, net price 10-tab pack = £42.90; 600 mg, 10-tab pack = £61.10

Injection, mesna 100 mg/mL, net price 4-mL amp = £3.95; 10-mL amp = £9.77

Note For oral administration contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container

8.1.1 Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), problems associated specifically with alkylating drugs include:

- an adverse effect on gametogenesis which may be reversible, particularly in females; amenorrhoea may also occur, which also may be reversible;
- a marked increase in the incidence of secondary tumours and leukaemia, particularly when alkylating drugs are combined with extensive irradiation;
- fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids;
- urothelial toxicity with intravenous use; adequate hydration may reduce this risk; mesna (section 8.1) provides further protection against urotoxic effects of cyclophosphamide and ifosfamide.

BUSULFAN

(Busulphan)

Cautions see section 8.1 and notes above; monitor blood count regularly throughout treatment; monitor liver function; previous mediastinal or pulmonary radiation therapy; avoid in acute porphyria (but see section 9.8.2); **interactions**: Appendix 1 (busulfan)

Hepatic impairment manufacturer advises monitor hepatic function—no information available

Pregnancy avoid (teratogenic in *animals*); manufacturers advise effective contraception during and for 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also hepatotoxicity (including hepatic veno-occlusive disease, hyperbilirubinaemia, jaundice, and fibrosis); cardiac tamponade in thalassaemia; pneumonia, skin hyperpigmentation; rarely progressive pulmonary

fibrosis, seizures, aplastic anaemia, visual disturbances, hypersensitivity reactions (including urticaria, erythema); *very rarely* myasthenia gravis, gynaecomastia

Indication and dose

Conditioning treatment before haematopoietic stem-cell transplantation

- By mouth or by intravenous infusion

Consult local treatment protocol for details

Myleran® (GSK) (PoM)

Tablets, f/c, busulfan 2 mg, net price 25-tab pack = £5.20

Busilvex® (Fabre) (PoM)

Concentrate for intravenous infusion, busulfan 6 mg/mL, net price 10-mL vial = £201.25

Busulfan

Capsules, busulfan 25 mg

Available from 'special-order' manufacturers or specialist importing companies, p. 809

- ▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

CHLORAMBUCIL

Cautions see section 8.1 and notes above; monitor full blood count regularly throughout treatment; increased seizure risk in children with nephrotic syndrome or history of epilepsy; avoid in acute porphyria (but see section 9.8.2)

Hepatic impairment manufacturer advises consider dose reduction in severe impairment—limited information available

Pregnancy avoid; manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also *less commonly* skin rash (possible progression to Stevens-Johnson syndrome and toxic epidermal necrolysis); *rarely* seizures, hepatotoxicity and jaundice; *very rarely* irreversible bone-marrow suppression, pulmonary fibrosis, tremor, peripheral neuropathy, sterile cystitis, sterility in prepubertal and pubertal males

Licensed use not licensed for use in nephrotic syndrome

Indication and dose

Hodgkin's disease

- By mouth

Consult local treatment protocol for details

Non-Hodgkin's lymphoma

- By mouth

Consult local treatment protocol for details

Relapsing steroid-sensitive nephrotic syndrome; initiated in specialist centres (see also section 6.3.2, p. 371)

- By mouth

Child 3 months–18 years 200 micrograms/kg once daily for 8 weeks

Leukeran® (GSK) (PoM)

Tablets, f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £8.36

- ▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

CYCLOPHOSPHAMIDE

Cautions see section 8.1 and notes above; previous or concurrent mediastinal irradiation—risk of cardiotoxicity; diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (cyclophosphamide)

Contra-indications haemorrhagic cystitis

Hepatic impairment reduce dose—consult local treatment protocol for details

Renal impairment reduce dose—consult local treatment protocol for details

Pregnancy avoid; manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding during and for 36 hours after stopping treatment

Side-effects see section 8.1 and notes above; *also* anorexia; pancreatitis; cardiotoxicity at high doses; interstitial pulmonary fibrosis; inappropriate secretion of anti-diuretic hormone, disturbances of carbohydrate metabolism; urothelial toxicity; pigmentation of the palms, nails and soles; *rarely* hepatotoxicity and renal dysfunction

Licensed use not licensed for use in children

Indication and dose

Acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis

- By mouth or by intravenous infusion

Consult local treatment protocol for details

Steroid-sensitive nephrotic syndrome see also section 6.3.2, p. 371

- By mouth

Child 3 months–18 years 2–3 mg/kg once daily for 8 weeks

- By intravenous infusion

Child 3 months–18 years 500 mg/m² once a month for 6 months

Administration Consult local treatment protocol for details

Cyclophosphamide (Non-proprietary) (PoM)

Tablets, s/c, cyclophosphamide (anhydrous) 50 mg, net price 100 = £20.20. Label: 25, 27

Injection, powder for reconstitution, cyclophosphamide, net price 500-mg vial = £5.66; 1-g vial = £10.66

- ▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

IFOSFAMIDE

Cautions see section 8.1 and notes above; ensure satisfactory electrolyte balance, and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome, or diabetes insipidus if renal toxicity not treated promptly); avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (ifosfamide)

Contra-indications urinary tract obstruction; acute infection (including urinary-tract infection); urothelial damage

Hepatic impairment avoid

Renal impairment avoid

Pregnancy avoid (teratogenic and carcinogenic in animals); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also drowsiness, confusion, disorientation, restlessness, psychosis; urothelial toxicity causing haemorrhagic cystitis and dysuria, renal toxicity (see Cautions above); *less commonly* severe encephalopathy; *rarely* diarrhoea, constipation, convulsions, anorexia; *very rarely* jaundice, thrombophlebitis, syndrome of inappropriate antidiuretic hormone secretion

Indication and dose

Rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, germ cell tumour, osteogenic sarcoma

- By intravenous infusion

Consult local treatment protocol for details

ifosfamide (Non-proprietary) (P_M)

Injection, powder for reconstitution, ifosfamide, net price 1-g vial = £43.53; 2-g vial = £88.62 (hosp. only)

MELPHALAN

Cautions see section 8.1 and notes above; monitor full blood count before and throughout treatment; for high-dose intravenous administration establish adequate hydration (see notes above), consider use of prophylactic anti-infective agents; haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details); avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (melphalan)

Renal impairment reduce dose initially—consult product literature

Pregnancy avoid; manufacturer advises adequate contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Licensed use childhood neuroblastoma

Indication and dose

High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours

- Intravenous infusion

Consult local treatment protocol for details

Alkeran® (GSK) (P_M)

Injection, powder for reconstitution, melphalan 50 mg (as hydrochloride). Net price 50-mg vial (with solvent-diluent) = £33.13

8.1.2 Cytotoxic antibiotics

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity.

Daurorubicin, doxorubicin, and epirubicin are anthracycline antibiotics. **Mitoxantrone** (mitozantrone) is an anthracycline derivative.

All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible. Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards. Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction. Epirubicin and mitoxantrone are considered less toxic, and may be suitable for children who have received high cumulative doses of other anthracyclines. **Dexrazoxane** can be used to prevent chronic cumulative cardiotoxicity, see section 8.1.

BLEOMYCIN

Cautions see section 8.1; ensure monitoring of pulmonary function—investigate any shortness of breath before initiation; caution in handling—irritant to tissues

Contra-indications acute pulmonary infection or significantly reduced lung function

Renal impairment reduce dose—consult local treatment protocol for details

Pregnancy avoid (teratogenic and carcinogenic in animal studies); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1, less bone marrow suppression; anorexia; pulmonary toxicity e.g. pulmonary fibrosis (usually dose-related and delayed); fever (directly following administration), fatigue; dermatological and mucous membrane toxicity, localised skin hyperpigmentation; rarely cardiorespiratory collapse and hyperpyrexia

Licensed use not licensed for use in children

Indication and dose

Some germ cell tumours, Hodgkin's lymphoma

- By intravenous infusion

Consult local treatment protocol for details

Bleomycin (Non-proprietary) (P_M)

Injection, powder for reconstitution, bleomycin (as sulphate), net price 15 000-unit vial = £15.56

Note To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

Brands include *Bleo-Kyowa®*

DACTINOMYCIN

(Actinomycin D)

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues**Hepatic impairment** consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols**Pregnancy** avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 416**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above; *less commonly* cheilitis, dysphagia; fever, malaise, lethargy; anaemia, hypoglycaemia; myalgia; acne; *rarely* hepatotoxicity (possibly dose-related)**Licensed use** not licensed for use in children under 12 years**Indication and dose****Wilms' tumour, childhood rhabdomyosarcoma and other soft tissue sarcomas, Ewing's sarcoma**

- By intravenous injection

Consult local treatment protocol for details

Cosmegen Lyovac® (Ovation) (POM)

Injection, powder for reconstitution, dactinomycin, net price 500-microgram vial = £6.75

DAUNORUBICIN**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues**Contra-indications** myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of daunorubicin or other anthracycline**Hepatic impairment** reduce dose according to serum bilirubin concentration—consult local treatment protocol for details; avoid in severe impairment**Renal impairment** reduce dose—consult local treatment protocol for details; avoid in severe impairment**Pregnancy** avoid (teratogenic and carcinogenic in *animal* studies), see also Pregnancy and Reproductive Function, p. 416**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above, leucopenia, less commonly mucositis; cardiac toxicity (usually 1–6 months after initiation of therapy); fever; red urine discoloration**Licensed use** **DaunoXome®** not licensed for use in children**Indication and dose****Acute myelogenous leukaemia, acute lymphocytic leukaemia**

- By intravenous infusion

Consult local treatment protocol for details

Daunorubicin (Non-proprietary) (POM)

Injection, powder for reconstitution, daunorubicin (as hydrochloride), net price 20-mg vial = £55.00

▲ **Lipid formulation****DaunoXome®** (Gilead) (POM)

Concentrate for intravenous infusion, daunorubicin encapsulated in liposomes. For dilution before use, net price 50-mg vial = £137.67

DOXORUBICIN HYDROCHLORIDE**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (doxorubicin)**Contra-indications** severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline**Hepatic impairment** reduce dose according to bilirubin concentration—consult local treatment protocol for details; avoid in severe impairment**Pregnancy** avoid (teratogenic and toxic in *animal* studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above; red urine discoloration; thrombophlebitis over injection site; less commonly bronchospasm, fever, amenorrhoea, and skin rash**Licensed use** not licensed for use in children**Indication and dose****Paediatric malignancies including Ewing's sarcoma, osteogenic sarcoma, Wilms' tumour, neuroblastoma, retinoblastoma, some liver tumours, acute lymphoblastic leukaemia, Hodgkin's lymphoma, non-Hodgkin's lymphoma**

- By intravenous infusion

Consult local treatment protocol for details

Doxorubicin (Non-proprietary) (POM)

Injection, powder for reconstitution, doxorubicin hydrochloride, net price 10-mg vial = £18.72; 50-mg vial = £96.86

Injection, doxorubicin hydrochloride 2 mg/mL, net price 5-mL vial = £20.60, 25-mL vial = £103.00, 100-mL vial = £275.00

EPIRUBICIN HYDROCHLORIDE**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues**Contra-indications** severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia, unstable angina, myocardial pathology; previous treatment with maximum cumulative doses of epirubicin or other anthracycline**Hepatic impairment** reduce dose according to bilirubin concentration—consult local treatment protocol for details; avoid in severe impairment**Renal impairment** dose reduction may be necessary in severe impairment**Pregnancy** avoid (carcinogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 416**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above; red urine discoloration; anaphylaxis**Licensed use** not licensed for use in children**Indication and dose****Recurrent acute lymphoblastic leukaemia, rhabdomyosarcoma, other soft tissue tumours of childhood**

- Intravenous infusion

Consult local treatment protocol for details

Epirubicin hydrochloride (Non-proprietary) (P_M)

Injection, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £18.31, 25-mL vial = £92.13, 50-mL vial = £95.54, 100-mL vial = £306.20

Injection, powder for reconstitution, epirubicin hydrochloride, net price 50-mg vial = £91.54

Pharmorubicin® Solution for Injection (Pharmacia)(P_M)

Injection, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £19.31, 25-mL vial = £96.54, 100-mL vial = £386.16

MITOXANTRONE

(Mitozantrone)

Cautions see section 8.1 and notes above

Hepatic impairment use with caution—consult local treatment protocol

Pregnancy avoid; effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; transient blue-green discoloration of urine; less commonly gastro-intestinal bleeding, anorexia, allergic reactions, dyspnoea, fatigue, fever, amenorrhoea, and transient blue discoloration of skin and nails

Licensed use not licensed for use in children

Indication and dose

Acute myeloid leukaemia, recurrent acute lymphoblastic leukaemia

- **By intravenous infusion**

Consult local treatment protocol for details

Mitoxantrone (Non-proprietary) (P_M)

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £100.00

Onkotrone® (Baxter) (P_M)

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £121.85, 12.5-mL vial = £152.33, 15-mL vial = £203.04

8.1.3 Antimetabolites

Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. **Cytarabine, fludarabine, mercaptopurine, methotrexate, and tioguanine** are commonly used in paediatric chemotherapy.

Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally. Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is **contra-indicated** in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be **avoided** in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration

and blood counts should be carefully monitored. Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

Cytarabine acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrathecally. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is available for lymphomatous meningitis.

Fludarabine is generally well tolerated but does cause myelosuppression, which may be cumulative.

Fludarabine has a potent and prolonged immunosuppressive effect. Children treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in children at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

Clofarabine is licensed for the treatment of acute lymphoblastic leukaemia in children who have relapsed or are refractory after receiving at least two previous regimens. It is given by intravenous infusion.

Nelarabine is licensed for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens. It is given by intravenous infusion. Neurotoxicity is common with nelarabine, and close monitoring for neurological events is strongly recommended—discontinue treatment if neurotoxicity occurs.

Mercaptopurine is used as maintenance therapy for acute lymphoblastic leukaemia and in the management of ulcerative colitis and Crohn's disease (section 1.5). Azathioprine, which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the child is receiving allopurinol since it interferes with their metabolism. For the role of thiopurine methyltransferase (TPMT) in the metabolism of azathioprine see section 8.2.1.

Tioguanine (thioguanine) is given by mouth for the treatment of acute lymphoblastic leukaemia; it is given at various stages of treatment in short-term cycles. Tioguanine has a lower incidence of gastro-intestinal side-effects than mercaptopurine. Long-term therapy with tioguanine is no longer recommended because of the high risk of liver toxicity.

CLOFARABINE

Cautions see section 8.1; cardiac disease

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Pregnancy manufacturer advises avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, abdominal pain, jaundice; tachycardia, flushing, hypotension, pericardial effusion, oedema, haematoma; dyspnoea, cough; anxiety, agitation, dizziness, drowsiness, headache, paraesthesia, peripheral neuropathy, restlessness; haematuria; arthralgia, myalgia; rash, pruritus, hand-foot (desquamative) syndrome, increased sweating; pancreatitis also reported

Licensed use not licensed for use in children under 1 year

Indication and dose

Relapsed or refractory acute lymphoblastic leukaemia

- By intravenous infusion

Consult local treatment protocol for details

Evltra[®] (Genzyme) ▼ (POM)

Concentrate for intravenous infusion, clofarabine

1 mg/mL, net price 20-mL vial = £1153.20

Electrolytes Na⁺ 3.08 mmol/vial

CYTARABINE

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (cytarabine)

Hepatic impairment reduce dose

Renal impairment consult local treatment protocols

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; 'cytarabine syndrome'—6–12 hours after intravenous administration—characterised by fever and malaise, myalgia, bone pain, maculopapular rash, and occasionally chest pain; *less commonly* conjunctivitis (consider prophylactic corticosteroid eye drops), neurotoxicity, renal and hepatic dysfunction, jaundice; *rarely* severe spinal cord toxicity following intrathecal administration

Licensed use *Depocyte*[®] intrathecal injection not licensed for use in children

Indication and dose

Acute lymphoblastic leukaemia, acute myeloid leukaemia, non-Hodgkin's lymphoma

- By intravenous injection, by intravenous infusion, or by subcutaneous injection

Consult local treatment protocol for details

Meningeal leukaemia, meningeal neoplasms

- By intrathecal injection

Consult local treatment protocol for details

Note Based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults

Cytarabine (Non-proprietary) (POM)

Injection (for intravenous, subcutaneous or intrathecal use), cytarabine 20 mg/mL, net price 5-mL vial = £4.00

Injection (for intravenous or subcutaneous use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90, 25-mL vial = £19.50

Injection (for intravenous or subcutaneous use), cytarabine 100 mg/mL, net price 1-mL vial = £4.00; 5-mL vial = £20.00; 10-mL vial = £39.00; 20-mL vial = £77.50

▲ Lipid formulation for intrathecal use

DepoCyte[®] (Napp) (POM)

Intrathecal injection, cytarabine encapsulated in liposomes, net price 50-mg vial = £1223.75

FLUDARABINE PHOSPHATE

Cautions see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to skin cancer; **interactions:** Appendix 1 (fludarabine)

Contra-indications haemolytic anaemia

Renal impairment reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m²; avoid if creatinine clearance less than 30 mL/minute/1.73 m²

Pregnancy avoid (embryotoxic and teratogenic in *animal* studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also diarrhoea, anorexia; oedema; pneumonia, cough; peripheral neuropathy, visual disturbances; chills, fever, malaise, weakness; rash; *less commonly* gastrointestinal haemorrhage, pulmonary toxicity (including pulmonary infiltrates, pneumonitis, and fibrosis), and confusion; *rarely* heart failure, arrhythmia, coma, seizures, agitation, myelodysplastic syndrome, acute myeloid leukaemia, optic neuropathy, blindness, Stevens-Johnson syndrome, toxic epidermal necrolysis, skin cancer, and haemorrhagic cystitis

Licensed use not licensed for use in children

Indication and dose

Poor prognosis or relapsed acute myeloid leukaemia, relapsed acute lymphoblastic leukaemia, conditioning before bone marrow transplantation

- By mouth, by intravenous injection, or by intravenous infusion

Consult local treatment protocol for details

Fludarabine phosphate (Non-proprietary) (POM)

Injection, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £140.40

Fludara[®] (Genzyme) (POM)

Tablets, f/c, pink, fludarabine phosphate 10 mg, net price 15-tab pack = £268.12, 20-tab pack = £350.70

Injection, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £147.07

MERCAPTOPYRINE

6-Mercaptopurine

Cautions see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor liver function—discontinue if jaundice develops; **interactions:** Appendix 1 (mercaptopurine)

Hepatic impairment may need dose reduction

Renal impairment manufacturer advises consider reducing dose

Pregnancy avoid (teratogenic); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; gastrointestinal effects less common; hepatotoxicity (more frequent at higher doses); *rarely* intestinal ulceration,

pancreatitis, fever, crystalluria with haematuria, rash, and hyperpigmentation; *very rarely* lymphoma

Licensed use not licensed for use in children for acute lymphoblastic lymphoma or T-cell non-Hodgkins lymphoma

Indication and dose

Acute lymphoblastic leukaemia, lymphoblastic lymphomas

• **By mouth**

Consult local treatment protocol for details

Severe ulcerative colitis and Crohn's disease section 1.5.3

Puri-Nethol® (GSK) (POM)

Tablets, yellow, scored, mercaptopurine 50 mg, net price 25-tab pack = £22.54

Mercaptopurine

Capsules, mercaptopurine 10 mg

Available from 'special-order' manufacturers or specialist importing companies, p. 809

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

METHOTREXATE

Cautions see section 8.1 and section 10.1.3; monitor renal and hepatic function; peptic ulceration, ulcerative colitis, diarrhoea, and ulcerative stomatitis; porphyria (section 9.8.2); **interactions:** Appendix 1 (methotrexate)

Hepatic impairment avoid in severe impairment—consult local treatment protocol for details

Renal impairment reduce dose—risk of nephrotoxicity at high doses; avoid in severe impairment

Pregnancy avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding—present in milk

Side-effects see section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration and bleeding, diarrhoea, toxic megacolon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade, thrombosis; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity, p. 509); anaphylactic reactions, urticaria; dizziness, fatigue, chills, fever, drowsiness, malaise, headache, mood changes, abnormal cranial sensations, neurotoxicity, confusion, psychosis, paraesthesia, cerebral oedema; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; haematuria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, blepharitis, visual disturbances; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, changes in nail and skin pigmentation, telangiectasia, acne, furunculosis, ecchymosis; injection-site reactions

Indication and dose

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma

• **By mouth**

Consult local treatment protocol for details

Treatment of early stage Burkitt's lymphoma, non-Hodgkin's lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia

• **By intravenous injection or infusion**

Consult local treatment protocol for details

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia

• **By intrathecal injection**

TIOGUANINE

(Thioguanine)

Cautions see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor

liver function weekly—discontinue if liver toxicity develops; **interactions:** Appendix 1 (tioguanine)

Hepatic impairment reduce dose

Renal impairment reduce dose

Pregnancy avoid (teratogenicity reported when men receiving tioguanine have fathered children); ensure effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also stomatitis and hepatotoxicity; rarely intestinal necrosis and perforation

Indication and dose

Infant acute lymphoblastic leukaemia

• By mouth

Consult local treatment protocol for details

Lanvis® (GSK) (Pm)

Tablets, yellow, scored, tioguanine 40 mg, net price 25-tab pack = £54.49

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, **vinblastine** and **vincristine** are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine; it occurs less often with vinblastine. Children with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced, but children generally tolerate vincristine better than adults. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is the dose-limiting side-effect of vinblastine; vincristine causes negligible myelosuppression. The vinca alkaloids may cause reversible alopecia. They cause severe local irritation and care must be taken to avoid extravasation. Constipation is common with vinblastine and vincristine; prophylactic use of laxatives may be considered.

Safe Practice

Vinblastine and vincristine are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that teenage patients treated in an adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

Etoposide, usually given by slow intravenous infusion, is used to treat acute leukaemias, lymphomas, and some

solid tumours. Etoposide may also be given by mouth but it is unpredictably absorbed.

ETOPOSIDE

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (etoposide)

Hepatic impairment avoid in severe impairment

Renal impairment consider dose reduction—consult local treatment protocol for details

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1, dose limiting myelosuppression, mucositis more common if given with doxorubicin; anaphylaxis associated with concentrated infusions; hypotension associated with rapid infusion; irritant to tissues if extravasated

Licensed use not licensed for use in children

Indication and dose

Stage 4 neuroblastoma, germ-cell tumours, intracranial germ-cell tumours, rhabdomyosarcoma, soft-tissue sarcomas, neuroectodermal tumours (including medulloblastoma), relapsed Hodgkin's disease, non-Hodgkin's lymphoma, Ewing tumour, acute lymphoblastic leukaemia, acute myeloid leukaemia

• By mouth or by intravenous infusion

Consult local treatment protocol for details

Etoposide (Non-proprietary) (Pm)

Concentrate for intravenous infusion, etoposide 20 mg/mL, net price 5-mL vial = £12.15, 10-mL vial = £29.00, 25-mL vial = £60.75

Brands include *Eposin®*

Etopophos® (Bristol-Myers Squibb) (Pm)

Injection, powder for reconstitution, etoposide (as phosphate), net price 100-mg vial = £26.17 (hosp. only)

Vepesid® (Bristol-Myers Squibb) (Pm)

Capsules, both pink, etoposide 50 mg, net price 20 = £99.82; 100 mg, 10-cap pack = £87.23 (hosp. only). Label: 23

VINBLASTINE SULPHATE

Cautions see section 8.1 and notes above; caution in handling; **interactions:** Appendix 1 (vinblastine)

Contra-indications see notes above

Safe Practice

Intrathecal injection **contra-indicated**

Hepatic impairment dose reduction may be necessary—consult local treatment protocol for details

Pregnancy avoid (limited experience suggests fetal harm; teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; abdominal pain, constipation, leucopenia, muscle pain; less commonly peripheral neuropathy; rarely paralytic ileus; irritant to tissues if extravasated

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose**Hodgkin's disease and other lymphomas**• **By intravenous injection**

Consult local treatment protocol for details

Vinblastine (Non-proprietary) (PoM)**Injection**, vinblastine sulphate 1 mg/mL, net price 10-mL vial = £13.09**Velbe®** (Genus) (PoM)**Injection**, powder for reconstitution, vinblastine sulphate, net price 10-mg amp = £14.15**VINCRISTINE SULPHATE****Cautions** see section 8.1 and notes above; neuromuscular disease; ileus; caution in handling; **interactions:** Appendix 1 (vincristine)**Contra-indications** see notes above**Safe Practice**Intrathecal injection **contra-indicated****Hepatic impairment** dose reduction may be necessary—consult local treatment protocol for details**Pregnancy** avoid (teratogenicity and fetal loss in *animal* studies); see also Pregnancy and Reproductive Function, p. 416**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above; constipation (see notes above), diarrhoea, intestinal necrosis, paralytic ileus may occur in young children; dose-limiting neuromuscular effects (see notes above); urinary retention, rarely convulsions followed by coma; inappropriate secretion of antidiuretic hormone; irritant to tissues if extravasated**Licensed use** licensed for use in children (age range not specified by manufacturer)**Indication and dose****Acute leukaemias, lymphomas, paediatric solid tumours**• **By intravenous injection**

Consult local treatment protocol for details

Vincristine (Non-proprietary) (PoM)**Injection**, vincristine sulphate 1 mg/mL, net price 1-mL vial = £13.47; 2-mL vial = £26.66; 5-mL vial = £44.16**Oncovin®** (Genus) (PoM)**Injection**, vincristine sulphate 1 mg/mL, net price 1-mL vial = £14.18; 2-mL vial = £28.05**8.1.5 Other antineoplastic drugs****Amsacrine****Amsacrine** has an action and toxic effects similar to those of doxorubicin (section 8.1.2) and is given *intravenously*. It is occasionally used in acute myeloid leukaemia.**AMSACRINE****Cautions** see section 8.1 and notes above; consider monitoring cardiac function; monitor electrolytes (fatal arrhythmias possible if hypokalaemia); previous treatment with anthracyclines; also caution in handling—irritant to skin and tissues**Hepatic impairment** manufacturer advises reduce initial dose by 20–30%**Renal impairment** manufacturer advises reduce initial dose by 20–30%**Pregnancy** avoid (teratogenic and toxic in *animal* studies); may reduce fertility; see also Pregnancy and Reproductive Function, p. 416**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1; mucositis, phlebitis; *less commonly* diarrhoea, cardiotoxicity, haematuria, renal impairment, hepatotoxicity, skin rash; *rarely* acute renal failure, grand mal seizures**Licensed use** not licensed for use in children**Indication and dose****Acute myeloid leukaemia**• **By intravenous infusion**

Consult local treatment protocol for details

Amsidine® (Goldshield) (PoM)**Concentrate for intravenous infusion**, amsacrine 5 mg (as lactate)/mL, when reconstituted by mixing two solutions. Net price 1.5-mL (75-mg) amp with 13.5-mL diluent vial = £54.08 (hosp. only)**Asparaginase****Asparaginase** is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.**Crisantaspase** is the enzyme asparaginase produced by *Erwinia chrysanthemi*. Preparations of asparaginase derived from *Escherichia coli* are also available. Children who are hypersensitive to asparaginase derived from one organism may tolerate asparaginase derived from another organism but cross-sensitivity occurs in about 20–30% of individuals.**CRISANTASPASE****Cautions** see section 8.1 and notes above**Contra-indications** history of pancreatitis related to asparaginase therapy**Pregnancy** avoid; see also Pregnancy and Reproductive Function, p. 416**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1; also liver dysfunction, pancreatitis, diarrhoea; coagulation disorders; lethargy, drowsiness, confusion, dizziness, neurotoxicity, convulsions, headache; *less commonly* changes in blood lipids, anaphylaxis, hyperglycaemia; *rarely* CNS depression; *very rarely* myalgia; abdominal pain and hypertension also reported

Indication and dose**Acute lymphoblastic leukaemia, acute myeloid leukaemia, non-Hodgkin's lymphoma**

- By intravenous, intramuscular or subcutaneous injection

Consult local treatment protocol for details

Erwinase® (EUSA Pharma) (POM)

Injection, powder for reconstitution, crisantaspase, net price 10 000-unit vial = £301.70

Preparations

Preparations of asparaginase derived from *Escherichia coli* are available but they are not licensed, they include: *Medac®* asparaginase, *Elspar®* asparaginase, and *Oncaspar®* pegaspargase.

Dacarbazine and temozolomide

Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin®*], bleomycin, vinblastine, and dacarbazine). It is given *intravenously*.

Temozolomide is structurally related to dacarbazine and is used in children for second-line treatment of malignant glioma.

DACARBAZINE

Cautions see section 8.1; caution in handling

Hepatic impairment dose reduction may be required in combined hepatic and renal impairment; avoid in severe impairment

Renal impairment dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

Pregnancy avoid (carcinogenic and teratogenic in animal studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; *also* anorexia; *less commonly* facial flushing, confusion, headache, seizures, facial paraesthesia, influenza-like symptoms, blurred vision, renal impairment, rash; *rarely* diarrhoea, hepatotoxicity including liver necrosis and hepatic vein thrombosis, photosensitivity, irritant to skin and tissues, injection-site reactions

Indication and dose**Hodgkin's disease, paediatric solid tumours**

- By intravenous injection or by intravenous infusion

Consult local treatment protocol for details

Imatinib

Imatinib, a tyrosine kinase inhibitor, has recently been licensed in children for the treatment of newly diagnosed Philadelphia-chromosome-positive chronic myeloid leukaemia when bone marrow transplantation is not considered first line treatment, and for Philadelphia-chromosome-positive chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis.

IMATINIB

Cautions see section 8.1; cardiac disease; monitor for fluid retention; monitor liver function (see also Hepatic Impairment, below); **interactions:** Appendix 1 (imatinib)

Hepatic impairment start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol

Renal impairment start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, appetite changes, constipation, diarrhoea, flatulence, gastro-oesophageal reflux, taste disturbance, weight changes, dry mouth; oedema (including pulmonary oedema, pleural effusion, and ascites), flushing, haemorrhage; cough, dyspnoea; dizziness, headache, insomnia, hypoaesthesia, paraesthesia, fatigue; influenza-like symptoms; cramps, arthralgia; visual disturbances, lacrimation, conjunctivitis, dry eyes; epis-

taxis; dry skin, sweating, rash, pruritus, photosensitivity; *less commonly* gastric ulceration, pancreatitis, hepatic dysfunction (rarely hepatic failure, hepatic necrosis), dysphagia, heart failure, tachycardia, palpitation, syncope, hypertension, hypotension, cold extremities, cough, acute respiratory failure, depression, drowsiness, anxiety, peripheral neuropathy, tremor, migraine, impaired memory, vertigo, gynaecomastia, menorrhagia, irregular menstruation, sexual dysfunction, electrolyte disturbances, renal failure, urinary frequency, gout, tinnitus, hearing loss; skin hyperpigmentation; *rarely* intestinal obstruction, gastro-intestinal perforation, inflammatory bowel disease, arrhythmia, atrial fibrillation, myocardial infarction, angina, pulmonary fibrosis, pulmonary hypertension, increased intracranial pressure, convulsions, confusion, haemolytic anaemia, rhabdomyolysis, myopathy, aseptic necrosis of bone, cataract, glaucoma, angioedema, exfoliative dermatitis, and Stevens-Johnson syndrome

Indication and dose

Chronic phase and advanced phase chronic myeloid leukaemia

- **By mouth**

Consult local treatment protocol for details

Glivec® (Novartis) ▼ (POM)

Tablets, f/c, imatinib (as mesilate) 100 mg (yellow-brown, scored), net price 60-tab pack = £802.04; 400 mg (yellow), 30-tab pack = £1604.08. Label: 21, 27

Counselling Tablets may be dispersed in water or apple juice

Mitotane

Mitotane is used in children for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection. Neuropsychological impairment can occur, possibly secondary to hypothyroidism, and growth retardation has also been reported in children treated with mitotane.

MITOTANE

Cautions see notes above; risk of accumulation in overweight patients; monitor plasma-mitotane concentration—consult product literature; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (mitotane)

Skilled tasks Central nervous system toxicity may affect performance of skilled tasks

Counselling Children and their carers should be warned to contact doctor immediately if injury, infection, or illness occurs (because of the risk of acute adrenal insufficiency)

Hepatic impairment manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

Renal impairment manufacturer advises caution in mild to moderate renal impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

Pregnancy manufacturer advises avoid—women of child-bearing age should use effective contraception

during and after treatment; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, epigastric discomfort), anorexia, liver disorders; hypercholesterolaemia, hypertriglyceridaemia; ataxia, confusion, asthenia, myasthenia, paraesthesia, drowsiness, neuropathy, cognitive impairment, movement disorder, dizziness, headache; gynaecomastia; prolonged bleeding time, leucopenia, thrombocytopenia, anaemia; rash; *rarely* hypersalivation, hypertension, postural hypotension, flushing, pyrexia, haematuria, proteinuria, haemorrhagic cystitis, hypouricaemia, visual disturbances and ocular disorders

Licensed use not licensed for use in children

Indication and dose

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- **By mouth**

Consult local treatment protocol for details

Lysodren® (HRA Pharma) (POM)

Tablets, scored, mitotane 500 mg, net price 100-tab pack = £590.97. Label: 2, 10, 21, counselling, skilled tasks, adrenal suppression

Platinum compounds

Carboplatin is used in the treatment of a variety of paediatric malignancies; it is given by intravenous infusion. Carboplatin can be given in an outpatient setting and is better tolerated than cisplatin; nausea and vomiting are less severe and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem. Carboplatin is, however, more myelosuppressive than cisplatin.

Cisplatin is of value in children with a variety of malignancies; it is given by intravenous infusion. Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control. Cisplatin has dose-related and potentially cumulative side-effects including nephrotoxicity, neurotoxicity, and ototoxicity. Baseline testing of renal function and hearing is required; for children with pre-existing renal or hearing impairment or marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.

CARBOPLATIN

Cautions see section 8.1 and notes above; consider therapeutic drug monitoring; **interactions:** Appendix 1 (platinum compounds)

Renal impairment reduce dose and monitor haematological parameters and renal function; avoid if creatinine clearance less than 20 mL/minute/1.73 m²

Pregnancy avoid (teratogenic and embryotoxic in animal studies); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Licensed use not licensed for use in children

Indication and dose

Stage 4 neuroblastoma, germ cell tumours, low-grade gliomas (including astrocytomas), neuroectodermal tumours (including medulloblastoma), rhabdomyosarcoma (metastatic and non-metastatic disease), soft-tissue sarcomas, retinoblastoma, high risk Wilms' tumour, some liver tumours

- By intravenous infusion
Consult local treatment protocol for details

Carboplatin (Non-proprietary) (POM)

Injection, carboplatin 10 mg/mL, net price 5-mL vial = £22.04, 15-mL vial = £56.92, 45-mL vial = £168.85, 60-mL vial = £260.00

CISPLATIN

Cautions see section 8.1 and notes above; monitor full blood count, renal function, audiology, and plasma electrolytes; **interactions:** Appendix 1 (platinum compounds)

Renal impairment avoid if possible—nephrotoxic

Pregnancy avoid (teratogenic and toxic in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also peripheral neuropathy; hypophosphataemia, hypocalcaemia, hyperuricaemia also reported

Licensed use not licensed for use in children

Indication and dose

Osteogenic sarcoma, stage 4 neuroblastoma, some liver tumours, infant brain tumours, intracranial germ-cell tumours

- By intravenous infusion
Consult local treatment protocol for details

Cisplatin (Non-proprietary) (POM)

Injection, cisplatin 1 mg/mL, net price 10-mL vial = £5.85, 50-mL vial = £24.50, 100-mL vial = £50.22

Injection, powder for reconstitution, cisplatin, net price 50-mg vial = £17.00

Procarbazine

Procarbazine is most often used in Hodgkin's disease. It is given *by mouth*. It is a weak monoamine-oxidase inhibitor and dietary restriction is rarely considered necessary. Alcohol ingestion may cause a disulfiram-like reaction.

PROCARBAZINE

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (procarbazine)

Hepatic impairment caution in mild to moderate impairment; avoid in severe impairment

Renal impairment caution in mild to moderate impairment; avoid in severe impairment

Pregnancy avoid (teratogenic in *animal* studies and isolated reports in humans); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; hypersensitivity rash (discontinue treatment)

Indication and dose

Hodgkin's lymphoma, gliomas

- By mouth
Consult local treatment protocol for details

Procarbazine (Non-proprietary) (POM)

Capsules, ivory, procarbazine (as hydrochloride) 50 mg, net price 50-cap pack = £199.60. Label: 4

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

Tretinoin

Tretinoin is licensed for the induction of remission in acute promyelocytic leukaemia. It is used in previously untreated children as well as in those who have relapsed after standard chemotherapy or who are refractory to it.

TRETINOIN

Note Tretinoin is the acid form of vitamin A

Cautions exclude pregnancy before starting treatment, see also Pregnancy below; monitor full blood count and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment; increased risk of thrombo-embolism during first month of treatment; **interactions:** Appendix 1 (retinoids)

Hepatic impairment reduce dose—consult local treatment protocol for details

Renal impairment reduce dose—consult local treatment protocol for details

Pregnancy teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives **not** considered effective); see also Pregnancy and Reproductive Function, p. 416

Breast-feeding discontinue breast-feeding

Side-effects retinoic acid syndrome (fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleukocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure) requires immediate treatment—consult product literature; gastro-intestinal disturbances, pancreatitis; arrhythmias, flushing, oedema; headache, benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache), shivering, dizziness, confusion, anxiety, depression, insomnia, paraesthesia, visual and hearing disturbances (children particularly susceptible to nervous system effects); raised liver enzymes, serum creatinine and lipids; bone and chest pain, alopecia, erythema, rash, pruritus, sweating, dry skin and mucous membranes, cheilitis; thromboembolism, hypercalcaemia, and genital ulceration reported

Indication and dose

Acute promyelocytic leukaemia

- By mouth
Consult treatment protocol for details

Vesanoid® (Roche) (POM)

Capsules, yellow/brown, tretinoin 10 mg, net price 100-cap pack = £160.63. Label: 21, 25

8.2 Drugs affecting the immune response

- 8.2.1 Antiproliferative immunosuppressants
- 8.2.2 Corticosteroids and other immunosuppressants
- 8.2.3 Rituximab and alemtuzumab
- 8.2.4 Other immunomodulating drugs

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are usually maintained on a calcineurin inhibitor (cyclosporin or tacrolimus), combined with an antiproliferative drug (azathioprine or mycophenolate mofetil) and a corticosteroid. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Bioavailability

Different formulations of the same immunosuppressant may vary in bioavailability and to avoid reduced effect or excessive side-effects, it is important not to change formulation except on the advice of a transplant specialist.

Impaired immune responsiveness Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine (section 14.4) is also necessary during this period—**important**: for advice on measles exposure, see section 14.5.1, and chickenpox (varicella) exposure, see section 14.5.2. For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1. For general comments and warnings relating to corticosteroids and immunosuppressants, see section 6.3.2.

Pregnancy Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies.

There is less experience of cyclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of these drugs during pregnancy needs to be supervised in specialist units.

8.2.1 Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions (see section 10.1.3), usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced to one quarter of the original dose when allopurinol is given concurrently. Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine.

Thiopurine methyltransferase

The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is used in combination with a corticosteroid and either cyclosporin or tacrolimus for the prophylaxis of acute rejection in transplant recipients. Compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment. Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation of mycophenolate mofetil should be considered under specialist supervision.

NICE guidance (immunosuppressive therapy for renal transplantation in children and adolescents)

See p. 433

Cyclophosphamide (section 8.1.1) is less commonly prescribed as an immunosuppressant.

AZATHIOPRINE

Cautions thiopurine methyltransferase status (see notes above); monitor for toxicity throughout treatment; monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months; **interactions**: Appendix 1 (azathioprine)

Bone marrow suppression Children and their carers should be warned to report immediately any signs or symptoms of

bone marrow suppression e.g. inexplicable bruising or bleeding, infection

Contra-indications hypersensitivity to mercaptopurine

Hepatic impairment reduce dose; monitor liver function; see also Cautions

Renal impairment reduce dose; see also Cautions

Pregnancy see section 8.2; treatment should not normally be initiated during pregnancy

Breast-feeding present in milk in low concentration; no evidence of harm in small studies—use if potential benefit outweighs risk

Side-effects hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea; rarely pancreatitis, pneumonitis, hepatic veno-occlusive disease, lymphoma

Indication and dose

Suppression of transplant rejection

- By mouth, or (if oral route not possible) by intravenous infusion (see also note below)

Consult local treatment protocol for details

Child 1 month–18 years maintenance, 1–3 mg/kg once daily, adjusted according to response; total daily dose may alternatively be given in 2 divided doses

Severe ulcerative colitis and Crohn's disease section 1.5.3

Systemic lupus erythematosus, vasculitis, auto-immune conditions when corticosteroid therapy alone has proved inadequate section 10.1.3

Administration Consult local treatment protocol for details

For *intravenous injection*, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute

For *intravenous infusion*, reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%

Note Intravenous injection is alkaline and very irritant. Intravenous route should therefore be used **only** if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid

Azathioprine (Non-proprietary) (POM)

Tablets, azathioprine 25 mg, net price 28-tab pack = £6.67; 50 mg, 56-tab pack = £5.56. Label: 21

Injection, powder for reconstitution, azathioprine (as sodium salt), net price 50-mg vial = £15.38

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

MYCOPHENOLATE MOFETIL

Cautions full blood counts every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops); active gastro-intestinal disease (risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); possible decreased effectiveness of vaccination—avoid live vaccines; **interactions:** Appendix 1 (mycophenolate mofetil)

Bone marrow suppression Children and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

Renal impairment manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid—congenital malformations reported; effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects taste disturbance, gingival hyperplasia, nausea, constipation, flatulence, anorexia, weight loss, diarrhoea, vomiting, abdominal pain, gastro-intestinal inflammation, ulceration, and bleeding, hepatitis, jaundice, pancreatitis, stomatitis, ileus, pleural effusion, oedema, tachycardia, hypotension, hypotension, vasodilatation, cough, dyspnoea, insomnia, agitation, confusion, depression, anxiety, convulsions, paraesthesia, myasthenic syndrome, tremor, dizziness, headache, influenza-like syndrome, infections, hyperglycaemia, renal impairment, malignancy (particularly of the skin), blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia, and red cell aplasia—see notes above), disturbances of electrolytes and blood lipids, arthralgia, alopecia, acne, skin hypertrophy, and rash; *also reported* intestinal villous atrophy, progressive multifocal leucoencephalopathy, interstitial lung disease, pulmonary fibrosis

Licensed use not licensed for use in children under 2 years for the prophylaxis of acute rejection in renal transplantation; not licensed for use in children for the prophylaxis of acute rejection in hepatic transplantation

Indication and dose

Prophylaxis of acute rejection in renal transplantation in combination with a corticosteroid and ciclosporin

- By mouth

Consult local treatment protocol for details

Child 1 month–18 years 600 mg/m² twice daily (max. 2 g daily)

Prophylaxis of acute rejection in renal transplantation in combination with a corticosteroid and tacrolimus

- By mouth

Consult local treatment protocol for details

Child 1 month–18 years 300 mg/m² twice daily (max. 2 g daily)

Prophylaxis of acute rejection in hepatic transplantation in combination with a corticosteroid and ciclosporin or tacrolimus

• By mouth

Consult local treatment protocol for details

Child 1 month–18 years 10 mg/kg twice daily, increased to 20 mg/kg twice daily (max. 2 g daily)

Note Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m²

Mycophenolate Mofetil (Non-proprietary) (POM)

Capsules, mycophenolate mofetil 250 mg, net price 100-cap pack = £35.00

Tablets, mycophenolate mofetil 500 mg, net price 50-tab pack = £31.50

Brands include Arzip®

CellCept® (Roche) (POM)

Capsules, blue/brown, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

Tablets, lavender, mycophenolate mofetil 500 mg, net price 50-tab pack = £82.26

Oral suspension, mycophenolate mofetil 1 g/5 mL when reconstituted with water, net price 175 mL = £115.16

Excipients include aspartame (section 9.4.1)

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

Sirolimus is a non-calcineurin inhibiting immunosuppressant.

Basiliximab is a monoclonal antibody that prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Antithymocyte immunoglobulin (rabbit) is used for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

NICE guidance

Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)

NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen **only if**:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; *or*
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

8.2.2 Corticosteroids and other immunosuppressants

The corticosteroids prednisolone and dexamethasone are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin's disease, non-Hodgkin's lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure (see p. 19), or to help control emesis when combined with an appropriate anti-emetic (see p. 19). For more information on glucocorticoid therapy, including the disadvantages of treatment, see section 6.3.2.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone (section 6.3).

ANTITHYMOCYTE IMMUNOGLOBULIN (RABBIT)

Cautions see notes above; monitor blood count

Contra-indications infection

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, dysphagia, diarrhoea; hypotension; infusion-related reactions (including cytokine release syndrome and anaphylaxis, see notes above), serum sickness; fever, shivering, increased susceptibility to infection; increased susceptibility to malignancy; lymphopenia, neutropenia, thrombocytopenia; myalgia; pruritus, rash

Indication and dose**Heart transplantation**

- By intravenous infusion over at least 6 hours

Child 1 month–18 years 1–2.5 mg/kg daily for 3–5 days starting the day of transplantation

Note To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

Renal transplantation

- By intravenous infusion over at least 6 hours

Child 1–18 years 1–1.5 mg/kg daily for 3–9 days starting the day of transplantation

Note To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

Corticosteroid-resistant renal graft rejection

- By intravenous infusion over at least 6 hours

Child 1–18 years 1.5 mg/kg daily for 7–14 days

Note To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

Administration For *continuous intravenous infusion* reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported

Thymoglobuline® (Genzyme) ▼ (P_oM)

Intravenous infusion, powder for reconstitution, rabbit anti-human thymocyte immunoglobulin, net price 25-mg vial = £158.77

BASILIXIMAB

Pregnancy manufacturer advises avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose

Breast-feeding manufacturer advises avoid—no information available

Side-effects severe hypersensitivity reactions and cytokine release syndrome reported

Indication and dose

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens

- By intravenous injection or by intravenous infusion

Consult local treatment protocol for details

Child over 1 year, body-weight under 35 kg 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery

Child body-weight over 35 kg 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery

Note withhold second dose if severe hypersensitivity or graft loss occurs

Administration For *intravenous infusion*, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes

Simulect® (Novartis) (P_oM)

Injection, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

CYCLOSPORIN

(Cyclosporin)

Cautions monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate discontinuation (exclude rejection of kidney transplant); monitor liver function (see also Hepatic Impairment below); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives; hyperuricaemia; monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia); monitor serum magnesium; measure blood lipids before treatment and thereafter as appropriate; monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details); use with tacrolimus specifically contra-indicated; for patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer); avoid excessive exposure to UV light, including sunlight; **interactions:** Appendix 1 (ciclosporin)

Additional cautions in nephrotic syndrome *Contra-indicated* in uncontrolled hypertension, uncontrolled infections, and malignancy; in long-term management, perform renal biopsies every 1–2 years

Additional cautions Atopic Dermatitis and Psoriasis, section 13.5.3; Rheumatoid Arthritis, section 10.1.3

Hepatic impairment dosage adjustment based on bilirubin and liver enzymes may be needed

Renal impairment dose as in normal renal function but see Cautions above; in *nephrotic syndrome* reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement

Pregnancy crosses placenta; see Immunosuppressant Therapy, p. 431

Breast-feeding present in milk—manufacturer advises avoid

Side-effects anorexia, nausea, vomiting, abdominal pain, diarrhoea, gingival hyperplasia, hepatic dysfunction, hypertension, tremor, headache, paraesthesia, fatigue, renal dysfunction (renal structural changes on long-term administration; see also under Cautions), hyperuricaemia, hyperkalaemia, hypomagnesaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; *less commonly* oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; *rarely* pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, micro-angiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances secondary to benign intracranial hypertension (discontinue); *also reported with infusion* anaphylaxis

Licensed use not licensed for use in children under 3 months

Indication and dose

Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, prophylaxis and treatment of graft-versus-host disease

- **By mouth or by intravenous infusion**

Consult local treatment protocols for details

Nephrotic syndrome see also section 6.3.2, p. 371

- **By mouth**

Child 1 month–18 years 3 mg/kg twice daily, increase if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

Refractory ulcerative colitis section 1.5.3

Severe psoriasis, severe eczema section 13.5.3

Important

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum-creatinine, blood pressure, and transplant function.

Capimune® (Mylan) (PmM)

Capsules, ciclosporin 25 mg (grey), net price 30-cap pack = £13.80; 50 mg (white), 30-cap pack = £27.00; 100 mg (grey), 30-cap pack = £51.50. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

Dexamune® (Dexcel) (PmM)

Capsules, grey, ciclosporin 25 mg, net price 30-cap pack = £13.94; 50 mg 30-cap pack = £27.31; 100 mg 30-cap pack = £51.83. Counselling, administration

Note Contains ethyl lactate which is metabolised to ethanol

Counselling Total daily dose should be taken in 2 divided doses

Neoral® (Novartis) (PmM)

Capsules, ciclosporin 10 mg (yellow/white), net price 60-cap pack = £18.48; 25 mg (blue/grey), 30-cap pack = £18.59; 50 mg (yellow/white), 30-cap pack = £36.41; 100 mg (blue/grey), 30-cap pack = £69.11. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Oral solution, yellow, sugar-free, ciclosporin 100 mg/mL, net price 50 mL = £103.55. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Keep medicine measure away from other liquids (including water)

Sandimmun® (Novartis) (PmM)

Concentrate for intravenous infusion (oily), ciclosporin 50 mg/mL. To be diluted before use, net price 1-mL amp = £1.94; 5-mL amp = £9.17

Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

Note Contains ethanol

Administration For *intravenous infusion*, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment; observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter

SIROLIMUS

Cautions monitor renal function when given with ciclosporin; monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses); hyperlipidaemia (monitor lipids); monitor urine proteins; increased susceptibility to infection (especially urinary-tract infection); increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light); **interactions:** Appendix 1 (sirolimus)

Hepatic impairment monitor blood-sirolimus trough concentration; dose reduction may be necessary, consult local treatment protocol for details

Pregnancy avoid unless essential—toxicity in *animal* studies; effective contraception must be used during treatment and for 12 weeks after stopping

Breast-feeding discontinue breast-feeding

Side-effects abdominal pain, constipation, nausea, diarrhoea, ascites, stomatitis, oedema, tachycardia, hypertension, hypercholesterolaemia, hypertriglyceridaemia, venous thromboembolism, pleural effusion, pneumonitis, headache, pyrexia, proteinuria, haemolytic uraemic syndrome, anaemia, thrombocytopenia, thrombotic thrombocytopenic purpura, leucopenia, neutropenia, hypokalaemia, hypophosphataemia, hyperglycaemia, lymphocele, arthralgia, osteonecrosis, epistaxis, acne, rash, impaired healing; *less commonly* pancreatitis, pulmonary embolism, pulmonary haemorrhage, pericardial effusion, nephrotic syndrome, pancytopenia; *rarely* interstitial lung disease, alveolar proteinosis, hepatic necrosis, lymphoedema, hypersensitivity reactions (including anaphylactic reactions, angioedema, exfoliative dermatitis, hypersensitivity vasculitis); *also reported* focal segmental glomerulosclerosis, reversible impairment of male fertility

Licensed use not licensed for use in children

Indication and dose

See NICE guidance, p. 433

- **By mouth**

Consult local treatment protocols for details

Rapamune® (Wyeth) (PmM)

Tablets, coated, sirolimus 0.5 mg (tan), net price 30-tab pack = £69.00; 1 mg (white), 30-tab pack = £86.49; 2 mg (yellow), 30-tab pack = £172.98. Counselling, administration

Important The 0.5-mg tablet is not bioequivalent to the 1-mg, 2-mg, and 5-mg tablets. Multiples of 0.5-mg tablets should not be used as a substitute for other tablet strengths

Oral solution, sirolimus 1 mg/mL, net price 60 mL = £162.41. Counselling, administration

Administration food may affect absorption (give at the same time with respect to food). Mix solution with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids

TACROLIMUS

Cautions monitor blood pressure, ECG (important: see cardiomyopathy below), fasting blood-glucose concentration, haematological and neurological (including visual) parameters, electrolytes, hepatic and renal function; monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details; QT-interval prolongation; neurotoxicity; increased risk of infections, malignancies, and lymphoproliferative disorders; avoid excessive exposure to UV light (including sunlight); pregnancy (exclude before starting); **interactions:** Appendix 1 (tacrolimus)

Skilled tasks May affect performance of skilled tasks (e.g. driving)

Contra-indications hypersensitivity to macrolides; avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin)

Hepatic impairment dose reduction may be necessary in severe impairment

Pregnancy avoid unless potential benefit outweighs risk—risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia; toxicity in *animal* studies

Breast-feeding avoid—present in milk

Side-effects nausea, vomiting, diarrhoea, constipation, dyspepsia, flatulence, bloating, weight changes, anorexia, gastro-intestinal inflammation, ulceration, and perforation, hepatic dysfunction, jaundice, cholestasis, ascites, bile-duct abnormalities, oedema, tachycardia, hypertension, haemorrhage, thromboembolic and ischaemic events, dyspnoea, pleural effusion, parenchymal lung disorders, sleep disturbances, tremor, headache, peripheral neuropathy, mood changes, depression, confusion, anxiety, psychosis, seizures, paraesthesia, dizziness, renal impairment, renal failure, renal tubular necrosis, urinary abnormalities, hyperglycaemia, electrolyte disturbances (including hyperkalaemia, hypokalaemia, and hyperuricaemia), blood disorders (including anaemia, leucopenia, pancytopenia, and thrombocytopenia), arthralgia, muscle cramp, visual disturbances, photophobia, tinnitus, impaired hearing, alopecia, sweating, acne; *less commonly* paralytic ileus, gastro-intestinal reflux disease, peritonitis, pancreatitis, heart failure, arrhythmia, cardiac arrest, cerebrovascular accident, cardiomyopathy (**important:** see Cardiomyopathy below), palpitation, respiratory failure, coma, speech disorder, amnesia, paralysis, influenza-like symptoms, encephalopathy, coagulation disorders, cataract, photosensitivity, hypoglycaemia, dysmenorrhoea, hypertension, dermatitis; *rarely* pericardial effusion, respiratory distress syndrome, posterior reversible encephalopathy syndrome, dehydration, thrombotic thrombocytopenic purpura, blindness, toxic epidermal necrolysis, hirsutism; *very rarely* myasthenia, haemorrhagic cystitis, Stevens Johnson syndrome

Cardiomyopathy Cardiomyopathy has been reported in children. Children should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur

Licensed use *Advagra*[®] not licensed for use in children

Indication and dose

See under preparations and consult local treatment protocols

Atopic eczema (topical use) section 13.5.3

Important

Adoport[®], *Prograf*[®], *Modigraf*[®], *Vivadex*[®], and *Advagraf*[®] (tacrolimus): serious medication errors

There are 3 different oral formulations of tacrolimus:

- *Adoport*[®], *Prograf*[®], and *Vivadex*[®] are immediate-release capsules taken twice daily, once in the morning and once in the evening;
- *Modigraf*[®] granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- *Advagraf*[®] is a prolonged-release capsule that is taken once daily in the morning.

Switching between different oral formulations of tacrolimus requires careful therapeutic monitoring.

Changes to oral tacrolimus therapy should be made only under the close supervision of a transplant specialist.

Administration For *continuous intravenous infusion* over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500 mL. Tacrolimus is incompatible with PVC

Adoport[®] (Sandoz) (PAM)

Capsules, tacrolimus (as monohydrate) 500 micrograms (white/ivory), net price 50-cap pack = £50.50; 1 mg (white/brown), 50-cap pack = £65.52, 100-cap pack = £131.02; 5 mg (white/orange), 50-cap pack = £242.05. Label: 23, counselling, skilled tasks

Dose

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

• By mouth

Neonate initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

• By mouth

Neonate initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Note A lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

• By mouth

Neonate initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

• **By mouth**

Neonate initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Allorgraft rejection resistant to conventional immunosuppressive therapy Consult local treatment protocol

Modigraf® (Astellas) ▼ (POM)

Granules, tacrolimus (as monohydrate), 200 micrograms, net price 50-sachet pack = £71.30; 1 mg, 50-sachet pack = £356.65. Label: 13, 23, counselling, skilled tasks

Dose

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

• **By mouth**

Neonate initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

• **By mouth**

Neonate initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Note A lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation without antibody induction starting within 12 hours of transplantation

• **By mouth**

Neonate initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuing intravenous infusion), adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuing intravenous infusion), adjusted according to whole-blood concentration

Prophylaxis of graft rejection following heart transplantation following antibody induction starting within 5 days of transplantation

• **By mouth**

Neonate initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Allorgraft rejection resistant to conventional immunosuppressive therapy Consult local treatment protocol

Prograf® (Astellas) (POM)

Capsules, tacrolimus (as monohydrate) 500 micrograms (yellow), net price 50-cap pack = £61.88; 1 mg (white), 50-cap pack = £80.28, 100-cap pack = £160.54; 5 mg (greyish-red), 50-cap pack = £296.58. Label: 23, counselling, skilled tasks

Concentrate for intravenous infusion, tacrolimus 5 mg/mL. To be diluted before use. Net price 1-mL amp = £58.46

Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

Dose

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

• **By mouth**

Neonate initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

• **By continuous intravenous infusion (only if oral route inappropriate)**

Neonate 50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

Child 1 month–18 years 50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

• **By mouth**

Neonate initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Note A lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

• **By continuous intravenous infusion (only if oral route inappropriate)**

Neonate 75–100 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

Child 1 month–18 years 75–100 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

• **By mouth**

Neonate initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

Child 1 month–18 years initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

• **By continuous intravenous infusion**

Neonate 30–50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

Child 1 month–18 years 30–50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

• **By mouth**

Neonate initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Child 1 month–18 years initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

Allgraft rejection resistant to conventional immunosuppressive therapy Consult local treatment protocol

Vivadex® (Dexcel) ^(PMM)

Capsules, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £46.41; 1 mg (white), 50-cap pack = £60.21, 100-cap pack = £120.41; 5 mg (red), 50-cap pack = £222.44. Label: 23, counselling, skilled tasks

Advagra® is not licensed for use in children

Advagra® (Astellas) ^(PMM)

Capsules, m/r, tacrolimus (as monohydrate) 500 micrograms (yellow/orange), net price 50-cap pack = £35.79; 1 mg (white/orange), 50-cap pack = £71.59, 100-cap pack = £143.17; 3 mg (red/orange), 50-cap pack = £214.76; 5 mg (red/orange), 50-cap pack = £266.92. Label: 23, 25, counselling, skilled tasks

■ **Extemporaneous formulations available see** Extemporaneous Preparations, p. 6

8.2.3 Rituximab and alemtuzumab

Rituximab, a monoclonal antibody which causes lysis of B lymphocytes, has been used as a component of the treatment of post-transplantation lymphoproliferative disease, non-Hodgkin's lymphoma, Hodgkin's lymphoma, and severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus. Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist.

Rituximab should be used with caution in children receiving cardiotoxic chemotherapy or with a history of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported. Transient hypotension occurs frequently during infusion and antihypertensives may need to be withheld for 12 hours before infusion. Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; children treated with rituximab should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

Infusion-related side-effects (including cytokine release syndrome) are reported commonly with rituximab and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Children should be given paracetamol and an antihistamine before each dose of rituximab to reduce these effects. Premedication with a corticosteroid should also be considered. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature or local treatment protocol for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following **severe** cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred 1–2 hours after infusion of rituximab. Children with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored **very closely** (and a slower rate of infusion considered).

Alemtuzumab, another monoclonal antibody that causes lysis of B and T lymphocytes, has been used in children for conditioning therapy before allogeneic bone marrow transplantation. In common with rituximab, it causes infusion-related side-effects including cytokine release syndrome (see above) and premedication with paracetamol, an antihistamine, and a corticosteroid is recommended.

ALEMTUZUMAB

Cautions see notes above—for full details (including monitoring) consult product literature or local treatment protocol

Contra-indications for full details consult product literature or local treatment protocol

Pregnancy avoid; manufacturer advises effective contraception during and for 6 months after treatment in men or women

Breast-feeding manufacturer advises avoid breast-feeding during treatment and for at least 4 weeks after treatment

Side-effects see notes above—for full details (including monitoring and management of side-effects) consult product literature

Licensed use not licensed for use in children under 17 years

Indication and dose

See notes above

- By intravenous infusion

Consult local treatment protocol for details

MabCampath[®] (Genzyme) (POM)

Concentrate for intravenous infusion, alemtuzumab 30 mg/mL, net price 1-mL amp = £264.11

RITUXIMAB

Cautions see notes above—but for full details (including monitoring) consult product literature or local treatment protocol

Pregnancy avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus—effective contraception (in both sexes) required during and for 12 months after treatment

Breast-feeding avoid breast-feeding during and for 12 months after treatment

Side-effects see notes above—but for full details (including monitoring and management of side-effects) consult product literature

Licensed use not licensed for use in children

Indication and dose

See notes above

- By intravenous infusion

Consult local treatment protocol for details

MabThera[®] (Roche) (POM)

Concentrate for intravenous infusion, rituximab 10 mg/mL, net price 10-mL vial = £174.63, 50-mL vial = £873.15

8.2.4 Other immunomodulating drugs

Interferon alfa

Interferon alfa has shown some antitumour effect and may have a role in inducing early regression of life-threatening corticosteroid-resistant haemangiomas of infancy. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (section 5.3.3). Interferon alfa should always be used under the close supervision of a specialist. Side-effects are dose-related, but commonly include anorexia, nausea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including suicidal behaviour) have also been reported. Myelosuppression may occur, particularly affecting granulocyte counts. Cardiovascular problems (hypotension, hypertension, and arrhythmias), nephrotoxicity and hepatotoxicity have been reported and monitoring of hepatic function is recommended. Hypertriglyceridaemia, sometimes severe, has been observed; monitoring of lipid concentration is recommended. Other side-effects include hypersensitivity reactions, thyroid abnormalities, hyperglycaemia, alopecia, psoriasiform rash, confusion, coma and seizures, and reversible motor problems in young children. Rarely pulmonary infiltrates, pneumonitis, and pneumonia have occurred; respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

INTERFERON ALFA

Cautions consult product literature and local treatment protocol for details; **interactions:** Appendix 1 (interferons)

Contra-indications consult product literature and local treatment protocol for details; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Hepatic impairment close monitoring in mild to moderate impairment; avoid if severe

Renal impairment close monitoring required in mild to moderate impairment; avoid in severe impairment

Pregnancy avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature

Breast-feeding unlikely to be harmful

Side-effects see notes above, consult product literature and local treatment protocols for details

Licensed use not licensed for use in children for chronic active hepatitis B; *Roferon-A*[®] not licensed for use in children

Indication and dose

Induction of early regression of life-threatening corticosteroid resistant haemangiomas of infancy

- By subcutaneous injection

Consult local treatment protocol for details

Chronic active hepatitis B infection see under preparations below

Chronic active hepatitis C infection see under preparations below

IntronA® (Schering-Plough) (Pm)

Injection, interferon alfa-2b (rbe) 10 million units/mL, net price 1-mL vial = £42.35, 2.5-mL vial = £105.95. For subcutaneous injection or intravenous infusion

Injection pen, interferon alfa-2b (rbe), net price 15 million units/mL, 1.5-mL cartridge = £76.28; 25 million units/mL, 1.5-mL cartridge = £127.14; 50 million units/mL, 1.5-mL cartridge = £254.28. For subcutaneous injection

Note Each 1.5-mL multidose cartridge delivers 6 doses of 0.2 mL i.e. a total of 1.2 mL

Dose

Chronic active hepatitis B

• By subcutaneous injection

Child 2–18 years 5–10 million units/m² 3 times weekly

Chronic active hepatitis C (in combination with oral ribavirin, see p. 328)

• By subcutaneous injection

Child 3–18 years 3 million units/m² 3 times weekly

Roferon-A® (Roche) (Pm)

Injection, interferon alfa-2a (rbe). Net price 6 million units/mL, 0.5-mL (3 million-unit) prefilled syringe = £14.20; 9 million units/mL, 0.5-mL (4.5 million-unit) prefilled syringe = £21.29; 12 million units/mL, 0.5-mL (6 million-unit) prefilled syringe = £28.37; 18 million units/mL, 0.5-mL (9 million-unit) prefilled syringe = £42.57; 30 million units/mL, 0.6-mL (18 million-unit) cartridge = £85.15, for use with *Roferon* pen device. For subcutaneous injection (cartridges, vials, and prefilled syringes) and intramuscular injection (cartridges and vials)

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Dose

Chronic active hepatitis B

• By subcutaneous injection

Child 2–18 years 2.5–5 million units/m² 3 times weekly; up to 10 million units/m² has been used 3 times weekly

Interferon gamma

Interferon gamma-1b is used to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

INTERFERON GAMMA-1b

(Immune interferon)

Cautions seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); **interactions:** Appendix 1 (interferons)

Driving May impair ability to perform skilled tasks; effects may be enhanced by alcohol

Hepatic impairment manufacturer advises caution in severe impairment—risk of accumulation

Renal impairment manufacturer advises caution in severe impairment—risk of accumulation

Pregnancy manufacturers advise avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting; headache, fatigue, fever; myalgia, arthralgia; rash, injection-site reactions; rarely confusion and systemic lupus erythematosus; also reported, neutropenia, thrombocytopenia, and raised liver enzymes

Indication and dose

See notes above and under Preparations below

Immukin® (Boehringer Ingelheim) (Pm)

Injection, recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-mL vial = £66.67

Dose

• By subcutaneous injection

Body surface area 0.5 m² or less 1.5 micrograms/kg 3 times a week

Body surface area greater than 0.5 m² 50 micrograms/m² 3 times a week

Not recommended for infant under 6 months with chronic granulomatous disease

Canakinumab

Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome). These are rare inherited auto-inflammatory disorders.

CANAKINUMAB

Cautions history of recurrent infection or predisposition to infection; monitor neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter; children should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information and section 14.1, p. 599

Tuberculosis Children should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during and after treatment

Contra-indications severe active infection (see also Cautions); neutropenia; concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections)

Hepatic impairment no information available

Renal impairment limited information available but manufacturer advises no dose adjustment required

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk; effective contraception

required during treatment and for up to 3 months after last dose

Breast-feeding consider if benefit outweighs risk— not known if present in human milk

Side-effects vertigo, increased susceptibility to infection, injection-site reactions

Indication and dose

Cryopyrin-associated periodic syndromes

- By subcutaneous injection

Child 4–18 years

Body-weight 15–40 kg 2 mg/kg every 8 weeks. If clinical response not achieved 7 days after starting treatment, a repeat dose of 2 mg/kg can be considered; if a full response is then achieved, subsequent dosing should be 4 mg/kg every 8 weeks

Body-weight over 40 kg 150 mg every 8 weeks. If clinical response not achieved 7 days after starting treatment, a repeat dose of 150 mg can be considered; if a full response is then achieved, subsequent dosing should be 300 mg every 8 weeks

Ilaris[®] (Novartis) ▼ (POM)

Injection, powder for reconstitution, canakinumab, net price 150-mg vial = £9927.80

Indication and dose

See notes above

- By intravenous infusion (over 1 hour)

Consult local treatment protocols for details

Mepact[®] (Takeda) ▼ (POM)

Intravenous infusion, powder for reconstitution, mifamurtide, net price 4-mg vial = £2375.00

8.3 Sex hormones and hormone antagonists in malignant disease

Classification not used in *BNF for Children*.

Mifamurtide

Mifamurtide is licensed in children and adolescents for the treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection. It is used in combination with chemotherapy.

MIFAMURTIDE

Cautions asthma and chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy; history of autoimmune, inflammatory, or collagen disease; monitor renal function, hepatic function and clotting parameters; monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature **interactions:** Appendix 1 (mifamurtide)

Hepatic impairment use with caution—no information available

Renal impairment use with caution—no information available

Pregnancy avoid; effective contraception required

Breast-feeding avoid—no information available

Side-effects gastro-intestinal disturbances (including anorexia, nausea, vomiting, diarrhoea, constipation, abdominal pain, dyspepsia); tachycardia, hypertension, palpitations, hypotension, phlebitis; oedema, respiratory disorders (including dyspnoea, epistaxis, cough, tachypnoea, haemoptysis, pleural effusion); confusion, depression, insomnia, headache, dizziness, paraesthesia, hypoaesthesia, tremor, drowsiness, anxiety; hypokalaemia, anaemia, leucopenia, thrombocytopenia, granulocytopenia; haematuria, dysuria, pollakiuria; musculoskeletal pain; blurred vision; vertigo, tinnitus, hearing loss; sweating, alopecia, rash, dry skin, flushing

9.1 Anaemias and some other blood disorders

9.1.1	Iron-deficiency anaemias
9.1.2	Drugs used in megaloblastic anaemias
9.1.3	Drugs used in hypoplastic, haemolytic, and renal anaemias
9.1.4	Drugs used in platelet disorders
9.1.5	G6PD deficiency
9.1.6	Drugs used in neutropenia

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

9.1.1 Iron-deficiency anaemias

9.1.1.1	Oral iron
9.1.1.2	Parenteral iron

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastrointestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian subcontinent descent.

Prophylaxis with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia, pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as pre-term neonates.

9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

Treatment of iron-deficiency anaemia The oral dose of **elemental iron** to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates. (See also Prophylaxis of iron deficiency, below.)

Prescribing Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

Iron content of different iron salts

Iron salt	Amount	Content of ferrous iron
Ferrous fumarate	200 mg	65 mg
Ferrous gluconate	300 mg	35 mg
Ferrous sulphate	300 mg	60 mg
Ferrous sulphate, dried	200 mg	65 mg
Sodium ferredetate	190 mg	27.5 mg

Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

Prophylaxis of iron deficiency In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow's milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Dose Prophylactic iron supplementation (elemental iron 5 mg daily) may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow's milk, rather than fortified formula feed, is a major part of the diet.

Compound preparations Some oral preparations contain **ascorbic acid** to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins**, except **folic acid** for pregnant women, see p. 446.

Side-effects Gastro-intestinal irritation can occur with iron salts. Nausea and epigastric pain are dose-related, but the relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear. Oral iron can exacerbate diarrhoea in patients with inflammatory bowel disease.

Iron preparations taken orally can be constipating and occasionally lead to faecal impaction.

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulphate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity. For the treatment of **iron overdose**, see Emergency Treatment of Poisoning, p. 30.

Counselling Although iron preparations are best absorbed on an empty stomach, they can be taken after food to reduce gastro-intestinal side-effects; they may discolour stools.

FERROUS SULPHATE

Cautions interactions: Appendix 1 (iron)

Side-effects see notes above

Indication and dose

Iron-deficiency anaemia, prophylaxis of iron deficiency see notes above and preparations

Ferrous Sulphate (Non-proprietary)

Tablets, coated, dried ferrous sulphate 200 mg (65 mg iron), net price 28-tab pack = £1.15

Dose

Child 6–18 years prophylactic, 1 tablet daily; therapeutic, 1 tablet 2–3 times daily, see notes above

Ironorm® Drops (Wallace Fmg)

Oral drops, ferrous sulphate 125 mg (25 mg iron)/mL, net price 15 mL = £4.95

Dose

Child 1 month–6 years prophylactic 0.3 mL daily, but see notes above

Child 6–18 years prophylactic 0.6 mL daily

FERROUS FUMARATE

Cautions interactions: Appendix 1 (iron)

Side-effects see notes above

Indication and dose

Iron-deficiency anaemia, prophylaxis of iron deficiency see notes above and preparations

Fersaday® (Goldshield)

Tablets, brown, f/c, ferrous fumarate 322 mg (100 mg iron). Net price 28-tab pack = 79p

Dose

Child 12–18 years prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily

Fersamal® (Goldshield)

Tablets, brown, ferrous fumarate 210 mg (68 mg iron), net price 100 = £1.44

Dose

Child 12–18 years prophylactic, 1 tablet 1–2 times daily; therapeutic, 1 tablet 2–3 times daily

Syrup, brown, ferrous fumarate approx. 140 mg (45 mg iron)/5 mL. Net price 200 mL = £3.11

Dose

Preterm neonate see notes above

Neonate see notes above

Child 1 month–12 years see notes above

Child 12–18 years prophylactic, 5 mL twice daily; therapeutic, 10 mL twice daily

Galfer® (Thornton & Ross)

Capsules, red/green, ferrous fumarate 305 mg (100 mg iron), net price 100 = £2.00

Dose

Child 12–18 years prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

Syrup, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL. Net price 300 mL = £5.33

Dose

Preterm neonate and body-weight up to 3 kg prophylactic, 0.5 mL daily, see notes above

Neonate prophylactic and therapeutic, 0.25 mL/kg twice daily (total daily dose may alternatively be given in 3 divided doses), see notes above

Child 1 month–12 years prophylactic and therapeutic, 0.25 mL/kg twice daily (total daily dose may alternatively be given in 3 divided doses); max 20 mL daily, see notes above

Child 12–18 years prophylactic, 10 mL once daily; therapeutic, 10 mL 1–2 times daily

FERROUS GLUCONATE

Cautions interactions: Appendix 1 (iron)

Side-effects see notes above

Indication and dose

Iron-deficiency anaemia see notes above and preparation

Ferrous Gluconate (Non-proprietary)

Tablets, red, coated, ferrous gluconate 300 mg (35 mg iron), net price 28 = £2.95

Dose

Child 6–12 years prophylactic and therapeutic, 1–3 tablets daily

Child 12–18 years prophylactic, 2 tablets daily; therapeutic, 4–6 tablets daily in divided doses

POLYSACCHARIDE-IRON COMPLEX

Cautions interactions: Appendix 1 (iron)

Side-effects see notes above

Indication and dose

Iron-deficiency anaemia, prophylaxis of iron deficiency see notes above and preparation

Niferex® (Tillomed)

Elixir, brown, sugar-free, polysaccharide-iron complex equivalent to 100 mg of iron/5 mL. Net price 240-mL

pack = £6.06; ¹ 30-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper

Dose

Neonate (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily, see notes above

Child 1 month–2 years (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily, see notes above

Child 2–6 years therapeutic, 2.5 mL daily

Child 6–12 years therapeutic, 5 mL daily

Child 12–18 years prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (5 mL once daily if required during second and third trimester of pregnancy)

1. except 30 mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription 'SLS'

SODIUM FEREDETATE

(Sodium ironedetate)

Cautions interactions: Appendix 1 (iron)

Side-effects see notes above

Licensed use not licensed for prophylaxis of iron deficiency

Indication and dose

Iron-deficiency anaemia, prophylaxis of iron deficiency see notes above and preparation

Sytron® (Archimedes)

Elixir, sugar-free, sodium ferredetate 190 mg equivalent to 27.5 mg of iron/5 mL. Net price 100 mL = £1.07

Dose

Neonate prophylactic, 1 mL daily, see notes above; therapeutic, up to 2.5 mL twice daily (smaller doses should be used initially), see notes above

Child 1 month–1 year prophylactic, 1 mL daily, see notes above; therapeutic, up to 2.5 mL twice daily (smaller doses should be used initially), see notes above

Child 1–5 years therapeutic, 2.5 mL 3 times daily

Child 5–12 years therapeutic, 5 mL 3 times daily

Child 12–18 years therapeutic, 5 mL increasing gradually to 10 mL 3 times daily

9.1.1.2 Parenteral iron

Iron can be administered parenterally as **iron dextran**, **iron sucrose**, or **ferric carboxymaltose**. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the child cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption.

Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis (see also Erythropoietins, section 9.1.3).

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately.

Anaphylactic reactions can occur with parenteral iron complexes; facilities for cardiopulmonary resuscitation must be available. Depending on the preparation, a small test dose may be required. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

FERRIC CARBOXYMALTOSE

A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

Cautions hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available; oral iron should not be given concomitantly; allergic disorders including asthma and eczema; infection (discontinue if ongoing bacteraemia)

Hepatic impairment use with caution; avoid in conditions where iron overload increases risk of impairment

Pregnancy avoid in first trimester; crosses the placenta in *animal* studies; may influence skeletal development

Side-effects gastro-intestinal disturbances; headache, dizziness; rash; injection-site reactions; *less commonly* hypotension, flushing, chest pain, peripheral oedema, hypersensitivity reactions (including anaphylaxis), fatigue, paraesthesia, malaise, pyrexia, rigors, myalgia, arthralgia, back pain, pruritus, and urticaria; *rarely* dyspnoea

Licensed use not licensed for use in children under 14 years

Indication and dose

Iron-deficiency anaemia see notes above

- By slow intravenous injection or by intravenous infusion

Calculated according to body-weight and iron deficit, consult product literature

Ferinject® (Vifor) (POM)

Injection, iron (as ferric carboxymaltose) 50 mg/mL, net price 2-mL vial = £21.75, 10-mL vial = £108.75
Electrolytes Na⁺ 0.24 mmol/mL

IRON DEXTRAN

A complex of ferric hydroxide with sucrose containing 5% (50 mg/mL) of iron

Cautions oral iron not to be given until 5 days after last injection

Anaphylaxis Anaphylactic reactions can occur with parenteral iron and a test dose is recommended before *each* dose; the patient should be carefully observed for 60 minutes after the first test dose and for 15 minutes after subsequent test doses. Facilities for cardiopulmonary resuscitation must be available; risk of allergic reactions increased in immune or inflammatory conditions

Contra-indications history of allergic disorders including asthma, and eczema; infection; active rheumatoid arthritis

Hepatic impairment avoid in severe impairment

Renal impairment avoid in acute renal failure

Pregnancy avoid in first trimester

Side-effects *less commonly* nausea, vomiting, abdominal pain, flushing, dyspnoea, anaphylactic reactions (see Anaphylaxis above), numbness, cramps, blurred vision, pruritus, and rash; *rarely* diarrhoea, chest pain, hypotension, angioedema, arrhythmias, tachycardia,

dizziness, restlessness, fatigue, seizures, tremor, impaired consciousness, myalgia, arthralgia, sweating, and injection-site reactions; *very rarely* hypertension, palpitation, headache, paraesthesia, haemolysis, and transient deafness

Licensed use not licensed for use in children under 14 years

Indication and dose

Iron-deficiency anaemia see notes above

- By slow intravenous injection or by intravenous infusion

Calculated according to body-weight and iron deficit, consult product literature

CosmoFer® (Vitaline) (POM)

Injection, iron (as iron dextran) 50 mg/mL, net price 2-mL amp = £7.97; 10-mL amp = £39.85

IRON SUCROSE

A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron

Cautions oral iron therapy should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

Anaphylaxis Anaphylactic reactions can occur with parenteral iron and a test dose is recommended before the first dose; the patient should be carefully observed for 15 minutes. Facilities for cardiopulmonary resuscitation must be available

Contra-indications history of allergic disorders including asthma, eczema, and anaphylaxis

Hepatic impairment use with caution; avoid in conditions where iron overload increases risk of impairment

Pregnancy avoid in first trimester

Side-effects taste disturbances; *less commonly* nausea, vomiting, abdominal pain, diarrhoea, hypotension, tachycardia, flushing, palpitation, chest pain, bronchospasm, dyspnoea, headache, dizziness, fever, myalgia, pruritus, rash, and injection-site reactions; *rarely* peripheral oedema, anaphylactic reactions (see Anaphylaxis above), fatigue, asthenia, and paraesthesia; confusion, arthralgia, and increased sweating also reported

Licensed use not licensed for use in children

Indication and dose

Iron-deficiency anaemia see notes above

- By slow intravenous injection or by intravenous infusion

Calculated according to body-weight and iron deficit, consult product literature

Venofer® (Vifor) (POM)

Injection, iron (as iron sucrose) 20 mg/mL, net price 5-mL vial = £9.35

9.1.2 Drugs used in megaloblastic anaemias

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B₁₂ or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to

administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B₁₂ is used in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare disorders of *congenital transcobalamin II deficiency*, *methylmalonic acidemia* and *homocystinuria* (see section 9.8.1).

Vitamin B₁₂ should be given prophylactically after *total ileal resection*.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in large oral doses [unlicensed] may be effective.

Hydroxocobalamin has completely replaced cyanocobalamin as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated (see above).

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or treatment with anti-epileptics), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid 5 mg daily is continued to term.

For prophylaxis in *chronic haemolytic states*, *malabsorption* or in *renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis (see also section 10.1.3, p. 508), severe Crohn's disease (see section 1.5.3, p. 54), and severe psoriasis (see section 13.5.3, p. 572).

For *prophylaxis in pregnancy*, see Prevention of Neural Tube Defects below.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow's milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folic acid is also effective in the treatment of folate-deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs (see section 8.1); it is given as calcium folinate.

Prevention of neural tube defects Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.8.1).

Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) and continue this throughout pregnancy).

There is **no** justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

HYDROXOCOBALAMIN

Cautions should not be given before diagnosis fully established but see also notes above; **interactions** Appendix 1 (hydroxocobalamin)

Breast-feeding present in milk but not known to be harmful

Side-effects nausea, headache, dizziness; fever, hypersensitivity reactions (including rash and pruritus); injection-site reactions; hypokalaemia and thrombocytosis during initial treatment; chromaturia

Licensed use licensed for use in children (age not specified by manufacturers); not licensed for use in inborn errors of metabolism

Indication and dose

Macrocytic anaemia without neurological involvement

• **By intramuscular injection**

Child 1 month–18 years initially 250 micrograms–1 mg 3 times a week for 2 weeks then 250 micrograms once weekly until blood count normal, then 1 mg every 3 months

Macrocytic anaemia with neurological involvement• **By intramuscular injection**

Child 1 month–18 years initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months

Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency• **By intramuscular injection**

Child 1 month–18 years 1 mg every 2–3 months

Leber's optic atrophy• **By intramuscular injection**

Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

Congenital transcobalamin II deficiency• **By intramuscular injection**

Neonate 1 mg 3 times a week, reduce after 1 year to 1 mg once weekly or as appropriate

Child 1 month–18 years 1 mg 3 times a week, reduce after 1 year to 1 mg once weekly or as appropriate

Methylmalonic acidaemia and homocystinuria• **By intramuscular injection**

Child 1 month–18 years initially 1 mg daily for 5–7 days, reduce according to response to maintenance dose of up to 1 mg once or twice weekly

Methylmalonic acidaemia, maintenance once intramuscular response established• **By mouth**

Child 1 month–18 years 5–10 mg once or twice weekly

Note Some children do not respond to the oral route

Cyanide poisoning

See Emergency Treatment of Poisoning, p. 32

Hydroxocobalamin (Non-proprietary) (POM)

Injection, hydroxocobalamin 1 mg/mL. Net price 1-mL amp = 74p

Brands include Cobalin-H[®] (S), Neo-Cytamen[®] (S)

Injection, hydroxocobalamin 2.5 mg/mL, 2 mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Administration For administration *by mouth*, injection solution may be given orally; it will not have prolonged effect via this route

Note The BP directs that when Vitamin B₁₂ injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

Powder available from specialist importing companies

FOLIC ACID

Cautions should never be given alone for vitamin B₁₂ deficiency states (may precipitate subacute combined degeneration of the spinal cord); **interactions:** Appendix 1 (folates)

Side-effects rarely gastro-intestinal disturbances

Licensed use unlicensed for limiting methotrexate toxicity

Indication and dose

Folate supplementation in neonates (see notes above)

• **By mouth**

Neonate 50 micrograms once daily *or* 500 micrograms once weekly

Megaloblastic anaemia due to folate deficiency (see notes above)

• **By mouth**

Neonate initially 500 micrograms/kg once daily for up to 4 months

Child 1 month–1 year initially 500 micrograms/kg once daily (max. 5 mg) for up to 4 months; up to 10 mg daily may be required in malabsorption states

Child 1–18 years 5 mg daily for 4 months (until term in pregnant women); up to 15 mg daily may be required in malabsorption states

Haemolytic anaemia; metabolic disorders

• **By mouth**

Child 1 month–12 years 2.5–5 mg once daily

Child 12–18 years 5–10 mg once daily

Prophylaxis of folate deficiency in dialysis

• **By mouth**

Child 1 month–12 years 250 microgram/kg (max. 10 mg) once daily

Child 12–18 years 5–10 mg once daily

Prevention of methotrexate side-effects in juvenile idiopathic arthritis

• **By mouth**

Child 2–18 years 1 mg daily *or* 5 mg once weekly, adjusted according to local guidelines

Prevention of methotrexate side-effects in severe Crohn's disease or severe psoriasis

• **By mouth**

See section 1.5.3 and section 13.5.3

Prevention of neural tube defects

• **By mouth**

See notes above

¹Folic Acid (Non-proprietary) (POM)

Tablets, folic acid 400 micrograms, net price 90-tab pack = £2.37; 5 mg, 28-tab pack = £1.00

Syrup, folic acid 2.5 mg/5 mL, net price 150 mL = £9.16; 400 micrograms/5 mL, 150 mL = £1.40

Brands include Folicare[®], Lеспеc[®] (sugar-free)

1. Can be sold to the public provided daily doses do not exceed 500 micrograms

9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids (see BNF, section 6.4.3), pyridoxine, antilymphocyte immunoglobulin, and various corticoids

teroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special-order' manufacturers or specialist importing companies, see p. 809) may be used in aplastic anaemia at a dose of 1–5 mg/kg daily for 3 to 6 months.

It is unlikely that dietary deficit of **pyridoxine** (section 9.6.2) produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but pyridoxine is indicated in pregnancy, haemolytic anaemias, or during isoniazid treatment.

Corticosteroids (section 6.3) have an important place in the management of haematological disorders including *autoimmune haemolytic anaemia*, *idiopathic thrombocytopenias* (section 9.1.4) and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, see below.

Epoetin beta is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks. Only unpreserved formulations should be used as other preparations may contain benzyl alcohol (see Excipients, p. 2).

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy.

Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates (see section 9.1.1.1). Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.

Erythropoietins—haemoglobin concentration

In chronic kidney disease, the use of erythropoietins can be considered in a child with anaemia. The aim of treatment is to relieve symptoms of anaemia and to avoid the need for blood transfusion. The optimum haemoglobin concentration is dependent on the child's age and factors such as symptoms, comorbidities, and patient preferences. The haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia. In *adults*, overcorrection of haemoglobin concentration with erythropoietins in those with chronic kidney disease may increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

For MHRA/CHM advice relating to adults, see BNFC section 9.1.3.

Pure red cell aplasia

There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should **not** be switched to another form of erythropoietin.

DARBEPOETIN ALFA

Cautions see Epoetin

Contra-indications see Epoetin

Hepatic impairment manufacturer advises caution

Pregnancy no evidence of harm in *animal* studies—manufacturer advises caution

Breast-feeding manufacturer advises avoid—no information available

Side-effects see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also notes above

Indication and dose

Symptomatic anaemia associated with chronic renal failure in children on dialysis (see also notes above)

• **By intravenous or subcutaneous injection**

Child 11–18 years initially 450 nanograms/kg once weekly adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly or once every 2 weeks

Symptomatic anaemia associated with chronic renal failure in children not on dialysis (see also notes above)

• **By intravenous or subcutaneous injection**

Child 11–18 years by *subcutaneous* or *intravenous injection*, initially 450 nanograms/kg once weekly or by *subcutaneous injection*, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given *sub-*

cutaneously or intravenously once weekly or subcutaneously once every 2 weeks or subcutaneously once every month

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements. Adjust doses not more frequently than every 2 weeks during maintenance treatment.

Aranesp® (Amgen) (P_{HM})

Injection, prefilled syringe, darbepoetin alfa, 25 micrograms/mL, net price 0.4 mL (10 micrograms) = £14.68; 40 micrograms/mL, 0.375 mL (15 micrograms) = £22.03, 0.5 mL (20 micrograms) = £29.37; 100 micrograms/mL, 0.3 mL (30 micrograms) = £44.05, 0.4 mL (40 micrograms) = £58.73, 0.5 mL (50 micrograms) = £73.41; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81, 0.65 mL (130 micrograms) = £190.86; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

Injection (*Aranesp® SureClick*), prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL, net price 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, net price 0.4 mL (40 micrograms) = £58.72; 200 micrograms/mL, net price 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81; 500 micrograms/mL, net price 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

EPOETIN ALFA, BETA, and ZETA (Recombinant human erythropoietins)

Note The prescriber must specify which epoetin is required, see also Biosimilar medicines, p. 2

Cautions see notes above; also inadequately treated or poorly controlled blood pressure (monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes), interrupt treatment if blood pressure uncontrolled; sudden stabbing migraine-like pain is warning of hypertensive crisis; sickle-cell disease (lower target haemoglobin concentration may be appropriate); ischaemic vascular disease; thrombocytosis (monitor platelet count for first 8 weeks); epilepsy; malignant disease; increase in unfractonated or low molecular weight heparin dose may be needed during dialysis

Contra-indications pure red cell aplasia following erythropoietin therapy (see also notes above); uncontrolled hypertension; avoid injections containing benzyl alcohol in neonates (see under preparations, below)

Hepatic impairment manufacturers advise caution in chronic hepatic failure

Pregnancy no evidence of harm; benefits probably outweigh risks of anaemia and blood transfusion

Breast-feeding unlikely to be present in milk; effect on infant minimal

Side-effects diarrhoea, nausea, vomiting; dose-dependent increase in blood pressure or aggravation of hypertension; in isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention; dose-dependent increase in platelet count (but thrombocytosis rare) regressing during treatment; influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes); cardiovascular events; shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications; *very rarely* sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue erythropoietin therapy)—see also notes above, hyperkalaemia, hypersensitivity reactions (including anaphylaxis and angioedema), skin reactions, injection-site reactions, and peripheral oedema also reported

Licensed use *Eprex®* 20 000–unit, 30 000–unit, and 40 000–unit prefilled syringes not licensed for use in children

Indication and dose

See under preparations, below

▲ **Epoetin alfa**

Binocrit® (Sandoz) ▼ (P_{HM})

Injection, prefilled syringe, epoetin alfa, net price 1000 units = £5.09; 2000 units = £10.18; 3000 units = £15.27; 4000 units = £20.36; 5000 units = £25.46; 6000 units = £30.55; 8000 units = £40.73; 10 000 units = £50.91

Note Biosimilar Medicine, p. 2

Dose

Symptomatic anaemia associated with chronic renal failure in children on haemodialysis (see also notes above)

- **By intravenous injection over 1–5 minutes**

Child 1 month–18 years initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Note Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Eprex® (Janssen) (P_{HM})

Injection, prefilled syringe, epoetin alfa, net price 1000 units = £5.53; 2000 units = £11.07; 3000 units = £16.60; 4000 units = £22.13; 5000 units = £27.66; 6000 units = £33.19; 8000 units = £44.25; 10 000 units = £55.31; 20 000 units = £110.62; 30 000 units = £165.93; 40 000 units = £221.24. An auto-injector device is available for use with prefilled syringes

Dose

Symptomatic anaemia associated with chronic renal failure in children on haemodialysis (see also notes above)

- **By intravenous injection over 1–5 minutes**

Child 1 month–18 years initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4

weeks; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight 30–60 kg usually 30–100 units/kg 3 times weekly, body-weight over 60 kg usually 75–300 units/kg weekly (as a single dose or in divided doses)

Note Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

■ Epoetin beta

NeoRecormon® (Roche) (Pm)

Injection, prefilled syringe, epoetin beta, net price 500 units = £3.75; 2000 units = £14.98; 3000 units = £22.47; 4000 units = £29.96; 5000 units = £37.47; 6000 units = £44.94; 10 000 units = £70.14; 20 000 units = £140.28; 30 000 units = £224.69

Excipients include phenylalanine up to 300 micrograms/syringe (section 9.4.1)

Dose

Symptomatic anaemia associated with chronic renal failure (see also notes above)

• By subcutaneous injection

Neonate initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

Child 1 month–18 years initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

• By intravenous injection over 2 minutes

Neonate initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

Child 1 month–18 years initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Prevention of anaemias of prematurity in neonates with birth-weight of 0.75–1.5 kg and gestational age under 34 weeks

• By subcutaneous injection (of single-dose, unreserved injection)

Neonate 250 units/kg 3 times weekly preferably starting within 3 days of birth and continued for 6 weeks

Multidose injection, powder for reconstitution, epoetin beta, net price 50 000-unit vial = £374.48 (with solvent)

Excipients include phenylalanine up to 5 mg/vial (section 9.4.1), benzyl alcohol (avoid in neonates, see Excipients p. 2)

Note Avoid contact of reconstituted injection with glass; use only plastic materials

Dose

Symptomatic anaemia associated with chronic renal failure (see also notes above)

• By subcutaneous injection

Child 3–18 years initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

• By intravenous injection over 2 minutes

Child 3–18 years initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

■ Epoetin zeta

Retacrit® (Hospira) (Pm)

Injection, prefilled syringe, epoetin zeta, net price 1000 units = £5.66; 2000 units = £11.31; 3000 units = £16.97; 4000 units = £22.63; 5000 units = £28.28; 6000 units = £33.94; 8000 units = £45.25; 10 000 units = £56.57; 20 000 units = £203.64; 30 000 units = £305.46; 40 000 units = £407.27

Excipients include phenylalanine up to 500 micrograms/syringe (section 9.4.1)

Note Biosimilar Medicine, p. 2

Dose

Symptomatic anaemia associated with chronic renal failure in children on haemodialysis (see also notes above)

• By intravenous injection over 1–5 minutes

Child 1 month–18 years initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Note Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include *sickle-cell crisis*, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia (section 4.7), and treatment of any concurrent infection. Chronic complica-

tions include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine (section 14.4), haemophilus influenzae type b vaccine (section 14.4), an annual influenza vaccine (section 14.4), and prophylactic penicillin (Table 2, section 5.1) reduce the risk of infection. Hepatitis B vaccine (section 14.4) should be considered if the child is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary (section 9.1.2).

Hydroxycarbamide can reduce the frequency of crises and the need for blood transfusions. Hydroxycarbamide should be considered, in consultation with a specialist centre, for children who have recurrent episodes of acute pain (more than 3 admissions in the previous 12 months, or who are very symptomatic in the community) or who have had 2 or more episodes of acute sickle chest syndrome in the last 2 years (or 1 episode requiring ventilatory support). Beneficial effects of hydroxycarbamide may not become evident for several months. Myelosuppression, and skin reactions are the most common side-effects.

HYDROXYCARBAMIDE

(Hydroxyurea)

Cautions see section 8.1 and notes above; also monitor renal and hepatic function before and during treatment; monitor full blood count before treatment, then every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on max. dose); leg ulcers (review treatment if cutaneous vasculitic ulcerations develop); **interactions:** Appendix 1 (hydroxycarbamide)

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy avoid (teratogenic in animal studies); manufacturer advises effective contraception before and during treatment; see also section 8.1

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also headache; *less commonly* dizziness, and rash; *rarely* reduced sperm count and activity; fever, amenorrhoea, bleeding, and hypomagnesaemia also reported

Indication and dose

Sickle-cell disease (see notes above)

• By mouth

Child 2–18 years initially 10–15 mg/kg once daily, increased every 12 weeks in steps of 5 mg/kg daily according to response; usual dose 15–30 mg/kg daily (max. 35 mg/kg daily)

Siklos® (Nordic) ▼ (POM)

Tablets, scored, f/c, hydroxycarbamide 1 g, net price 30-tab pack = £500.00

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

Iron overload

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound **desferrioxamine mesilate** is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week; the dose should reflect the degree of iron overload. The initial dose should not exceed 30 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine is enhanced by ascorbic acid (vitamin C, section 9.6.3) 100–200 mg daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

Desferrioxamine infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

Deferasirox, an oral iron chelator, is licensed for the treatment of chronic iron overload in children over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed blood cells). It is also licensed for chronic iron overload when desferrioxamine is contra-indicated or inadequate in children with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells), in children with other anaemias, and in children aged 2 to 5 years.

The *Scottish Medicines Consortium* (p. 3) has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

Deferiprone, an oral iron chelator, is licensed for the treatment of iron overload in children over 6 years of age with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate. Blood dyscrasias, particularly agranulocytosis, have been reported with deferiprone.

DEFERASIROX

Cautions eye and ear examinations required before treatment and annually during treatment; monitor body-weight, height and sexual development annually; monitor serum-ferritin concentration

monthly; risk of gastro-intestinal ulceration and haemorrhage; platelet count less than 50×10^9 /litre; consider treatment interruption if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes); history of liver cirrhosis; test liver function before treatment, then every 2 weeks during the first month, and then monthly; measure baseline serum-creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; **interactions:** Appendix 1 (deferiasirox)

Hepatic impairment manufacturer advises caution—no information available; avoid in severe impairment

Renal impairment reduce dose by 10 mg/kg if serum-creatinine increased above age-appropriate limits or estimated glomerular filtration rate less than 90 mL/minute/1.73 m² on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless essential—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects gastro-intestinal disturbances (including ulceration and fatal haemorrhage); headache; proteinuria; pruritus, rash; *less commonly* oedema, hepatitis, cholelithiasis, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, blood disorders (including agranulocytosis, neutropenia, pancytopenia, and thrombocytopenia), hypersensitivity reactions (including anaphylaxis and angioedema), and alopecia also reported

Licensed use see notes above

Indication and dose

Chronic iron overload

• By mouth

Child 2–18 years initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; usual max. 30 mg/kg daily, but may be increased to max. 40 mg/kg daily and reduced in steps of 5–10 mg/kg once control achieved

Note Dose should be rounded to nearest whole tablet size

Exjade® (Novartis) (PnM)

Dispersible tablets, deferiasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration

Counselling Tablets should be dispersed in water, orange juice, or apple juice; if necessary, resuspend residue and swallow

DEFERIPRONE

Cautions monitor neutrophil count weekly and discontinue treatment if neutropenia develops

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

Contra-indications history of agranulocytosis or recurrent neutropenia

Hepatic impairment manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in *animal* studies; contraception advised in girls of child-bearing potential

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discoloration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

Licensed use see notes above

Indication and dose

Iron overload in thalassaemia major

• By mouth

Child 6–18 years 25 mg/kg 3 times daily (max. 100 mg/kg daily)

Feriprox® (Swedish Orphan) (PnM)

Tablets, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39. Label: 14, counselling, blood disorders

Oral solution, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

DEFERIOXAMINE MESILATE

(Deferoxamine Mesilate)

Cautions eye and ear examinations before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth restriction with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); **interactions:** Appendix 1 (desferioxamine)

Renal impairment use with caution

Pregnancy teratogenic in *animal* studies, manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—no information available

Side-effects nausea, vomiting, abdominal pain, headache, pyrexia, growth retardation and bone disorders (see Cautions), arthralgia, myalgia, hearing disturbances, injection-site reactions; *rarely* diarrhoea, hepatic impairment, hypotension (especially when given too rapidly by intravenous injection), anaphylaxis, Yersinia and mucormycosis infections, blood dyscrasias (including thrombocytopenia and leucopenia), leg cramps, bone pain, visual disturbances (including lens opacity and retinopathy), rash; *very rarely* acute respiratory distress, neurological disturbances (including dizziness, neuropathy, con-

vulsions, and paraesthesia), renal impairment; muscle spasms also reported

Indication and dose

Chronic iron overload see notes above

Aluminium overload in dialysis patients

- By intravenous infusion
- Child 1 month–18 years** 5 mg/kg once weekly

Iron poisoning

See Emergency Treatment of Poisoning, p. 30

Administration For *intravenous* or *subcutaneous infusion*, reconstitute powder with Water for Injection to a concentration of 100 mg/mL; dilute with Glucose 5% or Sodium Chloride 0.9%. In *haemodialysis* or *haemofiltration* administer over the last hour of dialysis (may be given via the dialysis fistula). *Intra-peritoneal*: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

Note For full details and warnings relating to administration, consult product literature

Desferrioxamine mesilate (Non-proprietary) (Pom)

Injection, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.05

Desferal® (Novartis) (Pom)

Injection, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.67; 2-g vial = £18.66

9.1.4 Drugs used in platelet disorders

Idiopathic thrombocytopenic purpura Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. A **corticosteroid**, such as prednisolone (p. 376), is sometimes used if idiopathic thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

Immunoglobulin preparations (section 14.5) may be used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are often used in preference to a corticosteroid. Anti-D immunoglobulin is licensed for the management of idiopathic thrombocytopenic purpura.

Other therapy that has been tried under specialist supervision in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), and ciclosporin (section 8.2.2). Rituximab is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.11) may be given to reduce the severity of haemorrhage.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

Essential thrombocythaemia **Anagrelide** reduces platelets in essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

ANAGRELIDE

Cautions cardiovascular disease—assess cardiac function before and during treatment; concomitant aspirin in patients at risk of haemorrhage; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established), liver function, serum creatinine, and urea; **interactions**: Appendix 1 (anagrelide)

Skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving)

Hepatic impairment manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

Renal impairment manufacturer advises avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid (toxicity in animal studies)

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances; palpitation, tachycardia, fluid retention; headache, dizziness, fatigue; anaemia; rash; *less commonly* pancreatitis, gastro-intestinal haemorrhage, congestive heart failure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoaesthesia, depression, nervousness, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthralgia, epistaxis, dry mouth, alopecia, skin discoloration, and pruritus; *rarely* gastritis, colitis, postural hypotension, angina, myocardial infarction, vasodilatation, pulmonary infiltrates, migraine, drowsiness, impaired coordination, dysarthria, asthenia, tinnitus, renal failure, nocturia, visual disturbances, and gingival bleeding; allergic alveolitis and hepatitis also reported

Licensed use not licensed for use in children

Indication and dose

Essential thrombocythaemia in at-risk children who have not responded adequately to other therapy or who are intolerant of it (initiated under specialist supervision)

- By mouth

Child 7–18 years initially 500 micrograms daily adjusted according to response in steps of 500 micrograms daily at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses

Xagrid® (Shire) ▼ (Pom)

Capsules, anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack= £337.14. Counseling, skilled tasks, see above

9.1.5 G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for children with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the child belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These children must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with *definite* risk of haemolysis in most G6PD-deficient individuals

Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)

Methylthionium chloride

Niridazole [not on UK market]

Nitrofurantoin

Pamaquin [not on UK market]

Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people, see section 5.4.1)

Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)

Rasburicase

Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with *possible* risk of haemolysis in some G6PD-deficient individuals

Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)

Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)

Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)

Probenecid [not on UK market]

Quinidine (acceptable in acute malaria) [not on UK market]

Quinine (acceptable in acute malaria)

Note Naphthalene in mothballs also causes haemolysis in individuals with G6PD-deficiency.

9.1.6 Drugs used in neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. **Filgrastim** (unglycosylated rhG-CSF) and **lenograstim** (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

Cautions Granulocyte-colony stimulating factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts (including differential white cell count and platelet count) should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a history of pulmonary infiltrates or pneumonia may be at higher risk. Granulocyte-colony stimulating factors should be used with caution in children with sickle-cell disease. Spleen size should be monitored during treatment as there is a risk of splenomegaly and rupture.

Pregnancy There have been reports of toxicity in *animal* studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

Breast-feeding There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding use.

Side-effects Side-effects of granulocyte-colony stimulating factors include gastro-intestinal disturbances, anorexia, headache, asthenia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. *Less commonly* chest pain can occur. Pulmonary side-effects, particularly interstitial pneumonia (see Cautions above), cutaneous vasculitis, and acute febrile neutrophilic dermatitis have *rarely* been reported.

FILGRASTIM

(Recombinant human granulocyte-colony stimulating factor, G-CSF)

Cautions see notes above; also regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia); secondary acute myeloid leukaemia; osteoporotic bone disease (monitor bone density if given for more than 6 months); **interactions:** Appendix 1 (filgrastim)

Contra-indications severe congenital neutropenia (Kostman's syndrome) with abnormal cytogenetics

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also mucositis, splenic enlargement, hepatomegaly, transient hypotension, epistaxis, urinary abnormalities (including dysuria, proteinuria, and haematuria), osteoporosis, exacerbation of rheumatoid arthritis, anaemia, transient decrease in blood glucose, pseudogout, and raised uric acid; *very rarely* splenic rupture

Licensed use not licensed for treatment of glycogen storage disease or neonatal neutropenia

Indication and dose

Cytotoxic-induced neutropenia

- Preferably by subcutaneous injection or by intravenous infusion (over 30 minutes)

Child 1 month–18 years 5 micrograms/kg daily started not less than 24 hours after cytotoxic chemotherapy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)

Myeloablative therapy followed by bone-marrow transplantation

- By intravenous infusion over 30 minutes or over 24 hours or by subcutaneous infusion over 24 hours

Child 1 month–18 years 10 micrograms/kg daily, started not less than 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to absolute neutrophil count (consult product literature and local protocol)

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone

- By subcutaneous injection or by subcutaneous infusion over 24 hours

Child 1 month–18 years 10 micrograms/kg daily for 5–7 days

Mobilisation of peripheral blood progenitor cells for autologous infusion following adjunctive myelosuppressive chemotherapy (to improve yield)

- By subcutaneous injection

Child 1 month–18 years 5 micrograms/kg daily, started the day after completion of chemotherapy and continued until neutrophil count in normal range; for timing of leucopheresis consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion

- By subcutaneous injection

Child over 16 years 10 micrograms/kg daily for 4–5 days; for timing of leucopheresis consult product literature

Severe chronic neutropenia

- By subcutaneous injection

Child 1 month–18 years in severe congenital neutropenia, initially 12 micrograms/kg daily in single or divided doses (initially 5 micrograms/kg daily in idiopathic or cyclic neutropenia), adjusted according to response (consult product literature and local protocol)

Persistent neutropenia in HIV infection

- By subcutaneous injection

Child 1 month–18 years initially 1 microgram/kg daily, increased as necessary until absolute neutrophil count in normal range (usual max. 4 micrograms/kg daily), then adjusted to maintain absolute neutrophil count in normal range (consult product literature)

Neonatal neutropenia

- By subcutaneous injection

Neonate 10 micrograms/kg daily, discontinue if white cell count exceeds 50×10^9 /litre

Glycogen storage disease type 1b

- By subcutaneous injection

5 micrograms/kg daily, adjusted as necessary

Administration For *subcutaneous* or *intravenous infusion*, dilute with Glucose 5% to a concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions

Neupogen® (Amgen) (FoM)

Injection, filgrastim 30 million units (300 micrograms)/mL; net price 1-mL vial = £58.56

Injection (Singleject®), filgrastim 60 million units (600 micrograms)/mL, net price 0.5-mL pre-filled syringe = £58.56; 96 million units (960 micrograms)/mL, 0.5-mL pre-filled syringe = £93.40

Note Biosimilar medicine, p. 2

LENOGRASTIM

(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also splenic rupture and toxic epidermal necrolysis

Licensed use not licensed for use in children for cytotoxic-induced neutropenia, mobilisation of peripheral blood progenitor cells (monotherapy or adjunctive therapy), or following peripheral stem cells transplantation

Indication and dose

Following peripheral stem cells or bone-marrow transplantation

- By intravenous infusion over 30 minutes or by subcutaneous injection

Child 2–18 years 150 micrograms/m² daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)

Cytotoxic-induced neutropenia

- By subcutaneous injection

Child 2–18 years 150 micrograms/m² daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days)

Mobilisation of peripheral blood progenitor cells, used alone

- By subcutaneous injection

Child 2–18 years 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

Mobilisation of peripheral blood progenitor cells following adjunctive myelosuppressive chemotherapy (to improve yield)

- By subcutaneous injection

Child 2–18 years 150 micrograms/m² daily, started 1–5 days after completion of

chemotherapy and continued until neutrophil count in acceptable range; for timing of leuco-pheresis consult product literature

Administration for intravenous infusion, dilute reconstituted solution to a concentration of not less than 2 micrograms/mL (*Granocyte-13*) or 2.5 micrograms/mL (*Granocyte-34*) with Sodium Chloride 0.9%

Granocyte® (Chugai) (POM)

Injection, powder for reconstitution, lenograstim, net price 13.4 million-unit (105-microgram) vial = £40.11; 33.6 million-unit (263-microgram) vial = £62.54 (both with 1-mL prefilled syringe water for injections)

Excipients include phenylalanine (section 9.4.1)

9.2 Fluids and electrolytes

9.2.1 Oral preparations for fluid and electrolyte imbalance

9.2.2 Parenteral preparations for fluid and electrolyte imbalance

The following tables give a selection of useful electrolyte values:

Electrolyte concentrations—intravenous fluids

	Millimoles per litre				
Intravenous infusion	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻	Ca ²⁺
<i>Normal plasma values</i>	142	4.5	26	103	2.5
Sodium Chloride 0.9%	150	—	—	150	—
Compound Sodium Lactate (Hartmann's)	131	5	29	111	2
Sodium Chloride 0.45% and Glucose 5%	75	—	—	75	—
Potassium Chloride 0.15% and Glucose 5%	—	20	—	20	—
Potassium Chloride 0.15% and Sodium Chloride 0.9%	150	20	—	170	—
Potassium Chloride 0.3% and Glucose 5%	—	40	—	40	—
Potassium Chloride 0.3% and Sodium Chloride 0.9%	150	40	—	190	—
<i>To correct metabolic acidosis</i>					
Sodium Bicarbonate 1.26%	150	—	150	—	—
Sodium Bicarbonate 8.4% for cardiac arrest	1000	—	1000	—	—
Sodium Lactate (m/6)	167	—	167	—	—

Electrolyte content—gastro-intestinal secretions

Type of fluid	Millimoles per litre				
	H ⁺	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻
Gastric	40–60	20–80	5–20	—	100–150
Biliary	—	120–140	5–15	30–50	80–120
Pancreatic	—	120–140	5–15	70–110	40–80
Small bowel	—	120–140	5–15	20–40	90–130

Faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected; where this is impracticable the approximations above may be helpful in planning replacement therapy

9.2.1 Oral preparations for fluid and electrolyte imbalance

9.2.1.1 Oral potassium

9.2.1.2 Oral sodium and water

9.2.1.3 Oral bicarbonate

Sodium and potassium salts, which may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree, are discussed in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also described in this section.

For reference to calcium, magnesium, and phosphate, see section 9.5.

9.2.1.1 Oral potassium

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

Dosage If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride 1–2 mmol/kg (usual max. 50 mmol potassium) daily by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal insufficiency*

to reduce the **risk of hyperkalaemia**. Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable (see also above). Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Administration Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic states*, section 9.2.1.3). Potassium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, see p. 809; they should be used with care because they are hypertonic and can damage the gastric mucosa.

Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*[®] and *Ruthmo*[®]). These should not be used by patients with renal failure as potassium intoxication may result.

POTASSIUM CHLORIDE

Cautions see notes above; cardiac disease; *with modified-release preparations*, intestinal stricture, history of peptic ulcer, hiatus hernia; **interactions:** Appendix 1 (potassium salts)

Contra-indications plasma-potassium concentration above 5 mmol/litre

Renal impairment close monitoring required—risk of hyperkalaemia; avoid in severe impairment

Side-effects nausea, vomiting, abdominal pain, diarrhoea, flatulence; *with modified-release preparations*, gastro-intestinal obstruction, ulceration, and bleeding also reported

Indication and dose

Potassium depletion

• By mouth

Neonate 0.5–1 mmol/kg K⁺ twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to plasma-potassium concentration

Child 1 month–18 years 0.5–1 mmol/kg K⁺ twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to plasma-potassium concentration

Note Do not confuse Effervescent Potassium Tablets BPC 1968 (section 9.2.1.3) with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states (section 9.2.1.3).

Kay-Cee-L[®] (Geistlich)

Syrup, sugar-free, red, potassium chloride 7.5% (1 mmol/mL each of K⁺ and Cl⁻), net price 500 mL = £4.07. Label: 21

Sando-K® (HK Pharma)

Tablets, effervescent, potassium bicarbonate and chloride equivalent to potassium 470 mg (12 mmol of K^+) and chloride 285 mg (8 mmol of Cl^-), net price 20 = £1.53. Label: 13, 21

Modified-release preparations

Avoid unless effervescent tablets or liquid preparations inappropriate

Slow-K® (Alliance) 

Tablets, m/r, orange, s/c, potassium chloride 600 mg (8 mmol each of K^+ and Cl^-), net price 100 = £2.14. Label: 25, 27, counselling, swallow whole with fluid during meals while sitting or standing

Management of hyperkalaemia

Acute severe hyperkalaemia calls for urgent treatment with intravenous infusion of **soluble insulin** (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with **glucose** 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, **salbutamol** (section 3.1.1.1) can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate (section 9.5.1.1) is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with **sodium bicarbonate** infusion (section 9.2.2.1) should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous **furosemide** can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes. Calcium polystyrene sulphonate is preferred unless plasma-calcium concentrations are high.

POLYSTYRENE SULPHONATE RESINS

Cautions impaction of resin with excessive dosage or inadequate dilution; monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre); *sodium-containing resin* in congestive heart failure, hypertension, and oedema; **interactions**: Appendix 1 (polystyrene sulphonate resins)

Contra-indications obstructive bowel disease; neonates with reduced gut motility; *calcium-containing resin* in hyperparathyroidism, multiple myeloma, sarcoidosis, or metastatic carcinoma

Renal impairment use *sodium-containing resin* with caution

Pregnancy manufacturers advise use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturers advise use only if potential benefit outweighs risk—no information available

Side-effects faecal impaction following rectal administration, gastro-intestinal concretions following oral administration, intestinal necrosis reported with concomitant use of sorbitol, gastric irritation, anorexia, nausea, vomiting, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea, hypomagnesaemia; gastro-intestinal obstruction, ulceration, necrosis, and ischaemic colitis also reported; with *calcium-containing resin*, hypercalcaemia (including in dialysed patients and occasionally those with renal impairment); with *sodium-containing resin*, sodium retention, hypocalcaemia

Indication and dose

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

• By mouth

Child 1 month–18 years 125–250 mg/kg (max. 15 g) 3–4 times daily

• By rectum

Neonate 125–250 mg/kg repeated as necessary every 6–8 hours. Irrigate colon to remove resin after 6–12 hours

Child 1 month–18 years 125–250 mg/kg repeated as necessary every 6–8 hours. Irrigate colon to remove resin after 6–12 hours

Administration By mouth: administer in water or as a paste—do not give with fruit squash, which has a high potassium content.

By rectum: mix 1 g of resin with 5–10 mL of a methylcellulose solution. Water may be used but retention is more difficult.

Calcium Resonium® (Sanofi-Aventis)

Powder, buff, calcium polystyrene sulphonate, net price 300 g = £68.47. Label: 13

Resonium A® (Sanofi-Aventis)

Powder, buff, sodium polystyrene sulphonate, net price 454 g = £67.50. Label: 13

9.2.1.2 Oral sodium and water

Sodium chloride is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride (section 9.2.1.3) may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, see p. 809; they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to replace losses in children with cystic fibrosis particularly in warm weather.

SODIUM CHLORIDE

Indication and dose

See also section 9.2.2

Sodium supplementation in neonates• **By mouth**

Preterm neonate 2 mmol/100 mL of formula feed or 3–4 mmol/100 mL of breast milk, consult dietician

Sodium replacement• **By mouth**

Child 1 month–18 years according to requirements, generally 1–2 mmol/kg daily in divided doses, higher doses may be needed in severe depletion

Chronic renal loss• **By mouth**

Child 1 month–18 years 1–2 mmol/kg daily in divided doses, adjusted according to requirements

Slow Sodium[®] (HK Pharma)

Tablets, m/r, sodium chloride 600 mg (approx. 10 mmol each of Na⁺ and Cl⁻). Net price 100-tablet pack = £6.05. Label: 25

Capsules available from 'special-order' manufacturers or specialist importing companies, see p. 809

▲ **Extemporaneous formulations available see**

Extemporaneous Preparations, p. 6

Oral rehydration therapy (ORT)

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal

volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.

ORAL REHYDRATION SALTS (ORS)

Licensed use *Dioralyte*[®] *Relief* not licensed for use in children under 3 months

Indication and dose

Fluid and electrolyte loss in diarrhoea see notes above

• **By mouth**

Child 1 month–1 year 1–1½ times usual feed volume

Child 1–12 years 200 mL after every loose motion

Child 12–18 years 200–400 mL after every loose motion

▲ **UK formulations**

Note After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Dioralyte[®] (Sanofi-Aventis)

Oral powder, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 530 mg, glucose 3.56 g/sachet, net price 6-sachet pack = £2.25, 20-sachet pack (black currant- or citrus-flavoured or natural) = £6.72

Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol

Dioralyte[®] *Relief* (Sanofi-Aventis)

Oral powder, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, black currant- or raspberry-flavoured) = £2.50, 20-sachet pack (apricot-flavoured) = £7.13

Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 50 mmol and citrate 10 mmol; contains aspartame (section 9.4.1)

Electrolade[®] (Actavis)

Oral powder, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, black currant-, lemon and lime-, or orange-flavoured). Net price 6-sachet (plain or multiflavoured) pack = £1.33, 20-sachet (single- or multiflavoured) pack = £4.99

Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 50 mmol, K⁺ 20 mmol, Cl⁻ 40 mmol, HCO₃⁻ 30 mmol, and glucose 111 mmol

▲ **WHO formulation****Oral Rehydration Salts** (Non-proprietary)

Oral powder, sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. To be dissolved in sufficient water to produce 1 litre (providing Na⁺ 75 mmol, K⁺ 20 mmol, Cl⁻ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre)

Note Recommended by the WHO and the United Nations Children's Fund but not commonly used in the UK

9.2.1.3 Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously (section 9.2.2).

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastro-intestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

SODIUM BICARBONATE

Cautions see notes above; avoid in respiratory acidosis; **interactions:** Appendix 1 (antacids)

Indication and dose

Renal acidosis (see also notes above)

• By mouth

Neonate initially 1–2 mmol/kg daily in divided doses, adjusted according to response

Child 1 month–18 years initially 1–2 mmol/kg daily in divided doses, adjusted according to response

Metabolic acidosis section 9.2.2.1

Renal hyperkalaemia section 9.2.2.1

Sodium Bicarbonate (Non-proprietary)

Capsules, sodium bicarbonate 500 mg (approx. 6 mmol each of Na^+ and HCO_3^-), net price 56-cap pack = £5.16

Tablets, sodium bicarbonate 600 mg, net price 100-tab pack = £2.48

Important Oral solutions of sodium bicarbonate are required occasionally; these need to be obtained from 'special-order' manufacturers or specialist importing companies, see p. 809, and the strength of sodium bicarbonate should be stated on the prescription

POTASSIUM BICARBONATE

Cautions cardiac disease, **interactions:** Appendix 1 (potassium salts)

Contra-indications hypochloraemia; plasma-potassium concentration above 5 mmol/litre

Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

Side-effects nausea, vomiting, abdominal pain, diarrhoea, and flatulence

Potassium Tablets, Effervescent (Non-proprietary)

Effervescent tablets, potassium bicarbonate 500 mg, potassium acid tartrate 300 mg, each tablet providing 6.5 mmol of K^+ . To be dissolved in water before administration. Net price 56 = £33.38. Label: 13, 21

Note These tablets do not contain chloride; for effervescent tablets containing potassium and chloride, see under Potassium Chloride, section 9.2.1.1

9.2.2 Parenteral preparations for fluid and electrolyte imbalance

9.2.2.1 Electrolytes and water

9.2.2.2 Plasma and plasma substitutes

9.2.2.1 Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% or glucose 5%) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance; for reference to the use of magnesium and phosphates, see section 9.5.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

Maintenance fluid requirements in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride and glucose. Solutions containing 20 mmol/litre of potassium chloride meet usual potassium requirements when given in the suggested volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred; see Caution on dilutional hyponatraemia below.

Fluid requirements for children over 1 month:

Body-weight	24-hour fluid requirement
Under 10 kg	100 mL/kg
10–20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 10 kg
Over 20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10–20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)

Important The baseline fluid requirements shown in the table above should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

Caution During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution. The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hypothermia, and high humidity.

Dilutional hyponatraemia is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatraemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

Safe practice

Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not generally be used for fluid replacement in children because of the risk of hyponatraemia; availability of this infusion should be restricted to critical care and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

Replacement therapy: initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

Neonates Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and

up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

Intravenous sodium

Intravenous sodium chloride in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose, see notes above. Sodium chloride solutions should be used cautiously in renal insufficiency, cardiac failure, cardio-respiratory diseases, hepatic cirrhosis and in children receiving glucocorticoids. Hyponatraemia with serious consequences may occur if maintenance and replacement fluids do not meet sodium requirements (see Caution, dilutional hyponatraemia, above).

Chronic hyponatraemia should ideally be corrected by fluid restriction. However, if sodium chloride is required, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma-sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride and glucose solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na^+ remains extracellular. Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance. Illness or injury increase the secretion of anti-diuretic hormone and therefore the ability to excrete excess water may be impaired. Injudicious use of hypotonic solutions such as sodium chloride 0.18% and glucose 4% may also cause dilutional hyponatraemia especially in children (see Caution on dilutional hyponatraemia, above); if necessary, guidance should be sought from a clinician experienced in the management of fluid and electrolytes.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

Neonates The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. *Hyponatraemia* may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

Hypernatraemia may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe

hypernatraemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the patency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

SODIUM CHLORIDE

Cautions restrict intake in impaired renal function, cardiac failure, hypertension, peripheral and pulmonary oedema, toxemia of pregnancy; see also notes above

Side-effects administration of large doses may give rise to sodium accumulation and oedema

Indication and dose

Electrolyte imbalance see notes above, also section 9.2.1.2

Sodium Chloride (Non-proprietary) (POM)

Intravenous infusion, usual strength sodium chloride 0.9% (9 g, 150 mmol each of Na⁺ and Cl⁻/litre), this strength being supplied when normal saline for injection is requested. Net price 2-mL amp = 32p; 5-mL amp = 38p; 10-mL amp = 52p; 20-mL amp = £1.04; 50-mL amp = £3.63

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Note The term 'normal saline' should **not** be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

With other ingredients

Note See above for warning on hyponatraemia

Sodium Chloride and Glucose (Non-proprietary) (POM)

Intravenous infusion, sodium chloride 0.18% (Na⁺ and Cl⁻ each 30 mmol/litre), glucose 4%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.45% (Na⁺ and Cl⁻ each 75 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.9% (Na⁺ and Cl⁻ each 150 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Ringer's Solution (Non-proprietary) (POM)

Calcium chloride (dihydrate) 322 micrograms, potassium chloride 300 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/litre), Ca²⁺ 2.2, K⁺ 4, Na⁺ 147, Cl⁻ 156

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Sodium Lactate, Compound (Non-proprietary) (POM) (Hartmann's Solution; Ringer-Lactate Solution)

Intravenous infusion, sodium chloride 0.6%, sodium lactate 0.32%, potassium chloride 0.04%, calcium chloride 0.027% (containing Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 29 mmol, Cl⁻ 111 mmol/litre)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Intravenous glucose

Glucose solutions are used mainly to replace water deficit and should not be given alone except when there is no significant loss of electrolytes; prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given with insulin for the emergency management of *hyperkalaemia* (see p. 458). They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion (section 6.1.3).

Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.

GLUCOSE

(Dextrose Monohydrate)

Note Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

Side-effects glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

Indication and dose

Fluid replacement see notes above

Provision of energy section 9.3

Hypoglycaemia section 6.1.4

Glucose (Non-proprietary) (POM)

Intravenous infusion, glucose or anhydrous glucose (potency expressed in terms of anhydrous glucose), usual strengths 5% (50 mg/mL), 10% (100 mg/mL), and 20% (200 mg/mL); 20% solution, net price 20-mL amp = £2.04; 50% solution¹, 20-mL amp = 95 p, 50-mL vial = £2.13

In hospitals, 500- and 1000-mL packs, and sometimes other sizes and strengths, are available; also available *Minijet® Glucose*, 50% in 50-mL disposable syringe¹

1. (POM) restriction does not apply where administration is for saving life in emergency

Intravenous potassium

Potassium chloride and sodium chloride intravenous infusion is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used when possible (see under Safe Practice below); for peripheral intravenous infusion, the concentration of potassium should not usually exceed 40 mmol/litre. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Safe Practice

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

POTASSIUM CHLORIDE

Cautions for peripheral intravenous infusion the concentration of solution should not usually exceed 3 g (40 mmol)/litre; specialist advice and ECG monitoring (see notes above); **interactions:** Appendix 1 (potassium salts)

Contra-indications plasma-potassium concentration above 5 mmol/litre

Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

Side-effects rapid infusion toxic to heart

Indication and dose

Electrolyte imbalance see also oral potassium supplements, section 9.2.1.1

• By slow intravenous infusion

Depending on the deficit or the daily maintenance requirements, see also notes above

Neonate 1–2 mmol/kg daily

Child 1 month–18 years 1–2 mmol/kg daily

Administration see notes above

Potassium Chloride and Glucose (Non-proprietary)

(POM)

Intravenous infusion, usual strengths potassium chloride 0.3% (3 g, 40 mmol each of K⁺ and Cl⁻/litre) or 0.15% (1.5 g, 20 mmol each of K⁺ and Cl⁻/litre) with 5% of anhydrous glucose

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Potassium Chloride and Sodium Chloride (Non-proprietary) (POM)

Intravenous infusion, usual strength potassium chloride 0.15% (1.5 g/litre) with sodium chloride 0.9% (9 g/litre), containing K⁺ 20 mmol, Na⁺ 150 mmol, and Cl⁻ 170 mmol/litre

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Potassium Chloride, Sodium Chloride, and Glucose (Non-proprietary) (POM)

Intravenous infusion, sodium chloride 0.45% (4.5 g, Na⁺ 75 mmol/litre) with 5% of anhydrous glucose and usually sufficient potassium chloride to provide K⁺ 10–40 mmol/litre (to be specified by the prescriber)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes are available

Potassium Chloride (Non-proprietary) (POM)

Sterile concentrate, potassium chloride 15%

(150 mg, approximately 2 mmol each of K⁺ and Cl⁻/mL). Net price 10-mL amp = 48p

Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules

Important Must be diluted with **not less than 50 times** its volume of Sodium Chloride 0.9% or other suitable diluent and **mixed well**; see Safe Practice, above

Bicarbonate and trometamol

Sodium bicarbonate is used to control severe *metabolic acidosis* (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For *chronic acidotic states*, sodium bicarbonate can be given by mouth (section 9.2.1.3).

Trometamol (tris(hydroxymethyl)aminomethane, THAM), an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. Respiratory support may be required because trometamol induces respiratory depression. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

SODIUM BICARBONATE

Indication and dose

Metabolic acidosis see also notes above

- **By slow intravenous injection of a strong solution** (up to 8.4%), or **by continuous intravenous infusion of a weaker solution** (usually 1.26%)

An amount appropriate to the body base deficit

Renal hyperkalaemia

- By slow intravenous injection

Neonate 1 mmol/kg daily

Child 1 month–18 years 1 mmol/kg daily

Renal acidosis section 9.2.1.3

Sodium Bicarbonate (PoM)

Intravenous infusion, usual strength sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na^+ and HCO_3^- /litre); various other strengths available

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Administration For *peripheral infusion* dilute 8.4% solution at least 1 in 10; for *central line infusion* dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage

Minijet® Sodium Bicarbonate (UCB Pharma) (PoM)

Intravenous injection, sodium bicarbonate in disposable syringe, net price 4.2%, 10 mL = £11.03; 8.4%, 10 mL = £11.10, 50 mL = £12.15

TROMETAMOL

(Tris(hydroxymethyl)aminomethane, THAM)

Cautions see notes above; extravasation can cause severe tissue damage

Contra-indications anuria; chronic respiratory acidosis

Renal impairment use with caution, may cause hyperkalaemia

Pregnancy limited information available, hypoglycaemia may harm fetus

Breast-feeding no information available

Side-effects respiratory depression; hypoglycaemia; hyperkalaemia in renal impairment; liver necrosis reported following administration via umbilical vein in neonates

Licensed use unlicensed preparation

Indication and dose**Metabolic acidosis**

- By intravenous infusion

An amount appropriate to the body base deficit

▲ **Preparations**

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Water

Water for Injections (PoM) Net price 1-mL amp = 18p; 2-mL amp = 20p; 5-mL amp = 36p; 10-mL amp = 37p, 10-mL vial = £1.40; 20-mL amp = 92p; 50-mL amp = £1.91; 100-mL vial = £2.01

9.2.2.2 Plasma and plasma substitutes

Albumin solutions, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminaemia

itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma and plasma substitutes are often used in very ill children whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the child's condition at all times.

ALBUMIN SOLUTION

(Human Albumin Solution)

A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

Cautions history of cardiac or circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function); increased capillary permeability; correct dehydration when administering concentrated solution

Contra-indications cardiac failure; severe anaemia

Side-effects hypersensitivity reactions (including anaphylaxis) with nausea, vomiting, increased salivation, fever, tachycardia, hypotension and chills reported

Indication and dose

See notes above and under preparations, below

▲ **Isotonic solutions**

Indications: acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery; plasma exchange

Available as: *Human Albumin Solution 4.5%* (50-, 100-, 250- and 400-mL bottles—Baxter); *Human Albumin Solution 5%* (250- and 500-mL bottles—Baxter); *Alburnorm® 5%* (100-, 250-, and 500-mL bottles—Octapharma); *Octalbin® 5%* (100- and 250-mL bottles—Octapharma); *Zenalb® 4.5%* (50-, 100-, 250-, and 500-mL bottles—BPL)

▲ **Concentrated solutions (20%)**

Indications: severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associated with portal hypertension

Available as: *Human Albumin Solution 20%* (50- and 100-mL vials—Baxter); *Alburnorm® 20%* (50- and 100-mL bottles—Octapharma); *Flexbumin® 20%* (50- and 100-mL bags—Baxter); *Octalbin® 20%* (50- and 100-mL bottles—Octapharma); *Zenalb® 20%* (50- and 100-mL bottles—BPL)

Plasma substitutes

Gelatin and the **etherified starches** (pentastarch and tetrastarch) are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia. Plasma substitutes may be used as an immediate short-term measure to treat haemorrhage until blood is available. They are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Plasma and plasma substitutes are often used in very ill children whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the child's condition at all times.

The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.

Cautions Plasma substitutes should be used with caution in cardiac disease, liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the child should be monitored for hypersensitivity reactions.

Side-effects Hypersensitivity reactions may occur including, rarely, severe anaphylactic reactions. Transient increase in bleeding time may occur.

GELATIN

Note The gelatin is partially degraded

Cautions see notes above

Pregnancy manufacturer of *Geloplasma*[®] advises avoid at the end of pregnancy

Side-effects see notes above

Indication and dose

Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

• By intravenous infusion

Initially 10–20 mL/kg of a 3.5–4% solution (see notes above)

Gelofusine[®] (Braun) (POM)

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre, net price 500-mL *Ecobag*[®] = £5.15; 1-litre *Ecobag*[®] = £9.67
Contains traces of calcium

Geloplasma[®] (Fresenius Kabi) (POM)

Intravenous infusion, partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre, net price 500-mL bag = £5.05

Isoplex[®] (Beacon) (POM)

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre, net price 500-mL bag = £7.53; 1-litre bag = £14.54

Volplex[®] (Beacon) (POM)

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre, net price 500-mL bag = £4.70; 1-litre bag = £9.09

ETHERIFIED STARCH

A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the terms tetrastarch and pentastarch reflect the degree of etherification

Cautions see notes above

Renal impairment use with caution in mild to moderate impairment; avoid in severe impairment

Side-effects see notes above; also pruritus, raised serum amylase

Indication and dose

Low blood volume

• By intravenous infusion

According to the child's condition (see notes above)

▲ Pentastarch

HAES-steril[®] (Fresenius Kabi) (POM)

Intravenous infusion, pentastarch (weight average molecular weight 200 000) 10% in sodium chloride intravenous infusion 0.9%, net price, 500 mL = £16.50

Hemothes[®] (Braun) (POM)

Intravenous infusion, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £12.50; 10%, 500 mL = £16.50

▲ Tetrastarch

Tetraspan[®] (Braun) (POM)

Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride 0.625%, containing Na⁺ 140 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 118 mmol, Ca²⁺ 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500-mL bag = £13.50

Volulyte[®] (Fresenius Kabi) (POM)

Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride intravenous infusion 0.6%, containing Na⁺ 137 mmol, K⁺ 4 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 110 mmol, acetate 34 mmol/litre, net price 500-mL bag = £13.50

Voluven® (Fresenius Kabi) (POM)

Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £12.50

▲ **Hypertonic solution****HyperHAES®** (Fresenius Kabi) (POM)

Intravenous infusion, hydroxyethyl starch (weight average molecular weight 200 000) 6% in sodium chloride intravenous infusion 7.2%, net price 250-mL bag = £28.00

Cautions see notes above; also diabetes

9.3 Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to oral or enteral tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition** (TPN). Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given in the table Proprietary Infusion Fluids for Parenteral Feeding, p. 467.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single 'all-in-one' bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to

prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (*Primene®*) or breast milk (*Vaminolact®*) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

Energy requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child's age and condition. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

Fat (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. **Additives should not be mixed with fat emulsions unless compatibility is known.**

Proprietary Infusion Fluids for Parenteral Feeding

Preparation	Nitrogen g/litre	^{1,2} Energy kJ/litre	Electrolytes mmol/litre				Other components/litre	
			K ⁺	Mg ²⁺	Na ⁺	Acet ⁻ Cl ⁻		
ClinOleic 20% (Baxter) Net price 100 mL = £6.28; 250 mL = £10.08; 500 mL = £13.88		8360					purified olive and soya oil 200 g, glycerol 22.5 g, egg phosphatides 12 g	
Glamin (Fresenius Kabi) Net price 250 mL = £14.58; 500 mL = £27.20	22.4				62			
Intralipid 10% (Fresenius Kabi) Net price 100 mL = £4.70; 500 mL = £10.30		4600					soya oil 100 g, glycerol 22 g, purified egg phospholipids 12 g, phosphate 15 mmol	
Intralipid 20% (Fresenius Kabi) Net price 100 mL = £7.05; 250 mL = £11.60; 500 mL = £15.45		8400					soya oil 200 g, glycerol 22 g, purified egg phospholipids 12 g, phosphate 15 mmol	
Intralipid 30% (Fresenius Kabi) Net price 333 mL = £17.30		12600					soya oil 300 g, glycerol 16.7 g, purified egg phospholipids 12 g, phosphate 15 mmol	
Lipofundin MCT/LCT 10% (Braun) Net price 100 mL = £7.70; 500 mL = £12.90		4430					soya oil 50 g, medium chain triglycerides 50 g	
Lipofundin MCT/LCT 20% (Braun) Net price 100 mL = £12.51; 250 mL = £11.30; 500 mL = £19.18		8000					soya oil 100 g, medium chain triglycerides 100 g	
³ Primene 10% (Baxter) Net price 100 mL = £5.78; 250 mL = £7.92	15					19		
Synthamin 9 (Baxter) Net price 500 mL = £6.66; 1000 mL = £12.34	9.1		60	5	70	100	70	acid phosphate 30 mmol
Synthamin 9 EF (electrolyte-free) (Baxter) Net price 500 mL = £6.66; 1000 mL = £12.34	9.1					44	22	
Vamin 9 Glucose (Fresenius Kabi) Net price 100 mL = £3.80; 500 mL = £7.70; 1000 mL = £13.40	9.4	1700	20	1.5	50		50	Ca ²⁺ 2.5 mmol, anhydrous glucose 100 g
Vaminolact (Fresenius Kabi) Net price 100 mL = £4.35; 500 mL = £10.00	9.3							

1. Note. 1000 kcal = 4200 kJ; 1000 kJ = 238.8 kcal. All entries are ^(PoM)

2. Excludes protein- or amino acid-derived energy

3. For use in neonates and children only

Electrolytes are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce the amount of chloride infused; hyperchloraemic acidosis or hypochloraemic alkalosis can occur in pre-term neonates or children with renal impairment.

Administration. Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature and other specialist literature should be consulted.*

Supplementary preparations

Compatibility with the infusion solution must be ascertained before adding supplementary preparations.

Addiphos[®] (Fresenius Kabi) ^(PoM)

Solution, sterile, phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL. For addition to *Vamin[®]* solutions and glucose intravenous infusions. Net price 20-mL vial = £1.53

Additrac[®] (Fresenius Kabi) (P_M)

Solution, trace elements for addition to *Vamin[®]* solutions and glucose intravenous infusions, traces of Fe³⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻. For children over 40 kg. Net price 10-mL amp = £2.31

Cernevit[®] (Baxter) (P_M)

Solution, *d*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colexicaliferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpanthenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg. Dissolve in 5 mL water for injections. Net price per vial = £4.64

Decan[®] (Baxter) (P_M)

Solution, trace elements for addition to infusion solutions, Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺. For children over 40 kg. Net price 40-mL vial = £2.00

Dipeptiven[®] (Fresenius Kabi) (P_M)

Solution, *N*(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg). For addition to infusion solutions containing amino acids. Net price 50 mL = £16.40, 100 mL = £30.50

Dose

Amino acid supplement for hypercatabolic or hypermetabolic states

300–400 mg/kg daily, max. 400 mg/kg daily, dose not to exceed 20% of total amino acid intake

Glycophos[®] Sterile Concentrate (Fresenius Kabi) (P_M)

Solution, sterile, phosphate 20 mmol, Na⁺ 40 mmol/20 mL. For addition to *Vamin[®]* and *Vaminolact[®]* solutions, and glucose intravenous infusions. Net price 20-mL vial = £4.60

Peditrace[®] (Fresenius Kabi) (P_M)

Solution, trace elements for addition to *Vaminolact[®]*, *Vamin[®] 14 Electrolyte-Free* solutions and glucose intravenous infusions, traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻. For use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 10-mL vial = £4.18

Cautions reduced biliary excretion especially in cholestatic liver disease or in markedly reduced urinary excretion (careful biochemical monitoring required); total parenteral nutrition exceeding 1 month (measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment)—discontinue if manganese concentration raised or if cholestasis develops

Solivitro N[®] (Fresenius Kabi) (P_M)

Solution, powder for reconstitution, biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg. Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid[®]*; dissolve in *Vitlipid N[®]* or *Intralipid[®]* for adding to *Intralipid[®]* only. Net price per vial = £2.32

Vitlipid N[®] (Fresenius Kabi) (P_M)

Emulsion, adult, vitamin A 330 units, ergocalciferol 20 units, *d*-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For addition to *Intralipid[®]*. For adults and children over 11 years. Net price 10-mL amp = £2.32

Emulsion, infant, vitamin A 230 units, ergocalciferol 40 units, *d*-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL. For addition to *Intralipid[®]*. Net price 10-mL amp = £2.32

9.4 Oral nutrition

9.4.1 Foods for special diets

9.4.2 Enteral nutrition

9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

Coeliac disease Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription—see Appendix 2 (p. 777).

Phenylketonuria Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of aspartame consumed can be taken in to account in the management of the condition. Where the presence of aspartame in a preparation is specified in the product literature, aspartame is listed as an excipient in the relevant product entry in *BNF for Children*; the child or carer should be informed of this.

For further information on special dietary products used in the management of metabolic diseases, see Appendix 2.

Some rare forms of phenylketonuria are caused by a deficiency of tetrahydrobiopterin. Treatment involves oral supplementation of **tetrahydrobiopterin**; in some severe cases, the addition of the neurotransmitter precursors, levodopa (section 4.9.1) and 5-hydroxytryptophan, is also necessary.

Sapropterin, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

TETRAHYDROBIOPTERIN

Renal impairment use with caution—accumulation of metabolites

Pregnancy crosses the placenta; use only if benefit outweighs risk

Breast-feeding present in milk, effects unknown

Side-effects diarrhoea, urinary frequency, disturbed sleep

Licensed use not licensed

Indication and dose

Monotherapy in tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

• **By mouth**

Child 1 month–18 years 10 mg/kg twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to response

In combination with neurotransmitter precursors for tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

• **By mouth**

Child 1 month–2 years initially 250–750 micrograms/kg 4 times daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to response; max. 7 mg/kg daily

Child 2–18 years initially 250–750 micrograms/kg 4 times daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to response; usual max. 10 mg/kg daily

Tetrahydrobiopterin (Non-proprietary)

Tablets, tetrahydrobiopterin 10 mg and 50 mg
Available from 'special-order' manufacturers or specialist importing companies, see p. 809

SAPROPTERIN DIHYDROCHLORIDE

Note Sapropterin is a synthetic form of tetrahydrobiopterin

Cautions monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment; history of convulsions

Hepatic impairment manufacturer advises caution—no information available

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises caution—consider only if strict dietary management inadequate

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, vomiting, abdominal pain; nasal congestion, cough, pharyngolaryngeal pain; headache

Indication and dose

Phenylketonuria (specialist use only)

• **By mouth**

Child 4–18 years initially 10 mg/kg once daily, preferably in the morning, adjusted according to response; usual dose 5–20 mg/kg daily

Tetrahydrobiopterin deficiency (specialist use only)

• **By mouth**

Neonate initially 2–5 mg/kg once daily, preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

Child 1 month–18 years initially 2–5 mg/kg once daily, preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

Kuvan® (Merck Serono) ▼ [PwM]

Dispersible tablets, sapropterin dihydrochloride 100 mg, net price 30-tab pack = £597.22, 120-tab pack = £2388.88. Label: 13, 21, counselling, tablets should be dissolved in water and taken within 20 minutes

9.4.2 Enteral nutrition

Children have higher nutrient requirements per kg body-weight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased metabolic demands and can rapidly exhaust nutritional reserves.

Every effort should be made to optimise oral food intake before beginning enteral tube feeding; this may include change of posture, special seating, feeding equipment, oral desensitisation, food texture changes, thickening of liquids, increasing energy density of food, treatment of reflux or oesophagitis, as well as using age-specific nutritional supplements.

Enteral tube feeding has a role in both short-term rehabilitation and long-term nutritional management in paediatrics. It can be used as supportive therapy, in which the enteral feed supplies a proportion of the required nutrients, or as primary therapy, in which the enteral feed delivers all the necessary nutrients. Most children receiving tube feeds should also be encouraged to take oral food and drink. Tube feeding should be considered in the following situations:

- unsafe swallowing and risk of aspiration;
- inability to consume at least 60% of energy needs by mouth;
- total feeding time of more than 4 hours per day;
- weight loss or no weight gain for a period of 3 months (less for younger children and infants);
- weight for height (or length) less than 2nd percentile for age and sex.

Most feeds for enteral use (Appendix 2) contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Feeds containing vitamin K may affect the INR in children receiving warfarin—see **interactions**: Appendix 1 (vitamins).

Choosing the best formula for children depends on several factors including: nutritional requirements, gastro-intestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

Infant formula feeds **Child 0–12 months.** Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The average intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amylose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet The Infant Formula and Follow-on Formula Regulations (England and Wales) 2007, which enact the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed (Appendix 2, p. 750), which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively, energy supplements (Appendix 2, p. 771) may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load of more than 500 milliosmols/kg water to the normal functioning gut, otherwise osmotic diarrhoea will result. Concentrating or supplementing feeds should not be attempted without the advice of a paediatric dietician.

Enteral feeds **Child 1–6 years (body-weight 8–20 kg).** Ready-to-use feeds (Appendix 2, p. 750) based on caseinates, maltodextrin and vegetable oils (with or without added medium chain triglyceride (MCT) oil or fibre) are well tolerated and effective in improving nutritional status in this age group. Although originally designed for children 1–6 years (body-weight 8–20 kg), some products have ACBS approval for use in children weighing up to 30 kg (approx. 10 years of age). Enteral feeds formulated for children 1–6 years are low in sodium and potassium; electrolyte intake and biochemical status should be monitored. Older children in this age range taking small feed volumes may need to be given additional micronutrients. Fibre-enriched feeds may be helpful for children with chronic constipation or diarrhoea.

Child 7–12 years (body-weight 21–45 kg). Depending on age, weight, clinical condition and nutritional requirements, ready-to-use feeds (Appendix 2, p. 750) formulated for 7–12 year olds may be given at appropriate rates.

Child over 12 years (body-weight over 45 kg). As there are no standard enteral feeds formulated for this age group, adult formulations are used. The intake of protein, electrolytes, vitamins, and trace minerals should be carefully assessed and monitored.

Note Adult feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be used with caution and expert advice.

Specialised formula It is essential that any infant who is intolerant of breast milk or normal infant formula, or whose condition requires nutrient-specific adaptation, is prescribed an adequate volume of a nutritionally complete replacement formula (see Appendix 2, p. 763). In the first 4 months of life, a volume of 150–200 mL/kg/day is recommended. After 6 months, should the formula still be required, a volume of 600 mL/day should be maintained, in addition to solid food.

Products for cow's milk protein intolerance or lactose intolerance. There are a number of infant formulas formulated for cow's milk protein intolerance or lactose intolerance; these feeds may contain a residual amount of lactose (less than 1 g/100 mL formula)—sometimes described as clinically lactose-free or 'lactose-free' by manufacturers. If the total daily intake of these formulas is low, it may be necessary to supplement with calcium, and a vitamin and mineral supplement.

Soya-based infant formulas have a high phytoestrogen content and this may be a long-term reproductive health risk. The Chief Medical Officer has advised that soya-based infant formulas should not be used as the first choice for the management of infants with proven cow's milk sensitivity, lactose intolerance, galactokinase deficiency and galactosaemia. Most UK paediatricians with expertise in inherited metabolic disease still advocate soya-based formulations for infants with galactosaemia as there are concerns about the residual lactose content of low lactose formulas and protein hydrolysates based on cow's milk protein.

Low lactose infant formulations, based on whole cow's milk protein, are unsuitable for children with cow's milk protein intolerance. Liquid soya milks purchased from supermarkets and health food stores are not nutritionally complete and should never be used for infants under 1 year of age.

Protein hydrolysate formulas. Non-milk, peptide-based feeds containing hydrolysates of casein, whey, meat and soya protein, are suitable for infants with disaccharide or whole protein intolerance. The total daily intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet the child's nutritional requirements; these feeds have a high osmolality when given at recommended dilution and need gradual and careful introduction.

Elemental (amino acid based formula). Specially formulated elemental feeds containing essential and non-essential amino acids are available for use in infants and children under 6 years with proven whole protein intolerance. Adult elemental formula may be used for chil-

dren over 6 years; the intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet nutritional requirements. These feeds have a high osmolality when given at the recommended concentration and therefore need gradual and careful introduction.

Modular feeds. Modular feeds (see Specialised Formulas for Specific Clinical Conditions, p. 768) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

Specialised formula. Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

Feed thickeners **Carob based thickeners** (Appendix 2, p. 777) may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeds.

Pre-thickened formula Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

Starched based thickeners can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

Dietary supplements for oral use (Appendix 2, p. 756) Three types of prescribable fortified dietary supplements are available: fortified milk and non-milk tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1680 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.

Products for metabolic diseases There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases, Appendix 2, p. 781). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic

complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

Preparations (Borderline substances) See Appendix 2.

9.5 Minerals

- 9.5.1 Calcium and magnesium
- 9.5.2 Phosphorus
- 9.5.3 Fluoride
- 9.5.4 Zinc

See section 9.1.1 for iron salts.

9.5.1 Calcium and magnesium

- 9.5.1.1 Calcium supplements
- 9.5.1.2 Hypercalcaemia and hypercalcauria
- 9.5.1.3 Magnesium

9.5.1.1 Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (section 9.6.4), impaired metabolism, a failure of secretion (hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

Mild asymptomatic hypocalcaemia may be managed with oral calcium supplements. *Severe symptomatic hypocalcaemia* requires an intravenous infusion of calcium gluconate 10% over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection is also available, but is more irritant; care should be taken to prevent extravasation.

For the role of calcium gluconate in temporarily reducing the toxic effects of *hyperkalaemia*, see p. 458.

Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfacalcidol or calcitriol) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferol) if due to vitamin D deficiency (section 9.6.4). It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

Neonates Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

CALCIUM SALTS

Cautions see notes above; sarcoidosis; history of nephrolithiasis; avoid calcium chloride in respiratory acidosis or respiratory failure; **interactions:** Appendix 1 (antacids, calcium salts)

Contra-indications conditions associated with hypercalcaemia and hypercalciuria (e.g. some forms of malignant disease); see also Calcium Gluconate injection, below

Renal impairment use with caution; risk of hypercalcaemia and renal calculi

Side-effects gastro-intestinal disturbances, constipation; bradycardia, arrhythmias; with injection, peripheral vasodilatation, fall in blood pressure, injection-site reactions, severe tissue damage with extravasation

Indication and dose

See notes above; calcium deficiency

• By mouth

Neonate 0.25 mmol/kg 4 times a day, adjusted to response

Child 1 month–4 years 0.25 mmol/kg 4 times a day, adjusted to response

Child 5–12 years 0.2 mmol/kg 4 times a day, adjusted to response

Child 12–18 years 10 mmol 4 times a day, adjusted to response

Acute hypocalcaemia, urgent correction; hyperkalaemia (prevention of arrhythmias)

• By slow intravenous injection over 5–10 minutes

Neonate 0.11 mmol/kg (0.5 mL/kg of calcium gluconate 10%) as a single dose. [Some units use a dose of 0.46 mmol/kg (2 mL/kg calcium gluconate 10%) for hypocalcaemia in line with US practice]

Child 1 month–18 years 0.11 mmol/kg (0.5 mL/kg calcium gluconate 10%), max 4.5 mmol (20 mL calcium gluconate 10%)

Acute hypocalcaemia, maintenance

• By continuous intravenous infusion

Neonate 0.5 mmol/kg daily over 24 hours, adjusted to response, use oral route as soon as possible due to risk of extravasation

Child 1 month–2 years 1 mmol/kg daily (usual max 8.8 mmol) over 24 hours, use oral route as soon as possible due to risk of extravasation

Child 2–18 years 8.8 mmol over 24 hours, use oral route as soon as possible due to risk of extravasation

■ Oral preparations

Calcium Gluconate (Non-proprietary)

Effervescent tablets, calcium gluconate 1 g (calcium 89 mg or Ca^{2+} 2.23 mmol), net price 28-tab pack = £14.83. Label: 13

Note Each tablet usually contains 4.46 mmol Na^+

Calcium Lactate (Non-proprietary)

Tablets, calcium lactate 300 mg (calcium 39 mg or Ca^{2+} 1 mmol), net price 84 = £2.92

Adcal® (ProStrakan)

Chewable tablets, fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca^{2+} 15 mmol), net price 100-tab pack = £7.25. Label: 24

Cacit® (Warner Chilcott)

Tablets, effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca^{2+} 12.5 mmol), net price 76-tab pack = £11.81. Label: 13

Calcichew® (Shire)

Tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), net price 100-tab pack = £9.33. Label: 24

Forte tablets (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or Ca^{2+} 25 mmol), net price 60-tab pack = £13.16. Label: 24
Excipients include aspartame (section 9.4.1)

Calcium-500 (Martindale)

Tablets, pink, f/c, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), net price 100-tab pack = £9.46. Label: 25

Calcium-Sandoz® (Alliance)

Syrup, orange flavour, calcium gluconate 1.09 g, calcium lactobionate 727 mg (calcium 108.3 mg or Ca^{2+} 2.7 mmol)/5 mL, net price 300 mL = £4.07

Sandocal® (Novartis Consumer Health)

Sandocal 400 tablets, effervescent, orange flavour, calcium lactate gluconate 930 mg, calcium carbonate 700 mg, providing calcium 400 mg (Ca^{2+} 10 mmol), net price 5 × 20-tab pack = £6.87. Label: 13
Excipients include aspartame (section 9.4.1)

Sandocal 1000 tablets, effervescent, orange flavour, calcium lactate gluconate 2.263 g, calcium carbonate 1.75 g, providing 1 g calcium (Ca^{2+} 25 mmol), net price 3 × 10-tab pack = £6.17. Label: 13
Excipients include aspartame (section 9.4.1)

■ Parenteral preparations

Calcium Gluconate (Non-proprietary) (PoM)

Injection, calcium gluconate 10% (calcium 8.4 mg or Ca^{2+} 226 micromol)/mL. Net price 10-mL amp = 60p

Administration For intravenous infusion dilute to at least 45 micromol/mL with Glucose 5% or Sodium Chloride 0.9%. Maximum administration rate 45 micromol/kg/hour (or in neonates max. 22 micromol/kg/hour). May be given more concentrated via a central venous catheter. May be used undiluted (10% calcium gluconate) in emergencies. Avoid extravasation; should not be given by intramuscular injection. Incompatible with sodium bicarbonate and phosphate solutions.

Note The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended

Calcium Chloride (Non-proprietary) (PoM)

Injection, calcium chloride dihydrate 10% (calcium 27.3 mg or Ca^{2+} 680 micromol/mL), net price 10-mL disposable syringe = £5.10

Brands include Minijet® Calcium Chloride 10%

Injection, calcium chloride dihydrate 13.4% (calcium 36 mg or Ca^{2+} 910 micromol/mL), net price 10-mL amp = £14.94

With vitamin D

Section 9.6.4

9.5.1.2 Hypercalcaemia and hypercalciuria

Severe hypercalcaemia Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of **sodium chloride 0.9%**. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and disodium pamidronate (section 6.6.2) is probably the most effective.

Corticosteroids (section 6.3) are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (section 6.6.1) is relatively non-toxic, but its effect can wear off after a few days despite continued use; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful. Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

9.5.1.3 Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulphate (section 1.6.4) as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypomagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of **magnesium sulphate**; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth in divided doses. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 0.2–0.4 mmol/kg (usual max. 20 mmol) Mg^{2+} daily.

Arrhythmias Magnesium sulphate has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes* (see also section 2.3.1).

MAGNESIUM SULPHATE

Cautions see notes above; in severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump); monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech); **interactions:** Appendix 1 (magnesium, parenteral)

Hepatic impairment avoid in hepatic coma if risk of renal failure

Renal impairment avoid or reduce dose; increased risk of toxicity

Pregnancy sufficient may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns

Side-effects generally associated with hypermagnesaemia, nausea, vomiting, thirst, flushing of skin, hypotension, arrhythmias, coma, respiratory depression, drowsiness, confusion, loss of tendon reflexes, muscle weakness

Indication and dose

Neonatal hypocalcaemia

- By deep intramuscular injection or intravenous infusion

Neonate 0.4 mmol/kg Mg^{2+} (100 mg/kg magnesium sulphate) 12 hourly for 2–3 doses

Hypomagnesaemia

- By intravenous injection over at least 10 minutes

Neonate 0.4 mmol/kg Mg^{2+} (100 mg/kg magnesium sulphate) 6–12 hourly as necessary

Child 1 month–12 years 0.2 mmol/kg Mg^{2+} (50 mg/kg magnesium sulphate) 12 hourly as necessary

Child 12–18 years 4 mmol Mg^{2+} (1 g magnesium sulphate) 12 hourly as necessary

Torsade de pointes (consult local guidelines)

• By intravenous injection over 10–15 minutes

Child 1 month–18 years 0.1–0.2 mmol/kg (25–50 mg/kg magnesium sulphate); max. 8 mmol (2 g magnesium sulphate); dose repeated once if necessary

Persistent pulmonary hypertension section 2.5.1

Severe acute asthma section 3.1

Administration Dilute to 10% (100 mg in 1 mL) with Glucose 5 or 10%, Sodium Chloride 0.45 or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute of magnesium sulphate

Note Magnesium sulphate 1 g equivalent to Mg^{2+} approx. 4 mmol

Magnesium Sulphate (Non-proprietary) ^(POM)

Injection, magnesium sulphate 20% (Mg^{2+} approx. 0.8 mmol/mL), net price 20-mL (4-g) amp = £2.75; 50% (Mg^{2+} approx. 2 mmol/mL), 2-mL (1-g) amp = £2.39, 4-mL (2-g) prefilled syringe = £7.39; 5-mL (2.5-g) amp = £3.00, 10-mL (5-g) amp = 69p; 10-mL (5-g) prefilled syringe = £4.95

Brands include *Minijet® Magnesium Sulphate 50%*

MAGNESIUM-L-ASPARTATE

Cautions see under Magnesium Sulphate

Renal impairment avoid or reduce dose; increased risk of toxicity

Side-effects see under Magnesium Sulphate; also diarrhoea

Licensed use classified as a Food for Special Medical Purposes for use in children over 2 years

Indication and dose

Hypomagnesaemia

• By mouth

Child 1 month–2 years initially 0.2 mmol/kg of Mg^{2+} 3 times daily dissolved in water, dose adjusted as required

Child 2–10 years half a sachet (5 mmol Mg^{2+}) daily dissolved in 100 mL of water, dose adjusted as required

Child 10–18 years one sachet (10 mmol Mg^{2+}) daily dissolved in 200 mL of water, dose adjusted as required

Magnaspartate® (KoRa)

Oral powder, magnesium-l-aspartate 6.5 g (10 mmol Mg^{2+})/sachet, net price 10-sachet pack = £7.95

Excipients include sucrose

MAGNESIUM GLYCEROPHOSPHATE

Cautions see under Magnesium Sulphate

Renal impairment avoid or reduce dose; increased risk of toxicity

Side-effects see under Magnesium Sulphate; also diarrhoea

Licensed use not licensed

Indication and dose

Hypomagnesaemia

• By mouth

Child 1 month–12 years initially 0.2 mmol/kg Mg^{2+} 3 times daily, dose adjusted as required

Child 12–18 years initially 4–8 mmol Mg^{2+} 3 times daily, dose adjusted as required

Administration tablets may be dispersed in water

Magnesium Glycerophosphate (Non-proprietary)

Tablets, magnesium glycerophosphate 1 g (approximately magnesium 97 mg or Mg^{2+} 4 mmol)

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Liquid, magnesium glycerophosphate 250 mg/mL (approximately magnesium 24.25 mg or Mg^{2+} 1 mmol/mL)

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

9.5.2 Phosphorus

9.5.2.1 Phosphate supplements

9.5.2.2 Phosphate-binding agents

9.5.2.1 Phosphate supplements

Oral phosphate supplements may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets (section 9.6.4). Diarrhoea is a common side-effect and should prompt a reduction in dosage.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of *severe hypophosphatemia* because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue; excessive doses may cause hypocalcaemia and metastatic calcification. It is essential to monitor plasma concentrations of calcium, phosphate, potassium and other electrolytes. It is recommended that severe hypophosphatemia be treated intravenously as large doses of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of calcium phosphate in the kidney and other tissues. If used, the child should be well hydrated and electrolytes monitored.

Neonates Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolality of the milk should be considered.

PHOSPHATE

Cautions see notes above, also cardiac disease, diabetes mellitus, dehydration; avoid extravasation with parenteral forms, severe tissue necrosis; sodium and potassium concentrations of preparations

Renal impairment reduce dose; monitor closely

Side-effects nausea, diarrhoea; hypotension, oedema; hypocalcaemia; acute renal failure; phlebitis; tissue necrosis on extravasation

Indication and dose

Hypophosphataemia, including hypophosphataemic rickets and osteomalacia (see notes above)

- By mouth

Neonate 1 mmol/kg daily in 1–2 divided doses, or as a supplement in breast milk

Child 1 month–5 years 2–3 mmol/kg (max. 48 mmol) phosphate daily in 2–4 divided doses, adjusted as necessary

Child 5–18 years 2–3 mmol/kg (max. 97 mmol) phosphate daily in 2–4 divided doses, adjusted as necessary

Administration Caution, solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details

- By intravenous infusion (see administration below and seek specialist advice)

Neonate 1 mmol/kg phosphate daily, adjusted as necessary

Child 1 month–2 years 0.7 mmol/kg phosphate daily, adjusted as necessary

Child 2–18 years 0.4 mmol/kg phosphate daily, adjusted as necessary

Administration (see also Important, below) Dilute injection with Sodium Chloride 0.9% or 0.45% or Glucose 5% or 10%. Administration rate of phosphate should not exceed 0.05 mmol/kg/hour. In emergencies in intensive care faster rates may be used—seek specialist advice

Important

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the concentration of potassium should not usually exceed 40 mmol/litre. The infusion solution should be thoroughly mixed. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the rate at which they may be administered, see section 9.2.2.1.

Oral

Phosphate-Sandoz® (HK Pharma)

Tablets, effervescent, anhydrous sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na^+ 20.4 mmol), potassium 123 mg (K^+ 3.1 mmol). Net price 20 = £3.29. Label: 13

Extemporaneous formulations available see Extemporaneous Preparations, p. 6

Various strengths and salts available, caution electrolyte load

Injection

Phosphates (Fresenius Kabi) ^(Pom)

Intravenous infusion, phosphates (providing phosphate 100 mmol/litre, potassium 19 mmol/litre, sodium 162 mmol/litre), net price 500 mL (*Polyfusor®*) = £3.75.

Potassium acid phosphate (Non-proprietary) ^(Pom)

Injection, 13.6% (1 mmol/mL phosphate, 1 mmol/mL potassium) 10 mL ampoule

Note See also Important, above

Dipotassium hydrogen phosphate (Non-proprietary)

^(Pom)

Injection, 17.42% (1 mmol/mL phosphate and 2 mmol/mL potassium) 10 mL ampoule

Note See also Important, above

Disodium hydrogen phosphate (Non-proprietary) ^(Pom)

Injection, 17.42% (0.6 mmol/mL phosphate and 1.2 mmol/mL sodium) 10 mL ampoule

9.5.2.2 Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer may be useful when hypercalcaemia prevents the use of calcium carbonate.

ALUMINIUM HYDROXIDE

Cautions see notes above; **interactions:** Appendix 1 (antacids)

Side-effects constipation; hyperaluminiaemia

Alu-Cap® (Meda)

Capsules, green/red, dried aluminium hydroxide 475 mg (low Na^+), net price 120-cap pack = £3.75

Dose

Hyperphosphataemia

- By mouth

Child 5–12 years 1–2 capsules 3–4 times daily, adjusted as necessary

Child 12–18 years 1–5 capsules 3–4 times daily, adjusted as necessary

CALCIUM SALTS

Cautions interactions: Appendix 1 (antacids, calcium salts)

Contra-indications hypercalcaemia, hypercalciuria

Side-effects hypercalcaemia

Indication and dose

Phosphate binding in renal failure and hyperphosphataemia

• By mouth

Child 1 month–1 year 120 mg calcium carbonate 3–4 times daily with feeds, adjusted as necessary

Child 1–6 years 300 mg calcium carbonate 3–4 times daily prior to or with meals, adjusted as necessary

Child 6–12 years 600 mg calcium carbonate 3–4 times daily prior to or with meals, adjusted as necessary

Child 12–18 years 1.25 g calcium carbonate 3–4 times daily prior to or with meals, adjusted as necessary

Adcal[®] Section 9.5.1.1

Calcichew[®] Section 9.5.1.1

Calcium-500 Section 9.5.1.1

Phosex[®] (Vitaline)

Tablets, yellow, scored, calcium acetate 1 g (calcium 250 mg or Ca²⁺ 6.2 mmol), net price 180-tab pack = £19.79. Counselling, do not chew, with meals

Dose

Phosphate-binding agent (with meals) in renal failure, according to the requirements of the patient

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

SEVELAMER HYDROCHLORIDE

Cautions gastro-intestinal disorders; **interactions:** Appendix 1 (sevelamer)

Contra-indications bowel obstruction

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises use only if potential benefit outweighs risk

Side-effects nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; *very rarely* intestinal obstruction; *also reported* intestinal perforation, ileus, diverticulitis, pruritus, and rash

Licensed use not licensed for use in children under 18 years

Indication and dose

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

• By mouth

Child 12–18 years initially 0.8–1.6 g 3 times daily with meals, then adjusted according to plasma-phosphate concentration

Renagel[®] (Genzyme) ^(POM)

Tablets, f/c, sevelamer hydrochloride 800 mg, net price 180-tab pack = £117.97. Label: 25, counselling, with meals

Excipients include propylene glycol (see Excipients, p. 2)

9.5.3 Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provide suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent the child from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

Fluoride mouthwash, oral drops, tablets, and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see preparations below).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

FLUORIDES

Note Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion

Contra-indications not for areas where drinking water is fluoridated

Side-effects occasional white flecks on teeth with recommended doses; *rarely* yellowish-brown discoloration if recommended doses are exceeded

Indication and dose

Prophylaxis of dental caries—see notes above

Note Dose expressed as fluoride ion (F⁻):

Water content less than F⁻ 300 micrograms/litre (0.3 parts per million)

• By mouth

Child 6 months–3 years F⁻ 250 micrograms daily

Child 3–6 years F⁻ 500 micrograms daily

Child 6 years and over F⁻ 1 mg daily

Water content between F⁻ 300 and 700 micrograms/litre (0.3–0.7 parts per million)

Child 3–6 years F⁻ 250 micrograms daily

Child 6 years and over F⁻ 500 micrograms daily

Water content above F⁻ 700 micrograms/litre (0.7 parts per million), supplements not advised

Note These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; 182: 6–7)

▲ Tablets

Counselling Tablets should be sucked or dissolved in the mouth and taken preferably in the evening. There are arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

En-De-Kay® (Manx)

Fluotabs 3–6 years, orange-flavoured, scored, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £2.38

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

Fluotabs 6+ years, orange-flavoured, scored, sodium fluoride 2.2 mg (F⁻ 1 mg), net price 200-tab pack = £2.38

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

Fluor-a-day® (Dental Health)

Tablets, buff, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £2.54; 2.2 mg (F⁻ 1 mg), 200-tab pack = £2.54

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

FluoriGard® (Colgate-Palmolive)

Tablets 0.5, purple, grape-flavoured, scored, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £1.91

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

Tablets 1.0, orange, orange-flavoured, scored, sodium fluoride 2.2 mg (F⁻ 1 mg), net price 200-tab pack = £1.91

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

▲ Oral drops

Note Fluoride supplements not considered necessary below 6 months of age (see notes above)

En-De-Kay® (Manx)

Fluodrops® (= paediatric drops), sugar-free, sodium fluoride 550 micrograms (F⁻ 250 micrograms)/0.15 mL. Net price 60 mL = £2.38

Dental prescribing on NHS Corresponds to Sodium Fluoride Oral Drops DPF 0.37% equivalent to sodium fluoride 80 micrograms (F⁻ 36 micrograms)/drop

▲ Mouthwashes

Rinse mouth for 1 minute and spit out

Counselling Avoid eating, drinking, or rinsing mouth for 15 minutes after use

Duraphat® (Colgate-Palmolive)

Weekly dental rinse (= mouthwash), blue, sodium fluoride 0.2%. Net price 150 mL = £2.13. Counselling, see above

Dose

Child 6 years and over for *weekly* use, rinse with 10 mL

Dental prescribing on NHS May be prescribed as Sodium Fluoride Mouthwash 0.2%

En-De-Kay® (Manx)

Daily fluoride mouthrinse (= mouthwash), blue, sodium fluoride 0.05%. Net price 250 mL = £1.51

Dose

Child 6 years and over for *daily* use, rinse with 10 mL

Dental prescribing on NHS May be prescribed as Sodium Fluoride Mouthwash 0.05%

Fluorinse (P_oM) (= mouthwash), red, sodium fluoride 2%. Net price 100 mL = £4.97. Counselling, see above

Dose

Child 8 years and over for *daily* use, dilute 5 drops to 10 mL of water; for *weekly* use, dilute 20 drops to 10 mL

Dental prescribing on NHS May be prescribed as Sodium Fluoride Mouthwash 2%

FluoriGard® (Colgate-Palmolive)

Daily dental rinse (= mouthwash), blue, sodium fluoride 0.05%. Net price 500 mL = £2.61. Counselling, see above

Dose

Child 6 years and over for *daily* use, rinse with 10 mL

Dental prescribing on NHS May be prescribed as Sodium Fluoride Mouthwash 0.05%

▲ Gels

FluoriGard® (Colgate-Palmolive)

Gel-Kam (= gel), stannous fluoride 0.4% in glycerol basis. Net price 100 mL = £2.63. Counselling, see below

Dose

Child over 3 years for *daily* use, using a toothbrush, apply on to all tooth surfaces

Counselling Swish between teeth for 1 minute before spitting out. Avoid eating, drinking, or rinsing mouth for at least 30 minutes after use

▲ Toothpastes

Duraphat® (Colgate-Palmolive) (P_oM)

Duraphat® '2800 ppm' toothpaste, sodium fluoride 0.619%. Net price 75 mL = £3.26. Counselling, see below

Dose

Child over 10 years apply 1 cm twice daily using a toothbrush

Counselling Brush teeth for 1 minute before spitting out. Avoid drinking or rinsing mouth for 30 minutes after use

Dental prescribing on NHS May be prescribed as Sodium Fluoride Toothpaste 0.619%

Duraphat® '5000 ppm' toothpaste, sodium fluoride 1.1%. Net price 51 g = £6.50. Counselling, see below

Dose

Child over 16 years apply 2 cm 3 times daily after meals using a toothbrush

Counselling Brush teeth for 3 minutes before spitting out

Dental prescribing on NHS May be prescribed as Sodium Fluoride Toothpaste 1.1%

9.5.4 Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states. Zinc is used in the treatment of Wilson's disease (section 9.8.1) and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc (section 9.3). If necessary, further zinc can be added to some intravenous feeding regimens.

ZINC SULPHATE

Cautions interactions: Appendix 1 (zinc)

Renal impairment accumulation may occur in acute renal failure

Pregnancy crosses placenta; risk theoretically minimal, but no information available

Breast-feeding present in milk; risk theoretically minimal, but no information available

Side-effects abdominal pain, dyspepsia, nausea, vomiting, diarrhoea, gastric irritation, gastritis; irritability, headache, lethargy

Licensed use *Solvazinc*® not licensed for use in acrodermatitis enteropathica

Solvazinc® (Galen)

Effervescent tablets, zinc sulphate monohydrate 125 mg (45 mg zinc), net price 30 = £4.32. Label: 13, 21

Dose

Zinc deficiency (see notes above)

• **By mouth**

Neonate 1 mg/kg elemental zinc daily

Child under 10 kg half a tablet daily in water after food, adjusted as necessary

Child 10–30 kg half a tablet 1–3 times daily in water after food, adjusted as necessary

Child over 30 kg 1 tablet 1–3 times daily in water after food, adjusted as necessary

Acrodermatitis enteropathica

• **By mouth**

Neonate 0.5–1 mg/kg elemental zinc twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted as necessary

Child 1 month–18 years 0.5–1 mg/kg elemental zinc twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted as necessary

9.6 Vitamins

9.6.1 Vitamin A

9.6.2 Vitamin B group

9.6.3 Vitamin C

9.6.4 Vitamin D

9.6.5 Vitamin E

9.6.6 Vitamin K

9.6.7 Multivitamin preparations

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron-deficiency anaemia, a primary vitamin or mineral deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn's disease.

The use of vitamins as general 'pick-me-ups' is of unproven value and the 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine, is unscientific and can be harmful. Many vitamin supplements are described as 'multivitamin' but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects 41*. London: HMSO, 1991

Dental patients It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

9.6.1 Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation (section 9.6.7) once enteral feeding has been established.

Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

Pregnancy In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.

VITAMIN A

(Retinol)

Cautions see notes above; **interactions:** Appendix 1 (vitamins)

Pregnancy excessive doses can be teratogenic; see also notes above

Breast-feeding toxicity likely if mother taking high doses

Side-effects see notes above

Licensed use preparations containing only vitamin A are not licensed

Indication and dose

See also notes above

Vitamin A deficiency

• By mouth

Neonate 5000 units daily

Child 1 month–1 year 5000 units daily with or after food

Child 1–18 years 10 000 units daily with or after food

Note Higher doses may be used initially for treatment of severe deficiency

Prevention of deficiency in complete biliary obstruction

• By intramuscular injection

Neonate 50 000 units once a month

Child 1 month–1 year 50 000 units once a month

Arovit® (Non-proprietary)

Oral solution, vitamin A 150 000 units/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Aquasol-A® (Non-proprietary)

Injection, vitamin A (as palmitate) 50 000 units/mL, 2-mL amp

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

VITAMINS A and D

Cautions see notes above and section 9.6.4; prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis; **interactions:** Appendix 1 (vitamins)

Pregnancy see notes above

Side-effects see notes above and section 9.6.4

Licensed use not licensed in children under 6 months of age

Indication and dose

See notes above and section 9.6.4

Prevention of vitamin A and D deficiency see individual preparations for dose information

▲ Vitamins A and D

Vitamins A and D (Non-proprietary)

Capsules, vitamin A 4000 units, vitamin D 400 units.

Net price 84 = £3.44

Note May be difficult to obtain

Dose

Child 1–18 years 1 capsule daily

▲ Vitamins A, C and D

Healthy Start Children's Vitamin Drops (Non-proprietary)

Oral drops, vitamin A 5000 units, vitamin D 2000 units, ascorbic acid 150 mg/mL

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at <http://tinyurl.com/3yckebe>. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

Dose

Prevention of vitamin deficiency

• By mouth

Child 1 month–5 years 5 drops daily (5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units, ascorbic acid approx. 20 mg)

Note *Healthy Start Vitamins for women* (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at <http://tinyurl.com/3yckebe>. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

9.6.2 Vitamin B group

Deficiency of the B vitamins, other than vitamin B₁₂ (section 9.1.2), is rare in the UK and is usually treated by preparations containing thiamine (B₁), and riboflavin (B₂). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol, and pantothenic acid or panthenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders (section 9.8.1). Anaphylaxis has been reported with parental B vitamins (see MHRA/CHM advice, below).

As with other vitamins of the B group, pyridoxine (B₆) deficiency is rare, but it may occur during isoniazid therapy (section 5.1.9) or penicillamine treatment in Wilson's disease (section 9.8.1) and is characterised by peripheral neuritis. High doses of pyridoxine are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid supplementation may also be beneficial in these disorders

(section 9.1.2). Pyridoxine is also used in sideroblastic anaemia (section 9.1.3). Rarely, seizures in the neonatal period or during infancy respond to pyridoxine treatment; pyridoxine should be tried in all cases of early-onset intractable seizures and status epilepticus. Pyridoxine has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy, and overdosage induces toxic effects.

A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders require specialist management. **Thiamine** is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidurias and cytochrome oxidase deficiencies; biotin (section 9.8.1) is used in carboxylase defects.

Folic acid and vitamin B₁₂ are used in the treatment of megaloblastic anaemia (section 9.1.2). Folic acid (available as calcium folinate) is used in association with cytotoxic therapy (section 8.1).

RIBOFLAVIN

(Riboflavine, vitamin B₂)

Cautions see notes above

Pregnancy crosses the placenta but no adverse effects reported, information at high doses limited

Breast-feeding present in breast milk but no adverse effects reported, information at high doses limited

Side-effects bright yellow urine

Licensed use not licensed in children

Indication and dose

See also notes above

Metabolic diseases

• By mouth

Neonate 50 mg 1–2 times daily, adjusted according to response

Child 1 month–18 years 50–100 mg 1–2 times daily, adjusted according to response, up to 400 mg daily has been used

Riboflavin (Non-proprietary)

Tablets, 10 mg, 50 mg and 100 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Oral vitamin B complex preparations

See below

Extemporaneous formulations available see Extemporaneous Preparations, p. 6

THIAMINE

(Vitamin B₁)

Cautions anaphylactic shock may occasionally follow injection (see MHRA/CHM advice below)

MHRA/CHM advice (September 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

1. This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
2. Intravenous administration should be by infusion over 30 minutes;
3. Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

Breast-feeding severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk

Side-effects hypersensitivity reactions to injection

Licensed use not licensed in children

Indication and dose

See also notes above

Maple syrup urine disease

• By mouth

Neonate 5 mg/kg daily, adjusted as necessary

Child 1 month–18 years 5 mg/kg daily, adjusted as necessary

Metabolic disorders including congenital lactic acidosis

• By mouth or by intravenous infusion over 30 minutes

Neonate 50–200 mg once daily (total dose may alternatively be given in 2–3 divided doses), adjusted as necessary

Child 1 month–18 years 100–300 mg once daily (total dose may alternatively be given in 2–3 divided doses), adjusted as necessary; up to 2 g daily may be necessary

Thiamine (Non-proprietary)

Tablets, thiamine hydrochloride 50 mg, net price 100 = £5.19; 100 mg, 100 = £8.04

Brands include *Benerva*® 

Injection, 50 mg/mL, 2-mL vial; 100 mg/mL, 2-mL vial

Injection (intramuscular), 100 mg/mL, 5-mL vial
Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Note Some preparations may contain phenol as a preservative

Oral vitamin B complex preparations

See below

PYRIDOXINE HYDROCHLORIDE

(Vitamin B₆)

Cautions see notes above; risk of cardiovascular collapse with intravenous injection—resuscitation facilities must be available, monitor closely; **interactions:** Appendix 1 (vitamins)

Side-effects sensory neuropathy reported with high doses given for extended periods

Licensed use not licensed for use in children

Indication and dose

See also notes above

Metabolic diseases including cystathioninuria and homocystinuria

• By mouth

Neonate 50–100 mg 1–2 times daily**Child 1 month–18 years** 50–250 mg 1–2 times daily**Treatment of isoniazid-induced neuropathy**

• By mouth

Neonate 5–10 mg daily**Child 1 month–12 years** 10–20 mg 2–3 times daily**Child 12–18 years** 30–50 mg 2–3 times daily**Prevention of isoniazid-induced neuropathy**

• By mouth

Neonate 5 mg daily**Child 1 month–12 years** 5–10 mg daily**Child 12–18 years** 10 mg daily**Prevention of penicillamine-induced neuropathy in Wilson's disease (see notes above)**

• By mouth

Child 1–12 years 5–10 mg daily**Child 12–18 years** 10 mg daily**Pyridoxine-dependent seizures**

• By intravenous injection or by mouth

Neonate initial test dose 50–100 mg by intravenous injection, may be repeated; if responsive followed by an oral maintenance dose of 50–100 mg once daily, adjusted as necessary**Child 1 month–12 years** initial test dose 50–100 mg daily; if responsive followed by an oral dose of 20–50 mg 1–2 times daily, adjusted as necessary; doses up to 30 mg/kg or 1 g daily have been used**Pyridoxine (Non-proprietary)****Tablets**, pyridoxine hydrochloride 10 mg, net price 500 = £8.53; 20 mg, 500 = £8.53; 50 mg, 28 = £1.52**Injection**, 25 mg/mL, 2 mL vial

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

- Extemporaneous formulations available see Extemporaneous Preparations, p. 6

Oral vitamin B complex preparations**Note** Other multivitamin preparations are in section 9.6.7.**Vitamin B Tablets, Compound****Tablets**, nicotinamide 15 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, net price 28 = £1.00**Vitamin B Tablets, Compound, Strong****Tablets**, brown, f/c or s/c, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, riboflavin 2 mg, thiamine hydrochloride 5 mg. Net price 28-tab pack = £2.30**Vigranon B®** (Wallace Mfg)  **Syrup**, thiamine hydrochloride 5 mg, riboflavin 2 mg, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, panthenol 3 mg/5 mL. Net price 150 mL = £2.41**Dose****Treatment of deficiency**

• By mouth

Child 1 month–1 year 5 mL 3 times daily**Child 1–12 years** 10 mL 3 times daily**Child 12–18 years** 10–15 mL 3 times daily**Prophylaxis of deficiency**

• By mouth

Child 1 month–1 year 5 mL once daily**Child 1–12 years** 5 mL twice daily**Child 12–18 years** 5 mL 3 times daily**9.6.3 Vitamin C (Ascorbic acid)**

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency have been reported. Vitamin C is used to enhance the excretion of iron one month after starting desferrioxamine therapy (section 9.1.3); it is given separately from food as it also enhances iron absorption. Vitamin C is also used in the treatment of some inherited metabolic disorders, particularly mitochondrial disorders; specialist management of these conditions is required.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a child with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

ASCORBIC ACID (Vitamin C)**Cautions interactions:** Appendix 1 (vitamins)**Contra-indications** hyperoxaluria**Side-effects** nausea, diarrhoea; headache, fatigue; hyperoxaluria**Licensed use** not licensed for metabolic disorders**Indication and dose****Treatment of scurvy**

• By mouth

Child 1 month–4 years 125–250 mg daily in 1–2 divided doses**Child 4–12 years** 250–500 mg daily in 1–2 divided doses**Child 12–18 years** 500 mg–1 g daily in 1–2 divided doses**Adjunct to desferrioxamine (see notes above)**

• By mouth

Child 1 month–18 years 100–200 mg daily 1 hour before food

Metabolic disorders (tyrosinaemia type III; transient tyrosinaemia of the newborn; glutathione synthase deficiency; Hawkinsinuria)

• **By mouth**

Neonate 50–200 mg daily, adjusted as necessary

Child 1 month–18 years 200–400 mg daily in 1–2 divided doses, adjusted as necessary; up to 1 g daily may be required

Ascorbic Acid (Non-proprietary)

Tablets, ascorbic acid 50 mg, net price 28 = £1.79; 100 mg, 28 = £1.42; 200 mg, 28 = £1.42; 500 mg (label: 24), 28 = £2.34

Excipients may include aspartame

Brands include Redoxon® 

Injection, ascorbic acid 100 mg/mL, net price 5-mL amp = £4.39

Excipients include metabisulphite

9.6.4 Vitamin D

Note The term Vitamin D is used for a range of compounds including ergocalciferol (calciferol, vitamin D₂), colecalciferol (vitamin D₃), dihydrotachysterol, alfalcidol (1 α -hydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Asymptomatic vitamin D deficiency is common in the United Kingdom; symptomatic deficiency may occur in certain ethnic groups, particularly as rickets or hypocalcaemia, and rarely in association with malabsorption. The amount of vitamin D required in infancy is related to the stores built up *in-utero* and subsequent exposure to sunlight. The amount of vitamin D in breast milk varies and some breast-fed babies, particularly if pre-term or born to vitamin D deficient mothers, may become deficient. Most formula milk and supplement feeds contain adequate vitamin D to prevent deficiency.

Simple, nutritional vitamin D deficiency can be prevented by oral supplementation of 400 units of **ergocalciferol** (calciferol, vitamin D₂) or **colecalciferol** (vitamin D₃) daily, using multi-vitamin drops (section 9.6.7), preparations of vitamins A and D (section 9.6.1), manufactured 'special' solutions, or as calcium and ergocalciferol tablets (although the calcium and other vitamins in supplements are unnecessary); excessive supplementation may cause hypercalcaemia.

Inadequate bone mineralisation can be caused by a deficiency, or a lack of action of vitamin D or its active metabolite. In childhood this causes bowing and distortion of bones (rickets). In nutritional vitamin D deficiency rickets, initial high doses of ergocalciferol or colecalciferol should be reduced to supplemental doses after 8–12 weeks, as there is a significant risk of hypercalcaemia (see caution below). However, calcium supplements are recommended if there is hypocalcaemia or evidence of a poor dietary calcium intake. A single large dose of ergocalciferol or colecalciferol can also be effective for the treatment of nutritional vitamin D deficiency rickets.

Poor bone mineralisation in neonates and young children may also be due to inadequate intake of phosphate or calcium particularly during long-term parenteral nutrition—supplementation with phosphate (section 9.5.2.1) or calcium (section 9.5.1.1) may be required.

Hypophosphataemic rickets occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate (section 9.5.2.1), and hydroxylated (acti-

vated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses, such as **ergocalciferol** in doses of up to 40 000 units daily; the hypocalcaemia of *hypoparathyroidism* often requires higher doses in order to achieve normocalcaemia and alfalcidol is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease.

Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives **alfalcidol** or **calcitriol** should be prescribed if patients with *severe liver or renal impairment* require vitamin D therapy. Alfalcidol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

Important. All patients receiving pharmacological doses of vitamin D or its analogues should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

ERGOCALCIFEROL

(Calciferol, Vitamin D₂)

Cautions see notes above; monitor plasma-calcium concentration in patients receiving high doses and in renal impairment; **interactions:** Appendix 1 (vitamins)

Contra-indications hypercalcaemia; metastatic calcification

Pregnancy high doses teratogenic in *animals* but therapeutic doses unlikely to be harmful

Breast-feeding caution with high doses as may cause hypercalcaemia in infant—monitor serum-calcium concentration

Side-effects symptoms of overdose include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

Licensed use Calcium and Ergocalciferol tablets not licensed for use in children under 6 years

Indication and dose

See also notes above

Nutritional vitamin-D deficiency rickets

• **By mouth**

Child 1–6 months 3000 units daily, adjusted as necessary

Child 6 months–12 years 6000 units daily, adjusted as necessary

Child 12–18 years 10 000 units daily, adjusted as necessary

Nutritional or physiological supplement; prevention of rickets

- **By mouth**

Neonate 400 units daily

Child 1 month–18 years 400–600 units daily

Vitamin D deficiency in intestinal malabsorption or in chronic liver disease

- **By mouth or by intramuscular injection**

Child 1–12 years 10 000–25 000 units daily, adjusted as necessary

Child 12–18 years 10 000–40 000 units daily, adjusted as necessary

Pharmacological strengths

(see notes above)

The BP directs that when calciferol is prescribed or demanded colecalciferol or ergocalciferol should be dispensed or supplied

Ergocalciferol (Non-proprietary)

Tablets, ergocalciferol 250 micrograms (10 000 units), net price 100 = £21.99; 1.25 mg (50 000 units), 100 = £30.34

Note May be difficult to obtain

Important When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber or purchaser with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

Injection ^(POM), ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £8.50, 2-mL amp = £9.85

Note Other formulations of ergocalciferol are available from 'special-order' manufacturers or specialist importing companies, see p. 809

Daily supplements

Note There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamins capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.1), and calcium and ergocalciferol tablets (see below).

For prescribing information on calcium, see section 9.5.1

Calcium and Ergocalciferol (Non-proprietary) (Calcium and Vitamin D)

Tablets, calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units). Net price 28-tab pack = £7.10. Counselling, crush before administration or may be chewed

ALFACALCIDOL

(1 α -Hydroxycholecalciferol)

Cautions see under Ergocalciferol; also nephrolithiasis

Contra-indications see under Ergocalciferol

Pregnancy see under Ergocalciferol

Breast-feeding see under Ergocalciferol

Side-effects see under Ergocalciferol; also rarely nephrocalcinosis, pruritus, rash, and urticaria

Indication and dose

See also notes above

Hypophosphataemic rickets; persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

- **By mouth or by intravenous injection**

Child 1 month–12 years 25–50 nanograms/kg (max. 1 microgram) once daily, adjusted as necessary

Child 12–18 years 1 microgram once daily, adjusted as necessary

Persistent neonatal hypocalcaemia

- **By mouth or by intravenous injection**

Neonate 50–100 nanograms/kg once daily, adjusted as necessary (up to 2 micrograms/kg daily may be needed in resistant cases)

Prevention of vitamin D deficiency in renal or cholestatic liver disease

- **By mouth or by intravenous injection**

Neonate 20 nanograms/kg once daily, adjusted as necessary

Child 1 month–12 years, body-weight under 20 kg 15–30 nanograms/kg (max. 500 nanograms) once daily; **body-weight over 20 kg** 250–500 nanograms once daily, adjusted as necessary

Child 12–18 years 250–500 nanograms once daily, adjusted as necessary

Alfacalcidol (Non-proprietary) ^(POM)

Capsules, alfacalcidol 250 nanograms, net price 30-cap pack = £5.94; 500 nanograms 30-cap pack = £11.64; 1 microgram 30-cap pack = £15.91

One-Alpha[®] (LEO) ^(POM)

Capsules, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75

Excipients include sesame oil

Oral drops, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £22.49

Excipients include alcohol

Note The concentration of alfacalcidol in *One-Alpha[®] drops* is 10 times greater than that of the former preparation *One-Alpha[®] solution*.

Injection, alfacalcidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11

Excipients include alcohol, propylene glycol (caution in neonates, see, p. 2)

Note Shake ampoule for at least 5 seconds before use

CALCITRIOL

(1,25-Dihydroxycholecalciferol)

Cautions see under Ergocalciferol; monitor plasma calcium, phosphate, and creatinine during dosage titration

Contra-indications see under Ergocalciferol

Pregnancy see under Ergocalciferol

Breast-feeding see under Ergocalciferol

Side-effects see under Ergocalciferol

Licensed use not licensed for use in children

Indication and dose

See also notes above

Vitamin D dependent rickets; hypophosphataemic rickets; persistent hypocalcaemia due to hypoparathyroidism or pseudo-hypoparathyroidism (limited experience)

• **By mouth**

Child 1 month–12 years initially 15 nanograms/kg (max. 250 nanograms) once daily, increased if necessary in steps of 5 nanograms/kg daily (max. 250 nanograms) every 2–4 weeks

Child 12–18 years initially 250 nanograms once daily increased if necessary in steps of 5 nanograms/kg daily (max. 250 nanograms step) every 2–4 weeks; usual dose 0.5–1 microgram daily

Hypocalcaemia in dialysis patients (limited experience)

• **By intravenous injection**

Child 12–18 years initially 250–500 nanograms (approx. 10 nanograms/kg) 3 times a week, increased if necessary in steps of 2–5 nanograms/kg every 2–4 weeks; usual dose 0.5–3 micrograms 3 times a week

Administration For administration *by mouth*, injection solution may be given orally or contents of capsule administered by oral syringe; capsules contain approx. 0.168 mL of fluid
For administration *by intravenous injection*, injection may be given via catheter after dialysis

Calcitriol (Non-proprietary) (POM)

Capsules, calcitriol 250 nanograms, net price 30-cap pack = £18.04, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £32.25, 100-cap pack = £25.76

Rocaltrol® (Roche) (POM)

Capsules, calcitriol 250 nanograms (red/white), net price 100 = £18.04; 500 nanograms (red), 100 = £32.25

Calcijex® (Abbott) (POM)

Injection, calcitriol 1 microgram/mL, net price 1-mL amp = £5.14; 2 micrograms/mL, 1-mL amp = £10.28

COLECALCIFEROL

(Cholecalciferol, vitamin D₃)

Cautions see under Ergocalciferol

Contra-indications see under Ergocalciferol

Pregnancy see under Ergocalciferol

Breast-feeding see under Ergocalciferol

Side-effects see under Ergocalciferol

Licensed use *Sandocal*® + D 600 not licensed for use in children under 2 years; *Adcal-D3*®, *Calceos*®, and *Sandocal*® + D 1200 not licensed for use in children under 12 years; *Cacit*® D3, *Calcichew-D₃*® Forte, *Calcichew-D₃*® 500 mg/400 unit, and *Kalcipos-D*® not licensed for use in children (age range not specified by manufacturers); *Calfovit D3*® and *Natecal D3*® not licensed for use in children under 18 years

Indication and dose

See under Ergocalciferol and notes above—alternative to Ergocalciferol, see also Pharmacological Strengths

Colecalciferol

Various formulations available from 'special-order' manufacturers or specialist importing companies, see p. 809

▲ **With calcium**

For prescribing information on calcium, see section 9.5.1

Adcal-D₃® (ProStrakan)

Tablets (chewable), lemon or tutti-frutti flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £3.89, 112-tab pack = £7.78. Label: 24

Dissolve (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £4.99. Label: 13

Cacit® D3 (Warner Chilcott)

Granules, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet, net price 30-sachet pack = £4.06. Label: 13

Calceos® (Galen)

Tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.62. Label: 24

Calcichew-D₃® (Shire)

Calcichew-D₃® tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 5 micrograms (200 units), net price 100-tab pack = £7.68. Label: 24
Excipients include aspartame (section 9.4.1)

Calcichew-D₃® Forte tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.21. Label: 24
Excipients include aspartame (section 9.4.1)

Calcichew-D₃® 500 mg/400 unit caplets, f/c, lemon flavour, calcium carbonate providing calcium 500 mg (Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.57
Excipients include propylene glycol (see Excipients, p. 2)

Calfovit D3® (Menarini)

Powder, lemon flavour, calcium phosphate 3.1 g (calcium 1.2 g or Ca²⁺ 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. Label: 13, 21

Kalcipos-D® (Meda) (POM)

Tablets (chewable), calcium carbonate providing calcium 500 mg (Ca²⁺ 12.5 mmol), colecalciferol 20 micrograms (800 units), net price 30-tab pack = £4.21. Label: 24

Natecal D3® (Chiesi)

Tablets (chewable), (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.63. Label: 24
Excipients include aspartame (section 9.4.1)

Sandocal®+D (Novartis Consumer Health)

Sandocal® +D 600 tablets, effervescent, orange flavour, calcium lactate gluconate 1.36 g, calcium carbonate 1.05 g, providing calcium 600 mg (Ca²⁺

15 mmol), colecalciferol concentrate 4 mg, providing colecalciferol 10 micrograms (400 units), net price 60-tab pack = £5.35, 100-tab pack = £8.75. Label: 13
Excipients include aspartame (section 9.4.1)

Sandocal® +D 1200 tablets, effervescent, orange flavour, calcium lactate gluconate 2.72 g, calcium carbonate 2.1 g, providing calcium 1200 mg (Ca²⁺ 30 mmol), colecalciferol concentrate 8 mg, providing colecalciferol 20 micrograms (800 units), net price 30-tab pack = £4.32. Label: 13
Excipients include aspartame (section 9.4.1)

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

9.6.5 Vitamin E (Tocopherols)

The daily requirement of vitamin E has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinaemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

ALPHA TOCOPHERYL ACETATE

Cautions predisposition to thrombosis; increased risk of necrotising enterocolitis in preterm neonates (see administration); **interactions:** Appendix 1 (vitamins)

Pregnancy no evidence of safety of high doses

Breast-feeding excreted in milk, minimal risk although caution with large doses

Side-effects diarrhoea and abdominal pain, particularly with high doses

Indication and dose

Vitamin E deficiency

- By mouth

Neonate 10 mg/kg once daily

Child 1 month–18 years 2–10 mg/kg daily, up to 20 mg/kg has been used

Malabsorption in cystic fibrosis

- By mouth (with food and pancreatic enzymes)

Child 1 month–1 year 50 mg once daily, adjusted as necessary

Child 1–12 years 100 mg once daily, adjusted as necessary

Child 12–18 years 100–200 mg once daily, adjusted as necessary

Vitamin E deficiency in cholestasis and severe liver disease

- By mouth

Neonate 10 mg/kg daily

Child 1 month–12 years initially 100 mg daily, adjusted according to response; up to 200 mg/kg daily may be required

Child 12–18 years initially 200 mg daily, adjusted according to response; up to 200 mg/kg daily may be required

- By intramuscular injection

Neonate 10 mg/kg once a month

Child 1 month–18 years 10 mg/kg (max. 100 mg) once a month

Malabsorption in abetalipoproteinaemia

- By mouth

Neonate 100 mg/kg once daily

Child 1 month–18 years 50–100 mg/kg once daily

Vitamin E Suspension (Non-proprietary)

Suspension, alpha tocopheryl acetate 100 mg/mL. Net price 100 mL = £30.35

Excipients include sucrose

Administration consider dilution in neonates due to high osmolality (see Cautions)

Note Tablets containing tocopheryl acetate are available from 'special-order' manufacturers or specialist importing companies, see p. 809

Vitamin E Injection

Injection tocopheryl acetate 50 mg/mL, 2-mL ampoule

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

ALPHA TOCOPHEROL

Cautions predisposition to thrombosis; **interactions:** Appendix 1 (vitamins)

Contra-indications preterm neonates

Hepatic impairment manufacturer advises caution and monitor closely—no information available

Renal impairment manufacturer advises caution and monitor closely; risk of renal toxicity due to polyethylene glycol content

Pregnancy manufacturer advises caution; no evidence of harm in animal studies

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—no information available

Side-effects diarrhoea; *less commonly* asthenia, headache, pruritus, disturbances in serum-potassium and serum-sodium concentrations, alopecia, and rash

Vedrop® (Orphan Europe) ▼ (PvM)

Oral solution, yellow, D-alpha tocopherol (as tocopherolan) 50 mg/mL, net price 20 mL = £54.55, 60 mL = £163.65 (all with oral syringe)

Note Tocopherolan is a water-soluble form of D-alpha tocopherol

Dose

Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

- By mouth

Neonate 17 mg/kg daily, adjusted as necessary

Child 1 month–18 years 17 mg/kg daily, adjusted as necessary

9.6.6 Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, **menadiol sodium phosphate** (see Contra-indications below) can be used if supplementation with phytomenadione by mouth has been insufficient.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; for advice on the use of vitamin K in haemorrhage, see section 2.8.2.

Vitamin K deficiency bleeding Neonates are relatively deficient in vitamin K and those who do not receive supplements are at risk of serious bleeding, including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). Local protocols may vary and an appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as phytomenadione) 1 mg may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies; preterm neonates may be given 400 micrograms/kg (max. 1 mg). The intravenous route may be used in preterm neonates of very low birth-weight if intramuscular injection is not possible; however, it may not provide the prolonged protection of the intramuscular injection; any babies receiving intravenous vitamin K should be given subsequent oral doses.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given in the first week, the first dose being given at birth and the second at 4–7 days. For exclusively breast-fed babies, a third dose of phytomenadione 2 mg is given at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione 1 mg by mouth at birth (using the contents of a phytomenadione capsule, see preparation below) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione 1 mg are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

For the *treatment* of vitamin K deficiency bleeding, intravenous phytomenadione is used, see Phytomenadione below.

MENADIOL SODIUM PHOSPHATE

Cautions G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); **interactions:** Appendix 1 (vitamins)

Contra-indications neonates and infants

Pregnancy avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate

Indication and dose

See notes above

Supplementation in vitamin K malabsorption

• By mouth

Child 1–12 years 5–10 mg daily, adjusted as necessary

Child 12–18 years 10–20 mg daily, adjusted as necessary

Menadiol Phosphate (Non-proprietary)

Tablets, menadiol sodium phosphate equivalent to 10 mg of menadiol phosphate, net price 100-tab pack = £58.39

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

PHYTOMENADIONE

(Vitamin K₁)

Cautions intravenous injections should be given very slowly—risk of vascular collapse (see also below); **interactions:** Appendix 1 (vitamins)

Pregnancy use if potential benefit outweighs risk

Breast-feeding present in milk, but see notes above

Indication and dose

Neonatal prophylaxis of vitamin-K deficiency bleeding see notes above

Neonatal hypoprothrombinaemia or vitamin-K deficiency bleeding

• By intravenous injection

Neonate 1 mg repeated 8 hourly if necessary

Neonatal biliary atresia and liver disease

• By mouth

Neonate 1 mg daily

Reversal of coumarin anticoagulation when continued anticoagulation required or if no significant bleeding (see also section 2.8.2)—seek specialist advice

• By intravenous injection

Child 1 month–18 years 15–30 micrograms/kg (max. 1 mg) as a single dose, repeated as necessary

Reversal of coumarin anticoagulation when anticoagulation not required or if significant bleeding; treatment of haemorrhage associated with vitamin-K deficiency (see also section 2.8.2)—seek specialist advice

• By intravenous injection

Child 1 month–18 years 250–300 micrograms/kg (max. 10 mg) as a single dose

Neokay® (Neoceuticals) (POM)

Capsules, brown, phytomenadione 1 mg in an oily basis, net price 12-cap pack = £3.95; 100-cap pack = £34.00

Note The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given

Dose

Neonatal prophylaxis of vitamin-K deficiency bleeding see notes above

▲ **Colloidal formulation****Konakion® MM** (Roche) (POM)

Injection, phytomenadione 10 mg/mL in a mixed micelles vehicle. Net price 1-mL amp = 38p

Excipients include glycocholic acid 54.6 mg/amp, lecithin

Cautions reduce dose in liver impairment (glycocholic acid may displace bilirubin); reports of anaphylactoid reactions

Administration *Konakion® MM* may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; **not** for intramuscular injection

Konakion® MM Paediatric (Roche) ▼ (POM)

Injection, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 0.2-mL amp = 95p

Excipients include glycocholic acid 10.9 mg/amp, lecithin

Cautions parenteral administration in premature infants body-weight less than 2.5 kg (increased risk of kernicterus)

Administration *Konakion® MM Paediatric* may be administered by mouth or by intramuscular injection or by intravenous injection. For intravenous injection, may be diluted with Glucose 5% if necessary

9.6.7 Multivitamin preparations

Multivitamin supplements are used in children with vitamin deficiencies and also in malabsorption conditions such as cystic fibrosis or liver disease. To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements. Supplementation is not required if nutrient enriched feeds are used; consult a dietician for further advice.

MULTIVITAMIN PREPARATIONS

Cautions see individual vitamins; vitamin A concentration of preparations varies

Contra-indications see individual vitamins

Side-effects see individual vitamins

Licensed use *Dalivit®* not licensed for use in children under 6 weeks

Indication and dose

See under preparations below

Vitamins

Capsules, ascorbic acid 15 mg, nicotinamide 7.5 mg, riboflavin 500 micrograms, thiamine hydrochloride 1 mg, vitamin A 2500 units, vitamin D 300 units, net price 28-cap pack = £1.50

Dose**Prevention of deficiency**• **By mouth**

Child 1–12 years 1 capsule daily

Child 12–18 years 2 capsules daily

Cystic fibrosis: prevention of deficiency• **By mouth**

Child 1–18 years 2–3 capsules daily

Abidec® (Chefaro UK)

Drops, vitamins A, B group, C, and D. Net price 25 mL (with dropper) = £2.20

Note Contains 1333 units of vitamin A (as palmitate) per 0.6 mL dose

Excipients include arachis (peanut) oil and sucrose

Dose**Prevention of deficiency**• **By mouth**

Preterm neonate 0.6 mL daily

Neonate 0.3 mL daily

Child 1 month–1 year 0.3 mL daily

Child 1–18 years 0.6 mL daily

Cystic fibrosis: prevention of deficiency• **By mouth**

Child 1 month–1 year 0.6 mL daily

Child 1–18 years 1.2 mL daily

Dalivit® (LPC)

Oral drops, vitamins A, B group, C, and D, net price 25 mL = £2.98, 50 mL = £4.85

Note Contains 5000 units of vitamin A (as palmitate) per 0.6 mL dose

Excipients include sucrose

Dose**Prevention of deficiency**• **By mouth**

Neonate (including preterm) 0.3 mL daily

Child 1 month–1 year 0.3 mL daily

Child 1–18 years 0.6 mL daily

Cystic fibrosis: prevention of deficiency• **By mouth**

Child 1 month–1 year 0.6 mL daily

Child 1–18 years 1 mL daily

Vitamin and mineral supplements and adjuncts to synthetic diets

Forceval® (Alliance)

Capsules, brown/red, vitamins (ascorbic acid 60 mg, biotin 100 micrograms, cyanocobalamin 3 micrograms, folic acid 400 micrograms, nicotinamide 18 mg, pantothenic acid 4 mg, pyridoxine 2 mg, riboflavin 1.6 mg, thiamine 1.2 mg, vitamin A 2500 units, vitamin D₂ 400 units, vitamin E 10 mg, minerals and trace elements (calcium 100 mg, chromium 200 micrograms, copper 2 mg, iodine 140 micrograms, iron 12 mg, magnesium 30 mg, manganese 3 mg, molybdenum 250 micrograms, phosphorus 77 mg, potassium 4 mg, selenium 50 micrograms, zinc 15 mg), net price 15-cap pack = £2.83, 30-cap pack = £5.19, 90-cap pack = £12.53. Label: 25

Dose

Vitamin and mineral deficiency and as adjunct in synthetic diets

Child 12–18 years 1 capsule daily one hour after a meal

Junior capsules, brown, vitamins (ascorbic acid 25 mg, biotin 50 micrograms, cyanocobalamin

2 micrograms, folic acid 100 micrograms, nicotinamide 7.5 mg, pantothenic acid 2 mg, pyridoxine 1 mg, riboflavin 1 mg, thiamine 1.5 mg, vitamin A 1250 units, vitamin D₂ 200 units, vitamin E 5 mg, vitamin K₁ 25 micrograms), minerals and trace elements (chromium 50 micrograms, copper 1 mg, iodine 75 micrograms, iron 5 mg, magnesium 1 mg, manganese 1.25 mg, molybdenum 50 micrograms, selenium 25 micrograms, zinc 5 mg), net price 30-cap pack = £3.52, 60-cap pack = £6.69

Dose

Vitamin and mineral deficiency and as adjunct in synthetic diets

Child 5–12 years 2 junior capsules daily

Ketovite® (Paines & Byrne)

Tablets (POM), yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopheryl acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 250 micrograms, acetomenaphthone 500 micrograms, net price 100-tab pack = £4.17

Dose

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets

Child 1 month–18 years 1 tablet 3 times daily; dose adjusted according to condition, diet, or age; use with *Ketovite® Liquid* for complete vitamin supplementation

Administration may be crushed immediately before use

Liquid, pink, sugar-free, vitamin A 2500 units, ergocalciferol 400 units, choline chloride 150 mg, cyanocobalamin 12.5 micrograms/5 mL, net price 150-mL pack = £2.70

Dose

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets

Child 1 month–18 years 5 mL daily; dose adjusted according to condition, diet, or age; use with *Ketovite® Tablets* for complete vitamin supplementation

Administration may be mixed with milk, cereal, or fruit juice

9.8.1 Drugs used in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care.

General advice on the use of medicines in metabolic disorders can be obtained from:

Alder Hey Children's Hospital
Medicines Information Centre
Tel: (0151) 252 5381

and

Great Ormond Street Hospital for Children
Pharmacy
Tel: (020) 7405 9200

Wilson's disease

Penicillamine is used in Wilson's disease (hepatolenticular degeneration) to aid the elimination of copper ions; it is also used for cystinuria. Children who are hypersensitive to penicillin may react rarely to penicillamine.

Trientine is used for the treatment of Wilson's disease only, in patients intolerant of penicillamine; it is **not** an alternative to penicillamine in other diseases such as cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

Zinc prevents the absorption of copper in Wilson's disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

PENICILLAMINE

Cautions concomitant nephrotoxic drugs (increased risk of toxicity); monitor urine for proteinuria; monitor blood and platelet count regularly (see below); neurological involvement in Wilson's disease; **interactions:** Appendix 1 (penicillamine)

Blood counts and urine tests Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)

Counselling Warn child and carer to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop

Contra-indications lupus erythematosus

Renal impairment reduce dose and monitor renal function or avoid—consult product literature

Pregnancy fetal abnormalities reported rarely; avoid if possible

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk—no information available

9.7 Bitters and tonics

Classification not included in *BNF for Children*.

9.8 Metabolic disorders

9.8.1 Drugs used in metabolic disorders

9.8.2 Acute porphyrias

This section covers drugs used in metabolic disorders and not readily classified elsewhere.

Side-effects initially nausea, anorexia, fever, and skin reactions; taste loss (mineral supplements not recommended); blood disorders including thrombocytopenia, leucopenia, agranulocytosis and aplastic anaemia; proteinuria, rarely haematuria (withdraw immediately and seek specialist advice); haemolytic anaemia, pancreatitis, cholestatic jaundice, nephrotic syndrome, lupus erythematosus-like syndrome, myasthenia gravis-like syndrome, neuropathy (especially if neurological involvement in Wilson's disease—prophylactic pyridoxine recommended, see section 9.6.2, polymyositis (rarely with cardiac involvement), dermatomyositis, mouth ulcers, stomatitis, alopecia, bronchiolitis and pneumonitis, pemphigus, Goodpasture's syndrome, and Stevens-Johnson syndrome also reported; male and female breast enlargement reported; in non-rheumatoid conditions rheumatoid arthritis-like syndrome also reported; late rashes (consider withdrawing treatment)

Indication and dose

Wilson's disease

- By mouth

Child 1 month–12 years 2.5 mg/kg twice daily before food, increased at 1–2 week intervals to 10 mg/kg twice daily

Child 12–18 years 0.75–1 g twice daily before food, max. 2 g daily for 1 year; usual maintenance dose 0.75–1 g daily

Cystinuria

- By mouth

Child 1 month–12 years 5–10 mg/kg twice daily before food, adjusted to maintain urinary cystine below 200 mg/litre; maintain adequate fluid intake

Child 12–18 years 0.5–1.5 g twice daily before food, adjusted to maintain urinary cystine below 200 mg/litre; maintain adequate fluid intake

Penicillamine (Non-proprietary) (POM)

Tablets, penicillamine 125 mg, net price 56-tab pack = £16.66; 250 mg, 56-tab pack = £25.00. Label: 6, 22, counselling, blood disorder symptoms (see above)

Distamine® (Alliance) (POM)

Tablets, all f/c, penicillamine 125 mg, net price 100 = £10.34; 250 mg, 100 = £17.78. Label: 6, 22, counselling, blood disorder symptoms (see above)

TRIENTINE DIHYDROCHLORIDE

Cautions see notes above; **interactions:** Appendix 1 (trientine)

Pregnancy teratogenic in *animal* studies—use only if benefit outweighs risk; monitor maternal and neonatal serum-copper concentrations

Side-effects nausea, rash; *very rarely* anaemia; duodenitis and colitis also reported

Indication and dose

Wilson's disease in patients intolerant of penicillamine

- By mouth

Child 2–12 years 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response; reduce dose and increase frequency if nausea is a problem

Child 12–18 years 1.2–2.4 g daily in 2–4 divided doses before food, adjusted according to response; reduce dose and increase frequency if nausea is a problem

Trientine Dihydrochloride (Univar) (POM)

Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

ZINC ACETATE

Cautions portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol; **interactions:** Appendix 1 (zinc)

Pregnancy usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion

Breast-feeding manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant

Side-effects gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); *less commonly* sideroblastic anaemia and leucopenia

Indication and dose

Wilson's disease

Note dose expressed as elemental zinc

- By mouth

Child 1–6 years 25 mg twice daily

Child 6–16 years body-weight under 57 kg, 25 mg 3 times daily; body-weight 57 kg or over, 50 mg 3 times daily

Child 16–18 years 50 mg 3 times daily

Wilzin® (Orphan Europe) (POM)

Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23

Administration capsules may be opened and the contents mixed with water

Carnitine deficiency

Carnitine is available for the management of primary carnitine deficiency due to inborn errors of metabolism, or of secondary deficiency in haemodialysis patients.

Carnitine is also used in the treatment of some organic acidaemias; however, use in fatty acid oxidation is controversial.

CARNITINE

Cautions diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended

Renal impairment accumulation of metabolites may occur with chronic oral administration in severe impairment

Pregnancy appropriate to use; no evidence of teratogenicity in *animal* studies

Side-effects nausea, vomiting, abdominal pain, diarrhoea, fishy body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase

Licensed use not licensed for use by intravenous infusion; tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years; paediatric oral solution (30%) not licensed in children over 12 years; not licensed for use in organic acidaemias

Indication and dose

Primary deficiency and organic acidaemias

• By mouth

Neonate 50 mg/kg twice daily, higher doses up to 200 mg/kg daily occasionally required

Child 1 month–18 years 50 mg/kg twice daily, higher doses up to 200 mg/kg daily occasionally required; usual max. 3 g daily

• By intravenous infusion

Neonate initially 100 mg/kg over 30 minutes followed by a continuous infusion of 4 mg/kg/hour

Child 1 month–18 years initially 100 mg/kg over 30 minutes followed by a continuous infusion of 4 mg/kg/hour

• By slow intravenous injection over 2–3 minutes

Neonate up to 100 mg/kg/daily in 2–4 divided doses

Child 1 month–18 years up to 100 mg/kg/daily in 2–4 divided doses

Secondary deficiency in dialysis patients

• By slow intravenous injection over 2–3 minutes

Child 1 month–18 years 20 mg/kg after each dialysis session, adjusted according to plasmacarnitine concentration

• By mouth

(maintenance therapy if benefit gained from first intravenous course)

Child 1 month–18 years 1 g daily

Administration for intravenous infusion, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.

Carnitor® (Sigma-Tau) (PoM)

Tablets, L-carnitine 330 mg, net price 90-tab pack = £103.95

Chewable tablets, L-carnitine 1 g, net price 10-tab pack = £35.00

Oral liquid, L-carnitine 100 mg/mL (10%), net price 10 × 10-mL (1-g) single-dose bottle = £35.00

Paediatric oral solution, L-carnitine 300 mg/mL (30%), net price 20 mL = £21.00

Injection, L-carnitine 200 mg/mL, net price 5-mL amp = £11.90

Fabry's disease

Agalsidase alfa and agalsidase beta, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

AGALSIDASE ALFA and BETA

Cautions interactions: Appendix 1 (agalsidase alfa and beta)

Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an anti-histamine, antipyretic, or corticosteroid—consult product literature

Pregnancy use with caution

Breast-feeding use with caution—no information available

Side-effects gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing; dyspnoea, cough, rhinorrhoea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hypersensitivity reactions, angioedema, pruritus, urticaria, rash, acne; *less commonly* cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

Indication and dose

Fabry's disease (specialist use only)

see under preparations

Fabrazyme® (Genzyme) (PoM)

Intravenous infusion, powder for reconstitution, agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £2196.59

Dose

Fabry's disease (specialist use only)

• By intravenous infusion

Child 8–18 years 1 mg/kg every 2 weeks

Administration for intravenous infusion, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL; dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established

Replagal® (Shire HGT) (PoM)

Concentrate for intravenous infusion, agalsidase alfa 1 mg/mL, net price 1-mL vial = £356.85; 3.5-mL vial = £1068.64

Dose

Fabry's disease (specialist use only)

• By intravenous infusion

Child 7–18 years 200 micrograms/kg every 2 weeks

Administration for intravenous infusion, dilute requisite dose with 100 mL Sodium Chloride 0.9% and give over 40 minutes using an in-line filter; use within 3 hours of dilution

Gaucher's disease

Imiglucerase, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy in Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

Velaglucerase alfa, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

Miglustat, an inhibitor of glucosylceramide synthase, is licensed in adults for the treatment of mild to moderate type I Gaucher's disease in patients for whom imiglucerase is unsuitable; it is given by mouth.

IMIGLUCERASE

Cautions monitor for imiglucerase antibodies; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

Pregnancy manufacturer advises use with caution—limited information available

Breast-feeding no information available

Side-effects hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); *less commonly* nausea, vomiting, diarrhoea, abdominal cramps, fatigue, headache, dizziness, fever, arthralgia, injection-site reactions

Indication and dose

Gaucher's disease type I (specialist use only)

- By intravenous infusion

Neonate initially 60 units/kg once every 2 weeks, adjusted according to response; doses as low as 30 units/kg once every 2 weeks may be appropriate

Child 1 month–18 years initially 60 units/kg once every 2 weeks, adjusted according to response; doses as low as 30 units/kg once every 2 weeks may be appropriate

Gaucher's disease type III (specialist use only)

- By intravenous infusion

Neonate 60–120 units/kg once every 2 weeks, adjusted according to response

Child 1 month–18 years 60–120 units/kg once every 2 weeks, adjusted according to response

Administration For *intravenous infusion*, initially reconstitute with Water for Injections (200 units in 5.1 mL, 400 units in 10.2 mL) to a concentration of 40 units/mL; dilute requisite dose with Sodium Chloride 0.9% to a final volume of 100–200 mL; give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours of reconstitution

Cerezyme® (Genzyme) (PmI)

Intravenous infusion, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29

Electrolytes Na⁺ 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

VELAGLUCERASE ALFA

Cautions monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa

Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

Pregnancy manufacturer advises use with caution—limited information available

Breast-feeding manufacturer advises use with caution—no information available

Side-effects nausea, abdominal pain, tachycardia, hypertension, hypotension, flushing, headache, dizziness, malaise, pyrexia, arthralgia, bone pain, back pain, hypersensitivity reactions, rash, urticaria

Indication and dose

Gaucher's disease type I (specialist use only)

- By intravenous infusion

Child 4–18 years 60 units/kg once every 2 weeks; adjusted according to response to 15–60 units/kg once every 2 weeks

Administration for *intravenous infusion*, reconstitute each 400-unit vial with 4.3 mL water for injections; dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution

VPRIV® (Shire HGT) (PmI)

Intravenous infusion, powder for reconstitution, velaglucerase alfa, net price 400-unit vial = £1410.20
Electrolytes Na⁺ 0.53 mmol/400-unit vial

Mucopolysaccharidosis

Laronidase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

Idursulfase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

Galsulfase, a recombinant form of human N-acetylglactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

Infusion-related reactions Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

GALSULFASE

Cautions respiratory disease; acute febrile or respiratory illness (consider delaying treatment)

Infusion-related reactions See notes above

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid—no information available

Side-effects abdominal pain, umbilical hernia, gastroenteritis; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rigors, malaise, arflexia; pharyngitis; conjunctivitis, corneal opacity; ear pain; facial oedema

Indication and dose**Mucopolysaccharidosis VI** (specialist use only)

- By intravenous infusion

Child 5–18 years 1 mg/kg once weekly

Administration for *intravenous infusion*, dilute requisite dose with Sodium Chloride 0.9% to a final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over at least 4 hours

Naglazyme® (BioMarin) ▼ (P_M)

Concentrate for intravenous infusion, galsulfase
1 mg/mL, net price 5-mL vial = £982.00

IDURSULFASE

Cautions severe respiratory disease; acute febrile respiratory illness (consider delaying treatment)

Infection-related reactions See notes above

Contra-indications women of child-bearing potential

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects gastro-intestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea; headache, dizziness, tremor; pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

Indication and dose**Mucopolysaccharidosis II** (specialist use only)

- By intravenous infusion

Child 5–18 years 500 micrograms/kg once weekly

Administration for *intravenous infusion*, dilute requisite dose in 100 mL Sodium Chloride 0.9% and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions)

Elaprase® (Shire HGT) ▼ (P_M)

Concentrate for intravenous infusion, idursulfase
2 mg/mL, net price 3-mL vial = £1985.00

LARONIDASE

Cautions monitor immunoglobulin G (IgG) antibody concentration; **interactions:** Appendix 1 (laronidase)

Infection-related reactions See notes above

Pregnancy manufacturer advises avoid unless essential—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angioedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessness; influenza-like symptoms; musculoskeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

Indication and dose**Non-neurological manifestations of mucopolysaccharidosis I** (specialist use only)

- By intravenous infusion

Child 1 month–18 years 100 units/kg once weekly

Administration for *intravenous infusion*, dilute with Sodium Chloride 0.9%; body-weight under 20 kg, dilute to 100 mL, body-weight over 20 kg dilute to 250 mL; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour

Aldurazyme® (Genzyme) (P_M)

Concentrate for intravenous infusion, laronidase
100 units/mL, net price 5-mL vial = £444.70
Electrolytes Na⁺ 1.29 mmol/5-mL vial

Nephropathic cystinosis

Mercaptamine is available for the treatment of nephropathic cystinosis. The oral dose is increased over several weeks to avoid intolerance. Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

All patients receiving mercaptamine should be registered (contact local specialist centre for details).

Mercaptamine eye drops are used in the management of ocular symptoms arising from the deposition of cystine crystals in the eye.

Safe Practice

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

MERCAPTAMINE

(Cysteamine)

Cautions leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

Contra-indications hypersensitivity to penicillamine

Pregnancy avoid—teratogenic and toxic in *animal* studies

Breast-feeding avoid

Side-effects breath and body odour, nausea, vomiting, diarrhoea, anorexia, abdominal pain, gastroenteritis, dyspepsia, encephalopathy, headache, malaise, fever, rash; *less commonly* gastro-intestinal ulcer, seizures, hallucinations, nervousness, leucopenia, nephrotic syndrome

Licensed use eye drops not licensed

Indication and dose**Nephropathic cystinosis** (specialist use only)

- By mouth

Neonate initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks; maintenance, 1.3 g/m² (approx. 50 mg/kg) daily in 4 divided doses

Child 1 month–12 years or under 50 kg initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks; maintenance, 1.3 g/m² (approx. 50 mg/kg) daily in 4 divided doses

Child 12–18 years or over 50 kg initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks; maintenance, 2 g daily in 4 divided doses

Cystagon® (Orphan Europe) (POM)

Capsules, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £190.00. Label: 21

Note For child under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)

Eye drops

Mercaptamine (Non-proprietary)

Eye drops, mercaptamine 0.11%, 10 mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Pompe disease

Alglucosidase alfa, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

ALGLUCOSIDASE ALFA

Cautions cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration

Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details

Pregnancy toxicity in *animal* studies, but treatment should not be withheld

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue; pyrexia; antibody formation; myalgia, muscle spasms; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported

Indication and dose

Pompe disease (specialist use only)

- By intravenous infusion

Neonate 20 mg/kg every 2 weeks

Child 1 month–18 years 20 mg/kg every 2 weeks

Administration For *intravenous infusion*, reconstitute 50 mg with 10.3 mL Water for Injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to give a final concentration of 0.5–4 mg/mL; give

through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour

Myozyme® (Genzyme) (POM)

Intravenous infusion, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

Urea cycle disorders

Sodium benzoate and **sodium phenylbutyrate** are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycaemia.

Gastro-intestinal side-effects of sodium benzoate or sodium phenylbutyrate may be reduced by giving smaller doses more frequently. The preparations contain significant amounts of sodium; therefore, they should be used with caution in children with congestive heart failure, renal insufficiency and clinical conditions involving sodium retention with oedema.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as **arginine** or **citru-line**, depending on the specific disorder.

Carglumic acid is licensed for the treatment of hyperammonaemia due to *N*-acetylglutamate synthase deficiency.

ARGININE

Cautions monitor plasma pH and chloride

Contra-indications not to be used in the treatment of arginine deficiency

Pregnancy no information available

Breast-feeding no information available

Side-effects intravenous injection only: nausea, vomiting; flushing, hypotension; headache, numbness; hyperchloraemic metabolic acidosis; irritation at injection-site

Licensed use injection and tablets not licensed in children; powder licensed for urea cycle disorders in children

Indication and dose

Acute hyperammonaemia in carbamylphosphate synthetase deficiency, ornithine carbamyl transferase deficiency (specialist use only)

- By intravenous infusion

Neonate initially 200 mg/kg over 90 minutes followed by 8 mg/kg/hour

Child 1 month–18 years initially 200 mg/kg over 90 minutes followed by 8 mg/kg/hour

Maintenance treatment of hyperammonaemia in carbamyl phosphate synthetase deficiency, ornithine carbamyl transferase deficiency (specialist use only)

- **By mouth**

Neonate 100 mg/kg daily in 3–4 divided doses

Child 1 month–18 years 100 mg/kg daily in 3–4 divided doses

Acute hyperammonaemia in citrullinaemia, arginosuccinic aciduria (specialist use only)

- **By intravenous infusion**

Neonate initially 600 mg/kg over 90 minutes followed by 25 mg/kg/hour

Child 1 month–18 years initially 600 mg/kg over 90 minutes followed by 25 mg/kg/hour

Maintenance treatment of hyperammonaemia in citrullinaemia, arginosuccinic aciduria (specialist use only)

- **By mouth**

Neonate 100–175 mg/kg 3–4 times daily, with food, adjusted according to response

Child 1 month–18 years 100–175 mg/kg 3–4 times daily, with food, adjusted according to response

L-Arginine (Non-proprietary)

Tablets, L-arginine (as hydrochloride) 500 mg,

Oral solution, L-arginine 100 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Powder, L-arginine (as hydrochloride), net price 100 g = £12.27

Prescribe as a borderline substance (ACBS). For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase

Injection, L-arginine (as hydrochloride) 500 mg/mL, 10-mL ampoules; 100 mg/mL, 200-mL amp

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Note Other strengths may be available from 'special-order' manufacturers or specialist importing companies, see p. 809

Administration dilute to a concentration of 20 mg/mL with Sodium Chloride 0.9% or 0.45%, or Glucose 5% or 10%; max. concentration 100 mg/mL; may be given orally

CARGLUMIC ACID

Pregnancy manufacturer advises avoid unless essential—no information available

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects sweating

Indication and dose

Hyperammonaemia due to N-acetyl glutamate synthase deficiency (initiated under specialist supervision)

- **By mouth**

Neonate initially 50–125 mg/kg twice daily immediately before feeds, adjusted according to plasma-ammonia concentration; maintenance 5–

50 mg/kg twice daily; total daily dose may alternatively be given in 3–4 divided doses

Child 1 month–18 years initially 50–125 mg/kg twice daily immediately before food, adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily; total daily dose may alternatively be given in 3–4 divided doses

Carbaglu® (Orphan Europe) (POM)

Dispersible tablets, carglumic acid 200 mg, net price 5-tab pack = £299.00, 60-tab pack = £3499.00. Label: 13

CITRULLINE

Pregnancy no information available

Breast-feeding no information available

Indication and dose

Carbamyl phosphate synthase deficiency, ornithine carbamyl transferase deficiency

- **By mouth**

Neonate 150 mg/kg daily in 3–4 divided doses, adjusted according to response

Child 1 month–18 years 150 mg/kg daily in 3–4 divided doses, adjusted according to response

Citrulline Powder (Non-proprietary)

Powder, L-citrulline 100 g

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Administration May be mixed with drinks or taken as a paste

SODIUM BENZOATE

Cautions see notes above; neonates (risk of kernicterus and increased side-effects); **interactions:** Appendix 1 (sodium benzoate)

Renal impairment see notes above

Pregnancy no information available

Breast-feeding no information available

Side-effects nausea, vomiting, anorexia; irritability, lethargy, coma

Licensed use not licensed for use in children

Indication and dose

Acute hyperammonaemia due to urea cycle disorders (specialist use only)

- **By intravenous infusion**

Neonate initially 250 mg/kg over 90 minutes followed by 20 mg/kg/hour, adjusted according to response

Child 1 month–18 years initially 250 mg/kg over 90 minutes followed by 20 mg/kg/hour, adjusted according to response

Maintenance treatment of hyperammonaemia due to urea cycle disorders; non-ketotic hyperglycinaemia (specialist use only)

- **By mouth**

Neonate 50–150 mg/kg 3–4 times daily, with food, adjusted according to response

Child 1 month–18 years 50–150 mg/kg 3–4 times daily, with food, adjusted according to response

Administration for administration *by mouth*, oral solution or powder may be administered in fruit drinks; less soluble in acidic drinks

Sodium Benzoate (Non-proprietary) ^(POM)

Tablets, sodium benzoate 500 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Capsules, sodium benzoate 50 mg; 250 mg; 400 mg; 500 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Oral solution, sodium benzoate 100 mg/mL; 200 mg/mL; 300 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Powder Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Injection, sodium benzoate 200 mg/mL, 5-mL amp

Note Contains Na⁺ 1.4 mmol/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Administration for *intravenous infusion*, dilute to a concentration of 20 mg/mL with Sodium Chloride 0.9% or 0.45%, or Glucose 5% or 10%; max. concentration 50 mg/mL

SODIUM PHENYLBUTYRATE

Cautions see notes above; congestive heart failure; **interactions:** Appendix 1 (sodium phenylbutyrate)

Hepatic impairment manufacturer advises use with caution

Renal impairment manufacturer advises use with caution; see also notes above

Pregnancy avoid—toxicity in *animal* studies; manufacturer advises adequate contraception in women of child-bearing potential

Breast-feeding manufacturer advises avoid—no information available

Side-effects amenorrhoea and irregular menstrual cycles, decreased appetite, body odour, taste disturbances; less commonly nausea, vomiting, abdominal pain, peptic ulcer, pancreatitis, rectal bleeding, arrhythmia, oedema, syncope, depression, headache, rash, weight gain, renal tubular acidosis, aplastic anaemia, ecchymoses

Licensed use injection not licensed for use in children

Indication and dose

Acute hyperammonaemia due to urea cycle disorders (specialist use only)

• **By continuous intravenous infusion**

Neonate initially 250 mg/kg over 90 minutes followed by 20 mg/kg/hour adjusted according to response

Child 1 month–18 years initially 250 mg/kg over 90 minutes followed by 20 mg/kg/hour adjusted according to response

Maintenance treatment of hyperammonaemia due to urea cycle disorders (specialist use only)

• **By mouth**

Neonate 75–150 mg/kg 3–4 times daily, with food

Child 1 month–18 years 75–150 mg/kg 3–4 times daily, with food (max. 20 g daily)

Administration Oral dose may be mixed with fruit drinks, milk, or feeds

Sodium Phenylbutyrate (Non-proprietary) ^(POM)

Injection, sodium phenylbutyrate 200 mg/mL, 5-mL amp

Note Contains Na⁺ 1.1 mmol/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Administration for *intravenous infusion*, dilute to a concentration of 20 mg/mL (max. 50 mg/mL) with Glucose 5% or 10%

Ammonaps[®] (Swedish Orphan) ^(POM)

Tablets, sodium phenylbutyrate 500 mg. Contains Na⁺ 2.7 mmol/tablet. Net price 250-tab pack = £493.00

Granules, sodium phenylbutyrate 940 mg/g. Contains Na⁺ 5.4 mmol/g. Net price 266-g pack = £860.00

Note Granules should be mixed with food before taking

Other metabolic disorders

Other metabolic disorders and the drugs used in their management include:

Amino acid disorders: maple syrup urine disease (thiamine section 9.6.2); tyrosinaemia type III, hawkinsinuria (Vitamin C, section 9.6.3); tyrosinaemia type I (nitisinone).

Mitochondrial disorders: isolated carboxylase defects, defects of biotin metabolism (biotin, see below); mitochondrial myopathies (ubidecarenone); congenital lactic acidosis (riboflavin and thiamine, section 9.6.2); respiratory chain defects (thiamine, section 9.6.2); pyruvate dehydrogenase defects (sodium dichloroacetate)

Neimann-Pick type C disease: miglustat is available for the treatment of progressive neurological manifestations of Neimann-Pick type C disease, a neurodegenerative disorder characterised by impaired intracellular lipid trafficking.

Homocystinuria and defects in cobalamin metabolism: betaine, pyridoxine (section 9.6.2), hydroxocobalamin (section 9.1.2)

Tetrahydrofolate reductase deficiency: betaine, folic acid (section 9.1.2)

The *Scottish Medicines Consortium* (p. 3) has advised (July 2010) that betaine anhydrous (Cystadane[®]) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

BETAINE

Cautions monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur

Pregnancy manufacturer advises avoid unless essential—limited information available

Breast-feeding manufacturer advises caution—no information available

Side-effects *less commonly* gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cautions), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

Indication and dose

Adjunctive treatment of homocystinuria (specialist use only)

- **By mouth**

Neonate 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

Child 1 month–10 years 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

Child 10–18 years 3 g twice daily, adjusted according to response; max. 10 g twice daily

Administration Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of *Cystadane*[®] powder

Betaine (Non-proprietary) (PvM)

Powder (for oral solution), betaine anhydrous 500 mg/mL when reconstituted.

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Tablets, betaine anhydrous 500 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Cystadane[®] (Orphan Europe) (PvM)

Powder, betaine (anhydrous), net price 180 g = £347.00

BIOTIN

(Vitamin H)

Pregnancy no information available

Breast-feeding no information available

Indication and dose**Isolated carboxylase defects**

- **By mouth or by slow intravenous injection**

Neonate 5 mg once daily, adjusted according to response; usual maintenance 10–50 mg daily, higher doses may be required

Child 1 month–18 years 10 mg once daily, adjusted according to response; usual maintenance 10–50 mg daily but up to 100 mg daily may be required

Defects of biotin metabolism

- **By mouth or by slow intravenous injection**

Neonate 10 mg once daily adjusted according to response; usual maintenance 5–20 mg daily but higher doses may be required

Child 1 month–18 years 10 mg once daily adjusted according to response; usual maintenance 5–20 mg daily but higher doses may be required

Biotin (Non-proprietary) (PvM)

Tablets, biotin 5 mg, 20-tab pack

Injection, biotin 5 mg/mL

Available from 'special order' manufacturers or specialist importing companies, see p. 809

Administration For administration *by mouth*, tablets may be crushed and mixed with food or drink

MIGLUSTAT

Cautions monitor cognitive and neurological function, growth, and platelet count

Hepatic impairment manufacturer advises caution—no information available

Renal impairment child 12–18 years, initially 200 mg twice daily if estimated glomerular filtration rate 50–70 mL/minute/1.73 m²; child 12–18 years, initially 100 mg twice daily if estimated glomerular filtration rate 30–50 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; child under 12 years—consult product literature

Pregnancy manufacturer advises avoid (toxicity in *animal* studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes; tremor, dizziness, headache, peripheral neuropathy, ataxia, hypoaesthesia, paraesthesia, insomnia, fatigue, asthenia; decreased libido; thrombocytopenia; muscle spasm

Indication and dose

Neimann-Pick type C disease (specialist supervision only)

- **By mouth**

Child 4–12 years

Body surface area less than 0.47 m² 100 mg once daily

Body surface area 0.47–0.73 m² 100 mg twice daily

Body surface area 0.73–0.88 m² 100 mg three times daily

Body surface area 0.88–1.25 m² 200 mg twice daily

Body surface area greater than 1.25 m² 200 mg three times daily

Child 12–18 years 200 mg three times daily

Zavesca[®] (Actelion) (PvM)

Capsules, miglustat 100 mg, net price 84-cap pack = £3934.17 (hospital only)

NITISINONE

(NTBC)

Cautions slit-lamp examination of eyes recommended before treatment; monitor liver function regularly; monitor platelet and white blood cell count every 6 months

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—adverse effect in *animal* studies

Side-effects thrombocytopenia, leucopenia, granulocytopenia; conjunctivitis, photophobia, corneal opacity, keratitis, eye pain; *less commonly* leucocytosis, blepharitis, pruritus, exfoliative dermatitis, and erythematous rash

Indication and dose

Hereditary tyrosinaemia type 1 (in combination with dietary restriction of tyrosine and phenylalanine)

- By mouth

Neonate initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily

Child 1 month–18 years initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily

Administration capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately

Orfadin[®] (Swedish Orphan) (PoM)

Capsules, nitisinone 2 mg, net price 60-cap pack = £564.00; 5 mg, 60-cap pack = £1127.00; 10 mg, 60-cap pack = £2062.00

SODIUM DICHLOROACETATE

Pregnancy no information available

Breast-feeding no information available

Side-effects polyneuropathy on prolonged use; abnormal oxalate metabolism; metabolic acidosis

Indication and dose

Pyruvate dehydrogenase defects

- By mouth

Neonate initially 12.5 mg/kg 4 times daily, adjusted according to response; up to 200 mg/kg daily may be required

Child 1 month–18 years initially 12.5 mg/kg 4 times daily, adjusted according to response; up to 200 mg/kg daily may be required

Sodium dichloroacetate (Non-proprietary) (PoM)

Powder (for oral solution), sodium dichloroacetate 50 mg/mL when reconstituted with water
Available from 'special-order' manufacturers or specialist importing companies, see p. 809

UBIDECARENONE

(Ubiquinone, Co-enzyme Q10)

Cautions may reduce insulin requirement in diabetes mellitus; **interactions:** Appendix 1 (ubidecarenone)

Hepatic impairment reduce dose in moderate and severe impairment

Side-effects nausea, diarrhoea, heartburn; rarely headache, irritability, agitation, dizziness

Licensed use not licensed

Indication and dose

Mitochondrial disorders

- By mouth

Neonate initially 5 mg once or twice daily with food, adjusted according to response, up to 200 mg daily may be required

Child 1 month–18 years initially 5 mg once or twice daily with food, adjusted according to response, up to 300 mg daily may be required

Ubidecarenone (Non-proprietary) (PoM)

Oral solution, ubidecarenone 50 mg/10 mL

Tablets, ubidecarenone 10 mg

Capsules, ubidecarenone 10 mg, 30 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

9.8.2 Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs. Acute attacks of porphyria are exceptionally rare before puberty. When acute porphyria is suspected in a child, support from an expert porphyria service should be sought.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

Supplies of haem arginate may be obtained in an emergency outside office hours from the on-call pharmacist at:

St Thomas' Hospital
London
Tel: (020) 7188 7188

HAEM ARGINATE

(Human hemin)

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects rarely hypersensitivity reactions and fever; pain and thrombophlebitis at injection site

Indication and dose

Acute porphyrias (acute intermittent porphyria, porphyria variegata, hereditary coproporphyria)

- By intravenous infusion

Child 1 month–18 years 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

Normosang[®] (Orphan Europe) ▼ (PoM)

Concentrate for intravenous infusion, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

Administration administer over at least 30 minutes; dilute requisite dose in 100 mL Sodium Chloride 0.9% in glass bottle; administer within 1 hour after dilution; max. concentration 2.5 mg/mL

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or *in vitro*, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at www.wmic.wales.nhs.uk/porphyria_info.php.

Further information may be obtained from www.porphyria-europe.org and also from:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979/3877

Note Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe drug groups (check first)

Alkylating drugs ¹	Calcium channel blockers ⁵	Non-nucleoside reverse transcriptase inhibitors ¹	Sulfonylureas ¹¹
Amfetamines	Contraceptives, hormonal ⁴	Progestogens ⁵	Taxanes ¹
Anabolic steroids	Ergot derivatives ⁷	Protease inhibitors ¹	Tetracyclines
Antidepressants ²	Gold salts	Statins ⁹	Thiazolidinediones ¹
Antihistamines ³	Hormone replacement therapy ⁶	Sulfonamides ¹⁰	Triazole antifungals ⁸
Barbiturates ⁴	Imidazole antifungals ⁸		

Unsafe drugs (check groups above first)

Aceclofenac	Disopyramide	Methyldopa	Probenecid
Alcohol	Disulfiram	Metoclopramide ¹⁶	Pyrazinamide
Aminophylline	Erythromycin	Metolazone	Raloxifene
Amiodarone	Etamsylate	Metronidazole ¹⁶	Rifabutin ¹⁹
Artemether with lumefantrine	Ethosuximide	Metyrapone	Rifampicin ¹⁹
Bexarotene	Etomidate	Mifepristone	Risperidone
Bosentan	Fenfluramine	Minoxidil ¹⁶	Selegiline
Bromocriptine	Flupentixol	Mitotane	Spirolactone
Buspirone	Flutamide	Nalidixic acid	Sulfinpyrazone
Cabergoline	Fosphenytoin	Nitrazepam	Tamoxifen
Carbamazepine	Griseofulvin	Nitrofurantoin	Telithromycin
Chloral hydrate ¹²	Halothane	Orphenadrine	Temoporfin
Chloramphenicol	Hydralazine	Oxcarbazepine	Theophylline
Chloroform ¹³	Indapamide	Oxybutynin	Tiagabine
Clindamycin	Isometheptene mucate	Oxycodone ¹⁷	Tinidazole
Cocaine	Isoniazid	Pentazocine ¹⁷	Topiramate
Colistimethate sodium	Ketamine	Pentoxifylline	Toremifene
Cycloserine	Ketorolac	Phenoxybenzamine	Trimethoprim
Danazol	Lidocaine ¹⁵	Phenytoin	Valproate ¹⁴
Dapsone	Mebeverine	Pivmecillinam	Xipamide
Dexfenfluramine	Mefenamic acid ¹⁶	Porfimer	Zidovudine ¹
Diazepam ¹⁴	Meprobamate	Potassium canrenoate ¹⁸	Zuclopenthixol
Diclofenac			

1. Contact Welsh Medicines Information Centre for further advice.
2. Includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, mianserin, and venlafaxine thought to be safe.
3. Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
4. Includes primidone and thiopental.
5. Amlodipine, felodipine, and nifedipine may be used with caution.
6. Progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all young women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.
7. Includes ergometrine (oxytocin probably safe) and pergolide.
8. Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.
9. Rosuvastatin thought to be safe.
10. Includes co-trimoxazole and sulfasalazine.
11. Glipizide is thought to be safe.
12. Although evidence of hazard is uncertain, manufacturer advises avoid.
13. Small amounts in medicines probably safe.
14. Status epilepticus has been treated successfully with intravenous diazepam.
15. When used for local anaesthesia, articaine, bupivacaine, lidocaine, prilocaine, and tetracaine are thought to be safe.
16. May be used with caution if safer alternative not available.
17. Buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, pethidine, and tramadol are thought to be safe.
18. Evidence of hazard uncertain—contact Welsh Medicines Information Centre for further advice.
19. Rifamycins have been used in a few patients without evidence of harm—use with caution if safer alternative not available.

10 Musculoskeletal and joint diseases

10.1	Drugs used in rheumatic diseases	499
10.1.1	Non-steroidal anti-inflammatory drugs	499
10.1.2	Corticosteroids	506
10.1.2.1	Systemic corticosteroids	506
10.1.2.2	Local corticosteroid injections	506
10.1.3	Drugs that suppress the rheumatic disease process	507
10.1.4	Gout and cytotoxic-induced hyperuricaemia	511
10.1.5	Other drugs for rheumatic diseases	512
10.2	Drugs used in neuromuscular disorders	512
10.2.1	Drugs that enhance neuromuscular transmission	512
10.2.2	Skeletal muscle relaxants	513
10.3	Drugs for the relief of soft-tissue inflammation and topical pain relief	516
10.3.1	Enzymes	516
10.3.2	Rubefacients, topical NSAIDs, capsaicin, and poultices	516

This chapter also includes advice on the drug management of the following:

- dental and orofacial pain, p. 500
- extravasation, p. 516
- myasthenia gravis, p. 512
- soft-tissue and other musculoskeletal disorders, below
- juvenile idiopathic arthritis and other inflammatory disorders, below

For treatment of septic arthritis see Table 1, section 5.1.

10.1 Drugs used in rheumatic diseases

10.1.1	Non-steroidal anti-inflammatory drugs
10.1.2	Corticosteroids
10.1.3	Drugs that suppress the rheumatic disease process
10.1.4	Gout and cytotoxic-induced hyperuricaemia
10.1.5	Other drugs for rheumatic diseases

Juvenile idiopathic arthritis and other inflammatory disorders

Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve non-steroidal anti-inflammatory drugs (NSAIDs) (section 10.1.1), a disease modifying antirheumatic drug (DMARD) (section 10.1.3) such as methotrexate or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids (section 10.1.2).

Soft-tissue and musculoskeletal disorders

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, **paracetamol** (section 4.7.1) is often adequate and should be used first. Alternatively, the lowest effective dose of a **NSAID** (e.g. ibuprofen) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

10.1.1 Non-steroidal anti-inflammatory drugs

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

Choice Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. A large proportion of children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

Ibuprofen and **naproxen** are propionic acid derivatives used in children:

Ibuprofen combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker.

Naproxen combines good efficacy with a low incidence of side-effects.

Diclofenac, **indometacin**, **mefenamic acid**, and **piroxicam** have properties similar to those of propionic acid derivatives:

Diclofenac has actions and side-effects similar to those of naproxen.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (**important**: see CHMP advice, p. 505).

Meloxicam is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

Ketorolac can be used for the short-term management of postoperative pain (section 15.1.4.2).

Etoricoxib, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

For the role of **aspirin** in children, see section 2.9.

Dental and orofacial pain Most mild to moderate dental pain and inflammation is effectively relieved by **ibuprofen** or **diclofenac**. In an appraisal of the relative safety in adults of 7 non-selective NSAIDs, the CSM assessed ibuprofen to have the lowest risk of serious gastro-intestinal side-effects (see below).

For further information on the management of dental and orofacial pain, see p. 199.

Cautions and contra-indications NSAIDs should be used with caution in children with a history of hypersensitivity to any NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by any NSAID. NSAIDs should also be used with caution in coagulation defects. Caution may also be required in children with allergic disorders, and also in children with connective-tissue disorders, see Side-effects below.

In children with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects below). All NSAIDs are contra-indicated in severe heart failure. Non-selective NSAIDs should be used with caution in uncontrolled hypertension, heart failure, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, and when used long term in children with risk factors for cardiovascular events. The selective inhibitor of cyclo-oxygenase-2, etoricoxib, is contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and mild to severe heart failure. Etoricoxib should be used with caution in children with a history of cardiac failure, left ventricular dysfunction, hypertension, in children with oedema for any other reason, and in children with risk factors for cardiovascular events.

NSAIDs and cardiovascular events

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, **diclofenac** (150 mg daily) and **ibuprofen** (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of **etoricoxib**. **Naproxen** (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

NSAIDs are generally contra-indicated if there is active or previous gastro-intestinal ulceration or bleeding; however, some children may require NSAIDs for effective relief of pain and stiffness. For advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see section 1.3.

For **interactions** of NSAIDs, see Appendix 1 (NSAIDs).

Hepatic impairment NSAIDs should be used with caution in children with hepatic impairment; there is an increased risk of gastro-intestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

Renal impairment NSAIDs should be avoided if possible or used with caution in children with renal impairment; the **lowest effective dose** should be used for the **shortest possible duration**, and renal function should be **monitored**. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

Pregnancy Most manufacturers advise avoiding NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and the duration may be increased.

Breast-feeding NSAIDs should be used with caution during breast-feeding; see also individual drugs.

Side-effects The side-effects of NSAIDs vary in severity and frequency. Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration may occur (see also notes below and Cautions above).

Gastro-intestinal side-effects

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects. **Ibuprofen** is associated with the **lowest risk**; **piroxicam**, **indometacin**, **naproxen**, and **diclofenac** are associated with **intermediate risks** (possibly higher in the case of piroxicam, see also CHMP advice, p. 505). **Selective inhibitors of cyclo-oxygenase-2** are associated with a **lower risk** of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common; use of gastro-protective drugs may not be necessary (see also section 1.3).

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photosensitivity, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.

Asthma

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.

Renal failure may be provoked by NSAIDs, especially in patients with pre-existing renal impairment (**important**,

see Renal impairment above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure. Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis or Crohn's disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—children with connective tissue disorders such as systemic lupus erythematosus may be especially susceptible.

Overdosage: see Emergency Treatment of Poisoning, p. 26.

DICLOFENAC POTASSIUM

Cautions see notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount in milk too small to be harmful; see also notes above

Side-effects see notes above

Indication and dose

Rheumatic disease, musculoskeletal disorders, postoperative pain

• By mouth

Child 14–18 years 75–100 mg daily in 2–3 divided doses

Diclofenac Potassium (Non-proprietary) (POM)

Tablets, diclofenac potassium 25 mg, net price 28-tab pack = 81p; 50 mg, 28-tab pack = £1.55. Label: 21

¹Voltarol® Rapid (Novartis) (POM)

Tablets, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46; 50 mg (brown), 30-tab pack = £6.62. Label: 21

1. 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg, max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg

DICLOFENAC SODIUM

Cautions see notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes above; avoid injections containing benzyl alcohol in neonates (see preparations below)

Intravenous use Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparins), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment, hypovolaemia, dehydration

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also Intravenous Use and notes above

Pregnancy see notes above

Breast-feeding amount in milk too small to be harmful; see also notes above

Side-effects see notes above; suppositories may cause rectal irritation; injection site reactions

Licensed use not licensed for use in children under 1 year; *suppositories* not licensed for use in children under 6 years except for use in children over 1 year for juvenile idiopathic arthritis; solid dose forms containing more than 25 mg not licensed for use in children; *injection* not licensed for use in children

Indication and dose

Inflammation and mild to moderate pain

• By mouth or by rectum

Child 6 months–18 years 0.3–1 mg/kg (max. 50 mg) 3 times daily

Postoperative pain

• By rectum

Child 6–18 years 0.5–1 mg/kg (max. 75 mg) twice daily for max. 4 days; total daily dose may alternatively be given in 3 divided doses

• By intravenous infusion or deep intramuscular injection into gluteal muscle

Child 2–18 years 0.3–1 mg/kg once or twice daily for max. 2 days (max. 150 mg daily)

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

• By mouth

Child 6 months–18 years 1.5–2.5 mg/kg (max. 75 mg) twice daily; total daily dose may alternatively be given in 3 divided doses

Administration for *intravenous infusion*, dilute 75 mg with 100–500 mL Glucose 5% or Sodium Chloride 0.9% (previously buffered with 0.5 mL Sodium Bicarbonate 8.4% solution or with 1 mL Sodium Bicarbonate 4.2% solution); give over 30–120 minutes

Diclofenac Sodium (Non-proprietary) ^(POM)

Tablets, both e/c, diclofenac sodium 25 mg, net price 84-tab pack = £1.14; 50 mg, 84-tab pack = £1.31. Label: 5, 25

Brands include *Defenac[®], Dicliflex[®], Diclizip[®], Fenactol[®], Flamrase[®]*

Dispersible tablets, sugar-free, diclofenac sodium 10 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Suppositories, diclofenac sodium 100 mg, net price 10 = £3.97

Brands include *Econac[®]*

Voltarol[®] (Novartis) ^(POM)

Tablets, e/c, diclofenac sodium 25 mg (yellow), net price 84-tab pack = £2.94; 50 mg (brown), 84-tab pack = £4.57. Label: 5, 25

Dispersible tablets, sugar-free, pink, diclofenac, equivalent to diclofenac sodium 50 mg, net price 21-tab pack = £6.19. Label: 13, 21

Injection, diclofenac sodium 25 mg/mL, net price 3-mL amp = 83p

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2), propylene glycol

Suppositories, diclofenac sodium 12.5 mg, net price 10 = 58p; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03

Modified release

Diclomax SR[®] (Galen) ^(POM)

Capsules, m/r, yellow, diclofenac sodium 75 mg, net price 56-cap pack = £11.40. Label: 21, 25

Dose

Pain and inflammation

• By mouth

Child 12–18 years 1 capsule 1–2 times daily

Diclomax Retard[®] (Galen) ^(POM)

Capsules, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £8.20. Label: 21, 25

Dose

Pain and inflammation

• By mouth

Child 12–18 years 1 capsule once daily

Motifene[®] 75 mg (Daiichi Sankyo) ^(POM)

Capsules, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25
Excipients include propylene glycol (see Excipients, p. 2)

Dose

Pain and inflammation

• By mouth

Child 12–18 years 1 capsule 1–2 times daily

Voltarol[®] 75 mg SR (Novartis) ^(POM)

Tablets, m/r, pink, diclofenac sodium 75 mg, net price 28-tab pack = £6.46; 56-tab pack = £12.92. Label: 21, 25

Dose

Pain and inflammation

• By mouth

Child 12–18 years 1 tablet 1–2 times daily

Note Other brands of modified-release tablets containing diclofenac sodium 75 mg include *Defenac[®] SR, Dexomon[®] 75 SR, Dicliflex[®] 75 SR, Fenactol[®] 75 mg SR, Flamatak[®] 75 MR, Flamrase[®] SR, Flexotard[®] MR 75, Rheumatac[®] Retard 75, Rhumalgan[®] CR, Slofenac[®] SR, Volsaid[®] Retard 75*

Voltarol[®] Retard (Novartis) ^(POM)

Tablets, m/r, red, diclofenac sodium 100 mg, net price 28-tab pack = £9.47. Label: 21, 25

Dose

Pain and inflammation

• By mouth

Child 12–18 years 1 tablet once daily

Note Other brands of modified-release tablets containing diclofenac sodium 100 mg include *Defenac[®] Retard, Dexomon[®] Retard 100, Dicliflex[®] Retard, Fenactol[®] Retard 100 mg, Flamatak[®] 100 MR, Slofenac[®] SR, Volsaid[®] Retard 100*

ETORICOXIB

Cautions see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment

Contra-indications see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg)

Hepatic impairment max. 60 mg daily in mild impairment; max. 60 mg on alternate days or 30 mg once daily in moderate impairment; see also notes above

Renal impairment avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; see also notes above

Pregnancy manufacturer advises avoid (teratogenic in *animal* studies); see also notes above

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies; see also notes above

Side-effects see notes above; also palpitation, fatigue, influenza-like symptoms, ecchymosis; *less commonly* dry mouth, taste disturbance, mouth ulcer, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; *very rarely* confusion and hallucinations

Indication and dose

Osteoarthritis

• By mouth

Child 16–18 years 30 mg once daily, increased if necessary to 60 mg once daily

Rheumatoid arthritis and ankylosing spondylitis

• By mouth

Child 16–18 years 90 mg once daily

Acute gout

• By mouth

Child 16–18 years 120 mg once daily for max. 8 days

Arcoxia® (MSD) ▼ (PoM)

Tablets, f/c, etoricoxib 30 mg (blue-green), net price 28-tab pack = £13.99; 60 mg (dark green), 28-tab pack = £20.11; 90 mg (white), 28-tab pack = £22.96; 120 mg (pale green), 7-tab pack = £6.03, 28-tab pack = £24.11

IBUPROFEN

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful, but some manufacturers advise avoid; see also notes above

Side-effects see notes above

Licensed use not licensed for use in children under 3 months or body-weight under 5 kg

Indication and dose

Mild to moderate pain, pain and inflammation of soft-tissue injuries, pyrexia with discomfort

• By mouth

Child 1–3 months 5 mg/kg 3–4 times daily

Child 3–6 months 50 mg 3 times daily; max. 30 mg/kg daily in 3–4 divided doses

Child 6 months–1 year 50 mg 3–4 times daily; max. 30 mg/kg daily in 3–4 divided doses

Child 1–4 years 100 mg 3 times daily; max. 30 mg/kg daily in 3–4 divided doses

Child 4–7 years 150 mg 3 times daily; max. 30 mg/kg daily in 3–4 divided doses

Child 7–10 years 200 mg 3 times daily; max. 30 mg/kg (max. 2.4 g) daily in 3–4 divided doses

Child 10–12 years 300 mg 3 times daily; max. 30 mg/kg (max. 2.4 g) daily in 3–4 divided doses

Child 12–18 years initially 300–400 mg 3–4 times daily; increased if necessary to max. 600 mg 4 times daily; maintenance dose of 200–400 mg 3 times daily may be adequate

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

• By mouth

Child 3 months–18 years 30–40 mg/kg (max. 2.4 g) daily in 3–4 divided doses; in systemic juvenile idiopathic arthritis up to 60 mg/kg (max. 2.4 g) daily [unlicensed] in 4–6 divided doses

Post-immunisation pyrexia in infants (see also p. 600)

• By mouth

Child 2–3 months 50 mg as a single dose repeated once after 6 hours if necessary

Closure of patent ductus arteriosus in neonates see section 2.14

¹Ibuprofen (Non-proprietary) (PoM)

Tablets, coated, ibuprofen 200 mg, net price 84-tab pack = £1.62; 400 mg, 84-tab pack = £1.72; 600 mg, 84-tab pack = £4.06. Label: 21

Brands include *Arthrofen*®, *Ebujac*®, *Rimafen*®

Dental prescribing on NHS Ibuprofen Tablets may be prescribed

Oral suspension, ibuprofen 100 mg/5 mL, net price 100 mL = £1.48, 150 mL = £2.71, 500 mL = £8.88. Label: 21

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Calprofen*®, *Feverfen*®, *Nurofen*® for Children, *Orbifen*® for Children

Dental prescribing on NHS Ibuprofen Oral Suspension Sugar-free may be prescribed

- Can be sold to the public under certain circumstances; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

Brufen® (Abbott) (PoM)

Tablets, f/c, ibuprofen 200 mg, net price 100-tab pack = £3.92; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21

Syrup, orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21

Granules, effervescent, ibuprofen 600 mg/sachet, net price 20–sachet pack = £6.53. Label: 13, 21
Contains sodium approx. 9 mmol/sachet

■ Modified release

Brufen Retard® (Abbott) (PoM)

Tablets, m/r, ibuprofen 800 mg, net price 56-tab pack = £6.48. Label: 25, 27

Dose

Pain and inflammation

• By mouth

Child 12–18 years 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

Fenbid® (Goldshield) (POM)

Spansule® (= capsule m/r), maroon/pink, enclosing off-white pellets, ibuprofen 300 mg, net price 120-cap pack = £9.64. Label: 25

Dose**Pain and inflammation**

• By mouth

Child 12–18 years initially 2 capsules twice daily, increased in severe cases to 3 capsules twice daily; then 1–2 capsules twice daily

INDOMETACIN

(Indomethacin)

Cautions see notes above; also epilepsy, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

Skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount probably too small to be harmful—manufacturer advises avoid; see also notes above

Side-effects see notes above; *rarely* confusion, convulsions, psychiatric disturbances, syncope, blood disorders (particularly thrombocytopenia), hyperglycaemia, peripheral neuropathy, and intestinal strictures; suppositories may cause rectal irritation and occasional bleeding

Licensed use not licensed for use in children

Indication and dose

Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis (but see p. 500)

• By mouth

Child 1 month–18 years 0.5–1 mg/kg twice daily; higher doses may be used under specialist supervision

Closure of patent ductus arteriosus in premature babies section 2.14

Indometacin (Non-proprietary) (POM)

Capsules, indometacin 25 mg, net price 28-cap pack = £2.33; 50 mg, 28-cap pack = £2.29. Label: 21, counselling, driving, see above

Brands include *Rimacid®*

Suppositories, indometacin 100 mg, net price 10 = £20.07. Counselling, driving, see above

Suspension, indometacin 5 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

■ **Modified release****Indometacin m/r preparations** (PoM)

Capsules, m/r, indometacin 75 mg. Label: 21, 25, counselling, driving, see above

Brands include *Indolar SR®*, *Pardeprin®*

MEFENAMIC ACID

Cautions see notes above; epilepsy; acute porphyria (section 9.8.2)

Contra-indications see notes above; inflammatory bowel disease

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful but manufacturer advises avoid; see also notes above

Side-effects see notes above; also diarrhoea or rashes (withdraw treatment), stomatitis; *less commonly* paraesthesia and fatigue; *rarely* hypotension, palpitation, glucose intolerance, thrombocytopenia, haemolytic anaemia (positive Coombs' test), and aplastic anaemia

Indication and dose

Acute pain including dysmenorrhoea, menorrhagia

• By mouth

Child 12–18 years 500 mg 3 times daily

Mefenamic Acid (Non-proprietary) (POM)

Capsules, mefenamic acid 250 mg, net price 100 = £2.83. Label: 21

Tablets, mefenamic acid 500 mg, net price 28-tab pack = £2.20. Label: 21

Suspension, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.98. Label: 21

Excipients include ethanol

Ponstan® (Chemidex) (POM)

Capsules, blue/ivory, mefenamic acid 250 mg, net price 100-cap pack = £8.17. Label: 21

Forté tablets, yellow, mefenamic acid 500 mg, net price 100-tab pack = £15.72. Label: 21

MELOXICAM

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m²; see also notes above

Pregnancy see notes above

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid; see also notes above

Side-effects see notes above

Licensed use not licensed for use in children under 16 years

Indication and dose

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

• By mouth

Child 12–18 years and body-weight under 50 kg 7.5 mg once daily

Child 12–18 years and body-weight over 50 kg 15 mg once daily

Administration *Mobic®* tablets may be dispersed in water

Meloxicam (Non-proprietary) 

Tablets, meloxicam 7.5 mg, net price 30-tab pack = £1.36; 15 mg, 30-tab pack = £1.62

Mobic[®] (Boehringer Ingelheim) 

Tablets, yellow, scored, meloxicam 7.5 mg, net price 30-tab pack = £9.30; 15 mg, 30-tab pack = £12.93. Label: 21

NAPROXEN

Cautions see notes above; **interactions:** Appendix 1 (NSAIDs)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful but manufacturer advises avoid; see also notes above

Side-effects see notes above

Licensed use not licensed for use in children under 5 years for juvenile idiopathic arthritis; not licensed for use in children under 16 years for musculoskeletal disorders or dysmenorrhoea

Indication and dose

Pain and inflammation in musculoskeletal disorders, dysmenorrhoea

• By mouth

Child 1 month–18 years 5 mg/kg twice daily (max. 1 g daily)

Juvenile idiopathic arthritis

• By mouth

Child 2–18 years 5–7.5 mg/kg twice daily (max. 1 g daily)

¹Naproxen (Non-proprietary) 

Tablets, naproxen 250 mg, net price 28-tab pack = £1.35; 500 mg, 28-tab pack = £1.72. Label: 21

Brands include *Arthrofen*[®]

Tablets, e/c, naproxen 250 mg, net price 56-tab pack = £3.18; 375 mg, 56-tab pack = £26.82; 500 mg, 56-tab pack = £4.83. Label: 5, 25

Suspension, naproxen 25 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

- Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

Naprosyn[®] (Roche) 

Tablets, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56. Label: 21

Tablets, e/c, (*Naprosyn EC*[®]), naproxen 250 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £8.56. Label: 5, 25

Synflex[®] (Roche) 

Tablets, blue, naproxen sodium 275 mg, net price 60-tab pack = £7.10. Label: 21

Note 275 mg naproxen sodium ≡ 250 mg naproxen

PIROXICAM 

Cautions see notes above and CHMP advice below

Contra-indications inflammatory bowel disease; see also notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful; see also notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

Relief of pain and inflammation in juvenile idiopathic arthritis

• By mouth

Child 6–18 years and body-weight under 15 kg 5 mg daily

Child 6–18 years and body-weight 16–25 kg 10 mg daily

Child 6–18 years and body-weight 26–45 kg 15 mg daily

Child 6–18 years and body-weight over 46 kg 20 mg daily

CHMP advice**Piroxicam (June 2007)**

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent (section 1.3) should be considered

Note Topical preparations containing piroxicam are not affected by these restrictions

Piroxicam (Non-proprietary) 

Capsules, piroxicam 10 mg, net price 56-cap pack = £16.62; 20 mg, 28-cap pack = £22.45. Label: 21

Dispersible tablets, piroxicam 10 mg, net price 56-tab pack = £9.96; 20 mg, 28-tab pack = £32.41. Label: 13, 21

Brexidol[®] (Chiesi) 

Tablets, yellow, scored, piroxicam (as betadex) 20 mg, net price 30-tab pack = £13.82. Label: 21

Feldene[®] (Pfizer) 

Capsules, piroxicam 10 mg (red/blue), net price 30-cap pack = £3.86; 20 mg (white), 30-cap pack = £7.71. Label: 21

Tablets, (*Feldene Melt*®), piroxicam 20 mg, net price 30-tab pack = £10.53. Label: 10, patient information leaflet, 21

Excipients include aspartame equivalent to phenylalanine 140 micrograms/tablet (section 9.4.1)

Note Tablets may be halved [unlicensed] to give 10-mg dose; tablet placed on tongue and allowed to dissolve or may be swallowed

10.1.2 Corticosteroids

10.1.2.1 Systemic corticosteroids

The general actions, uses, and cautions of corticosteroids are described in section 6.3. In children with rheumatic diseases corticosteroids should be reserved for specific indications (e.g. when other anti-inflammatory drugs are unsuccessful) and should be used only under the supervision of a specialist.

Systemic corticosteroids may be considered for the management of juvenile idiopathic arthritis in systemic disease or when several joints are affected. Systemic corticosteroids may also be considered in severe, possibly life-threatening conditions such as systemic lupus erythematosus, systemic vasculitis, juvenile dermatomyositis, Behçet's disease, and polyarticular joint disease.

In severe conditions, short courses ('pulses') of high-dose intravenous methylprednisolone or a pulsed oral corticosteroid may be particularly effective for providing rapid relief, and has fewer long-term adverse effects than continuous treatment.

Corticosteroid doses should be reduced with care because of the possibility of relapse if the reduction is too rapid. If complete discontinuation of corticosteroids is not possible, consideration should be given to alternate-day (or alternate high-dose, low-dose) administration; on days when no corticosteroid is given, or a lower dose is given, an additional dose of a NSAID may be helpful. In some conditions, alternative treatment using an antimalarial or concomitant use of an immunosuppressant drug, such as azathioprine, methotrexate or cyclophosphamide may prove useful; in less severe conditions treatment with a NSAID alone may be adequate.

Administration of corticosteroids may result in suppression of growth and may affect the development of puberty. The risk of corticosteroid-induced osteoporosis should be considered for those on long-term corticosteroid treatment (section 6.6); corticosteroids may also increase the risk of osteopenia in those unable to exercise. For the disadvantages of corticosteroid treatment see section 6.3.2.

10.1.2.2 Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by *intra-articular injection* as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Aseptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia,

or conscious sedation should be used. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect. Triamcinolone acetate and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone acetate should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis* or *golfer's elbow* or *compression neuropathies*, which occur rarely in children. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

LOCAL CORTICOSTEROID INJECTIONS

Cautions see notes above and consult product literature; see also section 6.3.2

Contra-indications see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparation below)

Side-effects see notes above and consult product literature

Licensed use triamcinolone acetate not licensed for use in children under 6 years

Indication and dose

See under preparations

▲ Hydrocortisone acetate

Hydrocortistab® (Sovereign) (POM)

Injection (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £5.72

Dose

- **By intra-articular injection**

(for details consult product literature)

Child 1 month–12 years 5–30 mg according to size of child and joint

Child 12–18 years 5–50 mg according to size of child and joint

Note Where appropriate may be repeated at intervals of 21 days; not more than 3 joints should be treated on any one day

▲ Methylprednisolone acetate

Depo-Medrone® (Pharmacia) (POM)

Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £2.87; 2-mL vial = £5.15; 3-mL vial = £7.47

Depo-Medrone® with Lidocaine (Pharmacia) (POM)

Injection (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.28; 2-mL vial = £5.88

Triamcinolone hexacetonide

Triamcinolone hexacetonide (Non-proprietary) (PoM)

Injection, various strengths available from 'special order' manufacturers or specialist importing companies, see, p. 809

Dose

- **By intra-articular injection**
(for details consult product literature)

Child 1–18 years for larger joints 1 mg/kg (usual max. 20 mg, but higher doses have been used); if appropriate repeat treatment for relapse

Triamcinolone acetonide

Adcortyl® Intra-articular/Intradermal (Squibb) (PoM)

Injection (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL amp = 90p; 5-mL vial = £3.63

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Dose

- **By intra-articular injection**
(for details consult product literature)

Child 1–18 years for larger joints 2 mg/kg (max. 15 mg); for doses above 15 mg use *Kenalog® Intra-articular/Intramuscular*, if appropriate repeat treatment for relapse

Kenalog® Intra-articular/Intramuscular (Squibb)

(PoM)

Injection (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.49

Dose

- **By intra-articular injection**
(for details consult product literature)

Child 1–18 years for larger joints 2 mg/kg (usual max. 40 mg, but higher doses have been used); if appropriate repeat treatment for relapse

10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs, such as methotrexate, cytokine modulators, and sulfasalazine, are used to suppress the disease process in *juvenile idiopathic arthritis* (juvenile chronic arthritis); these drugs are known as disease-modifying antirheumatic drugs (DMARDs). In children, disease-modifying antirheumatic drugs should be used under specialist supervision.

Some children with juvenile idiopathic arthritis do not require disease-modifying antirheumatic drugs. Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine are no longer used. For the role of cytokine modulators in *polyarticular juvenile idiopathic arthritis*, see p. 509.

Unlike NSAIDs, disease-modifying antirheumatic drugs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a disease-modifying antirheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations such as vasculitis. They reduce the erythrocyte sedimentation rate and C-reactive protein.

Antimalarials

The antimalarial **hydroxychloroquine** is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine can also be useful for systemic or discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded.

Mepacrine is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

Cautions Hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), and in acute porphyria. Hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatotoxic drugs should be avoided; other **interactions**: Appendix 1 (chloroquine and hydroxychloroquine).

Pregnancy It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

Breast-feeding Hydroxychloroquine is present in breast milk leading to a risk of toxicity in infants—breast-feeding should be avoided when it is used to treat rheumatic disease.

Screening for ocular toxicity

Hydroxychloroquine is rarely associated with ocular toxicity. The British Society for Paediatric and Adolescent Rheumatology recommends that children should have their vision tested before long-term treatment with hydroxychloroquine and have an annual review of visual acuity. Children should be referred to an ophthalmologist if there is visual impairment, changes in visual acuity, or blurred vision. The Royal College of Ophthalmologists has recommended that a locally agreed protocol between the prescribing doctor and ophthalmologist be established to monitor the vision of these children.

Important

To avoid excessive dosage in obese children, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight; ocular toxicity is unlikely with doses under 5–6.5 mg/kg or max. 400 mg daily.

Side-effects The side-effects of hydroxychloroquine include gastro-intestinal disturbances, headache, and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, oto-

toxicity, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomyopathy and neuromyopathy), acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; angioedema and bronchospasm have also been reported. **Important:** very toxic in overdosage—immediate advice from poisons centres essential (see also p. 29).

HYDROXYCHLOROQUINE SULPHATE

Cautions see notes above

Hepatic impairment use with caution in moderate to severe impairment

Renal impairment manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe impairment

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Indication and dose

Juvenile idiopathic arthritis, systemic and discoid lupus erythematosus, dermatological conditions caused or aggravated by sunlight

• **By mouth**

Child 1 month–18 years based on ideal body-weight, 5–6.5 mg/kg (max. 400 mg) once daily

Hydroxychloroquine (Non-proprietary) (POM)

Tablets, hydroxychloroquine sulphate 200 mg, net price 60-tab pack = £5.10. Label: 21, counselling, antacids (see below)

Brands include *Quinoric*®

Counselling Avoid antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

Plaquenil® (Sanofi-Aventis) (POM)

Tablets, f/c, hydroxychloroquine sulphate 200 mg, net price 60-tab pack = £5.25. Label: 21, counselling, antacids (see below)

Counselling Avoid antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

Drugs affecting the immune response

Methotrexate, given as a once weekly dose, is the disease-modifying antirheumatic drug of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid has

not been established—in children over 2 years a dose of 5 mg weekly (unlicensed indication), may be given on a different day from the methotrexate.

Azathioprine may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of *polymyositis* which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive.

Cyclosporin is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

AZATHIOPRINE

Cautions section 8.2.1

Contra-indications section 8.2.1

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy section 8.2.1

Breast-feeding section 8.2.1

Side-effects section 8.2.1

Indication and dose

Systemic lupus erythematosus, vasculitis, auto-immune conditions usually when corticosteroid therapy alone has proved inadequate see also notes above

• **By mouth**

Child 1 month–18 years initially 1 mg/kg daily, adjusted according to response to max. 3 mg/kg daily (consider withdrawal if no improvement within 3 months)

Inflammatory bowel disease section 1.5.3

Transplantation rejection section 8.2.1

Preparations

Section 8.2.1

METHOTREXATE

Cautions section 8.1.3; see advice below (blood count, gastro-intestinal, liver, and pulmonary toxicity); extreme caution in blood disorders (avoid if severe); risk of accumulation in pleural effusion or ascites—drain before treatment; full blood count and liver function tests before starting treatment repeated fortnightly for at least the first 4 weeks and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests before starting treatment and then regularly during treatment; children or their carers should report all symptoms and signs suggestive of infection, especially sore throat; treatment with folic acid (as calcium folinate, section 8.1) may be required in acute toxicity; check immunity to varicella-zoster and consider vaccination (section 14.4) before initiating therapy; acute porphyria (section 9.8.2); **interactions:** see below and Appendix 1 (methotrexate)

Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include renal impairment and concomitant use with another anti-folate drug. A clini-

cally significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy

Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity

Liver toxicity Persistent 2-fold rise in liver transaminases may necessitate dose reduction or rarely discontinuation; abrupt withdrawal should be avoided as this can lead to disease flare

Pulmonary toxicity Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough or fever develops; discontinue if pneumonitis suspected.

NSAIDs Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen

Contra-indications see Cautions above; also active infection and immunodeficiency syndromes

Hepatic impairment avoid—dose-related toxicity; see also Cautions above

Renal impairment section 8.1.3

Pregnancy section 8.1.3

Breast-feeding section 8.1.3

Side-effects section 8.1.3; chronic pulmonary fibrosis; blood dyscrasias (including fatalities); liver cirrhosis

Licensed use *Metojeqt*[®] injection licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic arthritis; other preparations not licensed for use in children for non-malignant conditions

Indication and dose

Juvenile idiopathic arthritis, juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, sarcoidosis

- By mouth, subcutaneous injection, or intramuscular injection

Child 1 month–18 years 10–15 mg/m² once weekly initially, increased if necessary to max. 25 mg/m² once weekly

Safe Practice

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose and frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

Severe Crohn's disease section 1.5.3

Malignant disease section 8.1.3

Psoriasis section 13.5.3

Methotrexate (Non-proprietary) (POM)

Tablets, yellow, methotrexate 2.5 mg, net price 28-tab pack = £3.27. Counselling, dose, NSAIDs
Brands include *Maxtrex*[®]

Tablets, yellow, methotrexate 10 mg, net price 100-tab pack = £56.49. Counselling, dose, NSAIDs

Suspension, various strengths available from 'special-order' manufacturers or specialist importing companies, see p. 809

Parenteral preparations

See also section 8.1.3

Metojeqt[®] (Medac) (POM)

Injection, prefilled syringe, methotrexate (as disodium salt) 50 mg/mL, net price 0.15 mL (7.5 mg) = £14.85, 0.2 mL (10 mg) = £15.29, 0.3 mL (15 mg) = £16.57, 0.4 mL (20 mg) = £17.84, 0.5 mL (25 mg) = £18.48, 0.6 mL (30 mg) = £18.95

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab, etanercept, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF- α). Adalimumab and etanercept can be used for the management of active polyarticular juvenile idiopathic arthritis. Infliximab has been used in refractory polyarticular juvenile idiopathic arthritis [unlicensed indication] when other treatments, such as etanercept, have failed.

NICE guidance

Etanercept for the treatment of juvenile idiopathic arthritis (March 2002)

Etanercept is recommended in children aged 4–17 years with active polyarticular-course juvenile idiopathic arthritis who have not responded adequately to methotrexate or who are intolerant of it. Etanercept should be used under specialist supervision according to the guidelines of the British Society for Paediatric and Adolescent Rheumatology [previously the British Paediatric Rheumatology Group].

Etanercept should be withdrawn if severe side-effects develop or if there is no response after 6 months or if the initial response is not maintained. A decision to continue therapy beyond 2 years should be based on disease activity and clinical effectiveness in individual cases.

Prescribers of etanercept should register consenting patients with the Biologics Registry of the British Society for Paediatric and Adolescent Rheumatology.

Side-effects Adalimumab, etanercept, and infliximab have been associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, aplastic anaemia).

Abatacept prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors.

ABATACEPT

Cautions predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; progressive multifocal leucoencephalopathy—discontinue treatment if neurological symptoms present; **interactions:** Appendix 1 (abatacept)

Contra-indications severe infection (see also Cautions)

Pregnancy manufacturer advises avoid unless essential—effective contraception required during treatment and for 14 weeks after last dose

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

Side-effects abdominal pain, diarrhoea, dyspepsia, nausea; flushing, hypertension; cough; dizziness, fatigue, headache; infection, rhinitis; rash; *less commonly* gastritis, stomatitis, tachycardia, bradycardia, palpitation, hypotension, dyspnoea, paraesthesia, weight gain, depression, anxiety, amenorrhoea, basal cell carcinoma, thrombocytopenia, leucopenia, arthralgia, pain in extremities, conjunctivitis, visual disturbance, vertigo, bruising, alopecia, and dry skin

Indication and dose

Moderate to severe active polyarticular juvenile idiopathic arthritis (in combination with methotrexate) in children who have not responded adequately to other disease-modifying antirheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor)

- By intravenous infusion

Child 6–17 years

Body-weight less than 75 kg 10 mg/kg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

Body-weight 75–100 kg 750 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

Body-weight over 100 kg 1 g, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

Note Review treatment if no response within 6 months

Administration for *intravenous infusion*, reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron)

Orencia® (Bristol-Myers Squibb) ▼ (POM)

Intravenous infusion, powder for reconstitution, abatacept, net price 250-mg vial = £242.17

Electrolytes Na⁺ <0.5 mmol/vial

ADALIMUMAB

Cautions predisposition to infection; monitor for infections before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart

failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in children with history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **interactions:** Appendix 1 (adalimumab)

Tuberculosis Children should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting adalimumab. Children who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In those without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In children at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Children and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Contra-indications severe infection (see also Cautions)

Pregnancy avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

Breast-feeding avoid; manufacturer advises avoid for at least 5 months after last dose

Side-effects see under Cytokine Modulators, p. 509 and Cautions above; also vomiting, dyspepsia, gastrointestinal haemorrhage; dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia; cough, dyspnoea; mood changes, sleep disturbances, anxiety, paraesthesia; haematuria, renal impairment; benign tumours, skin cancer; electrolyte disturbances, hyperuricaemia; musculoskeletal pain; eye disorders; rash, dermatitis, onycholysis, impaired healing; *less commonly* dysphagia, pancreatitis, cholelithiasis, hepatic steatosis, cholecystitis, arrhythmias, interstitial lung disease, pneumonitis, tremor, erectile dysfunction, nocturia, malignancy (including solid tumours and lymphoma), rhabdomyolysis, hearing loss, tinnitus; *rarely* vascular occlusion, myocardial infarction, demyelinating disorders; *also reported* pulmonary embolism, pleural effusion, sarcoidosis, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis

Indication and dose

Active polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have not responded adequately to one or more disease-modifying antirheumatic drug

- By subcutaneous injection

Child 13–17 years 40 mg on alternate weeks; review treatment if no response within 12 weeks

Humira® (Abbott) ▼ (POM)

Injection, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £357.50. Counselling, tuberculosis

ETANERCEPT

Cautions predisposition to infection (avoid if predisposition to septicaemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening

hepatitis C infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; heart failure (risk of exacerbation); history or increased risk of demyelinating disorders; history or development of malignancy; monitor for skin cancer before and during treatment particularly in those at risk (including children with psoriasis or a history of PUVA treatment); history of blood disorders; diabetes mellitus; **interactions:** Appendix 1 (etanercept)

Tuberculosis Children should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Children who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In those without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In children at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Children and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Blood disorders Children and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

Contra-indications active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

Hepatic impairment use with caution in moderate to severe alcoholic hepatitis

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects see under Cytokine Modulators, p. 509; also *less commonly* interstitial lung disease, skin cancer, uveitis, rash, new onset or worsening psoriasis; *rarely* demyelinating disorders, seizures, lymphoma, Stevens-Johnson syndrome, vasculitis; *very rarely* toxic epidermal necrolysis; *also reported* appendicitis, gastritis, oesophagitis, inflammatory bowel disease, vomiting, diabetes mellitus, malignancy (including solid tumours and leukaemia), macrophage activation syndrome, and cutaneous ulcer

Indication and dose

Active polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it

• By subcutaneous injection

Child 4–17 years 400 micrograms/kg (max. 25 mg) twice weekly, with an interval of 3–4 days between doses

Severe plaque psoriasis section 13.5.3

Enbrel® (Wyeth) ▼ [PmH]

Injection, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

Paediatric injection, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38.

Label: 10, alert card, counselling, tuberculosis and blood disorders

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Injection, etanercept, net price 25-mg prefilled syringe = £89.38; 50-mg prefilled pen or prefilled syringe = £178.75. Label: 10, alert card, counselling, tuberculosis and blood disorders

Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease. Sulfasalazine may cause haematological abnormalities including leucopenia, neutropenia, and thrombocytopenia and close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver-function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory. For use of sulfasalazine also see section 1.5.1, aminosalicylates.

SULFASALAZINE

(Sulphasalazine)

Cautions see section 1.5.1 and notes above

Contra-indications see section 1.5.1

Hepatic impairment section 1.5.1

Renal impairment section 1.5.1

Pregnancy section 1.5.1

Breast-feeding section 1.5.1

Side-effects see section 1.5.1 and notes above

Licensed use not licensed for use in children for juvenile idiopathic arthritis

Indication and dose

Juvenile idiopathic arthritis (see also notes above)

• By mouth

Child 2–18 years initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week, maintenance dose 20–25 mg/kg twice daily; **Child 2–12 years** max. 2 g daily, **Child 12–18 years** max. 3 g daily

Preparations

Section 1.5.1

10.1.4 Gout and cytotoxic-induced hyperuricaemia

This section is not included in *BNF for Children*. For the role of allopurinol and rasburicase in the prophylaxis of hyperuricaemia associated with cancer chemotherapy and in enzyme disorders causing increased serum urate, see section 8.1. The management of gout in adolescents requires specialist supervision.

10.1.5 Other drugs for rheumatic diseases

Classification not used in *BNF for Children*.

10.2 Drugs used in neuromuscular disorders

10.2.1 Drugs that enhance neuromuscular transmission

10.2.2 Skeletal muscle relaxants

10.2.1 Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

Edrophonium has a very brief action and it is therefore used mainly for the diagnosis of *myasthenia gravis*. However, such testing should be performed only by those experienced in its use; other means of establishing the diagnosis are available. A single test-dose usually causes substantial improvement in muscle power (lasting about 5 minutes) in patients with the disease (if respiration already impaired, *only* in conjunction with someone skilled at intubation).

Edrophonium can also be used to determine whether a patient with *myasthenia* is receiving inadequate or

excessive treatment with cholinergic drugs. If treatment is excessive an injection of edrophonium will either have no effect or will intensify symptoms (if respiration already impaired, give *only* in conjunction with someone skilled at intubation). Conversely, transient improvement may be seen if the patient is being inadequately treated. The test is best performed just before the next dose of anticholinesterase.

Neostigmine produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of *myasthenia*.

Pyridostigmine is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine are needed. Neostigmine and pyridostigmine should be given to neonates 30 minutes before feeds to improve sucking.

Neostigmine and edrophonium are also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (section 15.1.6).

NEOSTIGMINE

Cautions asthma (*extreme* caution), bradycardia, arrhythmias, recent myocardial infarction, epilepsy, hypotension, parkinsonism, vagotonia, peptic ulceration, hyperthyroidism; atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection), but not given routinely because it may mask signs of overdosage; **interactions:** Appendix 1 (parasympathomimetics)

Contra-indications intestinal or urinary obstruction

Renal impairment may need dose reduction

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding amount probably too small to be harmful

Side-effects nausea, vomiting, increased salivation, diarrhoea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis

Indication and dose

Treatment of *myasthenia gravis*

- By mouth (as neostigmine bromide)

Neonate initially 1–2 mg, then 1–5 mg every 4 hours, give 30 minutes before feeds

Child up to 6 years initially 7.5 mg repeated at suitable intervals throughout the day, total daily dose 15–90 mg

Child 6–12 years initially 15 mg repeated at suitable intervals throughout the day, total daily dose 15–90 mg

Child 12–18 years initially 15–30 mg repeated at suitable intervals throughout the day, total daily dose 75–300 mg (but max. most can tolerate is 180 mg daily)

- By subcutaneous or intramuscular injection (as neostigmine metilsulfate)

Neonate 150 micrograms/kg every 6–8 hours, 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary [unlicensed]

Child 1 month–12 years 200–500 micrograms repeated at suitable intervals throughout the day

Child 12–18 years 1–2.5 mg repeated at suitable intervals throughout the day

Neostigmine (Non-proprietary) (POM)

Tablets, scored, neostigmine bromide 15 mg, net price 140 = £56.10

Injection

Section 15.1.6

EDROPHONIUM CHLORIDE

Cautions see under Neostigmine; have resuscitation facilities; *extreme* caution in respiratory distress (see notes above) and in asthma

Note Severe cholinergic reactions can be counteracted by injection of atropine sulphate (which should always be available)

Contra-indications see under Neostigmine

Pregnancy see under Neostigmine

Breast-feeding see under Neostigmine

Side-effects see under Neostigmine

Indication and dose

Diagnostic test for myasthenia gravis

- By intravenous injection

Child 1 month–12 years 20 micrograms/kg followed after 30 seconds (if no adverse reaction has occurred) by 80 micrograms/kg

Child 12–18 years 2 mg followed after 30 seconds (if no adverse reaction has occurred) by 8 mg

Detection of overdosage or underdosage of cholinergic drugs

- By intravenous injection

Child 1 month–12 years 20 micrograms/kg (preferably just before next dose of anticholinesterase, see notes above)

Child 12–18 years 2 mg (preferably just before next dose of anticholinesterase, see notes above)

Edrophonium (Non-proprietary) (POM)

Injection, edrophonium chloride 10 mg/mL, net price 1-mL amp = £19.50

PYRIDOSTIGMINE BROMIDE

Cautions see under Neostigmine; weaker muscarinic action

Contra-indications see under Neostigmine

Renal impairment reduce dose; excreted by kidney

Pregnancy see under Neostigmine

Breast-feeding see under Neostigmine

Side-effects see under Neostigmine

Indication and dose

Treatment of myasthenia gravis

- By mouth

Neonate initially 1–1.5 mg/kg, increased gradually to max. 10 mg, repeated throughout the day, give 30–60 minutes before feeds

Child 1 month–12 years initially 1–1.5 mg/kg/day, increased gradually to 7 mg/kg/day in 6 divided doses; usual total daily dose 30–360 mg

Child 12–18 years 30–120 mg, repeated throughout the day; usual total daily dose 300–600 mg (but consider immunosuppressant therapy if total daily dose exceeds 360 mg, down-regulation of acetylcholine receptors possible if total daily dose exceeds 450 mg; see notes above)

Mestinon® (Meda) (POM)

Tablets, scored, pyridostigmine bromide 60 mg, net price 200 = £45.33

- Extemporaneous formulations available see Extemporaneous Preparations, p. 6

Immunosuppressant therapy

A course of **corticosteroids** (section 6.3) is an established treatment in severe cases of myasthenia gravis and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose ('pulsed') methylprednisolone followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. For disadvantages of corticosteroid treatment, see section 6.3.2. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

10.2.2 Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection)

remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Dantrolene acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly.

Baclofen inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

Diazepam has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

BACLOFEN

Cautions psychiatric illness; respiratory impairment; epilepsy; history of peptic ulcer (avoid oral route in active peptic ulceration); diabetes; hypertonic bladder sphincter; avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions, see also under Withdrawal below); **interactions:** Appendix 1 (muscle relaxants)

Withdrawal CSM has advised that serious side-effects can occur on abrupt withdrawal; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Hepatic impairment manufacturer advises use by mouth with caution

Renal impairment risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73m² use by mouth only if potential benefit outweighs risk; excreted by kidney

Pregnancy manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies)

Breast-feeding present in milk—amount probably too small to be harmful

Side-effects gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular depression; sedation, drowsiness, confusion, dizziness, ataxia, hallucinations, nightmares, headache, euphoria, insomnia, depression, anxiety, agitation, tremor; seizure; urinary disturbances; myalgia; visual disorders; rash, hyperhidrosis; *rarely* taste disturbances, abdominal pain, changes in hepatic function, paraesthesia, erectile dysfunction, dysarthria; *very rarely* hypothermia

Indication and dose

Chronic severe spasticity of voluntary muscle

• By mouth

Child 1–2 years initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg (max. 40 mg) daily in divided doses (or 10–20 mg daily in divided doses); review treatment if no benefit within 6 weeks

Child 2–6 years initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual

maintenance dose of 0.75–2 mg/kg (max. 40 mg) daily in divided doses (or 20–30 mg daily in divided doses); review treatment if no benefit within 6 weeks

Child 6–8 years initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg (max. 40 mg) daily in divided doses (or 30–40 mg daily in divided doses); review treatment if no benefit within 6 weeks

Child 8–10 years initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg (max. 60 mg) daily in divided doses; review treatment if no benefit within 6 weeks

Child 10–18 years initially 5 mg 3 times daily increased gradually; usual maintenance dose up to 60 mg daily in divided doses (max. 100 mg daily); review treatment if no benefit within 6 weeks

Severe chronic spasticity of cerebral origin unresponsive to oral antispastic drugs (or oral therapy not tolerated), as alternative to ablative neurosurgical procedures—specialist use only

• By intrathecal injection

Child 4–18 years initial *test dose* 25 micrograms over at least 1 minute via catheter or lumbar puncture, increased in 25-microgram steps (not more often than every 24 hours) to max. 100 micrograms to determine appropriate dose *then dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish *maintenance dose* (ranging from 24 micrograms to 1.2 mg daily in children under 12 years or 1.4 mg daily for those over 12 years) retaining some spasticity to avoid sensation of paralysis

Safe Practice

Consult intrathecal injection product literature for details on dose testing and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use

Baclofen (Non-proprietary) ^(P_M)

Tablets, baclofen 10 mg, net price 84-tab pack = £1.58. Label: 2, 8, 21

Oral solution, baclofen 5 mg/5 mL, net price 300 mL = £9.26. Label: 2, 8, 21

Brands include *Lyfex*[®] (sugar-free)

Lioresal[®] (Novartis) ^(P_M)

Tablets, scored, baclofen 10 mg, net price 84-tab pack = £8.67. Label: 2, 8, 21

Excipients include gluten

Liquid, sugar-free, raspberry-flavoured, baclofen 5 mg/5 mL, net price 300 mL = £7.16. Label: 2, 8, 21

▲ By intrathecal injection

Lioresal[®] (Novartis) ^(P_M)

Intrathecal injection, baclofen, 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.19; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £48.62; 2 mg/mL, 5-mL amp (for use with implantable pump) = £48.62

DANTROLENE SODIUM

Cautions impaired cardiac and pulmonary function; therapeutic effect may take a few weeks to develop—discontinue if no response within 45 days; **interactions:** Appendix 1 (muscle relaxants)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported, usually if doses greater than 400 mg daily used, in females, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); re-introduce only if complete reversal of hepatotoxicity

Counselling Children and their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

Skilled tasks Drowsiness may affect performance of skilled tasks (eg. driving); effects of alcohol enhanced

Contra-indications acute muscle spasm; avoid when spasticity is useful, for example, locomotion

Hepatic impairment avoid—may cause severe liver damage; injection may be used in an emergency for malignant hyperthermia

Pregnancy avoid use in chronic spasticity—embryotoxic in *animal* studies

Breast-feeding present in milk—manufacturer advises avoid use in chronic spasticity

Side-effects diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction), nausea, vomiting, anorexia, hepatotoxicity (see above), abdominal pain; pericarditis; pleural effusion, respiratory depression; headache, drowsiness, dizziness, asthenia, fatigue, seizures, fever, chills; speech and visual disturbances; rash; *less commonly* dysphagia, constipation, exacerbation of cardiac insufficiency, tachycardia, erratic blood pressure, dyspnoea, depression, confusion, nervousness, insomnia, increased urinary frequency, urinary incontinence or retention, haematuria, crystalluria, and increased sweating

Licensed use not licensed for use in children

Indication and dose**Chronic severe spasticity of voluntary muscle**

• By mouth

Child 5–12 years initially 500 micrograms/kg once daily; after 7 days increase to 500 micrograms/kg/dose 3 times daily; every 7 days increase by further 500 micrograms/kg/dose until satisfactory response; max. 2 mg/kg 3–4 times daily (max. total daily dose 400 mg)

Child 12–18 years initially 25 mg once daily; increase to 3 times daily after 7 days; every 7 days increase by further 500 micrograms/kg/dose until satisfactory response; max. 2 mg/kg 3–4 times daily (max. total daily dose 400 mg)

Malignant hyperthermia section 15.1.8

Dantrium® (SpePharm) (POM)

Capsules, orange/brown, dantrolene sodium 25 mg, net price 100 = £16.87; 100 mg, 100 = £43.07. Label: 2, counselling, driving, hepatotoxicity

DIAZEPAM

Cautions section 4.8.2

Contra-indications section 4.8.2

Hepatic impairment section 4.8.2

Renal impairment section 4.8.2

Pregnancy section 4.8.2

Breast-feeding section 4.8.2

Side-effects section 4.8.2; also hypotonia

Indication and dose**Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm**

• By mouth

Child 1–12 months initially 250 microgram/kg twice daily

Child 1–5 years initially 2.5 mg twice daily

Child 5–12 years initially 5 mg twice daily

Child 12–18 years initially 10 mg twice daily; max. total daily dose 40 mg

Tetanus

• By intravenous injection

Child 1 month–18 years 100–300 micrograms/kg repeated every 1–4 hours

• By intravenous infusion (or by nasoduodenal tube)

Child 1 month–18 years 3–10 mg/kg over 24 hours, adjusted according to response

Status epilepticus section 4.8.2

Febrile convulsions section 4.8.3

Administration for *continuous intravenous infusion* of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion; diazepam adsorbed by plastics of infusion bags and giving sets

For *continuous intravenous infusion* of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; diazepam adsorbed by plastics of infusion bags and giving sets

Diazepam (Non-proprietary) (CB4-3)

Tablets, diazepam 2 mg, net price 28 = 89p; 5 mg, 28 = 90p; 10 mg, 28 = 92p. Label: 2 or 19

Brands include *Rimapam*® (JMS), *Tensium*® (JMS)

Dental prescribing on NHS Diazepam Tablets may be prescribed

Oral solution, diazepam 2 mg/5 mL, net price 100 mL = £6.08. Label: 2 or 19

Brands include *Dialar*® (JMS)

Dental prescribing on NHS Diazepam Oral Solution 2 mg/5 mL may be prescribed

Strong oral solution, diazepam 5 mg/5 mL, net price 100-mL pack = £6.38. Label: 2 or 19 (JMS)

Brands include *Dialar*® (JMS)

10.3 Drugs for the relief of soft-tissue inflammation and topical pain relief

10.3.1 Enzymes

10.3.2 Rubefaciants, topical NSAIDs, capsaicin, and poultices

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Prevention of extravasation Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose veins are prone to collapse.

Children or their carers should be asked to report any pain or burning at the site of injection immediately.

Management of extravasation If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy. **Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. **Antihistamines** (section 3.4.1) and **analgesics** (section 4.7) may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase (section 10.3.1). A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).

10.3.1 Enzymes

Hyaluronidase is used for the management of extravasation. For preparations, see *BNF section 10.3.1*.

10.3.2 Rubefaciants, topical NSAIDs, capsaicin, and poultices

Classification not used in *BNF for Children*.

11.8.2 Ocular diagnostic and peri-operative preparations	532
11.9 Contact lenses	533

11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles; they are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

Eye drops and eye ointments Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two. Eye ointment should be applied after drops. Both drops and ointment may cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

For warnings relating to eye drops and contact lenses, see section 11.9.

Eye lotions These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

Other preparations Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or

corticosteroids for conditions not responding to topical therapy. The drug diffuses through the cornea and sclera to the anterior and posterior chambers and vitreous humour. However, because the dose-volume is limited, this route is suitable only for drugs which are readily soluble.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat an eye condition.

Preservatives and sensitisers Information on preservatives and on substances identified as skin sensitisers (section 13.1.3) is provided under preparation entries.

11.2 Control of microbial contamination

Preparations for the eye should be sterile when issued. Eye drops in multiple-application containers include a preservative but care should nevertheless be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *home use* should not be used for more than 4 weeks after first opening (unless otherwise stated).

Eye drops for use in *hospital wards* are normally discarded 1 week after first opening (24 hours if preservative-free). Individual containers should be provided for each child, and for each eye if there are special concerns about contamination. Containers used before an operation should be discarded at the time of the operation and fresh containers supplied. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units it may be acceptable to issue eye-drop bottles that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application packs should preferably be used; if multiple-application packs are used, they should be discarded at the end of each day. In clinics for eye diseases and in accident and emergency departments, where the dangers of infection are high, single-application packs should be used; if a multiple-application pack is used, it should be discarded after single use.

Diagnostic dyes (section 11.8.2) should be used only from single-application packs.

In *eye surgery* single-application containers should be used if possible; if a multiple-application pack is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; large volume intravenous infusion preparations are not suitable for this purpose. For all surgical procedures, a previously unopened container is used for each patient.

11.3 Anti-infective eye preparations

11.3.1 Antibacterials

11.3.2 Antifungals

11.3.3 Antivirals

Eye infections Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by lid hygiene and application of antibacterial eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

Corneal ulcer and *keratitis* require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

Endophthalmitis is a medical emergency which also calls for specialist management and often requires parenteral, subconjunctival, or intra-ocular administration of antimicrobials.

For reference to the treatment of *crab lice of the eyelashes*, see section 13.10.4

11.3.1 Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments; systemic treatment is sometimes appropriate in blepharitis.

Chloramphenicol has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, and **ofloxacin**; the aminoglycosides, **gentamicin**, **neomycin**, and **tobramycin** are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for *corneal ulcers*; intensive application (especially in the first 2 days) is required throughout the day and night.

Trachoma, which results from chronic infection with *Chlamydia trachomatis*, can be treated with **azithromycin** by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamide isetionate is of little value in bacterial infections but is used by specialists to treat the rare but potentially sight-threatening condition of *acanthamoeba keratitis* (see also section 11.9).

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection, see section 11.8.

Neonates Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative micro-organism should be identified. **Chloramphenicol** or **neomycin** eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered.

Gonococcal eye infections are treated with a single-dose of parenteral **cefotaxime** or **ceftriaxone**. *Chlamydial eye infections* should be managed with oral **erythromycin**. **Gentamicin** eye drops together with appropriate systemic antibacterials are used in the treatment of *pseudomonal eye infections*; high-strength gentamicin eye drops (1.5%) [unlicensed] are available for severe infections.

With corticosteroids Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

Administration Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows.

Eye drops. Apply 1 drop at least every 2 hours in severe infection then reduce frequency as infection is controlled and continue for 48 hours after healing. For less severe infection 3–4 times daily is generally sufficient.

Eye ointment. Apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

CHLORAMPHENICOL

Side-effects transient stinging; see also notes above
Indication and dose

See notes above

Chloramphenicol (Non-proprietary) (PoM)

Eye drops, chloramphenicol 0.5%. Net price 10 mL = £2.05

Eye ointment, chloramphenicol 1%. Net price 4 g = £2.04

Note Chloramphenicol 0.5% eye drops (max. pack size 10 mL) and 1% eye ointment (max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in children over 2 years; max. duration of treatment 5 days

Chloromycetin® (Goldshield) (PoM)

Redidrops (= eye drops), chloramphenicol 0.5%. Net price 5 mL = £1.65; 10 mL = 90p

Excipients include phenylmercuric acetate

Ophthalmic ointment (= eye ointment), chloramphenicol 1%. Net price 4 g = £1.08

Single use

Minims® Chloramphenicol (Bausch & Lomb) (PoM)

Eye drops, chloramphenicol 0.5%. Net price 20 × 0.5 mL = £9.17

CIPROFLOXACIN

Cautions not recommended for children under 1 year

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises caution

Side-effects local burning and itching; lid margin crusting; hyperaemia; taste disturbances; corneal staining, keratitis, lid oedema, lacrimation, photophobia, corneal infiltrates; nausea and visual disturbances reported

Licensed use eye ointment not licensed for use in children under 1 year

Indication and dose

Superficial bacterial infections

See notes above

Corneal ulcer

Apply eye drops throughout day and night, day 1 apply every 15 minutes for 6 hours then every 30 minutes, day 2 apply every hour, days 3–14 apply every 4 hours (max. duration of treatment 21 days)

Apply eye ointment throughout day and night; apply 1.25 cm ointment every 1–2 hours for 2 days then every 4 hours for next 12 days

Ciloxan® (Alcon) (PoM)

Ophthalmic solution (= eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.70

Excipients include benzalkonium chloride

Eye ointment, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.22

FUSIDIC ACID

Indication and dose

See notes above and under preparation below

Fucithalmic® (LEO) (PoM)

Eye drops, m/r, fusidic acid 1% in gel basis (liquefies on contact with eye). Net price 5 g = £1.96

Excipients include benzalkonium chloride, disodium edetate

Dose

Apply twice daily

GENTAMICIN

Indication and dose

See notes above

Genticin® (Amdipharm) (PoM)

Drops (for ear or eye), gentamicin 0.3% (as sulphate). Net price 10 mL = £2.13

Excipients include benzalkonium chloride

Gentamicin (Non-proprietary) (PoM)

Eye drops, gentamicin 1.5%, 10 mL, available as a manufactured special from Moorfields Eye Hospital, see also 'special-order' manufacturers or specialist importing companies, p. 809

LEVOFLOXACIN

Pregnancy manufacturer advises avoid—systemic quinolones have caused arthropathy in *animal* studies

Breast-feeding manufacturer advises avoid

Side-effects transient ocular irritation, visual disturbances, lid margin crusting, lid or conjunctival oedema, hyperaemia, conjunctival follicles, photophobia, headache, rhinitis

Licensed use not licensed for use in children under 1 year

Indication and dose

See notes above

Oftaquix® (Kestrel Ophthalmics) ▼ (POM)

Eye drops, levofloxacin 0.5%, net price 5 mL = £6.95

MOXIFLOXACIN

Cautions not recommended for neonates

Side-effects taste disturbances, ocular discomfort (including pain, irritation and dryness), hyperaemia; *less commonly* vomiting, headache, paraesthesia, corneal disorders (including keratitis, erosion, and staining), conjunctival haemorrhage, eyelid erythema, visual disturbances, nasal discomfort, pharyngolaryngeal pain; *also reported* nausea, palpitation, dyspnoea, dizziness, raised intra-ocular pressure, photophobia, rash, pruritus

Indication and dose

Local treatment of infections (see also notes above)

Child 1 month–18 years apply 3 times daily (continue treatment for 2–3 days after infection improves; review if no improvement within 5 days)

Moxivig® (Alcon) ▼ (POM)

Eye drops, moxifloxacin (as hydrochloride) 0.5%. Net price 5 mL = £9.80

NEOMYCIN SULPHATE**Indication and dose**

See notes above

Neomycin (Non-proprietary) (POM)

Eye drops, neomycin sulphate 0.5% (3500 units/mL). Net price 10 mL = £3.11

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Eye ointment, neomycin sulphate 0.5% (3500 units/g). Net price 3 g = £2.44

Available from 'special-order' manufacturers or specialist importing companies, see p. 809

OFLOXACIN

Cautions not to be used for more than 10 days

Pregnancy manufacturer advises use only if benefit outweighs risk; systemic quinolones have caused arthropathy in *animal* studies

Breast-feeding manufacturer advises avoid

Side-effects local irritation including photophobia; dizziness, numbness, nausea and headache reported

Licensed use not licensed for use in neonates

Indication and dose

Local treatment of infections (see also notes above)

Apply every two to four hours for the first two days then reduce frequency to four times daily (max. 10 days treatment)

Excocin® (Allergan) (POM)

Ophthalmic solution (= eye drops), ofloxacin 0.3%. Net price 5 mL = £2.17

Excipients include benzalkonium chloride

POLYMYXIN B SULPHATE**Indication and dose**

See notes above

With other antibacterials

Polyfax® (TEVA UK) (POM)

Eye ointment, polymyxin B sulphate 10 000 units, bacitracin zinc 500 units/g. Net price 4 g = £3.26

PROPAMIDINE ISETIONATE**Indication and dose**

See under preparations below

Brolene® (Sanofi-Aventis)

Eye drops, propamidine isetionate 0.1%. Net price 10 mL = £2.80

Excipients include benzalkonium chloride

Dose

Local treatment of infections (but see notes above)

Apply 4 times daily

Note Eye drops containing propamidine isetionate 0.1% also available from Typharm (*Golden Eye Drops*)

Eye ointment, dibrompropamidine isetionate 0.15%. Net price 5 g = £2.92

Dose

Local treatment of infections (but see notes above)

Apply 1–2 times daily

Note Eye ointment containing dibrompropamidine isetionate 0.15% also available from Typharm (*Golden Eye Ointment*)

TOBRAMYCIN**Indication and dose**

Local treatment of infections (see also notes above)

Child 1–18 years apply twice daily for 6–8 days; in severe infection, apply 4 times daily on the first day, then twice daily for 5–7 days

Tobravisc® (Alcon) (POM)

Eye drops, tobramycin 0.3%, net price 5 mL = £4.74

Excipients include benzododecimum bromide

11.3.2 Antifungals

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment is normally carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk

11.3.3 Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with **aciclovir**. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster (section 5.3.2.1).

For systemic treatment of CMV retinitis, see section 5.3.2.2.

ACICLOVIR

(Acyclovir)

Side-effects local irritation and inflammation, superficial punctate keratopathy; *rarely* blepharitis; *very rarely* hypersensitivity reactions including angioedema

Indication and dose

Local treatment of herpes simplex infections

Apply 5 times daily (continue for at least 3 days after complete healing)

Herpes simplex skin infections section 13.10.3

Herpes simplex and varicella-zoster infections section 5.3.2.1

Zovirax® (GSK) (POM)

Eye ointment, aciclovir 3%. Net price 4.5 g = £9.34

11.4 Corticosteroids and other anti-inflammatory preparations

11.4.1 Corticosteroids

11.4.2 Other anti-inflammatory preparations

11.4.1 Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation in uveitis (section 11.5) and following surgery.

Topical corticosteroids should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' may follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' may follow prolonged use.

Other side-effects of ocular corticosteroids include thinning of the cornea and sclera. Prolonged use in neonates and infants can cause adrenal suppression.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

Systemic corticosteroids (section 6.3.2) may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

BETAMETHASONE

Cautions see notes above

Side-effects see notes above

Indication and dose

Local treatment of inflammation (short-term)

Apply eye drops every 1–2 hours until controlled then reduce frequency; eye ointment 2–4 times daily or at night when used with eye drops

Betnesol® (UCB Pharma) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.23

Excipients include benzalkonium chloride, disodium edetate

Eye ointment, betamethasone sodium phosphate 0.1%. Net price 3 g = £1.36

Vistamethasone® (Martindale) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

Excipients include benzalkonium chloride

With neomycin

Betnesol-N® (UCB Pharma) (POM) 

Drops (for ear, eye, or nose), see section 12.1.1

DEXAMETHASONE

Cautions see notes above

Side-effects see notes above

Indication and dose

Local treatment of inflammation (short-term)

Apply eye drops 4–6 times daily; severe conditions every 30–60 minutes until controlled then reduce frequency

Maxidex® (Alcon) (POM)

Eye drops, dexamethasone 0.1%, hypromellose 0.5%. Net price 5 mL = £1.42; 10 mL = £2.80

Excipients include benzalkonium chloride, disodium edetate, polysorbate 80

Single use

Minims® Dexamethasone (Bausch & Lomb) (POM)

Eye drops, dexamethasone sodium phosphate 0.1%.

Net price 20 × 0.5 mL = £9.38

Excipients include disodium edetate

With antibacterials

Maxitrol® (Alcon) (POM)

Eye drops, dexamethasone 0.1%, hypromellose 0.5%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/mL. Net price 5 mL = £1.68

Excipients include benzalkonium chloride, polysorbate 20

Eye ointment, dexamethasone 0.1%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/g. Net price 3.5 g = £1.44

Excipients include hydroxybenzoates (parabens), wool fat

Sofradex® (Sanofi-Aventis) (POM)

Drops (for ear or eye), see section 12.1.1

FLUOROMETHOLONE

Cautions see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 2 years

Indication and dose

Local treatment of inflammation (short-term)

Apply 2–4 times daily (initially every hour for 24–48 hours then reduce frequency)

FML® (Allergan) (POM)

Ophthalmic suspension (= eye drops), fluorometholone 0.1%, polyvinyl alcohol (*Liquifilm*®) 1.4%. Net price 5 mL = £1.71; 10 mL = £2.95

Excipients include benzalkonium chloride, disodium edetate, polysorbate 80

HYDROCORTISONE ACETATE

Cautions see notes above

Side-effects see notes above

Indication and dose

Local treatment of inflammation (short-term)

Apply eye drops 4 times daily; apply eye ointment twice daily or at night

Hydrocortisone (Non-proprietary) (POM)

Eye drops, hydrocortisone acetate 1%. Net price 10 mL = £3.21

Eye ointment, hydrocortisone acetate 0.5%, net price 3 g = £2.88; 1%, 3 g = £6.71

PREDNISOLONE

Cautions see notes above

Side-effects see notes above

Indication and dose

Local treatment of inflammation (short-term)

Apply every 1–2 hours until controlled then reduce frequency

Pred Forte® (Allergan) (POM)

Eye drops, prednisolone acetate 1%. Net price 5 mL = £1.52; 10 mL = £3.05

Excipients include benzalkonium chloride, disodium edetate, polysorbate 80

Predsol® (UCB Pharma) (POM)

Drops (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £1.92

Excipients include benzalkonium chloride, disodium edetate

Single use

Minims® Prednisolone Sodium Phosphate (Bausch & Lomb) (POM)

Eye drops, prednisolone sodium phosphate 0.5%. Net price 20 × 0.5 mL = £10.08

Excipients include disodium edetate

With neomycin

Predsol-N® (UCB Pharma) (POM)

Drops (for ear or eye), see section 12.1.1

11.4.2 Other anti-inflammatory preparations

Eye drops containing antihistamines, such as antazoline (with xylometazoline as *Otrivine-Antistin*®), azelastine, epinastine, ketotifen, and olopatadine, can be used for allergic conjunctivitis.

Sodium cromoglicate and nedocromil sodium eye drops may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Emedastine eye drops are licensed for seasonal allergic conjunctivitis.

ANTAZOLINE SULPHATE

Indication and dose

Allergic conjunctivitis

See preparation below

Otrivine-Antistin® (Novartis Consumer Health)

Eye drops, antazoline sulphate 0.5%, xylometazoline hydrochloride 0.05%. Net price 10 mL = £2.35

Excipients include benzalkonium chloride, disodium edetate

Dose

Child 12–18 years apply 2–3 times daily (max. duration 7 days)

Note Xylometazoline is a sympathomimetic; it should be used with caution in patients susceptible to angle-closure glaucoma; absorption of antazoline and xylometazoline may result in systemic side-effects and the possibility of interaction with other drugs, see Appendix 1 (antihistamines and sympathomimetics)

AZELASTINE HYDROCHLORIDE

Side-effects mild transient irritation; bitter taste reported

Indication and dose

Allergic conjunctivitis, seasonal allergic conjunctivitis

Child 4–18 years apply twice daily, increased if necessary to 4 times daily

Perennial conjunctivitis

Child 12–18 years apply twice daily, increased if necessary to 4 times daily; max. duration of treatment 6 weeks

Optilast® (Meda) (POM)

Eye drops, azelastine hydrochloride 0.05%. Net price 8 mL = £6.40

Excipients include benzalkonium chloride, disodium edetate

EMEDASTINE

Side-effects transient burning or stinging; blurred vision, local oedema, keratitis, irritation, dry eye, lacrimation, corneal infiltrates (discontinue) and staining; photophobia; headache, and rhinitis occasionally reported

Indication and dose

Seasonal allergic conjunctivitis

Child 3–18 years apply twice daily

Emadine® (Alcon) (POM)

Eye drops, emedastine 0.05% (as difumarate), net price 5 mL = £7.31

Excipients include benzalkonium chloride

EPINASTINE HYDROCHLORIDE

Side-effects burning; *less commonly* dry mouth, taste disturbance; nasal irritation, rhinitis; headache, blepharoptosis, conjunctival oedema and hyperaemia, dry eye, local irritation, photophobia, visual disturbance; pruritus

Indication and dose

Seasonal allergic conjunctivitis

Child 12–18 years apply twice daily; max. duration of treatment 8 weeks

Relestat® (Allergan) (POM)

Eye drops, epinastine hydrochloride 500 micrograms/mL, net price 5 mL = £9.90

Excipients include benzalkonium chloride, disodium edetate

KETOTIFEN

Side-effects transient burning or stinging, punctate corneal epithelial erosion; *less commonly* dry eye, subconjunctival haemorrhage, photophobia; headache, drowsiness, skin reactions, and dry mouth also reported

Indication and dose

Seasonal allergic conjunctivitis

Child 3–18 years apply twice daily

Zaditen® (Novartis) (POM)

Eye drops, ketotifen (as fumarate) 250 micrograms/mL, net price 5 mL = £7.80

Excipients include benzalkonium chloride

LODOXAMIDE

Side-effects burning, stinging, itching, blurred vision, tear production disturbance, and ocular discomfort; *less commonly*, flushing, nasal dryness, dizziness, drowsiness, headache, blepharitis, and keratitis

Indication and dose

Allergic conjunctivitis

Child 4–18 years apply 4 times daily

Note Improvement of symptoms may sometimes require treatment for up to 4 weeks

Alomide® (Alcon) (POM)

Ophthalmic solution (= eye drops), lodoxamide 0.1% (as trometamol). Net price 10 mL = £5.21

Excipients include benzalkonium chloride, disodium edetate

Note Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in children over 4 years

NEDOCROMIL SODIUM

Side-effects transient burning and stinging; distinctive taste reported

Indication and dose

Seasonal and perennial allergic conjunctivitis

Child 6–18 years apply twice daily increased if necessary to 4 times daily; max. 12 weeks treatment for seasonal allergic conjunctivitis

Vernal keratoconjunctivitis

Child 6–18 years apply 4 times daily

Rapitil® (Sanofi-Aventis) (POM)

Eye drops, nedocromil sodium 2%. Net price 5 mL = £4.92

Excipients include benzalkonium chloride, disodium edetate

OLOPATADINE

Side-effects local irritation; less commonly keratitis, dry eye, local oedema, photophobia; headache, asthenia, dizziness; dry nose also reported

Indication and dose

Seasonal allergic conjunctivitis

Child 3–18 years apply twice daily; max. duration of treatment 4 months

Opatanol® (Alcon) (POM)

Eye drops, olopatadine (as hydrochloride) 1 mg/mL, net price 5 mL = £3.91

Excipients include benzalkonium chloride

SODIUM CROMOGLICATE

(Sodium cromoglycate)

Side-effects transient burning and stinging

Indication and dose

Allergic conjunctivitis, vernal keratoconjunctivitis

Apply eye drops 4 times daily

Sodium Cromoglicate (Non-proprietary) (POM)

Eye drops, sodium cromoglicate 2%. Net price 13.5 mL = £1.79

Brands include Hay-Crom® Aqueous, Opticrom® Aqueous, Vividrin®

Note Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis

Single use**Catacrom®** (Moorfields)

Eye drops, sodium cromoglicate 2%, net price 30 x 0.3 mL = £8.99

11.5 Mydriatics and cycloplegics

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as **tropicamide** 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. **Cyclopentolate** 1% (action up to 24 hours) or **atropine** (action up to 7 days) are preferable for producing cycloplegia for refraction in young children; tropicamide may be preferred in neonates. **Phenylephrine** 2.5% is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours. Phenylephrine 10% drops are contra-indicated in children owing to the risk of systemic effects.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids (section 11.4.1). Atropine is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate or **homatropine** (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

Cautions and contra-indications Darkly pigmented irides are more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber. Atropine, cyclopentolate, and homatropine should be used with caution in children under 3 months owing to the possible association between cycloplegia and the development of amblyopia; also, neonates are at increased risk of systemic toxicity.

Skilled tasks Children may not be able to undertake skilled tasks until vision clears after mydriasis.

Side-effects Ocular side-effects of mydriatics and cycloplegics include transient stinging and raised intra-ocular pressure; on prolonged administration, local irritation, hyperaemia, oedema, and conjunctivitis can occur. Contact dermatitis can occur with the antimuscarinic mydriatic drugs, especially atropine.

Toxic systemic reactions to atropine and cyclopentolate can occur in neonates and children; see section 1.2 for systemic side-effects of antimuscarinic drugs.

Antimuscarinics

ATROPINE SULPHATE

Cautions risk of systemic effects with eye drops in infants under 3 months, see notes above

Side-effects see notes above

Licensed use not licensed for use in children for uveitis

Indication and dose

Cycloplegia

Child 3 months–18 years apply drops or ointment twice daily for 3 days before procedure

Anterior uveitis

Child 2–18 years 1 drop up to 4 times daily

Atropine (Non-proprietary) (P_m)

Eye drops, atropine sulphate 0.5%, net price 10 mL = £2.78; 1%, 10 mL = £9.50

Single use

Minims® Atropine Sulphate (Bausch & Lomb) (P_m)

Eye drops, atropine sulphate 1%. Net price 20 × 0.5 mL = £12.71

CYCLOPENTOLATE HYDROCHLORIDE

Cautions see notes above

Side-effects see notes above

Indication and dose

See notes above

Cycloplegia

Child 3 months–12 years 1 drop of 1% eye drops 30–60 minutes before examination

Child 12–18 years 1 drop of 0.5% eye drops 30–60 minutes before examination

Uveitis

Child 3 months–18 years 1 drop of 0.5% eye drops (1% for deeply pigmented eyes) 2–4 times daily

Mydrilate® (Intrapharm) (P_m)

Eye drops, cyclopentolate hydrochloride 0.5%, net price 5 mL = £6.73; 1%, 5 mL = £6.73

Excipients include benzalkonium chloride

Single use

Minims® Cyclopentolate Hydrochloride (Bausch & Lomb) (P_m)

Eye drops, cyclopentolate hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.64

HOMATROPINE HYDROBROMIDE

Cautions see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 3 months

Indication and dose

See notes above

Child 3 months–2 years (0.5% only) 1 drop daily or on alternate days adjusted according to response

Child 2–18 years 1 drop twice daily adjusted according to response

Homatropine (Non-proprietary) (P_m)

Eye drops, homatropine hydrobromide 1%, net price 10 mL = £2.57; 2%, 10 mL = £2.71

Available without preservatives as manufactured specials from Moorfields Eye Hospital

Eye drops, homatropine 0.125% and 0.5%, 10 mL, available as a manufactured special from Moorfields Eye Hospital, see also 'special-order' manufacturers or specialist importing companies, p. 809

Excipients include chlorhexidine

TROPICAMIDE

Cautions see notes above

Side-effects see notes above

Indication and dose

See notes above

Funduscopy

Neonate and child apply 0.5% eye drops 20 minutes before examination

Myriacryl® (Alcon) (POM)

Eye drops, tropicamide 0.5%, net price 5 mL = £1.29; 1%, 5 mL = £1.60

Excipients include benzalkonium chloride, disodium edetate

▲ **Single use**

Minims® Tropicamide (Bausch & Lomb) (POM)

Eye drops, tropicamide 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.01

Sympathomimetics**PHENYLEPHRINE HYDROCHLORIDE**

Cautions cardiovascular disease (avoid or use 2.5% strength only); tachycardia; hyperthyroidism; diabetes; susceptibility to angle-closure glaucoma; see also notes above

Contra-indications 10% drops in neonates and children

Side-effects eye pain and stinging; blurred vision, photophobia; systemic effects include palpitations, arrhythmias, hypertension, coronary artery spasm; very rarely angle-closure glaucoma

Indication and dose**Mydriasis**

See notes above

▲ **Single use**

Minims® Phenylephrine Hydrochloride (Bausch & Lomb)

Eye drops, phenylephrine hydrochloride 2.5%, net price 20 × 0.5 mL = £9.53

Excipients include disodium edetate, sodium metabisulphite

11.6 Treatment of glaucoma

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. *Primary congenital glaucoma* is the most common form of glaucoma in children, followed by *secondary glaucomas*, such as following hereditary anterior segment malformations; *juvenile open-angle glaucoma* is less common and usually occurs in older children. *Primary angle closure glaucoma* (acute closed-angle glaucoma, narrow angle glaucoma) is very rare in children; it results from blockage of aqueous humour flow into the anterior chamber and is a medical emergency that requires urgent reduction of intra-ocular pressure, see below.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-

ocular pressure with surgery and drug therapy. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as miotics, sympathomimetics, or carbonic anhydrase inhibitors, to control intra-ocular pressure.

For urgent reduction of intra-ocular pressure and before surgery, **mannitol** 20% (up to 500 mL) is given by slow intravenous infusion until the intra-ocular pressure has been satisfactorily reduced (see section 2.2.5). **Acetazolamide** by intravenous injection can also be used for the emergency management of raised intra-ocular pressure.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, or a drainage operation in either primary open-angle or acute closed-angle glaucoma.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in *primary open-angle glaucoma*, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Cautions, contra-indications, and side-effects

Systemic absorption can follow topical application to the eye; therefore, eye drops containing a beta-blocker are contra-indicated in bradycardia, heart block, or uncontrolled heart failure. **Important:** for a warning to avoid in asthma, see below. Consider also other cautions, contra-indications, and side-effects of beta-blockers (p. 87). Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharconjunctivitis; occasionally corneal disorders have been reported.

Important Beta-blockers, even those with apparent cardioselectivity, should not be used in patients with asthma or a history of bronchospasm, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

Interactions Since systemic absorption may follow topical application the possibility of interactions, in particular with drugs such as verapamil, should be borne in mind. See also Appendix 1 (beta-blockers).

BETAXOLOL

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

See notes above

Apply twice daily

Betaxolol (Non-proprietary) (POM)

Eye drops, solution, betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90

Excipients may include benzalkonium chloride, disodium edetate

Betoptic® (Alcon) (POM)

Ophthalmic solution (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90
Excipients include benzalkonium chloride, disodium edetate

Ophthalmic suspension (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.66
Excipients include benzalkonium chloride, disodium edetate

Unit dose eye drop suspension, betaxolol (as hydrochloride) 0.25%, net price 50 × 0.25 mL = £13.77

CARTEOLOL HYDROCHLORIDE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

See notes above

Apply twice daily

Teoptic® (Spectrum Thea) (POM)

Eye drops, carteolol hydrochloride 1%, net price 5 mL = £7.60; 2%, 5 mL = £8.40

Excipients include benzalkonium chloride

LEVOBUNOLOL HYDROCHLORIDE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; anterior uveitis occasionally reported

Licensed use not licensed for use in children

Indication and dose

See notes above

Apply once or twice daily

Levobunolol (Non-proprietary) (POM)

Eye drops, levobunolol hydrochloride 0.5%. Net price 5 mL = £3.05

Excipients may include benzalkonium chloride, disodium edetate, sodium metabisulphite

Betagan® (Allergan) (POM)

Eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm®*) 1.4%. Net price 5-mL = £1.85

Excipients include benzalkonium chloride, disodium edetate, sodium metabisulphite

Unit dose eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm®*) 1.4%. Net price 30 × 0.4 mL = £9.98

Excipients include disodium edetate

TIMOLOL MALEATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

See notes above

Apply twice daily; long-acting preparations, see under preparations below

Timolol (Non-proprietary) (POM)

Eye drops, timolol (as maleate) 0.25%, net price 5 mL = £1.56; 0.5%, 5 mL = £1.56

Timoptol® (MSD) (POM)

Eye drops, in *Ocumeter®* metered-dose unit, timolol (as maleate) 0.25%, net price 5 mL = £3.12; 0.5%, 5 mL = £3.12

Excipients include benzalkonium chloride

Unit dose eye drops, timolol (as maleate) 0.25%, net price 30 × 0.2 mL = £8.45; 0.5%, 30 × 0.2 mL = £9.65

Once-daily preparations**Nyogel®** (Novartis) (POM)

Eye gel (= eye drops), timolol (as maleate) 0.1%, net price 5 g = £2.85

Excipients include benzalkonium chloride

Dose

Child 12–18 years apply once daily in the morning

Timoptol®-LA (MSD) (POM)

Ophthalmic gel-forming solution (= eye drops), timolol (as maleate) 0.25%, net price 2.5 mL = £3.12; 0.5%, 2.5 mL = £3.12

Excipients include benzododecinium bromide

Dose

Apply eye drops once daily

With dorzolamide

See under Dorzolamide

Prostaglandin analogues

The prostaglandin analogues **latanoprost**, and **travoprost**, and the synthetic prostamide, **bimatoprost**, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost is licensed for use in children; for prescribing information, see BNF section 11.6. Children receiving prostaglandin analogues should be managed by a specialist and monitored for any changes to eye coloration since an increase in the brown pigment in the iris can occur; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only.

Sympathomimetics

Apraclonidine (section 11.8.2) is an α_2 -adrenoceptor agonist. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

Brimonidine is an α_2 -adrenoceptor agonist that reduces intra-ocular pressure; it is contra-indicated in neonates and children under 2 years (risk of severe systemic side-effects), and should be used with caution in children 2–12 years (increased risk of drowsiness).

Carbonic anhydrase inhibitors and systemic drugs

The **carbonic anhydrase inhibitors**, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally; children and their carers should be told to report any unusual skin rash. It is not generally recommended for long-term use; electrolyte disturbances and metabolic acidosis that occur can be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).

Dorzolamide and **brinzolamide** are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The **osmotic diuretics**, intravenous hypertonic **mannitol** (section 2.2.5) or **glycerol** by mouth, are useful short-term ocular hypotensive drugs.

ACETAZOLAMIDE

Cautions not generally recommended for prolonged use but if given monitor blood count and plasma electrolyte concentration; pulmonary obstruction and impaired alveolar ventilation (risk of acidosis); diabetes mellitus; renal calculi; avoid extravasation at injection site (risk of necrosis); **interactions:** Appendix 1 (diuretics)

Contra-indications hypokalaemia, hyponatraemia, hyperchloraemic acidosis, adrenocortical insufficiency; long-term administration in chronic angle-closure glaucoma; sulfonamide hypersensitivity

Hepatic impairment manufacturer advises avoid

Renal impairment avoid; metabolic acidosis

Pregnancy manufacturer advises avoid, especially in first trimester (toxicity in animal studies)

Breast-feeding amount too small to be harmful

Side-effects see notes above; also nausea, vomiting, diarrhoea, taste disturbance, loss of appetite, paraesthesia, flushing, headache, dizziness, fatigue, irritability, excitement, ataxia, depression, thirst, polyuria; less commonly melaena, drowsiness, confusion, hearing disturbances, fever, glycosuria, metabolic acidosis and electrolyte disturbances on long-term therapy, haematuria, crystalluria, renal and ureteral colic, renal lesions or calculi, renal failure, blood disorders, bone marrow suppression, rash (including Stevens-Johnson syndrome and toxic epidermal necrosis); rarely fulminant hepatic necrosis, hepatitis, cholestatic jaundice, flaccid paralysis, convulsions, photosensitivity; also reported transient myopia

Licensed use not licensed for use in children for treatment of glaucoma

Indication and dose

Reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma, peri-operatively in angle-closure glaucoma

• By mouth or by intravenous injection

Child 1 month–12 years 5 mg/kg 2–4 times daily, adjusted according to response, max. 750 mg daily

Child 12–18 years 250 mg 2–4 times daily

Epilepsy

• By mouth or slow intravenous injection

Neonate initially 2.5 mg/kg 2–3 times daily, followed by 5–7 mg/kg 2–3 times daily (maintenance dose)

Child 1 month–12 years initially 2.5 mg/kg 2–3 times daily, followed by 5–7 mg/kg 2–3 times daily, max. 750 mg daily (maintenance dose)

Child 12–18 years 250 mg 2–4 times daily

Raised intracranial pressure

• By mouth or slow intravenous injection

Child 1 month–12 years initially 8 mg/kg 3 times daily, increased as necessary to max. 100 mg/kg daily

Diamox® (Goldshield) (P_M)

Tablets, acetazolamide 250 mg. Net price 112-tab pack = £12.68. Label: 3

Sodium Parenteral (= injection), powder for reconstitution, acetazolamide (as sodium salt). Net price 500-mg vial = £14.76

Modified release

Diamox® SR (Goldshield) (P_M)

Capsules, m/r, orange, enclosing orange f/c pellets, acetazolamide 250 mg. Net price 30-cap pack = £13.88. Label: 3, 25

Dose

Child 12–18 years glaucoma, 1–2 capsules daily

Extemporaneous formulations available see Extemporaneous Preparations, p. 6

BRINZOLAMIDE

Cautions systemic absorption follows topical application; neonates and infants with immature renal tubules—risk of metabolic acidosis; **interactions:** Appendix 1 (brinzolamide)

Contra-indications hyperchloraemic acidosis

Hepatic impairment manufacturer advises avoid

Renal impairment see Cautions above; also avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless essential—toxicity in animal studies

Breast-feeding manufacturer advises avoid

Side-effects local irritation, taste disturbance; less commonly nausea, dyspepsia, dry mouth, chest pain, epistaxis, haemoptysis, dyspnoea, rhinitis, pharyngitis, bronchitis, paraesthesia, depression, dizziness, headache, dermatitis, alopecia, corneal erosion

Licensed use not licensed for use in children

Indication and dose

Adjunct to beta-blockers or used alone in raised intra-ocular pressure in ocular hypertension and in open-angle glaucoma if beta-blocker alone inadequate or inappropriate

Apply twice daily increased to 3 times daily if necessary

Azopt® (Alcon) (P_M)

Eye drops, brinzolamide 10 mg/mL, net price 5 mL = £6.56

Excipients include benzalkonium chloride, disodium edetate

DORZOLAMIDE

Cautions systemic absorption follows topical application; history of renal calculi; neonates and infants with immature renal tubules—risk of metabolic acidosis; chronic corneal defects, history of intra-ocular surgery; **interactions:** Appendix 1 (dorzolamide)

Contra-indications hyperchloraemic acidosis

Hepatic impairment manufacturer advises caution—no information available

Renal impairment see Cautions above; also avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid—toxicity in animal studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, bitter taste; headache, asthenia; ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctate keratitis, eyelid inflammation; *less commonly* iridocyclitis; *rarely* hypersensitivity reactions (including urticaria, angioedema, bronchospasm), dizziness, paraesthesia, urolithiasis, eyelid crusting, transient myopia, corneal oedema, epistaxis, dry mouth, throat irritation; also reported metabolic acidosis

Licensed use not licensed for use in children

Indication and dose

Raised intra-ocular pressure in ocular hypertension, open-angle glaucoma, pseudo-exfoliative glaucoma either as adjunct to beta-blocker or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

Used alone, apply 3 times daily; with topical beta-blocker, apply twice daily

Unit dose eye drops, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

Dose

Raised intra-ocular pressure in open-angle glaucoma, or pseudoexfoliative glaucoma when beta-blockers alone not adequate

Apply twice daily

Miotics

Pilocarpine is a miotic used in the management of raised intra-ocular pressure. The small pupil is an unwanted effect of these drugs (except when pilocarpine is used temporarily before an operation for angle-closure glaucoma). Miotics act by opening up the inefficient drainage channels in the trabecular meshwork.

Cautions A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic. Miotics should be used with caution in patients with peptic ulceration, gastro-intestinal spasm, cardiac disease, hypertension, hypotension, asthma, epilepsy, hyperthyroidism, and urinary-tract obstruction.

Counselling Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

Contra-indications Miotics are contra-indicated in conditions where pupillary constriction is undesirable such as acute iritis, anterior uveitis and some forms of secondary glaucoma. They should be avoided in acute inflammatory disease of the anterior segment.

Pregnancy Miotics should be avoided unless the potential benefit outweighs the risk—limited information available.

Breast-feeding Miotics should be avoided unless the potential benefit outweighs the risk—no information available.

Side-effects Ciliary spasm leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment. Ocular side-effects include burning, itching, smarting, blurred vision, conjunctival vascular congestion, myopia, lens changes with chronic use, vitreous haemorrhage, and pupillary block. Systemic side-effects are rare following application to the eye.

PILOCARPINE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Dorzolamide (Non-proprietary) (POM)

Eye drops, dorzolamide (as hydrochloride) 2%, net price 5 mL = £5.61

Excipients may include benzalkonium chloride

Brands include Dorzant[®]

Trusopt[®] (MSD) (POM)

Ophthalmic solution (= eye drops), in *Ocumeter[®]*

Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

Excipients include benzalkonium chloride

Unit dose eye drops, dorzolamide (as hydrochloride) 2%, net price 60 × 0.2 mL = £24.18

▲ **With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

Dorzolamide with Timolol (Non-proprietary) (POM)

Eye drops, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

Excipients may include benzalkonium chloride

Cosopt[®] (MSD) (POM)

Ophthalmic solution (= eye drops), in *Ocumeter[®]*

Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

Excipients include benzalkonium chloride

Indication and dose

See also notes above

Raised intra-ocular pressure in ocular hypertension and open-angle glaucoma**Child 1 month–2 years** 1 drop of 0.5% or 1% solution 3 times daily**Child 2–18 years** 1 drop 4 times daily**Pre-operatively in goniotomy and trabeculectomy****Child 1 month–18 years** apply 1% or 2% solution once daily**Pilocarpine Hydrochloride** (Non-proprietary) (PoM)**Eye drops**, pilocarpine hydrochloride 1%, 10 mL = £3.00; 2%, 10 mL = £2.87; 4%, 10 mL = £3.83**Excipients** may include benzalkonium chloride▲ **Single use****Minims® Pilocarpine Nitrate** (Bausch & Lomb) (PoM)**Eye drops**, pilocarpine nitrate 2%, net price 20 × 0.5 mL = £10.04

11.7 Local anaesthetics

Oxybuprocaine and **tetracaine** are widely used topical local anaesthetics. **Proxymetacaine** causes less initial stinging and is particularly useful for children. Oxybuprocaine or a combined preparation of lidocaine and fluorescein is used for tonometry. Tetracaine produces more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. **Lidocaine**, with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery, while retrobulbar or peribulbar injections are used for surgery of the globe itself, see section 15.2, p. 649. Local anaesthetics should never be used for the management of ocular symptoms.

Caution Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

LIDOCAINE HYDROCHLORIDE

(Lignocaine hydrochloride)

Contra-indications avoid in preterm neonates**Indication and dose****Local anaesthetic**

Use as required

Minims® Lidocaine and Fluorescein (Bausch & Lomb)(PoM)**Eye drops**, lidocaine hydrochloride 4%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £10.61

OXYBUPROCAINE HYDROCHLORIDE

(Benoxinate hydrochloride)

Contra-indications avoid in preterm neonates**Indication and dose****Local anaesthetic**

Use as required

Minims® Oxybuprocaine Hydrochloride (Bausch & Lomb) (PoM)**Eye drops**, oxybuprocaine hydrochloride 0.4%. Net price 20 × 0.5 mL = £8.92

PROXYMETACAINE HYDROCHLORIDE

Contra-indications avoid in preterm neonates**Indication and dose****Local anaesthetic**

Use as required

Minims® Proxymetacaine (Bausch & Lomb) (PoM)**Eye drops**, proxymetacaine hydrochloride 0.5%. Net price 20 × 0.5 mL = £9.51▲ **With fluorescein****Minims® Proxymetacaine and Fluorescein** (Bausch & Lomb) (PoM)**Eye drops**, proxymetacaine hydrochloride 0.5%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £10.59

TETRACAINE HYDROCHLORIDE

(Amethocaine hydrochloride)

Contra-indications avoid in preterm neonates**Indication and dose****Local anaesthetic**

Use as required

Minims® Tetracaine Hydrochloride (Bausch & Lomb)(PoM)**Eye drops**, tetracaine hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £8.93

11.8 Miscellaneous ophthalmic preparations

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistimethate sodium, desferrioxamine, dexamethasone, gentamicin, and vancomycin, can be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

Preparations may also be available from Moorfields Eye Hospital as manufactured specials, see also 'special-order' manufacturers or specialist importing companies, p. 809.

11.8.1 Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion often responds to tear replacement therapy. The severity of the condition and the child's preference will often guide the choice of preparation.

Hypromellose is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently

(e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as **acetylcysteine** can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops are also used in the management of tear deficiency.

Sodium chloride 0.9% drops are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery and in first-aid for removal of harmful substances.

Eye ointments containing a **paraffin** can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

ACETYL CYSTEINE

Indication and dose

Tear deficiency, impaired or abnormal mucus production

Apply 3–4 times daily

Ilube® (Moorfields) (POM)

Eye drops, acetylcysteine 5%, hypromellose 0.35%.
Net price 10 mL = £10.09

Excipients include benzalkonium chloride, disodium edetate

CARBOMERS

(Polyacrylic acid)

Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol

Licensed use some preparations not licensed for use in children

Indication and dose

Dry eyes including keratoconjunctivitis sicca, unstable tear film

Apply 3–4 times daily or as required

GelTears® (Bausch & Lomb)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80

Excipients include benzalkonium chloride

Liposic® (Bausch & Lomb)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.96

Excipients include cetrimide

Lumecare® Long Lasting Tear Gel (Medicom)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.10

Excipients include cetrimide

Viscotears® (Novartis)

Liquid gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.94

Excipients include cetrimide

Liquid gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 30 × 0.6-mL single-dose units = £5.42

CARMELOSE SODIUM

Indication and dose

Dry eye conditions

Apply as required

Optive® (Allergan)

Eye drops, carmellose sodium 0.5%, glycerol, net price 10 mL = £7.49

Single use

Carmellose (Non-proprietary)

Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75

Note Each unit is resealable for up to 12 hours

Carmize® (Aspire)

Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75, 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £6.00

Celuveis® (Allergan)

Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75, 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £10.99

HYDROXYETHYLCELLULOSE

Indication and dose

Tear deficiency

Apply as required

Minims® Artificial Tears (Bausch & Lomb)

Eye drops, hydroxyethylcellulose 0.44%, sodium chloride 0.35%. Net price 20 × 0.5 mL = £8.21

HYDROXYPROPYL GUAR

Indication and dose

Dry eye conditions

Apply as required

Systane® (Alcon)

Eye drops, hydroxypropyl guar, net price 10 mL = £4.66

Single use

Systane® (Alcon)

Eye drops, hydroxypropyl guar, net price 28 × 0.8 mL = £4.66

HYPROMELLOSE

Indication and dose

Tear deficiency

Apply as required

Note The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

Hypromellose (Non-proprietary)

Eye drops, hypromellose 0.3%, net price 10 mL = £1.61

Excipients may include benzalkonium chloride

Brands include Lumecare® Hypromellose

Artelac® (Pharma-Global)

Eye drops, hypromellose 0.32%, net price 10 mL = £4.99

Excipients include cetrimide, disodium edetate

Isopto Alkaline® (Alcon)

Eye drops, hypromellose 1%, net price 10 mL = 94p

Excipients include benzalkonium chloride

Isopto Plain® (Alcon)

Eye drops, hypromellose 0.5%, net price 10 mL = 81p

Excipients include benzalkonium chloride

Tears Naturale® (Alcon)

Eye drops, hypromellose 0.3%, dextran '70' 0.1%, net price 15 mL = £1.60

Excipients include benzalkonium chloride, disodium edetate

▲ **Single use**

Artelac® SDU (Pharma-Global)

Eye drops, hypromellose 0.32%, net price 30 × 0.5 mL = £16.95

Hydromoor® (Moorfields)

Eye drops, hypromellose 0.3%, net price 30 × 0.4 mL = £5.75

Lumecare® Preservative Free Tear Drops (Medicom)

Eye drops, hypromellose 0.3%, net price 30 × 0.5 mL = £5.72

Tears Naturale® Single Dose (Alcon)

Eye drops, hypromellose 0.3%, dextran '70' 0.1%, net price 28 × 0.4 mL = £13.26

LIQUID PARAFFIN

Indication and dose

Dry eye conditions

Apply as required

Lacri-Lube® (Allergan)

Eye ointment, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%. Net price 3.5 g = £2.51, 5 g = £3.32

PARAFFIN, YELLOW, SOFT

Indication and dose

See notes above

Apply 2 hourly as required

Simple Eye Ointment

Ointment, liquid paraffin 10%, wool fat 10%, in yellow soft paraffin. Net price 4 g = £3.06

POLYVINYL ALCOHOL

Indication and dose

Tear deficiency

Apply as required

Liquifilm Tears® (Allergan)

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%. Net price 15 mL = £1.93

Excipients include benzalkonium chloride, disodium edetate

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%, povidone 0.6%. Net price 30 × 0.4 mL = £5.35

Sno Tears® (Bausch & Lomb)

Eye drops, polyvinyl alcohol 1.4%. Net price 10 mL = £1.06

Excipients include benzalkonium chloride, disodium edetate

SODIUM CHLORIDE

Indication and dose

Irrigation, including first-aid removal of harmful substances

Use as required

Sodium Chloride 0.9% Solutions

See section 13.11.1

Balanced Salt Solution

Solution (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.048%, magnesium chloride 0.03%, potassium chloride 0.075%

For intra-ocular or topical irrigation during surgical procedures

Brands include *Ilocare®*

▲ **Single use**

Minims® Saline (Bausch & Lomb)

Eye drops, sodium chloride 0.9%. Net price 20 × 0.5 mL = £6.59

SODIUM HYALURONATE

Indication and dose

Dry eye conditions

Apply as required

Hyabak® (Spectrum Thea)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £7.99

Hilo-Care® (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.1%, dexpanthenol 2%, net price 10 mL = £10.30

Hilo-Forte® (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.2%, net price 10 mL = £10.80

Hilo-Tear® (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.1%, net price 10 mL = £9.80

Lumecare® Sodium Hyaluronate (Medicom)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £3.97

Oxal® (Kestrel Ophthalmics)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £4.15

Vismed® Multi (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 10 mL = £6.81

▲ **Single use**

Clinitas® (Altacor)

Eye drops, sodium hyaluronate 0.4%, net price 30 × 0.5 mL = £5.70

Note Each unit is resealable for up to 12 hours

Ocusan® (Agepha)

Eye drops, sodium hyaluronate 0.2%, net price 20 × 0.5 mL = £5.25

Vismed® (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 20 × 0.3 mL = £5.10

Vismed® Gel (TRB Chemedica)

Eye drops, sodium hyaluronate 0.3%, net price 20 × 0.45 mL = £5.98

11.8.2 Ocular diagnostic and peri-operative preparations

Ocular diagnostic preparations

Fluorescein sodium is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

FLUORESCIN SODIUM

Indication and dose

Detection of lesions and foreign bodies

Sufficient to stain damaged areas

Minims® Fluorescein Sodium (Bausch & Lomb)

Eye drops, fluorescein sodium 1% or 2%. Net price 20 × 0.5 mL (both) = £7.53

▲ With local anaesthetic

Section 11.7

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.

Sodium hyaluronate is used during surgical procedures on the eye.

Apraclonidine, an α_2 -adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.

Balanced Salt Solution is used routinely in intra-ocular surgery (section 11.8.1).

ACETYLCHOLINE CHLORIDE

Cautions gastro-intestinal spasm, peptic ulcer; heart failure; asthma; hyperthyroidism; urinary-tract obstruction

Pregnancy avoid unless potential benefit outweighs risk—no information available

Breast-feeding avoid unless potential benefit outweighs risk—no information available

Licensed use not licensed for use in children

Indication and dose

Cataract surgery, penetrating keratoplasty, iridectomy, other anterior segment surgery requiring rapid complete miosis

Consult product literature

Miochol-E® (Novartis) (POM)

Intra-ocular irrigation, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

Miphtel® (SD Healthcare) (POM)

Intra-ocular irrigation, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

APRACLONIDINE

Note Apraclonidine is a derivative of clonidine

Cautions history of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, chronic renal failure; depression; pregnancy and breast-feeding; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in vision occurs in end-stage glaucoma; monitor for excessive reduction in intra-ocular pressure following peri-operative use; **interactions:** Appendix 1 (α_2 -adrenoceptor stimulants)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications history of severe or unstable and uncontrolled cardiovascular disease

Side-effects dry mouth, taste disturbance; hyperaemia, ocular pruritus, discomfort and lacrimation (withdraw if ocular intolerance including oedema of lids and conjunctiva); headache, asthenia, dry nose; lid retraction, conjunctival blanching and mydriasis reported after peri-operative use; since absorption may follow topical application systemic effects (see Clonidine, section 2.5.2) may occur

Licensed use 0.5% drops not licensed for use in children under 12 years; 1% drops not licensed for use in children

Indication and dose

See preparations below

lopidine® (Alcon) (POM)

Ophthalmic solution (= eye drops), apraclonidine 1% (as hydrochloride). Net price 12 × 2 single use 0.25-mL units = £77.81

Dose

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

Apply 1 drop 1 hour before laser procedure then 1 drop immediately after completion of procedure

Ophthalmic solution (= eye drops), apraclonidine 0.5% (as hydrochloride). Net price 5 mL = £10.88
Excipients include benzalkonium chloride

Dose

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug (see note below)

Child 12–18 years apply 1 drop 3 times daily usually for max. 1 month

Note May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

DISCLOFENAC SODIUM

Licensed use not licensed for use in children

Indication and dose

Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties), postoperative inflammation in cataract surgery, strabismus surgery, argon laser trabeculoplasty

consult product literature

Voltarol® Ophtha Multidose (Novartis) (POM)

Eye drops, diclofenac sodium 0.1%, net price 5 mL = £6.68

Excipients include benzalkonium chloride, disodium edetate, propylene glycol

Single use

Voltarol® Ophtha (Novartis) (POM)

Eye drops, diclofenac sodium 0.1%. Net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

FLURBIPROFEN SODIUM

Licensed use not licensed for use in children

Indication and dose

Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties), control of postoperative and post-laser trabeculoplasty inflammation (if corticosteroids contra-indicated)

consult product literature

Ocufen® (Allergan) (POM)

Ophthalmic solution (= eye drops), flurbiprofen sodium 0.03%, polyvinyl alcohol (*Liquifilm®*) 1.4%. Net price 40 × 0.4 mL = £37.15

KETOROLAC TROMETAMOL

Licensed use not licensed for use in children

Indication and dose

Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

consult product literature

Acular® (Allergan) (POM)

Eye drops, ketorolac trometamol 0.5%. Net price 5 mL = £3.00

Excipients include benzalkonium chloride, disodium edetate

tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and can cause adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation, and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, anti-muscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine and hyalalazine). Other drugs that can affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolour lenses).

11.9 Contact lenses

Some children and adolescents prefer to wear contact lenses rather than spectacles for both cosmetic and medical reasons. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased with extended continuous contact lens wear in children, and it is not recommended except where medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or

12.1 Drugs acting on the ear

12.1.1	Otitis externa
12.1.2	Otitis media
12.1.3	Removal of ear wax

12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as **aluminium acetate** solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-infective which is not used systemically (such as **neomycin** or **clioquinol**) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. **Aluminium acetate** ear drops are also effective against bacterial infection and inflammation of the ear. **Chloramphenicol** may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid (such as *Locorten-Vioform*[®]) are used for treating children when infection is present with inflammation and eczema. **Clotrimazole** 1% solution is used topically to treat fungal infection in otitis externa.

In view of reports of ototoxicity in patients with a perforated tympanic membrane (eardrum), manufacturers contra-indicate treatment with a topical aminoglycoside antibiotic in those with a tympanic perforation. However, many specialists do use these drops cautiously in the presence of a perforation in children with otitis media (section 12.1.2) and when other measures have failed for otitis externa.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal and may be used to treat mild otitis externa. More severe cases require treatment with an anti-inflammatory preparation with

This chapter also includes advice on the drug management of the following:

 oropharyngeal infections, p. 545
 periodontitis, p. 543

or without an anti-infective drug. A proprietary preparation containing acetic acid 2% (*EarCalm*® spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as **paracetamol** (section 4.7.1) or **ibuprofen** (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the child is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory canal, oral **flucloxacillin** (section 5.1.1.2) is the drug of choice; oral **ciprofloxacin** (section 5.1.12) or a systemic aminoglycoside may be needed for pseudomonal infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid (section 13.4) cream or ointment is then required, but prolonged use should be avoided.

Administration To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

Astringent preparations

ALUMINIUM ACETATE

Licensed use not licensed

Indication and dose

Inflammation in otitis externa (see notes above)

Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

Aluminium Acetate (Non-proprietary)

Ear drops 13%, aluminium sulphate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL

Available as manufactured special

Ear drops 8%, dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

Anti-inflammatory preparations

Corticosteroids

Topical corticosteroids are used to treat inflammation and eczema in otitis externa.

Cautions Prolonged use of topical corticosteroid ear preparations should be avoided.

Contra-indications Corticosteroid ear preparations should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

Side-effects Local sensitivity reactions may occur.

BETAMETHASONE SODIUM PHOSPHATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturers)

Indication and dose

Ecematous inflammation in otitis externa (see notes above); for dose, see under preparations

Eye section 11.4.1

Nose section 12.2.1 and section 12.2.3

Betnesol® (UCB Pharma) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.23

Excipients include benzalkonium chloride, disodium edetate

Dose

ear, instil 2–3 drops every 2–3 hours; reduce frequency when relief obtained

Vistamethasone® (Martindale) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

Excipients include benzalkonium chloride, disodium edetate

Dose

ear, instil 2–3 drops every 3–4 hours; reduce frequency when relief obtained

With antibacterial

Betnesol-N® (UCB Pharma) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.30

Excipients include benzalkonium chloride, disodium edetate

Dose

ear, instil 2–3 drops 3–4 times daily

DEXAMETHASONE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use *Sofradex*® licensed for use in children (age range not specified by manufacturers)

Indication and dose

Ecematous inflammation in otitis externa (see notes above); for dose, see under preparations

With antibacterial

Otomize® (GSK Consumer Healthcare) (POM)

Ear spray, dexamethasone 0.1%, neomycin sulphate 3250 units/mL, glacial acetic acid 2%. Net price 5-mL pump-action aerosol unit = £3.71

Excipients include hydroxybenzoates (parabens)

Dose

Child 2–18 years *ear*, apply 1 metered spray 3 times daily

Sofradex® (Sanofi-Aventis)  

Drops (for ear or eye), dexamethasone (as sodium metasulphobenzoate) 0.05%, framycetin sulphate 0.5%, gramicidin 0.005%. Net price 10 mL = £6.25
Excipients include polysorbate 80

Dose

ear, instil 2–3 drops 3–4 times daily; eye, section 11.4.1

FLUMETASONE PIVALATE

(Flumetasone Pivalate)

Cautions see notes above**Contra-indications** see notes above**Side-effects** see notes above**Indication and dose**

Eczematous inflammation in otitis externa (see notes above); for dose, see under preparation

With antibacterial**Locorten-Vioform®** (Amdipharm) 

Ear drops, flumetasone pivalate 0.02%, clioquinol 1%. Net price 7.5 mL = £1.76

Contra-indications iodine sensitivity

Dose

Child 2–18 years instil 2–3 drops into the ear twice daily for 7–10 days

Note Clioquinol stains skin and clothing

HYDROCORTISONE**Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above

Licensed use *Otosporin®* not licensed for use in children under 3 years; *other preparations* licensed for use in children (age range not specified by manufacturers)

Indication and dose

Eczematous inflammation in otitis externa (see notes above); for dose, see under preparations

With antibacterial**Gentisone® HC** (Amdipharm) 

Ear drops, hydrocortisone acetate 1%, gentamicin 0.3% (as sulphate). Net price 10 mL = £3.92

Excipients include benzalkonium chloride, disodium edetate

Dose

ear, instil 2–4 drops 3–4 times daily and at night

Otosporin® (GSK)  

Ear drops, hydrocortisone 1%, neomycin sulphate 3400 units, polymyxin B sulphate 10 000 units/mL. Net price 5 mL = £2.00; 10 mL = £4.00

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), polysorbate 20

Dose

Child 3–18 years instil 3 drops into the ear 3–4 times daily

PREDNISOLONE SODIUM PHOSPHATE**Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above

Licensed use licensed for use in children (age range not specified by manufacturers)

Indication and dose

Eczematous inflammation in otitis externa (see notes above); for dose, see under preparations

Eye section 11.4.1

Predsol® (UCB Pharma) 

Drops (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £1.92

Excipients include benzalkonium chloride, disodium edetate

Dose

ear, instil 2–3 drops every 2–3 hours; reduce frequency when relief obtained

With antibacterial**Predsol-N®** (UCB Pharma) 

Drops (for ear or eye), prednisolone sodium phosphate 0.5%, neomycin sulphate 0.5%. Net price 10 mL = £2.27

Excipients include benzalkonium chloride, disodium edetate

Dose

ear, instil 2–3 drops 3–4 times daily

Anti-infective preparations**CHLORAMPHENICOL** **Cautions** avoid prolonged use (see notes above)**Side-effects** high incidence of sensitivity reactions to vehicle**Licensed use** licensed for use in children (age range not specified by manufacturers)**Indication and dose**

Bacterial infection in otitis externa (but see notes above); for dose, see under preparation

Chloramphenicol (Non-proprietary)  

Ear drops, chloramphenicol in propylene glycol, net price 5%, 10 mL = £6.22; 10%, 10 mL = £5.62

Excipients include propylene glycol

Dose

ear, instil 2–3 drops 2–3 times daily

CLOTRIMAZOLE**Side-effects** occasional local irritation or sensitivity**Licensed use** licensed for use in children (age range not specified by manufacturer)**Indication and dose**

Fungal infection in otitis externa (see notes above); for dose, see under preparation

Canesten® (Bayer Consumer Care)

Solution, clotrimazole 1% in polyethylene glycol 400 (macrogol 400). Net price 20 mL = £2.43

Dose

ear, apply 2–3 times daily continuing for at least 14 days after disappearance of infection

FRAMYCETIN SULPHATE**Cautions** avoid prolonged use (see notes above)**Contra-indications** perforated tympanic membrane (see p. 534)**Side-effects** local sensitivity**Indication and dose****Bacterial infection in otitis externa** (see notes above)

Eye section 11.3.1

Acute otitis media Acute otitis media is the commonest cause of severe aural pain in young children and may occur with even minor upper respiratory tract infections. Children diagnosed with acute otitis media should not be prescribed antibacterials routinely as many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases

resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** (Table 1, section 5.1) may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the child is systemically unwell, if the child is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in children with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given. Topical antibacterial treatment of acute otitis media is ineffective and there is no place for ear drops containing a local anaesthetic.

Otitis media with effusion Otitis media with effusion ('glue ear') occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If 'glue ear' persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

Chronic otitis media Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa (section 12.1.1); this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial (Table 1, section 5.1); a swab should be taken to identify infecting organisms and antibacterial sensitivity. Parenteral antibacterial treatment is required if *Pseudomonas aeruginosa* or *Proteus spp.* are present.

Manufacturers contra-indicate topical treatment with ototoxic antibacterials in the presence of a perforation (section 12.1.1). However, many specialists use ear drops containing **aminoglycosides** (e.g. neomycin) or **polymyxins** if the otitis media has failed to settle with systemic antibacterials; it is considered that the pus in the middle ear associated with otitis media carries a higher risk of ototoxicity than the drops themselves. **Ciprofloxacin** or **ofloxacin** ear drops (both unlicensed; available from 'special-order' manufacturers or specialist importing companies, see p. 809) or eye drops used in the ear [unlicensed indication] are an effective alternative to aminoglycoside ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

12.1.3 Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax causing discomfort or impaired hearing may be softened with simple remedies such as **olive oil** ear drops or **almond oil** ear drops; **sodium bicarbonate** ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children unable to co-operate with the procedure, in children who have had otitis media in the last 6 weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

For administration of ear drops, see p. 535.

Almond Oil (Non-proprietary)

Ear drops, almond oil in a suitable container
Allow to warm to room temperature before use

Olive Oil (Non-proprietary)

Ear drops, olive oil in a suitable container
Allow to warm to room temperature before use

Sodium Bicarbonate (Non-proprietary)

Ear drops, sodium bicarbonate 5%, net price 10 mL = £1.25

Cerumol® (Thornton & Ross)

Ear drops, chlorobutanol 5%, arachis (peanut) oil 57.3%. Net price 11 mL = £1.76

Exterol® (Dermal)

Ear drops, urea–hydrogen peroxide complex 5% in glycerol. Net price 8 mL = £1.75

Molcer® (Wallace Mfg)

Ear drops, docusate sodium 5%. Net price 15 mL = £5.60
Excipients include propylene glycol

Otex® (DDD)

Ear drops, urea–hydrogen peroxide 5%. Net price 8 mL = £2.64

Waxsol® (Norgine)

Ear drops, docusate sodium 0.5%. Net price 10 mL = £1.21

5.1). Many nasal preparations contain sympathomimetic drugs (section 12.2.2) which can give rise to rebound congestion (*rhinitis medicamentosa*) and may damage the nasal cilia. **Sodium chloride 0.9%** solution may be used as a douche or 'sniff' following endonasal surgery.

Administration To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

Nasal polyps Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the 'head down' position. A short course of a systemic corticosteroid (section 6.3.2) may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

12.2.1 Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see also section 3.4.1) or topical **nasal corticosteroids**; systemic nasal decongestants (section 3.10) are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal **corticosteroids**; **cromoglycate** is an alternative, but may be less effective. The topical antihistamine, **azelastine**, is useful for controlling breakthrough symptoms in allergic rhinitis. Azelastine is less effective than nasal corticosteroids, but probably more effective than sodium cromoglycate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous long-term treatment may be required in perennial rhinitis.

Montelukast (section 3.3.2) is less effective than topical nasal corticosteroids; montelukast can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral **corticosteroids** (section 6.3.2) for short periods. Oral corticosteroids may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal **ipratropium bromide** (section 12.2.2) can reduce watery rhinorrhoea.

Pregnancy If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclomethasone, budesonide, fluticasone propionate, or sodium cromoglycate may be considered.

12.2 Drugs acting on the nose

12.2.1 Drugs used in nasal allergy

12.2.2 Topical nasal decongestants

12.2.3 Nasal preparations for infection

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials (Table 1, section

Antihistamines

AZELASTINE HYDROCHLORIDE

Side-effects irritation of nasal mucosa; bitter taste (if applied incorrectly)

Indication and dose

Treatment of allergic rhinitis for dose, see under preparation

Rhinolast® (Meda) ^(POM)

Nasal spray, azelastine hydrochloride 140 micrograms (0.14 mL)/metered spray. Net price 22 mL (157-spray unit with metered pump) = £10.45

Excipients include sodium edetate

Dose

Child 5–18 years apply 140 micrograms (1 spray) into each nostril twice daily

Note Preparations of azelastine hydrochloride can be sold to the public for nasal administration in aqueous form (other than by aerosol) for the treatment of seasonal allergic rhinitis or perennial allergic rhinitis in children over 5 years, subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses

Corticosteroids

Nasal preparations containing corticosteroids have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above). They are also used for the symptomatic treatment of adenoidal hypertrophy.

Cautions Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Side-effects Local side-effects include dryness, irritation of nose and throat, and epistaxis. Nasal ulceration has been reported, and occurs commonly with nasal preparations containing fluticasone furoate or mometasone furoate. Nasal septal perforation (usually following nasal surgery) occurs very rarely. Raised intra-ocular pressure or glaucoma may occur rarely. Headache, smell and taste disturbances may also occur. Hyperactivity, sleep disturbances, anxiety, depression, and aggression have been reported. Hypersensitivity reactions, including bronchospasm, have also been reported.

BECLOMETASONE DIPROPIONATE (Beclomethasone Dipropionate)

Cautions see notes above

Side-effects see notes above

Indication and dose

Prophylaxis and treatment of allergic and vasomotor rhinitis

Child 6–18 years apply 100 micrograms (2 sprays) into each nostril twice daily; max. total 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

Beclometasone (Non-proprietary) ^(POM)

Nasal spray, beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.52

Brands include *Nasobec Aqueous*®

Beconase® (A&H) ^(POM)

Nasal spray (aqueous suspension), beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit with applicator = £2.19

Excipients include benzalkonium chloride, polysorbate 80

BETAMETHASONE SODIUM PHOSPHATE

Cautions see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Non-infected inflammatory conditions of nose for dose, see under preparations

Eye section 11.4.1

Ear section 12.1.1

Betnesol® (UCB Pharma) ^(POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.23

Excipients include benzalkonium chloride, disodium edetate

Dose

nose, instil 2–3 drops into each nostril 2–3 times daily

Vistamethasone® (Martindale) ^(POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02, 10 mL = £1.16

Excipients include benzalkonium chloride, disodium edetate

Dose

nose, instil 2–3 drops into each nostril twice daily

BUDESONIDE

Cautions see notes above; **interactions:** Appendix 1 (corticosteroids)

Side-effects see notes above

Indication and dose

See under preparations

Budesonide (Non-proprietary) (POM)

Nasal spray, budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90

Dose

Prophylaxis and treatment of allergic and vasomotor rhinitis

Child 12–18 years apply 200 micrograms (2 sprays) into each nostril once daily in the morning *or* 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily

Nasal polyps

Child 12–18 years apply 100 micrograms (1 spray) into each nostril twice daily for up to 3 months

Rhinocort Aqua® (AstraZeneca) (POM)

Nasal spray, budesonide 64 micrograms/metered spray. Net price 120-spray unit = £2.49

Excipients include disodium edetate, polysorbate 80, potassium sorbate

Dose**Rhinitis**

Child 12–18 years 128 micrograms (2 sprays) into each nostril once daily in the morning *or* 64 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 64 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months

Nasal polyps

Child 12–18 years 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

FLUNISOLIDE

Cautions see notes above

Side-effects see notes above

Indication and dose**Prophylaxis and treatment of allergic rhinitis**

Child 5–14 years initially 25 micrograms (1 spray) into each nostril up to 3 times daily then reduced for maintenance

Child 14–18 years 50 micrograms (2 sprays) into each nostril twice daily, increased if necessary to max. 3 times daily then reduced for maintenance

Syntaris® (IVAX) (POM)

Aqueous nasal spray, flunisolide 25 micrograms/metered spray. Net price 240-spray unit with pump and applicator = £5.05

Excipients include benzalkonium chloride, butylated hydroxytoluene, disodium edetate, polysorbate 20, propylene glycol

FLUTICASONE PROPIONATE

Cautions see notes above; **interactions:** Appendix 1 (corticosteroids)

Side-effects see notes above

Indication and dose**Prophylaxis and treatment of allergic rhinitis**

Child 4–12 years 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased to max. twice daily if required

Child 12–18 years 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased to max. twice daily if required; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily

Nasal polyps see *Flixonase Nasule*® below

Flixonase® (A&H) (POM)

Aqueous nasal spray, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit with applicator = £11.01

Excipients include benzalkonium chloride, polysorbate 80

Flixonase Nasule® (A&H) (POM)

Nasal drops, fluticasone propionate 400 micrograms/unit dose, net price 28 × 0.4-mL units = £12.99

Excipients include polysorbate 20

Dose**Nasal polyps**

Child 16–18 years instil 200 micrograms (approx. 6 drops) into each nostril once or twice daily; consider alternative treatment if no improvement after 4–6 weeks

Nasofan® (IVAX) (POM)

Aqueous nasal spray, fluticasone propionate

50 micrograms/metered spray. Net price 150-spray unit = £8.41

Excipients include benzalkonium chloride, polysorbate 80

Fluticasone furoate**Avamys**® (GSK) ▼ (POM)

Nasal spray, fluticasone furoate 27.5 micrograms/metered spray, net price 120-spray unit = £6.44

Excipients include benzalkonium chloride, disodium edetate, polysorbate 80

Dose**Prophylaxis and treatment of allergic rhinitis**

Child 6–12 years 27.5 micrograms (1 spray) into each nostril once daily, increased if necessary to 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to 27.5 micrograms (1 spray) into each nostril once daily

Child 12–18 years 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to minimum effective dose, 27.5 micrograms (1 spray) into each nostril once daily may be sufficient

MOMETASONE FUROATE

Cautions see notes above

Side-effects see notes above

Indication and dose

See under preparation

Nasonex® (Schering-Plough) (POM)

Nasal spray, mometasone furoate 50 micrograms/metered spray. Net price 140-spray unit = £7.68

Excipients include benzalkonium chloride, polysorbate 80

Dose**Prophylaxis and treatment of allergic rhinitis**

Child 6–12 years 50 micrograms (1 spray) into each nostril once daily

Child 12–18 years 100 micrograms (2 sprays) into each nostril once daily, increased if necessary to max. 200 micrograms (4 sprays) into each nostril once daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily

TRIAMCINOLONE ACETONIDE

Cautions see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 6 years

Indication and dose**Treatment of allergic rhinitis**

Child 2–6 years 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months

Child 6–12 years 55 micrograms (1 spray) into each nostril once daily, increased if necessary to 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months

Child 12–18 years 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily

Nasacort® (Sanofi-Aventis) (POM)

Aqueous nasal spray, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39

Excipients include benzalkonium chloride, disodium edetate, polysorbate 80

Cromoglicate**SODIUM CROMOGLICATE**

(Sodium Cromoglycate)

Side-effects local irritation; rarely transient bronchospasm

Licensed use licensed for use in children (age range not specified by manufacturers)

Indication and dose

Prophylaxis of allergic rhinitis for dose, see under preparations

Rynacrom® (Sanofi-Aventis)

4% aqueous nasal spray, sodium cromoglicate 4% (5.2 mg/spray). Net price 22 mL (150-spray unit with pump) = £17.07

Excipients include benzalkonium chloride, disodium edetate

Dose

nose, 1 spray into each nostril 2–4 times daily

Vividrin® (Pharma-Global)

Nasal spray, sodium cromoglicate 2%. Net price 15 mL (approx. 110-spray unit) = £11.60

Excipients include benzalkonium chloride, edetic acid, polysorbate 80

Dose

Nose, 1 spray into each nostril 4–6 times daily

12.2.2 Topical nasal decongestants

Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should **not** be recom-

mended. Volatile substances (section 3.8) such as menthol and eucalyptus may encourage inhalation of warm moist air.

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (*rhinitis medicamentosa*) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

Ephedrine nasal drops is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs **oxymetazoline** and **xylometazoline** are more likely to cause a rebound effect.

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age (section 3.9.1).

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic **ipratropium bromide**.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (*Naseptin®*) cream (section 12.2.3) may be effective.

Systemic nasal decongestants—see section 3.10.

Sinusitis and oral pain Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with **ephedrine nasal drops** (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.

Sympathomimetics**EPHEDRINE HYDROCHLORIDE**

Cautions see notes above; also avoid excessive or prolonged use; hyperthyroidism; diabetes mellitus; cardiovascular disease (including hypertension); **interactions:** Appendix 1 (sympathomimetics)

Pregnancy avoid

Breast-feeding avoid

Side-effects local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported

Licensed use not licensed for use in children under 12 years

Indication and dose

Nasal congestion (see notes above)

Child 12–18 years instil 1–2 drops (0.5% strength) into each nostril up to 3 or 4 times daily when required; max. duration 7 days

Ephedrine (Non-proprietary)

Nasal drops, ephedrine hydrochloride 0.5%, net price 10 mL = £1.39; 1%, 10 mL = £1.63

Note The BP directs that if no strength is specified 0.5% drops should be supplied

Dental prescribing on NHS Ephedrine nasal drops may be prescribed

- Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

XYLOMETAZOLINE HYDROCHLORIDE

Cautions see under Ephedrine Hydrochloride and notes above; also avoid excessive or prolonged use

Pregnancy avoid

Side-effects see under Ephedrine Hydrochloride and notes above; in small children, also restlessness, sleep disturbances, and hallucinations (discontinue treatment)

Indication and dose

Nasal congestion for dose, see under preparations

Xylometazoline (Non-proprietary)

Nasal drops, xylometazoline hydrochloride 0.1%, net price 10 mL = £1.91

Dose

Child 12–18 years instil 2–3 drops into each nostril 2–3 times daily when required; max. duration 7 days

Brands include Otradrops®, Otrivine®

Paediatric nasal drops, xylometazoline hydrochloride 0.05%, net price 10 mL = £1.59

Dose

Child 6–12 years instil 1–2 drops into each nostril 1–2 times daily when required; max. duration 5 days

Brands include Otradrops®, Otrivine®

Nasal spray, xylometazoline hydrochloride 0.1%, net price 10 mL = £1.91

Dose

Child 12–18 years apply 1 spray into each nostril 1–3 times daily when required; max. duration 7 days

Brands include Otrivine®

Antimuscarinic**IPRATROPIUM BROMIDE**

Cautions see section 3.1.2; avoid spraying near eyes

Side-effects epistaxis, nasal dryness, and irritation; less frequently nausea, headache, and pharyngitis; very rarely antimuscarinic effects such as gastrointestinal motility disturbances, palpitations, and urinary retention

Indication and dose

Rhinorrhoea associated with allergic and non-allergic rhinitis

Child 12–18 years apply 42 micrograms (2 sprays) into each nostril 2–3 times daily

Asthma and reversible airways obstruction section 3.1.2

Rinatec® (Boehringer Ingelheim) (POM)

Nasal spray 0.03%, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £3.99

Excipients include benzalkonium chloride, disodium edetate

12.2.3 Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below. Acute complications such as periorbital cellulitis require hospital treatment. For systemic treatment of sinusitis, see Table 1, section 5.1.

Betnesol-N® (UCB Pharma) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.30

Excipients include benzalkonium chloride, disodium edetate

Dose

nose, instil 2–3 drops into each nostril 2–3 times daily

Note *Betnesol-N®* licensed for use in children (age range not specified by manufacturer)

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin®*), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population. A nasal ointment containing **mupirocin** is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the *eradication* (in both patients and staff) of nasal carriage of methicillin-resistant *Staphylococcus aureus* (MRSA). The ointment should be applied 3 times daily for 5 days and a sample taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream. For eradication of MRSA also consult local infection control policy. See section 13.10.1 for treatment of MRSA-infected open wounds. See section 5.1.1.2 for *treatment* of children with MRSA-positive throat swabs or systemic MRSA infection.

Bactroban Nasal® (GSK) (POM)

Nasal ointment, mupirocin 2% (as calcium salt) in white soft paraffin basis. Net price 3 g = £5.80

Dose

For eradication of nasal carriage of staphylococci, including methicillin-resistant *Staphylococcus aureus* (MRSA)

Apply 2–3 times daily to the inner surface of each nostril (see notes above)

Naseptin® (Alliance) (POM)

Cream, chlorhexidine hydrochloride 0.1%, neomycin sulphate 0.5%, net price 15 g = £1.90

Excipients include arachis (peanut) oil, cetostearyl alcohol

Dose

For eradication of nasal carriage of staphylococci

Apply to nostrils 4 times daily for 10 days

For preventing nasal carriage of staphylococci

Apply to nostrils twice daily

12.3 Drugs acting on the oropharynx

12.3.1 Drugs for oral ulceration and inflammation

12.3.2 Oropharyngeal anti-infective drugs

12.3.3 Lozenges and sprays

12.3.4 Mouthwashes and gargles

12.3.5 Treatment of dry mouth

12.3.1 Drugs for oral ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthous ulcers, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy. It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Children with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude secondary causes such as leukaemia.

Simple mouthwashes A saline mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of **chlorhexidine** mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthous ulcers.

Corticosteroids Topical corticosteroid therapy may be used for some forms of oral ulceration; for aphthous ulcers it is most effective if applied in the 'prodromal' phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets are useful in recurrent aphthous ulcers and erosive lichenoid lesions.

Beclometasone dipropionate inhaler (p. 147) 50–100 micrograms sprayed twice daily on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, **betamethasone** soluble tablets dissolved in water, can be used as a mouthwash to treat oral ulceration.

Systemic corticosteroid therapy (section 6.3.2) is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration and analgesia cannot be maintained continuously throughout the day. When local anaesthetics are used in the mouth, care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Benzylamine mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some children find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water.

Flurbiprofen lozenges are licensed for the relief of sore throat in adolescents.

Choline salicylate dental gel has some analgesic action and may provide relief for recurrent aphthous ulcers in children over 16 years of age.

Periodontitis Low-dose **doxycycline** (*Periostat®*) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis in children over 12 years; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.

BENZYLAMINE HYDROCHLORIDE

Side-effects occasional numbness or stinging; rarely hypersensitivity reactions

Licensed use *Difflam® Spray* licensed for use in children (age range not specified by manufacturer)

Indication and dose

Painful inflammatory conditions of oropharynx for dose, see under preparations

Difflam® (3M)

Oral rinse, green, benzylamine hydrochloride 0.15%, net price 200 mL (*Difflam® Sore Throat Rinse*) = £2.50; 300 mL = £4.01

Dose

Child 12–18 years rinse or gargle, using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days

Dental prescribing on NHS May be prescribed as Benzylamine Mouthwash 0.15%

Spray, benzydamine hydrochloride 0.15%. Net price 30-mL unit = £3.17

Dose

Child under 6 years 1 puff per 4 kg body-weight to max. 4 puffs onto affected area every 1½–3 hours

Child 6–12 years 4 puffs onto affected area every 1½–3 hours

Child 12–18 years 4–8 puffs onto affected area every 1½–3 hours

Dental prescribing on NHS May be prescribed as Benzzydamine Oromucosal Spray 0.15%

CORTICOSTEROIDS

Contra-indications untreated oral infection

Side-effects occasional exacerbation of local infection; thrush or other candidal infections

Licensed use *Hydrocortisone mucoadhesive buccal tablets* licensed for use in children (under 12 years—on medical advice only)

Indication and dose

Oral and perioral lesions for dose, see under preparations

Hydrocortisone (Non-proprietary)

Mucoadhesive buccal tablets (= oromucosal tablets), hydrocortisone 2.5 mg (as sodium succinate). Net price 20 = £2.03

Dose

1 lozenge 4 times daily, allowed to dissolve slowly in the mouth in contact with the ulcer

Dental prescribing on NHS May be prescribed as Hydrocortisone Oromucosal Tablets

Betnesol® (UCB Pharma) (POM)

Soluble tablets, pink, scored, betamethasone 500 micrograms (as sodium phosphate), net price 100-tab pack = £4.97. Label: 10, steroid card, 13, 21

Dose

Oral ulceration

Child 12–18 years 500 micrograms dissolved in 20 mL water and rinsed around the mouth 4 times daily; not to be swallowed

Dental prescribing on NHS May be prescribed as Betamethasone Soluble Tablets 500 micrograms

DOXYCYCLINE

Cautions section 5.1.3; monitor for superficial fungal infection, particularly if predisposition to oral candidiasis

Contra-indications section 5.1.3

Hepatic impairment section 5.1.3

Renal impairment section 5.1.3

Pregnancy section 5.1.3

Breast-feeding section 5.1.3

Side-effects section 5.1.3; fungal superinfection

Indication and dose

See under preparations

Oral herpes section 12.3.2

Other indications section 5.1.3

Periostat® (Alliance) (POM)

Tablets, f/c, doxycycline (as hyclate) 20 mg, net price 56-tab pack = £16.50. Label: 6, 11, 27, counselling, posture

Dose

Periodontitis (as an adjunct to gingival scaling and root planing)

Child 12–18 years 20 mg twice daily for 3 months

Counselling Tablets should be swallowed whole with plenty of fluid, while sitting or standing

Dental prescribing on NHS May be prescribed as Doxycycline Tablets 20 mg

Local application

For severe recurrent aphthous ulceration, a 100 mg doxycycline dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes 4 times daily usually for 3 days; it should preferably not be swallowed [unlicensed indication].

Note Doxycycline stains teeth; avoid in children under 12 years of age

FLURBIPROFEN

Cautions section 10.1.1

Contra-indications section 10.1.1

Hepatic impairment section 10.1.1

Renal impairment section 10.1.1

Pregnancy section 10.1.1

Breast-feeding section 10.1.1

Side-effects taste disturbance, mouth ulcers (move lozenge around mouth); see also section 10.1.1

Indication and dose

Relief of sore throat for dose, see under preparation

Strefen® (Reckitt Benckiser)

Lozenges, flurbiprofen 8.75 mg, net price 16 = £2.24

Dose

Child 12–18 years allow 1 lozenge to dissolve slowly in the mouth every 3–6 hours, max. 5 lozenges in 24 hours, for max. 3 days

SALICYLATES

Cautions frequent application, especially in children, may give rise to salicylate poisoning

Contra-indications children under 16 years

Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome

Indication and dose

Mild oral and perioral lesions for dose, see under preparations

Choline salicylate

Choline Salicylate Dental Gel, BP

Oral gel, choline salicylate 8.7% in a flavoured gel basis, net price 15 g = £1.89

Brands include *Bonjela®* (sugar-free)

Dose

Child 16–18 years apply ½-inch of gel with gentle massage not more often than every 3 hours

Dental prescribing on NHS Choline Salicylate Dental Gel may be prescribed

Salicylic acid

Pyralvex® (Norgine)

Oral paint, brown, rhubarb extract (anthraquinone glycosides 0.5%), salicylic acid 1%. Net price 10 mL with brush = £3.25

Dose

Child 16–18 years apply 3–4 times daily; max duration 7 days

12.3.2 Oropharyngeal anti-infective drugs

Sore throat is usually a self-limiting condition often caused by viral infection which does not benefit from anti-infective treatment. Adequate analgesia may be all that is required. Systemic **antibacterials** (Table 1, section 5.1) should only be used in severe cases where there is concern for the child's overall clinical condition. Acute ulcerative gingivitis (Vincent's infection) requires treatment with oral **metronidazole** (section 5.1.11).

Benzylamine (section 12.3.1) may be beneficial in relieving pain and dysphagia in children, especially after tonsillectomy or the use of a nasogastric tube.

Oropharyngeal viral infections

Children with varicella-zoster infection often develop painful lesions in the mouth and throat. **Benzylamine** (section 12.3.1) may be used to provide local analgesia. **Chlorhexidine** mouthwash or gel (section 12.3.4) will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In severe herpetic stomatitis systemic **aciclovir** or **valaciclovir** (section 5.3.2.1) may be used for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used to prevent frequently recurring herpes simplex lesions of the mouth particularly when associated with the initiation of erythema multiforme. For the treatment of labial herpes simplex infections, see section 13.10.3.

Herpes infections of the mouth in children aged over 12 years may also respond to rinsing the mouth with **doxycycline** (section 12.3.1).

Oropharyngeal fungal infections

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics, or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the

problem. Treatment with **nystatin** or **miconazole** may be needed. **Fluconazole** (section 5.2.1) is effective for unresponsive infections or if a topical antifungal drug cannot be used. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred (section 5.2.1).

Acute erythematous candidiasis Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with **fluconazole** (section 5.2.1).

Angular cheilitis Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. While the underlying cause is being identified and treated, it is often helpful to apply **miconazole** cream (p. 588) or **sodium fusidate** ointment (p. 587); if the angular cheilitis is unresponsive to treatment, **miconazole** and **hydrocortisone** cream or ointment (p. 559) can be used.

Immunocompromised patients For advice on prevention of fungal infections in immunocompromised children see p. 301.

For the role of antiseptic mouthwashes in the prevention of oral candidiasis in immunocompromised children, see section 12.3.4.

Drugs used in oropharyngeal candidiasis **Nystatin** is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. **Miconazole** is used by local application (as an oral gel) in the mouth but it is also absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. In neonates, nystatin oral suspension or miconazole oral gel is used for the treatment of oropharyngeal candidiasis; to prevent re-infection it is important to ensure that the mother's breast nipples and the teats of feeding bottles are cleaned adequately.

Fluconazole (section 5.2.1) given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when topical therapy cannot be used. **Itraconazole** (section 5.2.1) can be used for fluconazole-resistant infections.

If candidal infection fails to respond after 1 to 2 weeks of treatment with antifungal drugs the child should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract.

MICONAZOLE

Cautions avoid in acute porphyria (section 9.8.2);

interactions: Appendix 1 (antifungals, imidazole)

Contra-indications impaired swallowing reflex

Hepatic impairment avoid

Pregnancy manufacturer advises avoid if possible—
toxicity at high doses in animal studies

Breast-feeding manufacturer advises caution—no information available

Side-effects nausea and vomiting, *very rarely* diarrhoea (usually on long-term treatment), hepatitis, rash, toxic epidermal necrolysis, and Stevens-Johnson syndrome

Licensed use not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term

Indication and dose

Prevention and treatment of oral and intestinal fungal infections

• By mouth

Neonate (oral fungal infections only) 1 mL 2–4 times daily smeared around the mouth after feeds

Child 1 month–2 years 2.5 mL twice daily smeared around the mouth after food

Child 2–6 years 5 mL twice daily after food; retain near lesions before swallowing

Child 6–12 years 5 mL 4 times daily after food; retain near lesions before swallowing

Child 12–18 years 5–10 mL 4 times daily after food; retain near lesions before swallowing

Note Treatment should be continued for 48 hours after lesions have healed

Localised lesions

Child 2–18 years smear small amount on affected area with clean finger 4 times daily for 5–7 days (orthodontic appliances should be removed at night and brushed with gel); continue treatment for 48 hours after lesions have healed

Daktarin[®] (Janssen) (POM)

Oral gel, sugar-free, orange-flavoured, miconazole 24 mg/mL (20 mg/g). Net price 15-g tube = £2.85, 80-g tube = £4.38. Label: 9, counselling, hold in mouth, after food

Dental prescribing on NHS May be prescribed as Miconazole Oromucosal Gel

1. 15-g tube can be sold to the public

NYSTATIN

Side-effects oral irritation and sensitisation, nausea reported

Licensed use *suspension* not licensed for use in neonates for the treatment of candidiasis

Indication and dose

Oral and perioral fungal infections

Neonate 100 000 units 4 times daily after feeds

Child 1 month–18 years 100 000 units 4 times daily after food

Note Treatment is usually given for 7 days, and continued for 48 hours after lesions have healed.

Skin infections section 13.10.2

Nystan[®] (Squibb) (POM)

Oral suspension, yellow, nystatin 100 000 units/mL. Net price 30 mL with pipette = £1.91. Label: 9, counselling, use of pipette, hold in mouth, after food

Dental prescribing on NHS May be prescribed as Nystatin Oral Suspension

12.3.3 Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

12.3.4 Mouthwashes and gargles

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal for its cleansing effect and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting **compound sodium chloride mouthwash** with an equal volume of warm water. **Mouthwash solution-tablets** containing thymol are used to remove unpleasant tastes.

Mouthwashes containing an oxidising agent, such as **hydrogen peroxide**, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection). Hydrogen peroxide solution has also a mechanical cleansing effect arising from frothing when in contact with oral debris, but in concentrations greater than 1.5% may cause ulceration and tissue damage.

Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; allow at least 30 minutes between using the mouthwash and toothpaste.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the child has a haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.

CHLORHEXIDINE GLUCONATE

Side-effects mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling reported

Note Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; leave an interval of at least 30 minutes between using mouthwash and toothpaste

Licensed use licensed for use in children (age range not specified by manufacturer); *Corsodyl*® not licensed for use in children under 12 years (unless on the advice of a healthcare professional)

Indication and dose

See under preparations below

Chlorhexidine (Non-proprietary)

Mouthwash, chlorhexidine gluconate 0.2%, net price 300 mL = £2.51

Dose

Oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers

Rinse mouth with 10 mL for about 1 minute twice daily

Dental prescribing on NHS Chlorhexidine Mouthwash may be prescribed

Corsodyl® (GSK Consumer Healthcare)

Dental gel, chlorhexidine gluconate 1%. Net price 50 g = £1.21

Dose

Oral hygiene and plaque inhibition and gingivitis

Brush on the teeth once or twice daily

Oral candidiasis and management of aphthous ulcers

Apply to affected areas once or twice daily

Dental prescribing on NHS May be prescribed as Chlorhexidine Gluconate Gel

Mouthwash, chlorhexidine gluconate 0.2%. Net price 300 mL (original or mint) = £2.18, 600 mL (mint) = £3.85

Dose

Oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers

Rinse mouth with 10 mL for about 1 minute twice daily

Oral spray, chlorhexidine gluconate 0.2% (mint-flavoured). Net price 60 mL = £4.10

Dose

Oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers

Apply as required to tooth, gingival, or ulcer surfaces using up to 12 actuations (approx. 0.14 mL/actuation) twice daily

Dental prescribing on NHS May be prescribed as Chlorhexidine Oral Spray

Periogard® (Colgate-Palmolive)

Oromucosal solution, alcohol-free, chlorhexidine gluconate 0.2%, net price 300 mL = £1.96

Dose

Short-term treatment of inflammation of gingival and oral mucosa

Child 6–18 years rinse mouth with 10 mL for about 1 minute twice daily

Dental prescribing on NHS May be prescribed as Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%

With chlorobutanol**Eludril**® (Fabre)

Mouthwash or gargle, chlorhexidine gluconate 0.1%, chlorobutanol 0.5% (mint-flavoured), net price 90 mL = £1.36, 250 mL = £2.83, 500 mL = £5.06

Dose**Oral hygiene and plaque inhibition**

Use 10–15 mL (diluted with warm water in measuring cup provided) 2–3 times daily

HEXETIDINE

Side-effects local irritation; *very rarely* taste disturbance and transient anaesthesia

Indication and dose

Oral hygiene for dose, see preparation below

Oraldene® (McNeil)

Mouthwash or gargle, red or blue-green (mint-flavoured), hexetidine 0.1%. Net price 100 mL = £1.31; 200 mL = £2.02

Dose

Child 6–18 years use 15 mL (undiluted) 2–3 times daily

HYDROGEN PEROXIDE

Side-effects hypertrophy of papillae of tongue on prolonged use

Indication and dose

Oral hygiene (see notes above); for dose, see under preparations

Hydrogen Peroxide Mouthwash, BP

Mouthwash, consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

Dose

Rinse the mouth for 2–3 minutes with 15 mL diluted in half a tumblerful of warm water 2–3 times daily (see notes above)

Dental prescribing on NHS Hydrogen Peroxide Mouthwash may be prescribed

Peroxyl® (Colgate-Palmolive)

Mouthwash, hydrogen peroxide 1.5%, net price 300 mL = £2.54

Dose

Child 6–18 years, rinse the mouth with 10 mL for about 1 minute 3 times daily (after meals and at bedtime) for max. 7 days

SODIUM CHLORIDE**Indication and dose**

Oral hygiene (see notes above); for dose, see under preparation

Sodium Chloride Mouthwash, Compound, BP

Mouthwash, sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with a peppermint flavour

Dose

Extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL

To be diluted with an equal volume of warm water

Dental prescribing on NHS Compound Sodium Chloride Mouthwash may be prescribed

THYMOL**Indication and dose**

Oral hygiene (see notes above); for dose, see under preparation

Mouthwash Solution-tablets

Consist of tablets which may contain antimicrobial, colouring, and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes. Net price 100-tab pack = £15.09

Dose

Dissolve 1 tablet in a tumblerful of warm water

Note Mouthwash Solution-tablets may contain ingredients such as thymol

Dental prescribing on NHS Mouthwash Solution-tablets may be prescribed

Local treatment

Artificial saliva products with **ACBS approval** may be prescribed for children with dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome. SST tablets may also be prescribed on the NHS.

AS Saliva Orthana® (AS Pharma)

Oral spray, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral, net price 50-mL bottle = £4.92; 500-mL refill = £34.27

Dose

(ACBS) spray 2–3 times onto oral and pharyngeal mucosa, when required

Dental prescribing on NHS *AS Saliva Orthana®* Oral Spray may be prescribed

Lozenges, mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral, net price 30-lozenge pack = £3.50

Note *AS Saliva Orthana®* lozenges do not contain fluoride

Dental prescribing on NHS *AS Saliva Orthana®* Lozenges may be prescribed

Biotène Oralbalance® (GSK)

Saliva replacement gel, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.10; 24 × 12.4 mL tube = £30.40 (for hospital use)

Dose**Symptomatic treatment of dry mouth**

Apply to gums and tongue as required

Note Avoid use with toothpastes containing detergents (including foaming agents)

Dental prescribing on NHS *Biotène Oralbalance®* Saliva Replacement Gel may be prescribed

BioXtra® (RIS Products)

Gel, lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94

Dose

(ACBS) apply to oral mucosa as required

Dental prescribing on NHS *BioXtra®* Gel may be prescribed

Glandosane® (Fresenius Kabi)

Aerosol spray, carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75, net price 50-mL unit (neutral, lemon or peppermint flavoured) = £4.82

Dose

(ACBS) spray onto oral and pharyngeal mucosa as required

Dental prescribing on NHS *Glandosane®* Aerosol Spray may be prescribed

Saliveze® (Wyvern)

Oral spray, carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral, net price 50-mL bottle (mint-flavoured) = £3.50

Dose

(ACBS) 1 spray onto oral mucosa as required

Dental prescribing on NHS *Saliveze®* Oral Spray may be prescribed

12.3.5 Treatment of dry mouth

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.

Salivix® (Galen)

Pastilles, sugar-free, reddish-amber, acacia, malic acid and other ingredients. Net price 50-pastille pack = £3.50

Dose

(ACBS) suck 1 pastille when required

Dental prescribing on NHS *Salivix®* Pastilles may be prescribed

SST (Medac)

Tablets, sugar-free, citric acid, malic acid and other ingredients in a sorbitol base, net price 100-tab pack = £4.86

Dose

Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts

Allow 1 tablet to dissolve slowly in the mouth when required

Dental prescribing on NHS May be prescribed as Saliva Stimulating Tablets

Xerotin® (SpePharm)

Oral spray, sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral. Net price 100-mL unit = £6.86

Dose

Symptomatic treatment of dry mouth

Spray as required

Dental prescribing on NHS *Xerotin®* Oral Spray may be prescribed as Artificial Saliva Oral Spray

The British Association of Dermatologists' list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/site/495/default.aspx.

13.1 Management of skin conditions

When prescribing topical preparations for the treatment of skin conditions in children, the site of application, the condition being treated, and the child's (and carer's) preference for a particular vehicle all need to be taken into consideration.

Neonates Caution is required when prescribing topical preparations for neonates—their large body surface area in relation to body mass increases susceptibility to toxicity from systemic absorption of substances applied to the skin. Topical preparations containing potentially sensitising substances such as corticosteroids, aminoglycosides, iodine, and parasitocidal drugs should be avoided. Preparations containing alcohol should be avoided because they can dehydrate the skin, cause pain if applied to raw areas, and the alcohol can cause necrosis.

In *preterm neonates*, the skin is more fragile and offers a poor barrier, especially in the first fortnight after birth. Preterm infants, especially if below 32 weeks post-

menstrual age, may also require special measures to maintain skin hydration.

13.1.1 Vehicles

The vehicle in topical preparations for the skin affects the degree of hydration, has a mild anti-inflammatory effect, and aids the penetration of the active drug. Therefore, the vehicle, as well as the active drug, should be chosen on the basis of their suitability for the child's skin condition.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Colloids are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid and hard paraffin. Some ointment bases have both *hydrophilic* and *lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to

prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of their preparation.

13.1.2 Suitable quantities for prescribing

Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of the body	Creams and Ointments		Lotions
Face	15–30 g	100 mL	
Both hands	25–50 g	200 mL	
Scalp	50–100 g	200 mL	
Both arms or both legs	100–200 g	200 mL	
Trunk	400 g	500 mL	
Groins and genitalia	15–25 g	100 mL	

The amounts shown above are usually suitable for children 12–18 years for twice daily application for 1 week; smaller quantities will be required for children under 12 years. These recommendations **do not apply** to corticosteroid preparations.

13.1.3 Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, then products containing the substance should be avoided (see also Anaphylaxis, p. 159). The following excipients in topical preparations may rarely be associated with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance, p. 2.

Beeswax	Imidurea
Benzyl alcohol	Isopropyl palmitate
Butylated hydroxyanisole	N-(3-Chloroallyl)hexamine chloride (quaternium 15)
Butylated hydroxytoluene	Polysorbates
Cetostearyl alcohol (including cetyl and stearyl alcohol)	Propylene glycol
Chlorocresol	Sodium metabisulphite
Edetic acid (EDTA)	Sorbic acid
Ethylenediamine	Wool fat and related substances including lanolin ¹
Fragrances	
Hydroxybenzoates (parabens)	

1. Purified versions of wool fat have reduced the problem

13.2 Emollient and barrier preparations

13.2.1 Emollients

13.2.2 Barrier preparations

Borderline substances The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated. See Appendix 2 for listing by clinical condition.

13.2.1 Emollients

Emollients hydrate the skin, soften the skin, act as barrier to water and external irritants, and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2); they should be applied in the direction of hair growth immediately after washing or bathing to maximise the effect of skin hydration. The choice of an appropriate emollient will depend on the severity of the condition, the child's (or carer's) preference, and the site of application. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Fire hazard with paraffin-based emollients

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Children and their carers should be told to keep away from fire or flames and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1.1) may also be helpful.

In the *neonate*, a preservative-free paraffin-based emollient hydrates the skin without affecting the normal skin flora; substances such as olive oil are also used. The development of blisters (epidermolysis bullosa) or ichthyosis may be alleviated by applying liquid and white soft paraffin ointment while awaiting dermatological investigation.

Preparations containing an antibacterial (section 13.10.1) should be avoided unless infection is present or is a frequent complication of the dry skin condition.

Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including

ichthyosis). It is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

▲ Non-proprietary emollient preparations

Aqueous Cream, BP

Cream, emulsifying ointment 30%, ¹phenoxyethanol 1% in freshly boiled and cooled purified water, net price 100 g = £1.51, 500 g = £1.86

Excipients include cetostearyl alcohol

1. The BP permits use of alternative antimicrobials provided their identity and concentration are stated on the label

Emulsifying Ointment, BP

Ointment, emulsifying wax 30%, white soft paraffin 50%, liquid paraffin 20%, net price 500 g = £2.22

Excipients include cetostearyl alcohol

Hydrous Ointment, BP

Ointment, (oily cream), dried magnesium sulphate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water, net price 500 g = £2.92

Liquid and White Soft Paraffin Ointment, NPF

Ointment, liquid paraffin 50%, white soft paraffin 50%, net price 500 g = £6.09

Paraffin, White Soft, BP

White petroleum jelly, net price 100 g = 51p

Paraffin, Yellow Soft, BP

Yellow petroleum jelly, net price 100 g = 49p

▲ Proprietary emollient preparations

Aquamol® (Thornton & Ross)

Cream, containing liquid paraffin, white soft paraffin, net price 50 g = £1.22, 500-g pump pack = £6.40

Excipients include cetostearyl alcohol, chlorocresol

Aveeno® (J&J)

Cream, colloidal oatmeal in emollient basis, net price 100 mL = £3.78, 300-mL pump pack = £6.80

Excipients include benzyl alcohol, cetyl alcohol, isopropyl palmitate
ACBS: For endogenous and exogenous eczema, xeroderma, and ichthyosis

Lotion, colloidal oatmeal in emollient basis, net price 400 mL = £6.42

Excipients include benzyl alcohol, cetyl alcohol, isopropyl palmitate
ACBS: as for Aveeno® Cream

Cetrabon® (Genus)

Emollient cream, white soft paraffin 13.2%, light liquid paraffin 10.5%, net price 50-g pump pack = £1.40, 150-g pump pack = £3.98, 500-g pump pack = £5.99, 1.05-kg pump pack = £11.62

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Dermamist® (Alliance)

Spray application, white soft paraffin 10% in a basis containing liquid paraffin, fractionated coconut oil, net price 250-mL pressurised aerosol unit = £5.97

Excipients none as listed in section 13.1.3

Note Flammable

Diprobase® (Schering-Plough)

Cream, cetomacrogol 2.25%, cetostearyl alcohol 7.2%, liquid paraffin 6%, white soft paraffin 15%, water-miscible basis used for *Diprobase*® cream, net price 50 g = £1.28; 500-g pump pack = £6.32

Excipients include cetostearyl alcohol, chlorocresol

Ointment, liquid paraffin 5%, white soft paraffin 95%, basis used for *Diprobase*® ointment, net price 50 g = £1.28, 500 g = £5.99

Excipients none as listed in section 13.1.3

Doublebase® (Dermal)

Gel, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500 g = £5.82
Excipients none as listed in section 13.1.3

E45® (Reckitt Benckiser)

Cream, light liquid paraffin 12.6%, white soft paraffin 14.5%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in self-emulsifying monostearin, net price 50 g = £1.40, 125 g = £2.55, 350 g = £4.46, 500-g pump pack = £4.89
Excipients include cetyl alcohol, hydroxybenzoates (parabens)

Lotion, light liquid paraffin 4%, cetomacrogol, white soft paraffin 10%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in glyceryl monostearate, net price 200 mL = £2.40, 500-mL pump pack = £4.50
Excipients include isopropyl palmitate, hydroxybenzoates (parabens), benzyl alcohol

ACBS: for symptomatic relief of dry skin conditions, such as those associated with atopic eczema and contact dermatitis

Emollin® (C D Medical)

Spray, liquid paraffin 50%, white soft paraffin 50% in aerosol basis, net price 150 mL = £3.74, 240 mL = £5.98
Excipients none as listed in section 13.1.3

Epaderm® (Mölnlycke)

Cream, yellow soft paraffin 15%, liquid paraffin 10%, emulsifying wax 5%, net price 50-g pump pack = £1.60, 500-g pump pack = £6.55
Excipients include cetostearyl alcohol, chlorocresol

Ointment, emulsifying wax 30%, yellow soft paraffin 30%, liquid paraffin 40%, net price 125 g = £3.72, 500 g = £6.30, 1 kg = £11.61
Excipients include cetostearyl alcohol

Hydromol® (Alliance)

Cream, sodium pidolate 2.5%, liquid paraffin 13.8%, net price 50 g = £2.04, 100 g = £3.80, 500 g = £11.09
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Ointment, yellow soft paraffin 30%, emulsifying wax 30%, liquid paraffin 40%, net price 125 g = £2.79, 500 g = £4.74, 1 kg = £8.81
Excipients include cetostearyl alcohol

Lipobase® (Astellas)

Cream, fatty cream basis used for *Locoid Lipocream®*, net price 50 g = £1.46

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
 For dry skin conditions, also for use during treatment with topical corticosteroid and as diluent for *Locoid Lipocream®*

Oilatum® (Stiefel)

Cream, light liquid paraffin 6%, white soft paraffin 15%, net price 40 g = £1.30, 150 g = £2.46, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98
Excipients include benzyl alcohol, cetostearyl alcohol

Oilatum® Junior Cream, light liquid paraffin 6%, white soft paraffin 15%, 150 g = £3.38, 350-mL pump pack = £4.65, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98
Excipients include benzyl alcohol, cetostearyl alcohol

QV® (Crawford)

Cream, glycerol 10%, light liquid paraffin 10%, white soft paraffin 5%, net price 100 g = £1.95, 500 g = £5.60
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Lotion, white soft paraffin 5%, net price 250 mL = £3.00
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Ultrabase® (Bayer Schering)

Cream, water-miscible, containing liquid paraffin and white soft paraffin, net price 50 g = £1.58, 500-g pump pack = £16.23

Excipients include fragrance, hydroxybenzoates (parabens), disodium edetate, stearyl alcohol

Unguentum M® (Almiral)

Cream, containing saturated neutral oil, liquid paraffin, white soft paraffin, net price 50 g = £1.41, 100 g = £2.78, 200-mL pump pack = £5.50, 500 g = £8.48

Excipients include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

Zerobase® (Thornton & Ross)

Cream, liquid paraffin 11%, net price 50 g = £1.04, 500-g pump pack = £5.26

Excipients include cetostearyl alcohol, chlorocresol

Zerocream® (Thornton & Ross)

Cream, liquid paraffin 12.6%, white soft paraffin 14.5%, net price 50 g = £1.17, 500-g pump pack = £4.08

Excipients include cetyl alcohol, hydroxybenzoates (parabens), lanolin anhydrous

Zerogent® (Thornton & Ross)

Cream, light liquid paraffin 8%, white soft paraffin 4%, refined soya bean oil 5%, net price 100 g = £2.33, 500 g = £7.07

Excipients include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

▲ **Preparations containing urea****Aquadrate®** (Alliance)

Cream, urea 10%, net price 100 g = £4.37

Excipients none as listed in section 13.1.3

Dose

Apply thinly twice daily

Balneum® (Almiral)

Cream, urea 5%, ceramide 0.1%, net price 50-g pump pack = £2.80, 500-g pump pack = £9.80

Excipients include cetostearyl alcohol, polysorbates, propylene glycol

Dose

Apply twice daily

Balneum® Plus Cream, urea 5%, lauromacrogols 3%, net price 100 g = £3.29, 500-g pump pack = £16.42

Excipients include benzyl alcohol, polysorbates

Dose

Apply twice daily

Calmurid® (Galderma)

Cream, urea 10%, lactic acid 5%, net price 100 g = £5.70, 500-g pump pack = £27.42

Excipients none as listed in section 13.1.3

Dose

Apply a thick layer for 3–5 minutes, massage into area, and remove excess, usually twice daily. Use half-strength cream for 1 week if stinging occurs

Note Can be diluted with aqueous cream (life of diluted cream 14 days)

Dermatonics Heel Balm® (Dermatonics)

Cream, urea 25%, net price 75 mL = £4.00, 200 mL = £9.50

Excipients include beeswax, lanolin

Dose

Child 12–18 years apply once daily to dry skin on soles of feet

E45® Itch Relief Cream (Reckitt Benckiser)

Cream, urea 5%, macrogol lauryl ether 3%, net price 50 g = £2.55, 100 g = £3.47, 500-g pump pack = £14.99
Excipients include benzyl alcohol, polysorbates

Dose

Apply twice daily

Eucerin® Intensive (Beiersdorf)

Cream, urea 10%, net price 100 mL = £7.59
Excipients include benzyl alcohol, isopropyl palmitate, wool fat

Dose

Apply thinly and rub into area twice daily

Lotion, urea 10%, net price 250 mL = £7.93

Excipients include benzyl alcohol, isopropyl palmitate

Dose

Apply sparingly and rub into area twice daily

Hydromol® Intensive (Alliance)

Cream, urea 10%, net price 30 g = £1.64, 100 g = £4.37
Excipients none as listed in section 13.1.3

Dose

Apply thinly twice daily

Nutraplus® (Galderma)

Cream, urea 10%, net price 100 g = £4.37
Excipients include hydroxybenzoates (parabens), propylene glycol

Dose

Apply 2–3 times daily

▲ **With antimicrobials****Dermol®** (Derma)

Cream, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, isopropyl myristate 10%, liquid paraffin 10%, net price 100-g tube = £2.86, 500-g pump pack = £6.63
Excipients include cetostearyl alcohol

Dose

Apply to skin or use as soap substitute

Dermol® 500 Lotion, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 500-mL pump pack = £6.03
Excipients include cetostearyl alcohol

Dose

Apply to skin or use as soap substitute

Eczmol® (Genus)

Cream, chlorhexidine gluconate 1% in emollient basis, net price 250 mL = £3.70
Excipients include cetostearyl alcohol

Dose

Apply to skin or use as soap substitute

13.2.1.1 Emollient bath additives and shower preparations

Emollient bath additives should be added to bath water; some can be applied to wet skin undiluted and rinsed off. Hydration can be improved by soaking in the bath for 10–20 minutes. In dry skin conditions soap should be avoided (see section 13.2.1 for soap substitutes).

The quantities of bath additives recommended for older children are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for younger children reflect this.

These preparations make skin and surfaces slippery—particular care is needed when bathing a child.

Aveeno® (J&J)

Bath oil, colloidal oatmeal, white oat fraction in emollient basis, net price 250 mL = £4.28

Excipients include beeswax, fragrance

ACBS: for endogenous and exogenous eczema, xeroderma, and ichthyosis

Dose

Child 2–18 years add 20–30 mL to bath water or apply to wet skin and rinse

Colloidal® bath additive, oatmeal, white oat fraction in emollient basis, net price 10 × 50-g sachets = £7.33;

Baby Bath Additive®, 10 × 15-g sachets = £4.39

Excipients none as listed in section 13.1.3

ACBS: as for Aveeno® Bath oil

Dose

Child 1 month–12 years add 15 g to bath water

Child 12–18 years add 50 g to bath water

Balneum® (Almirall)

Balneum® bath oil, soya oil 84.75%, net price 200 mL = £2.48, 500 mL = £5.38, 1 litre = £10.39

Excipients include butylated hydroxytoluene, propylene glycol, fragrance

Dose

Neonate add 5–15 mL to bath water; do not use undiluted

Child 1 month–2 years add 5–15 mL to bath water; do not use undiluted

Child 2–18 years add 20–60 mL to bath water; do not use undiluted

Balneum Plus® bath oil, soya oil 82.95%, mixed lauromacrogols 15%, net price 500 mL = £6.66

Excipients include butylated hydroxytoluene, propylene glycol, fragrance

Dose

Neonate add 5 mL to bath water or apply to wet skin and rinse

Child 1 month–2 years add 5 mL to bath water or apply to wet skin and rinse

Child 2–18 years add 10–20 mL to bath water or apply to wet skin and rinse

Cetramen® (Genus)

Emollient bath additive, light liquid paraffin 82.8%, net price 500 mL = £5.75

Excipients none as listed in section 13.1.3

Dose

Neonate add ½ capful to bath water or apply to wet skin and rinse

Child 1 month–12 years add ½–1 capful to bath water or apply to wet skin and rinse

Child 12–18 years add 1–2 capfuls to bath water or apply to wet skin and rinse

Dermalol® (Derma)

Bath emollient, acetylated wool alcohols 5%, liquid paraffin 65%, net price 500 mL = £3.44

Excipients none as listed in section 13.1.3

Dose

Neonate add 5 mL to bath water or apply to wet skin and rinse

Child 1 month–12 years add 5–10 mL to bath water or apply to wet skin and rinse

Child 12–18 years add 15–20 mL to bath water or apply to wet skin and rinse

Diprobath® (Schering-Plough)

Bath additive, isopropyl myristate 39%, light liquid paraffin 46%, net price 500 mL = £6.71

Excipients none as listed in section 13.1.3

Dose

Neonate add 5 mL to bath water; do not use undiluted

Child 1 month–12 years add 10 mL to bath water; do not use undiluted

Child 12–18 years add 25–50 mL to bath water; do not use undiluted

Doublebase® (Dermal)

Emollient bath additive, liquid paraffin 65%, net price 500 mL = £5.45

Excipients include cetostearyl alcohol

Dose

Neonate add 5–10 mL to bath water

Child 1 month–12 years add 5–10 mL to bath water

Child 12–18 years add 15–20 mL to bath water

Emollient shower gel, isopropyl myristate 15%, liquid paraffin 15%, net price 200 g = £5.21

Excipients none as listed in section 13.1.3

Note Also available as *Doublebase® Emollient Wash Gel*

Dose

Apply to wet or dry skin and rinse, or apply to dry skin after showering

E45® (Reckitt Benckiser)

Emollient bath oil, cetyl dimeticon 5%, liquid paraffin 91%, net price 250 mL = £3.19, 500 mL = £5.11

Excipients none as listed in section 13.1.3

ACBS: for endogenous and exogenous eczema, xeroderma, and ichthyosis

Dose

Neonate add 5 mL to bath water or apply to wet skin and rinse

Child 1 month–12 years add 5–10 mL to bath water or apply to wet skin and rinse

Child 12–18 years add 15 mL to bath water or apply to wet skin and rinse

Emollient wash cream, zinc oxide 5% in an emollient basis, net price 250-mL pump pack = £3.19

Excipients none as listed in section 13.1.3

ACBS: for endogenous and exogenous eczema, xeroderma, and ichthyosis

Dose

Use as a soap substitute

Hydromol® (Alliance)

Bath and Shower Emollient, isopropyl myristate 13%, light liquid paraffin 37.8%, net price 350 mL = £3.61, 500 mL = £4.11, 1 litre = £8.19

Excipients none as listed in section 13.1.3

Dose

Neonate add ½ capful to bath water or apply to wet skin and rinse

Child 1 month–12 years add ½–2 capfuls to bath water or apply to wet skin and rinse

Child 12–18 years add 1–3 capfuls to bath water or apply to wet skin and rinse

Oilatun® (Stiefel)

Emollient bath additive (emulsion), light liquid paraffin 63.4%, net price 250 mL = £2.75, 500 mL = £4.57

Excipients include acetylated lanolin alcohols, isopropyl palmitate, fragrance

Dose

Neonate add ½ capful to bath water or apply to wet skin and rinse

Child 1 month–12 years add ½–2 capfuls to bath water or apply to wet skin and rinse

Child 12–18 years add 1–3 capfuls to bath water or apply to wet skin and rinse

Junior bath additive, light liquid paraffin 63.4%, net price 150 mL = £2.82, 250 mL = £3.25, 300 mL = £5.10, 600 mL = £5.89

Excipients include acetylated lanolin alcohols, isopropyl palmitate

Dose

Neonate add ½ capful to bath water or apply to wet skin and rinse

Child 1 month–12 years add ½–2 capfuls to bath water or apply to wet skin and rinse

Child 12–18 years add 1–3 capfuls to bath water or apply to wet skin and rinse

Shower emollient (gel), light liquid paraffin 70%, net price (with fragrance or fragrance-free) 150 g = £5.15

Dose

Apply to wet skin and rinse

QV® (Crawford)

Bath oil, light liquid paraffin 85.09%, net price 200 mL = £2.20, 500 mL = £4.50

Excipients include hydroxybenzoates (parabens)

Dose

Child 1 month–1 year add 4 mL to bath water or apply to wet skin and rinse

Child 1–12 years add 7 mL to bath water or apply to wet skin and rinse

Child 12–18 years add 10 mL to bath water or apply to wet skin and rinse

Wash, glycerol 10%, net price 200 mL = £2.50

Excipients include hydroxybenzoates (parabens)

Dose

Use as a soap substitute

Zerolatum® (Thornton & Ross)

Emollient medicinal bath oil, liquid paraffin 65%, net price 500 mL = £4.79

Excipients include acetylated wool alcohols

Dose

Child 1 month–12 years add 5–10 mL to bath water

Child 12–18 years add 15–20 mL to bath water

Zeroneum® (Thornton & Ross)

Bath oil, refined soya bean oil 83.35%, net price 500 mL = £4.48

Excipients include butylated hydroxytoluene, fragrance, propylene glycol

Dose

Child 1 month–12 years add 5 mL to bath water

Child 12–18 years add 20 mL to bath water

Zerazole® (Thornton & Ross)

Bath oil, refined soya bean oil 83.45%, macrogol 4-lauryl ether 15%, net price 500 mL = £5.55

Excipients include butylated hydroxytoluene, fragrance, propylene glycol

Dose

Neonate add 5–15 mL to bath water

Child 1 month–12 years add 5–15 mL to bath water, or apply to wet skin and rinse

Child 12–18 years add 20–60 mL to bath water, or apply to wet skin and rinse

▲ **With antimicrobials****Dermol®** (Dermal)

Dermol® 600 bath emollient, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 600 mL = £7.55

Excipients include polysorbate 60

Dose

Child 1 month–2 years add 5–15 mL to bath water; do not use undiluted

Child 2–18 years add 15–30 mL to bath water; do not use undiluted

Dermol® 200 Shower Emollient, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.55

Excipients include cetostearyl alcohol

Dose

Apply to skin or use as soap substitute

Emulsiderm® (Dermal)

Liquid emulsion, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 300 mL (with 15-mL measure) = £3.85, 1 litre (with 30-mL measure) = £12.00

Excipients include polysorbate 60

Dose

Child 1 month–2 years add 5–10 mL to bath water or rub into dry skin until absorbed

Child 2–18 years add 10–30 mL to bath water or rub into dry skin until absorbed

Oilatum® Plus (Stiefel)

Bath additive, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 52.5%, net price 500 mL = £6.98

Excipients include acetylated lanolin alcohols, isopropyl palmitate

Dose

Child 6 months–1 year add 1 mL to bath water; do not use undiluted

Child 1–18 years add 1–2 capfuls to bath water; do not use undiluted

Zerolatum® Plus (Thornton & Ross)

Bath additive, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 51.66%, net price 500 mL = £5.81

Excipients include acetylated lanolin alcohols, isopropyl palmitate, polysorbate 80

Dose

Child 6 months–1 year add 1 mL to bath water; do not use undiluted

Child 1–18 years add 1–2 capfuls to bath water; do not use undiluted

▲ **With tar**

Section 13.5.2

13.2.2 Barrier preparations

Barrier preparations often contain water-repellent substances such as **dimeticone**, natural oils, and paraffins, to help protect the skin from abrasion and irritation; they are used to protect intact skin around stomas and pressure sores, and as a barrier against nappy rash. In neonates, barrier preparations which do not contain potentially sensitising excipients (section 13.1.3) are preferred. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. **Zinc ointments** or barrier creams with zinc oxide or titanium salts, are used to aid healing of uninfected, excoriated skin.

Nappy rash (Dermatitis) The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% (section 13.4) can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and water-proof pants may increase absorption of corticosteroids (for cautions, see section 13.4). If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream (section 13.10.2) can be used. Topical antibacterial preparations (section 13.10.1) can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

▲ **Non-proprietary barrier preparations****Zinc Cream, BP**

Cream, zinc oxide 32%, arachis (peanut) oil 32%, calcium hydroxide 0.045%, oleic acid 0.5%, wool fat 8%, in freshly boiled and cooled purified water, net price 50 g = 75p

Zinc Ointment, BP

Ointment, zinc oxide 15%, in Simple Ointment BP 1988 (which contains wool fat 5%, hard paraffin 5%, cetostearyl alcohol 5%, white soft paraffin 85%), net price 25 g = 30p

Zinc and Castor Oil Ointment, BP

Ointment, zinc oxide 7.5%, castor oil 50%, arachis (peanut) oil 30.5%, white beeswax 10%, cetostearyl alcohol 2%, net price 500 g = £2.93

▲ **Proprietary barrier preparations****Conotrane®** (Astellas)

Cream, benzalkonium chloride 0.1%, dimeticone 22%, net price 100 g = 88p, 500 g = £3.51

Excipients include cetostearyl alcohol, fragrance

Drapolene® (Chefaro UK)

Cream, benzalkonium chloride 0.01%, cetrimide 0.2% in a basis containing white soft paraffin, cetyl alcohol and wool fat, net price 100 g = £1.54, 200 g = £2.50, 350 g = £3.75

Excipients include cetyl alcohol, chlorocresol, wool fat

Medicaid® (LPC)

Cream, cetrimide 0.5% in a basis containing light liquid paraffin, white soft paraffin, cetostearyl alcohol, glyceryl monostearate, net price 50 g = £1.69

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), wool fat

Metanium® (Thornton & Ross)

Ointment, titanium dioxide 20%, titanium peroxide 5%, titanium salicylate 3% in a basis containing dimeticone, light liquid paraffin, white soft paraffin, and benzoin tincture, net price 30 g = £2.01

Excipients none as listed in section 13.1.3

Morhulin® (Actavis)

Ointment, cod-liver oil 11.4%, zinc oxide 38%, in a basis containing liquid paraffin and yellow soft paraffin, net price 50 g = £1.91

Excipients include wool fat derivative

Siopel® (Derma UK)

Barrier cream, dimeticone '1000' 10%, cetrimide 0.3%, arachis (peanut) oil, net price 50 g = £2.15

Excipients include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens)

Sprilon® (Ayrton Saunders)

Spray application, dimeticone 1.04%, zinc oxide 12.5%, in a basis containing wool alcohols, cetostearyl alcohol, dextran, white soft paraffin, liquid paraffin, propellants, net price 115-g pressurised aerosol unit = £3.54

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), wool fat

Note Flammable

Sudocrem® (Forest)

Cream, benzyl alcohol 0.39%, benzyl benzoate 1.01%, benzyl cinnamate 0.15%, hydrous wool fat (hypoallergenic lanolin) 4%, zinc oxide 15.25%, net price 60 g = £1.25, 125 g = £1.84, 250 g = £3.09, 400 g = £4.34

Excipients include beeswax (synthetic), propylene glycol, butylated hydroxyanisole, fragrance

Vasogen® (Forest)

Barrier cream, dimeticone 20%, calamine 1.5%, zinc oxide 7.5%, net price 100 g = £2.72

Excipients include hydroxybenzoates (parabens), wool fat

13.3 Topical antipruritics

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (such as eczema, psoriasis, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying cause should be treated. For the treatment of pruritus in palliative care, see *Prescribing in Palliative Care*, p. 19. Pruritus caused by cholestasis generally requires a bile acid sequestrant (section 1.9.2).

An **emollient** (section 13.2.1) may be of value where the pruritus is associated with dry skin. Preparations containing **calamine** or **crotamiton** are sometimes used but are of uncertain value.

A topical preparation containing **doxepin 5%** is licensed for the relief of pruritus in eczema in children over 12 years; it can cause drowsiness and there may be a risk of sensitisation.

Topical antihistamines and local anaesthetics (section 15.2) are only marginally effective and occasionally cause sensitisation. For *insect stings* and *insect bites*, a short course of a topical corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** (section 3.4.1) may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

In *pruritus ani*, the underlying cause such as faecal soiling, eczema, psoriasis, or helminth infection should be treated; for preparations used to relieve pruritus ani, see section 1.7.

CALAMINE

Indication and dose

Pruritus but see notes above

Calamine (Non-proprietary)

Aqueous cream, calamine 4%, zinc oxide 3%, liquid paraffin 20%, self-emulsifying glyceryl monostearate 5%, cetomacrogol emulsifying wax 5%, phenox-yethanol 0.5%, freshly boiled and cooled purified water 62.5%, net price 100 mL = 84p

Lotion (= cutaneous suspension), calamine 15%, zinc oxide 5%, glycerol 5%, bentonite 3%, sodium citrate 0.5%, liquefied phenol 0.5%, in freshly boiled and cooled purified water, net price 200 mL = 63p

Oily lotion (BP 1980), calamine 5%, arachis (peanut) oil 50%, oleic acid 0.5%, wool fat 1%, in calcium hydroxide solution, net price 200 mL = £1.57

CROTAMITON

Cautions avoid use near eyes and broken skin; use on doctor's advice for children under 3 years

Contra-indications acute exudative dermatoses

Indication and dose

Pruritus (including pruritus after scabies—section 13.10.4) see notes above

Apply 2–3 times daily (for pruritus after scabies in children under 3 years apply once daily only)

Eurax® (Novartis Consumer Health)

Cream, crotamiton 10%, net price 30 g = £2.38, 100 g = £4.15

Excipients include beeswax, fragrance, hydroxybenzoates (parabens), stearyl alcohol

Lotion, crotamiton 10%, net price 100 mL = £3.14

Excipients include cetyl alcohol, fragrance, propylene glycol, sorbic acid, stearyl alcohol

DOXEPIN HYDROCHLORIDE

Cautions susceptibility to angle-closure glaucoma; urinary retention; mania; cardiac arrhythmias; severe heart disease; avoid application to large areas; **interactions:** Appendix 1 (antidepressants, tricyclic)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Hepatic impairment manufacturer advises caution in severe liver disease

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises use only if potential benefit outweighs risk

Side-effects drowsiness; local burning, stinging, irritation, tingling and rash; systemic side-effects such as antimuscarinic affects, headache, fever, dizziness, gastro-intestinal disturbances also reported

Indication and dose

Pruritus in eczema

Child 12–18 years apply thinly 3–4 times daily; usual max. 3 g per application; usual total max. 12 g daily; coverage should be less than 10% of body surface area

Depressive illness section 4.3.1

Xepin® (CHS) (POM)

Cream, doxepin hydrochloride 5%, net price 30 g = £11.70. Label: 2, 10, patient information leaflet

Excipients include benzyl alcohol

13.4 Topical corticosteroids

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), particularly eczema (section 13.5.1), contact dermatitis, insect stings (p. 34), and eczema of scabies (section 13.10.4). Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. Carers of young children should be advised that treatment should **not** necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the child's condition.

In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% applied intermittently.

Topical corticosteroids are of no value in the treatment of *urticaria*. They may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in *pruritus* (where they will only benefit if inflammation is causing the itch) and are **not** recommended for *acne vulgaris*.

Systemic or potent topical corticosteroids should be avoided or given only under specialist supervision in *psoriasis* because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe

pustular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild to moderate topical corticosteroid for a short period (2–4 weeks) for *flexural* and *facial psoriasis*, and to use a more potent corticosteroid such as betamethasone or fluocinonide for *psoriasis* of the *scalp, palms, or soles* (see below for cautions in psoriasis).

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections (section 10.1.2.2) may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *keloid scars, hypertrophic lichen planus, or localised alopecia areata*.

Choice Water-miscible corticosteroid *creams* are suitable for moist or weeping lesions whereas *ointments* are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. *Lotions* may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene or hydrocolloid dressings* increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). Disposable nappies and tight fitting pants also increase the risk of side-effects by increasing absorption of the corticosteroid. The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

'Wet-wrap bandaging' (section 13.5.1) increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

In the *BNF for Children*, topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent' (see p. 559); the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

Topical hydrocortisone is usually used in children under 1 year of age. Moderately potent and potent topical corticosteroids should be used with great care in children and for short periods (1–2 weeks) only. A very potent corticosteroid should be initiated under the supervision of a specialist.

Appropriate topical corticosteroids for specific conditions are:

- *insect bites and stings*—mild corticosteroid such as hydrocortisone 1% cream;
- *inflamed nappy rash causing discomfort* in infant over 1 month (section 13.2.2)—mild corticosteroid such as hydrocortisone 0.5 or 1% for up to 7 days (combined with antimicrobial if infected);
- *mild to moderate eczema, flexural and facial eczema or psoriasis*—mild corticosteroid such as hydrocortisone 1%;

- *severe eczema of the face and neck*—moderately potent corticosteroid for 3–5 days only, if not controlled by a mild corticosteroid;
- *severe eczema on the trunk and limbs*—moderately potent or potent corticosteroid for 1–2 weeks only, switching to a less potent preparation as the condition improves;
- *eczema affecting area with thickened skin* (e.g. soles of feet)—potent topical corticosteroid in combination with urea or salicylic acid (to increase penetration of corticosteroid).

Perioral lesions Hydrocortisone cream 1% can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone and miconazole cream or ointment is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis (see also p. 545). Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

Cautions Avoid prolonged use of a topical corticosteroid particularly on the face (and keep away from eyes). Use potent or very potent corticosteroids under specialist supervision; extreme caution is required in dermatoses of infancy including nappy rash—treatment should be limited to 5–7 days.

Psoriasis The use of potent or very potent corticosteroids in psoriasis can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity, see notes above.

Contra-indications Topical corticosteroids are contra-indicated in untreated bacterial, fungal, or viral skin lesions, in acne, and in perioral dermatitis; potent corticosteroids are contra-indicated in widespread plaque psoriasis (see notes above).

Side-effects Mild and moderately potent topical corticosteroids are associated with few side-effects but particular care is required when treating neonates and infants, and in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome (section 6.3.2), depending on the area of the body being treated and the duration of treatment. Absorption of corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from flexural sites (e.g. axillae, groin), and in infants where skin surface area is higher in relation to body-weight; absorption is increased by occlusion. Local side-effects include:

- spread and worsening of untreated infection;
- thinning of the skin which may be restored over a period after stopping treatment but the original structure may never return;
- irreversible striae atrophicae and telangiectasia;
- contact dermatitis;
- perioral dermatitis;
- acne, or worsening of acne or rosacea;
- mild depigmentation which may be reversible;
- hypertrichosis also reported.

Children and their carers should be reassured that side effects such as skin thinning and systemic effects rarely

occur when topical corticosteroids are used appropriately.

Safe Practice

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it **thinly** to affected areas **only**, no more frequently than **twice daily**, and to use the least potent formulation which is fully effective.

Application Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient.

Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a *finger tip unit* (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg) is sufficient to cover an area that is twice that of the flat adult palm.

If a child is using topical corticosteroids of different potencies, the child and their carers should be told when to use each corticosteroid. The potency of each topical corticosteroid (see Topical Corticosteroid Preparation Potencies, below) should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

Compound preparations The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

Topical corticosteroid potencies

Potency of a topical corticosteroid preparation depends upon the formulation as well as the corticosteroid. Therefore, proprietary names are shown below.

Mild

Hydrocortisone 0.1–2.5%, *Dioderm*, *Mildison*, *Synalar 1 in 10 Dilution*

Mild with antimicrobials *Canesten HC*, *Daktacort*, *Econacort*, *Fucidin H*, *Nystaform-HC*, *Timodine*

Mild with crotamiton *Eurax-Hydrocortisone*

Moderate

Betnovate-RD, Eumovate, Haelan, Modrasone, Synalar 1 in 4 Dilution, Ultralanum Plain

Moderate with antimicrobials *Trimovate*

Moderate with urea *Alphaderm, Calmurid HC, Hydromol HC Intensive*

Potent

Beclomethasone dipropionate 0.025%, Betamethasone valerate 0.1%, *Betacap, Betta-mousse, Betnovate, Cutivate, Diprosone, Elocon, Hydrocortisone butyrate, Locoid, Locoid Crelo, Metosyn, Nerisone, Synalar*

Potent with antimicrobials *Aureocort, Betnovate-C, Betnovate-N, Fucibet, Lotriderm, Synalar C, Synalar N*

Potent with salicylic acid *Diprosalic*

Very potent

Dermovate, Nerisone Forte

Very potent with antimicrobials *Dermovate-NN*

HYDROCORTISONE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Indication and dose

Mild inflammatory skin disorders such as eczemas (but for over-the-counter preparations, see below); nappy rash (see also section 13.2.2)

Apply thinly 1–2 times daily

Over-the-counter hydrocortisone preparations

Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in children over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should **not** be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete's foot); over-the-counter hydrocortisone preparations containing clotrimazole or miconazole nitrate can be sold to the public for treatment of athlete's foot and candidal intertrigo

Hydrocortisone (Non-proprietary) (POM)

Cream, hydrocortisone 0.5%, net price 15 g = £1.92, 30 g = £5.19; 1%, 15 g = £1.64, 30 g = £1.99, 50 g = £4.06; 2.5%, 15 g = £19.70. Label: 28, counselling, application, see p. 559. Potency: mild

Dental prescribing on NHS Hydrocortisone Cream 1% 15 g may be prescribed

Ointment, hydrocortisone 0.5%, net price 15 g = £3.05, 30 g = £5.23; 1%, 15 g = £3.34, 30 g = £2.70, 50 g = £6.87; 2.5%, 15 g = £23.78. Label: 28, counselling, application, see p. 559. Potency: mild

When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied

Proprietary hydrocortisone preparations**Dioderm[®] (Dermal) (POM)**

Cream, hydrocortisone 0.1%, net price 30 g = £2.39.

Label: 28, counselling, application, see p. 559.

Potency: mild

Excipients include cetostearyl alcohol, propylene glycol

Note Although this contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP

Mildison[®] (Astellas) (POM)

Lipocream, hydrocortisone 1%, net price 30 g = £1.71.

Label: 28, counselling, application, see p. 559.

Potency: mild

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Compound preparations

Compound preparations with coal tar see section 13.5.2

Alphaderm[®] (Alliance) (POM)

Cream, hydrocortisone 1%, urea 10%, net price 30 g = £2.38; 100 g = £7.03. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients none as listed in section 13.1.3

Calmurid HC[®] (Galderma) (POM)

Cream, hydrocortisone 1%, urea 10%, lactic acid 5%, net price 30 g = £2.80, 50 g = £4.67. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients none as listed in section 13.1.3

Note If stinging occurs, manufacturer advises dilute to half-strength with aqueous cream for 1 week then transfer to undiluted preparation (but see section 13.1.1 for advice to avoid dilution where possible)

1st Eurax-Hydrocortisone[®] (Novartis Consumer Health) (POM)

Cream, hydrocortisone 0.25%, crotamiton 10%, net price 30 g = 87p. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients include fragrance, hydroxybenzoates (parabens), propylene glycol, stearyl alcohol

1. A 15-g tube is on sale to the public for treatment of contact dermatitis and insect bites in children 10–18 years.

Hydromol HC Intensive[®] (Alliance) (POM)

Cream, hydrocortisone 1%, urea 10%, net price 30 g = £2.38, 100 g = £7.03. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients none as listed in section 13.1.3

With antimicrobials

See notes above for comment on compound preparations

1st Canesten HC[®] (Bayer Consumer Care) (POM)

Cream, hydrocortisone 1%, clotrimazole 1%, net price 30 g = £2.42. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients include benzyl alcohol, cetostearyl alcohol

1. A 15-g tube is on sale to the public for the treatment of athlete's foot and fungal infection of skin folds with associated inflammation in children 10–18 years.

Daktacort[®] (Janssen) (POM)

Cream, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.28. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients include butylated hydroxyanisole, disodium edetate

Dental prescribing on NHS May be prescribed as Miconazole and Hydrocortisone Cream for max. 7 days

Note A 15-g tube is on sale to the public for the treatment of athlete's foot and candidal intertrigo in children 10–18 years

Ointment, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.28. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients none as listed in section 13.1.3

Dental prescribing on NHS May be prescribed as Miconazole and Hydrocortisone Ointment for max. 7 days

Fucidin H® (LEO) (POM)

Cream, hydrocortisone acetate 1%, fusidic acid 2%, net price 30 g = £4.99, 60 g = £9.98. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients include butylated hydroxyanisole, cetyl alcohol, polysorbate 60, potassium sorbate

Nystaform-HC® (Typharm) (POM)

Cream, hydrocortisone 0.5%, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbate '60'

Ointment, hydrocortisone 1%, nystatin 100 000 units/g, chlorhexidine acetate 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 559.

Potency: mild

Excipients none as listed in section 13.1.3

Timodine® (Alliance) (POM)

Cream, hydrocortisone 0.5%, nystatin 100 000 units/g, benzalkonium chloride solution 0.2%, dimeticone '350' 10%, net price 30 g = £2.03. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients include butylated hydroxyanisole, cetostearyl alcohol, hydroxybenzoates (parabens), sodium metabisulphite, sorbic acid

HYDROCORTISONE BUTYRATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Child 1–18 years apply thinly 1–2 times daily

Locoid® (Astellas) (POM)

Cream, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Lipocream, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £5.17. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

Note For bland cream basis see *Lipobase*®, section 13.2.1

Ointment, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

Scalp lotion, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £6.83. Label: 15, 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

Locoid Crelo® (Astellas) (POM)

Lotion (topical emulsion), hydrocortisone butyrate 0.1% in a water-miscible basis, net price 100 g (with applicator nozzle) = £5.91. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), propylene glycol

ALCLOMETASONE DIPROPIONATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Inflammatory skin disorders such as eczemas

Apply thinly 1–2 times daily

Modrasone® (TEVA UK) (POM)

Cream, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include cetostearyl alcohol, chlorocresol, propylene glycol

Ointment, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include beeswax, propylene glycol

BECLOMETASONE DIPROPIONATE

(Beclometasone dipropionate)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 1 year

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly 1–2 times daily

Beclometasone (Non-proprietary) (POM)

Cream, beclometasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 559. Potency: potent

Ointment, beclometasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 559. Potency: potent

BETAMETHASONE ESTERS

Cautions see notes above; use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

Contra-indications see notes above

Side-effects see notes above

Licensed use *Betacap*®, *Betnovate*®, *Betnovate-C*®, and *Betnovate-RD*® not licensed for use in children under 1 year; *Betamousse*® and *Fucibet*® *Lipid Cream* not licensed for use in children under 6 years; *Betnovate-N*® not licensed for use in children under 2 years; *Lotriderm*® not licensed for use in children under 12 years; *all other preparations* licensed for use in children (age range not specified by manufacturer)

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly 1–2 times daily

Betamethasone Valerate (Non-proprietary) (POM)

Cream, betamethasone (as valerate) 0.1%, net price 30 g = £2.36, 100 g = £4.93. Label: 28, counselling, application, see p. 559. Potency: potent

Ointment, betamethasone (as valerate) 0.1%, net price 30 g = £2.27, 100 g = £4.67. Label: 28, counselling, application, see p. 559. Potency: potent

Betacap[®] (Dermal) (POM)

Scalp application, betamethasone (as valerate) 0.1% in a water-miscible basis containing coconut oil derivative, net price 100 mL = £3.75. Label: 15, 28, counselling, application, see p. 559. Potency: potent
Excipients none as listed in section 13.1.3

Betnovate[®] (GSK) (POM)

Cream, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.1% in an anhydrous paraffin basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

Lotion, betamethasone (as valerate) 0.1%, net price 100 mL = £4.58. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Scalp application, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 100 mL = £4.99. Label: 15, 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

Betnovate-RD[®] (GSK) (POM)

Cream, betamethasone (as valerate) 0.025% in a water-miscible basis (1 in 4 dilution of *Betnovate*[®] cream), net price 100 g = £3.15. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.025% in an anhydrous paraffin basis (1 in 4 dilution of *Betnovate*[®] ointment), net price 100 g = £3.15. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients none as listed in section 13.1.3

Bettamousse[®] (UCB Pharma) (POM)

Foam (= scalp application), betamethasone valerate 0.12% (= betamethasone 0.1%), net price 100 g = £9.37. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetyl alcohol, polysorbate 60, propylene glycol, stearyl alcohol

Note Flammable

Diprosone[®] (Schering-Plough) (POM)

Cream, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

Lotion, betamethasone (as dipropionate) 0.05%, net price 30 mL = £2.73, 100 mL = £7.80. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

With salicylic acid

See notes above for comment on compound preparations
For prescribing information on salicylic acid, see p. 571

Diprosalic[®] (Schering-Plough) (POM)

Ointment, betamethasone (as dipropionate) 0.05%, salicylic acid 3%, net price 30 g = £3.18, 100 g = £9.14. Label: 28, counselling, application, see p. 559.

Potency: potent

Excipients none as listed in section 13.1.3

Dose

Apply thinly 1–2 times daily

Scalp application, betamethasone (as dipropionate) 0.05%, salicylic acid 2%, in an alcoholic basis, net price 100 mL = £10.10. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include disodium edetate

Dose

Apply a few drops 1–2 times daily

With antimicrobials

See notes above for comment on compound preparations

Betnovate-C[®] (Chemidex) (POM)

Cream, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £1.76. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Note Stains clothing

Ointment, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £1.76. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

Note Stains clothing

Betnovate-N[®] (Chemidex) (POM)

Cream, betamethasone (as valerate) 0.1%, neomycin sulphate 0.5%, net price 30 g = £1.76, 100 g = £4.88. Label: 28, counselling, application, see p. 559.

Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.1%, neomycin sulphate 0.5%, net price 30 g = £1.76, 100 g = £4.88. Label: 28, counselling, application, see p. 559.

Potency: potent

Excipients none as listed in section 13.1.3

Fucibet[®] (LEO) (POM)

Cream, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.29, 60 g = £10.58. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Lipid cream, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.62. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Lotriderm[®] (TEVA UK) (POM)

Cream, betamethasone dipropionate 0.064% (= betamethasone 0.05%), clotrimazole 1%, net price 30 g = £6.34. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include benzyl alcohol, cetostearyl alcohol, propylene glycol

CLOBETASOL PROPIONATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use *Dermovate*[®] not licensed for use in children under 1 year; *Dermovate-NH*[®] not licensed for use in children under 2 years

Indication and dose

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly 1–2 times daily for up to 4 weeks

Dermovate® (GSK) (Pom)

Cream, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 559. Potency: very potent
Excipients include beeswax (or beeswax substitute), cetostearyl alcohol, chlorocresol, propylene glycol

Ointment, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 559. Potency: very potent
Excipients include propylene glycol

Scalp application, clobetasol propionate 0.05%, in a thickened alcoholic basis, net price 30 mL = £3.07, 100 mL = £10.42. Label: 15, 28, counselling, application, see p. 559. Potency: very potent
Excipients none as listed in section 13.1.3

With antimicrobials

See notes above for comment on compound preparations

Dermovate-NN® (Chemdex) (Pom)

Cream, clobetasol propionate 0.05%, neomycin sulphate 0.5%, nystatin 100 000 units/g, net price 30 g = £3.91. Label: 28, counselling, application, see p. 559. Potency: very potent
Excipients include arachis (peanut) oil, beeswax or beeswax substitute

Ointment, clobetasol propionate 0.05%, neomycin sulphate 0.5%, nystatin 100 000 units/g, in a paraffin basis, net price 30 g = £3.91. Label: 28, counselling, application, see p. 559. Potency: very potent
Excipients none as listed in section 13.1.3

CLOBETASONE BUTYRATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Eczemas and dermatitis of all types; maintenance between courses of more potent corticosteroids

Apply thinly 1–2 times daily

Eumovate® (GSK) (Pom)

Cream, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 559. Potency: moderate
Excipients include beeswax substitute, cetostearyl alcohol, chlorocresol

Ointment, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 559. Potency: moderate
Excipients none as listed in section 13.1.3

1. Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in children over 12 years provided pack does not contain more than 15 g

With antimicrobials

See notes above for comment on compound preparations

Trimovate® (GSK) (Pom)

Cream, clobetasone butyrate 0.05%, oxytetracycline 3% (as calcium salt), nystatin 100 000 units/g, net

price 30 g = £3.29. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include cetostearyl alcohol, chlorocresol, sodium metabisulphite

Note Stains clothing

DIFLUCORTOLONE VALERATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use *Nerisone®* licensed for use in children (age range not specified by manufacturer); *Nerisone Forte®* not licensed for use in children under 4 years

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; high strength (0.3%), short-term treatment of severe exacerbations, psoriasis see notes above

Apply thinly 1–2 times daily for up to 4 weeks (0.1% preparations) or 2 weeks (0.3% preparations), reducing strength as condition responds

Nerisone® (Meadow) (Pom)

Cream, diflucortolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include disodium edetate, hydroxybenzoates (parabens), stearyl alcohol

Oily cream, diflucortolone valerate 0.1%, net price 30 g = £2.56. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include beeswax

Ointment, diflucortolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients none as listed in section 13.1.3

Nerisone Forte® (Meadow) (Pom)

Oily cream, diflucortolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 559. Potency: very potent

Excipients include beeswax

Ointment, diflucortolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 559. Potency: very potent

Excipients none as listed in section 13.1.3

FLUDROXYCORTIDE

(Flurandrenolone)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Inflammatory skin disorders such as eczemas

Apply thinly 1–2 times daily

Haelan® (Typharm) (Pom)

Cream, fludroxycortide 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include cetyl alcohol, propylene glycol

Ointment, fludroxycortide 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include beeswax, cetyl alcohol, polysorbate

Tape, polythene adhesive film impregnated with fluocycortide 4 micrograms/cm², net price 7.5 cm × 50 cm = £9.27, 7.5 cm × 200 cm = £24.95

Dose

Chronic localised recalcitrant dermatoses (but not acute or weeping)

Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

FLUOCINOLONE ACETONIDE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 1 year

Indication and dose

Severe inflammatory skin disorders such as eczemas, psoriasis see notes above

Apply thinly 1–2 times daily, reducing strength as condition responds

Synalar[®] (GP Pharma) (P_M)

Cream, fluocinolone acetonide 0.025%, net price 30 g = £3.76, 100 g = £10.68. Label: 28, counselling, application, see p. 559. Potency: potent
Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

Gel, fluocinolone acetonide 0.025%, net price 30 g = £5.56. For use on scalp and other hairy areas. Label: 28, counselling, application, see p. 559.

Potency: potent

Excipients include hydroxybenzoates (parabens), propylene glycol

Ointment, fluocinolone acetonide 0.025%, net price 30 g = £3.76, 100 g = £10.68. Label: 28, counselling, application, see p. 559. Potency: potent
Excipients include propylene glycol, wool fat

Synalar 1 in 4 Dilution[®] (GP Pharma) (P_M)

Cream, fluocinolone acetonide 0.00625%, net price 50 g = £4.40. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

Ointment, fluocinolone acetonide 0.00625%, net price 50 g = £4.40. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include propylene glycol, wool fat

Synalar 1 in 10 Dilution[®] (GP Pharma) (P_M)

Cream, fluocinolone acetonide 0.0025%, net price 50 g = £4.16. Label: 28, counselling, application, see p. 559. Potency: mild

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

▲ With antibacterials

See notes above for comment on compound preparations

Synalar C[®] (GP Pharma) (P_M)

Cream, fluocinolone acetonide 0.025%, clioquinol 3%, net price 15 g = £2.42. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

Ointment, fluocinolone acetonide 0.025%, clioquinol 3%, net price 15 g = £2.42. Label: 28, counselling, application, see p. 559. Potency: potent.

Note stains clothing

Excipients include propylene glycol, wool fat

Synalar N[®] (GP Pharma) (P_M)

Cream, fluocinolone acetonide 0.025%, neomycin sulphate 0.5%, net price 30 g = £3.96. Label: 28, counselling, application, see p. 559. Potency: potent
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), polysorbates, propylene glycol

Ointment, fluocinolone acetonide 0.025%, neomycin sulphate 0.5%, in a greasy basis, net price 30 g = £3.96. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include propylene glycol, wool fat

FLUOCINONIDE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 1 year

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly 1–2 times daily

Metosyn[®] (GP Pharma) (P_M)

FAPG cream, fluocinonide 0.05%, net price 25 g = £3.30, 100 g = £11.12. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include propylene glycol

Ointment, fluocinonide 0.05%, net price 25 g = £2.92, 100 g = £10.96. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include propylene glycol, wool fat

FLUOCORTOLONE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly 1–2 times daily

Ultralanum Plain[®] (Meadow) (P_M)

Cream, fluocortolone caproate 0.25%, fluocortolone pivalate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include disodium edetate, fragrance, hydroxybenzoates (parabens), stearyl alcohol

Ointment, fluocortolone 0.25%, fluocortolone caproate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 559. Potency: moderate

Excipients include wool fat, fragrance

FLUTICASONE PROPIONATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 3 months

Indication and dose

Inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly 1–2 times daily

Cutivate® (GSK) (POM)

Cream, fluticasone propionate 0.05%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include cetostearyl alcohol, imidurea, propylene glycol

Ointment, fluticasone propionate 0.005%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include propylene glycol

MOMETASONE FUROATE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly once daily (to scalp in case of lotion)

Elocon® (Schering-Plough) (POM)

Cream, mometasone furoate 0.1%, net price 30 g = £4.36, 100 g = £12.58. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include propylene glycol, stearyl alcohol

Ointment, mometasone furoate 0.1%, net price 30 g = £4.32, 100 g = £12.44. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include propylene glycol

Scalp lotion, mometasone furoate 0.1% in an aqueous isopropyl alcohol basis, net price 30 mL = £4.36. Label: 28, counselling, application, see p. 559.

Potency: potent

Excipients include propylene glycol

TRIAMCINOLONE ACETONIDE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Licensed use *Aureocort®* not licensed for use in children under 8 years

Indication and dose

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis see notes above

Apply thinly 1–2 times daily

▲ **With antimicrobials**

See notes above for comment on compound preparations

Aureocort® (Goldshield) (POM)

Ointment, triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3%, in an anhydrous greasy basis containing wool fat and white soft paraffin, net price 15 g = £2.70. Label: 28, counselling, application, see p. 559. Potency: potent

Excipients include wool fat

Note Stains clothing

13.5 Preparations for eczema and psoriasis**13.5.1 Preparations for eczema****13.5.2 Preparations for psoriasis****13.5.3 Drugs affecting the immune response****13.5.1 Preparations for eczema**

The main types of eczema (dermatitis) in children are atopic, irritant and allergic contact; different types may co-exist. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification caused by scratching and rubbing. *Seborrhoeic dermatitis* (see below) is also common in infants.

Management of eczema involves the removal or treatment of contributory factors; known or suspected irritants and contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin (section 13.1.3); *BNF for Children* lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** (section 13.2.1) applied regularly and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids (section 13.4) are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition, and the age of the child. Mild corticosteroids are generally used on the face and on flexures; the more potent corticosteroids are generally required for use on lichenified areas of eczema or for severe eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In children with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing zinc and **ichthammol**) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Wet elasticated viscose stockinette is used for 'wet-wrap' bandaging over topical corticosteroids or emollients to cool the skin and relieve itching, but there is an increased risk of infection and excessive absorption of the corticosteroid; 'wet-wrap' bandaging should be used under specialist supervision.

For details of elasticated viscose stockinette tubular bandages and garments, and silk clothing, see BNF section A8.8.3

For the role of topical **pimecrolimus** and **tacrolimus** in atopic eczema, see section 13.5.3.

Infection Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema. A topical antibacterial such as fusidic acid (section 13.10.1) may be used for small areas of mild infection; treatment should be limited to a short course (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a moder-

ately potent or potent topical corticosteroid which can be combined with an antimicrobial such as clioquinol. Eczema involving moderate to severe, widespread, or recurrent infection requires the use of a systemic antibacterial (section 5.1, table 1) that is active against the infecting organism. Preparations that combine an antiseptic with an emollient application (section 13.2.1) and with a bath emollient (section 13.2.1.1) can also be used; antiseptic shampoos (section 13.9) can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid combined with a suitable antimicrobial drug. For the treatment of nappy rash, see section 13.2.2.

Widespread *herpes simplex infection* may complicate atopic eczema (eczema herpeticum) and treatment under specialist supervision with a systemic antiviral drug (section 5.3.2.1) is indicated. Secondary bacterial infection often exacerbates eczema herpeticum.

The management of *seborrhoeic dermatitis* is described below.

Management of other features of eczema *Lichenification*, which results from repeated scratching, is treated initially with a potent corticosteroid. Bandages containing **ichthammol** (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** (section 13.5.2) and ichthammol can be useful in some cases of *chronic eczema*. *Discoid eczema*, with thickened plaques in chronic atopic eczema, is usually treated with a topical antiseptic preparation, a potent topical corticosteroid, and paste bandages containing zinc oxide and ichthammol.

A *non-sedating* antihistamine (section 3.4.1) may be of some value in relieving severe itching or urticaria associated with eczema. A *sedating* antihistamine (section 3.4.1) can be used at night if itching causes sleep disturbance, but a large dose may be needed and drowsiness may persist on the following day.

Exudative ('weeping') eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment (see above). **Potassium permanganate** solution (1 in 10 000) can be used as a soak in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system (section 13.5.3).

Seborrhoeic dermatitis *Seborrhoeic dermatitis* (*seborrhoeic eczema*) is associated with species of the yeast *Malassezia*. *Infantile seborrhoeic dermatitis* affects particularly the body folds, nappy area and scalp; it is treated with emollients and mild topical corticosteroids with suitable antimicrobials. Infantile seborrhoeic dermatitis affecting the scalp (*cradle cap*) is treated by hydrating the scalp using natural oils and the use of mild shampoo (section 13.9).

In older children, seborrhoeic dermatitis affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole and coal tar, section 13.9) and combinations of mild topical corticosteroids with suitable antimicrobials (section 13.4) are used to treat older children.

ICHTHAMMOL

Side-effects skin irritation

Licensed use no information available

Indication and dose

Chronic lichenified eczema

Child 1–18 years apply 1–3 times daily

Ichthammol Ointment, BP 1980

Ointment, ichthammol 10%, yellow soft paraffin 45%, wool fat 45%

Zinc and Ichthammol Cream, BP

Cream, ichthammol 5%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream

Medicated bandages

Zinc paste bandages are used with **coal tar** or **ichthammol** in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with **calamine** in milder eczematous skin conditions.

For information on available medicated bandages and stockings, see the BNF appendix on wound management products and elasticated garments.

13.5.2 Preparations for psoriasis

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary. *Guttate psoriasis* is a distinctive form of psoriasis that characteristically occurs in children and young adults, often following a streptococcal throat infection or tonsillitis.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not occur until the drug has been taken for weeks or months.

Emollients (section 13.2.1), in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis. They are particularly useful in *inflammatory psoriasis* and in *chronic stable plaque psoriasis*.

For *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs preparations containing **coal tar** are moderately effective, but the smell is unacceptable to some children. **Vitamin D** and its analogues are effective and cosmetically acceptable alternatives to preparations containing coal tar or dithranol. **Dithranol** is the most effective topical antipsoriatic agent but it irritates and stains the skin and it should be used only under specialist supervision. Adverse effects of dithranol are minimised by using a 'short-contact technique' (see below) and by starting with low concentration preparations. **Tazarotene**, a topical retinoid for the treatment of mild to moderate plaque psoriasis, is not recommended for use in children under 18 years. These medications can irritate the skin particularly in the flexures and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should

be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient ointment, cream, or oil and usually combined with **salicylic acid** as a keratolytic.

Some preparations for psoriasis affecting the scalp combine salicylic acid with coal tar or **sulphur**. The preparation should be applied generously and left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. for itch), it can be used in the morning.

Calcipotriol and **tacalcitol** are analogues of vitamin D that affect cell division and differentiation. **Calcitriol** is an active form of vitamin D. Vitamin D and its analogues are used as first-line treatment for plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Contact of coal tar products with normal skin is not normally harmful and preparations containing coal tar can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. Leave-on preparations that remain in contact with the skin, such as creams or ointments, containing up to 6% coal tar may be used on children 1 month to 2 years; leave-on preparations containing coal tar 10% may be used on children over 2 years with more severe psoriasis. Tar baths and tar shampoos (see section 13.9) may also be helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. It should be applied to chronic extensor plaques only, carefully avoiding normal skin. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. Proprietary preparations are more suitable for home use; they are usually washed off after 20–30 minutes ('short contact' technique). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable. When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards.

A topical **corticosteroid** (section 13.4) is not generally suitable as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis

(e.g. erythrodermic psoriasis or generalised pustular psoriasis). However, it may be appropriate to treat psoriasis in specific sites such as the face and flexures usually with a mild corticosteroid, and psoriasis of the scalp, palms and soles with a potent corticosteroid.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both. Systemic or potent topical corticosteroids should be avoided or used only under specialist supervision; although corticosteroids may suppress psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal.

Phototherapy **Phototherapy** is available in specialist centres under the supervision of a dermatologist. Narrow band ultraviolet B (UVB) radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*.

It can be considered for children with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis. The use of phototherapy and photochemotherapy in children is limited by concerns over carcinogenicity and premature ageing.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including the *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (section 13.5.3).

Acitretin, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication of acitretin is severe psoriasis resistant to other forms of therapy. It is also used in disorders of keratinisation such as severe *Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases; adverse effects are a limiting factor. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 to 6 weeks or longer. Continuous treatment for longer than 6 months is not usually necessary in psoriasis. However, some patients, particularly those with severe ichthyosis, may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly. Topical preparations containing keratolytics should normally be stopped before administration of acitretin. Liberal use of emol-

lients should be encouraged and topical corticosteroids can be continued if necessary.

Acitretin is teratogenic; in females of child-bearing age, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective). Common side-effects derive from its wide-spread but reversible effects on epithelia, such as dry and cracking lips, dry skin and mucosal surfaces, hair thinning, paronychia, and soft and sticky palms and soles.

Topical preparations for psoriasis

Vitamin D and analogues

Calcipotriol, calcitriol, and tacalcitol are used for the management of *plaque psoriasis*. They should be avoided by those with calcium metabolism disorders, and used with caution in *generalised pustular* or *erythrodermic exfoliative psoriasis* (enhanced risk of hypercalcaemia). Local skin reactions (itching, erythema, burning, paraesthesia, dermatitis) are common. Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas. Aggravation of psoriasis has also been reported.

CALCIPOTRIOL

Cautions see notes above; avoid use on face; avoid excessive exposure to sunlight and sunlamps

Contra-indications see notes above

Pregnancy manufacturer advises avoid unless essential

Breast-feeding no information available

Side-effects see notes above; also photosensitivity, dry skin; *rarely* facial or perioral dermatitis

Licensed use Calcipotriol ointment and scalp solution, *Dovobet*[®], and *Xamiol*[®] not licensed for use in children

Indication and dose

Plaque psoriasis

Child 6–18 years apply cream or ointment twice daily; 6–12 years max. 50 g weekly, over 12 years max. 75 g weekly (less with scalp solution, see below)

Note Patient information leaflets for *Dovonex*[®] cream and ointment advise liberal application (but note max. recommended weekly dose, above)

Scalp psoriasis (specialist use only)

Child 6–12 years apply scalp solution twice daily; max. 30 mL weekly (less when used with cream or ointment, see below)

Child 12–18 years apply scalp solution twice daily; max. 45 mL weekly (less when used with cream or ointment, see below)

Note When preparations used together max. total calcipotriol 2.5 mg in any one week for child 6–12 years (e.g. scalp solution 20 mL with cream or ointment 30 g); max. 3.75 mg in any one week for child 12–18 years (e.g. scalp solution 30 mL with cream or ointment 45 g)

Calcipotriol (Non-proprietary) (PoM)

Ointment, calcipotriol 50 micrograms/g, net price 120 g = £24.04

Scalp solution, calcipotriol 50 micrograms/mL, net price 60 mL = £12.53, 120 mL = £26.07

Dovonex[®] (LEO) (PoM)

Cream, calcipotriol (as hydrate) 50 micrograms/g, net price 120 g = £22.66

Excipients include cetostearyl alcohol, disodium edetate

Ointment, calcipotriol 50 micrograms/g, net price 120 g = £23.10

Excipients include disodium edetate, propylene glycol

▲ With betamethasone

For prescribing information, and for comment on the limited role of corticosteroids in psoriasis, see section 13.4.

Dovobet[®] (LEO) (PoM)

Ointment, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 60 g = £32.99, 120 g = £61.27. Label: 28

Excipients none as listed in section 13.1.3

Dose

Stable plaque psoriasis (specialist use only)

Child 12–18 years apply once daily to max. 30% of body surface for up to 4 weeks; max. 75 g weekly; if necessary, subsequent courses repeated on the advice of a specialist

Note When different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week for child 12–18 years

Gel, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 60 g = £36.50, 2 × 60 g = £67.79. Label: 28

Excipients include butylated hydroxytoluene

Dose

Scalp psoriasis (specialist use only)

Child 12–18 years apply 1–4 g to scalp once daily, shampoo off after leaving on scalp overnight or during the day; usual duration of therapy 4 weeks; if necessary, subsequent courses repeated on the advice of a specialist

Mild to moderate plaque psoriasis (specialist use only)

Child 12–18 years apply once daily to max. 30% of body surface for up to 4 weeks; max. 75 g weekly; if necessary, subsequent courses repeated on the advice of a specialist

Note When different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week for child 12–18 years

Xamiol[®] (LEO) (PoM)

Scalp gel, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 60 g = £36.50. Label: 28

Excipients include butylated hydroxytoluene

Dose

Scalp psoriasis (specialist use only)

Child 12–18 years apply 1–4 g to scalp once daily, shampoo off after leaving on scalp overnight or during the day; usual duration of therapy 4 weeks; if necessary, subsequent courses repeated on the advice of a specialist

Note When different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week for child 12–18 years

CALCITRIOL

(1,25-Dihydroxycholecalciferol)

Cautions see notes above

Contra-indications see notes above; do not apply under occlusion

Hepatic impairment manufacturer advises avoid—no information available

Renal impairment manufacturer advises avoid—no information available

Pregnancy manufacturer advises use in restricted amounts only if clearly necessary and to monitor urine- and serum-calcium concentration

Breast-feeding manufacturer advises avoid

Side-effects see notes above

Indication and dose

Mild to moderate plaque psoriasis

Child 12–18 years apply twice daily; not more than 35% of body surface to be treated daily, max. 30 g daily

Silkis[®] (Galderma) (P_{oM})

Ointment, calcitriol 3 micrograms/g, net price 100 g = £13.87

Excipients none as listed in section 13.1.3

TACALCITOL

Cautions see notes above; avoid eyes; monitor serum-calcium concentration if risk of hypercalcaemia; if used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime

Contra-indications see notes above

Renal impairment monitor serum-calcium concentration

Pregnancy manufacturer advises avoid unless no safer alternative—no information available

Breast-feeding manufacturer advises avoid application to breast area; no information available on presence in milk

Side-effects see notes above

Indication and dose

Plaque psoriasis

Child 12–18 years apply once daily preferably at bedtime; max. 10 g ointment or 10 mL lotion daily

Note When lotion and ointment used together, max. total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

Curatoderm[®] (Almirall) (P_{oM})

Lotion, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 mL = £12.73

Excipients include disodium edetate, propylene glycol

Ointment, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 g = £13.40, 60 g = £23.14, 100 g = £30.86

Excipients none as listed in section 13.1.3

Tars

TARS

Cautions application to face and skin flexures; use suitable chemical protection gloves for extemporaneous preparation

Contra-indications not for use in sore, acute, or pustular psoriasis or in presence of infection; avoid eyes, mucosa, genital or rectal areas; broken or inflamed skin

Side-effects skin irritation and acne-like eruptions, photosensitivity; stains skin, hair, and fabric

Indication and dose

Psoriasis and occasionally chronic atopic eczema

Apply 1–3 times daily starting with low-strength preparations; proprietary preparations, see individual entries below

Note For shampoo preparations see section 13.9

Non-proprietary preparations

May be difficult to obtain. Patients may find newer proprietary preparations more acceptable

Coal Tar Paste, BP

Paste, strong coal tar solution 7.5%, in compound zinc paste

Zinc and Coal Tar Paste, BP

Paste, zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%

Excipients include cetostearyl alcohol

Proprietary preparations

Carbo-Dome[®] (Sandoz)

Cream, coal tar solution 10%, in a water-miscible basis, net price 30 g = £4.77, 100 g = £16.38

Excipients include beeswax, hydroxybenzoates (parabens)

Dose

Psoriasis

Apply to skin 2–3 times daily

Cocois[®] (UCB Pharma)

Scalp ointment, coal tar solution 12%, salicylic acid 2%, precipitated sulphur 4%, in a coconut oil emollient basis, net price 40 g (with applicator nozzle) = £5.98, 100 g = £11.23

Excipients include cetostearyl alcohol

Dose

Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff

Child 6–12 years medical supervision required

Child 12–18 years apply to scalp once weekly as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour

Exorex[®] (Forest)

Lotion, coal tar solution 5% in an emollient basis, net price 100 mL = £8.11, 250 mL = £16.24

Excipients include hydroxybenzoates (parabens)

Dose

Psoriasis

Apply to skin or scalp 2–3 times daily; product can be diluted with a few drops of water before applying

Psoriderm[®] (Dermal)

Cream, coal tar 6%, lecithin 0.4%, net price 225 mL = £9.42

Excipients include isopropyl palmitate, propylene glycol

Dose

Psoriasis

Apply to skin or scalp 1–2 times daily

Scalp lotion—section 13.9

Sebco[®] (Derma UK)

Scalp ointment, coal tar solution 12%, salicylic acid 2%, precipitated sulphur 4%, in a coconut oil emollient basis, net price 40 g = £4.54, 100 g = £8.52

Excipients include cetostearyl alcohol

Dose

Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff

Child 6–12 years medical supervision required

Child 12–18 years apply to scalp as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour

▲ Bath preparations

Coal Tar Solution, BP

Solution, coal tar 20%, polysorbate '80' 5%, in alcohol (96%), net price 500 mL = £8.16. Label: 15

Excipients include polysorbates

Dose

Use 100 mL in an adult-size bath, and proportionally less for a child's bath

Note Strong Coal Tar Solution BP contains coal tar 40%

Pinetarsole® (Crawford)

Bath oil, tar 2.3% in a light liquid paraffin basis, net price 200 mL = £4.75, 500 mL = £7.95

Excipients include fragrance

Dose

Eczema and psoriasis

Use 15–30 mL in adult-size bath or apply directly to wet skin and rinse after a few minutes; can be used as a soap substitute

Gel, tar 1.6%, net price 100 g = £4.95

Dose

Eczema and psoriasis

Apply directly to wet skin and rinse after a few minutes; can be used as a soap substitute

Solution, tar 2.3%, net price 200 mL = £4.45, 500 mL = £7.45

Dose

Eczema and psoriasis

Use 15–30 mL in adult-size bath or dilute 15 mL with 3 litres of water and apply to affected areas or apply solution directly to wet skin and rinse after a few minutes; can be used as a soap substitute

Polytar Emollient® (Stiefel)

Bath additive, coal tar solution 2.5%, arachis (peanut) oil extract of coal tar 7.5%, tar 7.5%, cade oil 7.5%, liquid paraffin 35%, net price 500 mL = £5.78

Excipients include isopropyl palmitate

Dose

Psoriasis, eczema, atopic and pruritic dermatoses

Use 2–4 capfuls (15–30 mL) in adult-size bath and proportionally less for a child's bath; soak for 20 minutes

Psoriderm® (Dermal)

Bath emulsion, coal tar 40%, net price 200 mL = £2.74

Excipients include polysorbate 20

Dose

Psoriasis

Use 30 mL in adult-size bath, and proportionally less for a child's bath; soak for 5 minutes

▲ With corticosteroids

Alphosyl HC® (GSK Consumer Healthcare) (POM)

Cream, coal tar extract 5%, hydrocortisone 0.5%, allantoin 2%, net price 100 g = £3.10. Label: 28.

Potency: mild

Excipients include beeswax, cetyl alcohol, hydroxybenzoates (parabens), isopropyl palmitate

Dose

Psoriasis

Child 5–18 years apply thinly twice daily

Dithranol

DITHRANOL

(Anthralin)

Cautions avoid use near eyes and sensitive areas of skin; see also notes above

Contra-indications hypersensitivity; acute and pustular psoriasis

Pregnancy no adverse effects reported

Breast-feeding no adverse effects reported

Side-effects local burning sensation and irritation; stains skin, hair, and fabrics

Licensed use *Dithrocream*® and *Psorin*® licensed for use in children (age range not specified by manufacturer); *Micanol*® licensed for use in children, but not recommended for infants or young children (age range not specified by manufacturer)

Indication and dose

Subacute and chronic psoriasis

See notes above and under preparations

Note Some of these dithranol preparations also contain coal tar or salicylic acid—for prescribing information see under Tars or under Salicylic Acid

▲ Non-proprietary preparations

1 Dithranol Ointment, BP (POM)

Ointment, dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required. Label: 28

1. (POM) if dithranol content more than 1%, otherwise may be sold to the public

Dithranol Paste, BP

Paste, dithranol in zinc and salicylic acid (Lassar's) paste. Usual strengths 0.1–1% of dithranol. Label: 28

▲ Proprietary preparations

Dithrocream® (Dermal)

Cream, dithranol 0.1%, net price 50 g = £3.77; 0.25%, 50 g = £4.04; 0.5%, 50 g = £4.66; 1%, 50 g = £5.42; (POM) 2%, 50 g = £6.79. Label: 28

Excipients include cetostearyl alcohol, chlorocresol

Dose

For application to skin or scalp; 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for max. 1 hour

Micanol® (GP Pharma)

Cream, dithranol 1% in a lipid-stabilised basis, net price 50 g = £13.48; (POM) 3%, 50 g = £16.79. Label: 28

Excipients none as listed in section 13.1.3

Dose

For application to skin or scalp, apply 1% cream for up to 30 minutes once daily, if necessary 3% cream can be used under medical supervision

Note At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used *after* the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off

Psorin® (LPC)

Ointment, dithranol 0.11%, coal tar 1%, salicylic acid 1.6%, net price 50 g = £9.22, 100 g = £18.44. Label: 28

Excipients include beeswax, wool fat

Dose

For application to skin up to twice daily

Scalp gel, dithranol 0.25%, salicylic acid 1.6% in gel basis containing methyl salicylate, net price 50 g = £7.03. Label: 28

Excipients none as listed in section 13.1.3

Dose

For application to scalp, initially apply on alternate days for 10–20 minutes; may be increased to daily application for max. 1 hour and then wash off

Salicylic acid

SALICYLIC ACID

For coal tar preparations containing salicylic acid, see under Tars p. 569; for dithranol preparations containing salicylic acid see under Dithranol, above

Cautions see notes above; avoid broken or inflamed skin

Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin or on neonatal skin

Side-effects sensitivity, excessive drying, irritation, systemic effects after widespread use (see under Cautions)

Indication and dose

Hyperkeratotic skin disorders see under preparation

Acne section 13.6.1

Warts and calluses section 13.7

Scalp conditions section 13.9

Fungal nail infections section 13.10.2

Zinc and Salicylic Acid Paste, BP

Paste, (Lassar's Paste), zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%, net price 25 g = 17p

Dose

Child 1 month–18 years apply twice daily

Oral retinoids for psoriasis

ACITRETIN

Note Acitretin is a metabolite of etretinate

Cautions in children use only in exceptional circumstances (premature epiphyseal closure reported); in females of childbearing age exclude pregnancy before starting (test for pregnancy within 2 weeks before treatment and monthly thereafter; start treatment on day 2 or 3 of menstrual cycle)—females of childbearing age (including those with history of infertility) should avoid pregnancy and use effective contraception for at least 1 month before, during, and for at least 3 years after treatment (oral progestogen-only contraceptives not considered effective); patients should avoid concomitant tetracycline or methotrexate, high doses of vitamin A (more than 4000–5000 units daily), and use of keratolytics, and should not donate blood during or for at least 1 year after stopping therapy (teratogenic risk); check liver func-

tion at start, at least every 4 weeks for first 2 months and then every 3 months; monitor serum-triglyceride and serum-cholesterol concentrations at least every 4 weeks for first 2 months, then every 3 months; diabetes (can alter glucose tolerance—initial frequent blood glucose checks); radiographic assessment on long-term treatment; investigate atypical musculoskeletal symptoms; avoid excessive exposure to sunlight and unsupervised use of sunlamps; **interactions:** Appendix 1 (retinoids)

Contra-indications hyperlipidaemia

Hepatic impairment avoid—risk of further impairment

Renal impairment avoid; increased risk of toxicity

Pregnancy avoid—teratogenic; effective contraception must be used—see Cautions above

Breast-feeding avoid

Side-effects dryness of mucous membranes (sometimes erosion), of skin (sometimes scaling, thinning, erythema especially of face, and pruritus), and of conjunctiva (sometimes conjunctivitis and decreased tolerance of contact lenses); sticky skin, dermatitis; other side-effects reported include palmoplantar exfoliation, epistaxis, epidermal and nail fragility, peripheral oedema, vulvovaginal candidiasis, paronychia, granulomatous lesions, bullous eruptions, reversible hair thinning and alopecia, myalgia and arthralgia, occasional nausea, headache, malaise, drowsiness, rhinitis, sweating, taste disturbance, stomatitis, cheilitis, and gingivitis; benign intracranial hypertension (discontinue if severe headache, vomiting, diarrhoea, abdominal pain, and visual disturbance occur; **avoid** concomitant tetracyclines); photosensitivity, corneal ulceration, rarely jaundice and hepatitis (**avoid** concomitant methotrexate); raised serum-triglyceride or serum-cholesterol concentration; decreased night vision reported; skeletal hyperostosis and extrasosseous calcification reported following long-term administration of etretinate (and premature epiphyseal closure in children, see Cautions above)

Indication and dose

Harlequin ichthyosis (under expert supervision only)

• **By mouth**

Neonate 500 micrograms/kg once daily with food or milk (occasionally up to 1 mg/kg daily) with careful monitoring of musculoskeletal development

Severe extensive psoriasis resistant to other forms of therapy, palmoplantar pustular psoriasis, severe congenital ichthyosis, severe Darier's disease (keratosis follicularis) (all under expert supervision only)

• **By mouth**

Child 1 month–12 years 500 micrograms/kg once daily with food or milk (occasionally up to 1 mg/kg daily) to max. 35 mg daily with careful monitoring of musculoskeletal development (see also p. 567)

Child 12–18 years initially 25–30 mg daily (Darier's disease 10 mg daily) for 2–4 weeks, then adjusted according to response, usual range 25–50 mg daily; up to 75 mg daily for short periods in psoriasis and ichthyosis (see also p. 567)

Neotigason® (Actavis) (POM)

Capsules, acitretin 10 mg (brown/white), net price 60-cap pack = £23.80; 25 mg (brown/yellow), 60-cap pack = £55.24. Label: 10, patient information leaflet, 11, 21

- ▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

13.5.3 Drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis.

Pimecrolimus by topical application is licensed for *mild to moderate atopic eczema*. **Tacrolimus** is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatment unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema.

NICE guidance

Tacrolimus and pimecrolimus for atopic eczema (August 2004)

Topical pimecrolimus and tacrolimus are options for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years and topical tacrolimus is recommended for moderate to severe atopic eczema in children over 2 years. Pimecrolimus and tacrolimus should be used within their licensed indications.

The *Scottish Medicines Consortium* (p. 3) has advised (March 2010) that tacrolimus ointment (*Protopic®*) is accepted for restricted use within NHS Scotland for the prevention of flares in children aged over 2 years with moderate to severe atopic eczema in accordance with the licensed indication; it's use is restricted to initiation by doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

For the role of topical corticosteroids in eczema, see section 13.5.1, and for comment on their limited role in psoriasis, see section 13.4. A systemic corticosteroid (section 6.3.2) such as prednisolone may be used in *severe refractory eczema*.

Systemic drugs acting on the immune system are generally used by **specialists** in a hospital setting.

Ciclosporin by mouth can be used for *severe psoriasis* and for *severe eczema*. **Azathioprine** (section 8.2.1) or **mycophenolate mofetil** (section 8.2.1) are also used for severe refractory eczema in children.

Methotrexate can be used for *severe resistant psoriasis*; the dose is given **once weekly** and adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid (section 9.1.2)

should be given to reduce the possibility of methotrexate toxicity. Folic acid can be given at a dose of 5 mg once weekly [unlicensed indication]; alternative regimens may be used in some settings.

Etanercept (a cytokine modulator) is licensed in children over 8 years of age for the treatment of *severe plaque psoriasis* that is inadequately controlled by other systemic treatments and photochemotherapy, or when these other treatments cannot be used because of intolerance or contra-indications.

CICLOSPORIN

(Cyclosporin)

Cautions section 8.2.2

Additional cautions in atopic dermatitis and psoriasis
Contra-indicated in abnormal renal function, uncontrolled hypertension (see also below), infections not under control, and malignancy (see also below). Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting. During treatment, monitor serum creatinine every 2 weeks for first 3 months then every month; reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within one month. Discontinue if hypertension develops that cannot be controlled by dose reduction or antihypertensive therapy. Avoid excessive exposure to sunlight and avoid use of UVB or PUVA. *In atopic dermatitis*, also allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe); *Staphylococcus aureus* skin infections not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative—see also **interactions**: Appendix 1 (ciclosporin)); investigate lymphadenopathy that persists despite improvement in atopic dermatitis. *In psoriasis*, also exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops

Hepatic impairment section 8.2.2

Renal impairment see Cautions above

Pregnancy section 8.2.2

Breast-feeding section 8.2.2

Side-effects section 8.2.2

Licensed use not licensed for use in children under 16 years for atopic eczema (dermatitis) or psoriasis

Indication and dose

Short-term treatment (usually max. 8 weeks but may be used for longer under specialist supervision) of severe atopic dermatitis where conventional therapy ineffective or inappropriate

- By mouth, administered in accordance with expert advice

Child 1 month–18 years initially 1.25 mg/kg twice daily, if good initial response not achieved within 2 weeks, increase rapidly to max. 2.5 mg/kg twice daily; initial dose of 2.5 mg/kg twice daily if very severe

Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

Severe psoriasis where conventional therapy ineffective or inappropriate

- By mouth, administered in accordance with expert advice

Child 1 month–18 years initially 1.25 mg/kg twice daily, increased gradually to max. 2.5 mg/kg twice daily if no improvement within 1

month (discontinue if response still insufficient after 6 weeks); initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement
Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

Refractory ulcerative colitis section 1.5.3

Transplantation and graft-versus-host disease section 8.2.2

Preparations

Section 8.2.2

METHOTREXATE

Cautions see section 8.1.3, also photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported)

Contra-indications section 8.1.3

Hepatic impairment avoid—dose-related toxicity

Renal impairment section 8.1.3

Pregnancy section 8.1.3

Breast-feeding section 8.1.3

Side-effects section 8.1.3

Licensed use not licensed for use in children with psoriasis

Indication and dose

Severe uncontrolled psoriasis unresponsive to conventional therapy (specialist use only)

• By mouth

Child 2–18 years initially 200 micrograms/kg (max. 10 mg) once **weekly** increased according to response to 400 micrograms/kg (max. 25 mg) once **weekly**

Safe Practice

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose and frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

Malignant disease section 8.1.3

Rheumatoid arthritis section 10.1.3

Severe Crohn's disease section 1.5.3

Preparations

Section 10.1.3

PIMECROLIMUS

Cautions UV light (avoid excessive exposure to sunlight and sunlamps), avoid other topical treatments

except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation)

Contra-indications contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions

Side-effects burning sensation, pruritus, erythema, skin infections (including folliculitis and *less commonly* impetigo, herpes simplex and zoster, molluscum contagiosum); *rarely* papilloma, skin discoloration, local reactions including pain, paraesthesia, peeling, dryness, oedema, and worsening of eczema; skin malignancy reported

Indication and dose

Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used; see also notes above

Child 2–18 years apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

Elidel® (Novartis) (POM)

Cream, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 28

Excipients include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

TACROLIMUS

Cautions infection at treatment site, UV light (avoid excessive exposure to sunlight and sunlamps); alcohol consumption (risk of facial flushing and skin irritation)

Contra-indications hypersensitivity to macrolides; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions; application under occlusion; avoid contact with eyes and mucous membranes

Pregnancy manufacturer advises avoid unless essential; toxicity in *animal* studies following systemic administration

Breast-feeding manufacturer advises avoid—present in milk following systemic administration

Side-effects application-site reactions including rash, irritation, pain, and paraesthesia; herpes simplex infection, Kaposi's varicelliform eruption; application-site infections; *less commonly* acne; rosacea, and skin malignancy also reported

Indication and dose

Short-term treatment of moderate to severe atopic eczema (including flares) either unresponsive to, or in children intolerant of conventional therapy; see also notes above

Child 2–16 years initially apply 0.03% ointment thinly twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks) then reduce to once daily until lesion clears

Child 16–18 years initially apply 0.1% ointment thinly twice daily until lesion clears (consider other

treatment if eczema worsens or if no improvement after 2 weeks); reduce to once daily or switch to 0.03% ointment if clinical condition allows

Prevention of flares in children with moderate to severe atopic eczema and 4 or more flares a year, who have responded to initial treatment with topical tacrolimus

Child 2–16 years apply 0.03% ointment thinly twice weekly (with an interval of 2–3 days between applications); use short-term treatment regimen during an acute flare; interrupt preventative therapy after 1 year to reassess condition

Child 16–18 years apply 0.1% ointment thinly twice weekly (with an interval of 2–3 days between applications); use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

Other indications section 8.2.2

Protopic® (Astellas) (POM)

Ointment, tacrolimus (as monohydrate) 0.03%, net price 30 g = £19.44, 60 g = £35.46; 0.1%, 30 g = £21.60, 60 g = £39.40. Label: 4, 11, 28

Excipients include beeswax

Cytokine modulators

ETANERCEPT

Cautions section 10.1.3

Contra-indications section 10.1.3

Hepatic impairment section 10.1.3

Pregnancy section 10.1.3

Breast-feeding section 10.1.3

Side-effects section 10.1.3

Indication and dose

Severe plaque psoriasis

- By subcutaneous injection

Child 8–18 years 800 micrograms/kg (max. 50 mg) once weekly; max. treatment duration 24 weeks; discontinue if no response after 12 weeks

Polyarticular-course juvenile idiopathic arthritis

section 10.1.3

▮ **Preparations**

Section 10.1.3

13.6 Acne and rosacea

13.6.1 Topical preparations for acne

13.6.2 Oral preparations for acne

Acne vulgaris Acne vulgaris commonly affects children around puberty and occasionally affects infants. Treatment of acne should be commenced early to prevent scarring; lesions may worsen before improving. The choice of treatment depends on age, severity, and

whether the acne is predominantly inflammatory or comedonal.

Mild to moderate acne is generally treated with topical preparations, such as benzoyl peroxide, azelaic acid, and retinoids, (section 13.6.1).

For *moderate to severe inflammatory acne* or where topical preparations are not tolerated or are ineffective or where application to the site is difficult, systemic treatment (section 13.6.2) with oral antibacterials may be effective. **Co-cyprindiol** (cyproterone acetate with ethinylestradiol) has anti-androgenic properties and may be useful in young women with acne refractory to other treatments.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, acne with scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe oral **isotretinoin** (section 13.6.2).

Neonatal and infantile acne Inflammatory papules, pustules, and occasionally comedones may develop at birth or within the first month; most neonates with acne do not require treatment. Acne developing at 3–6 months of age may be more severe and persistent; lesions are usually confined to the face. Topical preparations containing benzoyl peroxide (at the lowest strength possible to avoid irritation), adapalene, or tretinoin may be used if treatment for infantile acne is necessary. In infants with inflammatory acne, oral **erythromycin** (section 5.1.5) is used because topical preparations for acne are not well tolerated. In cases of erythromycin-resistant acne, oral isotretinoin (section 13.6.2) can be given on the advice of a consultant dermatologist.

Rosacea The adult form of rosacea rarely occurs in children. Persistent or repeated use of potent topical corticosteroids may cause periorificial rosacea (steroid acne). The pustules and papules of rosacea may be treated for at least 6 weeks with a topical **metronidazole** preparation (section 13.10.1.2), or a systemic antibacterial such as **erythromycin** (section 5.1.5), or for a child over 12 years, **oxytetracycline** (section 5.1.3). Tetracyclines are **contra-indicated** in children under 12 years of age.

13.6.1 Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide (see below) or topical retinoids (see p. 576). Alternatively, topical application of an antibacterial such as erythromycin or clindamycin may be effective for inflammatory acne. However, topical antibacterials are probably no more effective than benzoyl peroxide and may promote the emergence of resistant organisms. If topical preparations prove inadequate oral preparations may be needed (section 13.6.2). The choice of product and formulation (gel, solution, lotion, or cream) is largely determined by skin type, patient preference, and previous usage of acne products.

Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with a reduction in benzoyl peroxide concentration, frequency, and area of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid has antimicrobial and anticomedonal properties. It may be used as an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face; azelaic acid is less likely to cause local irritation than benzoyl peroxide.

BENZOYL PEROXIDE

Cautions avoid contact with eyes, mouth, and mucous membranes; may bleach fabrics and hair; avoid excessive exposure to sunlight

Side-effects skin irritation (reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency)

Licensed use *Quinoderm*[®] is licensed for use in children; *all other preparations*, not licensed for use in treatment of infantile acne

Indication and dose

Acne vulgaris

Child 12–18 years apply 1–2 times daily preferably after washing with soap and water, start treatment with lower-strength preparations

Note May bleach clothing

Infantile acne

Child 1 month–2 years apply 1–2 times daily; start treatment with lower-strength preparations

Acnecide[®] (Galderma)

Gel, benzoyl peroxide 5% in an aqueous gel basis, net price 60 g = £10.88
Excipients include propylene glycol

Brevoxyl[®] (GSK)

Cream, benzoyl peroxide 4% in an aqueous basis, net price 40 g = £3.30
Excipients include cetyl alcohol, fragrance, stearyl alcohol

PanOxyl[®] (Stiefel)

Aquagel (= aqueous gel), benzoyl peroxide 2.5%, net price 40 g = £1.76; 5%, 40 g = £1.92; 10%, 40 g = £2.13
Excipients include propylene glycol

Cream, benzoyl peroxide 5% in a non-greasy basis, net price 40 g = £1.89
Excipients include isopropyl palmitate, propylene glycol

Gel, benzoyl peroxide 5% in an aqueous alcoholic basis, net price 40 g = £1.51; 10%, 40 g = £1.69
Excipients include fragrance

Wash, benzoyl peroxide 10% in a detergent basis, net price 150 mL = £4.00
Excipients include imidurea

With antimicrobials

Duac[®] Once Daily (GSK) ^(POM)

Gel, benzoyl peroxide 5%, clindamycin 1% (as phosphate) in an aqueous basis, net price 25 g = £9.95, 50 g = £19.90

Excipients include disodium edetate

Dose

Acne vulgaris

Child 12–18 years apply once daily in the evening

Quinoderm[®] (Ferndale)

Cream, benzoyl peroxide 5%, potassium hydroxyquinoline sulphate 0.5%, in an astringent vanishing-cream basis, net price 50 g = £2.21

Excipients include cetostearyl alcohol, edetic acid (EDTA)

Cream, benzoyl peroxide 10%, potassium hydroxyquinoline sulphate 0.5%, in an astringent vanishing-cream basis, net price 25 g = £1.30, 50 g = £2.49

Excipients include cetostearyl alcohol, edetic acid (EDTA)

Dose

Acne vulgaris, acneform eruptions, folliculitis

Apply 2–3 times daily

AZELAIC ACID

Cautions avoid contact with eyes, mouth, and mucous membranes

Side-effects local irritation (reduce frequency or discontinue temporarily); *less commonly* skin discoloration; *very rarely* photosensitisation

Indication and dose

See under preparations

Finacea[®] (Meda) ^(POM)

Gel, azelaic acid 15%, net price 30 g = £7.48

Excipients include disodium edetate, polysorbate 80, propylene glycol

Dose

Facial acne vulgaris

Child 12–18 years apply twice daily; discontinue if no improvement after 1 month

Skinoren[®] (Bayer Schering) ^(POM)

Cream, azelaic acid 20%, net price 30 g = £3.74

Excipients include propylene glycol

Dose

Acne vulgaris

Apply twice daily (sensitive skin, once daily for first week). Extended treatment may be required but manufacturer advises period of treatment should not exceed 6 months

Topical antibacterials for acne

In the treatment of mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for children who wish to avoid oral antibacterials or who cannot tolerate them.

Topical preparations of **erythromycin** and **clindamycin** may be used to treat *inflamed lesions* in mild to moderate acne when topical benzoyl peroxide or tretinoin is ineffective or poorly tolerated. Topical benzoyl peroxide, azelaic acid, or retinoids used in combination with an antibacterial (topical or systemic) may be more effective than an antibacterial used alone. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (but treatment with a topical preparation should be continued for at least 6 months).

ANTIBACTERIALS

Cautions some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide

Indication and dose

Acne vulgaris for dose, see under preparations

Dalacin T® (Pharmacia) (PoM)

Topical solution, clindamycin 1% (as phosphate), in an aqueous alcoholic basis, net price (both with applicator) 30 mL = £4.34, 50 mL = £7.23

Excipients include propylene glycol

Dose

Apply twice daily

Lotion, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 mL = £5.08, 50 mL = £8.47

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Dose

Apply twice daily

Stiemycin® (Stiefel) (PoM)

Solution, erythromycin 2% in an alcoholic basis, net price 50 mL = £7.69

Excipients include propylene glycol

Dose

Apply twice daily

Zindaclin® (Crawford) (PoM)

Gel, clindamycin 1% (as phosphate), net price 30 g = £8.66

Excipients include propylene glycol

Dose

Child 12–18 years apply once daily

Zineryt® (Astellas) (PoM)

Topical solution, powder for reconstitution, erythromycin 40 mg, zinc acetate 12 mg/mL when reconstituted with solvent containing ethanol, net price per pack of powder and solvent to provide 30 mL = £7.71, 90 mL = £16.68

Excipients none as listed in section 13.1.3

Dose

Apply twice daily

Topical retinoids and related preparations for acne

Topical **tretinoin**, its isomer **isotretinoin**, and **adapalene** (a retinoid-like drug), are useful for treating come-

done and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

Tretinoin can be used under specialist supervision to treat infantile acne; adapalene can also be used. See also Neonatal and Infantile Acne, p. 574.

Cautions Topical retinoids should be avoided in severe acne involving large areas. Contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin should be avoided. Topical retinoids should be used with caution on sensitive areas such as the neck, and accumulation in angles of the nose should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen (section 13.8.1) or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided. Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid; alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application).

Pregnancy Topical retinoids are contra-indicated in pregnancy; females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

Side-effects Local reactions include burning, erythema, stinging, pruritus, dry or peeling skin (discontinue if severe). Increased sensitivity to UVB light or sunlight occurs. Temporary changes of skin pigmentation with tretinoin have been reported. Eye irritation and oedema, and blistering or crusting of skin have been reported rarely.

ADAPALENE

Cautions see notes above

Pregnancy see notes above

Breast-feeding amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas

Side-effects see notes above

Licensed use not licensed for use in infantile acne

Indication and dose

Infantile acne

Child 1 month–2 years apply thinly once daily at night

Mild to moderate acne vulgaris

Child 12–18 years apply thinly once daily in the evening; reduce frequency or suspend treatment if irritation occurs

Differin® (Galderma) (PoM)

Cream, adapalene 0.1%, net price 45 g = £11.40.

Label: 11

Excipients include disodium edetate, hydroxybenzoates (parabens)

Gel, adapalene 0.1%, net price 45 g = £11.40.

Label: 11

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

With benzoyl peroxide

Epiduo® (Galderma) (POM)

Gel, adapalene 0.1%, benzoyl peroxide 2.5%, net price

45 g = £17.91. Label: 11

Excipients include disodium edetate, polysorbate 80, propylene glycol

Dose

Acne vulgaris

Child 12–18 years apply thinly once daily in the evening; reduce frequency or suspend treatment if irritation occurs

Note May bleach clothing and hair

ISOTRETINOIN

Note Isotretinoin is an isomer of tretinoin

Important For prescribing information on isotretinoin when given by mouth, see p. 579

Cautions (*topical application only*) see notes above; also personal or familial history of non-melanoma skin cancer

Contra-indications (*topical application only*) rosacea; perioral dermatitis

Pregnancy (*topical application only*) see notes above

Breast-feeding avoid

Side-effects (*topical application only*) see notes above

Indication and dose

Acne vulgaris

Apply thinly 1–2 times daily

Isotrex® (Stiefel) (POM)

Gel, isotretinoin 0.05%, net price 30 g = £5.94.

Label: 11

Excipients include butylated hydroxytoluene

With antibacterial

Isotrexin® (Stiefel) (POM)

Gel, isotretinoin 0.05%, erythromycin 2% in ethanolic

basis, net price 30 g = £7.47. Label: 11

Excipients include butylated hydroxytoluene

TRETINOIN

Note Tretinoin is the acid form of vitamin A

Cautions see notes above

Contra-indications personal or familial history of non-melanoma skin cancer; rosacea; perioral dermatitis

Pregnancy see notes above

Breast-feeding amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come into contact with treated areas

Side-effects see notes above

Licensed use *Retin-A*® not licensed for use in infantile acne

Indication and dose

See under preparations

Malignant disease section 8.1.5

Retin-A® (Janssen) (POM)

Gel, tretinoin 0.01%, net price 60 g = £5.28; 0.025%, 60 g = £5.28. Label: 11

Excipients include butylated hydroxytoluene

Dose

Infantile acne

Apply 0.01% gel thinly 1–2 times daily; increase to 0.025% gel if necessary

Acne vulgaris, particularly that associated with oily skin

Apply thinly 1–2 times daily

With antibacterial

Aknemycin Plus® (Almirall) (POM)

Solution, tretinoin 0.025%, erythromycin 4% in an alcoholic basis, net price 25 mL = £7.05. Label: 11

Excipients none as listed in section 13.1.3

Dose

Acne (all forms), particularly that associated with oily skin

Apply thinly 1–2 times daily

Other topical preparations for acne

Salicylic acid is available in various preparations for sale direct to the public for the treatment of mild acne. Other products are more suitable for acne; salicylic acid is used mainly for its keratolytic effect.

A topical preparation of **nicotinamide** is available for inflammatory acne.

NICOTINAMIDE

Cautions avoid contact with eyes and mucous membranes (including nose and mouth); reduce frequency of application if excessive dryness, irritation or peeling

Side-effects dryness of skin; also pruritus, erythema, burning and irritation

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Inflammatory acne vulgaris see under preparations below

Nicam® (Derma)

Gel, nicotinamide 4%, net price 60 g = £7.10

Excipients none as listed in section 13.1.3

Dose

Apply twice daily; reduce to once daily or on alternate days if irritation occurs

SALICYLIC ACID

Cautions risk of significant systemic absorption in neonates; avoid contact with mouth, eyes, mucous membranes; systemic effects after excessive use
Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin or on neonatal skin

Side-effects local irritation

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Acne vulgaris see under preparation

Psoriasis section 13.5.2

Warts and calluses section 13.7

Fungal nail infections section 13.10.2

Acnival® (Alliance) 

Topical solution, salicylic acid 2% in a detergent and emollient basis, net price 177 mL = £3.39.

Excipients include benzyl alcohol

Note may be difficult to obtain

Dose

Apply up to 3 times daily

13.6.2 Oral preparations for acne

Oral antibacterials for acne

Oral antibacterials may be used in *moderate to severe inflammatory acne* when topical treatment is not adequately effective or is inappropriate. Concomitant anti-comedonal treatment with topical benzoyl peroxide or azelaic acid may also be required (section 13.6.1).

Tetracyclines should not be given to children under 12 years. In children over 12 years, either **oxytetracycline** or **tetracycline** (section 5.1.3) is usually given for acne in a dose of 500 mg twice daily. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline and **lymecycline** (section 5.1.3) are alternatives to tetracycline in children over 12 years. Doxycycline can be used in a dose of 100 mg daily. Lymecycline is given in a dose of 408 mg daily.

Although **minocycline** is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a dose of 100 mg once daily or 50 mg twice daily.

Erythromycin (section 5.1.5) in a dose of 500 mg twice daily for children over 12 years is an alternative for the management of moderate to severe acne with inflamed lesions, but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response. Infants with acne requiring oral treatment with erythromycin should be given 250 mg once daily or 125 mg twice daily; in cases of erythromycin-resistant *P. acnes* in infants, oral isotretinoin may be used on the advice of a consultant dermatologist.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in females of childbearing age who also wish to receive oral contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some females with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent. Contra-indications of co-cyprindiol include pregnancy and a predisposition to thrombosis.

Venous thromboembolism occurs more frequently in women taking co-cyprindiol than those taking a low-dose combined oral contraceptive. Co-cyprindiol is licensed for use in women with severe acne that has not responded to oral antibacterials and for moderately severe hirsutism; it should not be used solely for contraception. It is contra-indicated in those with a personal or close family history of venous thromboembolism. Women with severe acne or hirsutism may have an inherently increased risk of cardiovascular disease.

CO-CYPRINDIOL

A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively

Cautions see under Combined Hormonal Contraceptives, section 7.3.1

Contra-indications see under Combined Hormonal Contraceptives, section 7.3.1

Hepatic impairment see under Combined Hormonal Contraceptives, section 7.3.1

Pregnancy avoid—risk of feminisation of male fetus with cyproterone

Breast-feeding manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone

Side-effects see under Combined Hormonal Contraceptives, section 7.3.1

Licensed use licensed for use in females of childbearing age

Indication and dose

Severe acne in females of childbearing age refractory to prolonged oral antibacterial therapy (but see notes above), moderately severe hirsutism

• By mouth

1 tablet daily for 21 days starting on day 1 of menstrual cycle and repeated after a 7-day interval, usually for several months; withdraw 3–4 months after acne or hirsutism completely resolved (repeat courses may be given if recurrence); long-term treatment may be necessary for severe symptoms

Co-cyprindiol (Non-proprietary) ^(Poli)

Tablets, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tablet pack = £4.70

Brands include Acnacin®, Cicaferm®, Clairette®

Dianette® (Bayer Schering) ^(Poli)

Tablets, beige, s/c, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tablet pack = £7.71

Oral retinoid for acne

The retinoid **isotretinoin** reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, acne with scarring, or for acne which has not responded to an adequate course of a systemic antibacterial. Isotretinoin is used for the treatment of severe infantile acne resistant to erythromycin.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant

dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must **not** be given to females of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. They must also be registered with a pregnancy prevention programme (see under Cautions below).

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

ISOTRETINOIN

Note Isotretinoin is an isomer of tretinoin

Cautions see notes above; also avoid blood donation during treatment and for at least 1 month after treatment; history of depression; monitor all patients for depression; measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised); discontinue if uncontrolled hypertriglyceridaemia or pancreatitis; diabetes; dry eye syndrome (associated with risk of keratitis); avoid keratolytics; **interactions:** Appendix 1 (retinoids)

Pregnancy prevention In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

Counselling Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment

Contra-indications hypervitaminosis A, hyperlipidaemia

Hepatic impairment avoid—further impairment may occur

Renal impairment in severe impairment, reduce initial dose and increase gradually, if necessary, up to 1 mg/kg daily as tolerated

Pregnancy avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

Breast-feeding avoid

Side-effects dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus), epidermal fragility (trauma may cause blistering), dryness of lips (sometimes cheilitis), dryness of eyes (with blepharitis and conjunctivitis), dryness of pharyngeal mucosa (with hoarseness), dryness of nasal mucosa (with epistaxis), headache, myalgia and arthralgia, raised plasma-triglyceride concentration (risk of pancreatitis if triglycerides above 9 mmol/litre), raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration), raised blood-glucose concentration, raised serum-transaminase concentration, haematuria and proteinuria, thrombocytopenia, thrombocytosis, neutropenia and anaemia; *rarely* mood changes (depression, aggressive behaviour, anxiety, and very rarely psychosis and suicidal ideation)—expert referral required, skin reactions (including reports of Stevens-Johnson syndrome and toxic epidermal necrolysis), alopecia; *very rarely* nausea, hepatitis, inflammatory bowel disease, gastrointestinal haemorrhage, haemorrhagic diarrhoea (discontinue treatment), benign intracranial hypertension (avoid concomitant tetracyclines), convulsions, malaise, drowsiness, dizziness, diabetes mellitus, lymphadenopathy, hyperuricaemia, glomerulonephritis, tendinitis, arthritis, raised serum-creatinine kinase concentration, bone changes (including reduced bone density, early epiphyseal closure, and skeletal hyperostosis) and calcification of tendons and ligaments following long-term administration, visual disturbances (papilloedema, corneal opacities, cataracts, decreased night vision, photophobia, blurred vision, colour blindness)—expert referral required and consider withdrawal, decreased tolerance to contact lenses, keratitis, impaired hearing, Gram-positive infections of skin and mucous membranes, exacerbation of acne, acne fulminans, allergic vasculitis and granulomatous lesions, paronychia, hirsutism, nail dystrophy, skin hyperpigmentation, photosensitivity, increased sweating

Licensed use not licensed for use in infantile acne
Indication and dose

Acne vulgaris under supervision of consultant dermatologist, see notes above

• **By mouth**

Child 12–18 years 500 micrograms/kg daily (in 1–2 divided doses), increased if necessary to 1 mg/kg daily, for 16–24 weeks (repeat treatment course after a period of at least 8 weeks if failure or relapse after first course); max. cumulative dose 150 mg/kg per course

Severe infantile acne under supervision of a consultant dermatologist, see p. 574

• **By mouth**

Child 1 month–2 years 200 micrograms/kg daily (in 1–2 divided doses), increased if necessary to 1 mg/kg daily, for 16–24 weeks; max. cumulative dose 150 mg/kg per course

Isotretinoin (Non-proprietary) (POM)

Capsules, isotretinoin 5 mg, net price 56-cap pack = £14.99; 20 mg, 56-cap pack = £39.99. Label: 10, patient information leaflet, 11, 21

Roaccutane® (Roche) (POM)

Capsules, isotretinoin 10 mg (brown-red), net price 30-cap pack = £14.54; 20 mg (brown-red/white), 30-

cap pack = £20.02. Label: 10, patient information card, 11, 21

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

13.7 Preparations for warts and calluses

Warts (*verruca vulgaris*) are common, benign, self-limiting, and usually asymptomatic. They are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction and is required only if the warts are painful, unsightly, persistent, or cause distress. In immunocompromised children, warts may be more difficult to eradicate.

Preparations of **salicylic acid**, **formaldehyde**, **gluteraldehyde** or **silver nitrate** are used for the removal of warts on hands and feet. **Salicylic acid** is a useful keratolytic which may be considered first-line in the treatment of warts; it is also suitable for the removal of *corns and calluses*. Preparations of salicylic acid in a collodion basis are available but some children may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

SALICYLIC ACID

Cautions significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas

Side-effects skin irritation, see notes above

Licensed use not licensed for use in children under 2 years

Indication and dose

Warts on hands and feet (plantar)

For dose see preparations; apply carefully to wart and protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

Psoriasis section 13.5.2

Acne section 13.6.1

Fungal nail infections section 13.10.2

Cuplex[®] (Crawford)

Gel, salicylic acid 11%, lactic acid 4%, in a collodion basis, net price 5 g = £2.23. Label: 15

Dose

Apply twice daily

Note Contains colophony (see notes above)

Duofilm[®] (GSK)

Paint, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 15 mL (with applicator) = £2.25. Label: 15

Dose

Apply daily

Occlusal[®] (Alliance)

Cutaneous solution, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.56. Label: 15

Dose

Apply daily

Salactol[®] (Dermal)

Paint, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 10 mL (with applicator) = £1.71. Label: 15

Dose

Apply daily

Note Contains colophony (see notes above)

Salatac[®] (Dermal)

Gel, salicylic acid 12%, lactic acid 4% in a collodion basis, net price 8 g (with applicator) = £2.98. Label: 15

Dose

Apply daily

Verrugon[®] (Ransom)

Ointment, salicylic acid 50% in a paraffin basis, net price 6 g = £3.12

Dose

Apply daily

FORMALDEHYDE

Cautions see under Salicylic Acid

Side-effects see under Salicylic Acid

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Warts, particularly plantar warts for dose see preparation below

Veracur[®] (Typharm)

Gel, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41.

Dose

Apply twice daily

GLUTARALDEHYDE

Cautions protect surrounding skin; not for application to face, mucosa, or anogenital areas

Side-effects rashes, skin irritation (discontinue if severe); stains skin brown

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Warts, particularly plantar warts

Apply twice daily

Glutarol[®] (Dermal)

Solution (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.07

SILVER NITRATE

Cautions protect surrounding skin and avoid broken skin; not suitable for application to face, ano-genital region, or large areas

Side-effects chemical burns on surrounding skin; stains skin and fabric

Licensed use no age range specified by manufacturer

Indication and dose**Common warts and verrucas**

Apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts or max. 6 applications for verrucas
Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

Umbilical granulomas

Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

Silver nitrate (Non-proprietary)

Caustic pencil, tip containing silver nitrate 40%, potassium nitrate 60%, net price = 93p

AVOCA® (Bray)

Caustic pencil, tip containing silver nitrate 95%, potassium nitrate 5%, net price, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £1.94.

Anogenital warts

Anogenital warts (*condylomata acuminata*) in children are often asymptomatic and require only a simple barrier preparation. If treatment is required it should be supervised by a hospital specialist. Persistent warts on genital skin may require treatment with cryotherapy or other forms of physical ablation under general anaesthesia.

Podophyllotoxin (the major active ingredient of podophyllum), or **imiquimod** are used to treat external anogenital warts; these preparations can cause considerable irritation of the treated area and are therefore suitable only for children who are able to cooperate with the treatment.

IMIQUIMOD

Cautions avoid normal or broken skin and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin); autoimmune disease; immunosuppressed patients

Pregnancy no evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution

Breast-feeding no information available

Side-effects local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; less commonly local ulceration and alopecia; rarely Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; very rarely dysuria in females; permanent hypopigmentation or hyperpigmentation reported

Licensed use not licensed for use in children

Indication and dose

External genital and perianal warts (for use under specialist supervision only)

Apply thinly 3 times a week at night until lesions resolve (max. 16 weeks)

Important Should be rubbed in and allowed to stay on the treated area for 6–10 hours then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

Aldara® (Meda) (P_m)

Cream, imiquimod 5%, net price 12-sachet pack = £48.34. Label: 10, patient information leaflet

Excipients include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

Condoms may damage latex condoms and diaphragms

PODOPHYLLOTOXIN

Cautions see notes above; avoid normal skin and open wounds; keep away from face; very irritant to eyes

Pregnancy avoid

Breast-feeding avoid

Side-effects local irritation

Licensed use not licensed for use in children

Indication and dose

See under preparations (for use under specialist supervision only)

Condyline® (Nycomed) (P_m)

Solution, podophyllotoxin 0.5% in alcoholic basis, net price 3.5 mL (with applicators) = £14.49. Label: 15

Dose

Condylomata acuminata affecting the penis or the female external genitalia

Child 2–18 years (see notes above) apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses; direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male; max. 50 single applications ('loops') per session (consult product literature)

Warticon® (GSK) (P_m)

Cream, podophyllotoxin 0.15%, net price 5 g (with mirror) = £14.86

Excipients include butylated hydroxyanisole, cetyl alcohol, hydroxybenzoates (parabens), sorbic acid, stearyl alcohol

Dose

Condylomata acuminata affecting the penis or the female external genitalia

Child 2–18 years (see notes above) apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm²

Solution, blue, podophyllotoxin 0.5% in alcoholic basis, net price 3 mL (with applicators) = £12.38. Label: 15

Dose

Condylomata acuminata affecting the penis or the female external genitalia

Child 2–18 years (see notes above) apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm²; max. 50 single applications ('loops') per session (consult product literature)

13.8 Sunscreens and camouflagers

13.8.1 Sunscreen preparations

13.8.2 Camouflagers

13.8.1 Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption*, *solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *lupus erythematosus* and may aggravate some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are not substitute for covering the skin and avoiding sunlight. Protective clothing and sun avoidance (rather than the use of sunscreen preparations) are recommended for children under 6 months of age.

The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a child to remain 8 times longer in the sun without burning. However, in practice users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies. Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly** and **frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

Ingredient nomenclature in sunscreen preparations

rINN	INCI
amiloxate	isoamyl <i>p</i> -methoxycinnamate
avobenzene	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenol methoxyphenyl triazine
bisotrizole	methylene bis-benzotriazolyl tetramethylbutylphenol
ecamsule	terephthalylidene dicamphor sulfonic acid
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (or ethylhexyl) methoxycinnamate
octocrilene	octocrylene
oxybenzone	benzophenone-3

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in BNFC

Borderline substances The preparations marked 'ACBS' cannot be prescribed on the NHS except for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed. See also Appendix 2.

Anthelios® (L'Oréal Active)

XL SPF 50+ Melt-in cream (UVA and UVB protection; UVB-SPF 50+), avobenzene 3.5%, bemotrizinol 3%, drometrizole trisiloxane 0.5%, ecamsule 1%, octocrilene 2.5%, titanium dioxide 4.2%, net price 50 mL = £3.63. ACBS

Excipients include disodium edetate, stearyl alcohol

Note For INCI synonyms, see table above

Delph® (Fenton)

Lotion (UVA and UVB protection; UVB-SPF 30), octinoxate 4.8%, oxybenzone 1.5%, titanium dioxide 2%, net price 200 mL = £3.57. ACBS

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), imidurea

Note For INCI synonyms, see table above

Sunsense® Ultra (Crawford)

Lotion (UVA and UVB protection; UVB-SPF 50+), avobenzene 2%, ensulizole 2%, enzacamene 4%, octinoxate 6%, oxybenzone 2%, titanium dioxide 3%, net price 50-mL bottle with roll-on applicator = £4.11, 125 mL = £6.86, 500-mL pump pack = £15.54. ACBS

Excipients include butylated hydroxytoluene, cetyl alcohol, fragrance, hydroxybenzoates (parabens), propylene glycol

Note For INCI synonyms, see table above

Uvistat® (LPC)

Cream (UVA and UVB protection; UVB-SPF 30), avobenzene 5%, bisoctrizole 1.5%, octinoxate 7.5%, octocriene 4%, titanium dioxide 5.2%, net price 125 mL = £7.45. ACBS

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Note For INCI synonyms, see table above

Cream (UVA and UVB protection; UVB-SPF 50), amiloxate 2%, avobenzene 5%, bisoctrizole 6%, octinoxate 10%, octocriene 4%, titanium dioxide 4.8%, net price 125 mL = £8.45. ACBS

Excipients include disodium edetate, polysorbate 60, propylene glycol

Note For INCI synonyms, see table above

Lipscreen (UVA and UVB protection; UVB-SPF 50), avobenzene 5%, bemotrizinol 3%, octinoxate 10%, octocriene 4%, titanium dioxide 3%, net price 5 g = £2.99. ACBS

Excipients include butylated hydroxytoluene, hydroxybenzoates (parabens)

Note For INCI synonyms, see table above

Photodamage

Actinic keratoses occur very rarely in healthy children; *actinic cheilitis* may occur on the lips of adolescents following excessive sun exposure.

Diclofenac gel (*Solaraze®*) and fluorouracil cream are licensed for the treatment of actinic keratoses but they are not licensed for use in children.

In children with photosensitivity disorders, such as erythropoietic protoporphyria, specialists may use **betacarotene**, **mepacrine**, **chloroquine** or **hydroxychloroquine** (section 10.1.3) to reduce skin reactions.

BETACAROTENE

Note Betacarotene is a precursor to vitamin A

Cautions monitor vitamin A intake; **interactions:** Appendix 1 (vitamins)

Hepatic impairment avoid

Renal impairment use with caution

Pregnancy partially converted to vitamin A, but does not give rise to abnormally high serum concentration; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding use with caution—present in milk

Side-effects loose stools; yellow discoloration of skin; rarely, bruising, arthralgia

Licensed use not licensed for use in UK

Indication and dose

Management of photosensitivity reactions in erythropoietic protoporphyria (specialist use only)

• **By mouth**

Child 1–5 years 60–90 mg daily in single or divided doses

Child 5–9 years 90–120 mg daily in single or divided doses

Child 9–12 years 120–150 mg daily in single or divided doses

Child 12–16 years 150–180 mg daily in single or divided doses

Child 16–18 years 180–300 mg daily in single or divided doses

Note Protection not total—avoid strong sunlight and use sunscreen preparations; generally 2–6 weeks of treatment (resulting in yellow coloration of palms and soles) necessary

before increasing exposure to sunlight; dose should be adjusted according to level of exposure to sunlight

Betacarotene (Non-proprietary)

Capsules, 15 mg, 25 mg are available from 'special-order' manufacturers or specialist importing companies, see p. 809. Label: 21

13.8.2 Camouflagers

Disfigurement of the skin can be very distressing and may have a marked psychological effect, especially in children. Cosmetic preparations may be used to camouflage unsightly scars, skin deformities, and pigment abnormalities, such as vitiligo and birthmarks.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances The preparations marked 'ACBS' cannot be prescribed on the NHS for postoperative scars and other deformities except as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Covermark® (Derma UK)

Classic foundation (masking cream), net price 15 g (10 shades) = £11.32. ACBS

Excipients include beeswax, hydroxybenzoates (parabens), fragrance

Finishing powder, net price 25 g = £11.32. ACBS

Excipients include beeswax, hydroxybenzoates (parabens), fragrance

Dermacolor® (Fox)

Camouflage creme, (100 shades), net price 25 mL = £9.96. ACBS

Excipients include beeswax, butylated hydroxytoluene, fragrance, propylene glycol, stearyl alcohol, wool fat

Fixing powder, (7 shades), net price 60 g = £8.45. ACBS

Excipients include fragrance

Keromask® (Lornamead)

Masking cream, (9 shades), net price 15 mL = £5.68. ACBS

Excipients include butylated hydroxyanisole, hydroxybenzoates (parabens), wool fat, propylene glycol

Finishing powder, net price 20 g = £5.68. ACBS

Excipients include butylated hydroxytoluene, hydroxybenzoates (parabens)

Veil® (Thomas Blake)

Cover cream (40 shades), net price 19 g = £20.63, 44 g = £30.68, 70 g = £38.74. ACBS

Excipients include hydroxybenzoates (parabens), wool fat derivative

Finishing powder, translucent, net price 35 g = £22.62. ACBS

Excipients include butylated hydroxyanisole, hydroxybenzoates (parabens)

13.9 Shampoos and other preparations for scalp conditions

The detergent action of shampoo removes grease (sebum) from hair. Prepubertal children produce very little grease and require shampoo less frequently than adults. Shampoos can be used as vehicles for medicinal products, but their usefulness is limited by the short time

the product is in contact with the scalp and by their irritant nature.

Oils and ointments are very useful for scaly, dry scalp conditions; if a greasy appearance is cosmetically unacceptable, the preparation may be applied at night and washed out in the morning. Alcohol-based lotions are rarely used in children; alcohol causes painful stinging on broken skin and the fumes may exacerbate asthma.

Itchy, inflammatory, eczematous scalp conditions may be relieved by a simple emollient oil such as **olive oil** or **coconut oil** (arachis oil (ground nut oil, peanut oil) is best avoided in children under 5 years). In more severe cases a topical **corticosteroid** (section 13.4) may be required. Preparations containing **coal tar** are used for the common scaly scalp conditions of childhood including seborrhoeic dermatitis, dandruff (a mild form of seborrhoeic dermatitis), and psoriasis (section 13.5.2); **salicylic acid** is used as a keratolytic in some scalp preparations.

Shampoos containing antimicrobials such as **selenium sulphide** or **ketoconazole** are used for seborrhoeic dermatitis and dandruff in which yeast infection has been implicated, and for tinea capitis (ringworm of the scalp, section 13.10.2). Bacterial infection affecting the scalp (usually secondary to eczema, head lice, or ringworm) may be treated with shampoos containing antimicrobials such as **pyrithione zinc**, **cetrimide**, or **povidone-iodine**.

In neonates and infants, *cradle cap* (which is also a form of seborrhoeic eczema) can be treated by massaging **coconut oil** or **olive oil** into the scalp; a bland emollient such as **emulsifying ointment** can be rubbed onto the affected area once or twice daily before bathing and a mild shampoo used.

Shampoos

Ketoconazole (Non-proprietary) (PoM)

Cream—section 13.10.2

Shampoo, ketoconazole 2%, net price 120 mL = £3.53

Excipients include imidurea

Brands include *Dandrazol*® 2% Shampoo, *Nizoral*®

Dose

Seborrhoeic dermatitis and dandruff

Treatment, apply twice weekly for 2–4 weeks; prophylaxis, apply once every 1–2 weeks; leave preparation on for 3–5 minutes before rinsing

Pityriasis versicolor

Treatment, apply once daily for max. 5 days; prophylaxis, apply once daily for up to 3 days before sun exposure; leave preparation on for 3–5 minutes before rinsing

- Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole max. 2%, in a pack containing max. 120 mL and labelled to show a max. frequency of application of once every 3 days

Alphosyl 2 in 1® (GSK Consumer Healthcare)

Shampoo, alcoholic coal tar extract 5%, net price 125 mL = £1.81, 250 mL = £3.43

Excipients include hydroxybenzoates (parabens), fragrance

Dose

Dandruff

Use once or twice weekly as necessary

Psoriasis, seborrhoeic dermatitis, scaling and itching

Use every 2–3 days

Capasal® (Dermal)

Shampoo, coal tar 1%, coconut oil 1%, salicylic acid 0.5%, net price 250 mL = £4.69

Excipients none as listed in section 13.1.3

Dose

Scaly scalp disorders including psoriasis, seborrhoeic dermatitis, dandruff, and cradle cap

Apply daily as necessary

Ceanel Concentrate® (Ferndale)

Shampoo, cetrimide 10%, undecenoic acid 1%, net price 150 mL = £3.40, 500 mL = £9.80

Excipients none as listed in section 13.1.3

Dose

Scalp psoriasis, seborrhoeic dermatitis, dandruff

Apply 3 times in first week then twice weekly

Dermax® (Dermal)

Shampoo, benzalkonium chloride 0.5%, net price 250 mL = £5.69

Excipients none as listed in section 13.1.3

Dose

Seborrhoeic scalp conditions associated with dandruff and scaling

Apply as necessary

Meted® (Alliance)

Shampoo, salicylic acid 3%, sulphur 5%, net price 120 mL = £3.80

Excipients include fragrance

Note may be difficult to obtain

Dose

Scaly scalp disorders including psoriasis, seborrhoeic dermatitis, and dandruff

Apply at least twice weekly

Pentrax® (Alliance)

Shampoo, coal tar 4.3%, net price 120 mL = £3.80

Excipients none as listed in section 13.1.3

Note may be difficult to obtain

Dose

Scaly scalp disorders including psoriasis, seborrhoeic dermatitis, and dandruff

Apply at least twice weekly

Psoriderm® (Dermal)

Scalp lotion (= shampoo), coal tar 2.5%, lecithin 0.3%, net price 250 mL = £4.74

Excipients include disodium edetate

Dose

Scalp psoriasis

Use as necessary

Selsun® (Chattem UK)

Shampoo, selenium sulphide 2.5%, net price 50 mL = £1.44, 100 mL = £1.96, 150 mL = £2.75

Excipients include fragrance

Cautions avoid using 48 hours before or after applying hair colouring, straightening or waving preparations

Dose

Seborrhoeic dermatitis and dandruff

Child 5–18 years apply twice weekly for 2 weeks then once weekly for 2 weeks and then as necessary

Pityriasis versicolor [unlicensed indication]

Child 5–18 years apply to affected area and leave on for 10 minutes before rinsing off; apply once daily for 7 days; repeat course if necessary

Note diluting with a small amount of water prior to application can reduce irritation

T/Gel® (J&J)

Shampoo, coal tar extract 2%, net price 125 mL = £3.18, 250 mL = £4.78

Excipients include fragrance, hydroxybenzoates (parabens), imidurea, tetrasodium edetate

Dose

Scalp psoriasis, seborrhoeic dermatitis, dandruff

Apply 2–3 times weekly

Other scalp preparations

Cocois®

Section 13.5.2

Polytar® (Stiefel)

Liquid, arachis (peanut) oil extract of coal tar 0.3%, cade oil 0.3%, coal tar solution 0.1%, oleyl alcohol 1%, tar 0.3%, net price 250 mL = £2.23

Excipients include fragrance, imidurea, polysorbate 80

Dose

Scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff

Apply 1–2 times weekly

Polytar Plus® (Stiefel)

Liquid, ingredients as *Polytar®* liquid with hydrolysed animal protein 3%, net price 500 mL = £3.91

Excipients include fragrance, imidurea, polysorbate 80

Dose

Scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff

Apply 1–2 times weekly

13.10 Anti-infective skin preparations

- 13.10.1 Antibacterial preparations
- 13.10.2 Antifungal preparations
- 13.10.3 Antiviral preparations
- 13.10.4 Parasiticial preparations
- 13.10.5 Preparations for minor cuts and abrasions

13.10.1 Antibacterial preparations

Topical antibacterial preparations are used to treat localised bacterial skin infections caused by Gram-positive organisms (particularly by staphylococci or streptococci). Systemic antibacterial treatment (Table 1, section 5.1) is more appropriate for deep-seated skin infections.

Problems associated with the use of topical antibacterials include bacterial resistance, contact sensitisation, and superinfection. In order to minimise the development of resistance, antibacterials used systemically (e.g. fusidic acid) should not generally be chosen for topical use. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Neomycin applied topically may cause sensitisation and cross-sensitivity with other aminoglycoside antibacterials such as gentamicin may occur. Topical antibacterials applied over large areas can cause systemic toxicity; ototoxicity with neomycin and with **polymyxins** is a particular risk for neonates and children with renal impairment.

Superficial bacterial infection of the skin may be treated with a topical antiseptic such as **povidone-iodine** (section 13.11.4) which also softens crusts, or **hydrogen peroxide** 1% cream (section 13.11.6).

Bacterial infections such as *impetigo* and *folliculitis* can be treated with a short course of topical **fusidic acid**; **mupirocin** should be used only to treat meticillin-resistant *Staphylococcus aureus*.

For extensive or long-standing *impetigo*, an oral antibacterial such as **flucloxacillin** (or **clarithromycin** in children with penicillin-allergy), Table 1, section 5.1, should be used. A mild antiseptic may help to soften crusts. Mild antiseptics may be useful in reducing the spread of infection, but there is little evidence to support the use of topical antiseptics alone in the treatment of *impetigo*.

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always *cellulitis*. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

Staphylococcal scalded-skin syndrome requires urgent treatment with a systemic antibacterial, such as flucloxacillin (see Table 1, section 5.1).

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic, such as povidone-iodine, chlorhexidine, or alcohol, can be used (section 13.11); their use should be discussed with the local microbiologist.

Mupirocin ointment contains macrogols; extensive absorption of macrogols through the mucous membranes or through application to thin or damaged skin may result in renal toxicity, especially in neonates. Mupirocin nasal ointment is formulated in a paraffin base and may be more suitable for the treatment of MRSA-infected open wound in neonates.

Metronidazole gel is used topically in children to reduce the odour associated with anaerobic infections and for the treatment of periorificial rosacea (section 13.6); oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

Retapamulin can be used for *impetigo* and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The *Scottish Medicines Consortium*

(p. 3) has advised (March 2008) that retapamulin (*Altargo*[®]) is **not** recommended for use within NHS Scotland for the treatment of superficial skin infections.

Silver sulfadiazine is licensed for the prevention and treatment of infection in burns but the use of appropriate dressings may be more effective. Systemic effects may occur following extensive application of silver sulfadiazine; its use is not recommended in neonates.

13.10.1.1 Antibacterial preparations only used topically

MUPIROCIN

Renal impairment manufacturer advises caution when *Bactroban*[®] ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycols)

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—no information available

Breast-feeding no information available

Side-effects local reactions including urticaria, pruritus, burning sensation, rash

Licensed use *Bactroban*[®] ointment licensed for use in children (age range not specified by manufacturer); *Bactroban*[®] cream not recommended for use in children under 1 year

Indication and dose

Bacterial skin infections (see also notes above)

Child 1 month–18 years apply up to 3 times daily for up to 10 days

Bactroban[®] (GSK) 

Cream, mupirocin (as mupirocin calcium) 2%, net price 15 g = £4.38

Excipients include benzyl alcohol, cetyl alcohol, stearyl alcohol

Ointment, mupirocin 2%, net price 15 g = £4.38

Excipients none as listed in section 13.1.3

Nasal ointment—section 12.2.3

NEOMYCIN SULPHATE

Cautions large areas—if large areas of skin are being treated ototoxicity may be a hazard in children, particularly in those with renal impairment

Contra-indications neonates

Renal impairment see Cautions above

Side-effects sensitisation (see also notes above)

Licensed use *Neomycin Cream BPC*—no information available

Indication and dose

Bacterial skin infections see under preparation

Neomycin Cream BPC  

Cream, neomycin sulphate 0.5%, cetomacrogol emulsifying ointment 30%, chlorocresol 0.1%, disodium edetate 0.01%, in freshly boiled and cooled purified water, net price 15 g = £2.17

Excipients include cetostearyl alcohol, edetic acid (EDTA)

Dose

Apply up to 3 times daily (short-term use)

POLYMYXIN

Cautions large areas—if large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children with renal impairment

Renal impairment see Cautions above

Side-effects sensitisation (see also notes above)

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Bacterial skin infections see under preparation

Polyfax[®] (TEVA UK) 

Ointment, polymyxin B sulphate 10 000 units, bacitracin zinc 500 units/g, net price 4 g = £3.26, 20 g = £4.62

Excipients none as listed in section 13.1.3

Dose

Apply twice daily or more frequently if required

RETAPAMULIN

Contra-indications contact with eyes and mucous membranes

Side-effects local reactions including irritation, erythema, pain, contact dermatitis, and pruritus

Indication and dose

Superficial bacterial skin infections (but see also notes above)

Child 9 months–18 years apply thinly twice daily for 5 days; max. area of skin treated 2% of body surface area; review treatment if no response within 2–3 days

Altargo[®] (GSK) 

Ointment, retapamulin 1%, net price 5 g = £7.89.

Label: 28

Excipients include butylated hydroxytoluene

SILVER SULFADIAZINE

(Silver sulphadiazine)

Cautions G6PD deficiency; may inactivate enzymatic debriding agents—concomitant use may be inappropriate; **interactions:** Appendix 1 (sulfonamides)

Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides (see section 5.1.8) if large areas of skin are treated. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to baseline within a few days. Argiria may also occur if large areas of skin are treated (or if application is prolonged).

Contra-indications sensitivity to sulfonamides; not recommended for neonates

Hepatic impairment manufacturer advises caution if significant impairment; see also Large areas, above

Renal impairment manufacturer advises caution if significant impairment; see also Large areas, above

Pregnancy risk of neonatal haemolysis and methaemoglobinaemia in third trimester

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD deficient infants

Side-effects allergic reactions including burning, itching and rashes; argiria reported following pro-

longed use; leucopenia reported (monitor blood count)

Licensed use no age range specified by manufacturer but see contra-indications, above

Indication and dose

Prophylaxis and treatment of infection in burn wounds, for conservative management of finger-tip injuries see under preparation below

Adjunct to short-term treatment of infection in pressure sores, adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions consult product literature for details

Flamazine® (S&N Hlth.) (POM)

Cream, silver sulfadiazine 1%, net price 20 g = £2.91, 50 g = £3.85, 250 g = £10.32, 500 g = £18.27

Excipients include cetyl alcohol, polysorbates, propylene glycol

Dose

Burns

Child 1 month–18 years apply daily or more frequently if very exudative

Finger-tip injuries

Child 1 month–18 years apply every 2–3 days

Note apply with sterile applicator

13.10.1.2 Antibacterial preparations also used systemically

Sodium fusidate is a narrow-spectrum antibacterial used for staphylococcal infections. For the role of sodium fusidate in the treatment of impetigo see p. 585.

Metronidazole is used topically to treat rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

Angular cheilitis An ointment containing sodium fusidate is used in the fissures of angular cheilitis when associated with staphylococcal infection. For further information on angular cheilitis, see p. 545.

FUSIDIC ACID

Cautions see notes above; avoid contact with eyes

Side-effects rarely hypersensitivity reactions

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Staphylococcal skin infections

Apply 3–4 times daily, usually for 7 days

Penicillin-resistant staphylococcal infections

section 5.1.7

Staphylococcal eye infections

section 11.3.1

Fucidin® (LEO) (POM)

Cream, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.64

Excipients include butylated hydroxyanisole, cetyl alcohol

Ointment, sodium fusidate 2%, net price 15 g = £2.23, 30 g = £3.79

Excipients include cetyl alcohol, wool fat

Dental prescribing on NHS May be prescribed as Sodium Fusidate ointment

METRONIDAZOLE

Cautions avoid exposure to strong sunlight or UV light

Side-effects skin irritation

Licensed use *Acea*® and *Anabact*® not licensed for use in children under 12 years; *Noritate*® not licensed for use in children under 16 years; *Metrogel*®, *Metrosa*®, *Rosiced*®, *Rozex*®, and *Zyomet*® not licensed for use in children

Indication and dose

Malodorous tumours and wounds

For dose see preparations

Rosacea (see also section 13.6)

For dose see preparations

Helicobacter pylori eradication

section 1.3

Anaerobic infections

section 5.1.11 and section 7.2.2

Protozoal infections

section 5.4.2

Acea® (Ferndale) (POM)

Gel, metronidazole 0.75%, net price 40 g = £9.95

Excipients include disodium edetate, hydroxybenzoates (parabens)

Dose

Acute inflammatory exacerbations of rosacea

Child 1–18 years apply thinly twice daily

Anabact® (CHS) (POM)

Gel, metronidazole 0.75%, net price 15 g = £4.47, 30 g = £7.89

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose

Malodorous fungating tumours and skin ulcers

Apply to clean wound 1–2 times daily and cover with non-adherent dressing

Metrogel® (Galderma) (POM)

Gel, metronidazole 0.75%, net price 40 g = £6.86

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose

Acute inflammatory exacerbations of rosacea

Child 1–18 years apply thinly twice daily

Malodorous fungating tumours

Apply to clean wound 1–2 times daily and cover with non-adherent dressing

Metrosa® (Linderna) (POM)

Gel, metronidazole 0.75%, net price 40 g = £19.90

Excipients include propylene glycol

Dose

Acute exacerbation of rosacea

Child 1–18 years apply thinly twice daily

Rosiced® (Fabre) (POM)

Cream, metronidazole 0.75%, net price 30 g = £7.50

Excipients include propylene glycol

Dose**Inflammatory papules and pustules of rosacea****Child 1–18 years** apply twice daily for 6 weeks (longer if necessary)**Rozex®** (Galderma) (POM)

Cream, metronidazole 0.75%, net price 40 g = £6.86

Excipients include benzyl alcohol, isopropyl palmitate

Gel, metronidazole 0.75%, net price 40 g = £6.86

Excipients include benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), propylene glycol

Dose**Inflammatory papules, pustules and erythema of rosacea****Child 1–18 years** apply twice daily**Zyomet®** (Goldshield) (POM)

Gel, metronidazole 0.75%, net price 30 g = £12.00

Excipients include benzyl alcohol, disodium edetate, propylene glycol

Dose**Acute inflammatory exacerbations of rosacea****Child 1–18 years** apply thinly twice daily

13.10.2 Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for nail or scalp infection or if the skin infection is widespread, disseminated or intractable. Specimens of scale, nail or hair should be sent for mycological examination before starting treatment, unless the diagnosis is certain.

Dermatophytoses Ringworm infection can affect the scalp (*tinea capitis*), body (*tinea corporis*), groin (*tinea cruris*), hand (*tinea manuum*), foot (*tinea pedis*, athlete's foot), or nail (*tinea unguium*, onychomycosis). *Tinea capitis* is a common childhood infection that requires systemic treatment with an oral antifungal (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm.

Tinea corporis and *tinea pedis* infections in children respond to treatment with a topical **imidazole** (clotrimazole, econazole, ketoconazole, or miconazole) or **terbinafine** cream. Nystatin is less effective against *tinea*.

Compound benzoic acid ointment (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic children with *tinea* infection of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of **tioconazole** may be useful for treating early onychomycosis when involvement is limited to mild distal disease in up to 2 nails, or for superficial

white onychomycosis, or where there are contra-indications to systemic therapy. Chronic paronychia on the fingers (usually due to a candidal infection) should be treated with topical clotrimazole or nystatin, but these preparations should be used with caution in children who suck their fingers. Chronic paronychia of the toes (usually due to dermatophyte infection) can be treated with topical terbinafine.

Pityriasis versicolor Pityriasis (*tinea*) versicolor can be treated with **ketoconazole** shampoo or **selenium sulphide** shampoo (section 13.9). Topical imidazole antifungals such as **clotrimazole**, **econazole**, **ketoconazole**, and **miconazole**, or topical **terbinafine** are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with an azole antifungal (section 5.2). Relapse is common, especially in the immunocompromised.

Candidiasis Candidal skin infections can be treated with topical imidazole antifungals **clotrimazole**, **econazole**, **ketoconazole**, or **miconazole**; topical terbinafine is an alternative. Topical application of **nystatin** is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment (section 5.2.1) generally with a triazole such as fluconazole; systemic treatment with griseofulvin or terbinafine is **not appropriate** for refractory candidiasis. For the treatment of oral candidiasis see section 12.3.2 and for the management of nappy rash see section 13.2.2.

Angular cheilitis Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*. For further information on angular cheilitis, see p. 545.

Cautions Contact with eyes and mucous membranes should be avoided.

Side-effects Occasional local irritation and hypersensitivity reactions include mild burning sensation, erythema, and itching. Treatment should be discontinued if symptoms are severe.

Compound topical preparations Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1%) (section 13.4) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of *intertriginous eczema* associated with candida.

AMOROLFINE

Cautions see notes above; also avoid contact with ears; use with caution in child likely to suck affected digits

Pregnancy systemic absorption very low, but manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above

Licensed use not licensed for use in children under 12 years

Indication and dose**Fungal nail infections**

Apply to infected nails 1–2 times weekly after filing and cleansing; allow to dry (approx. 3 minutes); treat finger nails for 6 months, toe nails for 9–12 months (review at intervals of 3 months); avoid nail varnish or artificial nails during treatment

Loceryl® (Galderma) (POM)

Nail lacquer, amorolfine (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas, and cleansing swabs) = £18.17. Label: 10, patient information leaflet

Excipients none as listed in section 13.1.3

BENZOIC ACID

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Ringworm (tinea) but see notes above; dose under preparation

▲ **With salicylic acid**

For prescribing information on salicylic acid, see p. 571

Benzoic Acid Ointment, Compound, BP (Whitfield's ointment)

Ointment, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

Excipients include cetostearyl alcohol

Dose

Child 1 month–18 years apply twice daily

CLOTRIMAZOLE

Cautions see notes above

Pregnancy minimal absorption from skin; not known to be harmful

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose**Fungal skin infections**

Apply 2–3 times daily

Vaginal candidiasis section 7.2.2

Otitis externa section 12.1.1

Clotrimazole (Non-proprietary)

Cream, clotrimazole 1%, net price 20 g = £1.52

Canesten® (Bayer Consumer Care)

Cream, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbate 60

Solution, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.43. For hairy areas

Excipients none as listed in section 13.1.3

Spray, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.99. Label: 15. For large or hairy areas

Excipients include propylene glycol

ECONAZOLE NITRATE

Cautions see notes above

Pregnancy minimal absorption from skin; not known to be harmful

Side-effects see notes above

Licensed use *Pevaryl®*, no age range specified by manufacturer

Indication and dose**Fungal skin infections**

Apply twice daily

Fungal nail infections

Apply once daily under occlusive dressing

Vaginal candidiasis section 7.2.2

Pevaryl® (Janssen)

Cream, econazole nitrate 1%, net price 30 g = £2.65

Excipients include butylated hydroxyanisole, fragrance

KETOCONAZOLE

Cautions see notes above; do not use within 2 weeks of a potent topical corticosteroid for seborrhoeic dermatitis—risk of skin sensitisation

Side-effects see notes above

Indication and dose**Tinea pedis**

Apply twice daily

Other fungal infections

Apply 1–2 times daily

Systemic or resistant fungal infections section 5.2.2

Vulval candidiasis section 7.2.2

Nizoral® (Janssen) (POM)

¹Cream, ketoconazole 2%, net price 30 g = £3.40

Excipients include cetyl alcohol, polysorbates, propylene glycol, stearyl alcohol

Note A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo

Shampoo—section 13.9

1. ^{NS} except for seborrhoeic dermatitis and pityriasis versicolor and endorsed 'SLS'

MICONAZOLE NITRATE

Cautions see notes above

Side-effects see notes above

Licensed use Licensed for use in children (age range not specified by manufacturer)

Indication and dose**Fungal skin infections**

Neonate apply twice daily continuing for 10 days after lesions have healed

Child 1 month–18 years apply twice daily continuing for 10 days after lesions have healed

Fungal nail infections

Apply 1–2 times daily

Oral and intestinal fungal infections section 12.3.2

Vaginal candidiasis section 7.2.2

Miconazole (Non-proprietary)

Cream, miconazole nitrate 2%, net price 20 g = £2.05, 45 g = £1.97

Dental prescribing on NHS Miconazole cream may be prescribed

Daktarin® (Janssen)

Cream, miconazole nitrate 2%, net price 30 g = £1.82
Excipients include butylated hydroxyanisole

NYSTATIN

Cautions see notes above

Side-effects see notes above

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Skin infections due to *Candida* spp. for dose, see preparation

Oral fungal infections section 12.3.2

Nystaform® (Typharm) (PoM)

Cream, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.62

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbate 60

Dose

Apply 2–3 times daily continuing for 7 days after lesions have healed.

SALICYLIC ACID

Cautions avoid broken or inflamed skin

Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin

Side-effects see notes above

Indication and dose

Fungal nail infections, particularly tinea

Child 5–18 years apply twice daily and after washing

Note Use with caution in child likely to suck affected digits

Hyperkeratotic skin disorders section 13.5.2

Acne vulgaris section 13.6.1

Warts and calluses section 13.7

Phytex® (Wynlit)

Paint, salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 mL (with brush) = £2.81

Excipients none as listed in section 13.1.3

Note Flammable

TERBINAFINE

Cautions avoid contact with eyes

Pregnancy manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects

Breast-feeding manufacturer advises avoid—present in milk, but less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

Fungal skin infections

Apply thinly 1–2 times daily for up to 1 week in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks

Systemic therapy section 5.2.5

¹Terbinafine (Non-proprietary) (PoM)

Cream, terbinafine hydrochloride 1%, net price 15 g = £5.10, 30 g = £2.69

- Can be sold to the public for external use in children over 16 years for the treatment of tinea pedis and tinea cruris as a cream containing terbinafine hydrochloride max. 1% in a pack containing max. 15 g; also for the treatment of tinea pedis, tinea cruris, and tinea corporis as a spray containing terbinafine hydrochloride max. 1% in a pack containing max. 30 mL or as a gel containing terbinafine hydrochloride max. 1% in a pack containing max. 30 g

Lamisil® (Novartis Consumer Health) (PoM)

Cream, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76

Excipients include benzyl alcohol, cetyl alcohol, polysorbate 60, stearyl alcohol

TIOCONAZOLE

Cautions see notes above; also use with caution if child likely to suck affected digits

Pregnancy manufacturer advises avoid

Side-effects see notes above; also local oedema, dry skin, nail discoloration, periungual inflammation, nail pain, rash, exfoliation

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Fungal nail infections

Apply to nails and surrounding skin twice daily for up to 6 months (may be extended to 12 months)

Trosyl® (Pfizer) (PoM)

Cutaneous solution, tioconazole 28%, net price 12 mL (with applicator brush) = £27.38

Excipients none as listed in section 13.1.3

UNDECENOATES

Side-effects see notes above

Licensed use *Monphyto*® not licensed for use in children under 12 years; *Mycota*® licensed for use in children (age range not specified by manufacturer)

Indication and dose

See under preparations

Mycota[®] (Thornton & Ross)

Cream, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £1.64
Excipients include fragrance

Dose**Treatment of athlete's foot**

Apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot

Apply once daily

Powder, zinc undecenoate 20%, undecenoic acid 2%, net price 70 g = £2.22
Excipients include fragrance

Dose**Treatment of athlete's foot**

Apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot

Apply once daily

Spray application, undecenoic acid 3.9%, dichlorophen 0.4% (pressurised aerosol pack), net price 100 mL = £2.46
Excipients include fragrance

Dose**Treatment of athlete's foot**

Apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot

Apply once daily

13.10.3 Antiviral preparations

See section 12.3.2 for drugs used in *herpetic stomatitis*, section 13.5.1 for *eczema herpeticum*, and section 11.3.3 for viral infections of the eye.

Aciclovir cream is used for the treatment of initial and recurrent labial, cutaneous, and genital *herpes simplex infections* in children; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections or if cold sores recur frequently (for details of systemic use see section 5.3.2.1).

Herpes labialis **Aciclovir** cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream. These creams should not be used in the mouth.

ACICLOVIR (Acyclovir)

Cautions avoid contact with eyes and mucous membranes

Pregnancy not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

Side-effects transient stinging or burning; occasionally erythema, itching or drying of the skin

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose**Herpes simplex infections**

Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

Herpes simplex and varicella-zoster infections section 5.3.2.1**Eye infections** section 11.3.3**1 Aciclovir** (Non-proprietary) ^(POM)

Cream, aciclovir 5%, net price 2 g = £1.10, 10 g = £1.81

Excipients include propylene glycol
Brands include *Zuvogen*[®] (**excipients** include cetyl alcohol, propylene glycol)

Dental prescribing on NHS Aciclovir Cream may be prescribed

1. A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

Zovirax[®] (GSK) ^(POM)

Cream, aciclovir 5%, net price 2 g = £4.63, 10 g = £13.96

Excipients include cetostearyl alcohol, propylene glycol

PENCICLOVIR

Cautions avoid contact with eyes and mucous membranes

Side-effects transient stinging, burning, numbness; hypersensitivity reactions also reported

Licensed use not licensed for use in children under 12 years

Vectavir[®] (Novartis Consumer Health) ^(POM)

Cream, penciclovir 1%, net price 2 g = £4.20

Excipients include cetostearyl alcohol, propylene glycol

Dose**Herpes labialis**

Apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack

Dental prescribing on NHS May be prescribed as Penciclovir Cream

13.10.4 Parasiticial preparations

Suitable quantities of parasiticial preparations

	Skin creams	Lotions	Cream rinses
Scalp (head lice)	—	50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	—
Body (crab lice)	30–60 g	100 mL	—

These amounts are usually suitable for a child 12–18 years for single application

Scabies

Permethrin is used for the treatment of *scabies* (*Sarcoptes scabiei*); **malathion** can be used if permethrin is inappropriate.

Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin (available from 'special-order' manufacturers or specialist importing companies, see p. 809), is used in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone.

Application Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. Malathion and permethrin should be applied twice, one week apart. It is important to warn users to reapply treatment to the hands if they are washed. Children with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of **crotamiton** can be used to control itching after treatment with more effective acaricides. A topical **corticosteroid** (section 13.4) may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest failure of scabies eradication. Oral administration of a **sedating antihistamine** (section 3.4.1) at night may also be useful.

Head lice

Dimeticone is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. **Malathion**, an organophosphorous insecticide, is an alternative but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is not recommended for use in children.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of a parasitocidal product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected individuals in a household should be treated at the same time.

Wet combing methods Head lice can be mechanically removed by combing wet hair meticulously with a

plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice, such as combs and topical solutions, are available and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents, p. 797 for links to online Drug Tariffs).

Crab lice

Permethrin and **malathion** are used to eliminate *crab lice* (*Phthirus pubis*); permethrin is not licensed for treatment of crab lice in children under 18 years. An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

Parasitocidal preparations

Dimeticone coats head lice and interferes with water balance in lice by preventing excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

Malathion is recommended for *scabies*, *head lice* and *crab lice* (see notes above). The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, except in the treatment of hyperkeratotic scabies (see notes above), applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be **avoided** since the likelihood of eradication of lice is not increased.

Permethrin is effective for *scabies*. It is active against *head lice* but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice. Permethrin is also effective against *crab lice* but it is not licensed for this purpose in children under 18 years.

DIMETICONE

Cautions avoid contact with eyes

Side-effects skin irritation

Licensed use not licensed for use in children under 6 months except under medical supervision

Indication and dose

Head lice

Rub into dry hair and scalp, allow to dry naturally, shampoo after 8 hours (or overnight); repeat application after 7 days

Hedrin® (Thornton & Ross)

Lotion, dimeticone 4%, net price 50 mL = £2.98, 120-mL spray pack = £7.13, 150 mL = £6.92

Note Patients should be told to keep their hair away from fire and flames during treatment

MALATHION

Cautions avoid contact with eyes; do not use on broken or secondarily infected skin; do not use lotion more than once a week for 3 consecutive weeks; alcoholic lotions **not** recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice (see notes above)

Side-effects skin irritation and hypersensitivity reactions; chemical burns also reported

Licensed use not licensed for use in children under 6 months except under medical supervision

Indication and dose

See notes above and under preparations

Head lice

Rub into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours; repeat application after 7 days (see also notes above)

Crab lice

Apply over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days

Scabies

Apply over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

Note For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

Derbac-M® (SSL)

Liquid, malathion 0.5% in an aqueous basis, net price 50 mL = £2.37, 200 mL = £5.93

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

PERMETHRIN

Cautions avoid contact with eyes; do not use on broken or secondarily infected skin

Side-effects pruritus, erythema, and stinging; rarely rashes and oedema

Licensed use *Dermal Cream* (scabies), not licensed for use in children under 2 months; children aged 2 months–2 years, medical supervision required; not licensed for treatment of crab lice in children under 18 years; *Crema Rinse* (head lice) not licensed for use in children under 6 months except under medical supervision

Indication and dose

See notes above

Scabies

Apply 5% preparation over whole body including face, neck, scalp and ears; wash off after 8–12 hours; if hands washed with soap within 8 hours of application, they should be treated again with cream (see notes above); repeat application after 7 days

Note Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears

Permethrin (Non-proprietary)

Cream, permethrin 5%, net price 30 g = £5.43

Lyclear® Crema Rinse (Chefaro UK) 

Cream rinse, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £2.38, 2 × 59-mL pack = £4.32

Excipients include cetyl alcohol

Note Use not recommended, therefore no dose stated (product too diluted in use and insufficient contact time)

Lyclear® Dermal Cream (Chefaro UK)

Dermal cream, permethrin 5%, net price 30 g = £5.71.

Label: 10, patient information leaflet

Excipients include butylated hydroxytoluene, wool fat derivative

13.10.5 Preparations for minor cuts and abrasions

Cetrimide cream is used to treat minor cuts and abrasions. **Proflavine** cream may be used to treat infected wounds or burns, but has now been largely superseded by other antiseptics or suitable antibacterials.

Cetrimide Cream, BP

Cream, cetrimide 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, liquid paraffin 50% in freshly boiled and cooled purified water, net price 50 g = £1.11

Proflavine Cream, BPC

Cream, proflavine hemisulphate 0.1%, yellow beeswax 2.5%, chlorocresol 0.1%, liquid paraffin 67.3%, freshly boiled and cooled purified water 25%, wool fat 5%, net price 100 mL = £1.59

Excipients include beeswax, wool fat

Note Stains clothing

Collodion

Flexible collodion may be used to seal minor cuts and wounds that have partially healed.

Collodion, Flexible, BP

Collodion, castor oil 2.5%, colophony 2.5% in a collodion basis, prepared by dissolving pyroxylin (10%) in a mixture of 3 volumes of ether and 1 volume of alcohol (90%), net price 10 mL = 38p. **Label:** 15

Contra-indications allergy to colophony in elastic adhesive plasters and tape

Skin tissue adhesive

Tissue adhesives are used for closure of minor skin wounds and for additional suture support. They should be applied by an appropriately trained healthcare professional. Skin tissue adhesives may cause skin sensitisation.

DermaBond ProPen® (Ethicon)

Topical skin adhesive, sterile, octyl 2-cyanoacrylate, net price 0.5 mL = £18.38

Epiglu® (Schuco)

Tissue adhesive, sterile, ethyl-2-cyanoacrylate 954.5 mg/g, polymethylmethacrylate, net price 4 × 3-g vials = £149.50 (with dispensing pipettes and palette)

Histoacryl® (Braun)

Tissue adhesive, sterile, enbucrilate, net price 5 × 200-mg unit (blue) = £32.00, 10 × 200-mg unit (blue) = £67.20, 5 × 500-mg unit (clear or blue) = £34.65, 10 × 500-mg unit (blue) = £69.30

LiquiBand® (MedLogic)

Tissue adhesive, sterile, enbucrilate, net price 0.5-g amp = £5.50

13.11 Skin cleansers, antiseptics, and preparations for promotion of wound healing

- 13.11.1 Alcohols and saline
- 13.11.2 Chlorhexidine salts
- 13.11.3 Cationic surfactants and soaps
- 13.11.4 Iodine
- 13.11.5 Phenolics
- 13.11.6 Oxidisers and dyes
- 13.11.7 Preparations for promotion of wound healing

Soap or detergent is used with water to cleanse intact skin but they can irritate infantile skin; emollient preparations such as aqueous cream or emulsifying ointment (section 13.2.1) that do not irritate the skin are best used in place of soap or detergent for cleansing dry or irritated skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing **chlorhexidine** or **povidone-iodine**, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics (section 13.2.1).

Antiseptics such as **chlorhexidine** or **povidone-iodine** are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing **cetrimide** can be used if a detergent effect is also required.

Preparations containing alcohol and regular use of povidone iodine should be avoided on neonatal skin (see section 13.1).

Hydrogen peroxide, an oxidising agent, is available as a cream and can be used for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile **sodium chloride 0.9% solution** is used but tap water is often appropriate.

Potassium permanganate solution 1 in 10 000, a mild antiseptic with astringent properties, can be used as a soak for exudative eczematous areas (section 13.5.1); treatment should be stopped when the skin becomes dry. Potassium permanganate can stain skin and nails especially with prolonged use.

13.11.1 Alcohols and saline

ALCOHOL

Cautions flammable; avoid broken skin; patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

Contra-indications neonates, see section 13.1

Indication and dose

Skin preparation before injection

Apply to skin as necessary

Industrial Methylated Spirit, BP

Solution, 19 volumes of ethanol and 1 volume approved wood naphtha, net price '66 OP' (containing 95% by volume alcohol) 100 mL = 39p; '74 OP' (containing 99% by volume alcohol) 100 mL = 39p. Label: 15

Surgical Spirit, BP

Spirit, methyl salicylate 0.5 mL, diethyl phthalate 2%, castor oil 2.5%, in industrial methylated spirit, net price 100 mL = 20p. Label: 15

SODIUM CHLORIDE

Indication and dose

See notes above

Nebuliser diluent section 3.1.5

Sodium depletion section 9.2.1.2

Electrolyte imbalance section 9.2.2.1

Eye section 11.8.1

Oral hygiene section 12.3.4

Sodium Chloride (Non-proprietary)

Solution (sterile), sodium chloride 0.9%, net price 25 × 20-mL unit = £5.50, 200-mL can = £2.65, 1 litre = 97p

Flowfusor® (Fresenius Kabi)

Solution (sterile), sodium chloride 0.9%, net price 120-mL Bellows Pack = £1.53

Irriclens® (ConvaTec)

Solution in aerosol can (sterile), sodium chloride 0.9%, net price 240-mL can = £3.30

Irripod® (C D Medical)

Solution (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £5.50

Miniversol® (Aguettant)

Solution (sterile), sodium chloride 0.9%, net price 30 × 45-mL unit = £13.20; 30 × 100-mL unit = £19.50

Normasol® (Mölnlycke)

Solution (sterile), sodium chloride 0.9%, net price 25 × 25-mL sachet = £6.14; 10 × 100-mL sachet = £7.47

Stericlens® (C D Medical)

Solution in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £1.94, 240-mL can = £2.95

Steripod® Sodium Chloride (Medlock)

Solution (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £7.57

13.11.2 Chlorhexidine salts

CHLORHEXIDINE

Cautions avoid contact with eyes, brain, meninges and middle ear; not for use in body cavities; alcoholic solutions not suitable before diathermy or for use on neonatal skin

Side-effects occasional sensitivity

Indication and dose

See under preparations

Bladder irrigation and catheter patency solutions section 7.4.4

Chlorhexidine 0.05% (Baxter)

2000 Solution (sterile), pink, chlorhexidine acetate 0.05%, net price 500 mL = 72p, 1000 mL = 77p

For cleansing and disinfecting wounds and burns

Cepton® (LPC)

Skin wash (= solution), red, chlorhexidine gluconate 1%, net price 150 mL = £2.48

For use as skin wash in acne

Lotion, blue, chlorhexidine gluconate 0.1%, net price 150 mL = £2.48

For skin disinfection in acne

Chloraprep® (CareFusion)

Cutaneous solution, sterile, chlorhexidine gluconate 2% in isopropyl alcohol 70%, net price (all with single applicator) 0.67 mL (with *SEPP®* applicator) = 30p, 1.5 mL (with *FREPP®* applicator) = 55p, 1.5 mL = 78p, 3 mL = 85p, 10.5 mL = £2.92, 26 mL = £6.50; (all with single applicator, with tint) 3 mL = 90p, 10.5 mL = £3.07, 26 mL = £6.83

For skin disinfection before invasive procedures; **Child under 2 months** not recommended

Note Flammable

CX Antiseptic Dusting Powder® (Ecolab)

Dusting powder, sterile, chlorhexidine acetate 1%, net price 15 g = £3.40

For skin disinfection

Hibiscrub® (Mölnlycke)

Cleansing solution, red, chlorhexidine gluconate 4%, perfumed, in a surfactant solution, net price 250 mL = £4.25, 500 mL = £5.25, 5 litres = £24.00

Excipients include fragrance

Use instead of soap for pre-operative hand and skin preparation and for general hand and skin disinfection

Hibi® Liquid Hand Rub+ (Mölnlycke)

Solution, chlorhexidine gluconate 0.5%, in isopropyl alcohol 70% with emollients, net price 500 mL = £5.25

To be used undiluted for hand and skin disinfection

Hibitane Obstetric® (Derma UK)

Cream, chlorhexidine gluconate solution 5% (≡ 1% chlorhexidine gluconate), in a pourable water-miscible basis, net price 250 mL = £4.44

For use in obstetrics and gynaecology as an antiseptic and lubricant (for application to skin around vulva and perineum and to hands of midwife or doctor)

Hidrex® (Ecolab)

Solution, chlorhexidine gluconate solution 2.5% (≡ chlorhexidine gluconate 0.5%), in an alcoholic solution, net price 600 mL (clear) = £2.72; 600 mL (pink) = £2.72, 200-mL spray = £1.77, 500-mL spray = £3.01; 600 mL (blue) = £2.26

Note Flammable

For pre-operative skin disinfection

Surgical scrub, chlorhexidine gluconate 4% in a surfactant solution, net price 250 mL = £2.44, 500 mL = £2.58

For pre-operative hand and skin preparation and for general hand disinfection

Unisept® (Medlock)

Solution (sterile), pink, chlorhexidine gluconate 0.05%, net price 25 × 25-mL sachet = £5.40; 10 × 100-mL sachet = £6.67

For cleansing and disinfecting wounds and burns and swabbing in obstetrics

▲ **With cetrimide****Tisept®** (Medlock)

Solution (sterile), yellow, chlorhexidine gluconate 0.015%, cetrimide 0.15%, net price 25 × 25-mL sachet = £5.20; 10 × 100-mL sachet = £6.68

To be used undiluted for general skin disinfection and wound cleansing

Travasept 100® (Baxter)

Solution (sterile), yellow, chlorhexidine acetate 0.015%, cetrimide 0.15%, net price 500 mL = 72p, 1 litre = 77p

To be used undiluted in skin disinfection such as wound cleansing and obstetrics

Concentrates

Hibitane® Plus 5% Concentrate (Mölnlycke)

Solution, red, chlorhexidine gluconate 5%, in a perfumed aqueous solution, net price 5 litres = £14.50

Dose

Pre-operative skin preparation

Dilute 1 in 10 (0.5%) with alcohol 70%

General skin disinfection

Dilute 1 in 100 (0.05%) with water

Note Alcoholic solutions not suitable for use before diathermy (see Alcohol, p. 594) or on neonatal skin

13.11.3 Cationic surfactants and soaps

CETRIMIDE

Cautions avoid contact with eyes; avoid use in body cavities

Side-effects skin irritation and occasionally sensitisation

Indication and dose

Skin disinfection

▲ **Preparations**

Ingredient of *Tisept®* and *Travasept® 100*, see above

13.11.4 Iodine

POVIDONE-IODINE

Cautions broken skin (see below)

Large open wounds The application of povidone-iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia, and impairment of renal function

Contra-indications preterm neonate gestational age under 32 weeks; infants body-weight under 1.5 kg; regular use in neonates; thyroid disorders; concomitant lithium treatment

Renal impairment avoid regular application to inflamed or broken skin or mucosa

Pregnancy sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester

Breast-feeding avoid regular or excessive use

Side-effects rarely sensitivity; may interfere with thyroid function tests

Indication and dose

Skin disinfection see preparations

Betadine® (Mölnlycke)

Dry powder spray, povidone-iodine 2.5% in a pressurised aerosol unit, net price 150-g unit = £2.63

For skin disinfection, particularly minor wounds and infections; **child under 2 years** not recommended

Note Not for use in serous cavities

Savlon® Dry (Novartis Consumer Health)

Powder spray, povidone-iodine 1.14% in a pressurised aerosol unit, net price 50-mL unit = £2.39

For minor wounds

Videne® (Ecolab)

Alcoholic tincture, povidone-iodine 10%, net price 500 mL = £3.46

Dose

Apply undiluted in pre-operative skin disinfection

Note Flammable—caution in procedures involving hot wire cautery and diathermy; avoid use in neonates

Antiseptic solution, povidone-iodine 10% in aqueous solution, net price 500 mL = £3.46

Dose

Apply undiluted in pre-operative skin disinfection and general antiseptics

Surgical scrub, povidone-iodine 7.5% in aqueous solution, net price 500 mL = £3.46

Dose

Use as a pre-operative scrub for hand and skin disinfection

13.11.5 Phenolics

Triclosan has been used for disinfection of the hands and wounds, and for disinfection of the skin before surgery.

13.11.6 Oxidisers and dyes

HYDROGEN PEROXIDE

Cautions large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Superficial bacterial skin infection see under preparation below

Crystacide® (GP Pharma)

Cream, hydrogen peroxide 1%, net price 25 g = £8.07, 40 g = £11.62

Dose

Superficial bacterial skin infection

Apply 2–3 times daily for up to 3 weeks

Excipients include edetic acid (EDTA), propylene glycol

POTASSIUM PERMANGANATE

Cautions irritant to mucous membranes

Indication and dose

Cleansing and deodorising suppurating eczematous reactions (section 13.5.1) and wounds

For wet dressings or baths, use approx. 0.01% (1 in 10 000) solution

Note Stains skin and clothing

Potassium Permanganate Solution

Solution, potassium permanganate 0.1% (1 in 1000) in water

Note to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution

Permitabs® (Alliance)

Solution tablets, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tablet pack = £9.85

Note 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution

13.11.7 Preparations for promotion of wound healing

Desloughing agents Alginate, hydrogel, and hydrocolloid dressings (see BNF appendix on wound management) are effective in wound debridement. Sterile larvae (maggots) (*LarvE®*, Zoobiotic) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised.

Growth factor A topical preparation of **becaplermin** (recombinant human platelet-derived growth factor) is used as an adjunct treatment of full-thickness, neuropathic, diabetic ulcers. It enhances the formulation of granulation tissue, thereby promoting wound healing.

For further information on wound management products and elastic hosiery, see the relevant BNF appendix.

BECAPLERMIN

(Recombinant human platelet-derived growth factor)

Cautions avoid on sites with infection or peripheral arteriopathy

Contra-indications malignant disease

Side-effects pain; infections including cellulitis and osteomyelitis, local reactions including erythema; rarely bullous eruption, oedema, and hypertrophic granulation

Licensed use not licensed for use in children

Indication and dose

Full-thickness, neuropathic, diabetic ulcers (no larger than 5 cm²)

Apply thin layer daily and cover with gauze dressing moistened with physiological saline; max. duration of treatment 20 weeks (reassess if no healing after first 10 weeks)

Regranex[®] (Janssen) (P_M)

Gel, becaplermin (recombinant human platelet-derived growth factor) 0.01%, net price 15 g = £240.92
Excipients include hydroxybenzoates (parabens)

13.12 Antiperspirants

Aluminium chloride is a potent antiperspirant used in the treatment of axillary, palmar, and plantar hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use tap water or glycopyrronium bromide (as a 0.05% solution) in the iontophoretic treatment of hyperhidrosis of palms and soles.

Botox[®] contains botulinum toxin type A complex (section 4.9.3) and is available for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment; intradermal treatment is unlikely to be tolerated by most children and should be administered under hospital specialist supervision.

ALUMINIUM SALTS

Cautions avoid contact with eyes or mucous membranes; avoid use on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing

Side-effects skin irritation

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Hyperhidrosis affecting axillae, hands or feet

Apply liquid formulation at night to dry skin, wash off the following morning, initially apply daily then reduce frequency as condition improves—do not bathe immediately before use

Hyperhidrosis, bromidrosis, intertrigo, and prevention of tinea pedis and related conditions

Apply powder to dry skin

Anhydrol[®] Forte (Dermal)

Solution (= application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.51. Label: 15
Excipients none as listed in section 13.1.3

¹Driclor[®] (Stiefel)

Application, aluminium chloride hexahydrate 20% in an alcoholic basis, net price 75-mL bottle with roll-on applicator = £3.01. Label: 15
Excipients none as listed in section 13.1.3

1. A 30-mL pack is on sale to the public

ZeaSORB[®] (Stiefel)

Dusting powder, aldioxa 0.22%, chloroxylenol 0.5%, net price 50 g = £2.61
Excipients include fragrance

GLYCOPYRRONIUM BROMIDE

Cautions see section 15.1.3 (but poorly absorbed and systemic effects unlikely)

Contra-indications see section 15.1.3 (but poorly absorbed and systemic effects unlikely), infections affecting the treatment site

Side-effects see section 15.1.3 (but poorly absorbed and systemic effects unlikely), tingling at administration site

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Iontophoretic treatment of hyperhidrosis

Consult product literature; only 1 site to be treated at a time, max. 2 sites treated in any 24 hours, treatment not to be repeated within 7 days

Other indications section 15.1.3

Robinul[®] (Goldshield) (P_M)

Powder, glycopyrronium bromide, net price 3 g = £175.00

13.13 Topical circulatory preparations

These preparations are used to improve circulation in conditions such as bruising and superficial thrombophlebitis but are of little value. First aid measures such as rest, ice, compression, and elevation should be used. Topical preparations containing heparinoids should not be used on large areas of skin, broken or sensitive skin, or mucous membranes. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

Hirudoid® (Genus) 

Cream, heparinoid 0.3% in a vanishing-cream basis,
net price 50 g = £3.99

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Dose

Superficial thrombophlebitis, bruising, and haematoma

Child 5–18 years apply up to 4 times daily

Gel, heparinoid 0.3%, net price 50 g = £3.99

Excipients include propylene glycol, fragrance

Dose

Superficial thrombophlebitis, bruising, and haematoma

Child 5–18 years apply up to 4 times daily

14 Immunological products and vaccines

14.1	Active immunity	599
14.2	Passive immunity	602
14.3	Storage and use	602
14.4	Vaccines and antisera	602
14.5	Immunoglobulins	622
14.5.1	Normal Immunoglobulin	622
14.5.2	Disease-specific immunoglobulins	624
14.5.3	Anti-D (Rh₀) immunoglobulin	626
14.6	International travel	626

14.1 Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

1. a *live attenuated* form of a virus (e.g. measles, mumps, and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. *inactivated* preparations of a virus (e.g. influenza vaccine) or bacteria, or
3. *detoxified* exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
4. *extracts* of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce durable immunity but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook *Immunisation against Infectious Disease* (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook are available at www.dh.gov.uk/immunisation

The advice in this chapter also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Cautions Most children can safely receive the majority of vaccines. Vaccination may be postponed if the child is suffering from an acute illness; however, it is not necessary to postpone immunisation in children with minor illnesses without fever or systemic upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of Administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more vaccines are required (and are not available as a combined preparation), they should be given simultaneously at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart (but see also BCG Vaccines, p. 603). When 2 live vaccines cannot be given at the same time, they should be separated by an interval of at least 4 weeks. For **interactions** see Appendix 1 (vaccines).

See also Cautions under individual vaccines.

Contra-indications Vaccines are contra-indicated in children who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

Gelatin	Neomycin	Streptomycin
Gentamicin	Penicillins	Thiomersal
Kanamycin	Polymyxin B	

Hypersensitivity to egg with evidence of previous anaphylactic reaction, contra-indicates influenza vaccine (prepared in hens' eggs), tick-borne encephalitis vaccine, and yellow fever vaccine. See also Cautions under MMR vaccine.

See also Vaccines and HIV infection, below.

Live vaccines may be contra-indicated temporarily in children who are:

- immunosuppressed (see Impaired Immune Response, below);
- pregnant (see Pregnancy and Breast-feeding, below).

See also Contra-indications under individual vaccines.

Impaired immune response Immune response to vaccines may be reduced in immunosuppressed children and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed children should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for children being treated with high doses of corticosteroids (dose equivalents of prednisolone: **children**, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immuno-

suppressive drugs¹, and for children with malignant conditions undergoing chemotherapy or generalised radiotherapy^{1,2}. For special reference to *HIV infection*, see below.

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immuno-compromised Child (2002)* (available at www.rcpch.ac.uk).

Pregnancy Live vaccines should not be administered routinely during pregnancy because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease (e.g. to yellow fever), the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during pregnancy, see under individual vaccines.

Breast-feeding Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during breast-feeding, see under individual vaccines.

Side-effects Injection of a vaccine may be followed by local reactions such as pain, inflammation, redness, and lymphangitis. An induration or sterile abscess may develop at the injection site. Gastro-intestinal disturbances, fever, headache, irritability, loss of appetite, fatigue, myalgia, and malaise are among the most commonly reported side-effects. Other side-effects include influenza-like symptoms, dizziness, paraesthesia, asthenia, drowsiness, arthralgia, rash, and lymphadenopathy. Hypersensitivity reactions, such as bronchospasm, angioedema, urticaria, and anaphylaxis, are very rare but can be fatal (see section 3.4.3 for management of allergic emergencies).

Oral vaccines, such as cholera, live poliomyelitis, rotavirus, and live typhoid, can also cause gastro-intestinal disturbances such as nausea, vomiting, abdominal pain and cramps, and diarrhoea.

See also Predisposition to Neurological Problems, below.

Some vaccines (e.g. poliomyelitis) produce very few reactions, while others (e.g. measles, mumps and rubella) may cause a very mild form of the disease. Occasionally more serious adverse reactions can occur—these should always be reported to the CHM (see Adverse Reactions to Drugs, p. 12).

See also Preterm Birth, p. 601.

1. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).
2. Use of normal immunoglobulin should be considered after exposure to measles (see p. 623) and varicella-zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 625).

Predisposition to neurological problems

When there is a personal or family history of *febrile convulsions*, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* (see Post-immunisation Pyrexia in Infants, below) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

Post-immunisation pyrexia in infants

The parent should be advised that if pyrexia develops after childhood immunisation and the infant seems distressed, a dose of paracetamol can be given and, if necessary, a second dose can be given 6 hours later; ibuprofen may be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

For post-immunisation pyrexia in an infant aged 2–3 months, the dose of paracetamol is 60 mg; the dose of ibuprofen is 50 mg (on a doctor's advice). An oral syringe can be obtained from any pharmacy to give the small volume required.

Further information on adverse effects associated with specific vaccines can be found under individual vaccines.

Vaccines and HIV infection HIV-positive children with or without symptoms can receive the following live vaccines:

MMR (but avoid if immunity significantly impaired), varicella-zoster (but avoid if immunity significantly impaired—consult product literature);²

and the following inactivated vaccines:

anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papilloma virus, influenza, meningococcal, pertussis, pneumococcal, poliomyelitis³, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive children should **not** receive:

BCG, typhoid (oral), yellow fever.⁴

Note The above advice differs from that for other immunocompromised children; Immunisation of HIV-infected Children issued by Children's HIV Association (CHIVA) are available at www.chiva.org.uk

3. Inactivated poliomyelitis vaccine is now used instead of oral poliomyelitis vaccine for routine immunisation of children.
4. If yellow fever risk is unavoidable, specialist advice should be sought.

Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from **local health organisations** or from ImmForm (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks postmenstrual age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* (type b), meningococcal C, and hepatitis B after primary immunisation.

When to immunise (for pre-mature infants—see note above) Vaccine given and dose schedule (for details of dose, see under individual vaccines)

Neonates at risk only	<ul style="list-style-type: none"> ● BCG Vaccine See section 14.4, BCG Vaccines ● Hepatitis B Vaccine See section 14.4, Hepatitis B Vaccine
2 months	<ul style="list-style-type: none"> ● Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed) First dose ● Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed) First dose
3 months	<ul style="list-style-type: none"> ● Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed) Second dose ● Meningococcal Group C Conjugate Vaccine First dose
4 months	<ul style="list-style-type: none"> ● Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed) Third dose ● Meningococcal Group C Conjugate Vaccine Second dose ● Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed) Second dose
12–13 months	<ul style="list-style-type: none"> ● Measles, Mumps and Rubella Vaccine, Live (MMR) First dose ● Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed) Single booster dose ● Haemophilus Type b Conjugate Vaccine and Meningococcal Group C Conjugate Vaccine Single booster dose
Between 3 years and 4 months, and 5 years	<ul style="list-style-type: none"> ● Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine or Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine Single booster dose Note: Preferably allow interval of at least 3 years after completing primary course ● Measles, Mumps and Rubella Vaccine, Live (MMR) Second dose
12–13 years (females only)	<ul style="list-style-type: none"> ● Human Papilloma Virus Vaccine 3 doses; second dose 1–2 months, and third dose 6 months after first dose¹
13–18 years	<ul style="list-style-type: none"> ● Adsorbed Diphtheria [low dose], Tetanus, and Poliomyelitis (Inactivated) Vaccine Single booster dose
During adult life, women of child-bearing age susceptible to rubella	<ul style="list-style-type: none"> ● Measles, Mumps and Rubella Vaccine, Live (MMR) Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, but see also section 14.4, Measles, Mumps and Rubella Vaccine

1. The two human papilloma virus vaccines are not interchangeable and one vaccine product should be used for the entire course; however, Department of Health (November 2008) states for individuals with previous incomplete vaccination with *Gardasil*®, who are eligible for HPV vaccination under the national programme, *Cervarix*® can be used to complete the vaccination course if necessary; the individual must be informed that *Cervarix*® does not protect against genital warts.

Vaccines and asplenia The following vaccines are recommended for asplenic children or those with splenic dysfunction:

haemophilus influenzae type b; influenza; meningococcal A, C, W135, and Y conjugate; pneumococcal.

For antibiotic prophylaxis in asplenia see p. 255.

Route of administration Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route; some vaccines are given by other routes—the intradermal route for BCG vaccine, deep subcutaneous route for Japanese encephalitis and varicella vaccines, and the oral route for cholera, live poliomyelitis, rotavirus, and live typhoid vaccines. The intramuscular route should not be used in children with **bleeding disorders** such as haemophilia or thrombocytopenia; vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

Note The Department of Health has advised *against the use of jet guns* for vaccination owing to the risk of transmitting blood-borne infections, such as HIV.

High-risk groups

For information on high-risk groups, see section 14.4 under individual vaccines

BCG Vaccines, p. 603

Hepatitis A Vaccine, p. 607

Hepatitis B Vaccine, p. 608

Influenza Vaccine, p. 611

Pneumococcal Vaccines, p. 616

Tetanus Vaccines, p. 619

Children with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

For advice on the immunisation of children coming to the UK, consult the handbook *Immunisation against Infectious Disease* (2006) (available at www.dh.gov.uk)

14.2 Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed *immunoglobulins*. The term *antisera* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections

of antisera, this therapy has been replaced whenever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins, but reports of such reactions are very rare.

14.3 Storage and use

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multi-dose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

14.4 Vaccines and antisera

Availability Anthrax and yellow fever vaccines, botulism antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 34.

Enquiries for vaccines not available commercially can also be made to:

Immunisation Policy, Monitoring and Surveillance
Department of Health
Wellington House
133–155 Waterloo Road
London, SE1 8UG
vaccine.supply@dh.gsi.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health. In Wales enquiries for vaccines not commercially available should be directed to:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979

and in Northern Ireland:

Pharmacy and Medicines Management Centre
Beech House
Antrim Hospital Site
Northern Health and Social Care Trust
Bush Road
Antrim, BT41 2RL
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine

Anthrax vaccine is rarely required for children. For further information see BNF section 14.4.

BCG vaccines

BCG (*Bacillus Calmette-Guérin*) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of hypersensitivity to *M. tuberculosis*. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small flat scar. A dry dressing may be used if the ulcer discharges, but air should **not** be excluded.

All children of 6 years and over being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculin (see under Diagnostic agents, below). A skin test is not necessary for a child under 6 years, provided that the child has not stayed for longer than 3 months in a country with an incidence¹ of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

BCG is recommended for the following groups of children if BCG immunisation has not previously been carried out and they are negative for tuberculin hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence¹ of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence¹ of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence¹ of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–18 years from Sub-Saharan Africa or a country¹ with an incidence of tuberculosis greater than 500 per 100 000;
- contacts of those with active respiratory tuberculosis;
- children under 16 years intending to live with local people for more than 3 months in a country with an incidence¹ of tuberculosis greater than 40 per 100 000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time, an interval of 4 weeks should normally be allowed between them. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given

1. List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.hpa.org.uk

in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for treatment of infection following vaccination, seek expert advice.

BACILLUS CALMETTE-GUÉRIN VACCINE

BCG vaccine

Cautions see section 14.1; **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1; also neonate in household contact with known or suspected case of active tuberculosis; generalised septic skin conditions (for children with eczema, lesion-free site should be used)

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1 and notes above; *also* at the injection-site, subcutaneous abscess, prolonged ulceration; *rarely* disseminated complications such as osteitis or osteomyelitis

Indication and dose

Immunisation against tuberculosis

- By intradermal injection

Neonate 0.05 mL

Child 1 month–1 year 0.05 mL

Child 1–18 years 0.1 mL

Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb = 0.1 mL injection, 3 mm bleb = 0.05 mL injection; if considerable resistance not felt, needle is too deep and should be removed and reinserted before giving more vaccine. To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**.

Intradermal

Bacillus Calmette-Guérin Vaccine (PoM)

BCG Vaccine, Dried/Tub/BCG

Injection. (powder for suspension), freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin

Available from health organisations or from ImmForm (SSI brand, multidose vial with diluent)

Diagnostic agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

Note Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantIFERON®-TB Gold* and *T-SPOT®. TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.hpa.org.uk.

Tuberculin Purified Protein Derivative (POM) (Tuberculin PPD)

Injection, heat-treated products of growth and lysis of appropriate *Mycobacterium* spp. 20 units/mL (2 units/0.1-mL dose) (for routine use), 1.5-mL vial; 100 units/mL (10 units/0.1-mL dose), 1.5-mL vial

Dose

Mantoux test

• By intradermal injection

2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength)

Available from ImmForm (SSI brand)

Important The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength

Botulism antitoxin

A polyvalent botulism antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of children thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All children should be tested for sensitivity (diluting the antitoxin if history of allergy).

Botulism Antitoxin (POM)

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

Note The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification

Dose

Prophylaxis

Consult product literature

Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the duty doctor at the Health Protection Agency (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank

Cholera vaccine

Cholera vaccine (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-

subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

CHOLERA VACCINE

Cautions see section 14.1 and notes above

Contra-indications see section 14.1; also acute gastro-intestinal illness

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1; also rarely respiratory symptoms such as rhinitis and cough; very rarely sore throat, insomnia

Indication and dose

See notes above

• By mouth

Child 2–6 years 3 doses each separated by an interval of 1–6 weeks

Child 6–18 years 2 doses separated by an interval of 1–6 weeks

Note If more than 6 weeks have elapsed between doses, the primary course should be restarted

A single booster dose can be given 2 years after primary course for children 6–18 years, and 6 months after primary course for children 2–6 years. If more than 2 years have elapsed since the last vaccination, the primary course should be repeated

Administration Dissolve effervescent sodium bicarbonate granules in a glassful of water (approximately 150 mL). For child over 6 years, add vaccine suspension to make one dose. For child 2–6 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink and other oral medicines should be avoided for 1 hour before and after vaccination

Dukoral® (CruCell) (POM)

Oral suspension, for dilution with solution of effervescent sodium bicarbonate granules, heat- and formaldehyde-inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae* bacteria and recombinant cholera toxin B-subunit produced in *V. cholerae*, net price 2-dose pack = £23.42. Counselling, administration

Diphtheria Vaccines

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria

toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of **diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed)** (see Immunisation schedule, section 14.1). In unimmunised children aged over 10 years the primary course comprises of 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive **either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine**. Children aged over 10 years should receive **adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine**.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed). For children who have been vaccinated following a tetanus-prone wound, see Tetanus vaccines, p. 619.

Travel Children travelling to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** should be administered.

Contacts Advice on the management of cases of diphtheria, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected children and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune child, see Table 2, section 5.1.

DIPHTHERIA-CONTAINING VACCINES

Cautions see section 14.1; see also individual components of vaccines

Contra-indications see section 14.1; see also individual components of vaccines

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1; also restlessness, sleep disturbances, and unusual crying in infants;

Licensed use *Infanrix-IPV + Hib*[®] not licensed for use in children over 36 months; *Pediacel*[®] not licensed in children over 4 years but Department of Health recommends that these be used for children up to 10 years

Indication and dose

See notes above and under preparations

▲ Diphtheria-containing vaccines for children under 10 years

Important Not recommended for children aged 10 years or over (see Diphtheria vaccines for children over 10)

Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed) ^(PoM)

Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis, inactivated poliomyelitis and *Haemophilus influenzae* type b (conjugated to tetanus protein), net price 0.5-mL prefilled syringe = £19.94

Excipients may include neomycin, polymyxin B and streptomycin

Dose

Primary immunisation

- By intramuscular injection

Child 2 months–10 years 3 doses each of 0.5 mL separated by intervals of 1 month; see also notes on booster doses, above

Available as part of childhood immunisation schedule, from health organisations or ImmForm

Brands include *Pediacel*[®]

Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine ^(PoM)

Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £17.56

Excipients may include neomycin and polymyxin B

Dose

First booster dose

- By intramuscular injection

Child 3–10 years 0.5 mL 3 years after primary immunisation; see also notes on booster doses, above

Available as part of childhood immunisation schedule, from health organisations or ImmForm

Brands include *Infanrix-IPV*[®]

Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine ^(PoM)

Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £11.98

Excipients may include neomycin, polymyxin B and streptomycin

Dose

First booster dose

- By intramuscular injection

Child 3–10 years 0.5 mL 3 years after primary immunisation; see also notes on booster doses, above

Available as part of childhood immunisation schedule, from health organisations or ImmForm

Brands include *Repevax*[®]

▲ Diphtheria-containing vaccines for children over 10 years

A low dose of diphtheria toxoid is sufficient to recall immunity in older children previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in a child who is already immune. Preparations containing low dose diphtheria should be used for children *over 10 years*, both for primary immunisation and booster doses.

Adsorbed Diphtheria [low dose], Tetanus and Poliomyelitis (Inactivated) Vaccine (PoM)

Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £6.35

Excipients may include neomycin, polymyxin B and streptomycin

Dose

Primary immunisation

• By intramuscular injection

Child 10–18 years 3 doses each of 0.5 mL separated by intervals of 1 month; second booster dose, 0.5 mL given 10 years after first booster dose (may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine); see also notes on booster doses, above

Available as part of childhood schedule, from health organisations or ImmForm

Brands include *Revaxis®*

▲ Diphtheria antitoxin

Diphtheria antitoxin is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (Table 2, section 5.1) and vaccine (see Contacts above, p. 605).

Diphtheria Antitoxin (PoM)

Dip/Ser

Dose**Prophylaxis**

Not recommended therefore no dose stated (see notes above)

Treatment

Consult product literature

Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

Haemophilus type B conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, (see under Diphtheria containing Vaccines) as a component of the primary course of childhood immunisation (see

Immunisation schedule, section 14.1). For infants under 1 year, the course consists of 3 doses of a vaccine containing haemophilus influenzae type b component, with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at around 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae type b* need to receive only 1 dose of the vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae type b* disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

For use of rifampicin in the prevention of secondary cases of Haemophilus influenza type b disease, see Table 2, section 5.1

Asplenia, splenic dysfunction, or complement deficiency Children diagnosed with asplenia, splenic dysfunction, or complement deficiency at:

- *under 2 years of age* should be vaccinated according to the Immunisation Schedule (section 14.1). The booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), given at 12–13 months of age, should be followed at least 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. An additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given after the second birthday;
- *over 2 years of age* should receive one dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine.

HAEMOPHILUS TYPE B CONJUGATE VACCINE

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1; also, atopic dermatitis, hypotonia

Licensed use *Menitorix®* is not licensed for use in children over 2 years

Indication and dose

See notes above and under preparation

Primary immunisation, see under Diphtheria-containing vaccines

Menitorix® (GSK) (Pm)

Injection, powder for reconstitution, capsular polysaccharide of *Haemophilus influenzae* type b and capsular polysaccharide of *Neisseria meningitidis* group C (both conjugated to tetanus protein), net price single dose vial (with syringe containing 0.5 mL diluent) = £39.87

Dose

- By intramuscular injection

CHILD 1–10 year 0.5 mL

CHILD over 1 year with asplenia or splenic dysfunction (see notes above), 0.5 mL

Available as part of the childhood immunisation schedule from ImmForm

▲ Combined vaccines

See also Diphtheria-containing vaccines

Hepatitis A vaccine

Hepatitis A vaccine is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:

- residents of homes for those with severe learning difficulties;
- children with haemophilia or other conditions treated with plasma-derived clotting factors;
- children with severe liver disease;
- children travelling to high-risk areas (see p. 626);
- adolescents who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- children with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose of hepatitis A vaccine is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

In children under 16 years, a single dose of the combined vaccine *Ambirix®* can be used to provide rapid protection against hepatitis A.

Intramuscular **normal immunoglobulin** (section 14.5.1) is recommended for use in addition to Hepatitis A vaccine for close contacts (of confirmed cases of

hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed.

HEPATITIS A VACCINE

Cautions section 14.1

Contra-indications section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects section 14.1; for combination vaccines, see also Typhoid vaccines, p. 620

Indication and dose

Immunisation against hepatitis A infection

For dose, see under preparations

▲ Single component

Avaxim® (Sanofi Pasteur) (Pm)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £18.10
Excipients include neomycin

Dose

- By intramuscular injection

(see note below)

CHILD 16–18 years 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose

Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Avaxim®*. The deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for children with bleeding disorders

Epaxal® (Cruce) (Pm)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (RG-SB grown in human diploid cells) at least 48 units/mL, net price 0.5-mL prefilled syringe = £23.81

Dose

- By intramuscular injection

(see note below)

CHILD 1–18 years 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose (1–6 months if splenectomised)

Note Booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for children with bleeding disorders

Important *Epaxal®* contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, and is therefore contra-indicated in those hypersensitive to eggs or chicken protein.

Havrix Monodose® (GSK) (Pm)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14, 0.5-mL (720 ELISA units) prefilled syringe (*Havrix Junior Monodose®*) = £16.77
Excipients include neomycin

Dose

- By intramuscular injection

(see note below)

CHILD 1–15 years 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose

Child 16–18 years 1 mL as a single dose; booster dose 1 mL 6–12 months after initial dose

Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Havrix Monodose*[®]. The deltoid region is the preferred site of injection. The subcutaneous route may be used for children with bleeding disorders

Vaqta[®] Paediatric (Sanofi Pasteur) (PoM)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL prefilled syringe = £14.74

Excipients include neomycin

Dose

- **By intramuscular injection** (see note below)

Child 1–18 years 0.5 mL as a single dose; booster dose 0.5 mL 6–18 months after initial dose

Note The deltoid region is the preferred site of injection. The subcutaneous route may be used for children with bleeding disorders (but immune response may be reduced)

▲ **With hepatitis B vaccine**

Ambirix[®] (GSK) ▼ (PoM)

Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium hydroxide and aluminium phosphate, net price 1-mL prefilled syringe = £31.18

Excipients include neomycin

Dose

- **By intramuscular injection** (see note below)

Child 1–15 years primary course, 2 doses of 1 mL, the second 6–12 months after initial dose

Note Primary course should be completed with *Ambirix*[®] (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for children with bleeding disorders (but immune response may be reduced)

Important *Ambirix*[®] not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus

Twinrix[®] (GSK) (PoM)

Injection, inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe (*Twinrix*[®] *Adult*) = £27.76, 0.5-mL prefilled syringe (*Twinrix*[®] *Paediatric*) = £20.79

Excipients include neomycin

Dose

- **By intramuscular injection** (see note below)

Child 1–15 years primary course 3 doses of 0.5 mL (*Twinrix*[®] *Paediatric*), the second 1 month and the third 6 months after first dose

Child 16–18 years primary course, 3 doses of 1 mL (*Twinrix*[®] *Adult*), the second 1 month and the third 6 months after first dose

Accelerated schedule (e.g. for travellers departing within 1 month) for child over 16 years, second dose given 7

days after first dose, third dose after further 14 days and fourth dose 12 months after the first dose

Note Primary course should be completed with *Twinrix*[®] (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for children with bleeding disorders (but immune response may be reduced).

Important *Twinrix*[®] not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular or mucous membrane exposure to hepatitis B virus.

▲ **With typhoid vaccine**

Hepatyrix[®] (GSK) (PoM)

Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £32.08

Excipients include neomycin

Dose

- **By intramuscular injection** (see note below)

Child 15–18 years 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 620

Note The deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for children with bleeding disorders

VIATIM[®] (Sanofi Pasteur) (PoM)

Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 160 antigen units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £29.80

Dose

- **By intramuscular injection** (see note below)

Child 16–18 years 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 620

Note The deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for children with bleeding disorders

Hepatitis B vaccine

Hepatitis B vaccine contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed on to aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, high-risk groups include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- adolescents who are at risk from their sexual behaviour;

- close family contacts of an individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy *or* are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and *hepatitis B immunoglobulin* (see p. 624) given at the same time (but at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother's e-antigen antibody status);
- children with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- children with chronic renal failure including those on haemodialysis. Children receiving haemodialysis should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- children with chronic liver disease;
- patients of day-care or residential accommodation for those with severe learning difficulties;
- children in custodial institutions;
- children travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 626);
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations); an 'accelerated schedule' is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below). Generally, three or four doses are required for primary immunisation. Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for common-sense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the initial dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the *Immunisation against Infectious Disease* handbook, see p. 599

Specific **hepatitis B immunoglobulin** ('HBIG') is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection (section 14.5.2).

A combined hepatitis A and hepatitis B vaccine is also available.

HEPATITIS B VACCINE

Cautions section 14.1

Contra-indications section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects section 14.1

Indication and dose

Immunisation against hepatitis B infection

For dose see under preparations

Single component

Engerix B[®] (GSK) (PvM)

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) pre-filled syringe = £9.67, 1-mL vial = £12.34, 1-mL pre-filled syringe = £12.99

Dose

- **By intramuscular injection** (see note below)

Neonate (except if born to hepatitis B surface antigen-positive mother, see below), 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose

Child 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose

Child 16–18 years 3 doses of 20 micrograms, second dose 1 month and third dose 6 months after first dose

Accelerated schedule (all age groups), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose

Alternative schedule for **Child 11–15 years**, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain)

Infant born to hepatitis B surface antigen-positive mother (see also notes above)

- **By intramuscular injection** (see note below)

Neonate 4 doses of 10 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after first dose

Renal insufficiency (including haemodialysis patients)

- **By intramuscular injection** (see note below)

Neonate (except if born to hepatitis B surface antigen positive mother, see above), 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose *or* accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months, and fourth dose 12 months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Child 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose *or* accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months, and fourth dose 12 months after first dose; immunisation schedule

and booster doses may need to be adjusted in those with low antibody concentration

Child 16–18 years 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note Deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in neonates, infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

Fendrix® (GSK) (PvM)

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £38.10

Excipients include traces of thiomersal

Dose

Renal insufficiency patients (including pre-haemodialysis and haemodialysis patients)

• By intramuscular injection

(see note below)

Child 15–18 years 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note Deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBvaxPRO® (Sanofi Pasteur) (PvM)

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL (5-microgram) prefilled syringe = £8.95, 1-mL (10-microgram) prefilled syringe = £12.20; 40 micrograms/mL, 1-mL (40-microgram) vial = £27.60

Dose

• By intramuscular injection

(see note below)

Neonate (except if born to hepatitis B surface antigen-positive mother, see below), 3 doses of 5 micrograms, second dose 1 month and third dose 6 months after first dose

Child 1 month–16 years 3 doses of 5 micrograms, second dose 1 month and third dose 6 months after first dose

Child 16–18 years 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose

Accelerated schedule (all age groups), second dose 1 month after first dose, third dose 2 months after first dose with fourth dose at 12 months

Booster doses may be required in immunocompromised patients with low antibody concentration

Infant born to hepatitis B surface antigen-positive mother (see also notes above)

• By intramuscular injection

(see note below)

Neonate 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site), the second 1 month, the third 2 months and the fourth 12 months after the first dose

Chronic haemodialysis patients

• By intramuscular injection

(see note below)

Child 16–18 years 3 doses of 40 micrograms, second dose 1 month and third dose 6 months after first dose;

booster doses may be required in those with low antibody concentration

Note Deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in neonates and infants; not to be injected into the buttock (vaccine efficacy reduced)

▲ With hepatitis A vaccine

See Hepatitis A Vaccine

Human papilloma virus vaccines

Human papilloma virus vaccine is available as a bivalent vaccine (*Cervarix*®) or a quadrivalent vaccine (*Gardasil*®). *Cervarix*® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papilloma virus types 16 and 18. *Gardasil*® is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papilloma virus types 6, 11, 16 and 18. The vaccines may also provide limited protection against disease caused by other types of human papilloma virus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course. However, the Department of Health (November 2008) states for individuals with previous incomplete vaccination with *Gardasil*®, who are eligible for HPV vaccination under the national programme, *Cervarix*® can be used to complete the vaccination course if necessary; the individual must be informed that *Cervarix*® does not protect against genital warts.

Human papilloma virus vaccine will be most effective if given before sexual activity starts. The first dose is given to females aged 12 to 13 years, the second and third doses are given 1–2 and 6 months after the first dose (see Immunisation schedule, section 14.1); all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed but not repeated, allowing the appropriate interval between the remaining doses. Where there are significant challenges in scheduling vaccination, or a high likelihood that the third dose will not be given, the third dose of *Cervarix*® can be given 3 months after the second dose; if this is not possible and the second dose was given late, in exceptional circumstances, the third dose can be given at least 1 month after the second dose. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

HUMAN PAPILLOMA VIRUS VACCINES

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy not known to be harmful, but vaccination should be postponed until completion of pregnancy

Breast-feeding see p. 600

Side-effects see section 14.1

Indication and dose

See notes above and under preparations

Note To avoid confusion, prescribers should specify the brand to be dispensed

Cervarix® (GSK) (PvM)

Injection, suspension of virus-like particles of human papilloma virus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5-mL pre-filled syringe = £80.50

Note To avoid confusion, prescribers should specify the brand to be dispensed

Dose

Prevention of premalignant genital lesions and cervical cancer (see notes above)

- **By intramuscular injection into deltoid region**

Child 10–18 years 3 doses of 0.5 mL, the second 1 month and the third 6 months after the first dose

Alternative schedule for **Child 10–18 years**, 3 doses of 0.5 mL, the second 1–2.5 months, and the third 5–12 months after the first dose

Gardasil® (Sanofi Pasteur) (PvM)

Injection, suspension of virus-like particles of human papilloma virus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA technique) adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL pre-filled syringe = £86.50

Note To avoid confusion, prescribers should specify the brand to be dispensed

Dose

Prevention of premalignant genital lesions, cervical cancer and genital warts (see notes above)

- **By intramuscular injection preferably into deltoid region or higher anterolateral thigh**

Child 9–18 years 3 doses of 0.5 mL, the second 2 months and the third 6 months after the first dose

Alternative schedule for **Child 9–18 years**, 3 doses of 0.5 mL, the second at least 1 month and the third at least 4 months after the first dose; schedule should be completed within 12 months

- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: 1 mg/kg or more daily or 20 mg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for children living in long-stay facilities, and for carers of children whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

Monovalent influenza A(H1N1)v vaccines

Pandemrix® and **Celvapan®** are monovalent vaccines licensed against the influenza A(H1N1)v (swine flu) strain.

Pandemrix® is recommended for children aged 6 months–5 years who have not received the monovalent vaccine previously and who are in the risk groups prioritised for seasonal influenza vaccine. **Pandemrix®** is also recommended for all immunocompromised patients over 6 months of age who have not received the monovalent vaccine previously. Seasonal influenza vaccine should continue to be offered as normal. **Pandemrix®** can be given at the same time as the first dose of seasonal influenza vaccine; however, **Pandemrix®** should be given 4 weeks before the seasonal influenza vaccine to immunocompromised patients who only require one dose of seasonal influenza vaccine.

Further information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.hpa.org.uk.

Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains recommended each year by the World Health Organization.

Seasonal influenza vaccines Seasonal influenza vaccines will not control epidemics — immunisation is recommended *only for persons at high risk*. Annual immunisation is strongly recommended for children (including infants that were preterm or low birth-weight) aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;

INFLUENZA VACCINES

Cautions see section 14.1; **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1; avoid **Enzira®** or preparations marketed by Pfizer, Wyeth or CSL. Biotherapies in child under 5 years—increased risk of febrile convulsions

Pregnancy not known to be harmful

Breast-feeding not known to be harmful

Side-effects see section 14.1; also reported, febrile convulsions and transient thrombocytopenia

Licensed use Inactivated Influenza Vaccine (Surface Antigen) and **Fluvirin®** are not licensed for use in children under 4 years

Indication and dose

Annual immunisation against seasonal influenza

- **By intramuscular injection**

Child 6 months–3 years 0.25–0.5 mL (repeated after 4–6 weeks in children who have not received seasonal influenza vaccine previously)

Child 3–13 years 0.5 mL (repeated after 4–6 weeks in children who have not received seasonal influenza vaccine previously)

Child 13–18 years 0.5 mL as a single dose

Influenza A(H1N1)v

See under *Celvapan*[®] and *Pandemrix*[®] below

▲ Seasonal influenza vaccines

Inactivated Influenza Vaccine (Split Virion) (PoM)

Flu

Injection, suspension of formaldehyde-inactivated influenza virus (split virion) grown in fertilised hens' eggs, net price 0.25-mL prefilled syringe = £6.29, 0.5-mL prefilled syringe = £6.29

Excipients may include neomycin and polymyxin

Available from Sanofi Pasteur

Contra-indications avoid preparations marketed by Pfizer, Wyeth, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

Inactivated Influenza Vaccine (Surface Antigen) (PoM)

Flu or Flu(adj)

Injection, suspension of propiolactone-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £4.15

Excipients may include neomycin, polymyxin B and traces of thiomersal

Available from Novartis Vaccines

Agrippal[®] (Novartis Vaccines) (PoM)

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £5.85

Excipients include kanamycin and neomycin

Begrivac[®] (Novartis Vaccines) (PoM)

Injection, suspension of formaldehyde-inactivated influenza virus (split virion) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £5.85

Excipients include polymyxin B

Enzira[®] (Pfizer) (PoM)

Injection, suspension of inactivated influenza virus (split virion) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £6.33

Excipients include neomycin and polymyxin B

Contra-indications child under 5 years—increased risk of febrile convulsions

Fluarix[®] (GSK) (PoM)

Injection, suspension of formaldehyde-inactivated influenza virus (split virion) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £5.39

Excipients include gentamicin

Fluvirin[®] (Novartis Vaccines) (PoM)

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5 mL prefilled syringe = £5.55

Excipients include neomycin, polymyxin B, and traces of thiomersal

Imuvac[®] (Abbott Healthcare) (PoM)

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £6.59

Excipients include gentamicin

Influvac Sub-unit[®] (Abbott Healthcare) (PoM)

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £5.22

Excipients include gentamicin

Mastafu[®] (MASTA) (PoM)

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £6.50

Excipients include gentamicin

Viroflu[®] (CruceI) (PoM)

Injection, suspension of inactivated influenza virus (surface antigen, virosome) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £6.33

Excipients include neomycin and polymyxin B

▲ Monovalent influenza A(H1N1)v vaccines

Celvapan[®] (Baxter) (PoM)

Injection, suspension of formaldehyde-inactivated influenza A(H1N1)v virus (whole virion, grown in vero cells), 15 micrograms/mL, 5-mL multidose vial contains 10 doses of 0.5 mL

Dose

Prevention of influenza A(H1N1)v

• By intramuscular injection

Child 6 months–18 years 2 doses each of 0.5 mL separated by an interval of at least 3 weeks

Note *Celvapan*[®] is not interchangeable with *Pandemrix*[®]

Pandemrix[®] (GSK) (PoM)

Injection, suspension of inactivated influenza A(H1N1)v virus (split virion, grown in fertilised hens' eggs) 7.5 micrograms/mL when mixed with emulsion of adjuvant, 5 mL of mixed multidose vial contains 10 doses of 0.5 mL

Excipients include gentamicin and thiomersal

Dose

Prevention of influenza A(H1N1)v

• By intramuscular injection

Child 6 months–10 years 0.25 mL as a single dose

Child 10–18 years 0.5 mL as a single dose

Note *Pandemrix*[®] is not interchangeable with *Celvapan*[®]

Measles vaccine

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine (MMR vaccine).

MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

▲ Single antigen vaccine

No longer available in the UK

▲ Combined vaccines

See MMR vaccine, below

Measles, Mumps and Rubella (MMR) vaccine

A combined live **measles, mumps, and rubella vaccine** (MMR vaccine) aims to eliminate measles, mumps and rubella (and congenital rubella syndrome). Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see section 14.1). MMR vaccine should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of MMR vaccine is given to children aged 12–13 months. A second dose is given before starting

school at 3–5 years of age (see Immunisation schedule, section 14.1).

When protection against measles is required urgently (e.g. during a measles outbreak), the second dose of MMR vaccine can be given 1 month after the first dose; if the second dose is given before 18 months of age, then children should still receive the routine dose before starting school at 3–5 years of age.

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose. At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In a young adult who has received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after the initial dose.

MMR vaccine should be used to protect against rubella in *seronegative females of child-bearing age* (see Immunisation schedule, section 14.1). MMR vaccine may also be offered to previously *unimmunised and seronegative post-partum* mothers—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of mothers who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children including babies aged over 6 months who are contacts of a case, within 3 days of exposure to infection; these children should still receive routine MMR vaccinations at the recommended ages. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin (section 14.5, p. 622) after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5).

Travel Unimmunised children over 6 months of age travelling to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR at the recommended ages. If one dose of MMR has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose, before starting school at 3–5 years, should still be given.

Side-effects See section 14.1. Also malaise, fever, or a rash can occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur rarely 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthropathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura *within 6 weeks* of the first dose of MMR.

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from:
www.dh.gov.uk/immunisation

MEASLES, MUMPS AND RUBELLA VACCINE, LIVE

Cautions see section 14.1; also after immunoglobulin administration or blood transfusion, leave an interval of at least 3 months before MMR immunisation as antibody response to measles component may be reduced; **interactions:** Appendix 1 (vaccines)

Hypersensitivity to egg There is increasing evidence that MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg (dislike of egg or refusal to eat egg is not a contra-indication). For children with a confirmed anaphylactic reaction to egg-containing food, MMR vaccine may be administered in a hospital setting.

Contra-indications see section 14.1

Pregnancy avoid pregnancy for at least 1 month after vaccination; see also, p. 600

Breast-feeding see p. 600

Side-effects see section 14.1 and notes above; also *less commonly* sleep disturbance, unusual crying in infants, also reported peripheral and optic neuritis.

Licensed use not licensed for use in children under 9 months

Indication and dose

Immunisation against measles, mumps, and rubella

- By intramuscular or deep subcutaneous injection

CHILD 6 months–18 years primary immunisation, 2 doses each of 0.5 mL, see Immunisation schedule, section 14.1, p. 601; see also notes above for use in outbreaks, for contacts of cases, and for travel

Combined vaccines

MMRvaxPro® (Sanofi Pasteur) ▼ (POM)

Injection, powder for reconstitution, live attenuated, measles virus (Enders' Edmonston strain) and mumps virus (Jeryl Lynn [Level B] strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); single-dose vial (with syringe containing solvent)

Excipients include gelatin and neomycin

Only available as part of childhood immunisation schedule from health organisations or ImmForm

Priorix® (GSK) (POM)

Injection, powder for reconstitution, live attenuated, measles virus (Schwarz strain) and mumps virus (RIT 4385 strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain), net price single-dose vial (with syringe containing solvent) = £6.37

Excipients include neomycin

Also available as part of childhood immunisation schedule from health organisations or ImmForm

Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal Group C conjugate vaccine** protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetavalent meningococcal vaccines that cover serotypes A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serotype C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal.

Childhood immunisation **Meningococcal Group C conjugate vaccine** provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 2 doses given at 3 months and 4 months of age; a booster dose should be given at 12–13 months of age, usually combined with haemophilus influenzae type b vaccine (see Immunisation Schedule, section 14.1, p. 601).

It is recommended that meningococcal group C conjugate vaccine be given to anyone aged under 25 years

who has not been vaccinated previously with this vaccine; those over 1 year receive a single dose. Children with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Asplenia, splenic dysfunction, or complement deficiency See p. 606.

Travel Individuals travelling to countries of risk (see below) should be immunised with **meningococcal A, C, W135, and Y conjugate vaccine**, even if they have previously received meningitis C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetavalent (A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where outbreaks and epidemics of meningococcal infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetavalent (A, C, W135 and Y) meningococcal vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts For advice on the immunisation of *laboratory workers and close contacts* of cases of meningococcal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidelines for Public Health Management of Meningococcal Disease in the UK at www.hpa.org.uk. See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

MENINGOCOCCAL VACCINES

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1; also *rarely* symptoms of meningitis reported (but no evidence that vaccine causes meningococcal C meningitis)

Licensed use **Menveo®** not licensed for use in children under 11 years

Indication and dose

Immunisation against *Neisseria meningitidis* for dose, see under preparations

Meningococcal Group C conjugate vaccine

Meningitec® (Wyeth) (POM)

Injection, suspension of capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed

onto aluminium phosphate, net price 0.5-mL prefilled syringe = £7.50

Dose

- **By intramuscular injection**

Child 2 months–1 year for routine immunisation, 0.5 mL, see notes above and Immunisation schedule, section 14.1

Child 1–18 years 0.5 mL as a single dose

Note Subcutaneous route used for children with bleeding disorders

Available as part of childhood immunisation schedule from ImmForm

Menjugate Kit® (Sanofi Pasteur) (PoM)

Injection, powder for reconstitution, capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed onto aluminium hydroxide, single-dose vials

Dose

- **By intramuscular injection**

Child 2 months–1 year for routine immunisation, 0.5 mL, see notes above and Immunisation schedule, section 14.1

Child 1–18 years 0.5 mL as a single dose

Note Subcutaneous route used for children with bleeding disorders

Available as part of childhood immunisation schedule from ImmForm

NeisVac-C® (Baxter) (PoM)

Injection, suspension of polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to tetanus toxoid protein), adsorbed onto aluminium hydroxide, 0.5-mL prefilled syringe

Dose

- **By intramuscular injection**

Child 2 months–1 year for routine immunisation, 0.5 mL, see notes above and Immunisation schedule, section 14.1

Child 1–18 years 0.5 mL as a single dose

Available as part of childhood immunisation schedule from ImmForm

▲ Meningococcal Group C conjugate vaccine with Haemophilus Influenzae type B vaccine

See *Haemophilus Influenzae* type B vaccine

▲ Meningococcal A, C, W135, and Y conjugate vaccine

Menveo® (Novartis Vaccines) ▼ (PoM)

Injection, powder for reconstitution, capsular oligosaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y (conjugated to *Corynebacterium diphtheriae* protein), net price single-dose vial (with syringe containing diluent) = £40.01

Dose

- **By intramuscular injection preferably into deltoid region**

Child 3 months–1 year 2 doses of 0.5 mL separated by an interval of 1 month

Child 1–18 years 0.5 mL as a single dose

▲ Meningococcal polysaccharide A, C, W135 and Y vaccine

ACWY Vax® (GSK) ▼ (PoM)

Injection, powder for reconstitution, capsular polysaccharide antigens of *Neisseria meningitidis* groups

A, C, W135 and Y, net price single-dose vial (with syringe containing diluent) = £16.73

Dose

- **By deep subcutaneous injection**

Child 5–18 years 0.5 mL as a single dose; booster dose for those at continued risk, 0.5 mL 5 years after initial dose

Mumps vaccine

▲ Single antigen vaccine

No longer available in the UK

▲ Combined vaccines

See MMR Vaccine, p. 612

Pertussis vaccine

Pertussis vaccine is given as a combination preparation containing other vaccines (see Diphtheria Vaccines). Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1, p. 601), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a *pertussis-containing* vaccine as part of their primary immunisation schedule should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Contacts Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis (Table 2, section 5.1). Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged 10–18 years who have not received a pertussis-containing vaccine in the last 10 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Cautions Section 14.1

Contra-indications Section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side effects See also section 14.1. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses (see below).

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

▲ Combined vaccines

Combined vaccines, see under Diphtheria vaccines

Pneumococcal vaccines

Pneumococcal vaccines protect against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. **Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas **pneumococcal polysaccharide conjugate vaccine** (adsorbed) contains polysaccharide from either 10 capsular types (*Synflorix*®) or 13 capsular types (*Prevenar 13*®) with the polysaccharide being conjugated to protein.

The 13-valent conjugate vaccine is used for childhood immunisation. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- child under 5 years with a history of invasive pneumococcal disease;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid could occur.

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, and chemotherapy; children and carers should be given advice about increased risk of pneumococcal infection. Prophylactic antibacterial therapy against

pneumococcal infection (Table 2, section 5.1, p. 255) should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

Choice of vaccine Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Revaccination In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

PNEUMOCOCCAL VACCINES

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1; also Revaccination, above

Indication and dose

Immunisation against pneumococcal infection

For dose see under preparations

▲ Pneumococcal polysaccharide vaccines

Pneumovax® II (Sanofi Pasteur) (PvM)

Injection, polysaccharide from each of 23 capsular types of pneumococcus, net price 0.5-mL vial = £8.32

Dose

- By subcutaneous or intramuscular injection

Child 2–18 years 0.5 mL; revaccination, see notes above

▲ Pneumococcal polysaccharide conjugate vaccine (adsorbed)

Prevenar 13[®] (Wyeth) ▼ (PvM)

Injection, polysaccharide from each of 13 capsular types of pneumococcus (conjugated to carrier protein) adsorbed onto aluminium phosphate, net price 0.5-mL, pre-filled syringe = £49.10

Dose

• By intramuscular injection

Child 2 months–5 years 0.5 mL (see notes above and Immunisation schedule, section 14.1)

Note Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

The dose in *BNF for Children* may differ from that in product literature

Available as part of childhood immunisation schedule from ImmForm

Synflorix[®] (GSK) ▼ (PvM)

Injection, polysaccharide from each of 10 capsular types of pneumococcus (conjugated to carrier proteins) adsorbed onto aluminium phosphate, net price 0.5-mL, pre-filled syringe = £27.60

Dose

• By intramuscular injection

Child 6 weeks–2 years consult product literature

Note Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

Poliomyelitis vaccines

Two types of poliomyelitis vaccine (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated poliomyelitis vaccine**, only available in combined preparation (see under Diphtheria vaccines, combined), is recommended for routine immunisation; it is given by injection and contains inactivated strains of human poliovirus types 1, 2 and 3.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccine starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule, section 14.1). A course of 3 doses should also be given to all unimmunised children; no child should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1). Further booster doses should be given every 10 years only to individuals at special risk.

Preparations containing inactivated poliomyelitis vaccine can be used to complete an immunisation course initiated with the live (oral) poliomyelitis vaccine. **Live (oral) poliomyelitis vaccine** is available only for use during outbreaks. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccine removes the risk of vaccine-associated paralytic polio altogether.

Travel Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre, p. 627 (www.nathnac.org).

POLIOMYELITIS VACCINES

Cautions see section 14.1; *also for live vaccine, interactions*: Appendix 1 (vaccines)

Contra-indications see notes above and section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see notes above and section 14.1

Indication and dose

See under preparations

▲ Combined vaccines

See under Diphtheria-containing Vaccines

▲ Inactivated (Salk) Vaccine

See under Diphtheria-containing Vaccines

▲ Live (oral) (Sabin) vaccine

Poliomyelitis Vaccine, Live (Oral) (GSK) (PvM)
OPV

A suspension of suitable live attenuated strains of poliomyelitis virus, types 1, 2, and 3. Available in single-dose and 10-dose containers

Excipients include neomycin and polymyxin B

Dose

Control of outbreaks

• By mouth

Child 1 month–18 years 3 drops; may be given on a lump of sugar; not to be given with foods which contain preservatives

Note Live poliomyelitis vaccine loses potency once the container has been opened—any vaccine remaining at the end of an immunisation session should be discarded; whenever possible sessions should be arranged to avoid undue wastage.

Rabies vaccine

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis Immunisation should be offered to children at high risk of exposure to rabies—where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk. Transmission of rabies by humans has not been recorded but it is advised that those caring for children with the disease should be vaccinated.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to

rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at continued risk.

Post-exposure management Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the Health Protection Agency Virus Reference Department, Colindale, London (tel. (020) 8200 4400) or the Centre for Infections (tel. (020) 8200 6868), in Scotland from Health Protection Scotland (tel. (0141) 300 1100), in Northern Ireland from the Public Health Laboratory, Belfast City Hospital (tel. (028) 9032 9241).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a child has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine, given on day 0 and day 3, are likely to be sufficient. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and 30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5.2) is given on day 0. The immunisation course can be discontinued if it is proved that the child was not at risk.

RABIES VACCINE

Cautions see section 14.1

Contra-indications see section 14.1; but see also Post-exposure Management in notes above

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1; also reported paresis

Indication and dose

Pre-exposure immunisation against rabies

- By intramuscular injection in deltoid region or anterolateral thigh in infants

Child 1 month–18 years 1 mL on days 0, 7, and 21 or 28; for those at continued risk give a single reinforcing dose 1 year after the primary course is completed and booster doses every 3–5 years; for those at intermittent risk give booster doses every 2–5 years

Post-exposure immunisation against rabies

- By intramuscular injection in deltoid region or anterolateral thigh in infants

Child 1 month–18 years 1 mL (see notes above)

Rabies Vaccine (Sanofi Pasteur) (PvM)

Rab

Injection, powder for reconstitution, freeze-dried inactivated Wistar rabies virus strain PM/WI 38 1503-3M cultivated in human diploid cells, net price single-dose vial with syringe containing diluent = £31.90

Excipients include neomycin

Rabipur® (Novartis Vaccines) (PvM)

Injection, powder for reconstitution, freeze-dried inactivated Flury LEP rabies virus strain cultivated in chick embryo cells, net price single-dose vial = £28.80

Excipients include neomycin

Rotavirus vaccine

Rotavirus vaccine is a live, oral vaccine licensed for immunisation of infants over 6 weeks of age for protection against gastro-enteritis caused by rotavirus infection. The vaccine is not included in the childhood immunisation schedule.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; the vaccine should be used with caution in those with immunosuppressed close contacts. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

ROTAVIRUS VACCINE

Cautions see section 14.1; also diarrhoea or vomiting (postpone vaccination); immunosuppressed close contacts (see notes above); **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1; also predisposition to, or history of, intussusception

Side-effects see section 14.1

Indication and dose

Immunisation against gastro-enteritis caused by rotavirus infection

- By mouth

Child over 6 weeks 2 doses of 1.5 mL, separated by an interval of at least 4 weeks; course should be completed before 24 weeks of age (preferably before 16 weeks)

Rotarix® (GSK) (PvM)

Oral suspension, live attenuated rotavirus (RIX4414 strain), net price 1.5 mL pre-filled oral syringe = £41.38

Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do not have immunity against rubella the combined live measles, mumps and rubella vaccine is a suitable alternative.

Single antigen vaccine

No longer available in the UK; see MMR vaccine, p. 612

Combined vaccines

see MMR vaccine

Smallpox vaccine

Limited supplies of **smallpox vaccine** are held at the Specialist and Reference Microbiology Division, Health Protection Agency (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, *Guidelines for smallpox response and management in the post-eradication era* should be consulted at www.dh.gov.uk

Tetanus vaccines

Tetanus vaccine contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school. (see Immunisation schedule, section 14.1).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total number of 5 doses of tetanus vaccine is considered sufficient for long-term protection.

For primary immunisation of children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

Cautions See also Section 14.1. When a child presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; carers of children awaiting elective surgery should be asked about the child's tetanus immunisation status and the child should be immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

Travel recommendations see section 14.6.

Contra-indications See section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects See section 14.1

Wounds Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).
- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5.2) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

Combined vaccines

See Diphtheria-containing Vaccines

Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those living in or visiting high-risk areas (see International Travel, section 14.6). Children walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of

tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects see section 14.1

Indication and dose

Immunisation against tick-borne encephalitis

- By intramuscular injection in deltoid region or anterolateral thigh in infants

Child 1–16 years initial immunisation, 3 doses of 0.25 mL, second dose after 1–3 months and third dose after a further 5–12 months

Child 16–18 years 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months

Immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

Note To achieve more rapid protection, second dose may be given 14 days after first dose.

Booster doses, give first dose within 3 years after initial course, then every 3–5 years

TicoVac® (MASTA) (Pm)

Injection, suspension, formaldehyde-inactivated Neudörf tick-borne encephalitis virus strain, (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25-mL prefilled syringe (*TicoVac Junior*) = £28.00, 0.5-mL prefilled syringe = £32.00

Excipients include gentamicin and neomycin

Typhoid vaccines

Typhoid vaccine is available as Vi capsular polysaccharide injectable vaccine (from *Salmonella typhi*) for injection; and as live attenuated *Salmonella typhi* vaccine for oral use.

Typhoid immunisation is advised for children travelling to:

- areas where typhoid is endemic, especially if staying with or visiting local people
- endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 627).

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Booster doses are needed every 3 years on continued exposure.

Oral typhoid vaccine is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but occasional travellers require further courses at intervals of 1 year.

interactions Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:

- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarials, vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

TYPHOID VACCINE

Cautions section 14.1; **interactions:** see above and Appendix 1 (vaccines)

Contra-indications section 14.1; also for oral vaccine, acute gastro-intestinal illness

Pregnancy see p. 600

Breast-feeding see p. 600

Side-effects section 14.1

Indication and dose

Immunisation against typhoid fever

For dose see under preparations

▲ Typhoid polysaccharide vaccine for injection

Typherix® (GSK) (Pm)

Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.93

Dose

- By intramuscular injection

Child under 2 years [unlicensed use], 0.5 mL, at least 2 weeks before potential exposure to typhoid infection; response may be suboptimal (see notes above)

Child 2–18 years 0.5 mL, at least 2 weeks before potential exposure to typhoid infection

Typhim Vi® (Sanofi Pasteur) (Pm)

Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.00

Dose

- By intramuscular injection

Child under 2 years [unlicensed use], 0.5 mL, at least 2 weeks before potential exposure to typhoid infection; response may be suboptimal (see notes above)

Child 2–18 years 0.5 mL, at least 2 weeks before potential exposure to typhoid infection

▲ Polysaccharide vaccine with hepatitis A vaccine

See Hepatitis A Vaccine

▲ Typhoid vaccine, live (oral)

Vivotif® (Crucell) (PAM)

Capsules, e/c, live attenuated *Salmonella typhi* (Ty21a), net price 3-cap pack = £14.77. Label: 23, 25, counselling, administration

Dose

• By mouth

Child 6–18 years 1 capsule on days 1, 3, and 5

Counselling Swallow as soon as possible after placing in mouth with a cold or lukewarm drink; it is important to store capsules in a refrigerator

in human diploid cells, net price 0.5-mL vial (with diluent) = £30.28

Excipients include gelatin and neomycin

Dose

• **By intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in young children)**

Child 1–13 years (see notes above) 2 doses of 0.5 mL separated by an interval of at least 4 weeks (2 doses separated by 12 weeks in children with asymptomatic HIV infection)

Child 13–18 years 2 doses of 0.5 mL separated by 4–8 weeks

Varicella-zoster vaccine

Varicella-zoster vaccine (live) is licensed for immunisation against varicella in seronegative individuals. It is not recommended for routine use in children but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant females;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Varicella-zoster immunoglobulin is used to protect susceptible children at increased risk of varicella infection, see p. 625.

VARICELLA-ZOSTER VACCINES

Cautions see section 14.1; also post-vaccination close-contact with susceptible individuals (see notes above); **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1

Pregnancy avoid pregnancy for 3 months after vaccination; see also p. 600

Breast-feeding see p. 600

Side-effects see section 14.1; *also* varicella-like rash; rarely thrombocytopenia

Indication and dose

Immunisation against varicella infection (see notes above)

For dose, see under preparations

Varilrix® (GSK) (PAM)

Injection, powder for reconstitution, live attenuated varicella-zoster virus (Oka strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £27.31

Excipients include neomycin

Dose

• **By subcutaneous injection preferably into deltoid region**

Child 1–18 years (see notes above), 2 doses of 0.5 mL separated by an interval of at least 6 weeks (minimum 4 weeks)

Varivax® (Sanofi Pasteur) (PAM)

Injection powder for reconstitution, live attenuated varicella-zoster virus (Oka/Merck strain) propagated

Yellow fever vaccine

Live yellow fever vaccine is indicated for those travelling to or living in areas where infection is endemic (see p. 626). Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rarely vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These *very rare* adverse effects have usually occurred after the first dose of yellow fever vaccine in those with no previous immunity.

Pregnancy Live yellow fever vaccine should not be given during pregnancy, but if a significant risk of exposure cannot be avoided then vaccination should be delayed to the third trimester if possible (but the need for immunisation usually outweighs risk to the fetus).

Breast-feeding Vaccination should be considered in breast-feeding women when there is a real risk to the mother from yellow fever disease.

YELLOW FEVER VACCINE

Cautions see section 14.1; also see **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1 and notes above; also children under 6 months; history of thymus dysfunction

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see section 14.1; *also* reported neurotropic disease, and viscerotropic disease (see notes above)

Indication and dose

Immunisation against yellow fever

• **By deep subcutaneous injection**

Child 9 months–18 years 0.5 mL (see also notes above)

Yellow Fever Vaccine, Live (PoM)

Yel(live)

Injection, powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL diluent

Available (only to designated Yellow Fever Vaccination centres) as *Stamari*[®]

14.5 Immunoglobulins

14.5.1 Normal Immunoglobulin

14.5.2 Disease-specific immunoglobulins

14.5.3 Anti-D (Rh₀) immunoglobulin

Two types of human immunoglobulin preparation are available, **normal immunoglobulin** and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK (for further information consult www.ivig.nhs.uk and *Clinical Guidelines for Immunoglobulin Use*, www.dh.gov.uk).

Immunoglobulins of animal origin (antisera) were frequently associated with hypersensitivity reactions and are no longer used.

Further information on the use of immunoglobulins is included in the Health Protection Agency's *Immunoglobulin Handbook*: www.hpa.org.uk and in the Department of Health's publication, *Immunisation against Infectious Disease*, www.dh.gov.uk.

Availability Normal immunoglobulin for intramuscular administration is available from some regional Health Protection Agencies and microbiology laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins (section 14.5.2) are available from some regional Health Protection Agencies and microbiology laboratories with the exception of **tetanus immunoglobulin** which is available from BPL, hospital pharmacies, or blood transfusion departments. **Rabies immunoglobulin** is available from the Specialist and Reference Microbiology Division, Health Protection Agency. **Hepatitis B immunoglobulin** required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS)

14.5.1 Normal Immunoglobulin

Human **normal immunoglobulin** ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given **at least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

Uses Normal immunoglobulin (containing 10–18% protein) is administered by **intramuscular injection** for the protection of susceptible contacts against **hepatitis A virus** (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting for several weeks.

Normal immunoglobulin (containing 3–12% protein) for **intravenous administration** is used as **replacement therapy** for children with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki syndrome; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

The dose of normal immunoglobulin used as replacement therapy in patients with immunodeficiencies is **not the same** as the dose required for treatment of acute conditions. For Kawasaki syndrome a single dose of 2 g/kg by intravenous infusion should be given with concomitant aspirin (see section 2.9) within 10 days of onset of symptoms (but children with a delayed diagnosis may also benefit).

For guidance on the use of intravenous normal immunoglobulins and alternative therapies for other conditions, consult *Clinical Guidelines for Immunoglobulin Use* (www.dh.gov.uk).

Hepatitis A **Hepatitis A vaccine** is preferred for children at risk of infection (see p.607) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised children, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosup-

pressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

Measles Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in children with compromised immunity. Children with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Health Protection Agency (tel. (020) 8200 6868).

Children with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given MMR vaccine (section 14.4) for prophylaxis following exposure to measles.

Rubella Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant females exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intrauterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is a minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant individual—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential.

For routine prophylaxis, see MMR vaccine (p. 612).

NORMAL IMMUNOGLOBULIN

Cautions hypo- or agammaglobulinaemia with or without IgA deficiency; interference with live virus vaccines—see p. 622

Intravenous use Thrombophilic disorders, or risk factors for arterial or venous thromboembolic events; obesity; ensure adequate hydration, renal insufficiency

Contra-indications patients with selective IgA deficiency who have known antibody against IgA

Renal impairment monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure

Side-effects nausea, diarrhoea, chills, fever, headache, dizziness, arthralgia, myalgia, muscle spasms, low back pain; *rarely* hypotension, anaphylaxis, cutaneous skin reactions, aseptic meningitis, acute renal failure; also reported with *intravenous use*, injection site reactions, abdominal pain and distension, blood pressure fluctuations, haemolytic anaemia, thromboembolic events including myocardial infarction, stroke, pulmonary embolism, and deep vein thrombosis

Note Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

Side-effects

Note Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered

Indication and dose

See under preparations

Note Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects

For intramuscular use

Normal Immunoglobulin ^(PoM)

Normal immunoglobulin injection. 250-mg vial; 750-mg vial

Dose

To control outbreaks of hepatitis A (see notes above)

- By deep intramuscular injection
 - Child under 10 years 250 mg
 - Child 10–18 years 500 mg

Rubella in pregnancy, prevention of clinical attack

- By deep intramuscular injection
 - 750 mg

Available from the Centre for Infections and other regional Health Protection Agency offices (for contacts and control of outbreaks only, see above)

For subcutaneous use

Note Preparations for subcutaneous use may be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not recommended for patients with thrombocytopenia or other bleeding disorders

Gammanorm[®] (Octapharma) ▼ ^(PoM)

Normal immunoglobulin (protein 16.5%) injection, net price 10-mL vial = £113.85, 20-mL vial = £227.70
Electrolytes Electrolytes: Na⁺ 1.09 mmol/10-mL vial

Dose

- Antibody deficiency syndromes
 - By subcutaneous infusion
 - Consult product literature

Subcuvia[®] (Baxter) ^(PoM)

Normal immunoglobulin (protein 16%) injection, net price 5-mL vial = £32.56, 10-mL vial = £65.12

Dose

- Antibody deficiency syndromes
 - By subcutaneous infusion
 - Consult product literature (not licensed for use in children under 12 years)

Subgam® (BPL) (PoM)

Normal immunoglobulin (protein 14–18%) injection, net price 250-mg vial = £11.20, 750-mg vial = £28.50, 1.5-g vial = £57.00

Dose**Antibody deficiency syndromes**

- By subcutaneous infusion
- Consult product literature

Hepatitis A prophylaxis (see also notes above)

- By intramuscular injection
- Child under 10 years 500 mg
Child 10–18 years 750 mg

Rubella prophylaxis in pregnancy (see also notes above)

- By intramuscular injection
- 750 mg

Note *Subgam®* is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, the Health Protection Agency recommends intramuscular use for prophylaxis against Hepatitis A, or rubella

Vivaglobin® (CSL Behring) (PoM)

Normal immunoglobulin (protein 16%) injection, net price 3-mL vial £17.76, 10-mL vial = £59.20, 20-mL vial = £118.40

Cautions risk factors for arterial or venous thromboembolic events; ensure adequate hydration

Side-effects rarely thromboembolic events

Dose**Antibody deficiency syndromes**

- By subcutaneous infusion
- Consult product literature

▲ **For intravenous use**

Note Dose recommendation for Kawasaki Syndrome, see section 14.5.1; other indications—consult product literature for dosage regimens

Flebogamma® DIF (Grifols) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 0.5 g (10 mL) = £30.00, 2.5 g (50 mL) = £150.00; 5 g (100 mL) = £300.00, 10 g (200 mL) = £600.00, 20 g (400 mL) = £1200.00

Note Contains sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

Gammagard S/D® (Baxter) (PoM)

Intravenous infusion, powder for reconstitution, human normal immunoglobulin (providing protein 5% or 10%), net price 0.5 g (with diluent) = £20.05, 2.5 g (with diluent) = £100.25, 5 g (with diluent) = £200.50, 10 g (with diluent) = £401.00

Gammplex® (BPL) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £85.00, 5 g (100 mL) = £170.00, 10 g (200 mL) = £340.00

Note Contains sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

Intratect® (Biotest UK) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 1 g (20 mL) = £45.00, 2.5 g (50 mL) = £112.50, 5 g (100 mL) = £225.00, 10 g (200 mL) = £450.00

Kiovig® (Baxter) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 10%), net price 1 g (10 mL) = £49.00, 2.5 g

(25 mL) = £122.50, 5 g (50 mL) = £245.00, 10 g (100 mL) = £490.00, 20 g (200 mL) = £980.00

Note Use Glucose 5% intravenous infusion, if dilution prior to administration is required

Privigen® (CSL Behring) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 10%), net price 2.5 g (25 mL) = £135.00, 5 g (50 mL) = £270.00, 10 g (100 mL) = £540.00, 20 g (200 mL) = £1080.00

Note Contains L-proline; contra-indicated in patients with hyperprolinaemia

Vigam® (BPL) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £95.00, 5 g (100 mL) = £190.00, 10 g (200 mL) = £380.00

Note Contains sucrose (see Renal Impairment above)

14.5.2 Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see *Immunoglobulin Handbook* (www.hpa.org.uk).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin, section 14.5.1 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor MMR vaccine is effective as post-exposure prophylaxis.

Hepatitis B

Disease-specific **hepatitis B immunoglobulin** ('HBIG') is available for use in association with hepatitis B vaccine for the prevention of infection in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 608). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine, but should be given at different sites.

An intravenous preparation of hepatitis B-specific immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

HEPATITIS B IMMUNOGLOBULIN

Cautions IgA deficiency; interference with live virus vaccines—see under Normal Immunoglobulin, p. 622

Side-effects injection site swelling and pain, arthralgia; rarely anaphylaxis chest tightness, dyspnoea; also reported tremor, dizziness, facial oedema, glossitis, and buccal ulceration; for side-effects associated with intravenous immunoglobulins, see section 14.5.1

Indication and dose

See under preparations and see also notes above

Hepatitis B Immunoglobulin (PoM)

Injection, hepatitis B-specific immunoglobulin, 100 units/mL. Vials containing 200 units or 500 units, available from selected Health Protection Agency and

NHS laboratories (except for Transplant Centres, see p. 622), also available from BPL

Dose

Prophylaxis against hepatitis B infection

• By intramuscular injection

(as soon as possible after exposure; ideally within 48 hours, but no later than 7 days after exposure)

Child 1 month–5 years 200 units

Child 5–10 years 300 units

Child 10–18 years 500 units

Prevention of transmitted infection at birth

• By intramuscular injection

Neonate 200 units as soon as possible after birth; for full details consult *Immunisation against Infectious Disease* (www.dh.gov.uk)

Hepatect® CP (Biotest UK) (PoM)

Intravenous infusion, hepatitis B-specific immunoglobulin 50 units/mL, net price 500 units (10 mL) = £300.00, 2000 units (40 mL) = £1100.00

Dose

Following exposure to hepatitis B virus-contaminated material (as soon as possible after exposure, but no later than 72 hours); prevention of transmitted infection at birth; prophylaxis against re-infection of transplanted liver

Consult product literature

Rabies

Following exposure of an unimmunised child to an animal in or from a country where the risk of rabies is high, the site of the bite should be washed with soapy water and specific **rabies immunoglobulin** of human origin should be administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination). Rabies vaccine should also be given intramuscularly at a different site (for details see Rabies Vaccine, p. 617).

RABIES IMMUNOGLOBULIN

Cautions IgA deficiency; interference with live virus vaccines—see p. 622 under Normal Immunoglobulin

Side-effects injection site swelling and pain; rarely anaphylaxis; buccal ulceration, glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported

Indication and dose

Post-exposure prophylaxis against rabies infection

• By intramuscular injection

20 units/kg, *by infiltration* in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder *by intramuscular injection* into anterolateral thigh (remote from vaccination site)

Note The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose

Rabies Immunoglobulin (PoM)

(Antirabies Immunoglobulin Injection)

See notes above

Available from Specialist and Reference Microbiology Division, Health Protection Agency (see section 14.5 under Availability) (also from BPL)

Tetanus

Tetanus immunoglobulin, together with metronidazole (section 5.1.11) and wound cleansing, should also be used for the treatment of established cases of tetanus.

For the management of tetanus-prone wounds, **tetanus immunoglobulin** of human origin should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine (see Diphtheria-containing Vaccines, section 14.4).

TETANUS IMMUNOGLOBULIN

Cautions IgA deficiency; interference with live virus vaccines—see, p. 622

Side-effects injection site swelling and pain; rarely anaphylaxis; buccal ulceration; glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported

Indication and dose

Post-exposure prophylaxis

• By intramuscular injection

250 units, increased to 500 units if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

Treatment of tetanus infection

• By intramuscular injection

150 units/kg (multiple sites)

Tetanus Immunoglobulin (PoM)

(Antitetanus Immunoglobulin Injection)

Available from BPL

Note May be difficult to obtain

Varicella-zoster

Varicella-zoster immunoglobulin (VZIG) is recommended for individuals who are at increased risk of severe varicella *and* who have no antibodies to varicella-zoster virus *and* who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks' gestation or to those near term) providing VZIG is given within 10 days of contact;

- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone: children 2 mg/kg daily (or more than 40 mg) for at least 1 week or 1 mg/kg daily for 1 month.

Important: for full details consult *Immunisation against Infectious Disease*. **Varicella-zoster vaccine** is available—see section 14.4.

For treatment of varicella-zoster infections and attenuation of infection if varicella-zoster immunoglobulin not indicated, see section 5.3.2.1

VARICELLA-ZOSTER IMMUNOGLOBULIN

Cautions IgA deficiency; interference with live virus vaccines—see p. 622 under Normal Immunoglobulins

Side-effects injection site swelling and pain; rarely anaphylaxis

Indication and dose

Prophylaxis against varicella infection (as soon as possible—not later than 10 days after exposure)

- By deep intramuscular injection

Neonate 250 mg

Child 1 month–6 years 250 mg

Child 6–11 years 500 mg

Child 11–15 years 750 mg

Child 15–18 years 1 g

Give second dose if further exposure occurs more than 3 weeks after first dose

Note No evidence that effective in treatment of severe disease.

Normal immunoglobulin for intravenous use (section 14.5.1) may be used in those unable to receive intramuscular injection.

Varicella-Zoster Immunoglobulin ^(POM) (Antivaricella-zoster Immunoglobulin)

Available from selected Health Protection Agency and NHS laboratories (see section 14.5 under Availability) (also from BPL)

surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** or **tuberculosis** should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised adults may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence¹ of tuberculosis greater than 40 per 100 000; it should preferably be given three months or more before departure.

Monovalent influenza A(H1N1)v vaccine (see p. 612) can be offered to travellers visiting countries in the southern hemisphere during their influenza season.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas, whilst other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, www.dh.gov.uk).

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world (for details, see p. 614).

Protection against **hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 607) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 622). Special care must also be taken with food hygiene (see below).

Hepatitis B vaccine (see p. 608) is recommended for those travelling to areas of high prevalence who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists are not generally at increased risk of infection but may place themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against **rabies** (see p. 617) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a **tetanus** booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine (see p. 604), even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below).

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** (see p. 604) should be considered for backpackers and those travelling to situations where the

1. List of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.hpa.org.uk

14.5.3 Anti-D (Rh₀) immunoglobulin

This section is not included in *BNF for Children*. See BNF for use of Anti-D (Rh₀) immunoglobulin

14.6 International travel

Note For advice on **malaria chemoprophylaxis**, see section 5.4.1.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); see also Tick-borne Encephalitis, p. 619. Certain precautions are required in Non-European areas

risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on **diphtheria**, on **Japanese encephalitis**¹ (vaccine available on named-patient basis from MASTA) and on **tick-borne encephalitis** is included in *Health Information for Overseas Travel*, see below.

Food hygiene In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled, or treated with sterilising tablets should be used for drinking.

Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from:

www.nathnac.org

The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for *healthcare professionals* regarding health advice for travellers, can also be obtained here.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

15 Anaesthesia

15.1 General anaesthesia	628
15.1.1 Intravenous anaesthetics	629
15.1.2 Inhalational anaesthetics	632
15.1.3 Antimuscarinic drugs	635
15.1.4 Sedative and analgesic peri-operative drugs	637
15.1.4.1 Anxiolytics	637
15.1.4.2 Non-opioid analgesics	639
15.1.4.3 Opioid analgesics	640
15.1.5 Neuromuscular blocking drugs	642
15.1.6 Drugs for reversal of neuromuscular blockade	646
15.1.7 Antagonists for central and respiratory depression	647
15.1.8 Drugs for malignant hyperthermia	648
15.2 Local anaesthesia	649

15.1 General anaesthesia

15.1.1 Intravenous anaesthetics
15.1.2 Inhalational anaesthetics
15.1.3 Antimuscarinic drugs
15.1.4 Sedative and analgesic peri-operative drugs
15.1.5 Neuromuscular blocking drugs
15.1.6 Drugs for reversal of neuromuscular blockade
15.1.7 Antagonists for central and respiratory depression
15.1.8 Drugs for malignant hyperthermia

Important

The drugs in section 15.1 should be used by experienced personnel only and when resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A topical local anaesthetic (section 15.2) can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated children and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent (section 15.1.4) or if an opioid analgesic has been used.

Surgery and long-term medication The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about **all** drugs that a child is (or has been) taking.

Children with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipi-

tous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate post-operative period. Anaesthetists must therefore know whether a child is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include drugs for epilepsy, asthma, immunosuppression, and metabolic, endocrine and cardiovascular disorders (but see potassium sparing diuretics, below). Expert advice is required for children receiving antivirals for HIV infection. For general advice on surgery in children with diabetes, see section 6.1.1.

Children taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with unfractionated or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details). If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage.

Anaesthesia and skilled tasks Children and their carers should be very carefully warned about the risk of undertaking skilled tasks after the use of sedatives and analgesics during minor outpatient procedures. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take children home. The dangers of taking **alcohol** should also be emphasised.

Prophylaxis of acid aspiration Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be a complication of general anaesthesia, particularly in obstetrics and in gastro-oesophageal reflux disease; prophylaxis against acid aspiration is not routinely used in children but may be required in high-risk cases.

An **H₂-receptor antagonist** (section 1.3.1) or a **proton pump inhibitor** (section 1.3.5), such as omeprazole, can be used before surgery to increase the pH and reduce the volume of gastric fluid. They do not affect the pH of fluid already in the stomach and this limits their value in emergency procedures; oral H₂-receptor antagonists can be given 1–2 hours before the procedure, but omeprazole must be given at least 12 hours earlier.

Anaesthesia, sedation, and resuscitation in dental practice

For details see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Conscious Sedation in the Provision of Dental Care*; report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003. Both documents are available at www.dh.gov.uk.

Guidance is also included in *Standards for Dental Professionals*, London, General Dental Council, May 2005 (and as amended subsequently) and *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, May 2006.

15.1.1 Intravenous anaesthetics

Important

The drugs in this section should be used by experienced personnel only and when resuscitation equipment is available.

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities **must** be available. They are **contraindicated** if the anaesthetist is not confident of being able to maintain the airway. Extreme care is required in surgery of the mouth, pharynx, or larynx and in children with acute circulatory failure (shock) or fixed cardiac output.

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.5) or a short-acting opioid (section 15.1.4.3).

The doses of all intravenous anaesthetic drugs should be titrated according to response (except when using 'rapid sequence induction'). The doses and rates of administration should be reduced in those with hypovolaemia or cardiovascular disease; reduced doses may also be required in premedicated children.

Total intravenous anaesthesia This is a technique in which surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations; specific models with paediatric pharmacokinetic data should be used for children.

Anaesthesia and skilled tasks See section 15.1.

Drugs used for intravenous anaesthesia Propofol, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in children, but it is not commonly used in neonates.

Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. It causes pain on intravenous injection which can be reduced by intravenous lidocaine. Significant extraneous muscle movements can occur. Rarely, convulsions, anaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; the onset of convulsions can be delayed. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an antimuscarinic drug is used to treat this.

Propofol can be used for sedation during diagnostic procedures but is contra-indicated in children under 16 years receiving intensive care because of the risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, cardiac failure, rhabdomyolysis, hyperlipidaemia, and hepatomegaly).

Thiopental sodium is a barbiturate that is used for induction of anaesthesia, but it has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiorespiratory depression can occur. Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect particularly in neonates, and recovery is much slower.

Etomidate is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate suppresses adrenocortical function, particularly on continuous administration, and it should not be used for maintenance of anaesthesia.

Ketamine causes less hypotension than thiopental and propofol during induction. It is sometimes used in children requiring repeat anaesthesia (such as for serial burns dressings), however recovery is relatively slow and there is a high incidence of extraneous muscle movements. Ketamine can cause hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine, such as diazepam or midazolam.

ETOMIDATE

Cautions see notes above; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Hepatic impairment reduce dose in liver cirrhosis

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also nausea, vomiting, hypotension, apnoea, hyperventilation, stridor, rash; *less commonly* hypersalivation, bradycardia, arrhythmias, hypertension, hiccups, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

Indication and dose

See under preparations

Etomidate-Lipuro® (Braun) (POM)

Injection (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.53

Dose

Induction of anaesthesia

- By slow intravenous injection

Child 1 month–18 years 150–300 micrograms/kg; child under 10 years may need up to 400 micrograms/kg

Hypnomidate® (Janssen) (POM)

Injection (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.38

Excipients include propylene glycol (see Excipients, p. 2)

Dose

Induction of anaesthesia

- By slow intravenous injection

Child 1 month–18 years 300 micrograms/kg (max. total dose 60 mg)

KETAMINE

Cautions see notes above; dehydration; hypertension; respiratory tract infection; increased cerebrospinal fluid pressure; predisposition to seizures, hallucinations, or nightmares; psychotic disorders; head injury or intracranial mass lesions; thyroid dysfunction; raised intraocular pressure; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above; hypertension, pre-eclampsia or eclampsia, severe cardiac disease, stroke; raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

Hepatic impairment consider dose reduction

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding avoid for at least 12 hours after last dose

Side-effects see notes above; also nausea, vomiting, tachycardia, hypertension, arrhythmias, hypotension, bradycardia, hypersalivation, laryngospasm, anxiety, insomnia, diplopia, nystagmus, raised intra-ocular pressure; rashes, apnoea, and respiratory depression also reported

Indication and dose

Sedation prior to invasive or painful procedures

- By intravenous injection

Child 1 month–18 years 1–2 mg/kg as a single dose

Induction and maintenance of anaesthesia (short procedures)

- By intravenous injection over at least 60 seconds

Neonate 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia, adjusted according to response

Child 1 month–12 years 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia, adjusted according to response

Child 12–18 years 1–4.5 mg/kg adjusted according to response (2 mg/kg usually produces 5–10 minutes of surgical anaesthesia)

- **By intramuscular injection**

Neonate 4 mg/kg usually produces 15 minutes of surgical anaesthesia, adjusted according to response

Child 1 month–18 years 4–13 mg/kg (4 mg/kg sufficient for some diagnostic procedures), adjusted according to response; 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

Induction and maintenance of anaesthesia (longer procedures)

- **By intravenous administration**

Neonate initially 0.5–2 mg/kg by *intravenous injection*, followed by a *continuous intravenous infusion* of 8 micrograms/kg/minute adjusted according to response; up to 30 micrograms/kg/minute may be used to produce deep anaesthesia

Child 1 month–18 years initially 0.5–2 mg/kg by *intravenous injection* followed by a *continuous intravenous infusion* of 10–45 micrograms/kg/minute adjusted according to response

Administration for *continuous intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia

For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9%

Ketalar® (Pfizer) (CD4-1)

Injection, ketamine (as hydrochloride) 10 mg/mL, net price 20-mL vial = £5.06; 50 mg/mL, 10-mL vial = £8.77; 100 mg/mL, 10-mL vial = £16.10

PROPOFOL

Cautions see notes above; cardiac impairment; respiratory impairment; hypovolaemia; epilepsy; hypotension; raised intracranial pressure; monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Hepatic impairment use with caution

Renal impairment use with caution

Pregnancy may depress neonatal respiration if used during delivery; max. dose for maintenance of anaesthesia, 6 mg/kg/hour

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also hypotension, tachycardia, flushing; transient apnoea, hyperventilation, coughing, and hiccup during induction; headache; *less commonly* thrombosis, phlebitis; *rarely* arrhythmia, headache, vertigo, shivering, euphoria; *very rarely* pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; serious and

sometimes fatal side-effects reported with prolonged infusion of doses exceeding 5 mg/kg/hour, including metabolic acidosis, rhabdomyolysis, hyperkalaemia, and cardiac failure, dystonia and dyskinesia also reported

Indication and dose

Induction of anaesthesia using 0.5% or 1% injection

- **By slow intravenous injection or by intravenous infusion**

Child 1 month–18 years adjust dose according to age, body-weight, and response; usual dose in child 1 month–17 years 2.5–4 mg/kg; usual dose in child 17–18 years 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response

Induction of anaesthesia using 2% injection

- **By intravenous infusion**

Child 3–18 years adjust dose according to age, body-weight, and response; usual dose in child 3–17 years 2.5–4 mg/kg; usual dose in child 17–18 years 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response

Maintenance of anaesthesia using 1% injection

- **By continuous intravenous infusion**

Child 1 month–18 years adjust dose according to age, body-weight, and response; usual dose in child 1 month–17 years 9–15 mg/kg/hour; usual dose in child 17–18 years 4–12 mg/kg/hour, adjusted according to response

Maintenance of anaesthesia using 2% injection

- **By continuous intravenous infusion**

Child 3–18 years adjust dose according to age, body-weight, and response; usual dose in child 3–17 years 9–15 mg/kg/hour; usual dose in child 17–18 years 4–12 mg/kg/hour, adjusted according to response

Sedation of ventilated children in intensive care using 1% or 2% injection

- **By continuous intravenous infusion**

Child 16–18 years 0.3–4 mg/kg/hour, adjusted according to response

Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

- **By slow intravenous injection**

Child 1 month–18 years dose and rate of administration adjusted according to desired level of sedation and response; usual dose in child 1 month–17 years 1–2 mg/kg; usual dose in child 17–18 years 0.5–1 mg/kg over 1–5 minutes

Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

- **By intravenous infusion**

Child 17–18 years dose and rate of administration adjusted according to desired level of sedation and response; usual dose 1.5–4.5 mg/kg/hour (additionally, if rapid increase in sedation required, *by slow intravenous injection* 10–20 mg)

Maintenance of sedation for surgical and diagnostic procedures using 1% injection• **By intravenous infusion**

Child 1 month–18 years dose and rate of administration adjusted according to desired level of sedation and response; usual dose in child 1 month–17 years 1.5–9 mg/kg/hour (additionally, if rapid increase in sedation required, by *slow intravenous injection*, max. 1 mg/kg); usual dose in child 17–18 years 1.5–4.5 mg/kg/hour (additionally, if rapid increase in sedation required, by *slow intravenous injection*, 10–20 mg)

Maintenance of sedation for surgical and diagnostic procedures using 2% injection• **By intravenous infusion**

Child 3–18 years dose and rate of administration adjusted according to desired level of sedation and response; usual dose in child 3–17 years 1.5–9 mg/kg/hour; usual dose in child 17–18 years 1.5–4.5 mg/kg/hour (additionally, if rapid increase in sedation required, by *slow intravenous injection* using 0.5% or 1% injection, 10–20 mg)

Administration for *continuous intravenous infusion*; microbiological filter not recommended; 0.5% or 1% emulsion may be infused undiluted using a suitable infusion pump; may also be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium Chloride 0.9%; *alternatively* dilute to a concentration not less than 2 mg/mL (1 mg/mL for 0.5% injection) with Glucose 5% (or Sodium Chloride 0.9% for *Propofol-Lipuro*[®], *Propoven*[®], Braun, and Fresenius Kabi brands); use glass or PVC containers (if PVC bag used, it should be full—withdraw volume of infusion fluid equal to that of propofol to be added); give within 6 hours of preparation

2% emulsion do not dilute; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium Chloride 0.9%

Propofol (Non-proprietary) (POM)

0.5% injection (emulsion), propofol 5 mg/mL, net price 20-mL amp = £3.46

Brands include *Propofol-Lipuro*[®]

1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £4.18, 50-mL bottle = £10.10, 100-mL bottle = £19.40

Brands include *Propofol-Lipuro*[®], *Propoven*[®]

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30

Brands include *Propofol-Lipuro*[®], *Propoven*[®]

Diprivan[®] (AstraZeneca) (POM)

1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £1.07, 50-mL pre-filled syringe (for use with *Diprifusor*[®] TCI system) = £4.72

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL pre-filled syringe (for use with *Diprifusor*[®] TCI system) = £5.27

THIOPENTAL SODIUM

(Thiopentone sodium)

Cautions see notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid

intra-arterial injection; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above; acute porphyria (section 9.8.2); myotonic dystrophy

Hepatic impairment use with caution—reduce dose

Renal impairment caution in severe impairment

Pregnancy may depress neonatal respiration if used during delivery; dose should not exceed 250 mg

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects hypotension, arrhythmias, myocardial depression, laryngeal spasm, cough, headache, sneezing, hypersensitivity reactions, rash

Licensed use not licensed for use in status epilepticus; not licensed for use by intravenous infusion

Indication and dose**Induction of anaesthesia**• **By slow intravenous injection**

Neonate initially up to 2 mg/kg, then 1 mg/kg repeated as necessary (max. total dose 4 mg/kg)

Child 1 month–18 years initially up to 4 mg/kg, then 1 mg/kg repeated as necessary (max. total dose 7 mg/kg)

Prolonged status epilepticus• **By slow intravenous injection and intravenous infusion**

Neonate initially up to 2 mg/kg by *intravenous injection*, then up to 8 mg/kg/hour by *continuous intravenous infusion*, adjusted according to response

Child 1 month–18 years initially up to 4 mg/kg by *intravenous injection*, then up to 8 mg/kg/hour by *continuous intravenous infusion*, adjusted according to response

Administration For *intravenous injection*, dilute to a concentration of 25 mg/mL with Water for Injections, and give over at least 10–15 seconds; for *intravenous infusion* dilute to a concentration of 2.5 mg/mL with Sodium Chloride 0.9%

Thiopental (Archimedes) (POM)

Injection, powder for reconstitution, thiopental sodium, net price 500-mg vial = £3.68

15.1.2 Inhalational anaesthetics**Important**

The drugs in this section should be used by experienced personnel only and when resuscitation equipment is available.

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier

gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia with nitrous oxide, see Nitrous Oxide, p. 634.

Anaesthesia and skilled tasks See section 15.1.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic (section 15.1.1).

Volatile liquid anaesthetics can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. They can increase cerebrospinal pressure and should be used with caution in those with raised intracranial pressure. They can also cause hepatotoxicity in those who are sensitised to halogenated anaesthetics; halothane has been associated with severe hepatotoxicity (**important**: see below). In children with neuromuscular disease, inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death. Cardiorespiratory depression, hypotension, and arrhythmias are common side-effects of volatile liquid anaesthetics.

Isoflurane is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane can irritate mucous membranes, causing cough, breath-holding, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane is a rapid-acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur.

Sevoflurane is a rapid-acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid but slower than desflurane. Sevoflurane is non-irritant and is therefore used for inhalational induction of anaesthesia. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

Halothane is a volatile liquid anaesthetic that has largely been superseded by newer agents, but is used occasionally by very specialised paediatric anaesthetists to manage difficult airways (with careful monitoring for cardiorespiratory depression and arrhythmias). Its advantages are that it is potent, induction is smooth, and the vapour is non-irritant and seldom induces coughing or breath-holding.

Halothane hepatotoxicity

Severe hepatotoxicity can follow halothane anaesthesia. It occurs more frequently after repeated exposure to halothane and has a high mortality. The risk of severe hepatotoxicity appears to be increased by repeated exposures within a short time interval, but even after a long interval (sometimes of several years), susceptible patients have been reported to develop jaundice. Since there is no reliable way of identifying patients at risk, the following precautions are recommended before the use of halothane:

- a careful anaesthetic history should be taken to determine previous exposure and previous reactions to halothane;
- repeated exposure to halothane within a period of at least 3 months should be **avoided** unless there are **overriding** clinical circumstances;
- a history of unexplained jaundice or pyrexia in a patient following exposure to halothane is an absolute **contra-indication** to its future use in that patient.

DESFLURANE

Cautions see notes above; **interactions**: Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Indication and dose

Induction of anaesthesia

- By inhalation through specifically calibrated vapouriser

Child 12–18 years 4–11%, but **not** recommended (see notes above)

Maintenance of anaesthesia

- By inhalation through specifically calibrated vapouriser

Neonate 2–6% in nitrous oxide-oxygen; 2.5–8.5% in oxygen or oxygen-enriched air

Child 1 month–18 years 2–6% in nitrous oxide-oxygen; 2.5–8.5% in oxygen or oxygen-enriched air

HALOTHANE

Cautions see notes above (**important**: see Halothane Hepatotoxicity above); avoid for dental procedures in those under 18 years unless treated in hospital (high risk of arrhythmia); avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Hepatic impairment avoid if history of unexplained pyrexia or jaundice following previous exposure to halothane

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Indication and dose

Induction of anaesthesia

- By inhalation through specifically calibrated vaporiser

Child 1 month–18 years initially 0.5% then increased gradually according to response to 2–5% in oxygen or nitrous oxide-oxygen

Maintenance of anaesthesia

- By inhalation through specifically calibrated vaporiser

Child 1 month–18 years 0.5–2% in oxygen, or oxygen-air, or nitrous oxide-oxygen

ISOFLURANE

Cautions see notes above; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Indication and dose

Induction of anaesthesia

- By inhalation through specifically calibrated vaporiser

Neonate increased gradually according to response from 0.5–3% in oxygen or nitrous oxide-oxygen

Child 1 month–18 years increased gradually according to response from 0.5–3% in oxygen or nitrous oxide-oxygen

Maintenance of anaesthesia

- By inhalation through specifically calibrated vaporiser

Neonate 1–2.5% in nitrous oxide-oxygen; additional 0.5–1% may be required if given with oxygen alone

Child 1 month–18 years 1–2.5% in nitrous oxide-oxygen; additional 0.5–1% may be required if given with oxygen alone; caesarean section, 0.5–0.75% in nitrous oxide-oxygen

SEVOFLURANE

Cautions see notes above; susceptibility to QT-interval prolongation; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Renal impairment use with caution

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also urinary retention,

leucopenia, agitation; cardiac arrest, torsade de pointes, dystonia, and seizures also reported

Indication and dose

Induction of anaesthesia

- By inhalation through specifically calibrated vaporiser

Neonate up to 4% in oxygen or nitrous oxide-oxygen, according to response

Child 1 month–18 years initially 0.5–1% then increased gradually up to 8% in oxygen or nitrous oxide-oxygen, according to response

Maintenance of anaesthesia

- By inhalation through specifically calibrated vaporiser

Neonate 0.5–2% in oxygen or nitrous oxide-oxygen, according to response

Child 1 month–18 years 0.5–3% in oxygen or nitrous oxide-oxygen, according to response

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For *anaesthesia* it is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For *analgesia* (without loss of consciousness) a mixture of nitrous oxide and oxygen containing 50% of each gas (*Entonox*[®], *Equanox*[®]) is used. Self-administration using a demand valve may be used in children who are able to self-regulate their intake (usually over 5 years of age) for painful dressing changes, as an aid to postoperative physiotherapy, for wound debridement and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in children with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in the presence of a pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury. Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of children to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur.

Assessment of plasma-vitamin B₁₂ concentration should be considered before nitrous oxide anaesthesia in children at risk of deficiency, including children who have a poor or vegetarian diet and children with a history of anaemia. Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

NITROUS OXIDE

Cautions see notes above; **interactions:** Appendix 1 (anaesthetics, general)

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Indication and dose

Maintenance of anaesthesia in conjunction with other anaesthetic agents

- By inhalation using suitable anaesthetic apparatus

Neonate 50–66% in oxygen

Child 1 month–18 years 50–66% in oxygen

Analgesia

- By inhalation using suitable anaesthetic apparatus

(see also notes above)

Neonate up to 50% in oxygen, according to the child's needs

Child 1 month–18 years up to 50% in oxygen, according to the child's needs

15.1.3 Antimuscarinic drugs

Important

The drugs in this section should be used by experienced personnel only.

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics, but they should not be used for this indication in children with cystic fibrosis. Antimuscarinics are also used before or with neostigmine (section 15.1.6) to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as halothane, propofol, and suxamethonium.

Atropine sulphate is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. For its role in cardiopulmonary resuscitation, see section 2.7.3.

Hyoscine hydrobromide reduces secretions and also provides a degree of amnesia, sedation and anti-emesis. Unlike atropine it may produce bradycardia rather than tachycardia. In some children hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

Glycopyrronium bromide reduces salivary secretions. When given intravenously it produces less tachycardia than atropine. It is widely used with neostigmine for reversal of non-depolarising muscle relaxants (section 15.1.5).

Glycopyrronium or hyoscine hydrobromide are also used to control excessive secretions in upper airways

or hypersalivation in palliative care and in children unable to control posture or with abnormal swallowing reflex; effective dose varies and tolerance may develop. The intramuscular route should be avoided if possible. Hyoscine transdermal patches may also be used (section 4.6).

ATROPINE SULPHATE

Cautions see notes in section 1.2

Duration of action Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary

Contra-indications see notes in section 1.2

Pregnancy not known to be harmful; use with caution

Breast-feeding small amount present in milk—use with caution

Side-effects see notes in section 1.2

Licensed use not licensed for use by oral route; not licensed for use in children under 12 years for intra-operative bradycardia; not licensed for use in children under 12 years by intravenous route for pre-medication; not licensed for the control of muscarinic side-effects of edrophonium in reversal of competitive neuromuscular block

Indication and dose

Premedication

- By mouth 1–2 hours before induction of anaesthesia

Neonate 20–40 micrograms/kg

Child 1 month–18 years 20–40 micrograms/kg (max. 900 micrograms)

- By intravenous injection immediately before induction of anaesthesia

Neonate 10 micrograms/kg

Child 1 month–12 years 20 micrograms/kg (minimum 100 micrograms, max. 600 micrograms)

Child 12–18 years 300–600 micrograms

- By subcutaneous or intramuscular injection 30–60 minutes before induction of anaesthesia

Neonate 10 micrograms/kg

Child 1 month–12 years 10–30 micrograms/kg (minimum 100 micrograms, max. 600 micrograms)

Child 12–18 years 300–600 micrograms

Intra-operative bradycardia

- By intravenous injection

Neonate 10–20 micrograms/kg

Child 1 month–12 years 10–20 micrograms/kg

Child 12–18 years 300–600 micrograms (larger doses in emergencies)

Control of muscarinic side-effects of neostigmine 50 micrograms/kg in reversal of competitive neuromuscular block

- By intravenous injection

Neonate 20 micrograms/kg

Child 1 month–12 years 20 micrograms/kg (max. 1.2 mg)

Child 12–18 years 0.6–1.2 mg

Control of muscarinic side-effects of edrophonium in reversal of competitive neuromuscular block

- By intravenous injection

Child 1 month–18 years 7 micrograms/kg (max. 600 micrograms)

Cycloplegia, anterior uveitis (section 11.5)

Administration for administration *by mouth*, injection solution may be given orally

1 Atropine (Non-proprietary) (POM)

Injection, atropine sulphate 600 micrograms/mL, net price 1-mL amp = 62p

Note Other strengths also available

Injection, prefilled disposable syringe, atropine sulphate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95

Injection, prefilled disposable syringe, atropine sulphate 200 micrograms/mL, net price 5 mL = £5.91; 300 micrograms/mL, 10 mL = £5.91; 600 micrograms/mL, 1 mL = £5.91

Oral solution, atropine sulphate 100 micrograms/mL available from 'special-order' manufacturers or specialist importing companies, see p. 809

Tablets , atropine sulphate 600 micrograms, net price 28-tab pack = £17.59

1. (POM) restriction does not apply where administration is for saving life in emergency

1 Minijet® Atropine (UCB Pharma) (POM)

Injection, atropine sulphate 100 micrograms/mL, net price 5 mL = £5.04, 10 mL = £5.93, 30 mL = £9.85

1. (POM) restriction does not apply where administration is for saving life in emergency

Child 1 month–12 years 10 micrograms/kg (max. 500 micrograms)

Child 12–18 years 200 micrograms per 1 mg of neostigmine, or 10–15 micrograms/kg

Control of upper airways secretion and hypersalivation

- By mouth

Child 1 month–18 years 40–100 micrograms/kg (max. 2 mg) 3–4 times daily, adjusted according to response

- By subcutaneous infusion

Child 1 month–12 years 12–40 micrograms/kg/24 hours (max. 1.2 mg)

Child 12–18 years 0.6–1.2 mg/24 hours

- By subcutaneous injection or intramuscular injection or intravenous injection (but see notes above)

Child 1 month–12 years 4–10 micrograms/kg (max. 200 micrograms) 4 times a day when required

Child 12–18 years 200 micrograms every 4 hours when required

Administration for administration *by mouth*, injection solution may be given or crushed tablets suspended in water

Glycopyrronium bromide (Non-proprietary)

Injection, glycopyrronium bromide 200 micrograms/mL, net price 1-mL amp = 54p, 3-mL amp = 91p

Tablets, glycopyrronium bromide 1 mg and 2 mg Available on a named-patient basis from specialist importing companies, p. 809

With neostigmine metilsulphate

Section 15.1.6

GLYCOPYRRONIUM BROMIDE

(Glycopyrrolate)

Cautions section 1.2

Contra-indications section 1.2

Side-effects section 1.2

Licensed use not licensed for use in control of upper airways secretion and hypersalivation

Indication and dose

Premedication at induction

- By intravenous or intramuscular injection

Neonate 5 micrograms/kg

Child 1 month–12 years 4–8 micrograms/kg (max. 200 micrograms)

Child 12–18 years 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms)

Intra-operative bradycardia

- By intravenous injection

Neonate 10 micrograms/kg, repeated if necessary

Child 1 month–18 years 4–8 micrograms/kg (max. 200 micrograms), repeated if necessary

Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

- By intravenous injection

Neonate 10 micrograms/kg

HYOSCINE HYDROBROMIDE

(Scopolamine hydrobromide)

Cautions see notes in section 1.2 and notes above; also epilepsy

Contra-indications see notes in section 1.2

Hepatic impairment see Hyoscine Hydrobromide, section 4.6

Renal impairment see Hyoscine Hydrobromide, section 4.6

Pregnancy see Hyoscine Hydrobromide, section 4.6

Breast-feeding see Hyoscine Hydrobromide, section 4.6

Side-effects see notes in section 1.2

Indication and dose

Premedication

- By subcutaneous or intramuscular injection 30–60 minutes before induction

Child 1–12 years 15 micrograms/kg (max. 600 micrograms)

Child 12–18 years 200–600 micrograms

Note Same dose may be given by intravenous injection immediately before induction

Motion sickness, excessive respiratory secretions, hypersalivation associated with clozapine therapy section 4.6

Hyoscine (Non-proprietary) (POM)

Injection, hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £2.80; 600 micrograms/mL, 1-mL amp = £2.94

▀ **Preparations**

For transdermal and oral preparations see section 4.6

15.1.4 Sedative and analgesic peri-operative drugs

15.1.4.1 Anxiolytics

15.1.4.2 Non-opioid analgesics

15.1.4.3 Opioid analgesics

Important

The drugs in this section should be used by experienced personnel only.

Premedication Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a **benzodiazepine**. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual child, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and recovery facilities. The choice also varies between elective and emergency procedures. Oral administration is preferred if possible; the rectal route should only be used in exceptional circumstances. Sedative premedication should be avoided in children with a compromised airway, CNS depression, or a history of sleep apnoea.

Premedicants can be given the night before major surgery; a further, smaller dose may be required the following morning if any delay in starting surgery is anticipated. Alternatively, the first dose may be given on the day of procedure.

Oral **midazolam** is the most common premedicant for children; **temazepam** may be used in older children. The antihistamine **alimemazine** (section 3.4.1) is occasionally used orally, but when given alone it may cause postoperative restlessness in the presence of pain.

Sedation for clinical procedures Sedation of children during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure and whether the child is cooperative; some procedures are safer and more successful under anaesthesia. The child should be **monitored carefully**; monitoring should begin as soon as the sedative is given or when the

child becomes drowsy, and should be continued until the child wakes up.

Midazolam and **chloral hydrate** (section 4.1.1) are suitable for sedating children for painless procedures, such as imaging. For painful procedures, alternative choices include **nitrous oxide** (section 15.1.2), **local anaesthesia** (section 15.2), **ketamine** (section 15.1.1), or concomitant use of sedation with **opioid** or **non-opioid analgesia** (section 4.7).

Dental procedures Sedation for dental procedures should be limited to conscious sedation whenever possible. **Nitrous oxide** (section 15.1.2) alone and **midazolam** are effective for many children. For further information on hypnotics used for dental procedures, see p. 170.

Anaesthesia and skilled tasks See section 15.1.

15.1.4.1 Anxiolytics

Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used for sedation prior to clinical procedures and for sedation in intensive care.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines.

Midazolam, a water-soluble benzodiazepine, is the preferred benzodiazepine for premedication and for sedation for clinical procedures in children. It has a fast onset of action, and recovery is faster than for other benzodiazepines. Recovery may be longer in children with a low cardiac output, or after repeated dosing.

Midazolam can be given by mouth [unlicensed], but its bitter acidic taste may need to be disguised. It can also be given buccally [unlicensed] or intranasally [unlicensed]. Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. It can cause severe disinhibition and restlessness in some children. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur

Overdosage with midazolam

There have been reports of overdosage in adults when high strength midazolam injection has been used for conscious sedation. The use of high strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available where midazolam is used, to reverse the effects if necessary.

Temazepam is given by mouth for premedication in older children and has a short duration of action. Anxi-

lytic and sedative effects last about 90 minutes, although there may be residual drowsiness. Temazepam is rarely used for dental procedures in children.

Lorazepam produces more prolonged sedation than temazepam and it has marked amnesic effects.

Peri-operative use of **diazepam** is not recommended in children; onset and magnitude of response are unreliable, and paradoxical effects may occur. Diazepam is not used for dental procedures in children.

LORAZEPAM

Cautions see notes above and section 4.8.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

Contra-indications see Diazepam, section 4.8.2

Hepatic impairment see Benzodiazepines, section 4.8.1

Renal impairment see Benzodiazepines, section 4.8.1

Pregnancy see Benzodiazepines, section 4.8.1

Breast-feeding see Benzodiazepines, section 4.8.1

Side-effects see notes above and Diazepam, section 4.8.2

Licensed use not licensed for use in children under 5 years by mouth; not licensed for use in children under 12 years by intravenous injection

Indication and dose

Premedication

• By mouth

Child 1 month–12 years 50–100 micrograms/kg (max. 4 mg) at least 1 hour before procedure

Child 12–18 years 1–4 mg at least 1 hour before procedure

Note Same dose may be given the night before procedure in addition to, or to replace, dose before procedure

• By intravenous injection

Child 1 month–18 years 50–100 micrograms/kg (max. 4 mg)

Note Give intravenous injection 30–45 minutes before procedure

Status epilepticus section 4.8.2

Administration for *intravenous injection*, dilute injection solution with an equal volume of Sodium Chloride 0.9%; give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes

Lorazepam (Non-proprietary) C04.1

Tablets, lorazepam 1 mg, net price 28-tab pack = £5.42; 2.5 mg, 28-tab pack = £7.11. Label: 2 or 19

Injection, lorazepam 4 mg/mL, net price 1-mL amp = 35p

Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative available, see Excipients, p. 2), propylene glycol
Brands include *Ativan*[®]

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 6

MIDAZOLAM

Cautions see notes above; cardiac disease; respiratory disease; myasthenia gravis; neonates; history of drug or alcohol abuse; reduce dose if debilitated; risk of severe hypotension in children with hypovolaemia, vasoconstriction, hypothermia; avoid prolonged

use (and abrupt withdrawal thereafter); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Contra-indications marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression; acute pulmonary insufficiency

Hepatic impairment use with caution; can precipitate coma

Renal impairment start with small doses in severe impairment; increased cerebral sensitivity

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression)

Breast-feeding present in milk—avoid breast-feeding for 24 hours after administration

Side-effects see notes above; gastro-intestinal disturbances, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), fatigue, dizziness, vertigo, involuntary movements, paradoxical excitement and aggression, dysarthria; urinary retention, incontinence; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions; with *intranasal administration* burning sensation, lacrimation, and severe irritation of nasal mucosa

Licensed use not licensed for use in children under 6 months for premedication and conscious sedation; not licensed for use by mouth, or by buccal administration

Indication and dose

Conscious sedation for procedures (but see notes above)

• By mouth

Child 1 month–18 years 500 micrograms/kg (max. 20 mg) 30–60 minutes before procedure

• By buccal administration

Child 6 months–10 years 200–300 micrograms/kg (max. 5 mg)

Child 10–18 years 6–7 mg (max. 8 mg if 70 kg or over)

• By rectum

Child 6 months–12 years 300–500 micrograms/kg 15–30 minutes before procedure

• By intravenous injection over 2–3 minutes 5–10 minutes before procedure

Child 1 month–6 years initially 25–50 micrograms/kg, increased if necessary in small steps (max. total dose 6 mg)

Child 6–12 years initially 25–50 micrograms/kg, increased if necessary in small steps (max. total dose 10 mg)

Child 12–18 years initially 25–50 micrograms/kg, increased if necessary in small steps (max. total dose 7.5 mg)

Premedication (but see notes above)• **By mouth**

Child 1 month–18 years 500 micrograms/kg (max. 20 mg) 15–30 minutes before the procedure

• **By rectum**

Child 6 months–12 years 300–500 micrograms/kg 15–30 minutes before induction

Induction of anaesthesia (but rarely used)• **By slow intravenous injection**

Child 7–18 years initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg)

Sedation in intensive care• **By intravenous injection and continuous intravenous infusion**

Neonate less than 32 weeks gestational age 60 micrograms/kg/hour by *continuous intravenous infusion*, reduced after 24 hours to 30 micrograms/kg/hour; adjusted according to response; max. treatment duration 4 days

Neonate over 32 weeks gestational age

60 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response; max. treatment duration 4 days

Child 1–6 months 60 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response

Child 6 months–12 years initially 50–200 micrograms/kg by *slow intravenous injection* over at least 3 minutes followed by 30–120 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response

Child 12–18 years initially 30–300 micrograms/kg by *slow intravenous injection* given in steps of 1–2.5 mg every 2 minutes followed by 30–200 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response

Note Initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia

Status epilepticus section 4.8.2

Administration for administration *by mouth*, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola

For *buccal administration*, administer half of the dose between the upper lip and gum on each side of the mouth using an oral syringe; retain in the mouth for at least 5 minutes then swallow

For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%

Neonatal intensive care, dilute 15 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour

For *rectal administration* of the injection solution, attach a plastic applicator onto the end of a syringe; if

the volume to be given rectally is too small, dilute with Water for Injections

Midazolam (Non-proprietary) (CB3)

Oral liquid, midazolam 2.5 mg/mL, 100 mL
Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Buccal liquid, midazolam 5 mg/mL, 0.5-mL (2.5 mg) prefilled syringe, 1-mL (5 mg) prefilled syringe, 1.5-mL (7.5 mg) prefilled syringe, 2-mL (10 mg) prefilled syringe; 10 mg/mL, 5-mL pack and 25-mL pack
Available from 'special-order' manufacturers or specialist importing companies, see p. 809

Injection, midazolam (as hydrochloride) 1 mg/mL, net price 2-mL amp = 50p, 5-mL amp = 60p, 50-mL vial = £7.87; 2 mg/mL, 5-mL amp = 65p; 5 mg/mL, 2-mL amp = 58p, 10-mL amp = £2.50

Hypnovel® (Roche) (CB3)

Injection, midazolam (as hydrochloride) 2 mg/mL, net price 5-mL amp = 85p; 5 mg/mL, 2-mL amp = 72p

TEMAZEPAM

Cautions see notes above and Diazepam, section 4.8.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

Contra-indications see Diazepam, section 4.8.2

Hepatic impairment see Benzodiazepines, section 4.8.1

Renal impairment see Benzodiazepines, section 4.8.1

Pregnancy see Benzodiazepines, section 4.8.1

Breast-feeding see Benzodiazepines, section 4.8.1

Side-effects see notes above and Diazepam, section 4.8.2

Licensed use tablets not licensed for use in children

Indication and dose**Premedication**• **By mouth**

Child 12–18 years 10–20 mg 1 hour before procedure

Temazepam (Non-proprietary) (CB3)

Tablets, temazepam 10 mg, net price 28-tab pack = £3.42; 20 mg, 28-tab pack = £2.24. Label: 19

Dental prescribing on NHS Temazepam Tablets may be prescribed

Oral solution, temazepam 10 mg/5 mL, net price 300 mL = £33.44. Label: 19

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Dental prescribing on NHS Temazepam Oral Solution may be prescribed

Note See p. 9 for prescribing requirements of controlled drugs

15.1.4.2 Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastrointestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Diclofenac, ibuprofen (section 10.1.1), paracetamol (section 4.7.1), and ketorolac are used to relieve post-operative pain in children; diclofenac and paracetamol can be given parenterally and rectally as well as by mouth. Ketorolac is given by mouth or by intravenous injection.

KETOROLAC TROMETAMOL

Cautions section 10.1.1; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (NSAIDs)

Contra-indications section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebrovascular bleeding; hypovolaemia or dehydration

Hepatic impairment section 10.1.1

Renal impairment max. 60 mg daily by intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1

Pregnancy section 10.1.1

Breast-feeding amount too small to be harmful

Side-effects section 10.1.1; also gastro-intestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations, urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site

Licensed use not licensed for use in children under 16 years

Indication and dose

Short-term management of moderate to severe acute postoperative pain only

• By mouth

Child 16–18 years 10 mg every 4–6 hours as required; max. 40 mg daily; max. duration of treatment 7 days

• By intravenous injection over at least 15 seconds

Child 6 months–16 years initially 0.5–1 mg/kg (max. 15 mg), then 500 micrograms/kg (max. 15 mg) every 6 hours as required; max. 60 mg daily; max. duration of treatment 2 days

• By intravenous injection over at least 15 seconds

Child 16–18 years initially 10 mg, then 10–30 mg every 4–6 hours as required (up to every 2 hours during initial postoperative period); max. 90 mg daily (children weighing less than 50 kg max. 60 mg daily); max. duration of treatment 2 days

Note When converting from parenteral to oral administration, total combined dose on the day of converting should not exceed 90 mg (60 mg in children weighing less than 50 kg) of which the oral component should not exceed 40 mg

Ketorolac (Non-proprietary) (POM)

Injection, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.10

Toradol® (Roche) (POM)

Tablets, ivory, f/c, ketorolac trometamol 10 mg, net price 20-tab pack = £5.45. Label: 17, 21

Injection, ketorolac trometamol 10 mg/mL, net price 1-mL amp = 89p; 30 mg/mL, 1-mL amp = £1.08

15.1.4.3 Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to children who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 4.7.2.

For the management of opioid-induced respiratory depression, see section 15.1.7.

Intra-operative analgesia Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil, fentanyl, and remifentanil are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the child might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall muscle or jaw muscle, which can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

Neonates The half-life of fentanyl and alfentanil is prolonged in neonates and accumulation is likely with prolonged use.

ALFENTANIL

Cautions section 4.7.2 and notes above

Contra-indications section 4.7.2

Hepatic impairment section 4.7.2

Renal impairment section 4.7.2

Pregnancy section 4.7.2

Breast-feeding present in milk—withhold breastfeeding for 24 hours

Side-effects section 4.7.2 and notes above; also hypertension, myoclonic movements; *less commonly* arrhythmias, hiccup, laryngospasm; *rarely* epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia

Indication and dose

To avoid excessive dosage in obese children, dose may need to be calculated on the basis of ideal weight for height

Analgesia especially during short procedures; enhancement of anaesthesia

- By intravenous injection over 30 seconds (with assisted ventilation)

Neonate initially 5–20 micrograms/kg; supplemental doses up to 10 micrograms/kg

Child 1 month–18 years initially 10–20 micrograms/kg; supplemental doses up to 10 micrograms/kg

- By intravenous infusion (with assisted ventilation)

Neonate initially 10–50 micrograms/kg over 10 minutes followed by 0.5–1 micrograms/kg/minute

Child 1 month–18 years initially 50–100 micrograms/kg over 10 minutes followed by 0.5–1 micrograms/kg/minute

Administration for *continuous or intermittent intravenous infusion* dilute in Glucose 5% or Sodium Chloride 0.9%

Alfentanil (Non-proprietary) (CB2)

Injection, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 70p, 10-mL amp = £3.20

Intensive care injection, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.50

Note To be diluted before use

Rapifen® (Janssen) (CB2)

Injection, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 64p; 10-mL amp = £2.90

Intensive care injection, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.32

Note To be diluted before use

FENTANYL

Cautions see Fentanyl, section 4.7.2 and notes above

Contra-indications see notes in section 4.7.2

Hepatic impairment see notes in section 4.7.2

Renal impairment see notes in section 4.7.2

Pregnancy see notes in section 4.7.2

Breast-feeding see Fentanyl, section 4.7.2

Side-effects see Fentanyl, section 4.7.2 and notes above; also myoclonic movements; *less commonly* laryngospasm; *rarely* asystole, insomnia

Licensed use not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years

Indication and dose

To avoid excessive dosage in obese children, dose may need to be calculated on the basis of ideal weight for height

Spontaneous respiration: analgesia during operation, enhancement of anaesthesia

- By intravenous injection over at least 30 seconds

Child 1 month–12 years initially 1–3 micrograms/kg, then 1 microgram/kg as required

Child 12–18 years initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 25–50 micrograms as required

Assisted ventilation: analgesia during operation, enhancement of anaesthesia

- By intravenous injection over at least 30 seconds

Neonate initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required

Child 1 month–12 years initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required

Child 12–18 years initially 1–5 micrograms/kg, then 50–200 micrograms as required

Assisted ventilation: analgesia and respiratory depression in intensive care

- By intravenous administration

Neonate initially by *intravenous injection* 1–5 micrograms/kg, then by *intravenous infusion*, 1.5 micrograms/kg/hour adjusted according to response

Child 1 month–18 years initially by *intravenous injection* 1–5 micrograms/kg, then by *intravenous infusion*, 1–6 micrograms/kg/hour adjusted according to response

Analgesia in other situations section 4.7.2

Administration for *intravenous infusion*, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%

Fentanyl (Non-proprietary) (CB2)

Injection, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 30p, 10-mL amp = 64p

Sublimaze® (Janssen) (CB2)

Injection, fentanyl (as citrate) 50 micrograms/mL, net price 10-mL amp = £1.31

REMIFENTANYL

Cautions section 4.7.2 and notes above

Contra-indications section 4.7.2 and notes above; left ventricular dysfunction; analgesia in conscious patients

Hepatic impairment section 4.7.2

Pregnancy no information available; see also section 4.7.2

Breast-feeding avoid breast-feeding for 24 hours after administration—present in milk in *animal studies*

Side-effects section 4.7.2 and notes above; also hypertension; *less commonly* hypoxia; *rarely* asystole; AV block and convulsions also reported

Licensed use not licensed for use in children under 1 year

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Enhancement and maintenance of anaesthesia in ventilated patients

• By intravenous administration

Neonate by *intravenous infusion* 0.4–1 micrograms/kg/minute; additional doses of 1 microgram/kg can be given by *intravenous injection* during the intravenous infusion

Child 1 month–12 years initially by *intravenous injection* 0.1–1 micrograms/kg over at least 30 seconds (omitted if not required) then by *intravenous infusion* 0.05–1.3 micrograms/kg/minute according to anaesthetic technique and adjusted according to response; additional doses can be given by *intravenous injection* during the intravenous infusion

Child 12–18 years initially by *intravenous injection* 0.1–1 micrograms/kg over at least 30 seconds (omitted if not required) then by *intravenous infusion* 0.05–2 micrograms/kg/minute according to anaesthetic technique and adjusted according to response; additional doses can be given by *intravenous injection* during the intravenous infusion

Administration for *intravenous injection*, reconstitute to a concentration of 1 mg/mL; for *continuous intravenous infusion*, dilute further with Glucose 5% or Sodium Chloride 0.9% to a concentration of 20–25 micrograms/mL for **Child 1–12 years** or 20–250 micrograms/mL (usually 50 micrograms/mL) for **Child 12–18 years**

Ultiva® (GSK) (C2)

Injection (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58

15.1.5 Neuromuscular blocking drugs

Important

The drugs in this section should be used by experienced personnel only.

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders (section 10.2.2) that act on the spinal cord or brain.

Children who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised (section 15.1.6). They should also receive suffi-

cient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases, such as neostigmine (section 15.1.6). Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium, rocuronium, and vecuronium, and the **benzylisoquinolinium** group, which includes atracurium, cisatracurium, and mivacurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium and vecuronium, are more widely used than those with a longer duration of action, such as pancuronium.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For children receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium, with a rapid onset of effect, may facilitate intubation. Atracurium or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Cautions Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. Their activity is prolonged in children with myasthenia gravis and in hypothermia, therefore lower doses are required. Non-depolarising neuromuscular blocking drugs should be used with great care in those with other neuromuscular disorders and those with fluid and electrolyte disturbances, as response in these children is unpredictable. Resistance may develop in children with burns who may require increased doses; low plasma cholinesterase activity in these children requires dose titration for mivacurium. The rate of administration of neuromuscular blocking drugs should be reduced in children with cardiovascular disease. **Interactions:** Appendix 1 (muscle relaxants).

Pregnancy Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

Breast-feeding Because they are ionised at physiological pH, non-depolarising neuromuscular blocking drugs are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

Side-effects Benzylisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely, anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

Atracurium, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in children with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release. Neonates may be more sensitive to the effects of atracurium and lower doses may be required.

Cisatracurium is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects. In children aged 1 month to 12 years, cisatracurium has a shorter duration of action and produces faster spontaneous recovery.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection. In children under 12 years mivacurium has a faster onset, shorter duration of action, and produces more rapid spontaneous recovery.

Pancuronium, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in children receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension. The half-life of pancuronium is prolonged in neonates; neonates should receive postoperative intermittent positive pressure ventilation.

Rocuronium exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity. In children under 12 years, rocuronium has a faster onset and shorter duration of action.

Vecuronium, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects. In neonates and infants, vecuronium has a faster onset and a longer duration of action; recovery is longer in these children. Unexpected sustained neuromuscular blockade may occur in neonates.

Side-effects see notes above; seizures also reported

Licensed use not licensed for use in neonates

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Neuromuscular blockade (short to intermediate duration) for surgery

• By intravenous administration

Neonate initially by *intravenous injection* 300–500 micrograms/kg followed *either* by *intravenous injection*, 100–200 micrograms/kg repeated as necessary *or* by *intravenous infusion*, 300–400 micrograms/kg/hour adjusted according to response

Child 1 month–18 years initially by *intravenous injection* 300–600 micrograms/kg then 100–200 micrograms/kg repeated as necessary *or* initially by *intravenous injection* 200–600 micrograms/kg followed by *intravenous infusion*, 300–600 micrograms/kg/hour adjusted according to response

Neuromuscular blockade during intensive care

• By intravenous administration

Neonate initially by *intravenous injection* 300–500 micrograms/kg followed *either* by *intravenous injection*, 100–200 micrograms/kg repeated as necessary *or* by *intravenous infusion*, 300–400 micrograms/kg/hour adjusted according to response; higher doses may be necessary

Child 1 month–18 years initially by *intravenous injection* 300–600 micrograms/kg (optional) then by *intravenous infusion*, 270–1770 micrograms/kg/hour (usual dose 650–780 micrograms/kg/hour)

Administration for *continuous intravenous infusion*, dilute to a concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent.

Neonatal intensive care, dilute 60 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; minimum concentration of 500 micrograms/mL, max. concentration of 5 mg/mL; an intravenous infusion rate of 0.1 mL/hour provides a dose of 120 micrograms/kg/hour

Atracurium (Non-proprietary) ^(Pom)

Injection, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.85; 5-mL amp = £3.37; 25-mL vial = £14.45

Tracrium[®] (GSK) ^(Pom)

Injection, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.66; 5-mL amp = £3.00; 25-mL vial = £12.91

ATRACURIUM BESILATE

(Atracurium besilate)

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

CISATRACURIUM

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also bradycardia

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Neuromuscular blockade (intermediate duration) during surgery• **By intravenous injection**

Child 1 month–2 years initially 150 micrograms/kg, then 30 micrograms/kg repeated approx. every 20 minutes as necessary

Child 2–12 years initially 150 micrograms/kg (80–100 micrograms/kg if not for intubation), then 20 micrograms/kg repeated approx. every 10 minutes as necessary

Child 12–18 years initially 150 micrograms/kg, then 30 micrograms/kg repeated approx. every 20 minutes as necessary

• **By intravenous administration**

Child 2–18 years initially 150 micrograms/kg by *intravenous injection*, then by *intravenous infusion* 180 micrograms/kg/hour, reduced to 60–120 micrograms/kg/hour according to response

Administration for *continuous intravenous infusion*, dilute to a concentration of 0.1–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted

Nimbex® (GSK) (PoM)

Injection, cisatracurium (as besilate) 2 mg/mL, net price 10-mL amp = £7.55

Forte injection, cisatracurium (as besilate) 5 mg/mL, net price 30-mL vial = £31.09

MIVACURIUM

Cautions see notes above; low plasma cholinesterase activity

Hepatic impairment reduce dose in severe impairment

Renal impairment clinical effect prolonged in renal failure—reduce dose according to response

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Neuromuscular blockade (short duration) during surgery• **By intravenous administration**

Child 2–6 months by *intravenous injection* initially 150 micrograms/kg, then *either* by *intravenous injection* 100 micrograms/kg repeated every 6–9 minutes as necessary *or* by *intravenous infusion*, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose 11–14 micrograms/kg/minute

Child 6 months–12 years by *intravenous injection* initially 200 micrograms/kg, then *either* by

intravenous injection 100 micrograms/kg repeated every 6–9 minutes as necessary *or* by *intravenous infusion*, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose 11–14 micrograms/kg/minute

Child 12–18 years by *intravenous injection* initially 70–250 micrograms/kg, then *either* by *intravenous injection* 100 micrograms/kg repeated every 15 minutes as necessary *or* by *intravenous infusion*, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose of 6–7 micrograms/kg/minute

Administration for *intravenous injection*, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

Mivacron® (GSK) (PoM)

Injection, mivacurium (as chloride) 2 mg/mL, net price 5-mL amp = £2.79; 10-mL amp = £4.51

PANCURONIUM BROMIDE

Cautions see notes above

Hepatic impairment possibly slower onset, higher dose requirement, and prolonged recovery time

Renal impairment use with caution; prolonged duration of block

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Neuromuscular blockade (long duration) during surgery• **By intravenous injection**

Neonate initially 100 micrograms/kg, then 50 micrograms/kg repeated as necessary

Child 1 month–18 years initially 100 micrograms/kg, then 20 micrograms/kg repeated as necessary

Administration for *intravenous injection*, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%

Pancuronium (Non-proprietary) (PoM)

Injection, pancuronium bromide 2 mg/mL, net price 2-mL amp = £1.20

ROCURONIUM BROMIDE

Cautions see notes above

Hepatic impairment reduce dose

Renal impairment reduce maintenance dose; prolonged paralysis

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Licensed use not licensed for use in children for assisted ventilation in intensive care

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Neuromuscular blockade (intermediate duration) during surgery

• **By intravenous administration**

Child 1 month–18 years initially by *intravenous injection* 600 micrograms/kg, then *either* by *intravenous injection*, 150 micrograms/kg repeated as required *or* by *intravenous infusion*, 300–600 micrograms/kg/hour adjusted according to response

Assisted ventilation in intensive care

• **By intravenous administration**

Child 1 month–18 years initially by *intravenous injection* 600 micrograms/kg (optional), then by *intravenous infusion*, 300–600 micrograms/kg/hour for first hour, then adjusted according to response

Administration for *continuous intravenous infusion* or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%

Rocuronium (Non-proprietary) (POM)

Injection, rocuronium bromide 10 mg/mL, net price 5-mL vial = £3.00, 10-mL vial = £6.00

Esmeron® (Organon) (POM)

Injection, rocuronium bromide 10 mg/mL, net price 5-mL vial = £2.90, 10-mL vial = £5.79

VECURONIUM BROMIDE

Cautions see notes above

Hepatic impairment caution in significant impairment

Renal impairment caution in renal failure

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Licensed use not licensed for assisted ventilation in intensive care

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Neuromuscular blockade (intermediate duration) during surgery

• **By intravenous administration**

Neonate by *intravenous injection* initially 80 micrograms/kg, then 30–50 micrograms/kg adjusted according to response

Child 1 month–18 years by *intravenous injection* initially 80–100 micrograms/kg, then *either* by *intravenous injection*, 20–30 micrograms/kg repeated as required *or* by *intravenous infusion*, 0.8–1.4 micrograms/kg/minute, adjusted according to response

Assisted ventilation in intensive care

• **By intravenous injection**

Neonate initially 80 micrograms/kg, then 30–50 micrograms/kg adjusted according to response

• **By intravenous administration**

Neonate by *intravenous injection* 80 micrograms/kg, then by *intravenous infusion*, 0.8–1.4 micrograms/kg/minute, adjusted according to response (risk of accumulation—consider interruption of infusion)

Child 1 month–18 years initially by *intravenous injection* 80–100 micrograms/kg (optional), then by *intravenous infusion* 0.8–1.4 micrograms/kg/minute, adjusted according to response; up to 3 micrograms/kg/minute may be required

Administration reconstitute each vial with 5 mL

Water for Injections to give 2 mg/mL solution; *alternatively* reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections.

For *continuous intravenous infusion*, dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.

Neonatal intensive care, reconstitute each vial with 5 mL Water for Injections to give a 2 mg/mL solution. Dilute 5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of 50 micrograms/kg/hour; minimum concentration of 40 micrograms/mL

Norcuron® (Organon) (POM)

Injection, powder for reconstitution, vecuronium bromide, net price 10-mg vial = £3.38 (with water for injections)

Depolarising neuromuscular blocking drugs

Suxamethonium has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required e.g. with tracheal intubation. Neonates and young children are less sensitive to suxamethonium and a higher dose may be required.

Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. Bradycardia may occur; premedication with atropine (section 15.1.3) reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium

and is caused by the development of a non-depolarising block following the initial depolarising block; edrophonium (section 15.1.6) may be used to confirm the diagnosis of dual block. Children with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

SUXAMETHONIUM CHLORIDE (Succinylcholine chloride)

Cautions see notes above; hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory or neuromuscular disease; raised intraocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); **interactions:** Appendix 1 (muscle relaxants)

Contra-indications family history of malignant hyperthermia, hyperkalaemia; major trauma, severe burns, neurological disease involving acute wasting of major muscle, prolonged immobilisation—risk of hyperkalaemia; personal or family history of congenital myotonic disease, Duchenne muscular dystrophy; low plasma-cholinesterase activity (including severe liver disease, see below)

Hepatic impairment prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase

Pregnancy mildly prolonged neuromuscular blockade may occur

Breast-feeding unlikely to be present in breast milk in significant amounts (ionised at physiological pH); breast-feeding may be resumed once the mother recovered from neuromuscular block

Side-effects see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, myoglobinuria, myoglobinaemia; increased intraocular pressure; flushing, rash; *rarely* arrhythmias, cardiac arrest; bronchospasm, apnoea, prolonged respiratory depression; limited jaw mobility; *very rarely* anaphylactic reactions, malignant hyperthermia; *also reported* hypertension, hypotension, rhabdomyolysis

Indication and dose

Neuromuscular blockade (short duration) during surgery

- By intravenous injection

Neonate 2 mg/kg produces 5–10 minutes neuromuscular blockade

Child 1 month–1 year 2 mg/kg

Child 1–18 years 1 mg/kg

- By intramuscular injection (onset in 2–3 minutes)

Neonate up to 4 mg/kg produces 10–30 minutes neuromuscular blockade

Child 1 month–1 year up to 4–5 mg/kg

Child 1–12 years up to 4 mg/kg; max. 150 mg

Administration for intravenous injection, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%

Suxamethonium Chloride (Non-proprietary) (POM)

Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 58p, 2-mL prefilled syringe = £8.45

Anectine® (GSK) (POM)

Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 71p

15.1.6 Drugs for reversal of neuromuscular blockade

Important

The drugs in this section should be used by experienced personnel only.

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium, but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

Edrophonium has a transient action and may be used in the diagnosis of suspected dual block due to suxamethonium. Atropine (section 15.1.3) is given before or with edrophonium to prevent muscarinic effects of edrophonium; it is also used in the diagnosis of myasthenia gravis (section 10.2.1).

Neostigmine has a longer duration of action than edrophonium and is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.3), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

EDROPHONIUM CHLORIDE

Cautions section 10.2.1; atropine should also be given

Contra-indications section 10.2.1

Pregnancy section 10.2.1

Breast-feeding section 10.2.1

Side-effects section 10.2.1

Indication and dose

Brief reversal of non-depolarising neuromuscular blockade

- By intravenous injection over several minutes
 - Child 1 month–18 years** 500–700 micrograms/kg (after or with atropine)

Myasthenia gravis section 10.2.1

Edrophonium (Non-proprietary) (POM)

Injection, edrophonium chloride 10 mg/mL, net price 1-mL amp = £19.50

NEOSTIGMINE METILSULFATE

(Neostigmine methylsulphate)

Cautions section 10.2.1; glycopyrronium or atropine should also be given

Contra-indications section 10.2.1

Renal impairment section 10.2.1

Pregnancy section 10.2.1

Breast-feeding section 10.2.1**Side-effects** section 10.2.1**Indication and dose****Reversal of non-depolarising muscle block**

- By intravenous injection over 1 minute

Neonate 50 micrograms/kg, after or with glycopyrronium or atropine; a further dose of 25 micrograms/kg may be required

Child 1 month–12 years 50 micrograms/kg (max. 2.5 mg) after or with glycopyrronium or atropine; a further dose of 25 micrograms/kg may be required

Child 12–18 years 50 micrograms/kg (max. 2.5 mg) after or with glycopyrronium or atropine; a further dose of 25 micrograms/kg (max. 2.5 mg) may be required

Myasthenia gravis section 10.2.1

Administration for intravenous injection, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%

Neostigmine (Non-proprietary) (POM)

Injection, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 58p

▲ With glycopyrronium

Glycopyrronium-Neostigmine (Non-proprietary) (POM)

Injection, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-mL amp = 91p

Dose**Reversal of non-depolarising neuromuscular blockade**

- By intravenous injection over 10–30 seconds

Child 1 month–18 years 0.02 mL/kg (or 0.2 mL/kg of a 1 in 10 dilution), dose may be repeated if required (total max. 2 mL)

Administration for intravenous injection, may be diluted with Sodium Chloride 0.9%

Other drugs for reversal of neuromuscular blockade

Sugammadex is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium (section 15.1.5). In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

SUGAMMADEX

Cautions recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease; pre-existing coagulation disorders or use of anticoagulants (unrelated to surgery); wait 24 hours before re-administering rocuronium; **interactions:** Appendix 1 (sugammadex)

Renal impairment avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy use with caution—no information available

Side-effects taste disturbances; *less commonly* allergic reactions; bronchospasm also reported

Indication and dose**Routine reversal of neuromuscular blockade induced by rocuronium**

- By intravenous injection

Child 2–18 years 2 mg/kg (consult product literature)

Administration for intravenous injection dose may be diluted to a concentration of 10 mg/mL with Sodium Chloride 0.9%

Bridion® (Schering-Plough) (POM)

Injection, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10
Electrolytes Na⁺ 0.42 mmol/mL

15.1.7 Antagonists for central and respiratory depression

Important

The drugs in this section should be used by experienced personnel only.

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by an opioid antagonist. **Naloxone** given intravenously immediately reverses opioid-induced respiratory depression but the dose may have to be repeated because of its **short duration of action**. Intramuscular injection of naloxone produces a more gradual and prolonged effect but absorption may be erratic. Care is required in children requiring pain relief because naloxone also antagonises the analgesic effect of opioids.

Neonates Naloxone is used in newborn infants to reverse respiratory depression and sedation resulting from the use of opioids by the mother, usually for pain during labour. In neonates the effects of opioids may persist for up to 48 hours and in such cases naloxone is often given by intramuscular injection for its prolonged effect. In severe respiratory depression after birth, breathing should first be established (using artificial means if necessary) and naloxone administered only if use of opioids by the mother is thought to cause the respiratory depression; the infant should be monitored closely and further doses of naloxone administered as necessary.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam and midazolam, so children may become re-sedated.

FLUMAZENIL

Cautions short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours); benzodiazepine dependence (may precipitate withdrawal symptoms); prolonged benzodiazepine therapy for epilepsy (risk of convulsions); history of panic disorders (risk of recurrence); ensure neuromuscular blockade cleared before giving; avoid rapid injection in high-risk or anxious children and following

major surgery; head injury (rapid reversal of benzodiazepine sedation may cause convulsions)

Contra-indications life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

Hepatic impairment carefully titrate dose

Pregnancy not known to be harmful

Breast-feeding avoid breast-feeding for 24 hours

Side-effects nausea and vomiting; *less commonly* palpitation, anxiety, fear; *also reported* transient hypertension, tachycardia, flushing, agitation, convulsions (particularly in those with epilepsy), dizziness, sensory disturbance, chills, sweating

Licensed use not licensed for use in children under 1 year; not licensed for use by intravenous infusion in children; not licensed for use in children in intensive care

Indication and dose

Reversal of sedative effects of benzodiazepines

- By intravenous injection over 15 seconds

Neonate 10 micrograms/kg, repeat at 1-minute intervals if required

Child 1 month–18 years 10 micrograms/kg (max. 200 micrograms), repeated at 1-minute intervals if required; max. total dose of 50 micrograms/kg (1 mg) (2 mg in intensive care)

- By intravenous infusion, if drowsiness recurs after injection

Neonate 2–10 micrograms/kg/hour, adjusted according to response

Child 1 month–18 years 2–10 micrograms/kg/hour, adjusted according to response; max. 400 micrograms/hour

Overdosage with benzodiazepines see Emergency Treatment of Poisoning p. 30

Administration for *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%

Flumazenil (Non-proprietary) (POM)

Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £14.49

Anexate[®] (Roche) (POM)

Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £13.66

NALOXONE HYDROCHLORIDE

Cautions cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported); maternal physical dependence on opioids (may precipitate withdrawal in newborn); pain (see also under Titration of Dose, below); has short duration of action (see notes above)

Titration of dose In postoperative use, the dose should be titrated for each child in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia

Pregnancy use only if potential benefit outweighs risk

Breast-feeding not orally bioavailable

Side-effects nausea, vomiting; hypotension, hypertension, ventricular tachycardia and fibrillation, cardiac arrest; hyperventilation, dyspnoea, pulmonary oedema; headache, dizziness; *less commonly* diarrhoea, dry mouth, agitation, excitement, paraesthesia,

tremor, sweating; *very rarely* seizures and erythema multiforme

Indication and dose

Reversal of respiratory and CNS depression in neonate following maternal opioid use during labour

- By intramuscular injection

Neonate 200 micrograms (60 micrograms/kg) as a single dose at birth

- By intravenous or subcutaneous injection

Neonate 10 micrograms/kg, repeated every 2–3 minutes if required

Reversal of postoperative respiratory depression

- By intravenous injection

Neonate 1 microgram/kg, repeated every 2–3 minutes if required

Child 1 month–12 years 1 microgram/kg, repeated every 2–3 minutes if required

Child 12–18 years 1.5–3 micrograms/kg; if response inadequate, give subsequent doses of 100 micrograms every 2 minutes

Overdosage with opioids see Emergency Treatment of Poisoning, p. 28

Preparation

See Emergency Treatment of Poisoning, p. 29

15.1.8 Drugs for malignant hyperthermia

Important

The drugs in this section should be used by experienced personnel only.

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium should be avoided during anaesthesia in children at high risk of malignant hyperthermia.

Dantrolene is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

DANTROLENE SODIUM

Cautions avoid extravasation (risk of tissue necrosis); **interactions:** Appendix 1 (muscle relaxants)

Pregnancy use only if potential benefit outweighs risk

Breast-feeding present in milk—use only if potential benefit outweighs risk

Side-effects hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

Licensed use not licensed for use in children

Indication and dose

Malignant hyperthermia

- By rapid intravenous injection

Child 1 month–18 years initially 2–3 mg/kg, then 1 mg/kg repeated as required (total max. dose 10 mg/kg)

Chronic severe spasticity of voluntary muscle
see section 10.2.2

Dantrium Intravenous® (SpePharm) (POM)

Injection, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £51.00 (hosp. only)

15.2 Local anaesthesia

Important

The drugs in section 15.2 should be used by experienced personnel only and should not be administered parenterally unless adequate resuscitation equipment is available.

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

See also section 1.7 (anus), section 11.7 (eye), section 12.3 (oropharynx), and section 13.3 (skin).

Use of local anaesthetics Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Administration The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The child's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local

anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so **careful surveillance** for toxic effects (see Toxicity and Side-effects, p. 650) is necessary during the first 30 minutes after injection.

Epidural anaesthesia is combined with general anaesthesia for certain surgical procedures in children.

Use of vasoconstrictors Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as **adrenaline (epinephrine)** to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline, and it is **not** advisable to give adrenaline with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline must be used in a low concentration when administered with a local anaesthetic (but see also Dental Anaesthesia, below). The total dose of adrenaline should **not** exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. For prescribing information on adrenaline, see section 2.7.2. For drug interactions of adrenaline, see Appendix 1 (sympathomimetics).

In children with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these children an anaesthetic without adrenaline should be used.

Dental anaesthesia **Lidocaine** is widely used in dental procedures; it is most often used in combination with **adrenaline (epinephrine)**. Lidocaine 2% combined with adrenaline 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline. See also Use of Vasoconstrictors, above.

The local anaesthetics **articaine** and **mepivacaine** are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine is available with or without adrenaline, and articaine is available with adrenaline.

In children with severe hypertension or unstable cardiac rhythm, mepivacaine without adrenaline may be used. Alternatively, **prilocaine** with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in children with coronary artery disease.

Cautions of local anaesthetics Local anaesthetics should be administered with caution in children, especially if debilitated (consider dose reduction) or those with impaired cardiac conduction, cardiovascular disease, hypovolaemia, shock, impaired respiratory function, epilepsy, or myasthenia gravis. See also Administration and Use of Vasoconstrictors, above.

Contra-indications of local anaesthetics Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. In such circumstances, increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH. See also Use of Vasoconstrictors, p. 649.

Local anaesthetic preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block).

Local anaesthetics can cause ototoxicity and should not be applied to the middle ear. They are also contra-indicated in children with complete heart block.

Toxicity and side-effects A single application of a topical lidocaine preparation does not generally cause systemic side-effects. Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. CNS effects include a feeling of inebriation and lightheadedness followed by drowsiness, numbness of the tongue and perioral region, restlessness, paraesthesia (including sensations of hot and cold), dizziness, blurred vision, nausea and vomiting, muscle twitching, tremors, and convulsions. Transient excitation may also occur, followed by depression with drowsiness, respiratory failure, unconsciousness, and coma. Effects on the cardiovascular system include myocardial depression and peripheral vasodilatation resulting in hypotension and bradycardia; arrhythmias and cardiac arrest can occur.

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

Articaine

Articaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 649). It is available in a preparation that also contains adrenaline (see Use of Vasoconstrictors, p. 649).

ARTICAINE HYDROCHLORIDE WITH ADRENALINE

(Carticaine hydrochloride with adrenaline)

Cautions see Cautions of Local Anaesthetics, p. 649 and Adrenaline, section 2.7.2

Contra-indications see Contra-indications of Local Anaesthetics, p. 650 and Adrenaline, section 2.7.2

Hepatic impairment use with caution; increased risk of side-effects in severe impairment

Renal impairment see Adrenaline, section 2.7.2

Pregnancy use only if potential benefit outweighs risk—no information available

Breast-feeding avoid breast-feeding for 48 hours after administration

Side-effects see Toxicity and Side-effects, above and Adrenaline, section 2.7.2; also methaemoglobinaemia (see Prilocaine (p. 653) for treatment)

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Infiltration anaesthesia in dentistry

Child 4–18 years consult expert dental sources; **important:** see also Administration, p. 649

Septanest® (Septodont) (POM)

Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 2.2-mL cartridge = 41p

Excipients include sulphites

Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 41p

Excipients include sulphites

Bupivacaine

Bupivacaine has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

BUPIVACAIN HYDROCHLORIDE

Cautions see Cautions of Local Anaesthetics, p. 649; myocardial depression may be more severe and more resistant to treatment; cardiovascular disease; hypertension; hypotension; cerebral atheroma; **interactions:** Appendix 1 (bupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, above

Hepatic impairment use with caution in severe impairment

Renal impairment use with caution in severe impairment

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after paracervical or epidural block; use lower doses for intrathecal use during late pregnancy

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, above

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Adjusted according to child's physical status and nature of procedure, seek expert advice—**important:** see also under Administration, p. 649

Bupivacaine (Non-proprietary) (POM)

Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), net price 10 mL = 82p; 5 mg/mL (0.5%), 10 mL = 94p

Infusion, anhydrous bupivacaine hydrochloride 1 mg/mL (0.1%), net price 100 mL = £8.41, 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

Marcain® (AstraZeneca) (Pom)

Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (*Marcain® 0.25%*), net price 10-mL *Polyamp®* = £1.06; 5 mg/mL (*Marcain® 0.5%*), 10-mL *Polyamp®* = £1.21

Marcain Heavy® (AstraZeneca) (Pom)

Injection, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), glucose 80 mg/mL, net price 4-mL amp = £1.21

▲ **With adrenaline**

For prescribing information on adrenaline, see section 2.7.2; see also Use of Vasoconstrictors, p. 649

Bupivacaine and Adrenaline (Non-proprietary) (Pom)

Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.40

Injection, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.50

Levobupivacaine

Levobupivacaine, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine but is thought to have fewer adverse effects.

LEVOBUPIVACAINE

Note Levobupivacaine is an isomer of bupivacaine

Cautions see Cautions of Local Anaesthetics, p. 649; cardiovascular disease; **interactions**: Appendix 1 (levobupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 650

Hepatic impairment use with caution

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid if possible in first trimester—toxicity in *animal* studies; may cause fetal distress syndrome; do not use for paracervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, p. 650; also sweating, pyrexia, anaemia

Licensed use not licensed for use in children except for analgesia by ilioinguinal or iliohypogastric block

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Adjusted according to child's physical status and nature of procedure, seek expert advice—**important**: see also under Administration, p. 649

Chirocaine® (Abbott) (Pom)

Injection, levobupivacaine (as hydrochloride) 2.5 mg/mL, net price 10-mL amp = £1.42; 5 mg/mL, 10-mL amp = £1.62; 7.5 mg/mL, 10-mL amp = £2.43

Note For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%

Infusion, levobupivacaine (as hydrochloride) 625 micrograms/mL, net price 100 mL = £6.63, 200 mL = £10.37; 1.25 mg/mL, net price 100 mL = £7.26, 200 mL = £12.20

Lidocaine

Lidocaine is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

Application of a mixture of lidocaine and prilocaine (*EMLA®*) under an occlusive dressing provides surface anaesthesia for 1–2 hours. *EMLA®* does not appear to be effective in providing local anaesthesia for heel lancing in neonates.

LIDOCAINE HYDROCHLORIDE

(Lignocaine hydrochloride)

Cautions see Cautions of Local Anaesthetics, p. 649 and section 2.3.2; hypertension; topical preparations can damage plastic cuffs of endotracheal tubes

Contra-indications see notes above, Contra-indications of Local Anaesthetics (p. 650), and section 2.3.2

Hepatic impairment section 2.3.2

Renal impairment section 2.3.2

Pregnancy large doses can cause fetal bradycardia; large doses during delivery can cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block

Breast-feeding see section 2.3.2

Side-effects see Toxicity and Side-effects, p. 650 and section 2.3.2; also methaemoglobinaemia (see Prilocaine (p. 653) for treatment), nystagmus, rash; hypoglycaemia also reported following intrathecal or extradural administration

Licensed use *EMLA®* cream not licensed for use in children under 1 year

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Infiltration anaesthesia

• **By injection**

(see also Administration, p. 649, and *Important* warning below)

Neonate according to nature of procedure, up to 3 mg/kg (0.3 mL/kg of 1% solution), repeated not more often than every 4 hours

Child 1 month–12 years according to nature of procedure, up to 3 mg/kg (0.3 mL/kg of 1% solution), repeated not more often than every 4 hours

Child 12–18 years according to weight of child and nature of procedure, max. 200 mg, repeated not more often than every 4 hours

Surface anaesthesia see preparations below

Ventricular arrhythmias, neonatal seizures section 2.3.2

Intravenous regional anaesthesia and nerve blocks seek expert advice

Dental anaesthesia seek expert advice

Important

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

▲ Lidocaine hydrochloride injections

Lidocaine (Non-proprietary) (POM)

Injection, lidocaine hydrochloride 5 mg/mL (0.5%), net price 10-mL amp = 35p; 10 mg/mL (1%), 2-mL amp = 25p, 5-mL amp = 26p, 10-mL amp = 39p, 10-mL prefilled syringe = £4.53, 20-mL amp = 75p; 20 mg/mL (2%), 2-mL amp = 32p, 5-mL amp = 31p

▲ With adrenaline

For prescribing information on adrenaline see section 2.7.2; see also Use of Vasoconstrictors, p. 649.

Xylocaine® (AstraZeneca) (POM)

Injection, anhydrous lidocaine hydrochloride 10 mg/mL (1%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = 99p

Excipients include sulphites

Injection, anhydrous lidocaine hydrochloride 20 mg/mL (2%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.04

Excipients include sulphites

▲ Lidocaine injections for dental use

A variety of lidocaine injections with adrenaline are available in dental cartridges; brand names include *Lignospan Special®*, *Rexocaine®*, and *Xylocaine®*.

For prescribing information on adrenaline see section 2.7.2; see also Use of Vasoconstrictors, p. 649.

Note Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia

▲ Lidocaine for surface anaesthesia

Instillagel® (CliniMed)

Gel, lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6-mL syringe = £1.41, 11-mL syringe = £1.58

Excipients include hydroxybenzoates (parabens)

Laryngojet® (UCB Pharma) (POM)

Solution, lidocaine hydrochloride 40 mg/mL (4%), net price per unit (4-mL vial and disposable sterile cannula with cover and vial injector) = £5.10

Dose

Anaesthesia of mucous membranes of oropharynx, trachea, and respiratory tract

Child up to 0.075 mL/kg (3 mg/kg) as a single dose sprayed, instilled (if a cavity) or applied with a swab;

reduce dose according to size, age, and condition of child, max. 5 mL (200 mg)

LMX 4® (Ferndale)

Cream, lidocaine 4%, net price 5-g tube = £2.98; 5 × 5-g tube with 10 occlusive dressings = £16.90

Excipients include benzyl alcohol and propylene glycol

Dose

Anaesthesia before venous cannulation or venepuncture

Child 1 month–18 years apply thick layer (1–2.5 g; child under 1 year max. 1 g) to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; max. application time 5 hours (child 1–3 months, 60 minutes; child 3 months–1 year, 4 hours); remove cream with gauze and perform procedure after approximately 5 minutes

Xylocaine® (AstraZeneca)

Spray, lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container, net price 50-mL bottle = £3.13

Dose

Bronchoscopy, laryngoscopy, oesophagoscopy, endotracheal intubation

Child up to 18 years up to 3 mg/kg

▲ With prilocaine

For prescribing information on prilocaine, see p. 653.

EMLA® (AstraZeneca)

Cream, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £1.73; 30-g tube (surgical pack) = £10.25; 5 × 5-g tube with 12 occlusive dressings (premedication pack) = £9.75

Dose

Anaesthesia before minor skin procedures including venepuncture

Neonate apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours

Child 1–3 months or body-weight less than 5 kg apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours

Child 3 months–1 year and body-weight over 5 kg apply max. 2 g under occlusive dressing for max. 4 hours before procedure; max. 2 doses in 24 hours

Child 1–18 years apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for child 1–12 years

Note Shorter application time of 15–30 minutes is recommended for children with atopic dermatitis

▲ Lidocaine for ear, nose, and oropharyngeal use

For prescribing information on phenylephrine, see section 2.7.2.

Lidocaine with Phenylephrine (Non-proprietary)

Topical solution, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £9.98

Dose

Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose

Child 12–18 years up to max. 8 sprays

Mepivacaine

Mepivacaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 649).

MEPIVACINE HYDROCHLORIDE

Cautions see Cautions of Local Anaesthetics, p. 649

Contra-indications see Contra-indications of Local Anaesthetics, p. 650

Hepatic impairment use with caution; increased risk of side-effects in severe impairment

Renal impairment use with caution; increased risk of side-effects

Pregnancy use with caution in early pregnancy

Breast-feeding use with caution

Side-effects see Toxicity and Side-effects, p. 650

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Infiltration anaesthesia and nerve block in dentistry

Child 3–18 years consult expert dental sources

Scandonest® 3% Plain (Septodont) ^(PoM)

Injection, mepivacaine hydrochloride 30 mg/mL, net price 2.2-mL cartridge = 36p

▲ With adrenaline

For prescribing information on adrenaline, see section 2.7.2; see Use of Vasoconstrictors, p. 649.

Scandonest® 2% Special (Septodont) ^(PoM)

Injection, mepivacaine hydrochloride 20 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 36p
Excipients include sulphites

Prilocaine

Prilocaine is a local anaesthetic of low toxicity which is similar to lidocaine. If used in high doses, methaemoglobinaemia may occur which can be treated with an intravenous injection of **methylthionium chloride** 1% using a dose of 1–2 mg/kg given over 5 minutes. The dose may be repeated after 30–60 minutes if necessary. Neonates and infants under 6 months are particularly susceptible to methaemoglobinaemia.

PRILOCAINE HYDROCHLORIDE

Cautions see Cautions of Local Anaesthetics, p. 649; severe or untreated hypertension; concomitant drugs which cause methaemoglobinaemia; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (prilocaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 650; anaemia, or congenital or acquired methaemoglobinaemia

Hepatic impairment use with caution; lower doses may be required for intrathecal anaesthesia

Renal impairment use with caution; lower doses may be required for intrathecal anaesthesia

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid paracervical or

podendal block in obstetrics (neonatal methaemoglobinaemia reported); use lower doses for intrathecal use during late pregnancy

Breast-feeding present in milk but not known to be harmful

Side-effects see notes above and Toxicity and Side-effects, p. 650; also hypertension

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Infiltration anaesthesia (higher strengths for dental use only), nerve block

See under preparations below, seek expert advice—**important:** see also under Administration, p. 649

Citanest 1%® (AstraZeneca) ^(PoM)

Injection, prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £2.01

Dose

Child 6 months–12 years up to 5 mg/kg adjusted according to site of administration and response; max. 400 mg

Child 12–18 years 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg (adjusted according to site of administration and response)

▲ With lidocaine

See Lidocaine, p. 652

▲ For dental use

Note Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia

Citanest 3% with Octapressin® (Dentsply) ^(PoM)

Injection, prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL, net price 2.2-mL cartridge and self-aspirating cartridge (both) = 47p

Ropivacaine

Ropivacaine is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotoxic than bupivacaine, but also less potent.

ROPIVACINE HYDROCHLORIDE

Cautions see Cautions of Local Anaesthetics, p. 649; also acute porphyria (section 9.8.2); **interactions:** Appendix 1 (ropivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 650

Hepatic impairment use with caution in severe impairment

Renal impairment use with caution in severe impairment; increased risk of systemic toxicity in chronic renal failure

Pregnancy not known to be harmful; do not use for paracervical block in obstetrics

Breast-feeding not known to be harmful

Side-effects see Toxicity and Side-effects, p. 650; also hypertension, pyrexia; *less commonly* syncope and hypothermia

Licensed use 2 mg/mL strength not licensed for use in children under 12 years except for acute pain management by caudal epidural block and continuous epidural infusion; 7.5 mg/mL and 10 mg/mL strengths not licensed for use in children under 12 years

Indication and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Adjust according to child's physical status and nature of procedure, seek expert advice—**important**: see also under Administration, p. 649

Ropivacaine (Non-proprietary) (POM)

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200 mL = £14.45

Naropin® (AstraZeneca) (POM)

Injection, ropivacaine hydrochloride 2 mg/mL, net price 10-mL *Polyamp*® = £1.78; 7.5 mg/mL, 10-mL *Polyamp*® = £2.65; 10 mg/mL, 10-mL *Polyamp*® = £3.20

Electrolytes Na⁺ <0.5 mmol/mL

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200-mL *Polybag*® = £14.45

Electrolytes Na⁺ <0.5 mmol/mL

Ametop® (S&N Hlth.)

Gel, tetracaine 4%, net price 1.5-g tube = £1.08

Excipients include hydroxybenzoates (parabens)

Dose

Neonate apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

Child 1 month–18 years apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

Note Child 5–18 years, contents of max. 5 tubes applied at separate sites at a single time, child 1 month–5 years, contents of max. 1 tube applied at separate sites at a single time

Tetracaine

Tetracaine is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. Tetracaine is effective for 4–6 hours after a single application in most children. It is not recommended prior to neonatal heel lancing.

Tetracaine is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should **never** be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine is a safer alternative.

TETRACAINE

(Amethocaine)

Cautions see Cautions of Local Anaesthetics, p. 649

Contra-indications see Contra-indications of Local Anaesthetics, p. 650

Breast-feeding not known to be harmful

Side-effects see Toxicity and Side-effects, p. 650

Important. Rapid and extensive absorption may result in systemic side-effects (see also notes above)

Licensed use not licensed for use in neonates

Indication and dose

Anaesthesia before venepuncture or venous cannulation see preparation below

Eye section 11.7

A1 Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 12), as for other adverse drug reactions.

Drug interactions may be **pharmacodynamic** or **pharmacokinetic**.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

Affecting absorption The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

Due to changes in protein binding To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides, and tolbutamide but the importance of these interactions is due

mainly to the fact that warfarin metabolism is also inhibited.

Affecting metabolism Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of *in-vitro* information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include those with impaired renal or liver function.

Serious interactions The symbol ● has been placed against interactions that are **potentially serious** and where combined administration of the drugs involved

should be **avoided** (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts. For explanation of symbol • see above

Abacavir

Analgesics: abacavir possibly reduces plasma concentration of **methadone**

Antibacterials: plasma concentration of abacavir possibly reduced by **rifampicin**

Antiepileptics: plasma concentration of abacavir possibly reduced by **phenobarbital** and **phenytoin**

- Antivirals: abacavir possibly reduces effects of
 - **ribavirin**; plasma concentration of abacavir reduced by • **tipranavir**

Abatacept

Adalimumab: increased risk of side-effects when abatacept given with **adalimumab**

- Certolizumab pegol: avoid concomitant use of abatacept with • **certolizumab pegol**
- Etanercept: avoid concomitant use of abatacept with • **etanercept**
- Golimumab: avoid concomitant use of abatacept with • **golimumab**
- Infliximab: avoid concomitant use of abatacept with • **infliximab**
- Vaccines: avoid concomitant use of abatacept with • **vaccines** (see p. 599)

Carbose see Antidiabetics

ACE Inhibitors

Alcohol: enhanced hypotensive effect when ACE inhibitors given with **alcohol**

Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with **aldesleukin**

Allopurinol: increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with **allopurinol** especially in renal impairment

Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when ACE inhibitors given with **general anaesthetics**

Analgesics: increased risk of renal impairment when ACE inhibitors given with **NSAIDs**, also hypotensive effect antagonised

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ACE inhibitors given with **angiotensin-II receptor antagonists**

Antacids: absorption of ACE inhibitors possibly reduced by **antacids**; absorption of captopril, enalapril and fosinopril reduced by **antacids**

Antibacterials: plasma concentration of active metabolite of imidapril reduced by **rifampicin** (reduced antihypertensive effect); quinapril tablets reduce absorption of **tetracyclines** (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with **trimethoprim**

Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with **heparins**

Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by **MAOIs**

Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of **insulin**, **metformin** and **sulfonylureas**

Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with **antipsychotics**

Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with **anxiolytics and hypnotics**

ACE Inhibitors (continued)

Azathioprine: increased risk of anaemia or leucopenia when captopril given with **azathioprine** especially in renal impairment; increased risk of anaemia when enalapril given with **azathioprine** especially in renal impairment

Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with **calcium-channel blockers**

Cardiac Glycosides: captopril possibly increases plasma concentration of **digoxin**

- Cyclosporin: increased risk of hyperkalaemia when ACE inhibitors given with • **cyclosporin**

Clonidine: enhanced hypotensive effect when ACE inhibitors given with **clonidine**; antihypertensive effect of captopril possibly delayed by previous treatment with **clonidine**

Corticosteroids: hypotensive effect of ACE inhibitors antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when ACE inhibitors given with **diazoxide**

- Diuretics: enhanced hypotensive effect when ACE inhibitors given with • **diuretics**; increased risk of severe hyperkalaemia when ACE inhibitors given with • **potassium-sparing diuretics** and **aldosterone antagonists** (monitor potassium concentration with low-dose spironolactone in heart failure)

Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with **levodopa**

- Gold: flushing and hypotension reported when ACE inhibitors given with • **sodium aurothiomalate**

- Lithium: ACE inhibitors reduce excretion of • **lithium** (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when ACE inhibitors given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when ACE inhibitors given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when ACE inhibitors given with **nitrates**

Oestrogens: hypotensive effect of ACE inhibitors antagonised by **oestrogens**

- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with • **potassium salts**

Probenecid: excretion of captopril reduced by **probenecid**

Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with **alprostadi**

Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with **hydralazine**, **minoxidil** or **sodium nitropruside**

Acebutolol see Beta-blockers

Aceclofenac see NSAIDs

Acemetacin see NSAIDs

Acenocoumarol see Coumarins

Acetazolamide see Diuretics

Aciclovir

Note Interactions do not apply to topical aciclovir preparations

Note Valaciclovir interactions as for aciclovir

Cyclosporin: increased risk of nephrotoxicity when aciclovir given with **cyclosporin**

Mycophenolate: plasma concentration of aciclovir increased by **mycophenolate**, also plasma concentration of inactive metabolite of mycophenolate increased

Probenecid: excretion of aciclovir reduced by **probenecid** (increased plasma concentration)

Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with **tacrolimus**

Theophylline: aciclovir possibly increases plasma concentration of **theophylline**

Acitretin see Retinoids

Acrivastine *see* Antihistamines

Adalimumab

Abatacept: increased risk of side-effects when adalimumab given with **abatacept**

- Anakinra: avoid concomitant use of adalimumab with live **anakinra**
- Vaccines: avoid concomitant use of adalimumab with live **vaccines** (see p. 599)

Adefovir

Antivirals: avoidance of adefovir advised by manufacturer of **tenofovir**

Adenosine

Note Possibility of interaction with drugs tending to impair myocardial conduction

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**
- Diprydamole: effect of adenosine enhanced and extended by **diprydamole** (important risk of toxicity)
- Nicotine: effects of adenosine possibly enhanced by **nicotine**
- Theophylline: anti-arrhythmic effect of adenosine antagonised by **theophylline**

Adrenaline (epinephrine) *see* Sympathomimetics

Adrenergic Neurone Blockers

Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with **alcohol**

Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **alpha-blockers**

- Anaesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with **general anaesthetics**
- Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with **angiotensin-II receptor antagonists**
- Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with **MAOIs**; hypotensive effect of adrenergic neurone blockers antagonised by **tricyclics**
- Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by **haloperidol**; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of **chlorpromazine**; enhanced hypotensive effect when adrenergic neurone blockers given with **phenothiazines**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with **clonidine**
- Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with **levodopa**
- Methylidopa: enhanced hypotensive effect when adrenergic neurone blockers given with **methylidopa**

Adrenergic Neurone Blockers (continued)

Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with **nitrates**

Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by **oestrogens**

Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by **pizotifen**

Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with **alprostadil**

- Sympathomimetics: hypotensive effect of guanethidine antagonised by **dexamfetamine**; hypotensive effect of adrenergic neurone blockers antagonised by **ephedrine**, **isometheptene**, **metaraminol**, **methylphenidate**, **noradrenaline (norepinephrine)**, **oxymetazoline**, **phenylephrine**, **pseudoephedrine** and **xylometazoline**
- Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

Adsorbents *see* Kaolin

Agalsidase Alfa and Beta

Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by **amiodarone** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antibacterials: effects of agalsidase alfa and beta possibly inhibited by **gentamicin** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antimalarials: effects of agalsidase alfa and beta possibly inhibited by **chloroquine** and **hydroxychloroquine** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Agomelatine

- Antibacterials: manufacturer of agomelatine advises avoid concomitant use with **ciprofloxacin**
- Antidepressants: metabolism of agomelatine inhibited by **fluvoxamine** (increased plasma concentration)
- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether/lumefantrine**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

Alcohol

ACE Inhibitors: enhanced hypotensive effect when alcohol given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with **adrenergic neurone blockers**

Alpha-blockers: increased sedative effect when alcohol given with **indoramin**; enhanced hypotensive effect when alcohol given with **alpha-blockers**

Analgesics: enhanced hypotensive and sedative effects when alcohol given with **opioid analgesics**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with **angiotensin-II receptor antagonists**

- Antibacterials: disulfiram-like reaction when alcohol given with **metronidazole**; possibility of disulfiram-like reaction when alcohol given with **tinidazole**; increased risk of convulsions when alcohol given with **cycloserine**
- Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with **coumarins** or **phenindione**
- Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with **MAOIs** (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with **SSRIs**; increased sedative effect when alcohol given with **mirtazapine**, **tricyclic-related antidepressants** or **tricyclics**

Alcohol (continued)

- Antidiabetics: alcohol enhances hypoglycaemic effect of **antidiabetics**; increased risk of lactic acidosis when alcohol given with **metformin**
- Antiepileptics: alcohol possibly increases CNS side-effects of **carbamazepine**; increased sedative effect when alcohol given with **phenobarbital**; chronic heavy consumption of alcohol possibly reduces plasma concentration of **phenytoin**
- Antifungals: effects of alcohol possibly enhanced by **griseofulvin**
- Antihistamines: increased sedative effect when alcohol given with **antihistamines** (possibly less effect with non-sedating antihistamines)
- Antimuscarinics: increased sedative effect when alcohol given with **hyoscine**
- Antipsychotics: increased sedative effect when alcohol given with **antipsychotics**
- Anxiolytics and Hypnotics: increased sedative effect when alcohol given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when alcohol given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with **calcium-channel blockers**; plasma concentration of alcohol possibly increased by **verapamil**
- Clonidine: enhanced hypotensive effect when alcohol given with **clonidine**
- Cytotoxics: disulfiram-like reaction when alcohol given with **procarbazine**
- Diazoxide: enhanced hypotensive effect when alcohol given with **diazoxide**
- Disulfiram: disulfiram reaction when alcohol given with **disulfiram** (see BNF section 4.10.1)
- Diuretics: enhanced hypotensive effect when alcohol given with **diuretics**
- Dopaminergics: alcohol reduces tolerance to **bromocriptine**
- Levamisole: possibility of disulfiram-like reaction when alcohol given with **levamisole**
- Lofexidine: increased sedative effect when alcohol given with **lofexidine**
- Methyldopa: enhanced hypotensive effect when alcohol given with **methyldopa**
- Metoclopramide: absorption of alcohol possibly increased by **metoclopramide**
- Moxonidine: enhanced hypotensive effect when alcohol given with **moxonidine**
- Muscle Relaxants: increased sedative effect when alcohol given with **baclofen, methocarbamol or tizanidine**
- Nicorandil: alcohol possibly enhances hypotensive effect of **nicorandil**
- Nitrates: enhanced hypotensive effect when alcohol given with **nitrates**
- Paraldehyde: increased sedative effect when alcohol given with ●**paraldehyde**
 - Retinoids: presence of alcohol causes etretinate to be formed from ●**acitretin** (increased risk of teratogenicity in women of child-bearing potential)
- Sympathomimetics: alcohol possibly enhances effects of **methyphenidate**
- Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with **hydralazine, minoxidil or sodium nitroprusside**

Aldesleukin

- ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with **ACE inhibitors**
- Alpha-blockers: enhanced hypotensive effect when aldesleukin given with **alpha-blockers**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with **angiotensin-II receptor antagonists**
- Antivirals: aldesleukin possibly increases plasma concentration of **indinavir**
- Beta-blockers: enhanced hypotensive effect when aldesleukin given with **beta-blockers**

Aldesleukin (continued)

- Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when aldesleukin given with **clonidine**
- Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with ●**corticosteroids**
 - Cytotoxics: manufacturer of aldesleukin advises avoid concomitant use with ●**cisplatin, dacarbazine and vinblastine**
- Diazoxide: enhanced hypotensive effect when aldesleukin given with **diazoxide**
- Diuretics: enhanced hypotensive effect when aldesleukin given with **diuretics**
- Methyldopa: enhanced hypotensive effect when aldesleukin given with **methyldopa**
- Moxonidine: enhanced hypotensive effect when aldesleukin given with **moxonidine**
- Nitrates: enhanced hypotensive effect when aldesleukin given with **nitrates**
- Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with **hydralazine, minoxidil or sodium nitroprusside**
- Alendronic Acid** see Bisphosphonates
- Alfentanil** see Opioid Analgesics
- Alfuzosin** see Alpha-blockers
- Alimemazine** see Antihistamines
- Aliskiren**
- Analgesics: hypotensive effect of aliskiren possibly antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: plasma concentration of aliskiren possibly reduced by **irbesartan**
- Anticoagulants: increased risk of hyperkalaemia when aliskiren given with **heparins**
- Antifungals: plasma concentration of aliskiren increased by **ketoconazole**
- Calcium-channel Blockers: manufacturer of aliskiren advises avoid concomitant use with **verapamil**
- Ciclosporin: plasma concentration of aliskiren increased by ●**ciclosporin**—avoid concomitant use
- Diuretics: aliskiren reduces plasma concentration of **furosemide**; increased risk of hyperkalaemia when aliskiren given with **potassium-sparing diuretics and aldosterone antagonists**
- Potassium Salts: increased risk of hyperkalaemia when aliskiren given with **potassium salts**
- Alitretinoin** see Retinoids
- Alkylating Drugs** see Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estramustine, Ifosfamide, Lomustine, Melphalan, and Thiotepa
- Allopurinol**
- ACE Inhibitors: increased risk of leucopenia and hypersensitivity reactions when allopurinol given with **ACE inhibitors** especially in renal impairment
- Antibacterials: increased risk of rash when allopurinol given with **amoxicillin or ampicillin**
- Anticoagulants: allopurinol possibly enhances anticoagulant effect of **coumarins**
- Antivirals: allopurinol increases plasma concentration of ●**didanosine** (risk of toxicity)—avoid concomitant use
 - Azathioprine: allopurinol enhances effects and increases toxicity of ●**azathioprine** (reduce dose of azathioprine to one quarter of usual dose)
- Ciclosporin: allopurinol possibly increases plasma concentration of **ciclosporin** (risk of nephrotoxicity)
- Cytotoxics: allopurinol enhances effects and increases toxicity of ●**mercaptopurine** (reduce dose of mercaptopurine to one quarter of usual dose); avoidance of allopurinol advised by manufacturer of ●**capecitabine**
- Diuretics: increased risk of hypersensitivity when allopurinol given with **thiazides and related diuretics** especially in renal impairment
- Theophylline: allopurinol possibly increases plasma concentration of **theophylline**
- Almotriptan** see 5HT₁ Agonists

Alpha₂-adrenoceptor Stimulants *see* Apraclonidine, Brimonidine, Clonidine and Methyldopa

Alpha-blockers

- ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when alpha-blockers given with **alcohol**; increased sedative effect when indoramin given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when alpha-blockers given with **aldesleukin**
- Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with **general anaesthetics**
- Analgesics: hypotensive effect of alpha-blockers antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with **angiotensin-II receptor antagonists**
- Antidepressants: enhanced hypotensive effect when alpha-blockers given with **MAOIs**; manufacturer of indoramin advises avoid concomitant use with **MAOIs**
- Antifungals: plasma concentration of alfuzosin possibly increased by **ketoconazole**
- Antipsychotics: enhanced hypotensive effect when alpha-blockers given with **antipsychotics**
- Antivirals: plasma concentration of alfuzosin possibly increased by **ritonavir**—avoid concomitant use
- Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when alpha-blockers given with **beta-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with **calcium-channel blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Cardiac Glycosides: prazosin increases plasma concentration of **digoxin**
- Clonidine: enhanced hypotensive effect when alpha-blockers given with **clonidine**
- Corticosteroids: hypotensive effect of alpha-blockers antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when alpha-blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when alpha-blockers given with **diuretics**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Dopaminergics: enhanced hypotensive effect when alpha-blockers given with **levodopa**
- Methyldopa: enhanced hypotensive effect when alpha-blockers given with **methyldopa**
- Moxisylyte: possible severe postural hypotension when alpha-blockers given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when alpha-blockers given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when alpha-blockers given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when alpha-blockers given with **nitrates**
- Oestrogens: hypotensive effect of alpha-blockers antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when alpha-blockers given with **alprostadil**
- Sildenafil: enhanced hypotensive effect when alpha-blockers given with **sildenafil** (avoid alpha-blockers for 4 hours after sildenafil)—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5
- Sympathomimetics: avoid concomitant use of tolazoline with **adrenaline (epinephrine)** or **dopamine**
- Tadalafil: enhanced hypotensive effect when alpha-blockers given with **tadalafil**—see also under Phos-

Alpha-blockers

- Tadalafil (*continued*)
 - phodiesterase type-5 inhibitors, BNF section 7.4.5; enhanced hypotensive effect when doxazosin given with **tadalafil**—manufacturer of tadalafil advises avoid concomitant use
- Ulcer-healing Drugs: effects of tolazoline antagonised by **cimetidine** and **ranitidine**
- Vardenafil: enhanced hypotensive effect when alpha-blockers (excludes tamsulosin) given with **vardenafil**—separate doses by 6 hours—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5
- Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with **hydralazine**, **minoxidil** or **sodium nitropruside**
- Alpha-blockers (post-synaptic)** *see* Alpha-blockers
- Alprazolam** *see* Anxiolytics and Hypnotics
- Alprostadil** *see* Prostaglandins
- Aluminium Hydroxide** *see* Antacids
- Amantadine**
 - Antimalarials: plasma concentration of amantadine possibly increased by **quinine**
 - Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with **antipsychotics**
 - Bupropion: increased risk of side-effects when amantadine given with **bupropion**
 - Memantine: increased risk of CNS toxicity when amantadine given with **memantine** (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by **memantine**
 - Methyldopa: increased risk of extrapyramidal side-effects when amantadine given with **methyldopa**; antiparkinsonian effect of dopaminergics antagonised by **methyldopa**
 - Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with **tetrabenazine**
- Amikacin** *see* Aminoglycosides
- Amiloride** *see* Diuretics
- Aminoglycosides**
 - Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of **agalsidase alfa** and **beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
 - Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by **indometacin**
 - Antibacterials: neomycin reduces absorption of **phenoxymethylpenicillin**; increased risk of nephrotoxicity when aminoglycosides given with **colistimethate sodium** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with **capreomycin** or **vancomycin**; possible increased risk of nephrotoxicity when aminoglycosides given with **cephalosporins**
 - Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with **coumarins** or **phenindione**
 - Antidiabetics: neomycin possibly enhances hypoglycaemic effect of **acarbose**, also severity of gastrointestinal effects increased
 - Antifungals: increased risk of nephrotoxicity when aminoglycosides given with **amphotericin**
 - Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with **bisphosphonates**
 - Cardiac Glycosides: neomycin reduces absorption of **digoxin**; gentamicin possibly increases plasma concentration of **digoxin**
 - Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with **ciclosporin**
 - Cytotoxics: neomycin possibly reduces absorption of **methotrexate**; neomycin reduces bioavailability of **sorafenib**; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with **platinum compounds**
 - Diuretics: increased risk of ototoxicity when aminoglycosides given with **loop diuretics**

Aminoglycosides (*continued*)

- Muscle Relaxants: aminoglycosides enhance effects of
 - non-depolarising muscle relaxants and
 - suxamethonium
 - Parasympathomimetics: aminoglycosides antagonise effects of ●neostigmine and ●pyridostigmine
 - Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with ●tacrolimus
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 620
- Vitamins: neomycin possibly reduces absorption of vitamin A

Aminophylline see Theophylline

Aminosalicylates

Azathioprine: possible increased risk of leucopenia when aminosalicylates given with azathioprine

Cardiac Glycosides: sulfasalazine possibly reduces absorption of digoxin

Cytotoxics: possible increased risk of leucopenia when aminosalicylates given with mercaptopurine

Folates: sulfasalazine possibly reduces absorption of folic acid

Amiodarone

Note Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped

Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●anti-arrhythmics; increased risk of ventricular arrhythmias when amiodarone given with ●disopyramide or ●dronedarone—avoid concomitant use; amiodarone increases plasma concentration of ●flecainide (halve dose of flecainide)
- Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with parenteral ●erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●levofloxacin or ●moxifloxacin—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with sulfamethoxazole and trimethoprim (as co-trimoxazole)—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
- Anticoagulants: amiodarone inhibits metabolism of ●coumarins and ●phenindione (enhanced anticoagulant effect); amiodarone increases plasma concentration of ●dabigatran etexilate (reduce dose of dabigatran etexilate)
- Antidepressants: increased risk of ventricular arrhythmias when amiodarone given with ●tricyclics—avoid concomitant use
- Antiepileptics: amiodarone inhibits metabolism of ●phenytoin (increased plasma concentration)
- Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with ●mizolastine—avoid concomitant use
- Antimalarials: avoidance of amiodarone advised by manufacturer of ●artemether/lumefantrine (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with ●chloroquine and hydroxychloroquine, ●mefloquine or ●quinine—avoid concomitant use
- Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with ●tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with ●benperidol—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●amisulpride, ●droperidol,

Amiodarone**Antipsychotics** (*continued*)

- ●haloperidol, ●phenothiazines, ●pimozide or ●zuclopenthixol—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●sulpiride
 - Antivirals: plasma concentration of amiodarone possibly increased by ●atazanavir; plasma concentration of amiodarone possibly increased by ●fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by ●indinavir—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●nelfinavir or ●saquinavir—avoid concomitant use; plasma concentration of amiodarone increased by ●ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use)
 - Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with ●atomoxetine
 - Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with ●beta-blockers; increased myocardial depression when anti-arrhythmics given with ●beta-blockers; increased risk of ventricular arrhythmias when amiodarone given with ●sotalol—avoid concomitant use
 - Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with ●diltiazem or ●verapamil
 - Cardiac Glycosides: amiodarone increases plasma concentration of ●digoxin (halve dose of digoxin)
 - Ciclosporin: amiodarone possibly increases plasma concentration of ciclosporin
 - Colchicine: amiodarone possibly increases risk of ●colchicine toxicity
 - Cytotoxics: increased risk of ventricular arrhythmias when amiodarone given with ●arsenic trioxide
 - Diuretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics; amiodarone increases plasma concentration of eplerenone (reduce dose of eplerenone)
 - Grapefruit Juice: plasma concentration of amiodarone increased by grapefruit juice
 - Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with ●ivabradine
 - Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with ●simvastatin
 - Lithium: manufacturer of amiodarone advises avoid concomitant use with ●lithium (risk of ventricular arrhythmias)
 - Orlistat: plasma concentration of amiodarone possibly reduced by orlistat
 - Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with ●pentamidine isetionate—avoid concomitant use
 - Thyroid Hormones: for concomitant use of amiodarone and thyroid hormones see p. 83
 - Ulcer-healing Drugs: plasma concentration of amiodarone increased by ●cimetidine
- Amisulpride** see Antipsychotics
- Amisulpride** see Antidepressants, Tricyclic
- Amiodipine** see Calcium-channel Blockers
- Amoxicillin** see Penicillins
- Amphotericin**
- Note** Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics
- Antibacterials: increased risk of nephrotoxicity when amphotericin given with aminoglycosides or polymyxins; possible increased risk of nephrotoxicity when amphotericin given with vancomycin
- Antifungals: amphotericin reduces renal excretion and increases cellular uptake of flucytosine (toxicity possibly increased); effects of amphotericin possibly antagonised by imidazoles and triazoles; plasma concentration of amphotericin possibly increased by micafungin

Amphotericin (continued)

- Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with ●**cardiac glycosides**
- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with ●**ciclosporin**
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with ●**corticosteroids**—avoid concomitant use unless corticosteroids needed to control reactions
- Cytotoxics: increased risk of ventricular arrhythmias when amphotericin given with ●**arsenic trioxide**
- Diuretics: increased risk of hypokalaemia when amphotericin given with **loop diuretics** or **thiazides and related diuretics**
- Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with **pentamidine isetionate**
- Tacrolimus: increased risk of nephrotoxicity when amphotericin given with ●**tacrolimus**

Ampicillin *see* Penicillins**Anabolic Steroids**

- Anticoagulants: anabolic steroids enhance anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of **antidiabetics**

Anaesthetics, General

Note *See also* Surgery and Long-term Medication, p. 628

- ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with ●**adrenergic neurone blockers**
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with ●**alpha-blockers**
- Analgesics: metabolism of etomidate inhibited by **fentanyl** (consider reducing dose of etomidate); effects of thiopental possibly enhanced by **aspirin**; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by **opioid analgesics**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with **angiotensin-II receptor antagonists**
- Antibacterials: effects of thiopental enhanced by **sulfonamides**; hypersensitivity-like reactions can occur when general anaesthetics given with **intravenous vancomycin**
- Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with **tricyclics**
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with ●**antipsychotics**; effects of thiopental enhanced by **droperidol**
- Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when general anaesthetics given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with **calcium-channel blockers**; general anaesthetics enhance hypotensive effect of ●**verapamil** (also AV delay)
- Clonidine: enhanced hypotensive effect when general anaesthetics given with **clonidine**
- Cytotoxics: nitrous oxide increases antifolate effect of ●**methotrexate**—avoid concomitant use
- Diazoxide: enhanced hypotensive effect when general anaesthetics given with **diazoxide**
- Diuretics: enhanced hypotensive effect when general anaesthetics given with **diuretics**
- Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with ●**levodopa**
- Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with ●**doxapram** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)

Anaesthetics, General (continued)

- Ergot Alkaloids: halothane reduces effects of **ergometrine** on the parturient uterus
 - Memantine: increased risk of CNS toxicity when ketamine given with ●**memantine** (manufacturer of memantine advises avoid concomitant use)
 - Methyldopa: enhanced hypotensive effect when general anaesthetics given with **methyldopa**
 - Metoclopramide: effects of thiopental enhanced by **metoclopramide**
 - Moxonidine: enhanced hypotensive effect when general anaesthetics given with **moxonidine**
 - Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with ●**suxamethonium**; volatile liquid general anaesthetics enhance effects of **non-depolarising muscle relaxants** and **suxamethonium**; ketamine enhances effects of **atracurium**
 - Nitrates: enhanced hypotensive effect when general anaesthetics given with **nitrates**
 - Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with **oxytocin**
 - Probencid: effects of thiopental possibly enhanced by **probencid**
 - Sympathomimetics: increased risk of arrhythmias when volatile liquid general anaesthetics given with ●**adrenaline (epinephrine)**; increased risk of hypertension when volatile liquid general anaesthetics given with ●**methyphenidate**
 - Theophylline: increased risk of convulsions when ketamine given with **theophylline**; increased risk of arrhythmias when halothane given with **theophylline**
 - Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Anaesthetics, General (intravenous)** *see* Anaesthetics, General
- Anaesthetics, General (volatile liquids)** *see* Anaesthetics, General
- Anaesthetics, Local** *see* Bupivacaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine
- Anagrelide**
- Cilostazol: manufacturer of anagrelide advises avoid concomitant use with ●**cilostazol**
 - Phosphodiesterase Type-3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with ●**enoximone** and ●**milrinone**
- Anakinra**
- Adalimumab: avoid concomitant use of anakinra with ●**adalimumab**
 - Certolizumab pegol: avoid concomitant use of anakinra with ●**certolizumab pegol**
 - Etanercept: avoid concomitant use of anakinra with ●**etanercept**
 - Golimumab: avoid concomitant use of anakinra with ●**golimumab**
 - Infliximab: avoid concomitant use of anakinra with ●**infliximab**
 - Vaccines: avoid concomitant use of anakinra with live ●**vaccines** (see p. 599)
- Analgesics** *see* Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol
- Angiotensin-II Receptor Antagonists**
- ACE Inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **ACE inhibitors**
 - Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **adrenergic neurone blockers**
 - Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alcohol**
 - Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **aldesleukin**
 - Aliskiren: irbesartan possibly reduces plasma concentration of **aliskiren**

Angiotensin-II Receptor Antagonists (*continued*)

- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **general anaesthetics**
- Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with **NSAIDs**, also hypotensive effect antagonised
- Antibacterials: plasma concentration of losartan and its active metabolite reduced by **rifampicin**; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **trimethoprim**
- Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **heparins**
- Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by **MAOIs**
- Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **antipsychotics**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **calcium-channel blockers**
- **Ciclosporin**: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **ciclosporin**
 - **Clonidine**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **clonidine**
 - **Corticosteroids**: hypotensive effect of angiotensin-II receptor antagonists antagonised by **corticosteroids**
 - **Diazoxide**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **diazoxide**
 - **Diuretics**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **diuretics**; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **potassium-sparing diuretics and aldosterone antagonists**
 - **Dopaminergics**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **levodopa**
 - **Lithium**: angiotensin-II receptor antagonists reduce excretion of **lithium** (increased plasma concentration)
 - **Methyldopa**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **methyldopa**
 - **Moxisylyte**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **moxisylyte**
 - **Moxonidine**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **moxonidine**
 - **Muscle Relaxants**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **baclofen or tizanidine**
 - **Nitrates**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **nitrates**
 - **Oestrogens**: hypotensive effect of angiotensin-II receptor antagonists antagonised by **oestrogens**
 - **Potassium Salts**: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **potassium salts**
 - **Prostaglandins**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alprostadil**
 - **Tacrolimus**: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **tacrolimus**
 - **Vasodilator Antihypertensives**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **hydralazine, minoxidil or sodium nitroprusside**

Antacids

- Note** Antacids should preferably not be taken at the same time as other drugs since they may impair absorption
- ACE Inhibitors**: antacids possibly reduce absorption of **ACE inhibitors**; antacids reduce absorption of **captopril, enalapril and fosinopril**
- Analgesics**: alkaline urine due to some antacids increases excretion of **aspirin**
- Antibacterials**: antacids reduce absorption of **azithromycin, cefaclor, cefpodoxime, ciprofloxacin, isoniazid, levofloxacin, moxifloxacin, norfloxacin, ofloxacin, rifampicin and tetracyclines**; avoid concomitant use of antacids with **methenamine**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **nitrofurantoin**
- Antiepileptics**: antacids reduce absorption of **gabapentin and phenytoin**
- Antifungals**: antacids reduce absorption of **itraconazole and ketoconazole**
- Antihistamines**: antacids reduce absorption of **fenofenadine**
- Antimalarials**: antacids reduce absorption of **chloroquine and hydroxychloroquine**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **proguanil**
- Antipsychotics**: antacids reduce absorption of **phenothiazines and sulpiride**
- Antivirals**: antacids possibly reduce plasma concentration of **atazanavir**; antacids reduce absorption of **tipranavir**
- Bile Acids**: antacids possibly reduce absorption of **bile acids**
- Bisphosphonates**: antacids reduce absorption of **bisphosphonates**
- Cardiac Glycosides**: antacids possibly reduce absorption of **digoxin**
- Corticosteroids**: antacids reduce absorption of **deflazacort**
- **Cytotoxics**: antacids possibly reduce plasma concentration of **erlotinib**—give antacids at least 4 hours before or 2 hours after erlotinib
 - **Deferasirox**: antacids containing aluminium possibly reduce absorption of **deferasirox** (manufacturer of deferasirox advises avoid concomitant use)
 - **Dipyridamole**: antacids possibly reduce absorption of **dipyridamole**
 - **Eltrombopag**: antacids reduce absorption of **eltrombopag** (give at least 4 hours apart)
 - **Iron**: oral magnesium salts (as magnesium trisilicate) reduce absorption of **oral iron**
 - **Lipid-regulating Drugs**: antacids reduce absorption of **rosuvastatin**
 - **Lithium**: sodium bicarbonate increases excretion of **lithium** (reduced plasma concentration)
 - **Mycophenolate**: antacids reduce absorption of **mycophenolate**
 - **Penicillamine**: antacids reduce absorption of **penicillamine**
 - **Polystyrene Sulphonate Resins**: risk of intestinal obstruction when aluminium hydroxide given with **polystyrene sulphonate resins**; risk of metabolic alkalosis when oral magnesium salts given with **polystyrene sulphonate resins**
 - **Thyroid Hormones**: antacids possibly reduce absorption of **levothyroxine**
 - **Ulcer-healing Drugs**: antacids possibly reduce absorption of **lansoprazole**
 - **Ulipristal**: avoidance of antacids advised by manufacturer of **ulipristal** (plasma concentration of ulipristal possibly reduced)
- Antazoline** see Antihistamines
- Anti-arrhythmics** see Adenosine, Amiodarone, Disopyramide, Dronedrone, Flecainide, Lidocaine, and Propafenone
- Antibacterials** see individual drugs
- Antibiotics (cytotoxic)** see Bleomycin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, and Mitoxantrone

Anticoagulants *see* Coumarins, Dabigatran etexilate, Heparins, Phenindione, and Rivaroxaban

Antidepressants *see* Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John's Wort; Tryptophan; Venlafaxine

Antidepressants, Noradrenaline Re-uptake Inhibitors *see* Reboxetine

Antidepressants, SSRI

Alcohol: sedative effects possibly increased when SSRIs given with **alcohol**

Anaesthetics, Local: fluvoxamine inhibits metabolism of **ropivacaine**—avoid prolonged administration of ropivacaine

- Analgesics: increased risk of bleeding when SSRIs given with ●**NSAIDs** or ●**aspirin**; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of **methadone**; increased risk of CNS toxicity when SSRIs given with ●**tramadol**

Anti-arrhythmics: fluoxetine increases plasma concentration of **flecainide**; paroxetine possibly inhibits metabolism of **propafenone** (increased risk of toxicity)

- Anticoagulants: SSRIs possibly enhance anticoagulant effect of ●**coumarins**
- Antidepressants: avoidance of fluvoxamine advised by manufacturer of ●**reboxetine**; possible increased serotonergic effects when SSRIs given with **duloxetine**; fluvoxamine inhibits metabolism of ●**duloxetine**—avoid concomitant use; CNS effects of SSRIs increased by ●**MAOIs** (risk of serious toxicity); citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping ●**MAOIs**, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping ●**MAOIs**, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; increased risk of CNS toxicity when escitalopram given with ●**moclobemide**, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start ●**moclobemide** for at least 1 week; after stopping fluoxetine do not start ●**moclobemide** for 5 weeks; increased serotonergic effects when SSRIs given with ●**St John's wort**—avoid concomitant use; fluvoxamine inhibits metabolism of ●**agomelatine** (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with **mirtazapine**; SSRIs increase plasma concentration of some ●**tricyclics**; CNS toxicity reported when fluoxetine given with **tryptophan**; agitation and nausea may occur when SSRIs given with ●**tryptophan**
- Antiepileptics: SSRIs antagonise anticonvulsant effect of ●**antiepileptics** (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of ●**carbamazepine**; plasma concentration of paroxetine reduced by **phenobarbital** and **phenytoin**; plasma concentration of sertraline possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased; fluoxetine and fluvoxamine increase plasma concentration of ●**phenytoin**
- Antihistamines: antidepressant effect of SSRIs possibly antagonised by **cyproheptadine**
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether/lumefantrine**
- Antimuscarinics: paroxetine increases plasma concentration of **darifenacin** and **procyclidine**
- Antipsychotics: avoidance of fluoxetine, fluvoxamine or sertraline advised by manufacturer of ●**droperidol** (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of ●**clozapine**, ●**haloperidol** and **risperidone**; fluvoxamine possibly increases plasma concentration of **haloperidol**; paroxetine inhibits metabolism of **perphenazine** (reduce dose of perphenazine); fluoxetine and paroxetine

Antidepressants, SSRI

● Antipsychotics (*continued*)

possibly inhibit metabolism of ●**aripiprazole** (reduce dose of aripiprazole); citalopram possibly increases plasma concentration of **clozapine** (increased risk of toxicity); fluvoxamine, paroxetine and sertraline increase plasma concentration of ●**clozapine**; fluvoxamine increases plasma concentration of **olanzapine**; SSRIs possibly increase plasma concentration of ●**pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of **risperidone** (increased risk of toxicity)

- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by **darunavir**; plasma concentration of SSRIs possibly increased by ●**ritonavir**; plasma concentration of paroxetine possibly reduced by **ritonavir**
- Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of **alprazolam**; fluvoxamine increases plasma concentration of some **benzodiazepines**; fluvoxamine increases plasma concentration of ●**melatonin**—avoid concomitant use; sedative effects possibly increased when sertraline given with **zolpidem**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**; fluoxetine and paroxetine possibly inhibit metabolism of **atomoxetine**

Beta-blockers: citalopram and escitalopram increase plasma concentration of **metoprolol**; paroxetine possibly increases plasma concentration of **metoprolol** (enhanced effect); fluvoxamine increases plasma concentration of **propranolol**

Bupropion: plasma concentration of citalopram possibly increased by **bupropion**

Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of **nifedipine** (increased plasma concentration)

- Clopidogrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of ●**clopidogrel**
- Dopaminergics: caution with paroxetine advised by manufacturer of **entacapone**; fluoxetine should not be started until 2 weeks after stopping ●**rasagiline**, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; increased risk of CNS toxicity when SSRIs given with ●**rasagiline**; fluvoxamine should not be started until 2 weeks after stopping ●**rasagiline**; increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with ●**selegiline** (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when paroxetine given with ●**selegiline** (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with ●**selegiline** (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); avoidance of citalopram and escitalopram advised by manufacturer of **selegiline**
- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of ●**tamoxifen** to active metabolite (avoid concomitant use)
- 5HT₁ Agonists: fluvoxamine inhibits the metabolism of **rovatriptan**; CNS toxicity reported when sertraline given with **sumatriptan**; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with ●**sumatriptan**; fluvoxamine possibly inhibits metabolism of **zolmitriptan** (reduce dose of zolmitriptan)
- Lithium: Increased risk of CNS effects when SSRIs given with ●**lithium** (lithium toxicity reported)

Antidepressants, SSRI (continued)

Metoclopramide: CNS toxicity reported when SSRIs given with **metoclopramide**

- Muscle Relaxants: fluvoxamine increases plasma concentration of **tizanidine** (increased risk of toxicity)—avoid concomitant use
 - Parasympathomimetics: paroxetine increases plasma concentration of **galantamine**
 - Ranolazine: paroxetine increases plasma concentration of **ranolazine**
 - Roflumilast: fluvoxamine inhibits the metabolism of **roflumilast**
 - Sympathomimetics: metabolism of SSRIs possibly inhibited by **methylphenidate**
 - Theophylline: fluvoxamine increases plasma concentration of **theophylline** (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)
- Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by **cimetidine**; fluvoxamine possibly increases plasma concentration of **lansoprazole**; plasma concentration of escitalopram increased by **omeprazole**

Antidepressants, SSRI (related) see Duloxetine and Venlafaxine

Antidepressants, Tricyclic

Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of **adrenergic neurone blockers**

- Alcohol: increased sedative effect when tricyclics given with **alcohol**
- Alpha₁-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of **apraclonidine** and **brimonidine**
- Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with **general anaesthetics**
- Analgesics: increased risk of CNS toxicity when tricyclics given with **tramadol**; side-effects possibly increased when tricyclics given with **nefopam**; sedative effects possibly increased when tricyclics given with **opioid analgesics**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with **amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with **disopyramide** or **flecainide**; avoidance of tricyclics advised by manufacturer of **dronedarone** (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with **propafenone**
- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with **moxifloxacin**—avoid concomitant use
- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of **coumarins**
- Antidepressants: possible increased serotonergic effects when amitriptyline or clomipramine given with **duloxetine**; increased risk of hypertension and CNS excitation when tricyclics given with **MAOIs**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start **moclobemide** for at least 1 week; plasma concentration of some tricyclics increased by **SSRIs**; plasma concentration of amitriptyline reduced by **St John's wort**
- Antiepileptics: tricyclics antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); metabolism of tricyclics accelerated by **carbamazepine** (reduced plasma concentration and reduced effect); metabolism of tricyclics possibly accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of tricyclics possibly reduced by **phenytoin**
- Antifungals: plasma concentration of tricyclics possibly increased by **terbinafine**

Antidepressants, Tricyclic (continued)

Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with **antihistamines**

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether/lumefantrine**
- Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with **antimuscarinics**
- Antipsychotics: plasma concentration of tricyclics increased by **antipsychotics**—possibly increased risk of ventricular arrhythmias; avoidance of tricyclics advised by manufacturer of **droperidol** (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with **clozapine**; increased risk of antimuscarinic side-effects when tricyclics given with **phenothiazines**; increased risk of ventricular arrhythmias when tricyclics given with **pimozide**—avoid concomitant use
- Antivirals: plasma concentration of tricyclics possibly increased by **ritonavir**; increased risk of ventricular arrhythmias when tricyclics given with **saquinavir**—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with **anxiolytics and hypnotics**
- Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with **atomoxetine**; possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Beta-blockers: plasma concentration of imipramine increased by **labetalol** and **propranolol**; increased risk of ventricular arrhythmias when tricyclics given with **sotalol**
- Bupropion: plasma concentration of tricyclics possibly increased by **bupropion** (possible increased risk of convulsions)
- Calcium-channel Blockers: plasma concentration of imipramine increased by **diltiazem** and **verapamil**; plasma concentration of tricyclics possibly increased by **diltiazem** and **verapamil**
- Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with **cannabis extract**
- Clonidine: tricyclics antagonise hypotensive effect of **clonidine**, also increased risk of hypertension on clonidine withdrawal
- Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with **arsenic trioxide**
- Disulfiram: metabolism of tricyclics inhibited by **disulfiram** (increased plasma concentration); concomitant amitriptyline reported to increase **disulfiram** reaction with alcohol
- Diuretics: increased risk of postural hypotension when tricyclics given with **diuretics**
- Dopaminergics: caution with tricyclics advised by manufacturer of **entacapone**; increased risk of CNS toxicity when tricyclics given with **rasagiline**; CNS toxicity reported when tricyclics given with **selegiline**
- Histamine: tricyclics theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use
- Lithium: risk of toxicity when tricyclics given with **lithium**
- Moxonidine: tricyclics possibly antagonise hypotensive effect of **moxonidine** (manufacturer of moxonidine advises avoid concomitant use)
- Muscle Relaxants: tricyclics enhance muscle relaxant effect of **baclofen**
- Nicorandil: tricyclics possibly enhance hypotensive effect of **nicorandil**
- Nitrates: tricyclics reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Oestrogens: antidepressant effect of tricyclics antagonised by **oestrogens** (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Antidepressants, Tricyclic (continued)

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with ●**pentamidine isetionate**

Sodium Oxybate: increased risk of side-effects when tricyclics given with **sodium oxybate**

- Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with ●**adrenaline (epinephrine)** (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by **methylphenidate**; increased risk of hypertension and arrhythmias when tricyclics given with ●**noradrenaline (norepinephrine)**

Thyroid Hormones: effects of tricyclics possibly enhanced by **thyroid hormones**; effects of amitriptyline and imipramine enhanced by **thyroid hormones**

Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by **cimetidine**; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by **cimetidine** (increased plasma concentration)

Antidepressants, Tricyclic (related)

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with ●**alcohol**
- Alpha₁-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of **apraclonidine** and **brimonidine**
- Anticoagulants: trazodone may enhance or reduce anticoagulant effect of **warfarin**
- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping ●**MAOIs**, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start ●**moclobemide** for at least 1 week
- Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of ●**antiepileptics** (convulsive threshold lowered); plasma concentration of mianserin reduced by ●**carbamazepine** and ●**phenytoin**; metabolism of mianserin accelerated by ●**phenobarbital** (reduced plasma concentration)
- Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with **antihistamines**
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether/lumefantrine**
- Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with **antimuscarinics**
- Antivirals: plasma concentration of trazodone increased by ●**ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with ●**saquinavir**—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with **anxiolytics and hypnotics**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with **diazoxide**
- Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with **hydralazine** or **sodium nitroprusside**

Antidiabetics

Note Other oral drugs may be taken at least 1 hour before or 4 hours after xenatide injection, or taken with a meal when xenatide is not administered, to minimise possible interference with absorption

ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by **ACE inhibitors**

Antidiabetics (continued)

- Alcohol: hypoglycaemic effect of antidiabetics enhanced by **alcohol**; increased risk of lactic acidosis when metformin given with **alcohol**
- Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by **anabolic steroids**
- Analgesics: effects of sulfonylureas possibly enhanced by ●**NSAIDs**
- Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by **disopyramide**
- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by **neomycin**, also severity of gastrointestinal effects increased; effects of repaglinide enhanced by **clarithromycin**; effects of glibenclamide possibly enhanced by **norfloxacin**; plasma concentration of nateglinide reduced by **rifampicin**; hypoglycaemic effect of repaglinide possibly antagonised by **rifampicin**; effects of sulfonylureas enhanced by ●**chloramphenicol**; metabolism of tolbutamide accelerated by ●**rifamycins** (reduced effect); metabolism of sulfonylureas possibly accelerated by ●**rifamycins** (reduced effect); effects of sulfonylureas rarely enhanced by **sulfonamides** and **trimethoprim**; hypoglycaemic effect of sulfonylureas possibly enhanced by **tetracyclines**; hypoglycaemic effect of repaglinide possibly enhanced by **trimethoprim**—manufacturer advises avoid concomitant use
- Anticoagulants: xenatide possibly enhances anticoagulant effect of **warfarin**; hypoglycaemic effect of sulfonylureas possibly enhanced by ●**coumarins**, also possible changes to anticoagulant effect
- Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by **MAOIs**; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by **MAOIs**
- Antiepileptics: tolbutamide transiently increases plasma concentration of **phenytoin** (possibility of toxicity); plasma concentration of glibenclamide possibly reduced by **topiramate**; plasma concentration of metformin possibly increased by **topiramate**
- Antifungals: plasma concentration of sulfonylureas increased by ●**fluconazole** and ●**miconazole**; hypoglycaemic effect of gliclazide and glibiclide enhanced by ●**miconazole**—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by **fluconazole**; hypoglycaemic effect of repaglinide possibly enhanced by **itraconazole**; hypoglycaemic effect of glipizide possibly enhanced by **posaconazole**; plasma concentration of sulfonylureas possibly increased by **voriconazole**
- Antihistamines: thrombocyte count depressed when metformin given with **ketotifen** (manufacturer of ketotifen advises avoid concomitant use)
- Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by **phenothiazines**
- Antivirals: plasma concentration of tolbutamide possibly increased by **ritonavir**
- Appetitant: plasma concentration of tolbutamide reduced by **aprepitant**
- Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with **beta-blockers**; hypoglycaemic effect of insulin enhanced by **beta-blockers**
- Bosentan: increased risk of hepatotoxicity when glibenclamide given with ●**bosentan**—avoid concomitant use
- Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with **nifedipine**
- Cardiac Glycosides: acarbose possibly reduces plasma concentration of **digoxin**; sitagliptin increases plasma concentration of **digoxin**
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by **ciclosporin**
- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by **corticosteroids**
- Cytotoxics: avoidance of repaglinide advised by manufacturer of ●**lapatinib**

Antidiabetics (continued)

Deferasirox: plasma concentration of repaglinide increased by **deferasirox**

Diazoxide: hypoglycaemic effect of antidiabetics antagonised by **diazoxide**

Diuretics: hypoglycaemic effect of antidiabetics antagonised by **loop diuretics** and **thiazides** and related diuretics

Hormone Antagonists: requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by **lanreotide**; requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by **octreotide**

Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by **leftunomide**

- **Lipid-regulating Drugs**: absorption of glibenclamide reduced by **colesvelam**; hypoglycaemic effect of acarbose possibly enhanced by **colestyramine**; hypoglycaemic effect of nateglinide possibly enhanced by **gemfibrozil**; increased risk of severe hypoglycaemia when repaglinide given with **gemfibrozil**—avoid concomitant use; plasma concentration of glibenclamide possibly increased by **fluvastatin**; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with **fibrates**
- **Oestrogens**: hypoglycaemic effect of antidiabetics antagonised by **oestrogens**
- **Orlistat**: avoidance of acarbose advised by manufacturer of **orlistat**
- **Pancreatin**: hypoglycaemic effect of acarbose antagonised by **pancreatin**
- **Progestogens**: hypoglycaemic effect of antidiabetics antagonised by **progestogens**
- **Sulfapyrazone**: effects of sulfonylureas enhanced by **sulfapyrazone**
- **Testosterone**: hypoglycaemic effect of antidiabetics possibly enhanced by **testosterone**

Ulcer-healing Drugs: excretion of metformin reduced by **cimetidine** (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by **cimetidine**

Antiepileptics see Carbamazepine, Eslicarbazepine, Ethosuximide, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Phenobarbital, Phenytoin, Rufinamide, Stripentol, Tiagabine, Topiramate, Valproate, Vigabatrin, and Zonisamide

Antifungals see Amphotericin, Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin; Micafungin; Terbinafine

Antifungals, Imidazole

Aliskiren: ketoconazole increases plasma concentration of **aliskiren**

Alpha-blockers: ketoconazole possibly increases plasma concentration of **alfuzosin**

- **Analgesics**: ketoconazole inhibits metabolism of **buprenorphine** (reduce dose of buprenorphine)
- **Antacids**: absorption of ketoconazole reduced by **antacids**
- **Anti-arrhythmics**: increased risk of ventricular arrhythmias when ketoconazole given with **disopyramide**—avoid concomitant use; ketoconazole increases plasma concentration of **dronedarone**—avoid concomitant use
- **Antibacterials**: metabolism of ketoconazole accelerated by **rifampicin** (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of ketoconazole possibly reduced by **isoniazid**; avoidance of concomitant ketoconazole in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
- **Anticoagulants**: ketoconazole enhances anticoagulant effect of **coumarins**; miconazole enhances anticoagulant effect of **coumarins** (miconazole oral gel and possibly vaginal formulations absorbed); ketoconazole increases plasma concentration of **rivaroxaban**—avoid concomitant use

Antifungals, Imidazole (continued)

- **Antidepressants**: avoidance of imidazoles advised by manufacturer of **reboxetine**; ketoconazole increases plasma concentration of **mirtazapine**
- **Antidiabetics**: miconazole enhances hypoglycaemic effect of **gliclazide** and **glipizide**—avoid concomitant use; miconazole increases plasma concentration of **sulfonylureas**
- **Antiepileptics**: ketoconazole and miconazole possibly increase plasma concentration of **carbamazepine**; plasma concentration of ketoconazole reduced by **phenytoin**; miconazole enhances anticonvulsant effect of **phenytoin** (plasma concentration of phenytoin increased)
- **Antifungals**: imidazoles possibly antagonise effects of **amphotericin**
- **Antihistamines**: manufacturer of loratadine advises ketoconazole possibly increases plasma concentration of **loratadine**; imidazoles possibly inhibit metabolism of **mizolastine** (avoid concomitant use); ketoconazole inhibits metabolism of **mizolastine**—avoid concomitant use; ketoconazole increases plasma concentration of **rupatadine**
- **Antimalarials**: avoidance of imidazoles advised by manufacturer of **artemether/lumefantrine**; ketoconazole increases plasma concentration of **mefloquine**
- **Antimuscarinics**: absorption of ketoconazole reduced by **antimuscarinics**; ketoconazole increases plasma concentration of **darifenacin**—avoid concomitant use; manufacturer of fesoterodine advises dose reduction when ketoconazole given with **fesoterodine**—consult fesoterodine product literature; ketoconazole increases plasma concentration of **solifenacin**; avoidance of ketoconazole advised by manufacturer of **tolterodine**
- **Antipsychotics**: ketoconazole inhibits metabolism of **aripiprazole** (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when imidazoles given with **pimozide**—avoid concomitant use; imidazoles possibly increase plasma concentration of **quetiapine** (reduce dose of quetiapine)
- **Antivirals**: plasma concentration of both drugs increased when ketoconazole given with **darunavir**; plasma concentration of ketoconazole increased by **fosamprenavir** (also plasma concentration of fosamprenavir possibly increased); ketoconazole increases plasma concentration of **indinavir** and **maraviroc** (consider reducing dose of indinavir and maraviroc); plasma concentration of ketoconazole reduced by **nevirapine**—avoid concomitant use; combination of ketoconazole with **ritonavir** may increase plasma concentration of either drug (or both); imidazoles possibly increase plasma concentration of **saquinavir**; ketoconazole increases plasma concentration of **saquinavir**
- **Anxiolytics** and **Hypnotics**: ketoconazole increases plasma concentration of **alprazolam**; ketoconazole increases plasma concentration of **midazolam** (risk of prolonged sedation)
- **Appetitant**: ketoconazole increases plasma concentration of **aprepitant**
- **Bosentan**: ketoconazole increases plasma concentration of **bosentan**
- **Calcium-channel Blockers**: ketoconazole inhibits metabolism of **felodipine** (increased plasma concentration); avoidance of ketoconazole advised by manufacturer of **lercanidipine**; ketoconazole possibly inhibits metabolism of **dihydropyridines** (increased plasma concentration)
- **Ciclosporin**: ketoconazole inhibits metabolism of **ciclosporin** (increased plasma concentration); miconazole possibly inhibits metabolism of **ciclosporin** (increased plasma concentration)
- **Cilostazol**: ketoconazole increases plasma concentration of **cilostazol** (consider reducing dose of cilostazol)
- **Cinacalcet**: ketoconazole inhibits metabolism of **cinacalcet** (increased plasma concentration)

Antifungals, Imidazole (continued)

- Clopidogrel: ketoconazole possibly reduces antiplatelet effect of ●**clopidogrel**
- Colchicine: ketoconazole possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ketoconazole possibly inhibits metabolism of ●**corticosteroids**; ketoconazole increases plasma concentration of *inhaled* and *oral* ●**budesonide**; ketoconazole increases plasma concentration of active metabolite of ●**ciclesonide**; ketoconazole inhibits the metabolism of ●**methylprednisolone**; ketoconazole increases plasma concentration of *inhaled* ●**mometasone**
- Cytotoxics: ketoconazole possibly increases plasma concentration of ●**dasatinib**; ketoconazole inhibits metabolism of ●**erlotinib** and ●**sunitinib** (increased plasma concentration); ketoconazole increases plasma concentration of ●**everolimus**, ●**lapatinib** and ●**nilotinib**—avoid concomitant use; ketoconazole increases plasma concentration of ●**bortezomib** and ●**imatinib**; avoidance of ketoconazole advised by manufacturer of ●**pazopanib**; ketoconazole increases plasma concentration of active metabolite of ●**temsirolimus**—avoid concomitant use; *in vitro* studies suggest a possible interaction between ketoconazole and ●**docetaxel** (consult docetaxel product literature); ketoconazole reduces plasma concentration of ●**irinotecan** (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; ketoconazole increases plasma concentration of ●**vinflunine**—manufacturer of vinflunine advises avoid concomitant use
- Diuretics: ketoconazole increases plasma concentration of ●**eplerenone**—avoid concomitant use
- Domperidone: ketoconazole possibly increases risk of arrhythmias with ●**domperidone**
- Ergot Alkaloids: increased risk of ergotism when imidazoles given with ●**ergotamine** and ●**methylsergide**—avoid concomitant use
- 5HT_{2A} Agonists: ketoconazole increases plasma concentration of ●**almotriptan** (increased risk of toxicity); ketoconazole increases plasma concentration of ●**eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: ketoconazole increases plasma concentration of ●**ivabradine**—avoid concomitant use
- Lanthanum: absorption of ketoconazole possibly reduced by ●**lanthanum** (give at least 2 hours apart)
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with ●**atorvastatin**; increased risk of myopathy when ketoconazole given with ●**simvastatin** (avoid concomitant use); possible increased risk of myopathy when miconazole given with ●**simvastatin**—avoid concomitant use
- Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with ●**oestrogens**
- Parasympathomimetics: ketoconazole increases plasma concentration of ●**galantamine**
- Ranolazine: ketoconazole increases plasma concentration of ●**ranolazine**—avoid concomitant use
- Retinoids: ketoconazole increases plasma concentration of ●**alitretinoin**
- Sildenafil: ketoconazole increases plasma concentration of ●**sildenafil**—reduce initial dose of sildenafil
- Sirolimus: ketoconazole increases plasma concentration of ●**sirolimus**—avoid concomitant use; miconazole increases plasma concentration of ●**sirolimus**
- Sympathomimetics, Beta₂: ketoconazole inhibits metabolism of ●**salmeterol** (increased plasma concentration)
- Tacrolimus: imidazoles possibly increase plasma concentration of ●**tacrolimus**; ketoconazole increases plasma concentration of ●**tacrolimus** (consider reducing dose of tacrolimus)
- Tadalafil: ketoconazole increases plasma concentration of ●**tadalafil**—manufacturer of tadalafil advises avoid concomitant use

Antifungals, Imidazole (continued)

- Theophylline: ketoconazole possibly increases plasma concentration of ●**theophylline**
 - Tolvaptan: ketoconazole increases plasma concentration of ●**tolvaptan**
 - Ulcer-healing Drugs: absorption of ketoconazole reduced by ●**histamine H₂-antagonists**, ●**proton pump inhibitors** and ●**sucralfate**
 - Vardenafil: ketoconazole increases plasma concentration of ●**vardenafil**—avoid concomitant use
 - Vitamins: ketoconazole possibly increases plasma concentration of ●**paricalcitol**
- Antifungals, Polyene** see Amphotericin
- Antifungals, Triazole**
- Note** In general, fluconazole interactions relate to multiple-dose treatment
- Analgesics: fluconazole increases plasma concentration of ●**celecoxib** (halve dose of celecoxib); voriconazole increases plasma concentration of ●**diclofenac**, ●**ibuprofen** and ●**oxycodone**; fluconazole increases plasma concentration of ●**flurbiprofen** and ●**ibuprofen**; fluconazole increases plasma concentration of ●**parecoxib** (reduce dose of parecoxib); voriconazole increases plasma concentration of ●**alfentanil** and ●**methadone** (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of ●**alfentanil** (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of ●**alfentanil**; triazoles possibly increase plasma concentration of ●**fentanyl**
 - Antacids: absorption of itraconazole reduced by ●**antacids**
 - Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with ●**disopyramide**; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●**dronedarone**
 - Antibacterials: plasma concentration of itraconazole increased by ●**clarithromycin**; triazoles possibly increase plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of ●**rifabutin** (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of ●**rifabutin**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by ●**rifabutin** and ●**rifampicin**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of posaconazole reduced by ●**rifampicin**; plasma concentration of voriconazole reduced by ●**rifampicin**—avoid concomitant use; metabolism of fluconazole accelerated by ●**rifampicin** (reduced plasma concentration)
 - Anticoagulants: fluconazole, itraconazole and voriconazole enhance anticoagulant effect of ●**coumarins**; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●**rivaroxaban**
 - Antidepressants: avoidance of triazoles advised by manufacturer of ●**reboxetine**; plasma concentration of voriconazole reduced by ●**St John's wort**—avoid concomitant use
 - Antidiabetics: posaconazole possibly enhances hypoglycaemic effect of ●**glipizide**; fluconazole possibly enhances hypoglycaemic effect of ●**nateglinide**; itraconazole possibly enhances hypoglycaemic effect of ●**repaglinide**; fluconazole increases plasma concentration of ●**sulfonylureas**; voriconazole possibly increases plasma concentration of ●**sulfonylureas**
 - Antiepileptics: fluconazole possibly increases plasma concentration of ●**carbamazepine**; plasma concentration of voriconazole possibly reduced by ●**carbamazepine** and ●**phenobarbital**—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ●**carbamazepine**; plasma concentration of itraconazole and posaconazole possibly reduced by ●**phenobarbital**; fluconazole

Antifungals, Triazole

- Antiepileptics (*continued*)
 - increases plasma concentration of ●phenytoin (consider reducing dose of phenytoin); voriconazole increases plasma concentration of ●phenytoin, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); plasma concentration of posaconazole reduced by ●phenytoin; plasma concentration of itraconazole reduced by ●phenytoin—avoid concomitant use

Antifungals; triazoles possibly antagonise effects of amphotericin; plasma concentration of itraconazole increased by micafungin (consider reducing dose of itraconazole)

- Antihistamines: itraconazole inhibits metabolism of ●mizolastine—avoid concomitant use
- Antimalarials: avoidance of triazoles advised by manufacturer of ●artemether/lumefantrine
- Antimuscarinics: avoidance of itraconazole advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when itraconazole given with fesoterodine—consult fesoterodine product literature; itraconazole increases plasma concentration of solifenacin
- Antipsychotics: itraconazole possibly increases plasma concentration of haloperidol; itraconazole possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when triazoles given with ●imipizide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine)
- Antivirals: posaconazole increases plasma concentration of ●atazanavir; plasma concentration of itraconazole and posaconazole reduced by ●efavirenz; plasma concentration of voriconazole reduced by ●efavirenz, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of both drugs may increase when itraconazole given with fosamprenavir; itraconazole increases plasma concentration of ●indinavir (consider reducing dose of indinavir); plasma concentration of itraconazole possibly reduced by nevirapine—consider increasing dose of itraconazole; fluconazole increases plasma concentration of ●nevirapine, ritonavir and tipranavir; combination of itraconazole with ●ritonavir may increase plasma concentration of either drug (or both); plasma concentration of voriconazole reduced by ●ritonavir—avoid concomitant use; triazoles possibly increase plasma concentration of saquinavir; fluconazole increases plasma concentration of ●zidovudine (increased risk of toxicity)
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; posaconazole increases plasma concentration of ●midazolam; fluconazole and itraconazole increase plasma concentration of ●midazolam (risk of prolonged sedation); itraconazole increases plasma concentration of buspirone (reduce dose of buspirone)
- Bosentan: fluconazole possibly increases plasma concentration of ●bosentan—avoid concomitant use; itraconazole possibly increases plasma concentration of bosentan
- Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with calcium-channel blockers; itraconazole inhibits metabolism of ●felodipine (increased plasma concentration); avoidance of itraconazole advised by manufacturer of lercanidipine; itraconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)
- Cardiac Glycosides: itraconazole increases plasma concentration of ●digoxin

Antifungals, Triazole (*continued*)

- Ciclosporin: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of ●ciclosporin (increased plasma concentration)
- Clopidogrel: fluconazole, itraconazole and voriconazole possibly reduce antiplatelet effect of ●clopidogrel
- Colchicine: itraconazole possibly increases risk of ●colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: itraconazole possibly inhibits metabolism of corticosteroids and methylprednisolone; itraconazole increases plasma concentration of inhaled budesonide
- Cytotoxics: itraconazole inhibits metabolism of busulfan (increased risk of toxicity); itraconazole possibly increases side-effects of cyclophosphamide; itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ●everolimus—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of gefitinib; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●lapatinib; avoidance of itraconazole and voriconazole advised by manufacturer of ●nilotinib; avoidance of itraconazole and voriconazole advised by manufacturer of ●pazopanib; posaconazole possibly inhibits metabolism of ●vinblastine and ●vincristine (increased risk of neurotoxicity); itraconazole possibly inhibits metabolism of ●vincristine and ●vinorelbine (increased risk of neurotoxicity); itraconazole possibly increases plasma concentration of ●vinflunine—manufacturer of vinflunine advises avoid concomitant use
- Diuretics: fluconazole increases plasma concentration of ●eplerenone (reduce dose of eplerenone); itraconazole increases plasma concentration of ●eplerenone—avoid concomitant use; plasma concentration of fluconazole increased by hydrochlorothiazide
- Ergot Alkaloids: increased risk of ergotism when triazoles given with ●ergotamine and methysergide—avoid concomitant use
- 5HT₁ Agonists: itraconazole increases plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: fluconazole increases plasma concentration of ivabradine—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when triazoles given with atorvastatin; increased risk of myopathy when itraconazole or posaconazole given with ●atorvastatin (avoid concomitant use); fluconazole increases plasma concentration of fluvastatin; increased risk of myopathy when itraconazole or posaconazole given with ●simvastatin (avoid concomitant use); possible increased risk of myopathy when voriconazole given with simvastatin; possible increased risk of myopathy when fluconazole given with ●simvastatin—avoid concomitant use
- Oestrogens: plasma concentration of voriconazole increased by ●oestrogens
- Progestogens: plasma concentration of voriconazole possibly increased by ●progestogens
- Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: itraconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: posaconazole possibly increases plasma concentration of ●sirolimus; itraconazole and voriconazole increase plasma concentration of ●sirolimus—avoid concomitant use
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma

Antifungals, Triazole

- Tacrolimus (*continued*)
 - concentration of ●tacrolimus (consider reducing dose of tacrolimus)
- Tadalafil: itraconazole possibly increases plasma concentration of tadalafil
- Theophylline: fluconazole possibly increases plasma concentration of ●theophylline
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by ●cimetidine; voriconazole possibly increases plasma concentration of ●esomeprazole; voriconazole increases plasma concentration of ●omeprazole (consider reducing dose of omeprazole); absorption of itraconazole reduced by histamine H₂-antagonists and proton pump inhibitors; manufacturer of posaconazole advises avoid concomitant use with histamine H₂-antagonists and proton pump inhibitors (plasma concentration of posaconazole possibly reduced)
- Vardenafil: itraconazole possibly increases plasma concentration of ●vardenafil—avoid concomitant use

Antihistamines

Note Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)

Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)

- Analgesics: sedative effects possibly increased when sedating antihistamines given with ●opioid analgesics
- Antacids: absorption of fexofenadine reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with ●amiodarone, ●disopyramide, ●flecainide or ●propafenone—avoid concomitant use

- Antibacterials: plasma concentration of rupatadine increased by ●erythromycin; manufacturer of loratadine advises plasma concentration possibly increased by ●erythromycin; metabolism of mizolastine inhibited by ●erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with ●moxifloxacin—avoid concomitant use; effects of fexofenadine possibly reduced by rifampicin; metabolism of mizolastine possibly inhibited by ●macrolides (avoid concomitant use)

Antidepressants: increased antimuscarinic and sedative effects when antihistamines given with MAOIs or tricyclics; manufacturer of promethazine advises avoid for 2 weeks after stopping MAOIs; cyproheptadine possibly antagonises antidepressant effect of SSRIs; possible increased antimuscarinic and sedative effects when antihistamines given with tricyclic-related antidepressants

Antidiabetics: thrombocytopenia depressed when ketotifen given with metformin (manufacturer of ketotifen advises avoid concomitant use)

- Antifungals: plasma concentration of rupatadine increased by ketoconazole; manufacturer of loratadine advises plasma concentration possibly increased by ketoconazole; metabolism of mizolastine inhibited by ●itraconazole or ●ketoconazole—avoid concomitant use; metabolism of mizolastine possibly inhibited by ●imidazoles (avoid concomitant use)

Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with antimuscarinics

- Antivirals: plasma concentration of chlorphenamine possibly increased by lopinavir; plasma concentration of non-sedating antihistamines possibly increased by ritonavir; increased risk of ventricular arrhythmias when mizolastine given with ●saquinavir—avoid concomitant use

Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with anxiolytics and hypnotics

Antihistamines (*continued*)

- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with ●sotalol—avoid concomitant use
- Bethahistine: antihistamines theoretically antagonise effect of bethahistine
- Grapefruit Juice: plasma concentration of rupatadine increased by ●grapefruit juice—avoid concomitant use
- Histamine: antihistamines theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use
- Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by cimetidine

Antihistamines, Non-sedating see Antihistamines

Antihistamines, Sedating see Antihistamines

Antimalarials see Artemether with Lumefantrine, Chloroquine and Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, Pyrimethamine, and Quinine

Antimetabolites see Cytarabine, Fludarabine, Fluorouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, and Tioguanine

Antimuscarinics

Note Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation

Alcohol: increased sedative effect when hyoscine given with alcohol

Analgesics: possible increased risk of antimuscarinic side-effects when antimuscarinics given with codeine; increased risk of antimuscarinic side-effects when antimuscarinics given with nefopam

- Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with ●amiodarone, ●disopyramide or ●flecainide; increased risk of antimuscarinic side-effects when antimuscarinics given with disopyramide

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with clarithromycin and telithromycin—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of darifenacin possibly increased by erythromycin; plasma concentration of active metabolite of fesoterodine reduced by rifampicin

Antidepressants: plasma concentration of darifenacin and procyclidine increased by paroxetine; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or tricyclics; possible increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants

Antifungals: antimuscarinics reduce absorption of ketoconazole; manufacturer of fesoterodine advises dose reduction when fesoterodine given with itraconazole and ketoconazole—consult fesoterodine product literature; plasma concentration of darifenacin increased by ketoconazole—avoid concomitant use; plasma concentration of solifenacin increased by itraconazole and ketoconazole; manufacturer of tolterodine advises avoid concomitant use with itraconazole and ketoconazole; manufacturer of darifenacin advises avoid concomitant use with itraconazole

Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines

Antipsychotics: antimuscarinics possibly reduce effects of haloperidol; increased risk of antimuscarinic side-effects when antimuscarinics given with clozapine; antimuscarinics reduce plasma concentration of phenothiazines, but risk of antimuscarinic side-effects increased

Antivirals: manufacturer of darifenacin advises avoid concomitant use with atazanavir, fosamprenavir,

Antimuscarinics**Antivirals (continued)**

indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir; manufacturer of fesoterodine advises dose reduction when fesoterodine given with atazanavir, indinavir, nelfinavir, ritonavir and saquinavir—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir and saquinavir; plasma concentration of solifenacin increased by nelfinavir and ritonavir

- Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with **sotalol**
- Calcium-channel Blockers: manufacturer of darifenacin advises avoid concomitant use with **verapamil**
- Cardiac Glycosides: darifenacin possibly increases plasma concentration of **digoxin**
- Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with **ciclosporin**
- Domeperidone: antimuscarinics antagonise effects of **domeperidone** on gastro-intestinal activity
- Dopaminergics: antimuscarinics possibly reduce absorption of **levodopa**
- Memantine: effects of antimuscarinics possibly enhanced by **memantine**
- Metoclopramide: antimuscarinics antagonise effects of **metoclopramide** on gastro-intestinal activity
- Nitrates: antimuscarinics possibly reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Parasympathomimetics: antimuscarinics antagonise effects of **parasympathomimetics**

Antipsychotics

Note Increased risk of toxicity with myelosuppressive drugs

Note Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis

ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with **adrenergic neurone blockers**; higher doses of chlorpromazine antagonise hypotensive effect of **adrenergic neurone blockers**; haloperidol antagonises hypotensive effect of **adrenergic neurone blockers**

Adsorbents: absorption of phenothiazines possibly reduced by **kaolin**

Alcohol: increased sedative effect when antipsychotics given with **alcohol**

Alpha-blockers: enhanced hypotensive effect when antipsychotics given with **alpha-blockers**

- Anaesthetics, General: droperidol enhances effects of **thiopental**; enhanced hypotensive effect when antipsychotics given with **general anaesthetics**
- Analgesics: possible severe drowsiness when haloperidol given with **indometacin**; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **methadone**; increased risk of ventricular arrhythmias when amisulpride given with **methadone**—avoid concomitant use; increased risk of convulsions when antipsychotics given with **tramadol**; enhanced hypotensive and sedative effects when antipsychotics given with **opioid analgesics**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with **angiotensin-II receptor antagonists**
- Antacids: absorption of phenothiazines and sulpiride reduced by **antacids**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **anti-arrhythmics** that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopentixol given with **amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **amiodarone**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **amiodarone** or **disopyramide**; increased risk of ventricular arrhythmias when amisulpride given with **disopyramide**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with **disopyramide**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with **disopyramide**; avoidance of phenothiazines advised by manufacturer of **dronedarone** (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with **flecainide**
- Antibacterials: increased risk of ventricular arrhythmias when pimozide given with **clarithromycin**, **moxifloxacin** or **tetracycline**—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride given with **erythromycin**—avoid concomitant use; plasma concentration of clozapine possibly increased by **erythromycin** (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with **erythromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **parenteral erythromycin**; increased risk of ventricular arrhythmias when zuclopentixol given with **parenteral erythromycin**—avoid concomitant use; plasma concentration of clozapine increased by **ciprofloxacin**; plasma concentration of olanzapine possibly increased by **ciprofloxacin**; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopentixol given with **moxifloxacin**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **moxifloxacin**—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by **rifabutin** and **rifampicin**—increase dose of aripiprazole; plasma concentration of clozapine possibly reduced by **rifampicin**; metabolism of haloperidol accelerated by **rifampicin** (reduced plasma concentration); avoid concomitant use of clozapine with **chloramphenicol** or **sulfonamides** (increased risk of agranulocytosis); plasma concentration of quetiapine possibly increased by **macrolides** (reduce dose of quetiapine); manufacturer of droperidol advises avoid concomitant use with **macrolides** (risk of ventricular arrhythmias)
- Antidepressants: plasma concentration of clozapine possibly increased by **citalopram** (increased risk of toxicity); metabolism of aripiprazole possibly inhibited by **fluoxetine** and **paroxetine** (reduce dose of aripiprazole); plasma concentration of clozapine, haloperidol and risperidone increased by **fluoxetine**; manufacturer of droperidol advises avoid concomitant use with **fluoxetine**, **fluvoxamine**, **sertraline** or **tricyclics** (risk of ventricular arrhythmias); plasma concentration of clozapine and olanzapine increased by **fluvoxamine**; plasma concentration of haloperidol possibly increased by **fluvoxamine**; plasma concentration of clozapine increased by **paroxetine**, **sertraline** and **venlafaxine**; plasma concentration of risperidone possibly increased by **paroxetine** (increased risk of toxicity); metabolism of perphenazine inhibited by **paroxetine** (reduce dose of perphenazine); plasma concentration of haloperidol increased by **venlafaxine**; clozapine possibly increases CNS effects of **MAOIs**; plasma concentration of pimozide possibly increased by **SSRIs** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by **St John's wort**—increase dose of aripiprazole; antipsychotics increase plasma concentration of **tricyclics**—possibly increased risk of ventricular

Antipsychotics

- **Antidepressants (continued)**
 - arrhythmias; increased risk of antimuscarinic side-effects when phenothiazines given with **tricyclics**; increased risk of ventricular arrhythmias when pimozide given with **tricyclics**—avoid concomitant use; possible increased antimuscarinic side-effects when clozapine given with **tricyclics**
- Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of **sulfonylureas**
- **Antiepileptics**: antipsychotics antagonise anti-convulsant effect of **antiepileptics** (convulsive threshold lowered); metabolism of clozapine accelerated by **carbamazepine** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by **carbamazepine**—increase dose of aripiprazole; plasma concentration of paliperidone reduced by **carbamazepine**; metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by **carbamazepine** (reduced plasma concentration); metabolism of haloperidol accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with **phenobarbital**; plasma concentration of clozapine possibly reduced by **phenobarbital**; plasma concentration of aripiprazole possibly reduced by **phenobarbital** and
 - **phenytoin**—increase dose of aripiprazole; plasma concentration of haloperidol reduced by **phenytoin**; chlorpromazine possibly increases or decreases plasma concentration of **phenytoin**; metabolism of clozapine and quetiapine accelerated by **phenytoin** (reduced plasma concentration); increased risk of side-effects including neutropenia when olanzapine given with **valproate**; plasma concentration of clozapine possibly increased or decreased by **valproate**; plasma concentration of quetiapine possibly increased by **valproate**
- **Antifungals**: metabolism of aripiprazole inhibited by **ketoconazole** (reduce dose of aripiprazole); metabolism of aripiprazole possibly inhibited by **itraconazole** (reduce dose of aripiprazole); plasma concentration of haloperidol possibly increased by **itraconazole**; increased risk of ventricular arrhythmias when pimozide given with **imidazoles** or **triazoles**—avoid concomitant use; plasma concentration of quetiapine possibly increased by **imidazoles** and **triazoles** (reduce dose of quetiapine)
- **Antimalarials**: avoidance of antipsychotics advised by manufacturer of **artemether/lumefantrine**; increased risk of ventricular arrhythmias when droperidol given with **chloroquine** and **hydroxychloroquine** or **quinine**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with **mefloquine** or **quinine**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with **mefloquine** or **quinine**—avoid concomitant use
- Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with **antimuscarinics**; plasma concentration of phenothiazines reduced by **antimuscarinics**, but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by **antimuscarinics**
- **Antipsychotics**: increased risk of ventricular arrhythmias when amisulpride, pimozide or sulpiride given with **droperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **droperidol**—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of **flupentixol**, **fluphenazine**, **haloperidol**, **pipotiazine**, **risperidone** or **zuclopentixol** as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with

Antipsychotics

- **Antipsychotics (continued)**
 - **haloperidol**; chlorpromazine possibly increases plasma concentration of **haloperidol**; increased risk of ventricular arrhythmias when droperidol given with **haloperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with **phenothiazines**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with **sulpiride**
- **Antivirals**: metabolism of aripiprazole possibly inhibited by **atazanavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **nelfinavir**, **ritonavir** and **saquinavir** (reduce dose of aripiprazole); plasma concentration of pimozide possibly increased by **atazanavir**—avoid concomitant use; plasma concentration of aripiprazole possibly reduced by **efavirenz** and **nevirapine**—increase dose of aripiprazole; plasma concentration of pimozide possibly increased by **efavirenz**, **indinavir**, **nelfinavir** and **saquinavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by **fosamprenavir** and **ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of olanzapine reduced by **ritonavir**—consider increasing dose of olanzapine; plasma concentration of clozapine increased by **ritonavir** (increased risk of toxicity)—avoid concomitant use; plasma concentration of antipsychotics possibly increased by **ritonavir**; increased risk of ventricular arrhythmias when clozapine, haloperidol or phenothiazines given with **saquinavir**—avoid concomitant use
- **Anxiolytics and Hypnotics**: increased sedative effect when antipsychotics given with **anxiolytics and hypnotics**; serious adverse events reported with concomitant use of clozapine and **lorazepam** (causality not established); increased risk of hypotension, bradycardia and respiratory depression when **intramuscular** olanzapine given with **parenteral benzodiazepines**; plasma concentration of haloperidol increased by **buspirone**
- **Apripitant**: avoidance of pimozide advised by manufacturer of **apripitant**
- **Atomoxetine**: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **atomoxetine**
- **Beta-blockers**: enhanced hypotensive effect when phenothiazines given with **beta-blockers**; plasma concentration of both drugs may increase when chlorpromazine given with **propranolol**; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide or sulpiride given with **sotalol**; increased risk of ventricular arrhythmias when droperidol or zuclopentixol given with **sotalol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with **sotalol**—avoid concomitant use
- Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when phenothiazines given with **clonidine**
- **Cytotoxics**: avoid concomitant use of clozapine with **cytotoxics** (increased risk of agranulocytosis); avoidance of pimozide advised by manufacturer of **lapatinib**; increased risk of ventricular arrhythmias when haloperidol given with **arsenic trioxide**; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **arsenic trioxide**
- Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with **desferrioxamine**; avoidance of prochlorperazine advised by manufacturer of **desferrioxamine**
- Diazoxide: enhanced hypotensive effect when phenothiazines given with **diazoxide**
- **Diuretics**: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by

Antipsychotics● **Diuretics** (*continued*)

- **diuretics**; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by
- **diuretics** (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with **diuretics**

Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with **amantadine**; antipsychotics antagonise effects of **apomorphine**, **levodopa** and **pergolide**; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of **bromocriptine** and **cabergoline**; manufacturer of amisulpride advises avoid concomitant use of **levodopa** (antagonism of effect); avoidance of antipsychotics advised by manufacturer of **pramipexole**, **ropinirole** and **rotigotine** (antagonism of effect)

Histamine: antipsychotics theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use

- **Hormone Antagonists**: manufacturer of droperidol advises avoid concomitant use with ● **tamoxifen** (risk of ventricular arrhythmias)
- **Ivabradine**: increased risk of ventricular arrhythmias when pimozide given with ● **ivabradine**
- Lithium**: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines or zuclopenthixol given with **lithium**; possible risk of toxicity when olanzapine given with **lithium**; increased risk of extrapyramidal side-effects when sulphiride given with **lithium**

Memantine: effects of antipsychotics possibly reduced by **memantine**

Methylidopa: enhanced hypotensive effect when antipsychotics given with **methylidopa** (also increased risk of extrapyramidal effects)

Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with **metoclopramide**

Moxonidine: enhanced hypotensive effect when phenothiazines given with **moxonidine**

Muscle Relaxants: promazine possibly enhances effects of **suxamethonium**

Nitrates: enhanced hypotensive effect when phenothiazines given with **nitrates**

- **Penicillamine**: avoid concomitant use of clozapine with ● **penicillamine** (increased risk of agranulocytosis)
- **Pentamidine Isetionate**: increased risk of ventricular arrhythmias when amisulpride or droperidol given with ● **pentamidine isetionate**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with ● **pentamidine isetionate**
- Sodium Benzoate**: haloperidol possibly reduces effects of **sodium benzoate**
- Sodium Oxybate**: antipsychotics possibly enhance effects of **sodium oxybate**
- Sodium Phenylbutyrate**: haloperidol possibly reduces effects of **sodium phenylbutyrate**
- Sympathomimetics**: antipsychotics antagonise hypertensive effect of **sympathomimetics**; antipsychotic effects of chlorpromazine possibly antagonised by **dexamfetamine**; side-effects of risperidone possibly increased by **methylphenidate**
- **Tacrolimus**: manufacturer of droperidol advises avoid concomitant use with ● **tacrolimus** (risk of ventricular arrhythmias)
- Tetrabenazine**: increased risk of extrapyramidal side-effects when antipsychotics given with **tetrabenazine**
- Ulcer-healing Drugs**: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by **cimetidine**; plasma concentration of clozapine possibly reduced by **omeprazole**; absorption of sulphiride reduced by **sucralfate**
- Vasodilator Antihypertensives**: enhanced hypotensive effect when phenothiazines given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

Antivirals see Abacavir, Aciclovir, Adefovir, Atazanavir, Cidofovir, Darunavir, Didanosine, Efavirenz, Emtri-

citabine, Etravirine, Famciclovir, Fosamprenavir, Foscarnet, Ganciclovir, Indinavir, Lamivudine, Lopinavir, Maraviroc, Nelfinavir, Nevirapine, Raltegravir, Ribavirin, Ritonavir, Saquinavir, Stavudine, Telbivudine, Tenofovir, Tipranavir, Valaciclovir, and Zidovudine

Anxiolytics and Hypnotics

ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with **adrenergic neurone blockers**

Alcohol: increased sedative effect when anxiolytics and hypnotics given with **alcohol**

Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with **alpha-blockers**

Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with **general anaesthetics**

Analgesics: metabolism of midazolam possibly inhibited by **fentanyl**; increased sedative effect when anxiolytics and hypnotics given with **opioid analgesics**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with **angiotensin-II receptor antagonists**

- **Antibacterials**: metabolism of midazolam inhibited by ● **clarithromycin**, ● **erythromycin** and ● **telithromycin** (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by **erythromycin** (reduce dose of buspirone); metabolism of zopiclone inhibited by **erythromycin**; metabolism of benzodiazepines possibly accelerated by **rifampicin** (reduced plasma concentration); metabolism of diazepam accelerated by **rifampicin** (reduced plasma concentration); metabolism of buspirone and zaleplon possibly accelerated by **rifampicin**; metabolism of zolpidem accelerated by **rifampicin** (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by **rifampicin**; metabolism of diazepam inhibited by **isoniazid**
- Anticoagulants**: chloral may transiently enhance anticoagulant effect of **coumarins**

- **Antidepressants**: plasma concentration of alprazolam increased by **fluoxetine**; plasma concentration of melatonin increased by ● **fluvoxamine**—avoid concomitant use; plasma concentration of some benzodiazepines increased by **fluvoxamine**; sedative effects possibly increased when zolpidem given with **sertraline**; manufacturer of buspirone advises avoid concomitant use with **MAOIs**; avoidance of buspirone for 10 days after stopping **tranylcypromine** advised by manufacturer of **oral** midazolam possibly reduced by **St John's wort**; increased sedative effect when anxiolytics and hypnotics given with **mirtazapine**, **tricyclic-related antidepressants** or **tricyclics**
- Antiepileptics**: plasma concentration of midazolam reduced by **carbamazepine**; plasma concentration of clonazepam often reduced by **carbamazepine**, **phenobarbital** and **phenytoin**; benzodiazepines possibly increase or decrease plasma concentration of **phenytoin**; diazepam increases or decreases plasma concentration of **phenytoin**; plasma concentration of clobazam increased by **stiripentol**; clobazam possibly increases plasma concentration of **valproate**; plasma concentration of diazepam and lorazepam possibly increased by **valproate**; increased risk of side-effects when clonazepam given with **valproate**
- **Antifungals**: plasma concentration of alprazolam increased by **itraconazole** and **ketoconazole**; plasma concentration of midazolam increased by ● **itraconazole**, ● **itraconazole** and ● **ketoconazole** (risk of prolonged sedation); plasma concentration of buspirone increased by **itraconazole** (reduce dose of buspirone); plasma concentration of midazolam increased by ● **posaconazole**

Anxiolytics and Hypnotics (continued)

- Antihistamines: increased sedative effect when anxiolytics and hypnotics given with **antihistamines**
- **Antipsychotics**: increased sedative effect when anxiolytics and hypnotics given with **antipsychotics**; bupropion increases plasma concentration of **haloperidol**; serious adverse events reported with concomitant use of lorazepam and ● **clozapine** (causality not established); increased risk of hypotension, bradycardia and respiratory depression when **parenteral benzodiazepines** given with **intramuscular olanzapine**
 - **Antivirals**: plasma concentration of midazolam possibly increased by ● **atazanavir**—avoid concomitant use of **oral** midazolam; increased risk of prolonged sedation when midazolam given with ● **efavirenz**—avoid concomitant use; plasma concentration of midazolam possibly increased by ● **fosamprenavir**, ● **indinavir**, ● **nefnavir** and ● **ritonavir** (risk of prolonged sedation—avoid concomitant use of **oral** midazolam); increased risk of prolonged sedation when alprazolam given with ● **indinavir**—avoid concomitant use; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by ● **ritonavir** (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of anxiolytics and hypnotics possibly increased by ● **ritonavir**; plasma concentration of bupropion increased by **ritonavir** (increased risk of toxicity); plasma concentration of midazolam increased by ● **saquinavir** (risk of prolonged sedation—avoid concomitant use of **oral** midazolam)
- Aprepitant**: plasma concentration of midazolam increased by **aprepitant** (risk of prolonged sedation)
- Beta-blockers**: enhanced hypotensive effect when anxiolytics and hypnotics given with **beta-blockers**
- Calcium-channel Blockers**: enhanced hypotensive effect when anxiolytics and hypnotics given with **calcium-channel blockers**; midazolam increases absorption of **lercanidipine**; metabolism of midazolam inhibited by **diltiazem** and **verapamil** (increased plasma concentration with increased sedation); plasma concentration of bupropion increased by **diltiazem** and **verapamil** (reduce dose of bupropion)
- Cardiac Glycosides**: alprazolam increases plasma concentration of **digoxin** (increased risk of toxicity)
- Clonidine**: enhanced hypotensive effect when anxiolytics and hypnotics given with **clonidine**
- Cytotoxics**: plasma concentration of midazolam increased by **nilotinib**
- Deferasirox**: plasma concentration of midazolam possibly reduced by **deferasirox**
- Diazoxide**: enhanced hypotensive effect when anxiolytics and hypnotics given with **diazoxide**
- Disulfiram**: metabolism of benzodiazepines inhibited by **disulfiram** (increased sedative effects); increased risk of temazepam toxicity when given with **disulfiram**
- Diuretics**: enhanced hypotensive effect when anxiolytics and hypnotics given with **diuretics**; administration of chloral with **parenteral furosemide** may displace thyroid hormone from binding sites
- Dopaminergics**: benzodiazepines possibly antagonise effects of **levodopa**
- Grapefruit Juice**: plasma concentration of bupropion increased by **grapefruit juice**
- Lithium**: increased risk of neurotoxicity when clonazepam given with **lithium**
- Lofexidine**: increased sedative effect when anxiolytics and hypnotics given with **lofexidine**
- Methyldopa**: enhanced hypotensive effect when anxiolytics and hypnotics given with **methyldopa**
- Moxonidine**: enhanced hypotensive effect when anxiolytics and hypnotics given with **moxonidine**; sedative effects possibly increased when benzodiazepines given with **moxonidine**

Anxiolytics and Hypnotics (continued)

- Muscle Relaxants**: increased sedative effect when anxiolytics and hypnotics given with **baclofen** or **tizanidine**
- Nitrates**: enhanced hypotensive effect when anxiolytics and hypnotics given with **nitrates**
- Oestrogens**: plasma concentration of melatonin increased by **oestrogens**
- Probenecid**: excretion of lorazepam reduced by **probenecid** (increased plasma concentration); excretion of nitrazepam possibly reduced by **probenecid** (increased plasma concentration)
- **Sodium Oxybate**: benzodiazepines enhance effects of ● **sodium oxybate** (avoid concomitant use)
- Theophylline**: effects of benzodiazepines possibly reduced by **theophylline**
- Ulcer-healing Drugs**: plasma concentration of melatonin increased by **cimetidine**; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by **cimetidine** (increased plasma concentration); metabolism of diazepam possibly inhibited by **esomeprazole** and **omeprazole** (increased plasma concentration)
- Vasodilator Antihypertensives**: enhanced hypotensive effect when anxiolytics and hypnotics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Apomorphine**
- Antipsychotics**: effects of apomorphine antagonised by **antipsychotics**
- Dopaminergics**: effects of apomorphine possibly enhanced by **entacapone**
- Memantine**: effects of dopaminergics possibly enhanced by **memantine**
- Methyldopa**: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**
- Apraclonidine**
- Antidepressants**: manufacturer of apraclonidine advises avoid concomitant use with **MAOIs**, **tricyclic-related antidepressants** and **tricyclics**
- Aprepitant**
- Note** Fosaprepitant is a prodrug of aprepitant
- Antibacterials**: plasma concentration of aprepitant possibly increased by **clarithromycin** and **telithromycin**; plasma concentration of aprepitant reduced by **rifampicin**
- Anticoagulants**: aprepitant possibly reduces anticoagulant effect of **warfarin**
- **Antidepressants**: manufacturer of aprepitant advises avoid concomitant use with ● **St John's wort**
- Antidiabetics**: aprepitant reduces plasma concentration of **tolbutamide**
- Antiepileptics**: plasma concentration of aprepitant possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals**: plasma concentration of aprepitant increased by **ketconazole**
- **Antipsychotics**: manufacturer of aprepitant advises avoid concomitant use with ● **pimozide**
- Antivirals**: plasma concentration of aprepitant possibly increased by **ritonavir**
- Anxiolytics and Hypnotics**: aprepitant increases plasma concentration of **midazolam** (risk of prolonged sedation)
- Calcium-channel Blockers**: plasma concentration of both drugs may increase when aprepitant given with **diltiazem**
- Corticosteroids**: aprepitant inhibits metabolism of **dexamethasone** and **methylprednisolone** (reduce dose of dexamethasone and methylprednisolone)
- **Oestrogens**: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ● **oestrogens** (alternative contraception recommended)
 - **Progestogens**: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ● **progestogens** (alternative contraception recommended)
- Aripiprazole** *see* Antipsychotics

Arsenic Trioxide

- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with
 - **amiodarone** or • **disopyramide**
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with • **erythromycin**, • **levofloxacin** or • **moxifloxacin**
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with
 - **amitriptyline** or • **clomipramine**
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with • **amphotericin**
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with
 - **antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with • **haloperidol**; avoid concomitant use of cytotoxics with • **clozapine** (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with • **sotalol**
- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by
 - **acetazolamide**, • **loop diuretics** or • **thiazides and related diuretics**
- Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with • **lithium**

Artemether with Lumefantrine

- Anti-arrhythmics: manufacturer of artemether/lumefantrine advises avoid concomitant use with
 - **amiodarone**, • **disopyramide** or • **flecainide** (risk of ventricular arrhythmias)
- Antibacterials: manufacturer of artemether/lumefantrine advises avoid concomitant use with
 - **macrolides** and • **quinolones**
- Antidepressants: manufacturer of artemether/lumefantrine advises avoid concomitant use with
 - **antidepressants**
- Antifungals: manufacturer of artemether/lumefantrine advises avoid concomitant use with • **imidazoles** and • **triazoles**
- Antimalarials: manufacturer of artemether/lumefantrine advises avoid concomitant use with
 - **antimalarials**; increased risk of ventricular arrhythmias when artemether/lumefantrine given with • **quinine**
- Antipsychotics: manufacturer of artemether/lumefantrine advises avoid concomitant use with
 - **antipsychotics**
- Antivirals: manufacturer of artemether/lumefantrine advises caution with **atazanavir**, **darunavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **nelfinavir**, **ritonavir**, **saquinavir** and **tipranavir**
- Beta-blockers: manufacturer of artemether/lumefantrine advises avoid concomitant use with
 - **metoprolol** and • **sotalol**
- Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by **grapefruit juice**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Ulcer-healing Drugs: manufacturer of artemether/lumefantrine advises avoid concomitant use with
 - **cimetidine**
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 620

Ascorbic acid see Vitamins**Aspirin**

- Adsorbents: absorption of aspirin possibly reduced by **kaolin**
- Anaesthetics, General: aspirin possibly enhances effects of **thiopental**
- Analgesics: avoid concomitant use of aspirin with
 - **NSAIDs** (increased side-effects); antiplatelet effect of aspirin possibly reduced by **ibuprofen**
- Antacids: excretion of aspirin increased by alkaline urine due to some **antacids**
- Anticoagulants: increased risk of bleeding when aspirin given with • **coumarins** or • **phenindione** (due

Aspirin

- Anticoagulants (*continued*)
 - to antiplatelet effect); aspirin enhances anticoagulant effect of • **heparins**
 - Antidepressants: increased risk of bleeding when aspirin given with • **SSRIs** or • **venlafaxine**
 - Antiepileptics: aspirin enhances effects of **phenytoin** and **valproate**
 - Clopidogrel: increased risk of bleeding when aspirin given with **clopidogrel**
 - Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with **corticosteroids**, also corticosteroids reduce plasma concentration of salicylate
 - Cytotoxics: aspirin reduces excretion of • **methotrexate** (increased risk of toxicity)
 - Diuretics: aspirin antagonises diuretic effect of **spironolactone**; increased risk of toxicity when high-dose aspirin given with **carbonic anhydrase inhibitors**
 - Iloprost: increased risk of bleeding when aspirin given with **iloprost**
 - Leukotriene Receptor Antagonists: aspirin increases plasma concentration of **zafirlukast**
 - Metoclopramide: rate of absorption of aspirin increased by **metoclopramide** (enhanced effect)
 - Probenecid: aspirin antagonises effects of **probenecid**
 - Sulfinpyrazone: aspirin antagonises effects of **sulfinpyrazone**
- Atazanavir**
- Antacids: plasma concentration of atazanavir possibly reduced by **antacids**
 - Anti-arrhythmics: atazanavir possibly increases plasma concentration of • **amiodarone** and • **lidocaine**
 - Antibacterials: plasma concentration of both drugs increased when atazanavir given with **clarithromycin**; atazanavir increases plasma concentration of
 - **rifabutin** (reduce dose of rifabutin); plasma concentration of atazanavir reduced by • **rifampicin**—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of • **telithromycin**
 - Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of **warfarin**; avoidance of atazanavir advised by manufacturer of **rivaroxaban**
 - Antidepressants: plasma concentration of atazanavir reduced by • **St John's wort**—avoid concomitant use
 - Antifungals: plasma concentration of atazanavir increased by • **posaconazole**
 - Antimalarials: caution with atazanavir advised by manufacturer of **artemether/lumefantrine**; atazanavir possibly increases plasma concentration of • **quinine** (increased risk of toxicity)
 - Antimuscarinics: avoidance of atazanavir advised by manufacturer of **darifenacin**; manufacturer of fesoterodine advises dose reduction when atazanavir given with **fesoterodine**—consult fesoterodine product literature
 - Antipsychotics: atazanavir possibly inhibits metabolism of • **aripiprazole** (reduce dose of aripiprazole); atazanavir possibly increases plasma concentration of • **pimozide**—avoid concomitant use
 - Antivirals: manufacturer of atazanavir advises avoid concomitant use with • **efavirenz** (plasma concentration of atazanavir reduced); avoid concomitant use of atazanavir with • **indinavir**; atazanavir increases plasma concentration of • **maraviroc** (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by • **nevirapine**—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with • **saquinavir**—avoid concomitant use; plasma concentration of atazanavir reduced by **tenofovir**, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of **tipranavir** (also plasma concentration of atazanavir reduced)
 - Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of • **midazolam**—avoid concomitant use of **oral midazolam**

Atazanavir (*continued*)

- Calcium-channel Blockers: atazanavir increases plasma concentration of ●**diltiazem** (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of ●**verapamil**
- Ciclosporin: atazanavir possibly increases plasma concentration of ●**ciclosporin**
- Colchicine: atazanavir possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: atazanavir possibly increases plasma concentration of ●**everolimus**—manufacturer of everolimus advises avoid concomitant use; avoidance of atazanavir advised by manufacturer of ●**pazopanib**; atazanavir possibly inhibits metabolism of ●**irinotecan** (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ●**ergot alkaloids**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with ●**atorvastatin**; possible increased risk of myopathy when atazanavir given with ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when atazanavir given with ●**simvastatin** (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of ●**ethinylestradiol**
- Progestogens: atazanavir increases plasma concentration of ●**norethisterone**
- Ranolazine: atazanavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: atazanavir possibly increases side-effects of ●**sildenafil**
- Sirolimus: atazanavir possibly increases plasma concentration of ●**sirolimus**
- Tacrolimus: atazanavir possibly increases plasma concentration of ●**tacrolimus**
- Ulcer-healing Drugs: plasma concentration of atazanavir reduced by ●**histamine H₂-antagonists**; plasma concentration of atazanavir reduced by ●**proton pump inhibitors**—avoid or adjust dose of both drugs (consult product literature)

Atenolol *see* Beta-blockers

Atomoxetine

- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with ●**methadone**; possible increased risk of convulsions when atomoxetine given with ●**tramadol**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with ●**amiodarone** or ●**disopyramide**
- Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with *parenteral* ●**erythromycin**; increased risk of ventricular arrhythmias when atomoxetine given with ●**moxifloxacin**
- Antidepressants: metabolism of atomoxetine possibly inhibited by ●**fluoxetine** and ●**paroxetine**; possible increased risk of convulsions when atomoxetine given with ●**antidepressants**; atomoxetine should not be started until 2 weeks after stopping ●**MAOIs**, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with ●**tricyclics**
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with ●**mefloquine**
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with ●**antipsychotics** that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with ●**sotalol**
- Bupropion: possible increased risk of convulsions when atomoxetine given with ●**bupropion**
- Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by ●**diuretics**

Atomoxetine (*continued*)

Sympathomimetics, Beta,: Increased risk of cardiovascular side-effects when atomoxetine given with *parenteral* ●**salbutamol**

Atorvastatin *see* Statins

Atovaquone

- Antibacterials: plasma concentration of atovaquone reduced by ●**rifabutin** and ●**rifampicin** (possible therapeutic failure of atovaquone); plasma concentration of atovaquone reduced by ●**tetracycline**
- Antivirals: atovaquone possibly reduces plasma concentration of ●**indinavir**; atovaquone possibly inhibits metabolism of ●**zidovudine** (increased plasma concentration)
- Histamine: avoidance of atovaquone advised by manufacturer of ●**histamine**
- Metoclopramide: plasma concentration of atovaquone reduced by ●**metoclopramide**

Atracurium *see* Muscle Relaxants

Atropine *see* Antimuscarinics

Azathioprine

- ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with ●**captopril** especially in renal impairment; increased risk of anaemia when azathioprine given with ●**enalapril** especially in renal impairment
- Allopurinol: enhanced effects and increased toxicity of azathioprine when given with ●**allopurinol** (reduce dose of azathioprine to one quarter of usual dose)
- Aminosalicylates: possible increased risk of leucopenia when azathioprine given with ●**aminosalicylates**
- Antibacterials: increased risk of haematological toxicity when azathioprine given with ●**sulfamethoxazole** (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with ●**trimethoprim** (also with co-trimoxazole)
- Anticoagulants: azathioprine possibly reduces anticoagulant effect of ●**coumarins**
- Antivirals: myelosuppressive effects of azathioprine possibly enhanced by ●**ribavirin**
- Febuxostat: avoidance of azathioprine advised by manufacturer of ●**febuxostat**

Azithromycin *see* Macrolides

Aztreonam

- Anticoagulants: aztreonam possibly enhances anticoagulant effect of ●**coumarins**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Baclofen *see* Muscle Relaxants

Balsalazide *see* Aminosalicylates

Bambuterol *see* Sympathomimetics, Beta,₂

Beclomethasone *see* Corticosteroids

Bemiparin *see* Heparins

Bendamustine

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Bendroflumethiazide *see* Diuretics

Benperidol *see* Antipsychotics

Benzodiazepines *see* Anxiolytics and Hypnotics

Benzthiazide *see* Diuretics

Benzylpenicillin *see* Penicillins

Beta-blockers

- Note* Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind
- ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with ●**ACE inhibitors**
 - Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with ●**adrenergic neurone blockers**
 - Alcohol: enhanced hypotensive effect when beta-blockers given with ●**alcohol**
 - Aldesleukin: enhanced hypotensive effect when beta-blockers given with ●**aldesleukin**
 - Alpha-blockers: enhanced hypotensive effect when beta-blockers given with ●**alpha-blockers**, also

Beta-blockers

- **Alpha-blockers** (*continued*)
increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with **general anaesthetics**
- **Anaesthetics, Local**: propranolol increases risk of **bupivacaine** toxicity
Analgesics: analgesic effect of beta-blockers antagonised by **NSAIDs**; plasma concentration of esmolol possibly increased by **morphine**
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with **angiotensin-II receptor antagonists**
- **Anti-arrhythmics**: increased myocardial depression when beta-blockers given with **anti-arrhythmics**; increased risk of ventricular arrhythmias when sotalol given with **amiodarone**, **disopyramide** or **dronedrone**—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with **amiodarone**; plasma concentration of metoprolol and propranolol possibly increased by **dronedrone**; increased risk of myocardial depression and bradycardia when beta-blockers given with **flecainide**; propranolol increases risk of **lidocaine** toxicity; plasma concentration of metoprolol and propranolol increased by **propafenone**
- **Antibacterials**: increased risk of ventricular arrhythmias when sotalol given with **moxifloxacin**—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by **rifampicin** (plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by **rifampicin**
- **Antidepressants**: plasma concentration of metoprolol increased by **citalopram** and **escitalopram**; plasma concentration of propranolol increased by **fluvoxamine**; plasma concentration of metoprolol possibly increased by **paroxetine** (enhanced effect); labetalol and propranolol increase plasma concentration of **imipramine**; enhanced hypotensive effect when beta-blockers given with **MAOIs**; increased risk of ventricular arrhythmias when sotalol given with **tricyclics**
- **Antidiabetics**: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with **antidiabetics**; beta-blockers enhance hypoglycaemic effect of **insulin**
- **Antiepileptics**: plasma concentration of propranolol possibly reduced by **phenobarbital**
- **Antihistamines**: increased risk of ventricular arrhythmias when sotalol given with **mizolastine**—avoid concomitant use
- **Antimalarials**: avoidance of metoprolol and sotalol advised by manufacturer of **artemether/lumefantrine**; increased risk of bradycardia when beta-blockers given with **mefloquine**
- **Antimuscarinics**: increased risk of ventricular arrhythmias when sotalol given with **tolterodine**
- **Antipsychotics**: increased risk of ventricular arrhythmias when sotalol given with **droperidol** or **zuclopenthixol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with **haloperidol**—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with **chlorpromazine**; increased risk of ventricular arrhythmias when sotalol given with **amisulpride**, **phenothiazines**, **pimozide** or **sulpiride**; enhanced hypotensive effect when beta-blockers given with **phenothiazines**
- **Antivirals**: increased risk of ventricular arrhythmias when sotalol given with **saquinavir**—avoid concomitant use; avoidance of metoprolol for heart failure advised by manufacturer of **tipranavir**
- **Anxiolytics and Hypnotics**: enhanced hypotensive effect when beta-blockers given with **anxiolytics and hypnotics**

Beta-blockers (*continued*)

- **Atomoxetine**: increased risk of ventricular arrhythmias when sotalol given with **atomoxetine**
- **Calcium-channel Blockers**: enhanced hypotensive effect when beta-blockers given with **calcium-channel blockers**; possible severe hypotension and heart failure when beta-blockers given with **nifedipine**; increased risk of AV block and bradycardia when beta-blockers given with **diltiazem**; asystole, severe hypotension and heart failure when beta-blockers given with **verapamil** (see p. 109)
- **Cardiac Glycosides**: increased risk of AV block and bradycardia when beta-blockers given with **cardiac glycosides**
- **Ciclosporin**: carvedilol increases plasma concentration of **ciclosporin**
- **Clonidine**: increased risk of withdrawal hypertension when beta-blockers given with **clonidine** (withdraw beta-blockers several days before slowly withdrawing clonidine)
- **Corticosteroids**: hypotensive effect of beta-blockers antagonised by **corticosteroids**
- **Cytotoxics**: increased risk of ventricular arrhythmias when sotalol given with **arsenic trioxide**
- **Diazoxide**: enhanced hypotensive effect when beta-blockers given with **diazoxide**
- **Diuretics**: enhanced hypotensive effect when beta-blockers given with **diuretics**; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by **loop diuretics** or **thiazides and related diuretics**
- **Dopaminergics**: enhanced hypotensive effect when beta-blockers given with **levodopa**
- **Ergot Alkaloids**: increased peripheral vasoconstriction when beta-blockers given with **ergotamine and methysergide**
- **5HT₁ Agonists**: propranolol increases plasma concentration of **rizatriptan** (manufacturer of rizatriptan advises half dose and avoid within 2 hours of propranolol)
- **Ivabradine**: increased risk of ventricular arrhythmias when sotalol given with **ivabradine**
- **Methyldopa**: enhanced hypotensive effect when beta-blockers given with **methyldopa**
- **Moxisylyte**: possible severe postural hypotension when beta-blockers given with **moxisylyte**
- **Moxonidine**: enhanced hypotensive effect when beta-blockers given with **moxonidine**
- **Muscle Relaxants**: propranolol enhances effects of **muscle relaxants**; enhanced hypotensive effect when beta-blockers given with **baclofen**; possible enhanced hypotensive effect and bradycardia when beta-blockers given with **tizanidine**
- **Nitrates**: enhanced hypotensive effect when beta-blockers given with **nitrates**
- **Oestrogens**: hypotensive effect of beta-blockers antagonised by **oestrogens**
- **Parasympathomimetics**: propranolol antagonises effects of **neostigmine** and **pyridostigmine**; increased risk of arrhythmias when beta-blockers given with **pilocarpine**
- **Prostaglandins**: enhanced hypotensive effect when beta-blockers given with **alprostadil**
- **Ranolazine**: avoidance of sotalol advised by manufacturer of **ranolazine**
- **Sympathomimetics**: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **adrenaline (epinephrine)**, also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **dobutamine**; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **noradrenaline (norepinephrine)**
- **Thyroid Hormones**: metabolism of propranolol accelerated by **levothyroxine**

Beta-blockers (continued)

Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by **cimetidine**

Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with **hydralazine**, **minoxidil** or **sodium nitropruside**

Betahistine

Antihistamines: effect of betahistine theoretically antagonised by **antihistamines**

Betamethasone see Corticosteroids**Betaxolol** see Beta-blockers**Bethanechol** see Parasympathomimetics**Bexarotene**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by **gemfibrozil**—avoid concomitant use

Bezafibrate see Fibrates**Bicalutamide**

Anticoagulants: bicalutamide possibly enhances anticoagulant effect of **coumarins**

Biguanides see Antidiabetics**Bile Acid Sequestrants** see Colesevelam, Colestipol, and Colestyramine**Bile Acids**

Antacids: absorption of bile acids possibly reduced by **antacids**

- Ciclosporin: ursodeoxycholic acid increases absorption of **ciclosporin**
- Lipid-regulating Drugs: absorption of bile acids possibly reduced by **colestipol** and **colestyramine**

Bisoprolol see Beta-blockers**Bisphosphonates**

Analgesics: bioavailability of tiludronic acid increased by **indometacin**

Antacids: absorption of bisphosphonates reduced by **antacids**

Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with **aminoglycosides**

Calcium Salts: absorption of bisphosphonates reduced by **calcium salts**

- Cytotoxics: sodium clodronate increases plasma concentration of **estramustine**
- Iron: absorption of bisphosphonates reduced by **oral iron**

Bleomycin

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: bleomycin possibly reduces absorption of **digoxin tablets**

- Cytotoxics: increased pulmonary toxicity when bleomycin given with **cisplatin**

Bortezomib

Antifungals: plasma concentration of bortezomib increased by **ketoconazole**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Bosentan

- Antibacterials: plasma concentration of bosentan reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of **coumarins**

- Antidiabetics: increased risk of hepatotoxicity when bosentan given with **glibenclamide**—avoid concomitant use
- Antifungals: plasma concentration of bosentan increased by **ketoconazole**; plasma concentration of bosentan possibly increased by **fluconazole**—avoid concomitant use; plasma concentration of bosentan possibly increased by **itraconazole**

Antivirals: plasma concentration of bosentan possibly increased by **ritonavir**

- Ciclosporin: plasma concentration of bosentan increased by **ciclosporin** (also plasma concentration of ciclosporin reduced—avoid concomitant use)

Bosentan (continued)

Lipid-regulating Drugs: bosentan reduces plasma concentration of **simvastatin**

- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing **oestrogens** (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing **progestogens** (alternative contraception recommended)
- Sildenafil: bosentan reduces plasma concentration of **sildenafil**
- Tadalafil: bosentan reduces plasma concentration of **tadalafil**

Brimonidine

Antidepressants: manufacturer of brimonidine advises avoid concomitant use with **MAOIs**, **tricyclic-related antidepressants** and **tricyclics**

Brimonidine see Diuretics**Bromocriptine**

Alcohol: tolerance of bromocriptine reduced by **alcohol**

Antibacterials: plasma concentration of bromocriptine increased by **erythromycin** (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by **macrolides** (increased risk of toxicity)

Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of bromocriptine antagonised by **antipsychotics**

Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by **domperidone**

Hormone Antagonists: plasma concentration of bromocriptine increased by **octreotide**

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by **metoclopramide**

- Sympathomimetics: risk of toxicity when bromocriptine given with **isometheptene**

Buclizine see Antihistamines**Budesonide** see Corticosteroids**Bumetanide** see Diuretics**Bupivacaine**

Anti-arrhythmics: increased myocardial depression when bupivacaine given with **anti-arrhythmics**

- Beta-blockers: increased risk of bupivacaine toxicity when given with **propranolol**

Buprenorphine see Opioid Analgesics**Bupropion**

- Antidepressants: bupropion possibly increases plasma concentration of **citalopram**; manufacturer of bupropion advises avoid for 2 weeks after stopping **MAOIs**; manufacturer of bupropion advises avoid concomitant use with **moclobemide**; bupropion possibly increases plasma concentration of **tricyclics** (possible increased risk of convulsions)

Antiepileptics: plasma concentration of bupropion reduced by **carbamazepine** and **phenytoin**; metabolism of bupropion inhibited by **valproate**

Antivirals: plasma concentration of bupropion reduced by **ritonavir**

Atomoxetine: possible increased risk of convulsions when bupropion given with **atomoxetine**

Dopaminergics: increased risk of side-effects when bupropion given with **amantadine** or **levodopa**

- Hormone Antagonists: bupropion possibly inhibits metabolism of **tamoxifen** to active metabolite (avoid concomitant use)

Buspirone see Anxiolytics and Hypnotics**Busulfan**

Analgesics: metabolism of **intravenous** busulfan possibly inhibited by **paracetamol** (manufacturer of **intravenous** busulfan advises caution within 72 hours of paracetamol)

Busulfan (*continued*)

- Antibacterials: plasma concentration of busulfan increased by ●**metronidazole** (increased risk of toxicity)
- Antiepileptics: plasma concentration of busulfan possibly reduced by ●**phenytoin**
- Antifungals: metabolism of busulfan inhibited by ●**itraconazole** (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when busulfan given with ●**tioguanine**

Butyrophenones *see* Antipsychotics**Cabergoline**

- Antibacterials: plasma concentration of cabergoline increased by ●**erythromycin** (increased risk of toxicity); plasma concentration of cabergoline possibly increased by ●**macrolides** (increased risk of toxicity)
- Antipsychotics: hypoprolactinaemic and anti-parkinsonian effects of cabergoline antagonised by ●**antipsychotics**
- Domperidone: hypoprolactinaemic effect of cabergoline possibly antagonised by ●**domperidone**
- Memantine: effects of dopaminergics possibly enhanced by ●**memantine**
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by ●**methyl dopa**
- Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by ●**metoclopramide**

Calcium Salts

Note *see also* Antacids

- Antibacterials: calcium salts reduce absorption of ●**ciprofloxacin** and ●**tetracycline**
- Bisphosphonates: calcium salts reduce absorption of ●**bisphosphonates**
- Cardiac Glycosides: large *intravenous* doses of calcium salts can precipitate arrhythmias when given with ●**cardiac glycosides**
- Corticosteroids: absorption of calcium salts reduced by ●**corticosteroids**
- Diuretics: increased risk of hypercalcaemia when calcium salts given with ●**thiazides and related diuretics**
- Eltrombopag: calcium salts possibly reduce absorption of ●**eltrombopag** (give at least 4 hours apart)
- Fluorides: calcium salts reduce absorption of ●**fluorides**
- Iron: calcium salts reduce absorption of ●**oral iron**
- Thyroid Hormones: calcium salts reduce absorption of ●**levothyroxine**
- Zinc: calcium salts reduce absorption of ●**zinc**

Calcium-channel Blockers

- Note Dihydropyridine calcium-channel blockers include amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine
- ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with ●**ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with ●**adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when calcium-channel blockers given with ●**alcohol**; verapamil possibly increases plasma concentration of ●**alcohol**
- Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with ●**aldesleukin**
- Aliskiren: avoidance of verapamil advised by manufacturer of ●**aliskiren**
- Alpha-blockers: enhanced hypotensive effect when calcium-channel blockers given with ●**alpha-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with ●**general anaesthetics** or ●**isoflurane**; hypotensive effect of verapamil enhanced by ●**general anaesthetics** (also AV delay)
- Analgesics: hypotensive effect of calcium-channel blockers antagonised by ●**NSAIDs**; diltiazem inhibits metabolism of ●**alfentanil** (risk of prolonged or delayed respiratory depression)

Calcium-channel Blockers (*continued*)

- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with ●**angiotensin-II receptor antagonists**
- Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with ●**amiodarone**; increased risk of myocardial depression and asystole when verapamil given with ●**disopyramide** or ●**flecainide**; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with ●**dronedarone**; nifedipine increases plasma concentration of ●**dronedarone**
- Antibacterials: metabolism of verapamil possibly inhibited by ●**clarithromycin** and ●**erythromycin** (increased risk of toxicity); metabolism of felodipine possibly inhibited by ●**erythromycin** (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with ●**erythromycin**; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by ●**rifampicin** (plasma concentration significantly reduced); metabolism of isradipine and nicardipine possibly accelerated by ●**rifampicin** (possible significantly reduced plasma concentration)
- Anticoagulants: verapamil possibly increases plasma concentration of ● **dabigatran etexilate** (reduce dose of dabigatran etexilate)
- Antidepressants: metabolism of nifedipine possibly inhibited by ●**fluoxetine** (increased plasma concentration); diltiazem and verapamil increase plasma concentration of ●**imipramine**; enhanced hypotensive effect when calcium-channel blockers given with ●**MAOIs**; plasma concentration of verapamil significantly reduced by ●**St John's wort**; plasma concentration of nifedipine reduced by ●**St John's wort**; plasma concentration of amlodipine possibly reduced by ●**St John's wort**; diltiazem and verapamil possibly increase plasma concentration of ●**tricyclics**
- Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with ●**insulin**
- Antiepileptics: effects of dihydropyridines, nicardipine and nifedipine probably reduced by ●**carbamazepine**; effects of felodipine and isradipine reduced by ●**carbamazepine**; diltiazem and verapamil enhance effects of ●**carbamazepine**; manufacturer of nimodipine advises avoid concomitant use with ●**carbamazepine** and ●**phenytoin** (plasma concentration of nimodipine possibly reduced); manufacturer of nimodipine advises avoid concomitant use with ●**phenobarbital** (plasma concentration of nimodipine reduced); manufacturer of isradipine advises avoid concomitant use with ●**phenobarbital** and ●**phenytoin**; effects of calcium-channel blockers probably reduced by ●**phenobarbital**; effects of felodipine and verapamil reduced by ●**phenytoin**; diltiazem increases plasma concentration of ●**phenytoin** but also effect of diltiazem reduced
- Antifungals: metabolism of dihydropyridines possibly inhibited by ●**itraconazole** and ●**ketoconazole** (increased plasma concentration); metabolism of felodipine inhibited by ●**itraconazole** and ●**ketoconazole** (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with ●**itraconazole** and ●**ketoconazole**; negative inotropic effect possibly increased when calcium-channel blockers given with ●**itraconazole**; plasma concentration of nifedipine increased by ●**micafungin**
- Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with ●**mefloquine**
- Antimuscarinics: avoidance of verapamil advised by manufacturer of ●**darifenacin**
- Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with ●**antipsychotics**
- Antivirals: plasma concentration of verapamil possibly increased by ●**atazanavir**; plasma concentration of diltiazem increased by ●**atazanavir** (reduce dose of

Calcium-channel Blockers

- **Antivirals (continued)**
diltiazem); plasma concentration of diltiazem reduced by **efavirenz**; plasma concentration of calcium-channel blockers possibly increased by **ritonavir**; manufacturer of lercanidipine advises avoid concomitant use with **ritonavir**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when calcium-channel blockers given with **anxiolytics and hypnotics**; diltiazem and verapamil inhibit metabolism of **midazolam** (increased plasma concentration with increased sedation); absorption of lercanidipine increased by **midazolam**; diltiazem and verapamil increase plasma concentration of **bupropion** (reduce dose of bupropion)
- Aprepitant: plasma concentration of both drugs may increase when diltiazem given with **aprepitant**
- **Beta-blockers**: enhanced hypotensive effect when calcium-channel blockers given with **beta-blockers**; increased risk of AV block and bradycardia when diltiazem given with **beta-blockers**; asystole, severe hypotension and heart failure when verapamil given with **beta-blockers** (see p. 109); possible severe hypotension and heart failure when nifedipine given with **beta-blockers**
- Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with **nifedipine**
- **Cardiac Glycosides**: nifedipine possibly increases plasma concentration of **digoxin**; diltiazem, lercanidipine and nicardipine increase plasma concentration of **digoxin**; verapamil increases plasma concentration of **digoxin**, also increased risk of AV block and bradycardia
- **Ciclosporin**: diltiazem, nicardipine and verapamil increase plasma concentration of **ciclosporin**; combination of lercanidipine with **ciclosporin** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by **ciclosporin** (increased risk of toxicity including gingival hyperplasia)
- Cilostazol: diltiazem increases plasma concentration of **cilostazol** (consider reducing dose of cilostazol)
- Clonidine: enhanced hypotensive effect when calcium-channel blockers given with **clonidine**
- **Colchicine**: diltiazem and verapamil possibly increase risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by **corticosteroids**; diltiazem increases plasma concentration of **methylprednisolone**
- **Cytotoxics**: verapamil possibly increases plasma concentration of **doxorubicin**; plasma concentration of both drugs may increase when verapamil given with **everolimus**; nifedipine possibly inhibits metabolism of **vincristine**
- Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when calcium-channel blockers given with **diuretics**; diltiazem and verapamil increase plasma concentration of **epplerenone** (reduce dose of eplerenone)
- Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with **levodopa**
- Grapefruit Juice: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by **grapefruit juice**; plasma concentration of amlodipine possibly increased by **grapefruit juice**
- Hormone Antagonists: diltiazem and verapamil increase plasma concentration of **dutasteride**
- **Ivabradine**: diltiazem and verapamil increase plasma concentration of **ivabradine**—avoid concomitant use

Calcium-channel Blockers (continued)

- **Lipid-regulating Drugs**: diltiazem increases plasma concentration of **atorvastatin** and **simvastatin**—possible increased risk of myopathy; increased risk of myopathy when verapamil given with **simvastatin**; possible increased risk of myopathy when amlodipine given with **simvastatin**
- Lithium: neurotoxicity may occur when diltiazem or verapamil given with **lithium** without increased plasma concentration of lithium
- **Magnesium (parenteral)**: profound hypotension reported with concomitant use of nifedipine and **parenteral magnesium** in pre-eclampsia
- Methyldopa: enhanced hypotensive effect when calcium-channel blockers given with **methyldopa**
- Moxisylyte: enhanced hypotensive effect when calcium-channel blockers given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when calcium-channel blockers given with **moxonidine**
- Muscle Relaxants: verapamil enhances effects of **non-depolarising muscle relaxants** and **suxamethonium**; enhanced hypotensive effect when calcium-channel blockers given with **baclofen** or **tizanidine**; manufacturer of verapamil advises avoid concomitant use of **intravenous dantrolene**; possible increased risk of ventricular arrhythmias when diltiazem given with **intravenous dantrolene**—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of **non-depolarising muscle relaxants**
- Nitrates: enhanced hypotensive effect when calcium-channel blockers given with **nitrates**
- Oestrogens: hypotensive effect of calcium-channel blockers antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with **alprostadil**
- Ranolazine: diltiazem and verapamil increase plasma concentration of **ranolazine** (consider reducing dose of ranolazine)
- Sildenafil: enhanced hypotensive effect when amlodipine given with **sildenafil**
- **Sirolimus**: diltiazem increases plasma concentration of **sirolimus**; plasma concentration of both drugs increased when verapamil given with **sirolimus**
- Sulfapyrazone: plasma concentration of verapamil reduced by **sulfapyrazone**
- **Tacrolimus**: diltiazem and nifedipine increase plasma concentration of **tacrolimus**; felodipine, nicardipine and verapamil possibly increase plasma concentration of **tacrolimus**
- **Theophylline**: calcium-channel blockers possibly increase plasma concentration of **theophylline** (enhanced effect); diltiazem increases plasma concentration of **theophylline**; verapamil increases plasma concentration of **theophylline** (enhanced effect)
- Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by **cimetidine** (increased plasma concentration); plasma concentration of isradipine increased by **cimetidine** (halve dose of isradipine)
- Vardenafil: enhanced hypotensive effect when nifedipine given with **vardenafil**
- Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Calcium-channel Blockers (dihydropyridines)** see Calcium-channel Blockers
- Candesartan** see Angiotensin-II Receptor Antagonists
- Cannabis Extract**
Antidepressants: possible increased risk of hypertension and tachycardia when cannabis extract given with **tricyclics**
- Capcitabine** see Fluorouracil
- Capreomycin**
Antibacterials: increased risk of nephrotoxicity when capreomycin given with **colistimethate sodium** or **polymyxins**; increased risk of nephrotoxicity and

Capreomycin**Antibacterials** (*continued*)

ototoxicity when capreomycin given with **aminoglycosides** or **vancomycin**

Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with **platinum compounds**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Captopril *see* ACE Inhibitors

Carbamazepine

Alcohol: CNS side-effects of carbamazepine possibly increased by **alcohol**

- **Analgesics:** effects of carbamazepine enhanced by ●**dextropropoxyphene**; carbamazepine reduces plasma concentration of **methadone**; carbamazepine reduces effects of **tramadol**; carbamazepine possibly accelerates metabolism of **paracetamol**
- **Anti-arrhythmics:** carbamazepine possibly reduces plasma concentration of ●**dronedaron**—avoid concomitant use
- **Antibacterials:** plasma concentration of carbamazepine increased by ●**clarithromycin** and ●**erythromycin**; plasma concentration of carbamazepine reduced by ●**nifabutin**; carbamazepine accelerates metabolism of **doxycycline** (reduced effect); plasma concentration of carbamazepine increased by ●**isoniazid** (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of ●**telithromycin** (avoid during and for 2 weeks after carbamazepine)
- **Anticoagulants:** carbamazepine accelerates metabolism of ●**coumarins** (reduced anticoagulant effect)
- **Antidepressants:** plasma concentration of carbamazepine increased by ●**fluoxetine** and ●**fluvoxamine**; carbamazepine reduces plasma concentration of ●**mianserin** and **mirtazapine**; anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); manufacturer of carbamazepine advises avoid for 2 weeks after stopping ●**MAOIs**, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●**St John's wort**; carbamazepine accelerates metabolism of ●**tricyclics** (reduced plasma concentration and reduced effect)
- **Antiepileptics:** plasma concentration of both drugs reduced when carbamazepine given with **eslicarbazepine**; carbamazepine possibly reduces plasma concentration of **ethosuximide**; carbamazepine often reduces plasma concentration of **lamotrigine**, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with **levetiracetam**; plasma concentration of carbamazepine sometimes reduced by **oxcarbazepine** (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine possibly increases plasma concentration of **phenobarbital**; plasma concentration of both drugs often reduced when carbamazepine given with **phenytoin**, also plasma concentration of phenytoin may be increased; plasma concentration of both drugs possibly reduced when carbamazepine given with **rufinamide**; plasma concentration of carbamazepine increased by ●**stiripentol**; carbamazepine reduces plasma concentration of **tiagabine** and **zonisamide**; carbamazepine often reduces plasma concentration of **topiramate**; carbamazepine reduces plasma concentration of **valproate**, also plasma concentration of active metabolite of carbamazepine increased
- **Antifungals:** plasma concentration of carbamazepine possibly increased by **fluconazole**, **ketoconazole** and **miconazole**; carbamazepine possibly reduces plasma

Carbamazepine**Antifungals** (*continued*)

concentration of **itraconazole** and ●**posaconazole**; carbamazepine possibly reduces plasma concentration of ●**voriconazole**—avoid concomitant use; carbamazepine possibly reduces plasma concentration of **casprofungin**—consider increasing dose of casprofungin

- **Antimalarials:** possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
 - **Antipsychotics:** anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered); carbamazepine accelerates metabolism of **haloperidol**, **olanzapine**, **quetiapine** and **risperidone** (reduced plasma concentration); carbamazepine reduces plasma concentration of ●**aripiprazole**—increase dose of aripiprazole; carbamazepine accelerates metabolism of ●**clozapine** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of **paliperidone**
 - **Antivirals:** carbamazepine possibly reduces plasma concentration of **darunavir**, **fosamprenavir**, **lopinavir**, **nelfinavir**, **saquinavir** and **tipranavir**; plasma concentration of both drugs reduced when carbamazepine given with **efavirenz**; avoidance of carbamazepine advised by manufacturer of **etravirine**; carbamazepine possibly reduces plasma concentration of ●**indinavir**, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of **nevirapine**; plasma concentration of carbamazepine possibly increased by ●**ritonavir**
- Anxiolytics and Hypnotics:** carbamazepine often reduces plasma concentration of **clonazepam**; carbamazepine reduces plasma concentration of **midazolam**
- Appetitant:** carbamazepine possibly reduces plasma concentration of **aprepitant**
- Bupropion:** carbamazepine reduces plasma concentration of **bupropion**
- **Calcium-channel Blockers:** carbamazepine reduces effects of **felodipine** and **isradipine**; carbamazepine probably reduces effects of **dihydropyridines**, **nicardipine** and **nifedipine**; avoidance of carbamazepine advised by manufacturer of **nimodipine** (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by ●**diltiazem** and ●**verapamil**
 - **Ciclosporin:** carbamazepine accelerates metabolism of ●**ciclosporin** (reduced plasma concentration)
 - **Clopidogrel:** carbamazepine possibly reduces antiplatelet effect of ●**clopidogrel**
 - **Corticosteroids:** carbamazepine accelerates metabolism of ●**corticosteroids** (reduced effect)
 - **Cytotoxics:** avoidance of carbamazepine advised by manufacturer of **gefitinib**; carbamazepine reduces plasma concentration of ●**imatinib** and ●**lapatinib**—avoid concomitant use; carbamazepine reduces plasma concentration of **irinotecan** and its active metabolite
 - **Diuretics:** increased risk of hyponatraemia when carbamazepine given with **diuretics**; plasma concentration of carbamazepine increased by ●**acetazolamide**; carbamazepine reduces plasma concentration of ●**eplerenone**—avoid concomitant use
 - **Hormone Antagonists:** metabolism of carbamazepine inhibited by ●**danzolol** (increased risk of toxicity); carbamazepine possibly accelerates metabolism of **toremifene** (reduced plasma concentration)
- 5HT₂ Antagonists:** carbamazepine accelerates metabolism of **ondansetron** (reduced effect)

Carbamazepine (*continued*)

- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of ●**simvastatin**—consider increasing dose of simvastatin
- Lithium: neurotoxicity may occur when carbamazepine given with **lithium** without increased plasma concentration of lithium
- Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of **non-depolarising muscle relaxants** (accelerated recovery from neuromuscular blockade)
- Oestrogens: carbamazepine accelerates metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 398)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- Progestogens: carbamazepine accelerates metabolism of ●**progestogens** (reduced contraceptive effect—see p. 398)
- Retinoids: plasma concentration of carbamazepine possibly reduced by ●**isotretinoin**
- Theophylline: carbamazepine accelerates metabolism of **theophylline** (reduced effect)
- Thyroid Hormones: carbamazepine accelerates metabolism of **thyroid hormones** (may increase requirements for thyroid hormones in hypothyroidism)
- Tibolone: carbamazepine accelerates metabolism of **tibolone** (reduced plasma concentration)
- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by ●**cimetidine** (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of ●**ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vitamins: carbamazepine possibly increases requirements for **vitamin D**

Carbapenems see Doripenem, Ertapenem, Imipenem with Cilastatin, and Meropenem

Carbonic Anhydrase Inhibitors see Diuretics

Carboplatin see Platinum Compounds

Carboprost see Prostaglandins

Cardiac Glycosides

- ACE Inhibitors: plasma concentration of digoxin possibly increased by **captopril**
- Alpha-blockers: plasma concentration of digoxin increased by **prazosin**
- Aminosalicylates: absorption of digoxin possibly reduced by **sulfasalazine**
- Analgesics: plasma concentration of cardiac glycosides possibly increased by **NSAIDs**, also possible exacerbation of heart failure and reduction of renal function
- Antacids: absorption of digoxin possibly reduced by **antacids**
- Anti-arrhythmics: plasma concentration of digoxin increased by ●**amiodarone**, ●**dronedarone** and ●**propafenone** (halve dose of digoxin)
- Antibacterials: plasma concentration of digoxin possibly increased by **gentamicin**, **telithromycin** and **trimethoprim**; absorption of digoxin reduced by **neomycin**; plasma concentration of digoxin possibly reduced by **rifampicin**; plasma concentration of digoxin increased by **macrolides** (increased risk of toxicity)
- Antidepressants: plasma concentration of digoxin reduced by ●**St John's wort**—avoid concomitant use
- Antidiabetics: plasma concentration of digoxin possibly reduced by **acarbose**; plasma concentration of digoxin increased by **sitagliptin**
- Antiepileptics: plasma concentration of digoxin possibly reduced by **phenytoin**
- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ●**amphotericin**; plasma concentration of digoxin increased by ●**itraconazole**
- Antimalarials: plasma concentration of digoxin possibly increased by ●**chloroquine** and **hydroxychloroquine**; possible increased risk of bradycardia when digoxin given with **mefloquine**; plasma concentration of digoxin increased by ●**quinine**
- Cardiac Glycosides** (*continued*)
 - Antimuscarinics: plasma concentration of digoxin possibly increased by **darifenacin**
 - Antivirals: plasma concentration of digoxin increased by **etravirine**; plasma concentration of digoxin possibly increased by **ritonavir**
 - Anxiolytics and Hypnotics: plasma concentration of digoxin increased by **alprazolam** (increased risk of toxicity)
 - Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with **beta-blockers**
 - Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large **intravenous** doses of **calcium salts**
 - Calcium-channel Blockers: plasma concentration of digoxin increased by ●**diltiazem**, ●**lercanidipine** and ●**nicardipine**; plasma concentration of digoxin possibly increased by ●**nifedipine**; plasma concentration of digoxin increased by ●**verapamil**, also increased risk of AV block and bradycardia
 - Ciclosporin: plasma concentration of digoxin increased by ●**ciclosporin** (increased risk of toxicity)
 - Colchicine: possible increased risk of myopathy when digoxin given with ●**colchicine**
 - Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with **corticosteroids**
 - Cytotoxics: absorption of digoxin **tablets** possibly reduced by **bleomycin**, **carbustine**, **cyclophosphamide**, **cytarabine**, **doxorubicin**, **melfalan**, **methotrexate**, **procarbazine** and **vincristine**
 - Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ●**acetazolamide**, ●**loop diuretics** or ●**thiazides** and **related diuretics**; plasma concentration of digoxin possibly increased by **potassium canrenoate**; plasma concentration of digoxin increased by ●**spironolactone**
 - Lenalidomide: plasma concentration of digoxin possibly increased by **lenalidomide**
 - Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by **colestipol** and **colestyramine**; plasma concentration of digoxin possibly increased by **atorvastatin**
 - Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with **suxamethonium**; possible increased risk of bradycardia when cardiac glycosides given with **tizanidine**
 - Penicillamine: plasma concentration of digoxin possibly reduced by **penicillamine**
 - Ranolazine: plasma concentration of digoxin increased by **ranolazine**
 - Sympathomimetics, Beta₂: plasma concentration of digoxin possibly reduced by **salbutamol**
 - Tolvaptan: plasma concentration of digoxin increased by **tolvaptan** (increased risk of toxicity)
 - Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by **proton pump inhibitors**; absorption of cardiac glycosides possibly reduced by **sucralfate**
- Carmustine**
 - Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: carmustine possibly reduces absorption of **digoxin tablets**
- Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by **cimetidine**

Carteolol see Beta-blockers

Carvedilol see Beta-blockers

Caspofungin

- Antibacterials: plasma concentration of caspofungin initially increased and then reduced by **rifampicin** (consider increasing dose of caspofungin)
- Antiepileptics: plasma concentration of caspofungin possibly reduced by **carbamazepine** and **phenytoin**—consider increasing dose of caspofungin
- Antivirals: plasma concentration of caspofungin possibly reduced by **efavirenz** and **nevirapine**—consider increasing dose of caspofungin

Caspofungin (*continued*)

- **Ciclosporin**: plasma concentration of caspofungin increased by ● **ciclosporin** (manufacturer of caspofungin recommends monitoring liver enzymes)
- **Corticosteroids**: plasma concentration of caspofungin possibly reduced by ● **dexamethasone**—consider increasing dose of caspofungin
- **Tacrolimus**: caspofungin reduces plasma concentration of ● **tacrolimus**

Cefaclor *see* Cephalosporins

Cefadroxil *see* Cephalosporins

Cefalexin *see* Cephalosporins

Cefixime *see* Cephalosporins

Cefotaxime *see* Cephalosporins

Cefpodoxime *see* Cephalosporins

Cefradine *see* Cephalosporins

Ceftazidime *see* Cephalosporins

Ceftriaxone *see* Cephalosporins

Cefuroxime *see* Cephalosporins

Celecoxib *see* NSAIDs

Celiprolol *see* Beta-blockers

Cephalosporins

Antacids: absorption of cefaclor and cefpodoxime reduced by **antacids**

Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with **aminoglycosides**

- **Anticoagulants**: cephalosporins possibly enhance anticoagulant effect of ● **coumarins**

Probenecid: excretion of cephalosporins reduced by **probenecid** (increased plasma concentration)

Ulcer-healing Drugs: absorption of cefpodoxime reduced by **histamine H₂-antagonists**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Certolizumab pegol

- **Abatacept**: avoid concomitant use of certolizumab pegol with ● **abatacept**
- **Anakinra**: avoid concomitant use of certolizumab pegol with ● **anakinra**
- **Vaccines**: avoid concomitant use of certolizumab pegol with live ● **vaccines** (see p. 599)

Cetirizine *see* Antihistamines

Chenodeoxycholic Acid *see* Bile Acids

Chloral *see* Anxiolytics and Hypnotics

Chloramphenicol

Antibacterials: metabolism of chloramphenicol accelerated by **rifampicin** (reduced plasma concentration)

- **Anticoagulants**: chloramphenicol enhances anticoagulant effect of ● **coumarins**
- **Antidiabetics**: chloramphenicol enhances effects of ● **sulfonylureas**
- **Antiepileptics**: metabolism of chloramphenicol possibly accelerated by ● **phenobarbital** (reduced plasma concentration); chloramphenicol increases plasma concentration of ● **phenytoin** (increased risk of toxicity)
- **Antipsychotics**: avoid concomitant use of chloramphenicol with ● **clozapine** (increased risk of agranulocytosis)
- **Ciclosporin**: chloramphenicol possibly increases plasma concentration of ● **ciclosporin**
- **Clopidogrel**: chloramphenicol possibly reduces antiplatelet effect of ● **clopidogrel**
- **Hydroxocobalamin**: chloramphenicol reduces response to **hydroxocobalamin**
- **Tacrolimus**: chloramphenicol possibly increases plasma concentration of ● **tacrolimus**
- **Vaccines**: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Chlordiazepoxide *see* Anxiolytics and Hypnotics

Chloroquine and Hydroxychloroquine

Adsorbents: absorption of chloroquine and hydroxychloroquine reduced by **kaolin**

Agalsidase Alfa and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of **agalsidase alfa** and **beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Chloroquine and Hydroxychloroquine (*continued*)

Antacids: absorption of chloroquine and hydroxychloroquine reduced by **antacids**

- **Anti-arrhythmics**: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ● **amiodarone**—avoid concomitant use
- **Antibacterials**: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ● **moxifloxacin**—avoid concomitant use
- **Antiepileptics**: possible increased risk of convulsions when chloroquine and hydroxychloroquine given with **antiepileptics**
- **Antimalarials**: avoidance of antimalarials advised by manufacturer of ● **artemether/Lumefantrine**; increased risk of convulsions when chloroquine and hydroxychloroquine given with ● **mefloquine**
- **Antipsychotics**: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ● **droperidol**—avoid concomitant use
- **Cardiac Glycosides**: chloroquine and hydroxychloroquine possibly increase plasma concentration of ● **digoxin**
- **Ciclosporin**: chloroquine and hydroxychloroquine increase plasma concentration of ● **ciclosporin** (increased risk of toxicity)
- **Histamine**: avoidance of antimalarials advised by manufacturer of **histamine**
- **Lanthanum**: absorption of chloroquine and hydroxychloroquine possibly reduced by **lanthanum** (give at least 2 hours apart)
- **Larionidase**: chloroquine and hydroxychloroquine possibly inhibit effects of **larionidase** (manufacturer of larionidase advises avoid concomitant use)
- **Parasympathomimetics**: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of **neostigmine** and **pyridostigmine**
- **Ulcer-healing Drugs**: metabolism of chloroquine and hydroxychloroquine inhibited by **cimetidine** (increased plasma concentration)
- **Vaccines**: antimalarials inactivate **oral typhoid vaccine**—see p. 620

Chlorothiazide *see* Diuretics

Chlorphenamine *see* Antihistamines

Chlorpromazine *see* Antipsychotics

Chlortalidone *see* Diuretics

Ciclesonide *see* Corticosteroids

Ciclosporin

- **ACE Inhibitors**: increased risk of hyperkalaemia when ciclosporin given with ● **ACE inhibitors**
- **Aliskiren**: ciclosporin increases plasma concentration of ● **aliskiren**—avoid concomitant use
- **Allopurinol**: plasma concentration of ciclosporin possibly increased by **allopurinol** (risk of nephrotoxicity)
- **Analgesics**: increased risk of nephrotoxicity when ciclosporin given with ● **NSAIDs**; ciclosporin increases plasma concentration of ● **diclofenac** (halve dose of diclofenac)
- **Angiotensin-II Receptor Antagonists**: increased risk of hyperkalaemia when ciclosporin given with ● **angiotensin-II receptor antagonists**
- **Anti-arrhythmics**: plasma concentration of ciclosporin possibly increased by **amiodarone** and **propafenone**
- **Antibacterials**: metabolism of ciclosporin inhibited by ● **clarithromycin** and ● **erythromycin** (increased plasma concentration); metabolism of ciclosporin accelerated by ● **rifampicin** (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by ● **sulfadiazine**; increased risk of nephrotoxicity when ciclosporin given with ● **aminoglycosides**, ● **polymyxins**, ● **quinolones**, ● **sulfonamides** or ● **vancomycin**; plasma concentration of ciclosporin possibly increased by ● **chloramphenicol** and ● **teltithromycin**; increased risk of myopathy when ciclosporin given with ● **daptomycin** (preferably avoid concomitant use); metabolism of ciclosporin possibly inhibited by ● **macrolides** (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin

Ciclosporin

- **Antibacterials** (*continued*)
 - given with ● **trimethoprim**, also plasma concentration of ciclosporin reduced by **intravenous trimethoprim**
- **Antidepressants**: plasma concentration of ciclosporin reduced by ● **St John's wort**—avoid concomitant use
- **Antidiabetics**: ciclosporin possibly enhances hypoglycaemic effect of **repaglinide**
- **Antiepileptics**: metabolism of ciclosporin accelerated by ● **carbamazepine**, ● **phenobarbital** and ● **phenytoin** (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by ● **carbazepine**
- **Antifungals**: metabolism of ciclosporin inhibited by ● **fluconazole**, ● **itraconazole**, ● **ketoconazole**, ● **posaconazole** and ● **voriconazole** (increased plasma concentration); metabolism of ciclosporin possibly inhibited by ● **micronazole** (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with ● **amphotericin**; ciclosporin increases plasma concentration of ● **caspofungin** (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by **griseofulvin** and **terbinafine**; plasma concentration of ciclosporin possibly increased by **miconazole**
- **Antimalarials**: plasma concentration of ciclosporin increased by ● **chloroquine** and ● **hydroxychloroquine** (increased risk of toxicity)
- **Antimuscarinics**: avoidance of ciclosporin advised by manufacturer of **darifenacin**
- **Antivirals**: increased risk of nephrotoxicity when ciclosporin given with ● **aciclovir**; plasma concentration of ciclosporin possibly increased by ● **atazanavir**, ● **nefnavir** and ● **ritonavir**; plasma concentration of ciclosporin possibly reduced by ● **efavirenz**; plasma concentration of ciclosporin increased by ● **fosamprenavir** and ● **indinavir**; plasma concentration of both drugs increased when ciclosporin given with ● **saquinavir**
- **Beta-blockers**: plasma concentration of ciclosporin increased by ● **carvedilol**
- **Bile Acids**: absorption of ciclosporin increased by ● **ursodeoxycholic acid**
- **Bosentan**: ciclosporin increases plasma concentration of ● **bosentan** (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- **Calcium-channel Blockers**: combination of ciclosporin with ● **lercanidipine** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by ● **diltiazem**, ● **nicardipine** and ● **verapamil**; ciclosporin possibly increases plasma concentration of **nifedipine** (increased risk of toxicity including gingival hyperplasia)
- **Cardiac Glycosides**: ciclosporin increases plasma concentration of ● **digoxin** (increased risk of toxicity)
- **Colchicine**: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with ● **colchicine**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- **Corticosteroids**: plasma concentration of ciclosporin increased by high-dose ● **methylprednisolone** (risk of convulsions); ciclosporin increases plasma concentration of **prednisolone**
- **Cytotoxics**: increased risk of nephrotoxicity when ciclosporin given with ● **melfalan**; increased risk of neurotoxicity when ciclosporin given with ● **doxorubicin**; ciclosporin increases plasma concentration of ● **epirubicin**, ● **everolimus** and ● **idarubicin**; ciclosporin reduces excretion of **mitoxantrone** (increased plasma concentration); risk of toxicity when ciclosporin given with ● **methotrexate**; plasma concentration of ciclosporin possibly increased by **imatinib**; *in vitro* studies suggest a possible interaction between ciclosporin and **docetaxel** (consult docetaxel product literature); ciclosporin possibly

Ciclosporin

- **Cytotoxics** (*continued*)
 - increases plasma concentration of **etoposide** (increased risk of toxicity)
 - **Diuretics**: plasma concentration of ciclosporin possibly increased by ● **acetazolamide**; increased risk of hyperkalaemia when ciclosporin given with ● **potassium-sparing diuretics** and **aldosterone antagonists**; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with **thiazides** and **related diuretics**
 - **Grapefruit Juice**: plasma concentration of ciclosporin increased by ● **grapefruit juice** (increased risk of toxicity)
 - **Hormone Antagonists**: metabolism of ciclosporin inhibited by ● **danazol** (increased plasma concentration); plasma concentration of ciclosporin reduced by **lanreotide** and ● **octreotide**
 - **Lipid-regulating Drugs**: absorption of ciclosporin reduced by ● **colestyramine**; increased risk of renal impairment when ciclosporin given with **bezafibrate** or **fenofibrate**; increased risk of myopathy when ciclosporin given with ● **rosuvastatin** (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with ● **ezetimibe**; increased risk of myopathy when ciclosporin given with ● **statins**
 - **Mannitol**: possible increased risk of nephrotoxicity when ciclosporin given with **mannitol**
 - **Metoclopramide**: plasma concentration of ciclosporin increased by ● **metoclopramide**
 - **Mifamurtide**: avoidance of ciclosporin advised by manufacturer of **mifamurtide**
 - **Modafinil**: plasma concentration of ciclosporin reduced by ● **modafinil**
 - **Oestrogens**: plasma concentration of ciclosporin possibly increased by **oestrogens**
 - **Orlistat**: absorption of ciclosporin possibly reduced by ● **orlistat**
 - **Potassium Salts**: increased risk of hyperkalaemia when ciclosporin given with ● **potassium salts**
 - **Progestogens**: plasma concentration of ciclosporin possibly increased by **progestogens**
 - **Ranolazine**: ciclosporin possibly increases plasma concentration of **ranolazine**
 - **Sevelamer**: plasma concentration of ciclosporin possibly reduced by **sevelamer**
 - **Sirolimus**: ciclosporin increases plasma concentration of **sirolimus**
 - **Sitaxentan**: ciclosporin increases plasma concentration of ● **sitaxentan**—avoid concomitant use
 - **Sulfapyrazone**: plasma concentration of ciclosporin reduced by ● **sulfapyrazone**
 - **Tacrolimus**: plasma concentration of ciclosporin increased by ● **tacrolimus** (increased risk of nephrotoxicity)—avoid concomitant use
 - **Ulcer-healing Drugs**: plasma concentration of ciclosporin possibly increased by ● **cimetidine**; plasma concentration of ciclosporin possibly affected by **omeprazole**
 - **Vitamins**: plasma concentration of ciclosporin possibly affected by **vitamin E**
- Cidofovir**
- **Antivirals**: manufacturers advise avoid concomitant use of cidofovir with ● **tenofovir**
- Cilazapril** see ACE Inhibitors
- Cilostazol**
- **Anagrelide**: avoidance of cilostazol advised by manufacturer of ● **anagrelide**
 - **Antibacterials**: plasma concentration of cilostazol increased by **erythromycin** (consider reducing dose of cilostazol)
 - **Antifungals**: plasma concentration of cilostazol increased by **ketoconazole** (consider reducing dose of cilostazol)
 - **Calcium-channel Blockers**: plasma concentration of cilostazol increased by **diltiazem** (consider reducing dose of cilostazol)

Cilostazol (*continued*)

Ulcer-healing Drugs: plasma concentration of cilostazol increased by **omeprazole** (consider reducing dose of cilostazol)

Cimetidine *see* Histamine H₂-antagonists

Cinacalcet

Antifungals: metabolism of cinacalcet inhibited by **ketoconazole** (increased plasma concentration)

- Hormone Antagonists: cinacalcet possibly inhibits metabolism of **tamoxifen** to active metabolite (avoid concomitant use)

Cinnarizine *see* Antihistamines

Ciprofibrate *see* Fibrates

Ciprofloxacin *see* Quinolones

Cisatracurium *see* Muscle Relaxants

Cisplatin *see* Platinum Compounds

Citalopram *see* Antidepressants, SSRI

Clarithromycin *see* Macrolides

Clemastine *see* Antihistamines

Clindamycin

- Muscle Relaxants: clindamycin enhances effects of
 - **non-depolarising muscle relaxants** and
 - **suxamethonium**

Parasympathomimetics: clindamycin antagonises effects of **neostigmine** and **pyridostigmine**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620

Clobazam *see* Anxiolytics and Hypnotics

Clomethiazole *see* Anxiolytics and Hypnotics

Clomipramine *see* Antidepressants, Tricyclic

Clonazepam *see* Anxiolytics and Hypnotics

Clonidine

ACE Inhibitors: enhanced hypotensive effect when clonidine given with **ACE inhibitors**; previous treatment with clonidine possibly delays antihypertensive effect of **captopril**

Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when clonidine given with **alcohol**

Aldesleukin: enhanced hypotensive effect when clonidine given with **aldesleukin**

Alpha-blockers: enhanced hypotensive effect when clonidine given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when clonidine given with **general anaesthetics**

Analgesics: hypotensive effect of clonidine antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with **angiotensin-II receptor antagonists**

- Antidepressants: enhanced hypotensive effect when clonidine given with **MAOIs**; hypotensive effect of clonidine possibly antagonised by **mirtazapine**; hypotensive effect of clonidine antagonised by
 - **tricyclics**, also increased risk of hypertension on clonidine withdrawal

Antipsychotics: enhanced hypotensive effect when clonidine given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with **anxiolytics and hypnotics**

- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with **beta-blockers** (withdraw beta-blockers several days before slowly withdrawing clonidine)

Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with **calcium-channel blockers**

Corticosteroids: hypotensive effect of clonidine antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when clonidine given with **diazoxide**

Diuretics: enhanced hypotensive effect when clonidine given with **diuretics**

Dopaminergics: enhanced hypotensive effect when clonidine given with **levodopa**

Clonidine (*continued*)

Histamine: avoidance of clonidine advised by manufacturer of **histamine**

Methyldopa: enhanced hypotensive effect when clonidine given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when clonidine given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when clonidine given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when clonidine given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when clonidine given with **nitrates**

Oestrogens: hypotensive effect of clonidine antagonised by **oestrogens**

Prostaglandins: enhanced hypotensive effect when clonidine given with **alprostadil**

- Sympathomimetics: possible risk of hypertension when clonidine given with **adrenaline** (epinephrine) or **noradrenaline** (norepinephrine); serious adverse events reported with concomitant use of clonidine and **methylphenidate** (causality not established)

Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

Clopidamide *see* Diuretics

Clopidogrel

Analgesics: increased risk of bleeding when clopidogrel given with **NSAIDs** or **aspirin**

- Antibacterials: antiplatelet effect of clopidogrel possibly reduced by **chloramphenicol**, **ciprofloxacin** and **erythromycin**
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with **warfarin**; antiplatelet action of clopidogrel enhances anticoagulant effect of **coumarins** and **phenindione**; increased risk of bleeding when clopidogrel given with **heparins**
- Antidepressants: antiplatelet effect of clopidogrel possibly reduced by **fluoxetine**, **fluvoxamine** and **moclobemide**
- Antiplateletics: antiplatelet effect of clopidogrel possibly reduced by **carbamazepine** and **oxcarbazepine**
- Antifungals: antiplatelet effect of clopidogrel possibly reduced by **fluconazole**, **itraconazole**, **ketoconazole** and **voriconazole**
- Antivirals: antiplatelet effect of clopidogrel possibly reduced by **etravirine**
- Dipyridamol: increased risk of bleeding when clopidogrel given with **dipyridamol**
- Ilprost: increased risk of bleeding when clopidogrel given with **ilprost**
- Prasugrel: possible increased risk of bleeding when clopidogrel given with **prasugrel**
- Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by **cimetidine**, **lansoprazole**, **pantoprazole** and **rabeprazole**; antiplatelet effect of clopidogrel reduced by **esomeprazole** and **omeprazole**

Clotrimazole *see* Antifungals, Imidazole

Clozapine *see* Antipsychotics

Co-amoxiclav *see* Penicillins

Co-beneldopa *see* Levodopa

Co-careldopa *see* Levodopa

Codeine *see* Opioid Analgesics

Co-fluampicil *see* Penicillins

Colchicine

- Anti-arrhythmics: possible increased risk of colchicine toxicity when given with **amiodarone**
- Antibacterials: possible increased risk of colchicine toxicity when given with **azithromycin**, **clarithromycin**, **erythromycin** and **telithromycin**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antifungals: possible increased risk of colchicine toxicity when given with **itraconazole** and **ketoconazole**—suspend or reduce dose of

Colchicine

- Antifungals (*continued*)
colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with ●*atazanavir*, ●*indinavir* and ●*ritonavir*—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with ●*diltiazem* and ●*verapamil*—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiac Glycosides: possible increased risk of myopathy when colchicine given with ●*digoxin*
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ●*ciclosporin*—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Grapefruit Juice: possible increased risk of colchicine toxicity when given with ●*grapefruit juice*
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with ●*fibrates* or ●*statins*

Colesevelam

Note Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption

- Antidiabetics: colesevelam reduces absorption of ●*glibenclamide*
- Antiepileptics: colesevelam possibly reduces absorption of ●*phenytoin*
- Ciclosporin: colesevelam reduces absorption of ●*ciclosporin*
- Oestrogens: colesevelam reduces absorption of ●*ethinylestradiol*
- Thyroid Hormones: colesevelam reduces absorption of ●*levothyroxine*

Colestipol

Note Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption

- Antibacterials: colestipol possibly reduces absorption of ●*tetracycline*
- Bile Acids: colestipol possibly reduces absorption of ●*bile acids*
- Cardiac Glycosides: colestipol possibly reduces absorption of ●*cardiac glycosides*
- Diuretics: colestipol reduces absorption of ●*thiazides* and ●*related diuretics* (give at least 2 hours apart)
- Thyroid Hormones: colestipol reduces absorption of ●*thyroid hormones*

Colestyramine

Note Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption

- Analgesics: colestyramine increases the excretion of ●*meloxicam*; colestyramine reduces absorption of ●*paracetamol*
- Antibacterials: colestyramine possibly reduces absorption of ●*tetracycline*; colestyramine antagonises effects of ●*oral vancomycin*
- Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of ●*coumarins* and ●*phenindione*
- Antidiabetics: colestyramine possibly enhances hypoglycaemic effect of ●*acarbose*
- Antiepileptics: colestyramine possibly reduces absorption of ●*valproate*
- Bile Acids: colestyramine possibly reduces absorption of ●*bile acids*
- Cardiac Glycosides: colestyramine possibly reduces absorption of ●*cardiac glycosides*
- Diuretics: colestyramine reduces absorption of ●*thiazides* and ●*related diuretics* (give at least 2 hours apart)

Colestyramine (*continued*)

- Leflunomide: colestyramine significantly decreases effect of ●*leflunomide* (enhanced elimination)—avoid unless drug elimination desired
- Mycophenolate: colestyramine reduces absorption of ●*mycophenolate*
- Raloxifene: colestyramine reduces absorption of ●*raloxifene* (manufacturer of raloxifene advises avoid concomitant administration)
- Thyroid Hormones: colestyramine reduces absorption of ●*thyroid hormones*

Colistimethate Sodium see Polymyxins

Contraceptives, oral see Oestrogens and Progestogens

Corticosteroids

Note Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified
● ACE Inhibitors: corticosteroids antagonise hypotensive effect of ●*ACE inhibitors*

- Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of ●*adrenergic neurone blockers*
- Aldesleukin: avoidance of corticosteroids advised by manufacturer of ●*aldesleukin*
- Alpha-blockers: corticosteroids antagonise hypotensive effect of ●*alpha-blockers*
- Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with ●*NSAIDs*; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with ●*aspirin*, also corticosteroids reduce plasma concentration of salicylate
- Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of ●*angiotensin-II receptor antagonists*
- Antacids: absorption of ●*deflazacort* reduced by ●*antacids*
- Antibacterials: plasma concentration of methylprednisolone possibly increased by ●*clarithromycin*; metabolism of corticosteroids possibly inhibited by ●*erythromycin*; metabolism of methylprednisolone inhibited by ●*erythromycin*; corticosteroids possibly reduce plasma concentration of ●*isoniazid*; metabolism of corticosteroids accelerated by ●*rifamycins* (reduced effect)
- Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of ●*coumarins* (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of ●*phenindione*
- Antidiabetics: corticosteroids antagonise hypoglycaemic effect of ●*antidiabetics*
- Antiepileptics: metabolism of corticosteroids accelerated by ●*carbamazepine*, ●*phenobarbital* and ●*phenytoin* (reduced effect)
- Antifungals: metabolism of corticosteroids possibly inhibited by ●*itraconazole* and ●*ketoconazole*; plasma concentration of active metabolite of ciclosporin increased by ●*ketoconazole*; plasma concentration of ●*inhaled* mometasone increased by ●*ketoconazole*; plasma concentration of ●*inhaled* and ●*oral* budesonide increased by ●*ketoconazole*; metabolism of methylprednisolone inhibited by ●*ketoconazole*; increased risk of hypokalaemia when corticosteroids given with ●*amphotericin*—avoid concomitant use unless corticosteroids needed to control reactions; plasma concentration of ●*inhaled* budesonide increased by ●*itraconazole*; metabolism of methylprednisolone possibly inhibited by ●*itraconazole*; dexamethasone possibly reduces plasma concentration of ●*casprofungin*—consider increasing dose of casprofungin
- Antivirals: dexamethasone possibly reduces plasma concentration of ●*indinavir*, ●*lopinavir* and ●*saquinavir*; plasma concentration of ●*inhaled* and ●*intranasal* fluticasone possibly increased by ●*nelfinavir*; plasma concentration of corticosteroids, dexamethasone and prednisolone possibly increased by ●*ritonavir*; plasma concentration of ●*inhaled* and ●*intranasal* budesonide and fluticasone increased by ●*ritonavir*

Corticosteroids (continued)

- Appetitant: metabolism of dexamethasone and methylprednisolone inhibited by **aprepitant** (reduce dose of dexamethasone and methylprednisolone)
- Beta-blockers: corticosteroids antagonise hypotensive effect of **beta-blockers**
- Calcium Salts: corticosteroids reduce absorption of **calcium salts**
- Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of **calcium-channel blockers**; plasma concentration of methylprednisolone increased by **diltiazem**
- Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with **cardiac glycosides**
- **Ciclosporin**: high-dose methylprednisolone increases plasma concentration of **ciclosporin** (risk of convulsions); plasma concentration of prednisolone increased by **ciclosporin**
- Clonidine: corticosteroids antagonise hypotensive effect of **clonidine**
- Diazoxide: corticosteroids antagonise hypotensive effect of **diazoxide**
- Diuretics: corticosteroids antagonise diuretic effect of **diuretics**; increased risk of hypokalaemia when corticosteroids given with **acetazolamide**, **loop diuretics** or **thiazides** and related diuretics
- Histamine: avoidance of corticosteroids advised by manufacturer of **histamine**
- Methylidopa: corticosteroids antagonise hypotensive effect of **methylidopa**
- Mifamurtide: avoidance of corticosteroids advised by manufacturer of **mifamurtide**
- Mifepristone: effect of corticosteroids (including **inhaled corticosteroids**) may be reduced for 3–4 days after **mifepristone**
- Moxonidine: corticosteroids antagonise hypotensive effect of **moxonidine**
- Muscle Relaxants: corticosteroids possibly antagonise effects of **pancuronium** and **vecuronium**
- Nitrate: corticosteroids antagonise hypotensive effect of **nitrate**
- Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing **oestrogens**
- Sodium Benzoate: corticosteroids possibly reduce effects of **sodium benzoate**
- Sodium Phenylbutyrate: corticosteroids possibly reduce effects of **sodium phenylbutyrate**
- Somatropin: corticosteroids may inhibit growth-promoting effect of **somatropin**
- Sympathomimetics: metabolism of dexamethasone accelerated by **ephedrine**
- Sympathomimetics, Beta₂: increased risk of hypokalaemia when corticosteroids given with high doses of **beta₂ sympathomimetics**—see Hypokalaemia, p. 138
- Theophylline: increased risk of hypokalaemia when corticosteroids given with **theophylline**
- **Vaccines**: high doses of corticosteroids impair immune response to **vaccines**, avoid concomitant use with live vaccines (see p. 599)
- Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**

Cortisone see Corticosteroids

Co-trimoxazole see Trimethoprim and Sulfamethoxazole

Coumarins

Note Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- **Alcohol**: anticoagulant control with coumarins may be affected by major changes in consumption of **alcohol**
- Allopurinol**: anticoagulant effect of coumarins possibly enhanced by **allopurinol**

Coumarins (continued)

- **Anabolic Steroids**: anticoagulant effect of coumarins enhanced by **anabolic steroids**
 - **Analgesics**: anticoagulant effect of coumarins possibly enhanced by **NSAIDs**; increased risk of haemorrhage when anticoagulants given with **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by **tramadol**; increased risk of bleeding when coumarins given with **aspirin** (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of **paracetamol**
 - **Anti-arrhythmics**: metabolism of coumarins inhibited by **amiodarone** (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by **propafenone**
 - **Antibacterials**: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with **neomycin** (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by **azithromycin**, **aztreonam**, **cephalosporins**, **levofloxacin**, **tetracyclines**, **tigecycline** and **trimethoprim**; anticoagulant effect of coumarins enhanced by **chloramphenicol**, **ciprofloxacin**, **clarithromycin**, **erythromycin**, **metronidazole**, **nalidixic acid**, **norfloxacin**, **ofloxacin** and **sulfonamides**; studies have failed to demonstrate an interaction with coumarins, but common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum **penicillins** such as ampicillin; metabolism of coumarins accelerated by **rifamycins** (reduced anticoagulant effect)
 - **Antidepressants**: anticoagulant effect of warfarin possibly enhanced by **venlafaxine**; anticoagulant effect of warfarin may be enhanced or reduced by **trazodone**; anticoagulant effect of coumarins possibly enhanced by **SSRIs**; anticoagulant effect of coumarins reduced by **St John's wort** (avoid concomitant use); anticoagulant effect of warfarin enhanced by **mirtazapine**; anticoagulant effect of coumarins may be enhanced or reduced by **tricyclics**
 - **Antidiabetics**: anticoagulant effect of warfarin possibly enhanced by **exenatide**; coumarins possibly enhance hypoglycaemic effect of **sulfonylureas**, also possible changes to anticoagulant effect
 - **Antiepileptics**: metabolism of coumarins accelerated by **carbamazepine** and **phenobarbital** (reduced anticoagulant effect); plasma concentration of warfarin reduced by **eslicarbazepine**; metabolism of coumarins accelerated by **phenytoin** (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by **valproate**
 - **Antifungals**: anticoagulant effect of coumarins enhanced by **fluconazole**, **itraconazole**, **ketoconazole** and **voriconazole**; anticoagulant effect of coumarins enhanced by **miconazole** (miconazole oral gel and possibly vaginal formulations absorbed); anticoagulant effect of coumarins reduced by **griseofulvin**
- Antimalarials**: isolated reports that anticoagulant effect of warfarin may be enhanced by **proguanil**; plasma concentration of both drugs increased when warfarin given with **quinine**
- **Antivirals**: anticoagulant effect of warfarin may be enhanced or reduced by **atazanavir**, **nevirapine** and **ritonavir**; plasma concentration of warfarin possibly affected by **efavirenz**; anticoagulant effect of coumarins may be enhanced or reduced by **fosamprenavir**; anticoagulant effect of coumarins possibly enhanced by **ritonavir**; anticoagulant effect of warfarin possibly enhanced by **saquinavir**
- Anxiolytics and Hypnotics**: anticoagulant effect of coumarins may transiently be enhanced by **chloral**

Coumarins (continued)

- Aprepitant: anticoagulant effect of warfarin possibly reduced by **aprepitant**
- Azathioprine: anticoagulant effect of coumarins possibly reduced by **azathioprine**
 - Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of **bosentan**
 - Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of **clopidogrel**; avoidance of warfarin advised by manufacturer of **clopidogrel**
 - Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by **corticosteroids** (high-dose corticosteroids enhance anticoagulant effect)
 - Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by **cranberry juice**—avoid concomitant use
 - Cytotoxics: anticoagulant effect of coumarins possibly enhanced by **etoposide**, **ifosfamide** and **sorafenib**; anticoagulant effect of coumarins enhanced by **florouracil**; anticoagulant effect of warfarin possibly enhanced by **gefitinib** and **gemcitabine**; anticoagulant effect of coumarins possibly reduced by **mercaptopurine** and **mitotane**; increased risk of bleeding when coumarins given with **erlotinib**; replacement of warfarin with a heparin advised by manufacturer of **imatinib** (possibility of enhanced warfarin effect)
 - Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of **dipyridamole**
 - Disulfiram: anticoagulant effect of coumarins enhanced by **disulfiram**
 - Dopaminergics: anticoagulant effect of warfarin enhanced by **entacapone**
 - Enteral Foods: anticoagulant effect of coumarins antagonised by vitamin K (present in some **enteral feeds**)
 - Glucosamine: anticoagulant effect of warfarin enhanced by **glucosamine** (avoid concomitant use)
 - Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by **bicalutamide** and **torsemide**; metabolism of coumarins inhibited by **danazol** (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by **flutamide** and **tamoxifen**
 - Iloprost: anticoagulant effect of coumarins possibly enhanced by **iloprost**
 - Lactulose: anticoagulant effect of coumarins possibly enhanced by **lactulose**
 - Leflunomide: anticoagulant effect of warfarin possibly enhanced by **leflunomide**
 - Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by **zafirlukast**
 - Levamisole: anticoagulant effect of warfarin possibly enhanced by **levamisole**
 - Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by **colestyramine**; anticoagulant effect of warfarin may be transiently reduced by **atorvastatin**; anticoagulant effect of coumarins enhanced by **fibrates**, **fluvastatin** and **simvastatin**; anticoagulant effect of coumarins possibly enhanced by **ezetimibe** and **rosuvastatin**
 - Memantine: anticoagulant effect of warfarin possibly enhanced by **memantine**
 - Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by **oestrogens**
 - Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of **orlistat**
 - Prasugrel: possible increased risk of bleeding when coumarins given with **prasugrel**
 - Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by **progestogens**
 - Raloxifene: anticoagulant effect of coumarins antagonised by **raloxifene**
 - Retinoids: anticoagulant effect of coumarins possibly reduced by **acitretin**
 - Sitaxentan: anticoagulant effect of coumarins enhanced by **sitaxentan**

Coumarins (continued)

- Sulfipyrazone: anticoagulant effect of coumarins enhanced by **sulfipyrazone**
- Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by **methylphenidate**
- Testolactone: anticoagulant effect of coumarins enhanced by **testolactone**
- Testosterone: anticoagulant effect of coumarins enhanced by **testosterone**
- Thyroid Hormones: anticoagulant effect of coumarins enhanced by **thyroid hormones**
- Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by **ubidecarenone**
- Ulcer-healing Drugs: metabolism of coumarins inhibited by **cimetidine** (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by **esomeprazole**, **omeprazole** and **pantoprazole**; absorption of coumarins possibly reduced by **sucralfate** (reduced anticoagulant effect)
- Vaccines: anticoagulant effect of warfarin possibly enhanced by **influenza vaccine**
- Vitamins: anticoagulant effect of coumarins possibly enhanced by **vitamin E**; anticoagulant effect of coumarins antagonised by **vitamin K**

Cranberry Juice

- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of **coumarins**—avoid concomitant use

Cyclizine *see* Antihistamines**Cyclophosphamide** *see* Diuretics**Cyclopentolate** *see* Antimuscarinics**Cyclophosphamide**

- Antifungals: side-effects of cyclophosphamide possibly increased by **itraconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: cyclophosphamide possibly reduces absorption of **digoxin tablets**
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with **pentostatin**—avoid concomitant use
- Muscle Relaxants: cyclophosphamide enhances effects of **suxamethonium**

Cycloserine

- Alcohol: increased risk of convulsions when cycloserine given with **alcohol**
- Antibacterials: increased risk of CNS toxicity when cycloserine given with **isoniazid**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620

Cyproheptadine *see* Antihistamines**Cytarabine**

- Antifungals: cytarabine possibly reduces plasma concentration of **flucytosine**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: cytarabine possibly reduces absorption of **digoxin tablets**
- Cytotoxics: intracellular concentration of cytarabine increased by **fludarabine**

Cytotoxics *see* individual drugs**Dabigatran Etxelate**

- Analgesics: possible increased risk of bleeding when dabigatran etexilate given with **NSAIDs**; increased risk of haemorrhage when anticoagulants given with **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: plasma concentration of dabigatran etexilate increased by **amiodarone** (reduce dose of dabigatran etexilate)
- Calcium-channel Blockers: plasma concentration of dabigatran etexilate possibly increased by **verapamil** (reduce dose of dabigatran etexilate)

Dacarbazine

- Aldesleukin: avoidance of dacarbazine advised by manufacturer of **aldesleukin**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Dairy Products

Antibacterials: dairy products reduce absorption of **ciprofloxacin** and **norfloxacin**; dairy products reduce absorption of **tetracyclines** (except doxycycline and minocycline)

Eltrombopag: dairy products possibly reduce absorption of **eltrombopag** (give at least 4 hours apart)

Dalteparin *see* Heparins

Danazol

- Anticoagulants: danazol inhibits metabolism of **coumarins** (enhanced anticoagulant effect)
 - Antiepileptics: danazol inhibits metabolism of **carbamazepine** (increased risk of toxicity)
 - Ciclosporin: danazol inhibits metabolism of **ciclosporin** (increased plasma concentration)
 - Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with **simvastatin**
- Tacrolimus: danazol possibly increases plasma concentration of **tacrolimus**

Dantrolene *see* Muscle Relaxants

Dapsone

- Antibacterials: plasma concentration of dapsone reduced by **rifamycins**; plasma concentration of both drugs may increase when dapsone given with **trimethoprim**
 - Antivirals: increased risk of ventricular arrhythmias when dapsone given with **saquinavir**—avoid concomitant use
- Probenecid: excretion of dapsone reduced by **probenecid** (increased risk of side-effects)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620

Daptomycin

- Ciclosporin: increased risk of myopathy when daptomycin given with **ciclosporin** (preferably avoid concomitant use)
 - Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with **fibrates** or **statins** (preferably avoid concomitant use)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620

Darifenacin *see* Antimuscarinics

Darunavir

- Anti-arrhythmics: darunavir possibly increases plasma concentration of **lidocaine**—avoid concomitant use
- Antibacterials: darunavir increases plasma concentration of **rifabutin** (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: avoidance of darunavir advised by manufacturer of **rivaroxaban**
- Antidepressants: darunavir possibly reduces plasma concentration of **paroxetine** and **sertraline**; plasma concentration of darunavir reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of darunavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of both drugs increased when darunavir given with **ketoconazole**
- Antimalarials: caution with darunavir advised by manufacturer of **artemether/lumefantrine**; darunavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)
- Antivirals: plasma concentration of darunavir reduced by **efavirenz** and **saquinavir**; plasma concentration of both drugs increased when darunavir given with **indinavir**; plasma concentration of darunavir reduced by **lopinavir**, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc)

Darunavir (continued)

- Cytotoxics: darunavir possibly increases plasma concentration of **everolimus**—manufacturer of everolimus advises avoid concomitant use
- Lipid-regulating Drugs: darunavir possibly increases plasma concentration of **pravastatin**; possible increased risk of myopathy when darunavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use
- Ranolazine: darunavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use

Dasatinib

- Antibacterials: metabolism of dasatinib accelerated by **rifampicin** (reduced plasma concentration—avoid concomitant use)
- Antifungals: plasma concentration of dasatinib possibly increased by **ketoconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of **simvastatin**
- Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by **famotidine**

Deferasirox

- Antacids: absorption of deferasirox possibly reduced by **antacids** containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
- Antibacterials: plasma concentration of deferasirox reduced by **rifampicin**
- Antidiabetics: deferasirox increases plasma concentration of **repaglinide**
- Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of **midazolam**

Deflazacort *see* Corticosteroids

Demeclocycline *see* Tetracyclines

Desferrioxamine

- Antipsychotics: avoidance of desferrioxamine advised by manufacturer of **levomepromazine**; manufacturer of desferrioxamine advises avoid concomitant use with **prochlorperazine**

Desflurane *see* Anaesthetics, General

Desloratadine *see* Antihistamines

Desmopressin

- Analgesics: effects of desmopressin enhanced by **indometacin**
- Loperamide: plasma concentration of **oral** desmopressin increased by **loperamide**

Desogestrel *see* Progestogens

Dexamethasone *see* Corticosteroids

Dexamfetamine *see* Sympathomimetics

Dexibuprofen *see* NSAIDs

Dexketoprofen *see* NSAIDs

Dextromethorphan *see* Opioid Analgesics

Dextropropoxyphene *see* Opioid Analgesics

Diamorphine *see* Opioid Analgesics

Diazepam *see* Anxiolytics and Hypnotics

Diazoxide

- ACE Inhibitors: enhanced hypotensive effect when diazoxide given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when diazoxide given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when diazoxide given with **aldesleukin**
- Alpha-blockers: enhanced hypotensive effect when diazoxide given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when diazoxide given with **general anaesthetics**
- Analgesics: hypotensive effect of diazoxide antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with **angiotensin-II receptor antagonists**

Diazoxide (*continued*)

- Antidepressants: enhanced hypotensive effect when diazoxide given with **MAOIs** or **tricyclic-related antidepressants**
- Antidiabetics: diazoxide antagonises hypoglycaemic effect of **antidiabetics**
- Antiepileptics: diazoxide reduces plasma concentration of **phenytoin**, also effect of diazoxide may be reduced
- Antipsychotics: enhanced hypotensive effect when diazoxide given with **phenothiazines**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when diazoxide given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when diazoxide given with **clonidine**
- Corticosteroids: hypotensive effect of diazoxide antagonised by **corticosteroids**
- Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when diazoxide given with **levodopa**
- Methyldopa: enhanced hypotensive effect when diazoxide given with **methyldopa**
- Moxisylyte: enhanced hypotensive effect when diazoxide given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when diazoxide given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when diazoxide given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when diazoxide given with **nitrates**
- Prostaglandins: enhanced hypotensive effect when diazoxide given with **alprostadil**
- Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

Diclofenac *see* NSAIDs**Dicycloverine** *see* Antimuscarinics**Didanosine**

Note Antacids in tablet formulation may affect absorption of other drugs

- Allopurinol: plasma concentration of didanosine increased by **allopurinol** (risk of toxicity)—avoid concomitant use
- Analgesics: plasma concentration of didanosine possibly reduced by **methadone**
- Antivirals: plasma concentration of didanosine possibly increased by **ganciclovir**; increased risk of side-effects when didanosine given with **ribavirin**—avoid concomitant use; increased risk of side-effects when didanosine given with **stavudine**; plasma concentration of didanosine increased by **tenofovir** (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by **tipranavir**
- Cytotoxics: increased risk of toxicity when didanosine given with **hydroxycarbamide**—avoid concomitant use

Dienogest *see* Progestogens**Digoxin** *see* Cardiac Glycosides**Dihydrocodeine** *see* Opioid Analgesics**Diltiazem** *see* Calcium-channel Blockers**Dimethyl sulfoxide**

- Analgesics: avoid concomitant use of dimethyl sulfoxide with **sulindac**

Dinoprostone *see* Prostaglandins**Diphenoxylate** *see* Opioid Analgesics**Dipipanone** *see* Opioid Analgesics**Dipyridamole**

Antacids: absorption of dipyridamole possibly reduced by **antacids**

Dipyridamole (*continued*)

- Anti-arrhythmics: dipyridamole enhances and extends the effects of **adenosine** (important risk of toxicity)
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of **coumarins** and **phenindione**; dipyridamole enhances anticoagulant effect of **heparins**
- Clopidogrel: increased risk of bleeding when dipyridamole given with **clopidogrel**
- Cytotoxics: dipyridamole possibly reduces effects of **fludarabine**

Disodium Etidronate *see* Bisphosphonates**Disodium Pamidronate** *see* Bisphosphonates**Disopyramide**

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**; increased risk of ventricular arrhythmias when disopyramide given with **amiodarone** or **dronedrone**—avoid concomitant use
 - Antibacterials: plasma concentration of disopyramide possibly increased by **clarithromycin** (increased risk of toxicity); plasma concentration of disopyramide increased by **erythromycin** (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with **moxifloxacin**—avoid concomitant use; metabolism of disopyramide accelerated by **rifamycins** (reduced plasma concentration)
 - Antidepressants: increased risk of ventricular arrhythmias when disopyramide given with **tricyclics**
 - Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of **gliazide**, **insulin** and **metformin**
 - Antiepileptics: metabolism of disopyramide accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of disopyramide reduced by **phenytoin**
 - Antifungals: increased risk of ventricular arrhythmias when disopyramide given with **ketoconazole**—avoid concomitant use; avoidance of disopyramide advised by manufacturer of **itraconazole**
 - Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with **mizolastine**—avoid concomitant use
 - Antimalarials: avoidance of disopyramide advised by manufacturer of **artemether/lumefantrine** (risk of ventricular arrhythmias)
 - Antimuscarinics: increased risk of antimuscarinic side-effects when disopyramide given with **antimuscarinics**; increased risk of ventricular arrhythmias when disopyramide given with **tolterodine**
 - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with **amisulpride**, **droperidol**, **spimozide** or **zuclopenthixol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with **haloperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with **phenothiazines** or **sulpiride**
 - Antivirals: plasma concentration of disopyramide possibly increased by **ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with **saquinavir**—avoid concomitant use
 - Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with **atomoxetine**
 - Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**; increased risk of ventricular arrhythmias when disopyramide given with **sotalol**—avoid concomitant use
 - Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with **verapamil**
 - Cytotoxics: increased risk of ventricular arrhythmias when disopyramide given with **arsenic trioxide**

Disopyramide (*continued*)

- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with ●acetazolamide, ●loop diuretics or ●thiazides and related diuretics
- Ivabradine: increased risk of ventricular arrhythmias when disopyramide given with ●ivabradine
- Nitrates: disopyramide reduces effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)
- Ranolazine: avoidance of disopyramide advised by manufacturer of ●ranolazine

Distigmine see Parasympathomimetics

Disulfiram

Alcohol: disulfiram reaction when disulfiram given with alcohol (see BNF section 4.10.1)

Antibacterials: psychotic reaction reported when disulfiram given with metronidazole; CNS effects of disulfiram possibly increased by isoniazid

- Anticoagulants: disulfiram enhances anticoagulant effect of ●coumarins

Antidepressants: increased disulfiram reaction with alcohol reported with concomitant amitriptyline; disulfiram inhibits metabolism of tricyclics (increased plasma concentration)

- Antiepileptics: disulfiram inhibits metabolism of ●phenytoin (increased risk of toxicity)

Anxiolytics and Hypnotics: disulfiram increases risk of temazepam toxicity; disulfiram inhibits metabolism of benzodiazepines (increased sedative effects)

- Paraldehyde: risk of toxicity when disulfiram given with ●paraldehyde

Theophylline: disulfiram inhibits metabolism of theophylline (increased risk of toxicity)

Diuretics

Note Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind

Note Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind

- ACE Inhibitors: enhanced hypotensive effect when diuretics given with ●ACE inhibitors; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●ACE inhibitors (monitor potassium concentration with low-dose spironolactone in heart failure)

Adrenergic Neurone Blockers: enhanced hypotensive effect when diuretics given with ●adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when diuretics given with alcohol

Aldesleukin: enhanced hypotensive effect when diuretics given with ●aldesleukin

Aliskiren: plasma concentration of furosemide reduced by ●aliskiren; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●aliskiren

Allopurinol: increased risk of hypersensitivity when thiazides and related diuretics given with ●allopurinol especially in renal impairment

- Alpha-blockers: enhanced hypotensive effect when diuretics given with ●alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when diuretics given with ●general anaesthetics

- Analgesics: diuretics increase risk of nephrotoxicity of NSAIDs, also antagonism of diuretic effect; Diuretic effect of potassium canrenoate possibly antagonised by NSAIDs; possible increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with NSAIDs; effects of diuretics antagonised by ●indometacin and ●ketorolac; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●indometacin; occasional reports of reduced renal function when tramterene given with ●indometacin—avoid concomitant use; diuretic effect of spironolactone antagonised by ●aspirin; increased risk of toxicity

Diuretics**Analgesics** (*continued*)

- when carbonic anhydrase inhibitors given with high-dose ●aspirin
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with ●angiotensin-II receptor antagonists; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●angiotensin-II receptor antagonists
- Anti-arrhythmics: plasma concentration of eplerenone increased by ●amiodarone (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ●amiodarone; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ●disopyramide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ●flecainide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of ●lidocaine
- Antibacterials: plasma concentration of eplerenone increased by ●clarithromycin and ●telithromycin—avoid concomitant use; plasma concentration of eplerenone increased by ●erythromycin (reduce dose of eplerenone); plasma concentration of eplerenone reduced by ●rifampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of ●lymecycline; increased risk of toxicity when loop diuretics given with ●aminoglycosides, ●polymyxins or ●vancomycin; acetazolamide antagonises effects of ●methenamine; increased risk of hyperkalaemia when eplerenone given with ●trimethoprim
- Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with ●reboxetine; enhanced hypotensive effect when diuretics given with MAOIs; plasma concentration of eplerenone reduced by ●St John's wort—avoid concomitant use; increased risk of postural hypotension when diuretics given with ●tricyclics
- Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of ●antidiabetics
- Antiepileptics: plasma concentration of eplerenone reduced by ●carbamazepine, ●phenobarbital and ●phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with ●carbamazepine; acetazolamide increases plasma concentration of ●carbamazepine; increased risk of osteomalacia when carbonic anhydrase inhibitors given with ●phenobarbital or ●phenytoin; effects of furosemide antagonised by ●phenytoin; acetazolamide possibly increases plasma concentration of ●phenytoin; hydrochlorothiazide possibly increases plasma concentration of ●topiramate
- Antifungals: plasma concentration of eplerenone increased by ●itraconazole and ●ketoconazole—avoid concomitant use; increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with ●amphotericin; hydrochlorothiazide increases plasma concentration of ●flucanazole; plasma concentration of eplerenone increased by ●itraconazole (reduce dose of eplerenone)
- Antipsychotics: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●amisulpride; enhanced hypotensive effect when diuretics given with ●phenothiazines; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●pimozide (avoid concomitant use)
- Antivirals: plasma concentration of eplerenone increased by ●nelfinavir and ●ritonavir—avoid concomitant use; plasma concentration of eplerenone increased by ●saquinavir (reduce dose of eplerenone)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when diuretics given with ●anxiolytics and

Diuretics

Anxiolytics and Hypnotics (*continued*)

hypnotics; administration of *parenteral* furosemide with **chloral** may displace thyroid hormone from binding sites

- **Atomoxetine**: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with
 - **atomoxetine**
- **Beta-blockers**: enhanced hypotensive effect when diuretics given with **beta-blockers**; hypokalaemia caused by loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with
 - **sotalol**
- **Calcium Salts**: increased risk of hypercalcaemia when thiazides and related diuretics given with **calcium salts**
- **Calcium-channel Blockers**: enhanced hypotensive effect when diuretics given with **calcium-channel blockers**; plasma concentration of eplerenone increased by **diltiazem** and **verapamil** (reduce dose of eplerenone)
- **Cardiac Glycosides**: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with
 - **cardiac glycosides**; spironolactone increases plasma concentration of
 - **digoxin**; potassium canrenoate possibly increases plasma concentration of **digoxin**
- **Ciclosporin**: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with **ciclosporin**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with
 - **ciclosporin**; acetazolamide possibly increases plasma concentration of
 - **ciclosporin**
- **Clonidine**: enhanced hypotensive effect when diuretics given with **clonidine**
- **Corticosteroids**: diuretic effect of diuretics antagonised by **corticosteroids**; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **corticosteroids**
- **Cytotoxics**: alkaline urine due to acetazolamide increases excretion of **methotrexate**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with
 - **arsenic trioxide**; avoidance of spironolactone advised by manufacturer of **mitotane** (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with
 - **platinum compounds**
- **Diazoxide**: enhanced hypotensive and hyperglycaemic effects when diuretics given with **diazoxide**
- **Diuretics**: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **acetazolamide**; profound diuresis possible when metolazone given with **furosemide**; increased risk of hypokalaemia when thiazides and related diuretics given with **loop diuretics**
- **Dopaminergics**: enhanced hypotensive effect when diuretics given with **levodopa**
- **Hormone Antagonists**: increased risk of hypercalcaemia when thiazides and related diuretics given with
 - **toremifene**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with
 - **trilostane**
- **Lipid-regulating Drugs**: absorption of thiazides and related diuretics reduced by **colestipol** and **colestyramine** (give at least 2 hours apart)
- **Lithium**: loop diuretics and thiazides and related diuretics reduce excretion of
 - **lithium** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of
 - **lithium** (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of
 - **lithium**
- **Methylodopa**: enhanced hypotensive effect when diuretics given with **methylodopa**

Diuretics (*continued*)

- **Moxisylyte**: enhanced hypotensive effect when diuretics given with **moxisylyte**
- **Moxonidine**: enhanced hypotensive effect when diuretics given with **moxonidine**
- **Muscle Relaxants**: enhanced hypotensive effect when diuretics given with **baclofen** or **tizanidine**
- **Nitrates**: enhanced hypotensive effect when diuretics given with **nitrates**
- **Oestrogens**: diuretic effect of diuretics antagonised by **oestrogens**
- **Potassium Salts**: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with
 - **potassium salts**
- **Progestogens**: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **drosiprenone** (monitor serum potassium during first cycle)
- **Prostaglandins**: enhanced hypotensive effect when diuretics given with **alprostadiol**
- **Symphathomimetics, Beta,**: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of
 - **beta, symphathomimetics**—see Hypokalaemia, p. 138
- **Tacrolimus**: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with
 - **tacrolimus**
- **Theophylline**: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **theophylline**
- **Vasodilator Antihypertensives**: enhanced hypotensive effect when diuretics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- **Vitamins**: increased risk of hypercalcaemia when thiazides and related diuretics given with **vitamin D**

Diuretics, Loop see Diuretics

Diuretics, Potassium-sparing and Aldosterone Antagonists see Diuretics

Diuretics, Thiazide and related see Diuretics

Dobutamine see Sympathomimetics

Docetaxel

- **Antibacterials**: *in vitro* studies suggest a possible interaction between docetaxel and **erythromycin** (consult docetaxel product literature)
- **Antifungals**: *in vitro* studies suggest a possible interaction between docetaxel and **ketoconazole** (consult docetaxel product literature)
- **Antipsychotics**: avoid concomitant use of cytotoxics with
 - **clozapine** (increased risk of agranulocytosis)
- **Antivirals**: plasma concentration of docetaxel possibly increased by
 - **ritonavir** (increased risk of toxicity)
- **Ciclosporin**: *in vitro* studies suggest a possible interaction between docetaxel and **ciclosporin** (consult docetaxel product literature)
- **Cytotoxics**: possible increased risk of neutropenia when docetaxel given with **lapatinib**; plasma concentration of docetaxel increased by **sorafenib**

Domperidone

- **Analgesics**: effects of domperidone on gastro-intestinal activity antagonised by **opioid analgesics**
- **Antifungals**: risk of arrhythmias with domperidone possibly increased by
 - **ketoconazole**
- **Antimuscarinics**: effects of domperidone on gastro-intestinal activity antagonised by **antimuscarinics**
- **Dopaminergics**: domperidone possibly antagonises hypoprolactinaemic effects of **bromocriptine** and **cabergoline**
- **Donepezil** see Parasympathomimetics
- **Dopamine** see Sympathomimetics
- **Dopaminergics** see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinire, Rotigotine, Selegiline, and Tolcapone
- **Dopexamine** see Sympathomimetics
- **Doripenem**
- **Antiepileptics**: carbapenems reduce plasma concentration of
 - **valproate**—avoid concomitant use

Doripenem (*continued*)

Probenecid: excretion of doripenem reduced by **probenecid** (manufacturers of doripenem advise avoid concomitant use)

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Dorzolamide *see* Diuretics**Dosulepin** *see* Antidepressants, Tricyclic**Doxapram**

- Anaesthetics, General: increased risk of arrhythmias when doxapram given with **volatile liquid general anaesthetics** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)

Antidepressants: effects of doxapram enhanced by **MAOIs**

Sympathomimetics: increased risk of hypertension when doxapram given with **sympathomimetics**

Theophylline: increased CNS stimulation when doxapram given with **theophylline**

Doxazosin *see* Alpha-blockers**Doxepin** *see* Antidepressants, Tricyclic**Doxorubicin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Antivirals: doxorubicin possibly inhibits effects of **stavudine**

Calcium-channel Blockers: plasma concentration of doxorubicin possibly increased by **verapamil**

Cardiac Glycosides: doxorubicin possibly reduces absorption of **digoxin tablets**

- Ciclosporin: increased risk of neurotoxicity when doxorubicin given with **ciclosporin**

Cytotoxics: plasma concentration of doxorubicin possibly increased by **sofenib**

Doxycycline *see* Tetracyclines**Dronedarone**

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine, levobupivacaine, prilocaine or ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**; increased risk of ventricular arrhythmias when dronedarone given with **amiodarone** or **disopyramide**—avoid concomitant use

- Antibacterials: manufacturer of dronedarone advises avoid concomitant use with **clarithromycin** or **telithromycin** (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly increased by **erythromycin** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedarone reduced by **rifampicin**—avoid concomitant use

- Antidepressants: plasma concentration of dronedarone possibly reduced by **St John's wort**—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with **tricyclics** (risk of ventricular arrhythmias)

- Antiepileptics: plasma concentration of dronedarone possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**—avoid concomitant use

- Antifungals: plasma concentration of dronedarone increased by **ketoconazole**—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with **itraconazole**, **posaconazole** and **voriconazole**

- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval; manufacturer of dronedarone advises avoid concomitant use with **phenothiazines** (risk of ventricular arrhythmias)

- Antivirals: manufacturer of dronedarone advises avoid concomitant use with **ritonavir**; increased risk of ventricular arrhythmias when dronedarone given with **saquinavir**—avoid concomitant use

- Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**; dronedarone

Dronedarone• Beta-blockers (*continued*)

darone possibly increases plasma concentration of **metoprolol** and **propranolol**; increased risk of ventricular arrhythmias when dronedarone given with **sotalol**—avoid concomitant use

- Calcium-channel Blockers: plasma concentration of dronedarone increased by **nifedipine**; increased risk of bradycardia and myocardial depression when dronedarone given with **diltiazem** and **verapamil**

- Cardiac Glycosides: dronedarone increases plasma concentration of **digoxin** (halve dose of digoxin)

- Grapefruit Juice: plasma concentration of dronedarone increased by **grapefruit juice**—avoid concomitant use

- Lipid-regulating Drugs: increased risk of myopathy when dronedarone given with **simvastatin**

Sirolimus: manufacturer of dronedarone advises caution with **sirolimus**

Tacrolimus: manufacturer of dronedarone advises caution with **tacrolimus**

Draperidol *see* Antipsychotics**Drospirenone** *see* Progestogens**Drotrecogin Alfa**

- Anticoagulants: manufacturer of drotrecogin alfa advises avoid concomitant use with high doses of **heparins**—consult product literature

Duloxetine

Analgesics: possible increased serotonergic effects when duloxetine given with **methidine** or **tramadol**

- Antibacterials: metabolism of duloxetine inhibited by **ciprofloxacin**—avoid concomitant use

- Antidepressants: metabolism of duloxetine inhibited by **fluvoxamine**—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John's wort, amitriptyline, clomipramine, moclobemide, tryptophan or venlafaxine; duloxetine should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start **moclobemide** for at least 1 week

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether/lumefantrine**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

- 5HT₂ Agonists: possible increased serotonergic effects when duloxetine given with **5HT₂ agonists**

Dutasteride

Calcium-channel Blockers: plasma concentration of dutasteride increased by **diltiazem** and **verapamil**

Dydrogesterone *see* Progestogens**Edrophonium** *see* Parasympathomimetics**Efavirenz**

Analgesics: **efavirenz** reduces plasma concentration of **methadone**

Antibacterials: increased risk of rash when efavirenz given with **clarithromycin**; efavirenz reduces plasma concentration of **rifabutin**—increase dose of rifabutin; plasma concentration of efavirenz reduced by **rifampicin**—increase dose of efavirenz

- Anticoagulants: efavirenz possibly affects plasma concentration of **warfarin**

- Antidepressants: plasma concentration of efavirenz reduced by **St John's wort**—avoid concomitant use

Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with **carbamazepine**

- Antifungals: efavirenz reduces plasma concentration of **itraconazole** and **posaconazole**; efavirenz reduces plasma concentration of **voriconazole**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of **casopfungin**—consider increasing dose of casopfungin

- Antipsychotics: efavirenz possibly reduces plasma concentration of **aripiprazole**—increase dose of aripiprazole; efavirenz possibly increases plasma

Efavirenz

- Antipsychotics (*continued*)
 - concentration of ●**pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of ●**atazanavir** (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of ●**darunavir**, ●**fosamprenavir** and ●**indinavir**; efavirenz possibly reduces plasma concentration of ●**etravirine**—avoid concomitant use; efavirenz reduces plasma concentration of ●**lopinavir**—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of ●**maraviroc**—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by ●**nevirapine**; toxicity of efavirenz increased by ●**ritonavir**, monitor liver function tests; efavirenz significantly reduces plasma concentration of ●**saquinavir**
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with ●**midazolam**—avoid concomitant use
- Calcium-channel Blockers: efavirenz reduces plasma concentration of ●**diltiazem**
- Ciclosporin: efavirenz possibly reduces plasma concentration of ●**ciclosporin**
- Ergot Alkaloids: increased risk of ergotism when efavirenz given with ●**ergot alkaloids**—avoid concomitant use
- Grapefruit Juice: plasma concentration of efavirenz possibly increased by ●**grapefruit juice**
- Lipid-regulating Drugs: efavirenz reduces plasma concentration of ●**atorvastatin**, ●**pravastatin** and ●**simvastatin**
- Progestogens: efavirenz possibly reduces contraceptive effect of ●**progestogens**
- Tacrolimus: efavirenz possibly affects plasma concentration of ●**tacrolimus**

Eletriptan *see* 5HT₁ Agonists

Eltrombopag

- Antacids: absorption of eltrombopag reduced by ●**antacids** (give at least 4 hours apart)
- Antivirals: plasma concentration of eltrombopag possibly reduced by ●**lopinavir**
- Calcium Salts: absorption of eltrombopag possibly reduced by ●**calcium salts** (give at least 4 hours apart)
- Dairy Products: absorption of eltrombopag possibly reduced by ●**dairy products** (give at least 4 hours apart)
- Iron: absorption of eltrombopag possibly reduced by ●**oral iron** (give at least 4 hours apart)
- Lipid-regulating Drugs: eltrombopag increases plasma concentration of ●**rosuvastatin** (consider reducing dose of rosuvastatin)
- Selenium: absorption of eltrombopag possibly reduced by ●**selenium** (give at least 4 hours apart)
- Zinc: absorption of eltrombopag possibly reduced by ●**zinc** (give at least 4 hours apart)

Emtricitabine

- Antivirals: manufacturer of emtricitabine advises avoid concomitant use with ●**lamivudine**

Enalapril *see* ACE Inhibitors

Enoxaparin *see* Heparins

Enoximone *see* Phosphodiesterase Inhibitors

Entacapone

- Anticoagulants: entacapone enhances anticoagulant effect of ●**warfarin**
- Antidepressants: manufacturer of entacapone advises caution with ●**moclobemide**, ●**paroxetine**, ●**tricyclics** and ●**venlafaxine**; avoid concomitant use of entacapone with non-selective ●**MAOIs**
- Dopaminergics: entacapone possibly enhances effects of ●**apomorphine**; entacapone possibly reduces plasma concentration of ●**rasagiline**; manufacturer of entacapone advises max. dose of 10 mg ●**selegiline** if used concomitantly
- Iron: absorption of entacapone reduced by ●**oral iron**
- Memantine: effects of dopaminergics possibly enhanced by ●**memantine**

Entacapone (*continued*)

Methyldopa: entacapone possibly enhances effects of ●**methyldopa**; antiparkinsonian effect of dopaminergics antagonised by ●**methyldopa**

Sympathomimetics: entacapone possibly enhances effects of ●**adrenaline** (epinephrine), ●**dobutamine**, ●**dopamine** and ●**noradrenaline** (norepinephrine)

Enteral Foods

- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antiepileptics: enteral feeds possibly reduce absorption of ●**phenytoin**

Ephedrine *see* Sympathomimetics

Epinephrine (adrenaline) *see* Sympathomimetics

Epirubicin

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of epirubicin increased by ●**ciclosporin**
- Ulcer-healing Drugs: plasma concentration of epirubicin increased by ●**cimetidine**

Eplerenone *see* Diuretics

Eprosartan *see* Angiotensin-II Receptor Antagonists

Eptifibatid

Iloprost: increased risk of bleeding when eptifibatid given with ●**iloprost**

Ergometrine *see* Ergot Alkaloids

Ergot Alkaloids

- Anaesthetics, General: effects of ergometrine on the parturient uterus reduced by ●**halothane**
 - Antibacterials: increased risk of ergotism when ergometrine and methysergide given with ●**macrolides** or ●**tetracyclines**—avoid concomitant use; increased risk of ergotism when ergometrine and methysergide given with ●**tetracyclines**
 - Antidepressants: possible risk of hypertension when ergometrine and methysergide given with ●**reboxetine**
 - Antifungals: increased risk of ergotism when ergometrine and methysergide given with ●**imidazoles** or ●**triazoles**—avoid concomitant use
 - Antivirals: plasma concentration of ergot alkaloids possibly increased by ●**atazanavir**—avoid concomitant use; increased risk of ergotism when ergot alkaloids given with ●**efavirenz**—avoid concomitant use; increased risk of ergotism when ergometrine and methysergide given with ●**fosamprenavir**, ●**indinavir**, ●**nelinavir**, ●**ritonavir** or ●**saquinavir**—avoid concomitant use
 - Beta-blockers: increased peripheral vasoconstriction when ergometrine and methysergide given with ●**beta-blockers**
 - 5HT₁ Agonists: increased risk of vasospasm when ergometrine and methysergide given with ●**almotriptan**, ●**rizatriptan**, ●**sumatriptan** or ●**zolmitriptan** (avoid ergometrine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergometrine and methysergide); increased risk of vasospasm when ergometrine and methysergide given with ●**eletriptan**, ●**frovatriptan** or ●**naratriptan** (avoid ergometrine and methysergide for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergometrine and methysergide)
 - Sympathomimetics: increased risk of ergotism when ergometrine and methysergide given with ●**sympathomimetics**
 - Ulcer-healing Drugs: increased risk of ergotism when ergometrine and methysergide given with ●**cimetidine**—avoid concomitant use
- Ergotamine and Methysergide** *see* Ergot Alkaloids
- Erlotinib**
- Analgesics: increased risk of bleeding when erlotinib given with ●**NSAIDs**

Erlotinib (*continued*)

- Antacids: plasma concentration of erlotinib possibly reduced by ●antacids—give antacids at least 4 hours before or 2 hours after erlotinib
- Antibacterials: plasma concentration of erlotinib increased by ●ciprofloxacin; metabolism of erlotinib accelerated by ●rifampicin (reduced plasma concentration)
- Anticoagulants: increased risk of bleeding when erlotinib given with ●coumarins
- Antifungals: metabolism of erlotinib inhibited by ●ketconazole (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Cytotoxics: plasma concentration of erlotinib possibly increased by ●capecitabine
- Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with ●cimetidine, ●esomeprazole, ●famotidine, ●lansoprazole, ●nizatidine, ●pantoprazole and ●rabeprazole; plasma concentration of erlotinib reduced by ●ranitidine—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by ●omeprazole—manufacturer of erlotinib advises avoid concomitant use

Ertapenem

- Antiepileptics: carbapenems reduce plasma concentration of ●valproate—avoid concomitant use
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 620

Erythromycin *see* Macrolides**Escitalopram** *see* Antidepressants, SSRI**Eslicarbazepine**

- Anticoagulants: eslicarbazepine reduces plasma concentration of ●warfarin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ●MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
- Antiepileptics: plasma concentration of both drugs reduced when eslicarbazepine given with ●carbamazepine; manufacturer of eslicarbazepine advises avoid concomitant use with ●oxcarbazepine; plasma concentration of eslicarbazepine reduced by ●phenytoin, also plasma concentration of phenytoin increased
- Antimalarials: possible increased risk of convulsions when antiepileptics given with ●chloroquine and ●hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)
- Oestrogens: eslicarbazepine accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 398)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat
- Progestogens: eslicarbazepine accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 398)

Esamolol *see* Beta-blockers**Esomeprazole** *see* Proton Pump Inhibitors**Estradiol** *see* Oestrogens**Estramustine**

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by ●sodium clodronate

Estrilol *see* Oestrogens**Estrone** *see* Oestrogens**Etanercept**

- Abatacept: avoid concomitant use of etanercept with ●abatacept

Etanercept (*continued*)

- Anakinra: avoid concomitant use of etanercept with ●anakinra
- Vaccines: avoid concomitant use of etanercept with live ●vaccines (see p. 599)
- Ethinylestradiol** *see* Oestrogens
- Ethosuximide**
- Antiepileptics: metabolism of ethosuximide inhibited by ●isoniazid (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ●MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by ●carbamazepine and ●phenobarbital; plasma concentration of ethosuximide possibly reduced by ●phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by ●valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with ●chloroquine and ●hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat

Etodolac *see* NSAIDs**Etomidate** *see* Anaesthetics, General**Etonogestrel** *see* Progestogens**Etoposide**

- Anticoagulants: etoposide possibly enhances anticoagulant effect of ●coumarins
- Antiepileptics: plasma concentration of etoposide possibly reduced by ●phenobarbital and ●phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of etoposide possibly increased by ●ciclosporin (increased risk of toxicity)

Etoricoxib *see* NSAIDs**Etravirine**

- Antibacterials: plasma concentration of etravirine increased by ●clarithromycin, also plasma concentration of clarithromycin reduced; plasma concentration of both drugs reduced when etravirine given with ●rifabutin; manufacturer of etravirine advises avoid concomitant use with ●rifampicin
- Antidepressants: manufacturer of etravirine advises avoid concomitant use with ●St John's wort
- Antiepileptics: manufacturer of etravirine advises avoid concomitant use with ●carbamazepine, ●phenobarbital and ●phenytoin
- Antivirals: plasma concentration of etravirine possibly reduced by ●efavirenz and ●nevirapine—avoid concomitant use; etravirine increases plasma concentration of ●fosamprenavir (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of ●indinavir—avoid concomitant use; etravirine possibly reduces plasma concentration of ●maraviroc; etravirine possibly increases plasma concentration of ●nelfinavir—avoid concomitant use; plasma concentration of etravirine reduced by ●tipranavir, also plasma concentration of tipranavir increased (avoid concomitant use)
- Cardiac Glycosides: etravirine increases plasma concentration of ●digoxin
- Clopidogrel: etravirine possibly reduces antiplatelet effect of ●clopidogrel
- Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of ●atorvastatin
- Sildenafil: etravirine reduces plasma concentration of ●sildenafil

Etinodiol *see* Progestogens**Everolimus**

- **Antibacterials:** plasma concentration of everolimus possibly increased by ● **clarithromycin** and ● **telithromycin**—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by ● **erythromycin**; plasma concentration of everolimus reduced by ● **rifampicin**
 - **Antidepressants:** plasma concentration of everolimus possibly reduced by **St John's wort**—manufacturer of everolimus advises avoid concomitant use
 - **Antifungals:** plasma concentration of everolimus increased by ● **ketokonazole**—avoid concomitant use; plasma concentration of everolimus possibly increased by ● **itraconazole**, ● **posaconazole** and ● **voriconazole**—manufacturer of everolimus advises avoid concomitant use
 - **Antipsychotics:** avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
 - **Antivirals:** plasma concentration of everolimus possibly increased by ● **atazanavir**, ● **darunavir**, ● **indinavir**, ● **nelfinavir**, ● **ritonavir** and ● **sacquinavir**—manufacturer of everolimus advises avoid concomitant use
 - **Calcium-channel Blockers:** plasma concentration of both drugs may increase when everolimus given with ● **verapamil**
 - **Ciclosporin:** plasma concentration of everolimus increased by ● **ciclosporin**
- Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with **grapefruit juice**

Exemestane

Antibacterials: plasma concentration of exemestane possibly reduced by **rifampicin**

Ezetimibe

Anticoagulants: ezetimibe possibly enhances anticoagulant effect of **coumarins**

- **Ciclosporin:** plasma concentration of both drugs may increase when ezetimibe given with ● **ciclosporin**
- **Lipid-regulating Drugs:** increased risk of cholelithiasis and gallbladder disease when ezetimibe given with **fibrates**—discontinue if suspected

Famciclovir

Probenecid: excretion of famciclovir possibly reduced by **probenecid** (increased plasma concentration)

Famotidine *see* Histamine H₂-antagonists**Febuxostat**

- **Azathioprine:** manufacturer of febuxostat advises avoid concomitant use with ● **azathioprine**
- **Cytotoxics:** manufacturer of febuxostat advises avoid concomitant use with ● **mercaptopurine**
- **Theophylline:** manufacturer of febuxostat advises caution with ● **theophylline**

Felodipine *see* Calcium-channel Blockers**Fenbufen** *see* NSAIDs**Fenofibrate** *see* Fibrates**Fenoprofen** *see* NSAIDs**Fenoterol** *see* Sympathomimetics, Beta₂**Fentanyl** *see* Opioid Analgesics**Ferrous Salts** *see* Iron**Fesoterodine** *see* Antimuscarinics**Fexofenadine** *see* Antihistamines**Fibrates**

- **Antibacterials:** increased risk of myopathy when fibrates given with ● **daptomycin** (preferably avoid concomitant use)
- **Anticoagulants:** fibrates enhance anticoagulant effect of ● **coumarins** and ● **phenindione**
- **Antidiabetics:** fibrates may improve glucose tolerance and have an additive effect with **insulin** or **sulfonylureas**; gemfibrozil possibly enhances hypoglycaemic effect of **nateglinide**; increased risk of severe hypoglycaemia when gemfibrozil given with ● **repaglinide**—avoid concomitant use
- **Ciclosporin:** increased risk of renal impairment when bezafibrate or fenofibrate given with **ciclosporin**
- **Colchicine:** possible increased risk of myopathy when fibrates given with ● **colchicine**

Fibrates (*continued*)

- **Cytotoxics:** gemfibrozil increases plasma concentration of ● **bexarotene**—avoid concomitant use
- **Lipid-regulating Drugs:** increased risk of cholelithiasis and gallbladder disease when fibrates given with **ezetimibe**—discontinue if suspected; increased risk of myopathy when fibrates given with ● **statins**; increased risk of myopathy when gemfibrozil given with ● **statins** (preferably avoid concomitant use)

Flgrastim

Note Pegfilgrastim interactions as for filgrastim
Cytotoxics: neutropenia possibly exacerbated when filgrastim given with **flurouracil**

Flavoxate *see* Antimuscarinics**Flecainide**

- **Anaesthetics, Local:** increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**
 - **Anti-arrhythmics:** increased myocardial depression when anti-arrhythmics given with other ● **anti-arrhythmics**; plasma concentration of flecainide increased by ● **amiodarone** (halve dose of flecainide)
 - **Antidepressants:** plasma concentration of flecainide increased by **fluoxetine**; increased risk of ventricular arrhythmias when flecainide given with ● **tricyclics**
 - **Antihistamines:** increased risk of ventricular arrhythmias when flecainide given with ● **mizolastine**—avoid concomitant use
 - **Antimalarials:** avoidance of flecainide advised by manufacturer of ● **artemether/lumefantrine** (risk of ventricular arrhythmias); plasma concentration of flecainide increased by ● **quinine**
 - **Antimuscarinics:** increased risk of ventricular arrhythmias when flecainide given with ● **tolterodine**
 - **Antipsychotics:** increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ● **antipsychotics** that prolong the QT interval; increased risk of arrhythmias when flecainide given with ● **clozapine**
 - **Antivirals:** plasma concentration of flecainide possibly increased by ● **fosamprenavir**, ● **indinavir**, ● **lopinavir** and ● **ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with ● **sacquinavir**—avoid concomitant use
 - **Beta-blockers:** increased risk of myocardial depression and bradycardia when flecainide given with ● **beta-blockers**; increased myocardial depression when anti-arrhythmics given with ● **beta-blockers**
 - **Calcium-channel Blockers:** increased risk of myocardial depression and asystole when flecainide given with ● **verapamil**
 - **Diuretics:** increased cardiac toxicity with flecainide if hypokalaemia occurs with ● **acetazolamide**, ● **loop diuretics** or ● **thiazides and related diuretics**
- Ulcer-healing Drugs: metabolism of flecainide inhibited by **cimetidine** (increased plasma concentration)

Fluocloxacillin *see* Penicillins**Fluconazole** *see* Antifungals, Triazole**Flucytosine**

- **Antifungals:** renal excretion of flucytosine decreased and cellular uptake increased by **amphotericin** (toxicity possibly increased)
- **Cytotoxics:** plasma concentration of flucytosine possibly reduced by **cytarabine**

Fludarabine

- **Antipsychotics:** avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
- **Cytotoxics:** fludarabine increases intracellular concentration of **cytarabine**; increased pulmonary toxicity when fludarabine given with ● **pentostatin** (unacceptably high incidence of fatalities)
- **Dipyridamole:** effects of fludarabine possibly reduced by **dipyridamole**

Fludrocortisone *see* Corticosteroids**Flunisolide** *see* Corticosteroids

Fluorides

Calcium Salts: absorption of fluorides reduced by calcium salts

Fluorouracil

Note Capecitabine is a prodrug of fluorouracil

Note Tegafur is a prodrug of fluorouracil

- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with ●allopurinol
- Antibacterials: metabolism of fluorouracil inhibited by ●metronidazole (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of ●coumarins
- Antiepileptics: fluorouracil possibly inhibits metabolism of ●phenytoin (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Cytotoxics: capecitabine possibly increases plasma concentration of ●erlotinib
- Filgrastim: neutropenia possibly exacerbated when fluorouracil given with ●filgrastim
- Temoporfin: increased skin photosensitivity when topical fluorouracil used with ●temoporfin
- Ulcer-healing Drugs: metabolism of fluorouracil inhibited by ●cimetidine (increased plasma concentration)

Fluoxetine see Antidepressants, SSRI

Flupentixol see Antipsychotics

Fluphenazine see Antipsychotics

Flurazepam see Anxiolytics and Hypnotics

Flurbiprofen see NSAIDs

Flutamide

- Anticoagulants: flutamide enhances anticoagulant effect of ●coumarins

Fluticasone see Corticosteroids

Fluvastatin see Statins

Flvoxamine see Antidepressants, SSRI

Folates

Aminosalicylates: absorption of folic acid possibly reduced by ●sulfasalazine

Antiepileptics: folates possibly reduce plasma concentration of ●phenobarbital and ●phenytoin

- Cytotoxics: avoidance of folates advised by manufacturer of ●alitretrexed

Folic Acid see Folates

Folinic Acid see Folates

Formoterol see Sympathomimetics, Beta₂

Fosamprenavir

Note Fosamprenavir is a prodrug of amprenavir

Analgesics: fosamprenavir reduces plasma concentration of ●methadone

- Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of ●amiodarone, ●flecainide and ●propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of ●lidocaine—avoid concomitant use
- Antibacterials: fosamprenavir increases plasma concentration of ●rifabutin (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by ●rifampicin—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin
- Anticoagulants: fosamprenavir may enhance or reduce anticoagulant effect of ●coumarins; avoidance of fosamprenavir advised by manufacturer of ●rivaroxaban
- Antidepressants: plasma concentration of fosamprenavir reduced by ●St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of fosamprenavir possibly reduced by ●carbamazepine and ●phenobarbital
- Antifungals: fosamprenavir increases plasma concentration of ●ketoconazole (also plasma concentration of fosamprenavir possibly increased); plasma concentration of both drugs may increase when fosamprenavir given with ●itraconazole

Fosamprenavir (continued)

- Antimalarials: caution with fosamprenavir advised by manufacturer of ●artemether/lumefantrine; fosamprenavir possibly increases plasma concentration of ●quinine (increased risk of toxicity)
- Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of ●darifenacin and ●tolterodine
- Antipsychotics: fosamprenavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); fosamprenavir increases plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: plasma concentration of fosamprenavir reduced by ●efavirenz and ●tipranavir; plasma concentration of fosamprenavir increased by ●etravirine (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by ●lopinavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by ●nevirapine
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of ●midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Ciclosporin: fosamprenavir increases plasma concentration of ●ciclosporin
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with ●ergotamine and ●methysergide—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with ●atorvastatin; possible increased risk of myopathy when fosamprenavir given with ●rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with ●simvastatin—avoid concomitant use
- Ranolazine: fosamprenavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: fosamprenavir possibly increases plasma concentration of ●sildenafil
- Tacrolimus: fosamprenavir increases plasma concentration of ●tacrolimus
- Tadalafil: fosamprenavir possibly increases plasma concentration of ●tadalafil
- Vardenafil: fosamprenavir possibly increases plasma concentration of ●vardenafil

Fosaprepitant see Aprepitant

Foscarnet

Antivirals: avoidance of foscarnet advised by manufacturer of ●lamivudine

- Pentamidine Isetionate: increased risk of hypocalcaemia when foscarnet given with ●parenteral ●pentamidine isetionate

Fosinopril see ACE Inhibitors

Fosphenytoin see Phenytoin

Framycetin see Aminoglycosides

Frovatriptan see 5HT₁ Agonists

Furosemide see Diuretics

Fusidic Acid

- Antivirals: plasma concentration of both drugs increased when fusidic acid given with ●ritonavir—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fusidic acid given with ●atorvastatin; increased risk of myopathy when fusidic acid given with ●simvastatin
- Sugammadex: fusidic acid possibly reduces response to ●sugammadex
- Vaccines: antibacterials inactivate ●oral typhoid vaccine—see p. 620

Gabapentin

Analgesics: bioavailability of gabapentin increased by ●morphine

Antacids: absorption of gabapentin reduced by ●antacids

Gabapentin (continued)

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with **St John's wort**
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

Galantamine *see* Parasympathomimetics**Ganciclovir**

Note Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature

Note Valganciclovir interactions as for ganciclovir

- Antibacterials: increased risk of convulsions when ganciclovir given with **imipenem** with **cilastatin**
- Antivirals: ganciclovir possibly increases plasma concentration of **didanosine**; avoidance of **intravenous** ganciclovir advised by manufacturer of **lamivudine**; profound myelosuppression when ganciclovir given with **zidovudine** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)

Mycophenolate: plasma concentration of ganciclovir possibly increased by **mycophenolate**, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Probenecid: excretion of ganciclovir reduced by **probenecid** (increased plasma concentration and risk of toxicity)

Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with **tacrolimus**

Gefitinib

- Antibacterials: plasma concentration of gefitinib reduced by **rifampicin**—avoid concomitant use
 - Anticoagulants: gefitinib possibly enhances anticoagulant effect of **warfarin**
- Antidepressants: manufacturer of gefitinib advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of gefitinib increased by **itraconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
 - Ulcer-healing Drugs: plasma concentration of gefitinib reduced by **ranitidine**

Gemcitabine

Anticoagulants: gemcitabine possibly enhances anticoagulant effect of **warfarin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Gemeprost *see* Prostaglandins**Gemfibrozil** *see* Fibrates**Gentamicin** *see* Aminoglycosides**Gestodene** *see* Progestogens**Glibenclamide** *see* Antidiabetics**Gliclazide** *see* Antidiabetics**Glimepiride** *see* Antidiabetics**Glipizide** *see* Antidiabetics**Glucosamine**

- Anticoagulants: glucosamine enhances anticoagulant effect of **warfarin** (avoid concomitant use)

Glyceril Trinitrate *see* Nitrates**Glycopyrronium** *see* Antimuscarinics**Gold** *see* Sodium Aurothiomalate**Golimimumab**

- Abatacept: avoid concomitant use of golimumab with **abatacept**

Golimimumab (continued)

- Anakinra: avoid concomitant use of golimumab with **anakinra**
- Vaccines: avoid concomitant use of golimumab with live **vaccines** (see p. 599)

Grapefruit Juice

- Anti-arrhythmics: grapefruit juice increases plasma concentration of **amiodarone**; grapefruit juice increases plasma concentration of **dronedarone**—avoid concomitant use
- Antihistamines: grapefruit juice increases plasma concentration of **rupatadine**—avoid concomitant use
- Antimalarials: grapefruit juice possibly increases plasma concentration of **artemether/lumefantrine**
- Antivirals: grapefruit juice possibly increases plasma concentration of **efavirenz**
- Anxiolytics and Hypnotics: grapefruit juice increases plasma concentration of **bupirone**
- Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of **amlodipine**; grapefruit juice increases plasma concentration of **felodipine**, **isradipine**, **lacidipine**, **lercanidipine**, **nicardipine**, **nifedipine**, **nimodipine** and **verapamil**
- Ciclosporin: grapefruit juice increases plasma concentration of **ciclosporin** (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of **colchicine** toxicity
- Cytotoxics: avoidance of grapefruit juice advised by manufacturer of **everolimus**, **lapatinib**, **nilotinib** and **pazopanib**; grapefruit juice possibly increases plasma concentration of **vinflunine**—manufacturer of vinflunine advises avoid concomitant use
- Ivabradine: grapefruit juice increases plasma concentration of **ivabradine**
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of **atorvastatin**; grapefruit juice increases plasma concentration of **simvastatin**—avoid concomitant use
- Ranolazine: grapefruit juice possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of **sildenafil**
- Sirolimus: grapefruit juice increases plasma concentration of **sirolimus**—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of **tacrolimus**
- Tadalafil: grapefruit juice possibly increases plasma concentration of **tadalafil**
- Tolvaptan: grapefruit juice increases plasma concentration of **tolvaptan**—avoid concomitant use
- Vardenafil: grapefruit juice possibly increases plasma concentration of **vardenafil**—avoid concomitant use

Griseofulvin

- Alcohol: griseofulvin possibly enhances effects of **alcohol**
 - Anticoagulants: griseofulvin reduces anticoagulant effect of **coumarins**
 - Antiepileptics: absorption of griseofulvin reduced by **phenobarbital** (reduced effect)
 - Ciclosporin: griseofulvin possibly reduces plasma concentration of **ciclosporin**
 - Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with **oestrogens**
 - Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with **progestogens**
- Guanethidine** *see* Adrenergic Neuron Blockers
- Haloperidol** *see* Antipsychotics
- Halothane** *see* Anaesthetics, General
- Heparin** *see* Heparins
- Heparins**
- ACE Inhibitors: increased risk of hyperkalaemia when heparins given with **ACE inhibitors**
 - Aliskiren: increased risk of hyperkalaemia when heparins given with **aliskiren**

Heparins (continued)

- Analgesics: possible increased risk of bleeding when heparins given with **NSAIDs**; increased risk of haemorrhage when anticoagulants given with *intravenous* • **diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with • **ketorolac** (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by • **aspirin**
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with **angiotensin-II receptor antagonists**
- Clopidogrel: increased risk of bleeding when heparins given with **clopidogrel**
- Dipyridamole: anticoagulant effect of heparins enhanced by **dipyridamole**
- Drotrecogin Alfa: avoidance of concomitant use of high doses of heparins with drotrecogin alfa advised by manufacturer of • **drotrecogin alfa**—consult product literature
- Iloprost: anticoagulant effect of heparins possibly enhanced by **iloprost**
- Nitrates: anticoagulant effect of heparins reduced by *infusion of* • **glyceryl trinitrate**

Histamine

- Antidepressants: manufacturer of histamine advises avoid concomitant use with **MAOIs**; effects of histamine theoretically antagonised by **tricyclics**—manufacturer of histamine advises avoid concomitant use
- Antihistamines: effects of histamine theoretically antagonised by **antihistamines**—manufacturer of histamine advises avoid concomitant use
- Antimalarials: manufacturer of histamine advises avoid concomitant use with **antimalarials**
- Antipsychotics: effects of histamine theoretically antagonised by **antipsychotics**—manufacturer of histamine advises avoid concomitant use
- Atovaquone: manufacturer of histamine advises avoid concomitant use with **atovaquone**
- Clonidine: manufacturer of histamine advises avoid concomitant use with **clonidine**
- Corticosteroids: manufacturer of histamine advises avoid concomitant use with **corticosteroids**
- Ulcer-healing Drugs: effects of histamine theoretically antagonised by **histamine H₂-antagonists**—manufacturer of histamine advises avoid concomitant use

Histamine H₂-antagonists

- Alpha-blockers: cimetidine and ranitidine antagonise effects of • **tolazoline**
- Analgesics: cimetidine inhibits metabolism of **opioid analgesics** (increased plasma concentration)
- Anti-arrhythmics: cimetidine increases plasma concentration of **amiodarone** and • **propafenone**; cimetidine inhibits metabolism of **flecainide** (increased plasma concentration); cimetidine increases plasma concentration of • **lidocaine** (increased risk of toxicity)
- Antibacterials: histamine H₂-antagonists reduce absorption of **cefpodoxime**; cimetidine increases plasma concentration of **erythromycin** (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of **metronidazole** (increased plasma concentration); metabolism of cimetidine accelerated by **rifampicin** (reduced plasma concentration)
- Anticoagulants: cimetidine inhibits metabolism of • **coumarins** (enhanced anticoagulant effect)
- Antidepressants: cimetidine increases plasma concentration of **citalopram**, **escitalopram**, **mirtazapine** and **sertraline**; cimetidine inhibits metabolism of **amitriptyline**, **doxepin**, **imipramine** and **nortriptyline** (increased plasma concentration); cimetidine increases plasma concentration of **moclobemide** (halve dose of moclobemide); cimetidine possibly increases plasma concentration of **tricyclics**
- Antidiabetics: cimetidine reduces excretion of **metformin** (increased plasma concentration); cimetidine enhances hypoglycaemic effect of **sulfonylureas**
- Histamine H₂-antagonists (continued)**
- Antiepileptics: cimetidine inhibits metabolism of • **carbamazepine**, • **phenytoin** and • **valproate** (increased plasma concentration)
- Antifungals: histamine H₂-antagonists reduce absorption of **itraconazole** and **ketoconazole**; avoidance of histamine H₂-antagonists advised by manufacturer of **posaconazole** (plasma concentration of posaconazole possibly reduced); cimetidine reduces plasma concentration of • **posaconazole**; cimetidine increases plasma concentration of **terbinafine**
- Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of **loratadine**
- Antimalarials: avoidance of cimetidine advised by manufacturer of • **artemether/lumefantrine**; cimetidine inhibits metabolism of **chloroquine** and **hydroxychloroquine** and **quinine** (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of **antipsychotics**, **chlorpromazine** and **clozapine**
- Antivirals: histamine H₂-antagonists reduce plasma concentration of • **atazanavir**; histamine H₂-antagonists possibly increase plasma concentration of **raltegravir**—manufacturer of raltegravir advises avoid concomitant use; cimetidine possibly increases plasma concentration of **saquinavir**
- Anxiolytics and Hypnotics: cimetidine inhibits metabolism of **benzodiazepines**, **clomethiazole** and **zaleplon** (increased plasma concentration); cimetidine increases plasma concentration of **melatonin**
- Beta-blockers: cimetidine increases plasma concentration of **labetalol**, **metoprolol** and **propranolol**
- Calcium-channel Blockers: cimetidine possibly inhibits metabolism of **calcium-channel blockers** (increased plasma concentration); cimetidine increases plasma concentration of **isradipine** (halve dose of isradipine)
- Ciclosporin: cimetidine possibly increases plasma concentration of • **ciclosporin**
- Clopidogrel: cimetidine possibly reduces antiplatelet effect of • **clopidogrel**
- Cytotoxics: cimetidine possibly enhances myelosuppressive effects of **caarmustine** and **lomustine**; cimetidine increases plasma concentration of • **epirubicin**; cimetidine inhibits metabolism of **flourouracil** (increased plasma concentration); famotidine possibly reduces plasma concentration of **dasatinib**; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of • **erlotinib**; ranitidine reduces plasma concentration of • **erlotinib**—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of • **gefitinib**; histamine H₂-antagonists possibly reduce absorption of **lapatinib**
- Dopaminergics: cimetidine reduces excretion of **pramipexole** (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with • **ergotamine** and **methysergide**—avoid concomitant use
- Histamine: histamine H₂-antagonists theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: absorption of cimetidine possibly delayed by **octreotide**
- 5HT₁ Agonists: cimetidine inhibits metabolism of **zolmitriptan** (reduce dose of zolmitriptan)
- Mebendazole: cimetidine possibly inhibits metabolism of **mebendazole** (increased plasma concentration)
- Roflumilast: cimetidine inhibits the metabolism of **roflumilast**
- Sildenafil: cimetidine increases plasma concentration of **sildenafil** (consider reducing dose of sildenafil)
- Theophylline: cimetidine inhibits metabolism of • **theophylline** (increased plasma concentration)
- Thyroid Hormones: cimetidine reduces absorption of **levothyroxine**
- Ulipristal: avoidance of histamine H₂-antagonists advised by manufacturer of • **ulipristal** (plasma concentration of ulipristal possibly reduced)

Homatropine *see* Antimuscarinics

Hormone Antagonists *see* Bicalutamide, Danazol, Dutasteride, Exemestane, Flutamide, Lanreotide, Octreotide, Tamoxifen, Toremifene, and Trilostane

5HT₂ Agonists

- Antibacterials: plasma concentration of eletriptan increased by ●clarithromycin and ●erythromycin (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by ●quinolones (reduce dose of zolmitriptan)

- Antidepressants: increased risk of CNS toxicity when sumatriptan given with ●citalopram, ●escitalopram, ●fluoxetine, ●fluvoxamine or ●paroxetine; metabolism of frovatriptan inhibited by ●fluvoxamine; metabolism of zolmitriptan possibly inhibited by ●fluvoxamine (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with ●sertraline; possible increased serotonergic effects when 5HT₂ agonists given with ●duloxetine or ●venlafaxine; increased risk of CNS toxicity when zolmitriptan given with ●MAOIs; risk of CNS toxicity when rizatriptan or sumatriptan given with ●MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when rizatriptan or sumatriptan given with ●moclobemide (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when zolmitriptan given with ●moclobemide (reduce dose of zolmitriptan); increased serotonergic effects when 5HT₂ agonists given with ●St John's wort—avoid concomitant use

- Antifungals: plasma concentration of eletriptan increased by ●itraconazole and ●ketoconazole (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptan increased by ●ketoconazole (increased risk of toxicity)

- Antivirals: plasma concentration of eletriptan increased by ●indinavir, ●nelfinavir and ●ritonavir (risk of toxicity)—avoid concomitant use

Beta-blockers: plasma concentration of rizatriptan increased by ●propranolol (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)

Dopaminergics: avoidance of 5HT₂ agonists advised by manufacturer of ●selegiline

- Ergot Alkaloids: increased risk of vasospasm when eletriptan, frovatriptan or naratriptan given with ●ergotamine and ●methysergide (avoid ergotamine and methysergide for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine and methysergide); increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ●ergotamine and ●methysergide (avoid ergotamine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine and methysergide)

Lithium: possible risk of toxicity when sumatriptan given with ●lithium

Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by ●cimetidine (reduce dose of zolmitriptan)

5HT₁ Antagonists

Analgesics: ondansetron possibly antagonises effects of ●tramadol

Antibacterials: metabolism of ondansetron accelerated by ●rifampicin (reduced effect)

Antiepileptics: metabolism of ondansetron accelerated by ●carbamazepine and ●phenytoin (reduced effect)

Hydralazine *see* Vasodilator Antihypertensives

Hydrochlorothiazide *see* Diuretics

Hydrocortisone *see* Corticosteroids

Hydroflumethiazide *see* Diuretics

Hydromorphone *see* Opioid Analgesics

Hydrotalcite *see* Antacids

Hydroxocobalamin

Antibacterials: response to hydroxocobalamin reduced by ●chloramphenicol

Hydroxycarbamide

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

- Antivirals: increased risk of toxicity when hydroxycarbamide given with ●didanosine and ●stavudine—avoid concomitant use

Hydroxychloroquine *see* Chloroquine and Hydroxychloroquine

Hydroxyzine *see* Antihistamines

Hyoscine *see* Antimuscarinics

Ibandronic Acid *see* Bisphosphonates

Ibuprofen *see* NSAIDs

Idarubicin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

- Cyclosporin: plasma concentration of idarubicin increased by ●cyclosporin

Ifosfamide

- Anticoagulants: ifosfamide possibly enhances anticoagulant effect of ●coumarins

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cytotoxics: increased risk of ototoxicity when ifosfamide given with ●cisplatin

Iloprost

Analgesics: increased risk of bleeding when iloprost given with ●NSAIDs or ●aspirin

Anticoagulants: iloprost possibly enhances anticoagulant effect of ●coumarins and ●heparins; increased risk of bleeding when iloprost given with ●phenindione

Clopidogrel: increased risk of bleeding when iloprost given with ●clopidogrel

Eptifibatid: increased risk of bleeding when iloprost given with ●eptifibatid

Tirofiban: increased risk of bleeding when iloprost given with ●tirofiban

Imatinib

Analgesics: manufacturer of imatinib advises caution with ●paracetamol

- Antibacterials: plasma concentration of imatinib reduced by ●rifampicin—avoid concomitant use

Anticoagulants: manufacturer of imatinib advises replacement of ●warfarin with a heparin (possibility of enhanced warfarin effect)

- Antidepressants: plasma concentration of imatinib reduced by ●St John's wort—avoid concomitant use

- Antiepileptics: plasma concentration of imatinib reduced by ●carbamazepine, ●oxcarbazepine and ●phenytoin—avoid concomitant use

Antifungals: plasma concentration of imatinib increased by ●ketoconazole

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cyclosporin: imatinib possibly increases plasma concentration of ●cyclosporin

Lipid-regulating Drugs: imatinib increases plasma concentration of ●simvastatin

Thyroid Hormones: imatinib possibly reduces plasma concentration of ●levothyroxine

Imidapril *see* ACE Inhibitors

Imipenem with Cilastatin

- Antiepileptics: carbapenems reduce plasma concentration of ●valproate—avoid concomitant use

- Antivirals: increased risk of convulsions when imipenem with cilastatin given with ●ganciclovir

Vaccines: antibacterials inactivate ●oral typhoid vaccine—see p. 620

Imipramine *see* Antidepressants, Tricyclic

Immunglobulins

Note For advice on immunoglobulins and live virus vaccines, see under Normal Immunoglobulin, p. 622

Indacaterol *see* Sympathomimetics, Beta₂

Indapamide *see* Diuretics

Indinavir

Aldesleukin: plasma concentration of indinavir possibly increased by ●aldesleukin

Indinavir (*continued*)

- Anti-arrhythmics: indinavir possibly increases plasma concentration of ●**amiodarone**—avoid concomitant use; indinavir possibly increases plasma concentration of ●**flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of ●**rifabutin**—avoid concomitant use; metabolism of indinavir accelerated by ●**rifampicin** (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of ●**telithromycin**
- Anticoagulants: avoidance of indinavir advised by manufacturer of **rivaroxaban**
- Antidepressants: plasma concentration of indinavir reduced by ●**St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by ●**carbamazepine** and ●**phenytoin**, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by ●**phenobarbital**
- Antifungals: plasma concentration of indinavir increased by ●**itraconazole** and ●**ketoconazole** (consider reducing dose of indinavir)
- Antimalarials: caution with indinavir advised by manufacturer of **artemether/lumefantrine**; indinavir possibly increases plasma concentration of ●**quinine** (increased risk of toxicity)
- Antimuscarinics: avoidance of indinavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when indinavir given with **fesoterodine**—consult fesoterodine product literature
- Antipsychotics: indinavir possibly inhibits metabolism of ●**aripiprazole** (reduce dose of aripiprazole); indinavir possibly increases plasma concentration of ●**pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoid concomitant use of indinavir with ●**atazanavir**; plasma concentration of both drugs increased when indinavir given with **darunavir**; plasma concentration of indinavir reduced by **efavirenz** and **nevirapine**; plasma concentration of indinavir possibly reduced by ●**etravirine**—avoid concomitant use; indinavir increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc); combination of indinavir with **nefinavir** may increase plasma concentration of either drug (or both); plasma concentration of indinavir increased by **ritonavir**; indinavir increases plasma concentration of **saquinavir**
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with ●**alprazolam**—avoid concomitant use; indinavir possibly increases plasma concentration of ●**midazolam** (risk of prolonged sedation—avoid concomitant use of **oral** midazolam)
- Atovaquone: plasma concentration of indinavir possibly reduced by **atovaquone**
- Cyclosporin: indinavir increases plasma concentration of ●**cyclosporin**
- Colchicine: indinavir possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of indinavir possibly reduced by **dexamethasone**
- Cytotoxics: indinavir possibly increases plasma concentration of ●**everolimus**—manufacturer of everolimus advises avoid concomitant use; avoidance of indinavir advised by manufacturer of ●**pazopanib**
- Ergot Alkaloids: increased risk of ergotism when indinavir given with ●**ergotamine** and **methysergide**—avoid concomitant use
- 5HT_{2A} Agonists: indinavir increases plasma concentration of ●**eletriptan** (risk of toxicity)—avoid concomitant use

Indinavir (*continued*)

- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with **atorvastatin**; possible increased risk of myopathy when indinavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with ●**simvastatin** (avoid concomitant use)
- Ranolazine: indinavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: indinavir increases plasma concentration of ●**sildenafil**—reduce initial dose of sildenafil
- Tadalafil: indinavir possibly increases plasma concentration of **tadalafil**
- Vardenafil: indinavir increases plasma concentration of ●**vardenafil**—avoid concomitant use

Indometacin *see* NSAIDs**Indoramin** *see* Alpha-blockers**Infliximab**

- Abatacept: avoid concomitant use of infliximab with ●**abatacept**
- Anakinra: avoid concomitant use of infliximab with ●**anakinra**
- Vaccines: avoid concomitant use of infliximab with live ●**vaccines** (*see* p. 599)

Influenza Vaccine *see* Vaccines**Insulin** *see* Antidiabetics**Interferon Alpha** *see* Interferons**Interferon Gamma** *see* Interferons**Interferons**

Note Peginterferon alfa interactions as for interferon alfa

- Antivirals: increased risk of peripheral neuropathy when interferon alfa given with ●**telbivudine**
- Theophylline: interferon alfa inhibits metabolism of ●**theophylline** (consider reducing dose of theophylline)

Vaccines: manufacturer of interferon gamma advises avoid concomitant use with **vaccines**

Ipratropium *see* Antimuscarinics**Irbesartan** *see* Angiotensin-II Receptor Antagonists**Irinotecan**

- Antidepressants: metabolism of irinotecan accelerated by ●**St John's wort** (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of irinotecan reduced by ●**ketoconazole** (but concentration of active metabolite of irinotecan increased)—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: metabolism of irinotecan possibly inhibited by ●**atazanavir** (increased risk of toxicity)
- Cytotoxics: plasma concentration of active metabolite of irinotecan increased by ●**lapatinib**—consider reducing dose of irinotecan; plasma concentration of irinotecan possibly increased by **sorafenib**

Iron

- Antacids: absorption of **oral** iron reduced by **oral** **magnesium salts** (as magnesium trisilicate)
- Antibacterials: **oral** iron reduces absorption of **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, **norfloxacin** and **ofloxacin**; **oral** iron reduces absorption of **tetracyclines**, also absorption of **oral** iron reduced by tetracyclines
- Bisphosphonates: **oral** iron reduces absorption of **bisphosphonates**
- Calcium Salts: absorption of **oral** iron reduced by **calcium salts**
- Dopaminergics: **oral** iron reduces absorption of **entacapone**; **oral** iron possibly reduces absorption of **levodopa**
- Eltrombopag: **oral** iron possibly reduces absorption of **eltrombopag** (give at least 4 hours apart)

Iron (continued)

- Methylodopa: *oral* iron antagonises hypotensive effect of **methylodopa**
- Mycophenolate: *oral* iron reduces absorption of **mycophenolate**
- Penicillamine: *oral* iron reduces absorption of **penicillamine**
- Thyroid Hormones: *oral* iron reduces absorption of **levothyroxine** (give at least 2 hours apart)
- Trientine: absorption of *oral* iron reduced by **trientine**
- Zinc: *oral* iron reduces absorption of **zinc**, also absorption of *oral* iron reduced by zinc

Iso-carboxazid see MAOIs**Isoflurane** see Anaesthetics, General**Iso-methoptene** see Sympathomimetics**Isoniazid**

- Antacids: absorption of isoniazid reduced by **antacids**
- Antibacterials: increased risk of CNS toxicity when isoniazid given with **cycloserine**
- Antiepileptics: isoniazid increases plasma concentration of ●**carbamazepine** (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of ●**ethosuximide** (increased plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of **phenytoin** (increased risk of toxicity)
- Antifungals: isoniazid possibly reduces plasma concentration of **ketoconazole**
- Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of **diazepam**
- Corticosteroids: plasma concentration of isoniazid possibly reduced by **corticosteroids**
- Disulfiram: isoniazid possibly increases CNS effects of **disulfiram**
- Dopaminergics: isoniazid possibly reduces effects of **levodopa**
- Theophylline: isoniazid possibly increases plasma concentration of **theophylline**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Iso-sorbide Dinitrate see Nitrates**Iso-sorbide Mononitrate** see Nitrates**Isotretinoin** see Retinoids**Iradipine** see Calcium-channel Blockers**Itraconazole** see Antifungals, Triazole**Ivabradine**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with ●**amiodarone** or ●**disopyramide**
 - Antibacterials: plasma concentration of ivabradine possibly increased by ●**clarithromycin** and ●**telithromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with ●**erythromycin**—avoid concomitant use
- Antidepressants: plasma concentration of ivabradine reduced by **St John's wort**—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by ●**ketoconazole**—avoid concomitant use; plasma concentration of ivabradine increased by **fluconazole**—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by ●**itraconazole**—avoid concomitant use
 - Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with ●**mefloquine**
 - Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with ● **pimozide**
 - Antivirals: plasma concentration of ivabradine possibly increased by ●**nefinavir** and ●**ritonavir**—avoid concomitant use
 - Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with ●**sotalol**
 - Calcium-channel Blockers: plasma concentration of ivabradine increased by ●**diltiazem** and ●**verapamil**—avoid concomitant use
- Grapefruit Juice: plasma concentration of ivabradine increased by **grapefruit juice**
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when ivabradine given with ●**pentamidine isetionate**

Kaolin

- Analgesics: kaolin possibly reduces absorption of **aspirin**
- Antibacterials: kaolin possibly reduces absorption of **tetracyclines**
- Antimalarials: kaolin reduces absorption of **chloroquine** and **hydroxychloroquine**
- Antipsychotics: kaolin possibly reduces absorption of **phenothiazines**
- Ketamine** see Anaesthetics, General
- Ketoconazole** see Antifungals, Imidazole
- Ketoprofen** see NSAIDs
- Ketorolac** see NSAIDs
- Ketotifen** see Antihistamines
- Labetalol** see Beta-blockers
- Lacidipine** see Calcium-channel Blockers
- Lacosamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●**St John's wort**
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

Lactulose

- Anticoagulants: lactulose possibly enhances anticoagulant effect of **coumarins**

Lamivudine

- Antibacterials: plasma concentration of lamivudine increased by **trimethoprim** (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- Antivirals: avoidance of lamivudine advised by manufacturer of **emtricitabine**; manufacturer of lamivudine advises avoid concomitant use with **foscarnet**; manufacturer of lamivudine advises avoid concomitant use of **intravenous ganciclovir**

Lamotrigine

- Antibacterials: plasma concentration of lamotrigine reduced by ●**rifampicin**
 - Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●**St John's wort**
- Antiepileptics: plasma concentration of lamotrigine often reduced by **carbamazepine**, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by **phenobarbital** and **phenytoin**; plasma concentration of lamotrigine increased by **valproate**
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
 - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Antivirals: plasma concentration of lamotrigine possibly reduced by **ritonavir**
- Oestrogens: plasma concentration of lamotrigine reduced by ●**oestrogens**—consider increasing dose of lamotrigine
 - Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- Progestogens: plasma concentration of lamotrigine possibly increased by **desogestrel**

Lanreotide

Antidiabetics: lanreotide possibly reduces requirements for **insulin**, **metformin**, **repaglinide** and **sulfonylureas**

Ciclosporin: lanreotide reduces plasma concentration of **ciclosporin**

Lansoprazole *see* Proton Pump Inhibitors**Lanthanum**

Antibacterials: lanthanum possibly reduces absorption of **quinolones** (give at least 2 hours before or 4 hours after lanthanum)

Antifungals: lanthanum possibly reduces absorption of **ketconazole** (give at least 2 hours apart)

Antimalarials: lanthanum possibly reduces absorption of **chloroquine** and **hydroxychloroquine** (give at least 2 hours apart)

Thyroid Hormones: lanthanum reduces absorption of **levothyroxine** (give at least 2 hours apart)

Lapatinib

- Antibacterials: manufacturer of lapatinib advises avoid concomitant use with **rifabutin**, **rifampicin** and **telithromycin**

- Antidepressants: manufacturer of lapatinib advises avoid concomitant use with **St John's wort**

- Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with **repaglinide**

- Antiepileptics: plasma concentration of lapatinib reduced by **carbamazepine**—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with **phenytoin**

- Antifungals: plasma concentration of lapatinib increased by **ketconazole**—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with **itraconazole**, **posaconazole** and **voriconazole**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with **pimozide**

- Antivirals: manufacturer of lapatinib advises avoid concomitant use with **ritonavir** and **saquinavir**

- Cytotoxics: lapatinib increases plasma concentration of **pazopanib**; possible increased risk of neutropenia when lapatinib given with **docetaxel**; increased risk of neutropenia when lapatinib given with **paclitaxel**; lapatinib increases plasma concentration of active metabolite of **irinotecan**—consider reducing dose of irinotecan

- Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with **grapefruit juice**

Ulcer-healing Drugs: absorption of lapatinib possibly reduced by **histamine H₂-antagonists** and **proton pump inhibitors**

Laronidase

Antimalarials: effects of laronidase possibly inhibited by **chloroquine** and **hydroxychloroquine** (manufacturer of laronidase advises avoid concomitant use)

Lefunomide

Note Increased risk of toxicity with other haematotoxic and hepatotoxic drugs

Antibacterials: plasma concentration of active metabolite of lefunomide possibly increased by **rifampicin**

Anticoagulants: lefunomide possibly enhances anticoagulant effect of **warfarin**

Antidiabetics: lefunomide possibly enhances hypoglycaemic effect of **tolbutamide**

Antiepileptics: lefunomide possibly increases plasma concentration of **phenytoin**

- Cytotoxics: risk of toxicity when lefunomide given with **methotrexate**

Lipid-regulating Drugs: the effect of lefunomide is significantly decreased by **colestyramine** (enhanced elimination)—avoid unless drug elimination desired

- Vaccines: avoid concomitant use of lefunomide with live **vaccines** (see p. 599)

Lenalidomide

Cardiac Glycosides: lenalidomide possibly increases plasma concentration of **digoxin**

Lercanidipine *see* Calcium-channel Blockers**Leukotriene Receptor Antagonists**

Analgesics: plasma concentration of **zafirlukast** increased by **aspirin**

Antibacterials: plasma concentration of **zafirlukast** reduced by **erythromycin**

Anticoagulants: **zafirlukast** enhances anticoagulant effect of **warfarin**

Antiepileptics: plasma concentration of **montelukast** reduced by **phenobarbital**

Theophylline: **zafirlukast** possibly increases plasma concentration of **theophylline**, also plasma concentration of **zafirlukast** reduced

Levamisole

Alcohol: possibility of disulfiram-like reaction when **levamisole** given with **alcohol**

- Anticoagulants: **levamisole** possibly enhances anticoagulant effect of **warfarin**

Antiepileptics: **levamisole** possibly increases plasma concentration of **phenytoin**

Levetiracetam

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with **St John's wort**

Antiepileptics: **levetiracetam** possibly increases risk of **carbamazepine** toxicity

- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**

- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)

- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

Levobunolol *see* Beta-blockers**Levobupivacaine**

Anti-arrhythmics: increased myocardial depression when **levobupivacaine** given with **anti-arrhythmics**

Levocetirizine *see* Antihistamines**Levodopa**

ACE Inhibitors: enhanced hypotensive effect when **levodopa** given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when **levodopa** given with **adrenergic neurone blockers**

Alpha-blockers: enhanced hypotensive effect when **levodopa** given with **alpha-blockers**

- Anaesthetics, General: increased risk of arrhythmias when **levodopa** given with **volatile liquid general anaesthetics**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when **levodopa** given with **angiotensin-II receptor antagonists**

Antibacterials: effects of **levodopa** possibly reduced by **isoniazid**

- Antidepressants: risk of hypertensive crisis when **levodopa** given with **MAOIs**, avoid **levodopa** for at least 2 weeks after stopping MAOIs; increased risk of side-effects when **levodopa** given with **moclobemide**

Antiepileptics: effects of **levodopa** possibly reduced by **phenytoin**

Antimuscarinics: absorption of **levodopa** possibly reduced by **antimuscarinics**

Antipsychotics: effects of **levodopa** antagonised by **antipsychotics**; avoidance of **levodopa** advised by manufacturer of **amisulpride** (antagonism of effect)

Anxiolytics and Hypnotics: effects of **levodopa** possibly antagonised by **benzodiazepines**

Beta-blockers: enhanced hypotensive effect when **levodopa** given with **beta-blockers**

Bupropion: increased risk of side-effects when **levodopa** given with **bupropion**

Calcium-channel Blockers: enhanced hypotensive effect when **levodopa** given with **calcium-channel blockers**

Levodopa (*continued*)

- Clonidine: enhanced hypotensive effect when levodopa given with **clonidine**
- Diazoxide: enhanced hypotensive effect when levodopa given with **diazoxide**
- Diuretics: enhanced hypotensive effect when levodopa given with **diuretics**
- Dopaminergics: enhanced effects and increased toxicity of levodopa when given with **selegiline** (reduce dose of levodopa)
- Iron: absorption of levodopa possibly reduced by **oral iron**
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methyldopa: enhanced hypotensive effect when levodopa given with **methyldopa**; antiparkinsonian effect of dopaminergics antagonised by **methyldopa**
- Moxonidine: enhanced hypotensive effect when levodopa given with **moxonidine**
- Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with **baclofen**
- Nitrates: enhanced hypotensive effect when levodopa given with **nitrates**
- Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with **hydalazine, minoxidil** or **sodium nitroprusside**
- Vitamins: effects of levodopa reduced by **pyridoxine** when given without dopa-decarboxylase inhibitor

Levofloxacin *see* Quinolones

Levofolinic Acid *see* Folates

Levomepromazine *see* Antipsychotics

Levonorgestrel *see* Progestogens

Levothyroxine *see* Thyroid Hormones

Lidocaine

- Note** Interactions less likely when lidocaine used topically
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine, levobupivacaine, prilocaine** or **ropivacaine**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**
 - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval
 - Antivirals: plasma concentration of lidocaine possibly increased by **atazanavir** and **lopinavir**; plasma concentration of lidocaine possibly increased by **darunavir** and **fosamprenavir**—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with **saquinavir**—avoid concomitant use
 - Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**; increased risk of lidocaine toxicity when given with **propranolol**
 - Diuretics: action of lidocaine antagonised by hypokalaemia caused by **acetazolamide, loop diuretics** or **thiazides and related diuretics**
- Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with **suxamethonium**
- Ulcer-healing Drugs: plasma concentration of lidocaine increased by **cimetidine** (increased risk of toxicity)

Linezolid

- Note** Linezolid is a reversible, non-selective MAO inhibitor—*see* interactions of MAOIs
- Antibacterials: plasma concentration of linezolid reduced by **rifampicin** (possible therapeutic failure of linezolid)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620
- Liothyronine** *see* Thyroid Hormones
- Lipid-regulating Drugs** *see* Colesevelam, Colestipol, Colestyramine, Ezetimibe, Fibrates, Nicotinic Acid, and Statins
- Liraglutide** *see* Antidiabetics
- Lisinopril** *see* ACE Inhibitors

Lithium

- ACE Inhibitors: excretion of lithium reduced by **ACE inhibitors** (increased plasma concentration)
 - Analgesics: excretion of lithium reduced by **NSAIDs** (increased risk of toxicity); excretion of lithium reduced by **ketorolac** (increased risk of toxicity)—avoid concomitant use
 - Angiotensin-II Receptor Antagonists: excretion of lithium reduced by **angiotensin-II receptor antagonists** (increased plasma concentration)
 - Antacids: excretion of lithium increased by **sodium bicarbonate** (reduced plasma concentration)
 - Anti-arrhythmics: avoidance of lithium advised by manufacturer of **amiodarone** (risk of ventricular arrhythmias)
 - Antibacterials: increased risk of lithium toxicity when given with **metronidazole**
 - Antidepressants: possible increased serotonergic effects when lithium given with **venlafaxine**; increased risk of CNS effects when lithium given with **SSRIs** (lithium toxicity reported); risk of toxicity when lithium given with **tricyclics**
 - Antiepileptics: neurotoxicity may occur when lithium given with **carbamazepine** or **phenytoin** without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by **topiramate**
 - Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with **clozapine, flupentixol, haloperidol, phenothiazines** or **zuclopenthixol**; possible risk of toxicity when lithium given with **olanzapine**; increased risk of extrapyramidal side-effects when lithium given with **sulpiride**
 - Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with **clonazepam**
 - Calcium-channel Blockers: neurotoxicity may occur when lithium given with **diltiazem** or **verapamil** without increased plasma concentration of lithium
 - Cytotoxics: increased risk of ventricular arrhythmias when lithium given with **arsenic trioxide**
 - Diuretics: excretion of lithium increased by **acetazolamide**; excretion of lithium reduced by **loop diuretics** and **thiazides and related diuretics** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by **potassium-sparing diuretics** and **aldosterone antagonists** (increased plasma concentration and risk of toxicity)
 - 5HT₁ Agonists: possible risk of toxicity when lithium given with **sumatriptan**
 - Methyldopa: neurotoxicity may occur when lithium given with **methyldopa** without increased plasma concentration of lithium
 - Muscle Relaxants: lithium enhances effects of **muscle relaxants**; hyperkinesia caused by lithium possibly aggravated by **baclofen**
 - Parasympathomimetics: lithium antagonises effects of **neostigmine** and **pyridostigmine**
 - Theophylline: excretion of lithium increased by **theophylline** (reduced plasma concentration)
- Lofepamine** *see* Antidepressants, Tricyclic
- Lofexidine**
- Alcohol: increased sedative effect when lofexidine given with **alcohol**
 - Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with **anxiolytics** and **hypnotics**
- Lomustine**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by **cimetidine**
- Loperamide**
- Desmopressin: loperamide increases plasma concentration of **oral desmopressin**

Lopinavir

Note In combination with ritonavir as *Kaletra*[®] (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir

- Anti-arrhythmics: lopinavir possibly increases plasma concentration of ●**flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of **lidocaine**
- Antibacterials: plasma concentration of lopinavir reduced by ●**rifampicin**—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of ●**telithromycin**

Anticoagulants: avoidance of lopinavir advised by manufacturer of **rivaroxaban**

- Antidepressants: plasma concentration of lopinavir reduced by ●**St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by **carbamazepine**, ●**phenobarbital** and **phenytoin**

Antihistamines: lopinavir possibly increases plasma concentration of **chlorphenamine**

Antimalarials: caution with lopinavir advised by manufacturer of **artemether/lumefantrine**

Antimuscarinics: avoidance of lopinavir advised by manufacturer of **darifenacin** and **tolterodine**

- Antipsychotics: lopinavir possibly inhibits metabolism of ●**aripiprazole** (reduce dose of aripiprazole)

- Antivirals: lopinavir reduces plasma concentration of ●**darunavir**, also plasma concentration of lopinavir increased (avoid concomitant use); plasma concentration of lopinavir reduced by ●**efavirenz**—consider increasing dose of lopinavir; lopinavir reduces plasma concentration of **fosamprenavir**, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc); plasma concentration of lopinavir reduced by **nelfinavir**, also plasma concentration of active metabolite of nelfinavir increased; plasma concentration of lopinavir possibly reduced by ●**nevirapine**—consider increasing dose of lopinavir; increased risk of ventricular arrhythmias when lopinavir given with ●**saquinavir**—avoid concomitant use; lopinavir increases plasma concentration of **tenofovir**; plasma concentration of lopinavir reduced by ●**tipranavir**

Corticosteroids: plasma concentration of lopinavir possibly reduced by **dexamethasone**

Eltrombopag: lopinavir possibly reduces plasma concentration of **eltrombopag**

- Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with **atorvastatin**; possible increased risk of myopathy when lopinavir given with ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when lopinavir given with ●**simvastatin**—avoid concomitant use
 - Ranolazine: lopinavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sirolimus: lopinavir possibly increases plasma concentration of **sirolimus**

Loprazolam see Anxiolytics and Hypnotics

Loratadine see Antihistamines

Lorazepam see Anxiolytics and Hypnotics

Lormetazepam see Anxiolytics and Hypnotics

Losartan see Angiotensin-II Receptor Antagonists

Lumefantrine see Artemether with Lumefantrine

Lymecycline see Tetracyclines

Macrolides

Note See also Telithromycin

Note Interactions do not apply to small amounts of erythromycin used topically

Analgesics: erythromycin increases plasma concentration of **alfentanil**

Antacids: absorption of azithromycin reduced by **antacids**

Macrolides (continued)

- Anti-arrhythmics: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**amiodarone**—avoid concomitant use; clarithromycin possibly increases plasma concentration of ●**disopyramide** (increased risk of toxicity); erythromycin increases plasma concentration of ●**disopyramide** (increased risk of toxicity); avoidance of clarithromycin advised by manufacturer of ●**dronedarone** (risk of ventricular arrhythmias); erythromycin possibly increases plasma concentration of ●**dronedarone** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**moxifloxacin**—avoid concomitant use; macrolides possibly increase plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); clarithromycin increases plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); plasma concentration of clarithromycin reduced by **rifamycins**
- Anticoagulants: clarithromycin and erythromycin enhance anticoagulant effect of ●**coumarins**; azithromycin possibly enhances anticoagulant effect of ●**coumarins**
- Antidepressants: avoidance of macrolides advised by manufacturer of ●**reboxetine**
- Antidiabetics: clarithromycin enhances effects of **repaglinide**
- Antiepileptics: clarithromycin and erythromycin increase plasma concentration of ●**carbamazepine**; clarithromycin inhibits metabolism of **phenytoin** (increased plasma concentration); erythromycin possibly inhibits metabolism of **valproate** (increased plasma concentration)
- Antifungals: clarithromycin increases plasma concentration of **itraconazole**
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of **loratadine**; macrolides possibly inhibit metabolism of ●**mizolastine** (avoid concomitant use); erythromycin inhibits metabolism of ●**mizolastine**—avoid concomitant use; erythromycin increases plasma concentration of **rupatadine**
- Antimalarials: avoidance of macrolides advised by manufacturer of ●**artemether/lumefantrine**
- Antimuscarinics: erythromycin possibly increases plasma concentration of **darifenacin**; manufacturer of fesoterodine advises dose reduction when clarithromycin given with **fesoterodine**—consult fesoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of **tolterodine**
- Antipsychotics: avoidance of macrolides advised by manufacturer of ●**droperidol** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**zuclopenthixol**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ●**amisulpride**—avoid concomitant use; erythromycin possibly increases plasma concentration of ●**clozapine** (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when erythromycin given with ●**pimozide**—avoid concomitant use; increased risk of ventricular arrhythmias when clarithromycin given with ●**pimozide**—avoid concomitant use; macrolides possibly increase plasma concentration of **quetiapine** (reduce dose of quetiapine); increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**sulpiride**
- Antivirals: plasma concentration of both drugs increased when clarithromycin given with **atazanavir**; increased risk of rash when clarithromycin given with **efavirenz**; clarithromycin increases plasma concentration of ●**etravirine**, also plasma concentration of clarithromycin reduced; clarithromycin possibly increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc); plasma concen-

Macrolides

- **Antivirals (continued)**
 - treatment of azithromycin increased by **nelfinavir** (increased risk of toxicity); plasma concentration of clarithromycin reduced by **nevirapine** (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; plasma concentration of clarithromycin increased by **ritonavir** (reduce dose of clarithromycin in renal impairment); plasma concentration of azithromycin and erythromycin possibly increased by **ritonavir**; increased risk of ventricular arrhythmias when clarithromycin or erythromycin given with **saquinavir**—avoid concomitant use; plasma concentration of clarithromycin increased by **tipranavir** (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of **zidovudine** (give at least 2 hours apart)
- **Anxiolytics and Hypnotics:** clarithromycin and erythromycin inhibit metabolism of **midazolam** (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of **bupropion** (reduce dose of bupropion); erythromycin inhibits the metabolism of **zopiclone**
- **Appetitant:** clarithromycin possibly increases plasma concentration of **aprepitant**
- **Atomoxetine:** increased risk of ventricular arrhythmias when **parenteral** erythromycin given with **atomoxetine**
- **Calcium-channel Blockers:** erythromycin possibly inhibits metabolism of **felodipine** (increased plasma concentration); avoidance of erythromycin advised by manufacturer of **lercanidipine**; clarithromycin and erythromycin possibly inhibit metabolism of **verapamil** (increased risk of toxicity)
- **Cardiac Glycosides:** macrolides increase plasma concentration of **digoxin** (increased risk of toxicity)
- **Ciclosporin:** macrolides possibly inhibit metabolism of **ciclosporin** (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of **ciclosporin** (increased plasma concentration)
- **Cilostazol:** erythromycin increases plasma concentration of **cilostazol** (consider reducing dose of cilostazol)
- **Clopidogrel:** erythromycin possibly reduces anti-platelet effect of **clopidogrel**
- **Colchicine:** azithromycin, clarithromycin and erythromycin possibly increase risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- **Corticosteroids:** erythromycin possibly inhibits metabolism of **corticosteroids**; erythromycin inhibits the metabolism of **methylprednisolone**; clarithromycin possibly increases plasma concentration of **methylprednisolone**
- **Cytotoxics:** clarithromycin possibly increases plasma concentration of **everolimus**—manufacturer of everolimus advises avoid concomitant use; erythromycin increases plasma concentration of **everolimus**; avoidance of clarithromycin advised by manufacturer of **nilotinib** and **pazopanib**; *in vitro* studies suggest a possible interaction between erythromycin and **docetaxel** (consult docetaxel product literature); increased risk of ventricular arrhythmias when erythromycin given with **arsenic trioxide**; erythromycin increases toxicity of **vinblastine**—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with **vinorelbine**
- **Diuretics:** clarithromycin increases plasma concentration of **eplerenone**—avoid concomitant use; erythromycin increases plasma concentration of **eplerenone** (reduce dose of eplerenone)
- **Dopaminergics:** macrolides possibly increase plasma concentration of **bromocriptine** and

Macrolides

- **Dopaminergics (continued)**
 - **cabergoline** (increased risk of toxicity); erythromycin increases plasma concentration of **bromocriptine** and **cabergoline** (increased risk of toxicity)
 - **Ergot Alkaloids:** increased risk of ergotism when macrolides given with **ergotamine and methysergide**—avoid concomitant use
 - **5HT₂ Agonists:** clarithromycin and erythromycin increase plasma concentration of **eletriptan** (risk of toxicity)—avoid concomitant use
 - **Ivabradine:** clarithromycin possibly increases plasma concentration of **ivabradine**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with **ivabradine**—avoid concomitant use
 - **Leukotriene Receptor Antagonists:** erythromycin reduces plasma concentration of **zafirlukast**
 - **Lipid-regulating Drugs:** clarithromycin increases plasma concentration of **atorvastatin** and **pravastatin**; possible increased risk of myopathy when erythromycin given with **atorvastatin**; erythromycin increases plasma concentration of **pravastatin**; erythromycin reduces plasma concentration of **rosuvastatin**; increased risk of myopathy when clarithromycin or erythromycin given with **simvastatin** (avoid concomitant use)
 - **Oestrogens:** erythromycin increases plasma concentration of **estradiol**
 - **Parasympathomimetics:** erythromycin increases plasma concentration of **galantamine**
 - **Pentamidine Isetionate:** increased risk of ventricular arrhythmias when **parenteral** erythromycin given with **pentamidine isetionate**
 - **Progestogens:** erythromycin increases plasma concentration of **dienogest**
 - **Ranolazine:** clarithromycin possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
 - **Sildenafil:** clarithromycin possibly increases plasma concentration of **sildenafil**—reduce initial dose of sildenafil; erythromycin increases plasma concentration of **sildenafil**—reduce initial dose of sildenafil
 - **Sirolimus:** clarithromycin increases plasma concentration of **sirolimus**—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with **sirolimus**
 - **Tacrolimus:** clarithromycin and erythromycin increase plasma concentration of **tacrolimus**
 - **Tadalafil:** clarithromycin and erythromycin possibly increase plasma concentration of **tadalafil**
 - **Theophylline:** azithromycin possibly increases plasma concentration of **theophylline**; clarithromycin inhibits metabolism of **theophylline** (increased plasma concentration); erythromycin increases plasma concentration of **theophylline** (also theophylline may reduce absorption of **oral** erythromycin)
 - **Ulcer-healing Drugs:** plasma concentration of erythromycin increased by **cimetidine** (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with **omeprazole**
 - **Vaccines:** antibacterials inactivate **oral typhoid vaccine**—see p. 620
 - **Vardenafil:** erythromycin increases plasma concentration of **varidenafil** (reduce dose of vardenafil)
- Magnesium (parenteral)**
- **Calcium-channel Blockers:** profound hypotension reported with concomitant use of parenteral magnesium and **nifedipine** in pre-eclampsia
 - **Muscle Relaxants:** parenteral magnesium enhances effects of non-depolarising muscle relaxants and **suxamethonium**
- Magnesium Salts (oral)** see Antacids
- Mannitol**
- **Ciclosporin:** possible increased risk of nephrotoxicity when mannitol given with **ciclosporin**

MAOIs

Note For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor

ACE Inhibitors: MAOIs possibly enhance hypotensive effect of **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with **adrenergic neurone blockers**

- **Alcohol:** MAOIs interact with tyramine found in some beverages containing **alcohol** and some dealcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect
- **Alpha-, adrenoceptor Stimulants:** avoidance of MAOIs advised by manufacturer of **apraclonidine** and **brimonidine**
- **Alpha-blockers:** avoidance of MAOIs advised by manufacturer of **indoramin**; enhanced hypotensive effect when MAOIs given with **alpha-blockers**
- **Analgesics:** CNS excitation or depression (hypertension or hypotension) when MAOIs given with **•pethidine**—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with **•tramadol**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of **•nefopam**; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with **•opioid analgesics**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs
- **Angiotensin-II Receptor Antagonists:** MAOIs possibly enhance hypotensive effect of **angiotensin-II receptor antagonists**
- **Antidepressants:** increased risk of hypertension and CNS excitation when MAOIs given with **•reboxetine** (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start **•citalopram**, **•escitalopram**, **•fluvoxamine**, **•paroxetine** or **•sertraline** for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start **•fluoxetine** for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start **•duloxetine** for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with **•venlafaxine** (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other **•MAOIs** (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start **•moclobemide** for at least 1 week; MAOIs increase CNS effects of **•SSRIs** (risk of serious toxicity); after stopping MAOIs do not start **•mirtazapine** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start **•tricyclic-related antidepressants** for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with **•tricyclics**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); CNS excitation and confusion when MAOIs given with **•tryptophan** (reduce dose of tryptophan)
- **Antidiabetics:** MAOIs possibly enhance hypoglycaemic effect of **antidiabetics**; MAOIs enhance hypo-

MAOIs

Antidiabetics (*continued*)

glycaemic effect of **insulin**, **metformin** and **sulfonylureas**

- **Antiepileptics:** MAOIs possibly antagonise anti-convulsant effect of **antiepileptics** (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of **•carbamazepine**, also antagonism of anticonvulsant effect
- **Antihistamines:** avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of **promethazine**; increased antimuscarinic and sedative effects when MAOIs given with **antihistamines**
- **Antimalarials:** avoidance of antidepressants advised by manufacturer of **•artemether/lumefantrine**
- **Antimuscarinics:** increased risk of antimuscarinic side-effects when MAOIs given with **antimuscarinics**
- **Antipsychotics:** CNS effects of MAOIs possibly increased by **•clozapine**
- **Anxiolytics and Hypnotics:** avoidance of MAOIs advised by manufacturer of **buspirone**; manufacturer of tranlycypromine advises avoid **buspirone** for 10 days after stopping tranlycypromine
- **Atomoxetine:** after stopping MAOIs do not start **•atomoxetine** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with **atomoxetine**
- **Beta-blockers:** enhanced hypotensive effect when MAOIs given with **beta-blockers**
- **Bupropion:** avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of **•bupropion**
- **Calcium-channel Blockers:** enhanced hypotensive effect when MAOIs given with **calcium-channel blockers**
- **Clonidine:** enhanced hypotensive effect when MAOIs given with **clonidine**
- **Diazoxide:** enhanced hypotensive effect when MAOIs given with **diazoxide**
- **Diuretics:** enhanced hypotensive effect when MAOIs given with **diuretics**
- **Dopaminergics:** avoid concomitant use of non-selective MAOIs with **•entacapone**; risk of hypertensive crisis when MAOIs given with **•levodopa**, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with **•rasagiline**, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with **•selegiline**—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with **tolcapone**
- **Doxapram:** MAOIs enhance effects of **doxapram**
- **Histamine:** avoidance of MAOIs advised by manufacturer of **histamine**
- **5HT₂ Agonists:** risk of CNS toxicity when MAOIs given with **•rizatriptan** or **•sumatriptan** (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); increased risk of CNS toxicity when MAOIs given with **•zolmitriptan**
- **Methylidopa:** avoidance of MAOIs advised by manufacturer of **•methylidopa**
- **Moxonidine:** enhanced hypotensive effect when MAOIs given with **moxonidine**
- **Muscle Relaxants:** phenelzine enhances effects of **suxamethonium**
- **Nicorandil:** enhanced hypotensive effect when MAOIs given with **nicorandil**
- **Nitrates:** enhanced hypotensive effect when MAOIs given with **nitrates**
- **Pholcodine:** avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of **pholcodine**
- **Sympathomimetics:** risk of hypertensive crisis when MAOIs given with **•sympathomimetics**; risk of hypertensive crisis when MAOIs given with **•methylphenidate**, some manufacturers advise

MAOIs

- Sympathomimetics (*continued*)
avoid methylphenidate for at least 2 weeks after stopping MAOIs
- Tetrabenazine: risk of CNS excitation and hypertension when MAOIs given with •**tetrabenazine**
Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

MAOIs, reversible see Moclobemide

Maraviroc

- Antibacterials: plasma concentration of maraviroc possibly increased by •**clarithromycin** and •**telithromycin** (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by •**rifampicin**—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by •**St John's wort**—avoid concomitant use
- Antifungals: plasma concentration of maraviroc increased by •**ketoconazole** (consider reducing dose of maraviroc)
- Antivirals: plasma concentration of maraviroc increased by •**atazanavir**, •**darunavir**, •**indinavir**, •**lopinavir** and •**saquinavir** (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by •**efavirenz**—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by **etravirine**; plasma concentration of maraviroc possibly increased by •**nelfinavir** (consider reducing dose of maraviroc); plasma concentration of maraviroc increased by **ritonavir**

Mebendazole

Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by **cimetidine** (increased plasma concentration)

Medroxyprogesterone see Progestogens

Mefenamic Acid see NSAIDs

Mefloquine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with •**amiodarone**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with •**moxifloxacin**—avoid concomitant use; plasma concentration of mefloquine reduced by •**rifampicin**—avoid concomitant use
- Antiepileptics: mefloquine antagonises anticonvulsant effect of •**antiepileptics**
- Antifungals: plasma concentration of mefloquine increased by **ketoconazole**
- Antimalarials: avoidance of antimalarials advised by manufacturer of •**artemether/lumefantrine**; increased risk of convulsions when mefloquine given with •**chloroquine** and **hydroxychloroquine**; increased risk of convulsions when mefloquine given with •**quinine** (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with •**haloperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when mefloquine given with •**pimozide**—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with •**atomoxetine**
- Beta-blockers: increased risk of bradycardia when mefloquine given with **beta-blockers**
- Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with **calcium-channel blockers**
- Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with **digoxin**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with •**ivabradine**

Mefloquine (continued)

Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 620

Megestrol see Progestogens

Melatonin see Anxiolytics and Hypnotics

Meloxicam see NSAIDs

Melphalan

- Antibacterials: increased risk of melphalan toxicity when given with **nalidixic acid**
- Antipsychotics: avoid concomitant use of cytotoxics with •**clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: melphalan possibly reduces absorption of **digoxin tablets**
- Cyclosporin: increased risk of nephrotoxicity when melphalan given with •**cyclosporin**

Memantine

- Anaesthetics, General: increased risk of CNS toxicity when memantine given with •**ketamine** (manufacturer of memantine advises avoid concomitant use)
- Analgesics: increased risk of CNS toxicity when memantine given with •**dextromethorphan** (manufacturer of memantine advises avoid concomitant use)
- Anticoagulants: memantine possibly enhances anticoagulant effect of **warfarin**
- Antimuscarinics: memantine possibly enhances effects of **antimuscarinics**
- Antipsychotics: memantine possibly reduces effects of **antipsychotics**
- Dopaminergics: memantine possibly enhances effects of **dopaminergics** and **selegiline**; increased risk of CNS toxicity when memantine given with •**amantadine** (manufacturer of memantine advises avoid concomitant use)
- Muscle Relaxants: memantine possibly modifies effects of **baclofen** and **dantrolene**

Mepacrine

Antimalarials: mepacrine increases plasma concentration of **primaquine** (increased risk of toxicity)

Meproamate see Anxiolytics and Hypnotics

Mepizolinol see Opioid Analgesics

Mercaptopurine

- Allopurinol: enhanced effects and increased toxicity of mercaptopurine when given with •**allopurinol** (reduce dose of mercaptopurine to one quarter of usual dose)
- Aminosalicylates: possible increased risk of leucopenia when mercaptopurine given with **aminosalicylates**
- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with •**sulfamethoxazole** (as co-trimoxazole); increased risk of haematological toxicity when mercaptopurine given with •**trimethoprim** (also with co-trimoxazole)
- Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of •**coumarins**
- Antipsychotics: avoid concomitant use of cytotoxics with •**clozapine** (increased risk of agranulocytosis)
- Febuxostat: avoidance of mercaptopurine advised by manufacturer of •**febuxostat**

Meropenem

• Antiepileptics: carbapenems reduce plasma concentration of •**valproate**—avoid concomitant use

Probenecid: excretion of meropenem reduced by **probenecid**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Mesalazine see Aminosalicylates

Mestranol see Oestrogens

Metaraminol see Sympathomimetics

Metformin see Antidiabetics

Methadone see Opioid Analgesics

Methenamine

Antacids: avoid concomitant use of methenamine with **antacids**

• Antibacterials: increased risk of crystalluria when methenamine given with •**sulfonamides**

Methenamine (*continued*)

- Diuretics: effects of methenamine antagonised by
 - **acetazolamide**
- Potassium Salts: avoid concomitant use of methenamine with **potassium citrate**
- Sodium Citrate: avoid concomitant use of methenamine with **sodium citrate**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Methocarbamol *see* Muscle Relaxants**Methotrexate**

- Anaesthetics, General: antifolate effect of methotrexate increased by **nitrous oxide**—avoid concomitant use
- Analgesics: excretion of methotrexate probably reduced by **NSAIDs** (increased risk of toxicity); excretion of methotrexate reduced by **aspirin**, **diclofenac**, **ibuprofen**, **indometacin**, **ketoprofen**, **meloxicam** and **naproxen** (increased risk of toxicity)
- Antibacterials: absorption of methotrexate possibly reduced by **neomycin**; excretion of methotrexate possibly reduced by **ciprofloxacin** (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with **sulfamethoxazole** (as co-trimoxazole); increased risk of methotrexate toxicity when given with **doxycycline**, **sulfonamides** or **tetracycline**; excretion of methotrexate reduced by **penicillins** (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with **trimethoprim** (also with co-trimoxazole)
- Antiepileptics: antifolate effect of methotrexate increased by **phenytoin**
- Antimalarials: antifolate effect of methotrexate increased by **pyrimethamine**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: methotrexate possibly reduces absorption of **digoxin tablets**
- Ciclosporin: risk of toxicity when methotrexate given with **ciclosporin**
- Cytotoxics: increased pulmonary toxicity when methotrexate given with **cisplatin**
- Diuretics: excretion of methotrexate increased by alkaline urine due to **acetazolamide**
- Leflunomide: risk of toxicity when methotrexate given with **leflunomide**
- Probenecid: excretion of methotrexate reduced by **probenecid** (increased risk of toxicity)
- Retinoids: plasma concentration of methotrexate increased by **acitretin** (also increased risk of hepatotoxicity)—avoid concomitant use
- Theophylline: methotrexate possibly increases plasma concentration of **theophylline**
- Ulcer-healing Drugs: excretion of methotrexate possibly reduced by **omeprazole** (increased risk of toxicity)

Methoxamine *see* Sympathomimetics**Methyldopa**

- ACE Inhibitors: enhanced hypotensive effect when methyldopa given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when methyldopa given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when methyldopa given with **aldesleukin**
- Alpha-blockers: enhanced hypotensive effect when methyldopa given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when methyldopa given with **general anaesthetics**
- Analgesics: hypotensive effect of methyldopa antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with **angiotensin-II receptor antagonists**
- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with **MAOIs**

Methyldopa (*continued*)

- Antipsychotics: enhanced hypotensive effect when methyldopa given with **antipsychotics** (also increased risk of extrapyramidal effects)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when methyldopa given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when methyldopa given with **clonidine**
- Corticosteroids: hypotensive effect of methyldopa antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when methyldopa given with **diazoxide**
- Diuretics: enhanced hypotensive effect when methyldopa given with **diuretics**
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of **dopaminergics**; increased risk of extrapyramidal side-effects when methyldopa given with **amantadine**; effects of methyldopa possibly enhanced by **entacapone**; enhanced hypotensive effect when methyldopa given with **levodopa**
- Iron: hypotensive effect of methyldopa antagonised by **oral iron**
- Lithium: neurotoxicity may occur when methyldopa given with **lithium** without increased plasma concentration of lithium
- Moxisylyte: enhanced hypotensive effect when methyldopa given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when methyldopa given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when methyldopa given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when methyldopa given with **nitrates**
- Oestrogens: hypotensive effect of methyldopa antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when methyldopa given with **alprostadil**
- Sympathomimetics, Beta₁: acute hypertension reported when methyldopa given with **infusion of salbutamol**
- Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- **Methylphenidate** *see* Sympathomimetics
- **Methylprednisolone** *see* Corticosteroids
- **Methysergide** *see* Ergot Alkaloids
- **Metipranolol** *see* Beta-blockers
- **Metoclopramide**
 - Alcohol: metoclopramide possibly increases absorption of **alcohol**
 - Anaesthetics, General: metoclopramide enhances effects of **thiopental**
 - Analgesics: metoclopramide increases rate of absorption of **aspirin** (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by **opioid analgesics**; metoclopramide increases rate of absorption of **paracetamol**
 - Antidepressants: CNS toxicity reported when metoclopramide given with **SSRIs**
 - Antimuscarinics: effects of metoclopramide on gastro-intestinal activity antagonised by **antimuscarinics**
 - Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with **antipsychotics**
 - Atovaquone: metoclopramide reduces plasma concentration of **atovaquone**
 - Ciclosporin: metoclopramide increases plasma concentration of **ciclosporin**
 - Dopaminergics: metoclopramide antagonises hypoprolactinaemic effects of **bromocriptine** and **cabergoline**; metoclopramide antagonises antiparkinsonian effect of **pergolide**; avoidance of metoclopramide

MetoclopramideDopaminergics (*continued*)advised by manufacturer of **ropinirole** and **rotigotine** (antagonism of effect)Muscle Relaxants: metoclopramide enhances effects of **suxamethonium**Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with **tetrabenazine****Metolazone** *see* Diuretics**Metoprolol** *see* Beta-blockers**Metronidazole****Note** Interactions do not apply to topical metronidazole preparationsAlcohol: disulfiram-like reaction when metronidazole given with **alcohol**

- Anticoagulants: metronidazole enhances anticoagulant effect of **coumarins**

Antiepileptics: metabolism of metronidazole accelerated by **phenobarbital** (reduced effect); metronidazole possibly inhibits metabolism of **phenytoin** (increased plasma concentration)

- Cytotoxics: metronidazole increases plasma concentration of **busulfan** (increased risk of toxicity); metronidazole inhibits metabolism of **fluorouracil** (increased toxicity)

Disulfiram: psychotic reaction reported when metronidazole given with **disulfiram**Lithium: metronidazole increases risk of **lithium** toxicityMycophenolate: metronidazole possibly reduces bioavailability of **mycophenolate**Ulcer-healing Drugs: metabolism of metronidazole inhibited by **cimetidine** (increased plasma concentration)Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620**Mianserin** *see* Antidepressants, Tricyclic (related)**Micafungin**Antifungals: micafungin possibly increases plasma concentration of **amphotericin**; micafungin increases plasma concentration of **itraconazole** (consider reducing dose of itraconazole)Calcium-channel Blockers: micafungin increases plasma concentration of **nifedipine**Ciclosporin: micafungin possibly increases plasma concentration of **ciclosporin**Sirolimus: micafungin increases plasma concentration of **sirolimus****Miconazole** *see* Antifungals, Imidazole**Midazolam** *see* Anxiolytics and Hypnotics**Mifamurtide**Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of **NSAIDs**Ciclosporin: manufacturer of mifamurtide advises avoid concomitant use with **ciclosporin**Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with **corticosteroids**Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with **tacrolimus****Mifepristone**Corticosteroids: mifepristone may reduce effect of **corticosteroids** (including *inhaled* corticosteroids) for 3–4 days**Milrinone** *see* Phosphodiesterase Inhibitors**Minocycline** *see* Tetracyclines**Minoxidil** *see* Vasodilator Antihypertensives**Mirtazapine**

- Alcohol: increased sedative effect when mirtazapine given with **alcohol**

Analgesics: possible increased serotonergic effects when mirtazapine given with **tramadol**Anticoagulants: mirtazapine enhances anticoagulant effect of **warfarin**

- Antidepressants: possible increased serotonergic effects when mirtazapine given with **fluoxetine**, **fluvoxamine** or **venlafaxine**; mirtazapine should not be started until 2 weeks after stopping **MAOIs**, also

Mirtazapine• Antidepressants (*continued*)MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start **moclobemide** for at least 1 weekAntiepileptics: plasma concentration of mirtazapine reduced by **carbamazepine** and **phenytoin**Antifungals: plasma concentration of mirtazapine increased by **ketocoazole**

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether/lumefantrine**

Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with **anxiolytics** and **hypnotics**Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**Clonidine: mirtazapine possibly antagonises hypotensive effect of **clonidine**Ulcer-healing Drugs: plasma concentration of mirtazapine increased by **cimetidine****Mitomycin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Mitotane

- Anticoagulants: mitotane possibly reduces anticoagulant effect of **coumarins**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Diuretics: manufacturer of mitotane advises avoid concomitant use of **spironolactone** (antagonism of effect)**Mitoxantrone**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Ciclosporin: excretion of mitoxantrone reduced by **ciclosporin** (increased plasma concentration)**Mivacurium** *see* Muscle Relaxants**Mizolastine** *see* Antihistamines**Moclobemide**

- Analgesics: possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with **dextromethorphan** or **pethidine**—avoid concomitant use; possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with **opioid analgesics**—manufacturer of moclobemide advises consider reducing dose of opioid analgesics

- Antidepressants: moclobemide should not be started for at least 1 week after stopping **MAOIs**, **SSRI-related antidepressants**, **citalopram**, **fluvoxamine**, **mirtazapine**, **paroxetine**, **sertraline**, **tricyclic-related antidepressants** or **tricyclics**; increased risk of CNS toxicity when moclobemide given with **escitalopram**, preferably avoid concomitant use; moclobemide should not be started until 5 weeks after stopping **fluoxetine**; possible increased serotonergic effects when moclobemide given with **duloxetine**

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether/lumefantrine**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

- Bupropion: avoidance of moclobemide advised by manufacturer of **bupropion**

- Clopidogrel: moclobemide possibly reduces antiplatelet effect of **clopidogrel**

- Dopaminergics: caution with moclobemide advised by manufacturer of **entacapone**; increased risk of side-effects when moclobemide given with **levodopa**; avoid concomitant use of moclobemide with **selegiline**

- 5HT₂ Agonists: risk of CNS toxicity when moclobemide given with **rizatriptan** or **sumatriptan** (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with **zolmitriptan** (reduce dose of zolmitriptan)

Moclobemide (*continued*)

- Sympathomimetics: risk of hypertensive crisis when moclobemide given with **sympathomimetics**
- Ulcer-healing Drugs: plasma concentration of moclobemide increased by **cimetidine** (halve dose of moclobemide)

Modafinil

- Antiepileptics: modafinil possibly increases plasma concentration of **phenytoin**
- Ciclosporin: modafinil reduces plasma concentration of **ciclosporin**
- Oestrogens: modafinil accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 398)

Moexipril *see* ACE Inhibitors**Mometasone** *see* Corticosteroids**Monobactams** *see* Aztreonam**Montelukast** *see* Leukotriene Receptor Antagonists**Morphine** *see* Opioid Analgesics**Moxifloxacin** *see* Quinolones**Moxisylyte**

- ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxisylyte given with **adrenergic neurone blockers**
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with **alpha-blockers**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with **angiotensin-II receptor antagonists**
- Beta-blockers: possible severe postural hypotension when moxisylyte given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when moxisylyte given with **clonidine**
- Diazoxide: enhanced hypotensive effect when moxisylyte given with **diazoxide**
- Diuretics: enhanced hypotensive effect when moxisylyte given with **diuretics**
- Methyldopa: enhanced hypotensive effect when moxisylyte given with **methyldopa**
- Moxonidine: enhanced hypotensive effect when moxisylyte given with **moxonidine**
- Nitrates: enhanced hypotensive effect when moxisylyte given with **nitrates**
- Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with **hydralazine, minoxidil or sodium nitroprusside**

Moxonidine

- ACE Inhibitors: enhanced hypotensive effect when moxonidine given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when moxonidine given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when moxonidine given with **aldesleukin**
- Alpha-blockers: enhanced hypotensive effect when moxonidine given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when moxonidine given with **general anaesthetics**
- Analgesics: hypotensive effect of moxonidine antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with **angiotensin-II receptor antagonists**
- Antidepressants: enhanced hypotensive effect when moxonidine given with **MAOIs**; hypotensive effect of moxonidine possibly antagonised by **tricyclics** (manufacturer of moxonidine advises avoid concomitant use)
- Antipsychotics: enhanced hypotensive effect when moxonidine given with **phenothiazines**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with **anxiolytics and hypnotics**; sedative effects possibly increased when moxonidine given with **benzodiazepines**
- Beta-blockers: enhanced hypotensive effect when moxonidine given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when moxonidine given with **clonidine**
- Corticosteroids: hypotensive effect of moxonidine antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when moxonidine given with **diazoxide**
- Diuretics: enhanced hypotensive effect when moxonidine given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when moxonidine given with **levodopa**
- Methyldopa: enhanced hypotensive effect when moxonidine given with **methyldopa**
- Moxisylyte: enhanced hypotensive effect when moxonidine given with **moxisylyte**
- Muscle Relaxants: enhanced hypotensive effect when moxonidine given with **baclofen or tizanidine**
- Nitrates: enhanced hypotensive effect when moxonidine given with **nitrates**
- Oestrogens: hypotensive effect of moxonidine antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when moxonidine given with **alprostadil**
- Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with **hydralazine, minoxidil or sodium nitroprusside**
- Muscle Relaxants
 - ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with **ACE inhibitors**
 - Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with **adrenergic neurone blockers**
 - Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with **alcohol**
 - Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with **alpha-blockers**
 - Anaesthetics, General: effects of atracurium enhanced by **ketamine**; increased risk of myocardial depression and bradycardia when suxamethonium given with **propofol**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **volatile liquid general anaesthetics**
 - Analgesics: excretion of baclofen possibly reduced by **NSAIDs** (increased risk of toxicity); excretion of baclofen reduced by **ibuprofen** (increased risk of toxicity); increased sedative effect when baclofen given with **fentanyl or morphine**
 - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with **angiotensin-II receptor antagonists**
 - Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with **lidocaine**
 - Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by **piperacillin**; plasma concentration of tizanidine increased by **ciprofloxacin** (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by **norfloxacin** (increased risk of toxicity); effects of non-depolarising muscle relaxants and suxamethonium enhanced by **aminoglycosides**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **clindamycin**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **polymyxins**; effects of suxamethonium enhanced by **vancomycin**
 - Antidepressants: plasma concentration of tizanidine increased by **fluvoxamine** (increased risk of toxicity)—avoid concomitant use; effects of suxa-

Muscle Relaxants

- **Antidepressants (continued)**
 - methionum enhanced by **phenelzine**; muscle relaxant effect of baclofen enhanced by **tricyclics**
- Antiepileptics:** muscle relaxant effect of non-depolarising muscle relaxants antagonised by **carbamazepine** and **phenytoin** (accelerated recovery from neuromuscular blockade)
- Antimalarials:** effects of suxamethonium possibly enhanced by **quinine**
- Antipsychotics:** effects of suxamethonium possibly enhanced by **promazine**
- Anxiolytics and Hypnotics:** increased sedative effect when baclofen or tizanidine given with **anxiolytics and hypnotics**
- Beta-blockers:** enhanced hypotensive effect when baclofen given with **beta-blockers**; possible enhanced hypotensive effect and bradycardia when tizanidine given with **beta-blockers**; effects of muscle relaxants enhanced by **propranolol**
- Calcium-channel Blockers:** enhanced hypotensive effect when baclofen or tizanidine given with **calcium-channel blockers**; effects of non-depolarising muscle relaxants possibly enhanced by **calcium-channel blockers**; possible increased risk of ventricular arrhythmias when **intravenous dantrolene** given with **diltiazem**—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **verapamil**; avoidance of **intravenous dantrolene** advised by manufacturer of **verapamil**
- Cardiac Glycosides:** possible increased risk of bradycardia when tizanidine given with **cardiac glycosides**; risk of ventricular arrhythmias when suxamethonium given with **cardiac glycosides**
- Clonidine:** enhanced hypotensive effect when baclofen or tizanidine given with **clonidine**
- Corticosteroids:** effects of pancuronium and vecuronium possibly antagonised by **corticosteroids**
- Cytotoxics:** effects of suxamethonium enhanced by **cyclophosphamide** and **thiotepa**
- Diazoxide:** enhanced hypotensive effect when baclofen or tizanidine given with **diazoxide**
- Diuretics:** enhanced hypotensive effect when baclofen or tizanidine given with **diuretics**
- Dopaminergics:** possible agitation, confusion and hallucinations when baclofen given with **levodopa**
- Lithium:** effects of muscle relaxants enhanced by **lithium**; baclofen possibly aggravates hyperkinesia caused by **lithium**
- Magnesium (parenteral):** effects of non-depolarising muscle relaxants and suxamethonium enhanced by **parenteral magnesium**
- Memantine:** effects of baclofen and dantrolene possibly modified by **memantine**
- Methylodopa:** enhanced hypotensive effect when baclofen or tizanidine given with **methylodopa**
- Metoclopramide:** effects of suxamethonium enhanced by **metoclopramide**
- Moxonidine:** enhanced hypotensive effect when baclofen or tizanidine given with **moxonidine**
- Nitrates:** enhanced hypotensive effect when baclofen or tizanidine given with **nitrates**
- Oestrogens:** plasma concentration of tizanidine possibly increased by **oestrogens** (increased risk of toxicity)
- Parasympathomimetics:** effects of non-depolarising muscle relaxants possibly antagonised by **donepezil**; effects of suxamethonium possibly enhanced by **donepezil**; effects of non-depolarising muscle relaxants antagonised by **edrophonium**, **neostigmine**, **pyridostigmine** and **rivastigmine**; effects of suxamethonium enhanced by **edrophonium**, **galantamine**, **neostigmine**, **pyridostigmine** and **rivastigmine**
- Progestogens:** plasma concentration of tizanidine possibly increased by **progestogens** (increased risk of toxicity)
- Sympathomimetics, Beta₂:** effects of suxamethonium enhanced by **bambuterol**

Muscle Relaxants (continued)

- Vasodilator Antihypertensives:** enhanced hypotensive effect when baclofen or tizanidine given with **hydralazine**; enhanced hypotensive effect when baclofen or tizanidine given with **minoxidil**; enhanced hypotensive effect when baclofen or tizanidine given with **sodium nitroprusside**
- Muscle Relaxants, depolarising see** Muscle Relaxants
- Muscle Relaxants, non-depolarising see** Muscle Relaxants
- Mycophenolate**
 - Antacids:** absorption of mycophenolate reduced by **antacids**
- **Antibacterials:** bioavailability of mycophenolate possibly reduced by **metronidazole** and **norfloxacin**; plasma concentration of active metabolite of mycophenolate reduced by **rifampicin**
- Antivirals:** mycophenolate increases plasma concentration of **aciclovir**, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of **ganciclovir**, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Iron:** absorption of mycophenolate reduced by **oral iron**
- Lipid-regulating Drugs:** absorption of mycophenolate reduced by **colestyramine**
- Sevelamer:** plasma concentration of mycophenolate possibly reduced by **sevelamer**
- Mycophenolate Mofetil see** Mycophenolate
- Mycophenolate Sodium see** Mycophenolate
- Mycophenolic Acid see** Mycophenolate
- Nabumetone see** NSAIDs
- Nadolol see** Beta-blockers
- Nalidixic Acid see** Quinolones
- Nandrolone see** Anabolic Steroids
- Naproxen see** NSAIDs
- Naratriptan see** 5HT₁ Agonists
- Nateglinide see** Antidiabetics
- Nebivolol see** Beta-blockers
- Nefopam**
 - **Antidepressants:** manufacturer of nefopam advises avoid concomitant use with **MAOIs**; side-effects possibly increased when nefopam given with **tricyclics**
 - Antimuscarinics:** increased risk of antimuscarinic side-effects when nefopam given with **antimuscarinics**
- Nelfinavir**
 - Analgesics:** nelfinavir reduces plasma concentration of **methadone**
 - **Anti-arrhythmics:** increased risk of ventricular arrhythmias when nelfinavir given with **amiodarone**—avoid concomitant use
 - **Antibacterials:** nelfinavir increases plasma concentration of **azithromycin** (increased risk of toxicity); nelfinavir increases plasma concentration of **rifabutin** (halves dose of rifabutin); plasma concentration of nelfinavir significantly reduced by **rifampicin**—avoid concomitant use; avoidance of concomitant nelfinavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
 - Anticoagulants:** avoidance of nelfinavir advised by manufacturer of **rivaroxaban**
 - **Antidepressants:** plasma concentration of nelfinavir reduced by **St John's wort**—avoid concomitant use
 - **Antiepileptics:** plasma concentration of nelfinavir possibly reduced by **carbamazepine** and **phenobarbital**; nelfinavir reduces plasma concentration of **phenytoin**
 - **Antimalarials:** caution with nelfinavir advised by manufacturer of **artemether/lumefantrine**; nelfinavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)
 - Antimuscarinics:** avoidance of nelfinavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when nelfinavir given with **fesoterodine**—consult fesoter-

Nelfinavir

Antimuscarinics (*continued*)

odine product literature; nelfinavir increases plasma concentration of **solifenacin**

- Antipsychotics: nelfinavir possibly inhibits metabolism of **aripiprazole** (reduce dose of aripiprazole); nelfinavir possibly increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: plasma concentration of nelfinavir possibly increased by **etravirine**—avoid concomitant use; combination of nelfinavir with **indinavir** or **ritonavir** may increase plasma concentration of either drug (or both); nelfinavir reduces plasma concentration of **lopinavir**, also plasma concentration of active metabolite of nelfinavir increased; nelfinavir possibly increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); nelfinavir increases plasma concentration of **saquinavir**—manufacturer of saquinavir advises avoid concomitant use
- Anxiolytics and Hypnotics: nelfinavir possibly increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Ciclosporin: nelfinavir possibly increases plasma concentration of **ciclosporin**

Corticosteroids: nelfinavir possibly increases plasma concentration of **inhaled and intranasal fluticasone**

- Cytotoxics: nelfinavir possibly increases plasma concentration of **everolimus**—manufacturer of everolimus advises avoid concomitant use; avoidance of nelfinavir advised by manufacturer of **pazopanib**; nelfinavir increases plasma concentration of **paclitaxel**
- Diuretics: nelfinavir increases plasma concentration of **eplerenone**—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when nelfinavir given with **ergotamine and methysergide**—avoid concomitant use
- 5HT₂ Agonists: nelfinavir increases plasma concentration of **eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: nelfinavir possibly increases plasma concentration of **ivabradine**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when nelfinavir given with **atorvastatin**; possible increased risk of myopathy when nelfinavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when nelfinavir given with **simvastatin** (avoid concomitant use)

- Oestrogens: nelfinavir accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 398)

Progestogens: nelfinavir possibly reduces contraceptive effect of **progestogens**

- Ranolazine: nelfinavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: nelfinavir possibly increases plasma concentration of **sildenafil**—reduce initial dose of sildenafil
- Tacrolimus: nelfinavir possibly increases plasma concentration of **tacrolimus**
- Ulcer-healing Drugs: plasma concentration of nelfinavir reduced by **omeprazole**—avoid concomitant use

Neomycin *see* Aminoglycosides

Neostigmine *see* Parasympathomimetics

Nevirapine

Analgesics: nevirapine possibly reduces plasma concentration of **methadone**

- Antibacterials: nevirapine reduces plasma concentration of **clarithromycin** (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of **rifabutin**; plasma concen-

Nevirapine

Antibacterials (*continued*)

- tration of nevirapine reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of **warfarin**
- Antidepressants: plasma concentration of nevirapine reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of nevirapine reduced by **carbamazepine**
- Antifungals: nevirapine reduces plasma concentration of **ketocoazole**—avoid concomitant use; plasma concentration of nevirapine increased by **fluconazole**; nevirapine possibly reduces plasma concentration of **caspofungin** and **itraconazole**—consider increasing dose of caspofungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of **aripiprazole**—increase dose of aripiprazole
- Antivirals: nevirapine possibly reduces plasma concentration of **atazanavir** and **etravirine**—avoid concomitant use; nevirapine reduces plasma concentration of **efavirenz** and **indinavir**; nevirapine possibly reduces plasma concentration of **fosamprenavir**; nevirapine possibly reduces plasma concentration of **lopinavir**—consider increasing dose of lopinavir
- Oestrogens: nevirapine accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 398)
- Progestogens: nevirapine accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 398)

Nicardipine *see* Calcium-channel Blockers

Nicorandil

Alcohol: hypotensive effect of nicorandil possibly enhanced by **alcohol**

- Antidepressants: enhanced hypotensive effect when nicorandil given with **MAOIs**; hypotensive effect of nicorandil possibly enhanced by **tricyclics**
- Sildenafil: hypotensive effect of nicorandil significantly enhanced by **sildenafil** (avoid concomitant use)
- Tadalafil: hypotensive effect of nicorandil significantly enhanced by **tadalafil** (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nicorandil given with **vardenafil**—avoid concomitant use

Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with **hydralazine, minoxidil** or **sodium nitroprusside**

Nicotine

Anti-arrhythmics: nicotine possibly enhances effects of **adenosine**

Nicotinic Acid

Note Interactions apply to lipid-regulating doses of nicotinic acid

- Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with **statins** (applies to lipid regulating doses of nicotinic acid)

Nifedipine *see* Calcium-channel Blockers

Nilotinib

- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with **clarithromycin** and **telithromycin**; plasma concentration of nilotinib reduced by **rifampicin**—avoid concomitant use
- Antifungals: plasma concentration of nilotinib increased by **ketocoazole**—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with **itraconazole** and **voriconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: manufacturer of nilotinib advises avoid concomitant use with **ritonavir**
- Anxiolytics and Hypnotics: nilotinib increases plasma concentration of **midazolam**
- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with **grapefruit juice**

Nimodipine *see* Calcium-channel Blockers**Nitrates**

- ACE Inhibitors: enhanced hypotensive effect when nitrates given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when nitrates given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when nitrates given with **aldesleukin**
- Alpha-blockers: enhanced hypotensive effect when nitrates given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when nitrates given with **general anaesthetics**
- Analgesics: hypotensive effect of nitrates antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with **angiotensin-II receptor antagonists**
- Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by **disopyramide** (failure to dissolve under tongue owing to dry mouth)
- Anticoagulants: **infusion of glyceryl trinitrate** reduces anticoagulant effect of **heparins**
- Antidepressants: enhanced hypotensive effect when nitrates given with **MAOIs**; effects of sublingual tablets of nitrates possibly reduced by **tricyclic-related antidepressants** (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by **tricyclics** (failure to dissolve under tongue owing to dry mouth)
- Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by **antimuscarinics** (failure to dissolve under tongue owing to dry mouth)
- Antipsychotics: enhanced hypotensive effect when nitrates given with **phenothiazines**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when nitrates given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when nitrates given with **clonidine**
- Corticosteroids: hypotensive effect of nitrates antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when nitrates given with **diazoxide**
- Diuretics: enhanced hypotensive effect when nitrates given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when nitrates given with **levodopa**
- Methyldopa: enhanced hypotensive effect when nitrates given with **methyldopa**
- Moxisylyte: enhanced hypotensive effect when nitrates given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when nitrates given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when nitrates given with **baclofen** or **tizanidine**
- Oestrogens: hypotensive effect of nitrates antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when nitrates given with **alprostadil**
- Sildenafil: hypotensive effect of nitrates significantly enhanced by **sildenafil** (avoid concomitant use)
 - Tadalafil: hypotensive effect of nitrates significantly enhanced by **tadalafil** (avoid concomitant use)
 - Vardenafil: possible increased hypotensive effect when nitrates given with **vardenafil**—avoid concomitant use
- Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

Nitrazepam *see* Anxiolytics and Hypnotics**Nitrofurantoin**

- Antacids: absorption of nitrofurantoin reduced by **oral magnesium salts** (as magnesium trisilicate)
- Antibacterials: nitrofurantoin possibly antagonises effects of **nalidixic acid**
- Probenecid: excretion of nitrofurantoin reduced by **probenecid** (increased risk of side-effects)
- Sulfapyrazone: excretion of nitrofurantoin reduced by **sulfapyrazone** (increased risk of toxicity)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620
- Nitroimidazoles** *see* Metronidazole and Tinidazole
- Nitrous Oxide** *see* Anaesthetics, General
- Nizatidine** *see* Histamine H₂-antagonists
- Noradrenaline (norepinephrine)** *see* Sympathomimetics
- Norelgestromin** *see* Progestogens
- Norepinephrine (noradrenaline)** *see* Sympathomimetics
- Norethisterone** *see* Progestogens
- Norfloxacin** *see* Quinolones
- Norgestimate** *see* Progestogens
- Norgestrel** *see* Progestogens
- Nortriptyline** *see* Antidepressants, Tricyclic
- NSAIDs**
- Note** *See also* Aspirin. Interactions do not generally apply to topical NSAIDs
- ACE Inhibitors: increased risk of renal impairment when NSAIDs given with **ACE inhibitors**, also hypotensive effect antagonised
- Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of **adrenergic neurone blockers**
- Aliskiren: NSAIDs possibly antagonise hypotensive effect of **aliskiren**
- Alpha-blockers: NSAIDs antagonise hypotensive effect of **alpha-blockers**
- Analgesics: avoid concomitant use of NSAIDs with **NSAIDs** or **aspirin** (increased side-effects); avoid concomitant use of NSAIDs with **ketorolac** (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of **aspirin**
- Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with **angiotensin-II receptor antagonists**, also hypotensive effect antagonised
- Antibacterials: indometacin possibly increases plasma concentration of **amikacin** and **gentamicin** in neonates; plasma concentration of celecoxib, diclofenac and etoricoxib reduced by **rifampicin**; possible increased risk of convulsions when NSAIDs given with **quinolones**
 - Anticoagulants: increased risk of haemorrhage when **intravenous diclofenac** given with **anticoagulants** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with **anticoagulants** (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of **coumarins** and **phenindione**; possible increased risk of bleeding when NSAIDs given with **dabigatran etexilate** or **heparins**
 - Antidepressants: increased risk of bleeding when NSAIDs given with **SSRIs** or **venlafaxine**
 - Antidiabetics: NSAIDs possibly enhance effects of **sulfonylureas**
- Antifungals: plasma concentration of parecoxib increased by **fluconazole** (reduce dose of parecoxib); plasma concentration of celecoxib increased by **fluconazole** (halve dose of celecoxib); plasma concentration of flurbiprofen and ibuprofen increased by **fluconazole**; plasma concentration of diclofenac and ibuprofen increased by **voriconazole**
- Antipsychotics: possible severe drowsiness when indometacin given with **haloperidol**
- Antivirals: plasma concentration of piroxicam increased by **ritonavir** (risk of toxicity)—avoid concomitant use; plasma concentration of NSAIDs possibly increased by **ritonavir**; increased risk of

NSAIDs

- Antivirals (*continued*)
 - haematological toxicity when NSAIDs given with **zidovudine**
- Beta-blockers: NSAIDs antagonise hypotensive effect of **beta-blockers**
- Bisphosphonates: indometacin increases bioavailability of **tiludronic acid**
- Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of **calcium-channel blockers**
- Cardiac Glycosides: NSAIDs possibly increase plasma concentration of **cardiac glycosides**, also possible exacerbation of heart failure and reduction of renal function
- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with ●**ciclosporin**; plasma concentration of diclofenac increased by ●**ciclosporin** (halve dose of diclofenac)
- Clonidine: NSAIDs antagonise hypotensive effect of **clonidine**
- Clopidogrel: increased risk of bleeding when NSAIDs given with **clopidogrel**
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with **corticosteroids**
- Cytotoxics: NSAIDs probably reduce excretion of ●**methotrexate** (increased risk of toxicity); diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of ●**methotrexate** (increased risk of toxicity); increased risk of bleeding when NSAIDs given with ●**erlotinib**
- Desmopressin: indometacin enhances effects of **desmopressin**
- Diazoxide: NSAIDs antagonise hypotensive effect of **diazoxide**
- Dimethyl sulfoxide: avoid concomitant use of sulindac with ●**dimethyl sulfoxide**
- Diuretics: risk of nephrotoxicity of NSAIDs increased by **diuretics**, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of **diuretics**; NSAIDs possibly antagonise diuretic effect of **potassium canrenoate**; occasional reports of reduced renal function when indometacin given with ●**triamterene**—avoid concomitant use; possible increased risk of hyperkalaemia when NSAIDs given with **potassium-sparing diuretics and aldosterone antagonists**; increased risk of hyperkalaemia when indometacin given with **potassium-sparing diuretics and aldosterone antagonists**
- Iloprost: increased risk of bleeding when NSAIDs given with **iloprost**
- Lipid-regulating Drugs: excretion of meloxicam increased by **colestyramine**
- Lithium: NSAIDs reduce excretion of ●**lithium** (increased risk of toxicity); ketorolac reduces excretion of ●**lithium** (increased risk of toxicity)—avoid concomitant use
- Methyldopa: NSAIDs antagonise hypotensive effect of **methyldopa**
- Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of **mifamurtide**
- Moxonidine: NSAIDs antagonise hypotensive effect of **moxonidine**
- Muscle Relaxants: ibuprofen reduces excretion of **baclofen** (increased risk of toxicity); NSAIDs possibly reduce excretion of **baclofen** (increased risk of toxicity)
- Nitrates: NSAIDs antagonise hypotensive effect of **nitrates**
- Oestrogens: etoricoxib increases plasma concentration of **ethinylestradiol**
- Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with **penicillamine**
- Pentoxifylline: possible increased risk of bleeding when NSAIDs given with **pentoxifylline**; increased risk of bleeding when ketorolac given with ●**pentoxifylline** (avoid concomitant use)
- Prasugrel: possible increased risk of bleeding when NSAIDs given with **prasugrel**

NSAIDs (continued)

- Probenecid: excretion of dextketoprofen, indometacin, ketoprofen and naproxen reduced by ●**probenecid** (increased plasma concentration); excretion of ketorolac reduced by ●**probenecid** (increased plasma concentration)—avoid concomitant use
 - Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with **tacrolimus**; increased risk of nephrotoxicity when ibuprofen given with ●**tacrolimus**
 - Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of **hydralazine, minoxidil and sodium nitroprusside**
- Octreotide**
- Antidiabetics: octreotide possibly reduces requirements for **insulin, metformin, repaglinide and sulfonylureas**
 - Ciclosporin: octreotide reduces plasma concentration of ●**ciclosporin**
 - Dopaminergics: octreotide increases plasma concentration of **bromocriptine**
 - Ulcer-healing Drugs: octreotide possibly delays absorption of **cimetidine**
- Oestrogens**
- Note** Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 398
- ACE Inhibitors: oestrogens antagonise hypotensive effect of **ACE inhibitors**
 - Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of **adrenergic neurone blockers**
 - Alpha-blockers: oestrogens antagonise hypotensive effect of **alpha-blockers**
 - Analgesics: plasma concentration of ethinylestradiol increased by **etoricoxib**
 - Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of **angiotensin-II receptor antagonists**
 - Antibacterials: plasma concentration of estradiol increased by **erythromycin**; metabolism of oestrogens accelerated by ●**rifamycins** (reduced contraceptive effect—see p. 398)
 - Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of **coumarins**; oestrogens antagonise anticoagulant effect of ●**phenindione**
 - Antidepressants: contraceptive effect of oestrogens reduced by ●**St John's wort** (avoid concomitant use); oestrogens antagonise antidepressant effect of **tricyclics** (but side-effects of tricyclics possibly increased due to increased plasma concentration)
 - Antidiabetics: oestrogens antagonise hypoglycaemic effect of **antidiabetics**
 - Antiepileptics: metabolism of oestrogens accelerated by ●**carbamazepine, eslicarbazepine, oxcarbazepine, phenobarbital, phenytoin, rufinamide and topiramate** (reduced contraceptive effect—see p. 398); oestrogens reduce plasma concentration of ●**lamotrigine**—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of **valproate**
 - Antifungals: oestrogens increase plasma concentration of **voriconazole**; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with **griseofulvin**; anecdotal reports of contraceptive failure when oestrogens given with **imidazoles**; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with **terbinafine**
 - Antivirals: plasma concentration of ethinylestradiol increased by **atazanavir**; metabolism of oestrogens accelerated by ●**nelfinavir, nevirapine and ritonavir** (reduced contraceptive effect—see p. 398)
 - Anxiolytics and Hypnotics: oestrogens increase plasma concentration of **melatonin**
 - Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with ●**aprepitant** (alternative contraception recommended)

Oestrogens (continued)

- Beta-blockers: oestrogens antagonise hypotensive effect of **beta-blockers**
- **Bosentan**: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with **•bosentan** (alternative contraception recommended)
- Calcium-channel Blockers: oestrogens antagonise hypotensive effect of **calcium-channel blockers**
- Ciclosporin: oestrogens possibly increase plasma concentration of **ciclosporin**
- Clonidine: oestrogens antagonise hypotensive effect of **clonidine**
- Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of **corticosteroids**
- Diuretics: oestrogens antagonise diuretic effect of **diuretics**
- **Dopaminergics**: oestrogens increase plasma concentration of **ropinirole**; oestrogens increase plasma concentration of **•selegiline**—manufacturer of selegiline advises avoid concomitant use
- Lipid-regulating Drugs: absorption of ethinylestradiol reduced by **colesevelam**; plasma concentration of ethinylestradiol increased by **atorvastatin** and **rosuvastatin**
- Methyldopa: oestrogens antagonise hypotensive effect of **methyldopa**
- **Modafinil**: metabolism of oestrogens accelerated by **•modafinil** (reduced contraceptive effect—see p. 398)
- Moxonidine: oestrogens antagonise hypotensive effect of **moxonidine**
- Muscle Relaxants: oestrogens possibly increase plasma concentration of **tizanidine** (increased risk of toxicity)
- Nitrates: oestrogens antagonise hypotensive effect of **nitrates**
- Sitaxentan: plasma concentration of oestrogens increased by **sitaxentan**
- Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of **somatropin**
- Tacrolimus: ethinylestradiol possibly increases plasma concentration of **tacrolimus**
- Theophylline: oestrogens increase plasma concentration of **theophylline** (consider reducing dose of theophylline)
- Thyroid Hormones: oestrogens may increase requirements for **thyroid hormones** in hypothyroidism
- Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**
- Oestrogens, conjugated** *see* Oestrogens
- Ofloxacin** *see* Quinolones
- Olanzapine** *see* Antipsychotics
- Olmесartan** *see* Angiotensin-II Receptor Antagonists
- Olsalazine** *see* Aminosalicylates
- Omeprazole** *see* Proton Pump Inhibitors
- Ondansetron** *see* 5HT₂ Antagonists

Opioid Analgesics

- Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with **alcohol**
- Anaesthetics, General: fentanyl inhibits metabolism of **etomidate** (consider reducing dose of etomidate); opioid analgesics possibly enhance effects of **intravenous general anaesthetics** and **volatile liquid general anaesthetics**
- Antibacterials: plasma concentration of alfentanil increased by **erythromycin**; avoidance of premedication with opioid analgesics advised by manufacturer of **ciprofloxacin** (reduced plasma concentration of ciprofloxacin) when ciprofloxacin used for surgical prophylaxis; metabolism of alfentanil, codeine, fentanyl, methadone and morphine accelerated by **rifampicin** (reduced effect); metabolism of oxycodone possibly accelerated by **rifampicin**; metabolism of oxycodone inhibited by **telithromycin**

Opioid Analgesics (continued)

- **Anticoagulants**: tramadol enhances anticoagulant effect of **•coumarins**
 - **Antidepressants**: plasma concentration of methadone possibly increased by **fluoxetine**, **fluvoxamine**, **paroxetine** and **sertraline**; possible increased serotonergic effects when pethidine or tramadol given with **duloxetine**; possible increased serotonergic effects when tramadol given with **mirtazapine** or **venlafaxine**; CNS excitation or depression (hypertension or hypotension) when pethidine given with **•MAOIs**—avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with **•MAOIs**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when tramadol given with **•MAOIs**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with **•moclobemide**—manufacturer of moclobemide advises consider reducing dose of opioid analgesics; possible CNS excitation or depression (hypertension or hypotension) when dextromethorphan or pethidine given with **•moclobemide**—avoid concomitant use; increased risk of CNS toxicity when tramadol given with **•SSRIs** or **•tricyclics**; plasma concentration of methadone possibly reduced by **St John's wort**; sedative effects possibly increased when opioid analgesics given with **tricyclics**
 - **Antiepileptics**: effects of tramadol reduced by **carbamazepine**; plasma concentration of methadone reduced by **carbamazepine** and **phenobarbital**; dextropropoxyphene enhances effects of **•carbamazepine**; morphine increases bioavailability of **gabapentin**; metabolism of methadone accelerated by **phenytoin** (reduced effect and risk of withdrawal effects)
 - **Antifungals**: metabolism of buprenorphine inhibited by **•ketoconazole** (reduce dose of buprenorphine); metabolism of alfentanil inhibited by **fluconazole** (risk of prolonged or delayed respiratory depression); metabolism of alfentanil possibly inhibited by **itraconazole**; plasma concentration of alfentanil and methadone increased by **•voriconazole** (consider reducing dose of alfentanil and methadone); plasma concentration of oxycodone increased by **•voriconazole**; plasma concentration of fentanyl possibly increased by **•triazoles**
 - **Antihistamines**: sedative effects possibly increased when opioid analgesics given with **•sedating antihistamines**
- Antimuscarinics: possible increased risk of antimuscarinic side-effects when codeine given with **antimuscarinics**
- **Antipsychotics**: enhanced hypotensive and sedative effects when opioid analgesics given with **antipsychotics**; increased risk of ventricular arrhythmias when methadone given with **•antipsychotics** that prolong the QT interval; increased risk of convulsions when tramadol given with **antipsychotics**; increased risk of ventricular arrhythmias when methadone given with **•amisulpride**—avoid concomitant use
 - **Antivirals**: plasma concentration of methadone possibly reduced by **abacavir** and **nevirapine**; methadone possibly reduces plasma concentration of **didanosine**; plasma concentration of methadone reduced by **efavirenz**, **fosamprenavir**, **nelfinavir** and **ritonavir**; plasma concentration of dextropropoxyphene increased by **ritonavir** (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by **ritonavir**; plasma concentration of alfentanil and fentanyl increased by **ritonavir**; plasma concentration of pethidine reduced by **ritonavir**, but plasma concentration of toxic pethidine metabolite increased (avoid con-

Opioid Analgesics

- Antivirals (*continued*)
 - mitant use); plasma concentration of morphine possibly reduced by **ritonavir**; increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with **saquinavir**—avoid concomitant use; buprenorphine possibly reduces plasma concentration of **tipranavir**; methadone possibly increases plasma concentration of **zidovudine**
- Anxiolytics and Hypnotics: increased sedative effect when opioid analgesics given with **anxiolytics and hypnotics**; fentanyl possibly inhibits metabolism of **midazolam**
- Atomoxetine: increased risk of ventricular arrhythmias when methadone given with **atomoxetine**; possible increased risk of convulsions when tramadol given with **atomoxetine**
- Beta-blockers: morphine possibly increases plasma concentration of **esmolol**
- Calcium-channel Blockers: metabolism of alfentanil inhibited by **diltiazem** (risk of prolonged or delayed respiratory depression)
- Domperidone: opioid analgesics antagonise effects of **domperidone** on gastro-intestinal activity
- Dopaminergics: avoid concomitant use of dextromethorphan with **rasagiline**; risk of CNS toxicity when pethidine given with **rasagiline** (avoid pethidine for 2 weeks after rasagiline); hyperpyrexia and CNS toxicity reported when pethidine given with **selegiline** (avoid concomitant use); avoidance of opioid analgesics advised by manufacturer of **selegiline**
- 5HT₂ Antagonists: effects of tramadol possibly antagonised by **ondansetron**
- Memantine: increased risk of CNS toxicity when dextromethorphan given with **memantine** (manufacturer of memantine advises avoid concomitant use)
- Metoclopramide: opioid analgesics antagonise effects of **metoclopramide** on gastro-intestinal activity
- Muscle Relaxants: increased sedative effect when fentanyl or morphine given with **baclofen**
- Sodium Oxybate: opioid analgesics enhance effects of **sodium oxybate** (avoid concomitant use)
- Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by **cimetidine** (increased plasma concentration)

Orlistat

- Anti-arrhythmics: orlistat possibly reduces plasma concentration of **amiodarone**
- Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of **coumarins**
- Antidiabetics: manufacturer of orlistat advises avoid concomitant use with **acarbose**
- Antiepileptics: possible increased risk of convulsions when orlistat given with **antiepileptics**
- Ciclosporin: orlistat possibly reduces absorption of **ciclosporin**
- Thyroid Hormones: possible increased risk of hypothyroidism when orlistat given with **levothyroxine**

Orphenadrine *see* Antimuscarinics**Oxaliplatin** *see* Platinum Compounds**Oxandrolone** *see* Anabolic Steroids**Oxazepam** *see* Anxiolytics and Hypnotics**Oxcarbazepine**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with **St John's wort**
- Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of **carbamazepine** (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced;

Oxcarbazepine**Antiepileptics** (*continued*)

- avoidance of oxcarbazepine advised by manufacturer of **eslicarbazepine**; oxcarbazepine increases plasma concentration of **phenobarbital** and **phenytoin**, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by **valproate**
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Ciclosporin: oxcarbazepine possibly reduces plasma concentration of **ciclosporin**
- Clopidogrel: oxcarbazepine possibly reduces antiplatelet effect of **clopidogrel**
- Cytotoxics: oxcarbazepine reduces plasma concentration of **imatinib**—avoid concomitant use
- Oestrogens: oxcarbazepine accelerates metabolism of **oestrogens** (reduced contraceptive effect—*see* p. 398)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Progestogens: oxcarbazepine accelerates metabolism of **progestogens** (reduced contraceptive effect—*see* p. 398)

Oxycodone *see* Beta-blockers**Oxybutynin** *see* Antimuscarinics**Oxycodone** *see* Opioid Analgesics**Oxymetazoline** *see* Sympathomimetics**Oxytetracycline** *see* Tetracyclines**Oxytocin**

- Anaesthetics, General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with **volatile liquid general anaesthetics**
- Prostaglandins: uterotonic effect of oxytocin potentiated by **prostaglandins**
- Sympathomimetics: risk of hypertension when oxytocin given with vasoconstrictor **sympathomimetics** (due to enhanced vasopressor effect)

Paclitaxel

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of paclitaxel increased by **nelfinavir** and **ritonavir**
- Cytotoxics: increased risk of neutropenia when paclitaxel given with **lapatinib**

Paliperidone *see* Antipsychotics**Pancreatin**

- Antidiabetics: pancreatin antagonises hypoglycaemic effect of **acarbose**

Pancuronium *see* Muscle Relaxants**Pantoprazole** *see* Proton Pump Inhibitors**Papaveretum** *see* Opioid Analgesics**Paracetamol**

- Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of **coumarins**
- Antiepileptics: metabolism of paracetamol possibly accelerated by **carbamazepine**
- Cytotoxics: paracetamol possibly inhibits metabolism of **intravenous busulfan** (manufacturer of **intravenous busulfan** advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of **imatinib**
- Lipid-regulating Drugs: absorption of paracetamol reduced by **colestyramine**
- Metoclopramide: rate of absorption of paracetamol increased by **metoclopramide**

Paraldehyde

- Alcohol: increased sedative effect when paraldehyde given with **alcohol**

Paraldehyde (continued)

- Disulfiram: risk of toxicity when paraldehyde given with ●disulfiram

Parasympathomimetics

- Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by ●propafenone
- Antibacterials: plasma concentration of galantamine increased by ●erythromycin; effects of neostigmine and pyridostigmine antagonised by ●aminoglycosides; effects of neostigmine and pyridostigmine antagonised by ●clindamycin; effects of neostigmine and pyridostigmine antagonised by ●polymyxins
- Antidepressants: plasma concentration of galantamine increased by ●paroxetine
- Antifungals: plasma concentration of galantamine increased by ●ketoconazole
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for ●chloroquine and ●hydroxychloroquine to increase symptoms of myasthenia gravis
- Antimuscarinics: effects of parasympathomimetics antagonised by ●antimuscarinics

Beta-blockers: increased risk of arrhythmias when pilocarpine given with ●beta-blockers; effects of neostigmine and pyridostigmine antagonised by ●propranolol

Lithium: effects of neostigmine and pyridostigmine antagonised by ●lithium

Muscle Relaxants: donepezil possibly enhances effects of ●suxamethonium; edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of ●suxamethonium; donepezil possibly antagonises effects of ●non-depolarising muscle relaxants; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of ●non-depolarising muscle relaxants

Parecoxib see NSAIDs

Paricalcitol see Vitamins

Paroxetine see Antidepressants, SSRI

Pazopanib

- Antibacterials: manufacturer of pazopanib advises avoid concomitant use with ●clarithromycin, ●rifampicin and ●telithromycin
- Antifungals: manufacturer of pazopanib advises avoid concomitant use with ●itraconazole, ●ketoconazole and ●voriconazole
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: manufacturer of pazopanib advises avoid concomitant use with ●atazanavir, ●indinavir, ●nelfinavir, ●ritonavir and ●saquinavir

Cytotoxics: plasma concentration of pazopanib increased by ●lapatinib

- Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with ●grapefruit juice

Pegfilgrastim see Filgrastim

Peginterferon Alfa see Interferons

Pemetrexed

- Antimalarials: antifolate effect of pemetrexed increased by ●pyrimethamine
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Penicillamine

Analgesics: possible increased risk of nephrotoxicity when penicillamine given with ●NSAIDs

Antacids: absorption of penicillamine reduced by ●antacids

- Antipsychotics: avoid concomitant use of penicillamine with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: penicillamine possibly reduces plasma concentration of ●digoxin

Gold: manufacturer of penicillamine advises avoid concomitant use with ●sodium aurothiomalate (increased risk of toxicity)

Iron: absorption of penicillamine reduced by ●oral iron

Penicillamine (continued)

Zinc: penicillamine reduces absorption of zinc, also absorption of penicillamine reduced by zinc

Penicillins

- Allopurinol: increased risk of rash when amoxicillin or ampicillin given with ●allopurinol
- Antibacterials: absorption of phenoxymethylpenicillin reduced by ●neomycin; effects of penicillins possibly antagonised by ●tetracyclines
- Anticoagulants: common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin, although studies have failed to demonstrate an interaction with ●coumarins or ●phenindione
- Cytotoxics: penicillins reduce excretion of ●methotrexate (increased risk of toxicity)
- Muscle Relaxants: piperacillin enhances effects of ●non-depolarising muscle relaxants and ●suxamethonium
- Probenecid: excretion of penicillins reduced by ●probenecid (increased plasma concentration)
- Sulfapyrazone: excretion of penicillins reduced by ●sulfapyrazone
- Vaccines: antibacterials inactivate ●oral typhoid vaccine—see p. 620

Pentamidine Isetionate

- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with ●amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with ●parenteral ●erythromycin; increased risk of ventricular arrhythmias when pentamidine isetionate given with ●moxifloxacin—avoid concomitant use
- Antidepressants: increased risk of ventricular arrhythmias when pentamidine isetionate given with ●tricyclics
- Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with ●amphotericin
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with ●amisulpride or ●droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with ●phenothiazines
- Antivirals: increased risk of hypocalcaemia when ●parenteral pentamidine isetionate given with ●foscarnet; increased risk of ventricular arrhythmias when pentamidine isetionate given with ●saquinavir—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with ●ivabradine

Pentazocine see Opioid Analgesics

Pentostatin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Cytotoxics: increased toxicity when pentostatin given with high-dose ●cyclophosphamide—avoid concomitant use; increased pulmonary toxicity when pentostatin given with ●fludarabine (unacceptably high incidence of fatalities)

Pentoxifylline

- Analgesics: possible increased risk of bleeding when pentoxifylline given with ●NSAIDs; increased risk of bleeding when pentoxifylline given with ●ketorolac (avoid concomitant use)

Theophylline: pentoxifylline increases plasma concentration of ●theophylline

Pergolide

- Antipsychotics: effects of pergolide antagonised by ●antipsychotics
- Memantine: effects of dopaminergic possibly enhanced by ●memantine
- Methyldopa: antiparkinsonian effect of dopaminergic antagonised by ●methyldopa
- Metoclopramide: antiparkinsonian effect of pergolide antagonised by ●metoclopramide

Percyazine see Antipsychotics

Perindopril see ACE Inhibitors

Perphenazine see Antipsychotics

Pethidine see Opioid Analgesics

Phenazocine see Opioid Analgesics

Phenelzine see MAOIs

Phenindione

Note Change in patient's clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of ●alcohol
- Anabolic Steroids: anticoagulant effect of phenindione enhanced by ●anabolic steroids
- Analgesics: anticoagulant effect of phenindione possibly enhanced by ●NSAIDs; increased risk of haemorrhage when anticoagulants given with *intravenous* ●diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ●ketorolac (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with ●aspirin (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by ●amiodarone (enhanced anticoagulant effect)
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with ●neomycin (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by ●levofloxacin and ●tetracyclines; studies have failed to demonstrate an interaction with phenindione, but common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum ●penicillins such as ampicillin; metabolism of phenindione possibly inhibited by ●sulfonamides
- Antivirals: anticoagulant effect of phenindione possibly enhanced by ●ritonavir
- Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of ●clopidogrel
- Corticosteroids: anticoagulant effect of phenindione may be enhanced or reduced by ●corticosteroids
- Dipyridamole: anticoagulant effect of phenindione enhanced due to antiplatelet action of ●dipyridamole
- Enteral Foods: anticoagulant effect of phenindione antagonised by vitamin K (present in some ●enteral feeds)
- Iloprost: increased risk of bleeding when phenindione given with ●loprost
- Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by ●colestyramine; anticoagulant effect of phenindione possibly enhanced by ●rosuvastatin; anticoagulant effect of phenindione enhanced by ●fibrates
- Oestrogens: anticoagulant effect of phenindione antagonised by ●oestrogens
- Prasugrel: possible increased risk of bleeding when phenindione given with ●prasugrel
- Progestogens: anticoagulant effect of phenindione antagonised by ●progestogens
- Testolactone: anticoagulant effect of phenindione enhanced by ●testolactone
- Testosterone: anticoagulant effect of phenindione enhanced by ●testosterone
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by ●thyroid hormones
- Vitamins: anticoagulant effect of phenindione antagonised by ●vitamin K

Phenobarbital

Note Primidone interactions as for phenobarbital

Alcohol: increased sedative effect when phenobarbital given with ●alcohol

Analgesics: phenobarbital reduces plasma concentration of ●methadone

- Anti-arrhythmics: phenobarbital accelerates metabolism of ●disopyramide (reduced plasma concentra-

Phenobarbital

- Anti-arrhythmics (*continued*)
 - tion); phenobarbital possibly reduces plasma concentration of ●dronedarone—avoid concomitant use
- Antibacterials: phenobarbital accelerates metabolism of ●metronidazole (reduced effect); phenobarbital possibly reduces plasma concentration of ●rifampicin; phenobarbital accelerates metabolism of ●doxycycline (reduced plasma concentration); phenobarbital possibly accelerates metabolism of ●chloramphenicol (reduced plasma concentration); phenobarbital reduces plasma concentration of ●elithromycin (avoid during and for 2 weeks after phenobarbital)
- Anticoagulants: phenobarbital accelerates metabolism of ●coumarins (reduced anticoagulant effect)
- Antidepressants: phenobarbital reduces plasma concentration of ●paroxetine; phenobarbital accelerates metabolism of ●mianserin (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly enhanced by ●MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort; phenobarbital possibly accelerates metabolism of ●tricyclics (reduced plasma concentration)
- Antiepileptics: plasma concentration of phenobarbital possibly increased by ●carbamazepine; phenobarbital possibly reduces plasma concentration of ●ethosuximide, ●rufinamide and ●topiramate; phenobarbital reduces plasma concentration of ●lamotrigine, ●tiagabine and ●zonisamide; plasma concentration of phenobarbital increased by ●oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital often increased by ●phenytoin, plasma concentration of phenytoin often reduced but may be increased; plasma concentration of phenobarbital increased by ●stiripentol; plasma concentration of phenobarbital increased by ●valproate (also plasma concentration of valproate reduced)
- Antifungals: phenobarbital possibly reduces plasma concentration of ●itraconazole and ●posaconazole; phenobarbital possibly reduces plasma concentration of ●voriconazole—avoid concomitant use; phenobarbital reduces absorption of ●griseofulvin (reduced effect)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with ●chloroquine and ●hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered); phenobarbital accelerates metabolism of ●haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with ●chlorpromazine; phenobarbital possibly reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole; phenobarbital possibly reduces plasma concentration of ●clozapine
- Antivirals: phenobarbital possibly reduces plasma concentration of ●abacavir, ●darunavir, ●fosamprenavir, ●indinavir, ●lopinavir, ●nefnavir and ●saquinavir; avoidance of phenobarbital advised by manufacturer of ●etravirine
- Anxiolytics and Hypnotics: phenobarbital often reduces plasma concentration of ●clonazepam
- Appetitants: phenobarbital possibly reduces plasma concentration of ●aprepitant
- Beta-blockers: phenobarbital possibly reduces plasma concentration of ●propranolol
- Calcium-channel Blockers: phenobarbital probably reduces effects of ●calcium-channel blockers; avoidance of phenobarbital advised by manufacturer of ●isradipine; avoidance of phenobarbital advised by

Phenobarbital

- Calcium-channel Blockers (*continued*)
 - manufacturer of ●nimodipine (plasma concentration of nimodipine reduced)
- Ciclosporin: phenobarbital accelerates metabolism of ●ciclosporin (reduced plasma concentration)
- Corticosteroids: phenobarbital accelerates metabolism of ●corticosteroids (reduced effect)
 - Cytotoxics: avoidance of phenobarbital advised by manufacturer of ●gefitinib; phenobarbital possibly reduces plasma concentration of ●etoposide; phenobarbital reduces plasma concentration of ●irinotecan and its active metabolite
- Diuretics: phenobarbital reduces plasma concentration of ●eplerenone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with ●carbonic anhydrase inhibitors
- Folates: plasma concentration of phenobarbital possibly reduced by ●folates
- Hormone Antagonists: phenobarbital accelerates metabolism of ●toremifene (reduced plasma concentration)
- Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of ●montelukast
- Oestrogens: phenobarbital accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 398)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat
- Progestogens: phenobarbital accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 398)
 - Sodium Oxybate: avoidance of phenobarbital advised by manufacturer of ●sodium oxybate
- Sympathomimetics: plasma concentration of phenobarbital possibly increased by ●methylphenidate
- Tacrolimus: phenobarbital reduces plasma concentration of ●tacrolimus
- Theophylline: phenobarbital accelerates metabolism of ●theophylline (reduced effect)
- Thyroid Hormones: phenobarbital accelerates metabolism of ●thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)
- Ulipristal: avoidance of phenobarbital advised by manufacturer of ●ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vitamins: phenobarbital possibly increases requirements for ●vitamin D

Phenothiazines see Antipsychotics

Phenox benzamine see Alpha-blockers

Phenoxymethylpenicillin see Penicillins

Phentolamine see Alpha-blockers

Phenylephrine see Sympathomimetics

Phenytoin

- Note Fosphenytoin interactions as for phenytoin
- Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of ●alcohol
- Analgesics: phenytoin accelerates metabolism of ●methadone (reduced effect and risk of withdrawal effects); effects of phenytoin enhanced by ●aspirin
- Antacids: absorption of phenytoin reduced by ●antacids
- Anti-arrhythmics: metabolism of phenytoin inhibited by ●amiodarone (increased plasma concentration); phenytoin reduces plasma concentration of ●disopyramide; phenytoin possibly reduces plasma concentration of ●dronedrone—avoid concomitant use
- Antibacterials: metabolism of phenytoin inhibited by ●clarithromycin (increased plasma concentration); metabolism of phenytoin possibly inhibited by ●metronidazole (increased plasma concentration); plasma concentration of phenytoin increased or decreased by ●ciprofloxacin; phenytoin accelerates metabolism of ●doxycycline (reduced plasma concentration); plasma concentration of phenytoin increased by ●chloramphenicol (increased risk of toxicity); metabolism of phenytoin possibly inhibited by ●isoniazid (increased risk of toxicity); metabolism of phenytoin accelerated by ●rifamycins (reduced

Phenytoin

- Antibacterials (*continued*)
 - plasma concentration); plasma concentration of phenytoin possibly increased by ●sulfonamides; phenytoin reduces plasma concentration of ●tetracyclines (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by ●trimethoprim (also increased antifolate effect)
- Anticoagulants: phenytoin accelerates metabolism of ●coumarins (possibility of reduced anticoagulant effect, but enhancement also reported)
- Antidepressants: plasma concentration of phenytoin increased by ●fluoxetine and ●fluvoxamine; phenytoin reduces plasma concentration of ●mianserin, ●mirtazapine and ●paroxetine; plasma concentration of phenytoin possibly increased by ●sertraline, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by ●MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort; phenytoin possibly reduces plasma concentration of ●tricyclics
- Antidiabetics: plasma concentration of phenytoin transiently increased by ●tolbutamide (possibility of toxicity)
- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with ●carbamazepine, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of ●eslicarbazepine, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by ●ethosuximide, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of ●lamotrigine, ●tiagabine and ●zonisamide; plasma concentration of phenytoin increased by ●oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin often increases plasma concentration of ●phenobarbital, plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of ●rufinamide, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased by ●stiripentol; plasma concentration of phenytoin increased by ●topiramate (also plasma concentration of topiramate reduced); plasma concentration of phenytoin increased or possibly reduced when given with ●valproate, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by ●vigabatrin
- Antifungals: phenytoin reduces plasma concentration of ●ketoconazole and ●posaconazole; anticonvulsant effect of phenytoin enhanced by ●miconazole (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by ●fluconazole (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of ●itraconazole—avoid concomitant use; plasma concentration of phenytoin increased by ●voriconazole, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of ●casprofungin—consider increasing dose of casprofungin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with ●chloroquine and ●hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine; anticonvulsant effect of phenytoin antagonised by ●pyrimethamine, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered); phenytoin reduces plasma concentration of ●haloperidol; plasma concentration of phenytoin

Phenytoin

- Antipsychotics (*continued*)
 - possibly increased or decreased by **chlorpromazine**; phenytoin possibly reduces plasma concentration of **aripiprazole**—increase dose of aripiprazole; phenytoin accelerates metabolism of **clozapine** and **quetiapine** (reduced plasma concentration)
- Antivirals: phenytoin possibly reduces plasma concentration of **abacavir**, **darunavir**, **lopinavir** and **saquinavir**; avoidance of phenytoin advised by manufacturer of **etravirine**; phenytoin possibly reduces plasma concentration of **indinavir**, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin reduced by **nefelinavir**; phenytoin possibly reduces plasma concentration of **ritonavir**, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by **zidovudine**
- Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of **clonazepam**; plasma concentration of phenytoin increased or decreased by **diazepam**; plasma concentration of phenytoin possibly increased or decreased by **benzodiazepines**
- Aprepitant: phenytoin possibly reduces plasma concentration of **aprepitant**
- Bupropion: phenytoin reduces plasma concentration of **bupropion**
- Calcium-channel Blockers: phenytoin reduces effects of **felodipine** and **verapamil**; avoidance of phenytoin advised by manufacturer of **isradipine**; avoidance of phenytoin advised by manufacturer of **nimodipine** (plasma concentration of nimodipine possibly reduced); plasma concentration of phenytoin increased by **diltiazem** but also effect of diltiazem reduced
- Cardiac Glycosides: phenytoin possibly reduces plasma concentration of **digoxin**
- Ciclosporin: phenytoin accelerates metabolism of **ciclosporin** (reduced plasma concentration)
- Corticosteroids: phenytoin accelerates metabolism of **corticosteroids** (reduced effect)
- Cytotoxics: phenytoin possibly reduces plasma concentration of **busulfan** and **etoposide**; metabolism of phenytoin possibly inhibited by **fluorouracil** (increased risk of toxicity); phenytoin increases antifolate effect of **methotrexate**; plasma concentration of phenytoin possibly reduced by **cisplatin**; avoidance of phenytoin advised by manufacturer of **gefitinib** and **lapatinib**; phenytoin reduces plasma concentration of **imatinib**—avoid concomitant use; phenytoin reduces plasma concentration of **irinotecan** and its active metabolite
- Diazoxide: plasma concentration of phenytoin reduced by **diazoxide**, also effect of diazoxide may be reduced
- Disulfiram: metabolism of phenytoin inhibited by **disulfiram** (increased risk of toxicity)
- Diuretics: plasma concentration of phenytoin possibly increased by **acetazolamide**; phenytoin antagonises effects of **furosemide**; phenytoin reduces plasma concentration of **epplerenone**—avoid concomitant use; increased risk of osteomalacia when phenytoin given with **carbonic anhydrase inhibitors**
- Dopaminergics: phenytoin possibly reduces effects of **levodopa**
- Enteral Foods: absorption of phenytoin possibly reduced by **enteral feeds**
- Folates: plasma concentration of phenytoin possibly reduced by **folates**
- Hormone Antagonists: phenytoin possibly accelerates metabolism of **toremifene**
- 5HT₂ Antagonists: phenytoin accelerates metabolism of **ondansetron** (reduced effect)
- Leflunomide: plasma concentration of phenytoin possibly increased by **leflunomide**
- Levamisole: plasma concentration of phenytoin possibly increased by **levamisole**

Phenytoin (continued)

- Lipid-regulating Drugs: absorption of phenytoin possibly reduced by **colesevelam**; combination of phenytoin with **fluvastatin** may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when phenytoin given with **lithium** without increased plasma concentration of lithium
- Modafinil: plasma concentration of phenytoin possibly increased by **modafinil**
- Muscle Relaxants: phenytoin antagonises muscle relaxant effect of **non-depolarising muscle relaxants** (accelerated recovery from neuromuscular blockade)
- Oestrogens: phenytoin accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 398)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Progestogens: phenytoin accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 398)
- Sulfapyrazone: plasma concentration of phenytoin increased by **sulfapyrazone**
- Sympathomimetics: plasma concentration of phenytoin increased by **methylphenidate**
- Tacrolimus: phenytoin reduces plasma concentration of **tacrolimus**, also plasma concentration of phenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when phenytoin given with **theophylline**
- Thyroid Hormones: phenytoin accelerates metabolism of **thyroid hormones** (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
- Tibolone: phenytoin accelerates metabolism of **tibolone**
- Ulcer-healing Drugs: metabolism of phenytoin inhibited by **cimetidine** (increased plasma concentration); effects of phenytoin enhanced by **esomeprazole**; effects of phenytoin possibly enhanced by **omeprazole**; absorption of phenytoin reduced by **sucralfate**
- Ulipristal: avoidance of phenytoin advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vaccines: effects of phenytoin enhanced by **influenza vaccine**
- Vitamins: phenytoin possibly increases requirements for **vitamin D**
- Pholcodine**
 - Antidepressants: manufacturer of pholcodine advises avoid for 2 weeks after stopping **MAOIs**
- Phosphodiesterase Type-3 Inhibitors**
 - Anagrelide: avoidance of enoximone and milrinone advised by manufacturer of **anagrelide**
- Physostigmine** *see* Parasympathomimetics
- Pilocarpine** *see* Parasympathomimetics
- Pimozide** *see* Antipsychotics
- Pindolol** *see* Beta-blockers
- Pioglitazone** *see* Antidiabetics
- Piperacillin** *see* Penicillins
- Pipotiazine** *see* Antipsychotics
- Piroxicam** *see* NSAIDs
- Pivmecillinam** *see* Penicillins
- Pizotifen**
 - Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of **adrenergic neurone blockers**
- Platinum Compounds**
 - Aldesleukin: avoidance of cisplatin advised by manufacturer of **aldesleukin**
 - Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with **aminoglycosides** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with **capreomycin**; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with **vancomycin**

Platinum Compounds (*continued*)

- Antiepileptics: cisplatin possibly reduces plasma concentration of **phenytoin**
- Antipsychotics: avoid concomitant use of cytotoxics with **•clozapine** (increased risk of agranulocytosis)
 - Cytotoxics: increased risk of ototoxicity when cisplatin given with **ifosfamide**; increased pulmonary toxicity when cisplatin given with **•bleomycin** and **•methotrexate**
- Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with **diuretics**

Polymyxin B *see* Polymyxins**Polymyxins**

- Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with **aminoglycosides**; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with **capreomycin**; increased risk of nephrotoxicity when polymyxins given with **vancomycin**; increased risk of nephrotoxicity and ototoxicity when colistimethate sodium given with **vancomycin**
- Antifungals: increased risk of nephrotoxicity when polymyxins given with **amphotericin**
- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with **•ciclosporin**
 - Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with **•platinum compounds**
 - Diuretics: increased risk of ototoxicity when polymyxins given with **•loop diuretics**
 - Muscle Relaxants: polymyxins enhance effects of **•non-depolarising muscle relaxants** and **•suxamethonium**
 - Parasympathomimetics: polymyxins antagonise effects of **•neostigmine** and **•pyridostigmine**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620

Polystyrene Sulphonate Resins

Antacids: risk of intestinal obstruction when polystyrene sulphonate resins given with **aluminium hydroxide**; risk of metabolic alkalosis when polystyrene sulphonate resins given with **oral magnesium salts**

Thyroid Hormones: polystyrene sulphonate resins reduce absorption of **levothyroxine**

Posaconazole *see* Antifungals, Triazole**Potassium Canrenoate** *see* Diuretics**Potassium Aminobenzoate**

Antibacterials: potassium aminobenzoate inhibits effects of **sulfonamides**

Potassium Bicarbonate *see* Potassium Salts**Potassium Chloride** *see* Potassium Salts**Potassium Citrate** *see* Potassium Salts**Potassium Salts**

Note Includes salt substitutes

- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with **•ACE inhibitors**
 - Aliskiren: increased risk of hyperkalaemia when potassium salts given with **aliskiren**
 - Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with **•angiotensin-II receptor antagonists**
- Antibacterials: avoid concomitant use of potassium citrate with **methenamine**
- Ciclosporin: increased risk of hyperkalaemia when potassium salts given with **•ciclosporin**
 - Diuretics: increased risk of hyperkalaemia when potassium salts given with **•potassium-sparing diuretics** and **aldosterone antagonists**
 - Tacrolimus: increased risk of hyperkalaemia when potassium salts given with **•tacrolimus**

Pramipexole

Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of **antipsychotics** (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Pramipexole (*continued*)

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Ulcer-healing Drugs: excretion of pramipexole reduced by **cimetidine** (increased plasma concentration)

Prasugrel

Analgesics: possible increased risk of bleeding when prasugrel given with **NSAIDs**

Anticoagulants: possible increased risk of bleeding when prasugrel given with **coumarins** or **phenindione**

Clopidogrel: possible increased risk of bleeding when prasugrel given with **clopidogrel**

Pravastatin *see* Statins**Prazosin** *see* Alpha-blockers**Prednisolone** *see* Corticosteroids**Prednisone** *see* Corticosteroids**Prilocaine**

Anti-arrhythmics: increased myocardial depression when prilocaine given with **anti-arrhythmics**

Antibacterials: increased risk of methaemoglobinemia when prilocaine given with **sulfonamides**

Primaquine

- Antimalarials: avoidance of antimalarials advised by manufacturer of **•artemether/lumefantrine**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Mepacrine: plasma concentration of primaquine increased by **mepacrine** (increased risk of toxicity)
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—*see* p. 620

Primidone *see* Phenobarbital**Probenecid**

- ACE Inhibitors: probenecid reduces excretion of **captopril**
- Anaesthetics, General: probenecid possibly enhances effects of **thiopental**
- Analgesics: probenecid reduces excretion of **•dexketoprofen**, **•indometacin**, **•ketoprofen** and **•naproxen** (increased plasma concentration); probenecid reduces excretion of **•ketorolac** (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by **aspirin**
- Antibacterials: probenecid reduces excretion of **doripenem** (manufacturers of doripenem advise avoid concomitant use); probenecid reduces excretion of **meropenem**; probenecid reduces excretion of **cephalosporins**, **ciprofloxacin**, **nalidixic acid**, **norfloxacin** and **penicillins** (increased plasma concentration); probenecid reduces excretion of **dapsone** and **nitrofurantoin** (increased risk of side-effects); effects of probenecid antagonised by **pyrazinamide**- Antivirals: probenecid reduces excretion of **aciclovir** (increased plasma concentration); probenecid possibly reduces excretion of **famciclovir** (increased plasma concentration); probenecid reduces excretion of **ganciclovir** and **•zidovudine** (increased plasma concentration and risk of toxicity)

Anxiolytics and Hypnotics: probenecid reduces excretion of **lorazepam** (increased plasma concentration); probenecid possibly reduces excretion of **nitrazepam** (increased plasma concentration)

 - Cytotoxics: probenecid reduces excretion of **•methotrexate** (increased risk of toxicity)

Sodium Benzoate: probenecid possibly reduces excretion of conjugate formed by **sodium benzoate**

Sodium Phenylbutyrate: probenecid possibly reduces excretion of conjugate formed by **sodium phenylbutyrate**

Procabazine

Alcohol: disulfiram-like reaction when procabazine given with **alcohol**

 - Antipsychotics: avoid concomitant use of cytotoxics with **•clozapine** (increased risk of agranulocytosis)

Cardiac Glycosides: procabazine possibly reduces absorption of **digoxin tablets**

Prochlorperazine *see* Antipsychotics

Procyclidine *see* Antimuscarinics

Progesterone *see* Progestogens**Progestogens**

Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 398. For further information on interactions of oral progestogen-only contraceptives, see also p. 403; parenteral progestogen-only contraceptives, see also p. 404; the intra-uterine progestogen-only device, see also p. 405; hormonal emergency contraception, see also p. 408

- **Antibacterials:** plasma concentration of dienogest increased by **erythromycin**; metabolism of progestogens accelerated by **rifamycins** (reduced contraceptive effect—see p. 398)
- **Anticoagulants:** progestogens may enhance or reduce anticoagulant effect of **coumarins**; progestogens antagonise anticoagulant effect of **phenindione**
- **Antidepressants:** contraceptive effect of progestogens reduced by **St John's wort** (avoid concomitant use)
- **Antidiabetics:** progestogens antagonise hypoglycaemic effect of **antidiabetics**
- **Antiepileptics:** metabolism of progestogens accelerated by **carbamazepine**, **eslicarbazepine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rufinamide** and **topiramate** (reduced contraceptive effect—see p. 398); desogestrel possibly increases plasma concentration of **lamotrigine**
- **Antifungals:** progestogens possibly increase plasma concentration of **voriconazole**; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with **griseofulvin**; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with **terbinafine**
- **Antivirals:** plasma concentration of norethisterone increased by **atazanavir**; contraceptive effect of progestogens possibly reduced by **efavirenz** and **nelfinavir**; metabolism of progestogens accelerated by **nevirapine** (reduced contraceptive effect—see p. 398)
- **Aprepitant:** possible contraceptive failure of hormonal contraceptives containing progestogens when given with **aprepitant** (alternative contraception recommended)
- **Bosentan:** possible contraceptive failure of hormonal contraceptives containing progestogens when given with **bosentan** (alternative contraception recommended)
- **Ciclosporin:** progestogens possibly increase plasma concentration of **ciclosporin**
- **Diuretics:** risk of hyperkalaemia when drospirenone given with **potassium-sparing diuretics** and **aldosterone antagonists** (monitor serum potassium during first cycle)
- **Dopaminergics:** progestogens increase plasma concentration of **selegiline**—manufacturer of selegiline advises avoid concomitant use
- **Lipid-regulating Drugs:** plasma concentration of norethisterone increased by **atorvastatin**; plasma concentration of active metabolite of norgestimate increased by **rosuvastatin**; plasma concentration of norgestrel increased by **rosuvastatin**
- **Muscle Relaxants:** progestogens possibly increase plasma concentration of **tizanidine** (increased risk of toxicity)
- **Sitaxentan:** plasma concentration of progestogens increased by **sitaxentan**
- **Sugammadex:** plasma concentration of progestogens possibly reduced by **sugammadex**—manufacturer of sugammadex advises additional contraceptive precautions
- **Ulipristal:** contraceptive effect of progestogens possibly reduced by **ulipristal**

Proguanil

- **Antacids:** absorption of proguanil reduced by **oral magnesium salts** (as magnesium trisilicate)
- **Anticoagulants:** isolated reports that proguanil may enhance anticoagulant effect of **warfarin**
- **Antimalarials:** avoidance of antimalarials advised by manufacturer of **artemether/lumefantrine**;

Proguanil● **Antimalarials** (*continued*)

- increased antifolate effect when proguanil given with **pyrimethamine**
- **Histamine:** avoidance of antimalarials advised by manufacturer of **histamine**
- **Vaccines:** antimalarials inactivate **oral typhoid vaccine**—see p. 620

Promazine *see* Antipsychotics**Promethazine** *see* Antihistamines**Propafenone**

- **Anaesthetics, Local:** increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**
- **Anti-arrhythmics:** increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**
- **Antibacterials:** metabolism of propafenone accelerated by **rifampicin** (reduced effect)
- **Anticoagulants:** propafenone enhances anticoagulant effect of **coumarins**
- **Antidepressants:** metabolism of propafenone possibly inhibited by **paroxetine** (increased risk of toxicity); increased risk of arrhythmias when propafenone given with **tricyclics**
- **Antihistamines:** increased risk of ventricular arrhythmias when propafenone given with **mizolastine**—avoid concomitant use
- **Antipsychotics:** increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval
- **Antivirals:** plasma concentration of propafenone possibly increased by **fosamprenavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by **ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with **saquinavir**—avoid concomitant use
- **Beta-blockers:** increased myocardial depression when anti-arrhythmics given with **beta-blockers**; propafenone increases plasma concentration of **metoprolol** and **propranolol**
- **Cardiac Glycosides:** propafenone increases plasma concentration of **digoxin** (halve dose of digoxin)
- **Ciclosporin:** propafenone possibly increases plasma concentration of **ciclosporin**
- **Parasympathomimetics:** propafenone possibly antagonises effects of **neostigmine** and **pyridostigmine**
- **Theophylline:** propafenone increases plasma concentration of **theophylline**
- **Ulcer-healing Drugs:** plasma concentration of propafenone increased by **cimetidine**

Propantheline *see* Antimuscarinics**Propiverine** *see* Antimuscarinics**Propofol** *see* Anaesthetics, General**Propranolol** *see* Beta-blockers**Prostaglandins**

- **ACE Inhibitors:** enhanced hypotensive effect when alprostadil given with **ACE inhibitors**
- **Adrenergic Neurone Blockers:** enhanced hypotensive effect when alprostadil given with **adrenergic neurone blockers**
- **Alpha-blockers:** enhanced hypotensive effect when alprostadil given with **alpha-blockers**
- **Angiotensin-II Receptor Antagonists:** enhanced hypotensive effect when alprostadil given with **angiotensin-II receptor antagonists**
- **Beta-blockers:** enhanced hypotensive effect when alprostadil given with **beta-blockers**
- **Calcium-channel Blockers:** enhanced hypotensive effect when alprostadil given with **calcium-channel blockers**
- **Clonidine:** enhanced hypotensive effect when alprostadil given with **clonidine**
- **Diazoxide:** enhanced hypotensive effect when alprostadil given with **diazoxide**

Prostaglandins (continued)

Diuretics: enhanced hypotensive effect when alprostadil given with **diuretics**

Methyldopa: enhanced hypotensive effect when alprostadil given with **methyldopa**

Moxonidine: enhanced hypotensive effect when alprostadil given with **moxonidine**

Nitrates: enhanced hypotensive effect when alprostadil given with **nitrates**

Oxytocin: prostaglandins potentiate uterotonic effect of **oxytocin**

Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

Protein Kinase Inhibitors *see* Dasatinib, Erlotinib, Everolimus, Gefitinib, Imatinib, Lapatinib, Nilotinib, Pazopanib, Sorafenib, Sunitinib, and Temsirolimus

Proton Pump Inhibitors

Antacids: absorption of lansoprazole possibly reduced by **antacids**

Antibacterials: plasma concentration of both drugs increased when omeprazole given with **clarithromycin**

- Anticoagulants: esomeprazole, omeprazole and pantoprazole possibly enhance anticoagulant effect of **coumarins**

Antidepressants: omeprazole increases plasma concentration of **escitalopram**; plasma concentration of lansoprazole possibly increased by **fluvoxamine**; plasma concentration of omeprazole possibly reduced by **St John's wort**

- Antiepileptics: esomeprazole enhances effects of **phenytoin**; omeprazole possibly enhances effects of **phenytoin**

Antifungals: proton pump inhibitors reduce absorption of **itraconazole** and **ketoconazole**; avoidance of proton pump inhibitors advised by manufacturer of **posaconazole** (plasma concentration of posaconazole possibly reduced); plasma concentration of esomeprazole possibly increased by **voriconazole**; plasma concentration of omeprazole increased by **voriconazole** (consider reducing dose of omeprazole)

Antipsychotics: omeprazole possibly reduces plasma concentration of **clozapine**

- Antivirals: proton pump inhibitors reduce plasma concentration of **atazanavir**—avoid or adjust dose of both drugs (consult product literature); omeprazole reduces plasma concentration of **nelfinavir**—avoid concomitant use; proton pump inhibitors possibly increase plasma concentration of **raltegravir**—manufacturer of raltegravir advises avoid concomitant use; omeprazole increases plasma concentration of **raltegravir**—avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly increase plasma concentration of **sacquinavir**—manufacturer of saquinavir advises avoid concomitant use; omeprazole increases plasma concentration of **sacquinavir**—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by **tipranavir**

Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of **diazepam** (increased plasma concentration)

Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of **digoxin**

Ciclosporin: omeprazole possibly affects plasma concentration of **ciclosporin**

Clostrazol: omeprazole increases plasma concentration of **clostrazol** (consider reducing dose of clostrazol)

- Clopidogrel: esomeprazole and omeprazole reduce antiplatelet effect of **clopidogrel**; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of **clopidogrel**
- Cytotoxics: omeprazole possibly reduces excretion of **methotrexate** (increased risk of toxicity); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of **erlotinib**; omeprazole reduces plasma concentration of

Proton Pump Inhibitors

- Cytotoxics (*continued*)

• **erlotinib**—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of **lapatinib**

Tacrolimus: omeprazole possibly increases plasma concentration of **tacrolimus**

Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by **sucralfate**

- Ulipristal: avoidance of proton pump inhibitors advised by manufacturer of **ulipristal** (plasma concentration of ulipristal possibly reduced)

Pseudoephedrine *see* Sympathomimetics

Pyrazinamide

Probenecid: pyrazinamide antagonises effects of **probenecid**

Sulfapyrazone: pyrazinamide antagonises effects of **sulfapyrazone**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 620

Pyridostigmine *see* Parasympathomimetics

Pyridoxine *see* Vitamins

Pyrimethamine

- Antibacterials: increased antifolate effect when pyrimethamine given with **sulfonamides** or **trimethoprim**
- Antiepileptics: pyrimethamine antagonises anti-convulsant effect of **phenytoin**, also increased antifolate effect
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether/lumefantrine**; increased antifolate effect when pyrimethamine given with **proguanil**
- Antivirals: increased antifolate effect when pyrimethamine given with **zidovudine**
- Cytotoxics: pyrimethamine increases antifolate effect of **methotrexate** and **pemetrexed**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—*see* p. 620

Quetiapine *see* Antipsychotics

Quinagolide

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Quinapril *see* ACE Inhibitors

Quinine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with **amiodarone**—avoid concomitant use; quinine increases plasma concentration of **flecainide**
- Antibacterials: increased risk of ventricular arrhythmias when quinine given with **moxifloxacin**—avoid concomitant use; plasma concentration of quinine reduced by **rifampicin**
- Anticoagulants: plasma concentration of both drugs increased when quinine given with **warfarin**
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether/lumefantrine**; increased risk of ventricular arrhythmias when quinine given with **artemether/lumefantrine**; increased risk of convulsions when quinine given with **mefloquine** (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: increased risk of ventricular arrhythmias when quinine given with **droperidol** or **pimozide**—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with **haloperidol**—avoid concomitant use
- Antivirals: plasma concentration of quinine possibly increased by **atazanavir**, **darunavir**, **fosamprenavir**, **indinavir**, **nelfinavir** and **tipranavir** (increased risk of toxicity); plasma concentration of quinine increased by **ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when

Quinine

- Antivirals (*continued*)
quinine given with ●**squonavir**—avoid concomitant use
- Cardiac Glycosides: quinine increases plasma concentration of ●**digoxin**
- Dopaminergics: quinine possibly increases plasma concentration of **amantadine**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Muscle Relaxants: quinine possibly enhances effects of **suxamethonium**
- Ulcer-healing Drugs: metabolism of quinine inhibited by **cimetidine** (increased plasma concentration)
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 620

Quinolones

- Analgesics: possible increased risk of convulsions when quinolones given with ●**NSAIDs**; manufacturer of ciprofloxacin advises avoid premedication with **opioid analgesics** (reduced plasma concentration of ciprofloxacin) when ciprofloxacin used for surgical prophylaxis
- Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by **antacids**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with ●**amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with ●**disopyramide**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with **parenteral** ●**erythromycin**—avoid concomitant use; effects of nalidixic acid possibly antagonised by **nitrofurantoin**
- Anticoagulants: ciprofloxacin, nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of ●**coumarins**; levofloxacin possibly enhances anticoagulant effect of **coumarins** and **phenindione**
- Antidepressants: ciprofloxacin inhibits metabolism of ●**duloxetine**—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of ●**agomelatine**; increased risk of ventricular arrhythmias when moxifloxacin given with ●**tricyclics**—avoid concomitant use

Antidiabetics: norfloxacin possibly enhances effects of **glibenclamide**

- Antiepileptics: ciprofloxacin increases or decreases plasma concentration of **phenytoin**
- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with ●**mizolastine**—avoid concomitant use
- Antimalarials: avoidance of quinolones advised by manufacturer of ●**artemether/lumefantrine**; increased risk of ventricular arrhythmias when moxifloxacin given with ●**chloroquine** and **hydroxychloroquine**, ●**mefloquine** or ●**quinine**—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with ●**benperidol**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with ●**droperidol**, ●**haloperidol**, ●**phenothiazines**, ●**pimozide** or ●**zuclopenthixol**—avoid concomitant use; ciprofloxacin increases plasma concentration of **clozapine**; ciprofloxacin possibly increases plasma concentration of **olanzapine**
- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with ●**atomoxetine**
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with ●**sotalol**—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by **calcium salts**
- Ciclosporin: increased risk of nephrotoxicity when quinolones given with ●**ciclosporin**
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of ●**clopidogrel**

Quinolones (*continued*)

- Cytotoxics: nalidixic acid increases risk of **melfalan** toxicity; ciprofloxacin possibly reduces excretion of **methotrexate** (increased risk of toxicity); ciprofloxacin increases plasma concentration of **erlotinib**; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with ●**arsenic trioxide**
- Dairy Products: absorption of ciprofloxacin and norfloxacin reduced by **dairy products**
- Dopaminergics: ciprofloxacin increases plasma concentration of **rasagiline**; ciprofloxacin inhibits metabolism of **ropinirole** (increased plasma concentration)
- 5HT₁ Agonists: quinolones possibly inhibit metabolism of **zolmitriptan** (reduce dose of zolmitriptan)
- Iron: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by **oral iron**
- Lanthanum: absorption of quinolones possibly reduced by **lanthanum** (give at least 2 hours before or 4 hours after lanthanum)
- Muscle Relaxants: norfloxacin possibly increases plasma concentration of **tizanidine** (increased risk of toxicity); ciprofloxacin increases plasma concentration of ●**tizanidine** (increased risk of toxicity)—avoid concomitant use
- Mycophenolate: norfloxacin possibly reduces bioavailability of **mycophenolate**
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when moxifloxacin given with ●**pentamidine isetionate**—avoid concomitant use
- Probenecid: excretion of ciprofloxacin, nalidixic acid and norfloxacin reduced by **probenecid** (increased plasma concentration)
- Sevelamer: bioavailability of ciprofloxacin reduced by **sevelamer**
- Strontium Ranelate: absorption of quinolones reduced by **strontium ranelate** (manufacturer of strontium ranelate advises avoid concomitant use)
- Theophylline: possible increased risk of convulsions when quinolones given with ●**theophylline**; ciprofloxacin and norfloxacin increase plasma concentration of ●**theophylline**
- Ulcer-healing Drugs: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by **sucralfate**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620
- Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by **zinc**

Rabeprazole see Proton Pump Inhibitors

Raloxifene

- Anticoagulants: raloxifene antagonises anticoagulant effect of **coumarins**
- Lipid-regulating Drugs: absorption of raloxifene reduced by **colestyramine** (manufacturer of raloxifene advises avoid concomitant administration)

Raltegravir

- Antibacterials: plasma concentration of raltegravir reduced by ●**rifampicin**—consider increasing dose of raltegravir
- Ulcer-healing Drugs: plasma concentration of raltegravir increased by ●**meprazole**—avoid concomitant use; plasma concentration of raltegravir possibly increased by **histamine H₂-antagonists** and **proton pump inhibitors**—manufacturer of raltegravir advises avoid concomitant use

Raltitrexed

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Folates: manufacturer of raltitrexed advises avoid concomitant use with ●**folates**

Ramipril see ACE Inhibitors

Ranitidine see Histamine H₂-antagonists

Ranolazine

- Anti-arrhythmics: manufacturer of ranolazine advises avoid concomitant use with ●**disopyramide**

Ranolazine (*continued*)

- **Antibacterials:** plasma concentration of ranolazine possibly increased by ● **clarithromycin** and ● **telithromycin**—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by ● **rifampicin**—manufacturer of ranolazine advises avoid concomitant use
- **Antidepressants:** plasma concentration of ranolazine increased by **paroxetine**
- **Antifungals:** plasma concentration of ranolazine increased by ● **ketconazole**—avoid concomitant use; plasma concentration of ranolazine possibly increased by ● **itraconazole**, ● **posaconazole** and ● **voriconazole**—manufacturer of ranolazine advises avoid concomitant use
- **Antivirals:** plasma concentration of ranolazine possibly increased by ● **atazanavir**, ● **darunavir**, ● **fosamprenavir**, ● **indinavir**, ● **lopinavir**, ● **nelfinavir**, ● **ritonavir**, ● **saquinavir** and ● **tipranavir**—manufacturer of ranolazine advises avoid concomitant use
- **Beta-blockers:** manufacturer of ranolazine advises avoid concomitant use with ● **sotalol**
- **Calcium-channel Blockers:** plasma concentration of ranolazine increased by **diltiazem** and **verapamil** (consider reducing dose of ranolazine)
- **Cardiac Glycosides:** ranolazine increases plasma concentration of **digoxin**
- **Ciclosporin:** plasma concentration of ranolazine possibly increased by **ciclosporin**
- **Grapefruit Juice:** plasma concentration of ranolazine possibly increased by ● **grapefruit juice**—manufacturer of ranolazine advises avoid concomitant use
- **Lipid-regulating Drugs:** ranolazine increases plasma concentration of **simvastatin** (consider reducing dose of simvastatin)

Rasagiline

Note Rasagiline is a MAO-B inhibitor

- **Analgesics:** avoid concomitant use of rasagiline with ● **dextromethorphan**; risk of CNS toxicity when rasagiline given with ● **pethidine** (avoid pethidine for 2 weeks after rasagiline)
- **Antibacterials:** plasma concentration of rasagiline increased by **ciprofloxacin**
- **Antidepressants:** after stopping rasagiline do not start ● **fluoxetine** for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start ● **fluvoxamine** for 2 weeks; risk of hypertensive crisis when rasagiline given with ● **MAOIs**, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with ● **SSRIs** or ● **tricyclics**
- **Dopaminergics:** plasma concentration of rasagiline possibly reduced by **entacapone**
- **Memantine:** effects of dopaminergics possibly enhanced by **memantine**
- **Methyl dopa:** antiparkinsonian effect of dopaminergics antagonised by **methyl dopa**
- **Sympathomimetics:** avoid concomitant use of rasagiline with ● **sympathomimetics**

Reboxetine

- **Antibacterials:** manufacturer of reboxetine advises avoid concomitant use with ● **macrolides**
- **Antidepressants:** manufacturer of reboxetine advises avoid concomitant use with ● **fluvoxamine**; increased risk of hypertension and CNS excitation when reboxetine given with ● **MAOIs** (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)
- **Antifungals:** manufacturer of reboxetine advises avoid concomitant use with ● **imidazoles** and ● **triazoles**
- **Antimalarials:** avoidance of antidepressants advised by manufacturer of **artemether/lumefantrine**
- **Atomoxetine:** possible increased risk of convulsions when antidepressants given with **atomoxetine**
- **Diuretics:** possible increased risk of hypokalaemia when reboxetine given with **loop diuretics** or **thiazides and related diuretics**

Reboxetine (*continued*)

- **Ergot Alkaloids:** possible risk of hypertension when reboxetine given with **ergotamine** and **methysergide**
- **Remifentanyl** see Opioid Analgesics
- **Repaglinide** see Antidiabetics
- **Retinoids**
 - **Alcohol:** etretinate formed from acitretin in presence of ● **alcohol** (increased risk of teratogenicity in women of child-bearing potential)
 - **Antibacterials:** possible increased risk of benign intracranial hypertension when retinoids given with ● **tetracyclines** (avoid concomitant use)
 - **Anticoagulants:** acitretin possibly reduces anticoagulant effect of ● **coumarins**
 - **Antiepileptics:** isotretinoin possibly reduces plasma concentration of **carbamazepine**
 - **Antifungals:** plasma concentration of alitretinoin increased by **ketconazole**
 - **Cytotoxics:** acitretin increases plasma concentration of ● **methotrexate** (also increased risk of hepatotoxicity)—avoid concomitant use
 - **Lipid-regulating Drugs:** alitretinoin reduces plasma concentration of **simvastatin**
 - **Vitamins:** risk of hypervitaminosis A when retinoids given with **vitamin A**
- **Ribavirin**
 - **Antivirals:** effects of ribavirin possibly reduced by ● **abacavir**; increased risk of side-effects when ribavirin given with ● **didanosine**—avoid concomitant use; increased risk of toxicity when ribavirin given with ● **stavudine**; increased risk of anaemia when ribavirin given with ● **zidovudine**—avoid concomitant use
 - **Azathioprine:** ribavirin possibly enhances myelosuppressive effects of ● **azathioprine**
- **Rifabutin** see Rifamycins
- **Rifampicin** see Rifamycins
- **Rifamycins**
 - **ACE Inhibitors:** rifampicin reduces plasma concentration of active metabolite of **imidapril** (reduced antihypertensive effect)
 - **Analgesics:** rifampicin reduces plasma concentration of **celecoxib**, **diclofenac** and **etoricoxib**; rifampicin accelerates metabolism of **alfentanil**, **codeine**, **fentanyl**, **methadone** and **morphine** (reduced effect); rifampicin possibly accelerates metabolism of **oxycodone**
 - **Angiotensin-II Receptor Antagonists:** rifampicin reduces plasma concentration of **losartan** and its active metabolite
 - **Antacids:** absorption of rifampicin reduced by **antacids**
 - **Anti-arrhythmics:** rifamycins accelerate metabolism of ● **disopyramide** (reduced plasma concentration); rifampicin reduces plasma concentration of ● **dronedrone**—avoid concomitant use; rifampicin accelerates metabolism of ● **propafenone** (reduced effect)
 - **Antibacterials:** rifamycins reduce plasma concentration of **clarithromycin** and **dapson**; plasma concentration of rifabutin increased by ● **clarithromycin** (increased risk of uveitis—reduce rifabutin dose); rifampicin reduces plasma concentration of **doxycycline**—consider increasing dose of doxycycline; rifampicin accelerates metabolism of **chloramphenicol** (reduced plasma concentration); rifampicin reduces plasma concentration of **linezolid** (possible therapeutic failure of linezolid); plasma concentration of rifabutin possibly increased by ● **macrolides** (increased risk of uveitis—reduce rifabutin dose); rifampicin reduces plasma concentration of ● **telithromycin** (avoid during and for 2 weeks after rifampicin); rifampicin possibly reduces plasma concentration of **trimethoprim**
 - **Anticoagulants:** rifamycins accelerate metabolism of ● **coumarins** (reduced anticoagulant effect); rifampicin reduces plasma concentration of **rivaroxaban**
 - **Antidiabetics:** rifamycins accelerate metabolism of ● **tolbutamide** (reduced effect); rifampicin reduces plasma concentration of **nateglinide**; rifampicin

Rifamycins

- **Antidiabetics** (*continued*)
possibly antagonises hypoglycaemic effect of **repaglinide**; rifamycins possibly accelerate metabolism of ● **sulfonylureas** (reduced effect)
- **Antiepileptics**: rifabutin reduces plasma concentration of ● **carbamazepine**; rifampicin reduces plasma concentration of ● **lamotrigine**; plasma concentration of rifampicin possibly reduced by **phenobarbital**; rifamycins accelerate metabolism of ● **phenytoin** (reduced plasma concentration)
- **Antifungals**: rifampicin accelerates metabolism of ● **ketoconazole** (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of rifabutin increased by ● **fluconazole** (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of ● **fluconazole** (reduced plasma concentration); rifabutin and rifampicin reduce plasma concentration of ● **itraconazole**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by ● **posaconazole** (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of ● **posaconazole** and ● **terbinafine**; plasma concentration of rifabutin increased by ● **voriconazole**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of ● **voriconazole**—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of **caspofungin** (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by ● **triazoles** (increased risk of uveitis—reduce rifabutin dose)
- Antihistamines**: rifampicin possibly reduces effects of **fenofenadine**
- **Antimalarials**: rifampicin reduces plasma concentration of ● **mefloquine**—avoid concomitant use; rifampicin reduces plasma concentration of ● **quinine**
- Antimuscarinics**: rifampicin reduces plasma concentration of active metabolite of **fesoterodine**
- **Antipsychotics**: rifampicin accelerates metabolism of ● **haloperidol** (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of ● **aripiprazole**—increase dose of aripiprazole; rifampicin possibly reduces plasma concentration of **clozapine**
- **Antivirals**: rifampicin possibly reduces plasma concentration of **abacavir** and **ritonavir**; rifampicin reduces plasma concentration of ● **atazanavir**, ● **lopinavir** and ● **nevirapine**—avoid concomitant use; plasma concentration of rifabutin increased by ● **atazanavir**, ● **darunavir**, ● **fosamprenavir** and ● **tipranavir** (reduce dose of rifabutin); rifampicin significantly reduces plasma concentration of ● **darunavir**, ● **fosamprenavir** and ● **nelfinavir**—avoid concomitant use; plasma concentration of rifabutin reduced by **efavirenz**—increase dose of rifabutin; rifampicin reduces plasma concentration of **efavirenz**—increase dose of efavirenz; plasma concentration of both drugs reduced when rifabutin given with ● **etravirine**; avoidance of rifampicin advised by manufacturer of **etravirine** and **zidovudine**; rifampicin accelerates metabolism of ● **indinavir** (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by ● **indinavir**—avoid concomitant use; rifampicin reduces plasma concentration of ● **maraviroc** and ● **raltegravir**—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin increased by ● **nelfinavir** (half dose of rifabutin); plasma concentration of rifabutin possibly increased by **nevirapine**; plasma concentration of rifabutin increased by ● **ritonavir** (increased risk of toxicity); rifampicin significantly reduces plasma concentration of ● **saquinavir**, also risk of hepatotoxicity

Rifamycins

- **Antivirals** (*continued*)
city—avoid concomitant use; plasma concentration of rifabutin increased by ● **saquinavir** (also plasma concentration of saquinavir reduced); rifampicin possibly reduces plasma concentration of ● **tipranavir**—avoid concomitant use
- Anxiolytics and Hypnotics**: rifampicin accelerates metabolism of **diazepam** (reduced plasma concentration); rifampicin possibly accelerates metabolism of **benzodiazepines** (reduced plasma concentration); rifampicin possibly accelerates metabolism of **bupirone** and **zaleplon**; rifampicin accelerates metabolism of **zolpidem** (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of **zopiclone**
- Apreritant**: rifampicin reduces plasma concentration of **apreritant**
- **Atovaquone**: rifabutin and rifampicin reduce plasma concentration of ● **atovaquone** (possible therapeutic failure of atovaquone)
- Beta-blockers**: rifampicin accelerates metabolism of **bisoprolol** and **propranolol** (plasma concentration significantly reduced); rifampicin reduces plasma concentration of **carvedilol**, **celiprolol** and **metoprolol**
- **Bosentan**: rifampicin reduces plasma concentration of ● **bosentan**—avoid concomitant use
- **Calcium-channel Blockers**: rifampicin possibly accelerates metabolism of ● **isradipine** and ● **nicardipine** (possibly significantly reduced plasma concentration); rifampicin accelerates metabolism of ● **diltiazem**, ● **nifedipine**, ● **nimodipine** and **verapamil** (plasma concentration significantly reduced)
- Cardiac Glycosides**: rifampicin possibly reduces plasma concentration of **digoxin**
- **Cyclosporin**: rifampicin accelerates metabolism of ● **cyclosporin** (reduced plasma concentration)
- **Corticosteroids**: rifamycins accelerate metabolism of ● **corticosteroids** (reduced effect)
- **Cytotoxics**: rifampicin accelerates metabolism of ● **dasatinib** (reduced plasma concentration—avoid concomitant use); rifampicin accelerates metabolism of **erlotinib** and **sunitinib** (reduced plasma concentration); rifampicin reduces plasma concentration of ● **everolimus** and **sorafenib**; rifampicin reduces plasma concentration of ● **gefitinib**, ● **imatinib** and ● **nilotinib**—avoid concomitant use; avoidance of rifabutin and rifampicin advised by manufacturer of ● **lapatinib**; avoidance of rifampicin advised by manufacturer of ● **pazopanib**; rifampicin reduces plasma concentration of active metabolite of ● **temsirolimus**—avoid concomitant use; rifampicin possibly reduces plasma concentration of ● **vinflunine**—manufacturer of vinflunine advises avoid concomitant use
- Deferasirox**: rifampicin reduces plasma concentration of **deferasirox**
- **Diuretics**: rifampicin reduces plasma concentration of ● **epplerenone**—avoid concomitant use
- Hormone Antagonists**: rifampicin possibly reduces plasma concentration of **exemestane**; rifampicin accelerates metabolism of **tamoxifen** (reduced plasma concentration)
- 5HT₂ Antagonists**: rifampicin accelerates metabolism of **ondansetron** (reduced effect)
- Leflunomide**: rifampicin possibly increases plasma concentration of active metabolite of **leflunomide**
- Lipid-regulating Drugs**: rifampicin possibly reduces plasma concentration of **atorvastatin** and **simvastatin**; rifampicin accelerates metabolism of **fluvastatin** (reduced effect)
- **Mycophenolate**: rifampicin reduces plasma concentration of active metabolite of ● **mycophenolate**
- **Oestrogens**: rifamycins accelerate metabolism of ● **oestrogens** (reduced contraceptive effect—see p. 398)

Rifamycins (*continued*)

- Progestogens: rifamycins accelerate metabolism of ● **progestogens** (reduced contraceptive effect—see p. 398)
 - Ranolazine: rifampicin reduces plasma concentration of ● **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
Roflumilast: rifampicin reduces plasma concentration of ● **roflumilast**—consider increasing dose of roflumilast
 - Sirolimus: rifabutin and rifampicin reduce plasma concentration of ● **sirolimus**—avoid concomitant use
 - Tacrolimus: rifabutin possibly reduces plasma concentration of ● **tacrolimus**; rifampicin reduces plasma concentration of ● **tacrolimus**
 - Tadalafil: rifampicin reduces plasma concentration of ● **tadalafil**—manufacturer of tadalafil advises avoid concomitant use
- Theophylline: rifampicin accelerates metabolism of ● **theophylline** (reduced plasma concentration)
- Thyroid Hormones: rifampicin accelerates metabolism of ● **levothyroxine** (may increase requirements for levothyroxine in hypothyroidism)
- Tibolone: rifampicin accelerates metabolism of ● **tibolone** (reduced plasma concentration)
- Tolvaptan: rifampicin reduces plasma concentration of ● **tolvaptan**
- Ulcer-healing Drugs: rifampicin accelerates metabolism of ● **cimetidine** (reduced plasma concentration)
- Ulipristal: avoidance of rifampicin advised by manufacturer of ● **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vaccines: antibacterials inactivate ● **oral typhoid vaccine**—see p. 620

Risedronate Sodium see Bisphosphonates

Risperidone see Antipsychotics

Ritodrine see Sympathomimetics, Beta₂

Ritonavir

- Alpha-blockers: ritonavir possibly increases plasma concentration of ● **alfuzosin**—avoid concomitant use
 - Analgesics: ritonavir possibly increases plasma concentration of ● **NSAIDs** and ● **buprenorphine**; ritonavir increases plasma concentration of ● **dextropropoxyphene** and ● **piroxicam** (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of ● **alfentanil** and ● **fentanyl**; ritonavir reduces plasma concentration of ● **methadone**; ritonavir possibly reduces plasma concentration of ● **morphine**; ritonavir reduces plasma concentration of ● **pehthidine**, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
 - Anti-arrhythmics: ritonavir increases plasma concentration of ● **amiodarone** and ● **propafenone** (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of ● **disopyramide** (increased risk of toxicity); avoidance of ritonavir advised by manufacturer of ● **dronedarone**; ritonavir possibly increases plasma concentration of ● **flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use)
 - Antibacterials: ritonavir possibly increases plasma concentration of ● **azithromycin** and ● **erythromycin**; ritonavir increases plasma concentration of ● **clarithromycin** (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of ● **rifabutin** (increased risk of toxicity); plasma concentration of ritonavir possibly reduced by ● **rifampicin**; plasma concentration of both drugs increased when ritonavir given with ● **fusidic acid**—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of ● **telithromycin**
 - Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of ● **warfarin**; ritonavir possibly enhances anticoagulant effect of ● **coumarins** and ● **phenindione**; ritonavir increases plasma concentration of ● **rivaroxaban**—manufacturer of rivaroxaban advises avoid concomitant use
- Ritonavir** (*continued*)
- Antidepressants: ritonavir possibly reduces plasma concentration of ● **paroxetine**; ritonavir increases plasma concentration of ● **trazodone** (increased risk of toxicity); ritonavir possibly increases plasma concentration of ● **SSRIs** and ● **tricyclics**; plasma concentration of ritonavir reduced by ● **St John's wort**—avoid concomitant use
 - Antidiabetics: ritonavir possibly increases plasma concentration of ● **tolbutamide**
 - Antiepileptics: ritonavir possibly increases plasma concentration of ● **carbamazepine**; ritonavir possibly reduces plasma concentration of ● **lamotrigine**; plasma concentration of ritonavir possibly reduced by ● **phenytoin**, also plasma concentration of phenytoin possibly affected
 - Antifungals: combination of ritonavir with ● **itraconazole** or ● **ketoconazole** may increase plasma concentration of either drug (or both); plasma concentration of ritonavir increased by ● **fluconazole**; ritonavir reduces plasma concentration of ● **voriconazole**—avoid concomitant use
 - Antihistamines: ritonavir possibly increases plasma concentration of ● **non-sedating antihistamines**
 - Antimalarials: caution with ritonavir advised by manufacturer of ● **artemether/lumefantrine**; ritonavir increases plasma concentration of ● **quinine** (increased risk of toxicity)
 - Antimuscarinics: avoidance of ritonavir advised by manufacturer of ● **darifenacin** and ● **tolterodine**; manufacturer of fesoterodine advises dose reduction when ritonavir given with ● **fesoterodine**—consult fesoterodine product literature; ritonavir increases plasma concentration of ● **solifenacin**
 - Antipsychotics: ritonavir possibly increases plasma concentration of ● **antipsychotics**; ritonavir possibly inhibits metabolism of ● **aripiprazole** (reduce dose of aripiprazole); ritonavir increases plasma concentration of ● **clozapine** (increased risk of toxicity)—avoid concomitant use; ritonavir reduces plasma concentration of ● **olanzapine**—consider increasing dose of olanzapine; ritonavir increases plasma concentration of ● **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use)
 - Antivirals: ritonavir increases toxicity of ● **efavirenz**, monitor liver function tests; ritonavir increases plasma concentration of ● **indinavir**, ● **maraviroc** and ● **saquinavir**; combination of ritonavir with ● **nelfinavir** may increase plasma concentration of either drug (or both)
 - Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of ● **anxiolytics** and ● **hypnotics**; ritonavir possibly increases plasma concentration of ● **alprazolam**, ● **diazepam**, ● **flurazepam** and ● **zolpidem** (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of ● **midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of ● **bupropion** (increased risk of toxicity)
 - Aprepitant: ritonavir possibly increases plasma concentration of ● **aprepitant**
 - Bosentan: ritonavir possibly increases plasma concentration of ● **bosentan**
 - Bupropion: ritonavir reduces plasma concentration of ● **bupropion**
 - Calcium-channel Blockers: ritonavir possibly increases plasma concentration of ● **calcium-channel blockers**; avoidance of ritonavir advised by manufacturer of ● **lercanidipine**
 - Cardiac Glycosides: ritonavir possibly increases plasma concentration of ● **digoxin**
 - Ciclosporin: ritonavir possibly increases plasma concentration of ● **ciclosporin**
 - Colchicine: ritonavir possibly increases risk of ● **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Ritonavir (*continued*)

- Corticosteroids: ritonavir possibly increases plasma concentration of **corticosteroids**, **dexamethasone** and **prednisolone**; ritonavir increases plasma concentration of **inhaled** and **intranasal budesonide** and **fluticasone**
- Cytotoxics: ritonavir possibly increases plasma concentration of **everolimus** and **vinflunine**—manufacturer of everolimus and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of **lapatinib**, **nilotinib** and **pazopanib**; ritonavir possibly increases plasma concentration of **docetaxel** (increased risk of toxicity); ritonavir increases plasma concentration of **paclitaxel**; ritonavir possibly increases plasma concentration of **vinblastine**
- Diuretics: ritonavir increases plasma concentration of **eplerenone**—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when ritonavir given with **ergotamine** and **methysergide**—avoid concomitant use
- 5HT₂ Agonists: ritonavir increases plasma concentration of **eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: ritonavir possibly increases plasma concentration of **ivabradine**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with **atorvastatin**; possible increased risk of myopathy when ritonavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with **simvastatin** (avoid concomitant use)
- Oestrogens: ritonavir accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 398)
- Ranolazine: ritonavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: ritonavir significantly increases plasma concentration of **sildenafil**—avoid concomitant use
- Sympathomimetics: ritonavir possibly increases plasma concentration of **dexamfetamine**
- Tacrolimus: ritonavir possibly increases plasma concentration of **tacrolimus**
- Tadalafil: ritonavir increases plasma concentration of **tadalafil**—manufacturer of tadalafil advises avoid concomitant use
- Theophylline: ritonavir accelerates metabolism of **theophylline** (reduced plasma concentration)
- Ulipristal: avoidance of ritonavir advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vardenafil: ritonavir increases plasma concentration of **vardenafil**—avoid concomitant use

Rivaroxaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins)
- Antibacterials: plasma concentration of rivaroxaban reduced by **rifampicin**
- Antifungals: plasma concentration of rivaroxaban increased by **ketokonazole**—avoid concomitant use; manufacturer of rivaroxaban advises avoid concomitant use with **itraconazole**, **posaconazole** and **voriconazole**
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with **atazanavir**, **darunavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **nelfinavir**, **saquinavir** and **tipranavir**; plasma concentration of rivaroxaban increased by **ritonavir**—manufacturer of rivaroxaban advises avoid concomitant use

Rivastigmine see Parasympathomimetics

Rizatriptan see 5HT₁ Agonists

Rocuronium see Muscle Relaxants

Roflumilast

- Antibacterials: plasma concentration of roflumilast reduced by **rifampicin**—consider increasing dose of roflumilast
- Antidepressants: metabolism of roflumilast inhibited by **fluvoxamine**
- Theophylline: manufacturer of roflumilast advises avoid concomitant use with **theophylline**
- Ulcer-healing Drugs: metabolism of roflumilast inhibited by **cimetidine**

Ropinirole

- Antibacterials: metabolism of ropinirole inhibited by **ciprofloxacin** (increased plasma concentration)
- Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of **antipsychotics** (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**
- Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of **metoclopramide** (antagonism of effect)
- Oestrogens: plasma concentration of ropinirole increased by **oestrogens**

Ropivacaine

- Anti-arrhythmics: increased myocardial depression when ropivacaine given with **anti-arrhythmics**
- Antidepressants: metabolism of ropivacaine inhibited by **fluvoxamine**—avoid prolonged administration of ropivacaine

Rosuvastatin see Statins

Rotigotine

- Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of **antipsychotics** (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**
- Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of **metoclopramide** (antagonism of effect)

Rufinamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with **St John's wort**
- Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with **carbamazepine**; plasma concentration of rufinamide possibly reduced by **phenobarbital**; plasma concentration of rufinamide possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased; plasma concentration of rufinamide possibly increased by **valproate** (reduce dose of rufinamide)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Oestrogens: rufinamide accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 398)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Progestogens: rufinamide accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 398)

Rupatadine see Antihistamines

St John's Wort

- Analgesics: St John's wort possibly reduces plasma concentration of **methadone**
- Anti-arrhythmics: St John's wort possibly reduces plasma concentration of **dronedarone**—avoid concomitant use
 - Antibacterials: St John's wort reduces plasma concentration of **telithromycin** (avoid during and for 2 weeks after St John's wort)
 - Anticoagulants: St John's wort reduces anticoagulant effect of **coumarins** (avoid concomitant use)
 - Antidepressants: possible increased serotonergic effects when St John's wort given with **duloxetine** or **venlafaxine**; St John's wort reduces plasma concentration of **amitriptyline**; increased serotonergic effects when St John's wort given with **SSRIs**—avoid concomitant use
 - Antiepileptics: avoid concomitant use of St John's wort with **antiepileptics**
 - Antifungals: St John's wort reduces plasma concentration of **voriconazole**—avoid concomitant use
 - Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether/lumefantrine**
 - Antipsychotics: St John's wort possibly reduces plasma concentration of **aripiprazole**—increase dose of aripiprazole
 - Antivirals: St John's wort reduces plasma concentration of **atazanavir**, **darunavir**, **efavirenz**, **fosamprenavir**, **indinavir**, **lopinavir**, **nelfinavir**, **nevirapine**, **ritonavir** and **saquinavir**—avoid concomitant use; avoidance of St John's wort advised by manufacturer of **etravirine**; St John's wort possibly reduces plasma concentration of **maraviroc** and **tipranavir**—avoid concomitant use
- Anxiolytics and Hypnotics: St John's wort possibly reduces plasma concentration of **oral/midazolam**
- Aprepitant: avoidance of St John's wort advised by manufacturer of **aprepitant**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Calcium-channel Blockers: St John's wort possibly reduces plasma concentration of **amlodipine**; St John's wort reduces plasma concentration of **nifedipine**; St John's wort significantly reduces plasma concentration of **verapamil**
 - Cardiac Glycosides: St John's wort reduces plasma concentration of **digoxin**—avoid concomitant use
 - Cyclosporin: St John's wort reduces plasma concentration of **cyclosporin**—avoid concomitant use
 - Cytotoxics: St John's wort possibly reduces plasma concentration of **everolimus** and **vinflunine**—manufacturer of everolimus and vinflunine advises avoid concomitant use; avoidance of St John's wort advised by manufacturer of **gefitinib** and **lapatinib**; St John's wort reduces plasma concentration of **matinib**—avoid concomitant use; St John's wort accelerates metabolism of **irinotecan** (reduced plasma concentration—avoid concomitant use)
 - Diuretics: St John's wort reduces plasma concentration of **eplerenone**—avoid concomitant use
 - 5HT₂ Agonists: increased serotonergic effects when St John's wort given with **5HT₂ agonists**—avoid concomitant use
- Ivabradine: St John's wort reduces plasma concentration of **ivabradine**—avoid concomitant use
- Lipid-regulating Drugs: St John's wort reduces plasma concentration of **simvastatin**
- Oestrogens: St John's wort reduces contraceptive effect of **oestrogens** (avoid concomitant use)
 - Progestogens: St John's wort reduces contraceptive effect of **progestogens** (avoid concomitant use)
 - Tacrolimus: St John's wort reduces plasma concentration of **tacrolimus**—avoid concomitant use
 - Theophylline: St John's wort reduces plasma concentration of **theophylline**—avoid concomitant use
- Ulcer-healing Drugs: St John's wort possibly reduces plasma concentration of **omeprazole**

St John's Wort (continued)

- Ulipristal: avoidance of St John's wort advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Salbutamol** see Sympathomimetics, Beta₂
- Salmeterol** see Sympathomimetics, Beta₂
- Saquinavir**
- Analgesics: increased risk of ventricular arrhythmias when saquinavir given with **alfentanil**, **fentanyl** or **methadone**—avoid concomitant use
 - Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir given with **amiodarone**, **disopyramide**, **dronedarone**, **flecainide**, **lidocaine** or **propafenone**—avoid concomitant use
 - Antibacterials: increased risk of ventricular arrhythmias when saquinavir given with **clarithromycin**, **dapsone** or **erythromycin**—avoid concomitant use; saquinavir increases plasma concentration of **rifabutin** (also plasma concentration of saquinavir reduced); plasma concentration of saquinavir significantly reduced by **rifampicin**, also risk of hepatotoxicity—avoid concomitant use; avoidance of concomitant saquinavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
- Anticoagulants: saquinavir possibly enhances anticoagulant effect of **warfarin**; avoidance of saquinavir advised by manufacturer of **rivaroxaban**
- Antidepressants: increased risk of ventricular arrhythmias when saquinavir given with **trazodone** or **tricyclics**—avoid concomitant use; plasma concentration of saquinavir reduced by **St John's wort**—avoid concomitant use
 - Antiepileptics: plasma concentration of saquinavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of saquinavir increased by **ketconazole**; plasma concentration of saquinavir possibly increased by **imidazoles** and **triazoles**
- Antihistamines: increased risk of ventricular arrhythmias when saquinavir given with **mizolastine**—avoid concomitant use
 - Antimalarials: caution with saquinavir advised by manufacturer of **artemether/lumefantrine**; increased risk of ventricular arrhythmias when saquinavir given with **quinine**—avoid concomitant use
- Antimuscarinics: avoidance of saquinavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when saquinavir given with **fesoterodine**—consult fesoterodine product literature
- Antipsychotics: increased risk of ventricular arrhythmias when saquinavir given with **clozapine**, **haloperidol** or **phenothiazines**—avoid concomitant use; saquinavir possibly inhibits metabolism of **aripiprazole** (reduce dose of aripiprazole); saquinavir possibly increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use)
 - Antivirals: increased risk of ventricular arrhythmias when saquinavir given with **atazanavir** or **lopinavir**—avoid concomitant use; saquinavir reduces plasma concentration of **darunavir**; plasma concentration of saquinavir significantly reduced by **efavirenz**; plasma concentration of saquinavir increased by **indinavir** and **ritonavir**; saquinavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of saquinavir increased by **nelfinavir**—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir reduced by **tipranavir**
 - Anxiolytics and Hypnotics: saquinavir increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of **oral midazolam**)

Saquinavir (continued)

- Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with ●**sotalol**—avoid concomitant use
- Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ●**ciclosporin**
- Corticosteroids: plasma concentration of saquinavir possibly reduced by ●**dexamethasone**
- Cytotoxics: saquinavir possibly increases plasma concentration of ●**everolimus**—manufacturer of everolimus advises avoid concomitant use; avoidance of saquinavir advised by manufacturer of ●**lapatinib** and ●**pazopanib**
- Diuretics: saquinavir increases plasma concentration of ●**plerenone** (reduce dose of plerenone)
- Ergot Alkaloids: increased risk of ergotism when saquinavir given with ●**ergotamine** and ●**methysergide**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with ●**atorvastatin**; possible increased risk of myopathy when saquinavir given with ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with ●**simvastatin** (avoid concomitant use)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when saquinavir given with ●**pentamidine isetionate**—avoid concomitant use
- Ranolazine: saquinavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: increased risk of ventricular arrhythmias when saquinavir given with ●**sildenafil**—avoid concomitant use
- Tacrolimus: saquinavir increases plasma concentration of ●**tacrolimus** (consider reducing dose of tacrolimus)
- Tadalafil: increased risk of ventricular arrhythmias when saquinavir given with ●**tadalafil**—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by ●**cimetidine**; plasma concentration of saquinavir possibly increased by ●**esomeprazole**, ●**lansoprazole**, ●**pantoprazole** and ●**rabeprazole**—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir increased by ●**omeprazole**—manufacturer of saquinavir advises avoid concomitant use
- Vardenafil: increased risk of ventricular arrhythmias when saquinavir given with ●**vardenafil**—avoid concomitant use

Saxagliptin *see* Antidiabetics**Selegiline**

Note Selegiline is a MAO-B inhibitor

- Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with ●**pehtidine** (avoid concomitant use); manufacturer of selegiline advises avoid concomitant use with ●**opioid analgesics**
- Antidepressants: manufacturer of selegiline advises avoid concomitant use with ●**citalopram** and ●**escitalopram**; increased risk of hypertension and CNS excitation when selegiline given with ●**fluoxetine** (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●**fluvoxamine**, ●**sertraline** or ●**venlafaxine** (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●**paroxetine** (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with ●**MAOIs**—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with ●**moclobemide**; CNS toxicity reported when selegiline given with ●**tricyclics**

Selegiline (continued)

- Dopaminergics: max. dose of 10 mg selegiline advised by manufacturer of ●**entacapone** if used concomitantly; selegiline enhances effects and increases toxicity of ●**levodopa** (reduce dose of levodopa)
- 5HT₂ Agonists: manufacturer of selegiline advises avoid concomitant use with ●**5HT₂ agonists**
- Memantine: effects of dopaminergics and selegiline possibly enhanced by ●**memantine**
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by ●**methyldopa**
- Oestrogens: plasma concentration of selegiline increased by ●**oestrogens**—manufacturer of selegiline advises avoid concomitant use
- Progestogens: plasma concentration of selegiline increased by ●**progestogens**—manufacturer of selegiline advises avoid concomitant use
- Sympathomimetics: risk of hypertensive crisis when selegiline given with ●**dopamine**

Selenium

- Eltrombopag: selenium possibly reduces absorption of ●**eltrombopag** (give at least 4 hours apart)
- Vitamins: absorption of selenium possibly reduced by ●**ascorbic acid** (give at least 4 hours apart)

Sertraline *see* Antidepressants, SSRI**Sevelamer**

- Antibacterials: sevelamer reduces bioavailability of ●**ciprofloxacin**
- Ciclosporin: sevelamer possibly reduces plasma concentration of ●**ciclosporin**
- Mycophenolate: sevelamer possibly reduces plasma concentration of ●**mycophenolate**
- Tacrolimus: sevelamer possibly reduces plasma concentration of ●**tacrolimus**
- Thyroid Hormones: sevelamer possibly reduces absorption of ●**levothyroxine**

Sevoflurane *see* Anaesthetics, General**Sildenafil**

- Alpha-blockers: enhanced hypotensive effect when sildenafil given with ●**alpha-blockers** (avoid alpha-blockers for 4 hours after sildenafil)—*see* also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5
- Antibacterials: plasma concentration of sildenafil possibly increased by ●**clarithromycin** and ●**telithromycin**—reduce initial dose of sildenafil; plasma concentration of sildenafil increased by ●**erythromycin**—reduce initial dose of sildenafil
- Antifungals: plasma concentration of sildenafil increased by ●**itraconazole** and ●**ketconazole**—reduce initial dose of sildenafil
- Antivirals: side-effects of sildenafil possibly increased by ●**atazanavir**; plasma concentration of sildenafil reduced by ●**etravirine**; plasma concentration of sildenafil possibly increased by ●**fosamprenavir**; plasma concentration of sildenafil increased by ●**indinavir**—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by ●**nelfinavir**—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ●**ritonavir**—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with ●**saquinavir**—avoid concomitant use
- Bosentan: plasma concentration of sildenafil reduced by ●**bosentan**
- Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with ●**amlodipine**
- Grapefruit Juice: plasma concentration of sildenafil possibly increased by ●**grapefruit juice**
- Nicorandil: sildenafil significantly enhances hypotensive effect of ●**nicorandil** (avoid concomitant use)
- Nitrates: sildenafil significantly enhances hypotensive effect of ●**nitrates** (avoid concomitant use)
- Ulcer-healing Drugs: plasma concentration of sildenafil increased by ●**cimetidine** (consider reducing dose of sildenafil)

Simvastatin *see* Statins

Sirolimus

- Anti-arrhythmics: caution with sirolimus advised by manufacturer of **dronedaron**
- Anticrosticals: plasma concentration of sirolimus increased by ●**clarithromycin** and ●**telithromycin**—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with ●**erythromycin**; plasma concentration of sirolimus reduced by ●**rifabutin** and ●**rifampicin**—avoid concomitant use
 - Antifungals: plasma concentration of sirolimus increased by ●**itraconazole**, ●**ketoconazole** and ●**voriconazole**—avoid concomitant use; plasma concentration of sirolimus increased by **micafungin** and ●**miconazole**; plasma concentration of sirolimus possibly increased by **posaconazole**
 - Antivirals: plasma concentration of sirolimus possibly increased by ●**atazanavir** and **lopinavir**
 - Calcium-channel Blockers: plasma concentration of sirolimus increased by ●**diltiazem**; plasma concentration of both drugs increased when sirolimus given with ●**verapamil**
- Ciclosporin: plasma concentration of sirolimus increased by **ciclosporin**
- Grapefruit Juice: plasma concentration of sirolimus increased by ●**grapefruit juice**—avoid concomitant use

Sitagliptin *see* Antidiabetics

Sitaxentan

- Anticoagulants: sitaxentan enhances anticoagulant effect of ●**coumarins**
 - Ciclosporin: plasma concentration of sitaxentan increased by ●**ciclosporin**—avoid concomitant use
- Oestrogens: sitaxentan increases plasma concentration of **oestrogens**
- Progestogens: sitaxentan increases plasma concentration of **progestogens**

Sodium Aurothiomalate

- ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with ●**ACE inhibitors**
- Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of **penicillamine** (increased risk of toxicity)

Sodium Benzoate

- Antiepileptics: effects of sodium benzoate possibly reduced by **valproate**
 - Antipsychotics: effects of sodium benzoate possibly reduced by **haloperidol**
- Corticosteroids: effects of sodium benzoate possibly reduced by **corticosteroids**
- Probenecid: excretion of conjugate formed by sodium benzoate possibly reduced by **probenecid**

Sodium Bicarbonate *see* Antacids

Sodium Citrate

- Anticrosticals: avoid concomitant use of sodium citrate with **methenamine**

Sodium Clodronate *see* Bisphosphonates

Sodium Nitroprusside *see* Vasodilator Antihypertensives

Sodium Oxybate

- Analgesics: effects of sodium oxybate enhanced by ●**opioid analgesics** (avoid concomitant use)
- Antidepressants: increased risk of side-effects when sodium oxybate given with **tricyclics**
- Antiepileptics: manufacturer of sodium oxybate advises avoid concomitant use with **phenobarbital**
- Antipsychotics: effects of sodium oxybate possibly enhanced by **antipsychotics**
- Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by ●**benzodiazepines** (avoid concomitant use)

Sodium Phenylbutyrate

- Antiepileptics: effects of sodium phenylbutyrate possibly reduced by **valproate**
- Antipsychotics: effects of sodium phenylbutyrate possibly reduced by **haloperidol**

Sodium Phenylbutyrate (*continued*)

- Corticosteroids: effects of sodium phenylbutyrate possibly reduced by **corticosteroids**
- Probenecid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by **probenecid**

Sodium Valproate *see* Valproate

Solifenacin *see* Antimuscarinics

Somatropin

- Corticosteroids: growth-promoting effect of somatropin may be inhibited by **corticosteroids**
- Oestrogens: increased doses of somatropin may be needed when given with **oestrogens** (when used as oral replacement therapy)

Sorafenib

- Anticrosticals: bioavailability of sorafenib reduced by **neomycin**; plasma concentration of sorafenib reduced by **rifampicin**
 - Anticoagulants: sorafenib possibly enhances anticoagulant effect of ●**coumarins**
 - Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: sorafenib possibly increases plasma concentration of **doxorubicin** and **irinotecan**; sorafenib increases plasma concentration of **docetaxel**

Sotalol *see* Beta-blockers

Spironolactone *see* Diuretics

Statins

- Antacids: absorption of rosuvastatin reduced by **antacids**
 - Anti-arrhythmics: increased risk of myopathy when simvastatin given with ●**amiodarone** or ●**dronedaron**
 - Anticrosticals: plasma concentration of atorvastatin and pravastatin increased by ●**clarithromycin**; increased risk of myopathy when simvastatin given with ●**clarithromycin**, ●**erythromycin** or ●**telithromycin** (avoid concomitant use); plasma concentration of rosuvastatin reduced by **erythromycin**; possible increased risk of myopathy when atorvastatin given with **erythromycin** or **fusidic acid**; plasma concentration of pravastatin increased by **erythromycin**; plasma concentration of atorvastatin and simvastatin possibly reduced by **rifampicin**; metabolism of fluvastatin accelerated by **rifampicin** (reduced effect); increased risk of myopathy when statins given with ●**daptomycin** (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with ●**fusidic acid**; increased risk of myopathy when atorvastatin given with ●**telithromycin** (avoid concomitant use); possible increased risk of myopathy when pravastatin given with **telithromycin**
 - Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of **warfarin**; rosuvastatin possibly enhances anticoagulant effect of ●**coumarins** and ●**phenindione**; fluvastatin and simvastatin enhance anticoagulant effect of ●**coumarins**
- Antidepressants: plasma concentration of simvastatin reduced by **St John's wort**
- Antidiabetics: fluvastatin possibly increases plasma concentration of **glibenclamide**
- Antiepileptics: plasma concentration of simvastatin reduced by ●**carbamazepine**—consider increasing dose of simvastatin; combination of fluvastatin with **phenytoin** may increase plasma concentration of either drug (or both)
 - Antifungals: increased risk of myopathy when simvastatin given with ●**itraconazole**, ●**ketoconazole** or ●**posaconazole** (avoid concomitant use); possible increased risk of myopathy when simvastatin given with ●**fluconazole** or ●**miconazole**—avoid concomitant use; plasma concentration of fluvastatin increased by **fluconazole**; increased risk of myopathy when atorvastatin given with ●**itraconazole** or ●**posaconazole** (avoid concomitant use); possible increased risk of myopathy when simvastatin given with **voriconazole**; possible increased risk of myopathy when atorvastatin given with **imidazoles** or **triazoles**

Statins (*continued*)

- Antivirals: possible increased risk of myopathy when atorvastatin given with **atazanavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **nelfinavir**, **ritonavir** or **saquinavir**; possible increased risk of myopathy when rosuvastatin given with **atazanavir**, **darunavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **nelfinavir**, **ritonavir** and **saquinavir**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when simvastatin given with **atazanavir**, **indinavir**, **nelfinavir**, **ritonavir** or **saquinavir** (avoid concomitant use); plasma concentration of pravastatin possibly increased by **darunavir**; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by **efavirenz**; plasma concentration of atorvastatin possibly reduced by **etravirine**; possible increased risk of myopathy when simvastatin given with **fosamprenavir** or **lopinavir**—avoid concomitant use; plasma concentration of rosuvastatin possibly increased by **tipranavir**—manufacturer of rosuvastatin advises avoid concomitant use; plasma concentration of simvastatin possibly increased by **tipranavir**—avoid concomitant use; plasma concentration of atorvastatin possibly increased by **tipranavir** (consider reducing dose of atorvastatin)
- Bosentan: plasma concentration of simvastatin reduced by **bosentan**
- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with **amlodipine**; plasma concentration of atorvastatin and simvastatin increased by **diltiazem**—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with **verapamil**
- Cardiac Glycosides: atorvastatin possibly increases plasma concentration of **digoxin**
- Cyclosporin: increased risk of myopathy when statins given with **cyclosporin**; increased risk of myopathy when rosuvastatin given with **cyclosporin** (avoid concomitant use)
- Colchicine: possible increased risk of myopathy when statins given with **colchicine**
- Cytotoxics: plasma concentration of simvastatin possibly increased by **dasatinib**; plasma concentration of simvastatin increased by **imatinib**
- Eltrombopag: plasma concentration of rosuvastatin increased by **eltrombopag** (consider reducing dose of rosuvastatin)
- Grapefruit Juice: plasma concentration of atorvastatin possibly increased by **grapefruit juice**; plasma concentration of simvastatin increased by **grapefruit juice**—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with **danazol**
- Lipid-regulating Drugs: increased risk of myopathy when statins given with **gemfibrozil** (preferably avoid concomitant use); increased risk of myopathy when statins given with **fibrates**; increased risk of myopathy when statins given with **nicotinic acid** (applies to lipid regulating doses of nicotinic acid)
- Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of **ethinylestradiol**
- Progestogens: atorvastatin increases plasma concentration of **norethisterone**; rosuvastatin increases plasma concentration of active metabolite of **norgestimate**; rosuvastatin increases plasma concentration of **norgestrel**
- Ranolazine: plasma concentration of simvastatin increased by **ranolazine** (consider reducing dose of simvastatin)
- Retinoids: plasma concentration of simvastatin reduced by **alitretinoin**

Stavudine

- Antivirals: increased risk of side-effects when stavudine given with **didanosine**; increased risk of toxicity when stavudine given with **ribavirin**; effects of stavudine possibly inhibited by **zidovudine** (manufacturers advise avoid concomitant use)

Stavudine (*continued*)

- Cytotoxics: effects of stavudine possibly inhibited by **doxorubicin**; increased risk of toxicity when stavudine given with **hydroxycarbamide**—avoid concomitant use

Stiripentol

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with **St John's wort**
- Antiepileptics: stiripentol increases plasma concentration of **carbamazepine**, **phenobarbital** and **phenytoin**
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Anxiolytics and Hypnotics: stiripentol increases plasma concentration of **clobazam**
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

Streptomycin *see* Aminoglycosides**Strontium Ranelate**

Antibacterials: strontium ranelate reduces absorption of **quinolones** and **tetracyclines** (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate

- Antibacterials: sucralfate reduces absorption of **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, **norfloxacin**, **ofloxacin** and **tetracyclines**
- Anticoagulants: sucralfate possibly reduces absorption of **coumarins** (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of **phenytoin**
- Antifungals: sucralfate reduces absorption of **ketconazole**
- Antipsychotics: sucralfate reduces absorption of **sulpiride**
- Cardiac Glycosides: sucralfate possibly reduces absorption of **cardiac glycosides**
- Theophylline: sucralfate possibly reduces absorption of **theophylline** (give at least 2 hours apart)
- Thyroid Hormones: sucralfate reduces absorption of **levothyroxine**
- Ulcer-healing Drugs: sucralfate possibly reduces absorption of **lansoprazole**

Sugammadex

- Antibacterials: response to sugammadex possibly reduced by **fusidic acid**
- Progestogens: sugammadex possibly reduces plasma concentration of **progestogens**—manufacturer of sugammadex advises additional contraceptive precautions

Sulfadiazine *see* Sulfonamides**Sulfadoxine** *see* Sulfonamides**Sulfamethoxazole** *see* Sulfonamides**Sulfasalazine** *see* Aminosalicylates**Sulfinpyrazone**

- Analgesics: effects of sulfinpyrazone antagonised by **aspirin**
- Antibacterials: sulfinpyrazone reduces excretion of **nitrofurantoin** (increased risk of toxicity); sulfinpyrazone reduces excretion of **penicillins**; effects of sulfinpyrazone antagonised by **pyrazinamide**
- Anticoagulants: sulfinpyrazone enhances anticoagulant effect of **coumarins**
- Antidiabetics: sulfinpyrazone enhances effects of **sulfonylureas**
- Antiepileptics: sulfinpyrazone increases plasma concentration of **phenytoin**
- Calcium-channel Blockers: sulfinpyrazone reduces plasma concentration of **verapamil**

Sulfapyrazone (*continued*)

- Cyclosporin: sulfapyrazone reduces plasma concentration of ●**cyclosporin**
Theophylline: sulfapyrazone reduces plasma concentration of ●**theophylline**

Sulfonamides

Anaesthetics, General: sulfonamides enhance effects of ●**thiopental**

Anaesthetics, Local: increased risk of methaemoglobinemia when sulfonamides given with ●**prilocaine**

Anti-arrhythmics: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with ●**amiodarone**—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole

- Antibacterials: increased risk of crystalluria when sulfonamides given with ●**methenamine**
- Anticoagulants: sulfonamides enhance anticoagulant effect of ●**coumarins**; sulfonamides possibly inhibit metabolism of ●**phenindione**
- Antidiabetics: sulfonamides rarely enhance the effects of ●**sulfonylureas**
- Antiepileptics: sulfonamides possibly increase plasma concentration of ●**phenytoin**
- Antimalarials: increased antifolate effect when sulfonamides given with ●**pyrimethamine**
- Antipsychotics: avoid concomitant use of sulfonamides with ●**clozapine** (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●**azathioprine**
- Cyclosporin: increased risk of nephrotoxicity when sulfonamides given with ●**cyclosporin**; sulfadiazine possibly reduces plasma concentration of ●**cyclosporin**
- Cytotoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●**mercaptopurine** or ●**methotrexate**; sulfonamides increase risk of ●**methotrexate** toxicity
- Potassium Aminobenzoate: effects of sulfonamides inhibited by ●**potassium aminobenzoate**
- Vaccines: antibacterials inactivate ●**oral typhoid vaccine**—see p. 620

Sulfonylureas see Antidiabetics

Sulindac see NSAIDs

Sulpiride see Antipsychotics

Sumatriptan see 5HT₁ Agonists

Sunitinib

Antibacterials: metabolism of sunitinib accelerated by ●**rifampicin** (reduced plasma concentration)

Antifungals: metabolism of sunitinib inhibited by ●**ketconazole** (increased plasma concentration)

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Suxamethonium see Muscle Relaxants

Sympathomimetics

- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypotensive effect of ●**adrenergic neurone blockers**; dexamfetamine antagonises hypotensive effect of ●**guanethidine**
- Alcohol: effects of methylphenidate possibly enhanced by ●**alcohol**

- Alpha-blockers: avoid concomitant use of adrenaline (epinephrine) or dopamine with ●**tolazoline**
- Anaesthetics, General: increased risk of arrhythmias when adrenaline (epinephrine) given with ●**volatile liquid general anaesthetics**; increased risk of hypertension when methylphenidate given with ●**volatile liquid general anaesthetics**
- Anticoagulants: methylphenidate possibly enhances anticoagulant effect of ●**coumarins**
- Antidepressants: risk of hypertensive crisis when methylphenidate given with ●**MAOIs**, some manufacturers advise avoid methylphenidate for at least 2 weeks after stopping MAOIs; risk of hypertensive

Sympathomimetics**Antidepressants** (*continued*)

- crisis when sympathomimetics given with ●**MAOIs** or ●**moclobemide**; methylphenidate possibly inhibits metabolism of ●**SSRIs** and ●**tricyclics**; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with ●**tricyclics** (but local anaesthetics with adrenaline appear to be safe); increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) given with ●**tricyclics**
- Antiepileptics: methylphenidate possibly increases plasma concentration of ●**phenobarbital**; methylphenidate increases plasma concentration of ●**phenytoin**
- Antipsychotics: hypertensive effect of sympathomimetics antagonised by ●**antipsychotics**; dexamfetamine possibly antagonises antipsychotic effects of ●**chlorpromazine**; methylphenidate possibly increases side-effects of ●**risperidone**
- Antivirals: plasma concentration of dexamfetamine possibly increased by ●**ritonavir**
- Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective ●**beta-blockers**, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective ●**beta-blockers**; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective ●**beta-blockers**
- Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with ●**clonidine**; serious adverse events reported with concomitant use of methylphenidate and ●**clonidine** (causality not established)
- Corticosteroids: ephedrine accelerates metabolism of ●**dexamethasone**
- Dopaminergics: risk of toxicity when isometheptene given with ●**bromocriptine**; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by ●**entacapone**; avoid concomitant use of sympathomimetics with ●**rasagiline**; risk of hypertensive crisis when dopamine given with ●**selegiline**
- Doxapram: increased risk of hypertension when sympathomimetics given with ●**doxapram**
- Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with ●**ergotamine** and ●**methysergide**
- Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with ●**oxytocin** (due to enhanced vasopressor effect)
- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by ●**dopexamine**; dopexamine possibly enhances effects of ●**noradrenaline** (norepinephrine)
- Theophylline: avoidance of ephedrine in children advised by manufacturer of ●**theophylline**

Sympathomimetics, Beta₂

- Antifungals: metabolism of salmeterol inhibited by ●**ketconazole** (increased plasma concentration)
- Atomoxetine: Increased risk of cardiovascular side-effects when ●**parenteral salbutamol** given with ●**atomoxetine**
- Cardiac Glycosides: salbutamol possibly reduces plasma concentration of ●**digoxin**
- Corticosteroids: increased risk of hypokalaemia when high doses of beta₂ sympathomimetics given with ●**corticosteroids**—see Hypokalaemia, p. 138
- Diuretics: increased risk of hypokalaemia when high doses of beta₂ sympathomimetics given with ●**acetazolamide**, ●**loop diuretics** or ●**thiazides and related diuretics**—see Hypokalaemia, p. 138
- Methyl dopa: acute hypotension reported when ●**infusion** of salbutamol given with ●**methyl dopa**
- Muscle Relaxants: bambuterol enhances effects of ●**suxamethonium**

Sympathomimetics, Beta₂ (continued)

Theophylline: increased risk of hypokalaemia when high doses of beta₂ sympathomimetics given with theophylline—see Hypokalaemia, p. 138

Tacrolimus

Note: Interactions do not generally apply to tacrolimus used topically; risk of facial flushing and skin irritation with alcohol consumption (p. 573) does not apply to tacrolimus taken systemically

- Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with **NSAIDs**; increased risk of nephrotoxicity when tacrolimus given with
 - **ibuprofen**

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when tacrolimus given with **angiotensin-II receptor antagonists**

Anti-arrhythmics: caution with tacrolimus advised by manufacturer of **dronedron**

- Antibacterials: plasma concentration of tacrolimus increased by ● **clarithromycin** and ● **erythromycin**; plasma concentration of tacrolimus possibly reduced by **rifabutin**; plasma concentration of tacrolimus reduced by ● **rifampicin**; increased risk of nephrotoxicity when tacrolimus given with
 - **aminoglycosides**; plasma concentration of tacrolimus possibly increased by ● **chloramphenicol** and ● **telithromycin**; possible increased risk of nephrotoxicity when tacrolimus given with **vancomycin**
 - Antidepressants: plasma concentration of tacrolimus reduced by ● **St John's wort**—avoid concomitant use
 - Antiepileptics: plasma concentration of tacrolimus reduced by ● **phenobarbital**; plasma concentration of tacrolimus reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased
 - Antifungals: plasma concentration of tacrolimus increased by ● **fluconazole**, ● **itraconazole**, ● **ketoconazole**, ● **posaconazole** and ● **voriconazole** (consider reducing dose of tacrolimus); increased risk of nephrotoxicity when tacrolimus given with
 - **amphotericin**; plasma concentration of tacrolimus reduced by ● **caspofungin**; plasma concentration of tacrolimus possibly increased by ● **imidazoles**
 - Antipsychotics: avoidance of tacrolimus advised by manufacturer of ● **droperidol** (risk of ventricular arrhythmias)
 - Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with **aciclovir** or **ganciclovir**; plasma concentration of tacrolimus possibly increased by ● **atazanavir**, ● **nelfinavir** and ● **ritonavir**; plasma concentration of tacrolimus possibly affected by ● **efavirenz**; plasma concentration of tacrolimus increased by ● **fosamprenavir**; plasma concentration of tacrolimus increased by ● **saquinavir** (consider reducing dose of tacrolimus)
 - Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by **felodipine**, **nicardipine** and **verapamil**; plasma concentration of tacrolimus increased by ● **diltiazem** and ● **nifedipine**
 - Ciclosporin: tacrolimus increases plasma concentration of ● **ciclosporin** (increased risk of nephrotoxicity)—avoid concomitant use
 - Diuretics: increased risk of hyperkalaemia when tacrolimus given with ● **potassium-sparing diuretics** and **aldosterone antagonists**
 - Grapefruit Juice: plasma concentration of tacrolimus increased by ● **grapefruit juice**
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by **danazol**
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of **mifamurtide**
- Oestrogens: plasma concentration of tacrolimus possibly increased by **ethinylestradiol**
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with ● **potassium salts**
- Sevelamer: plasma concentration of tacrolimus possibly reduced by **sevelamer**
- Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by **omeprazole**

Tadalafil

- Alpha-blockers: enhanced hypotensive effect when tadalafil given with ● **doxazosin**—manufacturer of tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with ● **alpha-blockers**—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5
 - Antibacterials: plasma concentration of tadalafil possibly increased by **clarithromycin** and **erythromycin**; plasma concentration of tadalafil reduced by ● **rifampicin**—manufacturer of tadalafil advises avoid concomitant use
 - Antifungals: plasma concentration of tadalafil increased by ● **ketoconazole**—manufacturer of tadalafil advises avoid concomitant use; plasma concentration of tadalafil possibly increased by **itraconazole**
 - Antivirals: plasma concentration of tadalafil possibly increased by **fosamprenavir** and **indinavir**; plasma concentration of tadalafil increased by ● **ritonavir**—manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with ● **saquinavir**—avoid concomitant use
- Bosentan: plasma concentration of tadalafil reduced by **bosentan**
- Grapefruit Juice: plasma concentration of tadalafil possibly increased by **grapefruit juice**
- Nicorandil: tadalafil significantly enhances hypotensive effect of ● **nicorandil** (avoid concomitant use)
 - Nitrates: tadalafil significantly enhances hypotensive effect of ● **nitrates** (avoid concomitant use)

Tamoxifen

- Antibacterials: metabolism of tamoxifen accelerated by **rifampicin** (reduced plasma concentration)
- Anticoagulants: tamoxifen enhances anticoagulant effect of ● **coumarins**
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by ● **fluoxetine** and ● **paroxetine** (avoid concomitant use)
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of ● **droperidol** (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by ● **bupropion** (avoid concomitant use)
- Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by ● **cinacalcet** (avoid concomitant use)

Tamsulosin see Alpha-blockers

Taxanes see Docetaxel and Paclitaxel

Teagur with uracil see Fluorouracil

Teicoplanin

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Telbivudine

- Interferons: increased risk of peripheral neuropathy when telbivudine given with ● **interferon alfa**

Telithromycin

- Analgesics: telithromycin inhibits the metabolism of **oxycodone**
- Anti-arrhythmics: avoidance of telithromycin advised by manufacturer of ● **dronedron** (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of telithromycin reduced by ● **rifampicin** (avoid during and for 2 weeks after rifampicin)
- Antidepressants: plasma concentration of telithromycin reduced by ● **St John's wort** (avoid during and for 2 weeks after St John's wort)
- Antiepileptics: plasma concentration of telithromycin reduced by ● **carbamazepine**, ● **phenobarbital** and ● **phenytoin** (avoid during and for 2 weeks after carbamazepine, phenobarbital and phenytoin)
- Antifungals: manufacturer of telithromycin advises avoid concomitant use with ● **ketoconazole** in severe renal and hepatic impairment

Telithromycin (*continued*)

Antimuscarinics: manufacturer of fesoterodine advises dose reduction when telithromycin given with **fesoterodine**—consult fesoterodine product literature

- Antipsychotics: increased risk of ventricular arrhythmias when telithromycin given with ●**pimozide**—avoid concomitant use
- Antivirals: manufacturer of telithromycin advises avoid concomitant use with ●**atazanavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**nelfinavir**, ●**ritonavir**, ●**saquinavir** and ●**tipranavir** in severe renal and hepatic impairment; telithromycin possibly increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc)
- Anxiolytics and Hypnotics: telithromycin inhibits metabolism of ●**midazolam** (increased plasma concentration with increased sedation)
Aprepitant: telithromycin possibly increases plasma concentration of ●**aprepitant**
- Cardiac Glycosides: telithromycin possibly increases plasma concentration of ●**digoxin**
- Ciclosporin: telithromycin possibly increases plasma concentration of ●**ciclosporin**
- Colchicine: telithromycin possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: telithromycin possibly increases plasma concentration of ●**everolimus**—manufacturer of everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of ●**lapatinib**, ●**nilotinib** and ●**pazopanib**
- Diuretics: telithromycin increases plasma concentration of ●**eplerenone**—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when telithromycin given with ●**ergotamine** and ●**methysergide**—avoid concomitant use
- Ivabradine: telithromycin possibly increases plasma concentration of ●**ivabradine**—avoid concomitant use
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with ●**atorvastatin** or ●**simvastatin** (avoid concomitant use); possible increased risk of myopathy when telithromycin given with ●**pravastatin**
- Ranolazine: telithromycin possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: telithromycin possibly increases plasma concentration of ●**sildenafil**—reduce initial dose of sildenafil
- Sirolimus: telithromycin increases plasma concentration of ●**sirolimus**—avoid concomitant use
- Tacrolimus: telithromycin possibly increases plasma concentration of ●**tacrolimus**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Telmisartan *see* Angiotensin-II Receptor Antagonists

Temazepam *see* Anxiolytics and Hypnotics

Temocillin *see* Penicillins

Temoporfin

● Cytotoxics: increased skin photosensitivity when temoporfin given with **topical** ●**fluorouracil**

Temozolomide

Antiepileptics: plasma concentration of temozolomide increased by ●**valproate**

● Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Temsirolimus

Note The main active metabolite of temsirolimus is sirolimus—*see also* interactions of sirolimus and consult product literature

- Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by ●**rifampicin**—avoid concomitant use
- Antifungals: plasma concentration of active metabolite of temsirolimus increased by ●**ketoconazole**—avoid concomitant use

Temsirolimus (*continued*)

● Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Tenofovir

● Antivirals: manufacturer of tenofovir advises avoid concomitant use with ●**adefovir**; tenofovir reduces plasma concentration of ●**atazanavir**, also plasma concentration of tenofovir possibly increased; manufacturers advise avoid concomitant use of tenofovir with ●**didanosine**, ●**tenofovir** increases plasma concentration of ●**didanosine** (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by ●**lopinavir**

Tenoxicam *see* NSAIDs

Terazosin *see* Alpha-blockers

Terbinafine

- Antibacterials: plasma concentration of terbinafine reduced by ●**rifampicin**
- Antidepressants: terbinafine possibly increases plasma concentration of ●**tricyclics**
- Ciclosporin: terbinafine possibly reduces plasma concentration of ●**ciclosporin**
- Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with ●**oestrogens** (when used for contraception)
- Progestogens: occasional reports of breakthrough bleeding when terbinafine given with ●**progestogens** (when used for contraception)
- Ulcer-healing Drugs: plasma concentration of terbinafine increased by ●**cimetidine**

Terbutaline *see* Sympathomimetics, Beta₂

Testolactone

● Anticoagulants: testolactone enhances anticoagulant effect of ●**coumarins** and ●**phenindione**

Testosterone

● Anticoagulants: testosterone enhances anticoagulant effect of ●**coumarins** and ●**phenindione**

Antidiabetics: testosterone possibly enhances hypoglycaemic effect of ●**antidiabetics**

Tetrabenazine

- Antidepressants: risk of CNS excitation and hypertension when tetrabenazine given with ●**MAOIs**
- Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with ●**antipsychotics**
- Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with ●**amantadine**
- Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with ●**metoclopramide**

Tetracosactide *see* Corticosteroids

Tetracycline *see* Tetracyclines

Tetracyclines

- ACE Inhibitors: absorption of tetracyclines reduced by ●**quinapril** tablets (quinapril tablets contain magnesium carbonate)
- Adsorbents: absorption of tetracyclines possibly reduced by ●**kaolin**
- Antacids: absorption of tetracyclines reduced by ●**antacids**
- Antibacterials: plasma concentration of doxycycline reduced by ●**rifampicin**—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of ●**penicillins**
- Anticoagulants: tetracyclines possibly enhance anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antidiabetics: tetracyclines possibly enhance hypoglycaemic effect of ●**sulfonylureas**
- Antiepileptics: metabolism of doxycycline accelerated by ●**carbamazepine** (reduced effect); metabolism of doxycycline accelerated by ●**phenobarbital** and ●**phenytoin** (reduced plasma concentration)
- Atovaquone: tetracycline reduces plasma concentration of ●**atovaquone**
- Calcium Salts: absorption of tetracycline reduced by ●**calcium salts**
- Cytotoxics: doxycycline or tetracycline increase risk of ●**methotrexate** toxicity

Tetracyclines (*continued*)

Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by **dairy products**

Diuretics: manufacturer of lymecycline advises avoid concomitant use with **diuretics**

Ergot Alkaloids: increased risk of ergotism when tetracyclines given with **ergotamine and methysergide**

Iron: absorption of tetracyclines reduced by **oral iron**, also absorption of **oral iron** reduced by tetracyclines

Lipid-regulating Drugs: absorption of tetracycline possibly reduced by **colestipol** and **colestyramine**

- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with **retinoids** (avoid concomitant use)

Strontium Ranelate: absorption of tetracyclines reduced by **strontium ranelate** (manufacturer of strontium ranelate advises avoid concomitant use)

Ulcer-healing Drugs: absorption of tetracyclines reduced by **sucralfate** and **tripotassium dicitrato-bismuthate**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Zinc: absorption of tetracyclines reduced by **zinc**, also absorption of zinc reduced by tetracyclines

Theophylline

Allopurinol: plasma concentration of theophylline possibly increased by **allopurinol**

Anaesthetics, General: increased risk of convulsions when theophylline given with **ketamine**; increased risk of arrhythmias when theophylline given with **halothane**

Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of **adenosine**; plasma concentration of theophylline increased by **propafenone**

- Antibacterials: plasma concentration of theophylline possibly increased by **azithromycin** and **isoniazid**; metabolism of theophylline inhibited by
 - **clarithromycin** (increased plasma concentration); plasma concentration of theophylline increased by **erythromycin** (also theophylline may reduce absorption of **oral erythromycin**); plasma concentration of theophylline increased by **ciprofloxacin** and **norfloxacin**; metabolism of theophylline accelerated by **rifampicin** (reduced plasma concentration); possible increased risk of convulsions when theophylline given with **quinolones**
- Antidepressants: plasma concentration of theophylline increased by **fluvoxamine** (concomitant use should usually be avoided, but where not possible have theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: metabolism of theophylline accelerated by **carbamazepine** and **phenobarbital** (reduced effect); plasma concentration of both drugs reduced when theophylline given with **phenytoin**
- Antifungals: plasma concentration of theophylline possibly increased by **fluconazole** and **ketokonazole**
- Antivirals: plasma concentration of theophylline possibly increased by **aciclovir**; metabolism of theophylline accelerated by **ritonavir** (reduced plasma concentration)
- Anxiolytics and Hypnotics: theophylline possibly reduces effects of **benzodiazepines**
- Calcium-channel Blockers: plasma concentration of theophylline possibly increased by **calcium-channel blockers** (enhanced effect); plasma concentration of theophylline increased by **diltiazem**; plasma concentration of theophylline increased by **verapamil** (enhanced effect)
- Corticosteroids: increased risk of hypokalaemia when theophylline given with **corticosteroids**
- Cytotoxics: plasma concentration of theophylline possibly increased by **methotrexate**

Theophylline (*continued*)

Disulfiram: metabolism of theophylline inhibited by **disulfiram** (increased risk of toxicity)

Diuretics: increased risk of hypokalaemia when theophylline given with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**

Doxapram: increased CNS stimulation when theophylline given with **doxapram**

- Febuxostat: caution with theophylline advised by manufacturer of **febuxostat**
- Interferons: metabolism of theophylline inhibited by **interferon alfa** (consider reducing dose of theophylline)
- Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by **zafirlukast**, also plasma concentration of zafirlukast reduced
- Lithium: theophylline increases excretion of **lithium** (reduced plasma concentration)
- Oestrogens: plasma concentration of theophylline increased by **oestrogens** (consider reducing dose of theophylline)
- Pentoxifylline: plasma concentration of theophylline increased by **pentoxifylline**
- Roflumilast: avoidance of theophylline advised by manufacturer of **roflumilast**
- Sulfipyrazone: plasma concentration of theophylline reduced by **sulfinpyrazone**
- Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with **ephedrine** in children
- Sympathomimetics, Beta₂: increased risk of hypokalaemia when theophylline given with high doses of **beta₂ sympathomimetics**—see Hypokalaemia, p. 138
- Ulcer-healing Drugs: metabolism of theophylline inhibited by **cimetidine** (increased plasma concentration); absorption of theophylline possibly reduced by **sucralfate** (give at least 2 hours apart)
- Vaccines: plasma concentration of theophylline possibly increased by **influenza vaccine**

Thiazolidinediones *see* Antidiabetics

Thiopental *see* Anaesthetics, General

Thioteopa

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Muscle Relaxants: thioteopa enhances effects of **suxamethonium**

Thioxanthenes *see* Antipsychotics

Thyroid Hormones

Anticids: absorption of levothyroxine possibly reduced by **antacids**

Anti-arrhythmics: for concomitant use of thyroid hormones and **amiodarone** *see* p. 83

Antibacterials: metabolism of levothyroxine accelerated by **rifampicin** (may increase requirements for levothyroxine in hypothyroidism)

- Anticoagulants: thyroid hormones enhance anticoagulant effect of **coumarins** and **phenindione**
- Antidepressants: thyroid hormones enhance effects of **amitriptyline** and **imipramine**; thyroid hormones possibly enhance effects of **tricyclics**
- Antiepileptics: metabolism of thyroid hormones accelerated by **carbamazepine** and **phenobarbital** (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by **phenytoin** (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
- Beta-blockers: levothyroxine accelerates metabolism of **propranolol**
- Calcium Salts: absorption of levothyroxine reduced by **calcium salts**
- Cytotoxics: plasma concentration of levothyroxine possibly reduced by **imatinib**
- Iron: absorption of levothyroxine reduced by **oral iron** (give at least 2 hours apart)
- Lanthanum: absorption of levothyroxine reduced by **lanthanum** (give at least 2 hours apart)

Thyroid Hormones (continued)

Lipid-regulating Drugs: absorption of levothyroxine reduced by **colesevelam**; absorption of thyroid hormones reduced by **colestipol** and **colestyramine**
 Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by **oestrogens**
 Orlistat: possible increased risk of hypothyroidism when levothyroxine given with **orlistat**
 Polystyrene Sulphonate Resins: absorption of levothyroxine reduced by **polystyrene sulphonate resins**
 Sevelamer: absorption of levothyroxine possibly reduced by **sevelamer**
 Ulcer-healing Drugs: absorption of levothyroxine reduced by **cimetidine** and **sucralfate**

Tiagabine

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with **St John's wort**
- Antiepileptics: plasma concentration of tiagabine reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

Tiaprofenic Acid see NSAIDs**Tibolone**

Antibacterials: metabolism of tibolone accelerated by **rifampicin** (reduced plasma concentration)
 Antiepileptics: metabolism of tibolone accelerated by **carbamazepine** (reduced plasma concentration); metabolism of tibolone accelerated by **phenytoin**

Ticarcillin see Penicillins**Tigecycline**

Anticoagulants: tigecycline possibly enhances anticoagulant effect of **coumarins**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Tiludronic Acid see Bisphosphonates**Timolol** see Beta-blockers**Tinidazole**

Alcohol: possibility of disulfiram-like reaction when tinidazole given with **alcohol**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Tinzaparin see Heparins**Tioguanine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when tioguanine given with **busulfan**

Tiotropium see Antimuscarinics**Tipranavir**

Analgesics: plasma concentration of tipranavir possibly reduced by **buprenorphine**

Antacids: absorption of tipranavir reduced by **antacids**

- Antibacterials: tipranavir increases plasma concentration of **clarithromycin** (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of **rifabutin** (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by **rifampicin**—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**

Tipranavir (continued)

Anticoagulants: avoidance of tipranavir advised by manufacturer of **rivaroxaban**

- Antidepressants: plasma concentration of tipranavir possibly reduced by **St John's wort**—avoid concomitant use
 - Antiepileptics: plasma concentration of tipranavir possibly reduced by **carbamazepine**
 - Antifungals: plasma concentration of tipranavir increased by **fluconazole**
 - Antimalarials: caution with tipranavir advised by manufacturer of **artemether/lumefantrine**; tipranavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)
 - Antimuscarinics: avoidance of tipranavir advised by manufacturer of **darifenacin**
 - Antivirals: tipranavir reduces plasma concentration of **abacavir**, **didanosine**, **fosamprenavir**, **lopinavir**, **saquinavir** and **zidovudine**; plasma concentration of tipranavir increased by **atazanavir** (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of **etravirine**, also plasma concentration of tipranavir increased (avoid concomitant use)
 - Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with **metoprolol** for heart failure
 - Lipid-regulating Drugs: tipranavir possibly increases plasma concentration of **atorvastatin** (consider reducing dose of atorvastatin); tipranavir possibly increases plasma concentration of **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; tipranavir possibly increases plasma concentration of **simvastatin**—avoid concomitant use
 - Ranolazine: tipranavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
 - Ulcer-healing Drugs: tipranavir reduces plasma concentration of **esomeprazole** and **omeprazole**
 - Vitamins: increased risk of bleeding when tipranavir given with high doses of **vitamin E**
- Tirofiban**
 Iloprost: increased risk of bleeding when tirofiban given with **iloprost**
- Tizanidine** see Muscle Relaxants
- Tobramycin** see Aminoglycosides
- Tocilizumab**
 • Vaccines: avoid concomitant use of tocilizumab with live **vaccines** (see p. 599)
- Tolazoline** see Alpha-blockers
- Tolbutamide** see Antidiabetics
- Tolcapone**
 Antidepressants: avoid concomitant use of tolcapone with **MAOIs**
 Memantine: effects of dopaminergics possibly enhanced by **memantine**
 Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by **methyl dopa**
- Tolfenamic Acid** see NSAIDs
- Tolterodine** see Antimuscarinics
- Tolvaptan**
 Antibacterials: plasma concentration of tolvaptan reduced by **rifampicin**
 Antifungals: plasma concentration of tolvaptan increased by **ketocanazole**
 Cardiac Glycosides: tolvaptan increases plasma concentration of **digoxin** (increased risk of toxicity)
- Grapefruit Juice: plasma concentration of tolvaptan increased by **grapefruit juice**—avoid concomitant use

Topiramate
 • Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold

Topiramate

- Antidepressants (*continued*) lowered); avoid concomitant use of antiepileptics with ●**St John's wort**
- Antidiabetics: topiramate possibly increases plasma concentration of **metformin**; topiramate possibly reduces plasma concentration of **glibenclamide**
- Antiepileptics: plasma concentration of topiramate often reduced by **carbamazepine**; plasma concentration of topiramate possibly reduced by **phenobarbital**; topiramate increases plasma concentration of ●**phenytoin** (also plasma concentration of topiramate reduced); hyperammonaemia and CNS toxicity reported when topiramate given with **valproate**
- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine and hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Diuretics: plasma concentration of topiramate possibly increased by **hydrochlorothiazide**
- Lithium: topiramate possibly affects plasma concentration of **lithium**
- Oestrogens: topiramate accelerates metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 398)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- Progestogens: topiramate accelerates metabolism of ●**progestogens** (reduced contraceptive effect—see p. 398)

Torasemide *see* Diuretics

Toremifene

- Anticoagulants: toremifene possibly enhances anticoagulant effect of ●**coumarins**
- Antiepileptics: metabolism of toremifene possibly accelerated by **carbamazepine** (reduced plasma concentration); metabolism of toremifene accelerated by **phenobarbital** (reduced plasma concentration); metabolism of toremifene possibly accelerated by **phenytoin**
- Diuretics: increased risk of hypercalcaemia when toremifene given with **thiazides and related diuretics**

Trabectedin

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Tramadol *see* Opioid Analgesics

Trandolapril *see* ACE Inhibitors

Tranylcypromine *see* MAOIs

Trazodone *see* Antidepressants, Tricyclic (related)

Tretinoin *see* Retinoids

Triamcinolone *see* Corticosteroids

Triamterene *see* Diuretics

Trientine

- Iron: trientine reduces absorption of **oral iron**
- Zinc: trientine reduces absorption of **zinc**, also absorption of trientine reduced by zinc

Trifluoperazine *see* Antipsychotics

Trihexyphenidyl *see* Antimuscarinics

Trilostane

- Diuretics: increased risk of hyperkalaemia when trilostane given with **potassium-sparing diuretics and aldosterone antagonists**

Trimethoprim

- ACE Inhibitors: possible increased risk of hyperkalaemia when trimethoprim given with **ACE inhibitors**
- Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimethoprim given with **angiotensin-II receptor antagonists**
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with **amiodarone**—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
- Antibacterials: plasma concentration of trimethoprim possibly reduced by **rifampicin**; plasma concentration

Trimethoprim

Antibacterials (*continued*)

- of both drugs may increase when trimethoprim given with **dapsone**
- Anticoagulants: trimethoprim possibly enhances anticoagulant effect of **coumarins**
- Antidiabetics: trimethoprim possibly enhances hypoglycaemic effect of **repaglinide**—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of **sulfonylureas**
- Antiepileptics: trimethoprim increases plasma concentration of ●**phenytoin** (also increased antifolate effect)
- Antimalarials: increased antifolate effect when trimethoprim given with ●**pyrimethamine**
- Antivirals: trimethoprim (as co-trimoxazole) increases plasma concentration of **lamivudine**—avoid concomitant use of high-dose co-trimoxazole
- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with ●**azathioprine**
- Cardiac Glycosides: trimethoprim possibly increases plasma concentration of **digoxin**
- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with ●**ciclosporin**, also plasma concentration of ciclosporin reduced by **intravenous trimethoprim**
- Cytotoxics: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with ●**mercaptopurine** or ●**methotrexate**
- Diuretics: increased risk of hyperkalaemia when trimethoprim given with **eprenaline**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Trimipramine *see* Antidepressants, Tricyclic

Tripotassium Dicitratobismuthate

- Antibacterials: tripotassium dicitratobismuthate reduces absorption of **tetracyclines**

Tropicamide *see* Antimuscarinics

Trospium *see* Antimuscarinics

Tryptophan

- Antidepressants: CNS toxicity reported when tryptophan given with **fluoxetine**; possible increased serotonergic effects when tryptophan given with **duloxetine**; CNS excitation and confusion when tryptophan given with ●**MAOIs** (reduce dose of tryptophan); agitation and nausea may occur when tryptophan given with ●**SSRIs**
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether/lumefantrine**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

Typhoid Vaccine (oral) *see* Vaccines

Typhoid Vaccine (parenteral) *see* Vaccines

Ubidecarenone

- Anticoagulants: ubidecarenone may enhance or reduce anticoagulant effect of **warfarin**

Ulcer-healing Drugs *see* Histamine H₂-antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate

Ulipristal

- Antacids: manufacturer of ulipristal advises avoid concomitant use with ●**antacids** (plasma concentration of ulipristal possibly reduced)
- Antibacterials: manufacturer of ulipristal advises avoid concomitant use with ●**rifampicin** (contraceptive effect of ulipristal possibly reduced)
- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with ●**St John's wort** (contraceptive effect of ulipristal possibly reduced)
- Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin** (contraceptive effect of ulipristal possibly reduced)
- Antivirals: manufacturer of ulipristal advises avoid concomitant use with ●**ritonavir** (contraceptive effect of ulipristal possibly reduced)

Ulipristal (*continued*)

- Progestogens: ulipristal possibly reduces contraceptive effect of **progestogens**
- Ulcer-healing Drugs: manufacturer of ulipristal advises avoid concomitant use with **histamine H₂-antagonists** and **proton pump inhibitors** (plasma concentration of ulipristal possibly reduced)

Ursodeoxycholic Acid *see* Bile Acids**Ustekinumab**

- Vaccines: avoid concomitant use of ustekinumab with live **vaccines** (see p. 599)

Vaccines

Note For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 599; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 622

- Abatacept: avoid concomitant use of live vaccines with **abatacept** (see p. 599)
- Adalimumab: avoid concomitant use of live vaccines with **adalimumab** (see p. 599)
- Anakinra: avoid concomitant use of live vaccines with **anakinra** (see p. 599)

Antibacterials: oral typhoid vaccine inactivated by **antibacterials**—see p. 620

Anticoagulants: influenza vaccine possibly enhances anticoagulant effect of **warfarin**

Antiepileptics: influenza vaccine enhances effects of **phenytoin**

Antimalarials: oral typhoid vaccine inactivated by **antimalarials**—see p. 620

- Certolizumab pegol: avoid concomitant use of live vaccines with **certolizumab pegol** (see p. 599)
- Corticosteroids: immune response to vaccines impaired by high doses of **corticosteroids**, avoid concomitant use with live vaccines (see p. 599)
- Etanercept: avoid concomitant use of live vaccines with **etanercept** (see p. 599)
- Golimumab: avoid concomitant use of live vaccines with **golimumab** (see p. 599)
- Infliximab: avoid concomitant use of live vaccines with **infliximab** (see p. 599)

Interferons: avoidance of vaccines advised by manufacturer of **interferon gamma**

Leflunomide: avoid concomitant use of live vaccines with **leflunomide** (see p. 599)

Theophylline: influenza vaccine possibly increases plasma concentration of **theophylline**

- Tocilizumab: avoid concomitant use of live vaccines with **tocilizumab** (see p. 599)
- Ustekinumab: avoid concomitant use of live vaccines with **ustekinumab** (see p. 599)

Valaciclovir *see* Aciclovir**Valganciclovir** *see* Ganciclovir**Valproate**

Analgesics: effects of valproate enhanced by **aspirin**

- Antibacterials: metabolism of valproate possibly inhibited by **erythromycin** (increased plasma concentration); plasma concentration of valproate reduced by **carbamapenems**—avoid concomitant use

Anticoagulants: valproate possibly enhances anticoagulant effect of **coumarins**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with **St John's wort**

Antiepileptics: plasma concentration of valproate reduced by **carbamazepine**, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of **ethosuximide**; valproate increases plasma concentration of **lamotrigine**; valproate sometimes reduces plasma concentration of an active metabolite of **oxcarbazepine**; valproate increases plasma concentration of **phenobarbital** (also plasma concentration of valproate reduced); valproate increases or possibly decreases plasma concentration of **phenytoin**, also

Valproate**Antiepileptics** (*continued*)

plasma concentration of valproate reduced; valproate possibly increases plasma concentration of **rufinamide** (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when valproate given with **topiramate**

- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered); valproate possibly increases or decreases plasma concentration of **clozapine**; increased risk of side-effects including neutropenia when valproate given with **olanzapine**; valproate possibly increases plasma concentration of **quetiapine**
- Antivirals: valproate possibly increases plasma concentration of **zidovudine** (increased risk of toxicity)
- Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by **clonazepam**; increased risk of side-effects when valproate given with **clonazepam**; valproate possibly increases plasma concentration of **diazepam** and **lorazepam**
- Bupropion: valproate inhibits the metabolism of **bupropion**
- Cytotoxics: valproate increases plasma concentration of **temozolomide**
- Lipid-regulating Drugs: absorption of valproate possibly reduced by **colestyramine**
- Oestrogens: plasma concentration of valproate possibly reduced by **ethinylestradiol**
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Sodium Benzoate: valproate possibly reduces effects of **sodium benzoate**
- Sodium Phenylbutyrate: valproate possibly reduces effects of **sodium phenylbutyrate**
- Ulcer-healing Drugs: metabolism of valproate inhibited by **cimetidine** (increased plasma concentration)

Valsartan *see* Angiotensin-II Receptor Antagonists**Vancomycin**

Anaesthetics, General: hypersensitivity-like reactions can occur when **intravenous vancomycin** given with **general anaesthetics**

- Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with **aminoglycosides**, **capreomycin** or **colistimethate sodium**; increased risk of nephrotoxicity when vancomycin given with **polymyxins**
- Antifungals: possible increased risk of nephrotoxicity when vancomycin given with **amphotericin**
- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with **ciclosporin**
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with **cisplatin**
- Diuretics: increased risk of ototoxicity when vancomycin given with **loop diuretics**
- Lipid-regulating Drugs: effects of **oral vancomycin** antagonised by **colestyramine**
- Muscle Relaxants: vancomycin enhances effects of **suxamethonium**
- Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with **tacrolimus**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 620

Vardenafil

- Alpha-blockers: enhanced hypotensive effect when vardenafil given with **alpha-blockers** (excludes tamsulosin)—separate doses by 6 hours—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5

Antibacterials: plasma concentration of vardenafil increased by **erythromycin** (reduce dose of vardenafil)

Vardenafil (*continued*)

- Antifungals: plasma concentration of vardenafil increased by ●**ketconazole**—avoid concomitant use; plasma concentration of vardenafil possibly increased by ●**itraconazole**—avoid concomitant use
- Antivirals: plasma concentration of vardenafil possibly increased by ●**fosamprenavir**; plasma concentration of vardenafil increased by ●**indinavir** and ●**ritonavir**—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with ●**saquinavir**—avoid concomitant use
- Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with **nifedipine**
- Grapefruit Juice: plasma concentration of vardenafil possibly increased by ●**grapefruit juice**—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with ●**nicorandil**—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with ●**nitrates**—avoid concomitant use

Vasodilator Antihypertensives

ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alcohol**

Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **aldesleukin**

Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **general anaesthetics**

Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **angiotensin-II receptor antagonists**

Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **MAOIs**; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with **tricyclic-related antidepressants**

Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **clonidine**

Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **diazoxide**

Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **diuretics**

Vasodilator Antihypertensives (*continued*)

Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **levodopa**

Methyldopa: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **baclofen**; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **tizanidine**

Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **nicorandil**

Nitrates: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **nitrates**

Oestrogens: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **oestrogens**

Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alprostadil**

Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with **minoxidil** or **sodium nitroprusside**; enhanced hypotensive effect when minoxidil given with **sodium nitroprusside**

Vecuronium *see* Muscle Relaxants

Venlafaxine

- Analgesics: increased risk of bleeding when venlafaxine given with ●**NSAIDs** or ●**aspirin**; possible increased serotonergic effects when venlafaxine given with **tramadol**

- Anticoagulants: venlafaxine possibly enhances anticoagulant effect of ●**warfarin**

- Antidepressants: possible increased serotonergic effects when venlafaxine given with **St John's wort**, **duloxetine** or **mirtazapine**; enhanced CNS effects and toxicity when venlafaxine given with ●**MAOIs** (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start ●**moclobemide** for at least 1 week

- Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether/lumefantrine**

- Antipsychotics: venlafaxine increases plasma concentration of ●**clozapine** and **haloperidol**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

- Dopaminergics: caution with venlafaxine advised by manufacturer of **entacapone**; increased risk of hypertension and CNS excitation when venlafaxine given with ●**selegiline** (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)

5HT₁ Agonists: possible increased serotonergic effects when venlafaxine given with **5HT₁ agonists**

Lithium: possible increased serotonergic effects when venlafaxine given with **lithium**

Verapamil *see* Calcium-channel Blockers

Vigabatrin

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●**St John's wort**

Antiepileptics: vigabatrin reduces plasma concentration of **phenytoin**

Vigabatrin (*continued*)

- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

Vildagliptin *see* Antidiabetics**Vinblastine**

- Aldesleukin: avoidance of vinblastine advised by manufacturer of ●**aldesleukin**
- Antibacterials: toxicity of vinblastine increased by ●**erythromycin**—avoid concomitant use
- Antifungals: metabolism of vinblastine possibly inhibited by ●**posaconazole** (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinblastine possibly increased by **ritonavir**

Vincristine

- Antifungals: metabolism of vincristine possibly inhibited by ●**itraconazole** and ●**posaconazole** (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by **nifedipine**
- Cardiac Glycosides: vincristine possibly reduces absorption of **digoxin tablets**

Vinflunine

- Antibacterials: plasma concentration of vinflunine possibly reduced by ●**rifampicin**—manufacturer of vinflunine advises avoid concomitant use
- Antidepressants: plasma concentration of vinflunine possibly reduced by ●**St John's wort**—manufacturer of vinflunine advises avoid concomitant use
- Antifungals: plasma concentration of vinflunine increased by ●**ketoconazole**—manufacturer of vinflunine advises avoid concomitant use; plasma concentration of vinflunine possibly increased by ●**itraconazole**—manufacturer of vinflunine advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinflunine possibly increased by ●**ritonavir**—manufacturer of vinflunine advises avoid concomitant use
- Grapefruit Juice: plasma concentration of vinflunine possibly increased by **grapefruit juice**—manufacturer of vinflunine advises avoid concomitant use

Vinorelbine

- Antibacterials: possible increased risk of neutropenia when vinorelbine given with ●**clarithromycin**
- Antifungals: metabolism of vinorelbine possibly inhibited by ●**itraconazole** (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Vitamin A *see* Vitamins**Vitamin D** *see* Vitamins**Vitamin E** *see* Vitamins**Vitamin K (Phytomenadione)** *see* Vitamins**Vitamins**

- Antibacterials: absorption of vitamin A possibly reduced by **neomycin**
- Anticoagulants: vitamin K antagonises anticoagulant effect of ●**coumarins** and ●**phenindione**; vitamin E possibly enhances anticoagulant effect of ●**coumarins**
- Antiepileptics: vitamin D requirements possibly increased when given with **carbamazepine**, **phenobarbital** or **phenytoin**
- Antifungals: plasma concentration of paricalcitol possibly increased by **ketoconazole**
- Antivirals: increased risk of bleeding when high doses of vitamin E given with **tipranavir**

Vitamins (*continued*)

- Cyclosporin: vitamin E possibly affects plasma concentration of **cyclosporin**
- Diuretics: increased risk of hypercalcaemia when vitamin D given with **thiazides** and **related diuretics**
- Dopaminergics: pyridoxine reduces effects of **levodopa** when given without dopa-decarboxylase inhibitor
- Retinoids: risk of hypervitaminosis A when vitamin A given with **retinoids**
- Selenium: ascorbic acid possibly reduces absorption of **selenium** (give at least 4 hours apart)
- **Voriconazole** *see* Antifungals, Triazole
- **Warfarin** *see* Coumarins
- **Xipamide** *see* Diuretics
- **Xylometazoline** *see* Sympathomimetics
- **Zafirlukast** *see* Leukotriene Receptor Antagonists
- **Zaleplon** *see* Anxiolytics and Hypnotics
- **Zidovudine**
 - **Note** Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature
 - Analgesics: increased risk of haematological toxicity when zidovudine given with **NSAIDs**; plasma concentration of zidovudine possibly increased by **methadone**
 - Antibacterials: absorption of zidovudine reduced by **clarithromycin** tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with **rifampicin**
 - Antiepileptics: zidovudine increases or decreases plasma concentration of **phenytoin**; plasma concentration of zidovudine possibly increased by **valproate** (increased risk of toxicity)
 - Antifungals: plasma concentration of zidovudine increased by ●**itraconazole** (increased risk of toxicity)
 - Antimalarials: increased antifolate effect when zidovudine given with **pyrimethamine**
 - Antivirals: profound myelosuppression when zidovudine given with ●**ganciclovir** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy); increased risk of anaemia when zidovudine given with ●**ribavirin**—avoid concomitant use; zidovudine possibly inhibits effects of ●**stavudine** (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by ●**tipranavir**
 - Atovaquone: metabolism of zidovudine possibly inhibited by **atovaquone** (increased plasma concentration)
 - Probenecid: excretion of zidovudine reduced by ●**probenecid** (increased plasma concentration and risk of toxicity)
- **Zinc**
 - Antibacterials: zinc reduces absorption of **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, **norfloxacin** and **ofloxacin**; zinc reduces absorption of **tetracyclines**, also absorption of zinc reduced by tetracyclines
 - Calcium Salts: absorption of zinc reduced by **calcium salts**
 - Eltrombopag: zinc possibly reduces absorption of **eltrombopag** (give at least 4 hours apart)
 - Iron: absorption of zinc reduced by **oral iron**, also absorption of **oral iron** reduced by zinc
 - Penicillamine: absorption of zinc reduced by **penicillamine**, also absorption of penicillamine reduced by zinc
 - Trientine: absorption of zinc reduced by **trientine**, also absorption of trientine reduced by zinc
- **Zoledronic Acid** *see* Bisphosphonates
- **Zolmitriptan** *see* 5HT₁ Agonists
- **Zolpidem** *see* Anxiolytics and Hypnotics
- **Zonisamide**
 - Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold

Zonisamide

- Antidepressants (*continued*)
lowered); avoid concomitant use of antiepileptics with ●**St John's wort**

Antiepileptics: plasma concentration of zonisamide reduced by **carbamazepine**, **phenobarbital** and **phenytoin**

- Antimalarials: possible increased risk of convulsions when antiepileptics given with **chloroquine** and **hydroxychloroquine**; anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

Zopiclone *see* Anxiolytics and Hypnotics

Zuclopenthixol *see* Antipsychotics

A2 Borderline substances

A2.1	Enteral feeds (non-disease specific)	744
A2.1.1	Enteral feeds (non-disease specific): less than 5 g protein/100 mL	744
A2.1.2	Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL	747
A2.1.3	Enteral feeds (non-disease specific): Child under 12 years	750
A2.2	Nutritional supplements (non-disease specific)	756
A2.2.1	Nutritional supplements: less than 5 g protein/100 mL	756
A2.2.2	Nutritional supplements: 5 g (or more) protein/100 mL	758
A2.3	Specialised formulas	763
A2.3.1	Specialised formulas: Infant and child	763
A2.3.2	Specialised formulas for specific clinical conditions	768
A2.4	Feed supplements	771
A2.4.1	High-energy supplements	771
A2.4.2	Fibre, vitamin, and mineral supplements	776
A2.5	Feed additives	777
A2.5.1	Special additives for conditions of intolerance	777
A2.5.2	Feed thickeners and pre-thickened drinks	777
A2.5.3	Flavouring preparations	777
A2.6	Foods for special diets	777
A2.6.1	Gluten-free foods	777
A2.6.2	Low-protein foods	780
A2.7	Nutritional supplements for metabolic diseases	781

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales) All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain cariogenic sugars and appropriate oral hygiene measures should be taken.

Enteral feeds and nutritional supplements For most enteral feeds and nutritional supplements, the main source of **carbohydrate** is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of **protein** or **amino acids** are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of **vitamins**, **minerals**, and **trace elements**—the manufacturer's product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2. Feeds containing vitamin K may affect the INR in children receiving warfarin; see **interactions**: Appendix 1 (vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Standard ACBS indications: Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Paediatric ACBS indications: Disease-related malnutrition, intractable malabsorption, growth failure, pre-operative preparation of malnourished patients, dysphagia, short-bowel syndrome, bowel fistula

A2.1 Enteral feeds (non-disease specific)

A2.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

A2.1.1.1 Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1–6 years

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® Original (Fresenius Kabi)	Liquid (sip or tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 3.5 g ¹)	3.4 g	Nil	Gluten-free Residual lactose Contains fish gelatin Feed in flexible pack contains fish oil and fish gelatin	Standard, p. 743	Bottle: 200 mL = £1.78 Black currant, chocolate, mocha, nut, peach, vanilla Flexible pack: 500 mL = £3.45 1000 mL = £6.81 1500 mL = £10.23
Fresubin® Original Fibre (Fresenius Kabi)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 1 g)	3.4 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 743 except bowel fistula. Not suitable for child under 2 years	Flexible pack: 500 mL = £3.90 1000 mL = £7.78 1500 mL = £10.69
Isosource® Fibre (Nestlé)	Liquid (tube feed) per 100 mL	422 kJ (100 kcal)	3.8 g cows' milk	13.6 g	3.4 g	1.4 g	Gluten-free Residual lactose	Standard, p. 743 Not suitable for child under 2 years	Flexible pack: 500 mL = £3.49 1000 mL = £6.97
Isosource® Standard (Nestlé)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g cows' milk	13.6 g	3.3 g	Nil	Gluten-free Residual lactose	Standard, p. 743	Flexible pack: 500 mL = £3.07 1000 mL = £6.13
Jevity® (Abbott)	Liquid (tube feed) per 100 mL	441 kJ (106 kcal)	4 g caseinates	14.1 g (sugars 470 mg)	3.47 g	1.76 g	Gluten-free Residual lactose	Standard, p. 743 except bowel fistula. Not suitable for child under 2 years	Flexible pack: 500 mL = £4.16 1000 mL = £7.81 1500 mL = £11.73
Novasource® GI Control (Nestlé)	Liquid (tube feed) per 100 mL	444 kJ (106 kcal)	4.1 g cows' milk	14.4 g (sugars 500 mg)	3.5 g (MCT 40%)	2.2 g	Gluten-free Residual lactose	Standard, p. 743	Flexible pack: 500 mL = £4.78

1. Sugar content varies with flavour

Nutrison® (Nutricia Clinical)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose	Standard, p. 743	Bottle: 500 mL = £3.76 Flexible pack: 500 mL = £4.17 1000 mL = £7.32 1500 mL = £10.97

A2.3 Specialised formulas

A2.3.1 Specialised formulas: Infant and child

Specialised formulas are suitable for infants from birth unless otherwise indicated (*see also* A2.1.3.1 Enteral feeds (non-disease specific): Child under 12 years)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
■ Specialised formulas: Infant and child: Amino acid-based formula									
ACBS Indications: Proven whole protein intolerance, short bowel syndrome, intractable malabsorption, or other gastro-intestinal disorders where an elemental diet is indicated									
Neocate® Active (SHS)	Standard dilution (21%) of powder per 300 mL serving (63-g sachet made up to 300 mL with water)	1255 kJ (300 kcal)	8.3 g protein equivalent (essential and non-essential amino acids)	34 g (sugars 3.1 g ¹)	14.5 g	Nil	Milk protein-free	See above Nutritional supplement only Not suitable for child under 1 year	Sachet: 15 × 63 g = £56.04 Black currant, unflavoured ²
Powder provides: protein equivalent 13.1 g, carbohydrate 54 g, fat 23 g, energy 1992 kJ (475 kcal)/100 g									
Neocate® Advance (SHS)	Standard dilution (25%) of powder per 100 mL	420 kJ (100 kcal)	2.5 g protein equivalent (essential and non-essential amino acids)	14.6 g (sugars 1.3 g ¹)	3.5 g (MCT 35%)	Nil	Milk protein-free	See above Not suitable for child under 1 year	Sachet: 100 g = £4.94 Unflavoured ² 15 × 50 g = £38.99 Banana-vanilla
Powder provides: protein equivalent 10 g, carbohydrate 58.5 g, fat 14 g, energy 1683 kJ (400 kcal)/100 g									
Neocate® LCP (SHS)	Standard dilution (14.7%) of powder per 100 mL	293 kJ (70 kcal)	1.9 g protein equivalent (essential and non-essential amino acids)	7.9 g (sugars 720 mg)	3.4 g	Nil	Milk protein-free	Cows' milk allergy, multiple food protein intolerance, and conditions requiring an elemental diet	Can: 400 g = £23.83 (4.9-g measuring scoop provided)
Powder provides: protein equivalent 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g									

1. Sugar content varies with flavour

2. Flavouring: see *Modjul*® Flavour System, p. 777

A2.3.1 Specialised formulas: Infant and child (*product list continued*)Specialised formulas are suitable for infants from birth unless otherwise indicated (*see also* A2.1.3.1 Enteral feeds (non-disease specific): Child under 12 years)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nutrigen® AA (Mead Johnson)	Standard dilution (13.6%) of powder per 100 mL	286 kJ (68 kcal)	1.89 g essential and non-essential amino acids	7 g	3.6 g	Nil	Gluten-free Lactose-free	Severe cows' milk protein intolerance, or multiple food intolerance, and other gastro-intestinal disorders where an elemental diet is specifically indicated	Can: 400 g = £22.89 (4.5-g measuring scoop provided)
Powder provides: protein 13.9 g, carbohydrate 51 g, fat 26 g, energy 2092 kJ (498 kcal)/100 g									
■ Specialised formulas: Infant and child: Hydrolysate formula									
Aptamil Pepti® 1 (Allergy) (Milupa)	Standard dilution (13.6%) of powder per 100 mL	280 kJ (67 kcal)	1.6 g whey hydrolysed	7.1 g (sugars 3.5 g)	3.5 g	600 mg	Contains lactose and fish oil	Established cows' milk protein intolerance, with or without secondary lactose intolerance	Can: 400 g = £8.62 900 g = £19.39 (4.5-g measuring scoop provided)
Formerly <i>Aptamil Pepti</i> ® Powder provides: protein 11.6 g, carbohydrate 52 g, fat 25.6 g, energy 2025 kJ (484 kcal)/100 g									
Aptamil Pepti® 2 (Allergy) (Milupa)	Standard dilution (14.3%) of powder per 100 mL	285 kJ (68 kcal)	1.6 g	8 g (sugars 3.6 g)	3.1 g	600 mg	Contains lactose and fish oil	Established cows' milk protein allergy or intolerance Not suitable for child under 6 months	Can: 900 g = £19.39 (4.8-g measuring scoop provided)
Powder provides: protein 11.2 g, carbohydrate 56.1 g, fat 21.8 g, energy 1985 kJ (473 kcal)/100 g									
Cow & Gate Pepti-Junior® (Cow & Gate)	Standard dilution (12.8%) of powder per 100 mL	275 kJ (66 kcal)	1.8 g whey hydrolysed	6.8 g (sugars 1.1 g)	3.5 g	Nil	Residual lactose Contains fish oil	Disaccharide and/or whole protein intolerance, or where amino acids and peptides are indicated in conjunction with medium chain triglycerides	Can: 450 g = £11.01 (4.3-g measuring scoop provided)
Powder provides: protein 14 g, carbohydrate 53.4 g, fat 27.3 g, energy 2155 kJ (515 kcal)/100 g									
Nutrigen® Lipil 1 (Mead Johnson)	Standard dilution (13.5%) of powder per 100 mL	280 kJ (68 kcal)	1.9 g casein hydrolysed	7.5 g	3.4 g	Nil	Gluten-free Lactose-free	Disaccharide and/or whole protein intolerance where additional medium chain triglycerides are not included	Can: 400 g = £9.29 (4.5-g measuring scoop provided)
Powder provides: protein 14 g, carbohydrate 55 g, fat 25 g, energy 2100 kJ (500 kcal)/100 g									

Nutramigen® Lipil 2 (Mead Johnson)	Standard dilution (14.6%) of powder per 100 mL	285 kJ (68 kcal)	1.7 g casein hydro- lysed	8.6 g	2.9 g	Nil	Gluten-free Lactose-free	Established disaccharide and/or whole protein intolerance (where additional chain triglycerides are not indicated) Not suitable for child under 6 months	Can: 400 g = £8.95 (4.9-g measuring scoop provided)
Powder provides: protein 11.6 g, carbohydrate 59 g, fat 20 g, energy 1950 kJ (466 kcal)/100 g									
Pepdite® (SHS)	Standard dilution (15%) of powder per 100 mL	297 kJ (71 kcal)	2.1 g protein equivalent (non-milk hydrolysate)	7.8 g (sugars 700 mg)	3.5 g	Nil	Lactose-free Contains meat (pork) and soya derivatives	Disaccharide and/or whole protein intolerance	Can: 400 g = £15.05 (5-g measuring scoop provided)
Powder provides: protein equivalent 13.8 g, carbohydrate 52 g, fat 23.2 g, energy 1977 kJ (472 kcal)/100 g									
Pepdite® 1+ (SHS)	Standard dilution (22.8%) of powder per 100 mL	423 kJ (100 kcal)	3.1 g protein equivalent (non-milk hydrolysate, essential amino acids)	13 g (sugars 1.2 g)	3.9 g (MCT 35%)	Nil	Lactose-free Contains meat (pork) and soya derivatives	Disaccharide and/or whole protein intolerance, or where amino acids or peptides are indicated in conjunc- tion with medium chain triglycerides Not suitable for child under 1 year	Can: 400 g = £15.81 Unflavoured ¹
Powder provides: protein equivalent 13.8 g, carbohydrate 57 g, fat 17.3 g, energy 1844 kJ (439 kcal)/100 g									
Pregestimil® Lipil (Mead Johnson)	Standard dilution (13.5%) of powder per 100 mL	280 kJ (68 kcal)	1.89 g casein hydro- lysed	6.9 g	3.8 g (MCT 54%)	Nil	Gluten-free Lactose-free	Disaccharide and/or whole protein intolerance, or where amino acids or peptides are indicated in conjunc- tion with medium chain triglycerides	Can: 400 g = £10.18 (4.5-g measuring scoop provided)
Powder provides: protein 14 g, carbohydrate 51 g, fat 28 g, energy 2100 kJ (500 kcal)/100 g									
■ Specialised formulas: Infant and child: Residual lactose formula									
Enfamil® O-Lac (Mead Johnson)	Standard dilution (13%) of powder per 100 mL	280 kJ (68 kcal)	1.42 g cows' milk	7.2 g	3.7 g	Nil	Gluten-free Residual lactose	Proven lactose intolerance	Can: 400 g = £4.16 (4.3-g measuring scoop provided)
Powder provides: protein 10.9 g, carbohydrate 55 g, fat 28 g, energy 2200 kJ (524 kcal)/100 g									
Galactomin 17® (SHS)	Standard dilution (13.6%) of powder per 100 mL	295 kJ (70 kcal)	1.7 g protein equivalent (cows' milk)	7.5 g (sugars 1.4 g)	3.7 g	Nil	Residual lactose	Proven lactose intolerance in pre- school children, galactosaemia, and galactokinase deficiency	Can: 400 g = £14.13 Unflavoured ¹ (4.3-g measuring scoop provided)
Powder provides: protein equivalent 12.3 g, carbohydrate 55.3 g, fat 27.2 g, energy 2155 kJ (515 kcal)/100 g									
1. Flavouring: see <i>Modju</i> ® Flavour System, p. 777									

A2.3.1 Specialised formulas: Infant and child (*product list continued*)Specialised formulas are suitable for infants from birth unless otherwise indicated (*see also* A2.1.3.1 Enteral feeds (non-disease specific): Child under 12 years)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
SMA® LF (SMA Nutrition)	Standard dilution (13%) of powder per 100 mL	281 kJ (67 kcal)	1.5 g casein, whey	7.2 g (sugars 2.6 g)	3.6 g	Nil	Residual lactose	Proven lactose intolerance	Can: 430 g = £4.60.
Powder provides: protein 12 g, carbohydrate 55.6 g, fat 28 g, energy 2185 kJ (522 kcal)/100 g									
■ Specialised formulas: Infant and child: MCT-enhanced formula									
Caprilon® (SHS)	Standard dilution (12.7%) of powder per 100 mL	277 kJ (66 kcal)	1.5 g cows' milk	7 g (sugars 1.3 g)	3.6 g (MCT 75%)	Nil	Contains lactose	Disorders in which a high intake of MCT is beneficial	Can: 420 g = £14.62 (4.2-g measuring scoop provided)
Powder provides: protein 11.8 g, carbohydrate 55.1 g, fat 28.3 g, energy 2184 kJ (522 kcal)/100 g									
MCT Peptide® (SHS)	Standard dilution (15%) of powder per 100 mL	286 kJ (68 kcal)	2 g protein equivalent (non-milk peptides, essential amino acids)	8.8 g (sugars 1.2 g)	2.7 g (MCT 75%)	Nil	Gluten-free Lactose-free Contains meat (pork) and soya derivatives	Disorders in which a high intake of MCT is beneficial	Can: 400 g = £16.39 (5-g measuring scoop provided)
Powder provides: protein equivalent 13.8 g, carbohydrate 59 g, fat 18 g, energy 1903 kJ (453 kcal)/100 g									
MCT Peptide® +1 (SHS)	Standard dilution (20%) of powder per 100 mL	381 kJ (91 kcal)	2.8 g protein equivalent (non-milk peptides, essential amino acids)	11.8 g (sugars 1.6 g)	3.6 g (MCT 75%)	Nil	Gluten-free Lactose-free Contains meat (pork) and soya derivatives	Disorders in which a high intake of MCT is beneficial Not suitable for child under 1 year	Can: 400 g = £16.39 Unflavoured ¹
Powder provides: protein equivalent 13.8 g, carbohydrate 59 g, fat 18 g, energy 1903 kJ (453 kcal)/100 g									
Monogen® (SHS)	Standard dilution (17.5%) of powder per 100 mL	313 kJ (74 kcal)	2 g protein equivalent (whey)	12 g (sugars 1.2 g)	2.1 g (MCT 90%)	Nil	Residual lactose Supplementation with essential fatty acids may be needed	Long-chain acyl-CoA dehydrogenase deficiency (LCAD), carnitine palmitoyl transferase deficiency (CPTD), primary and secondary lipoprotein lipase deficiency	Can: 400 g = £17.07 Unflavoured ¹ (5-g measuring scoop provided)
Powder provides: protein equivalent 11.4 g, carbohydrate 68 g, fat 11.8 g, energy 1786 kJ (424 kcal)/100 g									

1. Flavouring: see *Modju*® Flavour System, p. 777

■ Specialised formulas: Infant and child: Soya-based formula

InfaSoy® (Cow & Gate)	Standard dilution (12.8%) of powder per 100 mL	275 kJ (66 kcal)	1.6 g soya	7 g (sugars 1 g)	3.5 g	Nil	Lactose-free	Proven lactose and associated sucrose intolerance in pre-school children, galactokinase deficiency, galactosaemia, and proven whole cows' milk sensitivity	Can: 900 g = £7.47 (4.3-g measuring scoop provided)
--------------------------	---	---------------------	---------------	---------------------	-------	-----	--------------	--	---

Powder provides: protein 12.8 g, carbohydrate 54.5 g, fat 27.3 g, energy 2150 kJ (514 kcal)/100 g

Wysoy® (Wyeth)	Standard dilution (13.2%) of powder per 100 mL	280 kJ (67 kcal)	1.8 g soya protein isolate	6.9 g (sugars 2.5 g)	3.6 g	Nil	Lactose-free	Proven lactose and associated sucrose intolerance in pre-school children, galactokinase deficiency, galactosaemia, and proven whole cows' milk sensitivity	Can: 430 g = £4.59 860 g = £8.75
-------------------	---	---------------------	-------------------------------	-------------------------	-------	-----	--------------	--	--

Powder provides: protein 14 g, carbohydrate 54 g, fat 27 g, energy 2155 kJ (515 kcal)/100 g

■ Specialised formulas: Infant and child: Low calcium formula

Locasol® (SHS)	Standard dilution (13.1%) of powder per 100 mL	278 kJ (66 kcal)	1.9 g cows' milk	7 g (sugars 6.9 g)	3.4 g	Nil	Contains lactose Calcium less than 7 mg/ 100 mL No added vitamin D	Conditions of calcium intolerance requiring restriction of calcium and vitamin D intake	Can: 400 g = £19.63 (4.4-g measuring scoop provided)
-------------------	---	---------------------	---------------------	-----------------------	-------	-----	---	---	--

Powder provides: protein 14.6 g, carbohydrate 53.7 g, fat 26.1 g, energy 2125 kJ (508 kcal)/100 g

■ Specialised formulas: Infant and child: Fructose-based formula

Galactomin 19® (SHS)	Standard dilution (12.9%) of powder per 100 mL	288 kJ (69 kcal)	1.9 g protein equivalent (cows' milk)	6.4 g (fructose 6.3 g)	4 g	Nil	Residual lactose, galactose and glucose	Conditions of glucose plus galactose intolerance	Can: 400 g = £37.18
-------------------------	---	---------------------	---	---------------------------	-----	-----	---	--	------------------------

Powder provides: protein equivalent 14.6 g, carbohydrate 49.7 g, fat 30.8 g, energy 2233 kJ (534 kcal)/100 g

■ Specialised formulas: Infant and child: Pre-thickened infant feeds

Note Not to be used for a period of more than 6 months; not to be used in conjunction with any other feed thickener or antacid products

Enfamil® AR (Mead Johnson)	Standard dilution (13.5%) of powder per 100 mL	285 kJ (68 kcal)	1.7 g cows' milk	7.6 g (lactose 4.6 g)	3.5 g	Nil	Contains lactose, pregelatinised rice starch	Significant gastro-oesophageal reflux	Can: 400 g = £3.12 (4.5-g measuring scoop provided)
-------------------------------	---	---------------------	---------------------	--------------------------	-------	-----	--	---------------------------------------	---

Powder provides: protein 12.5 g, carbohydrate 56 g, fat 26 g, energy 2093 kJ (500 kcal)/100 g

SMA® Staydown (SMA Nutrition)	Standard dilution (12.9%) of powder per 100 mL	279 kJ (67 kcal)	1.6 g casein, whey	7 g (lactose 5 g)	3.6 g	Nil	Contains lactose, pre-cooked corn starch	Significant gastro-oesophageal reflux	Can: 900 g = £6.62
----------------------------------	---	---------------------	-----------------------	----------------------	-------	-----	--	---------------------------------------	-----------------------

Powder provides: protein 12.4 g, carbohydrate 54.3 g, fat 28 g, energy 2166 kJ (518 kcal)/100 g

A2.3.2 Specialised formulas for specific clinical conditions

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Alicalm® (SHS)	Standard dilution (30%) of powder per 100 mL	567 kJ (135 kcal)	4.5 g caseinate whey	17.4 g (sugars 3.2 g)	5.3 g	Nil	Residual lactose	Crohn's disease Not suitable for child under 1 year; use as nutritional supplement only in children 1–6 years.	Powder: 400 g = £18.08 Vanilla
Powder provides: protein 15 g, carbohydrate 58 g, fat 17.5 g, energy 1889 kJ (450 kcal)/100 g									
Forticare® (Nutricia Clinical)	Liquid (sip feed) per 100 mL	675 kJ (160 kcal)	9 g cows' milk	19.1 g (sugars 13.6 g)	5.3 g	2.1 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement in patients with lung cancer undergoing chemotherapy, or with pancreatic cancer Not suitable in child under 3 years	Carton: 125 mL = £2.02 Cappuccino, orange-lemon, peach-ginger.
Generaid® (SHS)	Powder per 100 g	1586 kJ (374 kcal)	76 g protein equivalent (whey protein, plus branched chain amino acids)	5 g (sugars 5 g)	5.5 g	Nil	Electrolytes/100 g: Na ⁺ 6.1 mmol K ⁺ 10.8 mmol Ca ²⁺ 6.5 mmol P ⁺ 6.45 mmol	Nutritional supplement for use in chronic liver disease and/or porto-hepatic encephalopathy	Tub: 400 g = £51.46 Unflavoured ¹
Generaid® Plus (SHS)	Standard dilution (22%) of powder per 100 mL	428 kJ (102 kcal)	2.4 g protein equivalent (whey protein, branched chain amino acids)	13.6 g (sugars 1.4 g)	4.2 g (MCT 32%)	Nil	Electrolytes/100 mL: Na ⁺ 0.7 mmol K ⁺ 2.7 mmol Ca ²⁺ 1.72 mmol P ⁺ 1.67 mmol	Enteral feed or nutritional supplement in children over 1 year with hepatic disorders	Can: 400 g = £18.40 Unflavoured ¹ (5-g measuring scoop provided)
Powder provides: protein equivalent 11 g, carbohydrate 62 g, fat 19 g, energy 1944 kJ (463 kcal)/100 g									
Heparon® Junior (SHS)	Standard dilution (18%) of powder per 100 mL	363 kJ (86 kcal)	2 g cows' milk	11.6 g (sugars 2.9 g)	3.6 g	Nil	Contains lactose Electrolytes/100 mL: Na ⁺ 0.56 mmol K ⁺ 1.9 mmol Ca ²⁺ 2.3 mmol P ⁺ 1.6 mmol	Enteral feed or nutritional supplement for children with acute or chronic liver failure	Can: 400 g = £18.20 (4.5-g measuring scoop provided)
Powder provides: protein 11.1 g, carbohydrate 64.2 g, fat 19.9 g, energy 2016 kJ (480 kcal)/100 g									

1. Flavouring: see *Modjul*® Flavour System, p. 777

KetoCal® (SHS)	Standard dilution (20%) of powder per 100 mL	602 kJ (146 kcal)	3.1 g cows' milk with additional amino acids	600 mg (sugars 120 mg)	14.6 g (LCT 100%)	Nil	Electrolytes/100 mL: Na ⁺ 4.3 mmol K ⁺ 4.1 mmol Ca ²⁺ 2.15 mmol P ⁺ 2.77 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of epilepsy resistant to drug therapy, in children over 1 year, only on the advice of secondary care physician with experience of ketogenic diet	Can: 300 g = £25.62 Vanilla, Unflavoured
Powder provides: protein 15.25 g, carbohydrate 3 g, fat 73 g, energy 3011 kJ (730 kcal)/100 g									
KetoCal® 4:1 LQ (SHS)	Liquid (sip or tube feed) per 100 mL	620 kJ (150 kcal)	3.09 g casein and whey with additional amino acids	610 mg (sugars 230 mg)	14.8 g (LCT 100%)	1.12 g	Residual lactose Electrolytes/100 mL: Na ⁺ 4.9 mmol K ⁺ 4.7 mmol Ca ²⁺ 2.4 mmol P ⁺ 3.1 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of drug resistant epilepsy or other conditions for which a ketogenic diet is indicated in children 1–10 years; as a nutritional supplement in children over 10 years	Carton: 237 mL = £4.56 Vanilla
Kindergen® (SHS)	Standard dilution (20%) of powder per 100 mL	421 kJ (101 kcal)	1.5 g whey protein	11.8 mg (sugars 1.2 g)	5.3 g (LCT 93%)	Nil	Electrolytes/100 mL: Na ⁺ 2 mmol K ⁺ 0.6 mmol Ca ²⁺ 2.8 mmol P ⁺ 3 mmol Low Vitamin A	Enteral feed or nutritional supplement for children with chronic renal failure receiving peritoneal rapid overnight dialysis	Tub: 400 g = £24.44 (5-g measuring scoop provided)
Powder provides: protein 7.5 g, carbohydrate 59 g, fat 26.3 g, energy 2104 kJ (504 kcal)/100 g									
Modulen IBD® (Nestlé)	Standard dilution (20%) of powder (sip or tube feed) per 100 mL	420 kJ (100 kcal)	3.6 g casein	11 g (sugars 3.98 g)	4.7 g	Nil	Gluten-free Residual lactose	Crohn's disease active phase, and in remission if malnourished	Can: 400 g = £14.38 Unflavoured ¹ (8.3-g measuring scoop provided)
Powder provides: protein 18 g, carbohydrate 54 g, fat 23 g, 2070 kJ (500 kcal)/100 g									
Nepro® (Abbott)	Liquid (sip or tube feed) per 100 mL	838 kJ (200 kcal) ²	7 g cows' milk	20.6 g (sugars 3.26 g)	9.6 g	1.56 g	Gluten-free Residual lactose Electrolytes/100 mL: Na ⁺ 3.67 mmol K ⁺ 2.72 mmol Ca ²⁺ 3.43 mmol P ⁺ 2.23 mmol	Enteral feed or nutritional supplement in patients with chronic renal failure who are on haemodialysis or CAPD, or with cirrhosis, or other conditions requiring a high energy, low fluid, low electrolyte diet. Not suitable for child under 1 year; use with caution in child 1–5 years	Carton: 200 mL = £2.41 Strawberry, vanilla Flexible pack: 500 mL = £5.22 Vanilla
ProSure® (Abbott)	Liquid (sip or tube feed) per 100 mL	529 kJ (125 kcal) ²	6.65 g cows' milk	18.3 g (sugars 2.95 g)	2.56 g	2.07 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement for patients with pancreatic cancer Not suitable for child under 1 year; use with caution in child 1–4 years	Carton: 240 mL = £2.85 Vanilla

A2.3.2 Specialised formulas for specific clinical conditions (*product list continued*)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Renamil® (KoRa)	Powder (sip or tube feed when reconstituted) per 100 g	2003 kJ (477 kcal)	4.6 g cows' milk	70.8 g	19.3 g	Nil	Contains lactose Gluten-free Electrolytes/100 g: Na ⁺ 1.04 mmol K ⁺ 0.13 mmol Ca ²⁺ 10.22 mmol P ⁺ 1.06 mmol Contains no vitamin A or vitamin D	Enteral feed or nutritional supplement for adults and children over 1 year with chronic renal failure	Sachet: 10 × 100 g = £25.40
Renapro® (KoRa)	Powder per 100 g	1580 kJ (372 kcal)	90 g whey protein	800 mg	1 g	Nil	Gluten-free Residual lactose Electrolytes/100 g: Na ⁺ 23 mmol K ⁺ 2 mmol Ca ²⁺ 4.99 mmol P ⁺ 4.84 mmol	Nutritional supplement for biochemically proven hypoproteinaemia and patients undergoing dialysis Not suitable for child under 1 year	Sachet: 30 × 20 g = £69.60
Powder provides: protein 18 g, energy 316 kJ (74 kcal)/20-g sachet									
Renastart® (Vitafo)	Standard dilution (20%) of powder per 100 mL	411 kJ (98 kcal)	1.5 g cows' milk soya	12.6 g (sugars 1.2 g)	4.6 g	Nil	Contains lactose Electrolytes/100 mL: Na ⁺ 2.1 mmol K ⁺ 0.6 mmol Ca ²⁺ 0.58 mmol P ⁺ 0.58 mmol	Dietary management of renal failure in child from birth to 10 years	Powder: 10 × 100 g = £56.93 Unflavoured (7-g measuring scoop provided)
Powder provides: protein 7.5 g, carbohydrate 63 g, fat 23.2 g, energy 2053 kJ (491 kcal)/100 g									
Suplena® (Abbott)	Liquid (sip or tube feed) per 100 mL	840 kJ (200 kcal)	3 g caseinates	25.5 g (sugars 2.7 g)	9.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na ⁺ 3.39 mmol K ⁺ 2.87 mmol Ca ²⁺ 3.48 mmol P ⁺ 2.39 mmol	Enteral feed or nutritional supplement in patients with chronic or acute renal failure who are not undergoing dialysis, or with chronic or acute liver disease with fluid restriction; other conditions requiring high energy, low protein, low electrolyte, low volume enteral feed Not suitable for child under 1 year; use with caution in child 1–5 years	Can: 237 mL = £2.47 Vanilla

A2.4 Feed supplements

A2.4.1 High-energy supplements

A2.4.1.1 High-energy supplements: carbohydrate

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years

ACBS Indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Caloreen® (Nestlé)	Powder per 100 g	1640 kJ (390 kcal)	Nil	96 g Maltodextrin	Nil	Nil	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Powder: 500 g = £3.52 Unflavoured (10-g measuring scoop provided)
Maxijul® Super Soluble (SHS)	Powder per 100 g	1615 kJ (380 kcal)	Nil	95 g Glucose polymer (sugars 8.6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Sachets: 4 × 132 g = £5.44 Can: 200 g = £2.19 2.5 kg = £19.25 25 kg = £130.76 Unflavoured
Maxijul® Liquid (SHS)	Liquid per 100 mL	850 kJ (200 kcal)	Nil	50 g Glucose polymer (sugars 4.5 g ¹)	Nil	Nil	Gluten-free Lactose-free	See above	Carton: 200 mL = £1.37 Orange, unflavoured
Polycal® (Nutricia Clinical)	Powder per 100 g	1630 kJ (384 kcal)	Nil	96 g Maltodextrin (sugars 6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £3.75 Neutral (5-g measuring scoop provided)
	Liquid per 100 mL	1050 kJ (247 kcal)	Nil	61.9 g Maltodextrin (sugars 12.2 g)	Nil	Nil		See above; liquid not suitable for child under 3 years	Bottle: 200 mL = £1.50 Neutral, orange
S.O.S.® (Vitaflo)	Powder per 100 g	1590 kJ (380 kcal)	Nil	95 g (sugars 9 g)	Nil	Nil		For use as an emergency regimen in the dietary management of inborn errors of metabolism in adults and children from birth	Sachets: 30 × 21 g (S.O.S. 10) = £6.30; 30 × 31 g (S.O.S. 15) = £9.30; 30 × 42 g (S.O.S. 20) = £12.60; 30 × 52 g (S.O.S. 25) = £15.60

Contents of each sachet should be reconstituted with water to a total volume of 200 mL.

1. Sugar content varies with flavour

A2.4.1.1 High-energy supplements: carbohydrate (*product list continued*)

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years

ACBS Indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Vitajoule® (Vitaflo)	Powder per 100 g	1610 kJ (380 kcal)	Nil	96 g Dried glucose syrup	Nil	Nil	Gluten-free Lactose-free	See above	Can: 500 g = £3.66 2.5 kg = £17.83 25 kg = £107.39 (10-g measuring scoop provided)

A2.4.1.2 High-energy supplements: fat

Liquid supplements should be diluted before use in child under 5 years

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Calogen® (Nutricia Clinical)	Liquid (emulsion) per 100 mL	1850 kJ (450 kcal) ¹	Nil	100 mg	50 g (LCT 100%)	Nil	Gluten-free Lactose-free	See above	Bottle: 200 mL = £4.00 500 mL = £9.83 Banana ² , neutral, strawberry ²
Fresubin® 5 kcal Shot (Fresenius Kabi)	Liquid (emulsion) per 100 mL	2100 kJ (500 kcal)	Nil	4.0 g (sucrose)	53.8 g	400 mg	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Bottle: 120 mL = £2.55 Lemon, neutral
Liquigen® (SHS)	Liquid (emulsion) per 100 mL	1850 kJ (450 kcal)	Nil	Nil	50 g (MCT 97%) Fractio- nated coconut oil	Nil	Gluten-free Lactose-free	Steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease, liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in epilepsy, and in type 1 lipoproteinemia Not suitable for child under 1 year	Bottle: 250 mL = £7.79

1. Nutritional values vary with flavour—consult product literature

2. Flavour not suitable for child under 3 years

Medium-chain Triglyceride (MCT) Oil (SHS)	Liquid per 100 mL	3515 kJ (855 kcal)	Nil	Nil	MCT 100%	Nil		Nutritional supplement for steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease and liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in management of epilepsy, type 1 hyperlipoproteinaemia	Bottle: 500 mL = £12.34
■ Fat and Carbohydrate									
Duobar® (SHS)	Bar per 45 g	1211 kJ (292 kcal)	Less than 20 mg	22.5 g (sucrose)	22.5 g	Nil	Contains phenylalanine 180 micrograms/45-g bar Gluten-free Lactose-free	See above	Bar: 45 g = £1.65 Neutral, strawberry, toffee
Duocal® (SHS)	Liquid per 100 mL	695 kJ (166 kcal)	Nil	23.7 g (sugars 2.1 g)	7.9 g (MCT 30%)	Nil	Contains vitamin E	See above	Bottle: 250 mL = £3.37
Duocal® Super Soluble (SHS)	Powder per 100 g	2061 kJ (492 kcal)	Nil	72.7 g (sugars 6.5 g)	22.3 g (MCT 35%)	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £15.20 (5-g measuring scoop provided)
Energivit® (SHS)	Standard dilution (15%) of powder per 100 mL	309 kJ (74 kcal)	Nil	10 g (sugars 900 mg)	3.75 g	Nil	Lactose-free With vitamins, minerals, and trace elements	For children requiring additional energy, vitamins, minerals, and trace elements following a protein-restricted diet	Can: 400 g = £18.49 (5-g measuring scoop provided)
Powder provides: carbohydrate 66.7 g, fat 25 g, energy 2059 kJ (492 kcal)/100 g									
MCT Duocal® (SHS)	Powder per 100 g	2082 kJ (497 kcal)	Nil	72 g (sugars 10.1 g)	23.2 g (MCT 83%)	Nil		See above	Can: 400 g = £18.07

A2.4.1.3 High-energy supplements: protein

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Casilan 90® (Heinz)	Powder per 100 g	1572 kJ (370 kcal)	90 g cows' milk	300 mg	1 g	Nil	Gluten-free Electrolytes/100 g: Na ⁺ 1.3 mmol K ⁺ 8.7 mmol Ca ²⁺ 35 mmol P ⁻ 22.6 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 250 g = £6.49

A2.4.1.3 High-energy supplements: protein (product list continued)**ACBS indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Protifar® (Nutricia Clinical)	Powder per 100 g	1580 kJ (373 kcal)	88.5 g cows' milk	less than 1.5 g	1.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na ⁺ 1.3 mmol K ⁺ 1.28 mmol Ca ²⁺ 33.75 mmol P ⁻ 22.58 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 225 g = £7.44 Unflavoured (2.5-g measuring scoop provided)
Powder provides: protein 2.2 g per 2.5 g									
Vitapro® (Vitafo)	Powder per 100 g	1506 kJ (360 kcal)	75 g whey protein isolate	9 g	6 g	Nil	Contains lactose	Biochemically proven hypoproteinaemia	Tub: 250 g = £7.47 2 kg = £58.69 (5-g measuring scoop provided)
■ Protein and carbohydrate									
Dialamine® (SHS)	Standard dilution (20%) of powder per 100 mL	264 kJ (62 kcal)	4.3 g protein equivalent (essential and non-essential amino acids)	11.2 g (sugars 10.2 g)	Nil	Nil	Contains vitamin C	Hypoproteinaemia, chronic renal failure, wound fistula leakage with excessive protein loss, conditions requiring a controlled nitrogen intake, and haemodialysis Not suitable for child under 6 months	Can: 400 g = £61.74 Orange
Powder provides: protein equivalent 25 g, carbohydrate 65 g, vitamin C 125 mg, energy 1530 kJ (360 kcal)/100 g									
ProSource® (Nutrinovo)	Liquid per 30 mL	420 kJ (100 kcal)	10 g collagen protein whey protein isolate	15 g (sugars 8 g)	Nil	Nil	Gluten-free Lactose-free May contain porcine derivatives	Biochemically proven hypoproteinaemia Not recommended for child under 3 years	Sachet: 100 × 30 mL = £83.36 Citrus-berry, neutral, orange creme
■ Protein, fat, and carbohydrate									
Calogen® Extra (Nutricia Clinical)	Liquid per 100 mL	1650 kJ (400 kcal)	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Residual lactose Contains vitamins, minerals, and trace elements	See above Not suitable for child under 3 years; may require dilution for child 3–5 years	Bottle: 200 mL = £4.56 Neutral, strawberry

Calshake® (Fresenius Kabi)	Powder per 87 g	1841 kJ (439 kcal) ¹	4.1 g cows' milk	56.4 g (sugars 20 g)	22 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year	Sachet: 87 g = £2.01 Banana, neutral, strawberry, vanilla 90 g = £2.01 Chocolate
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 12 g									
Enshake® (Abbott)	Powder per 100 g	1893 kJ (450 kcal) ¹	8.4 g cows' milk, soy protein isolate	69 g (sugars 14.5 g)	15.6 g	Nil	Residual lactose Contains vitamins and minerals	See above Not suitable for child under 1 year; use with caution in child 1–6 years	Sachet: 96.5 g = £1.98 Banana, chocolate, strawberry, vanilla
Powder: 96.5 g reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 16 g									
Pro-Cal® (Vitafo)	Powder per 100 g	2788 kJ (667 kcal)	13.5 g cows' milk	27 g	56 g	Nil	Contains lactose	See above Not suitable for child under 1 year	Sachets: 25 × 15 g = £13.51 Tub: 510 g = £12.52 1.5 kg = £25.50 12.5 kg = £181.28 25 kg = £279.36 (15-g measuring scoop provided)
Powder 15 g provides: protein 2 g, carbohydrate 4 g, fat 8.4 g, energy 418 kJ (100 kcal)									
Pro-Cal® Shot (Vitafo)	Liquid per 100 mL	1393 kJ (334 kcal)	6.7 g cows' milk	13.4 g	28.2 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year	Bottle: 6 × 250 mL = £26.76 Banana, neutral, strawberry ² Starter pack: 3 × 250 mL = £13.39
QuickCal® (Vitafo)	Powder per 100 g	3263 kJ (780 kcal)	4.6 g cows' milk	17 g	77 g	Nil	Contains lactose	See above Not suitable for child under 1 year	Sachets: 25 × 13 g = £12.16
Powder 13 g provides: protein 600 mg, carbohydrate 2.2 g, fat 10 g, energy 418 kJ (100 kcal)									
Scandishake® Mix (Nutricia Clinical)	Powder per 100 g	2099 kJ (500 kcal) ¹	4.7 g cows' milk	65 g (sugars 14.3 g)	24.7 g	Nil	Gluten-free Contains lactose	See above Not suitable for child under 3 years	Sachet: 85 g = £2.08 Banana, caramel, chocolate, strawberry, vanilla, unflavoured
Powder: 85 g reconstituted with 240 mL whole milk provides: protein 11.7 g, carbohydrate 66.8 g, fat 30.4 g, energy 2457 kJ (588 kcal)									
Vitasavoury® (Vitafo)	Powder per 100 g	2590 kJ (619 kcal) ¹	12.7 g cows' milk	23.5 g (sugars 1.5 g)	52.3 g	6.2 g	Contains lactose	See above Not suitable for child under 3 years	Cup (200 kcal): 24 × 33 g = £26.80 Sachet (300 kcal) 10 × 50 g = £16.35 Chicken, leek and potato, mushroom, vegetable
1. Nutritional values vary with flavour—consult product literature									
2. Flavour not suitable for child under 3 years									

A2.4.2 Fibre, vitamin, and mineral supplements

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
■ High-fibre supplements									
Resource® Optifibre® (Nestlé)	Powder per 100 g	323 kJ (76 kcal)	Nil	19 g guar gum, partially hydrolysed	Nil	78 g	Gluten-free Lactose-free	Standard, p. 743 except dysphagia Not suitable for child under 5 years	Sachet: 16 x 10 g = £7.72 Can: 250 g = £9.51 (5-g measuring scoop provided)
■ Vitamin and Mineral supplements									
Metabolic Mineral Mixture® (SHS)	Powder per 100 g	729 kJ (175 kcal)	Nil	Nil	Nil	Nil	Contains trace elements Electrolytes/100 g: Na ⁺ 172 mmol K ⁺ 212 mmol Ca ²⁺ 205 mmol P ⁺ 192 mmol Energy source: Calcium lactate	Mineral supplement for synthetic diets Suitable for infants (but may require further dilution)	Tub: 100 g = £10.67
Paediatric Seravit® (SHS)	Powder per 100 g	1275 kJ (300 kcal)	Nil	75 g (sugars 6.75 g ¹)	Nil	Nil		Vitamin and mineral supplement in infants and children with restrictive therapeutic diets	Tub: 200 g = £14.37 Unflavoured ² 200 g = £15.30 Pineapple ³ (5-g measuring scoop provided)

1. Sugar content varies with flavour

2. Flavouring: see *Modju*® Flavour System, p. 777

3. Flavour not suitable for child under 6 months

A2.5 Feed additives

A2.5.1 Special additives for conditions of intolerance

Colief® (Forum)

Liquid, lactase 50 000 units/g, net price 7-mL dropper bottle = £8.40

For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature

Fructose

(Laevulose)

For proven glucose/galactose intolerance

A2.5.2 Feed thickeners and pre-thickened drinks

Carobel, Instant® (Cow & Gate)

Powder, carob seed flour. Net price 135 g = £2.97

For thickening feeds in the treatment of vomiting

Nutlis® Powder (Nutricia Clinical)

Powder, carbohydrate 86 g, energy 1520 kJ (358 kcal)/100 g, modified maize starch, gluten- and lactose-free, net price 20 × 9-g sachets = £5.88, 225 g = £4.51

For thickening of foods in dysphagia. Not suitable for child under 1 year except in cases of failure to thrive

Resource® Thickened Drink (Nestlé)

Liquid, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 376 kJ (89 kcal)/100 mL. Flavours: apple or orange, syrup or custard consistencies. Gluten- and lactose-free, net price 12 × 114-mL cups = £7.44

For dysphagia. Not suitable for children under 1 year

Resource® ThickenUp® (Nestlé)

Powder, modified maize starch. Gluten- and lactose-free, net price 227 g = £4.35; 74 × 4.5-g sachet = £16.66

For thickening of foods in dysphagia. Not suitable for children under 1 year

SLO Drinks® (SLO Drinks)

Powder, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange; hot drinks: chocolate, white coffee, net price 25 × 115 mL = £7.50

Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years

Thick and Easy® (Fresenius Kabi)

Powder, modified maize starch, net price 225-g can = £4.46; 100 × 9-g sachets = £26.35; 4.54 kg = £70.53

Thickened Juices, liquid, modified food starch. Flavours: apple or orange, net price 118-mL pot = 57p; apple, black currant, cranberry, kiwi-strawberry, orange, 1.42-litre bottle = £3.61

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Thixo-D® (Sutherland)

Powder, modified maize starch, gluten-free. Net price 375-g tub = £7.15

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Vitaquick® (Vitafo)

Powder, Modified maize starch. Net price 300 g = £6.66; 2 kg = £33.91; 6 kg = £87.83

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

A2.5.3 Flavouring preparations

Flavour Mix® (Nestlé)

Powder, flavours: banana, chocolate, coffee, lemon-lime, or strawberry, net price 60 g = £6.85

FlavourPac® (Vitafo)

Powder, flavours: black currant, lemon, orange, tropical or raspberry, net price 30 × 4-g sachets = £11.54

For use with Vitafo's range of unflavoured protein substitutes for metabolic diseases

Modjul® Flavour System (SHS)

Powder, carbohydrate-based flavours, black currant, orange, pineapple, 100 g = £10.24; cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £10.24

For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months

A2.6 Foods for special diets

A2.6.1 Gluten-free foods

ACBS indications: established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

Bread

Loaves

Barkat® (Gluten Free Foods Ltd)

Gluten-free. Loaf, multigrain 500 g = £4.83. Loaf, sliced, wholemeal 500 g = £3.36. Loaf, sliced, part-baked, country-style 250 g = £3.69. Loaf, sliced, part-baked, white 550 g = £4.88. Rice bread, brown 500 g = £4.83; white 500 g = £4.83

Dietary Specials® (Nutrition Point)

Gluten-free. Loaf, sliced, multigrain, brown 400 g = £3.01; white 400 g = £3.01

Ener-G® (General Dietary)

Gluten-free. Loaf, sliced Seattle brown 600 g = £5.28. Rice bread, sliced, brown 474 g = £4.59; white 456 g = £4.59. Rice loaf, sliced 612 g = £4.59. Tapioca bread, sliced 480 g = £4.59

Genius Gluten Free® (Genius Foods)

Gluten-free. Loaf, unsliced, brown 400 g = £2.49; white 400 g = £2.49

Glutafin® (Nutrition Point)

Gluten-free. Loaf, sliced, fibre 400 g = £3.41; white 400 g = £3.41

Glutafin® Select (Nutrition Point)

Gluten-free. Loaf, sliced, fresh, brown 400 g = £3.25; white 400 g = £3.25. Loaf, sliced, fibre 400 g = £3.12; white 400 g = £3.12. Loaf, seeded 400 g = £3.39

Juvela® (Juvela)

Gluten-free. Loaf, sliced, fresh, fibre 400 g = £2.97; white 400 g = £3.23. Loaf, sliced, white 400 g = £3.10; fibre 400 g = £3.10. Loaf, white 400 g = £3.10; fibre 400 g = £3.10. Loaf, part-baked, fibre 400 g = £3.33; white 400 g = £3.46

Lifestyle® (Ultraparm)

Gluten-free. Loaf, sliced, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82. Loaf, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82

Livwell® (Livwell)

Gluten-free. Loaf, sliced, brown (seeded) 200 g = £2.25; white 200 g = £2.25

Pasticely® (GFF Trade)

Gluten-free. Loaf, sandwich, sliced, white 260 g = £3.29; rustic, sliced, white 260 g = £3.29

Proceli® (Proceli)

Gluten-free. Loaf, sliced, white 165 g = £2.30; sandwich 155 g = £2.32. Rice bread, brown 220 g = £2.30; sandwich 220 g = £2.30

Sunnyvale® (Everfresh)

Gluten-free. Loaf, mixed grain, sour dough 400 g = £1.91

Ultra® (Ultraparm)

Gluten-free. Loaf, white 400 g = £2.46; high fibre 500 g = £3.35

Wellfoods® (Wellfoods)

Gluten-free. Loaf, sliced 600 g = £4.95; unsliced 600 g = £4.85

Baguettes, buns and rolls**Barkat®** (Gluten Free Foods Ltd)

Gluten-free. Baguette, part-baked 200 g = £3.69. Rolls, part-baked 2 x 100 g = £3.30; 6 x 50 g = £3.69

Ener-G® (General Dietary)

Gluten-free. Rolls, dinner 4 x 6 = £3.11; white, long 4 x 55 g = £2.50; round 4 x 55 g = £2.50

Glutafin® (Nutrition Point)

Gluten-free. Baguette 2 x 175 g = £3.20. Rolls, fibre 4 x 50 g = £3.41; white 4 x 50 g = £3.41

Glutafin® Select (Nutrition Point)

Gluten-free. Rolls, fibre 4 x 65 g = £3.25; white 4 x 65 g = £3.25. Rolls, part-baked, white 4 x 50 g = £3.35; long 2 x 75 g = £2.56

Juvela® (Juvela)

Gluten-free. Rolls, fresh, fibre 5 x 85 g = £4.17; white 5 x 85 g = £4.17. Rolls, fibre 5 x 85 g = £4.18; white 5 x 85 g = £4.18. Rolls, part-baked, fibre 5 x 75 g = £4.33; white 5 x 75 g = £4.33

Lifestyle® (Ultraparm)

Gluten-free. Rolls, brown 5 x 80 g = £2.82; high fibre 5 x 80 g = £2.82; white 5 x 80 g = £2.82

Livwell® (Livwell)

Gluten-free. Baguette, white 250 g = £2.50. Buns, toasting 4 x 50 g = £2.50. Rolls, white 4 = £2.25. Rolls, part-baked, circle (bagel) 2 x 90 g = £2.50; dinner (square) 2 x 80 g = £2.09

Pasticely® (GFF Trade)

Gluten-free. Baguette, part-baked, white 160 g = £1.99. Rolls, part-baked, white 2 x 80 g = 2.39; rustic, part-baked, white 2 x 105 g = £2.39

Proceli® (Proceli)

Gluten-free. Baguette, part-baked 2 x 125 g = £3.24. Buns 4 x 50 g = £3.26. Lunch rolls, white 8 x 34 g = £3.26. Rolls, part-baked, white, dinner 4 x 35 g = £2.18; hotdog 3 x 35 g = £2.24; long 3 x 83 g = £2.95

Ultra® (Ultraparm)

Gluten-free. Baguette, 2 x 200 g = £2.46. Rolls, 4 x 70 g = £2.46

Wellfoods® (Wellfoods)

Gluten-free. Burger buns 4 x 75 g = £3.95. Rolls 4 x 70 g = £3.65

Speciality breads**Livwell®** (Livwell)

Gluten-free. Flat bread (pitta) 4 = £3.00. Tear-drop shape (naan) 2 x 90 g = £3.00

Proceli® (Proceli)

Gluten-free. Flat bread (pitta), part-baked 3 x 40 g = £4.36

Cookies and biscuits**Barkat®** (Gluten Free Foods Ltd)

Gluten-free. Biscuits, coffee-style 200 g = £ 2.86; digestive 175 g = £2.20

Juvela® (Juvela)

Gluten-free. Pizza base 2 × 180 g = £7.70

Pasticely® (GFF Trade)

Gluten-free. Pizza base 165 g = £2.99

Proceli® (Proceli)

Gluten-free. Pizza base 2 × 250 g = £3.90

Ultra® (Ultraparm)

Gluten-free. Pizza base 2 × 200 g = £2.65

Wellfoods® (Wellfoods)

Gluten-free. Pizza base 2 × 300 g = £8.95

A2.6.1.1 Gluten- and wheat-free foods

ACBS indications: established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

Ener-G® (General Dietary)

Gluten-free, wheat-free. Bread loaf, six flour 576 g = £3.60. Rolls, Seattle brown, round (hamburger) 4 × 119 g = £3.00; long (hot dog) 4 × 119 g = £3.00. Pizza base, 3 × 124 g = £3.75

Glutafin® (Nutrition Point)

Gluten-free, wheat-free. Flour mix, bread 500 g = £6.06; fibre 500 g = £6.06. Cake mix 500 g = £6.06. Crispbread 150 g = £3.82

Heron Foods® (Gluten Free Foods Ltd)

Gluten-free, wheat-free. Flour mix, organic, bread, fibre 500 g = £8.30. Bread and cake mix 500 g = £6.33

A2.6.2 Low-protein foods

ACBS indications: inherited metabolic disorders, renal or liver failure, requiring a low-protein diet

Bread**Ener-G®** (General Dietary)

Low protein. Rice bread, 600 g = £4.71

Juvela® (Juvela)

Low protein. Loaf, sliced 400 g = £3.19. Rolls 5 × 70 g = £3.96

Loprofin® (SHS)

Low protein. Loaf, part-baked, sliced 400 g = £3.35. Rolls, part-baked 4 × 65 g = £3.52

PK Foods® (Gluten Free Foods Ltd)

Low protein. Loaf, white, sliced 550 g = £4.40

Ultra PKU® (Ultraparm)

Low-protein. Loaf 400 g = £2.65

Cake, biscuits, and snacks**Harifen®** (Ultraparm)

Low protein. Cracker toast, 200 g = £2.75

Juvela® (Juvela)

Low-protein. Cookies, cinnamon 125 g = £6.67; chocolate chip 110 g = £6.67; orange 125 g = £6.67

Loprofin® (SHS)

Low-protein. Crunch bar 8 × 41 g = £11.92. Wafers, chocolate 100 g = £2.17; vanilla 100 g = £2.17. Crackers 150 g = £3.05, herb 150 g = £3.05

PK Foods® (Gluten Free Foods Ltd)

Low-protein. *Aminex®* biscuits 200 g = £4.67; cookies 150 g = £4.67. Cookies, chocolate chip 150 g = £4.67; cinnamon 150 g = £4.67; orange 150 g = £4.67. Rusks 200 g = £4.67. Crispbread 75 g = £2.24

Promin® (Firstplay Dietary)

Low-protein. Cooked and flavoured Pasta Snax, ready-salted 12 × 25 g = £9.84; salt and vinegar 12 × 25 g = £9.84; cheese and onion 12 × 25 g = £9.84; jalapeno 12 × 25 g = £9.84

Taranis® (Firstplay Dietary)

Low-protein. Cake bars, apricot 6 × 40 g = £5.77, lemon 6 × 40 g = £5.51, pear 6 × 40 g = £5.77

Vita Bite® (Vitaflo)

Low protein. Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g. Chocolate flavoured, 25 g = £1.02

Not recommended for any child under 1 year

Cereals**Loprofin®** (SHS)

Low-protein. Breakfast cereal flakes, apple 375 g = £6.70; chocolate 375 g = £6.70; strawberry 375 g = £6.70. Cereal loops 375 g = £6.95

Promin® (Firstplay Dietary)

Low-protein. Hot breakfast (powder sachets), apple and cinnamon 6 × 57 g = £7.35, banana 6 × 57 g = £7.35, chocolate 6 × 57 g = £7.35; original 6 × 56 g = £7.35

Desserts**Loprofin®** (SHS)

Low-protein. Powder, chocolate 150 g = £4.10; strawberry 150 g = £4.10; vanilla 150 g = £4.10

PK Foods® (Gluten Free Foods Ltd)

Low-protein. Jelly, orange 4 × 80 g = £7.43, cherry 4 × 80 g = £7.43

ACBS Indications

Promin® (Firstplay Dietary)

Low-protein. Dessert mix, caramel 6 × 36.5 g = £5.77; custard 6 × 36.5 g = £5.77; chocolate and banana 6 × 36.5 g = £5.77; strawberry and vanilla 6 × 36.5 g = £5.77. Rice pudding imitation, apple 4 × 69 g = £5.77; banana 4 × 69 g = £5.77; original 4 × 69 g = £5.77; strawberry 4 × 69 g = £5.77

Flour mixes and egg substitutes**Ener-G®** (General Dietary)

Low-protein. Egg replacer 454 g = £4.34

Fate® (Fate)

Low-protein. All purpose mix 500 g = £6.66. Cake mix, 2 × 250 g = £6.66; chocolate-flavour 2 × 250 g = £6.66

Juvela® (Juvela)

Low-protein. Mix 500 g = £6.82

Loprofin® (SHS)

Low-protein. Mix, plain 500 g = £7.09; chocolate 500 g = £7.50; lemon 500 g = £7.50. Egg replacer 2 × 250 g = £13.03. Egg-white replacer 100 g = £8.38

PK Foods® (Gluten Free Foods Ltd)

Low-protein. Flour mix 750 g = £9.91. Egg replacer 350 g = £4.67
ACBS Indications

Pasta**Loprofin®** (SHS)

Low-protein. Pasta, animal shapes 500 g = £7.13; conchige 500 g = £7.15; spirals 500 g = £7.42; gnocchetti sardi 500 g = £7.15; lasagne 250 g = £3.61; macaroni elbows 250 g = £3.56; penne 500 g = £7.42; spaghetti 500 g = £7.42; tagliatelle 250 g = £3.56; vermicelli 250 g = £3.69. Rice, imitation 500 g = £7.20

Promin® (Firstplay Dietary)

Low-protein. Pasta, alphabet shapes 500 g = £6.48; lasagne sheets 200 g = £2.76; macaroni 500 g = £6.48; noodles, flat 500 g = £6.48; shells 500 g = £6.48; spaghetti, short-cut 500 g = £6.48; spirals 500 g = £6.48. Rice, imitation 500 g = £6.48. Tricolour pasta, alphabet shapes 500 g = £6.48; shells 500 g = £6.48; spirals 500 g = £6.48

Pizza bases**Juvela®** (Juvela)

Low-protein. Pizza base 2 × 180 g = £7.55

Ultra PKU® (Ultraparm)

Low-protein. Pizza base 5 × 80 g = £2.45

Savoury meals and mixes**Loprofin®** (SHS)

Low-protein. Snack pot, curry 47 g = £3.94

Promin® (Firstplay Dietary)

Low-protein. Burger mix 2 × 62 g = £5.77; lamb & mint 2 × 62 g = £5.77. Couscous 500 g = £6.48. Pasta elbows in cheese and broccoli sauce 4 × 66 g = £7.54. Pasta meal 500 g = £6.48. Pasta shells in tomato, pepper, and herb sauce 4 × 72 g = £7.54. Pasta spirals in Moroccan sauce 4 × 72 g = £7.54. Sausage mix, apple & sage 4 × 30 g = £6.49; original 4 × 30 g = £6.49; tomato & basil 4 × 30 g = £6.49

Spreads**Taranis®** (Firstplay Dietary)

Low-protein. Spread, hazelnut 230 g = £6.80

carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years

GA Gel® (Vitaflo)

Gel, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 8.4 g, carbohydrate 8.6 g, fat trace, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 777), net price 30 × 20-g sachets = £149.04
Nutritional supplement for dietary management of type 1 glutaric aciduria in children 1–10 years

¹XLYS, Low TRY, Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 777), net price 500 g = £82.57

Nutritional supplement for dietary management of type 1 glutaric aciduria

XLYS, TRY, Glutaridon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g. Lactose-free. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 777), net price 2 × 500 g = £312.84

Nutritional supplement for type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals and trace elements

Glucogen storage disease**Corn flour and corn starch**

For hypoglycaemia associated with glycogen-storage disease

Glucose**(Dextrose monohydrate)**

Net price 500 g = £1.18.

For glycogen storage disease and sucrose/isomaltose intolerance

Glycosade® (Vitaflo)

Powder, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g, net price 30 × 60-g sachets = £92.03

A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years

Homocystinuria or hypermethioninaemia**HCU Anamix® Infant** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven vitamin B₆ non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years

1. Maxamaid products are generally intended for use in children 1–8 years

A2.7 Nutritional supplements for metabolic diseases**Glutaric aciduria (type 1)****GA1 Anamix® Infant** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g,

HCU cooler® (Vitaflo)

Liquid, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 386 kJ (92 kcal)/130 mL, with vitamins, minerals and trace elements. Orange or red flavour, net price 30 × 130-mL pouch = £277.20

A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria

HCU Express® (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals and trace elements. Unflavoured, (flavouring: see *Flavour Pac®*, p. 777), net price 30 × 25-g sachets = £277.88

A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria

HCU gel® (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 8.4 g, carbohydrate 8.6 g, fat 30 mg, energy 286 kJ (68 kcal)/20 g with vitamins, minerals and trace elements. Unflavoured, (flavouring: see *Flavour Pac®*, p. 777), net price 30 × 20-g sachets = £151.93

A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria

HCU LV® (SHS)

Powder, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modju®* Flavour System, p. 777), or tropical flavour (formulation varies slightly), net price 30 × 27.8-g sachets = £434.40

Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B₆ non-responsive homocystinuria in children over 8 years

XMET Homidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids, except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £156.42

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children

¹XMET Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £82.57

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

²XMET Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £132.36

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

Hyperlysinaemia**HYPER LYS Anamix® Infant** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years

¹XLYS Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 16 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £82.57

Nutritional supplement for the dietary management of hyperlysinaemia

Isovaleric acidaemia**IVA Anamix® Infant** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven isovaleric acidaemia or other proven disorders of leucine metabolism in children from birth to 3 years

XLEU Faladon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 200 g = £62.55

Nutritional supplement for the dietary management of isovaleric acidaemia in children

¹XLEU Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £82.57

Nutritional supplement for the dietary management of isovaleric acidaemia

Maple syrup urine disease**Isoleucine Amino Acid Supplement** (Vitaflo)

Powder, isoleucine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48

Nutritional supplement for use in the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 1 year and adults

MSUD Aid III® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £156.42

Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years

MSUD Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years

MSUD Anamix® Junior (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 30 × 29-g sachets = £166.73

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

MSUD Anamix® Junior LQ (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Orange flavour, net price 125-mL carton = £7.58

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

MSUD express® (Vitafo)

Powder, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Flavour Pac®*, p. 777), net price 30 × 25-g sachets = £271.88

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

MSUD cooler® (Vitafo)

Liquid, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL = £277.20

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

MSUD Gel® (Vitafo)

Powder, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Flavour Pac®*, p. 777), net price 30 × 20-g sachets = £151.93

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

¹MSUD Maxamaid® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £82.57

Nutritional supplement for the dietary management of maple syrup urine disease

²MSUD Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £132.36

Nutritional supplement for the dietary management of maple syrup urine disease

Valine Amino Acid Supplement (Vitafo)

Powder, valine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48

Nutritional supplement for the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 1 year

Methylmalonic propionic acidaemia**MMA/PA Anamix® Infant (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years

XMTVI Asadon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 200 g = £62.55

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults

¹XMTVI Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £82.57

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

²XMTVI Maxamum (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £132.36

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

Other inborn errors of metabolism**Cystine Amino Acid Supplement (Vitafo)**

Powder, cystine 500 mg, carbohydrate 3.4 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in children over 1 year

1. Maxamaid products are generally intended for use in children 1–8 years

2. Maxamum products are generally intended for use in children over 8 years

DocOmega® (Vitafo)

Powder, protein (cows' milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals, net price 30 × 4-g sachets = £32.20

Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth

EEA® Supplement (Vitafo)

Powder, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 × 12.5-g sachets = £174.48

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders in children over 3 years

KeyOmega® (Vitafo)

Powder, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 × 4-g sachet = £32.92

Nutritional supplement for the dietary management of inborn errors of metabolism

Leucine Amino Acid Supplement (Vitafo)

Powder, leucine 100 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in children over 1 year

Low protein drink (Milupa)

Powder, protein (cows' milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 400 g = £7.76 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year

Note Termed *Milupa® lp-drink* by manufacturer

Phenylalanine Amino Acid Supplement (Vitafo)

Powder, phenylalanine 50 mg, carbohydrate 3.8 g, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £43.18

Nutritional supplement for use in the dietary management of inborn errors of metabolism only

ProZero® (Vitafo)

Liquid, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose. Net price 18 × 250 mL = £22.50; 6 × 1 litre = £30.00

A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults

Phenylketonuria**Add-Ins®** (SHS)

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 60 × 18.2-g sachets = £315.60

Nutritional supplement for the dietary management of proven phenylketonuria in children over 4 years

Easiphen® (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL, with vitamins, minerals, and trace elements. Forest berries or orange flavour, net price 250-mL carton = £8.11

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years

Lophlex® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange, or unflavoured, net price 30 × 27.8-g sachets = £243.60

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

Looprofin® PKU Drink (SHS)

Liquid, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 61p

Nutritional supplement for the dietary management of phenylketonuria in children over 1 year

Milupa PKU 2-prima® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £131.68

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

Milupa PKU 2-secunda® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £153.62

Nutritional supplement for the dietary management of phenylketonuria in children 9–15 years

Milupa PKU 3-advanta® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £153.62

Nutritional supplement for the dietary management of phenylketonuria in children over 15 years

Phlexy-10® Exchange System (SHS)

Capsules, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule, net price 200-cap pack = £35.77

Tablets, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet, net price 75-tab pack = £23.17

Drink Mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour, net price 30 × 20-g sachet = £107.86

Nutritional supplement for the dietary management of phenylketonuria

Phlexy-Vits® (SHS)

Powder, vitamins, minerals, and trace elements, net price 30 × 7-g sachets = £60.00

Tablets, vitamins, minerals, and trace elements, net price 180-tab pack = £68.26

For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities

PK Aid 4® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured, (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £120.24 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of phenylketonuria in children and adults

PKU Anamix® First Spoon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 5 g, carbohydrate 4.8 g, fat 150 mg, fibre nil, energy 168 kJ (41 kcal)/12.5-g sachet, with vitamins, minerals, and trace elements, net price 30 × 12.5 g = £81.00

Nutritional supplement for the dietary management of proven phenylketonuria in children from 6 months to 5 years

PKU Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £29.72 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years

PKU Anamix® Junior (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 kJ (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Flavours: chocolate, pineapple-vanilla, or unflavoured (carbohydrate 11 g, energy 474 kJ (113 kcal)/29-g sachet), net price 30 × 29-g sachets = £106.20

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

PKU Anamix Junior LQ® (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: Berry, orange, or unflavoured, net price 125-mL carton = £4.72

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

PKU cooler10® (Vitafo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 87-mL = £112.80

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

PKU cooler15® (Vitafo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 130 mL = £168.00

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

PKU cooler20® (Vitafo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 174 mL = £225.60

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

PKU express® (Vitafo)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 3.8 g, energy 315 kJ (76 kcal)/25 g, with vitamins, minerals, and trace elements. Lemon, orange, tropical, or unflavoured, net price 30 × 25-g sachets = £164.84

Nutritional supplement for the dietary management of phenylketonuria in children over 8 years

PKU gel® (Vitafo)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals and trace elements. Orange, raspberry, or unflavoured (flavouring: see *Flavour Pac®*, p. 777), net price 30 × 20-g sachets = £95.03

For use as part of the low-protein dietary management of phenylketonuria in children 1–10 years

PKU Lophlex® LQ 10 (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 170 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 60 × 62.5 mL = £261.00

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Lophlex® LQ 20 (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 3 × 125 mL = £26.04

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Start® (Vitafo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £5.58

For the dietary management of phenylketonuria in children under 12 months

Sno-Pro® (SHS)

Liquid, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose. Net price 200 mL = £1.05

Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism

L-Tyrosine (SHS)

Powder, net price 100 g = £18.41

Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations

Tyrosine Amino Acid Supplement (Vitafo)

Powder, tyrosine 1 g, carbohydrate 2.9 g, energy 62 kJ (15 kcal)/4-g sachet, net price 30 × 4-g sachets = £4.08

Nutritional supplement for the dietary management of phenylketonuria and other inborn errors of amino acid metabolism

1XP Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour, or unflavoured (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £48.85

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

1. Maxamaid products are generally intended for use in children 1–8 years

1^X XP Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange, or unflavoured (flavouring: see *Modju®* Flavour System, p. 777), net price 30 × 50-g sachets = £226.50, 500 g = £75.54
Nutritional supplement for the dietary management of phenylketonuria in children over 8 years

Tyrosinaemia**Methionine-free TYR Anamix® Infant (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years

TYR Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years

TYR Anamix® Junior (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 30 × 29-g sachets = £173.32

Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years

TYR Anamix® Junior LQ (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals and trace elements. Orange flavour, net price 36 × 125-mL bottle = £272.79

Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see section 9.8.1), type II, and type III, in children over 1 year

TYR cooler® (Vitaflor)

Liquid, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 386 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL pouch = £277.20

Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years

TYR express® (Vitaflor)

Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (76 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Flavour Pac®*, p. 777), net price 30 × 25-g sachets = £271.88

Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years

TYR Gel® (Vitaflor)

Gel, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals and trace elements. Unflavoured (flavouring: see *Flavour Pac®*, p. 777), net price 30 × 20-g sachets = £151.93

Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

2^X XPHEN TYR Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £82.57

Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years

XPHEN TYR Tyrosidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £156.42

Nutritional supplement for the management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal

XPTM Tyrosidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modju®* Flavour System, p. 777), net price 500 g = £156.42

Nutritional supplement for the dietary management of tyrosinaemia type I in children and adults where plasma-methionine concentrations are above normal

Urea cycle disorders (other than arginase deficiency)**L-Arginine (SHS)**

Powder, net price 100 g = £12.27

For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, argininosuccinic aciduria, and deficiency of N-acetylglutamate synthetase

Conditions for which ACBS products can be prescribed

Note This is a list of clinical conditions for which the ACBS has approved toilet preparations. For details of the preparations see Chapter 13.

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)

Covermark[®] classic foundation and finishing powder;
Dermacolor[®] Camouflage cream and fixing powder;
Keromask[®] masking cream and finishing powder; *Veil*[®]
 Cover cream and Finishing Powder. (Cleansing Creams,
 Cleansing Milks, and Cleansing Lotions are excluded)

Disinfectants (antiseptics)

May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes

Dry mouth (xerostomia)

For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

AS Saliva Orthana[®]; *Biotène Oralbalance*[®]; *BioXtra*[®];
Glandosane[®]; *Saliveze*[®]; *Salivix*[®]

For details of preparations see section 12.3.5, p. 548

Eczema

See Dermatitis, above

Photodermatoses (skin protection in)

Delph[®] Sun Lotion SPF 30; *LA Roche-Posay Anthelios*[®] Melt in cream SPF 50⁺; *Sunsense Ultra*[®];
Uvistat[®] Lipscreen SPF 50, *Uvistat*[®] Suncream SPF 30 and 50

Pruritus

See Dermatitis, above

A3 Cautionary and advisory labels for dispensed medicines

Preparations in the *BNF for Children* include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that, when necessary, pharmacists will counsel children or their carers.

Counselling needs to be related to the age, experience, background, and understanding of the child or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discoloration of urine or stools by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs Most preparations are now dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. The advice in patient information leaflets may be less appropriate when the medicine is for a child, particularly for unlicensed medicines or indications. Pharmacists should explain discrepancies to carers, if necessary. The patient information leaflet should only be withheld in exceptional circumstances because it contains other information that should be provided. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels In general, no label recommendations are provided for injections on the assumption that they will be administered by a healthcare professional or a well-instructed child or carer. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular child. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish addi-

tional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard . . . days after opening' and 'Do not use after . . .', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the *BNF for Children* these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the *BNF for Children* apply to medicines dispensed against a prescription. Children and carers should be made aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the *BNF for Children* does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The *BNF for Children* will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For *BNF for Children* 2011–2012, a revised set of cautionary and advisory labels has been introduced. All of the existing labels have been user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the *BNF for children* and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

1 Warning: This medicine may make you sleepy

To be used on *preparations for children* containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

To be used on *preparations for adults that can cause drowsiness*, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. *It is an offence to drive while under the influence of drink or drugs.* It should be remembered that children and adolescents do, on occasion, consume alcohol and should be made aware of potential problems.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3).

Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient's doctor.

Side-effects unrelated to drowsiness that may affect a patient's ability to drive or operate machinery safely include *blurred vision, dizziness, or nausea*. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

To be used on *preparations containing monoamine-oxidase inhibitors*; the warning to avoid alcohol and dealcoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol

To be used on *preparations where a reaction such as flushing may occur if alcohol is taken* (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

To be used with label 25 on *preparations coated to resist gastric acid* (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as ketoconazole where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; where a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on *preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine*. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; where a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on *preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc*, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; where a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop

To be used on *preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit* (e.g. anti-tuberculous drugs).

Also to be used on *preparations that contain a drug whose withdrawal is likely to be a particular hazard* (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop

To be used on *preparations where a course of treatment should be completed* to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

To be used particularly on *preparations containing anticoagulants, lithium, and oral corticosteroids*. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds

To be used on *preparations that may cause phototoxic or photoallergic reactions* if the patient is exposed to ultraviolet radiation. Many drugs other than those listed (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine

To be used on *preparations containing probenecid and sulfapyrazone* whose activity is reduced by aspirin.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.

- 13 Dissolve or mix with water before taking**
To be used on *preparations that are intended to be dissolved in water* (e.g. soluble tablets) or *mixed with water* (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.
- 14 This medicine may colour your urine. This is harmless**
To be used on *preparations that may cause the patient's urine to turn an unusual colour*. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).
- 15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine**
To be used on *preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame*.
- 16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening**
To be used on *glyceryl trinitrate tablets* to remind the patient not to transfer the tablets to plastic or less suitable containers.
- 17 Do not take more than . . . in 24 hours**
To be used on *preparations for the treatment of acute migraine* except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.
It may also be used on preparations for which no dose has been specified by the prescriber.
- 18 Do not take more than . . . in 24 hours. Also, do not take more than . . . in any one week**
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.
- 19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol**
To be used on *preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night*. On the rare occasions (e.g. nitrazepam in epilepsies) when hypnotics are prescribed for daytime administration this label would clearly not be appropriate. Also to be used as an *alternative to the label 2 wording* (the choice being at the discretion of the pharmacist) *for anxiolytics prescribed to be taken at night*.
It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.
- 21 Take with or just after food, or a meal**
To be used on *preparations that are liable to cause gastric irritation, or those that are better absorbed with food*.
Patients should be advised that a *small amount of food is sufficient*.
- 22 Take 30 to 60 minutes before food**
To be used on some preparations whose *absorption is thereby improved*.
Most oral antibacterials require label 23 instead (see below).
- 23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food**
To be used on *oral preparations whose absorption may be reduced by the presence of food and acid in the stomach*.
- 24 Suck or chew this medicine**
To be used on *preparations that should be sucked or chewed*.
The pharmacist should use discretion as to which of these words is appropriate.
- 25 Swallow this medicine whole. Do not chew or crush**
To be used on *preparations that are enteric-coated or designed for modified-release*.
Also to be used on *preparations that taste very unpleasant or may damage the mouth* if not swallowed whole.
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.
- 26 Dissolve this medicine under your tongue**
To be used on *preparations designed for sublingual use*. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.
- 27 Take with a full glass of water**
To be used on *preparations that should be well diluted* (e.g. chloral hydrate), *where a high fluid intake is required* (e.g. sulfonamides), or *where water is required to aid the action* (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.
- 28 Spread thinly on the affected skin only**
To be used on *external preparations* that should be applied sparingly (e.g. corticosteroids, dithranol).
- 29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours**
To be used on containers of dispensed *solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis*. The dose form should be specified, e.g. tablets or capsules.
This label has been introduced because of the serious consequences of overdosage with paracetamol.
- 30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine**
To be used on all containers of dispensed *preparations containing paracetamol*.
- 32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine**
To be used on containers of dispensed *preparations containing aspirin when the name on the label does not include the word 'aspirin'*.

A4 Intravenous infusions for neonatal intensive care

Intravenous policy A local policy on the dilution of drugs with intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

1. Drugs should only be diluted with infusion fluid when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be mixed with an infusion fluid in a syringe and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion syringe should be labelled with the neonate's name and hospital number, the name and quantity of drug, the infusion fluid, and the expiry date and time. If a problem occurs during administration, containers should be retained for a period after use in case they are needed for investigation.
6. Administration using a suitable motorised syringe driver is advocated for preparations where strict control over administration is required.
7. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should

therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and parenteral nutrition). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates.

Blood Because of the large number of incompatibilities, drugs should not be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N[®]* (section 9.3) may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Method

Ready-prepared infusions should be used whenever available. When dilution of drugs is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, further dilution with the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5).

When drug dilutions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed, a concentrated layer of the drug may form owing to differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions; if such a mixture is administered it may have a serious effect on the heart.

A time limit between dilution and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. amphotericin and sodium nitroprusside.

Table of drugs given by continuous intravenous infusion to neonates

The table lists key drugs given by continuous intravenous infusion to neonates.

Covers dilution with *Glucose intravenous infusion* 5% and 10% and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided, therefore care should be taken if water for injections is used.

Adrenaline/Epinephrine (p. 113)

Dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions.

Note Usually made up with adrenaline 1 in 1000 (1 mg/mL) solution; this concentration of adrenaline is not licensed for intravenous administration

Alprostadil (*Prostin VR®*) (p. 131)

Dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. Undiluted solution must not come into contact with the barrel of the plastic syringe; add the required volume of alprostadil to a volume of infusion fluid in the syringe, and then make up to final volume

Atracurium besilate (p. 643)

Dilute 60 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 120 micrograms/kg/hour; minimum concentration of 500 micrograms/mL, max. concentration of 5 mg/mL

Intravenous infusion information for neonatal intensive care *only*; for information in other children, see individual drug monographs.

Dobutamine (as hydrochloride) (p. 111)

Dilute 30 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of 5 micrograms/kg/minute; max. concentration of 5 mg/mL; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions

Dopamine hydrochloride (p. 111)

Dilute 30 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.3 mL/hour provides a dose of 3 micrograms/kg/minute; max. concentration of 3.2 mg/mL; infuse higher concentration solutions through central venous catheter. Incompatible with bicarbonate and other alkaline solutions

Epoprostenol (*Flolan®*) (p. 96)

Reconstitute the 500-microgram vial using the glycine buffer diluent provided to make a 10 micrograms/mL concentrate (pH 10.5); filter the concentrate using the filter provided; the concentrate can be administered via a central venous catheter, or it may be diluted further.

Neonate body-weight under 2 kg, using the concentrate, dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute.

Neonate body-weight over 2 kg, using the concentrate, dilute 60 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 2 nanograms/kg/minute.

Note Diluted solution stable for 12 hours at room temperature, although some units use for 24 hours and allow for loss of potency. Minimum concentration of 1.43 micrograms/mL

Glyceryl trinitrate (p. 104)

Dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% *or* Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute; max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter).

Note Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used

Heparin (as sodium) (p. 115)

Maintenance of umbilical arterial catheter, dilute 50 units to a final volume of 50 mL with Sodium Chloride 0.45% *or* use ready-made bag containing 500 units in 500 mL Sodium Chloride 0.9%; infuse at 0.5 mL/hour.

Treatment of thrombosis, dilute 1250 units/kg body-weight to a final volume of 50 mL with Glucose 5% *or* Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 25 units/kg/hour

Insulin (soluble) (p. 352)

Dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.

Note Insulin may be absorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin

Midazolam (p. 234 and p. 638)

Dilute 15 mg/kg body-weight to a final volume of 50 mL with Glucose 5% *or* Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour

Intravenous infusion information for neonatal intensive care *only*; for information in other children, see individual drug monographs.

Morphine sulphate (p. 207)

Dilute 2.5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% *or* 10% *or* Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour

Noradrenaline/Norepinephrine (p. 113)

Dilute 600 micrograms (base)/kg body-weight to a final volume of 50 mL with Glucose 5% *or* Sodium Chloride and Glucose; an intravenous infusion rate of 0.1 mL/hour provides a dose of 20 nanograms (base)/kg/minute; infuse through central venous catheter; max. concentration of noradrenaline (base) 40 micrograms/mL (higher concentrations can be used if fluid restricted). Discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

Note 500 micrograms of noradrenaline base is equivalent to 1 mg of acid tartrate. Dose expressed as the base

Vecuronium (p. 645)

Reconstitute each vial with 5 mL Water for Injections to give a 2 mg/mL solution. Dilute 5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% *or* Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of 50 micrograms/kg/hour; minimum concentration of 40 micrograms/mL

Dental Practitioners' Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Sugar-free versions, where available, are preferred.

Aciclovir Cream, BP
 Aciclovir Oral Suspension, BP, 200 mg/5 mL
 Aciclovir Tablets, BP, 200 mg
 Aciclovir Tablets, BP, 800 mg
 Amoxicillin Capsules, BP
 Amoxicillin Oral Powder, DPF
 Amoxicillin Oral Suspension, BP
 Ampicillin Capsules, BP
 Ampicillin Oral Suspension, BP
 Artificial Saliva Oral Spray, DPF
¹Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS):
AS Saliva Orthana[®]
Glandosane[®]
Biotene Oralbalance[®]
BioXtra[®]
Saliveze[®]
Salivix[®]
²Aspirin Tablets, Dispersible, BP
 Azithromycin Oral Suspension, 200 mg/5 mL, DPF
 Beclomethasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:
Clenil Modulite[®]
 Benzylamine Mouthwash, BP 0.15%
 Benzylamine Oromucosal Spray, BP 0.15%
 Betamethasone Soluble Tablets, 500 micrograms, DPF
 Carbamazepine Tablets, BP
 Carmellose Gelatin Paste, DPF
 Cefalexin Capsules, BP
 Cefalexin Oral Suspension, BP
 Cefalexin Tablets, BP
 Cefradine Capsules, BP
 Cetirizine Hydrochloride Tablets, 10 mg, DPF
 Chlorhexidine Gluconate Gel, BP
 Chlorhexidine Mouthwash, BP
 Chlorhexidine Oral Spray, DPF
 Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%, DPF
 Chlorphenamine Oral Solution, BP
 Chlorphenamine Tablets, BP
 Choline Salicylate Dental Gel, BP
 Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
 Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
 Clarithromycin Tablets, BP
 Clindamycin Capsules, BP

Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
 Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL

Nurse Prescribers' Formulary

Nurse Prescribers' Formulary for Community Practitioners

Nurse Prescribers' Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms FP10(CN) and FP10(PN) in Wales or, when available, WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers' list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Almond Oil Ear Drops, BP
 Arachis Oil Enema, NPF
¹ Aspirin Tablets, Dispersible, 300 mg, BP
 Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
 Bisacodyl Tablets, BP
 Catheter Maintenance Solution, Chlorhexidine, NPF
 Catheter Maintenance Solution, Sodium Chloride, NPF
 Catheter Maintenance Solution, 'Solution G', NPF
 Catheter Maintenance Solution, 'Solution R', NPF
 Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
 Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
 Choline Salicylate Dental Gel, BP
 Clotrimazole Cream 1%, BP
 Co-danthramer Capsules, NPF
 Co-danthramer Capsules, Strong, NPF
 Co-danthramer Oral Suspension, NPF
 Co-danthramer Oral Suspension, Strong, NPF
 Co-danthrusate Capsules, BP
 Co-danthrusate Oral Suspension, NPF
 Crotamiton Cream, BP
 Crotamiton Lotion, BP
 Dimeticone barrier creams containing at least 10%
 Dimeticone Lotion, NPF
 Docusate Capsules, BP
 Docusate Enema, NPF
 Docusate Oral Solution, BP
 Docusate Oral Solution, Paediatric, BP
 Econazole Cream 1%, BP
 Emollients as listed below:

Aquadrate® 10% w/w Cream
 Aqueous Cream, BP
 Arachis Oil, BP
 Balneum® Plus Cream
 Cetraaben® Emollient Cream

Dermamist®
 Diprobace® Cream
 Diprobace® Ointment
 Doublebase®
 E45® Cream
 E45® Itch Relief Cream
 Emulsifying Ointment, BP
 Eucerin® Intensive 10% w/w Urea Treatment Cream
 Eucerin® Intensive 10% w/w Urea Treatment Lotion
 Hydromol® Cream
 Hydromol® Intensive
²Hydromol® Ointment
 Hydrous Ointment, BP
 Lipobase®
 Liquid and White Soft Paraffin Ointment, NPF
 Neutrogena® Norwegian Formula Dermatological Cream
 Nutraplus® Cream
 Oilatum® Cream
 Oilatum® Junior Cream
 Paraffin, White Soft, BP
 Paraffin, Yellow Soft, BP
³QV® Cream
³QV® Lotion
 Ultrabase®
 Unguentum M®
²Zerobase® Cream
²Zerocream®
²Zeroguent® Cream

Emollient Bath Additives as listed below:

⁴Balneum®
⁴Balneum Plus® Bath Oil
 Cetraaben® Emollient Bath Additive
 Dermalol® Bath Emollient
 Diprobath®
 Doublebase® Emollient Bath Additive
 Doublebase® Emollient Shower Gel
 Doublebase® Emollient Wash Gel
 Hydromol® Bath and Shower Emollient
 Oilatum® Emollient
 Oilatum® Junior Bath Additive
 Oilatum® Gel
³QV® Bath Oil
 QV® Wash
 Zerolatum® Emollient Medicinal Bath Oil
²Zeroneum® Bath Oil
 Zerazole® Bath Oil

Folic Acid 400 micrograms/5 mL Oral Solution, NPF
 Folic Acid Tablets 400 micrograms, BP

- Included in the Drug Tariff (Part IXA), the Scottish Drug Tariff (Part 2) and the Northern Ireland Drug Tariff (part III)
- Included in the Drug Tariff (Part IXA) and the Northern Ireland Drug Tariff (part III)
- Except pack sizes that are not to be prescribed under the NHS (see Part XVIII A of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)

Glycerol Suppositories, BP

¹Ibuprofen Oral Suspension, BP

¹Ibuprofen Tablets, BP

Ispaghula Husk Granules, BP

Ispaghula Husk Granules, Effervescent, BP

Ispaghula Husk Oral Powder, BP

Lactulose Solution, BP

Lidocaine and Chlorhexidine Gel, BP

Macrogol Oral Powder, Compound, NPF

Macrogol Oral Powder, Compound, Half-strength, NPF

Magnesium Hydroxide Mixture, BP

Magnesium Sulphate Paste, BP

Malathion aqueous lotions containing at least 0.5%

Mebendazole Oral Suspension, NPF

Mebendazole Tablets, NPF

Methylcellulose Tablets, BP

Miconazole Cream 2%, BP

Miconazole Oromucosal Gel, BP

Mouthwash Solution-tablets, NPF

Nicotine Inhalation Cartridge for Oromucosal Use, NPF

Nicotine Lozenge, NPF

Nicotine Medicated Chewing Gum, NPF

Nicotine Nasal Spray, NPF

Nicotine Sublingual Tablets, NPF

Nicotine Transdermal Patches, NPF

Nystatin Oral Suspension, BP

Olive Oil Ear Drops, BP

Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)

²Paracetamol Tablets, BP

²Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets)

Permethrin Cream, NPF

Phosphates Enema, BP

Phosphate suppositories, NPF

Piperazine and Senna Powder, NPF

Povidone–Iodine Solution, BP

Senna Oral Solution, NPF

Senna Tablets, BP

Senna and Ispaghula Granules, NPF

Sodium Chloride Solution, Sterile, BP

Sodium Citrate Compound Enema, NPF

Sodium Picosulfate Capsules, NPF

Sodium Picosulfate Elixir, NPF

Spermicidal contraceptives as listed below:

Gygel® Contraceptive Jelly

Sterculia Granules, NPF

Sterculia and Frangula Granules, NPF

Titanium Ointment, BP

Water for Injections, BP

Zinc and Castor Oil Ointment, BP

Zinc Cream, BP

Zinc Ointment, BP

Zinc Oxide and Dimeticone Spray, NPF

Zinc Oxide Impregnated Medicated Bandage, NPF

Zinc Oxide Impregnated Medicated Stocking, NPF

Zinc Paste Bandage, BP 1993

Zinc Paste and Ichthammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated **Nx**.

Appliances (including Contraceptive Devices³) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff)

The Drug Tariffs can be accessed online at:

National Health Service Drug Tariff for England and Wales:

www.ppa.org.uk/ppa/edt_intro.htm

Health and Personal Social Services for Northern Ireland Drug Tariff:

www.dhsspsni.gov.uk/pas-tariff

Scottish Drug Tariff: www.isdscotland.org/isd/2245.html

Nurse Independent Prescribing

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition, including some Controlled Drugs (see p. 798).

Nurse Independent Prescribers must work within their own level of professional competence and expertise. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Nurse Independent Prescribers are also able to prescribe independently the Controlled Drugs in the table below, *solely for the medical conditions indicated*.

For information on the mixing of medicines by Nurse Independent Prescribers, see *Mixing of medicines prior to administration in clinical practice—responding to legislative changes*, National Prescribing Centre, May 2010 (available at www.npc.co.uk/policy/mixing/mixing_medicines.htm).

Up-to-date information and guidance on nurse independent prescribing is available on the Department of Health website at

www.dh.gov.uk/nonmedicalprescribing

1. Except for indications and doses that are ^(PoM)

2. Max. 96 tablets; max. pack size 32 tablets

3. Nurse Prescribers in Family Planning Clinics—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms FP10(CN) and FP10(PN), or when available WP10CN and WP10PN, in Wales), they may prescribe using the same system as doctors in the clinic

Controlled drugs prescribable by Nurse Independent Prescribers solely for the medical conditions indicated

Drug	Indication	Route of Administration
Buprenorphine	Transdermal use in palliative care	Transdermal
Chlordiazepoxide hydrochloride	Treatment of initial or acute withdrawal symptoms caused by the withdrawal of alcohol from persons habituated to it	Oral
Codeine phosphate	–	Oral
Co-phenotrope	–	Oral
Diamorphine hydrochloride	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Oral, parenteral
Diazepam	Use in palliative care, treatment of initial or acute withdrawal symptoms caused by the withdrawal of alcohol from persons habituated to it, tonic-clonic seizures	Oral, parenteral, rectal
Dihydrocodeine tartrate	–	Oral
Fentanyl	Transdermal use in palliative care	Transdermal
Lorazepam	Use in palliative care, tonic-clonic seizures	Oral, parenteral
Midazolam	Use in palliative care, tonic-clonic seizures	Parenteral, buccal
Morphine hydrochloride	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Rectal
Morphine sulphate	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Oral, parenteral, rectal
Oxycodone hydrochloride	Use in palliative care	Oral, parenteral

Note For the purposes of nurse independent prescribing, palliative care means the care of patients with advanced, progressive illness

Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient's agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Up-to-date information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see *Mixing of medicines prior to administration in clinical practice—responding to legislative changes*, National Prescribing Centre, May 2010 (available at www.npc.co.uk/policy/mixing/mixing_medicines.htm).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 3.

Nurses

For further information on Nurse Independent Prescribing, see Nurse Prescribers' Formulary, p. 797.

Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine, except Controlled Drugs, for any medical condition. Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Index of manufacturers

Special-order Manufacturers

Unlicensed medicines are available from 'special-order' manufacturers and specialist importing companies; the MHRA maintains a register of these companies at <http://tinyurl.com/cdslike>.

Licensed **hospital manufacturing units** also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (*Pro-File*; www.pro-file.nhs.uk) provides information on all medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Commercial Specials Manufacturers may also be able to provide further information about commercial companies (www.acsm.uk.com).

The characteristics of unlicensed formulations may vary, see also Unlicensed Medicines (p. 6) and Extemporaneous Preparations (p. 6).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine

Yellowcard

COMMISSION ON HUMAN MEDICINES (CHM)

It's easiest to report online at www.yellowcard.gov.uk**MHRA****SUSPECTED ADVERSE DRUG REACTIONS**

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNFC or www.yellowcard.gov.uk for guidance. Do not be put off reporting because some details are not known.

PATIENT DETAILS Patient Initials: _____ Sex: M / F Ethnicity: _____ Weight if known (kg): _____
Age (at time of reaction): _____ Identification number (e.g. Your Practice or Hospital Ref): _____

SUSPECTED DRUG(S)/VACCINE(S)

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

SUSPECTED REACTION(S) Please describe the reaction(s) and any treatment given:

Outcome

Recovered
Recovering
Continuing
Other

Date reaction(s) started: _____ Date reaction(s) stopped: _____

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

Patient died due to reaction Involved or prolonged inpatient hospitalisation

Life threatening Involved persistent or significant disability or incapacity

Congenital abnormality Medically significant; please give details: _____

It's easiest to report online at www.yellowcard.gov.uk

OTHER DRUG(S) (including self-medication and complementary remedies)

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No

If yes, please give the following information if known:

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

Additional relevant information e.g. medical history, test results, known allergies, rechallenge (if performed), suspect drug interactions. For congenital abnormalities please state all other drugs taken during pregnancy and the last menstrual period.

Please list any medicines obtained from the internet: _____

REPORTER DETAILS

Name and Professional Address: _____

Postcode: _____ Tel No: _____

Email: _____

Speciality: _____

Signature: _____ Date: _____

CLINICIAN (if not the reporter)

Name and Professional Address: _____

Postcode: _____ Tel No: _____

Email: _____

Speciality: _____

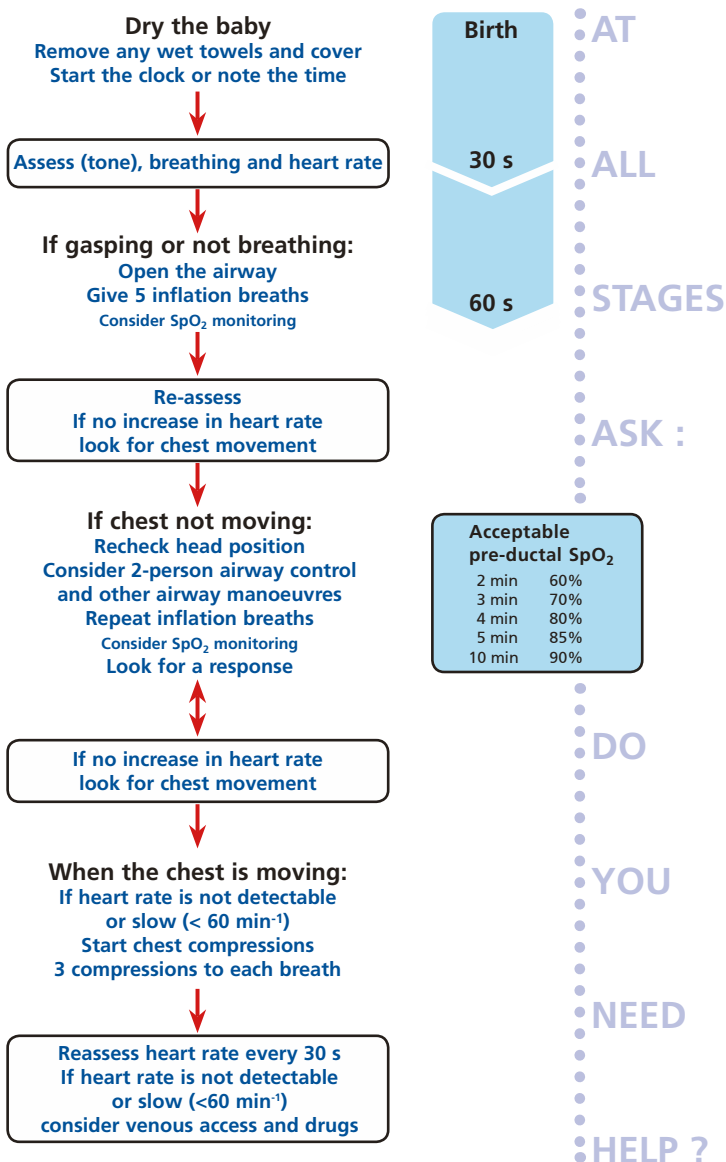

Date: _____

Information on adverse drug reactions received by the MHRA can be downloaded at www.mhra.gov.uk/daps

Stay up-to-date on the latest advice for the safe use of medicines with our monthly bulletin *Drug Safety Update*, at www.mhra.gov.uk/drugsafetyupdate

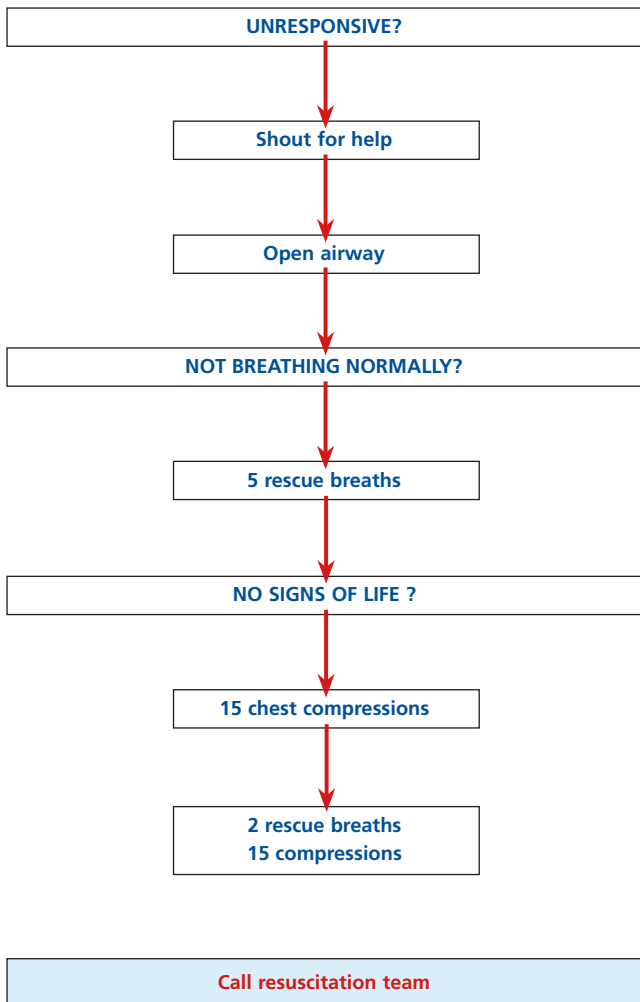

Please attach additional pages if necessary. Send to: FREEPOST YELLOW CARD (no other address details required)

NEWBORN LIFE SUPPORT

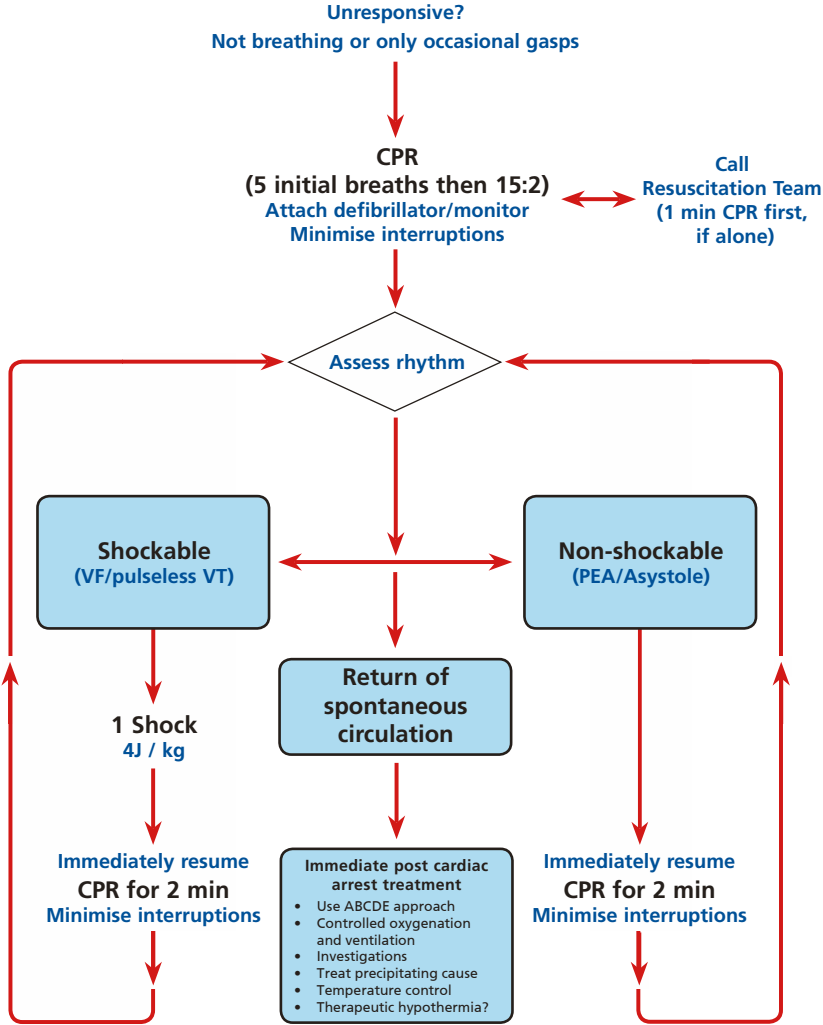

PAEDIATRIC BASIC LIFE SUPPORT

(Healthcare professionals with a duty to respond)

PAEDIATRIC ADVANCED LIFE SUPPORT

- During CPR**
- Ensure high-quality CPR: rate, depth, recoil
 - Plan actions before interrupting CPR
 - Give oxygen
 - Vascular access (intravenous, intraosseous)
 - Give adrenaline every 3-5 min
 - Consider advanced airway and capnography
 - Continuous chest compressions when advanced airway in place
 - Correct reversible causes

- Reversible causes**
- Hypoxia
 - Hypovolaemia
 - Hypo- / hyperkalaemia / metabolic
 - Hypothermia
 - Tension pneumothorax
 - Toxins
 - Tamponade - cardiac
 - Thromboembolism

BODY SURFACE AREA IN CHILDREN

Medical emergencies in the community

Drug treatment outlined below is intended for use by community healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the child's condition requires investigation and further treatment, the child should be transferred to hospital promptly.

Anaphylaxis

(section 3.4.3)

Adrenaline injection (1 mg/mL (1 in 1000))

- By intramuscular injection
Child under 6 years 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
Child 6–12 years 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
Child 12–18 years 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal

High-flow **oxygen** (section 3.6) and **intravenous fluids** should be given as soon as available.

Chlorphenamine injection by intramuscular or intravenous injection (section 3.4.1) may help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but it should be given to severely affected children to prevent further deterioration.

Asthma: acute

(section 3.1)

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise; failure to respond adequately at **any time** requires immediate transfer to hospital

Either salbutamol aerosol inhaler (100 micrograms/metered inhalation)

- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
Child under 18 years 2–10 puffs each inhaled separately, repeated at 10–20 minute intervals or as necessary

or salbutamol nebuliser solution (1 mg/mL, 2 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
Child under 5 years 2.5 mg every 20–30 minutes or as necessary
Child 5–12 years 2.5–5 mg every 20–30 minutes or as necessary
Child 12–18 years 5 mg every 20–30 minutes or as necessary

or terbutaline nebulised solution (2.5 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
Child under 5 years 5 mg every 20–30 minutes or as necessary

Child 5–12 years 5–10 mg every 20–30 minutes or as necessary

Child 12–18 years 10 mg every 20–30 minutes or as necessary

Plus (in all cases)

Either prednisolone tablets (or prednisolone soluble tablets) (5 mg)

- By mouth
Child under 12 years 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if the child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
Child 12–18 years 40–50 mg once daily for at least 5 days

or hydrocortisone (preferably as sodium succinate)

- By intravenous injection
Child up to 18 years 4 mg/kg (max. 100 mg) every 6 hours, until conversion to oral prednisolone is possible; alternative dose if weight unavailable, **Child under 2 years** 25 mg, **2–5 years** 50 mg, **5–18 years** 100 mg

High-flow **oxygen** (section 3.6) should be given if available

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta₂ agonist** (as above) and give with

ipratropium nebuliser solution (250 micrograms/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
Child under 12 years 250 micrograms repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
Child 12–18 years 500 micrograms every 4–6 hours as necessary

Convulsive (including febrile) seizures lasting longer than 5 minutes

(section 4.8.2 and section 4.8.3)

Either midazolam buccal solution (5 mg/mL, 10 mg/mL) or **injection solution given by buccal route**

- By buccal administration, repeated once after 10 minutes if necessary
Neonate 300 micrograms/kg
Child 1–6 months 300 micrograms/kg (max. 2.5 mg)
Child 6 months–1 year 2.5 mg
Child 1–5 years 5 mg
Child 5–10 years 7.5 mg
Child 10–18 years 10 mg

or diazepam rectal solution (2 mg/mL, 4 mg/mL)

- By rectum, repeated once after 10 minutes if necessary
Neonate 1.25–2.5 mg
Child 1 month–2 years 5 mg
Child 2–12 years 5–10 mg
Child 12–18 years 10–20 mg

Croup

(section 3.1)

Dexamethasone oral solution (2 mg/5 mL)

- By mouth
Child 1 month–2 years 150 micrograms/kg as a single dose

Diabetic hypoglycaemia

(section 6.1.4)

Glucose or sucrose

- By mouth
Child 2–18 years approx. 10–20 g (55–110 mL *Lucozade® Energy Original* or 100–200 mL *Coca-Cola®*—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps), repeated after 10–15 minutes if necessary

or if hypoglycaemia unresponsive or if oral route cannot be used

Glucagon injection (1 mg/mL)

- By subcutaneous, intramuscular or intravenous injection
Child body-weight under 25 kg 500 micrograms (0.5 mL)
Child body-weight over 25 kg 1 mg (1 mL)

or if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

Glucose intravenous infusion (10%)

- By intravenous injection into large vein
Child 1 month–18 years 5 mL/kg (glucose 500 mg/kg)

Meningococcal disease

(Table 1, section 5.1)

Benzylpenicillin sodium injection (600 mg, 1.2 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
Neonate 300 mg
Child 1 month–1 year 300 mg
Child 1–10 years 600 mg
Child 10–18 years 1.2 g

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of allergy to penicillin

Cefotaxime injection (1 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
Neonate 50 mg/kg
Child 1 month–12 years 50 mg/kg (max. 1 g)
Child 12–18 years 1 g

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema or urticarial reaction) to penicillin or to cephalosporins

Chloramphenicol injection (1 g)

- By intravenous injection
Child 1 month–18 years 12.5–25 mg/kg
Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

1 nanogram	= 1000 picograms

Volume

1 litre	= 1000 millilitres (mL)
1 millilitre (1 mL)	= 1000 microlitres
1 pint	≈ 568 mL

Other units

1 kilocalorie (kcal)	= 4186.8 joules (J)
1000 kilocalories (kcal)	= 4.1868 megajoules (MJ)
1 megajoule (MJ)	= 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg)	= 133.3 pascals (Pa)
1 kilopascal (kPa)	= 7.5 mmHg (pressure)

Plasma-drug concentrations in *BNF for Children* are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children

Weight, height, and gender

The table below shows the **mean values** for weight, height and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of actual measurements. However, the child's actual weight and height might vary considerably from the values in the table and it is important to see the child to ensure that the value chosen is appropriate. In most cases the child's actual measurement should be obtained as soon as possible and the dose re-calculated.

Age	Weight kg	Height cm
Full term neonate	3.5	51
1 month	4.3	55
2 months	5.4	58
3 months	6.1	61
4 months	6.7	63
6 months	7.6	67
1 year	9	75
3 years	14	96
5 years	18	109
7 years	23	122
10 years	32	138
12 years	39	149
14 year-old boy	49	163
14 year-old girl	50	159
Adult male	68	176
Adult female	58	164

Recommended wording of cautionary and advisory labels

For details see Appendix 3

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
21. Take with or just after food, or a meal
22. Take 30 to 60 minutes before food
23. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
24. Suck or chew this medicine
25. Swallow this medicine whole. Do not chew or crush
26. Dissolve this medicine under your tongue
27. Take with a full glass of water
28. Spread thinly on the affected skin only
29. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
30. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine
32. Contains aspirin. Do not take anything else containing aspirin while taking this medicine

Abbreviations and symbols

Internationally recognised units and symbols are used in the *BNF for Children* where possible.

ACBS	Advisory Committee on Borderline Substances, see Appendix 2
ACE	Angiotensin-converting enzyme
ADHD	attention deficit hyperactivity disorder
AIDS	Acquired immunodeficiency syndrome
approx.	approximately
AV	atrioventricular
BAN	British Approved Name
BMI	body mass index
BP	British Pharmacopoeia 2010, unless otherwise stated
BPC	British Pharmaceutical Codex 1973 and Supplement 1976, unless otherwise stated
CAPD	Continuous ambulatory peritoneal dialysis
	preparation in Schedule 2 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
	preparation in Schedule 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
	preparation in Schedule 4 (Part I) of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
	preparation in Schedule 4 (Part II) of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
CHM	Commission on Human Medicines
CHMP	Committee for Medicinal Products for Human Use
CNS	central nervous system
CSM	Committee on Safety of Medicines (now subsumed under Commission on Human Medicines)
d. c.	direct current
DMARD	Disease-modifying antirheumatic drug
DPF	Dental Practitioners' Formulary
e/c	enteric-coated (termed gastro-resistant in BP)
ECG	electrocardiogram
EEG	electro-encephalogram
f/c	film-coated
G6PD	glucose 6-phosphate dehydrogenase
HIV	Human immunodeficiency virus
HRT	Hormone replacement therapy
i/m	intramuscular
i/v	intravenous
INR	international normalised ratio
MAOI	Monoamine-oxidase inhibitors
max.	maximum
MHRA	Medicines and Healthcare products Regulatory Agency
m/r	modified-release
NCL	no cautionary labels, see Appendix 3
NHS	National Health Service
	not prescribable under National Health Service (NHS)
NICE	National Institute for Health and Clinical Excellence

NPF	Nurse Prescribers' Formulary
NSAID	non-steroidal anti-inflammatory drug
PGD	patient group direction
	prescription-only medicine
®	trade mark
rINN	Recommended International Non-proprietary Name
RSV	respiratory syncytial virus
s/c	sugar-coated
SLS	Selected List Scheme
SMC	Scottish Medicines Consortium
SPC	Summary of Product Characteristics
spp.	species
SSRI	Selective serotonin reuptake inhibitors
UK	United Kingdom
Units	for SI units see Prescription Writing
WHO	World Health Organization
	limited experience of the use of this product and the CHM requests that all suspected adverse reactions should be reported, see Adverse Reactions to Drugs
	considered by the Paediatric Formulary Committee to be less suitable for prescribing, see How to Use the <i>BNF for Children</i>

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing. The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c.	= ante cibum (before food)
b. d.	= bis die (twice daily)
o. d.	= omni die (every day)
o. m.	= omni mane (every morning)
o. n.	= omni nocte (every night)
p. c.	= post cibum (after food)
p. r. n.	= pro re nata (when required)
q. d. s.	= quater die sumendum (to be taken four times daily)
q. q. h.	= quarta quaque hora (every four hours)
stat	= immediately
t. d. s.	= ter die sumendum (to be taken three times daily)
t.i.d.	= ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102	Tartrazine	E223	Sodium Metabisulphite
E104	Quinoline Yellow	E320	Butylated Hydroxyanisole
E110	Sunset Yellow FCF	E321	Butylated Hydroxytoluene
E123	Amaranth	E322	Lecithins
E124	Ponceau 4R	E420	Sorbitol
E127	Erythrosine BS	E421	Mannitol
E132	Indigo Carmine	E422	Glycerol
E142	Green S	E901	Beeswax (white and yellow)
E171	Titanium Dioxide	E1520	Propylene Glycol
E172	Iron oxides, iron hydroxides		
E200	Sorbic Acid		
E211	Sodium Benzoate
