Sulfonylureas can be useful in the management of certain forms of diabetes that result from genetic defects of beta-cell function; there is most experience with gliclazide.

**Cautions** Sulfonylureas encourage weight gain and should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting; metformin (section 6.1.2.2) is considered the drug of choice in children. Caution is needed in children with G6PD deficiency (section 9.1.5).

**Contra-indications** Sulfonylureas should be avoided where possible in acute porphyria (section 9.8.2). Sulfonylureas are contra-indicated in the presence of ketoacidosis.

**Hepatic impairment** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

**Renal impairment** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia; they should be avoided where possible in severe renal impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

**Pregnancy** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes, see section 6.1.2.

**Breast-feeding** The use of sulfonylureas (except glibenclamide [unlicensed use], see section 6.1.2) in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

**Side-effects** Side-effects of sulfonylureas are generally mild and infrequent and include gastro-intestinal disturbances such as nausea, vomiting, diarrhoea and constipation.

Sulfonylureas can occasionally cause a disturbance in liver function, which rarely leads to cholestatic jaundice, hepatitis, and hepatic failure. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy. They consist mainly of allergic skin reactions which progress rarely to erythema multiforme or exfoliative dermatitis, fever, and jaundice; photosensitivity has rarely been reported with glipizide. Blood disorders are also rare but include leucopenia, thrombocytopenia, agranulocytosis, pancytopenia, haemolytic anaemia, and aplastic anaemia.

## GLIBENCLAMIDE

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children

## Indications and dose

**Type 2 diabetes mellitus, maturity-onset diabetes of the young (specialist management only, see notes above)**

- By mouth

**Child 12–18 years** initially 2.5 mg daily with or immediately after breakfast, adjusted according to response, max. 15 mg daily

**Glibenclamide** (Non-proprietary) (PoM)

Tablets, glibenclamide 2.5 mg, net price 28-tab pack = £18.27; 5 mg, 28-tab pack = 97p

## GLICLAZIDE

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children

## Indications and dose

**Type 2 diabetes mellitus, maturity-onset diabetes of the young (specialist management only, see notes above)**

- By mouth

**Child 12–18 years** initially 20 mg once daily with breakfast, adjusted according to response; up to 160 mg as a single dose; max. 160 mg twice daily

**Gliclazide** (Non-proprietary) (PoM)

Tablets, gliclazide 40 mg, net price 28-tab pack = £3.36; 80 mg, 28-tab pack = £1.04, 60-tab pack = £2.23

**Brands include** Zicron®

**Diamicon®** (Servier) (PoM)

Tablets, scored, gliclazide 80 mg, net price 60-tab pack = £4.38

## TOLBUTAMIDE

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also headache, tinnitus

**Licensed use** not licensed for use in children

## Indications and dose

**Type 2 diabetes mellitus** (see notes above), specialist management only

- By mouth

**Child 12–18 years** 0.5–1.5 g (max. 2 g) daily in divided doses with or immediately after meals or as a single dose with or immediately after breakfast

**Tolbutamide** (Non-proprietary) (PoM)

Tablets, tolbutamide 500 mg. Net price 28-tab pack = £22.64

## 6.1.2.2 Biguanides

**Metformin**, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them. It exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

Metformin is the drug of first choice in children with type 2 diabetes, in whom strict dieting has failed to control diabetes. When the combination of strict diet and metformin treatment fails, other options to be considered under specialist management only, include:

- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night);
- combining with a sulfonylurea (section 6.1.2.1) (reports of increased hazard with this combination remain unconfirmed).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Gastro-intestinal side-effects are initially common with metformin, and may persist in some children, particularly when high doses are given. A slow increase in dose may improve tolerability.

Very rarely, metformin can provoke lactic acidosis which is most likely to occur in children with renal impairment, see Lactic Acidosis p. 366.

## METFORMIN HYDROCHLORIDE

**Cautions** see notes above; determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected); **interactions:** Appendix 1 (antidiabetics)

**Lactic acidosis** Use with caution in renal impairment—increased risk of lactic acidosis; avoid in significant renal impairment. Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure, or hepatic impairment

**Contra-indications** ketoacidosis; use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

**Iodine-containing X-ray contrast media** Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin—see Lactic Acidosis above. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline

**Hepatic impairment** withdraw if tissue hypoxia likely

**Renal impairment** see under Cautions

**Pregnancy** used in pregnancy for both pre-existing and gestational diabetes—see also Pregnancy and Breast-feeding, p. 364

**Breast-feeding** may be used during breast-feeding—see also Pregnancy and Breast-feeding, p. 364

**Side-effects** anorexia, nausea, vomiting, diarrhoea (usually transient), abdominal pain, taste disturbance; rarely lactic acidosis (withdraw treatment), decreased vitamin-B<sub>12</sub> absorption, erythema, pruritus and urticaria; hepatitis also reported

**Licensed use** not licensed for use in children under 10 years

## Indications and dose

**Diabetes mellitus** (see notes above) specialist supervision only

## • By mouth

**Child 8–10 years** initially 200 mg once daily adjusted according to response at intervals of at least 1 week; max. 2 g daily in 2–3 divided doses

**Child 10–18 years** initially 500 mg once daily adjusted according to response at intervals of at least 1 week; max. 2 g daily in 2–3 divided doses

**Metformin** (Non-proprietary) <sup>(PoM)</sup>

Tablets, coated, metformin hydrochloride 500 mg, net price 28-tab pack = 87p, 84-tab pack = £1.00; 850 mg, 56-tab pack = £1.36. Label: 21

Oral solution, sugar-free, metformin hydrochloride 500 mg/5 mL, net price 100 mL = £40.50. Label: 21

**Glucophage**<sup>®</sup> (Merck Serono) <sup>(PoM)</sup>

Tablets, f/c, metformin hydrochloride 500 mg, net price 84-tab pack = £2.88; 850 mg, 56-tab pack = £3.20. Label: 21

Oral powder, sugar-free, metformin hydrochloride 500 mg/sachet, net price 30-sachet pack = £3.29, 60-sachet pack = £6.58; 1 g/sachet, 30-sachet pack = £6.58, 60-sachet pack = £13.16. Label: 13, 21, counselling, administration

**Excipients** include aspartame (section 9.4.1)

**Counselling** The contents of each sachet should be mixed with 150 mL of water and taken immediately

The Scottish Medicines Consortium (p. 3) has advised (March 2010) that *Glucophage*<sup>®</sup> oral powder is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients who are unable to swallow the solid dosage form.

## 6.1.2.3 Other antidiabetic drugs

There is little experience of the use of **acarbose** in children. It has been used in older children; therapy should be initiated by an appropriate expert.

The use of nateglinide in combination with a sulfonylurea is generally reserved for the management of some subtypes of diabetes resulting from genetic defects of beta-cell function or other syndromes of diabetes and requires specialist management.

## 6.1.3 Diabetic ketoacidosis

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes<sup>1</sup>, should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do

1. Available at [www.bsped.org.uk](http://www.bsped.org.uk)

not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in *shock*, give 10 mL/kg **sodium chloride 0.9%** as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
- Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over 48 hours; initially use **sodium chloride 0.9%**, changing to **sodium chloride 0.45%** and **glucose 5%** after 12 hours if response is adequate and plasma-sodium concentration is stable.
- Include **potassium chloride** in the fluids unless anuria is suspected, adjust according to plasma-potassium concentration.
- Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
- **Soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.
- **Sodium bicarbonate** infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.
- Once blood glucose falls to 14 mmol/litre, **glucose intravenous infusion 5% or 10%** should be added to the fluids.
- The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started (see above); it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
- The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long-acting insulin, or 10 minutes after starting subcutaneous insulin aspart, or insulin glulisine, or insulin lispro.

Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

### 6.1.4 Treatment of hypoglycaemia

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children.

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of *Lucozade® Energy Original* 55 mL, *Coca-Cola®* 100 mL, and *Ribena® Blackcurrant* 19 mL (to be

diluted), 2 teaspoons of sugar, and also from 3 sugar lumps<sup>1</sup>. If necessary this can be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. **Glucagon**, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an 'if necessary' basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, 5 mL/kg of glucose intravenous infusion 10% (500 mg/kg of glucose) (section 9.2.2) can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is **not** recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

**Neonatal hypoglycaemia** Neonatal hypoglycaemia at birth is treated with **glucose intravenous infusion 10%** given at a rate of 5 mL/kg/hour. An initial dose of 2.5 mL/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of **glucagon**. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.

## GLUCAGON

**Cautions** see notes above, insulinoma, glucagonoma; ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency; delayed hypoglycaemia when used as a diagnostic test—deaths reported (ensure a meal is eaten before discharge)

**Contra-indications** pheochromocytoma

**Side-effects** nausea, vomiting, diarrhoea, hypokalaemia, rarely hypersensitivity reactions

**Licensed use** unlicensed for growth hormone test and hyperinsulinism; intravenous route unlicensed

1. Proprietary products of quick-acting carbohydrate (e.g. *GlucoGel®*, *DextroGel®*, *G5F-Syrup®*, *Rapilose® gel*) are available on prescription for the patient to keep to hand in case of hypoglycaemia

**Indications and dose****Hypoglycaemia associated with diabetes**

- By subcutaneous, intramuscular, or intravenous injection

**Neonate** 20 micrograms/kg

**Child 1 month–2 years** 500 micrograms

**Child 2–18 years, body-weight less than 25 kg** 500 micrograms; **body-weight over 25 kg** 1 mg

**Endogenous hyperinsulinism**

- By intramuscular or intravenous injection

**Neonate** 200 micrograms/kg (max. 1 mg) as a single dose

**Child 1 month–2 years** 1 mg as a single dose

- By continuous intravenous infusion

**Neonate** 1–18 micrograms/kg/hour, adjusted according to response (max. 50 micrograms/kg/hour)

**Child 1 month–2 years** 1–10 micrograms/kg/hour, increased if necessary

**Administration** Do not add to infusion fluids containing calcium—precipitation may occur

**Diagnosis of growth hormone secretion** specialist centre only (section 6.5.1)

- By intramuscular injection

**Child 1 month–18 years** 100 micrograms/kg (max. 1 mg) as a single dose; dose may vary, consult local guidelines

**Beta-blocker poisoning**, see p. 29

**Note** 1 unit of glucagon = 1 mg of glucagon

**1 GlucaGen® HypoKit (Novo Nordisk) (POM)**

**Injection**, powder for reconstitution, glucagon (rys) as hydrochloride with lactose, net price 1-mg vial with prefilled syringe containing water for injection = £11.52

**Chronic hypoglycaemia**

**Diazoxide** is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis, see also glucagon above). Diazoxide has no place in the management of acute hypoglycaemia. **Chlorothiazide** 3–5 mg/kg twice daily (section 2.2.1) reduces diazoxide-induced sodium and water retention and has the added benefit of potentiating the glycaemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then **octreotide** or **nifedipine** (section 2.6.2) can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

**DIAZOXIDE**

**Cautions** impaired cardiac or cerebral circulation; heart failure; aortic coarctation; aortic stenosis; arteriovenous shunt; monitor blood pressure; hyperuricaemia; during prolonged use monitor white cell and platelet count, and regularly assess growth, bone,

and psychological development; **interactions:**

Appendix 1 (diazoxide)

**Renal impairment** dose reduction may be required

**Pregnancy** use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity in labour

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, constipation, ileus, pancreatitis, anorexia (prolonged use), taste disturbance, bleeding, heart failure, hypotension, pulmonary hypertension, dyspnoea, extrapyramidal effects, headache, dizziness, galactorrhoea, hyperglycaemia, decreased libido, leucopenia, thrombocytopenia, anaemia, eosinophilia, hyperosmolar non-ketotic coma, raised serum creatinine and urea, reversible nephritic syndrome, sodium and fluid retention, hyperuricaemia (prolonged use), musculoskeletal pain, visual disturbances, transient cataracts, lacrimation, tinnitus, voice changes (prolonged use), hypertrichosis, pruritus, dermatitis, lichenoid eruption

**Indications and dose****Chronic intractable hypoglycaemia**

- By mouth

**Neonate** initially 5 mg/kg twice daily to establish response, adjust dose according to response; usual maintenance dose 1.5–3 mg/kg 2–3 times daily; up to 7 mg/kg 3 times daily may be required in some cases, higher doses unlikely to be beneficial

**Child 1 month–18 years** initially 1.7 mg/kg 3 times daily then adjusted according to response; usual maintenance dose 1.5–3 mg/kg 2–3 times daily; up to 5 mg/kg 3 times daily may be required in some cases, higher doses unlikely to be beneficial

**Resistant hypertension** section 2.5.1.1

**Eudemine® (PharSafer) (POM)**

**Tablets**, diazoxide 50 mg, net price 100 = £46.45

**OCTREOTIDE**

**Cautions** avoid abrupt withdrawal of short-acting octreotide—see Side-effects below; in insulinoma (risk of increased depth and duration of hypoglycaemia—monitor closely when initiating treatment and changing doses); diabetes mellitus (antidiabetic requirements may be reduced); monitor thyroid function on long-term therapy; monitor liver function; **interactions:** Appendix 1 (octreotide)

**Pregnancy** possible effect on fetal growth, avoid unless benefit outweighs risk; effective contraception required during treatment

**Breast-feeding** avoid unless essential—present in milk in *animal* studies

**Side-effects** anorexia, nausea, vomiting, abdominal pain, bloating, flatulence, diarrhoea, constipation, and steatorrhoea (administer between meals or at bedtime to reduce gastro-intestinal side-effects); bradycardia, dyspnoea, headache, dizziness; postprandial glucose tolerance may be impaired, rarely persistent hyperglycaemia with chronic administration; hypoglycaemia has also been reported; reduced gall bladder motility and bile flow; gallstones reported after long-term treatment; abrupt withdrawal of subcutaneous octreotide is associated with biliary colic and pan-

1. (POM) restriction does not apply where administration is for saving life in emergency

creatitis; rash, alopecia; pain and irritation at injection site—sites should be rotated; rarely pancreatitis shortly after administration; hepatitis also reported

**Licensed use** not licensed in children

#### Indications and dose

##### Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose

- By subcutaneous injection

**Neonate** initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; up to 7 micrograms/kg every 4 hours may rarely be required

**Child 1 month–18 years** initially 1–2 micrograms/kg every 4–6 hours, dose adjusted according to response; up to 7 micrograms/kg every 4 hours may rarely be required

##### Bleeding from oesophageal or gastric varices

- By continuous intravenous infusion

**Child 1 month–18 years** 1 microgram/kg/hour, higher doses may be required initially; when no active bleeding reduce dose over 24 hours; usual max. 50 micrograms/hour

**Administration** for intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%

**Sandostatatin**<sup>®</sup> (Novartis) (POM)

**Injection**, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £2.97; 100 micrograms/mL, 1-mL amp = £5.59; 200 micrograms/mL 5-mL vial = £55.73; 500 micrograms/mL, 1-mL amp = £27.09

## 6.1.5 Treatment of diabetic nephropathy and neuropathy

### Diabetic nephropathy

Regular review of diabetic children over 12 years of age should include an annual test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*<sup>®</sup>  or *Microbumintest*<sup>®</sup> ) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Microalbuminuria can occur transiently during puberty; if it persists (at least 3 positive tests) treatment with an ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) under specialist guidance should be considered; to minimise the risk of renal deterioration, blood pressure should be carefully controlled (section 2.5).

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment.

For the treatment of hypertension in diabetes, see section 2.5.

### Diabetic neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

## 6.1.6 Diagnostic and monitoring devices for diabetes mellitus

### Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

**Note** In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood ketones should be measured according to local guidelines in order to detect diabetic ketoacidosis (section 6.1.3). Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

### Urinalysis

Reagent strips are available for measuring glucose in the urine. It is rarely necessary for children to test themselves for ketones unless they become unwell—see also Blood Monitoring, p. 369.

Microalbuminuria can be detected with *Micral-Test II*<sup>®</sup>  but this should be followed by confirmation in the laboratory, since false positive results are common.

#### ▲ Glucose

**Diabur-Test 5000**<sup>®</sup> (Roche Diagnostics)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £2.87

**Diastix**<sup>®</sup> (Bayer Diabetes Care)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £2.78

**Medi-Test**<sup>®</sup> **Glucose** (BHR)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £2.33

**Mission**<sup>®</sup> **Glucose** (Spirit)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £2.29

#### ▲ Ketones

**Ketostix**<sup>®</sup> (Bayer Diabetes Care)

**Reagent strips**, for detection of ketones in urine. Net price 50-strip pack = £3.03

## Meters and test strips

Meter (all NHS)	Type of monitoring	Compatible test strips	Test strip net price	Sensitivity range (mmol/litre)	Manufacturer

2. Free of charge from diabetes healthcare professionals

**Mission® Ketone** (Spirit)

Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.50

### Protein

**Albustix®** (Siemens)

Reagent strips, for detection of protein in urine. Net price 50-strip pack = £4.10

**Medi-Test® Protein 2** (BHR)

Reagent strips, for detection of protein in urine. Net price 50-strip pack = £3.27

### Other reagent strips available for urinalysis include:

*Combur-3 Test®* (glucose and protein—Roche Diagnostics),

*Clintek Microalbumin®* (albumin and creatinine—Siemens),

*Ketodiastix®* (glucose and ketones—Bayer Diagnostics),

*Medi-Test Combi 2®* (glucose and protein—BHR),

*Micral-Test II®* (albumin—Roche Diagnostics),

*Microalbustix®* (albumin and creatinine—Siemens),

*Uristix®* (glucose and protein—Siemens)

## Oral glucose tolerance test

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. However, it is used for the investigation of insulin resistance, glycogen storage disease, and excessive growth hormone secretion. In children who have less severe symptoms and blood-glucose concentrations that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. A dose of 1.75 g/kg (max. 75 g) of anhydrous glucose is used. It is also used to establish the presence of gestational diabetes; this generally involves giving anhydrous glucose 75 g (equivalent to Glucose BP 82.5 g) by mouth to the fasting patient, and measuring blood-glucose concentration at intervals. The appropriate amount of glucose should be given with 200–300 mL fluid. Alternatively anhydrous glucose 75 g can be given as 113 mL *Polycal®* with extra fluid to administer a total volume of 200–300 mL, or as *Rapilose®* OGTT oral solution.

## 6.2 Thyroid and antithyroid drugs

### 6.2.1 Thyroid hormones

### 6.2.2 Antithyroid drugs

### 6.2.1 Thyroid hormones

Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto's thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

**Levothyroxine sodium** (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

**Liothyronine sodium** has a similar action to levothyroxine but is more rapidly metabolised and has a more rapid effect; 20–25 micrograms is equivalent to approximately 100 micrograms of levothyroxine. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

## LEVOTHYROXINE SODIUM (Thyroxine sodium)

**Cautions** panhypopituitarism or predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine); cardiac disorders (monitor ECG; start at low dose and carefully titrate); long-standing hypothyroidism, diabetes insipidus, diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased); **interactions:** Appendix 1 (thyroid hormones)

**Pregnancy** monitor maternal serum-thyrotrophin concentration—levothyroxine may cross the placenta and excessive maternal concentration can be detrimental to fetus

**Breast-feeding** amount too small to affect tests for neonatal hypothyroidism

**Side-effects** usually at excessive dosage include diarrhoea, vomiting; anginal pain, arrhythmias, palpitation, tachycardia, benign intracranial hypertension; tremor, restlessness, excitability, insomnia, headache, flushing, sweating, fever, heat intolerance, weight loss, nervousness; craniosynostosis and premature closure of epiphyses; menstrual irregularities; eosinophilia, liver dysfunction; muscle cramps, muscular weakness; transient hair loss; hypersensitivity reactions including rash, pruritus and oedema also reported

### Indications and dose

Levothyroxine equivalent to 100 micrograms/m<sup>2</sup>/day can be used as a guide to the requirements in children

### Hypothyroidism

#### • By mouth

**Neonate** initially 10–15 micrograms/kg once daily (max. 50 micrograms daily), adjusted in steps of 5 micrograms/kg every 2 weeks or as necessary; usual maintenance dose 20–50 micrograms daily

**Child 1 month–2 years** initially 5 micrograms/kg once daily (max. 50 micrograms daily) adjusted in steps of 10–25 micrograms daily every 2–4 weeks until metabolism normalised; usual maintenance dose 25–75 micrograms daily

**Child 2–12 years** initially 50 micrograms once daily adjusted in steps of 25 micrograms daily every 2–4 weeks until metabolism normalised; usual maintenance dose 75–100 micrograms daily

**Child 12–18 years** initially 50 micrograms once daily adjusted in steps of 25–50 micrograms daily every 3–4 weeks until metabolism normalised; usual maintenance dose 100–200 micrograms daily

#### Levothyroxine (Non-proprietary) (PoM)

**Tablets**, levothyroxine sodium 25 micrograms, net price 28-tab pack = £2.58; 50 micrograms, 28-tab pack = £1.76; 100 micrograms, 28-tab pack = £1.76

**Brands include** *Eltroxin*<sup>®</sup>

**Oral solution**, levothyroxine sodium 25 micrograms/5 mL, net price 100 mL = £54.24; 50 micrograms/5 mL, 100 mL = £60.97; 100 micrograms/5 mL, 100 mL = £88.53

### LIOETHYRONINE SODIUM

(L-Tri-iodothyronine sodium)

**Cautions** severe and prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency); cardiac disorders (monitor ECG; start at low dose and carefully titrate); diabetes insipidus, diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased); **interactions:** Appendix 1 (thyroid hormones)

**Pregnancy** does not cross the placenta in significant amounts; monitor maternal thyroid function tests—dosage adjustment may be necessary

**Breast-feeding** amount too small to affect tests for neonatal hypothyroidism

**Side-effects** usually at excessive dosage include diarrhoea; abdominal pain, arrhythmias, palpitation, tachycardia; restlessness, excitability, headache, flushing, sweating, weight loss; muscle cramps, muscle weakness

#### Indications and dose

See also notes above

#### Hypothyroidism

##### • By mouth

**Child 12–18 years** initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses

##### • By slow intravenous injection

(replacement for oral levothyroxine)

Convert **daily** levothyroxine dose to liothyronine (see notes above for approximate equivalence) and give in 2–3 divided doses, adjusted according to response

#### Hypothyroid coma

##### • By slow intravenous injection

**Child 12–18 years** 5–20 micrograms repeated every 12 hours or up to every 4 hours if necessary; *alternatively* initially 50 micrograms then 25 micrograms every 8 hours reducing to 25 micrograms twice daily

#### Liothyronine sodium (Non-proprietary) (PoM)

**Tablets**, scored, liothyronine sodium 20 micrograms, net price 28-tab pack = £102.30

**Important** Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease

present) as brands without a UK licence may not be bioequivalent and dose adjustment may be necessary; pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

**Injection**, powder for reconstitution, liothyronine sodium, net price 20-microgram vial = £22.50

## 6.2.2 Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK **carbimazole** is the most commonly used drug. **Propylthiouracil** should be reserved for children who are intolerant of, or who experience sensitivity reactions to, carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Treatment in children should be undertaken by a specialist.

### Neutropenia and agranulocytosis

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

1. Children and their carers should be asked to report symptoms and signs suggestive of infection, especially sore throat.
2. A white blood cell count should be performed if there is any clinical evidence of infection.
3. Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

**Carbimazole** or **propylthiouracil** are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. *Alternatively* high-dose treatment is continued in combination with levothyroxine replacement (*blocking-replacement regimen*); this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is **not** suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted. If a child on carbimazole develops a sore throat it should be reported immediately because of the rare complication of agranulocytosis (see Neutropenia and Agranulocytosis, above).

**Iodine** has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide ( $^{131}\text{I}$ ) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

**Propranolol** (section 2.4) is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but **atenolol** (section 2.4) is also used.

**Thyrotoxic crisis** ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol and hydrocortisone as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

**Neonatal hyperthyroidism** is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

**Pregnancy** Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses can cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

**Breast-feeding** Carbimazole and propylthiouracil are present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.

## CARBIMAZOLE

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe hepatic impairment

**Pregnancy** see notes above

**Breast-feeding** amount in milk may be sufficient to affect neonatal thyroid function, therefore lowest effective dose should be used; see notes above

**Side-effects** nausea, mild gastro-intestinal disturbances, taste disturbance, hepatic disorders (including hepatitis and jaundice), headache, fever, malaise, rash, pruritus, arthralgia; *rarely* myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see Neutropenia and Agranulocytosis above), hypersensitivity reactions

## Indications and dose

### Hyperthyroidism (including Graves' disease)

#### • By mouth

**Neonate** initially 750 micrograms/kg daily in single or divided doses until euthyroid then adjust as necessary (see notes above); higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis

**Child 1 month–12 years** initially 750 micrograms/kg (max. 30 mg) daily in single or divided doses until euthyroid then adjusted as necessary (see notes above); higher initial doses occasionally required, particularly in thyrotoxic crisis

**Child 12–18 years** initially 30 mg daily in single or divided doses until euthyroid then adjusted as necessary (see notes above); higher initial doses occasionally required, particularly in thyrotoxic crisis

**Counselling** Warn child and carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

### Carbimazole (Non-proprietary) PoM

**Tablets**, carbimazole 5 mg, net price 100-tab pack = £46.50; 20 mg, 100-tab pack = £114.93. Counselling, blood disorder symptoms

## IODINE AND IODIDE

**Cautions** not for long-term treatment

**Pregnancy** neonatal goitre and hypothyroidism; see also notes above

**Breast-feeding** stop breast-feeding; danger of neonatal hypothyroidism or goitre; appears to be concentrated in milk; see also notes above

**Side-effects** hypersensitivity reactions including oryza-like symptoms, headache, lacrimation, conjunctivitis, pain in salivary glands, laryngitis, bronchitis, rashes; on prolonged treatment depression, insomnia, impotence; goitre in infants of mothers taking iodides

### Indications and dose

See under preparation

### Aqueous Iodine Oral Solution

**Oral solution**, iodine 5%, potassium iodide 10% in purified water, freshly boiled and cooled, total iodine 130 mg/mL, net price 500 mL = £9.23. Label: 27 Dose

#### Neonatal thyrotoxicosis

##### • By mouth

**Neonate** 0.05–0.1 mL 3 times daily

#### Thyrotoxicosis (pre-operative)

##### • By mouth

**Neonate** 0.1–0.3 mL 3 times daily

**Child 1 month–18 years** 0.1–0.3 mL 3 times daily

#### Thyrotoxic crisis

##### • By mouth

**Child 1 month–1 year** 0.2–0.3 mL 3 times daily

**Administration** Dilute well with milk or water

## PROPYLTHIOURACIL

**Cautions** monitor for hepatotoxicity

**Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver

transplant—discontinue if significant liver-enzyme abnormalities develop

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop

**Hepatic impairment** reduce dose (see also Hepatotoxicity above)

**Renal impairment** estimated glomerular filtration rate 10–50 mL/minute/1.73 m<sup>2</sup>, use 75% of normal dose; estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>, use 50% of normal dose

**Pregnancy** see notes above

**Breast-feeding** monitor infant's thyroid status but amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function; see also notes above

**Side-effects** see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hypoprothrombinaemia, hepatic disorders (including hepatitis, hepatic failure, encephalopathy, hepatic necrosis; see also Hepatotoxicity above), nephritis, lupus erythematosus-like syndromes

**Licensed use** not licensed for use in children under 6 years of age

#### Indications and dose

##### Hyperthyroidism (including Graves' disease)

###### • By mouth

**Neonate** initially 2.5–5 mg/kg twice daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

**Child 1 month–1 year** initially 2.5 mg/kg 3 times daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

**Child 1–5 years** initially 25 mg 3 times daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

**Child 5–12 years** initially 50 mg 3 times daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

**Child 12–18 years** initially 100 mg 3 times daily administered until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

**Propylthiouracil** (Non-proprietary) (POM)

Tablets, propylthiouracil 50 mg, net price 56-tab pack = £59.93, 100-tab pack = £96.32

## PROPRANOLOL HYDROCHLORIDE

**Cautions** see section 2.4

**Contra-indications** see section 2.4

**Hepatic impairment** section 2.4

**Renal impairment** section 2.4

**Pregnancy** section 2.4

**Breast-feeding** section 2.4

**Side-effects** see section 2.4

#### Indications and dose

##### Hyperthyroidism with autonomic symptoms, thyrotoxicosis, thyrotoxic crisis

###### • By mouth

**Neonate** initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response

**Child 1 month–18 years** initially 250–500 micrograms/kg every 8 hours, then adjusted according to response; doses up to 1 mg/kg every 8 hours occasionally required, max. 40 mg every 8 hours

###### • By intravenous injection over 10 minutes

**Neonate** initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response

**Child 1 month–18 years** initially 25–50 micrograms/kg (max. 5 mg) every 6–8 hours, adjusted according to response

#### Preparations

See section 2.4

## 6.3 Corticosteroids

### 6.3.1 Replacement therapy

#### 6.3.2 Glucocorticoid therapy

### 6.3.1 Replacement therapy

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of **hydrocortisone** (section 6.3.2) and the mineralocorticoid **fludrocortisone**; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, **hydrocortisone** by mouth is usually required. This is given in 2–3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone.

In *acute adrenocortical insufficiency*, **hydrocortisone** is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine (section 6.2.1) and sex hormones (section 6.4) should be given as indicated by the pattern of hormone deficiency.

In *congenital adrenal hyperplasia*, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone (section 6.3.2). Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical

response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

### FLUDROCORTISONE ACETATE

**Cautions** section 6.3.2; **interactions:** Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Hepatic impairment** see section 6.3.2

**Renal impairment** see section 6.3.2

**Pregnancy** see section 6.3.2

**Breast-feeding** see section 6.3.2

**Side-effects** section 6.3.2

**Indications and dose**

#### Mineralocorticoid replacement in adrenocortical insufficiency

##### • By mouth

**Neonate** initially 50 micrograms once daily, adjusted according to response; usual range 50–200 micrograms daily; higher doses may be required

**Child 1 month–18 years** initially 50–100 micrograms once daily; maintenance 50–300 micrograms once daily, adjusted according to response

**Note** Dose adjustment may be required if salt supplements are administered

**Florinef®** (Squibb) (PoM)

Tablets, scored, fludrocortisone acetate 100 micrograms. Net price 100-tab pack = £5.05. Label: 10, steroid card

The relatively high mineralocorticoid activity of **hydrocortisone**, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy (section 6.3.1). Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4).

**Prednisolone** has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

**Betamethasone** and **dexamethasone** have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion. Some esters of betamethasone and of **beclomethasone** (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

**Deflazacort** has a high glucocorticoid activity; it is derived from prednisolone.

### Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different children. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease (section 1.5 and section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose hydrocortisone can be used in septic shock (section 2.7.1) that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

## 6.3.2 Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The mineralocorticoid activity of **fludrocortisone** (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

### Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 1 mg	≡	Betamethasone 150 micrograms
	≡	Deflazacort 1.2 mg
	≡	Dexamethasone 150 micrograms
	≡	Hydrocortisone 4 mg
	≡	Methylprednisolone 800 micrograms
	≡	Triamcinolone 800 micrograms

The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of 1 mg of dexamethasone at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid can be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also p. 18); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation (section 3.2) but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma (section 3.1.1).

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as auto-immune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia (section 9.1.3) and thrombocytopenic purpura (section 9.1.4).

High doses of a corticosteroid (usually prednisolone) are used in the treatment of *glomerular kidney disease*, including *nephrotic syndrome*. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole (section 5.5.2), cyclophosphamide and chlorambucil (section 8.1.1), and ciclosporin (section 8.2.2). *Congenital nephrotic syndrome* may be resistant to corticosteroids and immunosuppressants; indometacin (section 10.1.1) and an ACE inhibitor such as captopril (section 2.5.5.1) have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see Prescribing in Palliative Care (p. 17), section 8.2.2 (immunosuppression), section 10.1.2 (rheumatic diseases), section 11.4 (eye), section 12.1.1 (otitis externa), section 12.2.1 (allergic rhinitis), and section 12.3.1 (aphthous ulcers).

### Administration

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma (section 3.2). Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

### Cautions and contra-indications of corticosteroids

#### Adrenal suppression

During prolonged therapy with corticosteroids, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death (see Withdrawal of Corticosteroids, below). Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules, and weight loss.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary re-introduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A regimen for corticosteroid replacement may be necessary before and after surgery.

Children on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 379) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

#### Infections

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections, e.g. *septicaemia* and *tuberculosis*, may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated (see also section 11.4.1).

**Chickenpox** Unless they have had chickenpox, children receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded

as being *at risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella–zoster immunoglobulin (section 14.5.2) is needed for exposed non-immune children receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

**Measles** Children taking corticosteroids, and their carers, should be advised to take particular care to avoid exposure to measles and to seek urgent medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5.1) may be needed.

### Withdrawal of corticosteroids

The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m<sup>2</sup> daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

### Psychiatric reactions

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in children with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Children and their carers should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

### Advice to children and carers

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Children and carers should especially be advised of the following (for details, see Infections, Adrenal Suppression, and Psychiatric Reactions above and Withdrawal of Corticosteroids below):

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, children are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the child or carer must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the child can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur; for details see Side-effects of Corticosteroids, p. 379.

### Steroid treatment cards

Steroid treatment cards (see p. 379) should be issued where appropriate, and are available for purchase from:

3M Security Print and Systems Limited  
Gorse Street, Chadderton  
Oldham,, OL9 9QH  
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team Stores. NHS Trusts can order supplies from [www.nhsforms.co.uk](http://www.nhsforms.co.uk) or by emailing [nhsforms@mmm.com](mailto:nhsforms@mmm.com).

### Other cautions and contra-indications

*Other cautions include:* growth restriction—possibly irreversible, frequent monitoring required if history of tuberculosis (or X-ray changes), hypertension, congestive heart failure, diabetes mellitus including family history, osteoporosis, susceptibility to angle-closure glaucoma (including family history), ocular herpes simplex—risk of corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis—see also Psychiatric Reactions above), epilepsy, peptic ulcer, hypothyroidism, history of steroid myopathy, ulcerative colitis, diverticulitis, recent intestinal anastomoses, thromboembolic disorders, myasthenia gravis; **interactions:** Appendix 1 (corticosteroids)

*Other contra-indications include:* systemic infection (unless specific therapy given); avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished)

## STEROID TREATMENT CARD

I am a patient on STEROID treatment which must not be stopped suddenly

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.
- Read the patient information leaflet given with the medicine.
- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.
- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.
- Make sure that the information on the card is kept up to date.

### Hepatic impairment

When corticosteroids are administered orally or parenterally, the plasma-drug concentration may be increased in children with hepatic impairment. Corticosteroids should be used with caution in hepatic impairment and the child should be monitored closely.

### Renal impairment

Oral and parenteral preparations of corticosteroids should be used with caution in children with renal impairment.

### Pregnancy and breast-feeding

The benefit of treatment with corticosteroids during pregnancy and breast-feeding outweighs the risk; pregnant women with fluid retention should be monitored closely. Corticosteroid cover will be required during labour.

Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;

- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;
- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);
- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;
- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.

### Side-effects of corticosteroids

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Corticosteroids suppress growth and can affect the development of puberty. It is important to use the lowest effective dose; alternate-day regimens may be appropriate and limit growth reduction. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breast-feeding, p. 379.

**Mineralocorticoid** side-effects include hypertension, sodium and water retention, and potassium, and calcium loss. They are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

**Glucocorticoid** side-effects include diabetes and osteoporosis (section 6.6); in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration; there is no conclusive evidence that the use of enteric-coated preparations of prednisolone reduces the risk of peptic ulceration. See also Psychiatric Reactions, p. 378.

High doses of corticosteroids can cause Cushing's syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (**important**: see also Adrenal Suppression, p. 377).

Side-effects can be minimised by using the lowest effective dose for the minimum period possible.

*Other side effects include: gastro-intestinal effects:* dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; *musculoskeletal effects:* muscle weakness, vertebral and long bone fractures, tendon rupture; *endocrine effects:* menstrual irregularities and amenorrhoea, hirsutism, weight gain, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; *neuropsychiatric effects:* psychological dependence, insomnia, increased intracranial pressure with papilloedema (usually after

withdrawal), aggravation of schizophrenia, aggravation of epilepsy; *ophthalmic effects*: papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos, very rarely angle-closure glaucoma; also impaired healing, petechiae, echymoses, facial erythema, suppression of skin test reactions, urticaria, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, hypersensitivity reactions (including anaphylaxis), thromboembolism, nausea, malaise, hiccups, headache, vertigo.

For other references to the side-effects of corticosteroids see section 1.5 (gastro-intestinal system), section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).

## BETAMETHASONE

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above; transient effect on fetal movements and heart rate

**Breast-feeding** see notes above

**Side-effects** see notes above

**Licensed use** *Betnesol*<sup>®</sup> tablets not licensed for use as mouthwash

### Indications and dose

**Suppression of inflammatory and allergic disorders; congenital adrenal hyperplasia; see also notes above**

- By slow intravenous injection or by intravenous infusion

**Child 1 month–1 year** initially 1 mg repeated up to 4 times in 24 hours according to response

**Child 1–6 years** initially 2 mg repeated up to 4 times in 24 hours according to response

**Child 6–12 years** initially 4 mg repeated up to 4 times in 24 hours according to response

**Child 12–18 years** initially 4–20 mg repeated up to 4 times in 24 hours according to response

**Eye** section 11.4.1

**Ear** section 12.1.1

**Nose** section 12.2.1

**Mouth** section 12.3.1

**Administration** For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%

**Betnesol**<sup>®</sup> (RPH) (PoM)

**Injection**, betamethasone 4 mg (as sodium phosphate) /mL. Net price 1-mL amp = £1.22. Label: 10, steroid card

## DEFLAZACORT

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Indications and dose

#### Inflammatory and allergic disorders

- By mouth

**Child 1 month–12 years** 0.25–1.5 mg/kg once daily or on alternate days; up to 2.4 mg/kg (max. 120 mg) daily has been used in emergency situations

**Child 12–18 years** 3–18 mg once daily or on alternate days; up to 2.4 mg/kg (max. 120 mg) daily has been used in emergency situations

#### Nephrotic syndrome

- By mouth

**Child 1 month–18 years** initially 1.5 mg/kg once daily (max. 120 mg) reduced to lowest effective dose for maintenance

**Calcort**<sup>®</sup> (Sanofi-Aventis) (PoM)

**Tablets**, deflazacort 6 mg, net price 60-tab pack = £15.82. Label: 5, 10, steroid card

## DEXAMETHASONE

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also perineal irritation may follow intravenous administration of the phosphate ester

**Licensed use** consult product literature; not licensed for use in bacterial meningitis

### Indications and dose

#### Inflammatory and allergic disorders

- By mouth

**Child 1 month–18 years** 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations

- By intramuscular injection or slow intravenous injection or infusion

**Child 1 month–12 years** 83–333 micrograms/kg daily in 1–2 divided doses; max. 20 mg daily

**Child 12–18 years** initially 0.4–20 mg daily

#### Life-threatening cerebral oedema

- By intravenous injection

**Child under 35 kg body-weight** initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 6 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then decrease by 0.8 mg daily

**Child over 35 kg body-weight** initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then decrease by 1.7 mg daily

#### Bacterial meningitis (see section 5.1)

- By slow intravenous injection

**Child 3 months–18 years** 150 micrograms/kg (max. 10 mg) every 6 hours for 4 days starting before or with first dose of antibacterial

**Physiological replacement**

- **By mouth or by slow intravenous injection**

**Child 1 month–18 years** 250–500 micrograms/m<sup>2</sup> every 12 hours, adjusted according to response

**Croup** section 3.1

**Nausea and vomiting with chemotherapy** section 8.1

**Rheumatic disease** section 10.1.2

**Eye** section 11.4.1

**Administration** for administration *by mouth* tablets may be dispersed in water or injection solution given by mouth

For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes

**Dexamethasone** (Non-proprietary) (PoM)

**Tablets**, dexamethasone 500 micrograms, net price 28-tab pack = £48.00; 2 mg, 50-tab pack = £7.06, 100-tab pack = £12.05. Label: 10, steroid card, 21

**Oral solution**, sugar-free, dexamethasone (as sodium phosphate) 2 mg/5 mL, net price 75-mL = £32.50, 150-mL = £42.30. Label: 10, steroid card, 21

**Brands include** *Dexsol*<sup>®</sup>, *Martapan*<sup>®</sup>

**Injection**, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14. Label: 10, steroid card

**Injection**, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p, 2-mL vial = £1.27. Label: 10, steroid card

**HYDROCORTISONE**

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also phosphate ester associated with paraesthesia and pain (particularly in the perineal region)

**Indications and dose**

**Congenital adrenal hyperplasia** see also section 6.3.1

- **By mouth**

**Neonate** 9–15 mg/m<sup>2</sup> in 3 divided doses, adjusted according to response

**Child 1 month–18 years** 9–15 mg/m<sup>2</sup> in 3 divided doses, adjusted according to response

**Acute adrenocortical insufficiency (Addisonian crisis)** see also notes above and section 6.3.1

- **By slow intravenous administration**

**Neonate** initially 10 mg *by slow intravenous injection* then 100 mg/m<sup>2</sup> daily *by continuous intravenous infusion* or in divided doses every 6–8 hours; adjusted according to response; when stable reduce over 4–5 days to oral maintenance dose

**Child 1 month–12 years** initially 2–4 mg/kg *by slow intravenous injection or infusion* then 2–4 mg/kg every 6 hours; adjusted according to response; when stable reduce over 4–5 days to oral maintenance dose

**Child 12–18 years** 100 mg every 6 to 8 hours *by slow intravenous injection or infusion*

**Adrenal hypoplasia, Addison's disease, chronic maintenance or replacement therapy**

- **By mouth**

**Neonate** 8–10 mg/m<sup>2</sup> daily in 3 divided doses; higher doses may be needed

**Child 1 month–18 years** 8–10 mg/m<sup>2</sup> daily in 3 divided doses; higher doses may be needed

**Note** Give larger doses in the morning and smaller doses in the evening

**Inflammatory bowel disease—induction of remission** see also section 1.5.2

- **By intravenous injection**

**Child 2–18 years** 2.5 mg/kg (max. 100 mg) every 6 hours

- **By continuous intravenous infusion**

**Child 2–18 years** 10 mg/kg daily (max. 400 mg daily)

**Acute hypersensitivity reactions, angioedema** see also section 3.4.3

- **By intramuscular or intravenous injection**

**Child under 6 months** initially 25 mg 3 times daily, adjusted according to response

**Child 6 months–6 years** initially 50 mg 3 times daily, adjusted according to response

**Child 6–12 years** initially 100 mg 3 times daily, adjusted according to response

**Child 12–18 years** initially 200 mg 3 times daily, adjusted according to response

**Hypotension resistant to inotropic treatment and volume replacement (limited evidence)**

- **By intravenous injection**

**Neonate** initially 2.5 mg/kg repeated if necessary after 4 hours, then 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, then dose reduced gradually over at least 48 hours

**Child 1 month–18 years** 1 mg/kg (max. 100 mg) every 6 hours

**Severe acute asthma** p. 132

**Haemorrhoids** section 1.7.2

**Rheumatic disease** section 10.1.2

**Shock** section 2.7.1

**Skin** section 13.4

**Administration** for *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%; for *intermittent infusion* give over 20–30 minutes.

For administration *by mouth*, injection solution may be swallowed [unlicensed use] but consider phosphate content; alternatively *Corlan*<sup>®</sup> pellets (section 12.3.1) may be swallowed [unlicensed use]—pellets should not be cut as may not provide appropriate dose

**Hydrocortisone** (Non-proprietary) (PoM)

**Tablets**, scored, hydrocortisone 10 mg, net price 30-tab pack = £59.24; 20 mg, 30-tab pack = £65.04. Label: 10, steroid card, 21

**<sup>1</sup>Efcortisol®** (AMCo) (PoM) 

**Injection**, hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = £1.08, 5-mL amp = £4.89. Label: 10, steroid card

**Note** Paraesthesia and pain (particularly in the perineal region) may follow intravenous injection of the phosphate ester

**<sup>1</sup>Solu-Cortef®** (Pharmacia) (PoM)

**Injection**, powder for reconstitution, hydrocortisone (as sodium succinate). Net price 100-mg vial = 92p, 100-mg vial with 2-mL amp water for injections = £1.16. Label: 10, steroid card

**METHYLPREDNISOLONE**

**Cautions** see notes above; rapid intravenous administration of large doses associated with cardiovascular collapse

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Indications and dose****Inflammatory and allergic disorders**

- By mouth, slow intravenous injection or by intravenous infusion

**Child 1 month–18 years** 0.5–1.7 mg/kg daily in 2–4 divided doses depending on condition and response

**Treatment of graft rejection reactions**

- By intravenous injection

**Child 1 month–18 years** 10–20 mg/kg or 400–600 mg/m<sup>2</sup> (max. 1 g) once daily for 3 days

**Severe erythema multiforme, lupus nephritis, systemic onset juvenile idiopathic arthritis**

- By intravenous injection

**Child 1 month–18 years** 10–30 mg/kg (max. 1 g) once daily or on alternate days for up to 3 doses

**Immunosuppression** section 8.2.2

**Rheumatic disease** section 10.1.2

**Skin** section 13.4

**Administration** intravenous injection given over 30 minutes; for intravenous infusion may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%

**Medrone®** (Pfizer) (PoM)

**Tablets**, scored, methylprednisolone 2 mg (pink), net price 30-tab pack = £3.88; 4 mg, 30-tab pack = £6.19; 16 mg, 30-tab pack = £17.17; 100 mg (blue), 20-tab pack = £48.32. Label: 10, steroid card, 21

**Solu-Medrone®** (Pharmacia) (PoM)

**Injection**, powder for reconstitution, methylprednisolone (as sodium succinate) (all with solvent). Net price 40-mg vial = £1.58; 125-mg vial = £4.75; 500-mg vial = £9.60; 1-g vial = £17.30; 2-g vial = £32.86. Label: 10, steroid card

**Intramuscular depot****Depo-Medrone®** (Pharmacia) (PoM)

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg/mL. Net price 1-mL vial = £3.44; 2-mL vial = £6.18; 3-mL vial = £8.96. Label: 10, steroid card

**Dose**

- By deep intramuscular injection into gluteal muscle seek specialist advice

**PREDNISOLONE**

**Cautions** see notes above; also Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Indications and dose****Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)**

- By mouth

**Child 1 month–18 years** initially 1–2 mg/kg once daily (usual max. 60 mg daily), then reduced after a few days if appropriate

**Autoimmune hepatitis**

- By mouth

**Child 1 month–18 years** initially 2 mg/kg once daily (max. 40 mg daily) then reduced to minimum effective dose

**Corticosteroid replacement therapy**

- By mouth

**Child 12–18 years** 2–2.5 mg/m<sup>2</sup> daily in 1–2 divided doses adjusted according to response

**Infantile spasms**

- By mouth

**Child 1 month–2 years** initially 10 mg 4 times daily for 14 days (if seizures not controlled after 7 days increase to 20 mg 3 times daily for 7 days); reduce dose gradually over 15 days until stopped (patients taking 40 mg daily, reduce dose in steps of 10 mg every 5 days, then stop; patients taking 60 mg daily, reduce dose to 40 mg daily for 5 days, then 20 mg daily for 5 days, then 10 mg daily for 5 days, then stop)

**Idiopathic thrombocytopenic purpura**

- By mouth

**Child 1–10 years** 1–2 mg/kg daily for max. 14 days or 4 mg/kg daily for max. 4 days

**Nephrotic syndrome**

- By mouth

**Child 1 month–18 years** initially 60 mg/m<sup>2</sup> once daily (max. 80 mg daily) for 4–6 weeks until proteinuria ceases then 40 mg/m<sup>2</sup> on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; prevention of relapse 0.5–1 mg/kg once daily or on alternate days for 3–6 months

1. (PoM) restriction does not apply where administration is for saving life in emergency

**Asthma** see p. 144

**Ear** section 12.1.1

**Eye** section 11.4.1

**Immunosuppression** section 8.2.2

**Inflammatory bowel disease** section 1.5.2

**Pneumocystis pneumonia** section 5.4.8

**Rheumatic disease** section 10.1.2

### **Prednisolone** (Non-proprietary) [PoM]

**Tablets**, prednisolone 1 mg, net price 28-tab pack = £1.03; 5 mg, 28-tab pack = £1.31; 25 mg, 56-tab pack = £40.00. Label: 10, steroid card, 21

**Tablets**, both e/c, prednisolone 2.5 mg, net price 28-tab pack = £1.86, 100-tab pack = £13.43; 5 mg, 28-tab pack = £1.89, 100-tab pack = £13.54. Label: 5, 10, steroid card, 25

**Brands include** *Deltacortril*<sup>®</sup>

**Soluble tablets**, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £42.78. Label: 10, steroid card, 13, 21

## 6.4 Sex hormones

### 6.4.1 Female sex hormones

### 6.4.2 Male sex hormones and antagonists

### 6.4.3 Anabolic steroids

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotropic hypogonadism, hypergonadotropic hypogonadism (Turner's syndrome, Klinefelter's syndrome), endocrine disorders (Cushing's syndrome or hyperprolactinaemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development.

Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

### 6.4.1 Female sex hormones

#### 6.4.1.1 Oestrogens

#### 6.4.1.2 Progestogens

#### 6.4.1.1 Oestrogens

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be

induced with ethinylestradiol in increasing doses, guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment (see section 6.4.1.2). Once the adult dosage of oestrogen has been reached (20 micrograms ethinylestradiol daily), it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] (see section 7.3.1) or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication] (see BNFC section 6.4.1.1). There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under **specialist supervision**, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion (see below). Side-effects include nausea and fluid retention.

Topical oestrogen creams are used in the treatment of labial adhesions (see section 7.2.1)

## ETHINYLESTRADIOL

(Ethinylestradiol)

**Cautions** see Combined Hormonal Contraceptives (section 7.3.1); **interactions**: Appendix 1 (Oestrogens)

**Contra-indications** cardiovascular disease (sodium retention with oedema), personal or family history of thromboembolism, acute porphyria; see also Combined Hormonal Contraceptives (section 7.3.1)

**Hepatic impairment** avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** nausea, vomiting, headache, breast tenderness, changes in body weight, fluid retention, depression, chorea, skin reactions, chloasma, hypertension, may irritate contact lenses, impairment of liver function, hepatic tumours, rarely photosensitivity; see also Combined Hormonal Contraceptives (section 7.3.1)

**Licensed use** unlicensed for use in children

### Indications and dose

See notes above

#### Induction of sexual maturation in girls

##### • By mouth

Initially 2 micrograms daily, increasing every 6 months to 5 micrograms, then to 10 micrograms, and then to 20 micrograms daily

**Note** after 12–18 months of treatment give progestogen for 7 days of each 28-day cycle

#### Maintenance of sexual maturation in girls

##### • By mouth

20 micrograms daily with cyclical progestogen for 7 days of each 28-day cycle

#### Prevention of tall stature in girls

##### • By mouth

**Girls 2–12 years** 20–50 micrograms daily

**Pituitary priming before growth hormone secretion test in girls**● **By mouth**

**Girls with bone age above 10 years** 100 micrograms daily for 3 days before test

**Ethinylestradiol** (Non-proprietary) (PoM)

**Tablets**, ethinylestradiol (unlicensed) 10 micrograms, net price 21-tab pack = £139.22; 50 micrograms, 21-tab pack = £139.22; 1 mg, 28-tab pack = £139.22

**Note** 2 microgram tablets available from 'special-order' manufacturers or specialist-importing companies, see p. 840

**6.4.1.2 Progestogens**

There are two main groups of progestogen, *progesterone and its analogues* (dydrogesterone and medroxyprogesterone) and *testosterone analogues* (norethisterone and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy (section 6.4.1.1) to establish a menstrual cycle; usually levonorgestrel 30 micrograms or norethisterone 5 mg daily are used for the last 7 days of each 28 day cycle.

Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

**NORETHISTERONE**

**Cautions** conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, cardiac dysfunction; susceptibility to thromboembolism (particular caution with high dose); history of depression; diabetes (monitor closely); **interactions:** Appendix 1 (progestogens)

**Contra-indications** history of liver tumours, severe liver impairment; severe arterial disease, undiagnosed vaginal bleeding; acute porphyria (section 9.8.2); history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis

**Hepatic impairment** caution; avoid if severe

**Renal impairment** use with caution

**Pregnancy** avoid

**Breast-feeding** higher doses may suppress lactation and alter milk composition; use lowest effective dose

**Side-effects** menstrual disturbances, premenstrual-like syndrome (including bloating, fluid retention, breast tenderness), weight gain, nausea, headache, dizziness, insomnia, drowsiness, depression; skin reactions (including urticaria, pruritus, rash, and acne), hirsutism and alopecia; jaundice and anaphylactoid reactions also reported

**Licensed use** not licensed for use in children

**Indications and dose**

See notes above

**Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12–24 months oestrogen therapy)**● **By mouth**

5 mg once daily for the last 7 days of a 28-day cycle

**Postponement of menstruation**● **By mouth**

5 mg 3 times daily, starting 3 days before expected onset of menstruation

**Norethisterone** (Non-proprietary) (PoM)

**Tablets**, norethisterone 5 mg, net price 30-tab pack = £2.04

**Primolut N<sup>®</sup>** (Bayer) (PoM)

**Tablets**, norethisterone 5 mg. Net price 30-tab pack = £2.26

**Utovlan<sup>®</sup>** (Pharmacia) (PoM)

**Tablets**, norethisterone 5 mg, net price 30-tab pack = £1.40, 90-tab pack = £4.21

**6.4.2 Male sex hormones and antagonists**

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate or propionate or alternatively *Sustanon<sup>®</sup>* which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the doses increased every 6 to 12 months according to response. Single ester testosterone injections may need to be given more frequently. Implants of testosterone can be used for hypogonadism; the implants are replaced every 4 to 5 months.

Oral **testosterone undecanoate** is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone (section 6.4.3).

Chorionic gonadotrophin (section 6.5.1) has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature.

Testosterone topical gel is also available but experience of use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of micropallus; an extemporaneously prepared cream

should be used because the alcohol in proprietary gel formulations causes irritation.

## TESTOSTERONE AND ESTERS

**Cautions** cardiac impairment, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia); **interactions:** Appendix 1 (testosterone)

**Contra-indications** history of primary liver tumours, hypercalcaemia, nephrosis

**Hepatic impairment** avoid if possible—fluid retention and dose-related toxicity

**Renal impairment** use with caution—potential for fluid retention

**Pregnancy** avoid; causes masculinisation of female fetus

**Breast-feeding** avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation

**Side-effects** headache, depression, gastro-intestinal bleeding, nausea, cholestatic jaundice, changes in libido, gynaecomastia, polycythaemia, anxiety, asthenia, paraesthesia, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus; excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyses in pre-pubertal males, suppression of spermatogenesis in males and virilism in females; rarely liver tumours; sleep apnoea also reported; *with gel*, local irritation and allergic reactions

**Licensed use** *Sustanon 250*<sup>®</sup> and testosterone enantate not licensed for use in children

### Indications and dose

See also under preparations; specialist use only

#### Induction and maintenance of sexual maturation in males

- By mouth (as testosterone undecanoate)

**Child over 12 years** 40 mg on alternate days increasing according to response up to 120 mg daily

- By deep intramuscular injection (as testosterone enantate)

**Child over 12 years** 25–50 mg/m<sup>2</sup> every month increasing dose every 6–12 months according to response

#### Treatment of microphallus

- Topically

Apply 3 times daily for 3 weeks

**Note** Use only specially manufactured preparation (see notes above)

### Oral

**Restanon<sup>®</sup> Testocaps** (MSD) CD4-2

**Capsules**, orange, testosterone undecanoate 40 mg in oily solution, net price 30-cap pack = £8.55; 60-cap pack = £17.10. Label: 21, 25

### Intramuscular

**Testosterone Enantate** (Non-proprietary) CD4-2

**Injection** (oily), testosterone enantate 250 mg/mL, net price 1-mL amp = £19.62

**Sustanon 250<sup>®</sup>** (MSD) CD4-2

**Injection** (oily), testosterone propionate 30 mg, testosterone phenylpropionate 60 mg, testosterone isocaproate 60 mg, and testosterone decanoate 100 mg/mL, net price 1-mL amp = £2.45

**Excipients** include arachis (peanut) oil, benzyl alcohol (see Excipients p. 2)

**Virmone<sup>®</sup>** (Nordic) CD4-2

**Injection**, testosterone propionate 50 mg/mL, net price 2-mL amp = £4.50

**Dose**

#### Delayed puberty in males

- By intramuscular injection  
50 mg once weekly

### Implant

**Testosterone** (MSD) CD4-2

**Implant**, testosterone 100 mg, net price = £9.99; 200 mg = £15.17

**Dose**

#### Maintenance of sexual maturation in males

**Child over 16 years** 100–600 mg; 600 mg usually maintains plasma-testosterone concentration within the normal range for 4–5 months

### Cream

**Testosterone** CD4-2

**Cream**, testosterone 5% (other strengths available)

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## Anti-androgens and precocious puberty

The gonadorelin stimulation test (section 6.5.1) is used to distinguish between *gonadotrophin-dependent (central) precocious puberty* and *gonadotrophin-independent precocious puberty*. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

**Testolactone** and **cyproterone** are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone is a progestogen with anti-androgen properties.

Spironolactone (section 2.2.3) is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

## CYPROTERONE ACETATE

**Cautions** blood counts initially and throughout treatment; monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications)

**Skilled tasks** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

**Contra-indications** severe diabetes (with vascular changes), sickle-cell anaemia, liver disease including Dubin-Johnson and Rotor syndromes, previous or existing liver tumours, malignant or wasting diseases, meningioma or history of meningioma, severe depression, history of thromboembolic disorders

**Hepatic impairment** avoid—dose-related toxicity, see Side-effects below

**Side-effects** fatigue and lassitude, breathlessness, weight changes, reduced sebum production (may clear acne), changes in hair pattern, gynaecomastia (rarely leading to galactorrhoea and benign breast nodules); rarely hypersensitivity reactions, rash and osteoporosis; inhibition of spermatogenesis (see notes above); hepatotoxicity reported (including jaundice, hepatitis and hepatic failure)

**Hepatotoxicity** Direct hepatic toxicity such as jaundice, hepatitis and hepatic failure, including fatal cases, have been reported (usually after several months) with cyproterone acetate dosages of 100 mg and above. Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

**Licensed use** unlicensed for use in children

### Indications and dose

**Gonadotrophin-independent precocious puberty** (specialist use only; see also notes above)

• **By mouth**

Initially 25 mg twice daily, adjusted according to response

**Cyproterone Acetate** (Non-proprietary) (PoM)

**Tablets**, cyproterone acetate 50 mg, net price 56-tab pack = £29.00. Label: 21, counselling, driving

**Note** 10 mg tablets available from 'special-order' manufacturers or specialist-importing companies, see p. 840

**Androcur**<sup>®</sup> (Bayer) (PoM)

**Tablets**, scored, cyproterone acetate 50 mg, net price 56-tab pack = £29.25. Label: 21, counselling, driving

## TESTOLACTONE

**Cautions** interactions: Appendix 1 (testolactone)

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** nausea, vomiting, anorexia, diarrhoea; hypertension; peripheral neuropathy; weight changes; changes in hair pattern; rarely hypersensitivity reactions, rash

### Indications and dose

**Gonadotrophin-independent precocious puberty** (specialist use only; see also notes above)

• **By mouth**

5 mg/kg 3–4 times daily; up to 10 mg/kg 4 times daily may be required

**Testolactone** (PoM)

**Tablets**, testolactone 50 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## GOSERELIN

**Cautions** monitor bone mineral density

**Contra-indications** undiagnosed vaginal bleeding

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** changes in blood pressure, headache, mood changes including depression, hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; changes in scalp and body hair, weight changes, withdrawal bleeding, ovarian cysts (may require withdrawal), breast swelling and tenderness (males and females), visual disturbances, paraesthesia, local reactions at injection site

**Licensed use** not licensed for use in children

### Indications and dose

**Gonadotrophin-dependent precocious puberty**

See notes above; for doses, see under preparations below

**Note** Injections may be required more frequently in some cases

**Administration** Rotate injection site to prevent atrophy and nodule formation

**Zoladex**<sup>®</sup> (AstraZeneca) (PoM)

**Implant**, goserelin (as acetate) 3.6 mg in *Safe-System*<sup>®</sup> syringe applicator, net price each = £65.00

**Dose**

- **Implant**, by subcutaneous injection into anterior abdominal wall  
3.6 mg every 28 days

**Zoladex**<sup>®</sup> LA (AstraZeneca) (PoM)

**Implant**, goserelin (as acetate) 10.8 mg in *SafeSystem*<sup>®</sup> syringe applicator, net price each = £235.00

**Dose**

- **Implant**, by subcutaneous injection into anterior abdominal wall  
10.8 mg every 12 weeks

## LEUPRORELIN ACETATE

**Cautions** see Goserelin

**Contra-indications** see Goserelin

**Pregnancy** avoid—teratogenic in *animal* studies

**Breast-feeding** avoid

**Side-effects** see Goserelin

**Licensed use** not licensed for use in children

### Indications and dose

**Gonadotrophin-dependent precocious puberty**

See notes above; for doses, see under preparations below

**Note** Injections may be required more frequently in some cases

**Administration** Rotate injection site to prevent atrophy and nodule formation

**Prostap® SR** (Wyeth) (PoM)

**Injection** (microsphere powder for reconstitution), leuporelin acetate, net price 3.75-mg vial with 1-mL vehicle-filled syringe = £75.24

**Dose**

- By subcutaneous or by intramuscular injection  
3.75 mg every four weeks (half this dose is sometimes used in children with body-weight under 20 kg)

**Prostap® 3** (Wyeth) (PoM)

**Injection** (microsphere powder for reconstitution), leuporelin acetate, net price 11.25-mg vial with 2-mL vehicle-filled syringe = £225.72

**Dose**

- By subcutaneous or by intramuscular injection  
11.25 mg every 12 weeks

**TRIPTORELIN**

**Cautions** see Goserelin

**Contra-indications** see Goserelin

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** see Goserelin; also gastro-intestinal disturbances; asthenia; arthralgia

**Indications and dose****Gonadotrophin-dependent precocious puberty**

See notes above; for doses, see under preparations below

**Administration** rotate injection site to prevent atrophy and nodule formation

**Decapeptyl® SR** (Ipsen) (PoM)

**Injection**, (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

**Dose**

- By intramuscular injection  
11.25 mg every 3 months
- Note** Each vial includes an overage to allow accurate administration of 11.25 mg dose

**Gonapeptyl® Depot** (Ferring) (PoM)

**Injection** (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69

**Dose**

- By subcutaneous or intramuscular injection  
**Body-weight under 20 kg** initially 1.875 mg on days 0, 14, and 28, then 1.875 mg every 4 weeks  
**Body-weight 20–30 kg** initially 2.5 mg on days 0, 14, and 28, then 2.5 mg every 4 weeks  
**Body-weight over 30 kg** initially 3.75 mg on days 0, 14, and 28, then 3.75 mg every 4 weeks; discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- Note** May be given every 3 weeks if necessary

**6.4.3 Anabolic steroids**

Anabolic steroids have some androgenic activity but in girls they cause less virilisation than androgens. They are used in the treatment of some *aplastic anaemias* (section 9.1.3). Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner's syndrome; specialist management is required.

**OXANDROLONE**

**Cautions** see Testosterone (section 6.4.2); **interactions:** Appendix 1 (oxandrolone)

**Contra-indications** see Testosterone (section 6.4.2)

**Hepatic impairment** see Testosterone (section 6.4.2)

**Renal impairment** see Testosterone (section 6.4.2)

**Pregnancy** see Testosterone (section 6.4.2)

**Breast-feeding** see Testosterone (section 6.4.2)

**Side-effects** see Testosterone (section 6.4.2)

**Indications and dose****Stimulation of late pre-pubertal growth in boys with short stature**

- By mouth  
**Boys 10–18 years (or appropriate age)** 1.25–2.5 mg daily for 3–6 months

**Stimulation of late pre-pubertal growth in girls with Turner's syndrome**

- By mouth  
**Girls** in combination with growth hormone 0.625–2.5 mg daily

**Oxandrolone**

**Tablets**, oxandrolone 2.5 mg  
Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**6.5 Hypothalamic and pituitary hormones**

- 6.5.1 Hypothalamic and anterior pituitary hormones including growth hormone**
- 6.5.2 Posterior pituitary hormones and antagonists**

Use of preparations in these sections requires detailed prior investigation of the patient and *should be reserved for specialist centres*.

**6.5.1 Hypothalamic and anterior pituitary hormones including growth hormone****Anterior pituitary hormones****Corticotrophins**

**Tetracosactide** (tetracosactrin), an analogue of corticotropin (adrenocorticotrophic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (*Synacthen Depot®*) is also used in the treatment of infantile spasms (see Infantile spasms, section 4.8.1) but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin, (also known as corticotropin-releasing hormone, CRH) is

used to test anterior pituitary function and secretion of corticotropin.

## TETRACOSACTIDE (Tetracosactrin)

**Cautions** as for corticosteroids, section 6.3.2; **important:** risk of anaphylaxis (medical supervision; consult product literature); history of atopic allergy (e.g. asthma, eczema, hayfever); history of hypersensitivity; **interactions:** Appendix 1 (corticosteroids)

**Contra-indications** as for corticosteroids, section 6.3.2; avoid injections containing benzyl alcohol in neonates (see under preparations); history of hypersensitivity to corticotrophins

**Hepatic impairment** see section 6.3.2

**Renal impairment** see section 6.3.2

**Pregnancy** avoid (but may be used diagnostically if essential)

**Breast-feeding** avoid (but may be used diagnostically if essential)

**Side-effects** as for corticosteroids, section 6.3.2

**Licensed use** not licensed for low-dose test for adrenocortical insufficiency or treatment of infantile spasms

### Indications and dose

See notes above and under preparations below

**Synacthen®** (Alliance) (POM)

**Injection**, tetracosactide 250 micrograms (as acetate)/mL. Net price 1-mL amp = £2.93

#### Dose

#### Diagnosis of adrenocortical insufficiency (30-minute test)

- By intramuscular or intravenous injection

**Standard-dose test** 145 micrograms/m<sup>2</sup> (max. 250 micrograms) as a single dose

**Low-dose test** 300 nanograms/m<sup>2</sup> as a single dose

**Administration** may be diluted in sodium chloride 0.9% to 250 nanograms/mL

**Synacthen Depot®** (Alliance) (POM)

**Injection** (aqueous suspension), tetracosactide acetate 1 mg/mL, with zinc phosphate complex. Net price 1-mL amp = £4.18

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients p. 2)

#### Dose

#### Infantile spasms

- By intramuscular injection

**Child 1 month–2 years** initially 500 micrograms on alternate days, adjusted according to response

## CORTICORELIN

(Corticotrophin-releasing hormone, CRH)

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** flushing of face, neck and upper body, hypotension, mild sensation of taste or smell

**Licensed use** not licensed

### Indications and dose

#### Test of anterior pituitary function

- By intravenous injection over 30 seconds

**Child 1 month–18 years** 1 microgram/kg (max. 100 micrograms) as a single dose

**CRH Ferring®** (Shire) (POM)

**Injection**, corticorelin 100 micrograms

## Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin is used in the investigation of testicular function in suspected primary hypogonadism and incomplete masculinisation. It has also been used in delayed puberty in boys to stimulate endogenous testosterone production, but it has little advantage over testosterone (section 6.4.2).

## CHORIONIC GONADOTROPHIN (Human Chorionic Gonadotrophin; HCG)

A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone

**Cautions** cardiac impairment, asthma, epilepsy, migraine; prepubertal boys (risk of premature epiphyseal closure or precocious puberty)

**Contra-indications** androgen-dependent tumours

**Renal impairment** use with caution

**Side-effects** oedema (reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions

**Licensed use** unlicensed in children for test of testicular function

### Indications and dose

#### Test of testicular function

- By intramuscular injection

Short stimulation test:

**Child 1 month–18 years** 1500–2000 units once daily for 3 days

Prolonged stimulation test:

**Child 1 month–18 years** 1500–2000 units twice weekly for 3 weeks

#### Hypogonadotrophic hypogonadism

- By intramuscular injection

**Child 1 month–18 years** 1000–2000 units twice weekly, adjusted to response

#### Undescended testes

- By intramuscular injection

**Child 7–18 years** initially 500 units 3 times weekly (1000 units twice weekly if over 17 years); adjusted to response; up to 4000 units 3 times weekly may be required; continue for 1–2 months after testicular descent

**Choragon®** (Ferring) (CD4-2)

**Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £3.26. For intramuscular injection

**Pregnyl®** (MSD) (CD4-2)

**Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.12; 5000-unit amp = £3.15 (both with solvent). For subcutaneous or intramuscular injection

## Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner's syndrome, growth disturbance in children born small for corrected gestational age, chronic renal insufficiency, and short stature homeobox-containing gene (SHOX) deficiency (see NICE guidance below). Growth

hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, **somatropin**, produced using recombinant DNA technology.

#### NICE guidance Somatropin for the treatment of growth failure in children (May 2010)

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency;
- have Turner's syndrome;
- have Prader-Willi syndrome;
- have chronic renal insufficiency;
- are born small for corrected gestational age with subsequent growth failure at 4 years of age or later;
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

[www.nice.org.uk/TA188](http://www.nice.org.uk/TA188)

**Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency (section 6.7.4).

### SOMATROPIN (Recombinant Human Growth Hormone)

**Cautions** diabetes mellitus (adjustment of antidiabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the epiphysis of the hip (monitor for limping), resolved intracranial hypertension (monitor closely), initiation of treatment close to puberty not recommended in child born small for corrected gestational age; Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipoatrophy;

**interactions:** Appendix 1 (somatropin)

**Contra-indications** evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory syndrome in Prader-Willi syndrome

**Pregnancy** interrupt treatment if pregnancy occurs

**Breast-feeding** absorption from milk unlikely

**Side-effects** headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypoglycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported

**Licensed use** not licensed for use in Noonan syndrome

#### Indications and dose

##### Gonadal dysgenesis (Turner's syndrome)

- By subcutaneous injection  
45–50 micrograms/kg daily or 1.4 mg/m<sup>2</sup> daily

##### Deficiency of growth hormone

- By subcutaneous or intramuscular injection  
23–39 micrograms/kg daily or 0.7–1 mg/m<sup>2</sup> daily

##### Prader-Willi syndrome

- By subcutaneous injection  
**Children with growth velocity greater than 1 cm/year** in combination with energy-restricted diet, 35 micrograms/kg daily or 1 mg/m<sup>2</sup> daily; max. 2.7 mg daily

##### Chronic renal insufficiency (renal function decreased to less than 50%)

- By subcutaneous injection  
45–50 micrograms/kg daily or 1.4 mg/m<sup>2</sup> daily (higher doses may be needed) adjusted if necessary after 6 months

##### Growth disturbance in children born small for corrected gestational age whose growth has not caught up by 4 years of age or later; Noonan syndrome

- By subcutaneous injection  
35 micrograms/kg daily or 1 mg/m<sup>2</sup> daily

##### SHOX deficiency

- By subcutaneous injection  
45–50 micrograms/kg daily

#### Genotropin® (Pharmacia) CD4-2

**Injection**, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £92.15; 12-mg (36-unit) cartridge = £208.65. For use with *Genotropin® Pen* JMS device (available free of charge from clinics). For subcutaneous injection

**GoQuick® injection**, two-compartment, multi-dose disposable, prefilled pen containing powder for reconstitution, somatropin (rbe) and diluents, net price 5.3-mg (16-unit) prefilled pen = £92.15; 12-mg (36-unit) prefilled pen = £208.65. For subcutaneous injection

**MiniQuick® injection**, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 0.2-mg (0.6-unit) syringe = £3.48; 0.4-mg (1.2-unit) syringe = £6.95; 0.6-mg (1.8-unit) syringe = £10.43; 0.8-mg (2.4-unit) syringe = £13.91; 1-mg (3-unit) syringe = £17.39; 1.2-mg (3.6-unit) syringe = £20.87; 1.4-mg (4.2-unit) syringe = £24.34; 1.6-mg (4.8-unit) syringe = £27.82; 1.8-mg (5.4-unit) syringe = £31.30; 2-mg (6-unit) syringe = £34.77. For subcutaneous injection

#### Humatrope® (Lilly) CD4-2

**Injection**, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £108.00; 12-mg (36-unit) cartridge = £216.00; 24-mg (72-unit) cartridge = £432.00; all supplied with diluent. For subcutaneous or intramuscular injection; cartridges for subcutaneous injection

**Norditropin**<sup>®</sup> (Novo Nordisk) CD4-2

**SimpleXx**<sup>®</sup> injection, somatropin (epr) 3.3 mg (10 units)/mL, net price 1.5-mL (5-mg, 15-unit) cartridge = £106.35; 6.7 mg (20 units)/mL, 1.5-mL (10-mg, 30-unit) cartridge = £212.70; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £319.05. For use with appropriate *NordiPen*<sup>®</sup>  device (available free of charge from clinics). For subcutaneous injection

**Nordiflex**<sup>®</sup> injection, multidose disposable prefilled pen, somatropin (rbe) 10 mg (30 units)/mL, net price 1.5-mL (15-mg, 45-unit) prefilled pen = £347.70. For use with *NovoFine*<sup>®</sup> or *NovoTwist*<sup>®</sup> needles. For subcutaneous injection

**NutropinAq**<sup>®</sup> (Ipsen) CD4-2

**Injection**, somatropin (rbe), net price 10 mg (30 units) 2-mL cartridge = £203.00. For use with *NutropinAq*<sup>®</sup> Pen  device (available free of charge from clinics). For subcutaneous injection

**Omnitrope**<sup>®</sup> (Sandoz) CD4-2

**Injection**, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £73.75; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £147.50. For use with *Omnitrope Pen 5*<sup>®</sup>  and *Omnitrope Pen 10*<sup>®</sup>  devices respectively (available free of charge from clinics). For subcutaneous injection

**Excipients** include benzyl alcohol (in 5-mg cartridge) (avoid in neonates, see Excipients, p. 2)

**Note** Biosimilar medicine, see p. 2

**Saizen**<sup>®</sup> (Merck Serono) CD4-2

**Injection**, somatropin (rmc), 5.83 mg (17.5 units)/mL, net price 1.03-mL (6-mg, 18-unit) cartridge = £139.08; 8 mg (24 units)/mL, 1.5-mL (12-mg, 36-unit) cartridge = £278.16, 2.5-mL (20-mg, 60-unit) cartridge = £463.60. For use with *cool.click*<sup>®</sup>  needle-free autoinjector device or *easypod*<sup>®</sup>  autoinjector device (available free of charge from clinics). For subcutaneous injection

**Click.easy**<sup>®</sup>, powder for reconstitution, somatropin (rmc), net price 8-mg (24-unit) vial (in *Click.easy*<sup>®</sup> device with diluent) = £185.44. For use with *One.click*<sup>®</sup>  autoinjector device or *cool.click*<sup>®</sup>  needle-free autoinjector device or *easypod*<sup>®</sup>  autoinjector device (available free of charge from clinics). For subcutaneous injection

**Zomacton**<sup>®</sup> (Ferring) CD4-2

**Injection**, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £79.69. For use with *ZomaJet 2 Vision*<sup>®</sup>  needle-free device (available free of charge from clinics) or with needles and syringes; 10-mg (30-unit) vial (with diluent) = £199.23, for use with *ZomaJet Vision X*<sup>®</sup>  needle-free device (available free of charge from clinics) or with needles and syringes. For subcutaneous injection

**Excipients** include benzyl alcohol (in 4-mg vial) (avoid in neonates, see Excipients, p. 2)

**Hypothalamic hormones**

**Gonadorelin** when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon, arginine, and clonidine [all uncensored uses]. The tests should be carried out in specialist centres.

**GONADORELIN**

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

**Cautions** pituitary adenoma

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** rarely nausea, headache, abdominal pain, increased menstrual bleeding; rarely, hypersensitivity reaction on repeated administration of large doses; irritation at injection site

**Licensed use** not licensed for use in children under 1 year

**Indications and dose**

**Assessment of anterior pituitary function; assessment of delayed puberty**

- By subcutaneous or intravenous injection

**Child 1–18 years** 2.5 micrograms/kg (max. 100 micrograms) as a single dose

**Gonadorelin**<sup>®</sup> (Intrapharm) PoM

**Injection**, powder for reconstitution, gonadorelin.

Net price 100-microgram vial (with diluent) = £67.00 (hosp. only)

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients p. 2)

**6.5.2 Posterior pituitary hormones and antagonists****Posterior pituitary hormones**

**Diabetes insipidus** Diabetes insipidus is caused by either a deficiency of anti-diuretic hormone (ADH, vasopressin) secretion (cranial, neurogenic, or pituitary diabetes insipidus) or by failure of the renal tubules to react to secreted antidiuretic hormone (nephrogenic diabetes insipidus).

**Vasopressin** (antidiuretic hormone, ADH) is used in the treatment of *pituitary diabetes insipidus* as its analogue **desmopressin**. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication. Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic

effect of thiazides (section 2.2.1) e.g. chlorothiazide 10–20 mg/kg (max. 500 mg) twice daily.

**Other uses** Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. **Terlipressin**, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

## DESMOPRESSIN

**Cautions** see under Vasopressin; less pressor activity, but still considerable caution in cardiovascular disease and in hypertension (not indicated for nocturnal enuresis or nocturia in these circumstances); also considerable caution in cystic fibrosis; in nocturia and nocturnal enuresis limit fluid intake from 1 hour before dose until 8 hours afterwards; in nocturia periodic blood pressure and weight checks needed to monitor for fluid overload; **interactions:** Appendix 1 (desmopressin)

For cautions specifically relating to the use of desmopressin in nocturnal enuresis see section 7.4.2

**Hyponatraemic convulsions** Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal). The risk of hyponatraemic convulsions can also be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)

**Contra-indications** cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polydipsia in alcohol dependence

**Renal impairment** use with caution; antidiuretic effect may be reduced

**Pregnancy** small oxytocic effect in third trimester; increased risk of pre-eclampsia

**Breast-feeding** amount too small to be harmful

**Side-effects** fluid retention, and hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake; stomach pain, headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

**Licensed use** consult product literature for individual preparations; not licensed for assessment of antidiuretic hormone secretion

### Indications and dose

**Assessment of antidiuretic hormone secretion (congenital deficiency suspected)** (specialist use only)

#### • Intranasally

**Child 1 month–2 years** initially 100–500 nanograms as a single dose

**Assessment of antidiuretic hormone secretion (congenital deficiency not suspected)** (specialist use only)

#### • Intranasally

**Child 1 month–2 years** 1–5 micrograms as a single dose

### Test for suspected diabetes insipidus (water deprivation test)

#### • Intranasally

**Neonate** not recommended, use trial of treatment

**Child 1 month–2 years** 5–10 micrograms as a single dose; not usually recommended, see notes above

**Child 2–12 years** 10–20 micrograms as a single dose, see notes above

**Child 12–18 years** 20 micrograms as a single dose, see notes above

#### • By subcutaneous or intramuscular injection

**Neonate** not recommended, use trial of treatment

**Child 1 month–2 years** 400 nanograms as a single dose; not usually recommended, see notes above

**Child 2–12 years** 0.5–1 microgram as a single dose, see notes above

**Child 12–18 years** 1–2 micrograms as a single dose, see notes above

### Diabetes insipidus, treatment

#### • By mouth

(as desmopressin acetate)

**Neonate** initially 1–4 micrograms 2–3 times daily, adjusted according to response

**Child 1 month–2 years** initially 10 micrograms 2–3 times daily, adjusted according to response (range 30–150 micrograms daily)

**Child 2–12 years** initially 50 micrograms 2–3 times daily, adjusted according to response (range 100–800 micrograms daily)

**Child 12–18 years** initially 100 micrograms 2–3 times daily, adjusted according to response (range 0.2–1.2 mg daily)

#### • Sublingually

(as desmopressin base)

**Child 2–18 years** initially 60 micrograms 3 times daily, adjusted according to response (range 40–240 micrograms 3 times daily)

#### • Intranasally

(as desmopressin acetate)

**Neonate** initially 100–500 nanograms, adjusted according to response (range 1.25–10 micrograms daily in 1–2 divided doses)

**Child 1 month–2 years** initially 2.5–5 micrograms 1–2 times daily, adjusted according to response

**Child 2–12 years** initially 5–20 micrograms 1–2 times daily, adjusted according to response

**Child 12–18 years** initially 10–20 micrograms 1–2 times daily, adjusted according to response

#### • By subcutaneous or intramuscular injection

**Neonate** initially 100 nanograms once daily, adjusted according to response (intramuscular route only)

**Child 1 month–12 years** initially 400 nanograms once daily, adjusted according to response

**Child 12–18 years** initially 1–4 micrograms once daily, adjusted according to response

**Primary nocturnal enuresis**● **By mouth**

(as desmopressin acetate)

**Child 5–18 years** 200 micrograms at bedtime, increased to 400 micrograms at bedtime only if lower dose not effective (**important**: see also Cautions), reassess after 3 months by withdrawing treatment for at least 1 week

● **Sublingually**

(as desmopressin base)

**Child 5–18 years** 120 micrograms at bedtime, increased to 240 micrograms at bedtime only if lower dose not effective (**important**: see also Cautions); reassess after 3 months by withdrawing treatment for at least 1 week

**Fibrinolytic response testing**● **By intravenous injection over 20 minutes or by subcutaneous injection**

**Child 2–18 years** 300 nanograms/kg as a single dose; blood sampled after 20 minutes for fibrinolytic activity

**Mild to moderate haemophilia and von Willebrand's disease**● **By intravenous infusion over 20 minutes or by subcutaneous injection**

**Child 1 month–18 years** 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

● **Intranasally**

**Child 1–18 years** 4 micrograms/kg as a single dose, for pre-operative use give 2 hours before procedure

**Renal function testing**● **Intranasally**

**Child 1 month–1 year** 10 micrograms (empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload)

**Child 1–15 years** 20 micrograms (empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload)

**Child 15–18 years** 40 micrograms (empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload)

● **By subcutaneous or intramuscular injection**

**Child 1 month–1 year** 400 nanograms (empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload)

**Child 1–18 years** 2 micrograms (empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload)

**Desmopressin acetate** (Non-proprietary) (PoM)

**Tablets**, desmopressin acetate 100 micrograms, net price 90-tab pack = £60.12; 200 micrograms, 30-tab pack = £9.02, 90-tab pack = £39.20. Counselling, fluid intake, see above

**Nasal spray**, desmopressin acetate 10 micrograms/metered spray, net price 6-mL unit (60 metered sprays) = £9.34. Counselling, fluid intake, see above

**Brands include** *Presinex*<sup>®</sup>

**Note** Children requiring dose of less than 10 micrograms should be given *DDAVP*<sup>®</sup> intranasal solution

**DDAVP**<sup>®</sup> (Ferring) (PoM)

**Tablets**, both scored, desmopressin acetate 100 micrograms, net price 90-tab pack = £44.12; 200 micrograms, 90-tab pack = £88.23. Counselling, fluid intake, see above

**Note** Tablets may be crushed

**Oral lyophilisates**, (*DDAVP*<sup>®</sup> *Melt*), desmopressin (as acetate) 60 micrograms, net price 100-tab pack = £50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. For sublingual administration. Label: 26, counselling, fluid intake, see notes above

**Intranasal solution**, desmopressin acetate 100 micrograms/mL. Net price 2.5-mL dropper bottle and catheter = £9.72. Counselling, fluid intake, see above

**Administration** May be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL

**Injection**, desmopressin acetate 4 micrograms/mL. Net price 1-mL amp = £1.32

**Administration** May be administered orally [unlicensed]; for intravenous infusion, higher doses used in mild to moderate haemophilia and von Willebrand's disease may be diluted with 30–50 mL Sodium Chloride 0.9% intravenous infusion

**Desmometil**<sup>®</sup> (Ferring) (PoM)

**Oral lyophilisates**, desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. For sublingual administration. Label: 26, counselling, fluid intake, see above

**Desmotabs**<sup>®</sup> (Ferring) (PoM)

**Tablets**, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £29.43. Counselling, fluid intake, see above

**Note** tablets may be crushed

**Desmospray**<sup>®</sup> (Ferring) (PoM)

**Nasal spray**, desmopressin acetate 10 micrograms/metered spray, net price 6-mL unit (60 metered sprays) = £25.02. Counselling, fluid intake, see above

**Note** Children requiring dose of less than 10 micrograms should be given *DDAVP*<sup>®</sup> intranasal solution

**Low dose Desmospray**<sup>®</sup> (PoM)

**Nasal spray**, desmopressin acetate 2.5 micrograms/metered spray  
Available from Ferring on a named-patient basis

**Octim**<sup>®</sup> (Ferring) (PoM)

**Nasal spray**, desmopressin acetate 150 micrograms/metered spray, net price 2.5-mL unit (25 metered sprays) = £576.60. Counselling, fluid intake, see above

**Injection**, desmopressin acetate 15 micrograms/mL, net price 1-mL amp = £19.22

**Administration** for intravenous infusion dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes

## TERLIPRESSIN ACETATE

**Cautions** uncontrolled hypertension; vascular disease; heart disease; history of QT-interval prolongation; concomitant use of drugs that prolong the QT-interval; arrhythmia; respiratory disease; septic shock; electrolyte and fluid disturbances

**Renal impairment** use with caution in chronic renal failure

**Pregnancy** avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported

**Breast-feeding** avoid unless benefits outweigh risk—no information available

**Side-effects** abdominal cramps, diarrhoea, hypertension, hypotension, peripheral ischaemia, pallor, arrhythmia, bradycardia, headache; *less commonly* nausea, vomiting, hot flushes, angina, myocardial infarction, tachycardia, intestinal ischaemia, bronchospasm, respiratory failure, pulmonary oedema, convulsions, hyponatraemia; *rarely* dyspnoea; *very rarely* stroke, hyperglycaemia; *also reported* heart failure, skin necrosis

**Licensed use** unlicensed for use in children

### Indications and dose

See under preparations

**Glypressin**<sup>®</sup> (Ferring) (PoM)

**Injection**, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £18.47

**Injection**, solution for injection, terlipressin acetate, 0.12 mg/mL, net price 1-mg (8.5 mL) amp = £19.39

#### Dose

**Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices** (specialist use only)

- By intravenous injection

**Child 12–18 years**, 2 mg every 4 hours until bleeding controlled (after initial dose, may reduce to 1 mg every 4 hours if not tolerated or body-weight under 50 kg); max. duration 48 hours

**Varique**<sup>®</sup> (Sinclair IS) (PoM)

**Injection**, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £17.90

#### Dose

**Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices** (specialist use only)

- By intravenous injection over 1 minute

**Child 12–18 years** initially 1 mg if body-weight under 50 kg (initial dose 1.5 mg if body-weight 50–70 kg, or 2 mg if body-weight over 70 kg), then 1 mg every 4–6 hours for up to 72 hours

## VASOPRESSIN

**Cautions** heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggravated by water retention; avoid fluid overload

**Contra-indications** vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (until reasonable blood nitrogen concentrations attained)

**Renal impairment** see Contra-indications

**Pregnancy** oxytocic effect in third trimester

**Breast-feeding** not known to be harmful

**Side-effects** fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defaecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

**Licensed use** not licensed for use in children

### Indications and dose

**Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices** (specialist use only)

- By continuous intravenous infusion (may also be infused directly into the superior mesenteric artery)

**Child 1 month–18 years** initially 0.3 units/kg (max. 20 units) over 20–30 minutes *then* 0.3 units/kg/hour, adjusted according to response (max. 1 unit/kg/hour); if bleeding stops, continue at same dose for 12 hours, then withdraw gradually over 24–48 hours; max. duration of treatment 72 hours

**Administration** for *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9% to a concentration of 0.2–1 unit/mL

### ▲ Synthetic vasopressin

**Argipressin** (Non-proprietary) (PoM)

**Injection**, argipressin (synthetic vasopressin) 20 units/mL, net price 1-mL amp = £22.50 (hosp. only)

## 6.6 Drugs affecting bone metabolism

- 6.6.1 Calcitonin
- 6.6.2 Bisphosphonates

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets (section 9.6.4) and hypophosphataemic rickets (section 9.5.2). See also calcium (section 9.5.1.1).

### Osteoporosis

Osteoporosis in children may be primary (e.g. *osteogenesis imperfecta* and *idiopathic juvenile osteoporosis*), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

**Corticosteroid-induced osteoporosis** To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

#### 6.6.1 Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. **Calcitonin (salmon)** (**salcatonin**, synthetic or recombinant salmon calcitonin) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

## CALCITONIN (SALMON)/ SALCATONIN

**Cautions** history of allergy (skin test advised); heart failure; avoid prolonged use—risk of malignancy (use lowest effective dose for shortest possible time); monitor bone growth

**Contra-indications** hypocalcaemia

**Renal impairment** use with caution

**Pregnancy** avoid unless essential, toxicity in *animal* studies

**Breast-feeding** avoid unless essential, may inhibit lactation

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, taste disturbance, flushing, dizziness, headache, fatigue, malignancy (with long-term use) musculo-skeletal pain; *less commonly* hypertension, oedema, cough, polyuria, visual disturbances, injection-site reactions, rash, hypersensitivity reactions including pruritus; *also reported* tremor

**Licensed use** not licensed in children

### Indications and dose

**Hypercalcaemia (experience limited in children)** (specialist use only)

• By subcutaneous or intramuscular injection

**Child 1 month–18 years** 2.5–5 units/kg every 12 hours, max. 400 units every 6–8 hours, adjusted according to response (no additional benefit with over 8 units/kg every 6 hours)

• By slow intravenous infusion

**Child 1 month–18 years** 5–10 units/kg over at least 6 hours

**Osteoporosis** (specialist use only)

Refer for specialist advice, experience very limited

**Administration** for *intravenous infusion*, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration—use diluted solution without delay

**Miacalcic®** (Novartis) (PoM)

**Injection**, calcitonin (salmon) 50 units/mL, net price 1-mL amp = £3.42; 100 units/mL, 1-mL amp = £6.84; 200 units/mL, 2-mL vial = £24.60

## 6.6.2 Bisphosphonates

Bisphosphonates are adsorbed on to hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

A bisphosphonate such as **pamidronate disodium** is used in the management of severe forms of *osteogenesis imperfecta* and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children have not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia (section 9.5.1.2). Treatment should be initiated under specialist advice **only**.

### Bisphosphonates: osteonecrosis of the jaw

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment.

During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at [www.sdcep.org.uk](http://www.sdcep.org.uk)).

### MHRA/CHM advice

#### Bisphosphonates: atypical femoral fractures (June 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

## ALENDRONIC ACID

**Cautions** upper gastro-intestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 394); exclude other causes of osteoporosis; atypical femoral fractures, see MHRA/CHM advice, p. 394; **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or achalasia), hypocalcaemia

**Renal impairment** avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, melaena, diarrhoea or constipation, flatulence, musculoskeletal pain, headache; *rarely* rash, pruritus, erythema, photosensitivity, uveitis, scleritis, transient decrease in serum phosphate; nausea, vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), atypical femoral fractures with long term use, see MHRA/CHM advice, p. 394; myalgia, malaise, and fever at initiation of treatment; *very rarely* severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 394)

**Oesophageal reactions** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

**Licensed use** not licensed for use in children

**Indications and dose**

See notes above, specialist use only

**Counselling** Swallow the tablets whole with a full glass of water on an empty stomach at least 30 minutes before breakfast (and any other oral medication); stand or sit upright for at least 30 minutes and do not lie down until after eating breakfast. Do not take the tablets at bedtime or before rising

**Alendronic acid** (Non-proprietary) (POM)

**Tablets**, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £1.28; 70 mg, 4-tab pack = 84p. Counselling, administration

**Oral solution**, sugar-free, alendronic acid (as sodium alendronate) 70 mg/100 mL, net price 4 × 100-mL single-use bottles = £22.80. Counselling, administration

**Counselling** oral solution intended for single use only; swallow required dose with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patients should stand or sit upright for at least 30 minutes after taking the solution

**Fosamax**<sup>®</sup> (MSD) (POM)

**Tablets**, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £23.12. Counselling, administration

**Fosamax**<sup>®</sup> Once Weekly (MSD) (POM)

**Tablets**, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £22.80. Counselling, administration

## PAMIDRONATE DISODIUM

Pamidronate disodium was formerly called aminohydroxypropylidenediphosphate disodium (APD)

**Cautions** cardiac disease; previous thyroid surgery (risk of hypocalcaemia); monitor serum electrolytes, calcium, and phosphate—possibility of convulsions due to electrolyte changes; ensure adequate hydration; avoid concurrent use with other bisphosphonates; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 394);

atypical femoral fractures, see MHRA/CHM advice, p. 394; **interactions:** Appendix 1 (bisphosphonates)

**Skilled tasks** Patients should be warned against driving, cycling, or performing skilled tasks immediately after treatment (somnolence or dizziness can occur)

**Hepatic impairment** use with caution in severe impairment—no information available

**Renal impairment** monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia)

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid

**Side-effects** hypophosphataemia, transient rise in body temperature, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue, and flushes); arthralgia, myalgia, bone pain, nausea, vomiting, headache, lymphocytopenia, hypomagnesaemia; *rarely* muscle cramps, atypical femoral fractures, see MHRA/CHM advice, p. 394, anorexia, abdominal pain, diarrhoea, constipation, dyspepsia, agitation, confusion, dizziness, insomnia, somnolence, lethargy, anaemia, leucopenia, hypotension or hypertension, rash, pruritus, symptomatic hypocalcaemia (paraesthesia, tetany), hyperkalaemia or hypokalaemia, hypernatraemia; osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 394); isolated cases of seizures, hallucinations, thrombocytopenia, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also local reactions at injection site

**Licensed use** not licensed for use in children

**Indications and dose**

See notes above, specialist use only

**Pamidronate disodium** (Non-proprietary) (POM)

**Concentrate for intravenous infusion**, pamidronate disodium 3 mg/mL, net price 5-mL vial = £13.33, 10-mL vial = £26.66; 6 mg/mL, 10-mL vial = £53.33; 9 mg/mL, 10-mL vial = £80.00; 15 mg/mL, 1-mL vial = £29.83, 2-mL vial = £59.66, 4-mL vial = £119.32, 6-mL vial £170.46

**Aredia Dry Powder**<sup>®</sup> (Novartis) (POM)

**Intravenous infusion**, powder for reconstitution, pamidronate disodium, net price 15-mg vial = £29.83; 30-mg vial = £59.66; 90-mg vial = £170.45 (all with diluent)

## RISEDRONATE SODIUM

**Cautions** oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia—see also under Side-effects); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. Vitamin-D deficiency) at onset of treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 394); atypical femoral fractures, see MHRA/CHM advice, p. 394; **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** hypocalcaemia (see Cautions above)

**Renal impairment** avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** abdominal pain, dyspepsia, nausea, diarrhoea, constipation, headache, musculoskeletal pain; *less commonly* oesophagitis, oesophageal ulcer, dysphagia, gastritis, duodenitis, uveitis; *rarely* glossitis, oesophageal stricture, atypical femoral fractures, see MHRA/CHM advice, p. 394; *also reported* gastro-duodenal ulceration, hepatic disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis, hair loss, cutaneous vasculitis, osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 394)

**Oesophageal reactions** Children and their carers should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

**Licensed use** not licensed for use in children

#### Indications and dose

See notes above, specialist use only

**Counselling** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

**Risedronate Sodium** (Non-proprietary) (PoM)

**Tablets**, risedronate sodium 5 mg, net price 28-tab pack = £13.24; 30 mg, 28-tab pack = £105.70; 35 mg, 4-tab pack = £1.08. Counselling, administration, food, and calcium (see above)

**Actonel**<sup>®</sup> (Warner Chilcott) (PoM)

**Tablets**, f/c, risedronate sodium 5 mg (yellow), net price 28-tab pack = £17.99; 30 mg (white), 28-tab pack = £143.95. Counselling, administration, food, and calcium (see above)

**Actonel Once a Week**<sup>®</sup> (Warner Chilcott) (PoM)

**Tablets**, f/c, orange, risedronate sodium 35 mg, net price 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

## SODIUM CLODRONATE

**Cautions** monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 394); atypical femoral fractures, see MHRA/CHM advice, p. 394; **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** acute gastro-intestinal inflammatory conditions

**Renal impairment** use half normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m<sup>2</sup>; avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, skin reactions, bronchospasm; *rarely* atypical femoral fractures, see MHRA/CHM advice, p. 394; *very rarely* osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 394); *also reported* renal impairment

**Licensed use** not licensed for use in children

#### Indications and dose

See notes above, specialist use only

**Counselling** Avoid food for 2 hours before and 1 hour after oral treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake

**Bonafos**<sup>®</sup> (Bayer) (PoM)

**Capsules**, yellow, sodium clodronate 400 mg. Net price 120-cap pack = £139.83. Counselling, food and calcium

**Tablets**, f/c, scored, sodium clodronate 800 mg. Net price 60-tab pack = £146.43. Counselling, food and calcium

**Clasteol**<sup>®</sup> (Beacon) (PoM)

**Capsules**, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £34.96, 120-cap pack = £139.83. Counselling, food and calcium

**Tablets**, f/c, sodium clodronate 800 mg, net price 60-tab pack = £146.43. Counselling, food and calcium

**Loron**<sup>®</sup> (Intrapharm) (PoM)

**Loron 520**<sup>®</sup> tablets, f/c, scored, sodium clodronate 520 mg, net price 60-tab pack = £152.59. Label: 10, patient information leaflet, counselling, food and calcium

## 6.7 Other endocrine drugs

- 6.7.1 Bromocriptine and other dopaminergic drugs
- 6.7.2 Drugs affecting gonadotrophins
- 6.7.3 Metyrapone
- 6.7.4 Somatomedins

### 6.7.1 Bromocriptine and other dopaminergic drugs

Classification not used in *BNF for Children*.

### 6.7.2 Drugs affecting gonadotrophins

Classification not used in *BNF for Children*. See section 6.4.2 for use in precocious puberty.

### 6.7.3 Metyrapone

**Metyrapone** is a competitive inhibitor of 11 $\beta$ -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. It is used as a test of anterior pituitary function.

Most types of *Cushing's syndrome* are treated surgically. Metyrapone may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

## METYRAPONE

**Cautions** gross hypopituitarism (risk of precipitating acute adrenal failure); hypertension on long-term administration; hypothyroidism (delayed response); many drugs interfere with diagnostic estimation of steroids; avoid in acute porphyria (section 9.8.2)

**Skilled tasks** Drowsiness may affect the performance of skilled tasks (e.g. driving)

**Contra-indications** adrenocortical insufficiency (see Cautions)

**Hepatic impairment** use with caution (delayed response)

**Pregnancy** avoid (may impair biosynthesis of fetal-placental steroids)

**Breast-feeding** avoid—no information available

**Side-effects** occasional nausea, vomiting, dizziness, headache, hypotension, sedation; rarely abdominal pain, allergic skin reactions, hypoadrenalism, hirsutism

**Licensed use** licensed for use in children

### Indications and dose

#### Differential diagnosis of ACTH-dependent Cushing's syndrome

##### • By mouth

**Child 1 month–18 years** 15 mg/kg (or 300 mg/m<sup>2</sup>) every 4 hours for 6 doses; minimum dose 250 mg every 4 hours, max. 750 mg every 4 hours

#### Management of Cushing's syndrome

##### • By mouth

Range 250 mg–6 g daily, adjusted according to cortisol production; see notes above

**Metopirone**<sup>®</sup> (HRA Pharma) (PoM)

**Capsules**, ivory, metyrapone 250 mg, net price 100-cap pack = £363.66. Label: 21, counselling, driving

## 6.7.4 Somatomedins

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). **Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone and is used to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

## MECASERMIN

(Recombinant human insulin-like growth factor-I; rhIGF-I)

**Cautions** correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions)

**Contra-indications** evidence of tumour activity (discontinue treatment)

**Pregnancy** avoid unless essential; contraception advised in women of child-bearing potential

**Breast-feeding** avoid

**Side-effects** headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia; visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

### Indications and dose

#### Growth failure in children with severe primary insulin-like growth factor-I deficiency

##### • By subcutaneous injection

**Child 2–18 years** initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year

**Counselling** Dose should be administered just before or after food; do not increase dose if a dose is missed

**Note** Reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

**Increlex**<sup>®</sup> (Ipsen) (PoM)

**Injection**, mecasermin 10 mg/mL, net price 4-mL vial = £605.00. Counselling, administration

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

## 7.1 Drugs used in obstetrics

This section is not included in *BNF for Children*. See BNF for management of obstetrics.

For the management of ductus arteriosus, see section 2.14.

## 7.2 Treatment of vaginal and vulval conditions

<b>7.2.1</b>	<b>Preparations for vaginal and vulval changes</b>
<b>7.2.2</b>	<b>Vaginal and vulval infections</b>

Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations (section 13.2.2) applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection (section 5.1) or threadworm infestation (section 5.5.1). Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults, see BNF section 7.2.2.

### 7.2.1 Preparations for vaginal and vulval changes

Topical oestrogen creams containing **estriol** 0.01% (*Gynest*<sup>®</sup>) are used in the treatment of labial adhesions (for details of preparation, see BNF section 7.2.1); treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

### 7.2.2 Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

#### Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. *Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis*, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

**Imidazole** drugs (clotrimazole, econazole, fenticonazole, and miconazole) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole (section 5.2.1) may be considered for girls post-puberty.

**Vulvovaginal candidiasis in pregnancy** Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

**Recurrent vulvovaginal candidiasis** Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens suitable for older children [all unlicensed] include:

- initially, fluconazole (section 5.2.1) 150 mg by mouth every 72 hours for 3 doses, then 150 mg once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then clotrimazole 500-mg pessary once every week for 6 months.

## PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS

**Cautions** avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative; **interactions:** Appendix 1 (miconazole)

**Pregnancy** see notes above

**Side-effects** occasional local irritation

**Licensed use** consult product literature for individual preparations

### Indications and dose

See notes above and under preparations below

#### Clotrimazole (Non-proprietary)

**Cream** (topical), clotrimazole 1%, net price 20 g = £1.26, 50 g = £3.15

**Condoms** effect on latex condoms and diaphragms not yet known

#### Dose

Apply to anogenital area 2–3 times daily

**Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £3.12

#### Dose

Insert 1 pessary at night as a single dose; can be repeated once if necessary

#### Canesten® (Bayer Consumer Care)

**Cream** (topical), clotrimazole 1%, net price 20 g = £2.14; 50 g = £3.50

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

#### Dose

Apply to anogenital area 2–3 times daily

**Thrush Cream** (topical), clotrimazole 2%, net price 20 g = £4.46

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

#### Dose

Apply to anogenital area 2–3 times daily

**Intravaginal cream (10% VC®)** (POM), clotrimazole 10%, net price 5-g applicator pack = £4.50

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

#### Dose

Insert 5 g at night as a single dose; may be repeated once if necessary

**Note** Brands for sale to the public include *Canesten® Internal Cream*

**Cream Combi**, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £8.21

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

#### Dose

See under individual components

**Pessaries**, clotrimazole 200 mg, net price 3 pessaries with applicator = £3.10

**Condoms** damages latex condoms and diaphragms

#### Dose

Insert 200 mg for 3 nights; course may be repeated once if necessary

**Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £2.00

**Excipients** none as listed in section 13.1.3

**Condoms** damages latex condoms and diaphragms

#### Dose

Insert 1 pessary at night as a single dose; may be repeated once if necessary

**Pessary Combi**, clotrimazole 500-mg pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £8.21

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

#### Dose

See under individual components

**Soft Gel Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £6.41

**Condoms** damages latex condoms and diaphragms

#### Dose

Insert 1 pessary at night as a single dose; may be repeated once if necessary

**Soft Gel Pessary Combi**, clotrimazole 500-mg soft gel pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £5.73

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

#### Dose

See under individual components

**Gyno-Daktarin®** (Janssen) (POM)

**Ovule** (= vaginal capsule) (*Gyno-Daktarin 1*®), miconazole nitrate 1.2 g in a fatty basis, net price 1 ovule = £2.94

**Excipients** include hydroxybenzoates (parabens)

**Condoms** damages latex condoms and diaphragms

**Dose**

Insert 1 ovule at night as a single dose; can be repeated once if necessary

**Gyno-Pevaryl®** (Janssen) (POM)

**Pessaries**, econazole nitrate 150 mg, net price 3 pessaries = £4.17

**Excipients** none as listed in section 13.1.3

**Condoms** damages latex condoms and diaphragms

**Dose**

Insert 1 pessary for 3 nights; course can be repeated once if necessary

**Pessary** (*Gyno-Pevaryl 1*®), econazole nitrate 150 mg, formulated for single-dose therapy, net price 1 pessary with applicator = £3.69

**Excipients** none as listed in section 13.1.3

**Condoms** damages latex condoms and diaphragms

**Dose**

Insert 1 pessary at night as a single dose; can be repeated once if necessary

**Gynoxin®** (Recordati) (POM)

**Intravaginal cream**, fenticonazole nitrate 2%, net price 30 g with applicator = £3.74

**Excipients** include cetyl alcohol, hydrogenated wool fat, propylene glycol

**Condoms** damages latex condoms and diaphragms

**Dose**

Insert 5-g applicatorful intravaginally twice daily for 3 days

**Vaginal capsule**, fenticonazole nitrate 200 mg, net price 3 vaginal capsules = £2.42

**Excipients** include hydroxybenzoates (parabens)

**Condoms** damages latex condoms and diaphragms

**Dose**

Insert 1 vaginal capsule at night for 3 nights

**Vaginal capsule**, fenticonazole nitrate 600 mg, net price 1 vaginal capsule = £2.62

**Excipients** include hydroxybenzoates (parabens)

**Condoms** damages latex condoms and diaphragms

**Dose**

Insert 1 vaginal capsule at night as a single dose

to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3 for systemic preparations, and section 13.10.3 for topical preparations.

## PREPARATIONS FOR OTHER VAGINAL INFECTIONS

**Cautions** avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative.

**Balance Activ Rx®** (BBI Healthcare)

**Vaginal gel**, lactic acid 4.9%, glycogen 0.1%, net price 7 x 5 mL-tube = £5.25

**Excipients** include propylene glycol

**Dose****Prevention of bacterial vaginosis**

Insert contents of 1 tube once or twice weekly

**Dalacin®** (Pharmacia) (POM)

**Cream**, clindamycin 2% (as phosphate), net price 40-g pack with 7 applicators = £10.86

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Condoms** damages latex condoms and diaphragms

**Side-effects** irritation, cervicitis and vaginitis; poorly absorbed into the blood—low risk of systemic effects, see section 5.1.6

**Licensed use** not licensed for use in children

**Dose****Bacterial vaginosis**

Insert 5-g applicatorful at night for 3–7 nights

**Zidoval®** (Meda) (POM)

**Vaginal gel**, metronidazole 0.75%, net price 40-g pack with 5 applicators = £4.31

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

**Side-effects** local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort

**Licensed use** not licensed for use in children under 18 years

**Note** Not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects

**Dose****Bacterial vaginosis**

Insert 5-g applicatorful at night for 5 nights

## Other infections

*Trichomonal infections* commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole (section 5.1.11) or tinidazole (section 5.4.2).

*Bacterial infections* with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

The antiviral drugs aciclovir, famciclovir, and valaciclovir can be used in the treatment of genital infection due

## 7.3 Contraceptives

- 7.3.1 Combined hormonal contraceptives
- 7.3.2 Progestogen-only contraceptives
- 7.3.3 Spermicidal contraceptives
- 7.3.4 Contraceptive devices
- 7.3.5 Emergency contraception

The Fraser Guidelines<sup>1</sup> should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at [tinyurl.com/bpg16](http://tinyurl.com/bpg16)

(available at [www.fsrh.org](http://www.fsrh.org)) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

**Hormonal contraception** is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

**Intra-uterine devices** are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity but are less appropriate for those with an increased risk of pelvic inflammatory disease.

**Barrier methods** alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*<sup>®</sup>) is also available; it is pre-lubricated but does not contain a spermicide.

### 7.3.1 Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- reduced risk of symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

**Choice** The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol valerate are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be

considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*<sup>®</sup>).

The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*<sup>®</sup>).

**Risk of venous thromboembolism** There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen, see Combined Hormonal Contraception and Risk of Venous Thromboembolism table below for details.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

#### Combined Hormonal Contraception and Risk of Venous Thromboembolism

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2
Levonorgestrel <sup>1</sup>	5–7
Norgestimate <sup>1</sup>	
Norethisterone <sup>1</sup>	6–12
Etonogestrel <sup>1</sup>	
Norelgestromin <sup>1</sup>	9–12
Gestodene <sup>1</sup>	
Desogestrel <sup>1</sup>	Not known—insufficient data
Drospirenone <sup>1</sup>	
Dienogest <sup>2</sup>	Not known—insufficient data
Nomegestrol acetate <sup>2</sup>	

1. Combined with ethinylestradiol
2. Combined with estradiol

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

**Travel** Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

**Missed pill** The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late; for women taking *Qlaira*<sup>®</sup>, see below. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

A missed pill for a woman taking *Qlaira*<sup>®</sup> is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*<sup>®</sup>, refer to product literature.

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

**Delayed application or detached patch** If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

**Expulsion, delayed insertion or removal, or broken vaginal ring** If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- if ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- if ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if the removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

**Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days (9 days for *Qlaira*<sup>®</sup>) after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

**Interactions** The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives (section 7.3.2.1), contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. **carbamazepine**, **nevirapine**, **oxcarbazepine**, **phenytoin**, **phenobarbital**, **primidone**, **ritonavir**, **St John's Wort**, **topiramate**, and, above all, **rifabutin** and **rifampicin**). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with anti-retroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives (p. 409), intra-uterine devices) for

the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a *short course (2 months or less) of an enzyme-inducing drug*, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a 'tricycling' regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin—see below) is to follow the advice for long-term courses, below.

For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

- For a *long-term course (over 2 months) of an enzyme-inducing drug* (except rifampicin or rifabutin—see below), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a 'tricycling' regimen (as above); continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a *long-term course (over 2 months) of rifampicin or rifabutin*, an alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

For information on interactions of oral progestogen-only contraceptives, see also p. 408; for information on interactions of parenteral progestogen-only contraceptives, see also p. 409; for information on interactions of the intra-uterine progestogen-only device, see also p. 410; for information on interactions of hormonal emergency contraception, see also p. 414

### **Antibacterials that do not induce liver enzymes**

Latest recommendations are that no additional contraceptive precautions are required when *combined* oral contraceptives are used with antibacterials that do not induce liver enzymes (e.g. ampicillin, doxycycline), unless diarrhoea or vomiting occur (see above). These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel; however, there is a lack of evidence to support this interaction.

**Surgery** Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation, as above. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

**Reason to stop immediately** Combined hormonal contraceptives should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- very high blood pressure;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below).

## **COMBINED HORMONAL CONTRACEPTIVES**

**Cautions** see notes above; also risk factors for venous thromboembolism (see below and also notes above), arterial disease and migraine, see below; personal or family history of hypertriglyceridaemia (increased risk of pancreatitis); hyperprolactinaemia (seek specialist advice); history of severe depression especially if induced by hormonal contraceptive; undiagnosed breast mass; gene mutations associated with breast cancer (e.g. BRCA 1); sickle-cell disease; inflamm-

atory bowel disease including Crohn's disease; reduced efficacy of contraceptive patch in women with body-weight  $\geq 90$  kg; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) —seek specialist advice; **interactions:** see above and Appendix 1 (oestrogens, progestogens)

**Risk factors for venous thromboembolism** See also notes above. Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- *obesity*—caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative;
- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *smoking*.

**Risk factors for arterial disease** Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension* (avoid if blood pressure very high);
- *smoking* (avoid if smoking 40 or more cigarettes daily);
- *obesity*—caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative;
- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

**Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason to stop immediately in notes above)

**Contra-indications** see notes above; also personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus; acute porphyria (section 9.8.2); gallstones; history of haemolytic uraemic syndrome or history during pregnancy of pruritus, cholestatic jaundice, chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

**Hepatic impairment** avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

**Pregnancy** not known to be harmful

**Breast-feeding** avoid until weaning or for 6 months after birth (adverse effects on lactation)

**Side-effects** see notes above; also nausea, vomiting, abdominal cramps, liver impairment, hepatic tumours; fluid retention, thrombosis (more common

when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, 'spotting' in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion; contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years

**Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches and vaginal rings is not yet known

**Note** The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

**Licensed use** consult product literature for the licensing status of individual preparations

#### Indications and dose

**Contraception, menstrual symptoms** (section 6.4.1.2)

##### • By mouth

Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost (see Missed Pill, above)

*21-day combined (monophasic) preparations*, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

*Every day (ED) combined (monophasic) preparations*, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days (see also Combined Oral Contraceptives table, below); subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

*Phasic preparations*, see Combined Oral Contraceptives table, below

**Changing to combined preparation containing different progestogen** If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately

*Changing to Qlaira®*: start the first active Qlaira® tablet on the day after taking the last active tablet of the previous brand  
*Changing from Qlaira®*: start the new brand after taking the last active Qlaira® tablet; if the inactive tablets are taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days of taking the new brand

**Changing from progestogen-only tablet** If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days

**Changing to Qlaira®:** start any day, additional precautions (barrier methods) necessary for first 9 days

**Secondary amenorrhoea (exclude pregnancy)** Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira®)

**After childbirth (not breast-feeding)** Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®)

**After abortion or miscarriage** Start same day

#### • By transdermal application

Apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle

**Note** If first patch applied later than day 1, additional precautions (barrier methods) should be used for the next 7 days

**Changing from combined oral contraception** Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

**Changing from progestogen-only method** From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be applied on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

**After childbirth (not breast-feeding)** Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

**After abortion or miscarriage** Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch

#### • By vagina

Insert ring into vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

**Note** If first ring inserted later than day 1, additional precautions (barrier methods) should be used for the next 7 days

**Changing from combined hormonal contraception** Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle

**Changing from progestogen-only method** From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when injection next due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

**After first trimester abortion** Start immediately

**After childbirth (not breast-feeding) or second trimester abortion** Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion additional precautions (barrier methods) should be used for first 7 days

## Oral (low and standard strength)

For information on these preparations, see Combined Oral Contraceptives table, p. 406

## Transdermal (standard strength)

### ■ Ethinylestradiol with Norelgestromin

See Risk of Venous Thromboembolism (in notes above) before prescribing

**Evra®** (Janssen) (PoM)

**Patches**, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9-patch pack = £19.51. Counselling, administration  
**Dose**

1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Note** Adhesives or bandages should not be used to hold patch in place. If patch no longer sticks do not reapply but use a new patch.

The *Scottish Medicines Consortium* has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives

## Vaginal (low strength)

### ■ Ethinylestradiol with Etonogestrel

See Risk of Venous Thromboembolism (in notes above) before prescribing

**NuvaRing®** (MSD) (PoM)

**Vaginal ring**, releasing ethinylestradiol approx. 15 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration  
**Dose**

1 ring to be inserted into the vagina for 3 weeks, removed on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Counselling** The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 402

## 7.3.2 Progestogen-only contraceptives

**7.3.2.1 Oral progestogen-only contraceptives**

**7.3.2.2 Parenteral progestogen-only contraceptives**

**7.3.2.3 Intra-uterine progestogen-only device**

### 7.3.2.1 Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only

## Combined Oral Contraceptives

See Risk of Venous Thromboembolism (in notes above) before prescribing

Type of preparation	Oestrogen content	Progestogen content	Tablets per cycle	Brand	Price, 3-cycle pack (unless stated)	Manufacturer

- <sup>1</sup> Dose 1 tablet daily for 21 days starting on day 1–5 of cycle (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting and changing routines see under Indications and Dose above
- <sup>2</sup> Dose 1 tablet daily for 28 days starting on day 1–5 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken) (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated without interval; for starting and changing routines see under Indications and Dose above
- <sup>3</sup> Dose 1 tablet daily for 28 days starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting and changing routines see under Indications and Dose above

contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contraindicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura). Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

**Interactions** Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 402 and Appendix 1 (progestogens). For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

**Surgery** All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine** One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for desogestrel) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

**Changing from a combined oral contraceptive** Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

**After childbirth** Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

**Missed pill** The following advice is recommended:

'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for desogestrel) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 413) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for desogestrel) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

**Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3

hours (12 hours for desogestrel) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

## ORAL PROGESTOGEN-ONLY CONTRACEPTIVES

(Progestogen-only pill, 'POP')

**Cautions** arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies; functional ovarian cysts; history of jaundice in pregnancy; **interactions:** see notes above and Appendix 1 (progestogens)

**Other conditions** The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

**Contra-indications** undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Hepatic impairment** caution in active liver disease; and recurrent cholestatic jaundice, avoid in liver tumour

**Pregnancy** not known to be harmful

**Breast-feeding** progestogen-only contraceptives do not affect lactation; see also After Childbirth above

**Side-effects** menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, changes in libido

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits

**Licensed use** consult product literature for the licensing status of individual preparations

### Indications and dose

#### Contraception

##### • By mouth

1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for desogestrel) or more it should be regarded as a 'missed pill', see notes above

**Desogestrel** (Non-proprietary) (PoM)

Tablets, desogestrel 75 micrograms, net price 3 × 28-tab pack = £3.51

**Brands include** Aizea<sup>®</sup>, Cerelle<sup>®</sup>, Nacrez<sup>®</sup>

**Cerazette<sup>®</sup>** (MSD) (PoM)

Tablets, f/c, desogestrel 75 micrograms, net price 3 × 28-tab pack = £8.68

The Scottish Medicines Consortium (p. 3) has advised (September 2003) that Cerazette<sup>®</sup> should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated

**Micronor**<sup>®</sup> (Janssen) (PoM)

Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £1.80

**Norgeston**<sup>®</sup> (Bayer) (PoM)

Tablets, s/c, levonorgestrel 30 micrograms, net price 35-tab pack = 92p

**Noriday**<sup>®</sup> (Pharmacia) (PoM)

Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £2.10

### 7.3.2.2 Parenteral progestogen-only contraceptives

**Medroxyprogesterone acetate** (*Depo-Provera*<sup>®</sup>, *SAYANA PRESS*<sup>®</sup>) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after the birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased). The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after the birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The reduction in bone mineral density occurs in the first 2–3 years of use and then stabilises. See also below.

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*<sup>®</sup>, *SAYANA PRESS*<sup>®</sup>) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

**Norethisterone enantate** (*Noristerat*<sup>®</sup>) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*<sup>®</sup>) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third

year; they advise that earlier replacement may be considered in such patients, however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant. *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

*Implanon*<sup>®</sup>, also an etonogestrel-releasing implant, has been discontinued (October 2010), but some women may have the implant in place until 2013.

#### Cautions, contra-indications, and side-effects

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

**Interactions** Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection and medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

### PARENTERAL PROGESTOGEN-ONLY CONTRACEPTIVES

**Cautions** see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of pruritus or of deterioration of otosclerosis, disturbances of lipid metabolism; **interactions:** see notes above and Appendix 1 (progestogens)

**Counselling** Full counselling backed by *patient information leaflet* required before administration

**Contra-indications** see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Hepatic impairment** see Oral Progestogen-only Contraceptives, section 7.3.2.1

**Pregnancy** not known to be harmful; for *Implanon*<sup>®</sup> or *Nexplanon*<sup>®</sup> if pregnancy occurs remove implant

**Breast-feeding** progestogen-only contraceptives do not affect lactation; see also notes above

**Side-effects** see notes above; injection-site reactions; with *medroxyprogesterone acetate injection*, weight gain also reported

**Cervical cancer** Use of injectable progestogen-only contraceptives is associated with a small increased risk of cervical cancer; this increased risk may be similar to that seen with combined oral contraceptives, see p. 403. The risk

of cervical cancer with other progestogen-only contraceptives is not yet known.

**Licensed use** consult product literature for the licensing status of individual preparations

#### Indications and dose

**Contraception** see also notes above and under preparations (roles vary according to preparation)

For dose see under preparations

#### Injectable preparations

##### Depo-Provera® (Pfizer) (PoM)

**Injection** (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

#### Dose

##### ● By deep intramuscular injection

150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks and 5 days, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

##### Noristerat® (Bayer) (PoM)

**Injection** (oily), norethisterone enantate 200 mg/mL, net price 1-mL amp = £4.05. Counselling, see patient information leaflet

#### Dose

##### ● By deep intramuscular injection

Given very slowly into gluteal muscle, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks), may be repeated once after 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

##### SAYANA PRESS® (Pfizer) (PoM)

**Injection** (suspension), medroxyprogesterone acetate 104 mg/0.65 mL, net price 0.65-mL prefilled injector device = £6.90. Counselling, see patient information leaflet

#### Dose

##### ● By subcutaneous injection into anterior thigh or abdomen

No hormonal contraceptive use in previous month, 104 mg within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding); for long-term contraception, repeated every 13 weeks (if interval greater than 13 weeks and 7 days, rule out pregnancy before next injection); changing from other hormonal contraceptive, consult product literature

#### Implants

##### Nexplanon® (MSD) (PoM)

**Implant**, containing etonogestrel 68 mg in radiopaque flexible rod, net price = £79.46. Counselling, see patient information leaflet

#### Dose

##### ● By subdermal implantation

No hormonal contraceptive use in previous month, 1 implant inserted during first 5 days of cycle; postpartum, 1 implant inserted 21–28 days after delivery; in breast-feeding mothers, 1 implant inserted after 28 days postpartum; abortion or miscarriage in the second trimester, 1 implant inserted 21–28 days after abortion or miscarriage; abortion or miscarriage in first trimester, 1 implant inserted within 5 days; changing from other hormonal contraceptive, consult product literature; remove implant within 3 years of insertion

#### 7.3.2.3 Intra-uterine progestogen-only device

The progestogen-only intra-uterine system, *Mirena*®, releases **levonorgestrel** directly into the uterine cavity. It is used as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete. *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

**Cautions and contra-indications** Generally the cautions and contra-indications for the progestogen-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4). Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

**Side-effects** Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

## INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM

**Cautions** see notes above; history of depression; advanced uterine atrophy; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; **interactions:** see notes above and Appendix 1 (progestogens)

**Contra-indications** see notes above; not suitable for emergency contraception

**Hepatic impairment** see Oral Progestogen-only Contraceptives, section 7.3.2.1

**Pregnancy** avoid; if pregnancy occurs remove system

**Breast-feeding** progestogen-only contraceptives do not affect lactation

**Side-effects** see notes above; also abdominal pain, expulsion, peripheral oedema, depression (sometimes severe), nervousness, salpingitis, pelvic inflammatory disease, pelvic pain, back pain; rarely uterine perforation, hirsutism, hair loss, pruritus, migraine, rash

**Licensed use** not licensed for use in women under 18 years

### Indications and dose

See under preparation

**Mirena**<sup>®</sup> (Bayer) [PoM]

**Intra-uterine system,** T-shaped plastic frame (impregnated with barium sulfate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours, net price = £88.00. Counselling, see patient information leaflet

### Dose

#### Contraception and menorrhagia

Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain the woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

**Note** When system is removed (and not immediately replaced) and pregnancy is not desired, remove during first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal

#### Prevention of endometrial hyperplasia during oestrogen replacement therapy

Insert during last days of menstruation or withdrawal bleeding or anytime if amenorrhoeic; effective for 4 years

## 7.3.3 Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections

Products such as petroleum jelly (*Vaseline*<sup>®</sup>), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

**Gygel**<sup>®</sup> (Marlborough)

**Gel,** nonoxinol '9' 2%, net price 30 g = £4.25

**Excipients** include hydroxybenzoates (parabens), propylene glycol, sorbic acid

**Condoms** No evidence of harm to latex condoms and diaphragms

**Pregnancy** toxicity in *animal* studies

**Breast-feeding** present in milk in *animal* studies

## 7.3.4 Contraceptive devices

### Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years (see below).

The most effective intra-uterine devices have at least 380 mm<sup>2</sup> of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

A frameless, copper-bearing intra-uterine device (*Gyne-Fix*<sup>®</sup>) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling, backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women under 25 years are at a higher risk of sexually transmitted infections, and pre-insertion screening (for chlamydia, and depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

## INTRA-UTERINE CONTRACEPTIVE DEVICES

**Cautions** see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to seek medical attention promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible)

**Contra-indications** severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; *copper devices*: copper allergy, Wilson's disease, medical diathermy

**Pregnancy** remove device; if pregnancy occurs, increased likelihood that it may be ectopic

**Breast-feeding** not known to be harmful

**Side-effects** uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; *on insertion*: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

### Indications and dose

See notes above

#### Ancora<sup>®</sup> 375 Ag (RF Medical)

**Intra-uterine device**, copper wire with silver core, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £9.95

For uterine length over 6.5 cm; replacement every 5 years (see also notes above)

#### Ancora<sup>®</sup> 375 Cu (RF Medical)

**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £7.95

For uterine length over 6.5 cm; replacement every 5 years (see also notes above)

#### Copper T 380A<sup>®</sup> (RF Medical)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; with loading capsule, net price = £8.95

For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

#### Cu-Safe<sup>®</sup> T300 (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.11

For uterine length over 5 cm; replacement every 5 years (see also notes above)

#### Flexi-T 300<sup>®</sup> (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47

For uterine length over 5 cm; replacement every 5 years (see also notes above)

#### Flexi-T<sup>®</sup> + 380 (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06

For uterine length over 6 cm; replacement every 5 years (see also notes above)

#### GyneFix<sup>®</sup> (Williams)

**Intra-uterine device**, 6 copper sleeves with surface area of 330 mm<sup>2</sup> on polypropylene thread, net price = £27.11

Suitable for all uterine sizes; replacement every 5 years

#### Load<sup>®</sup> 375 (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.52

For uterine length over 7 cm; replacement every 5 years (see also notes above)

#### Mini TT 380<sup>®</sup> Slimline (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For minimum uterine length 5 cm; replacement every 5 years (see also notes above)

#### Multiload<sup>®</sup> Cu375 (MSD)

**Intra-uterine device**, as *Load<sup>®</sup> 375*, with copper surface area approx. 375 mm<sup>2</sup> and vertical stem length 3.5 cm, net price = £9.24

For uterine length 6–9 cm; replacement every 5 years (see also notes above)

#### Multi-Safe<sup>®</sup> 375 (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.96

For uterine length 6–9 cm; replacement every 5 years (see also notes above)

**MultiSafe® 375 Short Stem** (Williams) 

**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80

For uterine length 5–7 cm; replacement every 5 years (see also notes above)

**Neo-Safe® T380** (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £13.31

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

**Novaplus T 380® Ag** (RF Medical)

**Intra-uterine device**, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £12.50

'Mini' size for minimum uterine length 5 cm; 'Normal' size for uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

**Novaplus T 380® Cu** (RF Medical)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £10.95

'Mini' size for minimum uterine length 5 cm; 'Normal' size for uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

**Nova-T® 380** (Bayer)

**Intra-uterine device**, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £15.20

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

**T-Safe® 380A Quickload** (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar on the distal portion of each arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £10.29; available with a capsule loading device (*T-Safe® CU 380A* ) , net price £10.29

For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

**TT 380® Slimline** (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

**UT 380 Short®** (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22

For uterine length 5–7 cm; replacement every 5 years (see also notes above)

**UT 380 Standard®** (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

**Other contraceptive devices****▲ Silicone contraceptive caps****Silicone Contraceptive Pessary**

Silicone, sizes 22, 26, and 30 mm, net price = £15.00

**Brands include** FemCap®

**▲ Rubber contraceptive diaphragms****Type A Diaphragm with Flat Metal Spring**

Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £5.78

**Brands include** Reflexions®

**▲ Silicone contraceptive diaphragms****Type B Diaphragm with Coiled Metal Spring**

Silicone with coiled metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35

**Brands include** Millex Omniflex®

**Type C Arcing Spring diaphragm**

Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35

**Brands include** Millex Arcing Style®, Ortho All-Flex®

**7.3.5 Emergency contraception****Hormonal methods**

Hormonal emergency contraceptives include **levonorgestrel** and **ulipristal**; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel but it's efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:

- that their next period may be early or late;

- that a barrier method of contraception needs to be used until the next period;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

**Interactions** The effectiveness of levonorgestrel, and possibly ulipristal is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

## LEVONORGESTREL

**Cautions** see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; **interactions:** see notes above and Appendix 1 (progestogens)

**Contra-indications** acute porphyria (section 9.8.2)

**Pregnancy** not known to be harmful

**Breast-feeding** progestogen-only contraceptives do not affect lactation

**Side-effects** menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

**Licensed use** consult product literature

### Indications and dose

#### Emergency contraception

- By mouth

1.5 mg as a single dose as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours (but see also notes above)

<sup>1</sup>Levonelle<sup>®</sup> One Step (Bayer)

Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

Levonelle<sup>®</sup> 1500 (Bayer) (PoM)

Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20

## ULIPRISTAL ACETATE

**Cautions** see notes above; uncontrolled severe asthma; effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira*<sup>®</sup>) and 9 days for oral progestogen-only contraceptives;

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society

**interactions:** see notes above and Appendix 1 (ulipristal)

**Contra-indications** repeated use within a menstrual cycle

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** limited information available

**Breast-feeding** manufacturer advises avoid for 1 week after administration—present in milk

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, and abdominal pain); dizziness, fatigue, headache, menstrual irregularities (see notes above); back pain, muscle spasms; *less commonly* tremor, hot flushes, uterine spasm, breast tenderness, dry mouth, blurred vision, pruritus, and rash

### Indications and dose

#### Emergency contraception

- By mouth

30 mg as a single dose as soon as possible after coitus, but no later than after 120 hours

ellaOne<sup>®</sup> (HRA Pharma) (PoM)

Tablets, ulipristal acetate 30 mg, net price 1-tab pack = £16.95

## Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception, see also notes above. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g by mouth as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

## 7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

7.4.3 Drugs used in urological pain

7.4.4 Bladder instillations and urological surgery

7.4.5 Drugs for erectile dysfunction

For drugs used in the treatment of urinary-tract infections see section 5.1.13.

### 7.4.1 Drugs for urinary retention

*Acute retention* is painful and is treated by catheterisation.

*Chronic retention* is painless and often long-standing. Clean intermittent catheterisation may be considered. After the cause has been established and treated, drugs may be required to increase detrusor muscle tone.

Alpha-blockers such as doxazosin and tamsulosin can be used in some cases of dysfunctional voiding.

## Alpha-blockers

The selective alpha-blockers **doxazosin** and **tamsulosin** can be used to improve bladder emptying in children with dysfunctional voiding where the post-void residual urine volume is significant; treatment should be under specialist advice only. Alpha-blockers can reduce blood pressure rapidly after the first dose and should be introduced with caution.

### DOXAZOSIN

**Cautions** see under Doxazosin (section 2.5.4)

**Contra-indications** see under Doxazosin (section 2.5.4)

**Hepatic impairment** see under Doxazosin (section 2.5.4)

**Pregnancy** see under Doxazosin (section 2.5.4)

**Breast-feeding** see under Doxazosin (section 2.5.4)

**Side-effects** see under Doxazosin (section 2.5.4)

**Licensed use** not licensed for use in children

#### Indications and dose

**Dysfunctional voiding** (see notes above)

- By mouth

**Child 4–12 years** initially 0.5 mg daily increased at monthly intervals according to response; maximum 2 mg daily

**Child 12–18 years** initially 1 mg daily, dose may be doubled at intervals of 1 month according to response; usual maintenance 2–4 mg daily; max. 8 mg daily

**Hypertension** section 2.5.4

#### Preparations

Section 2.5.4

### TAMSULOSIN HYDROCHLORIDE

**Cautions** care with initial dose (postural hypotension); cataract surgery (risk of intra-operative floppy iris syndrome); **interactions:** Appendix 1 (alpha-blockers)

**Driving** May affect performance of skilled tasks e.g. driving

**Contra-indications** history of postural hypotension

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>

**Side-effects** dizziness, headache, asthenia; abnormal ejaculation; *less commonly* nausea, vomiting, constipation, diarrhoea, palpitation, postural hypotension, syncope, rhinitis, rash, pruritus, and urticaria; *very rarely* angioedema and priapism; also drowsiness, blurred vision, dry mouth, and oedema; *also reported* intra-operative floppy iris syndrome

**Licensed use** not licensed for use in children

#### Indications and dose

**Dysfunctional voiding** (see notes above)

- By mouth

**Child 12–18 years** 400 micrograms once daily

### Tamsulosin hydrochloride (Non-proprietary) (Pom)

**Capsules**, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £5.10. Label: 25, counselling, driving

**Brands include** *Bazetham*® MR, *Contiflo*® XL, *Diffundox*® XL, *Losinate*® MR, *Pinexel*® PR, *Prosurin*® XL, *Stronazon*® MR, *Tabphyn*® MR

### Flomaxtra® XL (Astellas) (Pom)

**Tablets**, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-tab pack = £10.47. Label: 25, counselling, driving

## 7.4.2 Drugs for urinary frequency, enuresis, and incontinence

### Urinary incontinence

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; **oxybutynin** also has a direct relaxant effect on urinary smooth muscle. Oxybutynin can be considered first for children under 12 years. Side-effects limit the use of oxybutynin, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin can be given by intravesicular instillation. **Tolterodine** is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin. Modified-release preparations of oxybutynin and tolterodine are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled (see p. 416).

**Cautions** Antimuscarinic drugs should be used with caution in autonomic neuropathy and in children susceptible to angle-closure glaucoma. Antimuscarinics can worsen hyperthyroidism, congestive heart failure, arrhythmias, and tachycardia. For **interactions**, see Appendix 1 (antimuscarinics).

**Contra-indications** Antimuscarinic drugs should be avoided in myasthenia gravis, significant bladder outflow obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

**Side-effects** Side-effects of antimuscarinic drugs include dry mouth, gastro-intestinal disturbances including constipation, blurred vision, dry eyes, drowsiness, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arrhythmias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsions may occur. Antimuscarinic drugs may reduce sweating leading to heat sensations and fainting in hot environments or in patients with fever, and *very rarely* may precipitate angle-closure glaucoma.

### OXYBUTYNYN HYDROCHLORIDE

**Cautions** see notes above; acute porphyria (section 9.8.2)

- Contra-indications** see notes above
- Hepatic impairment** manufacturer advises caution
- Renal impairment** manufacturer advises caution
- Pregnancy** manufacturer advises avoid unless essential—toxicity in *animal* studies
- Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies
- Side-effects** see notes above; also dizziness; *less commonly* anorexia, facial flushing; *rarely* night terrors
- Licensed use** not licensed for use in children under 5 years; intravesical instillation not licensed for use in children

#### Indications and dose

##### Urinary frequency, urgency and incontinence, neurogenic bladder instability

- By mouth

**Child 2–5 years** 1.25–2.5 mg 2–3 times daily;

**Child 5–12 years** 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily

**Child 12–18 years** 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily

- By intravesical instillation

**Child 2–18 years** 5 mg 2–3 times daily

##### Nocturnal enuresis associated with overactive bladder

- By mouth

**Child 5–18 years** 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

#### Oxybutynin Hydrochloride (Non-proprietary) (PoM)

**Tablets**, oxybutynin hydrochloride 2.5 mg, net price 56-tab pack = £1.81; 3 mg, 56-tab pack = £14.00; 5 mg, 56-tab pack = £2.71, 84-tab pack = £4.45. Label: 3

**Intravesical instillation**, oxybutynin (as hydrochloride) 5 mg/30 mL.

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

#### Cystrin® (Winthrop) (PoM)

**Tablets**, oxybutynin hydrochloride 5 mg (scored), net price 84-tab pack = £21.99. Label: 3

#### Ditropan® (Sanofi-Aventis) (PoM)

**Tablets**, both blue, scored, oxybutynin hydrochloride 2.5 mg, net price 84-tab pack = £1.60; 5 mg, 84-tab pack = £2.90. Label: 3

**Elixir**, oxybutynin hydrochloride 2.5 mg/5 mL, net price 150-mL pack = £6.88. Label: 3

#### Modified release

##### Lyrinel® XL (Janssen) (PoM)

**Tablets**, m/r, oxybutynin hydrochloride 5 mg (yellow), net price 30-tab pack = £13.77; 10 mg (pink), 30-tab pack = £27.54. Label: 3, 25

##### Dose

**Urinary frequency, urgency, and incontinence associated with idiopathic overactive bladder or neurogenic bladder instability; nocturnal enuresis associated with overactive bladder (see also Nocturnal Enuresis, p. 416)**

- By mouth

**Child 5–18 years** initially 5 mg once daily adjusted according to response in steps of 5 mg at weekly intervals; max. 15 mg once daily

**Note** Children taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*® XL

## TOLTERODINE TARTRATE

**Cautions** see notes above; history of QT-interval prolongation; concomitant use with other drugs known to prolong QT interval

**Contra-indications** see notes above

**Hepatic impairment** reduce dose; avoid modified-release preparations

**Renal impairment** reduce dose and avoid modified-release preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, dizziness, vertigo, weight gain; *less commonly* memory impairment; *also reported* flushing

**Licensed use** not licensed for use in children

#### Indications and dose

##### Urinary frequency, urgency, incontinence

- By mouth

**Child 2–18 years** 1 mg once daily, increased according to response; max. 2 mg twice daily

##### Nocturnal enuresis associated with overactive bladder

- By mouth

**Child 5–18 years** 1 mg once daily at bedtime, increased according to response; max. 2 mg twice daily

#### Tolterodine Tartrate (Non-proprietary) (PoM)

**Tablets**, tolterodine tartrate 1 mg, net price 56-tab pack = £2.72; 2 mg, 56-tab pack = £2.68. Label: 3

#### Detrusitol® (Pfizer) (PoM)

**Tablets**, f/c, tolterodine tartrate 1 mg, net price 56-tab pack = £29.03; 2 mg, 56-tab pack = £30.56

#### Modified release

##### Tolterodine Tartrate (Non-proprietary) (PoM)

**Capsules**, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

**Brands include** *Santizor XL*®

**Note** Children stabilised on immediate-release tolterodine tartrate 2 mg twice daily may be transferred to modified-release tolterodine tartrate 4 mg once daily

##### Detrusitol® XL (Pfizer) (PoM)

**Capsules**, blue, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 25

**Note** Children stabilised on immediate-release tolterodine tartrate 2 mg twice daily may be transferred to *Detrusitol*® XL 4 mg once daily

## Nocturnal enuresis in children

*Nocturnal enuresis* is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment

may be necessary. An **enuresis alarm** should be first-line treatment for motivated, well supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with **desmopressin** (see below), or desmopressin alone if the alarm is no longer appropriate or desirable.

**Desmopressin** (section 6.5.2), an analogue of vasopressin, is given by oral or by sublingual administration; it should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Desmopressin should be withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. Particular care is needed to avoid fluid overload by restricting fluid intake from 1 hour before taking desmopressin until 8 hours after. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with antimuscarinic drugs (see Urinary incontinence, p. 415) in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant **imipramine** (section 4.3.1) may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully reassessed; toxicity following overdosage with tricyclics is of particular concern.

### 7.4.3 Drugs used in urological pain

**Lidocaine gel** is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation (section 15.2).

### Alkalinisation of urine

*Alkalinisation* of urine can be undertaken with **potassium citrate**. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections.

## POTASSIUM CITRATE

**Cautions** cardiac disease; **interactions:** Appendix 1 (potassium salts)

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** hyperkalaemia on prolonged high dosage, mild diuresis

### Indications and dose

**Relief of discomfort in mild urinary-tract infections, alkalinisation of urine** for dose see preparations below

### Potassium Citrate Mixture BP

(Potassium Citrate Oral Solution)

**Oral solution**, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K<sup>+</sup>/10 mL. Label: 27

#### Dose

##### • By mouth

**Child 1–6 years** 5 mL 3 times daily well diluted with water

**Child 6–18 years** 10 mL 3 times daily well diluted with water

**Note** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

## 7.4.4 Bladder instillations and urological surgery

**Bladder infection** Various solutions are available as irrigations or washouts.

Aqueous **chlorhexidine** (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used, but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile **sodium chloride solution 0.9%** (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

**Dissolution of blood clots** Clot retention is usually treated by irrigation with sterile **sodium chloride solution 0.9%** but sterile **sodium citrate solution for bladder irrigation 3%** may also be helpful.

### Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

## CATHETER PATENCY SOLUTIONS

### Chlorhexidine 0.02%

**Brands include** *Uro-Tainer Chlorhexidine*®, net price 100-mL sachet = £2.70

**Sodium chloride 0.9%**

**Brands include** *OptiFlo S*<sup>®</sup>, net price 50- and 100-mL sachets = £3.30; *Urflex S*<sup>®</sup>, 100-mL sachet = £3.45; *Urflex SP*<sup>®</sup>, with integral drug additive port, 100-mL sachet = £3.45; *Uro-Tainer Sodium Chloride*<sup>®</sup>, 50- and 100-mL sachets = £3.45; *Uro-Tainer M*<sup>®</sup>, with integral drug additive port, 50- and 100-mL sachets = £2.90

**Solution G**

Citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include *OptiFlo G*<sup>®</sup>, net price 50- and 100-mL sachets = £3.50; *Urflex G*<sup>®</sup>, 100-mL sachet = £2.40; *Uro-Tainer*<sup>®</sup> *Twin Suby G*, 2 × 30-mL = £4.72

**Solution R**

Citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include *OptiFlo R*<sup>®</sup>, net price 50- and 100-mL sachets = £3.50; *Urflex R*<sup>®</sup>, 100-mL sachet = £2.40; *Uro-Tainer*<sup>®</sup> *Twin Solutio R*, 2 × 30-mL = £4.72

**Diluents for bladder instillation****SODIUM CHLORIDE****Indications and dose**

Diluent for instillation of drugs to the bladder  
consult product literature

**Sodium Chloride 0.9% Solution for Intravesical Use** (Non-proprietary)

**Intravesical instillation**, sodium chloride 0.9%, net price 50-mL bag = £9.66

**7.4.5 Drugs for erectile dysfunction**

This section is not included in *BNF for Children*. Adolescents presenting with erectile dysfunction should be referred to a specialist.

**7.4.6 Drugs for premature ejaculation**

This section is not included in *BNF for Children*.

# 8 Malignant disease and immunosuppression

<b>8.1 Cytotoxic drugs</b>	<b>419</b>
8.1.1 Alkylating drugs	424
8.1.2 Cytotoxic antibiotics	426
8.1.3 Antimetabolites	428
8.1.4 Vinca alkaloids and etoposide	430
8.1.5 Other antineoplastic drugs	432
<b>8.2 Drugs affecting the immune response</b>	<b>435</b>
8.2.1 Antiproliferative immunosuppressants	436
8.2.2 Corticosteroids and other immunosuppressants	437
8.2.3 Anti-lymphocyte monoclonal antibodies	444
8.2.4 Other immunomodulating drugs	444
<b>8.3 Sex hormones and hormone antagonists in malignant disease</b>	<b>447</b>

## 8.1 Cytotoxic drugs

8.1.1 Alkylating drugs
8.1.2 Cytotoxic antibiotics
8.1.3 Antimetabolites
8.1.4 Vinca alkaloids and etoposide
8.1.5 Other antineoplastic drugs

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

### Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics;
- Reconstitution should be carried out in designated pharmacy areas;
- Protective clothing (including gloves, gowns, and masks) should be worn;
- The eyes should be protected and means of first aid should be specified;
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
- Staff exposure to cytotoxic drugs should be monitored.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

### Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:

Department of Health  
PO Box 777  
London SE1 6XH  
Fax: 01623 724524  
[www.dh.gov.uk](http://www.dh.gov.uk)

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is co-ordinated by a multi-disciplinary team;
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan;
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration;
- Oral cytotoxic medicines should be dispensed with clear directions for use.

### Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients and their carers should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital

### Doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

### Side-effects of cytotoxic drugs and their management

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and treatment protocols should be consulted for full details of side-effects of individual drugs.

Side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that children, their carers, and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer institute.

**Extravasation of intravenous drugs** A number of cytotoxic drugs will cause severe local tissue irritation and necrosis if leakage into the extravascular compartment occurs. For information on the prevention and management of extravasation injury, see section 10.3.

**Gastro-intestinal effects** Management of gastro-intestinal effects of cytotoxic drugs includes the use of antacids, H<sub>2</sub>-receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

**Oral mucositis** Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements (section 9.5.3) can be used on the advice of the child's dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia (section 4.7.2). Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole (section 5.2), is effective.

**Nausea and vomiting** Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered, and to the individual's susceptibility to emetogenic stimuli.

*Mildly emetogenic treatment*—fluorouracil, etoposide, low doses of methotrexate, the vinca alkaloids, and abdominal radiotherapy.

*Moderately emetogenic treatment*—carboplatin, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate.

*Highly emetogenic treatment*—cisplatin, dacarbazine, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

**Prevention of acute symptoms** For patients at *low risk of emesis*, pretreatment with a 5HT<sub>3</sub>-receptor antagonist (section 4.6) may be of benefit.

For patients at *high risk of emesis* or when other treatment is inadequate, a 5HT<sub>3</sub>-receptor antagonist (section 4.6) is often highly effective. The addition of dexamethasone and other anti-emetics may also be required.

**Prevention of delayed symptoms** Dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide. Due to the risks of neurological side-effects, metoclopramide should only be used in children as a second-line option (see section 4.6). The 5HT<sub>3</sub>-receptor antagonists may have a role in preventing uncontrolled symptoms.

**Prevention of anticipatory symptoms** Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesiac, sedative, and anxiolytic effects.

**Bone-marrow suppression** All cytotoxic drugs except vincristine and bleomycin cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors (section 9.1.6); their use should be reserved for children who have previously experienced severe neutropenia.

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens (Table 1, section 5.1). Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment (section 5.2) may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella–zoster immunoglobulin (section 14.5.2) is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis (section 5.3.2.1) can be considered in addition to varicella–zoster immunoglobulin or as an alternative if varicella–zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles,

normal immunoglobulin (section 14.5.1) should be given.

For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1.

**Alopecia** Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

**Pregnancy and reproductive function** Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

**Long-term and delayed toxicity** Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin or nephrotoxicity with cisplatin and ifosfamide). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

**Thromboembolism** Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

**Tumour lysis syndrome** Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

## Drugs for cytotoxic-induced side-effects

### Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure.

**Allopurinol** is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine or azathioprine should be reduced if allopurinol is given concomitantly (see Appendix 1).

**Rasburicase** is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

## ALLOPURINOL

**Cautions** ensure adequate fluid intake; for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy; **interactions:** Appendix 1 (allopurinol)

**Hepatic impairment** reduce dose, monitor hepatic function

**Renal impairment** manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre

**Pregnancy** toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child

**Breast-feeding** present in milk—not known to be harmful

**Side-effects** rashes (**withdraw** therapy; if rash mild re-introduce cautiously but **discontinue** immediately if recurrence—hypersensitivity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Stevens-Johnson or toxic epidermal necrolysis, vasculitis, hepatitis, renal impairment, and *very rarely* seizures); gastro-intestinal disorders; *rarely* malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatotoxicity, paraesthesia and neuropathy, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

### Indications and dose

**Prophylaxis of hyperuricaemia associated with cancer chemotherapy, prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g. Lesch-Nyhan syndrome**

#### • By mouth

**Child 1 month–15 years** 10–20 mg/kg daily (max. 400 mg daily), preferably after food

**Child 15–18 years** initially 100 mg daily, increased according to response; max. 900 mg daily (doses over 300 mg daily given in divided doses); preferably after food

**Allopurinol** (Non-proprietary) (PoM)

**Tablets**, allopurinol 100 mg, net price 28-tab pack = 97p; 300 mg, 28-tab pack = £1.00. Label: 8, 21, 27  
**Brands include** Caplenal<sup>®</sup>, Cosuric<sup>®</sup>, Rimapurinol<sup>®</sup>

**Zyloric<sup>®</sup>** (Aspen) (PoM)

**Tablets**, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Label: 8, 21, 27

## RASBURICASE

**Cautions** monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature

**Contra-indications** G6PD deficiency (section 9.1.5)

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** fever; nausea, vomiting; less frequently diarrhoea, headache, hypersensitivity reactions (including rash, bronchospasm and anaphylaxis); haemolytic anaemia, methaemoglobinaemia

**Licensed use** not licensed for use in children

### Indications and dose

**Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy**

#### • By intravenous infusion

Consult local treatment protocol for details

**Fasturtec<sup>®</sup>** (Sanofi-Aventis) (PoM)

**Intravenous infusion**, powder for reconstitution, rasburicase, net price 1.5-mg vial (with solvent) = £69.46; 7.5-mg vial (with solvent) = £289.44

## Methotrexate-induced mucositis and myelosuppression

**Folinic acid** (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

The calcium salt of **levofolinic acid**, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre).

In the treatment of methotrexate overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

## FOLINIC ACID

**Cautions** avoid simultaneous administration of methotrexate; **not** indicated for pernicious anaemia or other megaloblastic anaemias due to vitamin B<sub>12</sub> deficiency; **interactions:** Appendix 1 (folates)

### Contra-indications

#### Safe Practice

Intrathecal injection **contra-indicated**

**Pregnancy** not known to be harmful; benefit outweighs risk

**Breast-feeding** presence in milk unknown but benefit outweighs risk

**Side-effects** rarely pyrexia after parenteral use; gastro-intestinal disturbances, insomnia, agitation, and depression after high doses

**Licensed use** consult product literature for licensing status of individual preparations

### Indications and dose

See under preparation

### Calcium folinate

(Calcium leucovorin)

#### Calcium Folate (Non-proprietary) <sup>(PoM)</sup>

**Tablets**, scored, folic acid (as calcium salt) 15 mg, net price 10-tab pack = £47.22, 30-tab pack = £85.74

**Brands include** *Refolinon*<sup>®</sup>

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, folic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £4.62; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £34.94, 30-mL vial = £89.95, 35-mL vial = £90.98

**Brands include** *Refolinon*<sup>®</sup>

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, powder for reconstitution, folic acid (as calcium salt), net price 15-mg vial = £4.46; 30-mg vial = £8.36

#### Dose

#### Reduction of methotrexate-induced toxicity

- By mouth, by intravenous injection or by intravenous infusion  
See notes above. Consult local treatment protocol for details

#### Methotrexate overdose

- By intravenous injection or by intravenous infusion  
See notes above. Consult local treatment protocol for details

#### Megaloblastic anaemia due to folate deficiency

- By mouth  
**Child up to 12 years** 250 microgram/kg once daily  
**Child 12–18 years** 15 mg once daily

#### Metabolic disorders leading to folate deficiency

- By mouth or by intravenous infusion  
**Child up to 18 years** 15 mg once daily; larger doses may be required in older children

#### Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

- By mouth  
**Neonate** 5 mg 3 times a week (increased up to 20 mg 3 times a week if neutropenic)  
**Child 1 month–1 year** 10 mg 3 times a week

### Disodium folinate

#### Sodiofolin<sup>®</sup> (Medac) <sup>(PoM)</sup>

**Injection**, folic acid (as disodium salt) 50 mg/mL, net price 2-mL vial = £35.09, 8-mL vial = £126.25

#### Dose

#### Antidote to methotrexate

- By intravenous injection or by intravenous infusion  
Consult local treatment protocols for details

## LEVOLFOLINIC ACID

**Note** Levofolonic acid is an isomer of folic acid

**Cautions** see Folic acid

### Contra-indications

#### Safe Practice

Intrathecal injection **contra-indicated**

**Pregnancy** see Folic acid

**Breast-feeding** see Folic acid

**Side-effects** see Folic acid

### Indications and dose

#### Reduction of methotrexate-induced toxicity

- By intramuscular injection or by intravenous injection or by intravenous infusion  
See notes above. Consult local treatment protocol for details

#### Methotrexate overdose

- By intramuscular injection or by intravenous injection or by intravenous infusion  
See notes above. Consult local treatment protocol for details

### Calcium levofolinate

(Calcium levoleucovorin)

#### Calcium Levofolinate (Non-proprietary)

**Injection**, levofolonic acid (as calcium salt) 10 mg/mL, net price 17.5-mL vial = £84.63

#### Isovorin<sup>®</sup> (Pfizer) <sup>(PoM)</sup>

**Injection**, levofolonic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

### Disodium levofolinate

#### Levofolonic Acid (Non-proprietary) <sup>(PoM)</sup>

**Injection**, levofolonic acid (as disodium salt) 50 mg/mL, net price 1-mL vial = £24.70, 4-mL vial = £84.00

## Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. **Mesna** reacts specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine. For the role of nebulised mesna as a mucolytic in cystic fibrosis, see section 3.7.

## MESNA

**Contra-indications** hypersensitivity to thiol-containing compounds

**Pregnancy** not known to be harmful

**Side-effects** nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; rarely hypersensitivity reactions (more common in patients with auto-immune disorders)

**Licensed use** not licensed for use in children

**Indications and dose****Urothelial toxicity following oxazaphosphorine therapy**

- **By intravenous injection or by continuous intravenous infusion**  
See notes above. Consult local treatment protocol for details

**Mucolytic in cystic fibrosis** section 3.7**Mesna** (Non-proprietary) (PoM)

Tablets, f/c, mesna 400 mg, net price 10-tab pack = £42.90; 600 mg, 10-tab pack = £61.10

Injection, mesna 100 mg/mL, net price 4-mL amp = £3.95; 10-mL amp = £9.77

**Note** For oral administration contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container

**8.1.1 Alkylating drugs**

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), problems associated specifically with alkylating drugs include:

- an adverse effect on gametogenesis which may be reversible, particularly in females; amenorrhoea may also occur, which also may be reversible;
- a marked increase in the incidence of secondary tumours and leukaemia, particularly when alkylating drugs are combined with extensive irradiation;
- fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids;
- urothelial toxicity with intravenous use; adequate hydration may reduce this risk; mesna (section 8.1) provides further protection against urotoxic effects of cyclophosphamide and ifosfamide.

**BUSULFAN**  
(Busulphan)

**Cautions** see section 8.1 and notes above; monitor full blood count regularly throughout treatment; monitor cardiac and liver function; ineffective once in blast crisis phase; high dose or history of seizures—anti-epileptic prophylaxis required; previous radiation therapy, three or more cycles of chemotherapy, or previous progenitor cell transplant—increased risk of hepatic veno-occlusive disease; discontinue if lung toxicity develops; risk of second malignancy; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (busulfan)

**Hepatic impairment** manufacturer advises caution and regular liver function tests—consult product literature

**Pregnancy** avoid (teratogenic in *animals*); manufacturers advise effective contraception during and for 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also hepatotoxicity (including hepatic veno-occlusive disease, hyperbilirubinaemia, jaundice, and fibrosis); cardiac tamponade in thalassaemia; pneumonia, skin hyperpigmentation; *rarely* progressive pulmonary fibrosis, seizures, aplastic anaemia, visual disturbances, hypersensitivity reactions (including urticaria, erythema); *very rarely* myasthenia gravis, gynaecomastia

**Indications and dose****Conditioning treatment before haematopoietic stem-cell transplantation**

- **By mouth or by intravenous infusion**  
Consult local treatment protocol for details

**Myleran**<sup>®</sup> (Alkopharma) (PoM)

Tablets, f/c, busulfan 2 mg, net price 25-tab pack = £65.22

**Busilvex**<sup>®</sup> (Fabre) (PoM)

Concentrate for intravenous infusion, busulfan 6 mg/mL, net price 10-mL vial = £201.25

**Busulfan**

**Capsules**, busulfan 25 mg

Available from 'special-order' manufacturers or specialist importing companies, p. 840

**CHLORAMBUCIL**

**Cautions** see section 8.1 and notes above; monitor full blood count regularly throughout treatment; increased seizure risk in children with nephrotic syndrome or history of epilepsy; avoid in acute porphyria (but see section 9.8.2)

**Hepatic impairment** manufacturer advises consider dose reduction in severe impairment—limited information available

**Pregnancy** avoid; manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also *less commonly* skin rash (possible progression to Stevens-Johnson syndrome and toxic epidermal necrolysis); *rarely* seizures, hepatotoxicity and jaundice; *very rarely* irreversible bone-marrow suppression, pulmonary fibrosis, tremor, peripheral neuropathy, sterile cystitis, sterility in prepubertal and pubertal males

**Licensed use** not licensed for use in nephrotic syndrome

**Indications and dose****Hodgkin's disease**

- **By mouth**  
Consult local treatment protocol for details

**Non-Hodgkin's lymphoma**

- **By mouth**  
Consult local treatment protocol for details

**Relapsing steroid-sensitive nephrotic syndrome; initiated in specialist centres** (see also section 6.3.2, p. 377)

- **By mouth**  
**Child 3 months–18 years** 200 micrograms/kg once daily for 8 weeks

**Leukeran®** (Alkopharma) (PoM)

Tablets, f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £40.51

**CYCLOPHOSPHAMIDE**

**Cautions** see section 8.1 and notes above; previous or concurrent mediastinal irradiation—risk of cardio-toxicity; diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (cyclophosphamide)

**Contra-indications** haemorrhagic cystitis

**Hepatic impairment** reduce dose—consult local treatment protocol for details

**Renal impairment** reduce dose—consult local treatment protocol for details

**Pregnancy** avoid; manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding during and for 36 hours after stopping treatment

**Side-effects** see section 8.1 and notes above; *also* anorexia; pancreatitis; cardiotoxicity at high doses; interstitial pulmonary fibrosis; inappropriate secretion of anti-diuretic hormone, disturbances of carbohydrate metabolism; urothelial toxicity; pigmentation of palms, nails and soles; *rarely* hepatotoxicity and renal dysfunction

**Licensed use** not licensed for use in children

**Indications and dose**

Acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis

- By mouth or by intravenous infusion  
Consult local treatment protocol for details

**Steroid-sensitive nephrotic syndrome** see also section 6.3.2, p. 377

- By mouth  
**Child 3 months–18 years** 2–3 mg/kg once daily for 8 weeks
- By intravenous infusion  
**Child 3 months–18 years** 500 mg/m<sup>2</sup> once a month for 6 months

**Administration** Consult local treatment protocol for details

**Cyclophosphamide** (Non-proprietary) (PoM)

Tablets, s/c, cyclophosphamide (anhydrous) 50 mg, net price 100 = £70.70. Label: 25, 27

Injection, powder for reconstitution, cyclophosphamide, net price 500-mg vial = £9.20; 1-g vial = £17.06

**IFOSFAMIDE**

**Cautions** see section 8.1 and notes above; ensure satisfactory electrolyte balance, and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome, or diabetes insipidus if renal toxicity not treated promptly); avoid in acute porphyria (but

see section 9.8.2); **interactions:** Appendix 1 (ifosfamide)

**Contra-indications** urinary tract obstruction; acute infection (including urinary-tract infection); urothelial damage

**Hepatic impairment** avoid

**Renal impairment** avoid

**Pregnancy** avoid (teratogenic and carcinogenic in animals); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; *also* drowsiness, confusion, disorientation, restlessness, psychosis; urothelial toxicity causing haemorrhagic cystitis and dysuria, renal toxicity (see Cautions above); *less commonly* severe encephalopathy; *rarely* diarrhoea, constipation, convulsions, anorexia; *very rarely* jaundice, thrombophlebitis, syndrome of inappropriate antidiuretic hormone secretion

**Indications and dose**

Rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, germ cell tumour, osteogenic sarcoma

- By intravenous infusion  
Consult local treatment protocol for details

**Ifosfamide** (Non-proprietary) (PoM)

Injection, powder for reconstitution, ifosfamide, net price 1-g vial = £66.08; 2-g vial = £130.04 (hosp. only)

**MELPHALAN**

**Cautions** see section 8.1 and notes above; monitor full blood count before and throughout treatment; for high-dose intravenous administration establish adequate hydration (see notes above), consider use of prophylactic anti-infective agents; haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details); avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (melphalan)

**Renal impairment** reduce dose initially—consult product literature

**Pregnancy** avoid; manufacturer advises adequate contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Licensed use** childhood neuroblastoma

**Indications and dose**

High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours

- Intravenous infusion  
Consult local treatment protocol for details

**Alkeran®** (Genopharm) (PoM)

Injection, powder for reconstitution, melphalan 50 mg (as hydrochloride). Net price 50-mg vial (with solvent-diluent) = £129.81

**THIOTEPA**

**Cautions** see section 8.1; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (thiotepa)

**Pregnancy** avoid (teratogenic and embryotoxic in animals); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1

**Indications and dose**

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

- By intravenous infusion

Consult local treatment protocol for details

**Tepadina**® (Adienne) (PoM)

**Injection**, powder for reconstitution, thiotepa, net price 15-mg vial £123.00; 100-mg vial = £736.00

**Note** The *Scottish Medicines Consortium* (p. 3) has advised (June 2012) that thiotepa (*Tepadina*®) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in children or adults with haematological disease, or solid tumours prior to haematopoietic stem cell transplantation.

**8.1.2 Cytotoxic antibiotics**

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity.

**Daunorubicin**, **doxorubicin**, and **epirubicin** are anthracycline antibiotics. **Mitoxantrone** (mitozantrone) is an anthracycline derivative.

All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible. Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards. Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction. Epirubicin and mitoxantrone are considered less toxic, and may be suitable for children who have received high cumulative doses of other anthracyclines.

**BLEOMYCIN**

**Cautions** see section 8.1; ensure monitoring of pulmonary function—investigate any shortness of breath before initiation; caution in handling—irritant to tissues

**Contra-indications** acute pulmonary infection or significantly reduced lung function

**Renal impairment** reduce dose—consult local treatment protocol for details

**Pregnancy** avoid (teratogenic and carcinogenic in animal studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1, less bone marrow suppression; anorexia; pulmonary toxicity e.g. pulmonary

fibrosis (usually dose-related and delayed); fever (directly following administration), fatigue; dermatological and mucous membrane toxicity, localised skin hyperpigmentation; rarely cardiorespiratory collapse and hyperpyrexia

**Licensed use** not licensed for use in children

**Indications and dose**

Some germ cell tumours, Hodgkin's lymphoma

- By intravenous infusion

Consult local treatment protocol for details

**Bleomycin** (Non-proprietary) (PoM)

**Injection**, powder for reconstitution, bleomycin (as sulfate), net price 15 000-unit vial = £15.56

**Note** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

**Brands include** *Bleo-Kyowa*®

**DACTINOMYCIN**

(Actinomycin D)

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Hepatic impairment** consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols

**Pregnancy** avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; less commonly cheilitis, dysphagia; fever, malaise, lethargy; anaemia, hypoglycaemia; myalgia; acne; rarely hepatotoxicity (possibly dose-related)

**Licensed use** not licensed for use in children under 12 years

**Indications and dose**

Wilms' tumour, childhood rhabdomyosarcoma and other soft tissue sarcomas, Ewing's sarcoma

- By intravenous injection

Consult local treatment protocol for details

**Dactinomycin** (Non-proprietary) (PoM)

**Injection**, powder for reconstitution, dactinomycin Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**DAUNORUBICIN**

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; cardiac monitoring essential

**Contra-indications** myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of daunorubicin or other anthracycline

**Hepatic impairment** reduce dose according to serum bilirubin concentration—consult local treatment protocol for details; avoid in severe impairment

**Renal impairment** reduce dose—consult local treatment protocol for details; avoid in severe impairment

**Pregnancy** avoid (teratogenic and carcinogenic in animal studies), see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above, leucopenia, less commonly mucositis; cardiac

toxicity (usually 1–6 months after initiation of therapy); fever; red urine discoloration

**Licensed use** *DaunoXome*® not licensed for use in children

#### Indications and dose

**Acute myelogenous leukaemia, acute lymphocytic leukaemia**

- By intravenous infusion

Consult local treatment protocol for details

**Daurorubicin** (Non-proprietary) (PoM)

**Injection**, powder for reconstitution, daurorubicin (as hydrochloride), net price 20-mg vial = £55.00

#### ▲ Lipid formulation

**DaunoXome**® (Gilead) (PoM)

**Concentrate for intravenous infusion**, daurorubicin encapsulated in liposomes. For dilution before use, net price 50-mg vial = £131.75

### DOXORUBICIN HYDROCHLORIDE

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (doxorubicin)

**Contra-indications** severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline

**Hepatic impairment** reduce dose according to bilirubin concentration—consult local treatment protocol for details; avoid in severe impairment

**Pregnancy** avoid (teratogenic and toxic in *animal* studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; red urine discoloration; thrombophlebitis over injection site; less commonly bronchospasm, fever, amenorrhoea, and skin rash

**Licensed use** not licensed for use in children

#### Indications and dose

**Paediatric malignancies including Ewing's sarcoma, osteogenic sarcoma, Wilms' tumour, neuroblastoma, retinoblastoma, some liver tumours, acute lymphoblastic leukaemia, Hodgkin's lymphoma, non-Hodgkin's lymphoma**

- By intravenous infusion

Consult local treatment protocol for details

**Doxorubicin** (Non-proprietary) (PoM)

**Injection**, powder for reconstitution, doxorubicin hydrochloride, net price 10-mg vial = £18.72; 50-mg vial = £100.12

**Injection**, doxorubicin hydrochloride 2 mg/mL, net price 5-mL vial = £18.54, 25-mL vial = £92.70, 100-mL vial = £370.80

### EPIRUBICIN HYDROCHLORIDE

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Contra-indications** severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia, unstable angina, myocardial pathology; previous treatment

with maximum cumulative doses of epirubicin or other anthracycline

**Hepatic impairment** reduce dose according to bilirubin concentration—consult local treatment protocol for details; avoid in severe impairment

**Renal impairment** dose reduction may be necessary in severe impairment

**Pregnancy** avoid (carcinogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; red urine discoloration; anaphylaxis

**Licensed use** not licensed for use in children

#### Indications and dose

**Recurrent acute lymphoblastic leukaemia, rhabdomyosarcoma, other soft tissue tumours of childhood**

- Intravenous infusion

Consult local treatment protocol for details

**Epirubicin hydrochloride** (Non-proprietary) (PoM)

**Injection**, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £17.38, 25-mL vial = £84.85, 50-mL vial = £95.54, 100-mL vial = £306.20

**Injection**, powder for reconstitution, epirubicin hydrochloride, net price 50-mg vial = £91.54

**Pharmorubicin**® **Solution for Injection**

(Pharmacia) (PoM)

**Injection**, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £21.24, 25-mL vial = £106.19, 100-mL vial = £386.16

### MITOXANTRONE

(Mitoxantrone)

**Cautions** see section 8.1 and notes above

**Hepatic impairment** use with caution—consult local treatment protocol

**Pregnancy** avoid; effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; transient blue-green discoloration of urine; less commonly gastro-intestinal bleeding, anorexia, allergic reactions, dyspnoea, fatigue, fever, amenorrhoea, and transient blue discoloration of skin and nails

**Licensed use** not licensed for use in children

#### Indications and dose

**Acute myeloid leukaemia, recurrent acute lymphoblastic leukaemia**

- By intravenous infusion

Consult local treatment protocol for details

**Mitoxantrone** (Non-proprietary) (PoM)

**Concentrate for intravenous infusion**, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £100.00

**Onkotrone**® (Baxter) (PoM)

**Concentrate for intravenous infusion**, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £121.85, 12.5-mL vial = £152.33, 15-mL vial = £203.04

### 8.1.3 Antimetabolites

Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. **Cytarabine**, **fludarabine**, **mercaptopurine**, **methotrexate**, and **tioguanine** are commonly used in paediatric chemotherapy.

**Methotrexate** inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally. Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is **contra-indicated** in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be **avoided** in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration and blood counts should be carefully monitored. Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

**Cytarabine** acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrathecally. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is available for lymphomatous meningitis.

**Fludarabine** is generally well tolerated but does cause myelosuppression, which may be cumulative.

**Fludarabine** has a potent and prolonged immunosuppressive effect. Children treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in children at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

**Clofarabine** is licensed for the treatment of acute lymphoblastic leukaemia in children who have relapsed or are refractory after receiving at least two previous regimens. It is given by intravenous infusion.

**Nelarabine** is licensed for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens. It is given by intravenous infusion. Neurotoxicity is common with nelarabine, and close monitoring for neurological events is strongly recommended—discontinue treatment if neurotoxicity occurs.

**Mercaptopurine** is used as maintenance therapy for acute lymphoblastic leukaemia and in the management of ulcerative colitis and Crohn's disease (section 1.5). Azathioprine, which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the child is receiving allopurinol since it interferes with their metabolism. For the role of thio-

purine methyltransferase (TPMT) in the metabolism of azathioprine see section 8.2.1.

**Tioguanine** (thioguanine) is given by mouth for the treatment of acute lymphoblastic leukaemia; it is given at various stages of treatment in short-term cycles. Tioguanine has a lower incidence of gastro-intestinal side-effects than mercaptopurine. Long-term therapy with tioguanine is no longer recommended because of the high risk of liver toxicity.

### CLOFARABINE

**Cautions** see section 8.1; cardiac disease

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** manufacturer advises avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also diarrhoea, abdominal pain, jaundice; tachycardia, flushing, hypotension, pericardial effusion, oedema, haematoma; dyspnoea, cough; anxiety, agitation, dizziness, drowsiness, headache, paraesthesia, peripheral neuropathy, restlessness; haematuria; arthralgia, myalgia; rash, pruritus, hand-foot (desquamative) syndrome, increased sweating; pancreatitis also reported

**Licensed use** not licensed for use in children under 1 year

#### Indications and dose

**Relapsed or refractory acute lymphoblastic leukaemia**

- By intravenous infusion

Consult local treatment protocol for details

**Evoltra**® (Sanofi-Aventis) ▼ (POM)

**Concentrate for intravenous infusion**, clofarabine

1 mg/mL, net price 20-mL vial = £1326.18

**Electrolytes** Na<sup>+</sup> 3.08 mmol/vial

### CYTARABINE

**Cautions** see section 8.1 and notes above; **interactions**: Appendix 1 (cytarabine)

**Hepatic impairment** reduce dose—consult product literature

**Renal impairment** consult local treatment protocols

**Pregnancy** avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; 'cytarabine syndrome'—6–12 hours after intravenous administration—characterised by fever and malaise, myalgia, bone pain, maculopapular rash, and occasionally chest pain; *less commonly* conjunctivitis (consider prophylactic corticosteroid eye drops), neurotoxicity, renal and hepatic dysfunction, jaundice; *rarely* severe spinal cord toxicity following intrathecal administration

**Licensed use** **Depocyte**® intrathecal injection not licensed for use in children

**Indications and dose****Acute lymphoblastic leukaemia, acute myeloid leukaemia, non-Hodgkin's lymphoma**

- By intravenous injection, by intravenous infusion, or by subcutaneous injection  
Consult local treatment protocol for details

**Meningeal leukaemia, meningeal neoplasms**

- By intrathecal injection  
Consult local treatment protocol for details

**Note**

Based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults

**Cytarabine** (Non-proprietary) (PoM)

**Injection** (for intravenous, subcutaneous or intrathecal use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90

**Injection** (for intravenous or subcutaneous use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90, 25-mL vial = £19.50

**Injection** (for intravenous or subcutaneous use), cytarabine 100 mg/mL, net price 1-mL vial = £6.00; 5-mL vial = £20.00; 10-mL vial = £39.00; 20-mL vial = £77.50

**▲ Lipid formulation for intrathecal use****DepoCyt<sup>®</sup>** (Napp) (PoM)

**Intrathecal injection**, cytarabine encapsulated in liposomes, net price 50-mg vial = £1223.75

**FLUDARABINE PHOSPHATE**

**Cautions** see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to skin cancer; **interactions:** Appendix 1 (fludarabine)

**Contra-indications** haemolytic anaemia

**Renal impairment** reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m<sup>2</sup>; avoid if creatinine clearance less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid (embryotoxic and teratogenic in animal studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also diarrhoea, anorexia, oedema, pneumonia, cough, peripheral neuropathy, chills, fever, malaise, weakness, myelodysplastic syndrome, acute myeloid leukaemia, visual disturbances, rash; *less commonly* pulmonary toxicity (including pneumonitis and fibrosis), confusion, haemorrhage, autoimmune disorder; *rarely* heart failure, arrhythmia, coma, seizures, agitation, skin cancer, optic neuropathy, blindness, Stevens-Johnson syndrome, toxic epidermal necrolysis; *also reported* haemorrhagic cystitis

**Licensed use** not licensed for use in children

**Indications and dose**

**Poor prognosis or relapsed acute myeloid leukaemia, relapsed acute lymphoblastic leukaemia, conditioning before bone marrow transplantation**

- By mouth, by intravenous injection, or by intravenous infusion  
Consult local treatment protocol for details

**Fludarabine phosphate** (Non-proprietary) (PoM)

**Injection**, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £155.00

**Concentrate for intravenous injection or infusion**, fludarabine phosphate 25 mg/mL, net price 2-mL vial = £155.00

**Note** Must be diluted before administration (consult product literature)

**Fludara<sup>®</sup>** (Sanofi-Aventis) (PoM)

**Tablets**, f/c, pink, fludarabine phosphate 10 mg, net price 15-tab pack = £302.48, 20-tab pack = £403.31

**Injection**, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £147.07

**MERCAPTOPYRINE****(6-Mercaptopurine)**

**Cautions** see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor liver function—discontinue if jaundice develops; **interactions:** Appendix 1 (mercaptopurine)

**Hepatic impairment** may need dose reduction

**Renal impairment** manufacturer advises consider reducing dose

**Pregnancy** avoid (teratogenic); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; gastrointestinal effects less common; hepatotoxicity (more frequent at higher doses); *rarely* intestinal ulceration, pancreatitis, fever, crystalluria with haematuria, rash, and hyperpigmentation; *very rarely* lymphoma

**Licensed use** not licensed for use in children for acute lymphoblastic lymphoma or T-cell non-Hodgkins lymphoma

**Indications and dose**

**Acute lymphoblastic leukaemia, lymphoblastic lymphomas**

- By mouth

Consult local treatment protocol for details

**Severe ulcerative colitis and Crohn's disease**  
section 1.5.3

**Important** *Puri-Nethol<sup>®</sup>* tablets and *Xaluprine<sup>®</sup>* oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations

**Puri-Nethol<sup>®</sup>** (Alkopharma) (PoM)

**Tablets**, yellow, scored, mercaptopurine 50 mg, net price 25-tab pack = £50.47

**Xaluprine<sup>®</sup>** (Nova) (PoM)

**Oral Suspension**, mercaptopurine, 20 mg/mL, net price 100 mL (raspberry-flavoured) = £170.00

**Excipients** include aspartame (section 9.4.1)

**Mercaptopurine**

**Capsules**, mercaptopurine 10 mg

Available from 'special-order' manufacturers or specialist importing companies, p. 840

**METHOTREXATE**

**Cautions** see section 8.1 and section 10.1.3; monitor renal and hepatic function; peptic ulceration, ulcerative colitis, diarrhoea, and ulcerative stomatitis; porphyria (section 9.8.2); **interactions:** Appendix 1 (methotrexate)

**Hepatic impairment** avoid in severe impairment—consult local treatment protocol for details

**Renal impairment** reduce dose—risk of nephrotoxicity at high doses; avoid in severe impairment

**Pregnancy** avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding—present in milk

**Side-effects** see section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration and bleeding, diarrhoea, toxic megacolon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade, thrombosis; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity, p. 513); anaphylactic reactions, urticaria; dizziness, chills, fever, drowsiness, insomnia, malaise, headache, mood changes, abnormal cranial sensations, neurotoxicity, confusion, psychosis, paraesthesia, cerebral oedema; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; haematuria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, blepharitis, visual disturbances; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, changes in nail and skin pigmentation, telangiectasia, acne, furunculosis, ecchymosis; injection-site reactions

#### Indications and dose

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma

- By mouth

Consult local treatment protocol for details

Treatment of early stage Burkitt's lymphoma, non-Hodgkin's lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia

- By intravenous injection or infusion

Consult local treatment protocol for details

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia

- By intrathecal injection

Consult local treatment protocol for details

Severe Crohn's disease section 1.5.3

Rheumatic disease section 10.1.3

Psoriasis section 13.5.3

**Methodrexate** (Non-proprietary) (PoM)

**Injection**, methotrexate (as sodium salt) 2.5 mg/mL, net price 2-mL vial = £4.80

**Injection**, methotrexate (as sodium salt) 25 mg/mL, net price 2-mL vial = £2.62, 20-mL vial = £25.07

**Injection**, methotrexate 100 mg/mL (not for intrathecal use), net price 10-mL vial = £78.00, 50-mL vial = £380.00

#### Oral preparations

Section 10.1.3

## NELARABINE

**Cautions** see section 8.1 and notes above; previous or concurrent intrathecal chemotherapy or craniospinal irradiation (increased risk of neurotoxicity)

**Skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. cycling or driving)

**Pregnancy** avoid (teratogenic in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men and women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also constipation, diarrhoea; confusion, seizures, drowsiness, peripheral neurological disorders, demyelination, hypoesthesia, paraesthesia, ataxia, tremor, headache, asthenia, fatigue; pyrexia; hypoglycaemia, electrolyte disturbances; arthralgia; benign and malignant tumours also reported

#### Indications and dose

T-cell acute lymphoblastic leukaemia, T-cell lymphoblastic lymphoma

- By intravenous infusion

Consult local treatment protocol for details

**Atriance**<sup>®</sup> (GSK) (PoM)

**Intravenous infusion**, nelarabine 5 mg/mL, net price 50-mL vial = £222.00

**Electrolytes** Na<sup>+</sup> 3.75 mmol/vial

## TIOGUANINE

(Thioguanine)

**Cautions** see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor liver function weekly—discontinue if liver toxicity develops; **interactions:** Appendix 1 (thioguanine)

**Hepatic impairment** reduce dose

**Renal impairment** reduce dose

**Pregnancy** avoid (teratogenicity reported when men receiving thioguanine have fathered children); ensure effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also stomatitis and hepatotoxicity; rarely intestinal necrosis and perforation

#### Indications and dose

Infant acute lymphoblastic leukaemia

- By mouth

Consult local treatment protocol for details

**Lanvis**<sup>®</sup> (Alkopharma) (PoM)

**Tablets**, yellow, scored, thioguanine 40 mg, net price 25-tab pack = £103.54

## 8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, **vinblastine** and **vincristine** are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a

limiting side-effect of vincristine; it occurs less often with vinblastine. Children with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced, but children generally tolerate vincristine better than adults. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is the dose-limiting side-effect of vinblastine; vincristine causes negligible myelosuppression. The vinca alkaloids may cause reversible alopecia. They cause severe local irritation and care must be taken to avoid extravasation. Constipation is common with vinblastine and vincristine; prophylactic use of laxatives may be considered.

### Safe Practice

Vinblastine and vincristine are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that teenage patients treated in an adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**Etoposide**, usually given by slow intravenous infusion, is used to treat acute leukaemias, lymphomas, and some solid tumours. Etoposide may also be given by mouth but it is unpredictably absorbed.

## ETOPOSIDE

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (etoposide)

**Hepatic impairment** avoid in severe impairment

**Renal impairment** consider dose reduction—consult local treatment protocol for details

**Pregnancy** avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1, dose limiting myelosuppression, mucositis more common if given with doxorubicin; myalgia associated with concentrated infusions; hypotension associated with rapid infusion; irritant to tissues if extravasated

**Licensed use** not licensed for use in children

### Indications and dose

**Stage 4 neuroblastoma, germ-cell tumours, intracranial germ-cell tumours, rhabdomyosarcoma, soft-tissue sarcomas, neuroectodermal tumours (including medulloblastoma), relapsed Hodgkin's disease, non-Hodgkin's lymphoma, Ewing tumour, acute lymphoblastic leukaemia, acute myeloid leukaemia**

- By mouth or by intravenous infusion

Consult local treatment protocol for details

**Etoposide** (Non-proprietary) (PoM)

**Concentrate for intravenous infusion**, etoposide 20 mg/mL, net price 5-mL vial = £12.15, 10-mL vial = £29.00, 25-mL vial = £60.75

**Brands include** Eposin®

**Etopophos®** (Bristol-Myers Squibb) (PoM)

**Injection**, powder for reconstitution, etoposide (as phosphate), net price 100-mg vial = £26.17 (hosp. only)

**Vepesid®** (Bristol-Myers Squibb) (PoM)

**Capsules**, both pink, etoposide 50 mg, net price 20 = £99.82; 100 mg, 10-cap pack = £87.23 (hosp. only). Label: 23

## VINBLASTINE SULFATE

**Cautions** see section 8.1 and notes above; caution in handling; **interactions:** Appendix 1 (vinblastine)

**Contra-indications** see notes above

### Safe Practice

Intrathecal injection **contra-indicated**

**Hepatic impairment** dose reduction may be necessary—consult local treatment protocol for details

**Pregnancy** avoid (limited experience suggests fetal harm; teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; abdominal pain, constipation, leucopenia, muscle pain; less commonly peripheral neuropathy; rarely paralytic ileus; irritant to tissues if extravasated

**Licensed use** licensed for use in children (age range not specified by manufacturer)

### Indications and dose

**Hodgkin's disease and other lymphomas**

- By intravenous injection

Consult local treatment protocol for details

**Vinblastine** (Non-proprietary) (PoM)

**Injection**, vinblastine sulfate 1 mg/mL, net price 10-mL vial = £13.09

**Velbe®** (Genus) (PoM)

**Injection**, powder for reconstitution, vinblastine sulfate, net price 10-mg amp = £14.15

## VINCRIStINE SULFATE

**Cautions** see section 8.1 and notes above; neuro-muscular disease; ileus; caution in handling; **interactions:** Appendix 1 (vincristine)

**Contra-indications** see notes above

### Safe Practice

Intrathecal injection **contra-indicated**

**Hepatic impairment** dose reduction may be necessary—consult local treatment protocol for details

**Pregnancy** avoid (teratogenicity and fetal loss in *animal* studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; constipation (see notes above), diarrhoea, intestinal necrosis, paralytic ileus may occur in young children; dose-limiting neuromuscular effects (see notes above); urinary retention, rarely convulsions followed by coma; inappropriate secretion of antidiuretic hormone; irritant to tissues if extravasated

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Acute leukaemias, lymphomas, paediatric solid tumours**

- By intravenous injection

Consult local treatment protocol for details

**Vincristine** (Non-proprietary) (PoM)

**Injection**, vincristine sulfate 1 mg/mL, net price 1-mL vial = £10.92; 2-mL vial = £21.17; 5-mL vial = £44.16

**Oncovin**<sup>®</sup> (Genus) (PoM)

**Injection**, vincristine sulfate 1 mg/mL, net price 1-mL vial = £14.18; 2-mL vial = £28.05

## 8.1.5 Other antineoplastic drugs

**Asparaginase**

**Asparaginase** is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

**Crisantaspase** is the enzyme asparaginase produced by *Erwinia chrysanthemi*. Preparations of asparaginase derived from *Escherichia coli* are also available. Children who are hypersensitive to asparaginase derived from one organism may tolerate asparaginase derived from another organism but cross-sensitivity occurs in about 20–30% of individuals.

**CRISANTASPASE**

**Cautions** see section 8.1 and notes above

**Contra-indications** history of pancreatitis related to asparaginase therapy

**Pregnancy** avoid; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also liver dysfunction, pancreatitis, diarrhoea; coagulation disorders; lethargy, drowsiness, confusion, dizziness, neurotoxicity, convulsions, headache; *less commonly* changes in blood lipids, anaphylaxis, hyperglycaemia; *rarely* CNS depression; *very rarely* myalgia; abdominal pain and hypertension also reported

**Indications and dose**

**Acute lymphoblastic leukaemia, acute myeloid leukaemia, non-Hodgkin's lymphoma**

- By intravenous, intramuscular or subcutaneous injection

Consult local treatment protocol for details

**Erwinase**<sup>®</sup> (EUSA Pharma) (PoM)

**Injection**, powder for reconstitution, crisantaspase, net price 10 000-unit vial = £613.00

**Preparations**

Preparations of asparaginase derived from *Escherichia coli* are available but they are not licensed, they include: *Medac*<sup>®</sup> asparaginase, *Elspar*<sup>®</sup> asparaginase, and *Oncaspar*<sup>®</sup> pegaspargase.

**Dacarbazine and temozolomide**

**Dacarbazine** is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*<sup>®</sup>], bleomycin, vinblastine, and dacarbazine). It is given *intravenously*.

**Temozolomide** is structurally related to dacarbazine and is used in children for second-line treatment of malignant glioma.

**DACARBAZINE**

**Cautions** see section 8.1; caution in handling

**Hepatic impairment** dose reduction may be required in combined hepatic and renal impairment; avoid in severe impairment

**Renal impairment** dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

**Pregnancy** avoid (carcinogenic and teratogenic in *animal* studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; *also* anorexia; *less commonly* facial flushing, confusion, headache, seizures, facial paraesthesia, influenza-like symptoms, blurred vision, renal impairment, rash; *rarely* diarrhoea, hepatotoxicity including liver necrosis and hepatic vein thrombosis, photosensitivity, irritant to skin and tissues, injection-site reactions

**Indications and dose**

**Hodgkin's disease, paediatric solid tumours**

- By intravenous injection or by intravenous infusion

Consult local treatment protocol for details

**Dacarbazine** (Non-proprietary) (PoM)

**Injection**, powder for reconstitution, dacarbazine (as citrate), net price 100-mg vial = £5.05; 200-mg vial = £7.50; 500-mg vial = £16.50; 600-mg vial = £22.50; 1-g vial = £31.80

**TEMOZOLOMIDE**

**Cautions** see section 8.1; *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements; monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported); monitor for myelodysplastic syndrome and secondary malignancies; **interactions:** Appendix 1 (temozolomide)

**Hepatic impairment** use with caution in severe impairment—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** avoid (teratogenic and embryotoxic in *animal* studies); manufacturer advises adequate contraception during treatment; men should avoid fathering a child during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and consult product literature

**Indications and dose****Treatment of recurrent or progressive malignant glioma**

- By mouth

Consult local treatment protocol for details

**Temozolomide** (Non-proprietary) PoM

**Capsules**, temozolomide 5 mg, net price 5-cap pack = £16.00; 20 mg, 5-cap pack = £60.30; 100 mg, 5-cap pack = £320.80; 140 mg, 5-cap pack = £451.40; 180 mg, 5-cap pack = £580.37; 250 mg, 5-cap pack = £806.08. Label: 23, 25

**Brands include** *Temomedac*®

**Temodal**® (MSD) PoM

**Capsules**, temozolomide 5 mg (green/white), net price 5-cap pack = £10.59; 20 mg (yellow/white), 5-cap pack = £42.35; 100 mg (pink/white), 5-cap pack = £211.77; 140 mg (blue/white), 5-cap pack = £296.48; 180 mg (orange/white), 5-cap pack = £381.19; 250 mg (white), 5-cap pack = £529.43. Label: 23, 25

**Mitotane**

**Mitotane** is used in children for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection. Neuropsychological impairment can occur, possibly secondary to hypothyroidism, and growth retardation has also been reported in children treated with mitotane.

**MITOTANE**

**Cautions** see notes above; risk of accumulation in overweight patients; monitor plasma-mitotane concentration—consult product literature; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (mitotane)

**Skilled tasks** Central nervous system toxicity may affect performance of skilled tasks

**Counselling** Children and their carers should be warned to contact doctor immediately if injury, infection, or illness occurs (because of the risk of acute adrenal insufficiency)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild to moderate renal impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Pregnancy** manufacturer advises avoid—women of child-bearing age should use effective contraception during and after treatment; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, epigastric discomfort), anorexia, liver disorders; hypercholesterolaemia, hypertriglyceridaemia; ataxia, confusion, asthenia, myasthenia, paraesthesia, drowsiness, neuropathy, cognitive impairment, movement disorder, dizziness, headache; gynaecomastia; prolonged bleeding time, leucopenia, thrombocytopenia, anaemia; rash; *rarely* hypersalivation, hypertension, postural hypotension, flushing, pyrexia, haematuria, proteinuria, haemorrhagic cyst-

itis, hypouricaemia, visual disturbances and ocular disorders

**Licensed use** not licensed for use in children

**Indications and dose****Symptomatic treatment of advanced or inoperable adrenocortical carcinoma**

- By mouth

Consult local treatment protocol for details

**Lysodren**® (HRA Pharma) PoM

**Tablets**, scored, mitotane 500 mg, net price 100-tab pack = £590.97. Label: 2, 10, 21, counselling, skilled tasks, adrenal suppression

**Platinum compounds**

**Carboplatin** is used in the treatment of a variety of paediatric malignancies; it is given by intravenous infusion. Carboplatin can be given in an outpatient setting and is better tolerated than cisplatin; nausea and vomiting are less severe and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem. Carboplatin is, however, more myelosuppressive than cisplatin.

**Cisplatin** is of value in children with a variety of malignancies; it is given by intravenous infusion. Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control. Cisplatin has dose-related and potentially cumulative side-effects including nephrotoxicity, neurotoxicity, and ototoxicity. Baseline testing of renal function and hearing is required; for children with pre-existing renal or hearing impairment or marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.

**CARBOPLATIN**

**Cautions** see section 8.1 and notes above; consider therapeutic drug monitoring; **interactions:** Appendix 1 (platinum compounds)

**Renal impairment** reduce dose and monitor haematological parameters and renal function; avoid if creatinine clearance less than 20 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid (teratogenic and embryotoxic in animal studies); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Licensed use** not licensed for use in children

**Indications and dose**

**Stage 4 neuroblastoma, germ cell tumours, low-grade gliomas (including astrocytomas), neuroectodermal tumours (including medulloblastoma), rhabdomyosarcoma (metastatic and non-metastatic disease), soft-tissue sarcomas, retinoblastoma, high risk Wilms' tumour, some liver tumours**

- By intravenous infusion

Consult local treatment protocol for details

**Carboplatin** (Non-proprietary) PoM

**Injection**, carboplatin 10 mg/mL, net price 5-mL vial = £20.00, 15-mL vial = £50.00, 45-mL vial = £160.00, 60-mL vial = £260.00

**CISPLATIN**

**Cautions** see section 8.1 and notes above; monitor full blood count, renal function, audiology, and plasma electrolytes; **interactions:** Appendix 1 (platinum compounds)

**Renal impairment** avoid if possible—nephrotoxic

**Pregnancy** avoid (teratogenic and toxic in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also peripheral neuropathy; hypophosphataemia, hypocalcaemia, hyperuricaemia also reported

**Licensed use** not licensed for use in children

**Indications and dose**

Osteogenic sarcoma, stage 4 neuroblastoma, some liver tumours, infant brain tumours, intracranial germ-cell tumours

- By intravenous infusion

Consult local treatment protocol for details

**Cisplatin** (Non-proprietary) (PoM)

**Injection**, cisplatin 1 mg/mL, net price 10-mL vial = £5.90, 50-mL vial = £24.50, 100-mL vial = £50.22

**Injection**, powder for reconstitution, cisplatin, net price 50-mg vial = £17.00

**Procarbazine**

Procarbazine is most often used in Hodgkin's disease. It is given *by mouth*. It is a weak monoamine-oxidase inhibitor and dietary restriction is rarely considered necessary. Alcohol ingestion may cause a disulfiram-like reaction.

**PROCARBAZINE**

**Cautions** see section 8.1 and notes above; cardiovascular or cerebrovascular disease; pheochromocytoma; epilepsy; **interactions:** Appendix 1 (procarbazine)

**Contra-indications** pre-existing severe leucopenia or thrombocytopenia

**Hepatic impairment** caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** avoid (teratogenic in *animal* studies and isolated reports in humans); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; loss of appetite; also reported jaundice, hypersensitivity rash (discontinue treatment)

**Indications and dose**

Hodgkin's lymphoma

- By mouth

Consult local treatment protocol for details

**Procarbazine** (Non-proprietary) (PoM)

**Capsules**, ivory, procarbazine (as hydrochloride) 50 mg, net price 50-cap pack = £249.50. Label: 4

**Protein kinase inhibitors**

**Everolimus**, a protein kinase inhibitor, is licensed in children from the age of 3 years for the treatment of subependymal giant cell astrocytoma associated with tuberous sclerosis complex who require therapeutic intervention but are not amenable to surgery.

**Imatinib**, a tyrosine kinase inhibitor, is licensed in children for the treatment of newly diagnosed Philadelphia-chromosome-positive chronic myeloid leukaemia when bone marrow transplantation is not considered first line treatment, and for Philadelphia-chromosome-positive chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis.

**EVEROLIMUS**

**Cautions** see section 8.1; monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter; concomitant use of drugs that increase risk of bleeding; history of bleeding disorders; monitor renal function before treatment and periodically thereafter; reduce dose or discontinue if severe side-effects occur—consult product literature; **interactions:** Appendix 1 (everolimus)

**Pneumonitis** Non-infectious pneumonitis reported.

Children and their carers should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur

**Hepatic impairment** consult product literature

**Pregnancy** manufacturer advises avoid (toxicity in *animal* studies); effective contraception must be used during and for up to 8 weeks after treatment; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** manufacturer advises avoid

**Side-effects** see section 8.1; also diarrhoea, dry mouth, abdominal pain, dysphagia, anorexia, taste disturbance, chest pain, hypertension, hyperlipidaemia, hypercholesterolaemia, peripheral oedema, pneumonitis (including interstitial lung disease), asthenia, fatigue, headache, insomnia, convulsions, irritability, increased susceptibility to infections (including pneumonia, aspergillosis, and candidiasis), hyperglycaemia, hypoglycaemia, dehydration, renal failure, electrolyte disturbance, arthralgia, eyelid oedema, epistaxis, skin and nail disorders (including hand-foot syndrome); less commonly congestive heart failure, flushing, agitation, aggression, rhabdomyolysis and impaired wound healing; hepatitis B reactivation and haemorrhage also reported

**Indications and dose**

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- By mouth

Consult product literature

**Votubia**® (Novartis) ▼ (PoM)

**Tablets**, white-yellow, everolimus, 2.5 mg, net price 30-tab pack = £1200.00; 5 mg, 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

**Note** *Votubia*® tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed

**IMATINIB**

**Cautions** see section 8.1; cardiac disease; risk factors for heart failure; history of renal failure; monitor for fluid retention; monitor liver function (see also Hepatic Impairment, below); monitor growth in children (may cause growth retardation); **interactions:** Appendix 1 (imatinib)

**Hepatic impairment** start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol

**Renal impairment** start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also abdominal pain, appetite changes, constipation, diarrhoea, flatulence, gastro-oesophageal reflux, taste disturbance, weight changes, dry mouth; oedema (including pulmonary oedema, pleural effusion, and ascites), flushing, haemorrhage; cough, dyspnoea; dizziness, headache, insomnia, hypoesthesia, paraesthesia, fatigue; influenza-like symptoms; cramps, arthralgia; visual disturbances, lacrimation, conjunctivitis, dry eyes; epistaxis; dry skin, sweating, rash, pruritus, photosensitivity; *less commonly* gastric ulceration, pancreatitis, hepatic dysfunction (rarely hepatic failure, hepatic necrosis), dysphagia, heart failure, tachycardia, palpitation, syncope, hypertension, hypotension, cold extremities, cough, acute respiratory failure, depression, drowsiness, anxiety, peripheral neuropathy, tremor, migraine, impaired memory, vertigo, gynaecomastia, menorrhagia, irregular menstruation, sexual dysfunction, electrolyte disturbances, renal failure, urinary frequency, gout, tinnitus, hearing loss; skin hyperpigmentation; *rarely* intestinal obstruction, gastro-intestinal perforation, inflammatory bowel disease, arrhythmia, atrial fibrillation, myocardial infarction, angina, pulmonary fibrosis, pulmonary hypertension, increased intracranial pressure, convulsions, confusion, haemolytic anaemia, rhabdomyolysis, myopathy, aseptic necrosis of bone, cataract, glaucoma, angioedema, exfoliative dermatitis, and Stevens-Johnson syndrome; *also reported* growth retardation in children

**Indications and dose****Chronic phase and advanced phase chronic myeloid leukaemia**

- By mouth

Consult local treatment protocol for details

**Glivec®** (Novartis) (PoM)

**Tablets**, f/c, imatinib (as mesilate) 100 mg (yellow-brown, scored), net price 60-tab pack = £862.19; 400 mg (yellow), 30-tab pack = £1724.39. Label: 21, 27

**Counselling** Tablets may be dispersed in water or apple juice

**Tretinoin**

**Tretinoin** is licensed for the induction of remission in acute promyelocytic leukaemia. It is used in previously untreated children as well as in those who have relapsed after standard chemotherapy or who are refractory to it.

**TRETINOIN**

**Note** Tretinoin is the acid form of vitamin A

**Cautions** exclude pregnancy before starting treatment, see also Pregnancy below; monitor full blood count and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment; increased risk of thrombo-embolism during first month of treatment; **interactions:** Appendix 1 (retinoids)

**Hepatic impairment** reduce dose—consult local treatment protocol for details

**Renal impairment** reduce dose—consult local treatment protocol for details

**Pregnancy** teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective); see also Pregnancy and Reproductive Function, p. 421

**Breast-feeding** discontinue breast-feeding

**Side-effects** retinoic acid syndrome (fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleukocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure) requires immediate treatment—consult product literature; gastro-intestinal disturbances, pancreatitis; arrhythmias, flushing, oedema; headache, benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache), shivering, dizziness, confusion, anxiety, depression, insomnia, paraesthesia, visual and hearing disturbances (children particularly susceptible to nervous system effects); raised liver enzymes, serum creatinine and lipids; bone and chest pain, alopecia, erythema, rash, pruritus, sweating, dry skin and mucous membranes, cheilitis; thromboembolism, hypercalcaemia, and genital ulceration reported

**Indications and dose****Acute promyelocytic leukaemia**

- By mouth

Consult treatment protocol for details

**Vesanoid®** (Intrapharm) (PoM)

**Capsules**, yellow/brown, tretinoin 10 mg, net price 100-cap pack = £160.63. Label: 21, 25

**8.2 Drugs affecting the immune response**

- 8.2.1 Antiproliferative immunosuppressants
- 8.2.2 Corticosteroids and other immunosuppressants
- 8.2.3 Anti-lymphocyte monoclonal antibodies
- 8.2.4 Other immunomodulating drugs

**Immunosuppressant therapy**

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil), calcineurin inhi-

bitors (ciclosporin or tacrolimus), corticosteroids, or sirolimus. Choice is dependent on the type of organ, time after transplant, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

**Impaired immune responsiveness** Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine (section 14.4) is also necessary during this period—**important**: for advice on measles exposure, see section 14.5.1, and chickenpox (varicella) exposure, see section 14.5.2. For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1. For general comments and warnings relating to corticosteroids and immunosuppressants, see section 6.3.2.

**Pregnancy** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies.

There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of these drugs during pregnancy needs to be supervised in specialist units.

## 8.2.1 Antiproliferative immunosuppressants

**Azathioprine** is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions (see section 10.1.3), usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced to one quarter of the original dose when allopurinol is given concurrently. Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine.

### Thiopurine methyltransferase

The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

**Mycophenolate mofetil** is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is used in combination with a

corticosteroid and either ciclosporin or tacrolimus for the prophylaxis of acute rejection in transplant recipients. Compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment.

Cases of pure red cell aplasia have been reported with azathioprine and with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

### NICE guidance (immunosuppressive therapy for renal transplantation in children and adolescents)

See p. 438

Cyclophosphamide (section 8.1.1) is less commonly prescribed as an immunosuppressant.

## AZATHIOPRINE

**Cautions** reduced thiopurine methyltransferase activity (see notes above); monitor for toxicity throughout treatment; monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months; **interactions**: Appendix 1 (azathioprine)  
**Bone marrow suppression** Children and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection

**Contra-indications** hypersensitivity to mercaptopurine

**Hepatic impairment** reduce dose; monitor liver function; see also Cautions

**Renal impairment** reduce dose; see also Cautions

**Pregnancy** see section 8.2; treatment should not normally be initiated during pregnancy

**Breast-feeding** present in milk in low concentration; no evidence of harm in small studies—use if potential benefit outweighs risk

**Side-effects** hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea; *rarely* pancreatitis, pneumonitis, hepatic veno-occlusive disease, lymphoma, red cell aplasia—see notes above

### Indications and dose

#### Suppression of transplant rejection

- By mouth, or (if oral route not possible) by intravenous infusion (see also note below)

Consult local treatment protocol for details

**Child 1 month–18 years** maintenance, 1–3 mg/kg once daily, adjusted according to response; total daily dose may alternatively be given in 2 divided doses

**Severe ulcerative colitis and Crohn's disease**  
section 1.5.3

**Systemic lupus erythematosus, vasculitis, autoimmune conditions when corticosteroid therapy alone has proved inadequate** section 10.1.3

**Administration** Consult local treatment protocol for details

For *intravenous injection*, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute

For *intravenous infusion*, reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%

**Note** Intravenous injection is alkaline and very irritant. Intravenous route should therefore be used **only** if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid

**Azathioprine** (Non-proprietary) (PoM)

**Tablets**, azathioprine 25 mg, net price 28-tab pack = £3.66; 50 mg, 56-tab pack = £3.42. Label: 21

**Brands include** *Azamune*<sup>®</sup>

**Imuran**<sup>®</sup> (Aspen) (PoM)

**Tablets**, both f/c, azathioprine 25 mg (orange), net price 100-tab pack = £10.99; 50 mg (yellow), 100-tab pack = £7.99. Label: 21

**Injection**, powder for reconstitution, azathioprine (as sodium salt), net price 50-mg vial = £15.38

## MYCOPHENOLATE MOFETIL

**Cautions** monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops); active gastro-intestinal disease (risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); possible decreased effectiveness of vaccination—avoid live vaccines; **interactions**: Appendix 1 (mycophenolate mofetil)

**Bone marrow suppression** Children and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

**Renal impairment** manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—congenital malformations reported; effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** taste disturbance, gingival hyperplasia, nausea, constipation, flatulence, anorexia, weight loss, diarrhoea, vomiting, abdominal pain, gastro-intestinal inflammation, ulceration, and bleeding, hepatitis, jaundice, pancreatitis, stomatitis, ileus, pleural effusion, oedema, tachycardia, hypertension, hypotension, vasodilatation, cough, dyspnoea, insomnia, agitation, confusion, depression, anxiety, convulsions, paraesthesia, myasthenic syndrome, tremor, dizziness, headache, influenza-like syndrome, infections, hyperglycaemia, renal impairment, malignancy (particularly of the skin), blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia, and red cell aplasia—see notes above),

disturbances of electrolytes and blood lipids, arthralgia, alopecia, acne, skin hypertrophy, and rash; *also reported* intestinal villous atrophy, progressive multifocal leucoencephalopathy, interstitial lung disease, pulmonary fibrosis

**Licensed use** not licensed for use in children under 2 years for the prophylaxis of acute rejection in renal transplantation; not licensed for use in children for the prophylaxis of acute rejection in hepatic transplantation

**Indications and dose**

**Prophylaxis of acute rejection in renal transplantation in combination with a corticosteroid and ciclosporin**

• By mouth

Consult local treatment protocol for details

**Child 1 month–18 years** 600 mg/m<sup>2</sup> twice daily (max. 2 g daily)

**Prophylaxis of acute rejection in renal transplantation in combination with a corticosteroid and tacrolimus**

• By mouth

Consult local treatment protocol for details

**Child 1 month–18 years** 300 mg/m<sup>2</sup> twice daily (max. 2 g daily)

**Prophylaxis of acute rejection in hepatic transplantation in combination with a corticosteroid and ciclosporin or tacrolimus**

• By mouth

Consult local treatment protocol for details

**Child 1 month–18 years** 10 mg/kg twice daily, increased to 20 mg/kg twice daily (max. 2 g daily)

**Note** Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m<sup>2</sup>

**Mycophenolate Mofetil** (Non-proprietary) (PoM)

**Capsules**, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

**Tablets**, mycophenolate mofetil 500 mg, net price 50-tab pack = £11.82

**Brands include** *Arzip*<sup>®</sup>

**CellCept**<sup>®</sup> (Roche) (PoM)

**Capsules**, blue/brown, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

**Tablets**, lavender, mycophenolate mofetil 500 mg, net price 50-tab pack = £82.26

**Oral suspension**, mycophenolate mofetil 1 g/5 mL when reconstituted with water, net price 175 mL = £115.16

**Excipients** include aspartame (section 9.4.1)

## 8.2.2 Corticosteroids and other immunosuppressants

The corticosteroids prednisolone and dexamethasone are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin's disease, non-Hodgkin's lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of

their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure (see p. 19), or to help control emesis when combined with an appropriate anti-emetic (see p. 18). For more information on glucocorticoid therapy, including the disadvantages of treatment, see section 6.3.2.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

**Ciclosporin** (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone (section 6.3).

**Tacrolimus** is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

**Sirolimus** is a non-calcineurin inhibiting immunosuppressant.

**Basiliximab** is a monoclonal antibody that prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

**Antithymocyte immunoglobulin** (rabbit) is used for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

#### NICE guidance

#### Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)

NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen **only if**:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

[www.nice.org.uk/TA99](http://www.nice.org.uk/TA99)

## ANTITHYMOCYTE IMMUNOGLOBULIN (RABBIT)

**Cautions** see notes above; monitor blood count

**Contra-indications** infection

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, dysphagia, diarrhoea; hypotension; infusion-related reactions (including cytokine release syndrome and anaphylaxis, see notes above), serum sickness; fever, shivering, increased susceptibility to infection; increased susceptibility to malignancy; lymphopenia, neutropenia, thrombocytopenia; myalgia; pruritus, rash

### Indications and dose

#### Heart transplantation

- By intravenous infusion over at least 6 hours

**Child 1 month–18 years** 1–2.5 mg/kg daily for 3–5 days starting the day of transplantation

**Note** To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

#### Renal transplantation

- By intravenous infusion over at least 6 hours

**Child 1–18 years** 1–1.5 mg/kg daily for 3–9 days starting the day of transplantation

**Note** To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

#### Corticosteroid-resistant renal graft rejection

- By intravenous infusion over at least 6 hours

**Child 1–18 years** 1.5 mg/kg daily for 7–14 days

**Note** To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

**Administration** For *continuous intravenous infusion* reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractonated heparin and hydrocortisone in glucose infusion—precipitation reported

**Thymoglobuline**<sup>®</sup> (Sanofi Aventis) (PoM)

**Intravenous infusion**, powder for reconstitution, rabbit anti-human thymocyte immunoglobulin, net price 25-mg vial = £158.77

## BASILIXIMAB

**Pregnancy** manufacturer advises avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** severe hypersensitivity reactions and cytokine release syndrome reported

**Indications and dose**

**Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens**

- By intravenous injection or by intravenous infusion

Consult local treatment protocol for details

**Child over 1 year, body-weight under 35 kg** 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery

**Child body-weight over 35 kg** 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery

**Note** Withhold second dose if severe hypersensitivity or graft loss occurs

**Administration** For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes

**Simulect®** (Novartis) (PoM)

**Injection**, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

## CYCLOSPORIN

(Cyclosporin)

**Cautions** monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate discontinuation (exclude rejection of kidney transplant); monitor liver function (see also Hepatic Impairment below); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives; hyperuricaemia; monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia); monitor serum magnesium; measure blood lipids before treatment and after the first month of treatment; monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details); use with tacrolimus specifically contra-indicated; for patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer); avoid excessive exposure to UV light, including sunlight; **interactions:** Appendix 1 (ciclosporin)

**Additional cautions in nephrotic syndrome** *Contra-indicated* in uncontrolled hypertension, uncontrolled infections, and malignancy; in long-term management, perform renal biopsies every 1–2 years

**Additional cautions** Atopic Dermatitis and Psoriasis, section 13.5.3; Rheumatoid Arthritis, section 10.1.3

**Hepatic impairment** dosage adjustment based on bilirubin and liver enzymes may be needed

**Renal impairment** dose as in normal renal function but see Cautions above; in *nephrotic syndrome* reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement

**Pregnancy** crosses placenta; see Immunosuppressant Therapy, p. 436

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** anorexia, nausea, vomiting, abdominal pain, diarrhoea, gingival hyperplasia, hepatic dysfunction, hypertension, tremor, headache, paraes-

thesia, fatigue, renal dysfunction (renal structural changes on long-term administration; see also under Cautions), hyperuricaemia, hyperkalaemia, hypomagnesaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; *less commonly* oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; *rarely* pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, micro-angiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances secondary to benign intracranial hypertension (discontinue); *also reported with infusion* anaphylaxis

**Licensed use** not licensed for use in children under 3 months

**Indications and dose**

**Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, prophylaxis and treatment of graft-versus-host disease**

- By mouth or by intravenous infusion

Consult local treatment protocols for details

**Nephrotic syndrome** see also section 6.3.2, p. 377

- By mouth

**Child 1 month–18 years** 3 mg/kg twice daily, increase if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

**Refractory ulcerative colitis** section 1.5.3

**Severe psoriasis, severe eczema** section 13.5.3

**Important**

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum-creatinine, blood pressure, and transplant function.

**Capimune®** (Mylan) (PoM)

**Capsules**, ciclosporin 25 mg (grey), net price 30-cap pack = £13.50; 50 mg (white), 30-cap pack = £26.80; 100 mg (grey), 30-cap pack = £51.30. Counselling, administration

**Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Contains ethanol

**Counselling** Total daily dose should be taken in 2 divided doses

**Capsorin®** (Morningside) (PoM)

**Capsules**, ciclosporin 25 mg (grey), net price 30-cap pack = £13.11; 50 mg (white), 30-cap pack = £25.65; 100 mg (grey), 30-cap pack = £48.93. Counselling, administration

**Note** Contains ethanol

**Counselling** Total daily dose should be taken in 2 divided doses

**Dexamimune®** (Dexcel) (POM)

**Capsules**, grey, ciclosporin 25 mg, net price 30-cap pack = £13.06; 50 mg 30-cap pack = £25.60; 100 mg 30-cap pack = £48.90. Counselling, administration

**Note** Contains ethyl lactate which is metabolised to ethanol  
**Counselling** Total daily dose should be taken in 2 divided doses

**Neoral®** (Novartis) (POM)

**Capsules**, ciclosporin 10 mg (yellow/white), net price 60-cap pack = £19.40; 25 mg (blue/grey), 30-cap pack = £19.52; 50 mg (yellow/white), 30-cap pack = £38.23; 100 mg (blue/grey), 30-cap pack = £72.57. Counselling, administration

**Excipients** include propylene glycol (see Excipients, p. 2)  
**Note** Contains ethanol

**Oral solution**, yellow, sugar-free, ciclosporin 100 mg/mL, net price 50 mL = £108.73. Counselling, administration

**Excipients** include propylene glycol (see Excipients, p. 2)  
**Note** Contains ethanol  
**Counselling** Total daily dose should be taken in 2 divided doses

Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Keep medicine measure away from other liquids (including water)

**Sandimmun®** (Novartis) (POM)

**Concentrate for intravenous infusion** (oily), ciclosporin 50 mg/mL. To be diluted before use, net price 1-mL amp = £1.94; 5-mL amp = £9.17

**Excipients** include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Note** Contains ethanol

**Administration** For intravenous infusion, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment; observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter

**Note** Capsules and oral solution available direct from Novartis for children who cannot be transferred to a different oral preparation

**SIROLIMUS**

**Cautions** monitor renal function when given with ciclosporin; monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses); hyperlipidaemia (monitor lipids); monitor urine proteins; increased susceptibility to infection (especially urinary-tract infection); increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light); **interactions:** Appendix 1 (sirolimus)

**Hepatic impairment** monitor blood-sirolimus trough concentration; dose reduction may be necessary, consult local treatment protocol for details

**Pregnancy** avoid unless essential—toxicity in animal studies; effective contraception must be used during treatment and for 12 weeks after stopping

**Breast-feeding** discontinue breast-feeding

**Side-effects** abdominal pain, constipation, nausea, diarrhoea, ascites, stomatitis, oedema, tachycardia, hypertension, hypercholesterolaemia, hypertriglyceridaemia, venous thromboembolism, pleural effusion, pneumonitis, headache, pyrexia, proteinuria, haemolytic uraemic syndrome, anaemia, thrombocytopenia, thrombotic thrombocytopenic purpura, leucopenia, neutropenia, hypokalaemia, hypophosphataemia,

hyperglycaemia, lymphocele, arthralgia, osteonecrosis, epistaxis, acne, rash, impaired healing; *less commonly* pancreatitis, pulmonary embolism, pulmonary haemorrhage, pericardial effusion, nephrotic syndrome, pancytopenia; *rarely* interstitial lung disease, alveolar proteinosis, hepatic necrosis, lymphoedema, hypersensitivity reactions (including anaphylactic reactions, angioedema, exfoliative dermatitis, hypersensitivity vasculitis); *also reported* focal segmental glomerulosclerosis, reversible impairment of male fertility

**Licensed use** not licensed for use in children

**Indications and dose**

See NICE guidance, p. 438

- By mouth

Consult local treatment protocols for details

**Rapamune®** (Pfizer) (POM)

**Tablets**, coated, sirolimus 0.5 mg (tan), net price 30-tab pack = £69.00; 1 mg (white), 30-tab pack = £86.49; 2 mg (yellow), 30-tab pack = £172.98. Counselling, administration

**Important** The 0.5-mg tablet is not bioequivalent to the 1-mg, 2-mg, and 5-mg tablets. Multiples of 0.5-mg tablets should not be used as a substitute for other tablet strengths

**Oral solution**, sirolimus 1 mg/mL, net price 60 mL = £162.41. Counselling, administration

**Note** Contains ethanol

**Administration** food may affect absorption (give at the same time with respect to food). Mix solution with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids

**TACROLIMUS**

**Cautions** monitor blood pressure, ECG (**important:** see cardiomyopathy below), fasting blood-glucose concentration, haematological and neurological (including visual) parameters, electrolytes, hepatic and renal function; monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details; QT-interval prolongation; neurotoxicity; increased risk of infections, malignancies, and lymphoproliferative disorders; avoid excessive exposure to UV light (including sunlight); **interactions:** Appendix 1 (tacrolimus)

**Skilled tasks** May affect performance of skilled tasks (e.g. driving)

**Contra-indications** hypersensitivity to macrolides; avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin)

**Hepatic impairment** dose reduction may be necessary in severe impairment

**Pregnancy** exclude before treatment; avoid unless potential benefit outweighs risk—risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia

**Breast-feeding** avoid—present in breast milk

**Side-effects** nausea, vomiting, diarrhoea, constipation, dyspepsia, flatulence, bloating, weight changes, anorexia, gastro-intestinal inflammation, ulceration, and perforation, hepatic dysfunction, jaundice, cholestasis, ascites, bile-duct abnormalities, oedema, tachycardia, hypertension, haemorrhage, thromboembolic and ischaemic events, dyspnoea, pleural

effusion, parenchymal lung disorders, sleep disturbances, tremor, headache, peripheral neuropathy, mood changes, depression, confusion, anxiety, psychosis, seizures, paraesthesia, dizziness, renal impairment, renal failure, renal tubular necrosis, urinary abnormalities, hyperglycaemia, electrolyte disturbances (including hyperkalaemia, hypokalaemia, and hyperuricaemia), blood disorders (including anaemia, leucopenia, pancytopenia, and thrombocytopenia), arthralgia, muscle cramp, visual disturbances, photophobia, tinnitus, impaired hearing, alopecia, sweating, acne; *less commonly* paralytic ileus, gastro-intestinal reflux disease, peritonitis, pancreatitis, heart failure, arrhythmia, cardiac arrest, cerebrovascular accident, cardiomyopathy (**important:** see Cardiomyopathy below), palpitation, respiratory failure, coma, speech disorder, amnesia, paralysis, influenza-like symptoms, encephalopathy, coagulation disorders, cataract, photosensitivity, hypoglycaemia, dysmenorrhoea, hypertension, dermatitis; *rarely* pericardial effusion, respiratory distress syndrome, posterior reversible encephalopathy syndrome, dehydration, thrombotic thrombocytopenic purpura, blindness, toxic epidermal necrolysis, hirsutism; *very rarely* myasthenia, haemorrhagic cystitis, Stevens Johnson syndrome; *also reported* pure red cell aplasia, agranulocytosis, haemolytic anaemia

**Cardiomyopathy** Cardiomyopathy has been reported in children. Children should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur

**Licensed use** *Advagraf*<sup>®</sup> not licensed for use in children

#### Indications and dose

See under preparations and consult local treatment protocols

**Atopic eczema (topical use)** section 13.5.3

#### MHRA/CHM advice

**Oral tacrolimus products: prescribe and dispense by brand name only, to minimise the risk of inadvertent switching between products, which has been associated with reports of toxicity and graft rejection (June 2012)**

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- *Adoport*<sup>®</sup>, *Prograf*<sup>®</sup>, *Capexion*<sup>®</sup>, *Tacni*<sup>®</sup>, and *Vivadex*<sup>®</sup> are immediate-release capsules taken twice daily, once in the morning and once in the evening;
- *Modigraf*<sup>®</sup> granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- *Advagraf*<sup>®</sup> is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

**Administration** For *continuous intravenous infusion* over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500 mL. Tacrolimus is incompatible with PVC

#### Adoport<sup>®</sup> (Sandoz) (PoM)

**Capsules**, tacrolimus (as monohydrate) 500 micrograms (white/ivory), net price 50-cap pack = £42.92; 1 mg (white/brown), 50-cap pack = £56.69, 100-cap pack = £111.36; 5 mg (white/orange), 50-cap pack = £205.74. Label: 23, counselling, skilled tasks

#### Dose

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

##### • By mouth

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

##### • By mouth

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Note** A lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

##### • By mouth

**Neonate** initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

##### • By mouth

**Neonate** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Allograft rejection resistant to conventional immunosuppressive therapy** Consult local treatment protocol

#### Capexion<sup>®</sup> (Generics) (PoM)

**Capsules**, tacrolimus 500 micrograms, (ivory), net price 50-cap pack = £52.50; 1 mg (white), 50-cap pack = £68.20, 100-cap pack = £136.20; 5 mg (red), 50-cap pack = £252.00. Label: 23, counselling, skilled tasks

**Child 1 month–18 years** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Allotransplantation resistant to conventional immunosuppressive therapy** Consult local treatment protocol

**Note** The *Scottish Medicines Consortium* (p. 3) has advised (November 2010) that tacrolimus granules for oral suspension (*Modigraf®*) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

**Prograf®** (Astellas) **[PoM]**

**Capsules**, tacrolimus (as monohydrate) 500 micrograms (yellow), net price 50-cap pack = £61.88; 1 mg (white), 50-cap pack = £80.28, 100-cap pack = £160.54; 5 mg (greyish-red), 50-cap pack = £296.58. Label: 23, counselling, skilled tasks

**Concentrate for intravenous infusion**, tacrolimus 5 mg/mL. To be diluted before use. Net price 1-mL amp = £58.45

**Excipients** include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Dose****Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**● **By mouth**

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

● **By continuous intravenous infusion (only if oral route inappropriate)**

**Neonate** 50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

**Child 1 month–18 years** 50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**● **By mouth**

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Note** A lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

● **By continuous intravenous infusion (only if oral route inappropriate)**

**Neonate** 75–100 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

**Child 1 month–18 years** 75–100 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- **By mouth**

**Neonate** initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

- **By continuous intravenous infusion**

**Neonate** 30–50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

**Child 1 month–18 years** 30–50 micrograms/kg over 24 hours for up to 7 days (then transfer to oral therapy), adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- **By mouth**

**Neonate** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Allograft rejection resistant to conventional immunosuppressive therapy** Consult local treatment protocol

**Tacni<sup>®</sup>** (TEVA UK) (POM)

**Capsules**, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £50.48; 1 mg (white), 50-cap pack = £65.49, 100-cap pack = £130.99; 5 mg (red), 50-cap pack = £242.01. Label: 23, counselling, skilled tasks

**Dose**

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

- **By mouth**

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

- **By mouth**

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Note** A lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- **By mouth**

**Neonate** initially 150 micrograms/kg twice daily, as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- **By mouth**

**Neonate** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Allograft rejection resistant to conventional immunosuppressive therapy** Consult local treatment protocol

**Vivadox<sup>®</sup>** (Dexcel) (POM)

**Capsules**, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £46.41; 1 mg (white), 50-cap pack = £60.21, 100-cap pack = £120.41; 5 mg (red), 50-cap pack = £222.44. Label: 23, counselling, skilled tasks

**Dose**

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

- **By mouth**

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

- **By mouth**

**Neonate** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Note** A lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- **By mouth**

**Neonate** initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 150 micrograms/kg twice daily as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion), adjusted according to whole-blood concentration

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- **By mouth**

**Neonate** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Child 1 month–18 years** initially 50–150 micrograms/kg twice daily, adjusted according to whole-blood concentration

**Allograft rejection resistant to conventional immunosuppressive therapy** Consult local treatment protocol

▲ **Modified release**

*Advagraf<sup>®</sup>* is not licensed for use in children

**Advagraf<sup>®</sup>** (Astellas) (POM)

**Capsules**, m/r, tacrolimus (as monohydrate) 500 micrograms (yellow/orange), net price 50-cap pack = £35.79; 1 mg (white/orange), 50-cap pack =

£71.59, 100-cap pack = £143.17; 3 mg (red/orange), 50-cap pack = £214.76; 5 mg (red/orange), 50-cap pack = £266.92. Label: 23, 25, counselling, skilled tasks

### 8.2.3 Anti-lymphocyte monoclonal antibodies

**Rituximab**, a monoclonal antibody which causes lysis of B lymphocytes, has been used as a component of the treatment of post-transplantation lymphoproliferative disease, non-Hodgkin's lymphoma, Hodgkin's lymphoma, and severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus. Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist.

Rituximab should be used with caution in children receiving cardiotoxic chemotherapy or with a history of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported. Transient hypotension occurs frequently during infusion and antihypertensives may need to be withheld for 12 hours before infusion. Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; children treated with rituximab should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded. Severe (including fatal) skin reactions, including toxic epidermal necrolysis and Stevens-Johnson syndrome have been reported—permanently discontinue treatment if severe skin reactions occur.

Infusion-related side-effects (including cytokine release syndrome) are reported commonly with rituximab and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Children should be given paracetamol and an antihistamine before each dose of rituximab to reduce these effects. Premedication with a corticosteroid should also be considered. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature or local treatment protocol for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred 1–2 hours after infusion of rituximab. Children with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

Hepatitis B infection and reactivation (including fatal cases) has been reported in patients taking rituximab. All children should be screened before treatment. Children with positive hepatitis B serology should be

referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in children with active hepatitis B infection. Children should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for several months following the last infusion (consult product literature).

**Alemtuzumab** is no longer licensed but is available through a patient access programme for oncological and transplant indications.

### RITUXIMAB

**Cautions** see notes above—but for full details (including monitoring) consult product literature or local treatment protocol

**Pregnancy** avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus—effective contraception (in both sexes) required during and for 12 months after treatment

**Breast-feeding** avoid breast-feeding during and for 12 months after treatment

**Side-effects** see notes above—but for full details (including monitoring and management of side-effects) consult product literature

**Licensed use** not licensed for use in children

#### Indications and dose

See notes above

- **By intravenous infusion**

Consult local treatment protocol for details

**MabThera**<sup>®</sup> (Roche) (PoM)

Concentrate for intravenous infusion, rituximab

10 mg/mL, net price 10-mL vial = £174.63, 50-mL vial = £873.15

### 8.2.4 Other immunomodulating drugs

#### Interferon alfa

**Interferon alfa** has shown some antitumour effect and may have a role in inducing early regression of life-threatening corticosteroid-resistant haemangiomas of infancy. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (section 5.3.3). Interferon alfa should always be used under the close supervision of a specialist; the decision to treat should be made only after careful assessment of the expected benefits versus the potential risks, in particular the risk of growth inhibition caused by combination therapy. Side-effects are dose-related, but commonly include anorexia, nausea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including suicidal behaviour) have also been reported—treatment should not be initiated in children with a history of severe psychiatric illness. Myelosuppression may occur, particularly affecting granulocyte counts. Cardiovascular problems (hypotension, hypertension, and arrhythmias), nephrotoxicity and hepatotoxicity have been reported and monitoring of hepatic function is recommended. Hypertriglyceridaemia, sometimes severe, has been observed; monitoring of lipid concen-

tration is recommended. Other side-effects include hypersensitivity reactions, thyroid abnormalities, hyperglycaemia, alopecia, psoriasisiform rash, confusion, coma and seizures, and reversible motor problems in young children. Rarely pulmonary infiltrates, pneumonitis, and pneumonia have occurred; respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood. The peginterferons are licensed in combination with ribavirin (see section 5.3.3) for the treatment of chronic hepatitis C in previously untreated children and adolescents without liver decompensation.

## INTERFERON ALFA

**Cautions** consult product literature and local treatment protocol for details; **interactions:** Appendix 1 (interferons)

**Contra-indications** consult product literature and local treatment protocol for details; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Hepatic impairment** close monitoring in mild to moderate impairment; avoid if severe

**Renal impairment** close monitoring required in mild to moderate impairment; avoid in severe impairment

**Pregnancy** avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

**Breast-feeding** unlikely to be harmful

**Side-effects** see notes above, consult product literature and local treatment protocols for details

**Licensed use** not licensed for use in children for chronic active hepatitis B; *Roferon-A*<sup>®</sup> not licensed for use in children

### Indications and dose

**Induction of early regression of life-threatening corticosteroid resistant haemangiomas of infancy**

- By subcutaneous injection

Consult local treatment protocol for details

**Chronic active hepatitis B infection** see under preparations below

**Chronic active hepatitis C infection** see under preparations below

### IntronA<sup>®</sup> (MSD) (PoM)

**Injection**, interferon alfa-2b (rbe) 10 million units/mL, net price 1-mL vial = £41.55, 2.5-mL vial = £103.94. For subcutaneous injection or intravenous infusion

**Injection pen**, interferon alfa-2b (rbe), net price 15 million units/mL, 1.5-mL cartridge = £74.83; 25 million units/mL, 1.5-mL cartridge = £124.72; 50 million units/mL, 1.5-mL cartridge = £249.45.

For subcutaneous injection

**Note** Each 1.5-mL multidose cartridge delivers 6 doses of 0.2 mL i.e. a total of 1.2 mL

### Dose

#### Chronic active hepatitis B

- By subcutaneous injection

**Child 2–18 years** 5–10 million units/m<sup>2</sup> 3 times weekly

#### Chronic active hepatitis C (in combination with oral ribavirin, see p. 333)

- By subcutaneous injection

**Child 3–18 years** 3 million units/m<sup>2</sup> 3 times weekly

### Roferon-A<sup>®</sup> (Roche) (PoM)

**Injection**, interferon alfa-2a (rbe). Net price 6 million units/mL, 0.5-mL (3 million-unit) prefilled syringe = £14.20; 9 million units/mL, 0.5-mL (4.5 million-unit) prefilled syringe = £21.29; 12 million units/mL, 0.5-mL (6 million-unit) prefilled syringe = £28.37; 18 million units/mL, 0.5-mL (9 million-unit) prefilled syringe = £42.57. For subcutaneous injection

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

### Dose

#### Chronic active hepatitis B

- By subcutaneous injection

**Child 2–18 years** 2.5–5 million units/m<sup>2</sup> 3 times weekly; up to 10 million units/m<sup>2</sup> has been used 3 times weekly

## PEGINTERFERON ALFA

**Cautions** consult product literature; **interactions:** Appendix 1 (interferons)

**Contra-indications** consult product literature

**Hepatic impairment** avoid in severe impairment

**Renal impairment** close monitoring required—reduce dose in moderate to severe impairment; consult product literature

**Pregnancy** manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

**Breast-feeding** manufacturers advise avoid—no information available

**Side-effects** see notes above and consult product literature

### Indications and dose

**Chronic hepatitis C infection (in combination with ribavirin) in previously untreated children without liver decompensation** see under preparations below

### Pegasy<sup>®</sup> (Roche) (PoM)

**Injection**, peginterferon alfa-2a (rbe), net price 90-microgram prefilled syringe £76.51, 135-microgram prefilled syringe = £107.76, 180-microgram prefilled syringe = £124.40; 135-microgram prefilled pen = £107.76, 180-microgram prefilled pen = £124.40.

For subcutaneous injection

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

### Dose

**Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation**

- By subcutaneous injection

**Child 5–18 years** consult product literature

**ViraferonPeg<sup>®</sup>** (MSD) (PoM)

**Injection**, pre-filled pen, powder for reconstitution, peginterferon alfa-2b (rbe), net price 50-microgram pen = £66.46, 80-microgram pen = £106.34, 100-microgram pen = £132.92, 120-microgram pen = £159.51, 150-microgram pen = £199.38 (all with needles and swabs). For subcutaneous injection

**Dose**

**Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation**

- By subcutaneous injection
- **Child 3–18 years** consult product literature

**Interferon gamma**

**Interferon gamma-1b** is used to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

**INTERFERON GAMMA-1b**  
(Immune interferon)

**Cautions** seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); **interactions:** Appendix 1 (interferons)

**Hepatic impairment** manufacturer advises caution in severe impairment—risk of accumulation

**Renal impairment** manufacturer advises caution in severe impairment—risk of accumulation

**Pregnancy** manufacturers advise avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; headache, fatigue, fever, chills, depression; myalgia, arthralgia; rash, injection-site reactions; rarely confusion and systemic lupus erythematosus; also reported, neutropenia, thrombocytopenia, proteinuria and raised liver enzymes

**Indications and dose**

See notes above and under Preparations below

**Immukin<sup>®</sup>** (Boehringer Ingelheim) (PoM)

**Injection**, recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-mL vial = £75.00

**Dose**

- By subcutaneous injection
- **Body surface area 0.5 m<sup>2</sup> or less** 1.5 micrograms/kg 3 times a week
- **Body surface area greater than 0.5 m<sup>2</sup>** 50 micrograms/m<sup>2</sup> 3 times a week
- Not recommended for infant under 6 months with chronic granulomatous disease

**Canakinumab**

**Canakinumab** is a recombinant human monoclonal antibody that selectively inhibits interleukin-1beta

receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome). These are rare inherited auto-inflammatory disorders. It is also licensed for active systemic juvenile idiopathic arthritis in children who have had an inadequate response to NSAIDs and systemic corticosteroids (section 10.1.3).

**CANAKINUMAB**

**Cautions** history of recurrent infection or predisposition to infection; monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter; children should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature and section 14.1, p. 604 for further information

**Tuberculosis** Children should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during and after treatment

**Contra-indications** active infection (see also Cautions); neutropenia; leucopenia; concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections)

**Hepatic impairment** no information available

**Renal impairment** limited information available but manufacturer advises no dose adjustment required

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment and for up to 3 months after last dose

**Breast-feeding** consider if benefit outweighs risk—*not known* if present in human milk

**Side-effects** vertigo, malaise, increased susceptibility to infection (including serious infection), injection-site reactions, neutropenia, back pain; *less commonly* gastro-oesophageal reflux; *also reported* vomiting, malignancy

**Indications and dose****Cryopyrin-associated periodic syndromes**

- By subcutaneous injection
- Consult product literature

**Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to NSAIDs and systemic corticosteroids** section 10.1.3

**Ilaris<sup>®</sup>** (Novartis) (PoM)

**Injection**, powder for reconstitution, canakinumab, net price 150-mg vial = £927.80

**Mifamurtide**

**Mifamurtide** is licensed in children and adolescents for the treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection. It is used in combination with chemotherapy.

**NICE guidance****Mifamurtide for the treatment of osteosarcoma (October 2011)**

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.

[www.nice.org.uk/TA235](http://www.nice.org.uk/TA235)

**MIFAMURTIDE**

**Cautions** asthma and chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy; history of autoimmune, inflammatory, or collagen disease; monitor renal function, hepatic function and clotting parameters; monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature **interactions:** Appendix 1 (mifamurtide)

**Hepatic impairment** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** avoid; effective contraception required

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances (including anorexia, nausea, vomiting, diarrhoea, constipation, abdominal pain, dyspepsia); tachycardia, hypertension, palpitations, hypotension, phlebitis; oedema, respiratory disorders (including dyspnoea, epistaxis, cough, tachypnoea, haemoptysis, pleural effusion); confusion, depression, insomnia, headache, dizziness, paraesthesia, hypoaesthesia, tremor, drowsiness, anxiety; hypokalaemia, anaemia, leucopenia, thrombocytopenia, granulocytopenia; haematuria, dysuria, pollakiuria; musculoskeletal pain; blurred vision; vertigo, tinnitus, hearing loss; sweating, alopecia, rash, dry skin, flushing

**Indications and dose**

- See notes above
- **By intravenous infusion (over 1 hour)**  
Consult local treatment protocols for details

**Mepact**<sup>®</sup> (Takeda) ▼ [POM]

**Intravenous infusion**, powder for reconstitution, mifamurtide, net price 4-mg vial = £2375.00

## 8.3 Sex hormones and hormone antagonists in malignant disease

Classification not used in *BNF for Children*.

## 9.1 Anaemias and some other blood disorders

<b>9.1.1 Iron-deficiency anaemias</b>
<b>9.1.2 Drugs used in megaloblastic anaemias</b>
<b>9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias</b>
<b>9.1.4 Drugs used in platelet disorders</b>
<b>9.1.5 G6PD deficiency</b>
<b>9.1.6 Drugs used in neutropenia</b>

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

### 9.1.1 Iron-deficiency anaemias

<b>9.1.1.1 Oral iron</b>
<b>9.1.1.2 Parenteral iron</b>

*Treatment* with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastro-intestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian sub-continent descent.

*Prophylaxis* with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia, pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

#### 9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

**Treatment of iron-deficiency anaemia** The oral dose of **elemental iron** to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates. (See also Prophylaxis of iron deficiency, below.)

**Prescribing** Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

#### Iron content of different iron salts

Iron salt	Amount	Content of ferrous iron
Ferrous fumarate	200 mg	65 mg
Ferrous gluconate	300 mg	35 mg
Ferrous sulfate	300 mg	60 mg
Ferrous sulfate, dried	200 mg	65 mg
Sodium feredetate	190 mg	27.5 mg

**Therapeutic response** The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

**Prophylaxis of iron deficiency** In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow's milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

**Dose** Prophylactic iron supplementation (elemental iron 5 mg daily) may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow's milk, rather than fortified formula feed, is a major part of the diet.

**Compound preparations** Some oral preparations contain **ascorbic acid** to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins**, except **folic acid** for pregnant women, see p. 452.

**Side-effects** Gastro-intestinal irritation can occur with iron salts. Nausea and epigastric pain are dose-related, but the relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear. Oral iron can exacerbate diarrhoea in patients with inflammatory bowel disease.

Iron preparations taken orally can be constipating and occasionally lead to faecal impaction.

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity. For the treatment of **iron overdose**, see Emergency Treatment of Poisoning, p. 29.

**Counselling** Although iron preparations are best absorbed on an empty stomach, they can be taken after food to reduce gastro-intestinal side-effects; they may discolour stools.

### FERROUS SULFATE

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Indications and dose**

**Iron-deficiency anaemia, prophylaxis of iron deficiency** see notes above and preparations

**Ferrous Sulfate** (Non-proprietary)

**Tablets**, coated, dried ferrous sulfate 200 mg (65 mg iron), net price 28-tab pack = 97p

**Dose**

**Child 6–18 years** prophylactic, 1 tablet daily; therapeutic, 1 tablet 2–3 times daily, see notes above

**Ironorm® Drops** (Wallace Mfg)

**Oral drops**, ferrous sulfate 125 mg (25 mg iron)/mL, net price 15 mL = £28.00

**Dose**

**Child 1 month–6 years** prophylactic 0.3 mL daily, but see notes above

**Child 6–18 years** prophylactic 0.6 mL daily

### FERROUS FUMARATE

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Indications and dose**

**Iron-deficiency anaemia, prophylaxis of iron deficiency** see notes above and preparations

**Fersaday®** (AMCo)

**Tablets**, brown, f/c, ferrous fumarate 322 mg (100 mg iron). Net price 28-tab pack = 95p

**Dose**

**Child 12–18 years** prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily

**Ferrous Fumarate** (Non-proprietary)

**Tablets**, ferrous fumarate 210 mg (68 mg iron), net price 84 = £2.30

**Dose**

**Child 12–18 years** prophylactic, 1 tablet 1–2 times daily; therapeutic, 1 tablet 2–3 times daily

Syrup, ferrous fumarate approx. 140 mg (45 mg iron)/5 mL, net price 200 mL = £3.73

**Dose**

**Preterm neonate** see notes above

**Neonate** see notes above

**Child 1 month–12 years** see notes above

**Child 12–18 years** prophylactic, 5 mL twice daily; therapeutic, 10 mL twice daily

**Galfer®** (Thornton & Ross)

Capsules, red/green, ferrous fumarate 305 mg (100 mg iron), net price 100 = £2.00

**Dose**

**Child 12–18 years** prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

Syrup, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL. Net price 300 mL = £5.33

**Dose**

**Preterm neonate and body-weight up to 3 kg** prophylactic, 0.5 mL daily, see notes above

**Neonate** prophylactic and therapeutic, 0.25 mL/kg twice daily (total daily dose may alternatively be given in 3 divided doses), see notes above

**Child 1 month–12 years** prophylactic and therapeutic, 0.25 mL/kg twice daily (total daily dose may alternatively be given in 3 divided doses); max 20 mL daily, see notes above

**Child 12–18 years** prophylactic, 10 mL once daily; therapeutic, 10 mL 1–2 times daily

**FERROUS GLUCONATE**

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Indications and dose**

**Iron-deficiency anaemia** see notes above and preparation

**Ferrous Gluconate** (Non-proprietary)

Tablets, red, coated, ferrous gluconate 300 mg (35 mg iron), net price 28 = £1.95

**Dose**

**Child 6–12 years** prophylactic and therapeutic, 1–3 tablets daily

**Child 12–18 years** prophylactic, 2 tablets daily; therapeutic, 4–6 tablets daily in divided doses

**POLYSACCHARIDE-IRON COMPLEX**

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Indications and dose**

**Iron-deficiency anaemia, prophylaxis of iron deficiency** see notes above and preparation

**Niferex®** (Tillomed)

Elixir, brown, sugar-free, polysaccharide-iron complex equivalent to 100 mg of iron/5 mL. Net price 240-mL pack = £6.06;  30-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper

**Dose**

**Neonate** (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily, see notes above

**Child 1 month–2 years** (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily, see notes above

1.  except 30-mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription 'SL5'

**Child 2–6 years** therapeutic, 2.5 mL daily

**Child 6–12 years** therapeutic, 5 mL daily

**Child 12–18 years** prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (5 mL once daily if required during second and third trimester of pregnancy)

**SODIUM FEREDETATE**

(Sodium ironedetate)

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Licensed use** not licensed for prophylaxis of iron deficiency

**Indications and dose**

**Iron-deficiency anaemia, prophylaxis of iron deficiency** see notes above and preparation

**Sytron®** (Forum)

Elixir, sugar-free, sodium feredetate 190 mg equivalent to 27.5 mg of iron/5 mL. Net price 100 mL = £1.07

**Dose**

**Neonate** prophylactic, 1 mL daily, see notes above; therapeutic, up to 2.5 mL twice daily (smaller doses should be used initially), see notes above

**Child 1 month–1 year** prophylactic, 1 mL daily, see notes above; therapeutic, up to 2.5 mL twice daily (smaller doses should be used initially), see notes above

**Child 1–5 years** therapeutic, 2.5 mL 3 times daily

**Child 5–12 years** therapeutic, 5 mL 3 times daily

**Child 12–18 years** therapeutic, 5 mL increasing gradually to 10 mL 3 times daily

**9.1.1.2 Parenteral iron**

Iron can be administered parenterally as **iron dextran**, **iron sucrose**, or **ferric carboxymaltose**. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the child cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption.

Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis (see also Erythropoietins, section 9.1.3).

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available—see MHRA/CHM advice, below. If children complain of acute symptoms particularly nausea, back pain, breath-

lessness, or develop hypotension, the infusion should be stopped.

### MHRA/CHM advice Serious hypersensitivity reactions with intravenous iron (August 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

## FERRIC CARBOXYMALTOSE

A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, above); oral iron should not be given until 5 days after last injection; allergic disorders including asthma and eczema; infection (discontinue if ongoing bacteraemia)

**Hepatic impairment** use with caution; avoid in conditions where iron overload increases risk of impairment

**Pregnancy** avoid in first trimester; crosses the placenta in animal studies; may influence skeletal development

**Side-effects** gastro-intestinal disturbances; headache, dizziness; rash; injection-site reactions; *less commonly* hypotension, hypotension, flushing, chest pain, peripheral oedema, hypersensitivity reactions (including anaphylaxis), fatigue, paraesthesia, malaise, pyrexia, rigors, myalgia, arthralgia, back pain, pruritus, and urticaria; *rarely* dyspnoea

**Licensed use** not licensed for use in children under 14 years

### Indications and dose

**Iron-deficiency anaemia** see notes above

- By slow intravenous injection or by intravenous infusion

Calculated according to body-weight and iron deficit, consult product literature

**Ferinject®** (Vifor) ▼ (PoM)

**Injection**, iron (as ferric carboxymaltose) 50 mg/mL, net price 2-mL vial = £19.10, 10-mL vial = £95.50, 20-mL vial = £181.45

**Electrolytes** Na<sup>+</sup> 0.24 mmol/mL

## IRON DEXTRAN

A complex of ferric hydroxide with sucrose containing 5% (50 mg/mL) of iron

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, above); oral iron should not be given until 5 days after last injection

**Contra-indications** history of allergic disorders including asthma and eczema; infection; active rheumatoid arthritis

**Hepatic impairment** avoid in severe impairment

**Renal impairment** avoid in acute renal failure

**Pregnancy** avoid in first trimester

**Side-effects** *less commonly* nausea, vomiting, abdominal pain, flushing, dyspnoea, hypersensitivity reactions (including anaphylaxis), numbness, cramps, blurred vision, pruritus, and rash; *rarely* diarrhoea, chest pain, hypotension, angioedema, arrhythmias, tachycardia, dizziness, restlessness, fatigue, seizures, tremor, impaired consciousness, myalgia, arthralgia, sweating, and injection-site reactions; *very rarely* hypertension, palpitation, headache, paraesthesia, haemolysis, and transient deafness

**Licensed use** not licensed for use in children under 14 years

### Indications and dose

**Iron-deficiency anaemia** see notes above

- By slow intravenous injection or by intravenous infusion

Calculated according to body-weight and iron deficit, consult product literature

**CosmoFer®** (Pharmacosmos) ▼ (PoM)

**Injection**, iron (as iron dextran) 50 mg/mL, net price 2-mL amp = £7.97; 10-mL amp = £39.85

## IRON SUCROSE

A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron

**Cautions** hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, above); oral iron should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

**Contra-indications** history of allergic disorders including asthma, eczema, and anaphylaxis

**Hepatic impairment** use with caution; avoid in conditions where iron overload increases risk of impairment

**Pregnancy** avoid in first trimester

**Side-effects** taste disturbances; *less commonly* nausea, vomiting, abdominal pain, diarrhoea, hypotension, tachycardia, flushing, palpitation, chest pain, bronchospasm, dyspnoea, headache, dizziness, fever, myalgia, pruritus, rash, and injection-site reactions; *rarely* peripheral oedema, hypertension, hypersensitivity reactions (including anaphylaxis), fatigue, asth-

enia, and paraesthesia; bradycardia, confusion, arthralgia, and increased sweating also reported

**Licensed use** not licensed for use in children

**Indications and dose**

**Iron-deficiency anaemia** see notes above

● **By slow intravenous injection or by intravenous infusion**

Calculated according to body-weight and iron deficit, consult product literature; each divided dose should not exceed 3 mg/kg/dose (or for body-weight over 67 kg, max. 200 mg/dose)

**Venofer®** (Vifor) ▼ (PoM)

**Injection**, iron (as iron sucrose) 20 mg/mL, net price 5-mL vial = £10.24

## 9.1.2 Drugs used in megaloblastic anaemias

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B<sub>12</sub> or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B<sub>12</sub> is used in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare disorders of *congenital transcobalamin II deficiency*, *methylmalonic acidemia* and *homocystinuria* (see section 9.8.1).

Vitamin B<sub>12</sub> should be given prophylactically after *total ileal resection*.

Apart from dietary deficiency, all other causes of vitamin B<sub>12</sub> deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B<sub>12</sub> orally and none for vitamin B<sub>12</sub> intrinsic factor complexes given by mouth. Vitamin B<sub>12</sub> in large oral doses [unlicensed] may be effective.

**Hydroxocobalamin** has completely replaced cyanocobalamin as the form of vitamin B<sub>12</sub> of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B<sub>12</sub> neuropathy.

**Folic acid** has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B<sub>12</sub> is administered concurrently otherwise neuropathy may be precipitated (see above).

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or treatment with antiepileptics), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid 5 mg daily is continued to term.

For prophylaxis in *chronic haemolytic states*, *malabsorption* or in *renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis (see also section 10.1.3, p. 513), severe Crohn's disease (see section 1.5.3, p. 53), and severe psoriasis (see section 13.5.3, p. 578).

For *prophylaxis in pregnancy*, see Prevention of Neural Tube Defects below.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow's milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

**Folinic acid** is also effective in the treatment of folate-deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs (see section 8.1); it is given as calcium folinate.

**Prevention of neural tube defects** Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.8.1).

Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B<sub>12</sub> or folic acid.

## HYDROXOCOBALAMIN

**Cautions** should not be given before diagnosis fully established but see also notes above; **interactions** Appendix 1 (hydroxocobalamin)

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** nausea, headache, dizziness; fever, hypersensitivity reactions (including rash and pruritus); injection-site reactions; hypokalaemia and thrombocytosis during initial treatment; chromaturia

**Licensed use** licensed for use in children (age not specified by manufacturers); not licensed for use in inborn errors of metabolism

### Indications and dose

**Macrocytic anaemia without neurological involvement**

- By intramuscular injection

**Child 1 month–18 years** initially 250 micrograms–1 mg 3 times a week for 2 weeks then 250 micrograms once weekly until blood count normal, then 1 mg every 3 months

**Macrocytic anaemia with neurological involvement**

- By intramuscular injection

**Child 1 month–18 years** initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months

**Prophylaxis of macrocytic anaemias associated with vitamin B<sub>12</sub> deficiency**

- By intramuscular injection

**Child 1 month–18 years** 1 mg every 2–3 months

**Leber's optic atrophy**

- By intramuscular injection

Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

**Congenital transcobalamin II deficiency**

- By intramuscular injection

**Neonate** 1 mg 3 times a week, reduce after 1 year to 1 mg once weekly or as appropriate

**Child 1 month–18 years** 1 mg 3 times a week, reduce after 1 year to 1 mg once weekly or as appropriate

**Methylmalonic acidemia and homocystinuria**

- By intramuscular injection

**Child 1 month–18 years** initially 1 mg daily for 5–7 days, reduce according to response to maintenance dose of up to 1 mg once or twice weekly

**Methylmalonic acidemia, maintenance once intramuscular response established**

- By mouth

**Child 1 month–18 years** 5–10 mg once or twice weekly

**Note** Some children do not respond to the oral route

**Cyanide poisoning**

See Emergency Treatment of Poisoning, p. 31

**Hydroxocobalamin** (Non-proprietary) <sup>(POM)</sup>

**Injection**, hydroxocobalamin 1 mg/mL. Net price 1-mL amp = 73p

**Brands include** Cobalin-H<sup>®</sup> <sup>(PMS)</sup>, Neo-Cytamen<sup>®</sup> <sup>(PMS)</sup>

**Injection**, hydroxocobalamin 2.5 mg/mL, 2 mL. Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Administration** For administration *by mouth*, injection solution may be given orally; it will not have prolonged effect via this route

**Note** The BP directs that when Vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

Powder available from specialist importing companies

## FOLIC ACID

**Cautions** should never be given alone for vitamin B<sub>12</sub> deficiency states (may precipitate subacute combined degeneration of the spinal cord); **interactions**: Appendix 1 (fولات)

**Side-effects** rarely gastro-intestinal disturbances

**Licensed use** unlicensed for limiting methotrexate toxicity

### Indications and dose

**Folate supplementation in neonates** (see notes above)

- By mouth

**Neonate** 50 micrograms once daily or 500 micrograms once weekly

**Megaloblastic anaemia due to folate deficiency** (see notes above)

- By mouth

**Neonate** initially 500 micrograms/kg once daily for up to 4 months

**Child 1 month–1 year** initially 500 micrograms/kg once daily (max. 5 mg) for up to 4 months; up to 10 mg daily may be required in malabsorption states

**Child 1–18 years** 5 mg daily for 4 months (until term in pregnant women); up to 15 mg daily may be required in malabsorption states

**Haemolytic anaemia; metabolic disorders**

- By mouth

**Child 1 month–12 years** 2.5–5 mg once daily

**Child 12–18 years** 5–10 mg once daily

**Prophylaxis of folate deficiency in dialysis**

- By mouth

**Child 1 month–12 years** 250 microgram/kg (max. 10 mg) once daily

**Child 12–18 years** 5–10 mg once daily

**Prevention of methotrexate side-effects in juvenile idiopathic arthritis**

- By mouth

**Child 2–18 years** 1 mg daily or 5 mg once weekly, adjusted according to local guidelines

**Prevention of methotrexate side-effects in severe Crohn's disease or severe psoriasis**

- By mouth

See section 1.5.3 and section 13.5.3

**Prevention of neural tube defects**

- By mouth

See notes above

**Folic Acid** (Non-proprietary) (PoM)

Tablets, folic acid 400 micrograms, net price 90-tab pack = £2.71; 5 mg, 28-tab pack = 91p

Syrup, folic acid 2.5 mg/5 mL, net price 150 mL = £9.16

Brands include *Lexpec*® (sugar-free)

## 9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids (see BNF, section 6.4.3), pyridoxine, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

**Antilymphocyte immunoglobulin** given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special-order' manufacturers or specialist importing companies, see p. 840) may be used in aplastic anaemia at a dose of 1–5 mg/kg daily for 3 to 6 months.

It is unlikely that dietary deficit of **pyridoxine** (section 9.6.2) produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but pyridoxine is indicated in pregnancy, haemolytic anaemias, or during isoniazid treatment.

**Corticosteroids** (section 6.3) have an important place in the management of haematological disorders including *autoimmune haemolytic anaemia*, *idiopathic thrombocytopenias* (section 9.1.4) and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

### Erythropoietins

**Epoetins** (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, see below.

**Epoetin beta** is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks. Only unpressurized formulations should be used as other preparations may contain benzyl alcohol (see Excipients, p. 2).

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy.

**Darbepoetin** is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates (see section 9.1.1.1). Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.

### Erythropoietins—haemoglobin concentration

In chronic kidney disease, the use of erythropoietins can be considered in a child with anaemia. The aim of treatment is to relieve symptoms of anaemia and to avoid the need for blood transfusion. The optimum haemoglobin concentration is dependent on the child's age and factors such as symptoms, comorbidities, and patient preferences. The haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia. In *adults*, overcorrection of haemoglobin concentration with erythropoietins in those with chronic kidney disease may increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

For MHRA/CHM advice relating to adults, see BNF section 9.1.3.

### Pure red cell aplasia

There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

### DARBEPOETIN ALFA

**Cautions** see Epoetin

**Contra-indications** see Epoetin

**Hepatic impairment** manufacturer advises caution

**Pregnancy** no evidence of harm in *animal studies*—manufacturer advises caution

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also notes above

### Indications and dose

**Symptomatic anaemia associated with chronic renal failure in children on dialysis (see also notes above)**

• **Intravenous or subcutaneous injection**

**Child 11–18 years** initially 450 nanograms/kg once weekly adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly or once every 2 weeks

1. Can be sold to the public provided daily doses do not exceed 500 micrograms

**Symptomatic anaemia associated with chronic renal failure in children not on dialysis (see also notes above)**

• **By intravenous or subcutaneous injection**

**Child 11–18 years** by subcutaneous or intravenous injection, initially 450 nanograms/kg once weekly or by subcutaneous injection, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given subcutaneously or intravenously once weekly or subcutaneously once every 2 weeks or subcutaneously once every month

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements. Adjust doses not more frequently than every 2 weeks during maintenance treatment.

**Aranesp®** (Amgen) (PoM)

**Injection**, prefilled syringe, darbepoetin alfa, 25 micrograms/mL, net price 0.4 mL (10 micrograms) = £14.68; 40 micrograms/mL, 0.375 mL (15 micrograms) = £22.02, 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.3 mL (30 micrograms) = £44.04, 0.4 mL (40 micrograms) = £58.73, 0.5 mL (50 micrograms) = £73.41; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81, 0.65 mL (130 micrograms) = £190.86; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**Injection (Aranesp® SureClick)**, prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL, net price 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, net price 0.4 mL (40 micrograms) = £58.72; 200 micrograms/mL, net price 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81; 500 micrograms/mL, net price 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**EPOETIN ALFA, BETA, and ZETA**  
(Recombinant human erythropoietins)

**Note** The prescriber must specify which epoetin is required, see also Biosimilar medicines, p. 2

**Cautions** see notes above; also inadequately treated or poorly controlled blood pressure (monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes), interrupt treatment if blood pressure uncontrolled; sudden stabbing migraine-like pain is warning of hypertensive crisis; sickle-cell disease (lower target haemoglobin concentration may be appropriate); ischaemic vascular disease; thrombocytosis (monitor platelet count for first 8 weeks); epilepsy; malignant disease; increase in unfractionated or low molecular weight heparin dose may be needed during dialysis

**Contra-indications** pure red cell aplasia following erythropoietin therapy (see also notes above);

uncontrolled hypertension; avoid injections containing benzyl alcohol in neonates (see under preparations, below)

**Hepatic impairment** manufacturers advise caution in chronic hepatic failure

**Pregnancy** no evidence of harm; benefits probably outweigh risks of anaemia and blood transfusion

**Breast-feeding** unlikely to be present in milk; effect on infant minimal

**Side-effects** diarrhoea, nausea, vomiting; dose-dependent increase in blood pressure or aggravation of hypertension; in isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention; dose-dependent increase in platelet count (but thrombocytosis rare) regressing during treatment; influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes); cardiovascular events; shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications; very rarely sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue erythropoietin therapy)—see also notes above, hyperkalaemia, hypersensitivity reactions (including anaphylaxis and angioedema), skin reactions, injection-site reactions, and peripheral oedema also reported

**Licensed use** Epex® 20 000-unit, 30 000-unit, and 40 000-unit prefilled syringes not licensed for use in children

**Indications and dose**

See under preparations, below

▲ **Epoetin alfa**

**Binocrit®** (Sandoz) (PoM)

**Injection**, prefilled syringe, epoetin alfa, net price 1000 units = £4.33; 2000 units = £8.65; 3000 units = £12.98; 4000 units = £17.31; 5000 units = £21.64; 6000 units = £25.96; 8000 units = £40.73; 10 000 units = £43.27

**Note** Biosimilar Medicine, p. 2

**Dose**

**Symptomatic anaemia associated with chronic renal failure in children on haemodialysis (see also notes above)**

• **By intravenous injection over 1–5 minutes**

**Child 1 month–18 years** initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

**Note** Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

**Epex®** (Janssen) (PoM)

**Injection**, prefilled syringe, epoetin alfa, net price 1000 units = £5.53; 2000 units = £11.06; 3000 units = £16.59; 4000 units = £22.12; 5000 units = £27.65; 6000 units = £33.19; 8000 units = £44.25; 10 000 units = £55.31; 20 000 units = £110.62; 30 000 units = £199.11; 40 000 units = £265.48. An auto-injector device is available for use with prefilled syringes

**Dose**

Symptomatic anaemia associated with chronic renal failure in children on haemodialysis (see also notes above)

- By intravenous injection over 1–5 minutes

**Child 1 month–18 years** initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight 30–60 kg usually 30–100 units/kg 3 times weekly, body-weight over 60 kg usually 75–300 units/kg weekly (as a single dose or in divided doses)

**Note** Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

### ■ Epoetin beta

**NeoRecormon**<sup>®</sup> (Roche) (PoM)

**Injection**, prefilled syringe, epoetin beta, net price 500 units = £3.51; 2000 units = £14.03; 3000 units = £21.04; 4000 units = £28.06; 5000 units = £35.07; 6000 units = £42.08; 10 000 units = £70.14; 20 000 units = £140.29; 30 000 units = £210.43

**Excipients** include phenylalanine up to 300 micrograms/syringe (section 9.4.1)

**Dose**

Symptomatic anaemia associated with chronic renal failure (see also notes above)

- By subcutaneous injection

**Neonate** initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

**Child 1 month–18 years** initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

- By intravenous injection over 2 minutes

**Neonate** initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

**Child 1 month–18 years** initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Prevention of anaemias of prematurity in neonates with birth-weight of 0.75–1.5 kg and corrected gestational age under 34 weeks

- By subcutaneous injection (of single-dose, unpreserved injection)

**Neonate** 250 units/kg 3 times weekly preferably starting within 3 days of birth and continued for 6 weeks

**Multidose injection**, powder for reconstitution, epoetin beta, net price 50 000-unit vial = £374.48 (with solvent)

**Excipients** include phenylalanine up to 5 mg/vial (section 9.4.1), benzyl alcohol (avoid in neonates, see Excipients p. 2)

**Note** Avoid contact of reconstituted injection with glass; use only plastic materials

**Dose**

Symptomatic anaemia associated with chronic renal failure (see also notes above)

- By subcutaneous injection

**Child 3–18 years** initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

- By intravenous injection over 2 minutes

**Child 3–18 years** initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

### ■ Epoetin zeta

**Retacrit**<sup>®</sup> (Hospira) (PoM)

**Injection**, prefilled syringe, epoetin zeta, net price 1000 units = £5.66; 2000 units = £11.31; 3000 units = £16.97; 4000 units = £22.63; 5000 units = £28.28; 6000 units = £33.94; 8000 units = £45.25; 10 000 units = £56.57; 20 000 units = £113.13; 30 000 units = £169.70; 40 000 units = £226.26

**Excipients** include phenylalanine up to 500 micrograms/syringe (section 9.4.1)

**Note** Biosimilar Medicine, p. 2

**Dose**

Symptomatic anaemia associated with chronic renal failure in children on haemodialysis (see also notes above)

- By intravenous injection over 1–5 minutes

**Child 1 month–18 years** initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

**Note** Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

## Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe

forms include *sickle-cell crisis*, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia (section 4.7), and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine (section 14.4), haemophilus influenzae type b vaccine (section 14.4), an annual influenza vaccine (section 14.4), and prophylactic penicillin (Table 2, section 5.1) reduce the risk of infection. Hepatitis B vaccine (section 14.4) should be considered if the child is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary (section 9.1.2).

**Hydroxycarbamide** can reduce the frequency of crises and the need for blood transfusions. Hydroxycarbamide should be considered, in consultation with a specialist centre, for children who have recurrent episodes of acute pain (more than 3 admissions in the previous 12 months, or who are very symptomatic in the community) or who have had 2 or more episodes of acute sickle chest syndrome in the last 2 years (or 1 episode requiring ventilatory support). Beneficial effects of hydroxycarbamide may not become evident for several months. Myelosuppression, and skin reactions are the most common side-effects.

## HYDROXYCARBAMIDE

(Hydroxyurea)

**Cautions** see section 8.1 and notes above; also monitor renal and hepatic function before and during treatment; monitor full blood count before treatment, then every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on max. dose); leg ulcers (review treatment if cutaneous vasculitic ulcerations develop); **interactions:** Appendix 1 (hydroxycarbamide)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m<sup>2</sup>; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid (teratogenic in animal studies); manufacturer advises effective contraception before and during treatment; see also section 8.1

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also headache; *less commonly* dizziness, and rash; *rarely* reduced sperm count and activity; fever, amenorrhoea, bleeding, and hypomagnesaemia also reported

### Indications and dose

**Sickle-cell disease (see notes above)**

- **By mouth**

**Child 2–18 years** initially 10–15 mg/kg once daily, increased every 12 weeks in steps of 2.5–5 mg/kg daily according to response; usual dose 15–30 mg/kg daily (max. 35 mg/kg daily)

**Siklo<sup>®</sup>** (Nordic) [PmM]

Tablets, scored, f/c, hydroxycarbamide 100 mg, net price 60-tab pack = £100.00; 1 g, 30-tab pack = £500.00

## Iron overload

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound **desferrioxamine mesilate** is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week; the dose should reflect the degree of iron overload. The initial dose should not exceed 30 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine is enhanced by ascorbic acid (vitamin C, section 9.6.3) 100–200 mg daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

Desferrioxamine infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

**Deferasirox**, an oral iron chelator, is licensed for the treatment of chronic iron overload in children over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells). It is also licensed for transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in children aged 2–5 years with thalassaemia major who receive frequent blood transfusions, children over 2 years with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells), and in children over 2 years with other anaemias. Deferasirox is also licensed for the treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate in children over 10 years with non-transfusion-dependent thalassaemia syndromes.

The *Scottish Medicines Consortium* (p. 3) has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

**Deferiprone**, an oral iron chelator, is licensed for the treatment of iron overload in children over 6 years of age with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate. Blood dyscrasias, particularly agranulocytosis, have been reported with deferiprone.

**DEFERASIROX**

**Cautions** eye and ear examinations required before treatment and annually during treatment; monitor body-weight, height and sexual development annually; monitor serum-ferritin concentration monthly; risk of gastro-intestinal ulceration and haemorrhage; platelet count less than  $50 \times 10^9$ /litre; consider treatment interruption if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes); history of liver cirrhosis; test liver function before treatment, then every 2 weeks during the first month, and then monthly; measure baseline serum-creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; monitor liver-iron concentration every three months in children with non-transfusion-dependent thalassaemia syndromes when serum ferritin is  $< 800$  micrograms/litre; **interactions:** Appendix 1 (deferasirox)

**Hepatic impairment** use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose; avoid in severe impairment

**Renal impairment** reduce dose by 10 mg/kg if serum-creatinine increased above age-appropriate limits or estimated glomerular filtration rate less than 90 mL/minute/1.73 m<sup>2</sup> on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if estimated glomerular filtration rate less than 60 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid unless essential—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances (including ulceration and fatal haemorrhage); headache; proteinuria; pruritus, rash; *less commonly* oedema, hepatitis, cholelithiasis, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, tubulointerstitial nephritis, blood disorders (including anaemia, agranulocytosis, neutropenia, pancytopenia, and thrombocytopenia), hypersensitivity reactions (including anaphylaxis and angioedema), and alopecia also reported

**Licensed use** see notes above

**Indications and dose****Transfusion-related chronic iron overload**

## • By mouth

**Child 2–18 years** initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; usual max. 30 mg/kg daily, but may be increased to max. 40 mg/kg daily and reduced in steps of 5–10 mg/kg once control achieved

**Chronic iron overload in non-transfusion-dependent thalassaemia syndromes**

## • By mouth

**Child 10–18 years** initially 10 mg/kg once daily; adjust dose according to serum-ferritin concentration and liver-iron concentration (consult product literature); max. 10 mg/kg daily

**Exjade®** (Novartis) PoM

**Dispersible tablets**, deferasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration

**Counselling** Tablets should be dispersed in water, orange juice, or apple juice; if necessary, resuspend residue and swallow

**DEFERIPRONE**

**Cautions** monitor neutrophil count weekly and discontinue treatment if neutropenia develops; **interactions:** Appendix 1 (deferiprone)

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

**Contra-indications** history of agranulocytosis or recurrent neutropenia

**Hepatic impairment** manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in *animal* studies; contraception advised in girls of child-bearing potential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discoloration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

**Licensed use** see notes above

**Indications and dose****Iron overload in thalassaemia major**

## • By mouth

**Child 6–18 years** 25 mg/kg 3 times daily (max. 100 mg/kg daily)

**Ferriprox®** (Swedish Orphan) PoM

**Tablets**, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39; 1 g, 50-tab pack = £175.25. Label: 14, counselling, blood disorders

**Oral solution**, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

**DESFERIOXAMINE MESILATE**  
(Deferoxamine Mesilate)

**Cautions** eye and ear examinations before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth restriction with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); **interactions:** Appendix 1 (desferrioxamine)

**Renal impairment** use with caution

**Pregnancy** teratogenic in *animal* studies, manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** nausea, vomiting, abdominal pain, headache, pyrexia, growth retardation and bone disorders (see Cautions), arthralgia, myalgia, hearing disturbances, injection-site reactions; *rarely* diarrhoea, hepatic impairment, hypotension (especially when given too rapidly by intravenous injection), anaphylaxis, Yersinia and mucormycosis infections, blood dyscrasias (including thrombocytopenia and leucopenia), leg cramps, bone pain, visual disturbances (including lens opacity and retinopathy), rash; *very rarely* acute respiratory distress, neurological disturbances (including dizziness, neuropathy, convulsions, and paraesthesia), renal impairment; muscle spasms also reported

#### Indications and dose

**Chronic iron overload** see notes above

#### Aluminium overload in dialysis patients

- By intravenous infusion

**Child 1 month–18 years** 5 mg/kg once weekly

#### Iron poisoning

See Emergency Treatment of Poisoning, p. 29

**Administration** For *intravenous* or *subcutaneous* infusion, reconstitute powder with Water for Injection to a concentration of 100 mg/mL; dilute with Glucose 5% or Sodium Chloride 0.9%. In *haemodialysis* or *haemofiltration* administer over the last hour of dialysis (may be given via the dialysis fistula). *Intraperitoneal*: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

**Note** For full details and warnings relating to administration, consult product literature

**Desferrioxamine mesilate** (Non-proprietary) PoM

**Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.65

**Desferal**<sup>®</sup> (Novartis) PoM

**Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.67; 2-g vial = £18.66

## Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

**Eculizumab**, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy. Eculizumab is used to reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS). Eculizumab is also used in adults to reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), a severe and disabling form of haemolytic anaemia [unlicensed indication in children].

### ECULIZUMAB

**Cautions** active systemic infection; monitor child for 1 hour after infusion; for *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy

(measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation; for *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation

**Meningococcal infection** Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise child and carers to report promptly any signs of meningococcal infection. Other immunisations should also be up to date (section 14.1)

**Contra-indications** unresolved *Neisseria meningitidis* infection; patients unvaccinated against *Neisseria meningitidis* (see also Cautions above)

**Pregnancy** no information available—use only if potential benefit outweighs risk; human IgG antibodies known to cross placenta; manufacturer advises effective contraception during and for 5 months after treatment

**Breast-feeding** no information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment

**Side-effects** gastro-intestinal disturbances; oedema; cough, nasopharyngitis; headache, dizziness, vertigo, fatigue, dysgeusia, paraesthesia; infection (including meningococcal infection); spontaneous erection, dysuria; arthralgia, myalgia; blood disorders (including thrombocytopenia, leucopenia); alopecia, pruritus, rash; influenza-like symptoms; infusion-related reactions; *less commonly* anorexia, gingival pain, jaundice, palpitation, haematoma, hypotension, chest pain, syncope, tremor, hot flushing, epistaxis, anxiety, depression, mood changes, sleep disturbances, Graves' disease, menstrual disorders, renal impairment, malignant melanoma, muscle spasms, myelodysplastic syndrome, visual disturbances, tinnitus, hyperhidrosis, petechiae, and skin depigmentation

**Licensed use** not licensed for use in children for paroxysmal nocturnal haemoglobinuria

#### Indications and dose

**Atypical haemolytic uraemic syndrome** (specialist use only)

- By intravenous infusion

**Child 2 months–18 years**

**Body-weight 5–10 kg** initially 300 mg once a week for 2 weeks, then 300 mg once every 3 weeks

**Body-weight 10–20 kg** initially 600 mg on week 1, then 300 mg on week 2, then 300 mg once every 2 weeks

**Body-weight 20–30 kg** initially 600 mg once a week for 3 weeks, then 600 mg once every 2 weeks

**Body-weight 30–40 kg** initially 600 mg once a week for 2 weeks, then 900 mg on week 3, then 900 mg once every 2 weeks

**Body-weight over 40 kg** initially 900 mg once a week for 4 weeks, then 1.2 g on week 5, then 1.2 g once every 2 weeks

**Note** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion

**Paroxysmal nocturnal haemoglobinuria** (specialist use only)

- **By intravenous infusion**

Refer for specialist advice, experience very limited

**Administration** dilute requisite dose to a concentration of 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and mix gently; give over 25–45 minutes; if infusion-related reactions occur, infusion time may be increased to 4 hours in child under 12 years or 2 hours in child over 12 years

**Soliris**<sup>®</sup> (Alexion) [PoM]

**Concentrate for intravenous infusion**, eculizumab 10 mg/mL, net price 30-mL vial = £3150.00. Counselling, meningococcal infection, patient information card

**Electrolytes** Na<sup>+</sup> 5 mmol/vial

## 9.1.4 Drugs used in platelet disorders

**Idiopathic thrombocytopenic purpura** Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. A **corticosteroid**, such as prednisolone (p. 382), is sometimes used if idiopathic thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

**Immunoglobulin** preparations (section 14.5) may be used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are often used in preference to a corticosteroid. Anti-D immunoglobulin is licensed for the management of idiopathic thrombocytopenic purpura.

Other therapy that has been tried under specialist supervision in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), and ciclosporin (section 8.2.2). Rituximab is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.11) may be given to reduce the severity of haemorrhage.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

**Essential thrombocythaemia** **Anagrelide** reduces platelets in essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

### ANAGRELIDE

**Cautions** cardiovascular disease—assess cardiac function before and during treatment; concomitant aspirin in patients at risk of haemorrhage; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose estab-

lished), liver function, serum creatinine, and urea; **interactions:** Appendix 1 (anagrelide)

**Skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment** manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

**Renal impairment** manufacturer advises avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid (toxicity in animal studies)

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, palpitation, tachycardia, fluid retention, headache, dizziness, fatigue, anaemia, rash; *less commonly* pancreatitis, gastro-intestinal haemorrhage, congestive heart failure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoaesthesia, depression, nervousness, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthralgia, epistaxis, dry mouth, alopecia, skin discoloration, pruritus; *rarely* gastritis, colitis, postural hypotension, angina, myocardial infarction, vasodilatation, pulmonary hypertension, pulmonary infiltrates, migraine, drowsiness, impaired coordination, dysarthria, asthenia, tinnitus, renal failure, nocturia, visual disturbances, gingival bleeding; *also reported* allergic alveolitis, interstitial lung disease, pneumonitis, hepatitis, tubulointerstitial nephritis

**Licensed use** not licensed for use in children

#### Indications and dose

**Essential thrombocythaemia in at-risk children who have not responded adequately to other therapy or who are intolerant of it** (initiated under specialist supervision)

- **By mouth**

**Child 7–18 years** initially 500 micrograms daily adjusted according to response in steps of 500 micrograms daily at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses

**Xagrid**<sup>®</sup> (Shire) ▼ [PoM]

**Capsules**, anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack = £404.57. Counselling, skilled tasks, see above

## 9.1.5 G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for children with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the child belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These children must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

#### Drugs with *definite* risk of haemolysis in most G6PD-deficient individuals

**Dapsone** and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)

**Methylthionium chloride**

**Niridazole** [not on UK market]

**Nitrofurantoin**

**Pamaquin** [not on UK market]

**Primaquine** (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people, see section 5.4.1)

**Quinolones** (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)

**Rasburicase**

**Sulfonamides** (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

#### Drugs with *possible* risk of haemolysis in some G6PD-deficient individuals

**Aspirin** (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)

**Chloroquine** (acceptable in acute malaria and malaria chemoprophylaxis)

**Menadione**, water-soluble derivatives (e.g. menadiol sodium phosphate)

**Probenecid** [not on UK market]

**Quinidine** (acceptable in acute malaria) [not on UK market]

**Quinine** (acceptable in acute malaria)

**Sulfonylureas**

**Note** Naphthalene in mothballs also causes haemolysis in individuals with G6PD-deficiency.

## 9.1.6 Drugs used in neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. **Filgrastim** (unglycosylated rhG-CSF) and **lenograstim** (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

**Neonatal neutropenia** Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

**Cautions** Granulocyte-colony stimulating factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts (including differential white cell count and platelet count) should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk. Granulocyte-colony stimulating factors should be used with caution in children with sickle-cell disease. Spleen size should be monitored during treatment as there is a risk of splenomegaly and rupture.

**Pregnancy** There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

**Breast-feeding** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding use.

**Side-effects** Side-effects of granulocyte-colony stimulating factors include gastro-intestinal disturbances, anorexia, headache, asthenia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. *Less commonly* chest pain can occur. Pulmonary side-effects, particularly interstitial pneumonia (see Cautions above), cutaneous vasculitis, and acute febrile neutrophilic dermatosis have *rarely* been reported.

### FILGRASTIM

(Recombinant human granulocyte-colony stimulating factor, G-CSF)

**Cautions** see notes above; also regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia); secondary acute myeloid leukaemia; osteoporotic

bone disease (monitor bone density if given for more than 6 months); **interactions:** Appendix 1 (filgrastim)

**Contra-indications** severe congenital neutropenia (Kostman's syndrome) with abnormal cytogenetics

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also mucositis, splenic enlargement, hepatomegaly, transient hypotension, epistaxis, urinary abnormalities (including dysuria, proteinuria, and haematuria), osteoporosis, exacerbation of rheumatoid arthritis, anaemia, transient decrease in blood glucose, pseudogout, and raised uric acid; *less commonly* capillary leak syndrome (including fatal cases); *very rarely* splenic rupture

**Licensed use** notes for treatment of glycogen storage disease or neonatal neutropenia

#### Indications and dose

##### Cytotoxic-induced neutropenia

- Preferably by subcutaneous injection or by intravenous infusion (over 30 minutes)

**Child 1 month–18 years** 5 micrograms/kg daily started not less than 24 hours after cytotoxic chemotherapy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)

##### Myeloablative therapy followed by bone-marrow transplantation

- By intravenous infusion over 30 minutes or over 24 hours or by subcutaneous infusion over 24 hours

**Child 1 month–18 years** 10 micrograms/kg daily, started not less than 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to absolute neutrophil count (consult product literature and local protocol)

##### Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone

- By subcutaneous injection or by subcutaneous infusion over 24 hours

**Child 1 month–18 years** 10 micrograms/kg daily for 5–7 days

##### Mobilisation of peripheral blood progenitor cells for autologous infusion following adjunctive myelosuppressive chemotherapy (to improve yield)

- By subcutaneous injection

**Child 1 month–18 years** 5 micrograms/kg daily, started the day after completion of chemotherapy and continued until neutrophil count in normal range; for timing of leucopheresis consult product literature

##### Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion

- By subcutaneous injection

**Child over 16 years** 10 micrograms/kg daily for 4–5 days; for timing of leucopheresis consult product literature

#### Severe chronic neutropenia

- By subcutaneous injection

**Child 1 month–18 years** in severe congenital neutropenia, initially 12 micrograms/kg daily in single or divided doses (initially 5 micrograms/kg daily in idiopathic or cyclic neutropenia), adjusted according to response (consult product literature and local protocol)

#### Persistent neutropenia in HIV infection

- By subcutaneous injection

**Child 1 month–18 years** initially 1 microgram/kg daily, increased as necessary until absolute neutrophil count in normal range (usual max. 4 micrograms/kg daily), then adjusted to maintain absolute neutrophil count in normal range (consult product literature)

#### Neonatal neutropenia

- By subcutaneous injection

**Neonate** 10 micrograms/kg daily, discontinue if white cell count exceeds  $50 \times 10^9$ /litre

#### Glycogen storage disease type 1b

- By subcutaneous injection

5 micrograms/kg daily, adjusted as necessary

**Administration** For *subcutaneous* or *intravenous infusion*, dilute with Glucose 5% to a concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions

#### Neupogen® (Amgen) (PoM)

**Injection**, filgrastim 30 million units (300 micrograms)/mL; net price 1-mL vial = £52.70

**Injection (Singleject®)**, filgrastim 60 million units (600 micrograms)/mL, net price 0.5-mL prefilled syringe = £52.70; 96 million units (960 micrograms)/mL, 0.5-mL prefilled syringe = £84.06

#### Nivestim® (Hospira) ▼ (PoM)

**Injection**, prefilled syringe, filgrastim, net price 12 million-units (120 micrograms)/0.2 mL = £36.00; 30 million-units (300 micrograms)/0.5 mL = £58.00; 48 million-units (480 micrograms)/0.5 mL = £93.00

**Note** Biosimilar medicine, p. 2

#### Ratiograstim® (Ratiopharm UK) ▼ (PoM)

**Injection**, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £62.25; 48 million-units (480 micrograms)/0.8 mL = £99.29

**Note** Biosimilar medicine, p. 2

#### Zarzio® (Sandoz) (PoM)

**Injection**, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £50.15; 48 million-units (480 micrograms)/0.5 mL = £79.90

**Note** Biosimilar medicine, p. 2

## LENOGRASTIM

(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also splenic rupture and toxic epidermal necrolysis

**Licensed use** not licensed for use in children for cytotoxic-induced neutropenia, mobilisation of peripheral blood progenitor cells (monotherapy or adjunctive therapy), or following peripheral stem cells transplantation

#### Indications and dose

##### Following peripheral stem cells or bone-marrow transplantation

- By intravenous infusion over 30 minutes or by subcutaneous injection

**Child 2–18 years** 150 micrograms/m<sup>2</sup> daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)

##### Cytotoxic-induced neutropenia

- By subcutaneous injection

**Child 2–18 years** 150 micrograms/m<sup>2</sup> daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days)

##### Mobilisation of peripheral blood progenitor cells, used alone

- By subcutaneous injection

**Child 2–18 years** 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

##### Mobilisation of peripheral blood progenitor cells following adjunctive myelosuppressive chemotherapy (to improve yield)

- By subcutaneous injection

**Child 2–18 years** 150 micrograms/m<sup>2</sup> daily, started 1–5 days after completion of chemotherapy and continued until neutrophil count in acceptable range; for timing of leucopheresis consult product literature

**Administration** for intravenous infusion, dilute reconstituted solution to a concentration of not less than 2 micrograms/mL (*Granocyte-13*) or 2.5 micrograms/mL (*Granocyte-34*) with Sodium Chloride 0.9%

**Granocyte**<sup>®</sup> (Chugai) [PoM]

**Injection**, powder for reconstitution, lenograstim, net price 13.4 million-unit (105-microgram) vial = £40.11; 33.6 million-unit (263-microgram) vial = £62.54 (both with 1-mL prefilled syringe water for injections)

**Excipients** include phenylalanine (section 9.4.1)

## 9.2 Fluids and electrolytes

### 9.2.1 Oral preparations for fluid and electrolyte imbalance

### 9.2.2 Parenteral preparations for fluid and electrolyte imbalance

The following tables give a selection of useful electrolyte values:

### Electrolyte concentrations—intravenous fluids

	Millimoles per litre					
	Intravenous infusion	Na <sup>+</sup>	K <sup>+</sup>	HCO <sub>3</sub> <sup>-</sup>	Cl <sup>-</sup>	Ca <sup>2+</sup>
<b>Normal plasma values</b>	142	4.5	26	103	2.5	
Sodium Chloride 0.9%	150	—	—	150	—	
Compound Sodium Lactate (Hartmann's)	131	5	29	111	2	
Sodium Chloride 0.45% and Glucose 5%	75	—	—	75	—	
Potassium Chloride 0.15% and Glucose 5%	—	20	—	20	—	
Potassium Chloride 0.15% and Sodium Chloride 0.9%	150	20	—	170	—	
Potassium Chloride 0.3% and Glucose 5%	—	40	—	40	—	
Potassium Chloride 0.3% and Sodium Chloride 0.9%	150	40	—	190	—	
<b>To correct metabolic acidosis</b>						
Sodium Bicarbonate 1.26%	150	—	150	—	—	
Sodium Bicarbonate 8.4% for cardiac arrest	1000	—	1000	—	—	
Sodium Lactate (m/6)	167	—	167	—	—	

### Electrolyte content—gastro-intestinal secretions

Type of fluid	Millimoles per litre				
	H <sup>+</sup>	Na <sup>+</sup>	K <sup>+</sup>	HCO <sub>3</sub> <sup>-</sup>	Cl <sup>-</sup>
Gastric	40–60	20–80	5–20	—	100–150
Biliary	—	120–140	5–15	30–50	80–120
Pancreatic	—	120–140	5–15	70–110	40–80
Small bowel	—	120–140	5–15	20–40	90–130

Faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected; where this is impracticable the approximations above may be helpful in planning replacement therapy

## 9.2.1 Oral preparations for fluid and electrolyte imbalance

### 9.2.1.1 Oral potassium

### 9.2.1.2 Oral sodium and water

### 9.2.1.3 Oral bicarbonate

Sodium and potassium salts, which may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree, are discussed in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also described in this section.

For reference to calcium, magnesium, and phosphate, see section 9.5.

## 9.2.1.1 Oral potassium

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

**Dosage** If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride 1–2 mmol/kg (usual max. 50 mmol potassium) daily by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal insufficiency* to reduce the risk of **hyperkalaemia**. Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable (see also above). Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

**Administration** Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic states*, section 9.2.1.3). Potassium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, see p. 840; they should be used with care because they are hypertonic and can damage the gastric mucosa. **Salt substitutes** A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*<sup>®</sup> and *Ruthmol*<sup>®</sup>). These should not be used by patients with renal failure as potassium intoxication may result.

## POTASSIUM CHLORIDE

**Cautions** see notes above; cardiac disease; with *modified-release preparations*, intestinal stricture, history of peptic ulcer, hiatus hernia; **interactions:** Appendix 1 (potassium salts)

**Contra-indications** plasma-potassium concentration above 5 mmol/litre

**Renal impairment** close monitoring required—risk of hyperkalaemia; avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, flatulence; with *modified-release preparations*, gastro-intestinal obstruction, ulceration, and bleeding also reported

### Indications and dose

#### Potassium depletion

##### • By mouth

**Neonate** 0.5–1 mmol/kg K<sup>+</sup> twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to plasma-potassium concentration

**Child 1 month–18 years** 0.5–1 mmol/kg K<sup>+</sup> twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to plasma-potassium concentration

**Note** Do not confuse Effervescent Potassium Tablets BPC 1968 (section 9.2.1.3) with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states (section 9.2.1.3).

#### Kay-Cee-L<sup>®</sup> (Geistlich)

**Syrup**, sugar-free, red, potassium chloride 7.5% (1 mmol/mL each of K<sup>+</sup> and Cl<sup>-</sup>), net price 500 mL = £6.80. Label: 21

#### Sando-K<sup>®</sup> (HK Pharma)

**Tablets**, effervescent, potassium bicarbonate and chloride equivalent to potassium 470 mg (12 mmol of K<sup>+</sup>) and chloride 285 mg (8 mmol of Cl<sup>-</sup>), net price 20 = £1.53. Label: 13, 21

#### ▲ Modified-release preparations

Avoid unless effervescent tablets or liquid preparations inappropriate

#### Slow-K<sup>®</sup> (Alliance)

**Tablets**, m/r, orange, s/c, potassium chloride 600 mg (8 mmol each of K<sup>+</sup> and Cl<sup>-</sup>), net price 100 = £5.95. Label: 25, 27, counselling, swallow whole with fluid during meals while sitting or standing

**Note** May be difficult to obtain

## Management of hyperkalaemia

*Acute severe hyperkalaemia* calls for urgent treatment with intravenous infusion of **soluble insulin** (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with **glucose** 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, **salbutamol** (section 3.1.1.1) can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

**Calcium gluconate** (section 9.5.1.1) is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with **sodium bicarbonate** infusion (section 9.2.2.1) should be considered (**important:** preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous **furosemide** can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

**Ion-exchange resins** may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyper-*

*kalaemia* when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

## POLYSTYRENE SULFONATE RESINS

**Cautions** impaction of resin with excessive dosage or inadequate dilution; monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre); *sodium-containing resin* in congestive heart failure, hypertension, and oedema; **interactions:** Appendix 1 (polystyrene sulfonate resins)

**Contra-indications** obstructive bowel disease; neonates with reduced gut motility; *calcium-containing resin* in hyperparathyroidism, multiple myeloma, sarcoidosis, or metastatic carcinoma

**Renal impairment** use *sodium-containing resin* with caution

**Pregnancy** manufacturers advise use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturers advise use only if potential benefit outweighs risk—no information available

**Side-effects** faecal impaction following rectal administration, gastro-intestinal concretions following oral administration, intestinal necrosis reported with concomitant use of sorbitol, gastric irritation, anorexia, nausea, vomiting, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea, hypomagnesaemia; gastro-intestinal obstruction, ulceration, necrosis, and ischaemic colitis also reported; with *calcium-containing resin*, hypercalcaemia (including in dialysed patients and occasionally those with renal impairment); with *sodium-containing resin*, sodium retention, hypocalcaemia

### Indications and dose

See under preparations

#### Calcium Resonium® (Sanofi-Aventis)

**Powder**, buff, calcium polystyrene sulfonate, net price 300 g = £68.47. Label: 13

#### Dose

**Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients**

#### • By mouth

**Child 1 month–18 years** 0.5–1 g/kg (max. 60 g) daily in divided doses

**Administration** Administer in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content

#### • By rectum

**Neonate** 0.5–1 g/kg daily. Irrigate colon to remove resin after 8–12 hours

**Child 1 month–18 years** 0.5–1 g/kg (max. 30 g) daily. Irrigate colon to remove resin after 8–12 hours

**Administration** Mix each 1 g of resin with 5 mL of water or 10% glucose

#### Resonium A® (Sanofi-Aventis)

**Powder**, buff, sodium polystyrene sulfonate, net price 454 g = £67.50. Label: 13

#### Dose

**Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients**

#### • By mouth

**Child 1 month–18 years** 0.5–1 g/kg (max. 60 g) daily in divided doses

**Administration** Administer in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content

#### • By rectum

**Neonate** 0.5–1 g/kg daily. Irrigate colon to remove resin after 8–12 hours

**Child 1 month–18 years** 0.5–1 g/kg (max. 30 g) daily. Irrigate colon to remove resin after 8–12 hours

**Administration** Mix each 1 g of resin with 5 mL of water or 10% glucose

#### Sorbister® (Stanningley) (Pohl)

**Powder**, buff, calcium polystyrene sulfonate 759–949 mg/g, net price 500 g = £49.95. Label: 13, 21

**Excipients** include sucrose 51–241 mg per 1 g of powder

#### Dose

**Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients**

#### • By mouth

**Child 1 month–18 years** 0.5–1 g/kg (max. 60 g) daily in at least 3 divided doses

**Administration** Administer in a small amount of water or soft drink—do not give with fruit juice or squash, which have a high potassium content

#### • By rectum

**Neonate** 0.5–1 g/kg daily. Irrigate colon to remove resin after 6 hours

**Child 1 month–18 years** 0.5–1 g/kg (max. 40 g) daily. Irrigate colon to remove resin after 6 hours

**Administration** Mix each 1 g of resin with 4 mL of 5% glucose

### 9.2.1.2 Oral sodium and water

Sodium chloride is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride (section 9.2.1.3) may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, see p. 840; they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to replace losses in children with cystic fibrosis particularly in warm weather.

## SODIUM CHLORIDE

### Indications and dose

See also section 9.2.2

#### Sodium supplementation in neonates

#### • By mouth

**Preterm neonate** 2 mmol/100 mL of formula feed or 3–4 mmol/100 mL of breast milk, consult dietician

#### Sodium replacement

#### • By mouth

**Child 1 month–18 years** according to requirements, generally 1–2 mmol/kg daily in divided doses, higher doses may be needed in severe depletion

#### Chronic renal loss

#### • By mouth

**Child 1 month–18 years** 1–2 mmol/kg daily in divided doses, adjusted according to requirements

**Slow Sodium**<sup>®</sup> (HK Pharma)

Tablets, m/r, sodium chloride 600 mg (approx. 10 mmol each of Na<sup>+</sup> and Cl<sup>-</sup>). Net price 100-tab pack = £6.05. Label: 25

Capsules available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Oral rehydration therapy (ORT)**

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.

**ORAL REHYDRATION SALTS (ORS)**

**Licensed use** *Dioralyte*<sup>®</sup> Relief not licensed for use in children under 3 months

**Indications and dose**

**Fluid and electrolyte loss in diarrhoea** see notes above

● **By mouth**

**Child 1 month–1 year** 1–1½ times usual feed volume

**Child 1–12 years** 200 mL after every loose motion

**Child 12–18 years** 200–400 mL after every loose motion

**UK formulations**

**Note** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

**Dioralyte**<sup>®</sup> (Sanofi-Aventis)

**Oral powder**, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 530 mg, glucose 3.56 g/sachet, net price 6-sachet pack = £2.25, 20-sachet pack (black currant- or citrus-flavoured or natural) = £6.72

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na<sup>+</sup> 60 mmol, K<sup>+</sup> 20 mmol, Cl<sup>-</sup> 60 mmol, citrate 10 mmol, and glucose 90 mmol

**Dioralyte**<sup>®</sup> Relief (Sanofi-Aventis)

**Oral powder**, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, black currant- or raspberry-flavoured) = £2.50, 20-sachet pack (apricot-flavoured) = £7.13

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na<sup>+</sup> 60 mmol, K<sup>+</sup> 20 mmol, Cl<sup>-</sup> 50 mmol and citrate 10 mmol; contains aspartame (section 9.4.1)

**Electrolade**<sup>®</sup> (Actavis)

**Oral powder**, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, black currant-, lemon and lime-, or orange-flavoured). Net price 6-sachet (plain or multiflavoured) pack = £1.33, 20-sachet (single- or multiflavoured) pack = £4.99

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na<sup>+</sup> 50 mmol, K<sup>+</sup> 20 mmol, Cl<sup>-</sup> 40 mmol, HCO<sub>3</sub><sup>-</sup> 30 mmol, and glucose 111 mmol

**WHO formulation****Oral Rehydration Salts** (Non-proprietary)

**Oral powder**, sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. To be dissolved in sufficient water to produce 1 litre (providing Na<sup>+</sup> 75 mmol, K<sup>+</sup> 20 mmol, Cl<sup>-</sup> 65 mmol, citrate 10 mmol, glucose 75 mmol/litre)

**Note** Recommended by the WHO and the United Nations Children's Fund but not commonly used in the UK

**9.2.1.3 Oral bicarbonate**

**Sodium bicarbonate** is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously (section 9.2.2).

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

## SODIUM BICARBONATE

**Cautions** see notes above; respiratory acidosis; interactions: Appendix 1 (antacids)

### Indications and dose

**Renal acidosis** (see also notes above)

#### • By mouth

**Neonate** initially 1–2 mmol/kg daily in divided doses, adjusted according to response

**Child 1 month–18 years** initially 1–2 mmol/kg daily in divided doses, adjusted according to response

**Metabolic acidosis** section 9.2.2.1

**Renal hyperkalaemia** section 9.2.2.1

### Sodium Bicarbonate (Non-proprietary)

**Capsules**, sodium bicarbonate 500 mg (approx. 6 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ ), net price 56-cap pack = £2.66

**Tablets**, sodium bicarbonate 600 mg, net price 100-tab pack = £27.14

**Important** Oral solutions of sodium bicarbonate are required occasionally; these need to be obtained from 'special-order' manufacturers or specialist importing companies, see p. 840, and the strength of sodium bicarbonate should be stated on the prescription

## POTASSIUM BICARBONATE

**Cautions** cardiac disease, interactions: Appendix 1 (potassium salts)

**Contra-indications** hypochloraemia; plasma-potassium concentration above 5 mmol/litre

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, and flatulence

### Potassium Tablets, Effervescent (Non-proprietary)

**Effervescent tablets**, potassium bicarbonate 500 mg, potassium acid tartrate 300 mg, each tablet providing 6.5 mmol of  $\text{K}^+$ . To be dissolved in water before administration. Net price 56 = £87.25. Label: 13, 21

**Note** These tablets do not contain chloride; for effervescent tablets containing potassium and chloride, see under Potassium Chloride, section 9.2.1.1

## 9.2.2 Parenteral preparations for fluid and electrolyte imbalance

### 9.2.2.1 Electrolytes and water

#### 9.2.2.2 Plasma and plasma substitutes

### 9.2.2.1 Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% or glucose 5%) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium,

potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance; for reference to the use of magnesium and phosphates, see section 9.5.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

**Maintenance fluid requirements** in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride and glucose. Solutions containing 20 mmol/litre of potassium chloride meet usual potassium requirements when given in the suggested volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred; see Caution on dilutional hyponatraemia below.

### Fluid requirements for children over 1 month:

Body-weight	24-hour fluid requirement
Under 10 kg	100 mL/kg
10–20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 10 kg
Over 20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10–20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)

**Important** The baseline fluid requirements shown in the table above should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

**Caution** During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution. The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hypothermia, and high humidity.

**Dilutional hyponatraemia** is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatr-

aemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

### Safe practice

Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

**Replacement therapy:** initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

**Neonates** Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

## Intravenous sodium

**Intravenous sodium chloride** in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose, see notes above. Sodium chloride solutions should be used cautiously in renal insufficiency, cardiac failure, cardio-respiratory diseases, hepatic cirrhosis and in children receiving glucocorticoids. Hyponatraemia with serious consequences may occur if maintenance and replacement fluids do not meet sodium requirements (see Caution, dilutional hyponatraemia, above).

*Chronic hyponatraemia* should ideally be corrected by fluid restriction. However, if sodium chloride is required, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma-sodium concentration should be no more than 10 mmol/litre in 24 hours.

**Sodium chloride and glucose** solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma  $\text{Na}^+$  remains extracellular. Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electro-

lyte imbalance. Illness or injury increase the secretion of anti-diuretic hormone and therefore the ability to excrete excess water may be impaired. Inappropriate use of hypotonic solutions such as sodium chloride 0.18% and glucose 4% may also cause dilutional hyponatraemia especially in children (see Caution on dilutional hyponatraemia, above); if necessary, guidance should be sought from a clinician experienced in the management of fluid and electrolytes.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

**Compound sodium lactate** (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

**Neonates** The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. *Hyponatraemia* may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

*Hypernatraemia* may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe hypernatraemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the patency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

## SODIUM CHLORIDE

**Cautions** restrict intake in impaired renal function, cardiac failure, hypertension, peripheral and pulmonary oedema, toxemia of pregnancy; see also notes above

**Side-effects** administration of large doses may give rise to sodium accumulation and oedema

### Indications and dose

**Electrolyte imbalance** see notes above, also section 9.2.1.2

### Sodium Chloride (Non-proprietary) (PoM)

**Intravenous infusion**, usual strength sodium chloride 0.9% (9 g, 150 mmol each of  $\text{Na}^+$  and  $\text{Cl}^-$ /litre), this strength being supplied when normal saline for injection is requested. Net price 2-mL amp = 21p; 5-mL amp = 28p; 10-mL amp = 34p; 20-mL amp = £1.04; 50-mL amp = £3.63

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Note** The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

### With other ingredients

**Note** See above for warning on hyponatraemia

### Sodium Chloride and Glucose (Non-proprietary) (PoM)

**Intravenous infusion**, sodium chloride 0.18% ( $\text{Na}^+$  and  $\text{Cl}^-$  each 30 mmol/litre), glucose 4%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.45% (Na<sup>+</sup> and Cl<sup>-</sup> each 75 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.9% (Na<sup>+</sup> and Cl<sup>-</sup> each 150 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

#### **Ringer's Solution** (Non-proprietary) (PoM)

Calcium chloride (dihydrate) 322 micrograms, potassium chloride 300 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/litre), Ca<sup>2+</sup> 2.2, K<sup>+</sup> 4, Na<sup>+</sup> 147, Cl<sup>-</sup> 156

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

#### **Sodium Lactate, Compound** (Non-proprietary) (PoM)

(Hartmann's Solution; Ringer-Lactate Solution)

**Intravenous infusion**, sodium chloride 0.6%, sodium lactate 0.32%, potassium chloride 0.04%, calcium chloride 0.027% (containing Na<sup>+</sup> 131 mmol, K<sup>+</sup> 5 mmol, Ca<sup>2+</sup> 2 mmol, HCO<sub>3</sub><sup>-</sup> (as lactate) 29 mmol, Cl<sup>-</sup> 111 mmol/litre)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

### **Intravenous glucose**

Glucose solutions are used mainly to replace water deficit and should not be given alone except when there is no significant loss of electrolytes; prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given with insulin for the emergency management of hyperkalaemia (see p. 464). They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion (section 6.1.3).

Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.

### **GLUCOSE**

(Dextrose Monohydrate)

**Note** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

**Side-effects** glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

### **Indications and dose**

**Fluid replacement** see notes above

**Provision of energy** section 9.3

**Hypoglycaemia** section 6.1.4

### **Glucose** (Non-proprietary) (PoM)

**Intravenous infusion**, glucose or anhydrous glucose (potency expressed in terms of anhydrous glucose), usual strengths 5% (50 mg/mL), 10% (100 mg/mL), and 20% (200 mg/mL); 20% solution, net price 20-mL amp = £2.04; 50% solution<sup>1</sup>, 20-mL amp = £1.00, 50-mL vial = £2.02

In hospitals, 500- and 1000-mL packs, and sometimes other sizes and strengths, are available; also available *Minijet*<sup>®</sup> Glucose, 50% in 50-mL disposable syringe<sup>1</sup>

### **Intravenous potassium**

**Potassium chloride and sodium chloride** intravenous infusion is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used when possible (see under Safe Practice below); for peripheral intravenous infusion, the concentration of potassium should not usually exceed 40 mmol/litre. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

#### **Safe Practice**

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

### **POTASSIUM CHLORIDE**

**Cautions** for peripheral intravenous infusion the concentration of solution should not usually exceed 3 g (40 mmol)/litre; specialist advice and ECG monitoring (see notes above); **interactions:** Appendix 1 (potassium salts)

**Contra-indications** plasma-potassium concentration above 5 mmol/litre

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** rapid infusion toxic to heart

1. (PoM) restriction does not apply where administration is for saving life in emergency

**Indications and dose**

**Electrolyte imbalance** see also oral potassium supplements, section 9.2.1.1

- **By slow intravenous infusion**

Depending on the deficit or the daily maintenance requirements, see also notes above

**Neonate** 1–2 mmol/kg daily

**Child 1 month–18 years** 1–2 mmol/kg daily

**Administration** see notes above

**Potassium Chloride and Glucose** (Non-

proprietary) (PoM)

**Intravenous infusion**, usual strengths potassium chloride 0.3% (3 g, 40 mmol each of  $K^+$  and  $Cl^-$ /litre) or 0.15% (1.5 g, 20 mmol each of  $K^+$  and  $Cl^-$ /litre) with 5% of anhydrous glucose

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Potassium Chloride and Sodium Chloride** (Non-

proprietary) (PoM)

**Intravenous infusion**, usual strength potassium chloride 0.15% (1.5 g/litre) with sodium chloride 0.9% (9 g/litre), containing  $K^+$  20 mmol,  $Na^+$  150 mmol, and  $Cl^-$  170 mmol/litre

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Potassium Chloride, Sodium Chloride, and**

**Glucose** (Non-proprietary) (PoM)

**Intravenous infusion**, sodium chloride 0.45% (4.5 g,  $Na^+$  75 mmol/litre) with 5% of anhydrous glucose and usually sufficient potassium chloride to provide  $K^+$  10–40 mmol/litre (to be specified by the prescriber)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes are available

**Potassium Chloride** (Non-proprietary) (PoM)

**Sterile concentrate**, potassium chloride 15%

(150 mg, approximately 2 mmol each of  $K^+$  and  $Cl^-$ /mL). Net price 10-mL amp = 48p

Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules

**Important** Must be diluted with **not less** than 50 times its volume of Sodium Chloride 0.9% or other suitable diluent and **mixed well**; see Safe Practice, above

**Bicarbonate and trometamol**

**Sodium bicarbonate** is used to control severe *metabolic acidosis* ( $pH < 7.1$ ) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For *chronic acidotic states*, sodium bicarbonate can be given by mouth (section 9.2.1.3).

**Trometamol** (tris(hydroxymethyl)aminomethane, THAM), an organic buffer, corrects metabolic acidosis

by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. Respiratory support may be required because trometamol induces respiratory depression. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

**SODIUM BICARBONATE****Indications and dose**

**Metabolic acidosis** see also notes above

- **By slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)**

An amount appropriate to the body base deficit

**Renal hyperkalaemia**

- **By slow intravenous injection**

**Neonate** 1 mmol/kg daily

**Child 1 month–18 years** 1 mmol/kg daily

**Renal acidosis** section 9.2.1.3

**Sodium Bicarbonate** (PoM)

**Intravenous infusion**, usual strength sodium bicarbonate 1.26% (12.6 g, 150 mmol each of  $Na^+$  and  $HCO_3^-$ /litre); various other strengths available  
In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Administration** For *peripheral infusion* dilute 8.4% solution at least 1 in 10; for *central line infusion* dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage

**Minijet® Sodium Bicarbonate** (UCB Pharma) (PoM)

**Intravenous injection**, sodium bicarbonate in disposable syringe, net price 4.2%, 10 mL = £11.03; 8.4%, 10 mL = £11.10, 50 mL = £12.15

**TROMETAMOL**

(Tris(hydroxymethyl)aminomethane, THAM)

**Cautions** see notes above; extravasation can cause severe tissue damage

**Contra-indications** anuria; chronic respiratory acidosis

**Renal impairment** use with caution, may cause hyperkalaemia

**Pregnancy** limited information available, hypoglycaemia may harm fetus

**Breast-feeding** no information available

**Side-effects** respiratory depression; hypoglycaemia; hyperkalaemia in renal impairment; liver necrosis reported following administration via umbilical vein in neonates

**Licensed use** unlicensed preparation

**Indications and dose**

**Metabolic acidosis**

- **By intravenous infusion**

An amount appropriate to the body base deficit

**Preparations**

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## Water

### Water for Injections <sup>(PoM)</sup>

Net price 1-mL amp = £0.18; 2-mL amp = £0.13; 5-mL amp = £0.24; 10-mL amp = £0.25, 10-mL vial = £1.40; 20-mL amp = £0.39; 50-mL amp = £1.91; 100-mL vial = £2.60

**Note** Water for Injections can be sold or supplied by a pharmacist for a purpose other than parenteral administration, or when dry powder for parenteral administration has been prescribed without the Water for Injections that is needed as a diluent

### 9.2.2.2 Plasma and plasma substitutes

**Albumin solutions**, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma and plasma substitutes are often used in very ill children whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the child's condition at all times.

### ALBUMIN SOLUTION (Human Albumin Solution)

A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

**Cautions** history of cardiac or circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function); increased capillary permeability; correct dehydration when administering concentrated solution

**Contra-indications** cardiac failure; severe anaemia

**Side-effects** hypersensitivity reactions (including anaphylaxis) with nausea, vomiting, increased salivation, fever, tachycardia, hypotension and chills reported

### Indications and dose

See notes above and under preparations, below

#### Isotonic solutions

**Indications:** acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery; plasma exchange

Available as: *Human Albumin Solution 4.5%* (50-, 100-, 250- and 400-mL bottles—Baxter); *Human Albumin Solution 5%* (250- and 500-mL bottles—Baxter); *Albumnorm*® 5% (100-, 250-, and 500-mL bottles—Octapharma); *Zenalb*® 4.5% (50-, 100-, 250-, and 500-mL bottles—BPL)

#### Concentrated solutions (20%)

**Indications:** severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associated with portal hypertension

Available as: *Human Albumin Solution 20%* (50- and 100-mL vials—Baxter); *Albumnorm*® 20% (50- and 100-mL bottles—Octapharma); *Flexbumin*® 20% (50- and 100-mL bags—Baxter); *Zenalb*® 20% (50- and 100-mL bottles—BPL)

## Plasma substitutes

**Gelatin** and the **etherified starch, pentastarch**, are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia. Plasma substitutes may be used as an immediate short-term measure to treat haemorrhage until blood is available. They are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

### MHRA/CHM advice

#### MHRA suspends use of hydroxyethyl starch (HES) infusions (June 2013)

The use of hydroxyethyl starch infusions to treat critically ill patients and those undergoing surgery has been suspended in the UK because their benefits no longer outweigh the risk of using them. Studies have suggested an increased risk of renal injury and death in patients treated with these products compared with crystalloids (simple salt solutions).

*Tetraspan*®, *Venofundin*®, *Volulyte*®, and *Voluven*® have all been withdrawn by the manufacturers.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Plasma and plasma substitutes are often used in very ill children whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the child's condition at all times.

The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.

**Cautions** Plasma substitutes should be used with caution in cardiac disease, liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the child should be monitored for hypersensitivity reactions.

**Side-effects** Hypersensitivity reactions may occur including, rarely, severe anaphylactic reactions. Transient increase in bleeding time may occur.

## GELATIN

**Note** The gelatin is partially degraded

**Cautions** see notes above

**Pregnancy** manufacturer of *Geloplasma*<sup>®</sup> advises avoid at the end of pregnancy

**Side-effects** see notes above

### Indications and dose

**Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass**

- **By intravenous infusion**

Initially 10–20 mL/kg of a 3.5–4% solution (see notes above)

**Gelofusine**<sup>®</sup> (B. Braun) (PoM)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 124 mmol/litre, net price 500-mL *Ecobag*<sup>®</sup> = £4.83; 1-litre *Ecobag*<sup>®</sup> = £9.04  
Contains traces of calcium

**Geloplasma**<sup>®</sup> (Fresenius Kabi) (PoM)

**Intravenous infusion**, partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na<sup>+</sup> 150 mmol, K<sup>+</sup> 5 mmol, Mg<sup>2+</sup> 1.5 mmol, Cl<sup>-</sup> 100 mmol, lactate 30 mmol/litre, net price 500-mL bag = £5.05

**Isoplex**<sup>®</sup> (Beacon) (PoM)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 145 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 0.9 mmol, Cl<sup>-</sup> 105 mmol, lactate 25 mmol/litre, net price 500-mL bag = £7.53; 1-litre bag = £14.54

**Volplex**<sup>®</sup> (Beacon) (PoM)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 125 mmol/litre, net price 500-mL bag = £4.70; 1-litre bag = £9.09

## ETHERIFIED STARCH

A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term pentastarch reflects the degree of etherification

**Cautions** see notes above

**Renal impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Side-effects** see notes above; also pruritus, raised serum amylase

### Indications and dose

**Low blood volume**

- **By intravenous infusion**

According to the child's condition (see notes above)

### ▲ Pentastarch

**HAES-steril**<sup>®</sup> (Fresenius Kabi) (PoM)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000) 10% in sodium chloride intravenous infusion 0.9%, net price, 500 mL = £16.50

**Hemohe**<sup>®</sup> (B. Braun) (PoM)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £12.50; 10%, 500 mL = £16.50

## 9.3 Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to oral or enteral tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition** (TPN). Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given under Proprietary Infusion Fluids for Parenteral Feeding, p. 473

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single 'all-in-one' bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Proprietary Infusion Fluids for Parenteral Feeding								
Preparation	Nitrogen g/litre	<sup>1,2</sup> Energy kJ/litre	Electrolytes mmol/litre					Other components/litre
			K <sup>+</sup>	Mg <sup>2+</sup>	Na <sup>+</sup>	Acet <sup>-</sup>	Cl <sup>-</sup>	
ClinOleic 20% (Baxter) Net price 100 mL = £6.28; 250 mL = £10.08; 500 mL = £13.88	—	8360	—	—	—	—	—	purified olive and soya oil 200 g, glycerol 22.5 g, egg phosphatides 12 g

<sup>3</sup> Vaminolact (Fresenius Kabi) Net price 100 mL = £4.35; 500 mL = £10.00	9.3	—	—	—	—	—	—	—

1. Note. 1000 kcal = 4200 kJ; 1000 kJ = 238.8 kcal. All entries are <sup>(PabM)</sup>

2. Excludes protein- or amino acid-derived energy

3. For use in neonates and children only

**Protein** (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (*Primene*<sup>®</sup>) or breast milk (*Vaminolact*<sup>®</sup>) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

**Energy** requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child's age and condition. A

mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

**Glucose** is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is

complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

**Fat** (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. **Additives should not be mixed with fat emulsions unless compatibility is known.**

**Electrolytes** are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce the amount of chloride infused; hyperchloraemic acidosis or hypochloraemic alkalosis can occur in pre-term neonates or children with renal impairment.

**Administration.** Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature and other specialist literature should be consulted.*

## Supplementary preparations

Compatibility with the infusion solution must be ascertained before adding supplementary preparations.

### Addiphos<sup>®</sup> (Fresenius Kabi) (PoM)

**Solution**, sterile, phosphate 40 mmol, K<sup>+</sup> 30 mmol, Na<sup>+</sup> 30 mmol/20 mL. For addition to *Vamin<sup>®</sup>* solutions and glucose intravenous infusions. Net price 20-mL vial = £1.30

### Additrace<sup>®</sup> (Fresenius Kabi) (PoM)

**Solution**, trace elements for addition to *Vamin<sup>®</sup>* solutions and glucose intravenous infusions, traces of Fe<sup>3+</sup>, Zn<sup>2+</sup>, Mn<sup>2+</sup>, Cu<sup>2+</sup>, Cr<sup>3+</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, F<sup>-</sup>, I<sup>-</sup>. For children over 40 kg. Net price 10-mL amp = £1.96

### Cernevit<sup>®</sup> (Baxter) (PoM)

**Solution**, *dl*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpanthenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg. Dissolve in 5 mL water for injections. Net price per vial = £4.64

### Decan<sup>®</sup> (Baxter) (PoM)

**Solution**, trace elements for addition to infusion solutions, Fe<sup>2+</sup>, Zn<sup>2+</sup>, Cu<sup>2+</sup>, Mn<sup>2+</sup>, F<sup>-</sup>, Co<sup>2+</sup> I<sup>-</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, Cr<sup>3+</sup>. For children over 40 kg. Net price 40-mL vial = £2.00

### Dipeptiven<sup>®</sup> (Fresenius Kabi) (PoM)

**Solution**, *N*(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg). For addition to infusion solutions containing amino acids. Net price 50 mL = £13.94, 100 mL = £25.93

**Dose**

**Amino acid supplement for hypercatabolic or hypermetabolic states**

300–400 mg/kg daily; max. 400 mg/kg daily, dose not to exceed 20% of total amino acid intake

### Glycophos<sup>®</sup> Sterile Concentrate (Fresenius Kabi) (PoM)

**Solution**, sterile, phosphate 20 mmol, Na<sup>+</sup> 40 mmol/20 mL. For addition to *Vamin<sup>®</sup>* and *Vaminolact<sup>®</sup>* solutions, and glucose intravenous infusions. Net price 20-mL vial = £3.91

### Peditrace<sup>®</sup> (Fresenius Kabi) (PoM)

**Solution**, trace elements for addition to *Vaminolact<sup>®</sup>*, *Vamin<sup>®</sup> 14 Electrolyte-Free* solutions and glucose intravenous infusions, traces of Zn<sup>2+</sup>, Cu<sup>2+</sup>, Mn<sup>2+</sup>, Se<sup>4+</sup>, F<sup>-</sup>, I<sup>-</sup>. For use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 10-mL vial = £3.55

**Cautions** reduced biliary excretion especially in cholestatic liver disease or in markedly reduced urinary excretion (careful biochemical monitoring required); total parenteral nutrition exceeding 1 month (measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment)—discontinue if manganese concentration raised or if cholestasis develops

### Solivito N<sup>®</sup> (Fresenius Kabi) (PoM)

**Solution**, powder for reconstitution, biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg. Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid<sup>®</sup>*; dissolve in *Vitlipid N<sup>®</sup>* or *Intralipid<sup>®</sup>* for adding to *Intralipid<sup>®</sup>* only. Net price per vial = £1.97

### Vitlipid N<sup>®</sup> (Fresenius Kabi) (PoM)

**Emulsion, adult**, vitamin A 330 units, ergocalciferol 20 units, *dl*-alpha tocopherol 1 unit, phytonadione 15 micrograms/mL. For addition to *Intralipid<sup>®</sup>*. For adults and children over 11 years. Net price 10-mL amp = £1.97

**Emulsion, infant**, vitamin A 230 units, ergocalciferol 40 units, *dl*-alpha tocopherol 0.7 unit, phytonadione 20 micrograms/mL. For addition to *Intralipid<sup>®</sup>*. Net price 10-mL amp = £1.97

## 9.4 Oral nutrition

### 9.4.1 Foods for special diets

#### 9.4.2 Enteral nutrition

### 9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

**Coeliac disease** Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription—see Appendix 2 (p. 808).

**Phenylketonuria** Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

**Aspartame** (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of aspartame consumed can be taken in to account in the management of the condition. Where the presence of aspartame in a preparation is specified in the product literature, aspartame is listed as an excipient in the relevant product entry in *BNF for Children*; the child or carer should be informed of this.

For further information on special dietary products used in the management of metabolic diseases, see Appendix 2.

Some rare forms of phenylketonuria are caused by a deficiency of tetrahydrobiopterin. Treatment involves oral supplementation of **tetrahydrobiopterin**; in some severe cases, the addition of the neurotransmitter precursors, levodopa (section 4.9.1) and 5-hydroxytryptophan, is also necessary.

**Sapropterin**, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

## TETRAHYDROBIOPTERIN

**Renal impairment** use with caution—accumulation of metabolites

**Pregnancy** crosses the placenta; use only if benefit outweighs risk

**Breast-feeding** present in milk, effects unknown

**Side-effects** diarrhoea, urinary frequency, disturbed sleep

**Licensed use** not licensed

**Indications and dose**

**Monotherapy in tetrahydrobiopterin-sensitive phenylketonuria** (specialist use only)

• By mouth

**Child 1 month–18 years** 10 mg/kg twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to response

**In combination with neurotransmitter precursors for tetrahydrobiopterin-sensitive phenylketonuria** (specialist use only)

• By mouth

**Child 1 month–2 years** initially 250–750 micrograms/kg 4 times daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to response; max. 7 mg/kg daily

**Child 2–18 years** initially 250–750 micrograms/kg 4 times daily (total daily dose may alternatively be given in 3 divided doses), adjusted according to response; usual max. 10 mg/kg daily

**Tetrahydrobiopterin** (Non-proprietary)

**Tablets**, tetrahydrobiopterin 10 mg and 50 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## SAPROPTERIN DIHYDROCHLORIDE

**Note** Sapropterin is a synthetic form of tetrahydrobiopterin

**Cautions** monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment; history of convulsions

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises caution—consider only if strict dietary management inadequate

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** diarrhoea, vomiting, abdominal pain, nasal congestion, cough, pharyngolaryngeal pain, headache; also reported hypersensitivity reactions

**Indications and dose**

**Phenylketonuria** (specialist use only)

• By mouth

**Child 4–18 years** initially 10 mg/kg once daily, preferably in the morning, adjusted according to response; usual dose 5–20 mg/kg daily

**Tetrahydrobiopterin deficiency** (specialist use only)

• By mouth

**Neonate** initially 2–5 mg/kg once daily, preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

**Child 1 month–18 years** initially 2–5 mg/kg once daily, preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

**Kuvan**<sup>®</sup> (Merck Serono) (POM)

**Dispersible tablets**, sapropterin dihydrochloride 100 mg, net price 30-tab pack = £597.22, 120-tab pack = £2388.88. Label: 13, 21, counselling, tablets should be dissolved in water and taken within 20 minutes

## 9.4.2 Enteral nutrition

Children have higher nutrient requirements per kg body-weight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased metabolic demands and can rapidly exhaust nutritional reserves.

Every effort should be made to optimise oral food intake before beginning enteral tube feeding; this may include change of posture, special seating, feeding equipment,

oral desensitisation, food texture changes, thickening of liquids, increasing energy density of food, treatment of reflux or oesophagitis, as well as using age-specific nutritional supplements.

Enteral tube feeding has a role in both short-term rehabilitation and long-term nutritional management in paediatrics. It can be used as supportive therapy, in which the enteral feed supplies a proportion of the required nutrients, or as primary therapy, in which the enteral feed delivers all the necessary nutrients. Most children receiving tube feeds should also be encouraged to take oral food and drink. Tube feeding should be considered in the following situations:

- unsafe swallowing and risk of aspiration;
- inability to consume at least 60% of energy needs by mouth;
- total feeding time of more than 4 hours per day;
- weight loss or no weight gain for a period of 3 months (less for younger children and infants);
- weight for height (or length) less than 2nd percentile for age and sex.

Most feeds for enteral use (Appendix 2) contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Feeds containing vitamin K may affect the INR in children receiving warfarin—see **interactions**: Appendix 1 (vitamins).

Choosing the best formula for children depends on several factors including: nutritional requirements, gastro-intestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

**Infant formula feeds** Child 0–12 months. Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The average intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amylose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet The Infant Formula and Follow-on Formula Regulations (England and Wales) 2007, which enact the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed (Appendix 2, p. 778), which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively,

energy supplements (Appendix 2, p. 801) may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load of more than 500 milliosmols/kg water to the normal functioning gut, otherwise osmotic diarrhoea will result. Concentrating or supplementing feeds should not be attempted without the advice of a paediatric dietician.

**Enteral feeds** Child 1–6 years (body-weight 8–20 kg). Ready-to-use feeds (Appendix 2, p. 778) based on caseinates, maltodextrin and vegetable oils (with or without added medium chain triglyceride (MCT) oil or fibre) are well tolerated and effective in improving nutritional status in this age group. Although originally designed for children 1–6 years (body-weight 8–20 kg), some products have ACBS approval for use in children weighing up to 30 kg (approx. 10 years of age). Enteral feeds formulated for children 1–6 years are low in sodium and potassium; electrolyte intake and biochemical status should be monitored. Older children in this age range taking small feed volumes may need to be given additional micronutrients. Fibre-enriched feeds may be helpful for children with chronic constipation or diarrhoea.

**Child 7–12 years (body-weight 21–45 kg).** Depending on age, weight, clinical condition and nutritional requirements, ready-to-use feeds (Appendix 2, p. 778) formulated for 7–12 year olds may be given at appropriate rates.

**Child over 12 years (body-weight over 45 kg).** As there are no standard enteral feeds formulated for this age group, adult formulations are used. The intake of protein, electrolytes, vitamins, and trace minerals should be carefully assessed and monitored.

**Note** Adult feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be used with caution and expert advice.

**Specialised formula** It is essential that any infant who is intolerant of breast milk or normal infant formula, or whose condition requires nutrient-specific adaptation, is prescribed an adequate volume of a nutritionally complete replacement formula (see Appendix 2, p. 790). In the first 4 months of life, a volume of 150–200 mL/kg/day is recommended. After 6 months, should the formula still be required, a volume of 600 mL/day should be maintained, in addition to solid food.

**Products for cow's milk protein intolerance or lactose intolerance.** There are a number of infant formulas formulated for cow's milk protein intolerance or lactose intolerance; these feeds may contain a residual amount of lactose (less than 1 g/100 mL formula)—sometimes described as clinically lactose-free or 'lactose-free' by manufacturers. If the total daily intake of these formulas is low, it may be necessary to supplement with calcium, and a vitamin and mineral supplement.

**Soya-based** infant formulas have a high phytoestrogen content and this may be a long-term reproductive health risk. The Chief Medical Officer has advised that soya-based infant formulas should not be used as the first choice for the management of infants with proven cow's milk sensitivity, lactose intolerance, galactokinase deficiency and galactosaemia. Most UK paediatricians with expertise in inherited metabolic disease still advocate soya-based formulations for infants with galactosaemia as there are concerns about the residual lactose content

of low lactose formulas and protein hydrolysates based on cow's milk protein.

**Low lactose** infant formulations, based on whole cow's milk protein, are unsuitable for children with cow's milk protein intolerance. Liquid soya milks purchased from supermarkets and health food stores are not nutritionally complete and should never be used for infants under 1 year of age.

**Protein hydrolysate formulas.** Non-milk, peptide-based feeds containing hydrolysates of casein, whey, meat and soya protein, are suitable for infants with disaccharide or whole protein intolerance. The total daily intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet the child's nutritional requirements; these feeds have a high osmolality when given at recommended dilution and need gradual and careful introduction.

**Elemental (amino acid based formula).** Specially formulated elemental feeds containing essential and non-essential amino acids are available for use in infants and children under 6 years with proven whole protein intolerance. Adult elemental formula may be used for children over 6 years; the intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet nutritional requirements. These feeds have a high osmolality when given at the recommended concentration and therefore need gradual and careful introduction.

**Modular feeds.** Modular feeds (see Specialised Formulas for Specific Clinical Conditions, p. 800) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

**Specialised formula.** Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

**Feed thickeners** **Carob based thickeners** (Appendix 2, p. 807) may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeds.

**Pre-thickened formula** Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

**Starched based thickeners** can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

**Dietary supplements for oral use** (Appendix 2, p. 783) Three types of prescribable fortified dietary supplements are available: fortified milk and non-milk

tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1680 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.

**Products for metabolic diseases** There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases, Appendix 2, p. 811). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

**Preparations (Borderline substances)** See Appendix 2.

## 9.5 Minerals

9.5.1 Calcium and magnesium

9.5.2 Phosphorus

9.5.3 Fluoride

9.5.4 Zinc

See section 9.1.1 for iron salts.

### 9.5.1 Calcium and magnesium

9.5.1.1 Calcium supplements

9.5.1.2 Hypercalcaemia and hypercalciuria

9.5.1.3 Magnesium

#### 9.5.1.1 Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (section 9.6.4), impaired metabolism, a failure of secretion (hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

*Mild asymptomatic hypocalcaemia* may be managed with oral calcium supplements. *Severe symptomatic hypocalcaemia* requires an intravenous infusion of calcium gluconate 10% over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection is also available, but is more irritant; care should be taken to prevent extravasation.

For the role of calcium gluconate in temporarily reducing the toxic effects of *hyperkalaemia*, see p. 464.

Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfacalcidol or

calcitriol) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferol) if due to vitamin D deficiency (section 9.6.4). It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

**Neonates** Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

## CALCIUM SALTS

**Cautions** see notes above; sarcoidosis; history of nephrolithiasis; avoid calcium chloride in respiratory acidosis or respiratory failure; **interactions:** Appendix 1 (antacids, calcium salts)

**Contra-indications** conditions associated with hypercalcaemia and hypercalciuria (e.g. some forms of malignant disease); see also Calcium Gluconate injection, p. 478

**Renal impairment** use with caution; risk of hypercalcaemia and renal calculi

**Side-effects** rarely gastro-intestinal disturbances; with injection, bradycardia, arrhythmias, peripheral vasodilatation, fall in blood pressure, sweating, injection-site reactions, severe tissue damage with extravasation

### Indications and dose

See notes above; calcium deficiency

#### • By mouth

**Neonate** 0.25 mmol/kg 4 times a day, adjusted to response

**Child 1 month–4 years** 0.25 mmol/kg 4 times a day, adjusted to response

**Child 5–12 years** 0.2 mmol/kg 4 times a day, adjusted to response

**Child 12–18 years** 10 mmol 4 times a day, adjusted to response

### Acute hypocalcaemia, urgent correction; hyperkalaemia (prevention of arrhythmias)

#### • By slow intravenous injection over 5–10 minutes

**Neonate** 0.11 mmol/kg (0.5 mL/kg of calcium gluconate 10%) as a single dose. [Some units use a dose of 0.46 mmol/kg (2 mL/kg calcium gluconate 10%) for hypocalcaemia in line with US practice]

**Child 1 month–18 years** 0.11 mmol/kg (0.5 mL/kg calcium gluconate 10%), max 4.5 mmol (20 mL calcium gluconate 10%)

### Acute hypocalcaemia, maintenance

#### • By continuous intravenous infusion

**Neonate** 0.5 mmol/kg daily over 24 hours, adjusted to response, use oral route as soon as possible due to risk of extravasation

**Child 1 month–2 years** 1 mmol/kg daily (usual max 8.8 mmol) over 24 hours, use oral route as soon as possible due to risk of extravasation

**Child 2–18 years** 8.8 mmol over 24 hours, use oral route as soon as possible due to risk of extravasation

## Oral preparations

### Calcium Gluconate (Non-proprietary)

**Effervescent tablets**, calcium gluconate 1 g (calcium 89 mg or  $\text{Ca}^{2+}$  2.23 mmol), net price 28-tab pack = £14.82. Label: 13

**Note** Each tablet usually contains 4.46 mmol  $\text{Na}^+$

### Calcium Lactate (Non-proprietary)

**Tablets**, calcium lactate 300 mg (calcium 39 mg or  $\text{Ca}^{2+}$  1 mmol), net price 84 = £4.57

### Adcal<sup>®</sup> (ProStrakan)

**Chewable tablets**, fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or  $\text{Ca}^{2+}$  15 mmol), net price 100-tab pack = £8.70. Label: 24

### Cacit<sup>®</sup> (Warner Chilcott)

**Tablets**, effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or  $\text{Ca}^{2+}$  12.5 mmol), net price 76-tab pack = £11.81. Label: 13

### Calcichew<sup>®</sup> (Takeda)

**Tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or  $\text{Ca}^{2+}$  12.5 mmol), net price 100-tab pack = £9.33. Label: 24

**Forte tablets** (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or  $\text{Ca}^{2+}$  25 mmol), net price 60-tab pack = £13.16. Label: 24

**Excipients** include aspartame (section 9.4.1)

### Calcium-500 (Martindale)

**Tablets**, pink, f/c, calcium carbonate 1.25 g (calcium 500 mg or  $\text{Ca}^{2+}$  12.5 mmol), net price 100-tab pack = £9.46. Label: 25

### Calcium-Sandoz<sup>®</sup> (Alliance)

**Syrup**, orange flavour, calcium gluconate 1.09 g, calcium lactobionate 727 mg (calcium 108.3 mg or  $\text{Ca}^{2+}$  2.7 mmol)/5 mL, net price 300 mL = £4.07

### Sandocal<sup>®</sup> (Novartis Consumer Health)

**Sandocal 1000 tablets**, effervescent, orange flavour, calcium lactate gluconate 2.263 g, calcium carbonate 1.75 g, providing 1 g calcium ( $\text{Ca}^{2+}$  25 mmol), net price 3 × 10-tab pack = £6.91. Label: 13

**Excipients** include aspartame (section 9.4.1)

## Parenteral preparations

### Calcium Gluconate (Non-proprietary) <sup>(PoM)</sup>

**Injection**, calcium gluconate 10% ( $\text{Ca}^{2+}$  approx. 225 micromol/mL). Net price 10-mL amp = 65p

**Administration** For *intravenous infusion* dilute to at least 45 micromol/mL with Glucose 5% or Sodium Chloride 0.9%. Maximum administration rate 45 micromol/kg/hour (or in neonates max. 22 micromol/kg/hour). May be given more concentrated via a central venous catheter. May be used undiluted (10% calcium gluconate) in emergencies. Avoid extravasation; should not be given by intramuscular injection. Incompatible with sodium bicarbonate and phosphate solutions.

**Note** The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended

**Calcium Chloride** (Non-proprietary) (PoM)

**Injection**, calcium chloride dihydrate 10% (calcium 27.3 mg or  $\text{Ca}^{2+}$  680 micromol/mL), net price 10-mL disposable syringe = £6.94

**Brands include** *Minijet<sup>®</sup> Calcium Chloride 10%*

**Injection**, calcium chloride dihydrate 13.4% (calcium 36 mg or  $\text{Ca}^{2+}$  910 micromol/mL), net price 10-mL amp = £14.94

■ **With vitamin D**

Section 9.6.4

### 9.5.1.2 Hypercalcaemia and hypercalciuria

**Severe hypercalcaemia** Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of **sodium chloride 0.9%**. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium (section 6.6.2) is probably the most effective.

**Corticosteroids** (section 6.3) are widely given, but may only be useful where hypercalcaemia is due to sarcoïdosis or vitamin D intoxication; they often take several days to achieve the desired effect.

**Calcitonin** (section 6.6.1) can be used by specialists for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful. Parathyroidectomy may be indicated for hyperparathyroidism.

**Hypercalciuria** Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

### 9.5.1.3 Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate (section 1.6.4) as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypomagnesaemia* (causing muscle weakness and arrhythmias) is rare.

**Hypomagnesaemia** Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur as a result of treatment with certain drugs. Hypo-

magnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of **magnesium sulfate**; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 0.2–0.4 mmol/kg (usual max. 20 mmol  $\text{Mg}^{2+}$  daily).

**Arrhythmias** Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes* (see also section 2.3.1).

## MAGNESIUM SULFATE

**Note** Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate

**Cautions** see notes above; in severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump); monitor blood pressure, respiratory rate, urinary output and for signs of overdose (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech); **interactions:** Appendix 1 (magnesium, parenteral)

**Hepatic impairment** avoid in hepatic coma if risk of renal failure

**Renal impairment** avoid or reduce dose; increased risk of toxicity

**Pregnancy** sufficient may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns

**Side-effects** generally associated with hypermagnesaemia, nausea, vomiting, thirst, flushing of skin, hypotension, arrhythmias, coma, respiratory depression, drowsiness, confusion, loss of tendon reflexes, muscle weakness

### Indications and dose

#### Neonatal hypocalcaemia

- By deep intramuscular injection or intravenous infusion

**Neonate** 0.4 mmol/kg  $\text{Mg}^{2+}$  (100 mg/kg magnesium sulfate heptahydrate) 12 hourly for 2–3 doses

#### Hypomagnesaemia

- By intravenous injection over at least 10 minutes

**Neonate** 0.4 mmol/kg  $\text{Mg}^{2+}$  (100 mg/kg magnesium sulfate heptahydrate) 6–12 hourly as necessary

**Child 1 month–12 years** 0.2 mmol/kg  $\text{Mg}^{2+}$  (50 mg/kg magnesium sulfate heptahydrate) 12 hourly as necessary

**Child 12–18 years** 4 mmol  $\text{Mg}^{2+}$  (1 g magnesium sulfate heptahydrate) 12 hourly as necessary

**Torsade de pointes** (consult local guidelines)

- By intravenous injection over 10–15 minutes

**Child 1 month–18 years** 0.1–0.2 mmol/kg (25–50 mg/kg magnesium sulfate heptahydrate); max. 8 mmol (2 g magnesium sulfate heptahydrate); dose repeated once if necessary

**Persistent pulmonary hypertension** section 2.5.1

**Severe acute asthma** section 3.1

**Administration** Dilute to 10% (100 mg magnesium sulfate heptahydrate (0.4 mmol  $Mg^{2+}$ ) in 1 mL) with Glucose 5 or 10%, Sodium Chloride 0.45 or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute (0.04 mmol/kg/minute  $Mg^{2+}$ ) of magnesium sulfate heptahydrate

**Note** Magnesium sulfate heptahydrate 1 g equivalent to  $Mg^{2+}$  approx. 4 mmol

**Magnesium Sulfate Injection, BP** (Non-proprietary) <sup>(PoM)</sup>

**Injection**, magnesium sulfate heptahydrate 20% ( $Mg^{2+}$  approx. 0.8 mmol/mL), net price 20-mL (4-g) amp = £16.98; 50% ( $Mg^{2+}$  approx. 2 mmol/mL), 2-mL (1-g) amp = £1.09, 4-mL (2-g) prefilled syringe = £10.23; 5-mL (2.5-g) amp = £5.56, 10-mL (5-g) amp = £1.46; 10-mL (5-g) prefilled syringe = £4.95

**Brands include** *Minijet<sup>®</sup> Magnesium Sulfate Injection BP*

50%

**Note** The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions ( $Mg^{2+}$ ) in mmol/mL

## MAGNESIUM-L-ASPARTATE

**Cautions** see under Magnesium Sulfate

**Renal impairment** avoid or reduce dose; increased risk of toxicity

**Side-effects** see under Magnesium Sulfate; also diarrhoea

**Licensed use** classified as a Food for Special Medical Purposes for use in children over 2 years

**Indications and dose**

**Hypomagnesaemia (but see notes above)**

- By mouth

**Child 1 month–2 years** initially 0.2 mmol/kg of  $Mg^{2+}$  3 times daily dissolved in water, dose adjusted as required

**Child 2–10 years** half a sachet (5 mmol  $Mg^{2+}$ ) daily dissolved in 100 mL of water, dose adjusted as required

**Child 10–18 years** one sachet (10 mmol  $Mg^{2+}$ ) daily dissolved in 200 mL of water, dose adjusted as required

**Magnaspartate<sup>®</sup>** (KoRa)

**Oral powder**, magnesium-L-aspartate 6.5 g (10 mmol  $Mg^{2+}$ )/sachet, net price 10-sachet pack = £7.95

**Excipients** include sucrose

## MAGNESIUM GLYCEROPHOSPHATE

**Cautions** see under Magnesium Sulfate

**Renal impairment** avoid or reduce dose; increased risk of toxicity

**Side-effects** see under Magnesium Sulfate; also diarrhoea

**Licensed use** not licensed

**Indications and dose**

**Hypomagnesaemia (but see notes above)**

- By mouth

**Child 1 month–12 years** initially 0.2 mmol/kg  $Mg^{2+}$  3 times daily, dose adjusted as required

**Child 12–18 years** initially 4–8 mmol  $Mg^{2+}$  3 times daily, dose adjusted as required

**Administration** tablets may be dispersed in water

**Magnesium Glycerophosphate** (Non-proprietary)

**Tablets**, magnesium glycerophosphate 1 g (approximately magnesium 97 mg or  $Mg^{2+}$  4 mmol)

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Liquid**, magnesium glycerophosphate 250 mg/mL (approximately magnesium 24.25 mg or  $Mg^{2+}$  1 mmol/mL)

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## 9.5.2 Phosphorus

9.5.2.1 Phosphate supplements

9.5.2.2 Phosphate-binding agents

### 9.5.2.1 Phosphate supplements

Oral phosphate supplements may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets (section 9.6.4). Diarrhoea is a common side-effect and should prompt a reduction in dosage.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of severe hypophosphatemia because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue; excessive doses may cause hypocalcaemia and metastatic calcification. It is essential to monitor plasma concentrations of calcium, phosphate, potassium and other electrolytes. It is recommended that severe hypophosphataemia be treated intravenously as large doses of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of calcium phosphate in the kidney and other tissues. If used, the child should be well hydrated and electrolytes monitored.

**Neonates** Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolality of the milk should be considered.

## PHOSPHATE

**Cautions** see notes above, also cardiac disease, diabetes mellitus, dehydration; avoid extravasation with parenteral forms, severe tissue necrosis; sodium and potassium concentrations of preparations

**Renal impairment** reduce dose; monitor closely

**Side-effects** nausea, diarrhoea; hypotension, oedema; hypocalcaemia; acute renal failure; phlebitis; tissue necrosis on extravasation

### Indications and dose

**Hypophosphataemia, including hypophosphataemic rickets and osteomalacia** (see notes above)

#### • By mouth

**Neonate** 1 mmol/kg daily in 1–2 divided doses, or as a supplement in breast milk

**Child 1 month–5 years** 2–3 mmol/kg (max. 48 mmol) phosphate daily in 2–4 divided doses, adjusted as necessary

**Child 5–18 years** 2–3 mmol/kg (max. 97 mmol) phosphate daily in 2–4 divided doses, adjusted as necessary

**Administration** Caution, solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details

#### • By intravenous infusion (see notes above, administration below, and seek specialist advice)

**Neonate** 1 mmol/kg phosphate daily, adjusted as necessary

**Child 1 month–2 years** 0.7 mmol/kg phosphate daily, adjusted as necessary

**Child 2–18 years** 0.4 mmol/kg phosphate daily, adjusted as necessary

**Administration** (see also Important, below) Dilute injection with Sodium Chloride 0.9% or 0.45% or Glucose 5% or 10%. Administration rate of phosphate should not exceed 0.05 mmol/kg/hour. In emergencies in intensive care faster rates may be used—seek specialist advice

### Important

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the *concentration* of potassium should not usually exceed 40 mmol/litre. The infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the *rate* at which they may be administered, see section 9.2.2.1.

### Oral

#### Phosphate-Sandoz® (HK Pharma)

**Tablets**, effervescent, anhydrous sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na<sup>+</sup> 20.4 mmol), potassium 123 mg (K<sup>+</sup> 3.1 mmol). Net price 20 = £3.29. Label: 13

### Injection

#### Phosphates (Fresenius Kabli) (PoM)

**Intravenous infusion**, phosphates (providing phosphate 100 mmol/litre, potassium 19 mmol/litre, sodium 162 mmol/litre), net price 500 mL (*Polyfusor*®) = £53.40.

#### Potassium acid phosphate (Non-proprietary) (PoM)

**Injection**, 13.6% (1 mmol/mL phosphate, 1 mmol/mL potassium) 10 mL ampoule

**Note** See also Important, p. 481

#### Dipotassium hydrogen phosphate (Non-proprietary) (PoM)

**Injection**, 17.42% (1 mmol/mL phosphate and 2 mmol/mL potassium) 10 mL ampoule

**Note** See also Important, p. 481

#### Disodium hydrogen phosphate (Non-proprietary) (PoM)

**Injection**, 17.42% (0.6 mmol/mL phosphate and 1.2 mmol/mL sodium) 10 mL ampoule

## 9.5.2.2 Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

**Sevelamer hydrochloride** is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer may be useful when hypercalcaemia prevents the use of calcium carbonate.

## ALUMINIUM HYDROXIDE

**Cautions** see notes above; **interactions:** Appendix 1 (antacids)

**Side-effects** constipation; hyperaluminiaemia

#### Alu-Cap® (Meda)

**Capsules**, green/red, dried aluminium hydroxide 475 mg (low Na<sup>+</sup>), net price 120-cap pack = £13.71

#### Dose

##### Hyperphosphataemia

#### • By mouth

**Child 5–12 years** 1–2 capsules 3–4 times daily, adjusted as necessary

**Child 12–18 years** 1–5 capsules 3–4 times daily, adjusted as necessary

## CALCIUM SALTS

**Cautions** **interactions:** Appendix 1 (antacids, calcium salts)

**Contra-indications** hypercalcaemia, hypercalcauria

**Side-effects** hypercalcaemia

### Indications and dose

**Phosphate binding in renal failure and hyperphosphataemia**

#### • By mouth

**Child 1 month–1 year** 120 mg calcium carbonate 3–4 times daily with feeds, adjusted as necessary

**Child 1–6 years** 300 mg calcium carbonate 3–4 times daily prior to or with meals, adjusted as necessary

**Child 6–12 years** 600 mg calcium carbonate 3–4 times daily prior to or with meals, adjusted as necessary

**Child 12–18 years** 1.25 g calcium carbonate 3–4 times daily prior to or with meals, adjusted as necessary

**Adcal®**

Section 9.5.1.1

**Calcichew®**

Section 9.5.1.1

**Calcium-500**

Section 9.5.1.1

**Phosex®** (Pharmacosmos)

Tablets, yellow, scored, calcium acetate 1 g (calcium 250 mg or  $\text{Ca}^{2+}$  6.2 mmol), net price 180-tab pack = £19.79. Counselling, tablets can be broken to aid swallowing but not chewed (bitter taste), take with meals

**Dose**

Phosphate-binding agent (with meals) in renal failure, according to the requirements of the patient

**SEVELAMER HYDROCHLORIDE**

**Cautions** gastro-intestinal disorders; **interactions:** Appendix 1 (sevelamer)

**Contra-indications** bowel obstruction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; *very rarely* intestinal obstruction; *also reported* intestinal perforation, ileus, diverticulitis, pruritus, and rash

**Licensed use** not licensed for use in children under 18 years

**Indications and dose**

**Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis**

- By mouth

**Child 12–18 years** initially 0.8–1.6 g 3 times daily with meals, then adjusted according to plasma-phosphate concentration

**Renegel®** (Sanofi-Aventis) (PoM)

Tablets, f/c, sevelamer hydrochloride 800 mg, net price 180-tab pack = £167.04. Label: 25, counselling, with meals

**Excipients** include propylene glycol (see Excipients, p. 2)

**9.5.3 Fluoride**

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provide suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of

fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent the child from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

Fluoride mouthwash, oral drops, tablets, and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see preparations below).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

**FLUORIDES**

**Note** Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion

**Contra-indications** not for areas where drinking water is fluoridated

**Side-effects** occasional white flecks on teeth with recommended doses; *rarely* yellowish-brown discoloration if recommended doses are exceeded

**Indications and dose**

Dose expressed as fluoride ion ( $\text{F}^-$ )

**Prophylaxis of dental caries—see notes above**

Water content less than  $\text{F}^-$  300 micrograms/litre (0.3 parts per million)

- By mouth

**Child 6 months–3 years**  $\text{F}^-$  250 micrograms daily

**Child 3–6 years**  $\text{F}^-$  500 micrograms daily

**Child 6 years and over**  $\text{F}^-$  1 mg daily

Water content between  $\text{F}^-$  300 and 700 micrograms/litre (0.3–0.7 parts per million)

**Child 3–6 years**  $\text{F}^-$  250 micrograms daily

**Child 6 years and over**  $\text{F}^-$  500 micrograms daily

Water content above  $\text{F}^-$  700 micrograms/litre (0.7 parts per million), supplements not advised

**Note** These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; 182: 6–7)

**Tablets**

**Counselling** Tablets should be sucked or dissolved in the mouth and taken preferably in the evening. There are arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

**En-De-Kay®** (Manx)

**Fluotabs 3–6 years**, orange-flavoured, scored, sodium fluoride 1.1 mg ( $\text{F}^-$  500 micrograms), net price 200-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Fluotabs 6+ years**, orange-flavoured, scored, sodium fluoride 2.2 mg ( $\text{F}^-$  1 mg), net price 200-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Fluor-a-day<sup>®</sup>** (Dental Health)

**Tablets**, buff, sodium fluoride 1.1 mg (F<sup>-</sup> 500 micrograms), net price 200-tab pack = £2.79; 2.2 mg (F<sup>-</sup> 1 mg), 200-tab pack = £2.79

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Oral drops**

**Note** Fluoride supplements not considered necessary below 6 months of age (see notes above)

**En-De-Kay<sup>®</sup>** (Manx)

**Fluodrops<sup>®</sup>** (= paediatric drops), sugar-free, sodium fluoride 550 micrograms (F<sup>-</sup> 250 micrograms)/0.15 mL. Net price 60 mL = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Oral Drops

**Mouthwashes**

Rinse mouth for 1 minute and spit out

**Counselling** Avoid eating, drinking, or rinsing mouth for 15 minutes after use

**En-De-Kay<sup>®</sup>** (Manx)

**Daily fluoride mouthrinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 250 mL = £1.50

**Dose**

**Child 6 years and over** for *daily* use, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Fluorinse** (= mouthwash), red, sodium fluoride 2%. Net price 100 mL = £4.97. Counselling, see above

**Dose**

**Child 8 years and over** for *daily* use, dilute 5 drops to 10 mL of water; for *weekly* use, dilute 20 drops to 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 2%

**FluoriGard<sup>®</sup>** (Colgate-Palmolive)

**Daily dental rinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 400 mL = £2.99. Counselling, see above

**Dose**

**Child 6 years and over** for *daily* use, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Toothpastes****Duraphat<sup>®</sup>** (Colgate-Palmolive) (PoM)

**Duraphat<sup>®</sup> '2800 ppm' toothpaste**, sodium fluoride 0.619%. Net price 75 mL = £3.26. Counselling, see below

**Dose**

**Child over 10 years** apply 1 cm twice daily using a toothbrush

**Counselling** Brush teeth for 1 minute before spitting out. Avoid drinking or rinsing mouth for 30 minutes after use

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 0.619%

**Duraphat<sup>®</sup> '5000 ppm' toothpaste**, sodium fluoride 1.1%. Net price 51 g = £6.50. Counselling, see below

**Dose**

**Child over 16 years** apply 2 cm 3 times daily after meals using a toothbrush

**Counselling** Brush teeth for 3 minutes before spitting out

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 1.1%

**9.5.4 Zinc**

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states. Zinc is used in the treatment of Wilson's disease (section 9.8.1) and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc (section 9.3). If necessary, further zinc can be added to some intravenous feeding regimens.

**ZINC SULFATE**

**Cautions interactions:** Appendix 1 (zinc)

**Renal impairment** accumulation may occur in acute renal failure

**Pregnancy** crosses placenta; risk theoretically minimal, but no information available

**Breast-feeding** present in milk; risk theoretically minimal, but no information available

**Side-effects** abdominal pain, dyspepsia, nausea, vomiting, diarrhoea, gastric irritation, gastritis; irritability, headache, lethargy

**Licensed use** *Solvazinc<sup>®</sup>* not licensed for use in acrodermatitis enteropathica

**Solvazinc<sup>®</sup>** (Galen)

**Effervescent tablets**, zinc sulfate monohydrate

125 mg (45 mg zinc), net price 30 = £4.32. Label: 13, 21

**Dose**

**Zinc deficiency** (see notes above)

● By mouth

**Neonate** 1 mg/kg elemental zinc daily

**Child under 10 kg** half a tablet daily in water after food, adjusted as necessary

**Child 10–30 kg** half a tablet 1–3 times daily in water after food, adjusted as necessary

**Child over 30 kg** 1 tablet 1–3 times daily in water after food, adjusted as necessary

**Acrodermatitis enteropathica**

● By mouth

**Neonate** 0.5–1 mg/kg elemental zinc twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted as necessary

**Child 1 month–18 years** 0.5–1 mg/kg elemental zinc twice daily (total daily dose may alternatively be given in 3 divided doses), adjusted as necessary

## 9.6 Vitamins

- 9.6.1 **Vitamin A**
- 9.6.2 **Vitamin B group**
- 9.6.3 **Vitamin C**
- 9.6.4 **Vitamin D**
- 9.6.5 **Vitamin E**
- 9.6.6 **Vitamin K**
- 9.6.7 **Multivitamin preparations**

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron-deficiency anaemia, a primary vitamin or mineral deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn's disease.

The use of vitamins as general 'pick-me-ups' is of unproven value and the 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine, is unscientific and can be harmful. Many vitamin supplements are described as 'multivitamin' but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects 41*. London: HMSO, 1991

**Dental patients** It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

### 9.6.1 Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation (section 9.6.7) once enteral feeding has been established.

Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

**Pregnancy** In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.

### VITAMIN A (Retinol)

**Cautions** see notes above; **interactions:** Appendix 1 (vitamins)

**Pregnancy** excessive doses can be teratogenic; see also notes above

**Breast-feeding** toxicity likely if mother taking high doses

**Side-effects** see notes above

**Licensed use** preparations containing only vitamin A are not licensed

#### Indications and dose

See also notes above

#### Vitamin A deficiency

- **By mouth**

**Neonate** 5000 units daily

**Child 1 month–1 year** 5000 units daily with or after food

**Child 1–18 years** 10 000 units daily with or after food

**Note** Higher doses may be used initially for treatment of severe deficiency

#### Prevention of deficiency in complete biliary obstruction

- **By intramuscular injection**

**Neonate** 50 000 units once a month

**Child 1 month–1 year** 50 000 units once a month

**Arovit<sup>®</sup>** (Non-proprietary)

**Oral solution**, vitamin A 150 000 units/mL (1 drop contains approx. 5000 units)

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Aquasol-A<sup>®</sup>** (Non-proprietary)

**Injection**, vitamin A (as palmitate) 50 000 units/mL, 2-mL amp

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

### VITAMINS A and D

**Cautions** see notes above and section 9.6.4; prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis; **interactions:** Appendix 1 (vitamins)

**Pregnancy** see notes above

**Side-effects** see notes above and section 9.6.4

**Licensed use** not licensed in children under 6 months of age

#### Indications and dose

See notes above and section 9.6.4

**Prevention of vitamin A and D deficiency** see individual preparations for dose information

## ▲ Vitamins A and D

### Vitamins A and D (Non-proprietary)

**Capsules**, vitamin A 4000 units, vitamin D 400 units (10 micrograms). Net price 84 = £8.42

**Note** May be difficult to obtain

#### Dose

**Child 1–18 years** 1 capsule daily

## ▲ Vitamins A, C and D

### Healthy Start Children's Vitamin Drops (Non-proprietary)

**Oral drops**, vitamin A 5000 units, vitamin D 2000 units (50 micrograms), ascorbic acid 150 mg/mL

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at [www.healthystart.nhs.uk](http://www.healthystart.nhs.uk). Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

**Note** Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at [www.healthystart.nhs.uk](http://www.healthystart.nhs.uk). Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

#### Dose

#### Prevention of vitamin deficiency

##### • By mouth

**Child 1 month–5 years** 5 drops daily (5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg)

**Note** Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at [www.healthystart.nhs.uk](http://www.healthystart.nhs.uk). Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

## 9.6.2 Vitamin B group

Deficiency of the B vitamins, other than vitamin B<sub>12</sub> (section 9.1.2), is rare in the UK and is usually treated by preparations containing thiamine (B<sub>1</sub>), and riboflavin (B<sub>2</sub>). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol, and pantothenic acid or panthenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders (section 9.8.1). Anaphylaxis has been reported with parenteral B vitamins (see MHRA/CHM advice, below).

As with other vitamins of the B group, pyridoxine (B<sub>6</sub>) deficiency is rare, but it may occur during isoniazid therapy (section 5.1.9) or penicillamine treatment in Wilson's disease (section 9.8.1) and is characterised by peripheral neuritis. High doses of pyridoxine are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid supplementation may also be beneficial in these disorders (section 9.1.2). Pyridoxine is also used in sideroblastic anaemia (section 9.1.3). Rarely, seizures in the neonatal period or during infancy respond to pyridoxine treatment; pyridoxine should be tried in all cases of early-onset intractable seizures and status epilepticus. Pyridoxine has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy, and overdosage induces toxic effects.

A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders

require specialist management. **Thiamine** is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidurias and cytochrome oxidase deficiencies; biotin (section 9.8.1) is used in carboxylase defects.

Folic acid and vitamin B<sub>12</sub> are used in the treatment of megaloblastic anaemia (section 9.1.2). Folic acid (available as calcium folinate) is used in association with cytotoxic therapy (section 8.1).

## RIBOFLAVIN

(Riboflavine, vitamin B<sub>2</sub>)

**Cautions** see notes above

**Pregnancy** crosses the placenta but no adverse effects reported, information at high doses limited

**Breast-feeding** present in breast milk but no adverse effects reported, information at high doses limited

**Side-effects** bright yellow urine

**Licensed use** not licensed in children

### Indications and dose

See also notes above

#### Metabolic diseases

##### • By mouth

**Neonate** 50 mg 1–2 times daily, adjusted according to response

**Child 1 month–18 years** 50–100 mg 1–2 times daily, adjusted according to response, up to 400 mg daily has been used

### Riboflavin (Non-proprietary)

**Tablets**, 10 mg, 50 mg and 100 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

### ▲ Oral vitamin B complex preparations

See below

## THIAMINE

(Vitamin B<sub>1</sub>)

**Cautions** anaphylactic shock may occasionally follow injection (see MHRA/CHM advice below)

### MHRA/CHM advice (September 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

1. This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
2. Intravenous administration should be by infusion over 30 minutes;
3. Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

**Breast-feeding** severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk

**Side-effects** hypersensitivity reactions to injection

**Licensed use** not licensed in children

**Indications and dose**

See also notes above

**Maple syrup urine disease**

- By mouth

**Neonate** 5 mg/kg daily, adjusted as necessary**Child 1 month–18 years** 5 mg/kg daily, adjusted as necessary**Metabolic disorders including congenital lactic acidosis**

- By mouth or by intravenous infusion over 30 minutes

**Neonate** 50–200 mg once daily (total dose may alternatively be given in 2–3 divided doses), adjusted as necessary**Child 1 month–18 years** 100–300 mg once daily (total dose may alternatively be given in 2–3 divided doses), adjusted as necessary; up to 2 g daily may be necessary**Thiamine** (Non-proprietary)

Tablets, thiamine hydrochloride 50 mg, net price 100 = £3.85; 100 mg, 100 = £5.98

**Brands include** Benerva® 

Injection, 50 mg/mL, 2-mL vial; 100 mg/mL, 2-mL vial

Injection (intramuscular), 100 mg/mL, 5-mL vial Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Note** Some preparations may contain phenol as a preservative**Oral vitamin B complex preparations**

See below

**PYRIDOXINE HYDROCHLORIDE**  
(Vitamin B<sub>6</sub>)**Cautions** see notes above; risk of cardiovascular collapse with intravenous injection—resuscitation facilities must be available, monitor closely; **interactions:** Appendix 1 (vitamins)**Side-effects** sensory neuropathy reported with high doses given for extended periods**Licensed use** not licensed for use in children**Indications and dose**

See also notes above

**Metabolic diseases including cystathioninuria and homocystinuria**

- By mouth

**Neonate** 50–100 mg 1–2 times daily**Child 1 month–18 years** 50–250 mg 1–2 times daily**Treatment of isoniazid-induced neuropathy**

- By mouth

**Neonate** 5–10 mg daily**Child 1 month–12 years** 10–20 mg 2–3 times daily**Child 12–18 years** 30–50 mg 2–3 times daily**Prevention of isoniazid-induced neuropathy**

- By mouth

**Neonate** 5 mg daily**Child 1 month–12 years** 5–10 mg daily**Child 12–18 years** 10 mg daily**Prevention of penicillamine-induced neuropathy in Wilson's disease (see notes above)**

- By mouth

**Child 1–12 years** 5–10 mg daily**Child 12–18 years** 10 mg daily**Pyridoxine-dependent seizures**

- By intravenous injection or by mouth

**Neonate** initial test dose 50–100 mg by intravenous injection, may be repeated; if responsive followed by an oral maintenance dose of 50–100 mg once daily, adjusted as necessary**Child 1 month–12 years** initial test dose 50–100 mg daily; if responsive followed by an oral dose of 20–50 mg 1–2 times daily, adjusted as necessary; doses up to 30 mg/kg or 1 g daily have been used**Pyridoxine** (Non-proprietary)

Tablets, pyridoxine hydrochloride 10 mg, net price 500 = £8.48; 20 mg, 500 = £8.53; 50 mg, 28 = £3.29

Injection, 25 mg/mL, 2 mL vial

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Oral vitamin B complex preparations****Note** Other multivitamin preparations are in section 9.6.7.**Vitamin B Tablets, Compound** 

Tablets, nicotinamide 15 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, net price 28 = £22.26

**Vitamin B Tablets, Compound, Strong** 

Tablets, brown, f/c or s/c, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, riboflavin 2 mg, thiamine hydrochloride 5 mg. Net price 28-tab pack = £2.03

**Vigranon B®** (Wallace Mfg) **Syrup**, thiamine hydrochloride 5 mg, riboflavin 2 mg, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, panthenol 3 mg/5 mL. Net price 150 mL = £2.41**Dose****Treatment of deficiency**

- By mouth

**Child 1 month–1 year** 5 mL 3 times daily**Child 1–12 years** 10 mL 3 times daily**Child 12–18 years** 10–15 mL 3 times daily**Prophylaxis of deficiency**

- By mouth

**Child 1 month–1 year** 5 mL once daily**Child 1–12 years** 5 mL twice daily**Child 12–18 years** 5 mL 3 times daily**9.6.3 Vitamin C**  
(Ascorbic acid)

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency have been reported. Vitamin C is used to enhance the excretion of iron one month after starting desferrioxamine therapy (section 9.1.3); it is given separately from food as it also enhances iron absorption. Vitamin C is also used in the treatment of some inherited metabolic disorders, particularly mitochondrial disorders; specialist management of these conditions is required.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a child with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

## ASCORBIC ACID

(Vitamin C)

**Cautions** interactions: Appendix 1 (vitamins)

**Contra-indications** hyperoxaluria

**Side-effects** nausea, diarrhoea; headache, fatigue; hyperoxaluria

**Licensed use** not licensed for metabolic disorders

### Indications and dose

#### Treatment of scurvy

- By mouth

**Child 1 month–4 years** 125–250 mg daily in 1–2 divided doses

**Child 4–12 years** 250–500 mg daily in 1–2 divided doses

**Child 12–18 years** 500 mg–1 g daily in 1–2 divided doses

#### Adjunct to desferrioxamine (see notes above)

- By mouth

**Child 1 month–18 years** 100–200 mg daily 1 hour before food

**Metabolic disorders** (tyrosinaemia type III; transient tyrosinaemia of the newborn; glutathione synthase deficiency; Hawkinsinuria)

- By mouth

**Neonate** 50–200 mg daily, adjusted as necessary

**Child 1 month–18 years** 200–400 mg daily in 1–2 divided doses, adjusted as necessary; up to 1 g daily may be required

### Ascorbic Acid (Non-proprietary)

**Tablets**, ascorbic acid 50 mg, net price 28 = £2.13; 100 mg, 28 = £2.41; 200 mg, 28 = £3.14; 500 mg (label: 24), 28 = £4.54

**Excipients** may include aspartame

**Brands include** Redoxon®

**Injection**, ascorbic acid 100 mg/mL, net price 5-mL amp = £4.39

**Excipients** include metabisulfite

## 9.6.4 Vitamin D

**Note** The term Vitamin D is used for a range of compounds including ergocalciferol (calciferol, vitamin D<sub>2</sub>), colecalciferol (vitamin D<sub>3</sub>), dihydrotachysterol, alfalcidol (1 $\alpha$ -hydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Asymptomatic vitamin D deficiency is common in the United Kingdom; symptomatic deficiency may occur in certain ethnic groups, particularly as rickets or hypocalcaemia, and rarely in association with malabsorption. The amount of vitamin D required in infancy is related to the stores built up *in-utero* and subsequent exposure to sunlight. The amount of vitamin D in breast milk varies and some breast-fed babies, particularly if pre-term or born to vitamin D deficient mothers, may

become deficient. Most formula milk and supplement feeds contain adequate vitamin D to prevent deficiency.

Simple, nutritional vitamin D deficiency can be prevented by oral supplementation of 10 micrograms (400 units) of **ergocalciferol** (calciferol, vitamin D<sub>2</sub>) or **colecalciferol** (vitamin D<sub>3</sub>) daily, using multi-vitamin drops (section 9.6.7), preparations of vitamins A and D (section 9.6.1), manufactured 'special' solutions, or as calcium and ergocalciferol tablets (although the calcium and other vitamins in supplements are unnecessary); excessive supplementation may cause hypercalcaemia.

Inadequate bone mineralisation can be caused by a deficiency, or a lack of action of vitamin D or its active metabolite. In childhood this causes bowing and distortion of bones (rickets). In nutritional vitamin D deficiency rickets, initial high doses of ergocalciferol or colecalciferol should be reduced to supplemental doses after 8–12 weeks, as there is a significant risk of hypercalcaemia (see caution below). However, calcium supplements are recommended if there is hypocalcaemia or evidence of a poor dietary calcium intake. A single large dose of ergocalciferol or colecalciferol can also be effective for the treatment of nutritional vitamin D deficiency rickets.

Poor bone mineralisation in neonates and young children may also be due to inadequate intake of phosphate or calcium particularly during long-term parenteral nutrition—supplementation with phosphate (section 9.5.2.1) or calcium (section 9.5.1.1) may be required.

*Hypophosphataemic rickets* occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate (section 9.5.2.1), and hydroxylated (activated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses, such as **ergocalciferol** in doses of up to 40 000 units daily; the hypocalcaemia of *hypoparathyroidism* often requires higher doses in order to achieve normocalcaemia and alfalcidol is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease.

Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives **alfalcidol** or **calcitriol** should be prescribed if patients with *severe liver* or *renal impairment* require vitamin D therapy. Alfalcidol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

**Important.** All patients receiving pharmacological doses of vitamin D or its analogues should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

**ERGOCALCIFEROL**(Calciferol, Vitamin D<sub>2</sub>)

**Cautions** see notes above; monitor plasma-calcium concentration in patients receiving high doses and in renal impairment; **interactions:** Appendix 1 (vitamins)

**Contra-indications** hypercalcaemia; metastatic calcification

**Pregnancy** high doses teratogenic in *animals* but therapeutic doses unlikely to be harmful

**Breast-feeding** caution with high doses as may cause hypercalcaemia in infant—monitor serum-calcium concentration

**Side-effects** symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

**Licensed use** Calcium and Ergocalciferol tablets not licensed for use in children under 6 years

**Indications and dose**

See also notes above

**Nutritional vitamin-D deficiency rickets**

## ● By mouth

**Child 1–6 months** 3000 units daily, adjusted as necessary

**Child 6 months–12 years** 6000 units daily, adjusted as necessary

**Child 12–18 years** 10 000 units daily, adjusted as necessary

**Nutritional or physiological supplement; prevention of rickets**

## ● By mouth

**Neonate** 400 units daily

**Child 1 month–18 years** 400–600 units daily

**Vitamin D deficiency in intestinal malabsorption or in chronic liver disease**

## ● By mouth or by intramuscular injection

**Child 1–12 years** 10 000–25 000 units daily, adjusted as necessary

**Child 12–18 years** 10 000–40 000 units daily, adjusted as necessary

**Pharmacological strengths**

(see notes above)

The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied

**Ergocalciferol** (Non-proprietary)

**Tablets**, ergocalciferol 250 micrograms (10 000 units), net price 100 = £21.99; 1.25 mg (50 000 units), 100 = £30.34

**Note** May be difficult to obtain

**Important** When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber or purchaser with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**Injection**, ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £8.50, 2-mL amp = £9.85

**Note** Other formulations of ergocalciferol are available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Daily supplements**

**Note** There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamins capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.1), and calcium and ergocalciferol tablets (see below).

For prescribing information on calcium, see section 9.5.1

**Calcium and Ergocalciferol** (Non-proprietary)  
(Calcium and Vitamin D)

**Tablets**, calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca<sup>2+</sup> 2.4 mmol), ergocalciferol 10 micrograms (400 units). Net price 28-tab pack = £10.88. Counselling, crush before administration or may be chewed

**ALFACALCIDOL**(1 $\alpha$ -Hydroxycholecalciferol)

**Cautions** see under Ergocalciferol; also nephrolithiasis

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol; also *rarely* nephrocalcinosis, pruritus, rash, and urticaria

**Indications and dose**

See also notes above

**Hypophosphataemic rickets; persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism**

## ● By mouth or by intravenous injection

**Child 1 month–12 years** 25–50 nanograms/kg (max. 1 microgram) once daily, adjusted as necessary

**Child 12–18 years** 1 microgram once daily, adjusted as necessary

**Persistent neonatal hypocalcaemia**

## ● By mouth or by intravenous injection

**Neonate** 50–100 nanograms/kg once daily, adjusted as necessary (up to 2 micrograms/kg daily may be needed in resistant cases)

**Prevention of vitamin D deficiency in renal or cholestatic liver disease**

## ● By mouth or by intravenous injection

**Neonate** 20 nanograms/kg once daily, adjusted as necessary

**Child 1 month–12 years, body-weight under 20 kg** 15–30 nanograms/kg (max. 500 nanograms) once daily; **body-weight over 20 kg** 250–500 nanograms once daily, adjusted as necessary

**Child 12–18 years** 250–500 nanograms once daily, adjusted as necessary

**Alfacalcidol** (Non-proprietary) (PoM)

**Capsules**, alfacalcidol 250 nanograms, net price 30-cap pack = £2.62; 500 nanograms 30-cap pack = £5.77; 1 microgram 30-cap pack = £5.89

**One-Alpha**<sup>®</sup> (LEO) (PoM)

**Capsules**, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75

**Excipients** include sesame oil

Oral drops, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £21.30

**Excipients** include alcohol

**Note** The concentration of alfacalcidol in *One-Alpha® drops* is 10 times greater than that of the former preparation *One-Alpha® solution*.

**Injection**, alfacalcidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11

**Excipients** include alcohol, propylene glycol (caution in neonates, see, p. 2)

**Note** Shake ampoule for at least 5 seconds before use

## CALCITRIOL

(1,25-Dihydroxycholecalciferol)

**Cautions** see under Ergocalciferol; monitor plasma calcium, phosphate, and creatinine during dosage titration

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

**Licensed use** not licensed for use in children

### Indications and dose

See also notes above

**Vitamin D dependent rickets; hypophosphataemic rickets; persistent hypocalcaemia due to hypoparathyroidism or pseudo-hypoparathyroidism** (limited experience)

#### • By mouth

**Child 1 month–12 years** initially 15 nanograms/kg (max. 250 nanograms) once daily, increased if necessary in steps of 5 nanograms/kg daily (max. 250 nanograms) every 2–4 weeks

**Child 12–18 years** initially 250 nanograms once daily increased if necessary in steps of 5 nanograms/kg daily (max. 250 nanograms step) every 2–4 weeks; usual dose 0.5–1 microgram daily

**Administration** Contents of capsule may be administered by oral syringe

**Calcitriol** (Non-proprietary) <sup>(PoM)</sup>

**Capsules**, calcitriol 250 nanograms, net price 30-cap pack = £5.41, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £9.68, 100-cap pack = £25.76

**Rocaltrol®** (Roche) <sup>(PoM)</sup>

**Capsules**, calcitriol 250 nanograms (red/white), net price 100 = £18.04; 500 nanograms (red), 100 = £32.25

## COLECALCIFEROL

(Cholecalciferol, vitamin D<sub>3</sub>)

**Cautions** see under Ergocalciferol

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

**Licensed use** *Adcal-D<sub>3</sub>®*, *Calceos®*, and *Fultium-D<sub>3</sub>®* not licensed for use in children under 12 years; *Cacit®D<sub>3</sub>*, *Calcichew-D<sub>3</sub>® Forte*, *Calcichew-D<sub>3</sub>® 500 mg/400 unit*, and *Kalcipos-D®* not licensed for use in children (age range not specified by manufacturers); *Accrete D<sub>3</sub>®*, *Calfovite D<sub>3</sub>®*, and *Natecal D<sub>3</sub>®* not licensed for use in children under 18 years

### Indications and dose

See under Ergocalciferol and notes above—alternative to Ergocalciferol, see also Pharmacological Strengths

**Fultium-D<sub>3</sub>®** (Internis) <sup>(PoM)</sup>

**Capsules**, colecalciferol 20 micrograms (800 units), net price 30-cap pack = £3.60, 90-cap pack = £10.80. Label: 25

**Excipients** include arachis (peanut) oil

### Colecalciferol

Various formulations available from 'special-order' manufacturers or specialist importing companies, see p. 840

### With calcium

For prescribing information on calcium, see section 9.5.1

**Accrete D<sub>3</sub>®** (Internis)

**Tablets**, f/c, calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £2.95

**Adcal-D<sub>3</sub>®** (ProStrakan)

**Tablets** (chewable), lemon or tutti-frutti flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £3.65, 112-tab pack = £7.49. Label: 24

**Dissolve** (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £5.99. Label: 13

**Caplets** (=tablets), f/c, calcium carbonate 750 mg (calcium 300 mg or Ca<sup>2+</sup> 7.5 mmol), colecalciferol 5 micrograms (200 units), net price 112-tab pack = £3.65

**Cacit® D<sub>3</sub>** (Warner Chilcott)

**Granules**, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet, net price 30-sachet pack = £4.06. Label: 13

**Calceos®** (Galen)

**Tablets** (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.58. Label: 24

**Calcichew-D<sub>3</sub>®** (Takeda)

**Calcichew-D<sub>3</sub>® tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 5 micrograms (200 units), net price 100-tab pack = £7.68. Label: 24

**Excipients** include aspartame (section 9.4.1)

**Calcichew-D<sub>3</sub>® Forte tablets** (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.08. Label: 24

**Excipients** include aspartame (section 9.4.1)

**Calcichew-D<sub>3</sub>® 500 mg/400 unit caplets**, f/c, lemon flavour, calcium carbonate providing calcium 500 mg (Ca<sup>2+</sup> 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.43

**Excipients** include propylene glycol (see Excipients, p. 2)

**Calfoviv D3<sup>®</sup>** (Menarini)

**Powder**, lemon flavour, calcium phosphate 3.1 g (calcium 1.2 g or Ca<sup>2+</sup> 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. Label: 13, 21

**Kalcipos-D<sup>®</sup>** (Meda) (POM)

**Tablets** (chewable), calcium carbonate providing calcium 500 mg (Ca<sup>2+</sup> 12.5 mmol), colecalciferol 20 micrograms (800 units), net price 30-tab pack = £4.21. Label: 24

**Natecal D3<sup>®</sup>** (Chiesi)

**Tablets** (chewable), (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.63. Label: 24

**Excipients** include aspartame (section 9.4.1)

## 9.6.5 Vitamin E (Tocopherols)

The daily requirement of vitamin E has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinaemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

### ALPHA TOCOPHERYL ACETATE

**Cautions** predisposition to thrombosis; increased risk of necrotising enterocolitis in preterm neonates (see administration); **interactions:** Appendix 1 (vitamins)

**Pregnancy** no evidence of safety of high doses

**Breast-feeding** excreted in milk, minimal risk although caution with large doses

**Side-effects** diarrhoea and abdominal pain, particularly with high doses

#### Indications and dose

##### Vitamin E deficiency

- By mouth

**Neonate** 10 mg/kg once daily

**Child 1 month–18 years** 2–10 mg/kg daily, up to 20 mg/kg has been used

##### Malabsorption in cystic fibrosis

- By mouth (with food and pancreatic enzymes)

**Child 1 month–1 year** 50 mg once daily, adjusted as necessary

**Child 1–12 years** 100 mg once daily, adjusted as necessary

**Child 12–18 years** 100–200 mg once daily, adjusted as necessary

#### Vitamin E deficiency in cholestasis and severe liver disease

- By mouth

**Neonate** 10 mg/kg daily

**Child 1 month–12 years** initially 100 mg daily, adjusted according to response; up to 200 mg/kg daily may be required

**Child 12–18 years** initially 200 mg daily, adjusted according to response; up to 200 mg/kg daily may be required

- By intramuscular injection

**Neonate** 10 mg/kg once a month

**Child 1 month–18 years** 10 mg/kg (max. 100 mg) once a month

#### Malabsorption in abetalipoproteinaemia

- By mouth

**Neonate** 100 mg/kg once daily

**Child 1 month–18 years** 50–100 mg/kg once daily

#### Vitamin E Suspension (Non-proprietary)

**Suspension**, alpha tocopheryl acetate 100 mg/mL.

Net price 100 mL = £42.12

**Excipients** include sucrose

**Administration** consider dilution in neonates due to high osmolality (see Cautions)

**Note** Tablets containing tocopheryl acetate are available from 'special-order' manufacturers or specialist importing companies, see p. 840

#### Vitamin E Injection

**Injection** tocopheryl acetate 50 mg/mL, 2-mL ampoule

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## ALPHA TOCOPHEROL

**Cautions** predisposition to thrombosis; **interactions:** Appendix 1 (vitamins)

**Contra-indications** preterm neonates

**Hepatic impairment** manufacturer advises caution and monitor closely—no information available

**Renal impairment** manufacturer advises caution and monitor closely; risk of renal toxicity due to polyethylene glycol content

**Pregnancy** manufacturer advises caution; no evidence of harm in animal studies

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** diarrhoea; *less commonly* asthenia, headache, pruritus, disturbances in serum-potassium and serum-sodium concentrations, alopecia, and rash

#### Vedrop<sup>®</sup> (Orphan Europe) ▼ (POM)

**Oral solution**, yellow, D-alpha tocopherol (as tocopherol) 50 mg/mL, net price 20 mL = £54.55, 60 mL = £163.65 (all with oral syringe)

**Note** Tocopherol is a water-soluble form of D-alpha tocopherol

#### Dose

**Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis**

- By mouth

**Neonate** 17 mg/kg daily, adjusted as necessary

**Child 1 month–18 years** 17 mg/kg daily, adjusted as necessary

## 9.6.6 Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, **menadiol sodium phosphate** (see Contra-indications below) can be used if supplementation with phytomenadione by mouth has been insufficient.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; for advice on the use of vitamin K in haemorrhage, see section 2.8.2.

**Vitamin K deficiency bleeding** Neonates are relatively deficient in vitamin K and those who do not receive supplements are at risk of serious bleeding, including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). Local protocols may vary and an appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as phytomenadione) 1 mg may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies; preterm neonates may be given 400 micrograms/kg (max. 1 mg). The intravenous route may be used in preterm neonates of very low birth-weight if intramuscular injection is not possible; however, it may not provide the prolonged protection of the intramuscular injection; any babies receiving intravenous vitamin K should be given subsequent oral doses.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given in the first week, the first dose being given at birth and the second at 4–7 days. For exclusively breast-fed babies, a third dose of phytomenadione 2 mg is given at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione 1 mg by mouth at birth (using the contents of a phytomenadione capsule, see preparation below) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione 1 mg are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

For the treatment of vitamin K deficiency bleeding, intravenous phytomenadione is used, see Phytomenadione below.

### MENADIOL SODIUM PHOSPHATE

**Cautions** G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); **interactions:** Appendix 1 (vitamins)

**Contra-indications** neonates and infants

**Pregnancy** avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate

#### Indications and dose

See notes above

#### Supplementation in vitamin K malabsorption

##### • By mouth

**Child 1–12 years** 5–10 mg daily, adjusted as necessary

**Child 12–18 years** 10–20 mg daily, adjusted as necessary

#### Menadiol Phosphate (Non-proprietary)

**Tablets**, menadiol sodium phosphate equivalent to 10 mg of menadiol phosphate, net price 100-tab pack = £122.48

## PHYTOMENADIONE

(Vitamin K<sub>1</sub>)

**Cautions** intravenous injections should be given very slowly—risk of vascular collapse (see also below); **interactions:** Appendix 1 (vitamins)

**Pregnancy** use if potential benefit outweighs risk

**Breast-feeding** present in milk, but see notes above

#### Indications and dose

**Neonatal prophylaxis of vitamin-K deficiency bleeding** see notes above

**Neonatal hypoprothrombinaemia or vitamin-K deficiency bleeding**

##### • By intravenous injection

**Neonate** 1 mg repeated 8 hourly if necessary

**Neonatal biliary atresia and liver disease**

##### • By mouth

**Neonate** 1 mg daily

**Reversal of coumarin anticoagulation when continued anticoagulation required or if no significant bleeding** (see also section 2.8.2)—seek specialist advice

##### • By intravenous injection

**Child 1 month–18 years** 15–30 micrograms/kg (max. 1 mg) as a single dose, repeated as necessary

**Reversal of coumarin anticoagulation when anticoagulation not required or if significant bleeding; treatment of haemorrhage associated with vitamin-K deficiency** (see also section 2.8.2)—seek specialist advice

##### • By intravenous injection

**Child 1 month–18 years** 250–300 micrograms/kg (max. 10 mg) as a single dose

#### Neokay<sup>®</sup> (Neocenticals) (PoM)

**Capsules**, brown, phytomenadione 1 mg in an oily basis, net price 12-cap pack = £3.95; 100-cap pack = £34.00

**Note** The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given

#### Dose

**Neonatal prophylaxis of vitamin-K deficiency bleeding** see notes above

### Colloidal formulation

#### Konakion<sup>®</sup> MM (Roche) (PoM)

**Injection**, phytomenadione 10 mg/mL in a mixed micelles vehicle. Net price 1-mL amp = 38p

**Excipients** include glycocholic acid 54.6 mg/amp, lecithin

**Cautions** reduce dose in liver impairment (glycocholic acid may displace bilirubin); reports of anaphylactoid reactions

**Administration** *Konakion<sup>®</sup> MM* may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; **not** for intramuscular injection

#### Konakion<sup>®</sup> MM Paediatric (Roche) (PoM)

**Injection**, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 0.2-mL amp = 94p

**Excipients** include glycocholic acid 10.9 mg/amp, lecithin

**Cautions** parental administration in premature infants body-weight less than 2.5 kg (increased risk of kernicterus)

**Administration** *Konakion<sup>®</sup> MM Paediatric* may be administered *by mouth or by intramuscular injection or by intravenous injection*. For *intravenous injection*, may be diluted with Glucose 5% if necessary

#### Dose

##### Prevention of deficiency

- **By mouth**

**Preterm neonate** 0.6 mL daily

**Neonate** 0.3 mL daily

**Child 1 month–1 year** 0.3 mL daily

**Child 1–18 years** 0.6 mL daily

##### Cystic fibrosis: prevention of deficiency

- **By mouth**

**Child 1 month–1 year** 0.6 mL daily

**Child 1–18 years** 1.2 mL daily

#### Dalivit<sup>®</sup> (LPC)

**Oral drops**, vitamins A, B group, C, and D, net price 25 mL = £3.28, 50 mL = £5.58

**Note** Contains 5000 units of vitamin A (as palmitate) per 0.6 mL dose

**Excipients** include sucrose

#### Dose

##### Prevention of deficiency

- **By mouth**

**Neonate (including preterm)** 0.3 mL daily

**Child 1 month–1 year** 0.3 mL daily

**Child 1–18 years** 0.6 mL daily

##### Cystic fibrosis: prevention of deficiency

- **By mouth**

**Child 1 month–1 year** 0.6 mL daily

**Child 1–18 years** 1 mL daily

## 9.6.7 Multivitamin preparations

Multivitamin supplements are used in children with vitamin deficiencies and also in malabsorption conditions such as cystic fibrosis or liver disease. To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements. Supplementation is not required if nutrient enriched feeds are used; consult a dietician for further advice.

### MULTIVITAMIN PREPARATIONS

**Cautions** see individual vitamins; vitamin A concentration of preparations varies

**Contra-indications** see individual vitamins

**Side-effects** see individual vitamins

**Licensed use** *Dalivit<sup>®</sup>* not licensed for use in children under 6 weeks

#### Indications and dose

See under preparations below

#### Vitamins

**Capsules**, ascorbic acid 15 mg, nicotinamide 7.5 mg, riboflavin 500 micrograms, thiamine hydrochloride 1 mg, vitamin A 2500 units, vitamin D 300 units, net price 28-cap pack = £1.50

#### Dose

##### Prevention of deficiency

- **By mouth**

**Child 1–12 years** 1 capsule daily

**Child 12–18 years** 2 capsules daily

##### Cystic fibrosis: prevention of deficiency

- **By mouth**

**Child 1–18 years** 2–3 capsules daily

#### Abidec<sup>®</sup> (Chefaro UK)

**Drops**, vitamins A, B group, C, and D. Net price 25 mL (with dropper) = £3.33

**Note** Contains 1333 units of vitamin A (as palmitate) per 0.6 mL dose

**Excipients** include arachis (peanut) oil and sucrose

## Vitamin and mineral supplements and adjuncts to synthetic diets

#### Forceval<sup>®</sup> (Alliance)

**Capsules**, brown/red, vitamins (ascorbic acid 60 mg, biotin 100 micrograms, cyanocobalamin 3 micrograms, folic acid 400 micrograms, nicotinamide 18 mg, pantothenic acid 4 mg, pyridoxine 2 mg, riboflavin 1.6 mg, thiamine 1.2 mg, vitamin A 2500 units, vitamin D<sub>2</sub> 400 units, vitamin E 10 mg, minerals and trace elements (calcium 100 mg, chromium 200 micrograms, copper 2 mg, iodine 140 micrograms, iron 12 mg, magnesium 30 mg, manganese 3 mg, molybdenum 250 micrograms, phosphorus 77 mg, potassium 4 mg, selenium 50 micrograms, zinc 15 mg), net price 15-cap pack = £3.40, 30-cap pack = £5.93, 90-cap pack = £14.32. Label: 25 Dose

**Vitamin and mineral deficiency and as adjunct in synthetic diets**

**Child 12–18 years** 1 capsule daily one hour after a meal

#### Ketovite<sup>®</sup> (Essential)

**Tablets** (PoM), yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopheryl acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 250 micrograms, acetomenaphthone 500 micrograms, net price 100-tab pack = £9.21

#### Dose

**Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets**

**Child 1 month–18 years** 1 tablet 3 times daily: dose adjusted according to condition, diet, or age; use with *Ketovite<sup>®</sup> Liquid* for complete vitamin supplementation

**Administration** may be crushed immediately before use

Liquid, pink, sugar-free, vitamin A 2500 units, ergocalciferol 400 units, choline chloride 150 mg, cyanocobalamin 12.5 micrograms/5 mL, net price 150-mL pack = £19.10

**Dose**

**Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets**

**Child 1 month–18 years** 5 mL daily; dose adjusted according to condition, diet, or age; use with *Ketovite*® Tablets for complete vitamin supplementation

**Administration** may be mixed with milk, cereal, or fruit juice

## 9.7 Bitters and tonics

Classification not included in *BNF for Children*.

## 9.8 Metabolic disorders

### 9.8.1 Drugs used in metabolic disorders

### 9.8.2 Acute porphyrias

This section covers drugs used in metabolic disorders and not readily classified elsewhere.

### 9.8.1 Drugs used in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care.

General advice on the use of medicines in metabolic disorders can be obtained from:

Alder Hey Children's Hospital  
Medicines Information Centre  
Tel: (0151) 252 5381

and

Great Ormond Street Hospital for Children  
Pharmacy  
Tel: (020) 7405 9200

### Wilson's disease

**Penicillamine** is used in Wilson's disease (hepatolenticular degeneration) to aid the elimination of copper ions; it is also used for cystinuria. Children who are hypersensitive to penicillin may react rarely to penicillamine.

**Trientine** is used for the treatment of Wilson's disease only, in patients intolerant of penicillamine; it is **not** an alternative to penicillamine in other diseases such as cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**Zinc** prevents the absorption of copper in Wilson's disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

## PENICILLAMINE

**Cautions** concomitant nephrotoxic drugs (increased risk of toxicity); monitor urine for proteinuria; monitor blood and platelet count regularly (see below); neurological involvement in Wilson's disease; **interactions:** Appendix 1 (penicillamine)

**Blood counts and urine tests** Consider withdrawal if platelet count falls below 120 000/mm<sup>3</sup> or white blood cells below 2500/mm<sup>3</sup> or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)

**Counselling** Warn child and carer to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop

**Contra-indications** lupus erythematosus

**Renal impairment** reduce dose and monitor renal function or avoid—consult product literature

**Pregnancy** fetal abnormalities reported rarely; avoid if possible

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** initially nausea, anorexia, fever, rash; proteinuria, thrombocytopenia; *rarely* mouth ulceration, stomatitis, male and female breast enlargement, haematuria (withdraw immediately if cause unknown), alopecia, pseudoxanthoma elasticum, elastosis perforans, skin laxity; *also reported* pancreatitis, vomiting, cholestatic jaundice, pulmonary haemorrhage, bronchiolitis, pneumonitis, neuropathy (especially if neurological involvement in Wilson's disease—prophylactic pyridoxine recommended, see section 9.6.2), taste loss (mineral supplements not recommended), blood disorders including neutropenia, agranulocytosis, aplastic anaemia, haemolytic anaemia and leucopenia, nephrotic syndrome, glomerulonephritis, Goodpasture's syndrome, lupus erythematosus, myasthenia gravis, polymyositis, rheumatoid arthritis, urticaria, dermatomyositis, pemphigus, Stevens-Johnson syndrome, late rashes (consider dose reduction)

### Indications and dose

#### Wilson's disease

##### • By mouth

**Child 1 month–18 years** 20 mg/kg (max. 2 g) daily in 2–3 divided doses 1 hour before food; usual maintenance dose for child over 12 years 0.75–1 g daily

#### Cystinuria

##### • By mouth

**Child 1 month–18 years** 20–30 mg/kg (max. 3 g) daily in 2–3 divided doses 1 hour before food (lower doses may be used initially and increased gradually), adjusted to maintain 24-hour urinary cystine below 1 mmol/litre; maintain adequate fluid intake

#### Penicillamine (Non-proprietary) (PoM)

Tablets, penicillamine 125 mg, net price 56-tab pack = £11.20; 250 mg, 56-tab pack = £21.68. Label: 6, 22, counselling, blood disorder symptoms (see above)

#### Distamine® (Alliance) (PoM)

Tablets, all f/c, penicillamine 125 mg, net price 100 = £10.34; 250 mg, 100 = £17.78. Label: 6, 22, counselling, blood disorder symptoms (see above)

**TRIENTINE DIHYDROCHLORIDE**

**Cautions** see notes above; **interactions:** Appendix 1 (trientine)

**Pregnancy** teratogenic in *animal* studies—use only if benefit outweighs risk; monitor maternal and neonatal serum-copper concentrations

**Side-effects** nausea, rash; *very rarely* anaemia; duodenitis and colitis also reported

**Indications and dose**

**Wilson's disease in patients intolerant of penicillamine**

- By mouth

**Child 2–12 years** 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

**Child 12–18 years** 1.2–2.4 g daily in 2–4 divided doses before food, adjusted according to response

**Trientine Dihydrochloride** (Univar) (PoM)

**Capsules**, trientine dihydrochloride 300 mg. Label: 6, 22

**ZINC ACETATE**

**Cautions** portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol; **interactions:** Appendix 1 (zinc)

**Pregnancy** usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion

**Breast-feeding** manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant

**Side-effects** gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); *less commonly* sideroblastic anaemia and leucopenia

**Indications and dose**

Dose expressed as elemental zinc

**Wilson's disease**

- By mouth

**Child 1–6 years** 25 mg twice daily

**Child 6–16 years** body-weight under 57 kg, 25 mg 3 times daily; body-weight 57 kg or over, 50 mg 3 times daily

**Child 16–18 years** 50 mg 3 times daily

**Wilzin**<sup>®</sup> (Orphan Europe) (PoM)

**Capsules**, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23

**Administration** capsules may be opened and the contents mixed with water

**Carnitine deficiency**

**Levocarnitine** is available for the management of primary carnitine deficiency due to inborn errors of metabolism, or of secondary deficiency in haemodialysis patients.

Levocarnitine is also used in the treatment of some organic acidaemias; however, use in fatty acid oxidation is controversial.

**LEVOCARNITINE**

(Carnitine)

**Cautions** diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended

**Renal impairment** accumulation of metabolites may occur with chronic oral administration in severe impairment

**Pregnancy** appropriate to use; no evidence of teratogenicity in *animal* studies

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, fishy body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase

**Licensed use** not licensed for use by intravenous infusion; tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years; paediatric oral solution (30%) not licensed in children over 12 years; not licensed for use in organic acidaemias

**Indications and dose**

**Primary deficiency and organic acidaemias**

- By mouth

**Neonate** up to 200 mg/kg daily in 2–4 divided doses

**Child 1 month–18 years** up to 200 mg/kg daily in 2–4 divided doses; usual max. 3 g daily

- By intravenous infusion

**Neonate** initially 100 mg/kg over 30 minutes followed by a continuous infusion of 4 mg/kg/hour

**Child 1 month–18 years** initially 100 mg/kg over 30 minutes followed by a continuous infusion of 4 mg/kg/hour

- By slow intravenous injection over 2–3 minutes

**Neonate** up to 100 mg/kg/daily in 2–4 divided doses

**Child 1 month–18 years** up to 100 mg/kg/daily in 2–4 divided doses

**Secondary deficiency in dialysis patients**

- By slow intravenous injection over 2–3 minutes

**Child 1 month–18 years** 20 mg/kg after each dialysis session, adjusted according to plasma-carnitine concentration

- By mouth

(maintenance therapy if benefit gained from first intravenous course)

**Child 1 month–18 years** 1 g daily

**Administration** for *intravenous infusion*, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%

**Levocarnitine** (Non-proprietary) (PoM)

**Paediatric oral solution**, levocarnitine 300 mg/mL (30%), net price 20 mL = £55.55

**Carnitor**<sup>®</sup> (Sigma-Tau) (PoM)

**Tablets**, levocarnitine 330 mg, net price 90-tab pack = £103.95

**Chewable tablets**, levocarnitine 1 g, net price 10-tab pack = £35.00

**Oral liquid**, levocarnitine 100 mg/mL (10%), net price 10 × 10-mL (1-g) single-dose bottle = £35.00

**Injection**, levocarnitine 200 mg/mL, net price 5-mL amp = £11.90

## Fabry's disease

**Agalsidase alfa** and **agalsidase beta**, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

### AGALSIDASE ALFA and BETA

**Cautions interactions:** Appendix 1 (agalsidase alfa and beta)

**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** use with caution

**Breast-feeding** use with caution—no information available

**Side-effects** gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing; dyspnoea, cough, rhinorrhoea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hypersensitivity reactions, angioedema, pruritus, urticaria, rash, acne; *less commonly* cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

### Indications and dose

**Fabry's disease** (specialist use only)

see under preparations

**Fabrazyme**<sup>®</sup> (Genzyme) (POM)

**Intravenous infusion**, powder for reconstitution, agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £2196.59

#### Dose

**Fabry's disease** (specialist use only)

- By intravenous infusion

**Child 8–18 years** 1 mg/kg every 2 weeks

**Administration** for *intravenous infusion*, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL; dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter with an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established

**Replagal**<sup>®</sup> (Shire HGT) (POM)

**Concentrate for intravenous infusion**, agalsidase alfa 1 mg/mL, net price 1-mL vial = £356.85; 3.5-mL vial = £1068.64

#### Dose

**Fabry's disease** (specialist use only)

- By intravenous infusion

**Child 7–18 years** 200 micrograms/kg every 2 weeks

**Administration** for *intravenous infusion*, dilute requisite dose with 100 mL Sodium Chloride 0.9% and give over 40 minutes using an in-line filter; use within 3 hours of dilution

## Gaucher's disease

**Imiglucerase**, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy in Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

**Velaglucerase alfa**, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

**Miglustat**, an inhibitor of glucosylceramide synthase, is licensed in adults for the treatment of mild to moderate type I Gaucher's disease in patients for whom imiglucerase is unsuitable; it is given by mouth.

### IMIGLUCERASE

**Cautions** monitor for imiglucerase antibodies; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** no information available

**Side-effects** hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); *less commonly* nausea, vomiting, diarrhoea, abdominal cramps, fatigue, headache, dizziness, fever, arthralgia, injection-site reactions

### Indications and dose

**Gaucher's disease type I** (specialist use only)

- By intravenous infusion

**Neonate** initially 60 units/kg once every 2 weeks, adjusted according to response; doses as low as 30 units/kg once every 2 weeks may be appropriate

**Child 1 month–18 years** initially 60 units/kg once every 2 weeks, adjusted according to response; doses as low as 30 units/kg once every 2 weeks may be appropriate

**Gaucher's disease type III** (specialist use only)

- By intravenous infusion

**Neonate** 60–120 units/kg once every 2 weeks, adjusted according to response

**Child 1 month–18 years** 60–120 units/kg once every 2 weeks, adjusted according to response

**Administration** For *intravenous infusion*, initially reconstitute with Water for Injections (200 units in 5.1 mL, 400 units in 10.2 mL) to a concentration of 40 units/mL; dilute requisite dose with Sodium Chloride 0.9% to a final volume of 100–200 mL; give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours of reconstitution

**Cerezyme**<sup>®</sup> (Genzyme) (POM)

**Intravenous infusion**, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29

**Electrolytes** Na<sup>+</sup> 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

## VELAGLUCERASE ALFA

**Cautions** monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa  
**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** manufacturer advises use with caution—no information available

**Side-effects** nausea, abdominal pain, tachycardia, hypertension, hypotension, flushing, headache, dizziness, malaise, pyrexia, arthralgia, bone pain, back pain, hypersensitivity reactions, rash, urticaria

### Indications and dose

**Gaucher's disease type I** (specialist use only)

- By intravenous infusion

**Child 4–18 years** 60 units/kg once every 2 weeks; adjusted according to response to 15–60 units/kg once every 2 weeks

**Administration** for *intravenous infusion*, reconstitute each 400-unit vial with 4.3 mL water for injections; dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution

**VPRIV**<sup>®</sup> (Shire HGT) ▼ [PoM]

**Intravenous infusion**, powder for reconstitution, velaglucerase alfa, net price 400-unit vial = £1410.20

**Electrolytes** Na<sup>+</sup> 0.53 mmol/400-unit vial

## Mucopolysaccharidosis

**Laronidase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Idursulfase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

**Galsulfase**, a recombinant form of human N-acetylgalactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

**Infusion-related reactions** Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

## GALSULFASE

**Cautions** respiratory disease; acute febrile or respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** abdominal pain, umbilical hernia, gastroenteritis; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rigors, malaise, areflexia; pharyngitis; conjunctivitis, corneal opacity; ear pain; facial oedema

### Indications and dose

**Mucopolysaccharidosis VI** (specialist use only)

- By intravenous infusion

**Child 5–18 years** 1 mg/kg once weekly

**Administration** for *intravenous infusion*, dilute requisite dose with Sodium Chloride 0.9% to a final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over at least 4 hours

**Naglazyme**<sup>®</sup> (BioMarin) [PoM]

**Concentrate for intravenous infusion**, galsulfase 1 mg/mL, net price 5-mL vial = £982.00

## IDURSULFASE

**Cautions** severe respiratory disease; acute febrile respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Contra-indications** women of child-bearing potential

**Pregnancy** manufacturer advises avoid

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea; headache, dizziness, tremor; pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

### Indications and dose

**Mucopolysaccharidosis II** (specialist use only)

- By intravenous infusion

**Child 5–18 years** 500 micrograms/kg once weekly

**Administration** for *intravenous infusion*, dilute requisite dose in 100 mL Sodium Chloride 0.9% and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions)

**Elaprase**<sup>®</sup> (Shire HGT) ▼ [PoM]

**Concentrate for intravenous infusion**, idursulfase 2 mg/mL, net price 3-mL vial = £1985.00

## LARONIDASE

**Cautions** monitor immunoglobulin G (IgG) antibody concentration; **interactions:** Appendix 1 (laronidase)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angioedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessness; influenza-like symptoms; musculoskeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

#### Indications and dose

**Non-neurological manifestations of mucopolysaccharidosis I** (specialist use only)

- **By intravenous infusion**

**Child 1 month–18 years** 100 units/kg once weekly

**Administration** for *intravenous infusion*, dilute with Sodium Chloride 0.9%; body-weight under 20 kg, dilute to 100 mL, body-weight over 20 kg dilute to 250 mL; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour

**Alidurzyme** (Genzyme) (PoM)

**Concentrate for intravenous infusion**, laronidase 100 units/mL, net price 5-mL vial = £444.70

**Electrolytes** Na<sup>+</sup> 1.29 mmol/5-mL vial

## Nephropathic cystinosis

**Mercaptamine** is available for the treatment of nephropathic cystinosis. The oral dose is increased over several weeks to avoid intolerance. Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

All patients receiving mercaptamine should be registered (contact local specialist centre for details).

Mercaptamine eye drops are used in the management of ocular symptoms arising from the deposition of cystine crystals in the eye.

### Safe Practice

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

## MERCAPTAMINE

(Cysteamine)

**Cautions** leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

**Contra-indications** hypersensitivity to penicillamine

**Pregnancy** avoid—teratogenic and toxic in *animal* studies

**Breast-feeding** avoid

**Side-effects** breath and body odour, nausea, vomiting, diarrhoea, anorexia, abdominal pain, gastroenteritis, dyspepsia, encephalopathy, headache, malaise, fever, rash; *less commonly* gastro-intestinal ulcer, seizures, hallucinations, drowsiness, nervousness, leucopenia, nephrotic syndrome

**Licensed use** eye drops not licensed

## Indications and dose

**Nephropathic cystinosis** (specialist use only)

- **By mouth**

**Neonate** initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks; maintenance, 1.3 g/m<sup>2</sup> (approx. 50 mg/kg) daily in 4 divided doses

**Child 1 month–12 years or under 50 kg** initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks; maintenance, 1.3 g/m<sup>2</sup> (approx. 50 mg/kg) daily in 4 divided doses

**Child 12–18 years or over 50 kg** initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks; maintenance, 2 g daily in 4 divided doses

**Cystagon**<sup>®</sup> (Orphan Europe) (PoM)

**Capsules**, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £190.00. Label: 21

**Note** For child under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)

### Eye drops

**Mercaptamine** (Non-proprietary)

**Eye drops**, mercaptamine 0.11% and 0.55%, 10 mL. Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## Pompe disease

**Alglucosidase alfa**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

## ALGLUCOSIDASE ALFA

**Cautions** cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration

**Infusion-related reactions** Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details

**Pregnancy** toxicity in *animal* studies, but treatment should not be withheld

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue; pyrexia; antibody formation; myalgia, muscle spasms; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported

## Indications and dose

**Pompe disease** (specialist use only)

- **By intravenous infusion**

**Neonate** 20 mg/kg every 2 weeks

**Child 1 month–18 years** 20 mg/kg every 2 weeks

**Administration** For *intravenous infusion*, reconstitute 50 mg with 10.3 mL Water for Injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to

give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour

**Myozyme**<sup>®</sup> (Genzyme) POM

Intravenous infusion, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

## Urea cycle disorders

**Sodium benzoate** and **sodium phenylbutyrate** are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycaemia.

Gastro-intestinal side-effects of sodium benzoate or sodium phenylbutyrate may be reduced by giving smaller doses more frequently. The preparations contain significant amounts of sodium; therefore, they should be used with caution in children with congestive heart failure, renal insufficiency and clinical conditions involving sodium retention with oedema.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as **arginine** or **citrulline**, depending on the specific disorder.

**Carglumic acid** is licensed for the treatment of hyperammonaemia due to *N*-acetylglutamate synthase deficiency and organic acidaemia.

### Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at [www.bimdg.org.uk](http://www.bimdg.org.uk).

## ARGININE

**Cautions** monitor plasma pH and chloride

**Contra-indications** not to be used in the treatment of arginase deficiency

**Pregnancy** no information available

**Breast-feeding** no information available

**Side-effects** intravenous injection only: nausea, vomiting; flushing, hypotension; headache, numbness; hyperchloraemic metabolic acidosis; irritation at injection-site

**Licensed use** injection and tablets not licensed in children; powder licensed for urea cycle disorders in children

### Indications and dose

**Acute hyperammonaemia in carbamylphosphate synthetase deficiency, ornithine transcarbamylase deficiency** (specialist use only). See also notes above

• By intravenous infusion

**Neonate** 6 mg/kg/hour

**Child 1 month–18 years**

**Body-weight under 40 kg** 6 mg/kg/hour

**Body-weight over 40 kg** 4 mg/kg/hour

**Maintenance treatment of hyperammonaemia in carbamylphosphate synthetase deficiency, ornithine transcarbamylase deficiency** (specialist use only)

• By mouth

**Neonate** 100–200 mg/kg daily in 3–4 divided doses with feeds

**Child 1 month–18 years**

**Body-weight under 20 kg** 100–200 mg/kg daily in 3–4 divided doses with feeds or meals

**Body-weight over 20 kg** 2.5–6 g/m<sup>2</sup> daily in 3–4 divided doses with meals (max. 6 g daily)

**Acute hyperammonaemia in citrullinaemia, argininosuccinic aciduria** (specialist use only). See also notes above

• By intravenous infusion

**Neonate** initially 300 mg/kg over 90 minutes followed by 12.5 mg/kg/hour over 24 hours (max. 25 mg/kg/hour thereafter)

**Child 1 month–18 years**

**Body-weight under 40 kg** initially 300 mg/kg over 90 minutes followed by 12.5 mg/kg/hour over 24 hours (max. 25 mg/kg/hour thereafter)

**Body-weight over 40 kg** 21 mg/kg/hour

**Maintenance treatment of hyperammonaemia in citrullinaemia, argininosuccinic aciduria** (specialist use only)

• By mouth

**Neonate** 100–300 mg/kg daily in 3–4 divided doses with feeds

**Child 1 month–18 years**

**Body-weight under 20 kg** 100–300 mg/kg daily in 3–4 divided doses with feeds or meals

**Body-weight over 20 kg** 2.5–6 g/m<sup>2</sup> daily in 3–4 divided doses with meals (max. 6 g daily)

### L-Arginine (Non-proprietary)

**Tablets**, L-arginine (as hydrochloride) 500 mg.

**Oral solution**, L-arginine 100 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Powder**, L-arginine (as hydrochloride), net price 100 g = £12.23

Prescribe as a borderline substance (ACBS). For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, argininosuccinic aciduria, and deficiency of *N*-acetyl glutamate synthetase

**Injection**, L-arginine (as hydrochloride) 500 mg/mL, 10-mL ampoules; 100 mg/mL, 200-mL amp

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Note** Other strengths may be available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Administration** dilute to a max. concentration of 50 mg/mL with glucose 10%

## CARGLUMIC ACID

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** sweating; less commonly diarrhoea, vomiting, bradycardia, pyrexia

**Indications and dose**

**Hyperammonaemia due to *N*-acetyl glutamate synthase deficiency** (under specialist supervision). See also notes above

- By mouth

**Neonate** initially 50–125 mg/kg twice daily immediately before feeds, adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily; total daily dose may alternatively be given in 3–4 divided doses

**Child 1 month–18 years** initially 50–125 mg/kg twice daily immediately before food, adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily; total daily dose may alternatively be given in 3–4 divided doses

**Hyperammonaemia due to organic acidaemia** (under specialist supervision)

- By mouth

**Neonate** initially 50–125 mg/kg twice daily immediately before feeds, adjusted according to plasma-ammonia concentration; total daily dose may alternatively be given in 3–4 divided doses

**Child 1 month–18 years** initially 50–125 mg/kg twice daily immediately before food, adjusted according to plasma-ammonia concentration; total daily dose may alternatively be given in 3–4 divided doses

**Carbaglu<sup>®</sup>** (Orphan Europe) (PoM)

**Dispersible tablets**, carglumic acid 200 mg, net price 5-tab pack = £299.00, 60-tab pack = £3499.00.

Label: 13

**Administration** Must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube

**CITRULLINE**

**Pregnancy** no information available

**Breast-feeding** no information available

**Indications and dose**

**Carbamyl phosphate synthase deficiency, ornithine carbamyl transferase deficiency**

- By mouth

**Neonate** 150 mg/kg daily in 3–4 divided doses, adjusted according to response

**Child 1 month–18 years** 150 mg/kg daily in 3–4 divided doses, adjusted according to response

**Citrulline Powder** (Non-proprietary)

**Powder**, L-citrulline 100 g

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Administration** May be mixed with drinks or taken as a paste

**SODIUM BENZOATE**

**Cautions** see notes above; neonates (risk of kernicterus and increased side-effects); **interactions:** Appendix 1 (sodium benzoate)

**Renal impairment** see notes above

**Pregnancy** no information available

**Breast-feeding** no information available

**Side-effects** nausea, vomiting, anorexia; irritability, lethargy, coma

**Licensed use** not licensed for use in children

**Indications and dose**

**Acute hyperammonaemia due to urea cycle disorders** (specialist use only). See also notes above

- By intravenous infusion

**Neonate** initially 250 mg/kg over 90 minutes followed by 10 mg/kg/hour, adjusted according to response

**Child 1 month–18 years** initially 250 mg/kg over 90 minutes followed by 10 mg/kg/hour, adjusted according to response

**Maintenance treatment of hyperammonaemia due to urea cycle disorders; non-ketotic hyperglycaemia** (specialist use only)

- By mouth

**Neonate** up to 250 mg/kg daily in 3–4 divided doses with feeds

**Child 1 month–18 years** up to 250 mg/kg daily in 3–4 divided doses with feeds or meals (max. 12 g daily)

**Administration** for administration *by mouth*, oral solution or powder may be administered in fruit drinks; less soluble in acidic drinks

**Sodium Benzoate** (Non-proprietary) (PoM)

**Tablets**, sodium benzoate 500 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Capsules**, sodium benzoate 50 mg; 250 mg; 400 mg; 500 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Oral solution**, sodium benzoate 100 mg/mL; 200 mg/mL; 300 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Injection**, sodium benzoate 200 mg/mL, 5-mL amp

**Note** Contains Na<sup>+</sup> 1.4 mmol/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Administration** for *intravenous infusion*, dilute to a max. concentration of 50 mg/mL with Glucose 10%

**SODIUM PHENYLBUTYRATE**

**Cautions** see notes above; congestive heart failure; **interactions:** Appendix 1 (sodium phenylbutyrate)

**Hepatic impairment** manufacturer advises use with caution

**Renal impairment** manufacturer advises use with caution; see also notes above

**Pregnancy** avoid—toxicity in *animal* studies; manufacturer advises adequate contraception in women of child-bearing potential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** amenorrhoea and irregular menstrual cycles, decreased appetite, body odour, taste disturbances; less commonly nausea, vomiting, abdominal pain, peptic ulcer, pancreatitis, rectal bleeding, arrhythmia, oedema, syncope, depression, headache, rash, weight gain, renal tubular acidosis, aplastic anaemia, ecchymoses

**Licensed use** injection not licensed for use in children

### Indications and dose

**Acute hyperammonaemia due to urea cycle disorders** (specialist use only). See also notes above

• **By intravenous infusion**

**Neonate** initially 250 mg/kg over 90 minutes followed by 10 mg/kg/hour adjusted according to response

**Child 1 month–18 years** initially 250 mg/kg over 90 minutes followed by 10 mg/kg/hour adjusted according to response

**Maintenance treatment of hyperammonaemia due to urea cycle disorders** (specialist use only)

• **By mouth**

**Neonate** up to 250 mg/kg daily in 3–4 divided doses with feeds

**Child 1 month–18 years**

**Body-weight under 20 kg** up to 250 mg/kg daily in 3–4 divided doses with feeds or meals

**Body-weight over 20 kg** 5 g/m<sup>2</sup> daily in 3–4 divided doses with meals (max. 12 g daily)

**Administration** Oral dose may be mixed with fruit drinks, milk, or feeds

**Sodium Phenylbutyrate** (Non-proprietary) (PoM)

**Injection**, sodium phenylbutyrate 200 mg/mL, 5-mL amp

**Note** Contains Na<sup>+</sup> 1.1 mmol/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Administration** for intravenous infusion, dilute to a max. concentration of 50 mg/mL with Glucose 10%

**Ammonaps**<sup>®</sup> (Swedish Orphan) (PoM)

**Tablets**, sodium phenylbutyrate 500 mg. Contains Na<sup>+</sup> 2.7 mmol/tablet. Net price 250-tab pack = £493.00

**Granules**, sodium phenylbutyrate 940 mg/g. Contains Na<sup>+</sup> 5.4 mmol/g of sodium phenylbutyrate. Net price 266-g pack = £860.00

**Note** Granules should be mixed with food before taking

**Pheburane**<sup>®</sup> (Lucane) (PoM)

**Granules**, sodium phenylbutyrate 483 mg/g. Contains Na<sup>+</sup> 5.4 mmol/g of sodium phenylbutyrate, net price 174-g pack = £331.00

**Note** Granules should be mixed with food before taking orally and must not be administered by nasogastric or gastrostomy tubes

## Other metabolic disorders

Other metabolic disorders and the drugs used in their management include:

**Amino acid disorders:** maple syrup urine disease (thiamine section 9.6.2); tyrosinaemia type III, hawkinsinuria (Vitamin C, section 9.6.3); tyrosinaemia type I (nitisone).

**Mitochondrial disorders:** isolated carboxylase defects, defects of biotin metabolism (biotin, see below); mitochondrial myopathies (ubidecarenone); congenital lactic acidosis (riboflavin and thiamine, section 9.6.2); respiratory chain defects (thiamine, section 9.6.2); pyruvate dehydrogenase defects (sodium dichloroacetate)

**Neimann-Pick type C disease:** miglustat is available for the treatment of progressive neurological manifestations of Neimann-Pick type C disease, a neurodegen-

erative disorder characterised by impaired intracellular lipid trafficking.

**Homocystinuria and defects in cobalamin metabolism:** betaine, pyridoxine (section 9.6.2), hydroxocobalamin (section 9.1.2)

**Tetrahydrofolate reductase deficiency:** betaine, folic acid (section 9.1.2)

The *Scottish Medicines Consortium* (p. 3) has advised (July 2010) that betaine anhydrous (Cystadane<sup>®</sup>) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

## BETAINE

**Cautions** monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur

**Pregnancy** manufacturer advises avoid unless essential—limited information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** less commonly gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cautions), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

### Indications and dose

**Adjunctive treatment of homocystinuria** (specialist use only)

• **By mouth**

**Neonate** 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

**Child 1 month–10 years** 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

**Child 10–18 years** 3 g twice daily, adjusted according to response; max. 10 g twice daily

**Administration** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane<sup>®</sup> powder

**Betaine** (Non-proprietary) (PoM)

**Powder (for oral solution)**, betaine anhydrous 500 mg/mL when reconstituted.

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Tablets**, betaine anhydrous 500 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Cystadane**<sup>®</sup> (Orphan Europe) (PoM)

**Powder**, betaine (anhydrous), net price 180 g = £347.00

## BIOTIN (Vitamin H)

**Pregnancy** no information available

**Breast-feeding** no information available

**Indications and dose****Isolated carboxylase defects**

- By mouth or by slow intravenous injection

**Neonate** 5 mg once daily, adjusted according to response; usual maintenance 10–50 mg daily, higher doses may be required

**Child 1 month–18 years** 10 mg once daily, adjusted according to response; usual maintenance 10–50 mg daily but up to 100 mg daily may be required

**Defects of biotin metabolism**

- By mouth or by slow intravenous injection

**Neonate** 10 mg once daily adjusted according to response; usual maintenance 5–20 mg daily but higher doses may be required

**Child 1 month–18 years** 10 mg once daily adjusted according to response; usual maintenance 5–20 mg daily but higher doses may be required

**Biotin** (Non-proprietary) (PoM)

**Tablets**, biotin 5 mg, 20-tab pack

**Injection**, biotin 5 mg/mL

Available from 'special order' manufacturers or specialist importing companies, see p. 840

**Administration** For administration *by mouth*, tablets may be crushed and mixed with food or drink

**MIGLUSTAT**

**Cautions** monitor cognitive and neurological function, growth, and platelet count

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** child 12–18 years, initially 200 mg twice daily if estimated glomerular filtration rate 50–70 mL/minute/1.73 m<sup>2</sup>; child 12–18 years, initially 100 mg twice daily if estimated glomerular filtration rate 30–50 mL/minute/1.73 m<sup>2</sup>; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>; child under 12 years—consult product literature

**Pregnancy** manufacturer advises avoid (toxicity in *animal* studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes, tremor, dizziness, headache, peripheral neuropathy, ataxia, amnesia, hypoaesthesia, paraesthesia, insomnia, depression, chills, malaise, decreased libido, thrombocytopenia, muscle spasm and weakness

**Indications and dose**

**Neimann-Pick type C disease** (specialist supervision only)

- By mouth

**Child 4–12 years**

**Body surface area less than 0.47 m<sup>2</sup>** 100 mg once daily

**Body surface area 0.47–0.73 m<sup>2</sup>** 100 mg twice daily

**Body surface area 0.73–0.88 m<sup>2</sup>** 100 mg three times daily

**Body surface area 0.88–1.25 m<sup>2</sup>** 200 mg twice daily

**Body surface area greater than 1.25 m<sup>2</sup>** 200 mg three times daily

**Child 12–18 years** 200 mg three times daily

**Zavesca**® (Actelion) (PoM)

**Capsules**, miglustat 100 mg, net price 84-cap pack = £3934.17 (hospital only)

**NITISINONE**  
(NTBC)

**Cautions** slit-lamp examination of eyes recommended before treatment; monitor liver function regularly; monitor platelet and white blood cell count every 6 months

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—adverse effect in *animal* studies

**Side-effects** thrombocytopenia, leucopenia, granulocytopenia; conjunctivitis, photophobia, corneal opacity, keratitis, eye pain; *less commonly* leucocytosis, blepharitis, pruritus, exfoliative dermatitis, and erythematous rash

**Indications and dose**

**Hereditary tyrosinaemia type I** (in combination with dietary restriction of tyrosine and phenylalanine)

- By mouth

**Neonate** initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily

**Child 1 month–18 years** initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily

**Administration** capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately

**Orfadin**® (Swedish Orphan) (PoM)

**Capsules**, nitisinone 2 mg, net price 60-cap pack = £564.00; 5 mg, 60-cap pack = £1127.00; 10 mg, 60-cap pack = £2062.00

**SODIUM DICHOROACETATE**

**Pregnancy** no information available

**Breast-feeding** no information available

**Side-effects** polyneuropathy on prolonged use; abnormal oxalate metabolism; metabolic acidosis

**Indications and dose****Pyruvate dehydrogenase defects**

- By mouth

**Neonate** initially 12.5 mg/kg 4 times daily, adjusted according to response; up to 200 mg/kg daily may be required

**Child 1 month–18 years** initially 12.5 mg/kg 4 times daily, adjusted according to response; up to 200 mg/kg daily may be required

**Sodium dichloroacetate** (Non-proprietary) [PoM]

**Powder (for oral solution)**, sodium dichloroacetate 50 mg/mL when reconstituted with water  
Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**UBIDECARENONE**

(Ubiquinone, Co-enzyme Q10)

**Cautions** may reduce insulin requirement in diabetes mellitus; **interactions:** Appendix 1 (ubidecarenone)

**Hepatic impairment** reduce dose in moderate and severe impairment

**Side-effects** nausea, diarrhoea, heartburn; rarely headache, irritability, agitation, dizziness

**Licensed use** not licensed

**Indications and dose****Mitochondrial disorders**

## • By mouth

**Neonate** initially 5 mg once or twice daily with food, adjusted according to response, up to 200 mg daily may be required

**Child 1 month–18 years** initially 5 mg once or twice daily with food, adjusted according to response, up to 300 mg daily may be required

**Ubidecarenone** (Non-proprietary) [PoM]

**Oral solution**, ubidecarenone 50 mg/10 mL

**Tablets**, ubidecarenone 10 mg

**Capsules**, ubidecarenone 10 mg, 30 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**9.8.2 Acute porphyrias**

The acute porphyrias (acute intermittent porphyria, variegated porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs. Acute attacks of porphyria are exceptionally rare before puberty. When acute porphyria is suspected in a child, support from an expert porphyria service should be sought.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

**Haem arginate** is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

The National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke's Hospital, and King's College Hospital). To access

the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

**HAEM ARGINATE**

(Human hemin)

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** pain and thrombophlebitis at injection site; rarely hypersensitivity reactions and fever; also reported headache

**Indications and dose****Acute porphyrias (acute intermittent porphyria, porphyria variegata, hereditary coproporphyria)**

## • By intravenous infusion

**Child 1 month–18 years** 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

**Normosang<sup>®</sup>** (Orphan Europe) ▼ [PoM]

**Concentrate for intravenous infusion**, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

**Administration** administer over at least 30 minutes through a filter via large antebraachial or central vein; dilute requisite dose in 100 mL Sodium Chloride 0.9% in glass bottle; administer within 1 hour after dilution; max. concentration 2.5 mg/mL

**Drugs unsafe for use in acute porphyrias**

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or *in vitro*, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at [www.wmic.wales.nhs.uk/porphyria\\_info.php](http://www.wmic.wales.nhs.uk/porphyria_info.php).

Further information may be obtained from [www.porphyria-europe.org](http://www.porphyria-europe.org) and also from:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff, CF14 4XW  
Tel: (029) 2074 2979/3877

**Note** Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

## Unsafe drug groups (check first)

Alkylating drugs <sup>1</sup>	Calcium channel blockers <sup>5</sup>	Non-nucleoside reverse transcriptase inhibitors <sup>1</sup>	Taxanes <sup>1</sup>
Amfetamines	Contraceptives, hormonal <sup>6</sup>	Progesterogens <sup>6</sup>	Thiazolidinediones <sup>1</sup>
Anabolic steroids	Ergot derivatives <sup>7</sup>	Protease inhibitors <sup>1</sup>	Triazole antifungals <sup>8</sup>
Antidepressants <sup>2</sup>	Hormone replacement therapy <sup>6</sup>	Sulfonamides <sup>9</sup>	
Antihistamines <sup>3</sup>	Imidazole antifungals <sup>8</sup>	Sulfonylureas <sup>10</sup>	
Barbiturates <sup>4</sup>			

## Unsafe drugs (check groups above first)

Aceclofenac	Dapsone	Methyldopa	Rifabutin <sup>13</sup>
Alcohol	Dexfenfluramine	Metolazone	Rifampicin
Aminophylline	Disopyramide	Metirapone	Riluzole
Amiodarone	Disulfiram	Mifepristone	Risperidone
Aprepitant	Erythromycin	Minoxidil <sup>14</sup>	Selegiline
Artemether with lumefantrine	Etamsylate	Mitotane	Spiro lactone
Bexarotene	Ethosuximide	Nalidixic acid	Sulfapyrazone
Bosentan	Etomidate	Nitrazepam	Tamoxifen
Bromocriptine	Fenfluramine	Nitrofurantoin	Telithromycin
Buspiron	Flupentixol	Orphenadrine	Temoporfin
Cabergoline	Flutamide	Oxcarbazepine	Tiagabine
Carbamazepine	Fosphenytoin	Oxybutynin	Tinidazole
Chloral hydrate <sup>11</sup>	Griseofulvin	Pentazocine <sup>15</sup>	Topiramate
Chloramphenicol	Hydralazine	Pentoxifylline	Toremifene
Chloroform <sup>12</sup>	Indapamide	Phenoxybenzamine	Trimethoprim
Clindamycin	Isometheptene mucate	Phenytoin	Valproate
Cocaine	Isoniazid <sup>13</sup>	Pivmecillinam	Xipamide
Colistimethate sodium	Ketamine	Porfimer	Zidovudine <sup>1</sup>
Danazol	Mefenamic acid <sup>14</sup>	Potassium canrenoate <sup>16</sup>	Zuclopentixol
	Meprobamate	Raloxifene	

- Contact Welsh Medicines Information Centre for further advice.
- Includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe.
- Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
- Includes primidone and thiopental.
- Amlodipine, felodipine, and nifedipine thought to be safe.
- Progesterogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progesterogens should be avoided whenever possible by all young women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progesterogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progesterone preparations should never be used in those at risk of acute porphyria.
- Includes ergometrine (oxytocin probably safe) and pergolide.
- Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.
- Includes co-trimoxazole and sulfasalazine.
- Glipizide and glimepiride are thought to be safe.
- Although evidence of hazard is uncertain, manufacturer advises avoid.
- Small amounts in medicines probably safe.
- Safety uncertain, contact Welsh Medicines Information Centre for further advice.
- May be used with caution if safer alternative not available.
- Buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe.
- Evidence of hazard uncertain—contact Welsh Medicines Information Centre for further advice.

# 10 Musculoskeletal and joint diseases

<b>10.1</b>	<b>Drugs used in rheumatic diseases</b>	<b>504</b>
10.1.1	Non-steroidal anti-inflammatory drugs	504
10.1.2	Corticosteroids	510
10.1.2.1	Systemic corticosteroids	510
10.1.2.2	Local corticosteroid injections	511
10.1.3	Drugs that suppress the rheumatic disease process	512
10.1.4	Gout and cytotoxic-induced hyperuricaemia	518
10.1.5	Other drugs for rheumatic diseases	518
<b>10.2</b>	<b>Drugs used in neuromuscular disorders</b>	<b>518</b>
10.2.1	Drugs that enhance neuromuscular transmission	518
10.2.2	Skeletal muscle relaxants	520
<b>10.3</b>	<b>Drugs for the treatment of soft-tissue disorders and topical pain relief</b>	<b>522</b>
10.3.1	Enzymes	522
10.3.2	Rubefacients, topical NSAIDs, capsaicin, and poultices	522

This chapter also includes advice on the drug management of the following:

- dental and orofacial pain, p. 505
- extravasation, p. 522
- myasthenia gravis, p. 518
- soft-tissue and other musculoskeletal disorders, p. 504
- juvenile idiopathic arthritis and other inflammatory disorders, p. 504

For treatment of septic arthritis see Table 1, section 5.1.

## 10.1 Drugs used in rheumatic diseases

10.1.1	Non-steroidal anti-inflammatory drugs
10.1.2	Corticosteroids
10.1.3	Drugs that suppress the rheumatic disease process
10.1.4	Gout and cytotoxic-induced hyperuricaemia
10.1.5	Other drugs for rheumatic diseases

## Juvenile idiopathic arthritis and other inflammatory disorders

Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve non-steroidal anti-inflammatory drugs (NSAIDs) (section 10.1.1), a disease modifying antirheumatic drug (DMARD) (section 10.1.3) such as methotrexate or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids (section 10.1.2).

## Soft-tissue and musculoskeletal disorders

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, **paracetamol** (section 4.7.1) is often adequate and should be used first. Alternatively, the lowest effective dose of a **NSAID** (e.g. ibuprofen) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

### 10.1.1 Non-steroidal anti-inflammatory drugs

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

**Choice** Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance of these drugs. A large proportion of children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after

taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

**Ibuprofen** and **naproxen** are propionic acid derivatives used in children:

**Ibuprofen** combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker.

**Naproxen** combines good efficacy with a low incidence of side-effects.

**Diclofenac**, **indometacin**, **mefenamic acid**, and **piroxicam** have properties similar to those of propionic acid derivatives:

**Diclofenac** is similar in efficacy to naproxen.

**Indometacin** has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

**Mefenamic acid** has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

**Piroxicam** is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (**important**: see CHMP advice, p. 510).

**Meloxicam** is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

**Ketorolac** can be used for the short-term management of postoperative pain (section 15.1.4.2).

**Etoricoxib**, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

For the role of **aspirin** in children, see section 2.9.

**Dental and orofacial pain** Most mild to moderate dental pain and inflammation is effectively relieved by **ibuprofen** or **diclofenac**. For information on the risks of serious gastro-intestinal side-effects see below.

For further information on the management of dental and orofacial pain, see p. 199.

**Cautions and contra-indications** NSAIDs should be used with caution in children with a history of hypersensitivity to any NSAID—which includes those in

whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by any NSAID. NSAIDs should also be used with caution in coagulation defects. Caution may also be required in children with allergic disorders, and also in children with connective-tissue disorders, see Side-effects below.

In children with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects below). All NSAIDs are contra-indicated in severe heart failure. **Diclofenac** and the selective inhibitor of cyclo-oxygenase-2, **etoricoxib**, are contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and mild to severe heart failure. They should be used with caution in children with a history of cardiac failure, left ventricular dysfunction, hypertension, in children with oedema for any other reason, and in children with other risk factors for cardiovascular events. Other non-selective NSAIDs should be used with caution in uncontrolled hypertension, heart failure, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, and when used long term in children with risk factors for cardiovascular events.

### NSAIDs and cardiovascular events

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, **cyclo-oxygenase-2 selective inhibitors**, **diclofenac** (150 mg daily) and **ibuprofen** (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of **etoricoxib**. **Naproxen** (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

All NSAIDs (including cyclo-oxygenase-2 selective inhibitors) are contra-indicated in children with active gastro-intestinal ulceration or bleeding. **Piroxicam** and **ketorolac** are contra-indicated in children with a history of gastro-intestinal bleeding, ulceration or perforation. Other non-selective NSAIDs are contra-indicated in children with a history of recurrent gastro-intestinal ulceration or haemorrhage (two or more distinct episodes), and in children with a history of gastro-intestinal bleeding or perforation related to previous NSAID therapy, see also NSAIDs and gastro-intestinal events below. For advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see section 1.3. NSAIDs should also be used with caution in Crohn's disease or ulcerative colitis, as these conditions may be exacerbated.

For **interactions** of NSAIDs, see Appendix 1 (NSAIDs).

**Hepatic impairment** NSAIDs should be used with caution in children with hepatic impairment; there is an

increased risk of gastro-intestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

**Renal impairment** NSAIDs should be avoided if possible or used with caution in children with renal impairment; the **lowest effective dose** should be used for the **shortest possible duration**, and renal function should be **monitored**. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

**Pregnancy** Most manufacturers advise avoiding NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and the duration may be increased.

See also individual monograph for etoricoxib.

**Breast-feeding** NSAIDs should be used with caution during breast-feeding; see also individual drugs.

**Side-effects** The side-effects of NSAIDs vary in severity and frequency. Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration may occur (see also notes below and Cautions above).

#### NSAIDs and gastro-intestinal events

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam (see also CHMP advice, p. 510) and ketorolac are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). **Selective inhibitors of cyclooxygenase-2** are associated with a *lower risk* of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common although they do still occur and can be significant; use of gastro-protective drugs may be necessary (see also section 1.3).

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photopsensitivity, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.

#### Asthma

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.

Renal failure may be provoked by NSAIDs, especially in patients with pre-existing renal impairment (**important**, see Renal impairment above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure. Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis or Crohn's disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—children with connective tissue disorders such as systemic lupus erythematosus may be especially susceptible.

**Overdosage:** see Emergency Treatment of Poisoning, p. 25.

## DICLOFENAC POTASSIUM

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount in milk too small to be harmful; see also notes above

**Side-effects** see notes above

**Licensed use** *Voltarol<sup>®</sup> Rapid* not licensed for use in children under 14 years or in fever

#### Indications and dose

##### Rheumatic disease and musculoskeletal disorders

- **By mouth**

**Child 14–18 years** 75–100 mg daily in 2–3 divided doses

##### Postoperative pain

- **By mouth**

**Child 9–14 years and body-weight over 35 kg** up to 2 mg/kg (max. 100 mg) daily in 3 divided doses

**Child 14–18 years** 75–100 mg daily in 2–3 divided doses

##### Fever in ear, nose, or throat infection

- **By mouth**

**Child 9–18 years and body-weight over 35 kg** up to 2 mg/kg (max. 100 mg) daily in 3 divided doses

#### Diclofenac Potassium (Non-proprietary) <sup>(PoM)</sup>

**Tablets**, diclofenac potassium 25 mg, net price 28-tab pack = £3.23; 50 mg, 28-tab pack = £6.18. Label: 21

#### <sup>1</sup>**Voltarol<sup>®</sup> Rapid** (Novartis) <sup>(PoM)</sup>

**Tablets**, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46; 50 mg (brown), 30-tab pack = £6.62. Label: 21

- 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg, max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg

## DICLOFENAC SODIUM

**Cautions** see notes above

**Contra-indications** see notes above; avoid suppositories in proctitis; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Intravenous use** Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparins), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment, hypovolaemia, dehydration

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also Intravenous Use and notes above

**Pregnancy** see notes above

**Breast-feeding** amount in milk too small to be harmful; see also notes above

**Side-effects** see notes above; suppositories may cause rectal irritation; injection site reactions

**Licensed use** not licensed for use in children under 1 year; *suppositories* not licensed for use in children under 6 years except for use in children over 1 year for juvenile idiopathic arthritis; solid dose forms containing more than 25 mg not licensed for use in children; *injection* not licensed for use in children

### Indications and dose

#### Inflammation and mild to moderate pain

- By mouth or by rectum

**Child 6 months–18 years** 0.3–1 mg/kg (max. 50 mg) 3 times daily

#### Postoperative pain

- By rectum

**Child 6 months–18 years**

**Body-weight 8–12 kg** 12.5 mg twice daily for max. 4 days

**Body-weight over 12 kg** 1 mg/kg (max. 50 mg) 3 times daily for max. 4 days

- By intravenous infusion or deep intramuscular injection into gluteal muscle

**Child 2–18 years** 0.3–1 mg/kg once or twice daily for max. 2 days (max. 150 mg daily)

#### Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- By mouth

**Child 6 months–18 years** 1.5–2.5 mg/kg (max. 75 mg) twice daily; total daily dose may alternatively be given in 3 divided doses

**Administration** for *intravenous infusion*, dilute 75 mg with 100–500 mL Glucose 5% or Sodium Chloride 0.9% (previously buffered with 0.5 mL Sodium Bicarbonate 8.4% solution or with 1 mL Sodium Bicarbonate 4.2% solution); give over 30–120 minutes

### Diclofenac Sodium (Non-proprietary) <sup>(PoM)</sup>

**Tablets**, both e/c, diclofenac sodium 25 mg, net price 84-tab pack = £1.25; 50 mg, 84-tab pack = £1.10. Label: 5, 25

**Brands include** *Defenac*<sup>®</sup>, *Dicloflex*<sup>®</sup>, *Diclozip*<sup>®</sup>, *Fenactol*<sup>®</sup>, *Flamrase*<sup>®</sup>

**Dispersible tablets**, sugar-free, diclofenac sodium 10 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Suppositories**, diclofenac sodium 100 mg, net price 10 = £3.03

**Brands include** *Econac*<sup>®</sup>

### Voltarol<sup>®</sup> (Novartis) <sup>(PoM)</sup>

**Tablets**, e/c, diclofenac sodium 25 mg (yellow), net price 84-tab pack = £2.94; 50 mg (brown), 84-tab pack = £4.57. Label: 5, 25

**Dispersible tablets**, sugar-free, pink, diclofenac, equivalent to diclofenac sodium 50 mg, net price 21-tab pack = £6.19. Label: 13, 21

**Injection**, diclofenac sodium 25 mg/mL, net price 3-mL amp = 83p

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2), propylene glycol

**Suppositories**, diclofenac sodium 12.5 mg, net price 10 = 58p; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03

### Modified release

#### Diclomax SR<sup>®</sup> (Galen) <sup>(PoM)</sup>

**Capsules**, m/r, yellow, diclofenac sodium 75 mg, net price 56-cap pack = £9.69. Label: 21, 25

**Dose**

#### Pain and inflammation

- By mouth

**Child 12–18 years** 1 capsule 1–2 times daily

#### Diclofax Retard<sup>®</sup> (Galen) <sup>(PoM)</sup>

**Capsules**, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £6.97. Label: 21, 25

**Dose**

#### Pain and inflammation

- By mouth

**Child 12–18 years** 1 capsule once daily

#### Motifene<sup>®</sup> 75 mg (Daichi Sankyo) <sup>(PoM)</sup>

**Capsules**, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25

**Excipients** include propylene glycol (see Excipients, p. 2)

**Dose**

#### Pain and inflammation

- By mouth

**Child 12–18 years** 1 capsule 1–2 times daily

#### Voltarol<sup>®</sup> 75 mg SR (Novartis) <sup>(PoM)</sup>

**Tablets**, m/r, pink, diclofenac sodium 75 mg, net price 28-tab pack = £6.46; 56-tab pack = £12.92. Label: 21, 25

**Dose**

#### Pain and inflammation

- By mouth

**Child 12–18 years** 1 tablet 1–2 times daily

**Note** Other brands of modified-release tablets containing diclofenac sodium 75 mg include *Defenac*<sup>®</sup> SR, *Dexomon*<sup>®</sup> 75 SR, *Dicloflex*<sup>®</sup> 75 SR, *Fenactol*<sup>®</sup> 75 mg SR, *Flamatak*<sup>®</sup> 75 MR, *Flamrase*<sup>®</sup> SR, *Flexotard*<sup>®</sup> MR 75, *Rheumatac*<sup>®</sup> Retard 75, *Rhumalgan*<sup>®</sup> CR, *Slofenac*<sup>®</sup> SR, *Volsaid*<sup>®</sup> Retard 75

#### Voltarol<sup>®</sup> Retard (Novartis) <sup>(PoM)</sup>

**Tablets**, m/r, red, diclofenac sodium 100 mg, net price 28-tab pack = £9.47. Label: 21, 25

**Dose**

#### Pain and inflammation

- By mouth

**Child 12–18 years** 1 tablet once daily

**Note** Other brands of modified-release tablets containing diclofenac sodium 100 mg include *Defenac*<sup>®</sup> Retard, *Dexomon*<sup>®</sup> Retard 100, *Dicloflex*<sup>®</sup> Retard, *Fenactol*<sup>®</sup> Retard 100 mg, *Flamatak*<sup>®</sup> 100 MR, *Slofenac*<sup>®</sup> SR, *Volsaid*<sup>®</sup> Retard 100

## ETORICOXIB

**Cautions** see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment

**Contra-indications** see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg)

**Hepatic impairment** max. 60 mg daily in mild impairment; max. 60 mg on alternate days or 30 mg once daily in moderate impairment; see also notes above

**Renal impairment** avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** manufacturer advises avoid (teratogenic in animal studies); see also notes above

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies; see also notes above

**Side-effects** see notes above; also palpitation, fatigue, influenza-like symptoms, ecchymosis; *less commonly* dry mouth, taste disturbance, mouth ulcer, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; *very rarely* confusion and hallucinations

### Indications and dose

#### Osteoarthritis

- By mouth

**Child 16–18 years** 30 mg once daily, increased if necessary to 60 mg once daily

#### Rheumatoid arthritis and ankylosing spondylitis

- By mouth

**Child 16–18 years** 90 mg once daily

#### Acute gout

- By mouth

**Child 16–18 years** 120 mg once daily for max. 8 days

### Arcoxia® (MSD) (PoM)

**Tablets**, f/c, etoricoxib 30 mg (blue-green), net price 28-tab pack = £13.99; 60 mg (dark green), 28-tab pack = £20.11; 90 mg (white), 28-tab pack = £22.96; 120 mg (pale green), 7-tab pack = £6.03, 28-tab pack = £24.11

## IBUPROFEN

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful, but some manufacturers advise avoid; see also notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 3 months or body-weight under 5 kg

### Indications and dose

**Mild to moderate pain, pain and inflammation of soft-tissue injuries, pyrexia with discomfort**

- By mouth

**Child 1–3 months** 5 mg/kg 3–4 times daily

**Child 3–6 months** 50 mg 3 times daily; max. 30 mg/kg daily in 3–4 divided doses

**Child 6 months–1 year** 50 mg 3–4 times daily; max. 30 mg/kg daily in 3–4 divided doses

**Child 1–4 years** 100 mg 3 times daily; max. 30 mg/kg daily in 3–4 divided doses

**Child 4–7 years** 150 mg 3 times daily; max. 30 mg/kg daily in 3–4 divided doses

**Child 7–10 years** 200 mg 3 times daily; max. 30 mg/kg (max. 2.4 g) daily in 3–4 divided doses

**Child 10–12 years** 300 mg 3 times daily; max. 30 mg/kg (max. 2.4 g) daily in 3–4 divided doses

**Child 12–18 years** initially 300–400 mg 3–4 times daily; increased if necessary to max. 600 mg 4 times daily; maintenance dose of 200–400 mg 3 times daily may be adequate

**Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**

- By mouth

**Child 3 months–18 years** 30–40 mg/kg (max. 2.4 g) daily in 3–4 divided doses; in systemic juvenile idiopathic arthritis up to 60 mg/kg (max. 2.4 g) daily [unlicensed] in 4–6 divided doses

**Post-immunisation pyrexia in infants** (see also p. 605)

- By mouth

**Child 2–3 months** 50 mg as a single dose repeated once after 6 hours if necessary

**Closure of patent ductus arteriosus in neonates**

see section 2.14

### <sup>1</sup>Ibuprofen (Non-proprietary) (PoM)

**Tablets**, coated, ibuprofen 200 mg, net price 84-tab pack = £3.08; 400 mg, 84-tab pack = £3.15; 600 mg, 84-tab pack = £6.92. Label: 21

**Brands include** *Arthrofen*®, *Ebufac*®, *Rimafen*®

**Dental prescribing on NHS** Ibuprofen Tablets may be prescribed

**Oral suspension**, ibuprofen 100 mg/5 mL, net price 100 mL = £1.37, 150 mL = £2.11, 500 mL = £8.88. Label: 21

**Note** Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

**Brands include** *Calprofen*®, *Feverfen*®, *Nurofen*® for Children, *Orbifen*® for Children

**Dental prescribing on NHS** Ibuprofen Oral Suspension Sugar-free may be prescribed

### Brufen® (Abbott Healthcare) (PoM)

**Tablets**, f/c, ibuprofen 200 mg, net price 100-tab pack = £3.92; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21

**Syrup**, orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21

**Granules**, effervescent, ibuprofen 600 mg/sachet, net price 20–sachet pack = £6.80. Label: 13, 21  
Contains sodium approx. 6.5 mmol/sachet

1. Can be sold to the public under certain circumstances

### Modified release

**Brufen Retard**® (Abbott Healthcare) (PoM)

Tablets, m/r, ibuprofen 800 mg, net price 56-tab

pack = £7.74. Label: 25, 27

Dose

#### Pain and inflammation

- By mouth

**Child 12–18 years** 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

## INDOMETACIN

(Indomethacin)

**Cautions** see notes above; also epilepsy, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

**Skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful—manufacturer advises avoid; see also notes above

**Side-effects** see notes above; *rarely* confusion, convulsions, psychiatric disturbances, syncope, blood disorders (particularly thrombocytopenia), hyperglycaemia, peripheral neuropathy, intestinal strictures; *also reported* hyperkalaemia; suppositories may cause rectal irritation and occasional bleeding

**Licensed use** not licensed for use in children

#### Indications and dose

Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis (but see p. 504)

- By mouth

**Child 1 month–18 years** 0.5–1 mg/kg twice daily; higher doses may be used under specialist supervision

Closure of patent ductus arteriosus in premature babies section 2.14

**Indometacin** (Non-proprietary) (PoM)

Capsules, indometacin 25 mg, net price 28-cap pack = £1.17; 50 mg, 28-cap pack = £1.22. Label: 21, counselling, driving, see above

Suppositories, indometacin 100 mg, net price 10 = £17.61. Counselling, driving, see above

Suspension, indometacin 5 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

### Modified release

**Indometacin m/r preparations** (PoM)

Capsules, m/r, indometacin 75 mg. Label: 21, 25, counselling, driving, see above

Brands include *Indolar SR*®, *Pardelprin*®

## MEFENAMIC ACID

**Cautions** see notes above; epilepsy; acute porphyria (section 9.8.2)

**Contra-indications** see notes above; inflammatory bowel disease

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also diarrhoea or rashes (withdraw treatment), stomatitis; *less commonly* paraesthesia and fatigue; *rarely* hypotension, palpitation, glucose intolerance, thrombocytopenia, haemolytic anaemia (positive Coombs' test), and aplastic anaemia

#### Indications and dose

Acute pain including dysmenorrhoea, menorrhagia

- By mouth

**Child 12–18 years** 500 mg 3 times daily

**Mefenamic Acid** (Non-proprietary) (PoM)

Capsules, mefenamic acid 250 mg, net price 100 = £2.17. Label: 21

Tablets, mefenamic acid 500 mg, net price 28-tab pack = £1.66. Label: 21

Suspension, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.98. Label: 21

Excipients include ethanol

**Ponstan**® (Chemidex) (PoM)

Capsules, blue/ivory, mefenamic acid 250 mg, net price 100-cap pack = £8.17. Label: 21

Forte tablets, yellow, mefenamic acid 500 mg, net price 100-tab pack = £15.72. Label: 21

## MELOXICAM

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 16 years

#### Indications and dose

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

- By mouth

**Child 12–18 years and body-weight under 50 kg** 7.5 mg once daily

**Child 12–18 years and body-weight over 50 kg** 15 mg once daily

**Meloxicam** (Non-proprietary) (PoM)

Tablets, meloxicam 7.5 mg, net price 30-tab pack = £1.03; 15 mg, 30-tab pack = £1.13

## NAPROXEN

**Cautions** see notes above; interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 5 years for juvenile idiopathic arthritis; not licensed for use in children under 16 years for musculoskeletal disorders or dysmenorrhoea

### Indications and dose

#### Pain and inflammation in musculoskeletal disorders, dysmenorrhoea

- By mouth

**Child 1 month–18 years** 5 mg/kg twice daily (max. 1 g daily)

#### Juvenile idiopathic arthritis

- By mouth

**Child 2–18 years** 5–7.5 mg/kg twice daily (max. 1 g daily)

### <sup>1</sup>Naproxen (Non-proprietary) (PoM)

Tablets, naproxen 250 mg, net price 28-tab pack = £1.15; 500 mg, 28-tab pack = £1.82. Label: 21

Brands include *Arthrofen*<sup>®</sup>

Tablets, e/c, naproxen 250 mg, net price 56-tab pack = £2.71; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £5.02. Label: 5, 25

Suspension, naproxen 25 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

### Naprosyn<sup>®</sup> (Roche) (PoM)

Tablets, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56. Label: 21

Tablets, e/c, (*Naprosyn EC*<sup>®</sup>), naproxen 250 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £8.56. Label: 5, 25

## PIROXICAM

**Cautions** see notes above and CHMP advice below

**Contra-indications** inflammatory bowel disease; see also notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful; see also notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children

### Indications and dose

#### Relief of pain and inflammation in juvenile idiopathic arthritis

- By mouth

**Child 6–18 years and body-weight under 15 kg** 5 mg daily

1. Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets

**Child 6–18 years and body-weight 16–25 kg** 10 mg daily

**Child 6–18 years and body-weight 26–45 kg** 15 mg daily

**Child 6–18 years and body-weight over 46 kg** 20 mg daily

### CHMP advice

#### Piroxicam (June 2007)

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent (section 1.3) should be considered

### Note

Topical preparations containing piroxicam are not affected by these restrictions

### Piroxicam (Non-proprietary) (PoM)

Capsules, piroxicam 10 mg, net price 56-cap pack = £6.78; 20 mg, 28-cap pack = £7.80. Label: 21

Dispersible tablets, piroxicam 10 mg, net price 56-tab pack = £9.96; 20 mg, 28-tab pack = £32.41. Label: 13, 21

### Brexidol<sup>®</sup> (Chiesi) (PoM)

Tablets, yellow, scored, piroxicam (as betadex) 20 mg, net price 30-tab pack = £13.82. Label: 21

### Feldene<sup>®</sup> (Pfizer) (PoM)

Capsules, piroxicam 10 mg (red/blue), net price 30-cap pack = £3.86; 20 mg (white), 30-cap pack = £7.71. Label: 21

Tablets, (*Feldene Melt*<sup>®</sup>), piroxicam 20 mg, net price 30-tab pack = £10.53. Label: 10, patient information leaflet, 21

**Excipients** include aspartame equivalent to phenylalanine 140 micrograms/tablet (section 9.4.1)

**Note** Tablets may be halved [unlicensed] to give 10-mg dose; tablet placed on tongue and allowed to dissolve or may be swallowed

## 10.1.2 Corticosteroids

### 10.1.2.1 Systemic corticosteroids

#### 10.1.2.2 Local corticosteroid injections

### 10.1.2.1 Systemic corticosteroids

The general actions, uses, and cautions of corticosteroids are described in section 6.3. In children with rheumatic diseases corticosteroids should be reserved for specific indications (e.g. when other therapies are unsuccessful or while waiting for DMARDs to take effect) and should be used only under the supervision of a specialist.

Systemic corticosteroids may be considered for the management of juvenile idiopathic arthritis in systemic disease or when several joints are affected. Systemic corticosteroids may also be considered in severe, possibly life-threatening conditions such as systemic lupus erythematosus, systemic vasculitis, juvenile dermatomyositis, Behçet's disease, and polyarticular joint disease.

In severe conditions, short courses ('pulses') of high-dose intravenous methylprednisolone or a pulsed oral corticosteroid may be particularly effective for providing rapid relief, and has fewer long-term adverse effects than continuous treatment.

Corticosteroid doses should be reduced with care because of the possibility of relapse if the reduction is too rapid. If complete discontinuation of corticosteroids is not possible, consideration should be given to alternate-day (or alternate high-dose, low-dose) administration; on days when no corticosteroid is given, or a lower dose is given, an additional dose of a NSAID may be helpful. In some conditions, alternative treatment using an antimalarial or concomitant use of an immunosuppressant drug, such as azathioprine, methotrexate or cyclophosphamide may prove useful; in less severe conditions treatment with a NSAID alone may be adequate.

Administration of corticosteroids may result in suppression of growth and may affect the development of puberty. The risk of corticosteroid-induced osteoporosis should be considered for those on long-term corticosteroid treatment (section 6.6); corticosteroids may also increase the risk of osteopenia in those unable to exercise. For the disadvantages of corticosteroid treatment see section 6.3.2.

### 10.1.2.2 Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by *intra-articular injection* as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Aseptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia, or conscious sedation should be used. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect. Triamcinolone acetonide and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone acetate should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis* or *golfer's elbow* or *compression neuropathies*, which occur rarely in children. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true

tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

## LOCAL CORTICOSTEROID INJECTIONS

**Cautions** see notes above and consult product literature; see also section 6.3.2

**Contra-indications** see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparation below)

**Side-effects** see notes above and consult product literature

**Licensed use** triamcinolone acetonide not licensed for use in children under 6 years

### Indications and dose

See under preparations

#### Hydrocortisone acetate

**Hydrocortistab**® (AMCo) (PoM)

**Injection** (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £6.87  
**Dose**

- By intra-articular injection

(for details consult product literature)

**Child 1 month–12 years** 5–30 mg according to size of child and joint

**Child 12–18 years** 5–50 mg according to size of child and joint

**Note** Where appropriate may be repeated at intervals of 21 days; not more than 3 joints should be treated on any one day

#### Methylprednisolone acetate

**Depo-Medrone**® (Pharmacia) (PoM)

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £3.44; 2-mL vial = £6.18; 3-mL vial = £8.96

**Depo-Medrone**® with **Lidocaine** (Pharmacia) (PoM)

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.94; 2-mL vial = £7.06

#### Triamcinolone hexacetonide

**Triamcinolone hexacetonide** (Non-proprietary) (PoM)

**Injection**, various strengths available from 'special order' manufacturers or specialist importing companies, see, p. 840

**Dose**

- By intra-articular injection

(for details consult product literature)

**Child 1–18 years** for larger joints 1 mg/kg (usual max. 20 mg, but higher doses have been used); if appropriate repeat treatment for relapse

#### Triamcinolone acetonide

**Adcortyl**® **Intra-articular/Intradermal** (Squibb) (PoM)

**Injection** (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL amp = 89p; 5-mL vial = £3.63

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Dose**

- By intra-articular injection

(for details consult product literature)

**Child 1–18 years** for larger joints 2 mg/kg (max. 15 mg); for doses above 15 mg use **Kenalog**® **Intra-articular/Intramuscular**; if appropriate repeat treatment for relapse

**Kenalog® Intra-articular/Intramuscular**

(Squibb) (POM)

**Injection** (aqueous suspension), triamcinolone acetate 40 mg/mL, net price 1-mL vial = £1.49**Dose**

- By intra-articular injection (for details consult product literature)

**Child 1–18 years** for larger joints 2 mg/kg (usual max. 40 mg, but higher doses have been used); if appropriate repeat treatment for relapse

## 10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs, such as methotrexate, cytokine modulators, and sulfasalazine, are used to suppress the disease process in *juvenile idiopathic arthritis* (juvenile chronic arthritis); these drugs are known as disease-modifying antirheumatic drugs (DMARDs). In children, disease-modifying antirheumatic drugs should be used under specialist supervision.

Some children with juvenile idiopathic arthritis do not require disease-modifying antirheumatic drugs. Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine are no longer used. For the role of cytokine modulators in *polyarticular juvenile idiopathic arthritis*, see p. 514.

Unlike NSAIDs, disease-modifying antirheumatic drugs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a disease-modifying antirheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations. They reduce the erythrocyte sedimentation rate and C-reactive protein.

### Antimalarials

The antimalarial **hydroxychloroquine** is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine can also be useful for systemic or discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded.

**Mepacrine** is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

**Cautions** Hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), and in acute porphyria. Hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatotoxic drugs should be avoided; other interactions: Appendix 1 (chloroquine and hydroxychloroquine).

**Pregnancy** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease

is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**Breast-feeding** Hydroxychloroquine is present in breast milk leading to a risk of toxicity in infants—breast-feeding should be avoided when it is used to treat rheumatic disease.

### Screening for ocular toxicity

Hydroxychloroquine is rarely associated with ocular toxicity. The British Society for Paediatric and Adolescent Rheumatology recommends that children should have their vision tested before long-term treatment with hydroxychloroquine and have an annual review of visual acuity. Children should be referred to an ophthalmologist if there is visual impairment, changes in visual acuity, or blurred vision. The Royal College of Ophthalmologists has recommended that a locally agreed protocol between the prescribing doctor and ophthalmologist be established to monitor the vision of these children.

### Important

To avoid excessive dosage in obese children, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight; ocular toxicity is unlikely with doses under 5–6.5 mg/kg or max. 400 mg daily.

**Side-effects** The side-effects of hydroxychloroquine include gastro-intestinal disturbances, headache, and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, ototoxicity, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomyopathy and neuromyopathy), acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; angioedema and bronchospasm have also been reported. **Important:** very toxic in overdose—immediate advice from poisons centres essential (see also p. 28).

## HYDROXYCHLOROQUINE SULFATE

**Cautions** see notes above

**Hepatic impairment** use with caution in moderate to severe impairment

**Renal impairment** manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe impairment

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Licensed use** *Plaquenil*® not licensed for use in children for dermatological conditions caused or aggravated by sunlight

**Indications and dose**

**Juvenile idiopathic arthritis, systemic and discoid lupus erythematosus, dermatological conditions caused or aggravated by sunlight**

- By mouth

**Child 1 month–18 years** based on ideal body-weight, 5–6.5 mg/kg (max. 400 mg) once daily

**Hydroxychloroquine** (Non-proprietary) (PoM)

**Tablets**, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £4.97. Label: 21, counselling, antacids (see below)

**Brands include** *Quinoric*<sup>®</sup>

**Counselling** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

**Plaquenil**<sup>®</sup> (Sanofi-Aventis) (PoM)

**Tablets**, f/c, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £5.15. Label: 21, counselling, antacids (see below)

**Counselling** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

**Drugs affecting the immune response**

**Methotrexate**, given as a once weekly dose, is the disease-modifying antirheumatic drug of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely, the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid has not been established—in children over 2 years a dose of 5 mg weekly [unlicensed indication], may be given on a different day from the methotrexate.

**Azathioprine** may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of *polymyositis* which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive.

**Ciclosporin** is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

**AZATHIOPRINE**

**Cautions** section 8.2.1

**Contra-indications** section 8.2.1

**Hepatic impairment** section 8.2.1

**Renal impairment** section 8.2.1

**Pregnancy** section 8.2.1

**Breast-feeding** section 8.2.1

**Side-effects** section 8.2.1

**Indications and dose**

**Systemic lupus erythematosus, vasculitis, autoimmune conditions usually when corticosteroid therapy alone has proved inadequate** see also notes above

- By mouth

**Child 1 month–18 years** initially 1 mg/kg daily, adjusted according to response to max. 3 mg/kg daily (consider withdrawal if no improvement within 3 months)

**Inflammatory bowel disease** section 1.5.3

**Transplantation rejection** section 8.2.1

**Preparations**

Section 8.2.1

**METHOTREXATE**

**Cautions** section 8.1.3; see advice below (blood count, gastro-intestinal, liver, and pulmonary toxicity); extreme caution in blood disorders (avoid if severe); risk of accumulation in pleural effusion or ascites—drain before treatment; full blood count and liver function tests before starting treatment repeated fortnightly for at least the first 4 weeks and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests before starting treatment and then regularly during treatment; children or their carers should report all symptoms and signs suggestive of infection, especially sore throat; treatment with folic acid (as calcium folinate, section 8.1) may be required in acute toxicity; check immunity to varicella-zoster and consider vaccination (section 14.4) before initiating therapy; acute porphyria (section 9.8.2); **interactions:** see below and Appendix 1 (methotrexate)

**Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include renal impairment and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy

**Gastro-intestinal toxicity** Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity

**Liver toxicity** Persistent 2-fold rise in liver transaminases may necessitate dose reduction or rarely discontinuation; abrupt withdrawal should be avoided as this can lead to disease flare

**Pulmonary toxicity** Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough or fever develops; discontinue if pneumonitis suspected.

**NSAIDs** Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen

**Contra-indications** see Cautions above; also active infection and immunodeficiency syndromes

**Hepatic impairment** avoid—dose-related toxicity; see also Cautions above

**Renal impairment** section 8.1.3

**Pregnancy** section 8.1.3

**Breast-feeding** section 8.1.3

**Side-effects** section 8.1.3; chronic pulmonary fibrosis; blood dyscrasias (including fatalities); liver cirrhosis

**Licensed use** *Metotjecl*<sup>®</sup> is licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic arthritis; other preparations not licensed for use in children for non-malignant conditions

**Indications and dose**

**Juvenile idiopathic arthritis, juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, sarcoidosis**

● By mouth, subcutaneous injection, or intramuscular injection

**Child 1 month–18 years** 10–15 mg/m<sup>2</sup> once weekly initially, increased if necessary to max. 25 mg/m<sup>2</sup> once weekly

**Safe Practice**

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**Severe Crohn's disease** section 1.5.3

**Malignant disease** section 8.1.3

**Psoriasis** section 13.5.3

**Methotrexate** (Non-proprietary) (PoM)

Tablets, yellow, methotrexate 2.5 mg, net price 24-tab pack = £3.16, 28-tab pack = £2.60. Counselling, dose, NSAIDs

**Brands include** *Maxtrex*<sup>®</sup>

Tablets, yellow, methotrexate 10 mg, net price 100-tab pack = £37.06. Counselling, dose, NSAIDs

**Suspension**, various strengths available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Parenteral preparations**

See also section 8.1.3

**Metoject**<sup>®</sup> (Medac) (PoM)

**Injection**, prefilled syringe, methotrexate (as disodium salt) 50 mg/mL, net price 0.15 mL (7.5 mg) = £14.85, 0.2 mL (10 mg) = £15.29, 0.3 mL (15 mg) = £16.57, 0.4 mL (20 mg) = £17.84, 0.5 mL (25 mg) = £18.48, 0.6 mL (30 mg) = £18.95

**Cytokine modulators**

Cytokine modulators should be used under specialist supervision.

**Adalimumab, etanercept, and infliximab** inhibit the activity of tumour necrosis factor alpha (TNF- $\alpha$ ). Adalimumab can be used for the management of active polyarticular juvenile idiopathic arthritis. Etanercept is licensed for the treatment of the following subtypes of juvenile idiopathic arthritis: polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, oligoarthritis in children who have had an inadequate

response to methotrexate or who cannot tolerate it, psoriatic arthritis in children over 12 years who have had an inadequate response to methotrexate or cannot tolerate it, and enthesitis-related arthritis in children over 12 years who have had an inadequate response to conventional therapy or cannot tolerate it. Infliximab has been used in refractory polyarticular juvenile idiopathic arthritis (unlicensed indication) when other treatments, such as etanercept, have failed.

The *Scottish Medicines Consortium* (p. 3) has advised (January 2013) that etanercept (*Enbrel*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of polyarthritis (rheumatoid factor positive or negative) and extended oligoarthritis in children and adolescents from the age of 2 years who have had an inadequate response to or are intolerant of methotrexate, psoriatic arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of methotrexate, and enthesitis-related arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of conventional therapy. It is further restricted to use within specialist rheumatology services (including those working within the network for paediatric rheumatology).

**NICE guidance****Etanercept for the treatment of juvenile idiopathic arthritis (March 2002)**

Etanercept is recommended in children aged 4–17 years with active polyarticular-course juvenile idiopathic arthritis who have not responded adequately to methotrexate or who are intolerant of it. Etanercept should be used under specialist supervision according to the guidelines of the British Society for Paediatric and Adolescent Rheumatology [previously the British Paediatric Rheumatology Group]. Etanercept should be withdrawn if severe side-effects develop or if there is no response after 6 months or if the initial response is not maintained. A decision to continue therapy beyond 2 years should be based on disease activity and clinical effectiveness in individual cases.

Prescribers of etanercept should register consenting patients with the Biologics Registry of the British Society for Paediatric and Adolescent Rheumatology.

[www.nice.org.uk/TA35](http://www.nice.org.uk/TA35)

**Side-effects** Adalimumab, etanercept, and infliximab have been associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, aplastic anaemia).

**Abatacept** prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors.

The *Scottish Medicines Consortium* (p. 3) has advised (October 2011) that abatacept (*Orencia*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe active polyarticular juvenile idio-

pathic arthritis in accordance with the licensed indications, when used within specialist rheumatology services (including those working within the network for paediatric rheumatology).

**Canakinumab** inhibits the activity of interleukin-1 beta (IL-1 $\beta$ ) and is licensed for the treatment of active systemic juvenile idiopathic arthritis in children over 2 years, when there has been an inadequate response to NSAIDs and systemic corticosteroids.

**Tocilizumab** antagonises the actions of interleukin-6; it can be used for the management of active systemic juvenile idiopathic arthritis when there has been an inadequate response to NSAIDs and systemic corticosteroids and polyarticular juvenile idiopathic arthritis when there has been an inadequate response to methotrexate. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated (see also NICE guidance below). Tocilizumab is not recommended for use with other cytokine modulators.

#### NICE guidance

#### Tocilizumab for the treatment of systemic juvenile idiopathic arthritis (December 2011)

Tocilizumab is recommended for the treatment of systemic juvenile idiopathic arthritis in children aged over 2 years who have not responded adequately to NSAIDs, systemic corticosteroids and methotrexate, if the manufacturer makes tocilizumab available with the discount agreed as part of the patient access scheme.

Tocilizumab is not recommended for the treatment of systemic juvenile idiopathic arthritis in children whose disease continues to respond to methotrexate or who have not been treated with methotrexate.

Children currently receiving tocilizumab for systemic juvenile idiopathic arthritis who do not meet these criteria should have the option to continue treatment until it is considered appropriate to stop.

[www.nice.org.uk/TA238](http://www.nice.org.uk/TA238)

## ABATACEPT

**Cautions** predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; progressive multifocal leucoencephalopathy—discontinue treatment if neurological symptoms present; **interactions:** Appendix 1 (abatacept)

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** manufacturer advises avoid unless essential—effective contraception required during treatment and for 14 weeks after last dose

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

**Side-effects** abdominal pain, diarrhoea, dyspepsia, nausea, vomiting, stomatitis, flushing, hypertension, cough, dizziness, fatigue, headache, paraesthesia, infection, leucopenia, pain in extremities, conjunctivitis; *less commonly* gastritis, tachycardia, bradycardia, palpitation, hypotension, bronchospasm, dyspnoea, hyperhidrosis, weight gain, depression,

anxiety, sleep disorder, menstrual disturbances, basal and squamous cell carcinoma, skin papilloma, thrombocytopenia, arthralgia, visual disturbance, dry eye, bruising, alopecia, dry skin, psoriasis; *also reported* lymphoma, lung cancer

#### Indications and dose

**Moderate to severe active polyarticular juvenile idiopathic arthritis (in combination with methotrexate) in children who have not responded adequately to other disease-modifying anti-rheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor)**

##### • By intravenous infusion

###### Child 6–17 years

**Body-weight less than 75 kg** 10 mg/kg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

**Body-weight 75–100 kg** 750 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

**Body-weight over 100 kg** 1 g, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

**Note** Review treatment if no response within 6 months

**Administration** for *intravenous infusion*, reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron)

#### Orencia® (Bristol-Myers Squibb) (PoM)

**Intravenous infusion**, powder for reconstitution, abatacept, net price 250-mg vial = £302.40

**Electrolytes** Na<sup>+</sup> <0.5 mmol/vial

## ADALIMUMAB

**Cautions** predisposition to infection; monitor for infection before, during, and for 4 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating disorders (risk of exacerbation); history or development of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in children with history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **interactions:** Appendix 1 (adalimumab)

**Tuberculosis** Children should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting adalimumab. Children who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In those without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In children at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Children and their carers should be advised to seek medical attention if symptoms suggestive of

tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Children and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

**Breast-feeding** avoid; manufacturer advises avoid for at least 5 months after last dose

**Side-effects** see under Cytokine Modulators, p. 514 and Cautions above; also vomiting, dyspepsia, gastrointestinal haemorrhage, dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia, cough, dyspnoea, mood changes, sleep disturbances, anxiety, paraesthesia, haematuria, renal impairment, benign tumours, skin cancer, electrolyte disturbances, hyperuricaemia, dehydration, musculoskeletal pain, eye disorders, rash, dermatitis, onycholysis, impaired healing; *less commonly* dysphagia, pancreatitis, cholelithiasis, hepatic steatosis, cholelithiasis, arrhythmias, vascular occlusion, aortic aneurysm, interstitial lung disease, pneumonitis, tremor, erectile dysfunction, nocturia, malignancy (including solid tumours and lymphoma), rhabdomyolysis, hearing loss, tinnitus; *rarely* autoimmune hepatitis, myocardial infarction, demyelinating disorders; *also reported* pulmonary embolism, pleural effusion, sarcoidosis, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis

#### Indications and dose

**Active polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have not responded adequately to one or more disease-modifying antirheumatic drug**

- By subcutaneous injection

**Child 2–4 years** 24 mg/m<sup>2</sup> (max. 20 mg) on alternate weeks; review treatment if no response within 12 weeks

**Child 4–13 years** 24 mg/m<sup>2</sup> (max. 40 mg) on alternate weeks; review treatment if no response within 12 weeks

**Child 13–18 years** 40 mg on alternate weeks; review treatment if no response within 12 weeks

**Inflammatory bowel disease** section 1.5.3

**Humira®** (AbbVie) (POM)

**Injection**, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £352.14; 40 mg/0.8-mL vial = £352.14. Label: 10, alert card, counselling, tuberculosis and blood disorders

## CANAKINUMAB

**Cautions** section 8.2.4

**Contra-indications** section 8.2.4

**Hepatic impairment** section 8.2.4

**Renal impairment** section 8.2.4

**Pregnancy** section 8.2.4

**Breast-feeding** section 8.2.4

**Side-effects** section 8.2.4; also abdominal pain, arthralgia, musculoskeletal pain, rhinitis

#### Indications and dose

**Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to NSAIDs and systemic corticosteroids**

- By subcutaneous injection

**Child 2–18 years and body-weight over 7.5 kg** 4 mg/kg (max. 300 mg) once every 4 weeks

**Cryopyrin-associated periodic syndromes** section 8.2.4

#### Preparations

Section 8.2.4

## ETANERCEPT

**Cautions** predisposition to infection (avoid if predisposition to septicaemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella-zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening hepatitis C infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; heart failure (risk of exacerbation); history or increased risk of demyelinating disorders; history or development of malignancy; monitor for skin cancer before and during treatment particularly in those at risk (including children with psoriasis or a history of PUVA treatment); history of blood disorders; diabetes mellitus; **interactions:** Appendix 1 (etanercept)

**Tuberculosis** Children should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Children who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In those without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In children at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Children and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Children and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Hepatic impairment** use with caution in moderate to severe alcoholic hepatitis

**Pregnancy** avoid—limited information available; manufacturer advises effective contraception required during treatment and for 3 weeks after last dose

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see under Cytokine Modulators, p. 514; also *less commonly* interstitial lung disease, skin cancer, uveitis, rash, new onset or worsening psoriasis; *rarely* demyelinating disorders, seizures, lymphoma, Stevens-Johnson syndrome, vasculitis; *very rarely* toxic epidermal necrolysis; *also reported* appendicitis, gastritis, oesophagitis, inflammatory bowel disease, vomiting, diabetes mellitus, malignancy (including

solid tumours and leukaemia), macrophage activation syndrome, and cutaneous ulcer

### Indications and dose

#### Juvenile idiopathic arthritis (see also notes above)

- By subcutaneous injection

**Child 2–17 years** 400 micrograms/kg (max. 25 mg) twice weekly, with an interval of 3–4 days between doses or 800 micrograms/kg (max. 50 mg) once weekly; consider discontinuation if no response after 4 months

#### Severe plaque psoriasis section 13.5.3

### Enbrel® (Pfizer) (PoM)

**Injection**, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Paediatric injection**, powder for reconstitution, etanercept, net price 10-mg vial (with solvent) = £35.75; 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Injection**, etanercept, net price 25-mg prefilled syringe = £89.38; 50-mg prefilled pen or prefilled syringe = £178.75. Label: 10, alert card, counselling, tuberculosis and blood disorders

## TOCILIZUMAB

**Cautions** predisposition to infection or history of recurrent or chronic infection; interrupt treatment if serious infection occurs; history of intestinal ulceration or diverticulitis; monitor hepatic transaminases; monitor neutrophil and platelet counts; low platelet or absolute neutrophil count (discontinue if absolute neutrophil count less than  $0.5 \times 10^9$ /litre or platelet count less than  $50 \times 10^3$ /microlitre); monitor lipid profile 4–8 weeks after starting treatment and then as indicated; monitor for demyelinating disorders;

**interactions:** Appendix 1 (tocilizumab)

**Tuberculosis** Children should be evaluated for tuberculosis before treatment. Children with latent tuberculosis should be treated with standard therapy (section 5.1.9) before starting tocilizumab

**Counselling** Children and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur

**Contra-indications** severe active infection (see also Cautions) do not initiate if absolute neutrophil count less than  $2 \times 10^9$ /litre (see also Cautions)

**Hepatic impairment** manufacturer advises caution, consult product literature

**Renal impairment** manufacturer advises monitor renal function closely in moderate or severe impairment

**Pregnancy** manufacturer advises avoid unless essential (toxicity in *animal* studies); effective contraception required during and for 3 months after treatment

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk —no information available

**Side-effects** nausea, diarrhoea, raised hepatic transaminases, hypercholesterolaemia, headache, infection (including upper respiratory-tract infection),

thrombocytopenia, neutropenia, infusion-related reactions; antibody formation also reported

### Indications and dose

**Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to NSAIDs and systemic corticosteroids**

- By intravenous infusion

#### Child 2–18 years

**Body-weight less than 30 kg** 12 mg/kg once every 2 weeks; review treatment if no improvement within 6 weeks

**Body-weight over 30 kg** 8 mg/kg once every 2 weeks; review treatment if no improvement within 6 weeks

**Polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to methotrexate**

- By intravenous infusion

#### Child 2–18 years

**Body-weight less than 30 kg** 10 mg/kg once every 4 weeks; review treatment if no improvement within 12 weeks

**Body-weight over 30 kg** 8 mg/kg once every 4 weeks; review treatment if no improvement within 12 weeks

**Administration** for *intravenous infusion*; body-weight less than 30 kg, dilute requisite dose to a volume of 50 mL with Sodium chloride 0.9% and give over 1 hour; body-weight over 30 kg, dilute requisite dose to a volume of 100 mL with Sodium chloride 0.9% and give over 1 hour

### RoActemra® (Roche) (PoM)

**Concentrate for intravenous injection**, tocilizumab 20 mg/mL, net price 4 mL (80-mg vial) = £102.40, 10 mL (200-mg) vial = £256.00, 20 mL (400-mg vial) = £512.00. Alert card, counselling, see above

## Sulfasalazine

**Sulfasalazine** has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease. Sulfasalazine may cause haematological abnormalities including leucopenia, neutropenia, and thrombocytopenia and close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver-function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory. For use of sulfasalazine also see section 1.5.1, aminosalicylates.

## SULFASALAZINE

(Sulphasalazine)

**Cautions** see section 1.5.1 and notes above

**Contra-indications** see section 1.5.1

**Hepatic impairment** section 1.5.1

**Renal impairment** section 1.5.1

**Pregnancy** section 1.5.1

**Breast-feeding** section 1.5.1

**Side-effects** see section 1.5.1 and notes above

**Licensed use** not licensed for use in children for juvenile idiopathic arthritis

**Indications and dose**

**Juvenile idiopathic arthritis (see also notes above)**

• By mouth

**Child 2–18 years** initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week, maintenance dose 20–25 mg/kg twice daily; **Child 2–12 years** max. 2 g daily, **Child 12–18 years** max. 3 g daily

#### Preparations

Section 1.5.1

### 10.1.4 Gout and cytotoxic-induced hyperuricaemia

This section is not included in *BNF for Children*. For the role of allopurinol and rasburicase in the prophylaxis of hyperuricaemia associated with cancer chemotherapy and in enzyme disorders causing increased serum urate, see section 8.1. The management of gout in adolescents requires specialist supervision.

### 10.1.5 Other drugs for rheumatic diseases

Classification not used in *BNF for Children*.

## 10.2 Drugs used in neuromuscular disorders

**10.2.1 Drugs that enhance neuromuscular transmission**

**10.2.2 Skeletal muscle relaxants**

### 10.2.1 Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

## Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic

crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

**Edrophonium** has a very brief action and it is therefore used mainly for the diagnosis of myasthenia gravis. However, such testing should be performed only by those experienced in its use; other means of establishing the diagnosis are available. A single test-dose usually causes substantial improvement in muscle power (lasting about 5 minutes) in patients with the disease (if respiration already impaired, *only* in conjunction with someone skilled at intubation).

Edrophonium can also be used to determine whether a patient with myasthenia is receiving inadequate or excessive treatment with cholinergic drugs. If treatment is excessive an injection of edrophonium will either have no effect or will intensify symptoms (if respiration already impaired, *give only* in conjunction with someone skilled at intubation). Conversely, transient improvement may be seen if the patient is being inadequately treated. The test is best performed just before the next dose of anticholinesterase.

**Neostigmine** produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an anti-muscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of myasthenia.

**Pyridostigmine** is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastro-intestinal effect but an antimuscarinic drug may still be required. It is inadvisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine are needed. Neostigmine and pyridostigmine should be given to neonates 30 minutes before feeds to improve suckling.

Neostigmine and edrophonium are also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (section 15.1.6).

## NEOSTIGMINE

**Cautions** asthma (*extreme* caution), bradycardia, arrhythmias, recent myocardial infarction, epilepsy, hypotension, parkinsonism, vagotonia, peptic ulceration, hyperthyroidism; atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection), but not given routinely because it may mask signs of overdose; **interactions:** Appendix 1 (parasympathomimetics)

**Contra-indications** intestinal or urinary obstruction

**Renal impairment** may need dose reduction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** nausea, vomiting, increased salivation, diarrhoea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis

#### Indications and dose

##### Treatment of myasthenia gravis

- By mouth (as neostigmine bromide)

**Neonate** initially 1–2 mg, then 1–5 mg every 4 hours, give 30 minutes before feeds

**Child up to 6 years** initially 7.5 mg repeated at suitable intervals throughout the day, total daily dose 15–90 mg

**Child 6–12 years** initially 15 mg repeated at suitable intervals throughout the day, total daily dose 15–90 mg

**Child 12–18 years** initially 15–30 mg repeated at suitable intervals throughout the day, total daily dose 75–300 mg (but max. most can tolerate is 180 mg daily)

- By subcutaneous or intramuscular injection (as neostigmine metilsulfate)

**Neonate** 150 micrograms/kg every 6–8 hours, 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary [unlicensed]

**Child 1 month–12 years** 200–500 micrograms repeated at suitable intervals throughout the day

**Child 12–18 years** 1–2.5 mg repeated at suitable intervals throughout the day

**Neostigmine** (Non-proprietary) PoM

Tablets, scored, neostigmine bromide 15 mg, net price 140 = £88.31

#### Injection

Section 15.1.6

## EDROPHONIUM CHLORIDE

**Cautions** see under Neostigmine; have resuscitation facilities; *extreme* caution in respiratory distress (see notes above) and in asthma

**Note** Severe cholinergic reactions can be counteracted by injection of atropine sulfate (which should always be available)

**Contra-indications** see under Neostigmine

**Pregnancy** see under Neostigmine

**Breast-feeding** see under Neostigmine

**Side-effects** see under Neostigmine

#### Indications and dose

##### Diagnostic test for myasthenia gravis

- By intravenous injection

**Child 1 month–12 years** 20 micrograms/kg followed after 30 seconds (if no adverse reaction has occurred) by 80 micrograms/kg

**Child 12–18 years** 2 mg followed after 30 seconds (if no adverse reaction has occurred) by 8 mg

#### Detection of overdosage or underdosage of cholinergic drugs

- By intravenous injection

**Child 1 month–12 years** 20 micrograms/kg (preferably just before next dose of anticholinesterase, see notes above)

**Child 12–18 years** 2 mg (preferably just before next dose of anticholinesterase, see notes above)

**Edrophonium** (Non-proprietary) PoM

Injection, edrophonium chloride 10 mg/mL, net price 1-mL amp = £19.50

## PYRIDOSTIGMINE BROMIDE

**Cautions** see under Neostigmine; weaker muscarinic action

**Contra-indications** see under Neostigmine

**Renal impairment** reduce dose; excreted by kidney

**Pregnancy** see under Neostigmine

**Breast-feeding** see under Neostigmine

**Side-effects** see under Neostigmine

#### Indications and dose

##### Treatment of myasthenia gravis

- By mouth

**Neonate** initially 1–1.5 mg/kg, increased gradually to max. 10 mg, repeated throughout the day, give 30–60 minutes before feeds

**Child 1 month–12 years** initially 1–1.5 mg/kg/day, increased gradually to 7 mg/kg/day in 6 divided doses; usual total daily dose 30–360 mg

**Child 12–18 years** 30–120 mg, repeated throughout the day; usual total daily dose 300–600 mg (but consider immunosuppressant therapy if total daily dose exceeds 360 mg, down-regulation of acetylcholine receptors possible if total daily dose exceeds 450 mg; see notes above)

**Mestinon**<sup>®</sup> (Meda) PoM

Tablets, scored, pyridostigmine bromide 60 mg, net price 200 = £45.57

## Immunosuppressant therapy

A course of **corticosteroids** (section 6.3) is an established treatment in severe cases of myasthenia gravis and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose ('pulsed') methylprednisolone followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. For disadvantages of corticosteroid treatment, see section 6.3.2. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

## 10.2.2 Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

**Dantrolene** acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly.

**Baclofen** inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

**Diazepam** has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

### BACLOFEN

**Cautions** psychiatric illness; respiratory impairment; epilepsy; history of peptic ulcer (avoid oral route in active peptic ulceration); diabetes; hypertonic bladder sphincter; avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions, see also under Withdrawal below); **interactions:** Appendix 1 (muscle relaxants)

**Withdrawal** Serious side-effects can occur on abrupt withdrawal; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)

**Skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Specific cautions for intrathecal treatment** coagulation disorders; previous spinal fusion procedure; malnutrition (increased risk of post-surgical complications)

#### Contra-indications

**Specific contra-indications for intrathecal treatment** local or systemic infection

**Hepatic impairment** manufacturer advises use by mouth with caution

**Renal impairment** risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73m<sup>2</sup> use by mouth only if potential benefit outweighs risk; excreted by kidney

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies)

**Breast-feeding** present in milk—amount probably too small to be harmful

**Side-effects** gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular

depression; sedation, drowsiness, confusion, dizziness, ataxia, hallucinations, nightmares, headache, euphoria, insomnia, depression, anxiety, agitation, tremor; seizure; urinary disturbances; myalgia; visual disorders; rash, hyperhidrosis; rarely taste disturbances, abdominal pain, changes in hepatic function, paraesthesia, erectile dysfunction, dysarthria; very rarely hypothermia

#### Indications and dose

##### Chronic severe spasticity of voluntary muscle

###### • By mouth

**Child under 18 years** initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; usual maintenance dose of 0.75–2 mg/kg daily in divided doses; **Child up to 8 years** max. total daily dose 40 mg/day, **Child 8–18 years** max. total daily dose 60 mg/day; review treatment if no benefit within 6 weeks of achieving maximum dose

##### Severe chronic spasticity of cerebral or spinal origin unresponsive to oral antispastic drugs (or oral therapy not tolerated)—specialist use only

###### • By intrathecal injection

**Child 4–18 years** initial *test dose* 25–50 micrograms over at least 1 minute via catheter or lumbar puncture, increased in 25-microgram steps (not more often than every 24 hours) to max. 100 micrograms to determine initial maintenance dose *then dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose retaining some spasticity to avoid sensation of paralysis; initial *maintenance dose* 25–200 micrograms daily, adjusted according to response

#### Safe Practice

Consult intrathecal injection product literature for details on dose testing and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

#### Baclofen (Non-proprietary) (PoM)

**Tablets**, baclofen 10 mg, net price 84-tab pack = £1.67. Label: 2, 8, 21

**Oral solution**, baclofen 5 mg/5 mL, net price 300 mL = £4.48. Label: 2, 8, 21

**Brands include** *Lyflax*<sup>®</sup> (sugar-free)

**Intrathecal injection**, baclofen 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.19; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £48.62; 2 mg/mL, 5-mL amp (for use with implantable pump) = £48.62

#### Lioresal<sup>®</sup> (Novartis) (PoM)

**Tablets**, scored, baclofen 10 mg, net price 100-tab pack = £12.38. Label: 2, 8, 21

**Excipients** include gluten

**Liquid**, sugar-free, raspberry-flavoured, baclofen 5 mg/5 mL, net price 300 mL = £8.59. Label: 2, 8, 21

**Intrathecal injection**, baclofen 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.63; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £58.34; 2 mg/mL, 5-mL amp (for use with implantable pump) = £58.34

## DANTROLENE SODIUM

**Cautions** impaired cardiac and pulmonary function; therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks; **interactions:** Appendix 1 (muscle relaxants)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported, usually if doses greater than 400 mg daily used, in females, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); re-introduce only if complete reversal of hepatotoxicity

**Counselling** Children and their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

**Skilled tasks** Drowsiness may affect performance of skilled tasks (eg, driving); effects of alcohol enhanced

**Contra-indications** acute muscle spasm; avoid when spasticity is useful, for example, locomotion

**Hepatic impairment** avoid—may cause severe liver damage; injection may be used in an emergency for malignant hyperthermia

**Pregnancy** avoid use in chronic spasticity—embryotoxic in animal studies

**Breast-feeding** present in milk—manufacturer advises avoid use in chronic spasticity

**Side-effects** diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction), nausea, vomiting, anorexia, hepatotoxicity (see above), abdominal pain; pericarditis; pleural effusion, respiratory depression; headache, drowsiness, dizziness, asthenia, fatigue, seizures, fever, chills; speech and visual disturbances; rash; *less commonly* dysphagia, constipation, exacerbation of cardiac insufficiency, tachycardia, erratic blood pressure, dyspnoea, depression, confusion, nervousness, insomnia, increased urinary frequency, urinary incontinence or retention, haematuria, crystalluria, and increased sweating

**Licensed use** not licensed for use in children

### Indications and dose

#### Chronic severe spasticity of voluntary muscle

##### • By mouth

**Child 5–12 years** initially 500 micrograms/kg once daily; after 7 days increase to 500 micrograms/kg/dose 3 times daily; every 7 days increase by further 500 micrograms/kg/dose until satisfactory response; max. 2 mg/kg 3–4 times daily (max. total daily dose 400 mg)

**Child 12–18 years** initially 25 mg once daily; increase to 3 times daily after 7 days; every 7 days increase by further 500 micrograms/kg/dose until satisfactory response; max. 2 mg/kg 3–4 times daily (max. total daily dose 400 mg)

**Malignant hyperthermia** section 15.1.8

**Dantrium**<sup>®</sup> (SpePharm) (POM)

**Capsules**, orange/brown, dantrolene sodium 25 mg, net price 100 = £16.87; 100 mg, 100 = £43.07. Label: 2, counselling, driving, hepatotoxicity

## DIAZEPAM

**Cautions** section 4.8.2

**Contra-indications** section 4.8.2

**Hepatic impairment** section 4.8.2

**Renal impairment** section 4.8.2

**Pregnancy** section 4.8.2

**Breast-feeding** section 4.8.2

**Side-effects** section 4.8.2; also hypotonia

### Indications and dose

#### Muscle spasm in cerebral spasticity or in post-operative skeletal muscle spasm

##### • By mouth

**Child 1–12 months** initially 250 microgram/kg twice daily

**Child 1–5 years** initially 2.5 mg twice daily

**Child 5–12 years** initially 5 mg twice daily

**Child 12–18 years** initially 10 mg twice daily; max. total daily dose 40 mg

##### Tetanus

##### • By intravenous injection

**Child 1 month–18 years** 100–300 micrograms/kg repeated every 1–4 hours

##### • By intravenous infusion (or by nasoduodenal tube)

**Child 1 month–18 years** 3–10 mg/kg over 24 hours, adjusted according to response

**Status epilepticus** section 4.8.2

**Febrile convulsions** section 4.8.3

**Administration** for *continuous intravenous infusion* of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion; diazepam adsorbed by plastics of infusion bags and giving sets

For *continuous intravenous infusion* of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; diazepam adsorbed by plastics of infusion bags and giving sets

**Diazepam** (Non-proprietary) (CD4-1)

**Tablets**, diazepam 2 mg, net price 28 = 80p; 5 mg, 28 = 83p; 10 mg, 28 = 92p. Label: 2 or 19

**Brands include** Rimapam<sup>®</sup>, Tensium<sup>®</sup>

**Dental prescribing on NHS** Diazepam Tablets may be prescribed

**Oral solution**, diazepam 2 mg/5 mL, net price 100 mL = £6.08. Label: 2 or 19

**Brands include** Ditalar<sup>®</sup>

**Dental prescribing on NHS** Diazepam Oral Solution 2 mg/5 mL may be prescribed

**Strong oral solution**, diazepam 5 mg/5 mL, net price 100-mL pack = £6.38. Label: 2 or 19

**Brands include** Ditalar<sup>®</sup>

### Parenteral preparations

Section 4.8.2

## 10.3 Drugs for the treatment of soft-tissue disorders and topical pain relief

### 10.3.1 Enzymes

### 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

### Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation** Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose veins are prone to collapse.

Children or their carers should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation** If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy. **Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. **Antihistamines** (section 3.4.1) and **analgesics** (section 4.7) may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration

of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase (section 10.3.1). A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).

### 10.3.1 Enzymes

Hyaluronidase is used for the management of extravasation. For preparations, see *BNF section 10.3.1*.

### 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

Classification not used in *BNF for Children*.

## 11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary, see Other Preparations, below.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents, p. 829 for links to online Drug Tariffs). Product-specific devices may be supplied by manufacturers—contact individual manufacturers for further information. They are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

**Eye drops and eye ointments** Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow can occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops. Both drops and ointment can cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

For warnings relating to eye drops and contact lenses, see section 11.9.

**Eye lotions** These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

**Other preparations** Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat an eye condition.

**Preservatives and sensitisers** Information on preservatives and substances identified as skin sensitisers (section 13.1.3) is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

## 11.2 Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiliary* use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each child. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units it may be acceptable to issue containers that have been dispensed to the child on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each child.

## 11.3 Anti-infective eye preparations

### 11.3.1 Antibacterials

### 11.3.2 Antifungals

### 11.3.3 Antivirals

**Eye infections** Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by lid hygiene and application of antibacterial eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

*Corneal ulcer* and *keratitis* require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

*Endophthalmitis* is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

For reference to the treatment of *crab lice of the eyelashes*, see section 13.10.4

### 11.3.1 Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments; systemic treatment is sometimes appropriate in blepharitis.

**Chloramphenicol** has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, and **ofloxacin**; the aminoglycosides, **gentamicin** and **tobramycin** are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

**Ciprofloxacin** eye drops are licensed for *corneal ulcers*; intensive application (especially in the first 2 days) is required throughout the day and night.

**Azithromycin** eye drops are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma*, which results from chronic infection with *Chlamydia trachomatis*, can be treated with azithromycin by mouth [unlicensed indication].

**Fusidic acid** is useful for staphylococcal infections.

**Propamidine isetionate** is of little value in bacterial infections but is used by specialists to treat the rare, but

potentially sight-threatening, condition of *acanthamoeba keratitis* (see also section 11.9).

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection, see section 11.8.

**Neonates** Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative micro-organism should be identified. **Chloramphenicol** eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered.

Azithromycin eye drops are licensed to treat trachomatous conjunctivitis caused by *Chlamydia trachomatis* and purulent bacterial conjunctivitis in neonates. However, as there is a risk of simultaneous infection at other sites in neonates and children under 3 months presenting with conjunctivitis caused by *Chlamydia trachomatis*, systemic treatment with oral **erythromycin** is required, see section 5.1.

*Gonococcal eye infections* are treated with a single-dose of parenteral **cefotaxime** or **ceftriaxone**. **Gentamicin** eye drops together with appropriate systemic antibacterials are used in the treatment of *pseudomonal eye infections*; high-strength gentamicin eye drops (1.5%) [unlicensed] are available for severe infections.

**With corticosteroids** Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

**Administration** Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours in severe infection then reduce frequency as infection is controlled and continue for 48 hours after healing. For less severe infection 3–4 times daily is generally sufficient;
- *Eye ointment*, apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

### AZITHROMYCIN DIHYDRATE

**Side-effects** ocular discomfort (including pruritus and burning), blurred vision; *less commonly* eyelid eczema, eyelid erythema, eyelid oedema, conjunctival hyperaemia, keratitis

#### Indications and dose

##### Purulent bacterial conjunctivitis

Apply twice daily for 3 days; review if no improvement after 3 days

##### Trachomatous conjunctivitis (see also Neonates above)

Apply twice daily for 3 days; review if no improvement after 3 days

#### Single use

**Azyter**<sup>®</sup> (Spectrum Thera) (PoM)

**Eye drops**, azithromycin dihydrate 1.5%, net price 6 × 0.25 g = £6.99

### CHLORAMPHENICOL

**Pregnancy** avoid unless essential—no information on *topical* use but risk of neonatal 'grey-baby syndrome' with *oral* use in third trimester

**Breast-feeding** avoid unless essential—*theoretical* risk of bone-marrow toxicity

**Side-effects** transient stinging; see also notes above

#### Indications and dose

See notes above

**Chloramphenicol** (Non-proprietary) (PoM)

**Eye drops**, chloramphenicol 0.5%, net price 10 mL = £1.44

**Eye ointment**, chloramphenicol 1%, net price 4 g = £1.63

**Note** Chloramphenicol 0.5% eye drops (max. pack size 10 mL) and 1% eye ointment (max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in children over 2 years; max. duration of treatment 5 days

**Chloromycetin**<sup>®</sup> (AMCo) (PoM)

**Redidrops** (= eye drops), chloramphenicol 0.5%, net price 5 mL = £1.65; 10 mL = 90p

**Excipients** include phenylmercuric acetate

**Ophthalmic ointment** (= eye ointment), chloramphenicol 1%, net price 4 g = £1.08

#### Single use

**Minims**<sup>®</sup> **Chloramphenicol** (Bausch & Lomb) (PoM)

**Eye drops**, chloramphenicol 0.5%, net price 20 × 0.5 mL = £10.53

### CIPROFLOXACIN

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises caution

**Side-effects** taste disturbance, ocular discomfort, ocular hyperaemia, corneal deposits (reversible after completion of treatment); *less commonly* nausea, headache, keratopathy, corneal infiltrates, corneal staining, photophobia, blurred vision, eyelid disorders (including oedema, exfoliation, erythema), eye irritation (including pain, swelling, pruritus, dryness), increased lacrimation, conjunctival hyperaemia; *rarely* diarrhoea, abdominal pain, dizziness, keratitis, corneal disorders including corneal epithelium defect, eye hypoesthesia, asthenopia, diplopia, ear pain, paranasal sinus hypersecretion, rhinitis, dermatitis

**Licensed use** eye ointment not licensed for use in children under 1 year

#### Indications and dose

##### Superficial bacterial infections

Apply eye drops 4 times daily; in severe infection apply every 2 hours during waking hours for 2 days, then 4 times daily; max. duration of treatment 21 days

Apply 1.25 cm eye ointment 3 times daily for 2 days, then twice daily for 5 days

**Corneal ulcer**

Apply eye drops throughout day and night, day 1 apply every 15 minutes for 6 hours then every 30 minutes, day 2 apply every hour, days 3–14 apply every 4 hours; max. duration of treatment 21 days  
Apply eye ointment throughout day and night; apply 1.25 cm ointment every 1–2 hours for 2 days then every 4 hours for next 12 days

**Ciloxan<sup>®</sup>** (Alcon) (PoM)

**Ophthalmic solution** (= eye drops), ciprofloxacin (as hydrochloride) 0.3%, net price 5 mL = £4.70

**Excipients** include benzalkonium chloride

**Eye ointment**, ciprofloxacin (as hydrochloride) 0.3%, net price 3.5 g = £5.22

**FUSIDIC ACID****Indications and dose**

See notes above and under preparation below

**Fucithalmic<sup>®</sup>** (LEO) (PoM)

**Eye drops**, m/r, fusidic acid 1% in gel basis (liquifies on contact with eye), net price 5 g = £2.69

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

Apply twice daily

**GENTAMICIN****Indications and dose**

See notes above

**Genticin<sup>®</sup>** (AMCo) (PoM)

**Drops** (for ear or eye), gentamicin (as sulfate) 0.3%, net price 10 mL = £2.13

**Excipients** include benzalkonium chloride

**Gentamicin** (Non-proprietary) (PoM)

**Eye drops**, gentamicin 1.5%, 10 mL, available as a manufactured special from Moorfields Eye Hospital, see also 'special-order' manufacturers or specialist importing companies, p. 840

**LEVOFLOXACIN**

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** ocular burning, visual disturbances; *less commonly* headache, ocular discomfort (including itching, pain, and dryness), conjunctival follicles, lid oedema, lid erythema, photophobia, rhinitis

**Indications and dose**

**Local treatment of infections** (see also notes above)

**Child 1–18 years** apply every 2 hours (max. 8 times daily) for the first 2 days, then 4 times daily for 3 days

**Oftaquist<sup>®</sup>** (Kestrel Ophthalmics) (PoM)

**Eye drops**, levofloxacin 0.5%, net price 5 mL = £6.95

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, levofloxacin 0.5%, net price 30 × 0.5-mL single use units = £17.95

**MOXIFLOXACIN**

**Cautions** not recommended for neonates

**Side-effects** taste disturbances, ocular discomfort (including pain, irritation, and dryness), hyperaemia; *less commonly* vomiting, headache, paraesthesia, corneal disorders (including keratitis, erosion, and staining), conjunctival haemorrhage, eyelid erythema, visual disturbances, nasal discomfort, pharyngolaryngeal pain; *also reported* nausea, palpitation, dyspnoea, dizziness, raised intra-ocular pressure, photophobia, rash, pruritus

**Indications and dose**

**Local treatment of infections** (see also notes above)

**Child 1 month–18 years** apply 3 times daily (continue treatment for 2–3 days after infection improves; review if no improvement within 5 days)

**Moxivig<sup>®</sup>** (Alcon) (PoM)

**Eye drops**, moxifloxacin (as hydrochloride) 0.5%, net price 5 mL = £9.80

**OFLOXACIN**

**Cautions** corneal ulcer or epithelial defect (risk of corneal perforation)

**Pregnancy** manufacturer advises use only if benefit outweighs risk; systemic quinolones have caused arthropathy in *animal* studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** ocular discomfort and irritation; *also reported* facial oedema, keratitis, visual disturbances, photophobia, increased lacrimation, ocular oedema, dry eyes, ocular hyperaemia

**Indications and dose**

**Local treatment of infections** (see also notes above)

**Child 1–18 years** apply every 2–4 hours for the first 2 days, then reduce frequency to 4 times daily (max. 10 days treatment)

**Exocin<sup>®</sup>** (Allergan) (PoM)

**Ophthalmic solution** (= eye drops), ofloxacin 0.3%, net price 5 mL = £2.17

**Excipients** include benzalkonium chloride

**PROPAMIDINE ISETIONATE**

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** eye pain and irritation

**Indications and dose**

See under preparations below

**Brolene<sup>®</sup>** (Sanofi-Aventis)

**Eye drops**, propamidine isetionate 0.1%, net price 10 mL = £2.80

**Excipients** include benzalkonium chloride

**Dose**

**Local treatment of infections** (but see notes above)

Apply up to 4 times daily

Eye ointment, dibrompropamide isetionate 0.15%, net price 5 g = £2.92

**Dose**

**Local treatment of infections (but see notes above)**

Apply 1–2 times daily

**Golden Eye<sup>®</sup>** (Typharm)

Eye drops, propamide isetionate 0.1%, net price 10 mL = £3.26

**Excipients** include benzalkonium chloride

**Dose**

**Local treatment of infections (but see section 11.3.1)**

Apply up to 4 times daily

Eye ointment, dibrompropamide isetionate 0.15%, net price 5 g = £3.49

**Dose**

**Local treatment of infections (but see section 11.3.1)**

Apply 1–2 times daily

## TOBRAMYCIN

**Indications and dose**

**Local treatment of infections (see also notes above)**

**Child 1–18 years** apply twice daily for 6–8 days; in severe infection, apply 4 times daily on the first day, then twice daily for 5–7 days

**Tobravix<sup>®</sup>** (Alcon) (PoM)

Eye drops, tobramycin 0.3%, net price 5 mL = £4.74

**Excipients** include benzododecinium bromide

## 11.3.2 Antifungals

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment is normally carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or [www.moorfields.nhs.uk](http://www.moorfields.nhs.uk)

## 11.3.3 Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers, can be treated with **aciclovir**. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster (section 5.3.2.1).

For systemic treatment of CMV retinitis, see section 5.3.2.2.

## ACICLOVIR

(Acyclovir)

**Side-effects** local irritation and inflammation, superficial punctate keratopathy; rarely blepharitis; very rarely hypersensitivity reactions including angioedema

**Indications and dose**

**Local treatment of herpes simplex infections**

Apply 1 cm ointment 5 times daily (continue for at least 3 days after complete healing)

**Herpes simplex skin infections** section 13.10.3

**Herpes simplex and varicella–zoster infections** section 5.3.2.1

**Zovirax<sup>®</sup>** (GSK) (PoM)

Eye ointment, aciclovir 3%, net price 4.5 g = £9.34

## 11.4 Corticosteroids and other anti-inflammatory preparations

### 11.4.1 Corticosteroids

### 11.4.2 Other anti-inflammatory preparations

### 11.4.1 Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation in uveitis (section 11.5) and following surgery.

*Topical corticosteroids* should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' may follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' may follow prolonged use.

Other side-effects of ocular corticosteroids include thinning of the cornea and sclera. Prolonged use in neonates and infants can cause adrenal suppression.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

*Systemic corticosteroids* (section 6.3.2) may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

## BETAMETHASONE

**Cautions** see notes above

**Side-effects** see notes above

**Indications and dose****Local treatment of inflammation (short-term)**

Apply eye drops every 1–2 hours until controlled then reduce frequency; eye ointment 2–4 times daily or at night when used with eye drops

**Betnesol®** (Focus) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.32

**Excipients** include benzalkonium chloride, disodium edetate

**Eye ointment**, betamethasone sodium phosphate 0.1%, net price 3 g = £1.41

**Vistamethasone®** (Martindale) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzalkonium chloride

**With neomycin****Betnesol-N®** (RPH) (PoM) 

**Drops** (for ear, eye, or nose), see section 12.1.1

**DEXAMETHASONE**

**Cautions** see notes above

**Side-effects** see notes above

**Licensed use** *Maxidex®* not licensed for use in children under 2 years; *Dropdex®* not licensed for use in children

**Indications and dose****Local treatment of inflammation (short-term)**

Apply eye drops 4–6 times daily; severe conditions every 30–60 minutes until controlled then reduce frequency

**Maxidex®** (Alcon) (PoM)

**Eye drops**, dexamethasone 0.1%, net price 5 mL = £1.42; 10 mL = £2.80

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Single use****Dropdex®** (Moorfields) (PoM)

**Eye drops**, dexamethasone (as sodium phosphate) 0.1%, net price 20 × 0.4 mL = £9.75

**Excipients** include disodium edetate

**Minims® Dexamethasone** (Bausch & Lomb) (PoM)

**Eye drops**, dexamethasone sodium phosphate 0.1%, net price 20 × 0.5 mL = £10.98

**Excipients** include disodium edetate

**With antibacterials****Maxitrol®** (Alcon) (PoM) 

**Eye drops**, dexamethasone 0.1%, neomycin sulfate 3500 units/g, polymyxin B sulfate 6000 units/mL, net price 5 mL = £1.68

**Excipients** include benzalkonium chloride, polysorbate 20

**Eye ointment**, dexamethasone 0.1%, neomycin sulfate 3500 units/g, polymyxin B sulfate 6000 units/g, net price 3.5 g = £1.44

**Excipients** include hydroxybenzoates (parabens), wool fat

**Sofradex®** (Sanofi-Aventis) (PoM) 

**Drops** (for ear or eye), see section 12.1.1

**FLUOROMETHOLONE**

**Cautions** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 2 years

**Indications and dose****Local treatment of inflammation (short-term)**

Apply 2–4 times daily (initially every hour for 24–48 hours then reduce frequency)

**FML®** (Allergan) (PoM)

**Ophthalmic suspension** (= eye drops), fluorometholone 0.1%, polyvinyl alcohol (*Liquifilm®*) 1.4%, net price 5 mL = £1.71; 10 mL = £2.95

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**PREDNISOLONE**

**Cautions** see notes above

**Side-effects** see notes above

**Licensed use** *Pred Forte®* not licensed for use in children (age range not specified by manufacturer)

**Indications and dose****Local treatment of inflammation (short-term)**

Apply every 1–2 hours until controlled then reduce frequency

**Pred Forte®** (Allergan) (PoM)

**Eye drops**, prednisolone acetate 1%, net price 5 mL = £1.52; 10 mL = £3.05

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Predsol®** (Focus) (PoM)

**Drops** (for ear or eye), prednisolone sodium phosphate 0.5%, net price 10 mL = £2.00

**Excipients** include benzalkonium chloride, disodium edetate

**Single use****Minims® Prednisolone Sodium Phosphate** (Bausch & Lomb) (PoM)

**Eye drops**, prednisolone sodium phosphate 0.5%, net price 20 × 0.5 mL = £11.28

**Excipients** include disodium edetate

**11.4.2 Other anti-inflammatory preparations**

Eye drops containing **antihistamines**, such as **antazoline** (with xylometazoline as *Otrivine-Antistin®*), **azelastine**, **epinastine**, **ketotifen**, and **olopatadine**, can be used for allergic conjunctivitis.

**Sodium cromoglicate** and **nedocromil sodium** eye drops may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

**Lodoxamide** eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

**Emedastine** eye drops are licensed for seasonal allergic conjunctivitis.

**ANTAZOLINE SULFATE**

**Side-effects** transient stinging; *also reported* blurred vision, mydriasis, eye irritation

**Indications and dose****Allergic conjunctivitis**

See preparation below

**Otrivine-Antistin**<sup>®</sup> (Spectrum Thea)

**Eye drops**, antazoline sulfate 0.5%, xylometazoline hydrochloride 0.05%, net price 10 mL = £2.35

**Excipients** include benzalkonium chloride, disodium edetate

**Cautions** hypertension; hyperthyroidism; diabetes mellitus; angle-closure glaucoma; phaeochromocytoma; cardiovascular disease; urinary retention; **interactions:** Appendix 1 (antihistamines and sympathomimetics)

**Dose**

**Child 12–18 years** apply 2–3 times daily (max. duration 7 days)

**Note** Xylometazoline is a sympathomimetic; absorption of antazoline and xylometazoline may result in systemic side-effects and the possibility of interaction with other drugs

**AZELASTINE HYDROCHLORIDE**

**Side-effects** mild transient irritation; bitter taste reported

**Indications and dose**

**Allergic conjunctivitis, seasonal allergic conjunctivitis**

**Child 4–18 years** apply twice daily, increased if necessary to 4 times daily

**Perennial conjunctivitis**

**Child 12–18 years** apply twice daily, increased if necessary to 4 times daily; max. duration of treatment 6 weeks

**Opatilast**<sup>®</sup> (Meda) (PoM)

**Eye drops**, azelastine hydrochloride 0.05%, net price 8 mL = £6.40

**Excipients** include benzalkonium chloride, disodium edetate

**EMEDASTINE**

**Side-effects** transient burning or stinging; blurred vision, local oedema, keratitis, irritation, dry eye, lacrimation, corneal infiltrates (discontinue) and staining; photophobia; headache, and rhinitis occasionally reported

**Indications and dose**

**Seasonal allergic conjunctivitis**

**Child 3–18 years** apply twice daily

**Emadine**<sup>®</sup> (Alcon) (PoM)

**Eye drops**, emedastine 0.05% (as difumate), net price 5 mL = £7.31

**Excipients** include benzalkonium chloride

**EPINASTINE HYDROCHLORIDE**

**Side-effects** burning; *less commonly* taste disturbance, headache, conjunctival hyperaemia, dry eye, eye pruritus, visual disturbance, increased lacrimation, eye pain, nasal irritation, rhinitis

**Indications and dose**

**Seasonal allergic conjunctivitis**

**Child 12–18 years** apply twice daily; max. duration of treatment 8 weeks

**Relestat**<sup>®</sup> (Allergan) (PoM)

**Eye drops**, epinastine hydrochloride 500 micrograms/mL, net price 5 mL = £9.90

**Excipients** include benzalkonium chloride, disodium edetate

**KETOTIFEN**

**Side-effects** transient burning or stinging, punctate corneal epithelial erosion; *less commonly* dry eye, subconjunctival haemorrhage, photophobia; headache, drowsiness, skin reactions, and dry mouth also reported

**Indications and dose**

**Seasonal allergic conjunctivitis**

**Child 3–18 years** apply twice daily

**Zaditen**<sup>®</sup> (Spectrum Thea) (PoM)

**Eye drops**, ketotifen (as fumarate) 250 micrograms/mL, net price 5 mL = £7.80

**Excipients** include benzalkonium chloride

**LODOXAMIDE**

**Side-effects** burning, stinging, itching, blurred vision, tear production disturbance, and ocular discomfort; *less commonly*, flushing, nasal dryness, dizziness, drowsiness, headache, blepharitis, and keratitis

**Indications and dose**

**Allergic conjunctivitis**

**Child 4–18 years** apply 4 times daily

**Note** Improvement of symptoms may sometimes require treatment for up to 4 weeks

**Alomide**<sup>®</sup> (Alcon) (PoM)

**Ophthalmic solution** (= eye drops), lodoxamide (as trometamol) 0.1%, net price 10 mL = £5.21

**Excipients** include benzalkonium chloride, disodium edetate

**Note** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in children over 4 years

**NEDOCROMIL SODIUM**

**Side-effects** transient burning and stinging; distinctive taste reported

**Indications and dose**

**Seasonal and perennial allergic conjunctivitis**

**Child 6–18 years** apply twice daily increased if necessary to 4 times daily; max. 12 weeks treatment for seasonal allergic conjunctivitis

**Vernal keratoconjunctivitis**

**Child 6–18 years** apply 4 times daily

**Rapitol**<sup>®</sup> (Sanofi-Aventis) (PoM)

**Eye drops**, nedocromil sodium 2%, net price 5 mL = £2.86

**Excipients** include benzalkonium chloride, disodium edetate

**OLOPATADINE**

**Side-effects** local irritation; *less commonly* keratitis, dry eye, local oedema, photophobia; headache, asthenia, dizziness; dry nose also reported

**Indications and dose**

**Seasonal allergic conjunctivitis**

**Child 3–18 years** apply twice daily; max. duration of treatment 4 months

**Opatanol**<sup>®</sup> (Alcon) (PoM)

**Eye drops**, olopatadine (as hydrochloride) 1 mg/mL, net price 5 mL = £4.68

**Excipients** include benzalkonium chloride

**SODIUM CROMOGLICATE**

(Sodium cromoglycate)

**Side-effects** transient burning and stinging**Indications and dose****Allergic conjunctivitis, vernal keratoconjunctivitis**

Apply eye drops 4 times daily

**Sodium Cromoglicate** (Non-proprietary) (PoM)

Eye drops, sodium cromoglycate 2%, net price

13.5 mL = £1.67

**Brands include** Hay-Crom® Aqueous, Opticrom® Aqueous, Vividrin®**Note** Sodium cromoglycate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis**Single use****Catacom**® (Moorfields)

Eye drops, sodium cromoglycate 2%, net price 30 x 0.3 mL = £8.99

**11.5 Mydriatics and cycloplegics**

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as **tropicamide** 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. **Cyclopentolate** 1% (action up to 24 hours) or **atropine** (action up to 7 days) are preferable for producing cycloplegia for refraction in young children; tropicamide may be preferred in neonates. **Phenylephrine** 2.5% is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids (section 11.4.1). Atropine is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate or **homatropine** (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.**Cautions and contra-indications** Darkly pigmented irides are more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber. Atropine, cyclopentolate, and homatropine should be used with caution in children under 3 months owing to the possible association between cycloplegia and the development of amblyopia; also, neonates are at increased risk of systemic toxicity.**Skilled tasks** Children may not be able to undertake skilled tasks until vision clears after mydriasis.**Side-effects** Ocular side-effects of mydriatics and cycloplegics include transient stinging and raised intra-ocular pressure; on prolonged administration, local irritation, hyperaemia, oedema, and conjunctivitis can occur. Contact dermatitis can occur with the antimuscarinic mydriatic drugs, especially atropine.

Toxic systemic reactions to atropine and cyclopentolate can occur in neonates and children; see section 1.2 for systemic side-effects of antimuscarinic drugs.

**Antimuscarinics****ATROPINE SULFATE****Cautions** see notes above**Side-effects** see notes above**Licensed use** not licensed for use in children for uveitis**Indications and dose****Cycloplegia****Child 3 months–18 years** apply drops or ointment twice daily for 3 days before procedure**Anterior uveitis****Child 2–18 years** 1 drop up to 4 times daily**Atropine** (Non-proprietary) (PoM)

Eye drops, atropine sulfate 0.5%, net price 10 mL = £20.91; 1%, 10 mL = £13.25

**Single use****Minims**® Atropine Sulphate (Bausch & Lomb) (PoM)

Eye drops, atropine sulfate 1%, net price 20 x 0.5 mL = £14.46

**CYCLOPENTOLATE HYDROCHLORIDE****Cautions** see notes above**Side-effects** see notes above**Indications and dose**

See notes above

**Cycloplegia****Child 3 months–12 years** 1 drop of 1% eye drops 30–60 minutes before examination**Child 12–18 years** 1 drop of 0.5% eye drops 30–60 minutes before examination**Uveitis****Child 3 months–18 years** 1 drop of 0.5% eye drops (1% for deeply pigmented eyes) 2–4 times daily**Mydrilate**® (Intrapharm) (PoM)

Eye drops, cyclopentolate hydrochloride 0.5%, net price 5 mL = £6.73; 1%, 5 mL = £6.73

**Excipients** include benzalkonium chloride**Single use****Minims**® Cyclopentolate Hydrochloride (Bausch & Lomb) (PoM)

Eye drops, cyclopentolate hydrochloride 0.5% and 1%, net price 20 x 0.5 mL (both) = £9.64

**HOMATROPINE HYDROBROMIDE****Cautions** see notes above**Side-effects** see notes above**Licensed use** not licensed for use in children under 3 months**Indications and dose**

See notes above

**Child 3 months–2 years** (0.5% only) 1 drop daily or on alternate days adjusted according to response**Child 2–18 years** 1 drop twice daily adjusted according to response

**Homatropine** (Non-proprietary) (PoM)

**Eye drops**, homatropine 0.125% and 0.5%, 10 mL, available as a manufactured special from Moorfields Eye Hospital, see also 'special-order' manufacturers or specialist importing companies, p. 840

**TROPICAMIDE**

**Cautions** see notes above

**Side-effects** see notes above

**Indications and dose**

See notes above

**Funduscopy**

**Neonate and child** apply 0.5% eye drops 20 minutes before examination

**Mydracyl**<sup>®</sup> (Alcon) (PoM)

**Eye drops**, tropicamide 0.5%, net price 5 mL = £1.29; 1%, 5 mL = £1.60

**Excipients** include benzalkonium chloride, disodium edetate

**Single use****Minims**<sup>®</sup> Tropicamide (Bausch & Lomb) (PoM)

**Eye drops**, tropicamide 0.5% and 1%, net price 20 × 0.5 mL (both) = £10.00

**Sympathomimetics****PHENYLEPHRINE HYDROCHLORIDE**

**Cautions** see notes above; also corneal epithelial damage; ocular hyperaemia; susceptibility to angle-closure glaucoma; diabetes (avoid in long-standing diabetes); asthma; **interactions:** Appendix 1 (sympathomimetics)

**Contra-indications** 10% drops in neonates and children; cardiovascular disease; hypertension; aneurysms; thyrotoxicosis

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** use only if potential benefit outweighs risk—no information available

**Side-effects** see notes above; also blurred vision, photophobia; systemic effects include palpitations, tachycardia, extrasystoles, arrhythmias, hypertension; *also reported* coronary artery spasm, myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease)

**Indications and dose****Mydriasis**

Apply 1 drop before procedure; see also notes above

**Note** A drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

**Single use****Minims**<sup>®</sup> Phenylephrine Hydrochloride (Bausch & Lomb)

**Eye drops**, phenylephrine hydrochloride 2.5%, net price 20 × 0.5 mL = £10.93

**Excipients** include disodium edetate, sodium metabisulfite

**11.6 Treatment of glaucoma**

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. *Primary congenital glaucoma* is the most common form of glaucoma in children, followed by *secondary glaucomas*, such as following hereditary anterior segment malformations; *juvenile open-angle glaucoma* is less common and usually occurs in older children. *Primary angle closure glaucoma* (acute closed-angle glaucoma) is very rare in children; it is a medical emergency that requires urgent reduction of intra-ocular pressure, see below. Outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-ocular pressure with surgery. Drug therapy is generally supportive, and can be used temporarily, pre- or post-operatively, or both, to reduce intra-ocular pressure. In secondary glaucomas, drug therapy is often used first-line, and long-term treatment may be required. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

**Acetazolamide** by intravenous injection can be used for the emergency management of raised intra-ocular pressure. Rarely, **mannitol** can be given by slow intravenous infusion to reduce intra-ocular pressure (see section 2.2.5).

**Beta-blockers**

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary and secondary glaucomas, probably by reducing the rate of production of aqueous humour.

**Cautions, contra-indications, and side-effects**

Systemic absorption can follow topical application to the eye; therefore, eye drops containing a beta-blocker are contra-indicated in bradycardia, heart block, or uncontrolled heart failure. **Important:** for a warning to avoid in asthma, see below. Cough, rather than wheeze, may occur in children using topical beta-blockers. Consider also other cautions, contra-indications, and side-effects of beta-blockers (p. 87). Beta-blocker eye drops should be used with caution in children with corneal diseases. Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharoconjunctivitis; occasionally corneal disorders have been reported.

**Important** Beta-blockers, even those with apparent cardioselectivity, should not be used in patients with asthma or a history of bronchospasm, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

**Interactions** Since systemic absorption may follow topical application the possibility of interactions, in particular with drugs such as verapamil, should be borne in mind. See also Appendix 1 (beta-blockers).

**BETAXOLOL**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children

**Indications and dose**

See notes above

Apply twice daily

**Betaxolol** (Non-proprietary) (PoM)**Eye drops**, solution, betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90**Excipients** may include benzalkonium chloride, disodium edetate**Betoptic**® (Alcon) (PoM)**Ophthalmic solution** (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90**Excipients** include benzalkonium chloride, disodium edetate**Ophthalmic suspension** (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.66**Excipients** include benzalkonium chloride, disodium edetate**Unit dose eye drop suspension**, betaxolol (as hydrochloride) 0.25%, net price 50 × 0.25 mL = £13.77**CARTEOLOL HYDROCHLORIDE****Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above**Licensed use** not licensed for use in children**Indications and dose**

See notes above

Apply twice daily

**Teoptic**® (Spectrum Thea) (PoM)**Eye drops**, carteolol hydrochloride 1%, net price 5 mL = £7.60; 2%, 5 mL = £8.40**Excipients** include benzalkonium chloride**LEVUNOLOL HYDROCHLORIDE****Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above; anterior uveitis occasionally reported**Licensed use** not licensed for use in children**Indications and dose**

See notes above

Apply once or twice daily

**Levobunolol** (Non-proprietary) (PoM)**Eye drops**, levobunolol hydrochloride 0.5%, net price 5 mL = £1.85**Excipients** may include benzalkonium chloride, disodium edetate, sodium metabisulfite**Betagan**® (Allergan) (PoM)**Eye drops**, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm*®) 1.4%, net price 5 mL = £1.85**Excipients** include benzalkonium chloride, disodium edetate, sodium metabisulfite**Unit dose eye drops**, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm*®) 1.4%, net price 30 × 0.4 mL = £9.98**Excipients** include disodium edetate**TIMOLOL****Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above**Licensed use** not licensed for use in children**Indications and dose**

See notes above

Apply twice daily; long-acting preparations, see under preparations below

**Timolol** (Non-proprietary) (PoM)**Eye drops**, timolol (as maleate) 0.25%, net price 5 mL = £1.30; 0.5%, 5 mL = £1.22**Timoptol**® (MSD) (PoM)**Eye drops**, in *Ocumeter*® metered-dose unit, timolol (as maleate) 0.25%, net price 5 mL = £3.12; 0.5%, 5 mL = £3.12**Excipients** include benzalkonium chloride**Unit dose eye drops**, timolol (as maleate) 0.25%, net price 30 × 0.2 mL = £8.45; 0.5%, 30 × 0.2 mL = £9.65**Once-daily preparations****Timoptol**®-LA (MSD) (PoM)**Ophthalmic gel-forming solution** (= eye drops), timolol (as maleate) 0.25%, net price 2.5 mL = £3.12; 0.5%, 2.5 mL = £3.12**Excipients** include benzododecinium bromide**Dose**

Apply eye drops once daily

**Tipox**® (Spectrum Thea) (PoM)**Unit dose eye gel** (= eye drops), timolol (as maleate) 0.1%, net price 30 × 0.4 g = £7.49**Dose**

Apply once daily in the morning

**Note** The *Scottish Medicines Consortium* (p. 3) has advised (February 2014) that timolol gel eye drops (*Tipox*®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.**With dorzolamide**

See under Dorzolamide

**Prostaglandin analogues**The prostaglandin analogues **latanoprost**, and **travoprost**, and the synthetic prostamide, **bimatoprost**, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost (*Xalatan*®) and certain non-proprietary preparations of latanoprost is licensed for use in children. Children receiving prostaglandin analogues should be managed by a specialist.**LATANOPROST****Cautions** monitor for changes to eye coloration—see

Counselling below; peri-operative period of cataract surgery; history of herpetic keratitis; aphakia, pseudophakia with torn posterior lens capsule or anterior chamber lenses; risk factors for cystoid macular oedema, iritis, or uveitis; history of significant ocular viral infections; asthma; preterm neonates less than 36 weeks gestational age—no information available; children less than 1 year—limited information available

**Contra-indications** active herpes simplex keratitis and history of recurrent herpetic keratitis associated with prostaglandin analogues**Pregnancy** manufacturer advises avoid

**Breast-feeding** may be present in milk—manufacturer advises avoid

**Side-effects** eye pain, transient punctate epithelial erosions, blepharitis, increased iris pigmentation, conjunctival hyperaemia, eye irritation, eyelash and vellus hair changes; *less commonly* eyelid oedema, dry eye, keratitis, blurred vision, conjunctivitis, skin rash; *rarely* iritis, uveitis, macular oedema, corneal oedema and erosions, periorbital oedema, misdirected eyelashes, distichiasis, photophobia; *very rarely* chest pain, periorbital and lid changes resulting in deepening of the eyelid sulcus, localised skin reaction on the eyelids, darkening of the palpebral skin of the eyelids; *also reported* palpitations, asthma, exacerbation of asthma, dyspnoea, headache, dizziness, pyrexia, myalgia, arthralgia, herpetic keratitis, iris cyst, nasopharyngitis

#### Indications and dose

##### Reduction of intra-ocular pressure in raised intra-ocular pressure and glaucoma

Apply once daily, preferably in the evening

**Counselling** Before initiating treatment, children and their carers should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and children and their carers should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

#### Latanoprost (Non-proprietary) (POM)

**Eye drops**, latanoprost 50 micrograms/mL, net price 2.5 mL = £1.97. Counselling, see Counselling, p. 533

**Excipients** may include benzalkonium chloride

#### Xalatan® (Pfizer) (POM)

**Eye drops**, latanoprost 50 micrograms/mL, net price 2.5 mL = £12.48. Counselling, see Counselling, p. 533

**Excipients** include benzalkonium chloride

## Sympathomimetics

**Apraclonidine** (section 11.8.2) is an  $\alpha_2$ -adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

**Brimonidine**, an  $\alpha_2$ -adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow; it is contra-indicated in neonates and children under 2 years (risk of severe systemic side-effects), and should be used with caution in children 2–12 years (increased risk of drowsiness).

## Carbonic anhydrase inhibitors and systemic drugs

The **carbonic anhydrase inhibitors**, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

**Acetazolamide** is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is

used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—children and their carers should be told to report any unusual skin rash. It is not generally recommended for long-term use; if electrolyte disturbances and metabolic acidosis occur, they can be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).

**Dorzolamide** and **brinzolamide** are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

Metabolic acidosis can occur in children using topical carbonic anhydrase inhibitors; symptoms may include poor feeding and lack of weight gain.

## ACETAZOLAMIDE

**Cautions** not generally recommended for prolonged use, but if given, monitor blood count and plasma electrolyte concentrations; pulmonary obstruction and impaired alveolar ventilation (risk of acidosis); diabetes mellitus; renal calculi; avoid extravasation at injection site (risk of necrosis); **interactions:** Appendix 1 (diuretics)

**Contra-indications** hypokalaemia, hyponatraemia, hyperchloraemic acidosis; adrenocortical insufficiency; long-term administration in chronic angle-closure glaucoma; sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** avoid; metabolic acidosis

**Pregnancy** manufacturer advises avoid, especially in first trimester (toxicity in *animal studies*)

**Breast-feeding** amount too small to be harmful

**Side-effects** see notes above; also nausea, vomiting, diarrhoea, taste disturbance, loss of appetite, paraesthesia, flushing, headache, dizziness, fatigue, irritability, excitement, ataxia, depression, thirst, polyuria; *less commonly* melaena, drowsiness, confusion, hearing disturbances, fever, glycosuria, metabolic acidosis and electrolyte disturbances on long-term therapy, haematuria, crystalluria, renal and ureteral colic, renal lesions or calculi, renal failure, blood disorders, bone marrow suppression, rash (including Stevens-Johnson syndrome and toxic epidermal necrosis); *rarely* fulminant hepatic necrosis, hepatitis, cholestatic jaundice, flaccid paralysis, convulsions, photosensitivity; *also reported* transient myopia

**Licensed use** not licensed for use in children for treatment of glaucoma

#### Indications and dose

##### Reduction of intra-ocular pressure in primary and secondary glaucoma

- By mouth or by intravenous injection

**Child 1 month–12 years** 5 mg/kg 2–4 times daily, adjusted according to response, max. 750 mg daily

**Child 12–18 years** 250 mg 2–4 times daily

**Epilepsy**

## ● By mouth or slow intravenous injection

**Neonate** initially 2.5 mg/kg 2–3 times daily, followed by 5–7 mg/kg 2–3 times daily (maintenance dose)

**Child 1 month–12 years** initially 2.5 mg/kg 2–3 times daily, followed by 5–7 mg/kg 2–3 times daily, max. 750 mg daily (maintenance dose)

**Child 12–18 years** 250 mg 2–4 times daily

**Raised intracranial pressure**

## ● By mouth or slow intravenous injection

**Child 1 month–12 years** initially 8 mg/kg 3 times daily, increased as necessary to max. 100 mg/kg daily

**Diamox® (AMCo) (PoM)**

**Tablets**, acetazolamide 250 mg, net price 112-tab pack = £15.22. Label: 3

**Injection**, powder for reconstitution, acetazolamide (as sodium salt), net price 500-mg vial = £14.76

■ **Modified release****Diamox® SR (AMCo) (PoM)**

**Capsules**, m/r, orange, enclosing orange f/c pellets, acetazolamide 250 mg, net price 30-cap pack = £16.66. Label: 3, 25  
Dose

**Child 12–18 years** glaucoma, 1–2 capsules daily

**BRINZOLAMIDE**

**Cautions** systemic absorption follows topical application; renal tubular immaturity or abnormality—risk of metabolic acidosis; **interactions:** Appendix 1 (brinzolamide)

**Contra-indications** hyperchloraemic acidosis; sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** see Cautions above; also avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** use only if benefit outweighs risk

**Side-effects** see notes above; also taste disturbances, dry mouth, headache, ocular disturbances (including corneal erosion, corneal oedema, photophobia, and reduced visual acuity); *less commonly* nausea, vomiting, diarrhoea, dyspepsia, oesophagitis, flatulence, oral hypoesthesia and paraesthesia, chest pain, bradycardia, palpitation, dyspnoea, cough, upper respiratory tract congestion, pharyngitis, depression, sleep disturbances, nervousness, malaise, drowsiness, amnesia, dizziness, paraesthesia, sinusitis, decreased libido, erectile dysfunction, renal pain, epistaxis, nasal dryness, throat irritation, tinnitus, alopecia; *also reported* arrhythmia, tachycardia, hypertension, peripheral oedema, asthma, tremor, vertigo, pollakiuria, rhinitis, dermatitis, erythema

**Licensed use** not licensed for use in children

**Indications and dose**

**Reduction of intra-ocular pressure in primary and secondary glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone if unresponsive to beta-blockers or if beta-blockers contra-indicated**

Apply twice daily, increased to max. 3 times daily if necessary

**Azopt® (Alcon) (PoM)**

**Eye drops**, brinzolamide 10 mg/mL, net price 5 mL = £6.92

**Excipients** include benzalkonium chloride, disodium edetate

**DORZOLAMIDE**

**Cautions** systemic absorption follows topical application; history of renal calculi; neonates and infants with immature renal tubules—risk of metabolic acidosis; chronic corneal defects, low endothelial cell count, history of intra-ocular surgery; **interactions:** Appendix 1 (dorzolamide)

**Contra-indications** hyperchloraemic acidosis

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** see Cautions above; also avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also nausea, bitter taste, headache, asthenia, ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctate keratitis, eyelid inflammation; *less commonly* iridocyclitis; *rarely* dry mouth, dizziness, paraesthesia, urolithiasis, eyelid crusting, transient myopia, corneal oedema, epistaxis, throat irritation, contact dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis; *also reported* metabolic acidosis

**Licensed use** not licensed for use in children

**Indications and dose**

**Raised intra-ocular pressure in primary and secondary glaucoma either as adjunct to beta-blocker or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated**

Used alone, apply 3 times daily; with topical beta-blocker, apply twice daily

**Dorzolamide (Non-proprietary) (PoM)**

**Eye drops**, dorzolamide (as hydrochloride) 2%, net price 5 mL = £1.99

**Excipients** may include benzalkonium chloride

**Brands include** Dorzant®

**Trusopt® (MSD) (PoM)**

**Ophthalmic solution** (= eye drops), in Ocumeter® Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, net price 60 × 0.2 mL = £24.18

■ **With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Dorzolamide with Timolol (Non-proprietary) (PoM)**

**Eye drops**, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £2.90

**Excipients** may include benzalkonium chloride

**Cosopt® (MSD) (PoM)**

**Ophthalmic solution** (= eye drops), in Ocumeter® Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

**Excipients** include benzalkonium chloride

Unit dose eye drops, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

#### Dose

**Raised intra-ocular pressure in open-angle glaucoma, or pseudoexfoliative glaucoma when beta-blockers alone not adequate**

Apply twice daily

## Miotics

Miotics act by opening up the inefficient drainage channels in the trabecular meshwork. **Pilocarpine** is a miotic used pre- and postoperatively in goniotomy and trabeculotomy; it is used occasionally for aphakic glaucoma.

**Cautions** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic. Miotics should be used with caution in patients with peptic ulceration, gastro-intestinal spasm, cardiac disease, hypertension, hypotension, asthma, epilepsy, hyperthyroidism, and urinary-tract obstruction.

**Counselling** Blurred vision may affect performance of skilled tasks (e.g. cycling or driving) particularly at night or in reduced lighting

**Contra-indications** Miotics are contra-indicated in conditions where pupillary constriction is undesirable such as acute iritis, anterior uveitis and some forms of secondary glaucoma. They should be avoided in acute inflammatory disease of the anterior segment.

**Pregnancy** Miotics should be avoided unless the potential benefit outweighs the risk—limited information available.

**Breast-feeding** Miotics should be avoided unless the potential benefit outweighs the risk—no information available.

**Side-effects** Ciliary spasm leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment. Ocular side-effects include burning, itching, smarting, blurred vision, conjunctival vascular congestion, myopia, lens changes with chronic use, vitreous haemorrhage, and pupillary block. Systemic side-effects are rare following application to the eye.

## PILOCARPINE

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children

#### Indications and dose

See also notes above

#### Raised intra-ocular pressure

- **Child 1 month–2 years** 1 drop of 0.5% or 1% solution 3 times daily
- **Child 2–18 years** 1 drop 4 times daily

## Pre- and postoperatively in goniotomy and trabeculotomy

**Child 1 month–18 years** apply 1% or 2% solution once daily

### Pilocarpine Hydrochloride (Non-proprietary) (POM)

**Eye drops**, pilocarpine hydrochloride 1%, net price 10 mL = £2.32; 2%, 10 mL = £2.74; 4%, 10 mL = £3.46

**Excipients** may include benzalkonium chloride

#### Single use

### Minims® Pilocarpine Nitrate (Bausch & Lomb) (POM)

**Eye drops**, pilocarpine nitrate 2%, net price 20 × 0.5 mL = £11.48

## 11.7 Local anaesthetics

**Oxybuprocaine** and **tetracaine** are widely used topical local anaesthetics. **Proxymetacaine** causes less initial stinging and is particularly useful for children. **Oxybuprocaine** or a combined preparation of **lidocaine** and **fluorescein** is used for tonometry. **Tetracaine** produces more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. **Lidocaine**, with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery, see section 15.2, p. 654. Local anaesthetics should never be used for the management of ocular symptoms.

**Cautions** Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

## LIDOCAINE HYDROCHLORIDE (Lignocaine hydrochloride)

**Contra-indications** avoid in preterm neonates

#### Indications and dose

##### Local anaesthetic

Use as required

### Minims® Lidocaine and Fluorescein (Bausch & Lomb) (POM)

**Eye drops**, lidocaine hydrochloride 4%, fluorescein sodium 0.25%, net price 20 × 0.5 mL = £11.24

## OXYBUPROCAINE HYDROCHLORIDE (Benoxinate hydrochloride)

**Contra-indications** avoid in preterm neonates

#### Indications and dose

##### Local anaesthetic

Use as required

### Minims® Oxybuprocaine Hydrochloride (Bausch & Lomb) (POM)

**Eye drops**, oxybuprocaine hydrochloride 0.4%, net price 20 × 0.5 mL = £9.72

## PROXYMETACAINE HYDROCHLORIDE

**Contra-indications** avoid in preterm neonates

#### Indications and dose

##### Local anaesthetic

Use as required

**Minims® Proxymetacaine** (Bausch & Lomb) (PoM)

Eye drops, proxymetacaine hydrochloride 0.5%, net price 20 × 0.5 mL = £11.05

▲ **With fluorescein**

**Minims® Proxymetacaine and Fluorescein** (Bausch & Lomb) (PoM)

Eye drops, proxymetacaine hydrochloride 0.5%, fluorescein sodium 0.25%, net price 20 × 0.5 mL = £12.12

## TETRACAINE HYDROCHLORIDE

(Amethocaine hydrochloride)

**Contra-indications** avoid in preterm neonates

**Indications and dose****Local anaesthetic**

Use as required

**Minims® Tetracaine Hydrochloride** (Bausch & Lomb) (PoM)

Eye drops, tetracaine hydrochloride 0.5% and 1%, net price 20 × 0.5 mL (both) = £9.73

## 11.8 Miscellaneous ophthalmic preparations

### 11.8.1 Tear deficiency, ocular lubricants, and astringents

### 11.8.2 Ocular diagnostic and peri-operative preparations

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistimethate sodium, desferrioxamine, dexamethasone, gentamicin, and vancomycin, can be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

Preparations may also be available from Moorfields Eye Hospital as manufactured specials, see also 'special-order' manufacturers or specialist importing companies, p. 840.

### 11.8.1 Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion often responds to tear replacement therapy. The severity of the condition and the child's preference will often guide the choice of preparation.

**Hypromellose** is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as **acetylcysteine** can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

**Polyvinyl alcohol** increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

**Sodium hyaluronate** eye drops are also used in the management of tear deficiency.

**Sodium chloride 0.9%** drops are sometimes useful in tear deficiency, and can be used as 'comfort drops' by

contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery and in first-aid for removal of harmful substances.

Eye ointments containing a **paraffin** can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

## ACETYLCYSTEINE

**Indications and dose**

**Tear deficiency, impaired or abnormal mucus production**

Apply 3–4 times daily

**Ilube®** (Moorfields) (PoM)

Eye drops, acetylcysteine 5%, hypromellose 0.35%, net price 10 mL = £10.09

**Excipients** include benzalkonium chloride, disodium edetate

## CARBOMERS

(Polyacrylic acid)

Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol

**Licensed use** some preparations not licensed for use in children

**Indications and dose**

**Dry eyes including keratoconjunctivitis sicca, unstable tear film**

Apply 3–4 times daily or as required

**Artelac® Nighttime Gel** (Bausch & Lomb)

Gel (= eye drops), carbomer 2 mg, net price 10 g = £2.96

**GelTears®** (Bausch & Lomb)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80

**Excipients** include benzalkonium chloride

**Liquivisc®** (Spectrum Thea)

Gel (= eye drops), carbomer 974P (polyacrylic acid) 0.25%, net price 10 g = £4.50

**Excipients** include benzalkonium chloride

**Lumecare® Carbomer Gel** (Medicom)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.10

**Excipients** include cetrimide

**Viscotears®** (Alcon)

Liquid gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £1.59

**Excipients** include cetrimide

▲ **Single use**

**Viscotears®** (Alcon)

Liquid gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 30 × 0.6-mL = £5.42

## CARMELLOSE SODIUM

**Indications and dose**

**Dry eye conditions**

Apply as required

**Carmellose** (Non-proprietary)

**Eye drops**, carmellose sodium 0.5%, net price 10 mL = £7.49

**Carimize**<sup>®</sup> (Aspire)

**Eye drops**, carmellose sodium 0.5%, net price 10 mL = £7.49

**Optive**<sup>®</sup> (Allergan)

**Eye drops**, carmellose sodium 0.5%, glycerol, net price 10 mL = £7.49

### Single use

**Carmellose** (Non-proprietary)

**Eye drops**, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75

**Carimize**<sup>®</sup> (Aspire)

**Eye drops**, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75; 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £6.00

**Celluvisc**<sup>®</sup> (Allergan)

**Eye drops**, carmellose sodium 0.5%, net price 30 × 0.4 mL = £4.80, 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £10.99

**Melophtal**<sup>®</sup> (Martindale)

**Eye drops**, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75; 1%, 30 × 0.4 mL = £3.00

**Note** Each unit is resealable and may be used for up to 12 hours

## HYDROXYETHYLCELLULOSE

**Indications and dose****Tear deficiency**

Apply as required

**Minims**<sup>®</sup> **Artificial Tears** (Bausch & Lomb)

**Eye drops**, hydroxyethylcellulose 0.44%, sodium chloride 0.35%, net price 20 × 0.5 mL = £8.97

## HYPROMELLOSE

**Indications and dose****Tear deficiency**

Apply as required

**Note** The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

**Hypromellose** (Non-proprietary)

**Eye drops**, hypromellose 0.3%, net price 10 mL = £1.05

**Excipients** may include benzalkonium chloride

**Brands include** *Lumecare*<sup>®</sup> Hypromellose, *Mandanol*<sup>®</sup>

**Artelac**<sup>®</sup> (Bausch & Lomb)

**Eye drops**, hypromellose 0.32%, net price 10 mL = £4.99

**Excipients** include cetrimide, disodium edetate

**Isopto Alkaline**<sup>®</sup> (Alcon)

**Eye drops**, hypromellose 1%, net price 10 mL = 94p

**Excipients** include benzalkonium chloride

**Isopto Plain**<sup>®</sup> (Alcon)

**Eye drops**, hypromellose 0.5%, net price 10 mL = 81p

**Excipients** include benzalkonium chloride

**Tear-Lac**<sup>®</sup> (Scope Ophthalmics)

**Eye drops**, hypromellose 0.3%, net price 10 mL = £5.75

**Tears Naturale**<sup>®</sup> (Alcon)

**Eye drops**, hypromellose 0.3%, dextran '70' 0.1%, net price 15 mL = £1.89

**Excipients** include benzalkonium chloride, disodium edetate

### Single use

**Artelac**<sup>®</sup> **SDU** (Bausch & Lomb)

**Eye drops**, hypromellose 0.32%, net price 30 × 0.5 mL = £16.95, 60 × 0.5 mL = £32.85

**Hydromoor**<sup>®</sup> (Moorfields)

**Eye drops**, hypromellose 0.3%, net price 30 × 0.4 mL = £5.75

**Lumecare**<sup>®</sup> **Preservative Free Tear Drops** (Medicom)

**Eye drops**, hypromellose 0.3%, net price 30 × 0.5 mL = £5.72

**Tears Naturale**<sup>®</sup> **Single Dose** (Alcon)

**Eye drops**, hypromellose 0.3%, dextran '70' 0.1%, net price 28 × 0.4 mL = £13.26

## LIQUID PARAFFIN

**Indications and dose****Dry eye conditions**

Apply as required

**Lacri-Lube**<sup>®</sup> (Allergan)

**Eye ointment**, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%, net price 3.5 g = £2.51, 5 g = £3.32

**VitA-POS**<sup>®</sup> (Scope Ophthalmics)

**Eye ointment**, retinol palmitate 250 units/g, white soft paraffin, light liquid paraffin, liquid paraffin, wool fat, net price 5 g = £2.75

## MACROGOLS

(Polyethylene glycols)

**Indications and dose****Dry eye conditions**

Apply as required

**Systane**<sup>®</sup> (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, net price 10 mL = £4.66

**Systane**<sup>®</sup> **Ultra** (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, sorbitol, net price 10 mL = £6.69

### Single use

**Systane**<sup>®</sup> (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, net price 28 × 0.8 mL = £4.66

**Systane**<sup>®</sup> **Ultra** (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, sorbitol, net price 30 × 0.7 mL = £6.69

**PARAFFIN, YELLOW, SOFT****Indications and dose**

See notes above  
Apply 2 hourly as required

**Simple Eye Ointment**

Ointment, liquid paraffin 10%, wool fat 10%, in yellow soft paraffin, net price 4 g = £3.42

**POLYVINYL ALCOHOL****Indications and dose**

**Tear deficiency**  
Apply as required

**Liquifilm Tears®** (Allergan)

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%, net price 15 mL = £1.93  
**Excipients** include benzalkonium chloride, disodium edetate

**Sno Tears®** (Bausch & Lomb)

Eye drops, polyvinyl alcohol 1.4%, net price 10 mL = £1.06  
**Excipients** include benzalkonium chloride, disodium edetate

**Single use****Liquifilm Tears®** (Allergan)

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%, povidone 0.6%, net price 30 × 0.4 mL = £5.35

**SODIUM CHLORIDE****Indications and dose**

**Irrigation, including first-aid removal of harmful substances**  
Use as required

**Sodium Chloride 0.9% Solutions**

See section 13.11.1

**Balanced Salt Solution** (POM)

Solution (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.048%, magnesium chloride 0.03%, potassium chloride 0.075%  
For intra-ocular or topical irrigation during surgical procedures

**Single use****Minims® Saline** (Bausch & Lomb)

Eye drops, sodium chloride 0.9%, net price 20 × 0.5 mL = £7.14

**SODIUM HYALURONATE****Indications and dose**

**Dry eye conditions**  
Apply as required

**Artelac Rebalance®** (Bausch & Lomb)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £4.00

**Blink® Intensive Tears** (AMO)

Eye drops, sodium hyaluronate 0.2%, polyethylene glycol 400 0.25%, net price 10 mL = £2.97

**Hyabak®** (Spectrum Thea)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £7.99

**Hylo-Care®** (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.1%, dexpanthenol 2%, net price 10 mL = £10.30

**Hylo-Forte®** (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.2%, net price 10 mL = £9.50

**Hylo-Tear®** (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.1%, net price 10 mL = £8.50

**Lumecare® Sodium Hyaluronate** (Medicom)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £3.97

**Oxya®** (Kestrel Ophthalmics)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £4.15

**Vismed® Gel Multi** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.3%, net price 10 mL = £7.95

**Vismed® Multi** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 10 mL = £6.81

**Single use****Artelac® Splash** (Bausch & Lomb)

Eye drops, sodium hyaluronate 0.2%, net price 30 × 0.5 mL = £7.00, 60 × 0.5 mL = £11.50

**Blink® Intensive Tears** (AMO)

Eye drops, sodium hyaluronate 0.2%, polyethylene glycol 400 0.25%, net price 20 × 0.4 mL = £2.97

**Clinitas®** (Altacor)

Eye drops, sodium hyaluronate 0.4%, net price 30 × 0.5 mL = £5.70

**Note** Each unit is resealable and may be used for up to 12 hours after first opening

**Lubristil®** (Moorfields)

Eye drops, sodium hyaluronate 0.15%, net price 20 × 0.3 mL = £4.99

**Lubristil® Gel** (Moorfields)

Eye drops, sodium hyaluronate 0.15%, xanthan gum 1%, net price 20 × 0.4 mL = £6.49

**Ocusan®** (Agepha)

Eye drops, sodium hyaluronate 0.2%, net price 20 × 0.5 mL = £5.31

**Vismed®** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 20 × 0.3 mL = £5.10

**Vismed® Gel** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.3%, net price 20 × 0.45 mL = £5.98

**SOYBEAN OIL****Indications and dose**

**Dry eye conditions**  
Apply up to 4 times a day

**Emustil®** (Moorfields)

Eye drops, soybean oil 7%, natural phospholipids 3%, net price 20 × 0.3 mL = £6.22

## 11.8.2 Ocular diagnostic and peri-operative preparations

### Ocular diagnostic preparations

**Fluorescein sodium** is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

#### FLUORESCIN SODIUM

##### Indications and dose

###### Detection of lesions and foreign bodies

Sufficient to stain damaged areas

**Minims<sup>®</sup> Fluorescein Sodium** (Bausch & Lomb)

**Eye drops**, fluorescein sodium 1% or 2%, net price 20 × 0.5 mL (both) = £8.52

##### With local anaesthetic

Section 11.7

### Ocular peri-operative drugs

Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.

Sodium hyaluronate is used during surgical procedures on the eye.

**Apraclonidine**, an  $\alpha_2$ -adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.

**Balanced Salt Solution** is used routinely in intra-ocular surgery (section 11.8.1).

#### ACETYLCHOLINE CHLORIDE

**Cautions** gastro-intestinal spasm, peptic ulcer; heart failure; asthma; hyperthyroidism; urinary-tract obstruction

**Pregnancy** avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** avoid unless potential benefit outweighs risk—no information available

**Licensed use** not licensed for use in children

##### Indications and dose

**Cataract surgery, penetrating keratoplasty, iridectomy, other anterior segment surgery requiring rapid complete miosis**

Consult product literature

**Miochol-E<sup>®</sup>** (Bausch & Lomb) (PoM)

**Intra-ocular irrigation**, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**Miphte<sup>®</sup>** (SD Healthcare) (PoM)

**Intra-ocular irrigation**, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

#### APRACLONIDINE

**Note** Apraclonidine is a derivative of clonidine

**Cautions** history of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, hypertension; Raynaud's syndrome; thromboangiitis obli-

terans; depression; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in vision occurs in end-stage glaucoma; monitor for excessive reduction in intra-ocular pressure following peri-operative use; **interactions:** Appendix 1 ( $\alpha_2$ -adrenoceptor stimulants)

**Skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of severe or unstable and uncontrolled cardiovascular disease

**Hepatic impairment** manufacturer advises caution

**Renal impairment** use with caution in chronic renal failure

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** taste disturbance, conjunctivitis, dry eye, ocular intolerance (withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur), rhinitis; *less commonly* chest pain, asthma, dyspnoea, throat irritation, nervousness, irritability, impaired co-ordination, myalgia, mydriasis, keratitis, keratopathy, photophobia, visual impairment, corneal erosion and infiltrates, blepharospasm, blepharitis, eyelid ptosis or retraction, conjunctival vascular disorders, rhinorrhoea, parosmia; since absorption may follow topical application, systemic effects (see Clonidine, section 2.5.2) may occur

**Licensed use** 0.5% drops not licensed for use in children under 12 years; 1% drops not licensed for use in children

##### Indications and dose

See preparations below

**lopidine<sup>®</sup>** (Alcon) (PoM)

**Ophthalmic solution** (= eye drops), apraclonidine 1% (as hydrochloride), net price 12 × 2 single use 0.25-mL units = £77.81

##### Dose

**Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery**

Apply 1 drop 1 hour before laser procedure then 1 drop immediately after completion of procedure

**Ophthalmic solution** (= eye drops), apraclonidine 0.5% (as hydrochloride), net price 5 mL = £10.88

**Excipients** include benzalkonium chloride

##### Dose

**Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug** (see note below)

**Child 12–18 years** apply 1 drop 3 times daily usually for max. 1 month

**Note** May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

#### DICLOFENAC SODIUM

**Licensed use** not licensed for use in children

##### Indications and dose

**Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties), postoperative inflammation in cataract surgery, strabismus surgery, argon laser trabeculoplasty**

Consult product literature

**Voltarol® Ophtha Multidose** (Spectrum Thea) (PoM)  
**Eye drops**, diclofenac sodium 0.1%, net price 5 mL = £6.68  
**Excipients** include benzalkonium chloride, disodium edetate, propylene glycol

#### Single use

**Voltarol® Ophtha** (Spectrum Thea) (PoM)  
**Eye drops**, diclofenac sodium 0.1%, net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

## FLURBIPROFEN SODIUM

**Licensed use** not licensed for use in children

### Indications and dose

**Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties), control of postoperative and post-laser trabeculoplasty inflammation (if corticosteroids contra-indicated)**

Consult product literature

**Ocufen®** (Allergan) (PoM)  
**Ophthalmic solution** (= eye drops), flurbiprofen solution 0.03%, polyvinyl alcohol (*Liquifilm*®) 1.4%, net price 40 × 0.4 mL = £37.15

## KETOROLAC TROMETAMOL

**Licensed use** not licensed for use in children

### Indications and dose

**Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery**

Consult product literature

**Acular®** (Allergan) (PoM)  
**Eye drops**, ketorolac trometamol 0.5%, net price 5 mL = £3.00  
**Excipients** include benzalkonium chloride, disodium edetate

lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment** Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and can cause adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine and hyalalazine). Other drugs that can affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolour lenses).

## 11.9 Contact lenses

Some children and adolescents prefer to wear contact lenses rather than spectacles for both cosmetic and medical reasons. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear in children, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft

12.3.2	Oropharyngeal anti-infective drugs	551
12.3.3	Lozenges and sprays	552
12.3.4	Mouthwashes and gargles	553
12.3.5	Treatment of dry mouth	554

This chapter also includes advice on the drug management of the following:

- allergic rhinitis, p. 545
- nasal polyps, p. 545
- oropharyngeal infections, p. 551
- periodontitis, p. 550

## 12.1 Drugs acting on the ear

- 12.1.1 Otitis externa
- 12.1.2 Otitis media
- 12.1.3 Removal of ear wax

### 12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as **aluminium acetate** solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-infective which is not used systemically (such as **neomycin** or **clioquinol**) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. **Aluminium acetate** ear drops are also effective against bacterial infection and inflammation of the ear. **Chloramphenicol** may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid (such as *Locorten-Vioform*<sup>®</sup>) are used for treating children when infection is present with inflammation and eczema. **Clotrimazole** 1% solution is used topically to treat fungal infection in otitis externa.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in children with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in children with chronic suppurative otitis media (section 12.1.2) and when other measures have failed for otitis externa; treatment should be considered only by **specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;

- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal and may be used to treat mild otitis externa. More severe cases require treatment with an anti-inflammatory preparation with or without an anti-infective drug. A proprietary preparation containing acetic acid 2% (*EarCalm*<sup>®</sup> spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as **paracetamol** (section 4.7.1) or **ibuprofen** (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the child is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory canal, oral **flucloxacillin** (section 5.1.1.2) is the drug of choice; oral **ciprofloxacin** (section 5.1.12) or a systemic aminoglycoside may be needed for pseudomonas infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid (section 13.4) cream or ointment is then required, but prolonged use should be avoided.

**Administration** To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

## Astringent preparations

### ALUMINIUM ACETATE

**Licensed use** not licensed

**Indications and dose**

**Inflammation in otitis externa** (see notes above)

Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**Aluminium Acetate** (Non-proprietary)

**Ear drops** 13%, aluminium sulfate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL  
Available as manufactured special

**Ear drops** 8%, dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

## Anti-inflammatory preparations

### Corticosteroids

Topical corticosteroids are used to treat inflammation and eczema in otitis externa.

**Cautions** Prolonged use of topical corticosteroid ear preparations should be avoided.

**Contra-indications** Corticosteroid ear preparations should be avoided in the presence of an untreated ear

infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

**Side-effects** Local sensitivity reactions may occur.

### BETAMETHASONE SODIUM PHOSPHATE

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturers)

**Indications and dose**

**Eczematous inflammation in otitis externa** (see notes above); for dose, see under preparations

**Eye** section 11.4.1

**Nose** section 12.2.1 and section 12.2.3

**Betnesol**<sup>®</sup> (RPH) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.32

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

ear, instil 2–3 drops every 2–3 hours; reduce frequency when relief obtained

**Vistamethasone**<sup>®</sup> (Martindale) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

ear, instil 2–3 drops every 3–4 hours; reduce frequency when relief obtained

**With antibacterial**

**Betnesol-N**<sup>®</sup> (RPH) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

ear, instil 2–3 drops 3–4 times daily

### DEXAMETHASONE

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** *Sofradex*<sup>®</sup> licensed for use in children (age range not specified by manufacturers)

**Indications and dose**

**Eczematous inflammation in otitis externa** (see notes above); for dose, see under preparations

**With antibacterial**

**Otomize**<sup>®</sup> (Forest) (PoM)

**Ear spray**, dexamethasone 0.1%, neomycin sulfate 3250 units/mL, glacial acetic acid 2%. Net price 5-mL pump-action aerosol unit = £3.50

**Excipients** include hydroxybenzoates (parabens)

**Dose**

Child 2–18 years ear, apply 1 metered spray 3 times daily

**Sofradex®** (Sanofi-Aventis) (PoM) 

**Drops** (for ear or eye), dexamethasone (as sodium metasulfobenzoate) 0.05%, framycetin sulfate 0.5%, gramicidin 0.005%. Net price 10 mL = £6.25

**Excipients** include polysorbate 80

**Dose**

ear, instil 2–3 drops 3–4 times daily; eye, section 11.4.1

**FLUMETASONE PIVALATE**  
(Flumethasone Pivalate)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Indications and dose**

**Eczematous inflammation in otitis externa** (see notes above); for dose, see under preparation

**With antibacterial****Locorten-Vioform®** (AMCo) (PoM)

**Ear drops**, flumetasone pivalate 0.02%, clioquinol 1%. Net price 7.5 mL = £1.76

**Contra-indications** iodine sensitivity

**Dose**

**Child 2–18 years** instil 2–3 drops into the ear twice daily for 7–10 days

**Note** Clioquinol stains skin and clothing

**HYDROCORTISONE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Indications and dose**

**Eczematous inflammation in otitis externa** (see notes above); for dose, see under preparations

**With antibacterial****Gentisone® HC** (AMCo) (PoM)

**Ear drops**, hydrocortisone acetate 1%, gentamicin 0.3% (as sulfate). Net price 10 mL = £4.76

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

ear, instil 2–4 drops 3–4 times daily and at night

**PREDNISOLONE SODIUM PHOSPHATE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturers)

**Indications and dose**

**Eczematous inflammation in otitis externa** (see notes above); for dose, see under preparations

**Eye** section 11.4.1

**Predsol®** (RPH) (PoM)

**Drops** (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £2.00

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

ear, instil 2–3 drops every 2–3 hours; reduce frequency when relief obtained

**Anti-infective preparations****CHLORAMPHENICOL** 

**Cautions** avoid prolonged use (see notes above)

**Side-effects** high incidence of sensitivity reactions to vehicle

**Licensed use** licensed for use in children (age range not specified by manufacturers)

**Indications and dose**

**Bacterial infection in otitis externa** (but see notes above); for dose, see under preparation

**Chloramphenicol** (Non-proprietary) (PoM) 

**Ear drops**, chloramphenicol in propylene glycol, net price 5%, 10 mL = £33.40; 10%, 10 mL = £19.52

**Excipients** include propylene glycol

**Dose**

ear, instil 2–3 drops 2–3 times daily

**CLOTRIMAZOLE**

**Side-effects** occasional local irritation or sensitivity

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Fungal infection in otitis externa** (see notes above); for dose, see under preparation

**Canesten®** (Bayer Consumer Care)

**Solution**, clotrimazole 1% in polyethylene glycol 400 (macrogol 400). Net price 20 mL = £2.30

**Dose**

ear, apply 2–3 times daily continuing for at least 14 days after disappearance of infection

**FRAMYCETIN SULFATE**

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 541)

**Side-effects** local sensitivity

**Indications and dose**

**Bacterial infection in otitis externa** (see notes above)

**Eye** section 11.3.1

**With corticosteroid**

**Sofradex®** see Dexamethasone, p. 543

**GENTAMICIN**

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (but see p. 541 and section 12.1.2)

**Side-effects** local sensitivity

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Bacterial infection in otitis externa** (see notes above); for dose, see under preparations

**Gentamicin**® (AMCo) (PoM)

**Drops** (for ear or eye), gentamicin 0.3% (as sulfate).

Net price 10 mL = £2.13

**Excipients** include benzalkonium chloride

**Dose**

ear, instil 2–3 drops 3–4 times daily and at night; eye, section 11.3.1

▲ **With corticosteroid**

**Gentisone**® HC see Hydrocortisone, p. 543

## NEOMYCIN SULFATE

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 541)

**Side-effects** local sensitivity

**Indications and dose**

**Bacterial infection in otitis externa** (see notes above)

▲ **With corticosteroid**

**Betnesol-N**® (PoM) see Betamethasone, p. 542

**Otomize**® see Dexamethasone, p. 542

## 12.1.2 Otitis media

**Acute otitis media** Acute otitis media is the commonest cause of severe aural pain in young children and may occur with even minor upper respiratory tract infections. Children diagnosed with acute otitis media should not be prescribed antibacterials routinely as many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** (Table 1, section 5.1) may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the child is systemically unwell, if the child is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in children with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given. Topical antibacterial treatment of acute otitis media is ineffective and there is no place for ear drops containing a local anaesthetic.

**Otitis media with effusion** Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

**Chronic otitis media** Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough

cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa (section 12.1.1); this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial (Table 1, section 5.1); a swab should be taken to identify infecting organisms and antibacterial sensitivity.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. **Ciprofloxacin** or **ofloxacin** eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies, see p. 840] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in children with chronic suppurative otitis media and perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by **specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

## 12.1.3 Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax causing discomfort or impaired hearing may be softened with simple remedies such as **olive oil** ear drops or **almond oil** ear drops; **sodium bicarbonate** ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children

unable to co-operate with the procedure, in children who have had otitis media in the last 6 weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

For administration of ear drops, see p. 542.

#### Almond Oil (Non-proprietary)

**Ear drops**, almond oil in a suitable container  
Allow to warm to room temperature before use

#### Olive Oil (Non-proprietary)

**Ear drops**, olive oil in a suitable container  
Allow to warm to room temperature before use

#### Sodium Bicarbonate (Non-proprietary)

**Ear drops**, sodium bicarbonate 5%, net price 10 mL = £1.25

#### Cerumol® (Thornton & Ross)

**Ear drops**, chlorobutanol 5%, arachis (peanut) oil 57.3%. Net price 11 mL = £1.99

#### Exterol® (Dermal)

**Ear drops**, urea–hydrogen peroxide complex 5% in glycerol. Net price 8 mL = £1.75

#### Molcer® (Wallace Mfg)

**Ear drops**, docusate sodium 5%. Net price 15 mL = £8.08

**Excipients** include propylene glycol

#### Otex® (DDD)

**Ear drops**, urea–hydrogen peroxide 5%. Net price 8 mL = £2.89

#### Waxsol® (Meda)

**Ear drops**, docusate sodium 0.5%. Net price 10 mL = £1.95

## 12.2 Drugs acting on the nose

### 12.2.1 Drugs used in nasal allergy

### 12.2.2 Topical nasal decongestants

### 12.2.3 Nasal preparations for infection

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials (Table 1, section 5.1). Many nasal preparations contain sympathomimetic drugs (section 12.2.2) which can give rise to rebound congestion (*rhinitis medicamentosa*) and may damage the nasal cilia. **Sodium chloride 0.9%** solution may be used as a douche or 'sniff' following endonasal surgery.

**Administration** To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

**Nasal polyps** Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the 'head down' position. A short course of a systemic corticosteroid (section 6.3.2) may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

## 12.2.1 Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see also section 3.4.1) or topical **nasal corticosteroids**; systemic nasal decongestants (section 3.10) are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal **corticosteroids**; **sodium cromoglicate** is an alternative, but may be less effective. The topical antihistamine, **azelastine**, is useful for controlling breakthrough symptoms in allergic rhinitis. Azelastine is less effective than nasal corticosteroids, but probably more effective than sodium cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous long-term treatment may be required in perennial rhinitis.

**Montelukast** (section 3.3.2) is less effective than topical nasal corticosteroids; montelukast can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral **corticosteroids** (section 6.3.2) for short periods. Oral corticosteroids may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal **ipratropium bromide** (section 12.2.2) can reduce watery rhinorrhoea.

**Pregnancy** If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone, budesonide, fluticasone propionate, or sodium cromoglicate may be considered.

## Antihistamines

### AZELASTINE HYDROCHLORIDE

**Side-effects** irritation of nasal mucosa; bitter taste (if applied incorrectly); very rarely hypersensitivity reactions including rash, pruritus, and urticaria

#### Indications and dose

**Treatment of allergic rhinitis** for dose, see under preparation

#### Rhinolast® (Meda) (PoM)

**Nasal spray**, azelastine hydrochloride 140 micrograms (0.14 mL)/metered spray. Net price 22 mL (157-spray unit with metered pump) = £10.45

**Excipients** include sodium edetate

#### Dose

**Child 5–18 years** apply 140 micrograms (1 spray) into each nostril twice daily

**Note** Preparations of azelastine hydrochloride can be sold to the public for nasal administration in aqueous form (other than by aerosol) for the treatment of seasonal allergic rhinitis or perennial allergic rhinitis in children over 5 years, subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses

## Corticosteroids

Nasal preparations containing corticosteroids have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above). They are also used for the symptomatic treatment of adenoidal hypertrophy.

**Cautions** Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Side-effects** Local side-effects include dryness, irritation of nose and throat, and epistaxis. Nasal ulceration has been reported, and occurs commonly with nasal preparations containing fluticasone furoate or mometasone furoate. Nasal septal perforation (usually following nasal surgery) occurs very rarely. Raised intra-ocular pressure or glaucoma may occur rarely. Headache, smell and taste disturbances may also occur. Hyperactivity, sleep disturbances, anxiety, depression, and aggression have been reported. Hypersensitivity reactions, including bronchospasm, have also been reported.

### BECLOMETASONE DIPROPIONATE (Beclomethasone Dipropionate)

**Cautions** see notes above

**Side-effects** see notes above

#### Indications and dose

**Prophylaxis and treatment of allergic and vasomotor rhinitis**

**Child 6–18 years** apply 100 micrograms (2 sprays) into each nostril twice daily; max. total 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

**Beclometasone** (Non-proprietary) (PoM)

**Nasal spray**, beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.12

**Brands include** *Nasobec Aqueous*<sup>®</sup>

**Beconase**<sup>®</sup> (A&H) (PoM)

**Nasal spray (aqueous suspension)**, beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit with applicator = £2.19

**Excipients** include benzalkonium chloride, polysorbate 80

### BETAMETHASONE SODIUM PHOSPHATE

**Cautions** see notes above

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturer)

#### Indications and dose

**Non-infected inflammatory conditions of nose** for dose, see under preparations

**Eye** section 11.4.1

**Ear** section 12.1.1

**Betnesol**<sup>®</sup> (RPH) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.32

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

*nose*, instil 2–3 drops into each nostril 2–3 times daily

**Vistamethasone**<sup>®</sup> (Martindale) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02, 10 mL = £1.16

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

*nose*, instil 2–3 drops into each nostril twice daily

## BUDESONIDE

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

#### Indications and dose

See under preparations

**Budesonide** (Non-proprietary) (PoM)

**Nasal spray**, budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90

**Dose**

**Prophylaxis and treatment of allergic and vasomotor rhinitis**

**Child 12–18 years** apply 200 micrograms (2 sprays) into each nostril once daily in the morning or 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily

**Nasal polyps**

**Child 12–18 years** apply 100 micrograms (1 spray) into each nostril twice daily for up to 3 months

**Rhinocort Aqua**<sup>®</sup> (AstraZeneca) (PoM)

**Nasal spray**, budesonide 64 micrograms/metered spray. Net price 120-spray unit = £3.49

**Excipients** include disodium edetate, polysorbate 80, potassium sorbate

**Dose**

**Rhinitis**

**Child 12–18 years** 128 micrograms (2 sprays) into each nostril once daily in the morning or 64 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 64 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months

**Nasal polyps**

**Child 12–18 years** 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

## FLUTICASONE PROPIONATE

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

**Indications and dose****Prophylaxis and treatment of allergic rhinitis**

**Child 4–12 years** 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased to max. twice daily if required

**Child 12–18 years** 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased to max. twice daily if required; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily

**Nasal polyps** see *Flixonase Nasule*® below

**Flixonase**® (A&H) (PoM)

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit with applicator = £11.01

**Excipients** include benzalkonium chloride, polysorbate 80

**Flixonase Nasule**® (A&H) (PoM)

**Nasal drops**, fluticasone propionate 400 micrograms/unit dose, net price 28 × 0.4-mL units = £12.99

**Excipients** include polysorbate 20

**Dose****Nasal polyps**

**Child 16–18 years** instil 200 micrograms (approx. 6 drops) into each nostril once or twice daily; consider alternative treatment if no improvement after 4–6 weeks

**Nasofan**® (TEVA UK) (PoM)

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £8.04

**Excipients** include benzalkonium chloride, polysorbate 80

**With azelastine hydrochloride****Dymista**® (Meda) (PoM)

**Nasal spray**, fluticasone propionate 50 micrograms, azelastine hydrochloride 137 micrograms/metered spray, net price 120-spray unit = £18.91

**Excipients** include benzalkonium chloride, polysorbate 80

**Dose**

**Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate**

**Child 12–18 years** 1 spray into each nostril twice daily

**Fluticasone furoate****Avamys**® (GSK) (PoM)

**Nasal spray**, fluticasone furoate 27.5 micrograms/metered spray, net price 120-spray unit = £6.44

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose****Prophylaxis and treatment of allergic rhinitis**

- **Child 6–12 years** 27.5 micrograms (1 spray) into each nostril once daily, increased if necessary to 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to 27.5 micrograms (1 spray) into each nostril once daily
- **Child 12–18 years** 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to minimum effective dose, 27.5 micrograms (1 spray) into each nostril once daily may be sufficient

**MOMETASONE FUROATE**

**Cautions** see notes above

**Side-effects** see notes above

**Indications and dose**

See under preparation

**Nasonex**® (MSD) (PoM)

**Nasal spray**, mometasone furoate 50 micrograms/metered spray. Net price 140-spray unit = £7.68

**Excipients** include benzalkonium chloride, polysorbate 80

**Dose****Prophylaxis and treatment of allergic rhinitis**

**Child 6–12 years** 50 micrograms (1 spray) into each nostril once daily

**Child 12–18 years** 100 micrograms (2 sprays) into each nostril once daily, increased if necessary to max. 200 micrograms (4 sprays) into each nostril once daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily

**TRIAMCINOLONE ACETONIDE**

**Cautions** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 6 years

**Indications and dose****Treatment of allergic rhinitis**

**Child 2–6 years** 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months

**Child 6–12 years** 55 micrograms (1 spray) into each nostril once daily, increased if necessary to 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months

**Child 12–18 years** 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily

**Nasacort**® (Sanofi-Aventis) (PoM)

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Cromoglicate****SODIUM CROMOGLICATE**  
(Sodium Cromoglycate)

**Side-effects** local irritation; rarely transient bronchospasm

**Licensed use** licensed for use in children (age range not specified by manufacturers)

**Indications and dose**

**Prophylaxis of allergic rhinitis** for dose, see under preparations

**Rynacrom**® (Sanofi-Aventis)

**4% aqueous nasal spray**, sodium cromoglicate 4% (5.2 mg/spray). Net price 22 mL (150-spray unit with pump) = £17.07

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

*nose*, 1 spray into each nostril 2–4 times daily

## 12.2.2 Topical nasal decongestants

**Sodium chloride** 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should **not** be recommended. Volatile substances (section 3.8) such as menthol and eucalyptus may encourage inhalation of warm moist air.

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (*rhinitis medicamentosa*) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

**Ephedrine nasal drops** is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs **oxymetazoline** and **xylometazoline** are more likely to cause a rebound effect.

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age (section 3.9.1).

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic **ipratropium bromide**.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (*Naseptin*®) cream (section 12.2.3) may be effective.

Systemic nasal decongestants—see section 3.10.

**Sinusitis and oral pain** Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with **ephedrine nasal drops** (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.

## Sympathomimetics

### EPHEDRINE HYDROCHLORIDE

**Cautions** see notes above; also avoid excessive or prolonged use; hyperthyroidism; diabetes mellitus; cardiovascular disease (including hypertension); interactions: Appendix 1 (sympathomimetics)

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported

**Licensed use** not licensed for use in children under 12 years

### Indications and dose

**Nasal congestion** (see notes above)

**Child 12–18 years** instil 1–2 drops (0.5% strength) into each nostril up to 4 times daily when required; max. duration 7 days

### <sup>1</sup>Ephedrine (Non-proprietary)

**Nasal drops**, ephedrine hydrochloride 0.5%, net price 10 mL = £1.49; 1%, 10 mL = £1.54

**Note** The BP directs that if no strength is specified 0.5% drops should be supplied

**Dental prescribing on NHS** Ephedrine nasal drops may be prescribed

## XYLOMETAZOLINE HYDROCHLORIDE

**Cautions** see under Ephedrine Hydrochloride and notes above; also angle-closure glaucoma; avoid excessive or prolonged use

**Pregnancy** avoid

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see under Ephedrine Hydrochloride and notes above; also reported transient visual disturbances; in small children, also restlessness, sleep disturbances, and hallucinations (discontinue treatment)

### Indications and dose

**Nasal congestion** for dose, see under preparations

### Xylometazoline (Non-proprietary)

**Nasal drops**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10

#### Dose

**Child 12–18 years** instil 2–3 drops into each nostril 2–3 times daily when required; max. duration 7 days

**Brands include** *Otradrops*®, *Otrivine*® JMS

**Paediatric nasal drops**, xylometazoline hydrochloride 0.05%, net price 10 mL = £1.91

#### Dose

**Child 6–12 years** instil 1–2 drops into each nostril 1–2 times daily when required; max. duration 5 days

**Brands include** *Otradrops*®, *Otrivine*® JMS

**Nasal spray**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10

#### Dose

**Child 12–18 years** apply 1 spray into each nostril 1–3 times daily when required; max. duration 7 days

**Brands include** *Otrivine*® JMS, *Otrivine*® Allergy Relief

## Antimuscarinic

### IPRATROPIUM BROMIDE

**Cautions** see section 3.1.2; avoid spraying near eyes

**Side-effects** epistaxis, nasal dryness, and irritation; less frequently nausea, headache, and pharyngitis; very rarely antimuscarinic effects such as gastro-

1. Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

intestinal motility disturbances, palpitations, and urinary retention

### Indications and dose

**Rhinorrhoea associated with allergic and non-allergic rhinitis**

**Child 12–18 years** apply 42 micrograms (2 sprays) into each nostril 2–3 times daily

**Asthma and reversible airways obstruction** section 3.1.2

### Rinatec<sup>®</sup> (Boehringer Ingelheim) (PoM)

**Nasal spray 0.03%**, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £6.54

**Excipients** include benzalkonium chloride, disodium edetate

## 12.2.3 Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below. Acute complications such as periorbital cellulitis require hospital treatment. For systemic treatment of sinusitis, see Table 1, section 5.1.

### Betnesol-N<sup>®</sup> (RPH) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

**Excipients** include benzalkonium chloride, disodium edetate

#### Dose

*nose*, instil 2–3 drops into each nostril 2–3 times daily

**Note** *Betnesol-N<sup>®</sup>* licensed for use in children (age range not specified by manufacturer)

## Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin<sup>®</sup>*), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population. A nasal ointment containing **mupirocin** is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the *eradication* (in both patients and staff) of nasal carriage of methicillin-resistant *Staphylococcus aureus* (MRSA). The ointment should be applied 3 times daily for 5 days and a sample taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream. For eradication of MRSA also consult local infection control policy. See section 13.10.1 for treatment of MRSA-infected open wounds. See section 5.1.1.2 for *treatment* of children with MRSA-positive throat swabs or systemic MRSA infection.

### Bactroban Nasa<sup>®</sup> (GSK) (PoM)

**Nasal ointment**, mupirocin 2% (as calcium salt) in white soft paraffin basis. Net price 3 g = £3.54

#### Dose

**For eradication of nasal carriage of staphylococci, including methicillin-resistant *Staphylococcus aureus* (MRSA)**

Apply 2–3 times daily to the inner surface of each nostril (see notes above)

### Naseptin<sup>®</sup> (Alliance) (PoM)

**Cream**, chlorhexidine hydrochloride 0.1%, neomycin sulfate 0.5%, net price 15 g = £1.90

**Excipients** include arachis (peanut) oil, cetostearyl alcohol

#### Dose

**For eradication of nasal carriage of staphylococci**

Apply to nostrils 4 times daily for 10 days

**For preventing nasal carriage of staphylococci**

Apply to nostrils twice daily

## 12.3 Drugs acting on the oropharynx

### 12.3.1 Drugs for oral ulceration and inflammation

#### 12.3.2 Oropharyngeal anti-infective drugs

#### 12.3.3 Lozenges and sprays

#### 12.3.4 Mouthwashes and gargles

#### 12.3.5 Treatment of dry mouth

### 12.3.1 Drugs for oral ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthous ulcers, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy. It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Children with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude secondary causes such as leukaemia.

**Simple mouthwashes** A **saline** mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

**Antiseptic mouthwashes** Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of **chlorhexidine** mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthous ulcers.

**Corticosteroids** Topical corticosteroid therapy may be used for some forms of oral ulceration; for aphthous ulcers it is most effective if applied in the 'prodromal' phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

**Hydrocortisone oromucosal tablets** are useful in recurrent aphthous ulcers and erosive lichenoid lesions.

**Beclomethasone dipropionate** inhaler (p. 146) 50–100 micrograms sprayed twice daily on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, **betamethasone** soluble tablets dissolved in water, can be used as a mouthwash to treat oral ulceration.

Systemic corticosteroid therapy (section 6.3.2) is reserved for severe conditions such as pemphigus vulgaris.

**Local analgesics** Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration and analgesia cannot be maintained continuously throughout the day. When local anaesthetics are used in the mouth, care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Benzydamine** and **Flurbiprofen** are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some children find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat in adolescents.

**Choline salicylate** is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthous ulcers in children over 16 years of age.

**Periodontitis** Low-dose **doxycycline** (*Periostat*<sup>®</sup>) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis in children over 12 years; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.

## BENZYDAMINE HYDROCHLORIDE

**Side-effects** occasional numbness or stinging; rarely hypersensitivity reactions

### Indications and dose

#### Painful inflammatory conditions of oropharynx

- As a mouthwash (benzydamine hydrochloride 0.15%)
  - Child 13–18 years** rinse or gargle using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days
- As an oromucosal spray (benzydamine hydrochloride 0.15%)
  - Child under 6 years** 1 spray per 4 kg body-weight (max. 4 sprays) onto affected area every 1½–3 hours
  - Child 6–12 years** 4 sprays onto affected area every 1½–3 hours
  - Child 12–18 years** 4–8 sprays onto affected area every 1½–3 hours

**Benzydamine hydrochloride** (Non-proprietary)

**Mouthwash**, benzydamine hydrochloride 0.15%, net price 300 mL = £6.45  
**Brands include** *Oroze*<sup>®</sup>

**Oromucosal spray**, benzydamine hydrochloride 0.15%, net price 30 mL = £4.24

**Brands include** *Oroze*<sup>®</sup>  
**Dental prescribing on NHS** Benzydamine Oromucosal Spray 0.15% may be prescribed

**Difflam**<sup>®</sup> (Meda)

**Mouthwash (oral rinse)**, green, benzydamine hydrochloride 0.15%, net price 200 mL (*Difflam*<sup>®</sup> *Sore Throat Rinse*) = £4.64; 300 mL = £6.50

**Dental prescribing on NHS** May be prescribed as Benzydamine Mouthwash 0.15%

**Oromucosal spray**, benzydamine hydrochloride 0.15%, net price 30-mL unit = £4.24

## CORTICOSTEROIDS

**Contra-indications** untreated oral infection

**Side-effects** occasional exacerbation of local infection; thrush or other candidal infections

**Licensed use** *Hydrocortisone mucoadhesive buccal tablets* licensed for use in children (under 12 years—on medical advice only); *betamethasone soluble tablets* not licensed for use in oral ulceration

### Indications and dose

**Oral and perioral lesions** for dose, see under preparations

**Betamethasone** (Non-proprietary) (POM)

**Soluble tablets**, betamethasone 500 micrograms (as sodium phosphate), net price 100-tab pack = £18.95. Label: 10, 13, counselling, administration  
**Dose**

#### Oral ulceration

**Child 12–18 years** 500 micrograms dissolved in 20 mL water and rinsed around the mouth 4 times daily; not to be swallowed

**Dental prescribing on NHS** Betamethasone Soluble Tablets 500 micrograms may be prescribed

**Hydrocortisone** (Non-proprietary)

**Mucoadhesive buccal tablets** (= oromucosal tablets), hydrocortisone 2.5 mg (as sodium succinate). Net price 20 = £4.24

#### Dose

1 lozenge 4 times daily, allowed to dissolve slowly in the mouth in contact with the ulcer

**Dental prescribing on NHS** May be prescribed as Hydrocortisone Oromucosal Tablets

## DOXYCYCLINE

**Cautions** section 5.1.3; monitor for superficial fungal infection, particularly if predisposition to oral candidiasis

**Contra-indications** section 5.1.3

**Hepatic impairment** section 5.1.3

**Renal impairment** section 5.1.3

**Pregnancy** section 5.1.3

**Breast-feeding** section 5.1.3

**Side-effects** section 5.1.3; fungal superinfection

### Indications and dose

See under preparations

**Other indications** section 5.1.3

**Periostat®** (Alliance) (PoM)

Tablets, f/c, doxycycline (as hyclate) 20 mg, net price 56-tab pack = £17.30. Label: 6, 11, 27, counselling, posture

**Dose**

**Periodontitis (as an adjunct to gingival scaling and root planing)**

**Child 12–18 years** 20 mg twice daily for 3 months

**Counselling** Tablets should be swallowed whole with plenty of fluid, while sitting or standing

**Dental prescribing on NHS** May be prescribed as Doxycycline Tablets 20 mg

**Note** May be difficult to obtain

**Local application**

For severe recurrent aphthous ulceration, a 100 mg doxycycline dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes 4 times daily usually for 3 days; it should preferably not be swallowed [unlicensed indication].

**Note** Doxycycline stains teeth; avoid in children under 12 years of age

**FLURBIPROFEN**

**Cautions** section 10.1.1

**Contra-indications** section 10.1.1

**Hepatic impairment** section 10.1.1

**Renal impairment** section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** section 10.1.1

**Side-effects** taste disturbance, mouth ulcers (move lozenge around mouth); see also section 10.1.1

**Indications and dose**

**Relief of sore throat** for dose, see under preparation

**Strofen®** (Reckitt Benckiser)

Lozenges, flurbiprofen 8.75 mg, net price 16 = £2.58

**Dose**

**Child 12–18 years** allow 1 lozenge to dissolve slowly in the mouth every 3–6 hours, max. 5 lozenges in 24 hours, for max. 3 days

**SALICYLATES**

**Cautions** frequent application, especially in children, may give rise to salicylate poisoning

**Contra-indications** children under 16 years

**Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome

**Side-effects** transient local burning sensation

**Indications and dose**

**Mild oral and perioral lesions** for dose, see under preparations

**Choline salicylate**

**Choline Salicylate Dental Gel, BP**

Oral gel, choline salicylate 8.7% in a flavoured gel basis, net price 15 g = £2.26

**Brands include** *Bonjela®* (sugar-free)

**Dose**

**Child 16–18 years** apply ½-inch of gel with gentle massage not more often than every 3 hours

**Dental prescribing on NHS** Choline Salicylate Dental Gel may be prescribed

**Salicylic acid**

**Pyralvex®** (Meda)

Oral paint, brown, rhubarb extract (anthraquinone glycosides 0.5%), salicylic acid 1%. Net price 10 mL with brush = £3.25

**Excipients** include ethanol

**Dose**

**Child 16–18 years** apply 3–4 times daily; max. duration 7 days

**Note** May cause temporary discolouration of teeth and oral mucosa

**12.3.2 Oropharyngeal anti-infective drugs**

Sore throat is usually a self-limiting condition often caused by viral infection which does not benefit from anti-infective treatment. Adequate analgesia may be all that is required. Systemic **antibacterials** (Table 1, section 5.1) should only be used in severe cases where there is concern for the child's overall clinical condition. Acute ulcerative gingivitis (Vincent's infection) requires treatment with oral **metronidazole** (section 5.1.11).

**Benzydamine** (section 12.3.1) may be beneficial in relieving pain and dysphagia in children, especially after tonsillectomy or the use of a nasogastric tube.

**Oropharyngeal viral infections**

Children with varicella-zoster infection often develop painful lesions in the mouth and throat. **Benzydamine** (section 12.3.1) may be used to provide local analgesia. **Chlorhexidine** mouthwash or gel (section 12.3.4) will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In severe herpetic stomatitis systemic **aciclovir** or **valaciclovir** (section 5.3.2.1) may be used for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used to prevent frequently recurring herpes simplex lesions of the mouth particularly when associated with the initiation of erythema multiforme. For the treatment of labial herpes simplex infections, see section 13.10.3.

**Oropharyngeal fungal infections**

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush** Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics, or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with **nystatin** or **miconazole** may be needed. **Fluconazole** (section 5.2.1) is effective for unresponsive infections or if a topical antifungal drug cannot be used. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred (section 5.2.1).

**Acute erythematous candidiasis** Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with **fluconazole** (section 5.2.1).

**Angular cheilitis** Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. While the underlying cause is being identified and treated, it is often helpful to apply **miconazole** cream (p. 594) or **sodium fusidate** ointment (p. 593); if the angular cheilitis is unresponsive to treatment, **miconazole** and **hydrocortisone** cream or ointment (p. 565) can be used.

**Immunocompromised patients** For advice on prevention of fungal infections in immunocompromised children see p. 305.

For the role of antiseptic mouthwashes in the prevention of oral candidiasis in immunocompromised children, see section 12.3.4.

**Drugs used in oropharyngeal candidiasis** **Nystatin** is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. **Miconazole** is used by local application (as an oral gel) in the mouth but it is also absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. In neonates, nystatin oral suspension or miconazole oral gel is used for the treatment of oropharyngeal candidiasis; to prevent re-infection it is important to ensure that the mother's breast nipples and the teats of feeding bottles are cleaned adequately.

**Fluconazole** (section 5.2.1) given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when topical therapy cannot be used. **Itraconazole** (section 5.2.1) can be used for fluconazole-resistant infections.

If candidal infection fails to respond after 1 to 2 weeks of treatment with antifungal drugs the child should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract.

## MICONAZOLE

**Cautions** avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (antifungals, imidazole)

**Contra-indications** impaired swallowing reflex in infants

**Hepatic impairment** avoid

**Pregnancy** manufacturer advises avoid if possible—**toxicity** at high doses in *animal* studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** nausea and vomiting, *very rarely* diarrhoea (usually on long-term treatment), hepatitis, rash, toxic epidermal necrolysis, and Stevens-Johnson syndrome

**Licensed use** not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term

### Indications and dose

#### Prevention and treatment of oral candidiasis

- **By mouth**

**Neonate** 1 mL 2–4 times daily smeared around the inside of the mouth after feeds

**Child 1 month–2 years** 1.25 mL 4 times daily smeared around the inside of the mouth after meals

**Child 2–18 years** 2.5 mL 4 times daily after meals; retain near lesions before swallowing (orthodontic appliances should be removed at night and brushed with gel)

#### Prevention and treatment of intestinal candidiasis

- **By mouth**

**Child 4 months–18 years** 5 mg/kg 4 times daily; max. 250 mg (10 mL) 4 times daily

**Note** Treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

### <sup>1</sup>Daktarin® (Janssen) (PoM)

**Oral gel**, sugar-free, orange-flavoured, miconazole 24 mg/mL (20 mg/g). Net price 15-g tube = £2.97, 80-g tube = £4.38. Label: 9, counselling, hold in mouth, after food

**Excipients** include ethanol

**Dental prescribing on NHS** May be prescribed as Miconazole Oromucosal Gel

## NYSTATIN

**Side-effects** oral irritation and sensitisation, nausea reported

**Licensed use** *suspension* not licensed for use in neonates for the treatment of candidiasis

### Indications and dose

#### Oral and perioral fungal infections

**Neonate** 100 000 units 4 times daily after feeds

**Child 1 month–18 years** 100 000 units 4 times daily after food

**Note** Treatment is usually given for 7 days, and continued for 48 hours after lesions have healed.

**Skin infections** section 13.10.2

### Nystatin (Non-proprietary) (PoM)

**Oral suspension**, nystatin 100 000 units/mL, net price 30 mL = £20.46. Label: 9, counselling, use of pipette, hold in mouth, after food

**Dental prescribing on NHS** Nystatin Oral Suspension may be prescribed

### Nystan® (Squibb) (PoM)

**Oral suspension**, yellow, nystatin 100 000 units/mL. Net price 30 mL with pipette = £1.91. Label: 9, counselling, use of pipette, hold in mouth, after food

**Excipients** include ethanol

## 12.3.3 Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

1. 15-g tube can be sold to the public

### 12.3.4 Mouthwashes and gargles

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal for its cleansing effect and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting **compound sodium chloride mouthwash** with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as **hydrogen peroxide**, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection). Hydrogen peroxide solution has also a mechanical cleansing effect arising from frothing when in contact with oral debris, but in concentrations greater than 1.5% may cause ulceration and tissue damage.

**Chlorhexidine** is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the child has a haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.

#### CHLORHEXIDINE GLUCONATE

**Side-effects** mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling and hypersensitivity (including anaphylaxis) reported

**Note** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product

**Licensed use** licensed for use in children (age range not specified by manufacturer); *Corsodyl*<sup>®</sup> not

licensed for use in children under 12 years (unless on the advice of a healthcare professional)

#### Indications and dose

See under preparations below

#### Chlorhexidine (Non-proprietary)

**Mouthwash**, chlorhexidine gluconate 0.2%, net price 300 mL = £3.45

#### Dose

**Oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers**

Rinse mouth with 10 mL for about 1 minute twice daily

#### Corsodyl<sup>®</sup> (GSK Consumer Healthcare)

**Dental gel**, chlorhexidine gluconate 1%. Net price 50 g = £1.21

#### Dose

**Oral hygiene and plaque inhibition and gingivitis**

Brush on the teeth once or twice daily

#### Oral candidiasis and management of aphthous ulcers

Apply to affected areas once or twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Gluconate Gel

**Mouthwash**, chlorhexidine gluconate 0.2%, net price 300 mL (original or mint) = £2.28, 600 mL (mint) = £3.85; alcohol-free, 300 mL (mint) = £2.73

#### Dose

**Oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers**

Rinse mouth with 10 mL for about 1 minute twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Mouthwash

**Oral spray**, chlorhexidine gluconate 0.2% (mint-flavoured). Net price 60 mL = £4.10

#### Dose

**Oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers**

Apply as required to tooth, gingival, or ulcer surfaces using up to 12 actuations (approx. 0.14 mL/actuation) twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Oral Spray

#### With chlorobutanol

#### Eludril<sup>®</sup> (Fabre)

**Mouthwash or gargle**, chlorhexidine gluconate 0.1%, chlorobutanol 0.5% (mint-flavoured), net price 90 mL = £1.36, 250 mL = £2.83, 500 mL = £5.06

#### Dose

**Oral hygiene and plaque inhibition**

**Child 6–18 years** use 10–15 mL (diluted with lukewarm water in measuring cup provided) 2–3 times daily

#### HEXETIDINE

**Side-effects** local irritation; *very rarely* taste disturbance and transient anaesthesia

#### Indications and dose

**Oral hygiene** for dose, see preparation below

#### Oraldene<sup>®</sup> (McNeil)

**Mouthwash or gargle**, red or blue-green (mint-flavoured), hexetidine 0.1%. Net price 100 mL = £1.43; 200 mL = £2.21

#### Dose

**Child 6–18 years** use 15 mL (undiluted) 2–3 times daily

## HYDROGEN PEROXIDE

**Side-effects** hypertrophy of papillae of tongue on prolonged use

### Indications and dose

**Oral hygiene** (see notes above); for dose, see under preparations

### Hydrogen Peroxide Mouthwash, BP

**Mouthwash**, consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

#### Dose

Rinse the mouth for 2–3 minutes with 15 mL diluted in half a tumblerful of warm water 2–3 times daily (see notes above)

**Dental prescribing on NHS** Hydrogen Peroxide Mouthwash may be prescribed

### Peroxyl<sup>®</sup> (Colgate-Palmolive)

**Mouthwash**, hydrogen peroxide 1.5%, net price 300 mL = £2.94

#### Dose

**Child 6–18 years**, rinse the mouth with 10 mL for about 1 minute 3 times daily (after meals and at bedtime) for max. 7 days

## SODIUM CHLORIDE

### Indications and dose

**Oral hygiene** (see notes above); for dose, see under preparation

### Sodium Chloride Mouthwash, Compound, BP

**Mouthwash**, sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with a peppermint flavour

#### Dose

Extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL

To be diluted with an equal volume of warm water

**Dental prescribing on NHS** Compound Sodium Chloride Mouthwash may be prescribed

## 12.3.5 Treatment of dry mouth

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.

## Local treatment

Artificial saliva products with **ACBS approval** may be prescribed for children with dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome. SST tablets may also be prescribed on the NHS.

### AS Saliva Orthana<sup>®</sup> (AS Pharma)

**Oral spray**, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral, net price 50-mL bottle = £4.92; 500-mL refill = £34.27

#### Dose

(ACBS) spray 2–3 times onto oral and pharyngeal mucosa, when required

**Dental prescribing on NHS** AS Saliva Orthana<sup>®</sup> Oral Spray may be prescribed

**Lozenges**, mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral, net price 30-lozenge pack = £3.50

#### Dose

(ACBS) allow 1 lozenge to dissolve slowly in the mouth when required

**Note** AS Saliva Orthana<sup>®</sup> lozenges do not contain fluoride

**Dental prescribing on NHS** AS Saliva Orthana<sup>®</sup> Lozenges may be prescribed

### Biotène Oralbalance<sup>®</sup> (GSK)

**Saliva replacement gel**, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.46

#### Dose

#### Symptomatic treatment of dry mouth

Apply to gums and tongue as required

**Note** Avoid use with toothpastes containing detergents (including foaming agents)

**Dental prescribing on NHS** Biotène Oralbalance<sup>®</sup> Saliva Replacement Gel may be prescribed as Artificial Saliva Gel

### BioXtra<sup>®</sup> (RIS Products)

**Gel**, lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94

#### Dose

(ACBS) apply to oral mucosa as required

**Dental prescribing on NHS** BioXtra<sup>®</sup> Gel may be prescribed

### Glandosane<sup>®</sup> (Fresenius Kabi)

**Aerosol spray**, carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75, net price 50-mL unit (neutral, lemon or peppermint flavoured) = £5.38

#### Dose

(ACBS) spray onto oral and pharyngeal mucosa as required

**Dental prescribing on NHS** Glandosane<sup>®</sup> Aerosol Spray may be prescribed

### Saliveze<sup>®</sup> (Wyvern)

**Oral spray**, carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral, net price 50-mL bottle (mint-flavoured) = £3.50

#### Dose

(ACBS) 1 spray onto oral mucosa as required

**Dental prescribing on NHS** Saliveze<sup>®</sup> Oral Spray may be prescribed

**Salivix**<sup>®</sup> (Galen)

**Pastilles**, sugar-free, reddish-amber, acacia, malic acid and other ingredients. Net price 50-pastille pack = £3.50

**Dose****Symptomatic treatment of dry mouth**

Suck 1 pastille when required

**Dental prescribing on NHS** *Salivix*<sup>®</sup> Pastilles may be prescribed as Artificial Saliva Pastilles

**SST** (Medac)

**Tablets**, sugar-free, citric acid, malic acid and other ingredients in a sorbitol base, net price 100-tab pack = £4.86

**Dose****Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts**

Allow 1 tablet to dissolve slowly in the mouth when required

**Dental prescribing on NHS** May be prescribed as Saliva Stimulating Tablets

**Xerotin**<sup>®</sup> (SpePharm)

**Oral spray**, sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral. Net price 100-mL unit = £6.86

**Dose****Symptomatic treatment of dry mouth**

Spray as required

**Dental prescribing on NHS** *Xerotin*<sup>®</sup> Oral Spray may be prescribed as Artificial Saliva Oral Spray

## 13.1 Management of skin conditions

- |   |  |
|---|--|
| <b>13.1.1 Vehicles</b>                            |  |
| <b>13.1.2 Suitable quantities for prescribing</b> |  |
| <b>13.1.3 Excipients and sensitisation</b>        |  |

When prescribing topical preparations for the treatment of skin conditions in children, the site of application, the condition being treated, and the child's (and carer's) preference for a particular vehicle all need to be taken into consideration.

**Neonates** Caution is required when prescribing topical preparations for neonates—their large body surface area in relation to body mass increases susceptibility to toxicity from systemic absorption of substances applied to the skin. Topical preparations containing potentially sensitising substances such as corticosteroids, aminoglycosides, iodine, and parasiticial drugs should be avoided. Preparations containing alcohol should be avoided because they can dehydrate the skin, cause pain if applied to raw areas, and the alcohol can cause necrosis.

In *preterm neonates*, the skin is more fragile and offers a poor barrier, especially in the first fortnight after birth. Preterm infants, especially if below 32 weeks corrected gestational age, may also require special measures to maintain skin hydration.

### 13.1.1 Vehicles

The vehicle in topical preparations for the skin affects the degree of hydration, has a mild anti-inflammatory effect, and aids the penetration of the active drug. Therefore, the vehicle, as well as the active drug, should be chosen on the basis of their suitability for the child's skin condition.

**Applications** are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

**Collodions** are painted on the skin and allowed to dry to leave a flexible film over the site of application.

**Creams** are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

**Gels** consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

**Lotions** have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

**Ointments** are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic* and *lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

**Pastes** are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

**Dusting powders** are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

**Dilution** The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of their preparation.

### 13.1.2 Suitable quantities for prescribing

#### Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of the body	Creams and Ointments	Lotions
Face	15–30 g	100 mL
Both hands	25–50 g	200 mL
Scalp	50–100 g	200 mL
Both arms or both legs	100–200 g	200 mL
Trunk	400 g	500 mL
Groins and genitalia	15–25 g	100 mL

The amounts shown above are usually suitable for children 12–18 years for twice daily application for 1 week; smaller quantities will be required for children under 12 years. These recommendations **do not apply** to corticosteroid preparations.

### 13.1.3 Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, then products containing the substance should be avoided (see also Anaphylaxis, p. 158). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance, p. 2.

Beeswax	Imidurea
Benzyl alcohol	Isopropyl palmitate
Butylated hydroxyanisole	<i>N</i> -(3-Chloroallyl)hexami-
Butylated hydroxytoluene	nium chloride (quater-
Cetostearyl alcohol	nium 15)
(including cetyl and	Polysorbates
stearyl alcohol)	Propylene glycol
Chlorocresol	Sodium metabisulfite
Edetic acid (EDTA)	Sorbic acid
Ethylendiamine	Wool fat and related sub-
Fragrances	stances including
Hydroxybenzoates (para-	lanolin <sup>1</sup>
bens)	

## 13.2 Emollient and barrier preparations

### 13.2.1 Emollients

### 13.2.2 Barrier preparations

**Borderline substances** The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated. See Appendix 2 for listing by clinical condition.

1. Purified versions of wool fat have reduced the problem

## 13.2.1 Emollients

## 13.2.1.1 Emollient bath and shower preparations

Emollients hydrate the skin, soften the skin, act as barrier to water and external irritants, and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2); they should be applied immediately after washing or bathing to maximise the effect of skin hydration. The choice of an appropriate emollient will depend on the severity of the condition, the child's (or carer's) preference, and the site of application. Emollient preparations contained within tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

## Fire hazard with paraffin-based emollients

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Children and their carers should be told to keep away from fire or flames and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

Preparations such as **aqueous cream** (section 13.2.1.1) and **emulsifying ointment** can be used as soap substitutes; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1.1) may also be helpful.

In the *neonate*, a preservative-free paraffin-based emollient hydrates the skin without affecting the normal skin flora; substances such as olive oil are also used. The development of blisters (epidermolysis bullosa) or ichthyosis may be alleviated by applying liquid and white soft paraffin ointment while awaiting dermatological investigation.

Preparations containing an antibacterial (section 13.10.1) should be avoided unless infection is present or is a frequent complication of the dry skin condition.

**Urea** is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis). It is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

## Non-proprietary emollient preparations

## Emulsifying Ointment, BP

**Ointment**, emulsifying wax 30%, white soft paraffin 50%, liquid paraffin 20%, net price 500 g = £2.12  
**Excipients** include cetostearyl alcohol

## Hydrous Ointment, BP

**Ointment**, (oily cream), dried magnesium sulfate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water, net price 500 g = £4.89

## Liquid and White Soft Paraffin Ointment, NPF

**Ointment**, liquid paraffin 50%, white soft paraffin 50%, net price 500 g = £2.21

## Paraffin, White Soft, BP

White petroleum jelly, net price 100 g = 51p

## Paraffin, Yellow Soft, BP

Yellow petroleum jelly, net price 100 g = 49p

## Proprietary emollient preparations

Aquamax<sup>®</sup> (Dermato Logical)

**Cream**, light liquid paraffin 8%, white soft paraffin 20%, phenoxyethanol 1%, net price 100 g = £1.89, 500 g = £3.99

**Excipients** include cetostearyl alcohol, polysorbate 60

Aquamol<sup>®</sup> (Thornton & Ross)

**Cream**, containing liquid paraffin, white soft paraffin, net price 50 g = £1.22, 500-g pump pack = £6.40

**Excipients** include cetostearyl alcohol, chlorocresol

Aveeno<sup>®</sup> (J&J)

**Cream**, colloidal oatmeal in emollient basis, net price 100 mL = £3.97, 300-mL pump pack = £6.80

**Excipients** include benzyl alcohol, cetyl alcohol, isopropyl palmitate

ACBS: For endogenous and exogenous eczema, xeroderma, and ichthyosis

**Lotion**, colloidal oatmeal in emollient basis, net price 500 mL = £6.66

**Excipients** include benzyl alcohol, cetyl alcohol, isopropyl palmitate, stearyl alcohol

ACBS: as for Aveeno<sup>®</sup> Cream

Cetaben<sup>®</sup> (Genus)

**Emollient cream**, white soft paraffin 13.2%, light liquid paraffin 10.5%, net price 50-g pump pack = £1.40, 150-g pump pack = £3.98, 500-g pump pack = £5.99, 1.05-kg pump pack = £11.62

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

Dermamist<sup>®</sup> (Alliance)

**Spray application**, white soft paraffin 10% in a basis containing liquid paraffin, fractionated coconut oil, net price 250-mL pressurised aerosol unit = £5.97

**Excipients** none as listed in section 13.1.3

**Note** Flammable

Diprobase<sup>®</sup> (Schering-Plough)

**Cream**, cetomacrogol 2.25%, cetostearyl alcohol 7.2%, liquid paraffin 6%, white soft paraffin 15%, water-miscible basis used for *Diprosone*<sup>®</sup> cream, net price 50 g = £1.28; 500-g pump pack = £6.32

**Excipients** include cetostearyl alcohol, chlorocresol

**Ointment**, liquid paraffin 5%, white soft paraffin 95%, basis used for *Diprosone*<sup>®</sup> ointment, net price 50 g = £1.28, 500 g = £5.99

**Excipients** none as listed in section 13.1.3

Doublebase<sup>®</sup> (Dermal)

**Gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500 g = £5.83

**Excipients** none as listed in section 13.1.3

**Dayleve Gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500-g pump pack = £6.29

**Excipients** none as listed in section 13.1.3

**E45<sup>®</sup>** (Reckitt Benckiser)

**Cream**, light liquid paraffin 12.6%, white soft paraffin 14.5%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in self-emulsifying monostearin, net price 50 g = £1.61, 125 g = £2.90, 350 g = £5.17, 500-g pump pack = £5.62

**Excipients** include cetyl alcohol, hydroxybenzoates (parabens)

**Lotion**, light liquid paraffin 4%, cetomacrogol, white soft paraffin 10%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in glyceryl monostearate, net price 200 mL = £2.40, 500-mL pump pack = £4.50

**Excipients** include isopropyl palmitate, hydroxybenzoates (parabens), benzyl alcohol

ACBS: for symptomatic relief of dry skin conditions, such as those associated with atopic eczema and contact dermatitis

**Emollin<sup>®</sup>** (C D Medical)

**Spray**, liquid paraffin 50%, white soft paraffin 50% in aerosol basis, net price 150 mL = £3.97, 240 mL = £6.35

**Excipients** none as listed in section 13.1.3

**Epaderm<sup>®</sup>** (Mölnlycke)

**Cream**, yellow soft paraffin 15%, liquid paraffin 10%, emulsifying wax 5%, net price 50-g pump pack = £1.70, 500-g pump pack = £6.95

**Excipients** include cetostearyl alcohol, chlorocresol

**Ointment**, emulsifying wax 30%, yellow soft paraffin 30%, liquid paraffin 40%, net price 125 g = £3.85, 500 g = £6.53, 1 kg = £12.02

**Excipients** include cetostearyl alcohol

**Hydromol<sup>®</sup>** (Alliance)

**Cream**, sodium pidolate 2.5%, liquid paraffin 13.8%, net price 50 g = £2.19, 100 g = £4.09, 500 g = £11.92

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Ointment**, yellow soft paraffin 30%, emulsifying wax 30%, liquid paraffin 40%, net price 125 g = £2.84, 500 g = £4.82, 1 kg = £8.96

**Excipients** include cetostearyl alcohol

**Lipobase<sup>®</sup>** (Astellas)

**Cream**, fatty cream basis used for *Locoid Lipocream<sup>®</sup>*, net price 50 g = £1.46

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions, also for use during treatment with topical corticosteroid and as diluent for *Locoid Lipocream<sup>®</sup>*

**Oilatum<sup>®</sup>** (Stiefel)

**Cream**, light liquid paraffin 6%, white soft paraffin 15%, net price 50 g = £1.63, 150 g = £2.46, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98

**Excipients** include benzyl alcohol, cetostearyl alcohol

**Oilatum<sup>®</sup> Junior Cream**, light liquid paraffin 6%, white soft paraffin 15%, net price 150 g = £3.38, 350-mL pump pack = £4.65, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98

**Excipients** include benzyl alcohol, cetostearyl alcohol

**QV<sup>®</sup>** (Sound Opinion)

**Cream**, glycerol 10%, light liquid paraffin 10%, white soft paraffin 5%, net price 100 g = £2.04, 500 g = £5.86, 1.05-kg pump pack = £11.94

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Intensive ointment**, light liquid paraffin 50.5%, white soft paraffin 20%, net price 450 g = £5.65

**Excipients** include cetostearyl alcohol

**Lotion**, white soft paraffin 5%, net price 250 mL = £3.14, 500-mL pump pack = £5.24

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Ultrabase<sup>®</sup>** (Derma UK)

**Cream**, water-miscible, containing liquid paraffin and white soft paraffin, net price 50 g = £1.40, 500-g pump pack = £4.80

**Excipients** include fragrance, hydroxybenzoates (parabens), disodium edetate, stearyl alcohol

**Unguentum M<sup>®</sup>** (Almirall)

**Cream**, containing saturated neutral oil, liquid paraffin, white soft paraffin, net price 50 g = £1.41, 100 g = £2.78, 200-mL pump pack = £5.50, 500 g = £8.48

**Excipients** include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

**ZeroAQ5<sup>®</sup>** (Thornton & Ross)

**Cream**, macrogol cetostearyl ether 1.8%, liquid paraffin 6%, white soft paraffin 15%, net price 100 g = £1.65, 500 g = £3.29

**Excipients** include cetostearyl alcohol, chlorocresol

**Zerobase<sup>®</sup>** (Thornton & Ross)

**Cream**, liquid paraffin 11%, net price 50 g = £1.04, 500-g pump pack = £5.26

**Excipients** include cetostearyl alcohol, chlorocresol

**Zerocream<sup>®</sup>** (Thornton & Ross)

**Cream**, liquid paraffin 12.6%, white soft paraffin 14.5%, net price 50 g = £1.17, 500-g pump pack = £4.08

**Excipients** include cetyl alcohol, hydroxybenzoates (parabens), lanolin anhydrous

**Zeroguent<sup>®</sup>** (Thornton & Ross)

**Cream**, light liquid paraffin 8%, white soft paraffin 4%, refined soya bean oil 5%, net price 100 g = £2.33, 500 g = £6.99

**Excipients** include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

### ▲ Preparations containing urea

**Aquadrate<sup>®</sup>** (Alliance)

**Cream**, urea 10%, net price 100 g = £4.37

**Excipients** none as listed in section 13.1.3

**Dose**

Apply thinly twice daily

**Balneum<sup>®</sup>** (Almiral)

**Cream**, urea 5%, ceramide 0.1%, net price 50-g pump pack = £2.85, 500-g pump pack = £9.97

**Excipients** include cetostearyl alcohol, polysorbates, propylene glycol

**Dose**

Apply twice daily

**Balneum<sup>®</sup> Plus Cream**, urea 5%, laurmacrogols 3%, net price 100 g = £3.29, 500-g pump pack = £14.99

**Excipients** include benzyl alcohol, polysorbates

**Dose**

Apply twice daily

**Calmurid<sup>®</sup>** (Galderma)

**Cream**, urea 10%, lactic acid 5%, net price 100 g = £9.27, 500-g pump pack = £35.70

**Excipients** none as listed in section 13.1.3

**Dose**

Apply a thick layer for 3–5 minutes, massage into area, and remove excess, usually twice daily. Use half-strength cream for 1 week if stinging occurs

**Note** Can be diluted with aqueous cream (life of diluted cream 14 days)

**Dermatonic<sup>®</sup> Once Heel Balm<sup>®</sup>** (Dermatonic)

**Cream**, urea 25%, net price 75 mL = £3.60, 200 mL = £8.50

**Excipients** include beeswax, lanolin

**Dose**

**Child 12–18 years** apply once daily to dry skin on soles of feet

**E45<sup>®</sup> Itch Relief Cream** (Reckitt Benckiser)

**Cream**, urea 5%, macrogol lauryl ether 3%, net price 50 g = £2.81, 100 g = £3.74, 500-g pump pack = £14.99

**Excipients** include benzyl alcohol, polysorbates

**Dose**

Apply twice daily

**Eucerin<sup>®</sup> Intensive** (Beiersdorf)

**Cream**, urea 10%, net price 100 mL = £7.59

**Excipients** include benzyl alcohol, isopropyl palmitate, wool fat

**Dose**

Apply thinly and rub into area twice daily

**Lotion**, urea 10%, net price 250 mL = £7.93

**Excipients** include benzyl alcohol, isopropyl palmitate

**Dose**

Apply sparingly and rub into area twice daily

**Flexitol<sup>®</sup>** (LaCorium)

**Heel balm**, urea 25%, net price 40 g = £2.75, 75 g = £3.80, 200 g = £9.40, 500 g = £14.75

**Excipients** include benzyl alcohol, cetostearyl alcohol, fragrance, lanolin

**Dose**

**Child 12–18 years** apply 1–2 times daily to dry skin on soles of feet and heels

**Hydromol<sup>®</sup> Intensive** (Alliance)

**Cream**, urea 10%, net price 30 g = £1.64, 100 g = £4.37

**Excipients** none as listed in section 13.1.3

**Dose**

Apply thinly twice daily

**Nutraplus<sup>®</sup>** (Galderma)

**Cream**, urea 10%, net price 100 g = £4.37

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose**

Apply 2–3 times daily

▲ **With antimicrobials****Dermol<sup>®</sup>** (Derma)

**Cream**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, isopropyl myristate 10%, liquid paraffin 10%, net price 100-g tube = £2.86, 500-g pump pack = £6.63

**Excipients** include cetostearyl alcohol

**Dose**

Apply to skin or use as soap substitute

**Dermol<sup>®</sup> 500 Lotion**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 500-mL pump pack = £6.04

**Excipients** include cetostearyl alcohol

**Dose**

Apply to skin or use as soap substitute

**Eczmol<sup>®</sup>** (Genus)

**Cream**, chlorhexidine gluconate 1% in emollient basis, net price 250 mL = £3.70

**Excipients** include cetostearyl alcohol

**Dose**

Apply to skin or use as soap substitute

13.2.1.1 **Emollient bath and shower preparations**

Emollient bath additives should be added to bath water; some can be applied to wet skin undiluted and rinsed off. Hydration can be improved by soaking in the bath for 10–20 minutes. In dry skin conditions soap should be avoided (see section 13.2.1 for soap substitutes).

The quantities of bath additives recommended for older children are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for younger children reflect this.

These preparations make skin and surfaces slippery—particular care is needed when bathing a child.

**Aqueous Cream, BP**

**Cream**, emulsifying ointment 30%, <sup>1</sup>phenoxyethanol 1% in freshly boiled and cooled purified water, net price 100 g = 90p, 500 g = £4.50

**Excipients** include cetostearyl alcohol

1. The BP permits use of alternative antimicrobials provided their identity and concentration are stated on the label

**Aquamax<sup>®</sup>** (Dermato Logical)

**Cream wash**, light liquid paraffin 8%, white soft paraffin 20%, phenoxyethanol 1%, net price 250 g = £2.99

**Excipients** include cetostearyl alcohol, polysorbate 60  
**Dose**

Apply to wet or dry skin and rinse

**Aveeno<sup>®</sup>** (J&J)

**Bath oil**, colloidal oatmeal, white oat fraction in emollient basis, net price 250 mL = £4.49

**Excipients** include beeswax, fragrance

ACBS: for endogenous and exogenous eczema, xeroderma, and ichthyosis

**Dose**

**Child 2–18 years** add 20–30 mL to bath water or apply to wet skin and rinse

**Balneum<sup>®</sup>** (Almiral)

**Balneum<sup>®</sup> bath oil**, soya oil 84.75%, net price 200 mL = £2.48, 500 mL = £5.38, 1 litre = £10.39

**Excipients** include butylated hydroxytoluene, propylene glycol, fragrance

**Dose**

**Neonate** add 5–15 mL to bath water; do not use undiluted

**Child 1 month–2 years** add 5–15 mL to bath water; do not use undiluted

**Child 2–18 years** add 20–60 mL to bath water; do not use undiluted

**Balneum Plus<sup>®</sup> bath oil**, soya oil 82.95%, mixed laurumacrogols 15%, net price 500 mL = £6.66

**Excipients** include butylated hydroxytoluene, propylene glycol, fragrance

**Dose**

**Neonate** add 5 mL to bath water or apply to wet skin and rinse

**Child 1 month–2 years** add 5 mL to bath water or apply to wet skin and rinse

**Child 2–18 years** add 10–20 mL to bath water or apply to wet skin and rinse

**Cetaben<sup>®</sup>** (Genus)

**Emollient bath additive**, light liquid paraffin 82.8%, net price 500 mL = £5.75

**Excipients** none as listed in section 13.1.3

**Dose**

**Neonate** add ½ capful to bath water or apply to wet skin and rinse

**Child 1 month–12 years** add ½–1 capful to bath water or apply to wet skin and rinse

**Child 12–18 years** add 1–2 capfuls to bath water or apply to wet skin and rinse

**Dermalo<sup>®</sup>** (Dermal)

**Bath emollient**, acetylated wool alcohols 5%, liquid paraffin 65%, net price 500 mL = £3.44

**Excipients** none as listed in section 13.1.3

**Dose**

**Neonate** add 5 mL to bath water or apply to wet skin and rinse

**Child 1 month–12 years** add 5–10 mL to bath water or apply to wet skin and rinse

**Child 12–18 years** add 15–20 mL to bath water or apply to wet skin and rinse

**Doublebase<sup>®</sup>** (Derma)

**Emollient bath additive**, liquid paraffin 65%, net price 500 mL = £5.45

**Excipients** include cetostearyl alcohol

**Dose**

**Neonate** add 5–10 mL to bath water

**Child 1 month–12 years** add 5–10 mL to bath water

**Child 12–18 years** add 15–20 mL to bath water

**Emollient shower gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 200 g = £5.21

**Excipients** none as listed in section 13.1.3

**Note** Also available as *Doublebase<sup>®</sup> Emollient Wash Gel*

**Dose**

Apply to wet or dry skin and rinse, or apply to dry skin after showering

**E45<sup>®</sup>** (Reckitt Benckiser)

**Emollient bath oil**, cetyl dimeticone 5%, liquid paraffin 91%, net price 250 mL = £3.19, 500 mL = £5.11

**Excipients** none as listed in section 13.1.3

ACBS: for endogenous and exogenous eczema, xeroderma, and ichthyosis

**Dose**

**Neonate** add 5 mL to bath water or apply to wet skin and rinse

**Child 1 month–12 years** add 5–10 mL to bath water or apply to wet skin and rinse

**Child 12–18 years** add 15 mL to bath water or apply to wet skin and rinse

**Emollient wash cream**, zinc oxide 5% in an emollient basis, net price 250-mL pump pack = £3.19

**Excipients** none as listed in section 13.1.3

ACBS: for endogenous and exogenous eczema, xeroderma, and ichthyosis

**Dose**

Use as a soap substitute

**Hydromol<sup>®</sup>** (Alliance)

**Bath and Shower Emollient**, isopropyl myristate

13%, light liquid paraffin 37.8%, net price 350 mL = £3.88, 500 mL = £4.42, 1 litre = £8.80

**Excipients** none as listed in section 13.1.3

**Dose**

**Neonate** add ½ capful to bath water or apply to wet skin and rinse

**Child 1 month–12 years** add ½–2 capfuls to bath water or apply to wet skin and rinse

**Child 12–18 years** add 1–3 capfuls to bath water or apply to wet skin and rinse

**LPL 63.4<sup>®</sup>** (Huxley)

**Emollient bath additive**, light liquid paraffin 63.4%, net price 500 mL = £3.10

**Excipients** include acetylated wool alcohols, isopropyl palmitate

**Dose**

**Neonate** add ½ capful to bath water or apply to wet skin and rinse

**Child 1 month–12 years** add ½–2 capfuls to bath water or apply to wet skin and rinse

**Child 12–18 years** add 1–3 capfuls to bath water or apply to wet skin and rinse

**Oilatum**<sup>®</sup> (Stiefel)

**Emollient bath additive** (emulsion), light liquid paraffin 63.4%, net price 250 mL = £2.75, 500 mL = £4.57

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate, fragrance

**Dose**

**Neonate** add ½ capful to bath water or apply to wet skin and rinse

**Child 1 month–12 years** add ½–2 capfuls to bath water or apply to wet skin and rinse

**Child 12–18 years** add 1–3 capfuls to bath water or apply to wet skin and rinse

**Junior bath additive**, light liquid paraffin 63.4%, net price 150 mL = £2.82, 250 mL = £3.25, 300 mL = £5.10, 600 mL = £5.89

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate

**Dose**

**Neonate** add ½ capful to bath water or apply to wet skin and rinse

**Child 1 month–12 years** add ½–2 capfuls to bath water or apply to wet skin and rinse

**Child 12–18 years** add 1–3 capfuls to bath water or apply to wet skin and rinse

**Shower emollient** (gel), light liquid paraffin 70%, net price (with fragrance or fragrance-free) 150 g = £5.15

**Excipients** none as listed in section 13.1.3

**Dose**

Apply to wet skin and rinse

**QV**<sup>®</sup> (Sound Opinion)

**Bath oil**, light liquid paraffin 85.13%, net price 200 mL = £2.20, 500 mL = £4.66

**Excipients** none as listed in section 13.1.3

**Dose**

**Neonate** add 5 mL to bath water or apply to wet skin and rinse

**Child 1 month–1 year** add 5 mL to bath water or apply to wet skin and rinse

**Child 1–18 years** add 10 mL to bath water or apply to wet skin and rinse

**Gentle wash**, glycerol 15%, net price 250 mL = £3.14, 500-mL pump pack = £5.24

**Excipients** include hydroxybenzoates (parabens)

**Dose**

Use as a soap substitute

**Zerolatum**<sup>®</sup> (Thornton & Ross)

**Emollient medicinal bath oil**, liquid paraffin 65%, net price 500 mL = £4.79

**Excipients** include acetylated wool alcohols

**Dose**

**Child 1 month–12 years** add 5–10 mL to bath water

**Child 12–18 years** add 15–20 mL to bath water

**Zeroneum**<sup>®</sup> (Thornton & Ross)

**Bath oil**, refined soya bean oil 83.35%, net price 500 mL = £4.48

**Excipients** include butylated hydroxytoluene, fragrance, propylene glycol

**Dose**

**Child 1 month–12 years** add 5 mL to bath water

**Child 12–18 years** add 20 mL to bath water

### With antimicrobials

**Dermol**<sup>®</sup> (Dermal)

**Dermol<sup>®</sup> 600 Bath Emollient**, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 600 mL = £7.55

**Excipients** include polysorbate 60

**Dose**

**Child 1 month–2 years** add 5–15 mL to bath water; do not use undiluted

**Child 2–18 years** add 15–30 mL to bath water; do not use undiluted

**Dermol<sup>®</sup> 200 Shower Emollient**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.55

**Excipients** include cetostearyl alcohol

**Dose**

Apply to skin or use as soap substitute

**Dermol<sup>®</sup> Wash Emulsion**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200-mL pump pack = £3.55

**Excipients** include cetostearyl alcohol

**Dose**

Apply to skin or use as soap substitute

**Emulsiderm**<sup>®</sup> (Dermal)

**Liquid emulsion**, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 300 mL (with 15-mL measure) = £3.85, 1 litre (with 30-mL measure) = £12.00

**Excipients** include polysorbate 60

**Dose**

**Child 1 month–2 years** add 5–10 mL to bath water or rub into dry skin until absorbed

**Child 2–18 years** add 10–30 mL to bath water or rub into dry skin until absorbed

**Oilatum<sup>®</sup> Plus** (Stiefel)

**Bath additive**, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 52.5%, net price 500 mL = £6.98

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate

**Dose**

**Child 6 months–1 year** add 1 mL to bath water; do not use undiluted

**Child 1–18 years** add 1–2 capfuls to bath water; do not use undiluted

**Zerolatum<sup>®</sup> Plus** (Thornton & Ross)

**Bath additive**, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 51.66%, net price 500 mL = £5.82

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate, polysorbate 60

**Dose**

**Child 6 months–1 year** add 1 mL to bath water; do not use undiluted

**Child 1–18 years** add 1–2 capfuls to bath water; do not use undiluted

### With tar

Section 13.5.2

### 13.2.2 Barrier preparations

Barrier preparations often contain water-repellent substances such as **dimeticone**, natural oils, and paraffins, to help protect the skin from abrasion and irritation; they are used to protect intact skin around stomas and pressure sores, and as a barrier against nappy rash. In neonates, barrier preparations which do not contain potentially sensitising excipients (section 13.1.3) are preferred. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations with zinc oxide or titanium salts are used to aid healing of uninfected, excoriated skin.

**Nappy rash (Dermatitis)** The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% (section 13.4) can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and water-proof pants may increase absorption of corticosteroids (for cautions, see section 13.4). If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream (section 13.10.2) can be used. Topical antibacterial preparations (section 13.10.1) can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

#### ■ Non-proprietary barrier preparations

##### Zinc and Castor Oil Ointment, BP

**Ointment**, zinc oxide 7.5%, castor oil 50%, arachis (peanut) oil 30.5%, white beeswax 10%, cetostearyl alcohol 2%, net price 500 g = £6.41

#### ■ Proprietary barrier preparations

##### Conotrane® (Astellas)

**Cream**, benzalkonium chloride 0.1%, dimeticone 22%, net price 100 g = 88p, 500 g = £3.51  
**Excipients** include cetostearyl alcohol, fragrance

##### Drapolene® (Omega Pharma)

**Cream**, benzalkonium chloride 0.01%, cetrimide 0.2% in a basis containing white soft paraffin, cetyl alcohol and wool fat, net price 100 g = £1.76, 200 g = £2.86, 350 g = £4.28  
**Excipients** include cetyl alcohol, chlorocresol, wool fat

##### Medicaid® (LPC)

**Cream**, cetrimide 0.5% in a basis containing light liquid paraffin, white soft paraffin, cetostearyl alcohol, glyceryl monostearate, net price 50 g = £1.69  
**Excipients** include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), wool fat

##### Metanium® (Thornton & Ross)

**Ointment**, titanium dioxide 20%, titanium peroxide 5%, titanium salicylate 3% in a basis containing dimeticone, light liquid paraffin, white soft paraffin, and benzoin tincture, net price 30 g = £2.06  
**Excipients** none as listed in section 13.1.3

##### Morhulin® (Actavis)

**Ointment**, cod-liver oil 11.4%, zinc oxide 38%, in a basis containing liquid paraffin and yellow soft paraffin, net price 50 g = £1.91

**Excipients** include wool fat derivative

##### Siopel® (Derma UK)

**Barrier cream**, dimeticone '1000' 10%, cetrimide 0.3%, arachis (peanut) oil, net price 50 g = £2.15

**Excipients** include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens)

##### Sprilon® (Ayrton Saunders)

**Spray application**, dimeticone 1.04%, zinc oxide 12.5%, in a basis containing wool alcohols, cetostearyl alcohol, dextran, white soft paraffin, liquid paraffin, propellants, net price 115-g pressurised aerosol unit = £8.90

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens), wool fat

**Note** Flammable

##### Sudocrem® (Forest)

**Cream**, benzyl alcohol 0.39%, benzyl benzoate 1.01%, benzyl cinnamate 0.15%, hydrous wool fat (hypoallergenic lanolin) 4%, zinc oxide 15.25%, net price 60 g = £1.45, 125 g = £2.15, 250 g = £3.67, 400 g = £5.25

**Excipients** include beeswax (synthetic), propylene glycol, butylated hydroxyanisole, fragrance

## 13.3 Topical antipruritics

*Pruritus* may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (such as eczema, psoriasis, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying cause should be treated. For the treatment of pruritus in palliative care, see *Prescribing in Palliative Care*, p. 19. Pruritus caused by cholestasis generally requires a bile acid sequestrant (section 1.9.2).

An **emollient** (section 13.2.1) may be of value where the pruritus is associated with dry skin. Preparations containing **calamine** or **crotamiton** are sometimes used but are of uncertain value.

A topical preparation containing **doxepin 5%** is licensed for the relief of pruritus in eczema in children over 12 years; it can cause drowsiness and there may be a risk of sensitisation.

Topical antihistamines and local anaesthetics (section 15.2) are only marginally effective and occasionally cause sensitisation. For *insect stings* and *insect bites*, a short course of a topical corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** (section 3.4.1) may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

In *pruritus ani*, the underlying cause such as faecal soiling, eczema, psoriasis, or helminth infection should be treated; for preparations used to relieve pruritus ani, see section 1.7.

**CALAMINE** 

**Contra-indications** avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)

**Indications and dose**

**Pruritus** but see notes above

**Calamine** (Non-proprietary) 

**Aqueous cream**, calamine 4%, zinc oxide 3%, liquid paraffin 20%, self-emulsifying glyceryl monostearate 5%, cetomacrogol emulsifying wax 5%, phenoxethanol 0.5%, freshly boiled and cooled purified water 62.5%, net price 100 mL = £1.19

**Lotion** (= cutaneous suspension), calamine 15%, zinc oxide 5%, glycerol 5%, bentonite 3%, sodium citrate 0.5%, liquefied phenol 0.5%, in freshly boiled and cooled purified water, net price 200 mL = 81p

**Oily lotion** (BP 1980), calamine 5%, arachis (peanut) oil 50%, oleic acid 0.5%, wool fat 1%, in calcium hydroxide solution, net price 200 mL = £1.57

**CROTAMITON**

**Cautions** avoid use near eyes, in buccal mucosa, or on broken or very inflamed skin; use on doctor's advice for children under 3 years

**Contra-indications** acute exudative dermatoses

**Pregnancy** manufacturer advises avoid, especially during the first trimester—no information available

**Breast-feeding** no information available; avoid application to nipple area

**Indications and dose**

**Pruritus (including pruritus after scabies—section 13.10.4)** see notes above

Apply 2–3 times daily (for pruritus after scabies in children under 3 years apply once daily only)

**Eurax**<sup>®</sup> (Novartis Consumer Health)

**Cream**, crotamiton 10%, net price 30 g = £2.38, 100 g = £4.15

**Excipients** include beeswax, fragrance, hydroxybenzoates (parabens), stearyl alcohol

**Lotion**, crotamiton 10%, net price 100 mL = £3.14

**Excipients** include cetyl alcohol, fragrance, propylene glycol, sorbic acid, stearyl alcohol

**DOXEPIN HYDROCHLORIDE**

**Cautions** susceptibility to angle-closure glaucoma; urinary retention; mania; cardiac arrhythmias; severe heart disease; avoid application to large areas; **interactions:** Appendix 1 (antidepressants, tricyclic)

**Skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** manufacturer advises caution in severe liver disease

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** drowsiness; local burning, stinging, irritation, tingling and rash; systemic side-effects such as antimuscarinic effects, headache, fever, dizziness, gastro-intestinal disturbances also reported

**Indications and dose****Pruritus in eczema**

**Child 12–18 years** apply thinly 3–4 times daily; usual max. 3 g per application; usual total max. 12 g daily; coverage should be less than 10% of body surface area

**Depressive illness** section 4.3.1

**Xepin**<sup>®</sup> (CHS) 

**Cream**, doxepin hydrochloride 5%, net price 30 g = £11.70. Label: 2, 10, patient information leaflet

**Excipients** include benzyl alcohol

**13.4 Topical corticosteroids**

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), particularly eczema (section 13.5.1), contact dermatitis, insect stings (p. 33), and eczema of scabies (section 13.10.4). Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. Carers of young children should be advised that treatment should **not** necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the child's condition.

In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% applied intermittently.

Topical corticosteroids are not recommended in the routine treatment of *urticaria*; treatment should only be initiated and supervised by a specialist. Topical corticosteroids may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in *pruritus* (where they will only benefit if inflammation is causing the itch) and are **not** recommended for *acne vulgaris*.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in *psoriasis* because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild topical corticosteroid for a short period (2–4 weeks) for *flexural* and *facial psoriasis*, and to use a more potent corticosteroid such as betamethasone or fluocinonide for *psoriasis of the scalp, palms, or soles* (see below for cautions in psoriasis).

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus*, *lichen simplex chronicus*, *hypertrophic lichen planus*, and *palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections (section 10.1.2.2) may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *keloid scars*, *hypertrophic lichen planus*, or *localised alopecia areata*.

**Choice** Water-miscible corticosteroid *creams* are suitable for moist or weeping lesions whereas *ointments* are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. *Lotions* may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene or hydrocolloid dressings* increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). Disposable nappies and tight fitting pants also increase the risk of side-effects by increasing absorption of the corticosteroid. The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

'Wet-wrap bandaging' (section 13.5.1) increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a health-care professional trained in the technique.

In the *BNF for Children*, topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent' (see p. 566); the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

Topical hydrocortisone is usually used in children under 1 year of age. Moderately potent and potent topical corticosteroids should be used with great care in children and for short periods (1–2 weeks) only. A very potent corticosteroid should be initiated under the supervision of a specialist.

Appropriate topical corticosteroids for specific conditions are:

- *insect bites and stings*—mild corticosteroid such as hydrocortisone 1% cream;
- *inflamed nappy rash causing discomfort* in infant over 1 month (section 13.2.2)—mild corticosteroid such as hydrocortisone 0.5% or 1% for up to 7 days (combined with antimicrobial if infected);
- *mild to moderate eczema, flexural and facial eczema or psoriasis*—mild corticosteroid such as hydrocortisone 1%;
- *severe eczema of the face and neck*—moderately potent corticosteroid for 3–5 days only, if not controlled by a mild corticosteroid;
- *severe eczema on the trunk and limbs*—moderately potent or potent corticosteroid for 1–2 weeks only, switching to a less potent preparation as the condition improves;

- *eczema affecting area with thickened skin* (e.g. soles of feet)—potent topical corticosteroid in combination with urea or salicylic acid (to increase penetration of corticosteroid).

**Perioral lesions** Hydrocortisone cream 1% can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone and miconazole cream or ointment is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis (see also p. 552). Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

**Cautions** Avoid prolonged use of a topical corticosteroid particularly on the face (and keep away from eyes). Use potent or very potent corticosteroids under specialist supervision; extreme caution is required in dermatoses of infancy including nappy rash—treatment should be limited to 5–7 days.

**Psoriasis** The use of potent or very potent corticosteroids in psoriasis can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity, see notes above.

**Contra-indications** Topical corticosteroids are contra-indicated in untreated bacterial, fungal, or viral skin lesions, in acne, and in perioral dermatitis; potent corticosteroids are contra-indicated in widespread plaque psoriasis (see notes above).

**Side-effects** *Mild* and *moderately potent* topical corticosteroids are associated with few side-effects but particular care is required when treating neonates and infants, and in the use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome (section 6.3.2), depending on the area of the body being treated and the duration of treatment. Absorption of corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from flexural sites (e.g. axillae, groin), and in infants where skin surface area is higher in relation to body-weight; absorption is increased by occlusion. Local side-effects include:

- spread and worsening of untreated infection;
- thinning of the skin which may be restored over a period after stopping treatment but the original structure may never return;
- irreversible striae atrophicae and telangiectasia;
- contact dermatitis;
- perioral dermatitis;
- acne, or worsening of acne or rosacea;
- mild depigmentation which may be reversible;
- hypertrichosis also reported.

Children and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

#### Safe Practice

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it **thinly** to affected areas **only**, no more frequently than **twice daily**, and to use the least potent formulation which is fully effective.

**Application** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient.

Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a *finger tip unit* (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5-mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers).

If a child is using topical corticosteroids of different potencies, the child and their carers should be told when to use each corticosteroid. The potency of each topical corticosteroid (see Topical Corticosteroid Preparation Potencies, p. 566) should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

**Compound preparations** The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

## Topical corticosteroid potencies

Potency of a topical corticosteroid preparation depends upon the formulation as well as the corticosteroid. Therefore, proprietary names are shown below.

### Mild

Hydrocortisone 0.1–2.5%, *Dioderm*, *Mildison*, *Synalar 1 in 10 Dilution*

**Mild with antimicrobials** *Canesten HC*, *Daktacort*, *Econacort*, *Fucidin H*, *Nystaform-HC*, *Terra-Cortril*, *Timodine*

**Mild with cromatim Eurax-Hydrocortisone**

### Moderate

*Betnovate-RD*, *Eumovate*, *Haelan*, *Modrasone*, *Synalar 1 in 4 Dilution*, *Ultralanum Plain*

**Moderate with antimicrobials** *Trimovate*

**Moderate with urea** *Alphaderm*, *Calmurid HC*

### Potent

Beclomethasone dipropionate 0.025%, Betamethasone valerate 0.1%, *Betacap*, *Betamousse*, *Betnovate*, *Cutivate*, *Diprosone*, *Elocon*, Hydrocortisone butyrate, *Locoid*, *Locoid Crelo*, *Metosyn*, Mometasone furoate 0.1%, *Nerisone*, *Synalar*

**Potent with antimicrobials** *Aureocort*, Betamethasone and clioquinol, *Betamethasone* and neomycin, *Fucibet*, *Lotiderm*, *Synalar C*, *Synalar N*

**Potent with salicylic acid** *Diprosalic*

### Very potent

*Dermovate*, *Nerisone Forte*

**Very potent with antimicrobials** Clobetasol propionate 0.05% with neomycin and nystatin

## HYDROCORTISONE

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Indications and dose

**Mild inflammatory skin disorders such as eczema (but for over-the-counter preparations, see below); nappy rash** (see also section 13.2.2)

Apply thinly 1–2 times daily

### Hydrocortisone (Non-proprietary) (PoM)

**Cream**, hydrocortisone 0.5%, net price, 15 g = £1.31, 30 g = £2.96; 1%, 15 g = £1.04, 30 g = £2.08, 50 g = £3.47; 2.5%, 15 g = £23.92. Label: 28, counselling, application, see p. 566. Potency: mild

**Dental prescribing on NHS** Hydrocortisone Cream 1% 15 g may be prescribed

**Ointment**, hydrocortisone 0.5%, net price 15 g = £3.77, 30 g = £4.90; 1%, 15 g = £1.10, 30 g = £2.20, 50 g = £3.67; 2.5%, 15 g = £23.72. Label: 28, counselling, application, see p. 566. Potency: mild  
When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied

### Over-the-counter hydrocortisone preparations

Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in children over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should **not** be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete's foot); over-the-counter hydrocortisone preparations containing clotrimazole or miconazole nitrate can be sold to the public for treatment of athlete's foot and candidal intertrigo

### Proprietary hydrocortisone preparations

#### Dioderm® (Derma) (PoM)

**Cream**, hydrocortisone 0.1%, net price 30 g = £2.39. Label: 28, counselling, application, see p. 566.

Potency: mild

**Excipients** include cetostearyl alcohol, propylene glycol

**Note** Although this contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP

#### Mildison® (Astellas) (PoM)

**Lipocream**, hydrocortisone 1%, net price 30 g = £1.71. Label: 28, counselling, application, see p. 566.

Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

### Compound preparations

Compound preparations with coal tar, see section 13.5.2

#### Alphaderm® (Alliance) (PoM)

**Cream**, hydrocortisone 1%, urea 10%, net price 30 g = £2.38; 100 g = £7.03. Label: 28, counselling, application, see p. 566. Potency: moderate  
**Excipients** none as listed in section 13.1.3

#### Calmurid HC® (Galderma) (PoM)

**Cream**, hydrocortisone 1%, urea 10%, lactic acid 5%, net price 100 g = £10.51. Label: 28, counselling, application, see p. 566. Potency: moderate  
**Excipients** none as listed in section 13.1.3

**Note** If stinging occurs, manufacturer advises dilute to half strength with aqueous cream for 1 week then transfer to undiluted preparation (but see section 13.1.1 for advice to avoid dilution where possible)

### With antimicrobials

See notes above for comment on compound preparations

#### Canesten HC® (Bayer Consumer Care) (PoM)

**Cream**, hydrocortisone 1%, clotrimazole 1%, net price 30 g = £2.42. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol

**Note** A 15-g tube is on sale to the public for the treatment of athlete's foot and fungal infection of skin folds with associated inflammation in children 10–18 years

#### Daktacort® (Janssen) (PoM)

**Cream**, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.49. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** include butylated hydroxyanisole, disodium edetate

**Cautions interactions:** Appendix 1 (antifungals, imidazole)

**Dental prescribing on NHS** May be prescribed as Miconazole and Hydrocortisone Cream for max. 7 days

**Note** A 15-g tube is on sale to the public for the treatment of athlete's foot and candidal intertrigo in children 10–18 years

**Ointment**, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.50. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** none as listed in section 13.1.3

**Cautions interactions:** Appendix 1 (antifungals, imidazole)

**Dental prescribing on NHS** May be prescribed as Miconazole and Hydrocortisone Ointment for max. 7 days

#### Fucidin H® (LEO) (PoM)

**Cream**, hydrocortisone acetate 1%, fusidic acid 2%, net price 30 g = £5.02, 60 g = £10.04. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** include butylated hydroxyanisole, cetyl alcohol, polysorbate 60, potassium sorbate

#### Nystaform-HC® (Typharm) (PoM)

**Cream**, hydrocortisone 0.5%, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Ointment**, hydrocortisone 1%, nystatin 100 000 units/g, chlorhexidine acetate 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** none as listed in section 13.1.3

#### Terra-Cortril® (Alliance) (PoM)

**Ointment**, hydrocortisone 1%, oxytetracycline (as hydrochloride) 3%, net price 30 g = £5.01. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** none as listed in section 13.1.3

**Contra-indications** children under 12 years

**Pregnancy** section 5.1.3

**Breast-feeding** section 5.1.3

#### Timodine® (Alliance) (PoM)

**Cream**, hydrocortisone 0.5%, nystatin 100 000 units/g, benzalkonium chloride solution 0.2%, dimeticone '350' 10%, net price 30 g = £2.86. Label: 28, counselling, application, see p. 566. Potency: mild

**Excipients** include butylated hydroxyanisole, cetostearyl alcohol, hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid

## HYDROCORTISONE BUTYRATE

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Indications and dose**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

**Child 1–18 years** apply thinly 1–2 times daily

#### Locoid® (Astellas) (PoM)

**Cream**, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Lipocream**, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £5.17. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Note** For bland cream basis see *Lipobase*®, section 13.2.1

**Ointment**, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** none as listed in section 13.1.3

**Scalp lotion**, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £6.83. Label: 15, 28, counselling, application, see p. 566. Potency: potent

**Excipients** none as listed in section 13.1.3

#### Locoid Crelo® (Astellas) (PoM)

**Lotion** (topical emulsion), hydrocortisone butyrate 0.1% in a water-miscible basis, net price 100 g (with applicator nozzle) = £5.91. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), propylene glycol

## ALCLOMETASONE DIPROPIONATE

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Inflammatory skin disorders such as eczemas**

Apply thinly 1–2 times daily

**Modrasone**<sup>®</sup> (TEVA UK) (PoM)

**Cream**, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 566. Potency: moderate  
**Excipients** include cetostearyl alcohol, chlorocresol, propylene glycol

**BECLOMETASONE DIPROPIONATE**  
(Beclometasone dipropionate)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 1 year

**Indications and dose**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly 1–2 times daily

**Beclometasone** (Non-proprietary) (PoM)

**Cream**, beclometasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 566. Potency: potent

**Ointment**, beclometasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 566. Potency: potent

**BETAMETHASONE ESTERS**

**Cautions** see notes above; use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** *Betacap*<sup>®</sup>, Betamethasone and clioquinol preparations, *Betnovate*<sup>®</sup>, and *Betnovate-RD*<sup>®</sup> not licensed for use in children under 1 year; *Bettamousse*<sup>®</sup> and *Fucibel*<sup>®</sup> *Lipid Cream* not licensed for use in children under 6 years; Betamethasone and neomycin preparations not licensed for use in children under 2 years; *Lotiderm*<sup>®</sup> not licensed for use in children under 12 years; *all other preparations* licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly 1–2 times daily

**Betamethasone Valerate** (Non-proprietary) (PoM)

**Cream**, betamethasone (as valerate) 0.1%, net price 30 g = £2.84, 100 g = £9.47. Label: 28, counselling, application, see p. 566. Potency: potent

**Ointment**, betamethasone (as valerate) 0.1%, net price 30 g = £2.24, 100 g = £7.47. Label: 28, counselling, application, see p. 566. Potency: potent

**Betacap**<sup>®</sup> (Dermal) (PoM)

**Scalp application**, betamethasone (as valerate) 0.1% in a water-miscible basis containing coconut oil derivative, net price 100 mL = £3.75. Label: 15, 28, counselling, application, see p. 566. Potency: potent  
**Excipients** none as listed in section 13.1.3

**Betnovate**<sup>®</sup> (GSK) (PoM)

**Cream**, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 566.

Potency: potent

**Excipients** include cetostearyl alcohol, chlorocresol

**Ointment**, betamethasone (as valerate) 0.1% in an anhydrous paraffin basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** none as listed in section 13.1.3

**Lotion**, betamethasone (as valerate) 0.1%, net price 100 mL = £4.58. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Scalp application**, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 100 mL = £4.99. Label: 15, 28, counselling, application, see p. 566.

Potency: potent

**Excipients** none as listed in section 13.1.3

**Betnovate-RD**<sup>®</sup> (GSK) (PoM)

**Cream**, betamethasone (as valerate) 0.025% in a water-miscible basis (1 in 4 dilution of *Betnovate*<sup>®</sup> cream), net price 100 g = £3.15. Label: 28, counselling, application, see p. 566. Potency: moderate

**Excipients** include cetostearyl alcohol, chlorocresol

**Ointment**, betamethasone (as valerate) 0.025% in an anhydrous paraffin basis (1 in 4 dilution of *Betnovate*<sup>®</sup> ointment), net price 100 g = £3.15. Label: 28, counselling, application, see p. 566.

Potency: moderate

**Excipients** none as listed in section 13.1.3

**Bettamousse**<sup>®</sup> (RPH) (PoM)

**Foam** (= scalp application), betamethasone valerate 0.12% (= betamethasone 0.1%), net price 100 g = £9.75. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include cetyl alcohol, polysorbate 60, propylene glycol, stearyl alcohol

**Note** Flammable

**Diprosone**<sup>®</sup> (MSD) (PoM)

**Cream**, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include cetostearyl alcohol, chlorocresol

**Ointment**, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** none as listed in section 13.1.3

**Lotion**, betamethasone (as dipropionate) 0.05%, net price 30 mL = £2.73, 100 mL = £7.80. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** none as listed in section 13.1.3

**With salicylic acid**

See notes above for comment on compound preparations  
 For prescribing information on salicylic acid, see p. 577

**Diprosalic**<sup>®</sup> (MSD) (PoM)

**Ointment**, betamethasone (as dipropionate) 0.05%, salicylic acid 3%, net price 30 g = £3.18, 100 g = £9.14. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** none as listed in section 13.1.3

**Dose**

Apply thinly 1–2 times daily

**Scalp application**, betamethasone (as dipropionate) 0.05%, salicylic acid 2%, in an alcoholic basis, net price 100 mL = £10.10. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include disodium edetate

**Dose**

Apply a few drops 1–2 times daily

▲ **With antimicrobials**

See notes above for comment on compound preparations

**Betamethasone and clioquinol** (Non-proprietary) (PoM)

**Cream**, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** may include cetostearyl alcohol, chlorocresol

**Note** Stains clothing

**Ointment**, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 566. Potency: potent

**Note** Stains clothing

**Betamethasone and neomycin** (Non-proprietary) (PoM)

**Cream**, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 566.

Potency: potent

**Excipients** may include cetostearyl alcohol, chlorocresol

**Ointment**, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 566. Potency: potent

**Fucibet**<sup>®</sup> (LEO) (PoM)

**Cream**, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.32, 60 g = £10.63.

Label: 28, counselling, application, see p. 566.

Potency: potent

**Excipients** include cetostearyl alcohol, chlorocresol

**Lipid cream**, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.62. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Lotriderm**<sup>®</sup> (TEVA UK) (PoM)

**Cream**, betamethasone dipropionate 0.064% (= betamethasone 0.05%), clotrimazole 1%, net price 30 g = £6.34. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include benzyl alcohol, cetostearyl alcohol, propylene glycol

**CLOBETASOL PROPIONATE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** *Dermovate*<sup>®</sup> not licensed for use in children under 1 year; Clobetasol with neomycin and nystatin preparations not licensed for use in children under 2 years

**Indications and dose**

**Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly 1–2 times daily for up to 4 weeks

**Dermovate**<sup>®</sup> (GSK) (PoM)

**Cream**, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 566. Potency: very potent

**Excipients** include beeswax (or beeswax substitute), cetostearyl alcohol, chlorocresol, propylene glycol

**Ointment**, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 566. Potency: very potent

**Excipients** include propylene glycol

**Scalp application**, clobetasol propionate 0.05%, in a thickened alcoholic basis, net price 30 mL = £3.07, 100 mL = £10.42. Label: 15, 28, counselling, application, see p. 566. Potency: very potent

**Excipients** none as listed in section 13.1.3

▲ **With antimicrobials**

See notes above for comment on compound preparations

**Clobetasol with neomycin and nystatin** (Non-proprietary) (PoM)

**Cream**, clobetasol propionate 0.05%, neomycin sulfate 0.5%, nystatin 100 000 units/g, net price 30 g = £64.00. Label: 28, counselling, application, see p. 566. Potency: very potent

**Ointment**, clobetasol propionate 0.05%, neomycin sulfate 0.5%, nystatin 100 000 units/g, in a paraffin basis, net price 30 g = £64.00. Label: 28, counselling, application, see p. 566. Potency: very potent

**CLOBETASONE BUTYRATE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Eczemas and dermatitis of all types; maintenance between courses of more potent corticosteroids**

Apply thinly 1–2 times daily

**<sup>1</sup>Eumovate**<sup>®</sup> (GSK) (PoM)

**Cream**, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 566. Potency: moderate

**Excipients** include beeswax substitute, cetostearyl alcohol, chlorocresol

**Ointment**, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 566. Potency: moderate

**Excipients** none as listed in section 13.1.3

▲ **With antimicrobials**

See notes above for comment on compound preparations

**Trimovate**<sup>®</sup> (GSK) (PoM)

**Cream**, clobetasone butyrate 0.05%, oxytetracycline 3% (as calcium salt), nystatin 100 000 units/g, net price 30 g = £3.29. Label: 28, counselling, application, see p. 566. Potency: moderate

**Excipients** include cetostearyl alcohol, chlorocresol, sodium metabisulfite

**Note** Stains clothing

1. Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in children over 12 years provided pack does not contain more than 15 g

**DIFLUCORTOLONE VALERATE****Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above**Licensed use** *Nerisone*<sup>®</sup> licensed for use in children (age range not specified by manufacturer); *Nerisone Forte*<sup>®</sup> not licensed for use in children under 4 years**Indications and dose****Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; high strength (0.3%), short-term treatment of severe exacerbations, psoriasis** see notes above

Apply thinly 1–2 times daily for up to 4 weeks (0.1% preparations) or 2 weeks (0.3% preparations), reducing strength as condition responds

**Nerisone**<sup>®</sup> (Meadow) **(PoM)****Cream**, diflucortolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 566. Potency: potent**Excipients** include disodium edetate, hydroxybenzoates (parabens), stearyl alcohol**Oily cream**, diflucortolone valerate 0.1%, net price 30 g = £2.56. **Side-effects** see notes above

**Licensed use** not licensed for use in children under 1 year

**Indications and dose**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly 1–2 times daily

**Metosyn<sup>®</sup>** (GP Pharma) (PoM)

**FAPG cream**, fluocinonide 0.05%, net price 25 g = £3.96, 100 g = £13.34. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include propylene glycol

**Ointment**, fluocinonide 0.05%, net price 25 g = £3.50, 100 g = £13.15. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include propylene glycol, wool fat

**FLUCORTOLONE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly 1–2 times daily

**Ultralanum Plain<sup>®</sup>** (Meadow) (PoM)

**Cream**, flucortolone caproate 0.25%, flucortolone pivalate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 566. Potency: moderate

**Excipients** include disodium edetate, fragrance, hydroxybenzoates (parabens), stearyl alcohol

**Ointment**, flucortolone 0.25%, flucortolone caproate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 566. Potency: moderate

**Excipients** include wool fat, fragrance

**FLUTICASONE PROPIONATE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 3 months

**Indications and dose**

**Inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly 1–2 times daily

**Cutivate<sup>®</sup>** (GSK) (PoM)

**Cream**, fluticasone propionate 0.05%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include cetostearyl alcohol, imidurea, propylene glycol

**Ointment**, fluticasone propionate 0.005%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include propylene glycol

**MOMETASONE FUROATE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 2 years

**Indications and dose**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly once daily (to scalp in case of lotion)

**Mometasone** (Non-proprietary) (PoM)

**Ointment**, mometasone furoate 0.1%, net price 30 g = £3.24, 100 g = £10.80. Label: 28, counselling, application, see p. 566. Potency: potent

**Elocor<sup>®</sup>** (MSD) (PoM)

**Cream**, mometasone furoate 0.1%, net price 30 g = £4.36, 100 g = £12.58. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include beeswax

**Ointment**, mometasone furoate 0.1%, net price 30 g = £4.32, 100 g = £12.44. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include beeswax, propylene glycol

**Scalp lotion**, mometasone furoate 0.1% in an aqueous isopropyl alcohol basis, net price 30 mL = £4.36. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include propylene glycol

**TRIAMCINOLONE ACETONIDE**

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Licensed use** *Aureocort<sup>®</sup>* not licensed for use in children under 8 years

**Indications and dose**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids, psoriasis** see notes above

Apply thinly 1–2 times daily

### With antimicrobials

See notes above for comment on compound preparations

#### Aureocort® (AMCo) (POM)

**Ointment**, triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3%, in an anhydrous greasy basis containing wool fat and white soft paraffin, net price 15 g = £3.51. Label: 28, counselling, application, see p. 566. Potency: potent

**Excipients** include wool fat

**Note** Stains clothing

## 13.5 Preparations for eczema and psoriasis

### 13.5.1 Preparations for eczema

### 13.5.2 Preparations for psoriasis

### 13.5.3 Drugs affecting the immune response

## 13.5.1 Preparations for eczema

The main types of eczema (dermatitis) in children are atopic, irritant and allergic contact; different types may co-exist. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification caused by scratching and rubbing. *Seborrhoeic dermatitis* (see below) is also common in infants.

Management of eczema involves the removal or treatment of contributory factors; known or suspected irritants and contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin (section 13.1.3); *BNF for Children* lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** (section 13.2.1) applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** (section 13.4) are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition, and the age of the child. Mild corticosteroids are generally used on the face and on flexures; the more potent corticosteroids are generally required for use on lichenified areas of eczema or for severe eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In children with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing **zinc** and **ichthammol**) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. Wet elasticated viscose stockinette is used for 'wet-wrap' bandaging over topical corticosteroids or emollients to cool the skin and relieve itching, but there is an increased risk of infection and excessive absorption of the corticosteroid; 'wet-wrap' bandaging should be used under specialist supervision.

For details of elasticated viscose stockinette tubular bandages and garments, and silk clothing, see BNF section A5.8.3

For the role of topical **pimecrolimus** and **tacrolimus** in atopic eczema, see section 13.5.3.

**Infection** Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema. A topical antibacterial (section 13.10.1) may be used for small areas of mild infection; treatment should be limited to a short course (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving moderate to severe, widespread, or recurrent infection requires the use of a systemic antibacterial (section 5.1, table 1) that is active against the infecting organism. Preparations that combine an anti-septic with an emollient application (section 13.2.1) and with a bath emollient (section 13.2.1.1) can also be used; antiseptic shampoos (section 13.9) can be used on the scalp.

*Intertriginous eczema* commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid combined with a suitable antimicrobial drug. For the treatment of nappy rash, see section 13.2.2.

Widespread *herpes simplex infection* may complicate atopic eczema (eczema herpeticum) and treatment under specialist supervision with a systemic antiviral drug (section 5.3.2.1) is indicated. Secondary bacterial infection often exacerbates eczema herpeticum.

The management of *seborrhoeic dermatitis* is described below.

### Management of other features of eczema

*Lichenification*, which results from repeated scratching, is treated initially with a potent corticosteroid. Bandages containing **ichthammol** (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** (section 13.5.2) and **ichthammol** can be useful in some cases of *chronic eczema*. *Discoid eczema*, with thickened plaques in chronic atopic eczema, is usually treated with a topical antiseptic preparation, a potent topical corticosteroid, and paste bandages containing zinc oxide and **ichthammol**.

A *non-sedating* antihistamine (section 3.4.1) may be of some value in relieving severe itching or urticaria associated with eczema. A *sedating* antihistamine (section 3.4.1) can be used at night if itching causes sleep disturbance, but a large dose may be needed and drowsiness may persist on the following day.

*Exudative ('weeping') eczema* requires a potent corticosteroid initially; infection may also be present and require specific treatment (see above). **Potassium permanganate** solution (1 in 10 000) can be used as a soak in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

*Severe refractory eczema* is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system (section 13.5.3).

**Seborrhoeic dermatitis** *Seborrhoeic dermatitis* (*seborrhoeic eczema*) is associated with species of the yeast *Malassezia*. *Infantile seborrhoeic dermatitis* affects

particularly the body folds, nappy area and scalp; it is treated with emollients and mild topical corticosteroids with suitable antimicrobials. Infantile seborrhoeic dermatitis affecting the scalp (*cradle cap*) is treated by hydrating the scalp using natural oils and the use of mild shampoo (section 13.9).

In older children, seborrhoeic dermatitis affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole and coal tar, section 13.9) and combinations of mild topical corticosteroids with suitable antimicrobials (section 13.4) are used to treat older children.

## ICHTHAMMOL

**Side-effects** skin irritation

**Licensed use** no information available

**Indications and dose**

**Chronic lichenified eczema**

**Child 1–18 years** apply 1–3 times daily

**Ichthammol Ointment, BP 1980**

**Ointment**, ichthammol 10%, yellow soft paraffin 45%, wool fat 45%

**Zinc and Ichthammol Cream, BP**

**Cream**, ichthammol 5%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

## Medicated bandages

Zinc paste bandages are used with **coal tar** or **ichthammol** in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with **calamine** in milder eczematous skin conditions.

For information on available medicated bandages and stockings, see BNF Appendix 5.

## 13.5.2 Preparations for psoriasis

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary. *Guttate psoriasis* is a distinctive form of psoriasis that characteristically occurs in children and young adults, often following a streptococcal throat infection or tonsillitis.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not occur until the drug has been taken for weeks or months.

**Emollients** (section 13.2.1), in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis. They are particularly useful in *inflammatory psoriasis* and in *chronic stable plaque psoriasis*.

For *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs preparations containing **coal tar** are moderately effective, but the smell is unacceptable to some children. **Vitamin D** and its analogues are effective and cosmetically acceptable alternatives to preparations containing coal tar or dithranol. **Dithranol** is

an effective topical antipsoriatic agent but it irritates and stains the skin and it should be used only under specialist supervision. Adverse effects of dithranol are minimised by using a 'short-contact technique' (see below) and by starting with low concentration preparations. **Tazarotene**, a topical retinoid for the treatment of mild to moderate plaque psoriasis, is not recommended for use in children under 18 years. These medications can irritate the skin particularly in the flexures and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

*Scalp psoriasis* is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient ointment, cream, or oil and usually combined with **salicylic acid** as a keratolytic.

Some preparations for psoriasis affecting the scalp combine salicylic acid with coal tar or **sulfur**. The preparation should be applied generously and left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. for itch), it can be used in the morning.

*Flexural psoriasis* can be managed with short-term use of a mild potency topical corticosteroid. **Calcitriol** or **tacalcitol** can be used in the longer term; **calcipotriol** is more likely to cause irritation in flexures and should be avoided. Low-strength tar preparations can also be used.

*Facial psoriasis* can be treated with short-term use of a mild topical corticosteroid; if this is ineffective, calcitriol, tacalcitol, or a low-strength tar preparation can be used.

**Calcipotriol** and **tacalcitol** are analogues of vitamin D that affect cell division and differentiation. **Calcitriol** is an active form of vitamin D. Vitamin D and its analogues are used as first-line treatment for plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

**Coal tar** has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Contact of coal tar products with normal skin is not normally harmful and preparations containing coal tar can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. Leave-on preparations that remain in contact with the skin, such as creams or ointments, containing up to 6% coal tar may be used on children 1 month to 2 years; leave-on preparations containing coal tar 10% may be used on children over 2 years with more severe psoriasis. Tar baths and tar shampoos (see section 13.9) may also be helpful.

**Dithranol** is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. It should be applied to chronic extensor plaques only, carefully avoiding normal skin. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. Proprietary preparations are more suitable for home use; they are usually washed off after 20–30 minutes ('short contact' technique). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable. When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards.

A topical **corticosteroid** (section 13.4) is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis e.g. erythrodermic psoriasis or generalised pustular psoriasis on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid. Very potent topical corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

**Phototherapy** Phototherapy is available in specialist centres under the supervision of a dermatologist. Narrow band ultraviolet B (UVB) radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*. It can be considered for children with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis. The use of phototherapy and photochemotherapy in children is limited by concerns over carcinogenicity and premature ageing.

**Photochemotherapy** combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including the *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

**Systemic treatment** Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (section 13.5.3).

**Acitretin**, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication of acitretin is severe psoriasis resistant to other forms of therapy. It is also used in disorders of keratinisation such as severe *Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases; adverse effects are a limiting factor. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. Continuous treatment for longer than 6 months is not usually necessary in psoriasis. However, some patients, particularly those with severe ichthyosis, may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly. Topical preparations containing keratolytics should normally be stopped before administration of acitretin. Liberal use of emollients should be encouraged and topical corticosteroids can be continued if necessary.

Acitretin is teratogenic; in females of child-bearing age, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

## Topical preparations for psoriasis

### Vitamin D and analogues

**Calcipotriol**, **calcitriol**, and **tacalcitol** are used for the management of *plaque psoriasis*. They should be avoided by those with calcium metabolism disorders, and used with caution in *generalised pustular or erythrodermic exfoliative psoriasis* (enhanced risk of hypercalcaemia). Local skin reactions (itching, erythema, burning, paraesthesia, dermatitis) are common. Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas. Aggravation of psoriasis has also been reported.

### CALCIPOTRIOL

**Cautions** see notes above; avoid use on face; avoid excessive exposure to sunlight and sunlamps

**Contra-indications** see notes above

**Hepatic impairment** manufacturers advise avoid in severe impairment

**Renal impairment** manufacturers advise avoid in severe impairment

**Pregnancy** manufacturers advise avoid unless essential

**Breast-feeding** no information available

**Side-effects** see notes above; also photosensitivity, dry skin; rarely facial or perioral dermatitis

**Licensed use** Calcipotriol ointment and scalp solution, and *Dovobet*<sup>®</sup> not licensed for use in children

**Indications and dose****Plaque psoriasis**

**Child 6–18 years** apply ointment twice daily; 6–12 years max. 50 g weekly, over 12 years max. 75 g weekly (less with scalp solution, see below)

**Note** Patient information leaflet for *Dovonex*<sup>®</sup> ointment advises liberal application (but note max. recommended weekly dose, above)

**Scalp psoriasis (specialist use only)**

**Child 6–12 years** apply scalp solution twice daily; max. 30 mL weekly (less when used with ointment, see below)

**Child 12–18 years** apply scalp solution twice daily; max. 45 mL weekly (less when used with ointment, see below)

**Note** When preparations used together max. total calcipotriol 2.5 mg in any one week for child 6–12 years (e.g. scalp solution 20 mL with ointment 30 g); max. 3.75 mg in any one week for child 12–18 years (e.g. scalp solution 30 mL with ointment 45 g)

**Calcipotriol** (Non-proprietary) (PoM)

**Ointment**, calcipotriol 50 micrograms/g, net price 120 g = £24.04

**Scalp solution**, calcipotriol 50 micrograms/mL, net price 60 mL = £42.74, 120 mL = £85.48

**Dovonex**<sup>®</sup> (LEO) (PoM)

**Ointment**, calcipotriol 50 micrograms/g, net price 30 g = £5.78

**Excipients** include disodium edetate, propylene glycol

**With betamethasone**

For prescribing information, and for comment on the limited role of corticosteroids in psoriasis, see section 13.4.

**Dovobet**<sup>®</sup> (LEO) (PoM)

**Ointment**, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 30 g = £16.54. Label: 28

**Excipients** include butylated hydroxytoluene

**Dose****Stable plaque psoriasis (specialist use only)**

**Child 12–18 years** apply once daily to max. 30% of body surface for up to 4 weeks; max. 75 g weekly; if necessary, treatment should be continued beyond 4 weeks, or repeated, only on the advice of a specialist

**Note** When different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week for child 12–18 years

**Gel**, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 30 g = £16.54, 60 g = £33.08, 2 × 60 g = £61.43. Label: 28

**Excipients** include butylated hydroxytoluene

**Dose****Scalp psoriasis (specialist use only)**

**Child 12–18 years** apply 1–4 g to scalp once daily, shampoo off after leaving on scalp overnight or during the day; usual duration of therapy 4 weeks; if necessary, treatment should be continued beyond 4 weeks, or repeated, only on the advice of a specialist

**Mild to moderate plaque psoriasis (specialist use only)**

**Child 12–18 years** apply once daily to max. 30% of body surface for up to 4 weeks; max. 75 g weekly; if necessary, treatment should be continued beyond 4 weeks, or repeated, only on the advice of a specialist

**Note** When different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week for child 12–18 years

**CALCITRIOL**

(1,25-Dihydroxycholecalciferol)

**Cautions** see notes above

**Contra-indications** see notes above; do not apply under occlusion

**Hepatic impairment** manufacturer advises avoid—no information available

**Renal impairment** manufacturer advises avoid—no information available

**Pregnancy** manufacturer advises use in restricted amounts only if clearly necessary and to monitor urine- and serum-calcium concentration

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above

**Indications and dose****Mild to moderate plaque psoriasis**

**Child 12–18 years** apply twice daily; not more than 35% of body surface to be treated daily, max. 30 g daily

**Silkis**<sup>®</sup> (Galderma) (PoM)

**Ointment**, calcitriol 3 micrograms/g, net price 100 g = £16.34

**Excipients** none as listed in section 13.1.3

**TACALCITOL**

**Cautions** see notes above; avoid eyes; monitor serum-calcium concentration if risk of hypercalcaemia; if used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime

**Contra-indications** see notes above

**Renal impairment** monitor serum-calcium concentration

**Pregnancy** manufacturer advises avoid unless no safer alternative—no information available

**Breast-feeding** manufacturer advises avoid application to breast area; no information available on presence in milk

**Side-effects** see notes above

**Indications and dose****Plaque psoriasis**

**Child 12–18 years** apply once daily preferably at bedtime; max. 10 g ointment or 10 mL lotion daily

**Note** When lotion and ointment used together, max. total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

**Curatoderm**<sup>®</sup> (Almiral) (PoM)

**Lotion**, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 mL = £12.73

**Excipients** include disodium edetate, propylene glycol

**Ointment**, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 g = £13.40, 60 g = £23.14, 100 g = £30.86

**Excipients** none as listed in section 13.1.3

**Tars****TARS**

**Cautions** application to face and skin flexures; use suitable chemical protection gloves for extemporaneous preparation

**Contra-indications** not for use in sore, acute, or pustular psoriasis or in presence of infection; avoid

eyes, mucosa, genital or rectal areas; broken or inflamed skin

**Side-effects** skin irritation and acne-like eruptions, photosensitivity; stains skin, hair, and fabric

#### Indications and dose

##### Psoriasis and occasionally chronic atopic eczema

Apply 1–3 times daily starting with low-strength preparations; proprietary preparations, see individual entries below

**Note** For shampoo preparations see section 13.9

#### Non-proprietary preparations

May be difficult to obtain. Patients may find newer proprietary preparations more acceptable

##### Coal Tar Paste, BP

**Paste**, strong coal tar solution 7.5%, in compound zinc paste

##### Zinc and Coal Tar Paste, BP

**Paste**, zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%

**Excipients** include cetostearyl alcohol

#### Proprietary preparations

##### Carbo-Dome® (Sandoz)

**Cream**, coal tar solution 10%, in a water-miscible basis, net price 30 g = £4.77, 100 g = £16.38

**Excipients** include beeswax, hydroxybenzoates (parabens)

##### Dose

##### Psoriasis

Apply to skin 2–3 times daily; product can be diluted with a few drops of freshly boiled and cooled water before applying

##### Cocois® (RPH)

**Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40 g (with applicator nozzle) = £6.22, 100 g = £11.69

**Excipients** include cetostearyl alcohol

##### Dose

**Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff**

**Child 6–12 years** medical supervision required

**Child 12–18 years** apply to scalp once weekly as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour

##### Exorex® (Forest)

**Lotion**, coal tar solution 5% in an emollient basis, net price 100 mL = £8.11, 250 mL = £16.24

**Excipients** include hydroxybenzoates (parabens)

##### Dose

##### Psoriasis

Apply to skin or scalp 2–3 times daily; product can be diluted with a few drops of water before applying

##### Psoriderm® (Dermal)

**Cream**, coal tar 6%, lecithin 0.4%, net price 225 mL = £9.42

**Excipients** include isopropyl palmitate, propylene glycol

##### Dose

##### Psoriasis

Apply to skin or scalp 1–2 times daily

**Scalp lotion**—section 13.9

##### Sebco® (Derma UK)

**Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40 g = £4.54, 100 g = £8.52

**Excipients** include cetostearyl alcohol

##### Dose

**Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff**

**Child 6–12 years** medical supervision required

**Child 12–18 years** apply to scalp as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour

#### Bath preparations

##### Coal Tar Solution, BP

**Solution**, coal tar 20%, polysorbate '80' 5%, in alcohol (96%), net price 500 mL = £11.31. Label: 15

**Excipients** include polysorbates

##### Dose

Use 100 mL in an adult-size bath, and proportionally less for a child's bath

**Note** Strong Coal Tar Solution BP contains coal tar 40%

##### Polytar Emollient® (Stiefel)

**Bath additive**, coal tar solution 2.5%, arachis (peanut) oil extract of coal tar 7.5%, tar 7.5%, cade oil 7.5%, light liquid paraffin 35%, net price 500 mL = £5.78

**Excipients** include isopropyl palmitate

##### Dose

**Psoriasis, eczema, atopic and pruritic dermatoses**

Use 2–4 capfuls (15–30 mL) in adult-size bath and proportionally less for a child's bath; soak for 20 minutes

##### Psoriderm® (Dermal)

**Bath emulsion**, coal tar 40%, net price 200 mL = £2.74

**Excipients** include polysorbate 20

##### Dose

##### Psoriasis

Use 30 mL in adult-size bath, and proportionally less for a child's bath; soak for 5 minutes

## Dithranol

### DITHRANOL (Anthralin)

**Cautions** avoid use near eyes and sensitive areas of skin; see also notes above

**Contra-indications** hypersensitivity; acute and pustular psoriasis

**Pregnancy** no adverse effects reported

**Breast-feeding** no adverse effects reported

**Side-effects** local burning sensation and irritation; stains skin, hair, and fabrics

**Licensed use** *Dithrocream*® and *Psorin*® licensed for use in children (age range not specified by manufacturer); *Micanol*® licensed for use in children, but not recommended for infants or young children (age range not specified by manufacturer)

#### Indications and dose

##### Subacute and chronic psoriasis

See notes above and under preparations

**Note** Some of these dithranol preparations also contain coal tar or salicylic acid—for prescribing information see under Tars or under Salicylic Acid

**Non-proprietary preparations****1 Dithranol Ointment, BP** (PoM)

**Ointment**, dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required.  
Label: 28

**Dithranol Paste, BP**

**Paste**, dithranol in zinc and salicylic acid (Lassar's) paste. Usual strengths 0.1–1% of dithranol. Label: 28

**Proprietary preparations****Dithrocream**® (Dermal)

**Cream**, dithranol 0.1%, net price 50 g = £3.77; 0.25%, 50 g = £4.04; 0.5%, 50 g = £4.66; 1%, 50 g = £5.42; (PoM) 2%, 50 g = £6.79. Label: 28

**Excipients** include cetostearyl alcohol, chlorocresol  
**Dose**

For application to skin or scalp; 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for max. 1 hour

**Micano**® (GP Pharma)

**Cream**, dithranol 1% in a lipid-stabilised basis, net price 50 g = £16.18; (PoM) 3%, 50 g = £20.15. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose**

For application to skin or scalp, apply 1% cream for up to 30 minutes once daily, if necessary 3% cream can be used under medical supervision

**Note** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used *after* the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off

**Psorin**® (LPC)

**Ointment**, dithranol 0.11%, coal tar 1%, salicylic acid 1.6%, net price 50 g = £9.22, 100 g = £18.44. Label: 28

**Excipients** include beeswax, wool fat

**Dose**

For application to skin up to twice daily

**Scalp gel**, dithranol 0.25%, salicylic acid 1.6% in gel basis containing methyl salicylate, net price 50 g = £7.03. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose**

For application to scalp, initially apply on alternate days for 10–20 minutes; may be increased to daily application for max. 1 hour and then wash off

**Salicylic acid****SALICYLIC ACID**

For coal tar preparations containing salicylic acid, see under Tars p. 575; for dithranol preparations containing salicylic acid see under Dithranol, above

**Cautions** see notes above; avoid broken or inflamed skin

**Salicylate toxicity** Salicylate toxicity may occur particularly if applied on large areas of skin or on neonatal skin

**Side-effects** sensitivity, excessive drying, irritation, systemic effects after widespread use (see under Cautions)

1. (PoM) if dithranol content more than 1%, otherwise may be sold to the public

**Indications and dose**

**Hyperkeratotic skin disorders** see under preparation

**Warts and calluses** section 13.7

**Scalp conditions** section 13.9

**Fungal nail infections** section 13.10.2

**Zinc and Salicylic Acid Paste, BP**

**Paste**, (Lassar's Paste), zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%  
Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Dose**

**Child 1 month–18 years** apply twice daily

**Oral retinoids for psoriasis****ACITRETIN**

**Note** Acitretin is a metabolite of etretinate

**Cautions** in children use only in exceptional circumstances (premature epiphyseal closure reported); avoid concomitant use of keratolytics; do not donate blood during and for 2 years after stopping therapy (teratogenic risk); check liver function at start, at least every 4 weeks for first 2 months and then every 3 months; monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months; diabetes (can alter glucose tolerance—initial frequent blood glucose checks); monitor growth parameters and bone development; investigate atypical musculoskeletal symptoms; avoid excessive exposure to sunlight and unsupervised use of sunlamps; **interactions:** Appendix 1 (retinoids)

**Pregnancy prevention** In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. They should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Each prescription for acitretin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription. Females of child-bearing age should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should be advised to avoid alcohol during treatment and for 2 months after stopping treatment

**Contra-indications** hyperlipidaemia

**Hepatic impairment** avoid in severe impairment—risk of further impairment

**Renal impairment** avoid in severe impairment; increased risk of toxicity

**Pregnancy** avoid—teratogenic; effective contraception must be used—see Cautions above

**Breast-feeding** avoid

**Side-effects** abdominal pain, diarrhoea, nausea, vomiting, dryness and inflammation of mucous membranes, peripheral oedema, reversible increase in serum-cholesterol and serum-triglyceride concentrations (with high doses), headache, arthralgia, myalgia, dryness of conjunctiva (causing conjunctiv-

itis and decreased tolerance to contact lenses), alopecia (reversible on withdrawal), abnormal hair texture, skin exfoliation, pruritus, epidermal fragility, sticky skin, dermatitis, erythema, brittle nails, paronychia; *less commonly* hepatitis, dizziness, visual disturbances, photosensitivity; *rarely* peripheral neuropathy; *very rarely* benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, or visual disturbances occur), bone pain, exostosis (skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate, and premature epiphyseal closure in children, see Cautions above), night blindness, ulcerative keratitis; *also reported* taste disturbance, rectal haemorrhage, flushing, malaise, drowsiness, granulomatous lesions, impaired hearing, tinnitus, initial worsening of psoriasis, dry skin, sweating

#### Indications and dose

**Harlequin ichthyosis** (under expert supervision only)

- By mouth

**Neonate** 500 micrograms/kg once daily with food or milk (occasionally up to 1 mg/kg daily) with careful monitoring of musculoskeletal development

**Severe extensive psoriasis resistant to other forms of therapy, palmoplantar pustular psoriasis, severe congenital ichthyosis, severe Darier's disease (keratosis follicularis)** (all under expert supervision only)

- By mouth

**Child 1 month–12 years** 500 micrograms/kg once daily with food or milk (occasionally up to 1 mg/kg daily) to max. 35 mg daily with careful monitoring of musculoskeletal development (see also p. 574)

**Child 12–18 years** initially 25–30 mg daily (Darier's disease 10 mg daily) for 2–4 weeks, then adjusted according to response, usual range 25–50 mg daily; up to 75 mg daily for short periods in psoriasis (see also p. 574)

**Neotigason<sup>®</sup>** (Actavis) (PoM)

**Capsules**, acitretin 10 mg (brown/white), net price 60-cap pack = £17.30; 25 mg (brown/yellow), 60-cap pack = £43.00. Label: 10, patient information leaflet, 11, 21

## 13.5.3 Drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis.

**Pimecrolimus** by topical application is licensed for *mild to moderate atopic eczema*. **Tacrolimus** is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatment unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema.

#### NICE guidance

#### Tacrolimus and pimecrolimus for atopic eczema (August 2004)

Topical pimecrolimus and tacrolimus are options for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years and topical tacrolimus is recommended for moderate to severe atopic eczema in children over 2 years. Pimecrolimus and tacrolimus should be used within their licensed indications.

[www.nice.org.uk/TA82](http://www.nice.org.uk/TA82)

The *Scottish Medicines Consortium* (p. 3) has advised (March 2010) that tacrolimus ointment (*Protopic<sup>®</sup>*) is accepted for restricted use within NHS Scotland for the prevention of flares in children aged over 2 years with moderate to severe atopic eczema in accordance with the licensed indication; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

For the role of topical corticosteroids in eczema, see section 13.5.1, and for comment on their limited role in psoriasis, see section 13.4. A systemic corticosteroid (section 6.3.2) such as prednisolone may be used in *severe refractory eczema*.

Systemic drugs acting on the immune system are generally used by **specialists** in a hospital setting.

**Ciclosporin** by mouth can be used for *severe psoriasis* and for *severe eczema*. **Azathioprine** (section 8.2.1) or **mycophenolate mofetil** (section 8.2.1) are also used for severe refractory eczema in children.

**Methotrexate** can be used for *severe resistant psoriasis*; the dose is given **once weekly** and adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid (section 9.1.2) should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid can be given at a dose of 5 mg once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

**Etanercept** (a cytokine modulator) is licensed in children over 6 years of age for the treatment of *severe plaque psoriasis* that is inadequately controlled by other systemic treatments and photochemotherapy, or when these other treatments cannot be used because of intolerance or contra-indications.

## CYCLOSPORIN

(Cyclosporin)

#### Cautions section 8.2.2

**Additional cautions in atopic dermatitis and psoriasis** *Contra-indicated* in abnormal renal function, uncontrolled hypertension (see also below), infections not under control, and malignancy (see also below).

Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting. During treatment, monitor serum creatinine every 2 weeks for first 3 months then every month; reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within one month. Discontinue if hypertension develops that cannot be controlled by dose reduction or antihypertensive therapy.

Avoid excessive exposure to sunlight and avoid use of UVB or PUVA. *In atopic dermatitis*, also allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe); *Staphylococcus aureus* skin infections not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative—see also interactions: Appendix 1 (ciclosporin)); investigate lymphadenopathy that persists despite improvement in atopic dermatitis. *In psoriasis*, also exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops

**Hepatic impairment** section 8.2.2

**Renal impairment** see Cautions above

**Pregnancy** section 8.2.2

**Breast-feeding** section 8.2.2

**Side-effects** section 8.2.2

**Licensed use** not licensed for use in children under 16 years for atopic eczema (dermatitis) or psoriasis

#### Indications and dose

**Short-term treatment (usually max. 8 weeks but may be used for longer under specialist supervision) of severe atopic dermatitis where conventional therapy ineffective or inappropriate**

- By mouth, administered in accordance with expert advice

**Child 1 month–18 years** initially 1.25 mg/kg twice daily, if good initial response not achieved within 2 weeks, increase rapidly to max. 2.5 mg/kg twice daily; initial dose of 2.5 mg/kg twice daily if very severe

**Important** For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

**Severe psoriasis where conventional therapy ineffective or inappropriate**

- By mouth, administered in accordance with expert advice

**Child 1 month–18 years** initially 1.25 mg/kg twice daily, increased gradually to max. 2.5 mg/kg twice daily if no improvement within 1 month; initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

**Important** For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

**Refractory ulcerative colitis** section 1.5.3

**Transplantation and graft-versus-host disease** section 8.2.2

#### Preparations

Section 8.2.2

## METHOTREXATE

**Cautions** see section 8.1.3; also photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported)

**Contra-indications** section 8.1.3

**Hepatic impairment** avoid—dose-related toxicity

**Renal impairment** section 8.1.3

**Pregnancy** section 8.1.3

**Breast-feeding** section 8.1.3

**Side-effects** section 8.1.3

**Licensed use** not licensed for use in children with psoriasis

#### Indications and dose

**Severe uncontrolled psoriasis unresponsive to conventional therapy (specialist use only)**

- By mouth

**Child 2–18 years** initially 200 micrograms/kg (max. 10 mg) once **weekly** increased according to response to 400 micrograms/kg (max. 25 mg) once **weekly**; stop treatment if inadequate response after 3 months at the optimum dose

#### Safe Practice

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose and frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**Malignant disease** section 8.1.3

**Rheumatoid arthritis** section 10.1.3

**Severe Crohn's disease** section 1.5.3

#### Preparations

Section 10.1.3

## PIMECROLIMUS

**Cautions** UV light (avoid excessive exposure to sunlight and sunlamps), avoid other topical treatments except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation)

**Contra-indications** contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions

**Side-effects** burning sensation, pruritus, erythema, skin infections (including folliculitis and *less commonly* impetigo, herpes simplex and zoster, molluscum contagiosum); *rarely* papilloma, skin discoloration, local reactions including pain, paraesthesia, peeling, dryness, oedema, and worsening of eczema; skin malignancy reported

#### Indications and dose

**Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used; see also notes above**

**Child 2–18 years** apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

Elidel® (Meda) (POM)

Cream, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 11, 28

**Excipients** include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

## TACROLIMUS

**Cautions** UV light (avoid excessive exposure to sun-light and sunlamps); alcohol consumption (risk of facial flushing and skin irritation)

**Contra-indications** infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions; application under occlusion; avoid contact with eyes and mucous membranes

**Pregnancy** manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration

**Breast-feeding** manufacturer advises avoid—present in milk following systemic administration

**Side-effects** application-site reactions including rash, irritation, pain, and paraesthesia; herpes simplex infection, Kaposi's varicelliform eruption; application-site infections; *less commonly* acne; *also reported* rosacea, malignancies (including skin malignancy, cutaneous lymphoma, and other types of lymphomas)

### Indications and dose

**Short-term treatment of moderate to severe atopic eczema (including flares) either unresponsive to, or in children intolerant of conventional therapy; see also notes above**

**Child 2–16 years** initially apply 0.03% ointment thinly twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks) then reduce to once daily until lesion clears

**Child 16–18 years** initially apply 0.1% ointment thinly twice daily until lesion clears (consider other treatment if eczema worsens or if no improvement after 2 weeks); reduce to once daily or switch to 0.03% ointment if clinical condition allows

**Prevention of flares in children with moderate to severe atopic eczema and 4 or more flares a year, who have responded to initial treatment with topical tacrolimus**

**Child 2–16 years** apply 0.03% ointment thinly twice weekly (with an interval of 2–3 days between applications); use short-term treatment regimen during an acute flare; interrupt preventative therapy after 1 year to reassess condition

**Child 16–18 years** apply 0.1% ointment thinly twice weekly (with an interval of 2–3 days between applications); use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

**Other indications** section 8.2.2

Protopic® (Astellas) (POM)

Ointment, tacrolimus (as monohydrate) 0.03%, net price 30 g = £19.44, 60 g = £35.46; 0.1%, 30 g = £21.60, 60 g = £39.40. Label: 4, 11, 28

**Excipients** include beeswax

## Cytokine modulators

### ETANERCEPT

**Cautions** section 10.1.3, p. 516

**Important** See section 10.1.3, p. 516 for information on tuberculosis and blood disorders

**Contra-indications** section 10.1.3, p. 516

**Hepatic impairment** section 10.1.3, p. 516

**Pregnancy** section 10.1.3, p. 516

**Breast-feeding** section 10.1.3, p. 516

**Side-effects** section 10.1.3, p. 516

### Indications and dose

#### Severe plaque psoriasis

- By subcutaneous injection

**Child 6–18 years** 800 micrograms/kg (max. 50 mg) once weekly for up to 24 weeks; discontinue if no response after 12 weeks

#### Polyarticular-course juvenile idiopathic arthritis

section 10.1.3

### Preparations

Section 10.1.3

## 13.6 Acne and rosacea

### 13.6.1 Topical preparations for acne

### 13.6.2 Oral preparations for acne

**Acne vulgaris** Acne vulgaris commonly affects children around puberty and occasionally affects infants. Treatment of acne should be commenced early to prevent scarring; lesions may worsen before improving. The choice of treatment depends on age, severity, and whether the acne is predominantly inflammatory or comedonal.

*Mild to moderate acne* is generally treated with topical preparations, such as benzoyl peroxide, azelaic acid, and retinoids (section 13.6.1).

For *moderate to severe inflammatory acne* or where topical preparations are not tolerated or are ineffective or where application to the site is difficult, systemic treatment (section 13.6.2) with oral antibacterials may be effective. **Co-cyprindiol** (cyproterone acetate with ethinylestradiol) has anti-androgenic properties and may be useful in young women with acne refractory to other treatments.

*Severe acne*, acne unresponsive to prolonged courses of oral antibacterials, acne with scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe oral isotretinoin (section 13.6.2).

**Neonatal and infantile acne** Inflammatory papules, pustules, and occasionally comedones may develop at birth or within the first month; most neonates with acne do not require treatment. Acne developing at 3–6 months of age may be more severe and persistent; lesions are usually confined to the face. Topical preparations containing benzoyl peroxide (at the lowest strength possible to avoid irritation), adapalene, or tretinoin may be used if treatment for infantile acne is necessary. In infants with inflammatory acne, oral erythromycin (section 5.1.5) is used because topical preparations for acne are not well tolerated. In cases of

erythromycin-resistant acne, oral isotretinoin (section 13.6.2) can be given on the advice of a consultant dermatologist.

**Rosacea** The adult form of rosacea rarely occurs in children. Persistent or repeated use of potent topical corticosteroids may cause periorificial rosacea (steroid acne). The pustules and papules of rosacea may be treated for at least 6 weeks with a topical **metronidazole** preparation (section 13.10.1.2), or a systemic antibacterial such as **erythromycin** (section 5.1.5), or for a child over 12 years, **oxytetracycline** (section 5.1.3). Tetracyclines are **contra-indicated** in children under 12 years of age.

### 13.6.1 Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide (see below) or topical retinoids (see p. 582). Alternatively, topical application of an antibacterial such as erythromycin or clindamycin may be effective for inflammatory acne. However, topical antibacterials are probably no more effective than benzoyl peroxide and may promote the emergence of resistant organisms. If topical preparations prove inadequate, oral preparations may be needed (section 13.6.2). The choice of product and formulation (gel, solution, lotion, or cream) is largely determined by skin type, patient preference, and previous usage of acne products.

#### Benzoyl peroxide and azelaic acid

**Benzoyl peroxide** is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. The usefulness of benzoyl peroxide washes is limited by the short time the products are in contact with the skin. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with a reduction in benzoyl peroxide concentration, frequency, and area of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

**Azelaic acid** has antimicrobial and anticomedonal properties. It may be used as an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face; azelaic acid is less likely to cause local irritation than benzoyl peroxide.

#### BENZOYL PEROXIDE

**Cautions** avoid contact with eyes, mouth, mucous membranes, and broken skin; may bleach fabrics and hair; avoid excessive exposure to sunlight

**Side-effects** skin irritation (reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency)

**Licensed use** *Quinoderm*<sup>®</sup> is licensed for use in children; *all other preparations*, not licensed for use in treatment of infantile acne

#### Indications and dose

##### Acne vulgaris

**Child 12–18 years** apply 1–2 times daily preferably after washing with soap and water, start treatment with lower-strength preparations

**Note** May bleach clothing

##### Infantile acne

**Child 1 month–2 years** apply 1–2 times daily; start treatment with lower-strength preparations

##### Acnecide<sup>®</sup> (Galderma)

**Gel**, benzoyl peroxide 5% in an aqueous gel basis, net price 30 g = £5.44, 60 g = £12.56

**Excipients** include propylene glycol

##### Brevoxyl<sup>®</sup> (GSK)

**Cream**, benzoyl peroxide 4% in an aqueous basis, net price 50 g = £4.13

**Excipients** include cetyl alcohol, fragrance, stearyl alcohol

##### PanOxyl<sup>®</sup> (GSK)

**Aquagel** (= aqueous gel), benzoyl peroxide 2.5%, net price 40 g = £1.76; 5%, 40 g = £1.92; 10%, 40 g = £2.13

**Excipients** include propylene glycol

**Cream**, benzoyl peroxide 5% in a non-greasy basis, net price 40 g = £1.89

**Excipients** include isopropyl palmitate, propylene glycol

**Gel**, benzoyl peroxide 10% in an aqueous alcoholic basis, net price 40 g = £1.99

**Excipients** include fragrance

**Note** May be difficult to obtain

#### ▲ With antimicrobials

See also Topical Antibacterials for Acne, p. 582 and Antibacterials, p. 582

##### Duac<sup>®</sup> Once Daily (GSK) (POM)

**Gel**, benzoyl peroxide 3%, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 g = £11.94

**Excipients** include disodium edetate

**Dose**

##### Acne vulgaris

**Child 12–18 years** apply once daily in the evening

**Gel**, benzoyl peroxide 5%, clindamycin 1% (as phosphate) in an aqueous basis, net price 25 g = £9.95, 50 g = £19.90

**Excipients** include disodium edetate

**Dose**

##### Acne vulgaris

**Child 12–18 years** apply once daily in the evening

##### Quinoderm<sup>®</sup> (Alliance)

**Cream**, benzoyl peroxide 5%, potassium hydroxyquinoline sulfate 0.5%, in an astringent vanishing-cream basis, net price 50 g = £2.43

**Excipients** include cetostearyl alcohol, edetic acid (EDTA)

**Cream**, benzoyl peroxide 10%, potassium hydroxyquinoline sulfate 0.5%, in an astringent vanishing-cream basis, net price 25 g = £1.58, 50 g = £2.55

**Excipients** include cetostearyl alcohol, edetic acid (EDTA)

**Dose**

##### Acne vulgaris, acneform eruptions, folliculitis

Apply 2–3 times daily

**AZELAIC ACID**

**Cautions** avoid contact with eyes, mouth, and mucous membranes

**Side-effects** local irritation (reduce frequency or discontinue temporarily); *less commonly* skin discoloration; *also reported* worsening of asthma

**Indications and dose**

See under preparations

**Finacea**<sup>®</sup> (Bayer) (PoM)

**Gel**, azelaic acid 15%, net price 30 g = £7.48

**Excipients** include disodium edetate, polysorbate 80, propylene glycol

**Dose**

**Facial acne vulgaris**

**Child 12–18 years** apply twice daily; discontinue if no improvement after 1 month

**Skinoren**<sup>®</sup> (Bayer) (PoM)

**Cream**, azelaic acid 20%, net price 30 g = £3.74

**Excipients** include propylene glycol

**Dose**

**Acne vulgaris**

**Child 12–18 years** apply twice daily (sensitive skin, once daily for first week)

**Topical antibacterials for acne**

In the treatment of mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for children who wish to avoid oral antibacterials or who cannot tolerate them.

Topical preparations of **erythromycin** and **clindamycin** may be used to treat *inflamed lesions* in mild to moderate acne when topical benzoyl peroxide or tretinoin is ineffective or poorly tolerated. Topical benzoyl peroxide, azelaic acid, or retinoids used in combination with an antibacterial (topical or systemic) may be more effective than an antibacterial used alone. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin. Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (but treatment with a topical preparation should be continued for at least 6 months).

**ANTIBACTERIALS**

**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide; discontinue clindamycin preparations immediately if diarrhoea or colitis occur

**Indications and dose**

**Acne vulgaris** for dose, see under preparations

**Dalacin T**<sup>®</sup> (Pharmacia) (PoM)

**Topical solution**, clindamycin 1% (as phosphate), in an aqueous alcoholic basis, net price (both with applicator) 30 mL = £4.34, 50 mL = £7.23

**Excipients** include propylene glycol

**Dose**

Apply thinly twice daily

**Lotion**, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 mL = £5.08, 60 mL = £10.16

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Dose**

Apply thinly twice daily

**Stiemycin**<sup>®</sup> (Stiefel) (PoM)

**Solution**, erythromycin 2% in an alcoholic basis, net price 50 mL = £7.69

**Excipients** include propylene glycol

**Dose**

**Child 12–18 years** apply thinly twice daily

**Zindaclin**<sup>®</sup> (Crawford) (PoM)

**Gel**, clindamycin 1% (as phosphate), net price 30 g = £8.66

**Excipients** include propylene glycol

**Dose**

**Child 12–18 years** apply thinly once daily

**Zineryt**<sup>®</sup> (Astellas) (PoM)

**Topical solution**, powder for reconstitution, erythromycin 40 mg, zinc acetate 12 mg/mL when reconstituted with solvent containing ethanol, net price per pack of powder and solvent to provide 30 mL = £7.71, 90 mL = £16.68

**Excipients** none as listed in section 13.1.3

**Dose**

Apply twice daily

**Topical retinoids and related preparations for acne**

Topical **tretinoin**, its isomer **isotretinoin**, and **adapalene** (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

Tretinoin can be used under specialist supervision to treat infantile acne; adapalene can also be used. See also Neonatal and Infantile Acne, p. 580.

**Cautions** Topical retinoids should be avoided in severe acne involving large areas. Contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin should be avoided. Topical retinoids should be used with caution on sensitive areas such as the neck, and accumulation in angles of the nose should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen (section 13.8.1) or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided. Allow peeling (result-

ing from other irritant treatments) to subside before using a topical retinoid; alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application).

**Pregnancy** Topical retinoids are contra-indicated in pregnancy; females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

**Side-effects** Local reactions include burning, erythema, stinging, pruritus, dry or peeling skin (discontinue if severe). Increased sensitivity to UVB light or sunlight occurs. Temporary changes of skin pigmentation with tretinoin have been reported. Eye irritation and oedema, and blistering or crusting of skin have been reported rarely.

## ADAPALENE

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas

**Side-effects** see notes above

**Licensed use** not licensed for use in infantile acne

### Indications and dose

#### Infantile acne

**Child 1 month–2 years** apply thinly once daily in the evening

#### Mild to moderate acne vulgaris

**Child 12–18 years** apply thinly once daily in the evening

**Differin**<sup>®</sup> (Galderma) (PoM)

**Cream**, adapalene 0.1%, net price 45 g = £16.15.

Label: 11

**Excipients** include disodium edetate, hydroxybenzoates (parabens)

**Gel**, adapalene 0.1%, net price 45 g = £16.15. Label: 11

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

### With benzoyl peroxide

**Epiduo**<sup>®</sup> (Galderma) (PoM)

**Gel**, adapalene 0.1%, benzoyl peroxide 2.5%, net price 45 g = £17.91. Label: 11

**Excipients** include disodium edetate, polysorbate 80, propylene glycol

#### Dose

#### Acne vulgaris

**Child 9–18 years** apply thinly once daily in the evening

**Note** May bleach clothing and hair

**Note** The *Scottish Medicines Consortium* (p. 3) has advised (March 2014) that *Epiduo*<sup>®</sup> should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate

## ISOTRETINOIN

**Note** Isotretinoin is an isomer of tretinoin

**Important** For prescribing information on isotretinoin when given by mouth, see p. 585

**Cautions** (*topical application only*) see notes above; also personal or familial history of non-melanoma skin cancer

**Contra-indications** (*topical application only*) rosacea; perioral dermatitis

**Pregnancy** (*topical application only*) see notes above

**Breast-feeding** avoid

**Side-effects** (*topical application only*) see notes above

### Indications and dose

#### Acne vulgaris

Apply thinly 1–2 times daily

**Isotrex**<sup>®</sup> (Stiefel) (PoM)

**Gel**, isotretinoin 0.05%, net price 30 g = £5.94.

Label: 11

**Excipients** include butylated hydroxytoluene

### With antibacterial

**Isotrexin**<sup>®</sup> (Stiefel) (PoM)

**Gel**, isotretinoin 0.05%, erythromycin 2% in ethanolic basis, net price 30 g = £7.47. Label: 11

**Excipients** include butylated hydroxytoluene

## TRETINOIN

**Note** Tretinoin is the acid form of vitamin A

**Cautions** see notes above

**Contra-indications** personal or familial history of non-melanoma skin cancer; rosacea; perioral dermatitis

**Pregnancy** see notes above

**Breast-feeding** amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come into contact with treated areas

**Side-effects** see notes above

### Indications and dose

See under preparations

**Malignant disease** section 8.1.5

### With antibacterial

**Aknemycin Plus**<sup>®</sup> (Almirall) (PoM)

**Solution**, tretinoin 0.025%, erythromycin 4% in an alcoholic basis, net price 25 mL = £7.05. Label: 11

**Excipients** none as listed in section 13.1.3

#### Dose

**Acne (all forms), particularly that associated with oily skin**

Apply thinly 1–2 times daily

## Other topical preparations for acne

A topical preparation of **nicotinamide** is available for inflammatory acne.

## NICOTINAMIDE

**Cautions** avoid contact with eyes and mucous membranes (including nose and mouth); reduce frequency of application if excessive dryness, irritation, or peeling

**Side-effects** dry skin, pruritus, erythema, burning, irritation

**Licensed use** licensed for use in children (age range not specified by manufacturer)

### Indications and dose

**Inflammatory acne vulgaris** see under preparations below

**Nicam<sup>®</sup>** (Dermal)

Gel, nicotinamide 4%, net price 60 g = £7.10

**Excipients** none as listed in section 13.1.3**Dose**

Apply twice daily; reduce to once daily or on alternate days if irritation occurs

**13.6.2 Oral preparations for acne****Oral antibacterials for acne**

Oral antibacterials may be used in *moderate to severe inflammatory acne* when topical treatment is not adequately effective or is inappropriate. Concomitant antimicrobial treatment with topical benzoyl peroxide or azelaic acid may also be required (section 13.6.1).

Tetracyclines should not be given to children under 12 years. In children over 12 years, either **oxytetracycline** or **tetracycline** (section 5.1.3) is usually given for acne in a dose of 500 mg twice daily. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

**Doxycycline** and **lymecycline** (section 5.1.3) are alternatives to tetracycline in children over 12 years. Doxycycline can be used in a dose of 100 mg daily. Lymecycline is given in a dose of 408 mg daily.

Although **minocycline** is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a dose of 100 mg once daily or 50 mg twice daily.

**Erythromycin** (section 5.1.5) in a dose of 500 mg twice daily for children over 12 years is an alternative for the management of moderate to severe acne with inflamed lesions, but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response. Infants with acne requiring oral treatment with erythromycin should be given 250 mg once daily or 125 mg twice daily; in cases of erythromycin-resistant *P. acnes* in infants, oral isotretinoin may be used on the advice of a consultant dermatologist.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

**Hormone treatment for acne**

**Co-cyprindiol** (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in females of childbearing age who also wish to receive oral contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some females with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with combined oral contraceptives containing third-generation progestogens (desogestrel or gestodene) or drospirenone (see section 7.3.1). Co-cyprindiol is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism; it should not be used solely for contraception. It is contra-indicated in those with a history of venous or arterial thromboembolism, or in those with severe or multiple risk factors for arterial disease or venous thromboembolism (see section 7.3.1). Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

**CO-CYPRINDIOL**

A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively

**Cautions** see under Combined Hormonal Contraceptives, section 7.3.1

**Contra-indications** see under Combined Hormonal Contraceptives, section 7.3.1

**Hepatic impairment** see under Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** avoid—risk of feminisation of male fetus with cyproterone

**Breast-feeding** manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone

**Side-effects** see under Combined Hormonal Contraceptives, section 7.3.1

**Licensed use** licensed for use in females of childbearing age

**Indications and dose**

**Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials (but see notes above), moderately severe hirsutism**

- **By mouth**

1 tablet daily for 21 days starting on day 1 of menstrual cycle; subsequent cycles repeated after a 7-day interval (during which withdrawal bleeding occurs); time to symptom remission, at least 3 months; review need for treatment regularly

**Co-cyprindiol** (Non-proprietary) ▼ (PoM)

**Tablets**, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £5.40

**Brands include** *Acnacin<sup>®</sup>, Cicafem<sup>®</sup>, Clairette<sup>®</sup>*

**Dianette<sup>®</sup>** (Bayer) ▼ (PoM)

**Tablets**, beige, s/c, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £7.71

**Oral retinoid for acne**

The retinoid **isotretinoin** reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, acne with scarring, or for

acne which has not responded to an adequate course of a systemic antibacterial. Isotretinoin is used for the treatment of severe infantile acne resistant to erythromycin.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must **not** be given to females of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. They must also be registered with a pregnancy prevention programme (see under Cautions below).

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

## ISOTRETINOIN

**Note** Isotretinoin is an isomer of tretinoin

**Cautions** see notes above; also avoid blood donation during treatment and for at least 1 month after treatment; history of depression; monitor all patients for depression; measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised); discontinue if uncontrolled hypertriglyceridaemia or pancreatitis; diabetes; dry eye syndrome (associated with risk of keratitis); avoid keratolytics; **interactions:** Appendix 1 (retinoids)

**Pregnancy prevention** In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

**Counselling** Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment

**Contra-indications** hypervitaminosis A, hyperlipidaemia

**Hepatic impairment** avoid—further impairment may occur

**Renal impairment** in severe impairment, reduce initial dose and increase gradually, if necessary, up to 1 mg/kg daily as tolerated

**Pregnancy** avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

**Breast-feeding** avoid

**Side-effects** dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus), epidermal fragility (trauma may cause blistering), dryness of lips (sometimes cheilitis), dryness of eyes (with blepharitis and conjunctivitis), dryness of pharyngeal mucosa (with hoarseness), dryness of nasal mucosa (with epistaxis), headache, myalgia and arthralgia, raised plasma-triglyceride concentration (risk of pancreatitis if triglycerides above 9 mmol/litre), raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration), raised blood-glucose concentration, raised serum-transaminase concentration, haematuria and proteinuria, thrombocytopenia, thrombocytosis, neutropenia and anaemia; *rarely* mood changes (depression, aggressive behaviour, anxiety, and very rarely psychosis and suicidal ideation)—expert referral required, skin reactions (including reports of Stevens-Johnson syndrome and toxic epidermal necrolysis), alopecia; *very rarely* nausea, hepatitis, inflammatory bowel disease, gastrointestinal haemorrhage, haemorrhagic diarrhoea (discontinue treatment), benign intracranial hypertension (avoid concomitant tetracyclines), convulsions, malaise, drowsiness, dizziness, diabetes mellitus, lymphadenopathy, hyperuricaemia, glomerulonephritis, tendonitis, arthritis, raised serum-creatinine kinase concentration, bone changes (including reduced bone density, early epiphyseal closure, and skeletal hyperostosis) and calcification of tendons and ligaments following long-term administration, visual disturbances (papilloedema, corneal opacities, cataracts, decreased night vision, photophobia, blurred vision, colour blindness)—expert referral required and consider withdrawal, decreased tolerance to contact lenses, keratitis, impaired hearing, Gram-positive infections of skin and mucous membranes, exacerbation of acne, acne fulminans, allergic vasculitis and granulomatous lesions, paronychia, hirsutism, nail dystrophy, skin hyperpigmentation, photosensitivity, increased sweating

**Licensed use** not licensed for use in infantile acne

**Indications and dose**

**Acne vulgaris** under supervision of consultant dermatologist, see notes above

• **By mouth**

**Child 12–18 years** 500 micrograms/kg daily (in 1–2 divided doses), increased if necessary to 1 mg/kg daily, for 16–24 weeks (repeat treatment course after a period of at least 8 weeks if relapse after first course); max. cumulative dose 150 mg/kg per course

**Severe infantile acne** under supervision of a consultant dermatologist, see p. 580

• **By mouth**

**Child 1 month–2 years** 200 micrograms/kg daily (in 1–2 divided doses), increased if necessary to 1 mg/kg daily, for 16–24 weeks; max. cumulative dose 150 mg/kg per course

**Isotretinoin** (Non-proprietary) (PoM)

**Capsules**, isotretinoin 5 mg, net price 56-cap pack = £14.78; 20 mg, 56-cap pack = £37.85. Label: 10, patient information leaflet, 11, 21

**Roaccutane**® (Roche) (PoM)

**Capsules**, isotretinoin 10 mg (brown-red), net price 30-cap pack = £14.54; 20 mg (brown-red/white), 30-cap pack = £20.02. Label: 10, patient information card, 11, 21

## 13.7 Preparations for warts and calluses

Warts (*verruca vulgaris*) are common, benign, self-limiting, and usually asymptomatic. They are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction and is required only if the warts are painful, unsightly, persistent, or cause distress. In immunocompromised children, warts may be more difficult to eradicate.

Preparations of **salicylic acid**, **formaldehyde**, **glutaraldehyde** or **silver nitrate** are used for the removal of warts on hands and feet. **Salicylic acid** is a useful keratolytic which may be considered first-line in the treatment of warts; it is also suitable for the removal of *corns and calluses*. Preparations of salicylic acid in a colloidion basis are available but some children may develop an allergy to colophony in the formulation; colloidion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

### SALICYLIC ACID

**Cautions** significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; impaired peripheral circulation; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas

**Side-effects** skin irritation, skin ulceration (with high concentrations)

**Licensed use** not licensed for use in children under 2 years

#### Indications and dose

##### Warts on hands and feet (plantar)

For dose see preparations; apply carefully to wart and protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

**Psoriasis** section 13.5.2

**Fungal nail infections** section 13.10.2

**Cuplex**® (Crawford)

**Gel**, salicylic acid 11%, lactic acid 4%, in a colloidion basis, net price 5 g = £2.88. Label: 15

**Dose**

Apply twice daily

**Note** Contains colophony (see notes above)

**Duofilm**® (GSK)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible colloidion, net price 15 mL (with applicator) = £2.25. Label: 15

**Dose**

Apply daily

**Occlusal**® (Alliance)

**Cutaneous solution**, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.56.

Label: 15

**Dose**

Apply daily

**Salactol**® (Dermal)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible colloidion, net price 10 mL (with applicator) = £1.71. Label: 15

**Dose**

Apply daily

**Note** Contains colophony (see notes above)

**Salatac**® (Dermal)

**Gel**, salicylic acid 12%, lactic acid 4% in a colloidion basis, net price 8 g (with applicator) = £2.98. Label: 15

**Dose**

Apply daily

**Verrugon**® (Ransom)

**Ointment**, salicylic acid 50% in a paraffin basis, net price 6 g = £3.12

**Dose**

Apply daily

### FORMALDEHYDE

**Cautions** see under Salicylic Acid

**Side-effects** see under Salicylic Acid

**Licensed use** licensed for use in children (age range not specified by manufacturer)

#### Indications and dose

**Warts, particularly plantar warts** for dose see preparation below

**Veracur**® (Typharm)

**Gel**, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41

**Dose**

Apply twice daily

### GLUTARALDEHYDE

**Cautions** protect surrounding skin; not for application to face, mucosa, or anogenital areas

**Side-effects** rashes, skin irritation (discontinue if severe); stains skin brown

**Licensed use** licensed for use in children (age range not specified by manufacturer)

#### Indications and dose

**Warts, particularly plantar warts**

Apply twice daily

**Glutarol**® (Dermal)

**Solution** (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.07

## SILVER NITRATE

**Cautions** protect surrounding skin and avoid broken skin; not suitable for application to face, ano-genital region, or large areas

**Side-effects** chemical burns on surrounding skin; stains skin and fabric

**Licensed use** no age range specified by manufacturer

### Indications and dose

#### Common warts and verrucas

Apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts or max. 6 applications for verrucas

Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

#### Umbilical granulomas

Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

**AVOCA**<sup>®</sup> (Bray)

**Caustic pencil**, tip containing silver nitrate 40%, potassium nitrate 60%, net price = £0.94; silver nitrate 95%, potassium nitrate 5%, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £2.27

## Anogenital warts

Anogenital warts (condylomata acuminata) in children are often asymptomatic and require only a simple barrier preparation. If treatment is required it should be supervised by a hospital specialist. Persistent warts on genital skin may require treatment with cryotherapy or other forms of physical ablation under general anaesthesia.

**Podophyllotoxin** (the major active ingredient of podophyllum), or **imiquimod** are used to treat external anogenital warts; these preparations can cause considerable irritation of the treated area and are therefore suitable only for children who are able to cooperate with the treatment.

## IMIQUIMOD

**Cautions** avoid normal or broken skin and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin); autoimmune disease; immunosuppressed patients

**Pregnancy** no evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution

**Breast-feeding** no information available

**Side-effects** local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; *less commonly* local ulceration and alopecia; *rarely* Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; *very rarely* dysuria in females; permanent hypopigmentation or hyperpigmentation reported

**Licensed use** not licensed for use in children

### Indications and dose

**External genital and perianal warts** (for use under specialist supervision only)

Apply thinly 3 times a week at night until lesions resolve (max. 16 weeks)

**Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

**Aldara**<sup>®</sup> (Meda) (POM)

**Cream**, imiquimod 5%, net price 12-sachet pack = £48.60. Label: 10, patient information leaflet

**Excipients** include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

**Condoms** may damage latex condoms and diaphragms

## PODOPHYLLOTOXIN

**Cautions** see notes above; avoid normal skin and open wounds; keep away from face; very irritant to eyes

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** local irritation

**Licensed use** not licensed for use in children

### Indications and dose

See under preparations (for use under specialist supervision only)

**Condylone**<sup>®</sup> (Takeda) (POM)

**Solution**, podophyllotoxin 0.5% in alcoholic basis, net price 3.5 mL (with applicators) = £14.49. Label: 15

#### Dose

**Condylomata acuminata affecting the penis or the female external genitalia**

**Child 2–18 years** (see notes above) apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses; direct medical supervision for lesions in the female and for lesions greater than 4 cm<sup>2</sup> in the male; max. 50 single applications ('loops') per session (consult product literature)

**Warticon**<sup>®</sup> (GSK) (POM)

**Cream**, podophyllotoxin 0.15%, net price 5 g (with mirror) = £14.86

**Excipients** include butylated hydroxyanisole, cetyl alcohol, hydroxybenzoates (parabens), sorbic acid, stearyl alcohol

#### Dose

**Condylomata acuminata affecting the penis or the female external genitalia**

**Child 2–18 years** (see notes above) apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm<sup>2</sup>

**Solution**, blue, podophyllotoxin 0.5% in alcoholic basis, net price 3 mL (with applicators) = £12.38. Label: 15

#### Dose

**Condylomata acuminata affecting the penis or the female external genitalia**

**Child 2–18 years** (see notes above) apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm<sup>2</sup>; max. 50 single applications ('loops') per session (consult product literature)

## 13.8 Sunscreens and camouflagers

### 13.8.1 Sunscreen preparations

### 13.8.2 Camouflagers

### 13.8.1 Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption*, *solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *lupus erythematosus* and may aggravate some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. Protective clothing and sun avoidance (rather than the use of sunscreen preparations) are recommended for children under 6 months of age.

The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a child to remain 8 times longer in the sun without burning. However, in practice users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies. Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly** and **frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

### Ingredient nomenclature in sunscreen preparations

rINN	INCI
amiloxate	isoamyl <i>p</i> -methoxycinnamate
avobenzene	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenol methoxyphenyl triazine
bisocotrizole	methylene bis-benzotriazolyl tetramethylbutylphenol
ecamsule	terephthalylidene dicamphor sulfonic acid
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (or ethylhexyl) methoxycinnamate
octocrilene	octocrylene
oxybenzone	benzophenone-3

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in BNFC

**Borderline substances** The preparations marked 'ACBS' cannot be prescribed on the NHS except for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed. See also Appendix 2.

#### Anthelios® (L'Oréal Active)

**XL SPF 50+ Melt-in cream** (UVA and UVB protection; UVB-SPF 50+), avobenzene 3.5%, bemotrizinol 3%, drometrizole trisiloxane 0.5%, ecamsule 1%, octocrilene 2.5%, titanium dioxide 4.2%, net price 50 mL = £3.63. ACBS

**Excipients** include disodium edetate, stearyl alcohol

**Note** For INCI synonyms, see table above

#### Sunsense® Ultra (Crawford)

**Lotion** (UVA and UVB protection; UVB-SPF 50+), avobenzene 2%, ensulizole 2%, enzacamene 4%, octinoxate 6%, oxybenzone 2%, titanium dioxide 3%, net price 50-mL bottle with roll-on applicator = £5.01, 125 mL = £8.14, 500-mL pump pack = £18.17. ACBS

**Excipients** include butylated hydroxytoluene, cetyl alcohol, fragrance, hydroxybenzoates (parabens), propylene glycol

**Note** For INCI synonyms, see table above

**Uvistat®** (LPC)

**Cream** (UVA and UVB protection; UVB-SPF 30), avobenzone 5%, bisotrizole 1.5%, octinoxate 7.5%, octocriene 4%, titanium dioxide 5.2%, net price 125 mL = £7.45. ACBS

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

**Note** For INCI synonyms, see table above

**Cream** (UVA and UVB protection; UVB-SPF 50), amiloxate 2%, avobenzone 5%, bisotrizole 6%, octinoxate 10%, octocriene 4%, titanium dioxide 4.8%, net price 125 mL = £8.45. ACBS

**Excipients** include disodium edetate, polysorbate 60, propylene glycol

**Note** For INCI synonyms, see table above

**Lipscreen** (UVA and UVB protection; UVB-SPF 50), avobenzone 5%, bemotrizinol 3%, octinoxate 10%, octocriene 4%, titanium dioxide 3%, net price 5 g = £2.99. ACBS

**Excipients** include butylated hydroxytoluene, hydroxybenzoates (parabens)

**Note** For INCI synonyms, see table above

## Photodamage

*Actinic keratoses* occur very rarely in healthy children; *actinic cheilitis* may occur on the lips of adolescents following excessive sun exposure.

**Diclofenac gel** (*Solaraze*®) and topical preparations of **fluorouracil** are licensed for the treatment of actinic keratoses but they are not licensed for use in children.

In children with photosensitivity disorders, such as erythropoietic protoporphyria, specialists may use **betacarotene**, **mepacrine**, **chloroquine** or **hydroxychloroquine** (section 10.1.3) to reduce skin reactions.

## BETACAROTENE

**Note** Betacarotene is a precursor to vitamin A

**Cautions** monitor vitamin A intake; **interactions:**

Appendix 1 (vitamins)

**Hepatic impairment** avoid

**Renal impairment** use with caution

**Pregnancy** partially converted to vitamin A, but does not give rise to abnormally high serum concentration; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** use with caution—present in milk

**Side-effects** loose stools; yellow discoloration of skin; rarely, bruising, arthralgia

**Licensed use** not licensed for use in UK

### Indications and dose

**Management of photosensitivity reactions in erythropoietic protoporphyria** (specialist use only)

#### • By mouth

**Child 1–5 years** 60–90 mg daily in single or divided doses

**Child 5–9 years** 90–120 mg daily in single or divided doses

**Child 9–12 years** 120–150 mg daily in single or divided doses

**Child 12–16 years** 150–180 mg daily in single or divided doses

**Child 16–18 years** 180–300 mg daily in single or divided doses

**Note** Protection not total—avoid strong sunlight and use sunscreen preparations; generally 2–6 weeks of

treatment (resulting in yellow coloration of palms and soles) necessary before increasing exposure to sunlight; dose should be adjusted according to level of exposure to sunlight

### Betacarotene (Non-proprietary)

**Capsules**, 15 mg, 25 mg are available from 'special-order' manufacturers or specialist importing companies, see p. 840. Label: 21

## 13.8.2 Camouflagers

Disfigurement of the skin can be very distressing and may have a marked psychological effect, especially in children. Cosmetic preparations may be used to camouflage unsightly scars, skin deformities, and pigment abnormalities, such as vitiligo and birthmarks.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

**Borderline substances** The preparations marked 'ACBS' cannot be prescribed on the NHS for postoperative scars and other deformities except as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

### Covermark® (Derma UK)

**Classic foundation** (masking cream), net price 15 mL (10 shades) = £11.86. ACBS

**Excipients** include beeswax, hydroxybenzoates (parabens), fragrance

**Finishing powder**, net price 25 g = £11.86. ACBS

**Excipients** include beeswax, hydroxybenzoates (parabens), fragrance

### Dermablend® (L'Oréal Active)

**Ultra corrective foundation**, (7 shades), net price 12 g = £5.60. ACBS

**Excipients** include beeswax, isopropyl palmitate

### DermaColor® (Fox)

**Camouflage creme**, (100 shades), net price 25 mL = £10.52. ACBS

**Excipients** include beeswax, butylated hydroxytoluene, fragrance, propylene glycol, stearyl alcohol, wool fat

**Fixing powder**, (7 shades), net price 60 g = £9.05. ACBS

**Excipients** include fragrance

### Keromask® (Lornamead)

**Masking cream**, (24 shades), net price 15 mL = £5.68. ACBS

**Excipients** include butylated hydroxyanisole, hydroxybenzoates (parabens), wool fat, propylene glycol

**Finishing powder**, (4 shades) net price 20 g = £5.68. ACBS

**Excipients** include butylated hydroxytoluene, hydroxybenzoates (parabens)

### Veil® (Thomas Blake)

**Cover cream** (40 shades), net price 19 g = £22.42, 44 g = £33.35, 70 g = £42.10. ACBS

**Excipients** include hydroxybenzoates (parabens), wool fat derivative

**Finishing powder**, translucent, net price 35 g = £24.58. ACBS

**Excipients** include butylated hydroxyanisole, hydroxybenzoates (parabens)

## 13.9 Shampoos and other preparations for scalp conditions

The detergent action of shampoo removes grease (sebum) from hair. Prepubertal children produce very little grease and require shampoo less frequently than adults. Shampoos can be used as vehicles for medicinal products, but their usefulness is limited by the short time the product is in contact with the scalp and by their irritant nature.

Oils and ointments are very useful for scaly, dry scalp conditions; if a greasy appearance is cosmetically unacceptable, the preparation may be applied at night and washed out in the morning. Alcohol-based lotions are rarely used in children; alcohol causes painful stinging on broken skin and the fumes may exacerbate asthma.

Itchy, inflammatory, eczematous scalp conditions may be relieved by a simple emollient oil such as **olive oil** or **coconut oil** (arachis oil (ground nut oil, peanut oil) is best avoided in children under 5 years). In more severe cases a topical **corticosteroid** (section 13.4) may be required. Preparations containing **coal tar** are used for the common scaly scalp conditions of childhood including seborrhoeic dermatitis, dandruff (a mild form of seborrhoeic dermatitis), and psoriasis (section 13.5.2); **salicylic acid** is used as a keratolytic in some scalp preparations.

Shampoos containing antimicrobials such as **selenium sulfide** or **ketoconazole** are used for seborrhoeic dermatitis and dandruff in which yeast infection has been implicated, and for tinea capitis (ringworm of the scalp, section 13.10.2). Bacterial infection affecting the scalp (usually secondary to eczema, head lice, or ringworm) may be treated with shampoos containing antimicrobials such as **pyrithione zinc**, **cetrimide**, or **povidone-iodine**.

In neonates and infants, **cradle cap** (which is also a form of seborrhoeic eczema) can be treated by massaging **coconut oil** or **olive oil** into the scalp; a bland emollient such as **emulsifying ointment** can be rubbed onto the affected area once or twice daily before bathing and a mild shampoo used.

### Shampoos

#### **1 Ketoconazole** (Non-proprietary) (PoM)

**Shampoo**, ketoconazole 2%, net price 120 mL = £3.27

**Excipients** include imidurea

**Brands include** Dandrazol® 2% Shampoo, Nizoral®

**Dose**

**Seborrhoeic dermatitis and dandruff**

**Child 12–18 years** treatment, apply twice weekly for 2–4 weeks; prophylaxis, apply once every 1–2 weeks; leave preparation on for 3–5 minutes before rinsing

- Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole max. 2%, in a pack containing max. 120 mL and labelled to show a max. frequency of application of once every 3 days

#### Pityriasis versicolor

**Child 12–18 years** treatment, apply once daily for max. 5 days; prophylaxis, apply once daily for up to 3 days before sun exposure; leave preparation on for 3–5 minutes before rinsing

#### Alphosyl 2 in 1® (GSK Consumer Healthcare)

**Shampoo**, alcoholic coal tar extract 5%, net price 125 mL = £1.89, 250 mL = £4.52

**Excipients** include hydroxybenzoates (parabens), fragrance

**Dose**

**Dandruff**

Use once or twice weekly as necessary

**Psoriasis, seborrhoeic dermatitis, scaling and itching**

Use every 2–3 days

#### Capasal® (Dermal)

**Shampoo**, coal tar 1%, coconut oil 1%, salicylic acid 0.5%, net price 250 mL = £4.69

**Excipients** none as listed in section 13.1.3

**Dose**

**Scaly scalp disorders including psoriasis, seborrhoeic dermatitis, dandruff, and cradle cap**

Apply daily as necessary

#### Ceanel Concentrate® (Alliance)

**Shampoo**, cetrimide 10%, undecenoic acid 1%, net price 150 mL = £3.40, 500 mL = £9.80

**Excipients** none as listed in section 13.1.3

**Dose**

**Scalp psoriasis, seborrhoeic dermatitis, dandruff**

Apply 3 times in first week then twice weekly

#### Dermax® (Dermal)

**Shampoo**, benzalkonium chloride 0.5%, net price 250 mL = £5.69

**Excipients** none as listed in section 13.1.3

**Dose**

**Seborrhoeic scalp conditions associated with dandruff and scaling**

Apply as necessary

#### Psoriderm® (Dermal)

**Scalp lotion** (= shampoo), coal tar 2.5%, lecithin 0.3%, net price 250 mL = £4.74

**Excipients** include disodium edetate

**Dose**

**Scalp psoriasis**

Use as necessary

#### Selsun® (Chatterm UK)

**Shampoo**, selenium sulfide 2.5%, net price 50 mL = £1.44, 100 mL = £1.96, 150 mL = £2.75

**Excipients** include fragrance

**Cautions** avoid using 48 hours before or after applying hair colouring, straightening or waving preparations

**Dose**

**Seborrhoeic dermatitis and dandruff**

**Child 5–18 years** apply twice weekly for 2 weeks then once weekly for 2 weeks and then as necessary

#### Pityriasis versicolor [unlicensed indication]

**Child 5–18 years** apply to affected area and leave on for 10 minutes before rinsing off; apply once daily for 7 days; repeat course if necessary

**Note** diluting with a small amount of water prior to application can reduce irritation

**T/Gel®** (J&J)

**Shampoo**, coal tar extract 2%, net price 125 mL = £3.61, 250 mL = £5.12

**Excipients** include fragrance, hydroxybenzoates (parabens), imidurea, tetrasodium edetate

**Dose**

**Scalp psoriasis, seborrhoeic dermatitis, dandruff**

Apply 2–3 times weekly

### Other scalp preparations

**Cocoi®**

Section 13.5.2

**Polytar®** (GSK)

**Liquid**, tar blend 1%, net price 250 mL = £2.23

**Excipients** include arachis (peanut) oil, fragrance, imidurea, polysorbate 80

**Dose**

**Scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff**

Apply 1–2 times weekly

**Polytar Plus®** (GSK)

**Liquid**, tar blend 1%, net price 500 mL = £3.91

**Excipients** include arachis (peanut) oil, fragrance, imidurea, polysorbate 80

**Dose**

**Scalp disorders including psoriasis, seborrhoea, pruritus, and dandruff**

Apply 1–2 times weekly

**Sebco®**

Section 13.5.2

## 13.10 Anti-infective skin preparations

- 13.10.1 Antibacterial preparations
- 13.10.2 Antifungal preparations
- 13.10.3 Antiviral preparations
- 13.10.4 Parasitocidal preparations
- 13.10.5 Preparations for minor cuts and abrasions

### 13.10.1 Antibacterial preparations

- 13.10.1.1 Antibacterial preparations only used topically
- 13.10.1.2 Antibacterial preparations also used systemically

Topical antibacterial preparations are used to treat localised bacterial skin infections caused by Gram-positive organisms (particularly by staphylococci or streptococci). Systemic antibacterial treatment (Table 1, section 5.1) is more appropriate for deep-seated skin infections.

Problems associated with the use of topical antibacterials include bacterial resistance, contact sensitisation, and superinfection. In order to minimise the development of resistance, antibacterials used systemically (e.g. fusidic acid) should not generally be chosen for topical use. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

**Neomycin** applied topically may cause sensitisation and cross-sensitivity with other aminoglycoside antibac-

terials such as gentamicin may occur. Topical antibacterials applied over large areas can cause systemic toxicity; ototoxicity with neomycin and with **polymyxins** is a particular risk for neonates and children with renal impairment.

Superficial bacterial infection of the skin may be treated with a topical antiseptic such as **povidone-iodine** (section 13.11.4) which also softens crusts, or **hydrogen peroxide** 1% cream (section 13.11.6).

Bacterial infections such as *impetigo* and *folliculitis* can be treated with a short course of topical **fusidic acid**; **mupirocin** should be used only to treat meticillin-resistant *Staphylococcus aureus*.

For extensive or long-standing impetigo, an oral antibacterial such as **flucloxacillin** (or **clarithromycin** in children with penicillin-allergy), Table 1, section 5.1, should be used. A mild antiseptic may help to soften crusts. Mild antiseptics may be useful in reducing the spread of infection, but there is little evidence to support the use of topical antiseptics alone in the treatment of impetigo.

*Cellulitis*, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

*Staphylococcal scalded-skin syndrome* requires urgent treatment with a systemic antibacterial, such as flucloxacillin (see Table 1, section 5.1).

**Mupirocin** is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic, such as povidone-iodine, chlorhexidine, or alcohol, can be used (section 13.11); their use should be discussed with the local microbiologist.

Mupirocin ointment contains macrogols; extensive absorption of macrogols through the mucous membranes or through application to thin or damaged skin may result in renal toxicity, especially in neonates. Mupirocin nasal ointment is formulated in a paraffin base and may be more suitable for the treatment of MRSA-infected open wound in neonates.

**Metronidazole** gel is used topically in children to reduce the odour associated with anaerobic infections and for the treatment of periorificial rosacea (section 13.6); oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

**Retapamulin** can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The *Scottish Medicines Consortium* (p. 3) has advised (March 2008) that retapamulin (*Altargo*®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

**Silver sulfadiazine** is licensed for the prevention and treatment of infection in burns but the use of appropriate dressings may be more effective. Systemic effects may occur following extensive application of silver sulfadiazine; its use is not recommended in neonates.

### 13.10.1.1 Antibacterial preparations only used topically

#### MUPIROCIN

**Renal impairment** manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycols)

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** no information available

**Side-effects** local reactions including urticaria, pruritus, burning sensation, rash

**Licensed use** mupirocin ointment licensed for use in children (age range not specified by manufacturer); *Bactroban*<sup>®</sup> cream not recommended for use in children under 1 year

#### Indications and dose

**Bacterial skin infections** (see also notes above)

**Child 1 month–18 years** apply up to 3 times daily for up to 10 days

**Mupirocin** (Non-proprietary) (PoM)

**Ointment**, mupirocin 2%, net price 15 g = £5.32

**Bactroban**<sup>®</sup> (GSK) (PoM)

**Cream**, mupirocin (as mupirocin calcium) 2%, net price 15 g = £4.38

**Excipients** include benzyl alcohol, cetyl alcohol, stearyl alcohol

**Ointment**, mupirocin 2%, net price 15 g = £4.38

**Excipients** none as listed in section 13.1.3

**Nasal ointment**—section 12.2.3

#### NEOMYCIN SULFATE

**Cautions** large areas—if large areas of skin are being treated ototoxicity may be a hazard in children, particularly in those with renal impairment

**Contra-indications** neonates

**Renal impairment** see Cautions above

**Side-effects** sensitisation (see also notes above)

**Licensed use** *Neomycin Cream BPC*—no information available

#### Indications and dose

**Bacterial skin infections** see under preparation

**Neomycin Cream BPC** (PoM) 

**Cream**, neomycin sulfate 0.5%, cetomacrogol emulsifying ointment 30%, chlorocresol 0.1%, disodium edetate 0.01%, in freshly boiled and cooled purified water, net price 15 g = £2.17

**Excipients** include cetostearyl alcohol, edetic acid (EDTA)

**Dose**

Apply up to 3 times daily (short-term use)

#### POLYMYXINS

**Cautions** large areas—if large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children with renal impairment

**Renal impairment** see Cautions above

**Side-effects** sensitisation (see also notes above)

**Licensed use** licensed for use in children (age range not specified by manufacturer)

#### Indications and dose

**Bacterial skin infections** see under preparation

**Polyfax**<sup>®</sup> (TEVA UK) (PoM)

**Ointment**, polymyxin B sulfate 10 000 units, bacitracin zinc 500 units/g, net price 4 g = £3.26, 20 g = £4.62

**Excipients** none as listed in section 13.1.3

**Dose**

Apply twice daily or more frequently if required

#### RETAPAMULIN

**Contra-indications** contact with eyes and mucous membranes

**Side-effects** local reactions including irritation, erythema, pain, contact dermatitis, and pruritus

#### Indications and dose

**Superficial bacterial skin infections** (but see also notes above)

**Child 9 months–18 years** apply thinly twice daily for 5 days; max. area of skin treated 2% of body surface area; review treatment if no response within 2–3 days

**Altargo**<sup>®</sup> (GSK) (PoM)

**Ointment**, retapamulin 1%, net price 5 g = £7.89.

**Label:** 28

**Excipients** include butylated hydroxytoluene

#### SILVER SULFADIAZINE

**Cautions** G6PD deficiency; may inactivate enzymatic debriding agents—concomitant use may be inappropriate; **interactions:** Appendix 1 (sulfonamides)

**Large areas** Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides (see section 5.1.8) if large areas of skin are treated. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to baseline within a few days. Argiria may also occur if large areas of skin are treated (or if application is prolonged).

**Contra-indications** sensitivity to sulfonamides; not recommended for neonates

**Hepatic impairment** manufacturer advises caution if significant impairment; see also Large areas, above

**Renal impairment** manufacturer advises caution if significant impairment; see also Large areas, above

**Pregnancy** risk of neonatal haemolysis and methaemoglobinaemia in third trimester

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD deficient infants

**Side-effects** allergic reactions including burning, itching and rashes; argyria reported following prolonged use; leucopenia reported (monitor blood count)

**Licensed use** no age range specified by manufacturer but see contra-indications, above

**Indications and dose**

**Prophylaxis and treatment of infection in burn wounds, for conservative management of finger-tip injuries** see under preparation below

**Adjunct to short-term treatment of infection in pressure sores, adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions** consult product literature for details

**Flamazine**<sup>®</sup> (S&N Hlth.) (PoM)

**Cream**, silver sulfadiazine 1%, net price 20 g = £2.91, 50 g = £3.85, 250 g = £10.32, 500 g = £18.27

**Excipients** include cetyl alcohol, polysorbates, propylene glycol

**Dose**

**Burns**

**Child 1 month–18 years** apply daily or more frequently if very exudative

**Finger-tip injuries**

**Child 1 month–18 years** apply every 2–3 days

**Note** apply with sterile applicator

### 13.10.1.2 Antibacterial preparations also used systemically

**Sodium fusidate** is a narrow-spectrum antibacterial used for staphylococcal infections. For the role of sodium fusidate in the treatment of impetigo see p. 591.

**Metronidazole** is used topically to treat rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

**Angular cheilitis** An ointment containing sodium fusidate is used in the fissures of angular cheilitis when associated with staphylococcal infection. For further information on angular cheilitis, see p. 552.

## FUSIDIC ACID

**Cautions** see notes above; avoid contact with eyes

**Side-effects** rarely hypersensitivity reactions

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Staphylococcal skin infections**

Apply 3–4 times daily, usually for 7 days

**Penicillin-resistant staphylococcal infections**

section 5.1.7

**Staphylococcal eye infections**

section 11.3.1

**Fucidin**<sup>®</sup> (LEO) (PoM)

**Cream**, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.59

**Excipients** include butylated hydroxyanisole, cetyl alcohol

**Ointment**, sodium fusidate 2%, net price 15 g =

£2.23, 30 g = £3.79

**Excipients** include cetyl alcohol, wool fat

**Dental prescribing on NHS** May be prescribed as Sodium Fusidate ointment

## METRONIDAZOLE

**Cautions** avoid exposure to strong sunlight or UV light

**Side-effects** skin irritation

**Licensed use** *Acea*<sup>®</sup> and *Anabact*<sup>®</sup> not licensed for use in children under 12 years; *Noritate*<sup>®</sup> not licensed for use in children under 16 years; *Metrogel*<sup>®</sup>, *Metro-sa*<sup>®</sup>, *Rosiced*<sup>®</sup>, *Rozex*<sup>®</sup>, and *Zyomet*<sup>®</sup> not licensed for use in children

**Indications and dose**

**Malodorous tumours and wounds**

For dose see preparations

**Rosacea** (see also section 13.6)

For dose see preparations

**Helicobacter pylori eradication**

section 1.3

**Anaerobic infections**

section 5.1.11 and section 7.2.2

**Protozoal infections**

section 5.4.2

**Acea**<sup>®</sup> (Ferndale) (PoM)

**Gel**, metronidazole 0.75%, net price 40 g = £9.95

**Excipients** include disodium edetate, hydroxybenzoates (parabens)

**Dose**

**Acute inflammatory exacerbations of rosacea**

**Child 1–18 years** apply thinly twice daily

**Anabact**<sup>®</sup> (CHS) (PoM)

**Gel**, metronidazole 0.75%, net price 15 g = £4.47, 30 g = £7.89

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose**

**Malodorous fungating tumours and skin ulcers**

Apply to clean wound 1–2 times daily and cover with non-adherent dressing

**Metrogel**<sup>®</sup> (Galderma) (PoM)

**Gel**, metronidazole 0.75%, net price 40 g = £22.63

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose**

**Acute inflammatory exacerbations of rosacea**

**Child 1–18 years** apply thinly twice daily

**Malodorous fungating tumours**

Apply to clean wound 1–2 times daily and cover with non-adherent dressing

**Metro-sa**<sup>®</sup> (Linderna) (PoM)

**Gel**, metronidazole 0.75%, net price 40 g = £19.90

**Excipients** include propylene glycol

**Dose**

**Acute exacerbation of rosacea**

**Child 1–18 years** apply thinly twice daily

**Rosiced**<sup>®</sup> (Fabre) (PoM)

**Cream**, metronidazole 0.75%, net price 30 g = £7.50

**Excipients** include propylene glycol

**Dose**

**Inflammatory papules and pustules of rosacea**

**Child 1–18 years** apply twice daily for 6 weeks (longer if necessary)

**Rozex®** (Galderma) **[POM]**

**Cream**, metronidazole 0.75%, net price 30 g = £6.60, 40 g = £9.88

**Excipients** include benzyl alcohol, isopropyl palmitate

**Gel**, metronidazole 0.75%, net price 30 g = £6.60, 40 g = £9.88

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

**Dose**

**Inflammatory papules, pustules and erythema of rosacea**

**Child 1–18 years** apply twice daily

**Zyomet®** (AMCo) **[POM]**

**Gel**, metronidazole 0.75%, net price 30 g = £12.00

**Excipients** include benzyl alcohol, disodium edetate, propylene glycol

**Dose**

**Acute inflammatory exacerbations of rosacea**

**Child 1–18 years** apply thinly twice daily

## 13.10.2 Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for scalp infection or if the skin infection is widespread, disseminated or intractable; although topical therapy may be used to treat some nail infections, systemic therapy (section 5.2) is more effective. Specimens of scale, nail or hair should be sent for mycological examination before starting treatment, unless the diagnosis is certain.

**Dermatophytoses** Ringworm infection can affect the scalp (*tinea capitis*), body (*tinea corporis*), groin (*tinea cruris*), hand (*tinea manuum*), foot (*tinea pedis*, athlete's foot), or nail (*tinea unguium*, onychomycosis). *Tinea capitis* is a common childhood infection that requires systemic treatment with an oral antifungal (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm.

*Tinea corporis* and *tinea pedis* infections in children respond to treatment with a topical **imidazole** (clotrimazole, econazole, or miconazole) or **terbinafine** cream. Nystatin is less effective against *tinea*.

**Compound benzoic acid ointment** (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic children with *tinea* infection of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of **tioconazole** may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy. Chronic paronychia on the fingers (usually due to a candidal infection) should be treated with topical clotrimazole or nystatin, but these preparations should be used with caution in children who suck their

fingers. Chronic paronychia of the toes (usually due to dermatophyte infection) can be treated with topical terbinafine.

**Pityriasis versicolor** Pityriasis (*tinea*) versicolor can be treated with **ketoconazole** shampoo or **selenium sulfide** shampoo (section 13.9). Topical imidazole antifungals such as **clotrimazole**, **econazole**, and **miconazole**, or topical **terbinafine** are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with an azole antifungal (section 5.2). Relapse is common, especially in the immunocompromised.

**Candidiasis** Candidal skin infections can be treated with topical imidazole antifungals **clotrimazole**, **econazole**, or **miconazole**; topical terbinafine is an alternative. Topical application of **nystatin** is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment (section 5.2.1) generally with a triazole such as fluconazole; systemic treatment with griseofulvin or terbinafine is **not appropriate** for refractory candidiasis. For the treatment of oral candidiasis see section 12.3.2 and for the management of nappy rash see section 13.2.2.

**Angular cheilitis** Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*. For further information on angular cheilitis, see p. 552.

**Cautions** Contact with eyes and mucous membranes should be avoided.

**Side-effects** Occasional local irritation and hypersensitivity reactions include mild burning sensation, erythema, and itching. Treatment should be discontinued if symptoms are severe.

**Compound topical preparations** Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1%) (section 13.4) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of *intertriginous eczema* associated with candida.

### AMOROLFINE

**Cautions** see notes above; also avoid contact with ears; use with caution in child likely to suck affected digits

**Side-effects** see notes above

**Licensed use** not licensed for use in children under 12 years

**Indications and dose****Fungal nail infections**

Apply to infected nails 1–2 times weekly after filing and cleansing; allow to dry (approx. 3 minutes); treat finger nails for 6 months, toe nails for 9–12 months (review at intervals of 3 months); avoid nail varnish or artificial nails during treatment

**Amorolfine** (Non-proprietary) **[POM]**

**Nail lacquer**, amorolfine (as hydrochloride) 5%, net price 5-mL pack = £14.86, 2 × 2.5-mL pack = £19.53. Label: 10, patient information leaflet

**Brands include** Omicur®

**Loceryl®** (Galderma) (PoM)

**Nail lacquer**, amorolfine (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas, and cleansing swabs) = £9.08. Label: 10, patient information leaflet

**Excipients** none as listed in section 13.1.3

**BENZOIC ACID**

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Ringworm (tinea)** but see notes above; dose under preparation

**With salicylic acid**

For prescribing information on salicylic acid, see p. 577

**Benzoic Acid Ointment, Compound, BP** (Whitfield's ointment)

**Ointment**, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

**Excipients** include cetostearyl alcohol

**Dose**

**Child 1 month–18 years** apply twice daily

**CLOTRIMAZOLE**

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Fungal skin infections**

Apply 2–3 times daily

**Vaginal candidiasis** section 7.2.2

**Otitis externa** section 12.1.1

**Clotrimazole** (Non-proprietary)

**Cream**, clotrimazole 1%, net price 20 g = £1.26

**Canesten®** (Bayer Consumer Care)

**Cream**, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Solution**, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.30. For hairy areas

**Excipients** none as listed in section 13.1.3

**Spray**, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.72. Label: 15. For large or hairy areas

**Excipients** include propylene glycol

**ECONAZOLE NITRATE**

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

**Licensed use** *Pevaryl®*, no age range specified by manufacturer

**Indications and dose**

**Fungal skin infections**

Apply twice daily

**Fungal nail infections**

Apply once daily under occlusive dressing

**Vaginal candidiasis** section 7.2.2

**Pevaryl®** (Janssen)

**Cream**, econazole nitrate 1%, net price 30 g = £3.71

**Excipients** include butylated hydroxyanisole, fragrance

**MICONAZOLE NITRATE**

**Cautions** see notes above; **interactions:** Appendix 1 (antifungals, imidazole)

**Pregnancy** absorbed from skin in small amounts; manufacturer advises caution

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Fungal skin infections**

**Neonate** apply twice daily continuing for 10 days after lesions have healed

**Child 1 month–18 years** apply twice daily continuing for 10 days after lesions have healed

**Fungal nail infections**

Apply 1–2 times daily

**Oral and intestinal fungal infections** section 12.3.2

**Vaginal candidiasis** section 7.2.2

**Miconazole** (Non-proprietary)

**Cream**, miconazole nitrate 2%, net price 20 g = £2.05, 45 g = £1.97

**Dental prescribing on NHS** Miconazole cream may be prescribed

**Daktarin®** (Janssen)

**Cream**, miconazole nitrate 2%, net price 30 g = £1.82

**Excipients** include butylated hydroxyanisole

**NYSTATIN**

**Cautions** see notes above

**Side-effects** see notes above

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Skin infections due to *Candida* spp.** for dose, see preparation

**Oral fungal infections** section 12.3.2

**Nystaform®** (Typharm) (PoM)

**Cream**, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.62

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Dose**

Apply 2–3 times daily continuing for 7 days after lesions have healed.

## SALICYLIC ACID

**Cautions** avoid broken or inflamed skin

**Salicylate toxicity** Salicylate toxicity can occur particularly if applied on large areas of skin

**Side-effects** see notes above

**Indications and dose**

**Fungal nail infections, particularly tinea**

**Child 5–18 years** apply twice daily and after washing

**Note** Use with caution in child likely to suck affected digits

**Hyperkeratotic skin disorders** section 13.5.2

**Warts and calluses** section 13.7

**Phytex<sup>®</sup>** (Wynlit) 

**Paint**, salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 mL (with brush) = £2.97

**Excipients** none as listed in section 13.1.3

**Note** Flammable

## TERBINAFINE

**Cautions** avoid contact with eyes

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects

**Breast-feeding** manufacturer advises avoid—present in milk, but less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest

**Side-effects** see notes above

**Licensed use** not licensed for use in children

**Indications and dose**

**Fungal skin infections**

Apply thinly 1–2 times daily for up to 1 week in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks

**Systemic therapy** section 5.2.5

**<sup>1</sup>Terbinafine** (Non-proprietary) 

**Cream**, terbinafine hydrochloride 1%, net price 15 g = £1.73, 30 g = £3.46

**Lamisil<sup>®</sup>** (Novartis Consumer Health) 

**Cream**, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76

**Excipients** include benzyl alcohol, cetyl alcohol, polysorbate 60, stearyl alcohol

## TIOCONAZOLE

**Cautions** see notes above; also use with caution if child likely to suck affected digits

**Pregnancy** manufacturer advises avoid

- Can be sold to the public for external use in children over 16 years for the treatment of tinea pedis and tinea cruris as a cream containing terbinafine hydrochloride max. 1% in a pack containing max. 15 g; also for the treatment of tinea pedis, tinea cruris, and tinea corporis as a spray containing terbinafine hydrochloride max. 1% in a pack containing max. 30 mL or as a gel containing terbinafine hydrochloride max. 1% in a pack containing max. 30 g

**Side-effects** see notes above; also local oedema, dry skin, nail discoloration, periungual inflammation, nail pain, rash, exfoliation

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Fungal nail infections**

Apply to nails and surrounding skin twice daily for up to 6 months (may be extended to 12 months)

**Trosyl<sup>®</sup>** (Pfizer) 

**Cutaneous solution**, tioconazole 28%, net price 12 mL (with applicator brush) = £27.38

**Excipients** none as listed in section 13.1.3

## UNDECENOATES

**Cautions** see notes above; avoid broken skin

**Side-effects** see notes above

**Licensed use** *Monophytol<sup>®</sup>* not licensed for use in children under 12 years; *Mycota<sup>®</sup>* licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

See under preparations

**Mycota<sup>®</sup>** (Thornton & Ross)

**Cream**, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £1.64

**Excipients** include cetostearyl alcohol, fragrance

**Dose**

**Treatment of athlete's foot**

Apply twice daily continuing for 7 days after lesions have healed

**Prevention of athlete's foot**

Apply once daily

**Powder**, zinc undecenoate 20%, undecenoic acid 2%, net price 70 g = £2.22

**Excipients** include fragrance

**Dose**

**Treatment of athlete's foot**

Apply twice daily continuing for 7 days after lesions have healed

**Prevention of athlete's foot**

Apply once daily

**Spray application**, undecenoic acid 3.9%, dichlorophen 0.4% (pressurised aerosol pack), net price 100 mL = £2.46

**Excipients** include fragrance

**Note** Flammable

**Dose**

**Treatment of athlete's foot**

Apply twice daily continuing for 7 days after lesions have healed

**Prevention of athlete's foot**

Apply once daily

## 13.10.3 Antiviral preparations

See section 12.3.2 for drugs used in *herpetic stomatitis*, section 13.5.1 for *eczema herpeticum*, and section 11.3.3 for viral infections of the eye.

**Aciclovir** cream is used for the treatment of initial and recurrent labial, cutaneous, and genital *herpes simplex infections* in children; treatment should begin as early as

possible. Systemic treatment is necessary for buccal or vaginal infections or if cold sores recur frequently (for details of systemic use see section 5.3.2.1).

**Herpes labialis** **Aciclovir** cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

**Penciclovir** cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

## ACICLOVIR (Acyclovir)

**Cautions** avoid contact with eyes and mucous membranes

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

**Side-effects** transient stinging or burning; occasionally erythema, itching or drying of the skin

**Licensed use** licensed for use in children (age range not specified by manufacturer)

### Indications and dose

#### Herpes simplex infections

Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

#### Herpes simplex and varicella–zoster infections section 5.3.2.1

#### Eye infections section 11.3.3

**Aciclovir** (Non-proprietary) (PoM)

**Cream**, aciclovir 5%, net price 2 g = 83p, 10 g = £4.15

**Dental prescribing on NHS** Aciclovir Cream may be prescribed

**Note** A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

**Zovirax**<sup>®</sup> (GSK) (PoM)

**Cream**, aciclovir 5%, net price 2 g = £4.63, 10 g = £13.96

**Excipients** include cetostearyl alcohol, propylene glycol

## PENCICLOVIR

**Cautions** avoid contact with eyes and mucous membranes

**Side-effects** transient stinging, burning, numbness; hypersensitivity reactions also reported

**Licensed use** not licensed for use in children under 12 years

**Vectavir**<sup>®</sup> (Novartis Consumer Health) (PoM)

**Cream**, penciclovir 1%, net price 2 g = £4.20

**Excipients** include cetostearyl alcohol, propylene glycol  
**Dose**

#### Herpes labialis

Apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack

**Dental prescribing on NHS** May be prescribed as Penciclovir Cream

## 13.10.4 Parasiticial preparations

### Suitable quantities of parasiticial preparations

Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)	—	50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	—
Body (crab lice)	30–60 g	100 mL	—

These amounts are usually suitable for a child 12–18 years for single application

### Scabies

**Permethrin** is used for the treatment of scabies (*Sarcoptes scabiei*); **malathion** can be used if permethrin is inappropriate.

**Benzyol benzoate** is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

**Ivermectin** (available from 'special-order' manufacturers or specialist importing companies, see p. 840), is used in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone.

**Application** Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. Malathion and permethrin should be applied twice, one week apart. It is important to warn users to reapply treatment to the hands if they are washed. Children with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Itching** The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of **crotamiton** can be used to control itching after treatment with more effective acaricides. A topical **corticosteroid** (section 13.4) may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest failure of scabies eradication. Oral administration of a **sedating antihistamine** (section 3.4.1) at night may also be useful.

### Head lice

**Dimeticone** is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. **Malathion**, an organophosphorous insecticide, is an alternative but resistance has been reported. Benzyol benzoate is licensed for the treatment of head lice but it is not recommended for use in children.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of a parasitocidal product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected individuals in a household should be treated at the same time.

**Wet combing methods** Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice, such as combs and topical solutions, are available and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents, p. 829 for links to online Drug Tariffs).

## Crab lice

Permethrin and malathion are used to eliminate *crab lice* (*Phthirus pubis*); permethrin is not licensed for treatment of crab lice in children under 18 years. An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

## Parasitocidal preparations

**Dimeticone** coats head lice and interferes with water balance in lice by preventing excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

**Malathion** is recommended for *scabies*, *head lice* and *crab lice* (see notes above). The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, except in the treatment of hyperkeratotic scabies (see notes above), applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be **avoided** since the likelihood of eradication of lice is not increased.

**Permethrin** is effective for *scabies*. It is active against *head lice* but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice. Permethrin is also effective against *crab lice* but it is not licensed for this purpose in children under 18 years.

## DIMETICONE

**Cautions** avoid contact with eyes

**Side-effects** skin irritation

**Licensed use** not licensed for use in children under 6 months except under medical supervision

## Indications and dose

### Head lice

Rub into dry hair and scalp, allow to dry naturally, shampoo after 8 hours (or overnight); repeat application after 7 days

**Hedrin**<sup>®</sup> (Thornton & Ross)

**Lotion**, dimeticone 4%, net price 50 mL = £2.98, 120-mL spray pack = £7.13, 150 mL = £6.92

**Note** Patients should be told to keep their hair away from fire and flames during treatment

## MALATHION

**Cautions** avoid contact with eyes; do not use on broken or secondarily infected skin; do not use lotion more than once a week for 3 consecutive weeks; alcoholic lotions **not** recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice (see notes above)

**Side-effects** skin irritation and hypersensitivity reactions; chemical burns also reported

**Licensed use** not licensed for use in children under 6 months except under medical supervision

## Indications and dose

See notes above and under preparations

### Head lice

Rub into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours; repeat application after 7 days (see also notes above)

### Crab lice

Apply over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days

### Scabies

Apply over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

**Note** For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

**Derbac-M**<sup>®</sup> (SSL)

**Liquid**, malathion 0.5% in an aqueous basis, net price 50 mL = £3.05, 200 mL = £7.33

**Excipients** include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

## PERMETHRIN

**Cautions** avoid contact with eyes; do not use on broken or secondarily infected skin

**Side-effects** pruritus, erythema, and stinging; rarely rashes and oedema

**Licensed use** *Dermal Cream* (scabies), not licensed for use in children under 2 months; children aged 2 months–2 years, medical supervision required; not licensed for treatment of crab lice in children under 18 years; *Crema Rinse* (head lice) not licensed for use in children under 6 months except under medical supervision

**Indications and dose**

See notes above

**Scabies**

Apply 5% preparation over whole body including face, neck, scalp and ears; wash off after 8–12 hours; if hands washed with soap within 8 hours of application, they should be treated again with cream (see notes above); repeat application after 7 days

**Note** Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears

**Permethrin** (Non-proprietary)

**Cream**, permethrin 5%, net price 30 g = £6.96

**Lyclear® Creme Rinse** (Omega Pharma) 

**Cream rinse**, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £3.55, 2 × 59-mL pack = £6.46

**Excipients** include cetyl alcohol

**Note** Use not recommended, therefore no dose stated (product too diluted in use and insufficient contact time)

**Lyclear® Dermal Cream** (Omega Pharma)

**Dermal cream**, permethrin 5%, net price 30 g = £5.71. Label: 10, patient information leaflet

**Excipients** include butylated hydroxytoluene, wool fat derivative

## 13.10.5 Preparations for minor cuts and abrasions

Cetrimide cream is used to treat minor cuts and abrasions. **Proflavine** cream may be used to treat infected wounds or burns, but has now been largely superseded by other antiseptics or suitable antibacterials.

**Cetrimide Cream, BP**

**Cream**, cetrimide 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, liquid paraffin 50% in freshly boiled and cooled purified water, net price 50 g = £1.11

**Proflavine Cream, BPC**

**Cream**, proflavine hemisulfate 0.1%, yellow beeswax 2.5%, chlorocresol 0.1%, liquid paraffin 67.3%, freshly boiled and cooled purified water 25%, wool fat 5%, net price 100 mL = £2.40

**Excipients** include beeswax, wool fat

**Note** Stains clothing

**Collodion**

**Flexible collodion** may be used to seal minor cuts and wounds that have partially healed.

**Collodion, Flexible, BP**

**Collodion**, castor oil 2.5%, colophony 2.5% in a collodion basis, prepared by dissolving pyroxylin (10%) in a mixture of 3 volumes of ether and 1 volume of alcohol (90%), net price 10 mL = 38p. Label: 15

**Contra-indications** allergy to colophony in elastic adhesive plasters and tape

**Skin tissue adhesive**

Tissue adhesives are used for closure of minor skin wounds and for additional suture support. They should be applied by an appropriately trained healthcare professional. Skin tissue adhesives may cause skin sensitisation.

**Dermabond ProPen®** (Ethicon)

**Topical skin adhesive**, sterile, octyl 2-cyanoacrylate, net price 0.5 mL = £18.92

**Epiglu®** (Schuco)

**Tissue adhesive**, sterile, ethyl-2-cyanoacrylate 954.5 mg/g, polymethylmethacrylate, net price 4 × 3-g vials = £149.50 (with dispensing pipettes and palette)

**Histoacryl®** (B. Braun)

**Tissue adhesive**, sterile, enbucrilate, net price 5 × 200-mg unit (blue) = £32.00, 10 × 200-mg unit (blue) = £67.20, 5 × 500-mg unit (clear or blue) = £34.65, 10 × 500-mg unit (blue) = £69.30

**LiquiBand®** (MedLogic)

**Tissue adhesive**, sterile, enbucrilate, net price 0.5-g amp = £5.50

## 13.11 Skin cleansers, antiseptics, and desloughing agents

- 13.11.1 Alcohols and saline
- 13.11.2 Chlorhexidine salts
- 13.11.3 Cationic surfactants and soaps
- 13.11.4 Iodine
- 13.11.5 Phenolics
- 13.11.6 Oxidisers and dyes
- 13.11.7 Desloughing agents

Soap or detergent is used with water to cleanse intact skin but they can irritate infantile skin; emollient preparations such as aqueous cream (section 13.2.1.1) or emulsifying ointment (section 13.2.1) can be used in place of soap or detergent for cleansing dry or irritated skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing **chlorhexidine** or **povidone-iodine**, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics (section 13.2.1).

Antiseptics such as **chlorhexidine** or **povidone-iodine** are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing **cetrimide** can be used if a detergent effect is also required.

Preparations containing alcohol, and regular use of povidone-iodine, should be avoided on neonatal skin (see section 13.1).

**Hydrogen peroxide**, an oxidising agent, is available as a cream and can be used for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile **sodium chloride 0.9% solution** is used but tap water is often appropriate.

**Potassium permanganate** solution 1 in 10 000, a mild antiseptic with astringent properties, can be used as a soak for exudative eczematous areas (section 13.5.1); treatment should be stopped when the skin becomes dry. Potassium permanganate can stain skin and nails especially with prolonged use.

## 13.11.1 Alcohols and saline

## ALCOHOL

**Cautions** flammable; avoid broken skin; patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

**Contra-indications** neonates, see section 13.1

**Indications and dose****Skin preparation before injection**

Apply to skin as necessary

**Industrial Methylated Spirit, BP**

**Solution**, 19 volumes of ethanol and 1 volume approved wood naphtha, net price '66 OP' (containing 95% by volume alcohol) 100 mL = 39p; '74 OP' (containing 99% by volume alcohol) 100 mL = 39p. Label: 15

**Surgical Spirit, BP**

**Spirit**, methyl salicylate 0.5 mL, diethyl phthalate 2%, castor oil 2.5%, in industrial methylated spirit, net price 100 mL = 20p. Label: 15

## SODIUM CHLORIDE

**Indications and dose**

See notes above

**Nebuliser diluent** section 3.1.5

**Sodium depletion** section 9.2.1.2

**Electrolyte imbalance** section 9.2.2.1

**Eye** section 11.8.1

**Oral hygiene** section 12.3.4

**Sodium Chloride** (Non-proprietary)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 20-mL unit = £4.95, 200-mL can = £2.65, 1 litre = 80p

**Flowfusor**<sup>®</sup> (Fresenius Kabi)

**Solution** (sterile), sodium chloride 0.9%, net price 120-mL Bellows Pack = £1.53

**Irriclen**<sup>®</sup> (ConvaTec)

**Solution** in aerosol can (sterile), sodium chloride 0.9%, net price 240-mL can = £3.46

**Irripod**<sup>®</sup> (C D Medical)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £5.84

**Miniversol**<sup>®</sup> (Aguettant)

**Solution** (sterile), sodium chloride 0.9%, net price 30 × 45-mL unit = £13.20; 30 × 100-mL unit = £19.50

**Normasol**<sup>®</sup> (Mölnlycke)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 25-mL sachet = £6.36; 10 × 100-mL sachet = £7.73

**Stericlen**<sup>®</sup> (C D Medical)

**Solution** in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £2.06, 240-mL can = £3.13

**Steripod**<sup>®</sup> Sodium Chloride (Medlock)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £7.84

## 13.11.2 Chlorhexidine salts

## CHLORHEXIDINE

**Cautions** avoid contact with eyes, brain, meninges and middle ear; not for use in body cavities; alcoholic solutions not suitable before diathermy or for use on neonatal skin

**Side-effects** occasional sensitivity

**Indications and dose**

See under preparations

**Bladder irrigation and catheter patency solutions** section 7.4.4**Chlorhexidine 0.05%** (Baxter)

**2000 Solution** (sterile), pink, chlorhexidine acetate 0.05%, net price 1000 mL = £0.77

For cleansing and disinfecting wounds and burns

**Cepton**<sup>®</sup> (LPC)

**Skin wash** (= solution), red, chlorhexidine gluconate

1%, net price 150 mL = £3.64

For use as skin wash in acne

**Lotion**, blue, chlorhexidine gluconate 0.1%, net price 150 mL = £2.48

For skin disinfection in acne

**Chloraprep**<sup>®</sup> (CareFusion)

**Cutaneous solution**, sterile, chlorhexidine gluconate

2% in isopropyl alcohol 70%, net price (all with single applicator) 0.67 mL (with *SEPP*<sup>®</sup> applicator) =

30p, 1.5 mL (with *FREPP*<sup>®</sup> applicator) = 55p, 1.5 mL =

55p, 3 mL = 85p, 10.5 mL = £2.92, 26 mL =

£6.50; (all with single applicator, with tint) 3 mL =

89p, 10.5 mL = £3.07, 26 mL = £6.83

For skin disinfection before invasive procedures; **Child**

**under 2 months** not recommended

**Note** Flammable

**CX Antiseptic Dusting Powder**<sup>®</sup> (Ecolab)

**Dusting powder**, sterile, chlorhexidine acetate 1%,

net price 15 g = £3.93

For skin disinfection

**Hibiscrub**<sup>®</sup> (Mölnlycke)

**Cleansing solution**, red, chlorhexidine gluconate 4%,

perfumed, in a surfactant solution, net price 250 mL =

£4.25, 500 mL = £5.25, 5 litres = £24.00

**Excipients** include fragrance

Use instead of soap for pre-operative hand and skin

preparation and for general hand and skin disinfection

**Hibi**<sup>®</sup> Liquid Hand Rub+ (Mölnlycke)

**Solution**, chlorhexidine gluconate 0.5%, in isopropyl

alcohol 70% with emollients, net price 500 mL =

£5.25

To be used undiluted for hand and skin disinfection

**Hibitane Obstetric**<sup>®</sup> (Derma UK)

**Cream**, chlorhexidine gluconate solution 5% (= 1%

chlorhexidine gluconate), in a pourable water-miscible

basis, net price 250 mL = £9.00

For use in obstetrics and gynaecology as an antiseptic and

lubricant (for application to skin around vulva and

perineum and to hands of midwife or doctor)

**Hydrex**<sup>®</sup> (Ecolab)

**Solution**, chlorhexidine gluconate solution 2.5% (=

chlorhexidine gluconate 0.5%), in denatured ethanol

70%, net price 600 mL (clear) = £3.49; 600 mL

(pink) = £3.49, 200-mL spray = £1.77, 500-mL spray

= £3.01

**Note** Flammable

For pre-operative skin disinfection

**Surgical scrub**, chlorhexidine gluconate 4% in a surfactant solution, net price 250 mL = £3.39, 500 mL = £3.59

**Excipients** include fragrance

For pre-operative hand and skin preparation and for general hand disinfection

**Unisept®** (Medlock)

**Solution** (sterile), pink, chlorhexidine gluconate 0.05%, net price 25 × 25-mL sachet = £5.54; 10 × 100-mL sachet = £6.83

To be used undiluted for general skin disinfection and swabbing in obstetrics

#### ▲ With cetrimide

**Tisept®** (Medlock)

**Solution** (sterile), yellow, chlorhexidine gluconate 0.015%, cetrimide 0.15%, net price 25 × 25-mL sachet = £5.33; 10 × 100-mL sachet = £6.85

To be used undiluted for general skin disinfection and wound cleansing

**Travasept 100®** (Baxter)

**Solution** (sterile), yellow, chlorhexidine acetate 0.015%, cetrimide 0.15%, net price 500 mL = 72p, 1 litre = 77p

To be used undiluted in skin disinfection such as wound cleansing and obstetrics

## Concentrates

**Hibitane® Plus 5% Concentrate** (Mölnlycke)

**Solution**, red, chlorhexidine gluconate 5%, in a perfumed aqueous solution, net price 5 litres = £14.50

**Dose**

Dilute 1 in 10 (0.5%) with alcohol 70%

**General skin disinfection**

Dilute 1 in 100 (0.05%) with water

**Note** Alcoholic solutions not suitable for use before diathermy (see Alcohol, p. 600) or on neonatal skin

## 13.11.3 Cationic surfactants and soaps

### CETRIMIDE

**Cautions** avoid contact with eyes; avoid use in body cavities

**Side-effects** skin irritation and occasionally sensitisation

**Indications and dose**

**Skin disinfection**

▲ **Preparations**

Ingredient of *Tisept®* and *Travasept® 100*, see above

## 13.11.4 Iodine

### POVIDONE-IODINE

**Cautions** broken skin (see below)

**Large open wounds** The application of povidone-iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia, and impairment of renal function

**Contra-indications** corrected gestational age under 32 weeks; infants body-weight under 1.5 kg; regular use in neonates; thyroid disorders; concomitant lithium treatment

**Renal impairment** avoid regular application to inflamed or broken skin or mucosa

**Pregnancy** sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester

**Breast-feeding** avoid regular or excessive use

**Side-effects** rarely sensitivity; may interfere with thyroid function tests

**Indications and dose**

**Skin disinfection** see preparations

**Betadine®** (Ayrton Saunders)

**Dry powder spray**, povidone-iodine 2.5% in a pressurised aerosol unit, net price 150-g unit = £2.63

For skin disinfection, particularly minor wounds and infections; **Child under 2 years** not recommended

**Note** Not for use in serous cavities

**Savlon® Dry** (Novartis Consumer Health)

**Powder spray**, povidone-iodine 1.14% in a pressurised aerosol unit, net price 50-mL unit = £2.51

For minor wounds

**Videne®** (Ecolab)

**Alcoholic tincture**, povidone-iodine 10%, net price 500 mL = £5.43

**Dose**

Apply undiluted in pre-operative skin disinfection

**Note** Flammable—caution in procedures involving hot wire cautery and diathermy; avoid use in neonates

**Antiseptic solution**, povidone-iodine 10% in aqueous solution, net price 500 mL = £5.43

**Dose**

Apply undiluted in pre-operative skin disinfection and general antiseptics

**Surgical scrub**, povidone-iodine 7.5% in aqueous solution, net price 500 mL = £5.43

**Dose**

Use as a pre-operative scrub for hand and skin disinfection

## 13.11.5 Phenolics

Triclosan has been used for disinfection of the hands and wounds, and for disinfection of the skin before surgery.

## 13.11.6 Oxidisers and dyes

### HYDROGEN PEROXIDE

**Cautions** large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Superficial bacterial skin infection** see under preparation below

**Crystacide**<sup>®</sup> (Derma UK)

**Cream**, hydrogen peroxide 1%, net price 25 g = £8.07, 40 g = £11.62

**Excipients** include edetic acid (EDTA), propylene glycol

**Dose**

**Superficial bacterial skin infection**

Apply 2–3 times daily for up to 3 weeks

**POTASSIUM PERMANGANATE**

**Cautions** irritant to mucous membranes

**Indications and dose**

**Cleansing and deodorising suppurating eczematous reactions (section 13.5.1) and wounds**

For wet dressings or baths, use approx. 0.01% (1 in 10 000) solution

**Note** Stains skin and clothing

**Potassium Permanganate Solution**

**Solution**, potassium permanganate 0.1% (1 in 1000) in water

**Note** to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution

**Permitabs**<sup>®</sup> (Alliance)

**Solution tablets**, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tab pack = £14.59

**Note** 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution

**13.11.7 Desloughing agents**

Alginate, hydrogel, and hydrocolloid dressings (see BNF Appendix 5) are effective in wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised.

For further information on wound management products and elastic hosiery, see BNF Appendix 5.

**13.12 Antiperspirants**

Aluminium chloride is a potent antiperspirant used in the treatment of axillary, palmar, and plantar hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use tap water or **glycopyrronium bromide** (as a 0.05% solution) in the iontophoretic treatment of hyperhidrosis of palms and soles.

**Botox**<sup>®</sup> contains botulinum toxin type A complex (section 4.9.3) and is available for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment; intradermal treatment is unlikely to be tolerated by most children and should be administered under hospital specialist supervision.

**ALUMINIUM SALTS**

**Cautions** avoid contact with eyes or mucous membranes; avoid use on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing

**Side-effects** skin irritation

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Hyperhidrosis affecting axillae, hands or feet**

Apply liquid formulation at night to dry skin, wash off the following morning, initially apply daily then reduce frequency as condition improves—do not bathe immediately before use

**Hyperhidrosis, bromidrosis, intertrigo, and prevention of tinea pedis and related conditions**

Apply powder to dry skin

**Anhydrol**<sup>®</sup> Forte (Dermal)

**Solution** (= application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.51. Label: 15

**Excipients** none as listed in section 13.1.3

**Driclor**<sup>®</sup> (Stiefel)

**Application**, aluminium chloride hexahydrate 20% in an alcoholic basis, net price 75-mL bottle with roll-on applicator = £3.01. Label: 15

**Excipients** none as listed in section 13.1.3

**Note** A 30-mL pack is on sale to the public

**ZeaSORB**<sup>®</sup> (Stiefel)

**Dusting powder**, aldioxa 0.22%, chloroxylenol 0.5%, net price 50 g = £2.61

**Excipients** include fragrance

**GLYCOPYRRONIUM BROMIDE**

**Cautions** see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely)

**Contra-indications** see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also infections affecting the treatment site

**Side-effects** see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also tingling at administration site

**Licensed use** licensed for use in children (age range not specified by manufacturer)

**Indications and dose**

**Iontophoretic treatment of hyperhidrosis**

Consult product literature; only 1 site to be treated at a time, max. 2 sites treated in any 24 hours, treatment not to be repeated within 7 days

**Other indications** section 15.1.3

**Robinul**<sup>®</sup> (AMCo) (PoM)

**Powder**, glycopyrronium bromide, net price 3 g = £266.00

**13.13 Topical circulatory preparations**

These preparations are used to improve circulation in conditions such as bruising and superficial thrombophlebitis but are of little value. First aid measures such

as rest, ice, compression, and elevation should be used. Topical preparations containing heparinoids should not be used on large areas of skin, broken or sensitive skin, or mucous membranes. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

**Hirudoid<sup>®</sup>** (Genus) 

**Cream**, heparinoid 0.3% in a vanishing-cream basis, net price 50 g = £3.99

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Dose**

**Superficial thrombophlebitis, bruising, and haematoma**

**Child 5–18 years** apply up to 4 times daily

**Gel**, heparinoid 0.3%, net price 50 g = £3.99

**Excipients** include propylene glycol, fragrance

**Dose**

**Superficial thrombophlebitis, bruising, and haematoma**

**Child 5–18 years** apply up to 4 times daily

# 14 Immunological products and vaccines

14.1	Active immunity	604
14.2	Passive immunity	607
14.3	Storage and use	607
14.4	Vaccines and antisera	607
14.5	Immunoglobulins	627
14.5.1	Normal Immunoglobulin	628
14.5.2	Disease-specific immunoglobulins	630
14.5.3	Anti-D (Rh <sub>0</sub> ) immunoglobulin	632
14.6	International travel	632

## 14.1 Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

1. a *live attenuated* form of a virus (e.g. measles, mumps, and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. *inactivated* preparations of a virus (e.g. influenza vaccine) or bacteria, or
3. *detoxified* exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
4. *extracts* of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

**Live attenuated vaccines** usually produce durable immunity but not always as long-lasting as that resulting from natural infection.

**Inactivated vaccines** may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook *Immunisation against Infectious Disease* (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook are available at [www.immunisation.dh.gov.uk](http://www.immunisation.dh.gov.uk)

The advice in this chapter also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

**Cautions** Most children can safely receive the majority of vaccines. Vaccination may be postponed if the child is suffering from an acute illness; however, it is not necessary to postpone immunisation in children with minor illnesses without fever or systemic upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of Administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more vaccines are required (and are not available as a combined preparation), they should be given simultaneously at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart (but see also BCG Vaccines, p. 608). When 2 live vaccines cannot be given at the same time, they should be separated by an interval of at least 4 weeks. For **interactions** see Appendix 1 (vaccines).

See also Cautions under individual vaccines.

**Contra-indications** Vaccines are contra-indicated in children who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

Gelatin	Polymyxin B
Gentamicin	Streptomycin
Kanamycin	Thiomersal
Neomycin	
Penicillins	

**Hypersensitivity to egg** Children with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine, and yellow fever vaccine should only be considered under the guidance of a specialist. Children with a history of egg allergy can be immunised with either an egg-free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these children should be referred to a specialist in hospital. See also Cautions under MMR vaccine.

See also Vaccines and HIV infection, below.

Live vaccines may be contra-indicated temporarily in individuals who are:

- immunosuppressed (see Impaired Immune Response, below);
- pregnant (see Pregnancy and Breast-feeding, below).

See also Contra-indications under individual vaccines.

**Impaired immune response** Immune response to vaccines may be reduced in immunosuppressed children and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed children should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for children being treated with high doses of corticosteroids (dose equivalents of prednisolone: children, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs<sup>1</sup>, and for children with malignant conditions undergoing chemotherapy or generalised radiotherapy<sup>1,2</sup>. However, with the exception of severe combined immunodeficiency, the benefit from rotavirus vaccination is likely to outweigh the risk in other types of immunosuppression; if there is any doubt, advice should be sought from a specialist. For special reference to *HIV infection*, see below.

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child (2002)* (available at [www.rcpch.ac.uk](http://www.rcpch.ac.uk)).

**Pregnancy** Live vaccines should not be administered routinely during pregnancy because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease (e.g. to yellow fever), the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during pregnancy, see under individual vaccines.

**Breast-feeding** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during breast-feeding, see under individual vaccines.

**Side-effects** Injection of a vaccine may be followed by local reactions such as pain, inflammation, redness, and lymphangitis. An induration or sterile abscess may develop at the injection site. Gastro-intestinal disturbances, fever, headache, irritability, loss of appetite, fatigue, myalgia, and malaise are among the most commonly reported side-effects. Other side-effects include influenza-like symptoms, dizziness, paraesthesia, asthenia, drowsiness, arthralgia, rash, and lymphadenopathy. Hypersensitivity reactions, such as bronchospasm, angioedema, urticaria, and anaphylaxis, are very rare but can be fatal (see section 3.4.3 for management of allergic emergencies).

**Oral vaccines**, such as cholera, live poliomyelitis, rotavirus, and live typhoid, can also cause gastro-intestinal disturbances such as nausea, vomiting, abdominal pain and cramps, and diarrhoea.

1. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).
2. Use of normal immunoglobulin should be considered after exposure to measles (see p. 628) and varicella-zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 631).

See also Predisposition to Neurological Problems, below.

Some vaccines (e.g. poliomyelitis) produce very few reactions, while others (e.g. measles, mumps and rubella) may cause a very mild form of the disease. Occasionally more serious adverse reactions can occur—these should always be reported to the CHM (see Adverse Reactions to Drugs, p. 11).

See also Preterm Birth, p. 606.

### Predisposition to neurological problems

When there is a personal or family history of *febrile convulsions*, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* (see Post-immunisation Pyrexia in Infants, below) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

### Post-immunisation pyrexia in infants

The carer should be advised that if pyrexia develops after childhood immunisation and the infant seems distressed, a dose of paracetamol can be given and, if necessary, a second dose can be given 4–6 hours later. Ibuprofen can be used if paracetamol is unsuitable, but if a second dose of ibuprofen is required, it is given 6 hours after the first dose. The carer should be warned to seek medical advice if the pyrexia persists.

For post-immunisation pyrexia in an infant aged 2–3 months, the dose of paracetamol is 60 mg; the dose of ibuprofen is 50 mg (on a doctor's advice). An oral syringe can be obtained from any pharmacy to give the small volume required.

Further information on adverse effects associated with specific vaccines can be found under individual vaccines.

**Vaccines and HIV infection** HIV-positive children with or without symptoms can receive the following live vaccines:

MMR (but avoid if immunity significantly impaired), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature)<sup>2</sup>, rotavirus;

and the following inactivated vaccines:

anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human

## Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from **local health organisations** or from ImmForm ([www.immform.dh.gov.uk](http://www.immform.dh.gov.uk))—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

### Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks postmenstrual age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* type b, meningococcal C, and hepatitis B after primary immunisation.

When to immunise (for preterm infants—see note above)	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only	<ul style="list-style-type: none"> <li>● <b>BCG Vaccine</b> See section 14.4, BCG Vaccines</li> <li>● <b>Hepatitis B Vaccine</b> See section 14.4, Hepatitis B Vaccine</li> </ul>
2 months	<ul style="list-style-type: none"> <li>● <b>Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)</b> First dose</li> <li>● <b>Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)</b> First dose</li> <li>● <b>Rotavirus vaccine</b> First dose</li> </ul>
3 months	<ul style="list-style-type: none"> <li>● <b>Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)</b> Second dose</li> <li>● <b>Meningococcal Group C Conjugate Vaccine</b> First dose</li> <li>● <b>Rotavirus vaccine</b> Second dose</li> </ul>
4 months	<ul style="list-style-type: none"> <li>● <b>Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)</b> Third dose</li> <li>● <b>Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)</b> Second dose</li> </ul>
12–13 months	<ul style="list-style-type: none"> <li>● <b>Measles, Mumps and Rubella Vaccine, Live (MMR)</b> First dose</li> <li>● <b>Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)</b> Single booster dose</li> <li>● <b>Haemophilus Type b Conjugate Vaccine and Meningococcal Group C Conjugate Vaccine</b> Single booster dose</li> </ul>
Between 3 years and 4 months, and 5 years	<ul style="list-style-type: none"> <li>● <b>Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine</b> or <b>Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine</b> Single booster dose <b>Note:</b> Preferably allow interval of at least 3 years after completing primary course</li> <li>● <b>Measles, Mumps and Rubella Vaccine, Live (MMR)</b> Second dose</li> </ul>
12–13 years (females only)	<ul style="list-style-type: none"> <li>● <b>Human Papillomavirus Vaccine</b> 3 doses; second dose 1 month, and third dose 4–6 months after first dose<sup>1</sup></li> </ul>
13–15 years	<ul style="list-style-type: none"> <li>● <b>Meningococcal Group C Conjugate Vaccine</b> Single booster dose</li> </ul>
13–18 years	<ul style="list-style-type: none"> <li>● <b>Adsorbed Diphtheria [low dose], Tetanus, and Poliomyelitis (Inactivated) Vaccine</b> Single booster dose <b>Note:</b> Can be given at the same time as the booster dose of meningococcal group C conjugate vaccine at 13–15 years of age</li> </ul>
During adult life, women of child-bearing age susceptible to rubella	<ul style="list-style-type: none"> <li>● <b>Measles, Mumps and Rubella Vaccine, Live (MMR)</b> Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, but see also section 14.4, Measles, Mumps and Rubella Vaccine</li> </ul>

1. The two human papillomavirus vaccines are not interchangeable and one vaccine product should be used for the entire course.

papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis<sup>1</sup>, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive children should **not** receive:

BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever.<sup>2</sup>

**Note** The above advice differs from that for other immunocompromised children; Immunisation of HIV-infected Children issued by Children's HIV Association (CHIVA) are available at [www.chiva.org.uk](http://www.chiva.org.uk)

**Vaccines and asplenia** The following vaccines are recommended for asplenic children or those with splenic dysfunction:

haemophilus influenzae type b; influenza; meningococcal A, C, W135, and Y conjugate; pneumococcal.

For antibiotic prophylaxis in asplenia see p. 259.

**Route of administration** Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal route, deep subcutaneous route, or oral route. The intramuscular route should not be used in children with **bleeding disorders** such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

**Note** The Department of Health has advised *against the use of jet guns* for vaccination owing to the risk of transmitting blood-borne infections, such as HIV.

### High-risk groups

For information on high-risk groups, see section 14.4 under individual vaccines

BCG Vaccines, p. 608

Hepatitis A Vaccine, p. 612

Hepatitis B Vaccine, p. 614

Influenza Vaccine, p. 616

Pneumococcal Vaccines, p. 622

Tetanus Vaccines, p. 625

### Children with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

For advice on the immunisation of children coming to the UK, consult the handbook *Immunisation against Infectious Disease* (2006) (available at [www.dh.gov.uk](http://www.dh.gov.uk))

## 14.2 Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals

1. Inactivated poliomyelitis vaccine is now used instead of oral poliomyelitis vaccine for routine immunisation of children.
2. If yellow fever risk is unavoidable, specialist advice should be sought.

with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed *immunoglobulins*. The term *antiserum* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced whenever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins, but reports of such reactions are very rare.

## 14.3 Storage and use

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multi-dose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

## 14.4 Vaccines and antisera

**Availability** Anthrax and yellow fever vaccines, botulism antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 33.

Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department  
Public Health England  
Wellington House  
133–155 Waterloo Road  
London, SE1 8UG  
[vaccinesupply@phe.gov.uk](mailto:vaccinesupply@phe.gov.uk)

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not commercially available should be directed to:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff  
CF14 4XW  
Tel: (029) 2074 2979

In Northern Ireland:

Pharmacy and Medicines Management Centre  
Beech House  
Antrim Hospital Site  
Northern Health and Social Care Trust  
Bush Road  
Antrim, BT41 2RL  
rphs.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

## Anthrax vaccine

Anthrax vaccine is rarely required for children. For further information see BNF section 14.4.

## BCG vaccines

BCG (*Bacillus Calmette-Guérin*) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of hypersensitivity to *M. tuberculosis*. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small flat scar. A dry dressing may be used if the ulcer discharges, but air should **not** be excluded.

All children of 6 years and over being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see under Diagnostic agents, below). A skin test is not necessary for a child under 6 years, provided that the child has not stayed for longer than 3 months in a country with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

BCG is recommended for the following groups of children if BCG immunisation has not previously been carried out and they are negative for tuberculoprotein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence<sup>1</sup> of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–18 years from Sub-Saharan Africa or a country<sup>1</sup> with an incidence of tuberculosis greater than 500 per 100 000;
- contacts of those with active respiratory tuberculosis;

1. List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at [www.hpa.org.uk](http://www.hpa.org.uk)

- children under 16 years intending to live with local people for more than 3 months in a country with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time, an interval of 4 weeks should normally be allowed between them. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for treatment of infection following vaccination, seek expert advice.

## BACILLUS CALMETTE-GUÉRIN VACCINE

### BCG vaccine

**Cautions** see section 14.1

**Contra-indications** see section 14.1; also neonate in household contact with known or suspected case of active tuberculosis; generalised septic skin conditions (for children with eczema, lesion-free site should be used)

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1 and notes above; *also* at the injection-site, subcutaneous abscess, prolonged ulceration; *rarely* disseminated complications such as osteitis or osteomyelitis

### Indications and dose

#### Immunisation against tuberculosis

- By intradermal injection

Neonate 0.05 mL

Child 1 month–1 year 0.05 mL

Child 1–18 years 0.1 mL

**Intradermal injection technique** Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb  $\equiv$  0.1 mL injection, 3 mm bleb  $\equiv$  0.05 mL injection; if considerable resistance not felt, needle is too deep and should be removed and reinserted before giving more vaccine.

To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**.

### ■ Intradermal

#### Bacillus Calmette-Guérin Vaccine (PoM)

BCG Vaccine, Dried/Tub/BCG Injection, (powder for suspension), freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin  
Available from health organisations or from ImmForm (SSI brand, multidose vial with diluent)

## Diagnostic agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

**Note** Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment.

Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantIFERON<sup>®</sup>-TB Gold* and *T-SPOT<sup>®</sup>-TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see [www.hpa.org.uk](http://www.hpa.org.uk).

### Tuberculin Purified Protein Derivative (PoM) (Tuberculin PPD)

**Injection**, heat-treated products of growth and lysis of appropriate *Mycobacterium* spp. 20 units/mL (2 units/0.1-mL dose) (for routine use), 1.5-mL vial; 100 units/mL (10 units/0.1-mL dose), 1.5-mL vial

**Dose**

#### Mantoux test

- **By intradermal injection**

2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength)

Available from *ImmForm* (SSI brand)

**Important** The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength

## Botulism antitoxin

A polyvalent botulism antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of children thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All children should be tested for sensitivity (diluting the antitoxin if history of allergy).

### Botulism Antitoxin (PoM)

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

**Note** The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification

**Dose**

#### Prophylaxis

Consult product literature

Available from local designated centres, for details see TOXBASE (requires registration) [www.toxbase.org](http://www.toxbase.org). For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank

## Cholera vaccine

**Cholera vaccine** (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V.cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

*Injectable cholera vaccine* provides unreliable protection and is no longer available in the UK.

## CHOLERA VACCINE

**Cautions** see section 14.1 and notes above

**Contra-indications** see section 14.1; also acute gastro-intestinal illness

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1; also *rarely* respiratory symptoms such as rhinitis and cough; *very rarely* sore throat, insomnia

### Indications and dose

See notes above

- **By mouth**

**Child 2–6 years** 3 doses each separated by an interval of 1–6 weeks

**Child 6–18 years** 2 doses separated by an interval of 1–6 weeks

**Note** If more than 6 weeks have elapsed between doses, the primary course should be restarted

A single booster dose can be given 2 years after primary course for children 6–18 years, and 6 months after primary course for children 2–6 years. If more than 2 years have elapsed since the last vaccination, the primary course should be repeated

**Administration** Dissolve effervescent sodium bicarbonate granules in a glassful of water (approximately 150 mL). For child over 6 years, add vaccine suspension to make one dose. For child 2–6 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink and other oral medicines should be avoided for 1 hour before and after vaccination

**Dukoral<sup>®</sup>** (Crucell) (PoM)

**Oral suspension**, for dilution with solution of effervescent sodium bicarbonate granules, heat- and formaldehyde-inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae* bacteria and recombinant cholera toxin B-subunit produced in *V. cholerae*, net price 2-dose pack = £23.42. Counselling, administration

## Diphtheria Vaccines

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves anti-

genicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule, section 14.1). In unimmunised children aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Children aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed). For children who have been vaccinated following a tetanus-prone wound, see Tetanus vaccines, p. 625.

**Travel** Children travelling to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

**Contacts** Advice on the management of cases of diphtheria, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected children and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune child, see Table 2, section 5.1.

## DIPHTHERIA-CONTAINING VACCINES

**Cautions** see section 14.1; see also individual components of vaccines

**Contra-indications** see section 14.1; see also individual components of vaccines

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1; also restlessness, sleep disturbances, and unusual crying in infants;

**Licensed use** *Infranrix-IPV + Hib*<sup>®</sup> not licensed for use in children over 36 months; *Pediacel*<sup>®</sup> not licensed in children over 4 years but

Department of Health recommends that these be used for children up to 10 years

### Indications and dose

See notes above and under preparations

### ▲ Diphtheria-containing vaccines for children under 10 years

**Important** For children aged 10 years or over see Diphtheria-containing Vaccines for Children Over 10 Years, p. 611, and see Diphtheria-containing Vaccines for Immunisation of Pregnant Women Against Pertussis, p. 611

#### Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed) (PoM)

**Injection**, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis, inactivated poliomyelitis and *Haemophilus influenzae* type b (conjugated to tetanus protein), net price 0.5-mL prefilled syringe = £32.00

**Excipients** may include neomycin, polymyxin B and streptomycin

#### Dose

##### Primary immunisation

- By intramuscular injection

**Child 2 months–10 years** 3 doses each of 0.5 mL separated by intervals of 1 month; see also notes on booster doses, above

Available as part of childhood immunisation schedule from health organisations or **ImmForm**

**Brands include** *Pediacel*<sup>®</sup>

#### Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (PoM)

**Injection**, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £17.56

**Excipients** may include neomycin and polymyxin B

#### Dose

##### First booster dose

- By intramuscular injection

**Child 3–10 years** 0.5 mL 3 years after primary immunisation; see also notes on booster doses, above

Available as part of childhood immunisation schedule from health organisations or **ImmForm**

**Brands include** *Infranrix-IPV*<sup>®</sup>

#### Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (PoM)

**Injection**, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £20.00

**Excipients** may include neomycin, polymyxin B and streptomycin

#### Dose

##### First booster dose

- By intramuscular injection

**Child 3–10 years** 0.5 mL 3 years after primary immunisation; see also notes on booster doses, above

Available as part of childhood immunisation schedule from health organisations or **ImmForm**

**Brands include** *Repevax*<sup>®</sup>

### ▲ Diphtheria-containing vaccines for children over 10 years

A low dose of diphtheria toxoid is sufficient to recall immunity in older children previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in a child who is already immune. Preparations containing low dose diphtheria should be used for children over 10 years, both for primary immunisation and booster doses. For immunisation of pregnant women against pertussis see Diphtheria-containing Vaccines for Immunisation of Pregnant Women Against Pertussis, p. 611.

### Adsorbed Diphtheria [low dose], Tetanus and Poliomyelitis (Inactivated) Vaccine <sup>(PoM)</sup>

**Injection**, suspension of diphtheria toxoid [low dose], tetanus toxoid and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £6.50

**Excipients** may include neomycin, polymyxin B and streptomycin

#### Dose

Primary immunisation

#### ● By intramuscular injection

**Child 10–18 years** 3 doses each of 0.5 mL separated by intervals of 1 month; second booster dose, 0.5 mL given 10 years after first booster dose (may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine); see also notes on booster doses, above

Available as part of childhood schedule from health organisations or **ImmForm**

**Brands include** *Revaxis*®

### ▲ Diphtheria-containing vaccines for immunisation of pregnant women against pertussis

For immunisation of children over 10 years against diphtheria see Diphtheria-containing Vaccines for Children Over 10 Years, p. 611

### Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine <sup>(PoM)</sup>

**Injection**, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5 mL prefilled syringe = £20.00

**Excipients** may include neomycin, polymyxin B and streptomycin

**Contra-indications** section 14.1; see also individual components of vaccine; also contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine

#### Dose

**Vaccination of pregnant women against pertussis** see p. 621

#### ● By intramuscular injection

0.5 mL as a single dose

Available from **ImmForm**

**Brands include** *Repevax*®

### ▲ Diphtheria antitoxin

**Diphtheria antitoxin** is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (Table 2, section 5.1) and vaccine (see Contacts above, p. 610).

### Diphtheria Antitoxin <sup>(PoM)</sup>

Dip/Ser

Dose

#### Prophylaxis

Not recommended therefore no dose stated (see notes above)

#### Treatment

Consult product literature

Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

## Haemophilus type b conjugate vaccine

**Haemophilus influenzae type b (Hib) vaccine** is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. *Haemophilus influenzae* type b vaccine is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, (see under Diphtheria containing Vaccines) as a component of the primary course of childhood immunisation (see Immunisation schedule, section 14.1). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae* type b component, with an interval of 1 month between doses. A booster dose of *haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at around 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of the vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and *haemophilus* type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

*Haemophilus influenzae* type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

### Invasive *Haemophilus influenzae* type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of *haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations

below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

For use of rifampicin in the prevention of secondary cases of *Haemophilus influenzae* type b disease, see Table 2, section 5.1

**Asplenia, splenic dysfunction, or complement deficiency** Children diagnosed with asplenia, splenic dysfunction, or complement deficiency at:

- *under 2 years of age* should be vaccinated according to the Immunisation Schedule (section 14.1). The booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), given at 12–13 months of age, should be followed at least 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. An additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given after the second birthday;
- *over 2 years of age* should receive one dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine.

## HAEMOPHILUS TYPE B CONJUGATE VACCINE

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1; also, atopic dermatitis, hypotonia

**Licensed use** *Menitorix*<sup>®</sup> is not licensed for use in children over 2 years

### Indications and dose

See notes above and under preparation

**Primary immunisation**, see under Diphtheria-containing vaccines

**Menitorix**<sup>®</sup> (GSK) (Pom)

**Injection**, powder for reconstitution, capsular polysaccharide of *Haemophilus influenzae* type b and capsular polysaccharide of *Neisseria meningitidis* group C (both conjugated to tetanus protein), net price single dose vial (with syringe containing 0.5 mL diluent) = £37.76

**Dose**

- By intramuscular injection

**CHILD 1–10 year** 0.5 mL

**CHILD over 1 year** with asplenia or splenic dysfunction (see notes above), 0.5 mL

Available as part of the childhood immunisation schedule from **ImmForm**

### Combined vaccines

See also Diphtheria-containing vaccines

## Hepatitis A vaccine

**Hepatitis A vaccine** is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:

- residents of homes for those with severe learning difficulties;
- children with haemophilia or other conditions treated with plasma-derived clotting factors;
- children with severe liver disease;
- children travelling to high-risk areas (see p. 632);
- adolescents who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- children with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose of hepatitis A vaccine is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

In children under 16 years, a single dose of the combined vaccine *Ambirix*<sup>®</sup> can be used to provide rapid protection against hepatitis A.

Intramuscular normal immunoglobulin (section 14.5.1) is recommended for use in addition to Hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

## HEPATITIS A VACCINE

**Cautions** section 14.1

**Contra-indications** section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** section 14.1; for combination vaccines, see also Typhoid vaccines, p. 626

### Indications and dose

**Immunisation against hepatitis A infection**

For dose, see under preparations

### Single component

#### Avaxim<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £18.10

**Excipients** include neomycin

#### Dose

- By intramuscular injection (see note below)

**Child 16–18 years** 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose

**Note** Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Avaxim*<sup>®</sup>. The deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for children with bleeding disorders

#### Epaxal<sup>®</sup> (Crucell) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (RG-SB grown in human diploid cells) at least 48 units/mL, net price 0.5-mL prefilled syringe = £23.81

#### Dose

- By intramuscular injection (see note below)

**Child 1–18 years** 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose (1–6 months if splenectomised)

**Note** Booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for children with bleeding disorders

**Important** *Epaxal*<sup>®</sup> contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, and is therefore contra-indicated in those hypersensitive to eggs or chicken protein.

#### Havrix Monodose<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14, 0.5-mL (720 ELISA units) prefilled syringe (*Havrix Junior Monodose*<sup>®</sup>) = £16.77

**Excipients** include neomycin

#### Dose

- By intramuscular injection (see note below)

**Child 1–15 years** 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose

**Child 16–18 years** 1 mL as a single dose; booster dose 1 mL 6–12 months after initial dose

**Note** Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Havrix Monodose*<sup>®</sup>. The deltoid region is the preferred site of injection. The subcutaneous route may be used for children with bleeding disorders

#### Vaqa<sup>®</sup> Paediatric (Sanofi Pasteur) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxyphosphate sulfate, net price 0.5-mL prefilled syringe = £14.74

**Excipients** include neomycin

#### Dose

- By intramuscular injection (see note below)

**Child 1–18 years** 0.5 mL as a single dose; booster dose

0.5 mL 6–18 months after initial dose

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for children with bleeding disorders (but immune response may be reduced)

### With hepatitis B vaccine

#### Ambirix<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium hydroxide and aluminium phosphate, net price 1-mL prefilled syringe = £31.18

**Excipients** include neomycin

#### Dose

- By intramuscular injection (see note below)

**Child 1–15 years** primary course, 2 doses of 1 mL, the second 6–12 months after initial dose

**Note** Primary course should be completed with *Ambirix*<sup>®</sup> (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for children with bleeding disorders (but immune response may be reduced)

**Important** *Ambirix*<sup>®</sup> not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus

#### Twinrix<sup>®</sup> (GSK) (PoM)

**Injection**, inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe (*Twinrix*<sup>®</sup> *Adult*) = £27.76, 1-mL vial (*Twinrix*<sup>®</sup> *Adult*) = £26.44, 0.5-mL prefilled syringe (*Twinrix*<sup>®</sup> *Paediatric*) = £20.79

**Excipients** include neomycin

#### Dose

- By intramuscular injection (see note below)

**Child 1–15 years** primary course 3 doses of 0.5 mL (*Twinrix*<sup>®</sup> *Paediatric*), the second 1 month and the third 6 months after first dose

**Child 16–18 years** primary course, 3 doses of 1 mL (*Twinrix*<sup>®</sup> *Adult*), the second 1 month and the third 6 months after first dose

Accelerated schedule (e.g. for travellers departing within 1 month) for child over 16 years, second dose given 7 days after first dose, third dose after further 14 days and fourth dose 12 months after the first dose

**Note** Primary course should be completed with *Twinrix*<sup>®</sup> (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for children with bleeding disorders (but immune response may be reduced).

**Important** *Twinrix*<sup>®</sup> not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular or mucous membrane exposure to hepatitis B virus.

### With typhoid vaccine

#### Hepatitis<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £32.08

**Excipients** include neomycin

**Note** May be difficult to obtain

#### Dose

##### • By intramuscular injection

(see note below)

**Child 15–18 years** 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 626

**Note** The deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for children with bleeding disorders

#### VIATIM<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 160 antigen units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £29.80

#### Dose

##### • By intramuscular injection

(see note below)

**Child 16–18 years** 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 626

**Note** The deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for children with bleeding disorders

## Hepatitis B vaccine

**Hepatitis B vaccine** contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed on to aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, high-risk groups include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- adolescents who are at risk from their sexual behaviour;
- close family contacts of an individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and *hepatitis B immunoglobulin* (see p. 630) given at the same time (but at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother's e-antigen antibody status);
- children with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;

- children with chronic renal failure including those on haemodialysis. Children receiving haemodialysis should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- children with chronic liver disease;
- patients of day-care or residential accommodation for those with severe learning difficulties;
- children in custodial institutions;
- children travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 632);
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations); an 'accelerated schedule' is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below). Generally, three or four doses are required for primary immunisation. Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for common-sense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at [www.dh.gov.uk](http://www.dh.gov.uk)). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the initial dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the *Immunisation against Infectious Disease* handbook, see p. 604.

Specific **hepatitis B immunoglobulin** ('HBIG') is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection (section 14.5.2).

A combined hepatitis A and hepatitis B vaccine is also available.

## HEPATITIS B VACCINE

**Cautions** section 14.1

**Contra-indications** section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** section 14.1

**Indications and dose**

**Immunisation against hepatitis B infection**

For dose see under preparations

### Single component

#### Engerix B<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) pre-filled syringe = £9.67, 1-mL vial = £12.34, 1-mL pre-filled syringe = £12.99

#### Dose

- By intramuscular injection (see note below)

**Neonate** (except if born to hepatitis B surface antigen-positive mother, see below), 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose

**Child 1 month–16 years** 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose

**Child 16–18 years** 3 doses of 20 micrograms, second dose 1 month and third dose 6 months after first dose  
Accelerated schedule (all age groups), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose

Alternative schedule for **Child 11–15 years**, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain)

**Infant born to hepatitis B surface antigen-positive mother** (see also notes above)

- By intramuscular injection (see note below)

**Neonate** 4 doses of 10 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after first dose

**Renal insufficiency (including haemodialysis patients)**

- By intramuscular injection (see note below)

**Neonate** (except if born to hepatitis B surface antigen positive mother, see above), 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose or accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months, and fourth dose 12 months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Child 1 month–16 years** 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose or accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months, and fourth dose 12 months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Child 16–18 years** 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in neonates, infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

#### Fendrix<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL pre-filled syringe = £38.10

**Excipients** include traces of thiomersal

#### Dose

**Renal insufficiency patients (including pre-haemodialysis and haemodialysis patients)**

- By intramuscular injection

(see note below)

**Child 15–18 years** 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

#### HBVaxPro<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxyphosphate sulfate, net price 0.5-mL (5-microgram) pre-filled syringe = £8.95, 1-mL (10-microgram) pre-filled syringe = £12.20; 40 micrograms/mL, 1-mL (40-microgram) vial = £27.60

#### Dose

- By intramuscular injection

(see note below)

**Neonate** (except if born to hepatitis B surface antigen-positive mother, see below), 3 doses of 5 micrograms, second dose 1 month and third dose 6 months after first dose

**Child 1 month–16 years** 3 doses of 5 micrograms, second dose 1 month and third dose 6 months after first dose

**Child 16–18 years** 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose  
Accelerated schedule (all age groups), second dose 1 month after first dose, third dose 2 months after first dose with fourth dose at 12 months

Booster doses may be required in immunocompromised patients with low antibody concentration

**Infant born to hepatitis B surface antigen-positive mother** (see also notes above)

- By intramuscular injection

(see note below)

**Neonate** 4 doses of 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site), the second 1 month, the third 2 months and the fourth 12 months after the first dose

**Chronic haemodialysis patients**

- By intramuscular injection

(see note below)

**Child 16–18 years** 3 doses of 40 micrograms, second dose 1 month and third dose 6 months after first dose; booster doses may be required in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in neonates and infants; not to be injected into the buttock (vaccine efficacy reduced)

### With hepatitis A vaccine

See Hepatitis A Vaccine

## Human papillomavirus vaccines

**Human papillomavirus vaccine** is available as a bivalent vaccine (*Cervarix*<sup>®</sup>) or a quadrivalent vaccine (*Gardasil*<sup>®</sup>). *Cervarix*<sup>®</sup> is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. *Gardasil*<sup>®</sup> is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papillomavirus types 6, 11, 16 and 18. The vaccines may also provide

limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. The first dose is given to females aged 12 to 13 years, the second and third doses are given 1 and 4–6 months after the first dose (see Immunisation schedule, section 14.1); all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed but not repeated, allowing the appropriate interval between the remaining doses. Where the second dose was given late and there are significant challenges in scheduling vaccination, or a high likelihood that the third dose will not be given, in exceptional circumstances, the third dose can be given at least 1 month after the second dose. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

## HUMAN PAPILLOMAVIRUS VACCINES

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** not known to be harmful, but vaccination should be postponed until completion of pregnancy

**Breast-feeding** see p. 605

**Side-effects** see section 14.1

### Indications and dose

See notes above and under preparations

**Note** To avoid confusion, prescribers should specify the brand to be dispensed

**Cervarix**<sup>®</sup> (GSK) (POM)

**Injection**, suspension of virus-like particles of human papillomavirus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5-mL pre-filled syringe = £80.50

**Note** To avoid confusion, prescribers should specify the brand to be dispensed

#### Dose

**Prevention of premalignant genital lesions and cervical cancer (see notes above)**

- By intramuscular injection into deltoid region

**Child 9–18 years** 3 doses of 0.5 mL, the second 1 month and the third 6 months after the first dose

Alternative schedule for **Child 9–18 years**, 3 doses of 0.5 mL, the second 1–2.5 months, and the third 5–12 months after the first dose

**Gardasil**<sup>®</sup> (Sanofi Pasteur) (POM)

**Injection**, suspension of virus-like particles of human papillomavirus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA techni-

que) adsorbed onto aluminium hydroxyphosphate sulfate, net price 0.5-mL pre-filled syringe = £86.50

**Note** To avoid confusion, prescribers should specify the brand to be dispensed

#### Dose

**Prevention of premalignant genital lesions, cervical cancer and genital warts (see notes above)**

- By intramuscular injection preferably into deltoid region or higher anterolateral thigh

**Child 9–18 years** 3 doses of 0.5 mL, the second at least 1 month after the first dose and the third at least 3 months after the second dose; schedule should be completed within 12 months

Alternative schedule for **Child 9–13 years**, 2 doses of 0.5 mL, the second 6 months after the first dose (if administered earlier than 6 months, a third dose should be administered)

## Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains recommended each year by the World Health Organization.

Seasonal influenza vaccines will not control epidemics — immunisation is recommended for *persons at high risk*, and to reduce transmission of infection. Annual immunisation is strongly recommended for children (including infants that were preterm or low birth-weight) aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: *child under 20 kg*, 1 mg/kg or more daily; *child over 20 kg*, 20 mg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for children living in long-stay facilities, and for carers of children whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

From 1 September 2013, seasonal influenza vaccine will also be offered to all children aged 2–4 years (i.e. those born between 2 September 2009 and 1 September 2011). Unless contra-indicated, the live influenza vaccine, *Fluenz*<sup>®</sup>, is preferred in children aged 2–18 years because it provides a higher level of protection than inactivated influenza vaccine.

Further information on pandemic influenza, avian influenza, and swine influenza may be found at [www.dh.gov.uk/pandemicflu](http://www.dh.gov.uk/pandemicflu) and at [www.hpa.org.uk](http://www.hpa.org.uk).

## INFLUENZA VACCINES

**Cautions** see section 14.1; increased risk of fever in child under 5 years with *Viroflu*<sup>®</sup> and *Inflexal*<sup>®</sup> V, and in child 5–9 years with *Enzira*<sup>®</sup> or preparations marketed by Pfizer or CSL Biotherapies

**Contra-indications** see section 14.1 and also under *Fluenz*<sup>®</sup> below; avoid *Enzira*<sup>®</sup> or preparations marketed by Pfizer or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

**Pregnancy** see section 14.1; inactivated vaccines not known to be harmful; avoid *Fluenz*<sup>®</sup>

**Breast-feeding** see section 14.1; inactivated vaccines not known to be harmful; avoid *Fluenz*<sup>®</sup>

**Side-effects** see section 14.1; also reported, febrile convulsions and transient thrombocytopenia; with *intranasal spray*, rhinorrhoea

**Licensed use** Inactivated Influenza Vaccine (Surface Antigen) and *Fluvirin*<sup>®</sup> are not licensed for use in children under 4 years; *Fluarix Tetra*<sup>®</sup> not licensed for use in children under 3 years

### Indications and dose

#### Annual immunisation against seasonal influenza

- By intramuscular injection

**Child 6 months–9 years** 0.5 mL (repeated after at least 4 weeks in children who have not received seasonal influenza vaccine previously)

**Child 9–18 years** 0.5 mL as a single dose

- Intranasally

See under *Fluenz*<sup>®</sup> below

### ▲ Trivalent seasonal influenza vaccines for intramuscular use

#### Inactivated Influenza Vaccine (Split Virion) (PoM)

Flu

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion) grown in fertilised hens' eggs, net price 0.25-mL prefilled syringe = £6.29, 0.5-mL prefilled syringe = £6.59

**Excipients** may include neomycin and polymyxin B  
Available from Sanofi Pasteur

**Cautions** increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

**Contra-indications** avoid preparations marketed by Pfizer or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

#### Inactivated Influenza Vaccine (Surface

Antigen) (PoM)

Flu or Flu(adj)

**Injection**, suspension of propiolactone-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £4.15

**Excipients** may include neomycin, polymyxin B and traces of thiomersal

Available from Novartis Vaccines

#### Agrippal<sup>®</sup> (Novartis Vaccines) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £5.85

**Excipients** include kanamycin and neomycin

#### Enzira<sup>®</sup> (Pfizer) (PoM)

**Injection**, suspension of inactivated influenza virus (split virion) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £5.25

**Excipients** include neomycin and polymyxin B

**Cautions** child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

**Contra-indications** child under 5 years—increased risk of febrile convulsions

#### Fluarix<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £5.39

**Excipients** include gentamicin

**Note** Ovalbumin content less than 100 nanograms/mL

#### Fluvirin<sup>®</sup> (Novartis Vaccines) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5 mL prefilled syringe = £5.55

**Excipients** include neomycin, polymyxin B, and traces of thiomersal

#### Imuvac<sup>®</sup> (Abbott Healthcare) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £6.59

**Excipients** include gentamicin

#### Influvac Desu<sup>®</sup> (Abbott Healthcare) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £5.22

**Excipients** include gentamicin

#### Viroflu<sup>®</sup> (Janssen) (PoM)

**Injection**, suspension of inactivated influenza virus (surface antigen, virosome) grown in fertilised hens' eggs, net price 0.5-mL prefilled syringe = £6.59

**Excipients** include neomycin and polymyxin B

**Cautions** child under 5 years (increased risk of fever)—use only if a safer alternative influenza vaccine is not available

**Note** Ovalbumin content less than 100 nanograms/mL

**Note** Also available as *Inflexal*<sup>®</sup> V

### ▲ Tetravalent seasonal influenza vaccine for intramuscular use

#### Fluarix Tetra<sup>®</sup> (GSK) ▼ (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £9.94

**Excipients** include gentamicin

**Note** Ovalbumin content less than 100 nanograms/mL

### ▲ Trivalent seasonal influenza vaccine for intranasal use

#### Fluenz<sup>®</sup> (AstraZeneca) ▼ (PoM)

**Nasal spray**, suspension of live, attenuated influenza virus (produced in vero cells and grown in fertilised hens' eggs), net price 0.2 mL nasal applicator = £14.00

**Excipients** include gelatin and gentamicin

**Contra-indications** see section 14.1; also severe asthma, active wheezing; avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination; concomitant use with antiviral therapy for

influenza (avoid antivirals for at least 2 weeks after *Fluenz*<sup>®</sup>; avoid *Fluenz*<sup>®</sup> for at least 48 hours after stopping the antiviral); concomitant use with salicylates in children  
**Dose**

#### Annual immunisation against seasonal influenza

**Child 2–18 years** 0.1 mL into each nostril as a single dose; for children 2–9 years in the clinical risk groups, who have not received seasonal influenza vaccine previously, repeat after at least 4 weeks

## Japanese encephalitis vaccine

Japanese encephalitis vaccine is indicated for travellers to areas in Asia and the Far East where infection is endemic. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre ([www.nathnac.org](http://www.nathnac.org)).

### JAPANESE ENCEPHALITIS VACCINE

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy

**Breast-feeding** see section 14.1

**Side-effects** see section 14.1, also *less commonly* cough

#### Indications and dose

##### Immunisation against Japanese encephalitis

###### • By intramuscular injection

**Child 2 months–3 years** 2 doses of 0.25 mL separated by interval of 28 days

**Child 3–18 years** 2 doses of 0.5 mL separated by interval of 28 days

**Note** Deltoid muscle is preferred site of injection; anterolateral thigh is preferred site in infants. The subcutaneous route may be used for children with bleeding disorders see section 14.1

**ixiaro**<sup>®</sup> (Novartis Vaccines) ▼ (PoM)

**Injection**, suspension, inactivated Japanese encephalitis virus (produced in Vero cells), adsorbed onto aluminium hydroxide, net price 0.5-mL (6 micrograms) prefilled syringe = £59.50

## Measles vaccine

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine (MMR vaccine).

MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

#### ▲ Single antigen vaccine

No longer available in the UK

#### ▲ Combined vaccines

See MMR vaccine, p. 618

## Measles, Mumps and Rubella (MMR) vaccine

A combined live **measles, mumps, and rubella vaccine** (MMR vaccine) aims to eliminate measles, mumps and rubella (and congenital rubella syndrome).

Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see section 14.1). MMR vaccine should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of MMR vaccine is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation schedule, section 14.1).

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after the initial dose.

MMR vaccine should be used to protect against rubella in *seronegative females of child-bearing age* (see Immunisation schedule, section 14.1). MMR vaccine may also be offered to previously *unimmunised and seronegative post-partum* mothers—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of mothers who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

**Contacts** MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children, including babies, aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin (section 14.5, p. 628) after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5).

**Travel** Unimmunised children over 6 months of age travelling to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child,

then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years, should still be given.

**Side-effects** See section 14.1. Also malaise, fever, or a rash can occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur rarely 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthropathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura *within 6 weeks* of the first dose of MMR.

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from:

[www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation)

## MEASLES, MUMPS AND RUBELLA VACCINE, LIVE

**Cautions** see section 14.1; also after immunoglobulin administration or blood transfusion, leave an interval of at least 3 months before MMR immunisation as antibody response to measles component may be reduced

**Hypersensitivity to egg** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for at least 1 month after vaccination; see also, p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1 and notes above; also *less commonly* sleep disturbance, unusual crying in infants, also reported peripheral and optic neuritis.

**Licensed use** not licensed for use in children under 9 months

### Indications and dose

#### Immunisation against measles, mumps, and rubella

##### ● By intramuscular or deep subcutaneous injection

**CHILD 6 months–18 years** primary immunisation, 2 doses each of 0.5 mL, see Immunisation schedule, section 14.1, p. 606; see also notes above for use in outbreaks, for contacts of cases, and for travel

### Combined vaccines

#### MMRVaxPro® (Sanofi Pasteur) (PoM)

**Injection**, powder for reconstitution, live attenuated, measles virus (Enders' Edmonston strain) and mumps virus (Jeryl Lynn [Level B] strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); single-dose vial (with syringe containing solvent)

**Excipients** include gelatin and neomycin

Only available as part of childhood immunisation schedule from health organisations or **ImmForm**

#### Priorix® (GSK) (PoM)

**Injection**, powder for reconstitution, live attenuated, measles virus (Schwarz strain) and mumps virus (RIT 4385 strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain), net price single-dose vial (with syringe containing solvent) = £7.64

**Excipients** include neomycin

Also available as part of childhood immunisation schedule from health organisations or **ImmForm**

## Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal.

A **meningococcal group B vaccine**, *Bexsero*®, is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B. *Bexsero*® contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

**Childhood immunisation** Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 3 months of age; 2 booster doses are recommended, the first is given at 12–13 months of age (combined with haemophilus influenzae type b vaccine), and the second at 13–15 years of age (see Immunisation Schedule, section 14.1, p. 606).

Unimmunised children aged 4–12 months should be given 1 dose of meningococcal group C conjugate vaccine and then they should be vaccinated according to the Immunisation Schedule (section 14.1, p. 606). Unimmunised children aged 1–10 years should be given 1 dose of meningococcal group C conjugate vaccine, followed by a booster dose at 13–15 years of age. Unimmunised children aged 10–18 years should be given 1 dose of meningococcal group C conjugate vaccine, but a booster dose is not required.

Children with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

**Asplenia, splenic dysfunction, or complement deficiency** See p. 612.

**Travel** Individuals travelling to countries of risk (see below) should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where outbreaks and epidemics of meningococcal infection are reported. Country-by-country information is available from the National Travel Health Network and Centre ([www.nathnac.org](http://www.nathnac.org)).

Proof of vaccination with the tetravalent (meningococcal groups A, C, W135 and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

**Contacts** For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidelines for Public Health Management of Meningococcal Disease in the UK at [www.hpa.org.uk](http://www.hpa.org.uk). See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

## MENINGOCOCCAL VACCINES

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1; also rarely symptoms of meningitis reported (but no evidence that vaccine causes meningococcal C meningitis); also reported in children with meningococcal group B vaccine (*Bexsero*<sup>®</sup>) unusual crying and rarely Kawasaki disease

**Licensed use** *Menveo*<sup>®</sup> not licensed for use in children under 11 years

**Indications and dose**

**Immunisation against *Neisseria meningitidis* for dose, see under preparations**

### ■ Meningococcal group C conjugate vaccine

**Menjugate Kit**<sup>®</sup> (Novartis Vaccines) (PoM)

**Injection**, powder for reconstitution, capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed onto aluminium hydroxide, single-dose vials

**Dose**

- By intramuscular injection

**Child 3 months–18 years** 0.5 mL, see notes above and Immunisation Schedule, section 14.1

**Note** Subcutaneous route used for children with bleeding disorders

Available as part of childhood immunisation schedule from ImmForm

**NeisVac-C**<sup>®</sup> (Baxter) (PoM)

**Injection**, suspension of polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to tetanus toxoid protein), adsorbed onto aluminium hydroxide, 0.5-mL prefilled syringe

**Dose**

- By intramuscular injection

**Child 3 months–18 years** 0.5 mL, see notes above and Immunisation Schedule, section 14.1

Available as part of childhood immunisation schedule from ImmForm

### ■ Meningococcal group C conjugate vaccine with *Haemophilus influenzae* type B vaccine

See *Haemophilus influenzae* type B vaccine

### ■ Meningococcal groups A, C, W135, and Y conjugate vaccine

**Menveo**<sup>®</sup> (Novartis Vaccines) (PoM)

**Injection**, powder for reconstitution, capsular oligosaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y (conjugated to *Corynebacterium diphtheriae* protein), net price single-dose vial (with vial or prefilled syringe containing diluent) = £30.00

**Dose**

- By intramuscular injection preferably into deltoid region

**Child 3 months–1 year** 2 doses of 0.5 mL separated by an interval of 1 month

**Child 1–18 years** 0.5 mL as a single dose

**Nimenrix**<sup>®</sup> (GSK) ▼ (PoM)

**Injection**, powder for reconstitution, capsular polysaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y (conjugated to tetanus toxoid protein), net price single-dose vial (with syringe containing diluent) = £30.00

**Dose**

- By intramuscular injection preferably into deltoid region (or anterolateral thigh in child 1–2 years)

**Child 1–18 years** 0.5 mL as a single dose; a second dose may be considered after 1 year in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

### ▲ Meningococcal polysaccharide A, C, W135 and Y vaccine

**ACWY Vax<sup>®</sup>** (GSK) (PoM)

**Injection**, powder for reconstitution, capsular polysaccharide antigens of *Neisseria meningitidis* groups A, C, W135 and Y, net price single-dose vial (with syringe containing diluent) = £16.73

#### Dose

- By deep subcutaneous injection

**Child 5–18 years** 0.5 mL as a single dose; booster dose for those at continued risk, 0.5 mL every 5 years

### ▲ Meningococcal group B vaccine

**Bexsero<sup>®</sup>** (Novartis) ▼ (PoM)

**Injection**, suspension of antigen of *Neisseria meningitidis* group B (produced in *E. Coli* cells by recombinant DNA technology), adsorbed onto aluminium hydroxide, net price 0.5 mL prefilled syringe = £75.00

**Excipients** may include traces of kanamycin

#### Dose

- By deep intramuscular injection preferably into deltoid region (or anterolateral thigh in infants)

**Child 2–6 months** primary immunisation, 3 doses of 0.5 mL separated by an interval of at least 1 month; booster dose of 0.5 mL given between 1–2 years of age

**Child 6 months–1 year** (unimmunised) primary immunisation, 2 doses of 0.5 mL separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation

**Child 1–2 years** (unimmunised) primary immunisation, 2 doses of 0.5 mL separated by an interval of at least 2 months; booster dose of 0.5 mL given 12–24 months after completion of primary immunisation

**Child 2–11 years** (unimmunised) 2 doses of 0.5 mL separated by an interval of at least 2 months

**Child 11–18 years** (unimmunised) 2 doses of 0.5 mL separated by an interval of at least 1 month

## Mumps vaccine

### ▲ Single antigen vaccine

No longer available in the UK

### ▲ Combined vaccines

See MMR Vaccine, p. 618

## Pertussis vaccine

**Pertussis vaccine** is given as a combination preparation containing other vaccines (see Diphtheria Vaccines). Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1, p. 606), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation schedule should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

### Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred, through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; *Repevax<sup>®</sup>*) between 28 to 38 weeks of pregnancy; the optimal time for vaccination is between 28–32 weeks of pregnancy. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 28–38 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

**Contacts** Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis (Table 2, section 5.1). Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

**Cautions** Section 14.1

**Contra-indications** Section 14.1

**Pregnancy** see p. 605

and also Vaccination of Pregnant Women Against Pertussis above

**Breast-feeding** see p. 605

**Side effects** See also section 14.1. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses (see below).

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

#### Combined vaccines

Combined vaccines, see under Diphtheria vaccines

### Pneumococcal vaccines

Pneumococcal vaccines protect against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci, **Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas **pneumococcal polysaccharide conjugate vaccine** (adsorbed) contains polysaccharide from either 10 capsular types (*Synflorix*<sup>®</sup>) or 13 capsular types (*Prevenar 13*<sup>®</sup>) with the polysaccharide being conjugated to protein.

The 13-valent conjugate vaccine is used for childhood immunisation. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- child under 5 years with a history of invasive pneumococcal disease;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: *child under 20 kg*, 1 mg/kg or more daily; *child over 20 kg*, 20 mg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid could occur.

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; children and carers should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection (Table 2, section 5.1, p. 259) should not be stopped after immunisation. A patient card and

information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

**Choice of vaccine** Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

**Revaccination** In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

## PNEUMOCOCCAL VACCINES

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1; *also* Revaccination, above

#### Indications and dose

##### Immunisation against pneumococcal infection

For dose see under preparations

#### ▲ Pneumococcal polysaccharide vaccines

**Pneumovax<sup>®</sup> II** (Sanofi Pasteur) (POM)

**Injection**, polysaccharide from each of 23 capsular types of pneumococcus, net price 0.5-mL vial = £8.32

##### Dose

- By subcutaneous or intramuscular injection

**Child 2–18 years** 0.5 mL; revaccination, see notes above

### ▲ Pneumococcal polysaccharide conjugate vaccine (adsorbed)

#### Prevenar 13<sup>®</sup> (Pfizer) ▼ (PoM)

**Injection**, polysaccharide from each of 13 capsular types of pneumococcus (conjugated to carrier protein) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £49.10

#### Dose

- By intramuscular injection

**Child 2 months–5 years** 0.5 mL (see notes above and Immunisation Schedule, section 14.1)

**Note** Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

The dose in *BNF for Children* may differ from that in product literature

Available as part of childhood immunisation schedule from **ImmForm**

#### Synflorix<sup>®</sup> (GSK) (PoM)

**Injection**, polysaccharide from each of 10 capsular types of pneumococcus (conjugated to carrier proteins) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £27.60

#### Dose

- By intramuscular injection

**Child 6 weeks–5 years** consult product literature

**Note** Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

## Poliomyelitis vaccines

Two types of poliomyelitis vaccine (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated poliomyelitis vaccine**, only available in combined preparation (see under Diphtheria vaccines, combined), is recommended for routine immunisation; it is given by injection and contains inactivated strains of human poliovirus types 1, 2 and 3.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccine starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule, section 14.1). A course of 3 doses should also be given to all unimmunised children; no child should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1). Further booster doses should be given every 10 years only to individuals at special risk.

**Live (oral) poliomyelitis vaccine** is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must **not** be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccine removes the risk of vaccine-associated paralytic polio altogether.

**Travel** Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of

adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from [www.travax.nhs.uk](http://www.travax.nhs.uk) or from the National Travel Health Network and Centre, p. 633 ([www.nathnac.org](http://www.nathnac.org)).

## ▲ POLIOMYELITIS VACCINES

**Cautions** see section 14.1

**Contra-indications** see notes above and section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see notes above and section 14.1

### Indications and dose

See under preparations

### ▲ Combined vaccines

See under Diphtheria-containing Vaccines

### ▲ Inactivated (Salk) Vaccine

See under Diphtheria-containing Vaccines

## Rabies vaccine

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

**Pre-exposure prophylaxis** Immunisation should be offered to children at high risk of exposure to rabies—where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk. Transmission of rabies by humans has not been recorded but it is advised that those caring for children with the disease should be vaccinated.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre ([www.nathnac.org](http://www.nathnac.org)) and, in Scotland, from Health Protection Scotland ([www.hps.scot.nhs.uk](http://www.hps.scot.nhs.uk)).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk.

**Post-exposure management** Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England's Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in

Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a child has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5.2) is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proved that the child was not at risk.

## RABIES VACCINE

**Cautions** see section 14.1

**Contra-indications** see section 14.1; but see also Post-exposure Management in notes above

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1; also reported paresis

### Indications and dose

#### Pre-exposure immunisation against rabies

- By intramuscular injection in deltoid region or anterolateral thigh in infants

**Child 1 month–18 years** 1 mL on days 0, 7, and 28 (3rd dose can be given from day 21 if insufficient time before travel); for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL; for those at frequent risk, give a single reinforcing dose 1 year after the primary course is completed, and then give booster doses every 3–5 years or determine the frequency of booster doses according to plasma-concentration of antirabies antibodies; for those at infrequent risk, consider giving a booster dose 10 years after the primary course is completed

#### Post-exposure immunisation against rabies

- By intramuscular injection in deltoid region or anterolateral thigh in infants

**Child 1 month–18 years** 1 mL (see notes above)

## Rabies Vaccine (Sanofi Pasteur) <sup>(PoM)</sup>

Rab

**Injection**, powder for reconstitution, freeze-dried inactivated Wistar rabies virus strain PM/WI 38 1503-3M cultivated in human diploid cells, net price single-dose vial with syringe containing diluent = £33.90

**Excipients** include neomycin

## Rabipur<sup>®</sup> (Novartis Vaccines) <sup>(PoM)</sup>

**Injection**, powder for reconstitution, freeze-dried inactivated Flury LEP rabies virus strain cultivated in chick embryo cells, net price single-dose vial = £28.80

**Excipients** include neomycin

## Rotavirus vaccine

**Rotavirus vaccine** is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule, section 14.1). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with *immunosuppressed* close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

## ROTAVIRUS VACCINE

**Cautions** see section 14.1; *also* diarrhoea or vomiting (postpone vaccination); immunosuppressed close contacts (see notes above)

**Contra-indications** see section 14.1, however, with the exception of severe combined immunodeficiency, benefit from vaccination is likely to outweigh the risk in other types of immunosuppression—if there is any doubt, seek specialist advice; also predisposition to, or history of, intussusception

**Side-effects** see section 14.1

### Indications and dose

#### Immunisation against gastro-enteritis caused by rotavirus

- By mouth

**Child over 6 weeks** 2 doses of 1.5 mL, separated by an interval of at least 4 weeks; first dose must be given between 6–15 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

## Rotarix<sup>®</sup> (GSK) <sup>(PoM)</sup>

**Oral suspension**, live attenuated rotavirus (RIX4414 strain), net price 1.5 mL pre-filled oral syringe = £34.76

## Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do not have immunity against rubella the combined live measles, mumps and rubella vaccine is a suitable alternative.

### Single antigen vaccine

No longer available in the UK; see MMR vaccine, p. 618

### Combined vaccines

see MMR vaccine

## Smallpox vaccine

Limited supplies of **smallpox vaccine** are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, *Guidelines for smallpox response and management in the post-eradication era* should be consulted at [www.hpa.org.uk](http://www.hpa.org.uk).

## Tetanus vaccines

**Tetanus vaccine** contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school. (see Immunisation schedule, section 14.1).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total number of 5 doses of tetanus vaccine is considered sufficient for long-term protection.

For primary immunisation of children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

**Cautions** See also Section 14.1. When a child presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; carers of children awaiting elective surgery should be asked about the child's tetanus immunisation status and the child should be immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

Travel recommendations see section 14.6.

**Contra-indications** See section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** See section 14.1

**Wounds** Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).
- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5.2) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

### Combined vaccines

See Diphtheria-containing Vaccines

## Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those living in or visiting high-risk areas (see International Travel, section 14.6). Children walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

## TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1

**Indications and dose**

### Immunisation against tick-borne encephalitis

- By intramuscular injection in deltoid region or anterolateral thigh in infants

**Child 1–16 years** initial immunisation, 3 doses of 0.25 mL, second dose after 1–3 months and third dose after a further 5–12 months

**Child 16–18 years** 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months

Immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

**Note** To achieve more rapid protection, second dose may be given 14 days after first dose.

Booster doses, give first dose within 3 years after initial course, then every 3–5 years

**TicoVac**<sup>®</sup> (MASTA) (POM)

**Injection**, suspension, formaldehyde-inactivated Neudörfel tick-borne encephalitis virus strain, (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25-mL prefilled syringe (*TicoVac Junior*<sup>®</sup>) = £28.00, 0.5-mL prefilled syringe = £32.00

**Excipients** include gentamicin and neomycin

## Typhoid vaccines

Typhoid vaccine is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* vaccine for oral use.

Typhoid immunisation is advised for children travelling to:

- areas where typhoid is endemic, especially if staying with or visiting local people;
- endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely.

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 632).

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

Oral typhoid vaccine is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

**Interactions** Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or anti-malarials:

- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarials, vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

## TYPHOID VACCINE

**Cautions** section 14.1; **interactions:** see above and Appendix 1 (vaccines)

**Contra-indications** section 14.1; also for oral vaccine, acute gastro-intestinal illness

**Pregnancy** see p. 605

**Breast-feeding** see p. 605

**Side-effects** section 14.1

**Indications and dose**

### Immunisation against typhoid fever

For dose see under preparations

### ▲Typhoid polysaccharide vaccine for injection

**Typherix**<sup>®</sup> (GSK) (POM)

**Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.93

**Note** May be difficult to obtain

**Dose**

- By intramuscular injection
  - **Child under 2 years** [unlicensed use], 0.5 mL, at least 2 weeks before potential exposure to typhoid infection; response may be suboptimal (see notes above)
  - **Child 2–18 years** 0.5 mL, at least 2 weeks before potential exposure to typhoid infection

**Typhim Vi**<sup>®</sup> (Sanofi Pasteur) (POM)

**Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.30

**Dose**

- By intramuscular injection
  - **Child under 2 years** [unlicensed use], 0.5 mL, at least 2 weeks before potential exposure to typhoid infection; response may be suboptimal (see notes above)
  - **Child 2–18 years** 0.5 mL, at least 2 weeks before potential exposure to typhoid infection

### ▲Polysaccharide vaccine with hepatitis A vaccine

See Hepatitis A Vaccine

### ▲Typhoid vaccine, live (oral)

**Vivotif**<sup>®</sup> (Crucell) (POM)

**Capsules**, e/c, live attenuated *Salmonella typhi* (Ty21a), net price 3-cap pack = £14.77. Label: 25, counselling, administration

**Dose**

- By mouth
  - **Child 6–18 years** 1 capsule on days 1, 3, and 5
  - **Counselling** Take one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink; it is important to store capsules in a refrigerator

## Varicella–zoster vaccine

Varicella–zoster vaccine (live) is licensed for immunisation against varicella (chickenpox) in seronegative individuals. It is not recommended for routine use in children but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections.

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant females;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

**Varicella–zoster immunoglobulin** is used to protect susceptible children at increased risk of varicella infection, see p. 631.

## VARICELLA–ZOSTER VACCINE

**Cautions** see section 14.1; also post-vaccination close-contact with susceptible individuals (see notes above)

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for 3 months after vaccination; see also p. 605

**Breast-feeding** see p. 605

**Side-effects** see section 14.1; also conjunctivitis and varicella-like rash; rarely thrombocytopenia

### Indications and dose

**Immunisation against varicella (chickenpox) infection** (see notes above)

For dose, see under preparations

**Varilrix**<sup>®</sup> (GSK) (PoM)

**Injection**, powder for reconstitution, live attenuated varicella–zoster virus (Oka strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £27.31

**Excipients** include neomycin

#### Dose

- By subcutaneous injection preferably into deltoid region

**Child 1–18 years** (see notes above), 2 doses of 0.5 mL separated by an interval of at least 6 weeks (minimum 4 weeks)

**Varivax**<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection** powder for reconstitution, live attenuated varicella–zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £30.28

**Excipients** include gelatin and neomycin

#### Dose

- By intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in young children)

**Child 1–13 years** (see notes above) 2 doses of 0.5 mL separated by an interval of at least 4 weeks (2 doses separated by 12 weeks in children with asymptomatic HIV infection)

**Child 13–18 years** 2 doses of 0.5 mL separated by 4–8 weeks

## Yellow fever vaccine

Live yellow fever vaccine is indicated for those travelling to or living in areas where infection is endemic (see

p. 632). Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rarely vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These *very rare* adverse effects have usually occurred after the first dose of yellow fever vaccine in those with no previous immunity.

**Pregnancy** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

**Breast-feeding** Avoid; seek specialist advice if exposure to virus cannot be avoided.

## YELLOW FEVER VACCINE, LIVE

**Cautions** see section 14.1

**Contra-indications** see section 14.1 and notes above; also children under 6 months; history of thymus dysfunction

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see section 14.1; also reported neurotropic disease, and viscerotropic disease (see notes above)

### Indications and dose

**Immunisation against yellow fever**

- By deep subcutaneous injection

**Child 9 months–18 years** 0.5 mL (see also notes above)

**Yellow Fever Vaccine, Live** (PoM)

Yel(live)

**Injection**, powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL diluent

Available (only to designated Yellow Fever Vaccination centres) as *Stamart*<sup>®</sup>

## 14.5 Immunoglobulins

14.5.1 Normal Immunoglobulin

14.5.2 Disease-specific immunoglobulins

14.5.3 Anti-D (Rh<sub>0</sub>) immunoglobulin

Two types of human immunoglobulin preparation are available, normal immunoglobulin and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK (for further information consult [www.ivig.nhs.uk](http://www.ivig.nhs.uk) and *Clinical Guidelines for Immunoglobulin Use*, [www.gov.uk/dh](http://www.gov.uk/dh)).

Immunoglobulins of animal origin (antisera) were frequently associated with hypersensitivity reactions and are no longer used.

Further information on the use of immunoglobulins is included in the Health Protection Agency's *Immunoglobulin Handbook*: [www.hpa.org.uk](http://www.hpa.org.uk) and in the Department of Health's publication, *Immunisation against Infectious Disease*, [www.gov.uk/dh](http://www.gov.uk/dh).

**Availability** Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

**Disease-specific immunoglobulins** (section 14.5.2) are available from some regional Public Health laboratories with the exception of **tetanus immunoglobulin** which is available from BPL, hospital pharmacies, or blood transfusion departments. **Rabies immunoglobulin** is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. **Hepatitis B immunoglobulin** required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS).

In Wales all immunoglobulins are available from the *Welsh Blood Service* (WBS).

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service* (NIBTS).

## 14.5.1 Normal Immunoglobulin

Human **normal immunoglobulin** ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given at **least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

**Uses** Normal immunoglobulin (containing 10–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A virus** (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting for several weeks.

Normal immunoglobulin (containing 3–12% protein) for *intravenous administration* is used as *replacement therapy* for children with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

The dose of normal immunoglobulin used as replacement therapy in patients with immunodeficiencies is **not the same** as the dose required for treatment of acute conditions. For Kawasaki disease a single dose of 2 g/kg by intravenous infusion should be given with concomitant aspirin (see section 2.9) within 10 days of onset of symptoms (but children with a delayed diagnosis may also benefit).

For guidance on the use of intravenous normal immunoglobulins and alternative therapies for other conditions, consult *Clinical Guidelines for Immunoglobulin Use* ([www.gov.uk/dh](http://www.gov.uk/dh)).

**Hepatitis A** **Hepatitis A vaccine** is preferred for children at risk of infection (see p. 612) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised children, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles** Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in children with compromised immunity. Children with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Children with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given MMR vaccine (section 14.4) for prophylaxis following exposure to measles.

**Rubella** Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant females exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intrauterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is a minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant individual—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential.

For routine prophylaxis, see MMR vaccine (p. 618).

## NORMAL IMMUNOGLOBULIN

**Cautions** hypo- or agammaglobulinaemia with or without IgA deficiency; interference with live virus vaccines—see p. 628

**Intravenous use** Thrombophilic disorders, or risk factors for arterial or venous thromboembolic events; obesity; ensure adequate hydration, renal insufficiency

**Contra-indications** patients with selective IgA deficiency who have known antibody against IgA

**Renal impairment** monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure

**Side-effects** nausea, diarrhoea, chills, fever, headache, dizziness, arthralgia, myalgia, muscle spasms, low back pain; *rarely* hypotension, anaphylaxis, cutaneous skin reactions, aseptic meningitis, acute renal failure; also reported with *intravenous use*, injection site reactions, abdominal pain and distension, blood pressure fluctuations, haemolytic anaemia, thromboembolic events including myocardial infarction, stroke, pulmonary embolism, and deep vein thrombosis

**Note** Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

### Indications and dose

See under preparations

**Note** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects

### For intramuscular use

#### Normal Immunoglobulin (PoM)

Normal immunoglobulin injection. 250-mg vial; 750-mg vial

#### Dose

To control outbreaks of hepatitis A (see notes above)

- By deep intramuscular injection
  - Child under 10 years 250 mg
  - Child 10–18 years 500 mg

### Rubella in pregnancy, prevention of clinical attack

- By deep intramuscular injection
  - 750 mg

Available from the Centre for Infections and other regional Health Protection Agency offices (for contacts and control of outbreaks only, see above)

### For subcutaneous use

**Note** Preparations for subcutaneous use may be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not recommended for patients with thrombocytopenia or other bleeding disorders

#### Gammanorm® (Octapharma) (PoM)

Normal immunoglobulin (protein 16.5%) injection, net price 1.65 g (10 mL) = £96.77, 3.3 g (20 mL) = £193.55

**Electrolytes** Na<sup>+</sup> 1.09 mmol/10-mL vial

#### Dose

#### Antibody deficiency syndromes

- By subcutaneous infusion
  - Consult product literature

#### Hizentra® (CSL Behring) ▼ (PoM)

Normal immunoglobulin (protein 20%) injection, net price 1 g (5 mL) = £45.90, 2 g (10 mL) = £91.80, 4 g (20 mL) = £183.60

**Note** Contains L-proline; contra-indicated in patients with hyperprolinaemia

#### Dose

#### Antibody deficiency syndromes

- By subcutaneous infusion
  - Consult product literature

#### Subcuvia® (Baxter) (PoM)

Normal immunoglobulin (protein 16%) injection, net price 800 mg (5 mL) = £32.56, 1.6 g (10 mL) = £65.12

#### Dose

#### Antibody deficiency syndromes

- By subcutaneous infusion
  - Consult product literature (not licensed for use in children under 12 years)

#### Subgam® (BPL) (PoM)

Normal immunoglobulin (protein 14–18%) injection, net price 250-mg vial = £11.20, 750-mg vial = £34.20, 1.5-g vial = £68.40

#### Dose

#### Antibody deficiency syndromes

- By subcutaneous infusion
  - Consult product literature

#### Hepatitis A prophylaxis (see also notes above)

- By intramuscular injection
  - Child under 10 years 500 mg
  - Child 10–18 years 750 mg

#### Rubella prophylaxis in pregnancy (see also notes above)

- By intramuscular injection
  - 750 mg

**Note** *Subgam*® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, the Health Protection Agency recommends intramuscular use for prophylaxis against Hepatitis A, or rubella

**For intravenous use**

**Note** Dose recommendation for Kawasaki disease, see section 14.5.1; other indications—consult product literature for dosage regimens

**Aragam<sup>®</sup>** (Oxbridge) (PoM)

**Intravenous infusion**, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £145.00, 5 g (100 mL) = £290.00, 10 g (200 mL) = £580.00, 20 g (400 mL) = £1160.00

**Excipients** include glucose 50 mg/mL

**Flebogamma<sup>®</sup> DIF** (Grifols) (PoM)

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 0.5 g (10 mL) = £30.00, 2.5 g (50 mL) = £150.00, 5 g (100 mL) = £300.00, 10 g (200 mL) = £600.00, 20 g (400 mL) = £1200.00; protein 10%, 5 g (50 mL) = £300.00, 10 g (100 mL) = £600.00, 20 g (200 mL) = £1200.00

**Note** Both strengths contain sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

**Gammagard S/D<sup>®</sup>** (Baxter) (PoM)

**Intravenous infusion**, powder for reconstitution, human normal immunoglobulin (providing protein 5% or 10%), net price 5 g (with diluent) = £200.50, 10 g (with diluent) = £401.00

**Gammaplex<sup>®</sup>** (BPL) (PoM)

**Intravenous infusion**, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £104.50, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00

**Note** Contains sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

**Gamunex<sup>®</sup>** (Grifols) (PoM)

**Intravenous infusion**, human normal immunoglobulin (protein 10%), net price 5 g (50 mL) = £250.00, 10 g (100 mL) = £500.00, 20 g (200 mL) = £1000.00

**Note** Use Glucose 5% intravenous infusion if dilution prior to infusion required

**Intratec<sup>®</sup>** (Biotest UK) (PoM)

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 1 g (20 mL) = £45.00, 2.5 g (50 mL) = £112.50, 5 g (100 mL) = £225.00, 10 g (200 mL) = £450.00; protein 10%, 1 g (10 mL) = £45.00, 5 g (50 mL) = £225.00, 10 g (100 mL) = £450.00, 20 g (200 mL) = £900.00

**Kiovig<sup>®</sup>** (Baxter) (PoM)

**Intravenous infusion**, human normal immunoglobulin (protein 10%), net price 1 g (10 mL) = £49.00, 2.5 g (25 mL) = £122.50, 5 g (50 mL) = £245.00, 10 g (100 mL) = £490.00, 20 g (200 mL) = £980.00, 30 g (300 mL) = £1470.00

**Note** Use Glucose 5% intravenous infusion, if dilution prior to administration is required

**Octagam<sup>®</sup>** (Octapharma) (PoM)

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £1.02, 5 g (100 mL) = £2.04, 10 g (200 mL) = £2.04; protein 10%, 2 g (20 mL) = £117.30, 5 g (50 mL) = £293.25, 10 g (100 mL) = £586.50, 20 g (200 mL) = £1173.00

**Note** Contains maltose (may cause falsely elevated results with blood glucose testing systems)

**Privigen<sup>®</sup>** (CSL Behring) (PoM)

**Intravenous infusion**, human normal immunoglobulin (protein 10%), net price 2.5 g (25 mL) = £114.75, 5 g (50 mL) = £229.50, 10 g (100 mL) = £459.00, 20 g (200 mL) = £918.00

**Note** Contains L-proline; contra-indicated in patients with hyperprolinaemia

**Vigam<sup>®</sup>** (BPL) (PoM)

**Intravenous infusion**, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £95.00, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00

**Note** Contains sucrose (see Renal Impairment above)

**14.5.2 Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see *Immunoglobulin Handbook* ([www.hpa.org.uk](http://www.hpa.org.uk)).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin, section 14.5.1 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor MMR vaccine is effective as post-exposure prophylaxis.

**Hepatitis B**

Disease-specific **hepatitis B immunoglobulin** ('HBIG') is available for use in association with hepatitis B vaccine for the prevention of infection in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 614). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine, but should be given at different sites.

An intravenous preparation of hepatitis B-specific immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**HEPATITIS B IMMUNOGLOBULIN**

**Cautions** IgA deficiency; interference with live virus vaccines—see under Normal Immunoglobulin, p. 628

**Side-effects** injection site swelling and pain, arthralgia; rarely anaphylaxis chest tightness, dyspnoea; also reported tremor, dizziness, facial oedema, glossitis, and buccal ulceration; for side-effects associated with intravenous immunoglobulins, see section 14.5.1

**Indications and dose**

See under preparations and see also notes above

**Hepatitis B Immunoglobulin** (PoM)

**Injection**, hepatitis B-specific immunoglobulin, 100 units/mL. Vials containing 200 units or 500 units, available from selected Health Protection Agency and NHS laboratories (except for Transplant Centres, see p. 628), also available from BPL

**Dose****Prophylaxis against hepatitis B infection**

- **By intramuscular injection**  
(as soon as possible after exposure; ideally within 48 hours, but no later than 7 days after exposure)

**Child 1 month–5 years** 200 units

**Child 5–10 years** 300 units

**Child 10–18 years** 500 units

**Prevention of transmitted infection at birth**

- **By intramuscular injection**

**Neonate** 200 units as soon as possible after birth; for full details consult *Immunisation against Infectious Disease* ([www.dh.gov.uk](http://www.dh.gov.uk))

**Hepatect® CP** (Biotech UK) (PoM)

**Intravenous infusion**, hepatitis B-specific immunoglobulin 50 units/mL, net price 500 units (10 mL) = £300.00, 2000 units (40 mL) = £1100.00, 5000 units (100 mL) = £3000.00

**Dose**

Following exposure to hepatitis B virus-contaminated material (as soon as possible after exposure, but no later than 72 hours); prevention of transmitted infection at birth; prophylaxis against re-infection of transplanted liver

Consult product literature

**Rabies**

Following exposure of an unimmunised child to an animal in or from a country where the risk of rabies is high, the site of the bite should be washed with soapy water and specific **rabies immunoglobulin** of human origin should be administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination). Rabies vaccine should also be given intramuscularly at a different site (for details see Rabies Vaccine, p. 623). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

**RABIES IMMUNOGLOBULIN**

**Cautions** IgA deficiency; interference with live virus vaccines—see p. 628 under Normal Immunoglobulin

**Side-effects** injection site swelling and pain; rarely anaphylaxis; buccal ulceration, glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported

**Indications and dose****Post-exposure prophylaxis against rabies infection**

- **By intramuscular injection**

20 units/kg, by *infiltration* in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by *intramuscular injection* into anterolateral thigh (remote from vaccination site)

**Note** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose

**Rabies Immunoglobulin** (PoM)

(Antirabies Immunoglobulin Injection)

See notes above

Available from Specialist and Reference Microbiology Division, Public Health England (see section 14.5 under Availability) (also from BPL)

**Tetanus**

Tetanus immunoglobulin, together with metronidazole (section 5.1.11) and wound cleansing, should also be used for the treatment of established cases of tetanus.

For the management of tetanus-prone wounds, **tetanus immunoglobulin** of human origin should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine (see Diphtheria-containing Vaccines, section 14.4).

**TETANUS IMMUNOGLOBULIN**

**Cautions** IgA deficiency; interference with live virus vaccines—see, p. 628

**Side-effects** injection site swelling and pain; rarely anaphylaxis; buccal ulceration; glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported

**Indications and dose****Post-exposure prophylaxis**

- **By intramuscular injection**

250 units, increased to 500 units if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

**Treatment of tetanus infection**

- **By intramuscular injection**

150 units/kg (multiple sites)

**Tetanus Immunoglobulin** (PoM)

(Antitetanus Immunoglobulin Injection)

Available from BPL

**Note** May be difficult to obtain

**Varicella-zoster**

**Varicella-zoster immunoglobulin** (VZIG) is recommended for individuals who are at increased risk of severe varicella *and* who have no antibodies to varicella-zoster virus *and* who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks' gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone: *children* 2mg/kg daily (or more than 40 mg) for at least 1 week or 1mg/kg daily for 1 month.

**Important:** for full details consult *Immunisation against Infectious Disease*. **Varicella-zoster vaccine** is available—see section 14.4.

For treatment of varicella-zoster infections and attenuation of infection if varicella-zoster immunoglobulin not indicated, see section 5.3.2.1

**VARICELLA-ZOSTER IMMUNOGLOBULIN**

**Cautions** IgA deficiency; interference with live virus vaccines—see p. 628 under Normal Immunoglobulins

**Side-effects** injection site swelling and pain; rarely anaphylaxis

**Indications and dose****Prophylaxis against varicella infection (as soon as possible—not later than 10 days after exposure)**● **By deep intramuscular injection****Neonate** 250 mg**Child 1 month–6 years** 250 mg**Child 6–11 years** 500 mg**Child 11–15 years** 750 mg**Child 15–18 years** 1 g

Give second dose if further exposure occurs more than 3 weeks after first dose

**Note** No evidence that effective in treatment of severe disease.

Normal immunoglobulin for intravenous use (section 14.5.1) may be used in those unable to receive intramuscular injection.

**Varicella–Zoster Immunoglobulin** (PoM)

(Antivaricella–zoster Immunoglobulin)

Available from selected Health Protection Agency and NHS laboratories (see section 14.5 under Availability) (also from BPL)

**14.5.3 Anti-D (Rh)  
immunoglobulin**This section is not included in *BNF for Children*. See *BNF* for use of Anti-D (Rh)<sub>0</sub> immunoglobulin**14.6 International travel****Note** For advice on **malaria chemoprophylaxis**, see section 5.4.1.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); see also Tick-borne Encephalitis, p. 625. Certain precautions are required in Non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** or **tuberculosis** should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised adults may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000; it should preferably be given three months or more before departure.

**Yellow fever** immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas, whilst other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, [www.dh.gov.uk](http://www.dh.gov.uk)).

1. List of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at [www.hpa.org.uk](http://www.hpa.org.uk)

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world (for details, see p. 619).

Protection against **hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 612) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 628). Special care must also be taken with food hygiene (see below).

**Hepatitis B** vaccine (see p. 614) is recommended for those travelling to areas of high prevalence who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists are not generally at increased risk of infection but may place themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against **rabies** (see p. 623) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a **tetanus** booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine (see p. 609), even if they have received 5 doses of a tetanus-containing vaccine previously.

**Typhoid vaccine** is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below).

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** (see p. 609) should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on **diphtheria** (see p. 609), on **Japanese encephalitis** (see p. 618), and on **tick-borne encephalitis** (see p. 625) is included in *Health Information for Overseas Travel*, see below.

**Food hygiene** In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled, or treated with sterilising tablets should be used for drinking.

**Information on health advice for travellers**

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: [www.nathnac.org](http://www.nathnac.org)

The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for *healthcare professionals* regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

# 15 Anaesthesia

<b>15.1</b>	<b>General anaesthesia</b>	<b>634</b>
15.1.1	Intravenous anaesthetics	635
15.1.2	Inhalational anaesthetics	638
15.1.3	Antimuscarinic drugs	640
15.1.4	Sedative and analgesic peri-operative drugs	642
15.1.4.1	Benzodiazepines	642
15.1.4.2	Non-opioid analgesics	645
15.1.4.3	Opioid analgesics	645
15.1.4.4	Other drugs for sedation	647
15.1.5	Neuromuscular blocking drugs	647
15.1.6	Drugs for reversal of neuromuscular blockade	651
15.1.7	Antagonists for central and respiratory depression	652
15.1.8	Drugs for malignant hyperthermia	654
<b>15.2</b>	<b>Local anaesthesia</b>	<b>654</b>

## 15.1 General anaesthesia

15.1.1	Intravenous anaesthetics
15.1.2	Inhalational anaesthetics
15.1.3	Antimuscarinic drugs
15.1.4	Sedative and analgesic peri-operative drugs
15.1.5	Neuromuscular blocking drugs
15.1.6	Drugs for reversal of neuromuscular blockade
15.1.7	Antagonists for central and respiratory depression
15.1.8	Drugs for malignant hyperthermia

### Important

The drugs in section 15.1 should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A topical local anaesthetic (section 15.2) can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated children and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent (section 15.1.4) or if an opioid analgesic has been used.

**Surgery and long-term medication** The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a child is (or has been) taking.

Children with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipitous fall in blood pressure unless corticosteroid cover is

provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a child is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include drugs for epilepsy, asthma, immunosuppression, and metabolic, endocrine and cardiovascular disorders (but see potassium sparing diuretics, below). Expert advice is required for children receiving antivirals for HIV infection. For general advice on surgery in children with diabetes, see section 6.1.1.

Children taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with unfractionated or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details). If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

**Anaesthesia and skilled tasks** Children and their carers should be very carefully warned about the risk of undertaking skilled tasks after the use of sedatives and analgesics during minor outpatient procedures. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take children home. The dangers of taking alcohol should also be emphasised.

**Prophylaxis of acid aspiration** Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be a complication of general anaesthesia, particularly in obstetrics and in gastro-oesophageal reflux disease; prophylaxis against acid aspiration is not routinely used in children but may be required in high-risk cases.

An **H<sub>2</sub>-receptor antagonist** (section 1.3.1) can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H<sub>2</sub>-receptor antagonist can be given 1–2 hours before the procedure.

## Anaesthesia, sedation, and resuscitation in dental practice

For details see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Conscious Sedation in the Provision of Dental Care*; report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003.

Guidance is also included in *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, June 2012 ([www.sdcep.org.uk](http://www.sdcep.org.uk)).

### 15.1.1 Intravenous anaesthetics

#### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities **must** be available. They are **contraindicated** if the anaesthetist is not confident of being able to maintain the airway. Extreme care is required in surgery of the mouth, pharynx, or larynx and in children with acute circulatory failure (shock) or fixed cardiac output.

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.5) or a short-acting opioid (section 15.1.4.3).

The doses of all intravenous anaesthetic drugs should be titrated according to response (except when using 'rapid sequence induction'). The doses and rates of administration should be reduced in those with hypovolaemia or cardiovascular disease; reduced doses may also be required in premedicated children.

**Total intravenous anaesthesia** This is a technique in which surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations; specific models with paediatric pharmacokinetic data should be used for children.

**Anaesthesia and skilled tasks** See section 15.1.

**Drugs used for intravenous anaesthesia** Propofol, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in children, but it is not commonly used in neonates.

Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. It causes pain on intravenous injection which can be reduced by intravenous lidocaine. Significant extraneous muscle movements can occur. Rarely, convulsions, anaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; the onset of convulsions can be delayed. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an antimuscarinic drug is used to treat this.

Propofol can be used for sedation during diagnostic procedures but is contra-indicated in children under 16 years receiving intensive care because of the risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).

**Thiopental sodium** is a barbiturate that is used for induction of anaesthesia, but it has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiorespiratory depression can occur. Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect particularly in neonates, and recovery is much slower.

**Etomidate** is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate suppresses adrenocortical function, particularly on continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

**Ketamine** causes less hypotension than thiopental and propofol during induction. It is sometimes used in children requiring repeat anaesthesia (such as for serial burns dressings), however recovery is relatively slow and there is a high incidence of extraneous muscle movements. Ketamine can cause hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine, such as diazepam or midazolam.

mias, hypertension, hiccups, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

**Licensed use** *Hypnomidate*<sup>®</sup> licensed for use in children (age range not specified by manufacturer); *Etomidate-Lipuro*<sup>®</sup> not licensed for children under 6 months except for imperative indications during inpatient treatment.

#### Indications and dose

##### Induction of anaesthesia

- **By slow intravenous injection**
- **Child 1 month–18 years** 150–300 micrograms/kg (max. total dose 60 mg); child under 15 years may need up to 400 micrograms/kg (max. total dose 60 mg)

**Important** Administer over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous)

**Note** Doses in *BNF for Children* may differ from those in the product literature

**Etomidate-Lipuro**<sup>®</sup> (B. Braun) (POM)

**Injection** (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.56

**Hypnomidate**<sup>®</sup> (Janssen) (POM)

**Injection**, etomidate 2 mg/mL, net price 10-mL amp = £1.38

**Excipients** include propylene glycol (see Excipients, p. 2)

## KETAMINE

**Cautions** see notes above; dehydration; hypertension; respiratory tract infection; increased cerebrospinal fluid pressure; predisposition to seizures, hallucinations, or nightmares; psychotic disorders; head injury or intracranial mass lesions; thyroid dysfunction; raised intraocular pressure; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above; hypertension, pre-eclampsia or eclampsia, severe cardiac disease, stroke; raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

**Hepatic impairment** consider dose reduction

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** avoid for at least 12 hours after last dose

**Side-effects** see notes above; also nausea, vomiting, tachycardia, hypertension, diplopia, nystagmus, rash; *less commonly* arrhythmias, hypotension, bradycardia, respiratory depression, laryngospasm; *rarely* hypersalivation, apnoea, insomnia, cystitis (including haemorrhagic); *also reported* raised intra-ocular pressure

#### Indications and dose

##### Sedation prior to invasive or painful procedures

- **By intravenous injection**
- **Child 1 month–18 years** 1–2 mg/kg as a single dose

##### Induction and maintenance of anaesthesia (short procedures)

- **By intravenous injection over at least 60 seconds**

**Neonate** 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia, adjusted according to response

**Child 1 month–12 years** 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia, adjusted according to response

## ETOMIDATE

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Hepatic impairment** reduce dose in liver cirrhosis

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also nausea, vomiting, hypotension, apnoea, hyperventilation, stridor, rash; *less commonly* hypersalivation, bradycardia, arrhyth-

**Child 12–18 years** 1–4.5 mg/kg adjusted according to response (2 mg/kg usually produces 5–10 minutes of surgical anaesthesia)

- By intramuscular injection

**Neonate** 4 mg/kg usually produces 15 minutes of surgical anaesthesia, adjusted according to response

**Child 1 month–18 years** 4–13 mg/kg (4 mg/kg sufficient for some diagnostic procedures), adjusted according to response; 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

#### Induction and maintenance of anaesthesia (longer procedures)

- By intravenous administration

**Neonate** initially 0.5–2 mg/kg by intravenous injection, followed by a continuous intravenous infusion of 8 micrograms/kg/minute adjusted according to response; up to 30 micrograms/kg/minute may be used to produce deep anaesthesia

**Child 1 month–18 years** initially 0.5–2 mg/kg by intravenous injection followed by a continuous intravenous infusion of 10–45 micrograms/kg/minute adjusted according to response

**Administration** for continuous intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia

For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9%

#### Ketalar® (Pfizer) (CD4+1)

**Injection**, ketamine (as hydrochloride) 10 mg/mL, net price 20-mL vial = £5.06; 50 mg/mL, 10-mL vial = £8.77; 100 mg/mL, 10-mL vial = £16.10

**Note** 100 mg/mL, 10-mL vial may be difficult to obtain

## PROPOFOL

**Cautions** see notes above; cardiac impairment; respiratory impairment; hypovolaemia; epilepsy; hypotension; raised intracranial pressure; monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** may depress neonatal respiration if used during delivery; max. dose for maintenance of anaesthesia, 6 mg/kg/hour

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also hypotension, tachycardia, transient apnoea, headache; *less commonly* thrombosis, phlebitis; *rarely* arrhythmia, euphoria; *very rarely* pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure) reported with prolonged infusion of doses exceeding 4 mg/kg/hour

### Indications and dose

#### Induction of anaesthesia using 0.5% or 1% injection

- By slow intravenous injection or by intravenous infusion

**Child 1 month–18 years** adjust dose according to age, body-weight, and response; usual dose in child 1 month–17 years 2.5–4 mg/kg; usual dose in child 17–18 years 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response

#### Induction of anaesthesia using 2% injection

- By intravenous infusion

**Child 3–18 years** adjust dose according to age, body-weight, and response; usual dose in child 3–17 years 2.5–4 mg/kg; usual dose in child 17–18 years 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response

#### Maintenance of anaesthesia using 1% injection

- By continuous intravenous infusion

**Child 1 month–18 years** adjust dose according to age, body-weight, and response; usual dose in child 1 month–17 years 9–15 mg/kg/hour; usual dose in child 17–18 years 4–12 mg/kg/hour, adjusted according to response

#### Maintenance of anaesthesia using 2% injection

- By continuous intravenous infusion

**Child 3–18 years** adjust dose according to age, body-weight, and response; usual dose in child 3–17 years 9–15 mg/kg/hour; usual dose in child 17–18 years 4–12 mg/kg/hour, adjusted according to response

#### Sedation of ventilated children in intensive care using 1% or 2% injection

- By continuous intravenous infusion

**Child 16–18 years** 0.3–4 mg/kg/hour, adjusted according to response

#### Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

- By slow intravenous injection

**Child 1 month–18 years** dose and rate of administration adjusted according to desired level of sedation and response; usual dose in child 1 month–17 years 1–2 mg/kg; usual dose in child 17–18 years 0.5–1 mg/kg over 1–5 minutes

#### Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

- By intravenous infusion

**Child 17–18 years** dose and rate of administration adjusted according to desired level of sedation and response; usual dose 1.5–4.5 mg/kg/hour (additionally, if rapid increase in sedation required, by slow intravenous injection 10–20 mg)

#### Maintenance of sedation for surgical and diagnostic procedures using 1% injection

- By intravenous infusion

**Child 1 month–18 years** dose and rate of administration adjusted according to desired level of sedation and response; usual dose in child 1 month–17 years 1.5–9 mg/kg/hour (addition-

ally, if rapid increase in sedation required, *by slow intravenous injection*, max. 1 mg/kg); usual dose in child 17–18 years 1.5–4.5 mg/kg/hour (additionally, if rapid increase in sedation required, *by slow intravenous injection*, 10–20 mg)

#### Maintenance of sedation for surgical and diagnostic procedures using 2% injection

##### • By intravenous infusion

**Child 3–18 years** dose and rate of administration adjusted according to desired level of sedation and response; usual dose in child 3–17 years 1.5–9 mg/kg/hour; usual dose in child 17–18 years 1.5–4.5 mg/kg/hour (additionally, if rapid increase in sedation required, *by slow intravenous injection* using 0.5% or 1% injection, 10–20 mg)

**Administration** shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%

**0.5% emulsion** for injection or infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL

**1% emulsion** for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (*Diprivan*® or *Propofol-Lipuro*®) or Sodium chloride 0.9% (*Propofol-Lipuro*® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation

**2% emulsion** for infusion; do not dilute

**Propofol** (Non-proprietary) (PoM)

**0.5% injection** (emulsion), propofol 5 mg/mL, net price 20-mL amp = £3.46

**Brands include** *Propofol-Lipuro*®

**1% injection** (emulsion), propofol 10 mg/mL, net price 20-mL amp = £4.18, 50-mL bottle = £10.10, 100-mL bottle = £19.40

**Brands include** *Propofol-Lipuro*®, *Propoven*®

**2% injection** (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30

**Brands include** *Propofol-Lipuro*®, *Propoven*®

**Diprivan**® (AstraZeneca) (PoM)

**1% injection** (emulsion), propofol 10 mg/mL, net price 20-mL amp = £3.07, 50-mL prefilled syringe (for use with *Diprifusor*® TCI system) = £10.68

**2% injection** (emulsion), propofol 20 mg/mL, net price 50-mL prefilled syringe (for use with *Diprifusor*® TCI system) = £15.16

## THIOPENTAL SODIUM

### (Thiopentone sodium)

**Cautions** see notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid intra-arterial injection; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above; acute porphyria (section 9.8.2); myotonic dystrophy

**Hepatic impairment** use with caution—reduce dose

**Renal impairment** caution in severe impairment

**Pregnancy** may depress neonatal respiration when used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** hypotension, arrhythmias, myocardial depression, laryngeal spasm, cough, headache, sneezing, hypersensitivity reactions, rash

**Licensed use** not licensed for use in status epilepticus; not licensed for use by intravenous infusion

#### Indications and dose

##### Induction of anaesthesia

##### • By slow intravenous injection

**Neonate** initially up to 2 mg/kg, then 1 mg/kg repeated as necessary (max. total dose 4 mg/kg)

**Child 1 month–18 years** initially up to 4 mg/kg, then 1 mg/kg repeated as necessary (max. total dose 7 mg/kg)

##### Prolonged status epilepticus

##### • By slow intravenous injection and intravenous infusion

**Neonate** initially up to 2 mg/kg by *intravenous injection*, then up to 8 mg/kg/hour by *continuous intravenous infusion*, adjusted according to response

**Child 1 month–18 years** initially up to 4 mg/kg by *intravenous injection*, then up to 8 mg/kg/hour by *continuous intravenous infusion*, adjusted according to response

**Administration** For *intravenous injection*, reconstitute 500-mg vial with 20 mL Water for Injections to give 25 mg/mL solution; give over at least 10–15 seconds; for *intravenous infusion* reconstituted solution may be further diluted with Sodium Chloride 0.9%

**Thiopental** (Archimedes) (PoM)

**Injection**, powder for reconstitution, thiopental sodium, net price 500-mg vial = £5.75

## 15.1.2 Inhalational anaesthetics

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia with nitrous oxide, see Nitrous Oxide, p. 640.

**Anaesthesia and skilled tasks** See section 15.1.

### Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic (section 15.1.1).

Volatile liquid anaesthetics can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. They can increase cerebrospinal pressure and should be

used with caution in those with raised intracranial pressure. They can also cause hepatotoxicity in those who are sensitised to halogenated anaesthetics. In children with neuromuscular disease, inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death. Cardiorespiratory depression, hypotension, and arrhythmias are common side-effects of volatile liquid anaesthetics; convulsions have also been reported. They may also cause mood changes that can last for several days.

**Isoflurane** is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane can irritate mucous membranes, causing cough, breath-holding, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

**Desflurane** is a rapid-acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur.

**Sevoflurane** is a rapid-acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid but slower than desflurane. Sevoflurane is non-irritant and is therefore used for inhalational induction of anaesthesia. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

## DESFLURANE

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

### Indications and dose

#### Induction of anaesthesia

- By inhalation through specifically calibrated vaporiser
- Child 12–18 years** 4–11%, but not recommended (see notes above)

#### Maintenance of anaesthesia

- By inhalation through specifically calibrated vaporiser
- Neonate** 2–6% in nitrous oxide-oxygen; 2.5–8.5% in oxygen or oxygen-enriched air
- Child 1 month–18 years** 2–6% in nitrous oxide-oxygen; 2.5–8.5% in oxygen or oxygen-enriched air

## ISOFLURANE

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

### Indications and dose

#### Induction of anaesthesia

- By inhalation through specifically calibrated vaporiser
- Neonate** increased gradually according to response from 0.5–3% in oxygen or nitrous oxide-oxygen
- Child 1 month–18 years** increased gradually according to response from 0.5–3% in oxygen or nitrous oxide-oxygen

#### Maintenance of anaesthesia

- By inhalation through specifically calibrated vaporiser
- Neonate** 1–2.5% in nitrous oxide-oxygen; additional 0.5–1% may be required if given with oxygen alone
- Child 1 month–18 years** 1–2.5% in nitrous oxide-oxygen; additional 0.5–1% may be required if given with oxygen alone; caesarean section, 0.5–0.75% in nitrous oxide-oxygen

## SEVOFLURANE

**Cautions** see notes above; susceptibility to QT-interval prolongation; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Renal impairment** use with caution

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also urinary retention, leucopenia, agitation, cardiac arrest, torsade de pointes, and dystonia also reported

### Indications and dose

#### Induction of anaesthesia

- By inhalation through specifically calibrated vaporiser
- Neonate** up to 4% in oxygen or nitrous oxide-oxygen, according to response
- Child 1 month–18 years** initially 0.5–1% then increased gradually up to 8% in oxygen or nitrous oxide-oxygen, according to response

#### Maintenance of anaesthesia

- By inhalation through specifically calibrated vaporiser
- Neonate** 0.5–2% in oxygen or nitrous oxide-oxygen, according to response
- Child 1 month–18 years** 0.5–3% in oxygen or nitrous oxide-oxygen, according to response

## Nitrous oxide

**Nitrous oxide** is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For *anaesthesia* it is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For *analgesia* (without loss of consciousness) a mixture of nitrous oxide and oxygen containing 50% of each gas (*Entonox*<sup>®</sup>, *Equanox*<sup>®</sup>) is used. Self-administration using a demand valve may be used in children who are able to self-regulate their intake (usually over 5 years of age) for painful dressing changes, as an aid to postoperative physiotherapy, for wound debridement and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in children with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of children to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B<sub>12</sub>; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur.

Assessment of plasma-vitamin B<sub>12</sub> concentration should be considered before nitrous oxide anaesthesia in children at risk of deficiency, including children who have a poor, vegetarian, or vegan diet and children with a history of anaemia. Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

## NITROUS OXIDE

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

### Indications and dose

#### Maintenance of anaesthesia in conjunction with other anaesthetic agents

- By inhalation using suitable anaesthetic apparatus

**Neonate** 50–66% in oxygen

**Child 1 month–18 years** 50–66% in oxygen

### Analgesia

- By inhalation using suitable anaesthetic apparatus

(see also notes above)

**Neonate** up to 50% in oxygen, according to the child's needs

**Child 1 month–18 years** up to 50% in oxygen, according to the child's needs

## 15.1.3 Antimuscarinic drugs

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics, but they should not be used for this indication in children with cystic fibrosis. Antimuscarinics are also used before or with neostigmine (section 15.1.6) to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol and suxamethonium.

**Atropine sulfate** is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. For its role in cardiopulmonary resuscitation, see section 2.7.3.

**Hyoscine hydrobromide** reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine it may produce bradycardia rather than tachycardia. In some children hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

**Glycopyrronium bromide** reduces salivary secretions. When given intravenously it produces less tachycardia than atropine. It is widely used with neostigmine for reversal of non-depolarising muscle relaxants (section 15.1.5).

Glycopyrronium or hyoscine hydrobromide are also used to control excessive secretions in upper airways or hypersalivation in palliative care and in children unable to control posture or with abnormal swallowing reflex; effective dose varies and tolerance may develop. The intramuscular route should be avoided if possible. Hyoscine transdermal patches may also be used (section 4.6).

## ATROPINE SULFATE

**Cautions** see notes in section 1.2

**Duration of action** Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary

**Contra-indications** see notes in section 1.2

**Pregnancy** not known to be harmful; manufacturer advises caution

**Breast-feeding** small amount present in milk—manufacturer advises caution

**Side-effects** see notes in section 1.2

**Licensed use** not licensed for use by oral route; not licensed for use in children under 12 years for intra-operative bradycardia; not licensed for use in children under 12 years by intravenous route for premedication; not licensed for the control of muscarinic side-effects of edrophonium in reversal of competitive neuromuscular block

### Indications and dose

#### Premedication

- By mouth 1–2 hours before induction of anaesthesia

**Neonate** 20–40 micrograms/kg

**Child 1 month–18 years** 20–40 micrograms/kg (max. 900 micrograms)

- By intravenous injection immediately before induction of anaesthesia

**Neonate** 10 micrograms/kg

**Child 1 month–12 years** 20 micrograms/kg (minimum 100 micrograms, max. 600 micrograms)

**Child 12–18 years** 300–600 micrograms

- By subcutaneous or intramuscular injection 30–60 minutes before induction of anaesthesia

**Neonate** 10 micrograms/kg

**Child 1 month–12 years** 10–30 micrograms/kg (minimum 100 micrograms, max. 600 micrograms)

**Child 12–18 years** 300–600 micrograms

#### Intra-operative bradycardia

- By intravenous injection

**Neonate** 10–20 micrograms/kg

**Child 1 month–12 years** 10–20 micrograms/kg

**Child 12–18 years** 300–600 micrograms (larger doses in emergencies)

#### Control of muscarinic side-effects of neostigmine 50 micrograms/kg in reversal of competitive neuromuscular block

- By intravenous injection

**Neonate** 20 micrograms/kg

**Child 1 month–12 years** 20 micrograms/kg (max. 1.2 mg)

**Child 12–18 years** 0.6–1.2 mg

#### Control of muscarinic side-effects of edrophonium in reversal of competitive neuromuscular block

- By intravenous injection

**Child 1 month–18 years** 7 micrograms/kg (max. 600 micrograms)

#### Cycloplegia, anterior uveitis (section 11.5)

**Administration** for administration *by mouth*, injection solution may be given orally

### <sup>1</sup>Atropine (Non-proprietary) (PoM)

**Injection**, atropine sulfate 600 micrograms/mL, net price 1-mL amp = 86p

**Note** Other strengths also available

**Injection**, prefilled disposable syringe, atropine sulfate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95

**Injection**, prefilled disposable syringe, atropine sulfate 200 micrograms/mL, net price 5 mL = £6.78; 300 micrograms/mL, 10 mL = £6.47; 600 micrograms/mL, 1 mL = £6.78

**Oral solution**, atropine sulfate 100 micrograms/mL available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Tablets** , atropine sulfate 600 micrograms, net price 28-tab pack = £23.80

### <sup>1</sup>Minijet<sup>®</sup> Atropine (UCB Pharma) (PoM)

**Injection**, atropine sulfate 100 micrograms/mL, net price 5 mL = £6.34, 10 mL = £7.11, 30 mL = £11.19

## GLYCOPYRRONIUM BROMIDE (Glycopyrrolate)

**Cautions** see notes in section 1.2 (Antimuscarinics)

**Contra-indications** see notes in section 1.2 (Antimuscarinics)

**Side-effects** see notes in section 1.2 (Antimuscarinics)

**Licensed use** not licensed for use in control of upper airways secretion and hypersalivation

### Indications and dose

#### Premedication at induction

- By intravenous or intramuscular injection

**Neonate** 5 micrograms/kg

**Child 1 month–12 years** 4–8 micrograms/kg (max. 200 micrograms)

**Child 12–18 years** 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms)

#### Intra-operative bradycardia

- By intravenous injection

**Neonate** 10 micrograms/kg, repeated if necessary

**Child 1 month–18 years** 4–8 micrograms/kg (max. 200 micrograms), repeated if necessary

#### Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

- By intravenous injection

**Neonate** 10 micrograms/kg

**Child 1 month–12 years** 10 micrograms/kg (max. 500 micrograms)

**Child 12–18 years** 200 micrograms per 1 mg of neostigmine, or 10–15 micrograms/kg

#### Control of upper airways secretion and hypersalivation

- By mouth

**Child 1 month–18 years** 40–100 micrograms/kg (max. 2 mg) 3–4 times daily, adjusted according to response

- By subcutaneous infusion

**Child 1 month–12 years** 12–40 micrograms/kg/24 hours (max. 1.2 mg)

**Child 12–18 years** 0.6–1.2 mg/24 hours

- By subcutaneous injection or intramuscular injection or intravenous injection (but see notes above)

**Child 1 month–12 years** 4–10 micrograms/kg (max. 200 micrograms) 4 times a day when required

**Child 12–18 years** 200 micrograms every 4 hours when required

1. (PoM) restriction does not apply where administration is for saving life in emergency

**Administration** for administration *by mouth*, injection solution may be given or crushed tablets suspended in water

**Glycopyrronium bromide** (Non-proprietary)

**Injection**, glycopyrronium bromide 200 micrograms/mL, net price 1-mL amp = 54p, 3-mL amp = £1.50

**Tablets**, glycopyrronium bromide 1 mg and 2 mg Available on a named-patient basis from specialist importing companies, p. 840

▲ **With neostigmine metilsulfate**

Section 15.1.6

## HYOSCINE HYDROBROMIDE

(Scopolamine hydrobromide)

**Cautions** see notes in section 1.2 and notes above; also epilepsy

**Contra-indications** see notes in section 1.2

**Hepatic impairment** see Hyoscine Hydrobromide, section 4.6

**Renal impairment** see Hyoscine Hydrobromide, section 4.6

**Pregnancy** see Hyoscine Hydrobromide, section 4.6

**Breast-feeding** see Hyoscine Hydrobromide, section 4.6

**Side-effects** see notes in section 1.2

**Indications and dose**

**Premedication**

- By subcutaneous or intramuscular injection 30–60 minutes before induction

**Child 1–12 years** 15 micrograms/kg (max. 600 micrograms)

**Child 12–18 years** 200–600 micrograms

**Note** Same dose may be given by intravenous injection immediately before induction

**Motion sickness, excessive respiratory secretions, hypersalivation associated with clozapine therapy** section 4.6

**Hyoscine** (Non-proprietary) <sup>(POM)</sup>

**Injection**, hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £2.88; 600 micrograms/mL, 1-mL amp = £2.53

▲ **Preparations**

For transdermal and oral preparations see section 4.6

## 15.1.4 Sedative and analgesic peri-operative drugs

15.1.4.1 **Benzodiazepines**

15.1.4.2 **Non-opioid analgesics**

15.1.4.3 **Opioid analgesics**

15.1.4.4 **Other drugs for sedation**

**Important**

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**Premedication** Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a **benzodiazepine**. Premedication may also augment the action of anaesthetics

and provide some degree of pre-operative amnesia. The choice of drug depends on the individual child, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and recovery facilities. The choice also varies between elective and emergency procedures. Oral administration is preferred if possible; the rectal route should only be used in exceptional circumstances. Sedative premedication with benzodiazepines should be avoided in children with a compromised airway, CNS depression, or a history of sleep apnoea.

Premedicants can be given the night before major surgery; a further, smaller dose may be required the following morning if any delay in starting surgery is anticipated. Alternatively, the first dose may be given on the day of procedure.

Oral **midazolam** is the most common premedicant for children; **temazepam** may be used in older children. The antihistamine **alimemazine** (section 3.4.1) is occasionally used orally, but when given alone it may cause postoperative restlessness in the presence of pain.

**Sedation for clinical procedures** Sedation of children during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure and whether the child is cooperative; some procedures are safer and more successful under anaesthesia. The child should be **monitored carefully**; monitoring should begin as soon as the sedative is given or when the child becomes drowsy, and should be continued until the child wakes up.

**Midazolam** and **chloral hydrate** (section 4.1.1) are suitable for sedating children for painless procedures, such as imaging. For painful procedures, alternative choices include **nitrous oxide** (section 15.1.2), **local anaesthesia** (section 15.2), **ketamine** (section 15.1.1), or concomitant use of sedation with **opioid** or **non-opioid analgesia** (section 4.7).

**Dental procedures** Sedation for dental procedures should be limited to conscious sedation whenever possible. **Nitrous oxide** (section 15.1.2) alone and **midazolam** are effective for many children. For further information on hypnotics used for dental procedures, see p. 169.

**Anaesthesia and skilled tasks** See section 15.1.

### 15.1.4.1 Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used for sedation prior to clinical procedures and for sedation in intensive care.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines.

**Midazolam**, a water-soluble benzodiazepine, is the preferred benzodiazepine for premedication and for sedation for clinical procedures in children. It has a fast onset of action, and recovery is faster than for other benzodiazepines. Recovery may be longer in

children with a low cardiac output, or after repeated dosing.

Midazolam can be given by mouth [unlicensed], but its bitter acidic taste may need to be disguised. It can also be given buccally [unlicensed indication] or intranasally [unlicensed]. Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. It can cause severe disinhibition and restlessness in some children. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur

#### Overdosage with midazolam

There have been reports of overdosage in adults when high strength midazolam injection has been used for conscious sedation. The use of high strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available where midazolam is used, to reverse the effects if necessary.

**Temazepam** is given by mouth for premedication in older children and has a short duration of action. Anxiolytic and sedative effects last about 90 minutes, although there may be residual drowsiness. Temazepam is rarely used for dental procedures in children.

**Lorazepam** produces more prolonged sedation than temazepam and it has marked amnesic effects.

Peri-operative use of **diazepam** is not recommended in children; onset and magnitude of response are unreliable, and paradoxical effects may occur. Diazepam is not used for dental procedures in children.

## LORAZEPAM

**Cautions** see notes above and section 4.8.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** see Diazepam, section 4.8.2

**Hepatic impairment** see Benzodiazepines, section 4.8.1

**Renal impairment** see Benzodiazepines, section 4.8.1

**Pregnancy** see Benzodiazepines, section 4.8.1

**Breast-feeding** see Benzodiazepines, section 4.8.1

**Side-effects** see notes above and Diazepam, section 4.8.2

**Licensed use** not licensed for use in children under 5 years by mouth; not licensed for use in children under 12 years by intravenous injection

#### Indications and dose

##### Premedication

###### • By mouth

**Child 1 month–12 years** 50–100 micrograms/kg (max. 4 mg) at least 1 hour before procedure

**Child 12–18 years** 1–4 mg at least 1 hour before procedure

**Note** Same dose may be given the night before procedure in addition to, or to replace, dose before procedure

###### • By intravenous injection

**Child 1 month–18 years** 50–100 micrograms/kg (max. 4 mg)

**Note** Give intravenous injection 30–45 minutes before procedure

#### Status epilepticus section 4.8.2

**Administration** for *intravenous injection*, dilute injection solution with an equal volume of Sodium Chloride 0.9%; give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes

#### Lorazepam (Non-proprietary) CD4-1

**Tablets**, lorazepam 1 mg, net price 28-tab pack = £2.45; 2.5 mg, 28-tab pack = £3.68. Label: 2 or 19

**Injection**, lorazepam 4 mg/mL, net price 1-mL amp = 35p

**Excipients** include benzyl alcohol (avoid in neonates unless there is no safer alternative available, see Excipients, p. 2), propylene glycol

**Brands include** *Ativan*<sup>®</sup>

## MIDAZOLAM

**Cautions** see notes above; cardiac disease; respiratory disease; myasthenia gravis; neonates; history of drug or alcohol abuse; reduce dose if debilitated; risk of severe hypotension in children with hypovolaemia, vasoconstriction, hypothermia; avoid prolonged use (and abrupt withdrawal thereafter); **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome

**Hepatic impairment** use with caution; can precipitate coma

**Renal impairment** use with caution in chronic renal failure—increased cerebral sensitivity

**Pregnancy** avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression)

**Breast-feeding** small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses)

**Side-effects** see notes above; gastro-intestinal disturbances, dry mouth, hiccups, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), fatigue, dizziness, vertigo, involuntary movements, paradoxical excitement and aggression, dysarthria; urinary retention, incontinence; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions; with *intranasal administration* burning sensation, lacrimation, and severe irritation of nasal mucosa

**Licensed use** not licensed for use in children under 6 months for premedication and conscious sedation; not licensed for use by mouth; not licensed for use by buccal administration for conscious sedation

**Indications and dose**

**Conscious sedation for procedures** (but see notes above)

- **By mouth**

**Child 1 month–18 years** 500 micrograms/kg (max. 20 mg) 30–60 minutes before procedure

- **By buccal administration**

**Child 6 months–10 years** 200–300 micrograms/kg (max. 5 mg)

**Child 10–18 years** 6–7 mg (max. 8 mg if 70 kg or over)

- **By rectum**

**Child 6 months–12 years** 300–500 micrograms/kg 15–30 minutes before procedure

- **By intravenous injection over 2–3 minutes 5–10 minutes before procedure**

**Child 1 month–6 years** initially 25–50 micrograms/kg, increased if necessary in small steps (max. total dose 6 mg)

**Child 6–12 years** initially 25–50 micrograms/kg, increased if necessary in small steps (max. total dose 10 mg)

**Child 12–18 years** initially 25–50 micrograms/kg, increased if necessary in small steps (max. total dose 7.5 mg)

**Premedication** (but see notes above)

- **By mouth**

**Child 1 month–18 years** 500 micrograms/kg (max. 20 mg) 15–30 minutes before the procedure

- **By rectum**

**Child 6 months–12 years** 300–500 micrograms/kg 15–30 minutes before induction

**Induction of anaesthesia** (but rarely used)

- **By slow intravenous injection**

**Child 7–18 years** initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg)

**Sedation in intensive care**

- **By intravenous injection and continuous intravenous infusion**

**Neonate less than 32 weeks corrected gestational age** 60 micrograms/kg/hour by *continuous intravenous infusion*, reduced after 24 hours to 30 micrograms/kg/hour; adjusted according to response; max. treatment duration 4 days

**Neonate over 32 weeks corrected gestational age** 60 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response; max. treatment duration 4 days

**Child 1–6 months** 60 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response

**Child 6 months–12 years** initially 50–200 micrograms/kg by *slow intravenous injection* over at least 3 minutes followed by 30–120 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response

**Child 12–18 years** initially 30–300 micrograms/kg by *slow intravenous injection* given in steps of 1–2.5 mg every 2 minutes followed by 30–200 micrograms/kg/hour by *continuous intravenous infusion* adjusted according to response

**Note** Initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia

**Status epilepticus** section 4.8.2

**Administration** for administration by *mouth*, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola

For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%

**Neonatal intensive care**, dilute 15 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour

For *rectal administration* of the injection solution, attach a plastic applicator onto the end of a syringe; if the volume to be given rectally is too small, dilute with Water for Injections

**Midazolam** (Non-proprietary) CD3

**Oral liquid**, midazolam 2.5 mg/mL, 100 mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 840

**Injection**, midazolam (as hydrochloride) 1 mg/mL, net price 2-mL amp = 45p, 5-mL amp = 60p, 50-mL vial = £9.56; 2 mg/mL, 5-mL amp = 65p; 5 mg/mL, 2-mL amp = 63p, 10-mL amp = £2.50

**Hypnovel<sup>®</sup>** (Roche) CD3

**Injection**, midazolam (as hydrochloride) 5 mg/mL, 2-mL amp = 71p

▀ **Buccal preparation**

Section 4.8.2

## TEMAZEPAM

**Cautions** see notes above and Diazepam, section 4.8.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** see Diazepam, section 4.8.2

**Hepatic impairment** see Benzodiazepines, section 4.8.1

**Renal impairment** see Benzodiazepines, section 4.8.1

**Pregnancy** see Benzodiazepines, section 4.8.1

**Breast-feeding** see Benzodiazepines, section 4.8.1

**Side-effects** see notes above and Diazepam, section 4.8.2

**Licensed use** tablets not licensed for use in children

**Indications and dose**

**Premedication**

- **By mouth**

**Child 12–18 years** 10–20 mg 1 hour before procedure

**Temazepam** (Non-proprietary) CD3

**Tablets**, temazepam 10 mg, net price 28-tab pack = £20.55; 20 mg, 28-tab pack = £19.64. Label: 19

**Dental prescribing on NHS** Temazepam Tablets may be prescribed

**Oral solution**, temazepam 10 mg/5 mL, net price 300 mL = £55.93. Label: 19

**Note** Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

**Dental prescribing on NHS** Temazepam Oral Solution may be prescribed

**Note** See p. 8 for prescribing requirements of controlled drugs

**Ketorolac** (Non-proprietary) <sup>(PoM)</sup>

**Injection**, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.09

**Toradol**<sup>®</sup> (Roche) <sup>(PoM)</sup>

**Injection**, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.07

### 15.1.4.2 Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

**Diclofenac**, **ibuprofen** (section 10.1.1), **paracetamol** (section 4.7.1), and **ketorolac** are used to relieve post-operative pain in children; diclofenac and paracetamol can be given parenterally and rectally as well as by mouth. Ketorolac is given by intravenous injection.

## KETOROLAC TROMETAMOL

**Cautions** section 10.1.1; **interactions:** Appendix 1 (NSAIDs)

**Contra-indications** section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebrovascular bleeding; hypovolaemia or dehydration

**Hepatic impairment** section 10.1.1

**Renal impairment** max. 60 mg daily by intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** amount too small to be harmful

**Side-effects** section 10.1.1; also gastro-intestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations, urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site

**Licensed use** not licensed for use in children under 16 years

### Indications and dose

**Short-term management of moderate to severe acute postoperative pain only**

- By intravenous injection over at least 15 seconds  
**Child 6 months–16 years** initially 0.5–1 mg/kg (max. 15 mg), then 500 micrograms/kg (max. 15 mg) every 6 hours as required; max. 60 mg daily; max. duration of treatment 2 days
- By intravenous injection over at least 15 seconds  
**Child 16–18 years** initially 10 mg, then 10–30 mg every 4–6 hours as required (up to every 2 hours during initial postoperative period); max. 90 mg daily (children weighing less than 50 kg max. 60 mg daily); max. duration of treatment 2 days

### 15.1.4.3 Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to children who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 4.7.2.

For the management of opioid-induced respiratory depression, see section 15.1.7.

**Intra-operative analgesia** Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

**Alfentanil**, **fentanyl**, and **remifentanyl** are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the child might be less intensive. Alfentanil, fentanyl, and remifentanyl can cause muscle rigidity, particularly of the chest wall muscle or jaw muscle, which can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanyl should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

## ALFENTANIL

**Cautions** section 4.7.2 and notes above

**Contra-indications** section 4.7.2

**Hepatic impairment** section 4.7.2

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2

**Breast-feeding** present in milk—withhold breast-feeding for 24 hours

**Side-effects** section 4.7.2 and notes above; also hypertension, myoclonic movements; *less commonly* arrhythmias, hiccups, laryngospasm; *rarely* epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia

**Indications and dose**

To avoid excessive dosage in obese children, dose may need to be calculated on the basis of ideal weight for height

**Assisted ventilation: analgesia and enhancement of anaesthesia at induction and during short procedures**

- By intravenous injection over 30 seconds

**Neonate** initially 5–20 micrograms/kg; supplemental doses up to 10 micrograms/kg

**Child 1 month–18 years** initially 10–20 micrograms/kg; supplemental doses up to 10 micrograms/kg

**Assisted ventilation: maintenance of analgesia and enhancement of anaesthesia during longer surgical procedures**

- By intravenous infusion

**Neonate** initially 10–50 micrograms/kg over 10 minutes followed by 30–60 micrograms/kg/hour

**Child 1 month–18 years** initially 50–100 micrograms/kg over 10 minutes followed by 30–120 micrograms/kg/hour; usual dose with intravenous anaesthetic, 60 micrograms/kg/hour

**Note** Half-life is prolonged in neonates and accumulation is likely with prolonged use. Clearance may be increased in children 1 month–12 years and higher infusion doses might be needed

**Administration** for continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%

**Alfentanil** (Non-proprietary) <sup>(CD2)</sup>

**Injection**, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 70p, 10-mL amp = £3.20

**Injection**, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.50

**Note** To be diluted before use

**Rapifen**<sup>®</sup> (Janssen) <sup>(CD2)</sup>

**Injection**, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 63p; 10-mL amp = £2.90

**FENTANYL**

**Cautions** see Fentanyl, section 4.7.2 and notes above

**Contra-indications** see notes in section 4.7.2

**Hepatic impairment** see notes in section 4.7.2

**Renal impairment** see notes in section 4.7.2

**Pregnancy** see notes in section 4.7.2

**Breast-feeding** see Fentanyl, section 4.7.2

**Side-effects** see Fentanyl, section 4.7.2 and notes above; also myoclonic movements; *less commonly* laryngospasm; *rarely* asystole, insomnia

**Licensed use** not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years

**Indications and dose**

To avoid excessive dosage in obese children, dose may need to be calculated on the basis of ideal weight for height

**Spontaneous respiration: analgesia and enhancement of anaesthesia during operation**

- By intravenous injection over at least 30 seconds

**Child 1 month–12 years** initially 1–3 micrograms/kg, then 1 microgram/kg as required

**Child 12–18 years** initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 25–50 micrograms as required

**Assisted ventilation: analgesia and enhancement of anaesthesia during operation**

- By intravenous injection over at least 30 seconds

**Neonate** initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required

**Child 1 month–12 years** initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required

**Child 12–18 years** initially 1–5 micrograms/kg, then 50–200 micrograms as required

**Assisted ventilation: analgesia and respiratory depression in intensive care**

- By intravenous administration

**Neonate** initially by *intravenous injection* 1–5 micrograms/kg, then by *intravenous infusion*, 1.5 micrograms/kg/hour adjusted according to response

**Child 1 month–18 years** initially by *intravenous injection* 1–5 micrograms/kg, then by *intravenous infusion*, 1–6 micrograms/kg/hour adjusted according to response

**Analgesia in other situations** section 4.7.2

**Administration** for intravenous infusion, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%

**Fentanyl** (Non-proprietary) <sup>(CD2)</sup>

**Injection**, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 30p, 10-mL amp = 75p

**Sublimaze**<sup>®</sup> (Janssen) <sup>(CD2)</sup>

**Injection**, fentanyl (as citrate) 50 micrograms/mL, net price 10-mL amp = £1.31

**REMIFENTANYL**

**Cautions** section 4.7.2 and notes above

**Contra-indications** section 4.7.2 and notes above; analgesia in conscious patients

**Hepatic impairment** section 4.7.2

**Pregnancy** no information available; see also section 4.7.2

**Breast-feeding** avoid breast-feeding for 24 hours after administration—present in milk in *animal studies*

**Side-effects** section 4.7.2 and notes above; also hypertension; *less commonly* hypoxia; *rarely* asystole; AV block and convulsions also reported

**Licensed use** not licensed for use in children under 1 year

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

**Analgesia and enhancement of anaesthesia at induction**

- By intravenous infusion

**Child 12–18 years** 30–60 micrograms/kg/hour, with or without an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds

**Note** If child is to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**

- By intravenous administration

**Neonate** by intravenous infusion 24–60 micrograms/kg/hour; additional doses of 1 microgram/kg can be given by intravenous injection during the intravenous infusion

**Child 1 month–12 years** initially by intravenous injection 0.1–1 micrograms/kg over at least 30 seconds (omitted if not required) then by intravenous infusion 3–78 micrograms/kg/hour according to anaesthetic technique and adjusted according to response; additional doses can be given by intravenous injection during the intravenous infusion

**Child 12–18 years** initially by intravenous injection 0.1–1 micrograms/kg over at least 30 seconds (omitted if not required) then by intravenous infusion 3–120 micrograms/kg/hour according to anaesthetic technique and adjusted according to response; additional doses can be given by intravenous injection during the intravenous infusion

**Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**

- By intravenous infusion

**Child 12–18 years** initially 2.4 micrograms/kg/hour adjusted according to response, usual range 1.5–6 micrograms/kg/hour

**Administration** for intravenous injection, reconstitute to a concentration of 1 mg/mL; for continuous intravenous infusion, dilute further with Glucose 5% or Sodium Chloride 0.9% to a concentration of 20–25 micrograms/mL for **Child 1–12 years** or 20–250 micrograms/mL (usually 50 micrograms/mL) for **Child 12–18 years**

**Remifentanil** (Non-proprietary) CD2

**Injection**, powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £4.61; 2-mg vial = £5.72; 5-mg vial = £23.02

**Ultiva**<sup>®</sup> (GSK) CD2

**Injection**, powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58

**15.1.5 Neuromuscular blocking drugs****Important**

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders (section 10.2.2) that act on the spinal cord or brain.

Children who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised (section 15.1.6). They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

**Non-depolarising neuromuscular blocking drugs**

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases, such as neostigmine (section 15.1.6). Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium, rocuronium, and vecuronium, and the **benzylisoquinolinium** group, which includes atracurium, cisatracurium, and mivacurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium and vecuronium, are more widely used than those with a longer duration of action, such as pancuronium.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For children receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium, with a rapid onset of effect, may facilitate intubation. Atracurium or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

**Cautions** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. Their activity is prolonged in children with myasthenia gravis and in hypothermia, therefore lower doses are required.

**15.1.4.4 Other drugs for sedation**

This section is not included in *BNF for Children*.

Non-depolarising neuromuscular blocking drugs should be used with great care in those with other neuromuscular disorders and those with fluid and electrolyte disturbances, as response in these children is unpredictable. Resistance may develop in children with burns who may require increased doses; low plasma cholinesterase activity in these children requires dose titration for mivacurium. The rate of administration of neuromuscular blocking drugs should be reduced in children with cardiovascular disease. **Interactions:** Appendix 1 (muscle relaxants).

**Pregnancy** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

**Breast-feeding** Because they are ionised at physiological pH, non-depolarising neuromuscular blocking drugs are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

**Side-effects** Benzyliisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely, anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

**Atracurium**, a mixture of 10 isomers, is a benzyliisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in children with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute. Neonates may be more sensitive to the effects of atracurium and lower doses may be required.

**Cisatracurium** is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects. In children aged 1 month to 12 years, cisatracurium has a shorter duration of action and produces faster spontaneous recovery.

**Mivacurium**, a benzyliisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection. In children under 12 years mivacurium has a faster onset, shorter duration of action, and produces more rapid spontaneous recovery.

**Pancuronium**, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in children receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension. The half-life of pancuronium is prolonged in neonates; neonates should

receive postoperative intermittent positive pressure ventilation.

**Rocuronium** exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity. In most children, the duration of action of rocuronium may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

**Vecuronium**, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects. In most children, the duration of action of vecuronium may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

## ATRACURIUM BESILATE

(Atracurium besylate)

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; seizures also reported

**Licensed use** not licensed for use in neonates

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

### Neuromuscular blockade (short to intermediate duration) for surgery

#### • By intravenous administration

**Neonate** initially by *intravenous injection* 300–500 micrograms/kg followed *either by intravenous injection*, 100–200 micrograms/kg repeated as necessary *or by intravenous infusion*, 300–400 micrograms/kg/hour adjusted according to response

**Child 1 month–18 years** initially by *intravenous injection* 300–600 micrograms/kg then 100–200 micrograms/kg repeated as necessary *or initially by intravenous injection* 300–600 micrograms/kg followed *by intravenous infusion*, 300–600 micrograms/kg/hour adjusted according to response

### Neuromuscular blockade during intensive care

#### • By intravenous administration

**Neonate** initially by *intravenous injection* 300–500 micrograms/kg followed *either by intravenous injection*, 100–200 micrograms/kg repeated as necessary *or by intravenous infusion*, 300–400 micrograms/kg/hour adjusted according to response; higher doses may be necessary

**Child 1 month–18 years** initially by *intravenous injection* 300–600 micrograms/kg (optional) then *by intravenous infusion*, 270–1770 micrograms/kg/hour (usual dose 650–780 micrograms/kg/hour)

**Administration** for *continuous intravenous infusion*, dilute to a concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent.

*Neonatal intensive care*, dilute 60 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; minimum concentration of 500 micrograms/mL, max. concentration of 5 mg/mL; an intravenous infusion rate of 0.1 mL/hour provides a dose of 120 micrograms/kg/hour

**Atracurium** (Non-proprietary) (PoM)

**Injection**, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.70; 5-mL amp = £3.00; 25-mL vial = £14.45

**Tracrium**<sup>®</sup> (GSK) (PoM)

**Injection**, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.66; 5-mL amp = £3.00; 25-mL vial = £12.91

## CISATRACURIUM

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also bradycardia

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

### Neuromuscular blockade (intermediate duration) during surgery

#### • By intravenous injection

**Child 1 month–2 years** initially 150 micrograms/kg, then 30 micrograms/kg repeated approx. every 20 minutes as necessary

**Child 2–12 years** initially 150 micrograms/kg (80–100 micrograms/kg if not for intubation), then 20 micrograms/kg repeated approx. every 10 minutes as necessary

**Child 12–18 years** initially 150 micrograms/kg, then 30 micrograms/kg repeated approx. every 20 minutes as necessary

#### • By intravenous administration

**Child 2–18 years** initially 150 micrograms/kg by *intravenous injection*, then by *intravenous infusion* 180 micrograms/kg/hour, reduced to 60–120 micrograms/kg/hour according to response

**Administration** for *continuous intravenous infusion*, dilute to a concentration of 0.1–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted

**Cisatracurium** (Non-proprietary) (PoM)

**Injection**, cisatracurium (as besilate) 2 mg/mL, net price 10-mL vial = £7.55; 5 mg/mL, 30-mL vial = £31.09

**Nimbex**<sup>®</sup> (GSK) (PoM)

**Injection**, cisatracurium (as besilate) 2 mg/mL, net price 10-mL amp = £7.55

**Forté injection**, cisatracurium (as besilate) 5 mg/mL, net price 30-mL vial = £31.09

## MIVACURIUM

**Cautions** see notes above; low plasma cholinesterase activity

**Hepatic impairment** reduce dose in severe impairment

**Renal impairment** clinical effect prolonged in renal failure—reduce dose according to response

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

### Neuromuscular blockade (short duration) during surgery

#### • By intravenous administration

**Child 2–6 months** by *intravenous injection* initially 150 micrograms/kg, then *either* by *intravenous injection* 100 micrograms/kg repeated every 6–9 minutes as necessary *or* by *intravenous infusion*, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose 11–14 micrograms/kg/minute

**Child 6 months–12 years** by *intravenous injection* initially 200 micrograms/kg, then *either* by *intravenous injection* 100 micrograms/kg repeated every 6–9 minutes as necessary *or* by *intravenous infusion*, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose 11–14 micrograms/kg/minute

**Child 12–18 years** by *intravenous injection* initially 70–250 micrograms/kg, then *either* by *intravenous injection* 100 micrograms/kg repeated every 15 minutes as necessary *or* by *intravenous infusion*, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose of 6–7 micrograms/kg/minute

**Administration** for *intravenous injection*, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

**Mivacron**<sup>®</sup> (GSK) (PoM)

**Injection**, mivacurium (as chloride) 2 mg/mL, net price 5-mL amp = £2.79; 10-mL amp = £4.51

## PANCURONIUM BROMIDE

**Cautions** see notes above

**Hepatic impairment** possibly slower onset, higher dose requirement, and prolonged recovery time

**Renal impairment** use with caution; prolonged duration of block

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

**Neuromuscular blockade (long duration) during surgery**

- By intravenous injection

**Neonate** initially 100 micrograms/kg, then 50 micrograms/kg repeated as necessary

**Child 1 month–18 years** initially 100 micrograms/kg, then 20 micrograms/kg repeated as necessary

**Administration** for *intravenous injection*, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%

**Pancuronium** (Non-proprietary) (POM)

**Injection**, pancuronium bromide 2 mg/mL, net price 2-mL amp = £4.00

**ROCURONIUM BROMIDE**

**Cautions** see notes above

**Hepatic impairment** reduce dose

**Renal impairment** reduce maintenance dose; prolonged paralysis

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for use in children for assisted ventilation in intensive care

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

**Neuromuscular blockade (intermediate duration) during surgery**

- By intravenous administration

**Neonate** initially by *intravenous injection* 600 micrograms/kg, then *either by intravenous injection*, 150 micrograms/kg repeated as required or by *intravenous infusion*, 300–600 micrograms/kg/hour adjusted according to response

**Child 1 month–18 years** initially by *intravenous injection* 600 micrograms/kg, then *either by intravenous injection*, 150 micrograms/kg repeated as required or by *intravenous infusion*, 300–600 micrograms/kg/hour adjusted according to response

**Assisted ventilation in intensive care**

- By intravenous administration

**Child 1 month–18 years** initially by *intravenous injection* 600 micrograms/kg (optional), then by *intravenous infusion*, 300–600 micrograms/kg/hour for first hour, then adjusted according to response

**Administration** for *continuous intravenous infusion* or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%

**Rocuronium** (Non-proprietary) (POM)

**Injection**, rocuronium bromide 10 mg/mL, net price 5-mL vial = £3.00, 10-mL vial = £6.00

**Esmeron**<sup>®</sup> (MSD) (POM)

**Injection**, rocuronium bromide 10 mg/mL, net price 5-mL vial = £2.89, 10-mL vial = £5.79

**VECURONIUM BROMIDE**

**Cautions** see notes above

**Hepatic impairment** caution in significant impairment

**Renal impairment** caution in renal failure

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Licensed use** not licensed for assisted ventilation in intensive care

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

**Neuromuscular blockade (intermediate duration) during surgery**

- By intravenous administration

**Neonate** by *intravenous injection* initially 80 micrograms/kg, then 30–50 micrograms/kg adjusted according to response

**Child 1 month–18 years** by *intravenous injection* initially 80–100 micrograms/kg, then *either by intravenous injection*, 20–30 micrograms/kg repeated as required or by *intravenous infusion*, 0.8–1.4 micrograms/kg/minute, adjusted according to response

**Assisted ventilation in intensive care**

- By intravenous injection

**Neonate** initially 80 micrograms/kg, then 30–50 micrograms/kg adjusted according to response

- By intravenous administration

**Neonate** by *intravenous injection* 80 micrograms/kg, then by *intravenous infusion*, 0.8–1.4 micrograms/kg/minute, adjusted according to response (risk of accumulation—consider interruption of infusion)

**Child 1 month–18 years** initially by *intravenous injection* 80–100 micrograms/kg (optional), then by *intravenous infusion* 0.8–1.4 micrograms/kg/minute, adjusted according to response; up to 3 micrograms/kg/minute may be required

**Administration** reconstitute each vial with 5 mL Water for Injections to give 2 mg/mL solution; *alternatively* reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections.

For *continuous intravenous infusion*, dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.

*Neonatal intensive care*, reconstitute each vial with 5 mL Water for Injections to give a 2 mg/mL solution. Dilute 5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of 50 micrograms/kg/hour; minimum concentration of 40 micrograms/mL.

#### Norcuron® (MSD) (PoM)

**Injection**, powder for reconstitution, vecuronium bromide, net price 10-mg vial = £3.37 (with water for injections)

### Depolarising neuromuscular blocking drugs

**Suxamethonium** has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required e.g. with tracheal intubation. Neonates and young children are less sensitive to suxamethonium and a higher dose may be required.

Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. Bradycardia may occur; premedication with atropine (section 15.1.3) reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium and is caused by the development of a non-depolarising block following the initial depolarising block; edrophonium (section 15.1.6) may be used to confirm the diagnosis of dual block. Children with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

#### SUXAMETHONIUM CHLORIDE (Succinylcholine chloride)

**Cautions** see notes above; hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory or neuromuscular disease; raised intra-ocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); **interactions:** Appendix 1 (muscle relaxants)

**Contra-indications** family history of malignant hyperthermia, hyperkalaemia; major trauma, severe burns, neurological disease involving acute wasting of major muscle, prolonged immobilisation—risk of hyperkalaemia; personal or family history of congenital myotonic disease, Duchenne muscular dystrophy; low plasma-cholinesterase activity (including severe liver disease, see below)

**Hepatic impairment** prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase

**Pregnancy** mildly prolonged neuromuscular blockade may occur

**Breast-feeding** unlikely to be present in breast milk in significant amounts (ionised at physiological pH); breast-feeding may be resumed once the mother recovered from neuromuscular block

**Side-effects** see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, myoglobinuria, myoglobinaemia; increased intra-ocular pressure; flushing, rash; *rarely* arrhythmias, cardiac arrest; bronchospasm, apnoea, prolonged respiratory depression; limited jaw mobility; *very rarely* anaphylactic reactions, malignant hyperthermia; *also reported* hypertension, hypotension, rhabdomyolysis

#### Indications and dose

##### Neuromuscular blockade (short duration) during surgery

###### • By intravenous injection

**Neonate** 2 mg/kg produces 5–10 minutes neuromuscular blockade

**Child 1 month–1 year** 2 mg/kg

**Child 1–18 years** 1 mg/kg

###### • By intramuscular injection (onset in 2–3 minutes)

**Neonate** up to 4 mg/kg produces 10–30 minutes neuromuscular blockade

**Child 1 month–1 year** up to 4–5 mg/kg

**Child 1–12 years** up to 4 mg/kg; max. 150 mg

**Administration** for *intravenous injection*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%

#### Suxamethonium Chloride (Non-proprietary) (PoM)

**Injection**, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 58p, 2-mL prefilled syringe = £8.45

#### Anectine® (GSK) (PoM)

**Injection**, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 71p

### 15.1.6 Drugs for reversal of neuromuscular blockade

#### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

#### Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium, but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

**Edrophonium** has a transient action and may be used in the diagnosis of suspected dual block due to suxamethonium. Atropine (section 15.1.3) is given before or with edrophonium to prevent muscarinic effects of edrophonium; it is also used in the diagnosis of myasthenia gravis (section 10.2.1).

**Neostigmine** has a longer duration of action than edrophonium and is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.3), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

## EDROPHONIUM CHLORIDE

**Cautions** section 10.2.1; atropine should also be given

**Contra-indications** section 10.2.1

**Pregnancy** section 10.2.1

**Breast-feeding** section 10.2.1

**Side-effects** section 10.2.1

**Indications and dose**

**Brief reversal of non-depolarising neuromuscular blockade**

- By intravenous injection over several minutes

**Child 1 month–18 years** 500–700 micrograms/kg (after or with atropine)

**Myasthenia gravis** section 10.2.1

**Edrophonium** (Non-proprietary) (PoM)

**Injection**, edrophonium chloride 10 mg/mL, net price 1-mL amp = £19.50

## NEOSTIGMINE METILSULFATE (Neostigmine methylsulfate)

**Cautions** section 10.2.1; glycopyrronium or atropine should also be given

**Contra-indications** section 10.2.1

**Renal impairment** section 10.2.1

**Pregnancy** section 10.2.1

**Breast-feeding** section 10.2.1

**Side-effects** section 10.2.1

**Indications and dose**

**Reversal of non-depolarising muscle block**

- By intravenous injection over 1 minute

**Neonate** 50 micrograms/kg, after or with glycopyrronium or atropine; a further dose of 25 micrograms/kg may be required

**Child 1 month–12 years** 50 micrograms/kg (max. 2.5 mg) after or with glycopyrronium or atropine; a further dose of 25 micrograms/kg may be required

**Child 12–18 years** 50 micrograms/kg (max. 2.5 mg) after or with glycopyrronium or atropine; a further dose of 25 micrograms/kg (max. 2.5 mg) may be required

**Myasthenia gravis** section 10.2.1

**Administration** for intravenous injection, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%

**Neostigmine** (Non-proprietary) (PoM)

**Injection**, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 50p

## With glycopyrronium

**Glycopyrronium-Neostigmine** (Non-proprietary) (PoM)

**Injection**, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-mL amp = £1.15

**Dose**

**Reversal of non-depolarising neuromuscular blockade**

- By intravenous injection over 10–30 seconds

**Child 1 month–18 years** 0.02 mL/kg (or 0.2 mL/kg of a 1 in 10 dilution), dose may be repeated if required (total max. 2 mL)

**Administration** for intravenous injection, may be diluted with Sodium Chloride 0.9%

## Other drugs for reversal of neuromuscular blockade

**Sugammadex** is a modified gamma cyclodextrin that can be used in children for the routine reversal of neuromuscular blockade induced by rocuronium (section 15.1.5).

The *Scottish Medicines Consortium*, p. 3 has advised (February 2013) that sugammadex (*Bridion*®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

## SUGAMMADEX

**Cautions** recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease; pre-existing coagulation disorders or use of anticoagulants (unrelated to surgery); wait 24 hours before re-administering rocuronium; **interactions:** Appendix 1 (sugammadex)

**Renal impairment** avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** use with caution—no information available

**Side-effects** bronchospasm, bradycardia, cardiac arrest, hypersensitivity reactions

**Indications and dose**

**Routine reversal of neuromuscular blockade induced by rocuronium**

- By intravenous injection

**Child 2–18 years** 2 mg/kg (consult product literature)

**Administration** for intravenous injection dose may be diluted to a concentration of 10 mg/mL with Sodium Chloride 0.9%

**Bridion**® (MSD) (PoM)

**Injection**, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10

**Electrolytes** Na<sup>+</sup> 0.42 mmol/mL

## 15.1.7 Antagonists for central and respiratory depression

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by an opioid antagonist. **Naloxone** given intravenously immediately reverses opioid-induced respiratory depression but the dose may have to be repeated because of its **short duration of action**. Intramuscular injection of naloxone produces a more gradual and prolonged effect but absorption may be erratic. Care is required in children requiring pain relief because naloxone also antagonises the analgesic effect of opioids.

**Neonates** Naloxone is used in newborn infants to reverse respiratory depression and sedation resulting from the use of opioids by the mother, usually for pain during labour. In neonates the effects of opioids may persist for up to 48 hours and in such cases naloxone is often given by intramuscular injection for its prolonged effect. In severe respiratory depression after birth, breathing should first be established (using artificial means if necessary) and naloxone administered only if use of opioids by the mother is thought to cause the respiratory depression; the infant should be monitored closely and further doses of naloxone administered as necessary.

**Flumazenil** is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam and midazolam, so children may become resedated.

## FLUMAZENIL

**Cautions** short-acting (repeat doses may be necessary)—benzodiazepine effects may persist for at least 24 hours; benzodiazepine dependence (may precipitate withdrawal symptoms); prolonged benzodiazepine therapy for epilepsy (risk of convulsions); history of panic disorders (risk of recurrence); ensure neuromuscular blockade cleared before giving; avoid rapid injection in high-risk or anxious children and following major surgery; head injury (rapid reversal of benzodiazepine sedation may cause convulsions)

**Contra-indications** life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

**Hepatic impairment** carefully titrate dose

**Pregnancy** not known to be harmful

**Breast-feeding** avoid breast-feeding for 24 hours

**Side-effects** nausea and vomiting; *less commonly* palpitation, anxiety, fear; *also reported* transient hypertension, tachycardia, flushing, agitation, convulsions (particularly in those with epilepsy), dizziness, sensory disturbance, chills, sweating

**Licensed use** not licensed for use in children under 1 year; not licensed for use by intravenous infusion in children; not licensed for use in children in intensive care

### Indications and dose

#### Reversal of sedative effects of benzodiazepines

- By intravenous injection over 15 seconds

**Neonate** 10 micrograms/kg, repeat at 1-minute intervals if required

**Child 1 month–18 years** 10 micrograms/kg (max. 200 micrograms), repeated at 1-minute intervals if required; max. total dose of 50 micrograms/kg (1 mg) (2 mg in intensive care)

- By intravenous infusion, if drowsiness recurs after injection

**Neonate** 2–10 micrograms/kg/hour, adjusted according to response

**Child 1 month–18 years** 2–10 micrograms/kg/hour, adjusted according to response; max. 400 micrograms/hour

**Overdosage with benzodiazepines** see Emergency Treatment of Poisoning p. 29

**Administration** for *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%

**Flumazenil** (Non-proprietary) (POM)

**Injection**, flumazenil 100 micrograms/mL, net price 5-mL amp = £13.50

## NALOXONE HYDROCHLORIDE

**Cautions** cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported); maternal physical dependence on opioids (may precipitate withdrawal in newborn); pain (see also under Titration of Dose, below); has short duration of action (see notes above)

**Titration of dose** In postoperative use, the dose should be titrated for each child in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** not orally bioavailable

**Side-effects** nausea, vomiting; hypotension, hypertension, ventricular tachycardia and fibrillation, cardiac arrest; hyperventilation, dyspnoea, pulmonary oedema; headache, dizziness; *less commonly* diarrhoea, dry mouth, agitation, excitement, paraesthesia, tremor, sweating; *very rarely* seizures and erythema multiforme

### Indications and dose

#### Reversal of respiratory and CNS depression in neonate following maternal opioid use during labour

- By intramuscular injection

**Neonate** 200 micrograms (60 micrograms/kg) as a single dose at birth

- By intravenous or subcutaneous injection

**Neonate** 10 micrograms/kg, repeated every 2–3 minutes if required

#### Reversal of postoperative respiratory depression

- By intravenous injection

**Neonate** 1 microgram/kg, repeated every 2–3 minutes if required

**Child 1 month–12 years** 1 microgram/kg, repeated every 2–3 minutes if required

**Child 12–18 years** 1.5–3 micrograms/kg; if response inadequate, give subsequent doses of 100 micrograms every 2 minutes

**Overdosage with opioids** see Emergency Treatment of Poisoning, p. 27

### Preparation

See Emergency Treatment of Poisoning, p. 28

## 15.1.8 Drugs for malignant hyperthermia

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium should be avoided during anaesthesia in children at high risk of malignant hyperthermia.

**Dantrolene** is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

### DANTROLENE SODIUM

**Cautions** avoid extravasation (risk of tissue necrosis); interactions: Appendix 1 (muscle relaxants)

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** present in milk—use only if potential benefit outweighs risk

**Side-effects** hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

**Licensed use** not licensed for use in children

#### Indications and dose

##### Malignant hyperthermia

- By rapid intravenous injection

**Child 1 month–18 years** initially 2–3 mg/kg, then 1 mg/kg repeated as required (total max. dose 10 mg/kg)

**Chronic severe spasticity of voluntary muscle** see section 10.2.2

**Dantrium Intravenous**<sup>®</sup> (SpePharm) (POM)

**Injection**, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £51.00 (hosp. only)

## 15.2 Local anaesthesia

### Important

The drugs in section 15.2 should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

See also section 1.7 (anus), section 11.7 (eye), section 12.3 (oropharynx), and section 13.3 (skin).

**Use of local anaesthetics** Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

**Administration** The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The child's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so **careful surveillance** for toxic effects (see Toxicity and Side-effects, p. 655) is necessary during the first 30 minutes after injection.

Epidural anaesthesia is combined with general anaesthesia for certain surgical procedures in children.

**Use of vasoconstrictors** Local anaesthetics cause dilation of blood vessels. The addition of a vasoconstrictor such as **adrenaline (epinephrine)** to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline, and it is **not** advisable to give adrenaline with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline must be used in a low concentration when administered with a local anaesthetic (but see also Dental Anaesthesia, p. 655). The total dose of adrenaline should **not** exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. For prescribing information on adrenaline, see section 2.7.2. For drug interactions of adrenaline, see Appendix 1 (sympathomimetics).

In children with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these children an anaesthetic without adrenaline should be used.

**Dental anaesthesia** Lidocaine is widely used in dental procedures; it is most often used in combination with **adrenaline** (epinephrine). Lidocaine 2% combined with adrenaline 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline. See also Use of Vasoconstrictors, p. 654.

The local anaesthetics **articaine** and **mepivacaine** are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine is available with or without adrenaline, and articaine is available with adrenaline.

In children with severe hypertension or unstable cardiac rhythm, mepivacaine without adrenaline may be used. Alternatively, **prilocaine** with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in children with coronary artery disease.

**Cautions of local anaesthetics** Local anaesthetics should be administered with caution in children, especially if debilitated (consider dose reduction) or those with impaired cardiac conduction, cardiovascular disease, hypovolaemia, shock, impaired respiratory function, epilepsy, or myasthenia gravis. See also Administration and Use of Vasoconstrictors, above.

**Contra-indications of local anaesthetics** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. In such circumstances, increased absorption into the blood increases the possibility of systemic effects, and the local anaesthetic effect may also be reduced by altered local pH. See also Use of Vasoconstrictors, p. 654.

Local anaesthetic preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block).

Local anaesthetics can cause ototoxicity and should not be applied to the middle ear. They are also contra-indicated in children with complete heart block.

**Toxicity and side-effects** A single application of a topical lidocaine preparation does not generally cause systemic side-effects. Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. CNS effects include a feeling of inebriation and lightheadedness followed by drowsiness, numbness of the tongue and perioral region, restlessness, paraesthesia (including sensations of hot and cold), dizziness, blurred vision, tinnitus, headache, nausea and vomiting, muscle twitching, tremors, and convulsions. Transient excitation may also occur, followed by depression with drowsiness, respiratory failure, unconsciousness, and coma. Effects on the cardiovascular system include myocardial depression and peripheral vasodilatation resulting in hypotension and bradycardia; arrhythmias and cardiac arrest can occur.

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine,

prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

### Management of severe local anaesthetic-induced cardiovascular toxicity

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed, see section 2.7.3 (Cardiopulmonary Resuscitation).

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the child does not respond rapidly to standard procedures, 20% lipid emulsion such as *Intralipid*<sup>®</sup> [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the **National Poisons Information Service**, p. 23.

Detailed treatment algorithms and accompanying notes are available at [www.toxbase.org](http://www.toxbase.org) or [www.aagbi.org](http://www.aagbi.org) (search site for: local anaesthetic toxicity).

## Articaine

**Articaine** is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 655). It is available in a preparation that also contains adrenaline (see Use of Vasoconstrictors, p. 654).

### ARTICAINE HYDROCHLORIDE WITH ADRENALINE

(Carticaine hydrochloride with adrenaline)

**Cautions** see Cautions of Local Anaesthetics, p. 655 and Adrenaline, section 2.7.2

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 655 and Adrenaline, section 2.7.2

**Hepatic impairment** use with caution; increased risk of side-effects in severe impairment

**Renal impairment** see Adrenaline, section 2.7.2

**Pregnancy** use only if potential benefit outweighs risk—no information available

**Breast-feeding** avoid breast-feeding for 48 hours after administration

**Side-effects** see Toxicity and Side-effects, p. 655 and Adrenaline, section 2.7.2; also methaemoglobinaemia (see Prilocaine (p. 658) for treatment)

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

**Infiltration anaesthesia in dentistry**

**Child 4–18 years** consult expert dental sources; **important:** see also Administration, p. 654

**Septanest®** (Septodont) [PoM]

**Injection**, articaine hydrochloride 40 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 2.2-mL cartridge = 41p

**Excipients** include sulfites

**Injection**, articaine hydrochloride 40 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 41p

**Excipients** include sulfites

**Bupivacaine**

**Bupivacaine** has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

**BUPIVACAINE HYDROCHLORIDE**

**Cautions** see Cautions of Local Anaesthetics, p. 655; myocardial depression may be more severe and more resistant to treatment; cardiovascular disease; hypertension; hypotension; cerebral atheroma; **interactions:** Appendix 1 (bupivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 655

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** use with caution in severe impairment

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; use lower doses for intrathecal use during late pregnancy

**Breast-feeding** amount too small to be harmful

**Side-effects** see Toxicity and Side-effects, p. 655

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Adjusted according to child's physical status and nature of procedure, seek expert advice—**important:** see also under Administration, p. 654

**Bupivacaine** (Non-proprietary) [PoM]

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), net price 10 mL = 88p; 5 mg/mL (0.5%), 10 mL = 92p

**Infusion (epidural)**, anhydrous bupivacaine hydrochloride 1 mg/mL (0.1%), net price 100 mL = £8.41, 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

**Marcain®** (AstraZeneca) [PoM]

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (*Marcain® 0.25%*), net price 10-mL *Polyamp®* = £1.06; 5 mg/mL (*Marcain® 0.5%*), 10-mL *Polyamp®* = £1.21

**Marcain Heavy®** (AstraZeneca) [PoM]

**Injection**, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), glucose 80 mg/mL, net price 4-mL amp = £1.45

**With adrenaline**

For prescribing information on adrenaline, see section 2.7.2; see also Use of Vasoconstrictors, p. 654

**Bupivacaine and Adrenaline** (Non-proprietary) [PoM]

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.40

**Injection**, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £2.10

**Levobupivacaine**

**Levobupivacaine**, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine but is thought to have fewer adverse effects.

**LEVOBUPIVACAINE**

**Note** Levobupivacaine is an isomer of bupivacaine

**Cautions** see Cautions of Local Anaesthetics, p. 655; cardiovascular disease; **interactions:** Appendix 1 (levobupivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 655

**Hepatic impairment** use with caution

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid if possible in first trimester—*toxicity in animal studies*; may cause fetal distress syndrome; do not use for paracervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

**Breast-feeding** amount too small to be harmful

**Side-effects** see Toxicity and Side-effects, p. 655; also sweating, pyrexia, anaemia

**Licensed use** not licensed for use in children except for analgesia by ilioinguinal or iliohypogastric block

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Adjusted according to child's physical status and nature of procedure, seek expert advice—**important:** see also under Administration, p. 654

**Chirocaine®** (AbbVie) [PoM]

**Injection**, levobupivacaine (as hydrochloride) 2.5 mg/mL, net price 10-mL amp = £1.41; 5 mg/mL, 10-mL amp = £1.62; 7.5 mg/mL, 10-mL amp = £2.42

**Note** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%

**Infusion**, levobupivacaine (as hydrochloride) 1.25 mg/mL, net price 100 mL = £7.26, 200 mL = £12.20

## Lidocaine

Lidocaine is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

Application of a mixture of lidocaine and prilocaine (*EMLA*<sup>®</sup>) under an occlusive dressing provides surface anaesthesia for 1–2 hours. *EMLA*<sup>®</sup> does not appear to be effective in providing local anaesthesia for heel lancing in neonates.

### LIDOCAINE HYDROCHLORIDE (Lignocaine hydrochloride)

**Cautions** see Cautions of Local Anaesthetics, p. 655 and section 2.3.2; hypertension; topical preparations can damage plastic cuffs of endotracheal tubes

**Contra-indications** see notes above, Contra-indications of Local Anaesthetics (p. 655), and section 2.3.2

**Hepatic impairment** section 2.3.2

**Renal impairment** section 2.3.2

**Pregnancy** large doses can cause fetal bradycardia; large doses during delivery can cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block

**Breast-feeding** section 2.3.2

**Side-effects** see Toxicity and Side-effects, p. 655 and section 2.3.2; also methaemoglobinaemia (see Prilocaine (p. 658) for treatment), nystagmus, rash; hypoglycaemia also reported following intrathecal or extradural administration

#### Indications and dose

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

#### Infiltration anaesthesia

##### • By injection

(see also Administration, p. 654, and *Important* warning below)

**Neonate** according to nature of procedure, up to 3 mg/kg (0.3 mL/kg of 1% solution), repeated not more often than every 4 hours

**Child 1 month–12 years** according to nature of procedure, up to 3 mg/kg (0.3 mL/kg of 1% solution), repeated not more often than every 4 hours

**Child 12–18 years** according to weight of child and nature of procedure, max. 200 mg, repeated not more often than every 4 hours

**Surface anaesthesia** see preparations below

**Ventricular arrhythmias, neonatal seizures** section 2.3.2

**Intravenous regional anaesthesia and nerve blocks** seek expert advice

**Dental anaesthesia** seek expert advice

#### Important

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

### ▲ Lidocaine hydrochloride injections

**Lidocaine** (Non-proprietary) (PoM)

**Injection**, lidocaine hydrochloride 5 mg/mL (0.5%), net price 10-mL amp = 50p; 10 mg/mL (1%), 2-mL amp = 27p, 5-mL amp = 27p, 10-mL amp = 40p, 10-mL prefilled syringe = £8.48, 20-mL amp = 76p; 20 mg/mL (2%), 2-mL amp = 31p, 5-mL amp = 31p

### ▲ With adrenaline

For prescribing information on adrenaline see section 2.7.2; see also Use of Vasoconstrictors, p. 654.

**Xylocaine**<sup>®</sup> (AstraZeneca) (PoM)

**Injection**, anhydrous lidocaine hydrochloride 10 mg/mL (1%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.93

**Excipients** include sulfites

**Injection**, anhydrous lidocaine hydrochloride 20 mg/mL (2%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.77

**Excipients** include sulfites

### ▲ Lidocaine injections for dental use

A variety of lidocaine injections with adrenaline are available in dental cartridges; brand names include *Lignospan Special*<sup>®</sup>, *Rexocaine*<sup>®</sup>, and *Xylocaine*<sup>®</sup>.

For prescribing information on adrenaline see section 2.7.2; see also Use of Vasoconstrictors, p. 654.

**Note** Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia

### ▲ Lidocaine for surface anaesthesia

**Lidocaine** (Non-proprietary)

**Ointment**, lidocaine 5%, net price 15 g = £6.18

#### Dose

##### Dental practice

**Child** rub gently into dry gum

**Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis), lubricant in cystoscopy or proctoscopy**

**Child** apply 1–2 mL when necessary; avoid long-term use

**Instillagel**<sup>®</sup> (CliniMed)

**Gel**, lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6-mL syringe = 23p, 11-mL syringe = 14p

**Excipients** include hydroxybenzoates (parabens)

**Laryngojet**<sup>®</sup> (UCB Pharma) (PoM)

**Solution**, lidocaine hydrochloride 40 mg/mL (4%), net price per unit (4-mL vial and disposable sterile cannula with cover and vial injector) = £5.10

**Note** May be difficult to obtain

#### Dose

**Anaesthesia of mucous membranes of oropharynx, trachea, and respiratory tract**

**Child** up to 0.075 mL/kg (3 mg/kg) as a single dose sprayed, instilled (if a cavity) or applied with a swab; reduce dose according to size, age, and condition of child, max. 5 mL (200 mg)

**LMX 4**<sup>®</sup> (Ferndale)

**Cream**, lidocaine 4%, net price 5-g tube = £2.98, 30-g tube = £14.90; 12 × 5-g tube with 24 waterproof dressings = £38.16

**Excipients** include benzyl alcohol and propylene glycol

#### Dose

**Anaesthesia before venous cannulation or venepuncture**

**Child 1 month–18 years** apply thick layer (1–2.5 g; child under 1 year max. 1 g) to small area (2.5 cm × 2.5 cm) of

non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours (child 1–3 months, 60 minutes; child 3 months–1 year, 4 hours); remove cream with gauze and perform procedure after approximately 5 minutes

### Xylocaine® (AstraZeneca)

**Spray**, lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container, net price 50-mL bottle = £6.29

#### Dose

**Bronchoscopy, laryngoscopy, oesophagoscopy, endotracheal intubation**

**Child up to 18 years** up to 3 mg/kg

### With prilocaine

For prescribing information on prilocaine, see p. 658.

### EMLA® (AstraZeneca)

**Cream**, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £2.25; 30-g tube (surgical pack) = £12.30; 5 × 5-g tube with 12 occlusive dressings (premedication pack) = £11.70

**Contra-indications** use in child less than 37 weeks corrected gestational age

#### Dose

**Anaesthesia before minor skin procedures including venepuncture**

**Neonate** apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours

**Child 1–3 months** apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours

**Child 3 months–1 year** apply max. 2 g under occlusive dressing for max. 4 hours before procedure; max. 2 doses in 24 hours

**Child 1–18 years** apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for child 1–12 years

**Note** Shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

### Lidocaine for ear, nose, and oropharyngeal use

For prescribing information on phenylephrine, see section 2.7.2.

### Lidocaine with phenylephrine (Non-proprietary)

**Topical solution**, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £11.48

#### Dose

**Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose**

**Child 12–18 years** up to max. 8 sprays

## Mepivacaine

**Mepivacaine** is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 655).

### MEPIVACAINE HYDROCHLORIDE

**Cautions** see Cautions of Local Anaesthetics, p. 655

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 655

**Hepatic impairment** use with caution; increased risk of side-effects in severe impairment

**Renal impairment** use with caution; increased risk of side-effects

**Pregnancy** use with caution in early pregnancy

**Breast-feeding** use with caution

**Side-effects** see Toxicity and Side-effects, p. 655

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

### Infiltration anaesthesia and nerve block in dentistry

**Child 3–18 years** consult expert dental sources

### Scandonest® 3% Plain (Septodont) (PoM)

**Injection**, mepivacaine hydrochloride 30 mg/mL, net price 2.2-mL cartridge = 36p

### With adrenaline

For prescribing information on adrenaline, see section 2.7.2; see Use of Vasoconstrictors, p. 654.

### Scandonest® 2% Special (Septodont) (PoM)

**Injection**, mepivacaine hydrochloride 20 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 36p

**Excipients** include sulfites

## Prilocaine

**Prilocaine** is a local anaesthetic of low toxicity which is similar to lidocaine. If used in high doses, methaemoglobinemia may occur, which can be treated with an intravenous injection of **methythionium chloride** (see Emergency Treatment of Poisoning, p. 24); neonates and infants under 6 months are particularly susceptible to methaemoglobinemia.

### PRILOCAINE HYDROCHLORIDE

**Cautions** see Cautions of Local Anaesthetics, p. 655; severe or untreated hypertension; concomitant drugs which cause methaemoglobinemia; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (prilocaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 655; anaemia, or congenital or acquired methaemoglobinemia

**Hepatic impairment** use with caution; lower doses may be required for intrathecal anaesthesia

**Renal impairment** use with caution; lower doses may be required for intrathecal anaesthesia

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported); use lower doses for intrathecal use during late pregnancy

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** see notes above and Toxicity and Side-effects, p. 655; also hypertension

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

**Infiltration anaesthesia (higher strengths for dental use only), nerve block**

See under preparations below, seek expert advice—**important**: see also under Administration, p. 654

**Citanest 1%®** (AstraZeneca) (PoM)

**Injection**, prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £5.06

**Dose**

**Child 6 months–12 years** up to 5 mg/kg adjusted according to site of administration and response; max. 400 mg

**Child 12–18 years** 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg (adjusted according to site of administration and response)

**With lidocaine**

See Lidocaine, p. 658

**For dental use**

**Note** Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia

**Citanest 3% with Octapressin®** (Dentsply) (PoM)

**Injection**, prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL, net price 2.2-mL cartridge and self-aspirating cartridge (both) = 47p

**Ropivacaine**

**Ropivacaine** is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotoxic than bupivacaine, but also less potent.

**ROPIVACAINE HYDROCHLORIDE**

**Cautions** see Cautions of Local Anaesthetics, p. 655; also acute porphyria (section 9.8.2); **interactions**: Appendix 1 (ropivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 655

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** use with caution in severe impairment; increased risk of systemic toxicity in chronic renal failure

**Pregnancy** not known to be harmful; do not use for paracervical block in obstetrics

**Breast-feeding** not known to be harmful

**Side-effects** see Toxicity and Side-effects, p. 655; also hypertension, pyrexia; *less commonly* syncope and hypothermia

**Licensed use** 2 mg/mL strength not licensed for use in children under 12 years except for acute pain management by caudal epidural block and continuous epidural infusion; 7.5 mg/mL and 10 mg/mL strengths not licensed for use in children under 12 years

**Indications and dose**

To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Adjust according to child's physical status and nature of procedure, seek expert advice—**important**: see also under Administration, p. 654

**Ropivacaine** (Non-proprietary) (PoM)

**Injection**, ropivacaine hydrochloride 2 mg/mL, net price 10 mL = £1.65; 7.5 mg/mL, 10 mL = £2.50; 10 mg/mL, 10 mL = £3.00

**Infusion**, ropivacaine hydrochloride 2 mg/mL, net price 200 mL = £13.70

**Naropin®** (AstraZeneca) (PoM)

**Injection**, ropivacaine hydrochloride 2 mg/mL, net price 10-mL *Polyamp*® = £1.37; 7.5 mg/mL, 10-mL *Polyamp*® = £2.65; 10 mg/mL, 10-mL *Polyamp*® = £3.20

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/mL

**Infusion**, ropivacaine hydrochloride 2 mg/mL, net price 200-mL *Polybag*® = £17.34

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/mL

**Tetracaine**

**Tetracaine**, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. Tetracaine is effective for 4–6 hours after a single application in most children. It is not recommended prior to neonatal heel lancing.

Tetracaine is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should **never** be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine is a safer alternative.

**TETRACAINE**  
(Amethocaine)

**Cautions** see Cautions of Local Anaesthetics, p. 655

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 655

**Breast-feeding** not known to be harmful

**Side-effects** see Toxicity and Side-effects, p. 655

**Important** Rapid and extensive absorption may result in systemic side-effects (see also notes above)

**Licensed use** not licensed for use in neonates

**Indications and dose**

**Anaesthesia before venepuncture or venous cannulation** see preparation below

**Eye** section 11.7

**Ametop®** (S&N Hlth.)

**Gel**, tetracaine 4%, net price 1.5-g tube = £1.08

**Excipients** include hydroxybenzoates (parabens)

**Dose**

**Neonate** apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

**Child 1 month–18 years** apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

**Note** Child 5–18 years, contents of max. 5 tubes applied at separate sites at a single time, child 1 month–5 years, contents of max. 1 tube applied at separate sites at a single time

# A1 Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 11), as for other adverse drug reactions.

Drug interactions may be **pharmacodynamic** or **pharmacokinetic**.

## Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

## Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

**Affecting absorption** The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

**Due to changes in protein binding** To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides, and tolbutamide but the importance of these interactions is due

mainly to the fact that warfarin metabolism is also inhibited.

**Affecting metabolism** Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of *in-vitro* information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

**Affecting renal excretion** Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

## Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include those with impaired renal or liver function.

**Serious interactions** The symbol ● has been placed against interactions that are **potentially serious** and where concomitant administration of the drugs involved should be **avoided** (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.

## List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts. For explanation of symbol ● see above

### Abacavir

Analgesics: abacavir possibly reduces plasma concentration of **methadone**

Antibacterials: plasma concentration of abacavir possibly reduced by **rifampicin**

Antiepileptics: plasma concentration of abacavir possibly reduced by **phenobarbital** and **phenytoin**

- Antivirals: abacavir possibly reduces effects of ●**ribavirin**; plasma concentration of abacavir reduced by ●**tipranavir**
- Orlistat: absorption of abacavir possibly reduced by ●**orlistat**

### Abatacept

Adalimumab: increased risk of side-effects when abatacept given with **adalimumab**

- Certolizumab pegol: avoid concomitant use of abatacept with ●**certolizumab pegol**
- Etanercept: avoid concomitant use of abatacept with ●**etanercept**
- Golimumab: avoid concomitant use of abatacept with ●**golimumab**
- Infliximab: avoid concomitant use of abatacept with ●**infliximab**
- Vaccines: avoid concomitant use of abatacept with live ●**vaccines** (see p. 604)

### Abiraterone

- Antibacterials: plasma concentration of abiraterone possibly reduced by ●**rifabutin**—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by ●**rifampicin**—manufacturer of abiraterone advises avoid concomitant use
- Antidepressants: plasma concentration of abiraterone possibly reduced by ●**St John's wort**—manufacturer of abiraterone advises avoid concomitant use
- Antiepileptics: plasma concentration of abiraterone possibly reduced by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**—manufacturer of abiraterone advises avoid concomitant use

**Acarbose** see Antidiabetics

### ACE Inhibitors

Alcohol: enhanced hypotensive effect when ACE inhibitors given with **alcohol**

Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with **aldesleukin**

- Aliskiren: avoid concomitant use of ACE inhibitors with ●**aliskiren** (see also under Renin inhibitors, BNF section 2.5.5.3)

Allopurinol: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with **allopurinol** especially in renal impairment

Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when ACE inhibitors given with **general anaesthetics**

Analgesics: increased risk of renal impairment when ACE inhibitors given with **NSAIDs**, also hypotensive effect antagonised

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ACE inhibitors given with **angiotensin-II receptor antagonists**

### ACE Inhibitors (continued)

Antacids: absorption of ACE inhibitors possibly reduced by **antacids**; absorption of captopril, enalapril and fosinopril reduced by **antacids**

Antibacterials: plasma concentration of active metabolite of imidapril reduced by **rifampicin** (reduced antihypertensive effect); quinapril tablets reduce absorption of **tetracyclines** (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with **trimethoprim**

Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with **heparins**

Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by **MAOIs**

Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of **insulin**, **metformin** and **sulfonylureas**

Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with **antipsychotics**

Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with **anxiolytics** and **hypnotics**

Azathioprine: increased risk of anaemia or leucopenia when captopril given with **azathioprine** especially in renal impairment; increased risk of anaemia when enalapril given with **azathioprine** especially in renal impairment

Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with **calcium-channel blockers**

Cardiac Glycosides: captopril possibly increases plasma concentration of **digoxin**

- Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with ●**ciclosporin**
- Clonidine: enhanced hypotensive effect when ACE inhibitors given with **clonidine**; antihypertensive effect of captopril possibly delayed by previous treatment with **clonidine**
- Corticosteroids: hypotensive effect of ACE inhibitors antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when ACE inhibitors given with **diazoxide**
- Diuretics: enhanced hypotensive effect when ACE inhibitors given with ●**diuretics**; increased risk of severe hyperkalaemia when ACE inhibitors given with ●**potassium-sparing diuretics** and **aldosterone antagonists**
- Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with **levodopa**
- Gold: flushing and hypotension reported when ACE inhibitors given with ●**sodium aurothiomalate**
- Lithium: ACE inhibitors reduce excretion of ●**lithium** (increased plasma concentration)
- Methylodopa: enhanced hypotensive effect when ACE inhibitors given with **methylodopa**
- Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when ACE inhibitors given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when ACE inhibitors given with **nitrates**
- Oestrogens: hypotensive effect of ACE inhibitors antagonised by **oestrogens**
- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with ●**potassium salts**
- Probenecid: excretion of captopril reduced by **probenecid**
- Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with **alprostadiol**

**ACE Inhibitors** (*continued*)

Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Acebutolol** *see* Beta-blockers

**Aceclofenac** *see* NSAIDs

**Acemetacin** *see* NSAIDs

**Acenocoumarol** *see* Coumarins

**Acetazolamide** *see* Diuretics

**Aciclovir**

**Note** Interactions do not apply to topical aciclovir preparations

**Note** Valaciclovir interactions as for aciclovir

Ciclosporin: increased risk of nephrotoxicity when aciclovir given with **ciclosporin**

Mycophenolate: plasma concentration of aciclovir increased by **mycophenolate**, also plasma concentration of inactive metabolite of mycophenolate increased

Probenecid: excretion of aciclovir reduced by **probenecid** (increased plasma concentration)

Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with **tacrolimus**

Theophylline: aciclovir possibly increases plasma concentration of **theophylline**

**Acitretin** *see* Retinoids

**Acrivastine** *see* Antihistamines

**Adalimumab**

Abatacept: increased risk of side-effects when adalimumab given with **abatacept**

- Anakinra: avoid concomitant use of adalimumab with **anakinra**

- Vaccines: avoid concomitant use of adalimumab with live **vaccines** (see p. 604)

**Adefovir**

Antivirals: avoidance of adefovir advised by manufacturer of **tenofovir**

Interferons: manufacturer of adefovir advises caution with **peginterferon alfa**

**Adenosine**

**Note** Possibility of interaction with drugs tending to impair myocardial conduction

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval

- Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**

Caffeine citrate: anti-arrhythmic effect of adenosine antagonised by **caffeine citrate**—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine

- Dipyridamole: effect of adenosine enhanced and extended by **dipyridamole** (important risk of toxicity)—reduce dose of adenosine, see Dose under Adenosine, p. 82

Nicotine: effects of adenosine possibly enhanced by **nicotine**

Theophylline: anti-arrhythmic effect of adenosine antagonised by **theophylline**—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine

**Adrenaline (epinephrine)** *see* Sympathomimetics

**Adrenergic Neuron Blockers**

Alcohol: enhanced hypotensive effect when adrenergic neuron blockers given with **alcohol**

Alpha-blockers: enhanced hypotensive effect when adrenergic neuron blockers given with **alpha-blockers**

**Adrenergic Neuron Blockers** (*continued*)

- Anaesthetics, General: enhanced hypotensive effect when adrenergic neuron blockers given with **general anaesthetics**

Analgesics: hypotensive effect of adrenergic neuron blockers antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neuron blockers given with **angiotensin-II receptor antagonists**

Antidepressants: enhanced hypotensive effect when adrenergic neuron blockers given with **MAOIs**; hypotensive effect of adrenergic neuron blockers antagonised by **tricyclics**

Antipsychotics: hypotensive effect of adrenergic neuron blockers antagonised by **haloperidol**; hypotensive effect of adrenergic neuron blockers antagonised by higher doses of **chlorpromazine**; enhanced hypotensive effect when adrenergic neuron blockers given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neuron blockers given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when adrenergic neuron blockers given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neuron blockers given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when adrenergic neuron blockers given with **clonidine**

Corticosteroids: hypotensive effect of adrenergic neuron blockers antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when adrenergic neuron blockers given with **diazoxide**

Diuretics: enhanced hypotensive effect when adrenergic neuron blockers given with **diuretics**

Dopaminergics: enhanced hypotensive effect when adrenergic neuron blockers given with **levodopa**

Methyl dopa: enhanced hypotensive effect when adrenergic neuron blockers given with **methyl dopa**

Moxisylyte: enhanced hypotensive effect when adrenergic neuron blockers given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when adrenergic neuron blockers given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when adrenergic neuron blockers given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when adrenergic neuron blockers given with **nitrates**

Oestrogens: hypotensive effect of adrenergic neuron blockers antagonised by **oestrogens**

Pizotifen: hypotensive effect of adrenergic neuron blockers antagonised by **pizotifen**

Prostaglandins: enhanced hypotensive effect when adrenergic neuron blockers given with **alprostadil**

- Sympathomimetics: hypotensive effect of guanethidine antagonised by **dexamfetamine** and **lisdexamfetamine**; hypotensive effect of adrenergic neuron blockers antagonised by **ephedrine**, **isometheptene**, **metaraminol**, **methylphenidate**, **noradrenaline (norepinephrine)**, **oxymetazoline**, **phenylephrine**, **pseudoephedrine** and **xylometazoline**

Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neuron blockers given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Adsorbents** *see* Kaolin

**Afatinib**

Anti-arrhythmics: plasma concentration of afatinib possibly increased by **amiodarone**—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours

Antibacterials: plasma concentration of afatinib possibly increased by **erythromycin**—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by **rifampicin**

**Afatinib** (*continued*)

Antifungals: plasma concentration of afatinib possibly increased by **itraconazole**—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Antivirals: plasma concentration of afatinib increased by **ritonavir**—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; plasma concentration of afatinib possibly increased by **saquinavir**—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours

Calcium-channel Blockers: plasma concentration of afatinib possibly increased by **verapamil**—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours

Ciclosporin: plasma concentration of afatinib possibly increased by **ciclosporin**—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours

Tacrolimus: plasma concentration of afatinib possibly increased by **tacrolimus**—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours

**Agalsidase Alfa and Beta**

Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by **amiodarone** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antibacterials: effects of agalsidase alfa and beta possibly inhibited by **gentamicin** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antimalarials: effects of agalsidase alfa and beta possibly inhibited by **chloroquine and hydroxychloroquine** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

**Agomelatine**

● Antibacterials: manufacturer of agomelatine advises avoid concomitant use with **ciprofloxacin**

- Antidepressants: metabolism of agomelatine inhibited by **fluvoxamine** (increased plasma concentration)

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

**Alcohol**

ACE Inhibitors: enhanced hypotensive effect when alcohol given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with **adrenergic neurone blockers**

Alpha-blockers: increased sedative effect when alcohol given with **indoramin**; enhanced hypotensive effect when alcohol given with **alpha-blockers**

Analgesics: enhanced hypotensive and sedative effects when alcohol given with **opioid analgesics**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with **angiotensin-II receptor antagonists**

- Antibacterials: disulfiram-like reaction when alcohol given with **metronidazole**; possibility of disulfiram-like reaction when alcohol given with **tinidazole**; increased risk of convulsions when alcohol given with **cycloserine**
- Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with **coumarins** or **phenindione**
- Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with **MAOIs** (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given

**Alcohol**● Antidepressants (*continued*)

with **SSRIs**; increased sedative effect when alcohol given with **mirtazapine**, **tricyclic-related antidepressants** or **tricyclics**

Antidiabetics: alcohol enhances hypoglycaemic effect of **antidiabetics**; increased risk of lactic acidosis when alcohol given with **metformin**

Antiepileptics: alcohol possibly increases CNS side-effects of **carbamazepine**; increased sedative effect when alcohol given with **phenobarbital**; chronic heavy consumption of alcohol possibly reduces plasma concentration of **phenytoin**; increased risk of blurred vision when alcohol given with **retigabine**

Antifungals: effects of alcohol possibly enhanced by **griseofulvin**

Antihistamines: increased sedative effect when alcohol given with **antihistamines** (possibly less effect with non-sedating antihistamines)

Antimuscarinics: increased sedative effect when alcohol given with **hyoscine**

Antipsychotics: increased sedative effect when alcohol given with **antipsychotics**

Anxiolytics and Hypnotics: increased sedative effect when alcohol given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when alcohol given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with **calcium-channel blockers**; plasma concentration of alcohol possibly increased by **verapamil**

Clonidine: enhanced hypotensive effect when alcohol given with **clonidine**

Cytotoxics: disulfiram-like reaction when alcohol given with **procarbazine**

- Dapoxetine: increased sedative effect when alcohol given with **dapoxetine**

Diazoxide: enhanced hypotensive effect when alcohol given with **diazoxide**

Disulfiram: disulfiram reaction when alcohol given with **disulfiram** (see BNF section 4.10.1)

Diuretics: enhanced hypotensive effect when alcohol given with **diuretics**

Dopaminergics: alcohol reduces tolerance to **bromocriptine**

Levamisole: possibility of disulfiram-like reaction when alcohol given with **levamisole**

Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of **lomitapide**

Lofexidine: increased sedative effect when alcohol given with **lofexidine**

Methyldopa: enhanced hypotensive effect when alcohol given with **methyldopa**

Metoclopramide: absorption of alcohol possibly increased by **metoclopramide**

Moxonidine: enhanced hypotensive effect when alcohol given with **moxonidine**

Muscle Relaxants: increased sedative effect when alcohol given with **baclofen**, **methocarbamol** or **tizanidine**

Nicorandil: alcohol possibly enhances hypotensive effect of **nicorandil**

Nitrates: enhanced hypotensive effect when alcohol given with **nitrates**

- Paraldehyde: increased sedative effect when alcohol given with **paraldehyde**

- Retinoids: presence of alcohol causes etretinate to be formed from **acitretin** (increased risk of teratogenicity in women of child-bearing potential)

Sympathomimetics: alcohol possibly enhances effects of **methylphenidate**

Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Aldesleukin**

- ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with **ACE inhibitors**
- Alpha-blockers: enhanced hypotensive effect when aldesleukin given with **alpha-blockers**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with **angiotensin-II receptor antagonists**
- Antivirals: aldesleukin possibly increases plasma concentration of **indinavir**
- Beta-blockers: enhanced hypotensive effect when aldesleukin given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when aldesleukin given with **clonidine**
- Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with **corticosteroids**
  - Cytotoxics: manufacturer of aldesleukin advises avoid concomitant use with **cisplatin**, **dacarbazine** and **vinblastine**
- Diazoxide: enhanced hypotensive effect when aldesleukin given with **diazoxide**
- Diuretics: enhanced hypotensive effect when aldesleukin given with **diuretics**
- Methyldopa: enhanced hypotensive effect when aldesleukin given with **methyldopa**
- Moxonidine: enhanced hypotensive effect when aldesleukin given with **moxonidine**
- Nitrates: enhanced hypotensive effect when aldesleukin given with **nitrates**
- Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Alendronic Acid** *see* Bisphosphonates

**Alfentanil** *see* Opioid Analgesics

**Alfuzosin** *see* Alpha-blockers

**Alimemazine** *see* Antihistamines

**Aliskiren**

- ACE Inhibitors: avoid concomitant use of aliskiren with **ACE inhibitors** (see also under Renin inhibitors, BNF section 2.5.5.3)
- Analgesics: hypotensive effect of aliskiren possibly antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: avoid concomitant use of aliskiren with **angiotensin-II receptor antagonists** (see also under Renin inhibitors, BNF section 2.5.5.3); plasma concentration of aliskiren possibly reduced by **irbesartan**
- Antibacterials: plasma concentration of aliskiren reduced by **rifampicin**
- Anticoagulants: increased risk of hyperkalaemia when aliskiren given with **heparins**
- Antifungals: plasma concentration of aliskiren increased by **itraconazole**—avoid concomitant use
- Calcium-channel Blockers: plasma concentration of aliskiren increased by **verapamil**
- Ciclosporin: plasma concentration of aliskiren increased by **ciclosporin**—avoid concomitant use
- Diuretics: aliskiren reduces plasma concentration of **furosemide**; increased risk of hyperkalaemia when aliskiren given with **potassium-sparing diuretics** and **aldosterone antagonists**
- Grapefruit Juice: plasma concentration of aliskiren reduced by **grapefruit juice**—avoid concomitant use
- Potassium Salts: increased risk of hyperkalaemia when aliskiren given with **potassium salts**

**Alitretinoin** *see* Retinoids

**Alkylating Drugs** *see* Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estramustine, Ifosfamide, Lomustine, Melphalan, and Thiotepa

**Allopurinol**

ACE Inhibitors: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions

**Allopurinol**

- ACE Inhibitors (*continued*)  
when allopurinol given with **ACE inhibitors** especially in renal impairment
- Antibacterials: increased risk of rash when allopurinol given with **amoxicillin** or **ampicillin**
- Anticoagulants: allopurinol possibly enhances anticoagulant effect of **coumarins**
- Antivirals: allopurinol increases plasma concentration of **didanosine** (risk of toxicity)—avoid concomitant use
  - Azathioprine: allopurinol enhances effects and increases toxicity of **azathioprine** (reduce dose of azathioprine to one quarter of usual dose)
- Ciclosporin: allopurinol possibly increases plasma concentration of **ciclosporin** (risk of nephrotoxicity)
- Cytotoxics: allopurinol enhances effects and increases toxicity of **mercaptopurine** (reduce dose of mercaptopurine to one quarter of usual dose); avoidance of allopurinol advised by manufacturer of **capecitabine**
- Diuretics: increased risk of hypersensitivity when allopurinol given with **thiazides and related diuretics** especially in renal impairment
- Theophylline: allopurinol possibly increases plasma concentration of **theophylline**

**Almotriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)

**Allogliptin** *see* Antidiabetics

**Alpha<sub>2</sub>-adrenoceptor Stimulants** *see* Apraclonidine, Brimonidine, Clonidine, and Methyldopa

**Alpha-blockers**

- ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when alpha-blockers given with **alcohol**; increased sedative effect when indoramin given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when alpha-blockers given with **aldesleukin**
- Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with **general anaesthetics**
- Analgesics: hypotensive effect of alpha-blockers antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with **angiotensin-II receptor antagonists**
- Antidepressants: enhanced hypotensive effect when alpha-blockers given with **MAOIs**; manufacturer of indoramin advises avoid concomitant use with **MAOIs**
  - Antipsychotics: enhanced hypotensive effect when alpha-blockers given with **antipsychotics**
  - Antivirals: plasma concentration of alfuzosin possibly increased by **ritonavir**—avoid concomitant use; avoidance of alfuzosin advised by manufacturer of **telaprevir**
- Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when alpha-blockers given with **beta-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
  - Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with **calcium-channel blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin; plasma concentration of tamsulosin increased by **verapamil**
- Cardiac Glycosides: prazosin increases plasma concentration of **digoxin**
- Clonidine: enhanced hypotensive effect when alpha-blockers given with **clonidine**

**Alpha-blockers (continued)**

- Cobicistat: plasma concentration of alfuzosin possibly increased by ● **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: hypotensive effect of alpha-blockers antagonised by **corticosteroids**
- Diazoxide: enhanced hypertensive effect when alpha-blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when alpha-blockers given with ● **diuretics**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Dopaminergics: enhanced hypotensive effect when alpha-blockers given with **levodopa**
- Methyl dopa: enhanced hypotensive effect when alpha-blockers given with **methyl dopa**
- Moxisylyte: possible severe postural hypotension when alpha-blockers given with ● **moxisylyte**
- Moxonidine: enhanced hypotensive effect when alpha-blockers given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when alpha-blockers given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when alpha-blockers given with **nitrates**
- Oestrogens: hypotensive effect of alpha-blockers antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when alpha-blockers given with **alprostadil**
- Sildenafil: enhanced hypotensive effect when alpha-blockers given with ● **sildenafil** (avoid alpha-blockers for 4 hours after sildenafil)—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5
- Sympathomimetics: avoid concomitant use of tozaloline with ● **adrenaline (epinephrine)** or ● **dopamine**
- Tadalafil: enhanced hypotensive effect when alpha-blockers given with ● **tadalafil**—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5; enhanced hypotensive effect when doxazosin given with ● **tadalafil**—manufacturer of tadalafil advises avoid concomitant use
- Ulcer-healing Drugs: effects of tozaloline antagonised by ● **cimetidine** and ● **ranitidine**
- Vardenafil: enhanced hypotensive effect when alpha-blockers given with ● **vardenafil**—separate doses by 6 hours (except with tamsulosin)—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5
- Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Alpha-blockers (post-synaptic)** see Alpha-blockers

**Alprazolam** see Anxiolytics and Hypnotics

**Alprostadil** see Prostaglandins

**Aluminium Hydroxide** see Antacids

**Amantadine**

- Antimalarials: plasma concentration of amantadine possibly increased by **quinine**
- Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with **antipsychotics**
- Bupropion: increased risk of side-effects when amantadine given with **bupropion**
- Memantine: increased risk of CNS toxicity when amantadine given with ● **memantine** (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by **memantine**
- Methyl dopa: increased risk of extrapyramidal side-effects when amantadine given with **methyl dopa**; antiparkinsonian effect of dopaminergics antagonised by **methyl dopa**
- Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with **tetrabenazine**

**Ambrisentan**

Antibacterials: plasma concentration of ambrisentan possibly increased by **rifampicin**

**Ambrisentan (continued)**

- Ciclosporin: plasma concentration of ambrisentan increased by ● **ciclosporin** (see Dose under Ambrisentan, BNF section 2.5.1)

**Amikacin** see Aminoglycosides

**Amiloride** see Diuretics

**Aminoglycosides**

- Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of **agalsidase alfa and beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by **indometacin**
- Antibacterials: neomycin reduces absorption of **phenoxymethylpenicillin**; increased risk of nephrotoxicity when aminoglycosides given with **colistimethate sodium** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with **capreomycin** or ● **vancomycin**; possible increased risk of nephrotoxicity when aminoglycosides given with **cephalosporins**
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with ● **coumarins** or ● **phenindione**
- Antidiabetics: neomycin possibly enhances hypoglycaemic effect of **acarbose**, also severity of gastrointestinal effects increased
- Antifungals: increased risk of nephrotoxicity when aminoglycosides given with **amphotericin**
- Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with **bisphosphonates**
- Cardiac Glycosides: gentamicin possibly increases plasma concentration of **digoxin**; neomycin reduces absorption of **digoxin**
- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with ● **ciclosporin**
- Cytotoxics: neomycin possibly reduces absorption of **methotrexate**; neomycin reduces bioavailability of **sorafenib**; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with ● **platinum compounds**
- Diuretics: increased risk of ototoxicity when aminoglycosides given with ● **loop diuretics**
- Mannitol: manufacturer of tobramycin advises avoid concomitant use with **mannitol**
- Muscle Relaxants: aminoglycosides enhance effects of ● **non-depolarising muscle relaxants** and ● **suxamethonium**
- Parasympathomimetics: aminoglycosides antagonise effects of ● **neostigmine** and ● **pyridostigmine**
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with ● **tacrolimus**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626
- Vitamins: neomycin possibly reduces absorption of **vitamin A**

**Aminophylline** see Theophylline

**Aminosalicylates**

- Azathioprine: possible increased risk of leucopenia when aminosalicylates given with **azathioprine**
- Cardiac Glycosides: sulfasalazine possibly reduces absorption of **digoxin**
- Cytotoxics: possible increased risk of leucopenia when aminosalicylates given with **mercaptopurine**
- Folates: sulfasalazine possibly reduces absorption of **folic acid**

**Amiodarone**

**Note** Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped

Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of **agalsidase alfa and beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

**Amiodarone** (*continued*)

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**; increased risk of ventricular arrhythmias when amiodarone given with **disopyramide** or **dronedarone**—avoid concomitant use; amiodarone increases plasma concentration of **flecainide** (halve dose of flecainide)
  - Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with *parenteral* **erythromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with **levofloxacin** or **moxifloxacin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with **sulfamethoxazole** and **trimethoprim** (as co-trimoxazole)—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole; possible increased risk of ventricular arrhythmias when amiodarone given with **telithromycin**
  - Anticoagulants: amiodarone inhibits metabolism of **coumarins** and **phenindione** (enhanced anticoagulant effect); amiodarone increases plasma concentration of **dabigatran** (see Dose under Dabigatran, BNFC section 2.8.2)
  - Antidepressants: avoidance of amiodarone advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with **tricyclics**—avoid concomitant use
  - Antiepileptics: amiodarone inhibits metabolism of **phenytoin** (increased plasma concentration)
  - Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with **mizolastine**—avoid concomitant use
  - Antimalarials: avoidance of amiodarone advised by manufacturer of **piperaquine with arteminol** (possible risk of ventricular arrhythmias); avoidance of amiodarone advised by manufacturer of **artemether with lumefantrine** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with **chloroquine** and **hydroxychloroquine**, **mefloquine** or **quinine**—avoid concomitant use
  - Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with **tolterodine**
  - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with **benperidol**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with **amisulpride**, **droperidol**, **haloperidol**, **phenothiazines**, **pimozide** or **zuclopenthixol**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with **sulpiride**
  - Antivirals: plasma concentration of amiodarone possibly increased by **atazanavir**; plasma concentration of amiodarone possibly increased by **fosamprenavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by **indinavir**—avoid concomitant use; plasma concentration of amiodarone increased by **ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with **saquinavir**—avoid concomitant use; avoidance of amiodarone advised by manufacturer of **telaprevir** (risk of ventricular arrhythmias)

**Amiodarone** (*continued*)

- Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with **atomoxetine**
  - Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with **beta-blockers**; increased myocardial depression when anti-arrhythmics given with **beta-blockers**; increased risk of ventricular arrhythmias when amiodarone given with **sotalolol**—avoid concomitant use
  - Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with **diltiazem** or **verapamil**
  - Cardiac Glycosides: amiodarone increases plasma concentration of **digoxin** (halve dose of digoxin)
 

Ciclosporin: amiodarone possibly increases plasma concentration of **ciclosporin**
  - Cobicistat: plasma concentration of amiodarone possibly increased by **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
  - Colchicine: amiodarone possibly increases risk of **colchicine** toxicity
  - Cytotoxics: amiodarone possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with **bosutinib**; possible increased risk of ventricular arrhythmias when amiodarone given with **vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with **arsenic trioxide**
  - Diuretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**; amiodarone increases plasma concentration of **eplerenone** (reduce dose of eplerenone)
  - Fidaxomicin: avoidance of amiodarone advised by manufacturer of **fidaxomicin**
  - Fingolimod: possible increased risk of bradycardia when amiodarone given with **fingolimod**
  - Grapefruit Juice: plasma concentration of amiodarone increased by **grapefruit juice**
  - Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with **ivabradine**
  - Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with **simvastatin** (see Dose under Simvastatin, p. 126)
  - Lithium: manufacturer of amiodarone advises avoid concomitant use with **lithium** (risk of ventricular arrhythmias)
  - Orlistat: plasma concentration of amiodarone possibly reduced by **orlistat**
  - Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with **pentamidine isetionate**—avoid concomitant use
  - Thyroid Hormones: for concomitant use of amiodarone and **thyroid hormones** see p. 82
  - Ulcer-healing Drugs: plasma concentration of amiodarone increased by **cimetidine**
- Amisulpride** *see* Antipsychotics
- Amitriptyline** *see* Antidepressants, Tricyclic
- Amiodipine** *see* Calcium-channel Blockers
- Amoxicillin** *see* Penicillins
- Amphotericin**
- Note** Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics
- Antibacterials: increased risk of nephrotoxicity when amphotericin given with **aminoglycosides** or **polymyxins**; possible increased risk of nephrotoxicity when amphotericin given with **vancomycin**
- Antifungals: amphotericin reduces renal excretion and increases cellular uptake of **flucytosine** (toxicity possibly increased); effects of amphotericin possibly antagonised by **imidazoles** and **triazoles**; plasma

**Amphotericin**Antifungals (*continued*)

concentration of amphotericin possibly increased by **micafungin**

- Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with **cardiac glycosides**
- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with **ciclosporin**
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with **corticosteroids**—avoid concomitant use unless corticosteroids needed to control reactions
- Cytotoxics: increased risk of ventricular arrhythmias when amphotericin given with **arsenic trioxide**
- Diuretics: increased risk of hypokalaemia when amphotericin given with **loop diuretics** or **thiazides and related diuretics**
- Pentamidine Isetonate: possible increased risk of nephrotoxicity when amphotericin given with **pentamidine isetonate**
- Sodium Stibogluconate: possible increased risk of arrhythmias when amphotericin given after **sodium stibogluconate**—manufacturer of sodium stibogluconate advises giving 14 days apart
- Tacrolimus: increased risk of nephrotoxicity when amphotericin given with **tacrolimus**

**Ampicillin** *see* Penicillins**Anabolic Steroids**

- Anticoagulants: anabolic steroids enhance anticoagulant effect of **coumarins** and **phenindione**
- Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of **antidiabetics**

**Anaesthetics, General**

**Note** *See also* Surgery and Long-term Medication, p. 634  
ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with **ACE inhibitors**

- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with **adrenergic neurone blockers**
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with **alpha-blockers**
- Analgesics: metabolism of etomidate inhibited by **fentanyl** (consider reducing dose of etomidate); effects of thiopental possibly enhanced by **aspirin**; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by **opioid analgesics**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with **angiotensin-II receptor antagonists**
- Antibacterials: increased risk of hepatotoxicity when isoflurane given with **isoniazid**; effects of thiopental enhanced by **sulfonamides**; hypersensitivity-like reactions can occur when general anaesthetics given with **intravenous vancomycin**
- Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with **tricyclics**
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with **antipsychotics**; effects of thiopental enhanced by **droperidol**
- Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when general anaesthetics given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with **calcium-channel blockers**; general anaesthetics enhance hypotensive effect of **verapamil** (also AV delay)
- Clonidine: enhanced hypotensive effect when general anaesthetics given with **clonidine**
- Cytotoxics: nitrous oxide increases antifolate effect of **methotrexate**—avoid concomitant use

**Anaesthetics, General** (*continued*)

Diazoxide: enhanced hypotensive effect when general anaesthetics given with **diazoxide**

- Diuretics: enhanced hypotensive effect when general anaesthetics given with **diuretics**
  - Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with **levodopa**
  - Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with **doxapram** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
  - Memantine: increased risk of CNS toxicity when ketamine given with **memantine** (manufacturer of memantine advises avoid concomitant use)
  - Methyldopa: enhanced hypotensive effect when general anaesthetics given with **methyldopa**
  - Metoclopramide: effects of thiopental enhanced by **metoclopramide**
  - Moxonidine: enhanced hypotensive effect when general anaesthetics given with **moxonidine**
  - Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with **suxamethonium**; volatile liquid general anaesthetics enhance effects of **non-depolarising muscle relaxants** and **suxamethonium**; ketamine enhances effects of **atracurium**
  - Nitrates: enhanced hypotensive effect when general anaesthetics given with **nitrates**
  - Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with **oxytocin**
  - Probencid: effects of thiopental possibly enhanced by **probencid**
  - Sympathomimetics: manufacturer of isoflurane advises avoid concomitant use with **sympathomimetics** (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with **adrenaline (epinephrine)** or **noradrenaline (norepinephrine)**; increased risk of hypertension when volatile liquid general anaesthetics given with **methylphenidate**
  - Theophylline: increased risk of convulsions when ketamine given with **theophylline**
  - Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Anaesthetics, General (intravenous)** *see* Anaesthetics, General
- Anaesthetics, General (volatile liquids)** *see* Anaesthetics, General
- Anaesthetics, Local** *see* Bupivacaine, Chloroprocaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine
- Anagrelide**
- Cilostazol: manufacturer of anagrelide advises avoid concomitant use with **cilostazol**
  - Phosphodiesterase Type-3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with **enoximone** and **milrinone**
- Anakinra**
- Adalimumab: avoid concomitant use of anakinra with **adalimumab**
  - Certolizumab pegol: avoid concomitant use of anakinra with **certolizumab pegol**
  - Etanercept: avoid concomitant use of anakinra with **etanercept**
  - Golimumab: avoid concomitant use of anakinra with **golimumab**
  - Infliximab: avoid concomitant use of anakinra with **infliximab**
  - Vaccines: avoid concomitant use of anakinra with live **vaccines** (*see* p. 604)
- Analgesics** *see* Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

**Angiotensin-II Receptor Antagonists**

ACE Inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alcohol**

Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **aldesleukin**

- **Aliskiren**: avoid concomitant use of angiotensin-II receptor antagonists with **aliskiren** (see also under Renin inhibitors, BNF section 2.5.5.3); **irbesartan** possibly reduces plasma concentration of **aliskiren**

Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **general anaesthetics**

Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with **NSAIDs**, also hypotensive effect antagonised

Antibacterials: plasma concentration of losartan and its active metabolite reduced by **rifampicin**; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **trimethoprim**

Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **heparins**

Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by **MAOIs**

Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **antipsychotics**

Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **calcium-channel blockers**

- **Ciclosporin**: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **ciclosporin**

Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **clonidine**

Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **diazoxide**

- **Diuretics**: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **diuretics**; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **potassium-sparing diuretics and aldosterone antagonists**

Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **levodopa**

- **Lithium**: angiotensin-II receptor antagonists reduce excretion of **lithium** (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **baclofen** or **tizanidine**

**Angiotensin-II Receptor Antagonists (continued)**

Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **nitrates**

Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by **oestrogens**

- **Potassium Salts**: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **potassium salts**

Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alprostadil**

Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **tacrolimus**

Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **hydralazine, minoxidil** or **sodium nitroprusside**

**Antacids**

**Note** Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

ACE Inhibitors: antacids possibly reduce absorption of **ACE inhibitors**; antacids reduce absorption of **captopril, enalapril** and **fosinopril**

Analgesics: antacids possibly reduce absorption of **acemetacin**; alkaline urine due to some antacids increases excretion of **aspirin**

Antibacterials: antacids reduce absorption of **azithromycin, cefaclor, ciprofloxacin, isoniazid, levofloxacin, moxifloxacin, norfloxacin, ofloxacin, rifampicin** and **tetracyclines**; avoid concomitant use of antacids with **methenamine**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **nitrofurantoin**

Antiepileptics: antacids reduce absorption of **gabapentin** and **phenytoin**

Antifungals: antacids reduce absorption of **itraconazole**

Antihistamines: antacids reduce absorption of **fenoxamine**

Antimalarials: antacids reduce absorption of **chloroquine** and **hydroxychloroquine**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **proguanil**

Antipsychotics: antacids reduce absorption of **phenothiazines** and **sulpiride**

Antivirals: antacids reduce absorption of **atazanavir** (give at least 2 hours before or 1 hour after antacids); aluminium hydroxide possibly reduces absorption of **dolutegravir**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; oral magnesium salts possibly reduce absorption of **dolutegravir**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral magnesium salts; antacids reduce absorption of **elvitegravir** (give at least 4 hours apart); antacids possibly reduce absorption of **raltegravir** (give at least 2 hours apart); manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after **rilpivirine**; antacids reduce absorption of **tipranavir**

Bile Acids: antacids possibly reduce absorption of **bile acids**

Bisphosphonates: antacids reduce absorption of **bisphosphonates**

Cardiac Glycosides: antacids possibly reduce absorption of **digoxin**

Corticosteroids: antacids reduce absorption of **deflazacort**

- **Cytotoxics**: aluminium hydroxide and oral magnesium salts possibly reduce absorption of **estramustine**—manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of **bosutinib**; antacids possibly reduce

**Antacids**

- Cytotoxics (*continued*)
  - plasma concentration of **erlotinib**—give antacids at least 4 hours before or 2 hours after erlotinib
- Deferasirox: antacids containing aluminium possibly reduce absorption of **deferasirox** (manufacturer of deferasirox advises avoid concomitant use)
- Deferiprone: antacids containing aluminium possibly reduce absorption of **deferiprone** (manufacturer of deferiprone advises avoid concomitant use)
- Dipyridamol: antacids possibly reduce absorption of **dipyridamol**
- Eltrombopag: antacids reduce absorption of **eltrombopag** (give at least 4 hours apart)
- Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of **oral iron**
- Lipid-regulating Drugs: antacids reduce absorption of **rosuvastatin**
- Lithium: sodium bicarbonate increases excretion of **lithium** (reduced plasma concentration)
- Mycophenolate: antacids reduce absorption of **mycophenolate**
- Penicillamine: antacids reduce absorption of **penicillamine**
- Polystyrene Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with **polystyrene sulfonate resins**; risk of metabolic alkalosis when oral magnesium salts given with **polystyrene sulfonate resins**
- Sympathomimetics: aluminium hydroxide possibly increases absorption of **pseudoephedrine**
- Thyroid Hormones: antacids possibly reduce absorption of **levothyroxine**
- Ulcer-healing Drugs: antacids possibly reduce absorption of **lansoprazole**
- Ulipristal: avoidance of antacids advised by manufacturer of **high-dose ulipristal** (contraceptive effect of ulipristal possibly reduced)

**Antazoline** *see* Antihistamines

**Anti-arrhythmics** *see* Adenosine, Amiodarone, Disopyramide, Dronedaron, Flecainide, Lidocaine, and Propafenone

**Antibacterials** *see* individual drugs

**Antibiotics (cytotoxic)** *see* Bleomycin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, and Mitoxantrone

**Anticoagulants** *see* Apixaban, Coumarins, Dabigatran, Heparins, Phenindione, and Rivaroxaban

**Antidepressants** *see* Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John's Wort; Venlafaxine

**Antidepressants, Noradrenaline Re-uptake Inhibitors** *see* Reboxetine

**Antidepressants, SSRI**

**Note** *see also* Dapoxetine

Alcohol: sedative effects possibly increased when SSRIs given with **alcohol**

Anaesthetics, Local: fluvoxamine inhibits metabolism of **ropivacaine**—avoid prolonged administration of ropivacaine

- Analgesics: increased risk of bleeding when SSRIs given with **NSAIDs** or **aspirin**; possible increased serotonergic effects when SSRIs given with **fentanyl**; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of **methadone**; increased risk of CNS toxicity when SSRIs given with **tramadol**
- Anti-arrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with **amiodarone** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **disopyramide** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **dronedaron** (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of **darifenacin** and **procyclidine**
- Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of **droperidol** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **haloperidol** (risk of ventricular

**Antidepressants, SSRI****Anti-arrhythmics (continued)**

with **dronedaron** (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of **flecainide**; fluoxetine and paroxetine possibly inhibit metabolism of **propafenone**

- Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with **intravenous erythromycin** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **moxifloxacin** (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with **telithromycin**

- Anticoagulants: SSRIs possibly enhance anticoagulant effect of **coumarins**; possible increased risk of bleeding when SSRIs given with **dabigatran**

- Antidepressants: avoidance of fluvoxamine advised by manufacturer of **reboxetine**; possible increased serotonergic effects when SSRIs given with **duloxetine**; fluvoxamine inhibits metabolism of **duloxetine**—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by **MAOIs** (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with **moclobemide**, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start **moclobemide** for at least 1 week; after stopping fluoxetine do not start **moclobemide** for 5 weeks; increased serotonergic effects when SSRIs given with **St John's wort**—avoid concomitant use; fluvoxamine inhibits metabolism of **agomelatine** (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with **mirtazapine**; SSRIs increase plasma concentration of some **tricyclics**; manufacturer of citalopram and escitalopram advises avoid concomitant use with **tricyclics** (risk of ventricular arrhythmias)

- Antiepileptics: SSRIs antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of **carbamazepine**; plasma concentration of paroxetine reduced by **phenobarbital** and **phenytoin**; fluoxetine and fluvoxamine increase plasma concentration of **phenytoin**; plasma concentration of sertraline possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased

- Antifungals: plasma concentration of paroxetine possibly increased by **terbinafine**

- Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with **mizolastine** (risk of ventricular arrhythmias); antidepressant effect of SSRIs possibly antagonised by **cyproheptadine**

- Antimalarials: manufacturer of citalopram and escitalopram advises avoid concomitant use with **anti-malarials** (risk of ventricular arrhythmias); avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**

- Antimutagens: paroxetine increases plasma concentration of **darifenacin** and **procyclidine**

- Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of **droperidol** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **haloperidol** (risk of ventricular

## Antidepressants, SSRI

- Antipsychotics (*continued*)
  - arrhythmias; fluoxetine increases plasma concentration of ●**clozapine**, ●**haloperidol** and ●**risperidone**; fluvoxamine possibly increases plasma concentration of ●**asenapine** and ●**haloperidol**; paroxetine inhibits metabolism of ●**perphenazine** (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by ●**asenapine**; fluvoxamine, paroxetine and sertraline increase plasma concentration of ●**clozapine**; citalopram possibly increases plasma concentration of ●**clozapine** (increased risk of toxicity); fluvoxamine increases plasma concentration of ●**olanzapine**; manufacturer of citalopram and escitalopram advises avoid concomitant use with ●**phenothiazines** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ●**pimozide** (risk of ventricular arrhythmias); SSRIs possibly increase plasma concentration of ●**pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of ●**risperidone** (increased risk of toxicity)
- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by ●**darunavir**; plasma concentration of paroxetine possibly reduced by ●**ritonavir**; plasma concentration of SSRIs possibly increased by ●**ritonavir**
- Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of ●**alprazolam**; fluvoxamine increases plasma concentration of some ●**benzodiazepines**; fluvoxamine increases plasma concentration of ●**melatonin**—avoid concomitant use; sedative effects possibly increased when sertraline given with ●**zolpidem**  
Atomoxetine: possible increased risk of convulsions when antidepressants given with ●**atomoxetine**; fluoxetine and paroxetine possibly inhibit metabolism of ●**atomoxetine**
- Beta-blockers: citalopram and escitalopram increase plasma concentration of ●**metoprolol**; paroxetine possibly increases the plasma concentration of ●**metoprolol**—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of ●**propranolol**; manufacturer of escitalopram advises avoid concomitant use with ●**sotalol** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when citalopram given with ●**sotalol**—avoid concomitant use  
Bupropion: plasma concentration of citalopram possibly increased by ●**bupropion**  
Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of ●**nifedipine** (increased plasma concentration)
- Clopidogrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of ●**clopidogrel**
- Dapoxetine: possible increased risk of serotonergic effects when SSRIs given with ●**dapoxetine** (manufacturer of dapoxetine advises SSRIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs)
- Dopaminergics: increased risk of CNS toxicity when SSRIs given with ●**rasagiline**; fluvoxamine should not be started until 2 weeks after stopping ●**rasagiline**; fluoxetine should not be started until 2 weeks after stopping ●**rasagiline**, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; increased risk of hypertension and CNS excitation when paroxetine given with ●**selegiline** (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hyper-

## Antidepressants, SSRI

- Dopaminergics (*continued*)
    - tension and CNS excitation when fluvoxamine or sertraline given with ●**selegiline** (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with ●**selegiline** (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); avoidance of citalopram and escitalopram advised by manufacturer of ●**selegiline**
  - Grapefruit Juice: plasma concentration of sertraline possibly increased by ●**grapefruit juice**
  - Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of ●**tamoxifen** to active metabolite (avoid concomitant use)
  - 5HT<sub>1</sub>-receptor Agonists: increased risk of CNS toxicity when citalopram given with ●**5HT<sub>1</sub> agonists** (manufacturer of citalopram advises avoid concomitant use); fluvoxamine inhibits the metabolism of ●**frovatriptan**; possible increased serotonergic effects when SSRIs given with ●**naratriptan**; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with ●**sumatriptan**; CNS toxicity reported when sertraline given with ●**sumatriptan**; fluvoxamine possibly inhibits metabolism of ●**zolmitriptan** (reduce dose of zolmitriptan)
  - Lithium: Increased risk of CNS effects when SSRIs given with ●**lithium** (lithium toxicity reported)
  - Methylthionium: risk of CNS toxicity when SSRIs given with ●**methylthionium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)  
Metoclopramide: CNS toxicity reported when SSRIs given with ●**metoclopramide**
  - Muscle Relaxants: fluvoxamine increases plasma concentration of ●**tizanidine** (increased risk of toxicity)—avoid concomitant use  
Parasympathomimetics: paroxetine increases plasma concentration of ●**galantamine**
  - Pentamidine Isetionate: manufacturer of citalopram and escitalopram advises avoid concomitant use with ●**pentamidine isetionate** (risk of ventricular arrhythmias)
  - Pirfenidone: fluvoxamine increases plasma concentration of ●**pirfenidone**—manufacturer of pirfenidone advises avoid concomitant use
  - Pomalidomide: fluvoxamine increases plasma concentration of ●**pomalidomide**  
Ranolazine: paroxetine increases plasma concentration of ●**ranolazine**  
Roflumilast: fluvoxamine inhibits the metabolism of ●**roflumilast**  
Sympathomimetics: metabolism of SSRIs possibly inhibited by ●**methylphenidate**
  - Theophylline: fluvoxamine increases plasma concentration of ●**theophylline** (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)  
Ticagrelor: possible increased risk of bleeding when citalopram, paroxetine or sertraline given with ●**ticagrelor**  
Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by ●**cimetidine**; fluvoxamine possibly increases plasma concentration of ●**lansoprazole**; plasma concentration of escitalopram increased by ●**omeprazole**
- Antidepressants, SSRI (related)** see Duloxetine and Venlafaxine

**Antidepressants, Tricyclic**

- Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of **adrenergic neurone blockers**
- Alcohol: increased sedative effect when tricyclics given with **alcohol**
  - Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of **apraclonidine** and **brimonidine**
  - Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with **general anaesthetics**
  - Analgesics: increased risk of CNS toxicity when tricyclics given with **tramadol**; side-effects possibly increased when tricyclics given with **nefopam**; sedative effects possibly increased when tricyclics given with **opioid analgesics**
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with **amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with **disopyramide** or **flécainide**; avoidance of tricyclics advised by manufacturer of **dronedarone** (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with **propafenone**
  - Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with **moxifloxacin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics given with **tellithromycin**
  - Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of **coumarins**
  - Antidepressants: avoidance of tricyclics advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); possible increased serotonergic effects when amitriptyline or clomipramine given with **duloxetine**; increased risk of hypertension and CNS excitation when tricyclics given with **MAOIs**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start **moclobemide** for at least 1 week; plasma concentration of some tricyclics increased by **SSRIs**; plasma concentration of amitriptyline reduced by **St John's wort**
  - Antiepileptics: tricyclics antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); metabolism of tricyclics accelerated by **carbamazepine** (reduced plasma concentration and reduced effect); metabolism of tricyclics possibly accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of tricyclics possibly reduced by **phenytoin**
  - Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by **fluconazole**; plasma concentration of tricyclics possibly increased by **terbinafine**
  - Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with **antihistamines**
  - Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperquine with arteminol**
  - Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with **antimuscarinics**
  - Antipsychotics: avoidance of tricyclics advised by manufacturer of **droperidol**, **fluphenazine**, **haloperidol**, **sulpiride** and **zuclopenthixol** (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with **clozapine**; increased risk of antimuscarinic side-effects when tricyclics given with **phenothiazines**
  - Antivirals: plasma concentration of tricyclics possibly increased by **ritonavir**; increased risk of ventricular

**Antidepressants, Tricyclic**

- Antivirals (*continued*)  
arrhythmias when tricyclics given with **saquinavir**—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with **anxiolytics and hypnotics**
- Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with **atomoxetine**; possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Beta-blockers: plasma concentration of imipramine increased by **labetalol** and **propranolol**; increased risk of ventricular arrhythmias when tricyclics given with **sotalol**
- Bupropion: plasma concentration of tricyclics possibly increased by **bupropion** (possible increased risk of convulsions)
- Calcium-channel Blockers: plasma concentration of tricyclics possibly increased by **diltiazem** and **verapamil**; plasma concentration of imipramine increased by **diltiazem** and **verapamil**
- Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with **cannabis extract**
- Clonidine: tricyclics antagonise hypotensive effect of **clonidine**, also increased risk of hypertension on clonidine withdrawal
- Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with **arsenic trioxide**
- Dapoxetine: possible increased risk of serotonergic effects when tricyclics given with **dapoxetine** (manufacturer of dapoxetine advises tricyclics should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricyclics)
- Disulfiram: metabolism of tricyclics inhibited by **disulfiram** (increased plasma concentration); concomitant amitriptyline reported to increase **disulfiram** reaction with alcohol
- Diuretics: increased risk of postural hypotension when tricyclics given with **diuretics**
- Dopaminergics: caution with tricyclics advised by manufacturer of **entacapone**; increased risk of CNS toxicity when tricyclics given with **rasagiline**; CNS toxicity reported when tricyclics given with **selegiline**
- Histamine: tricyclics theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use
- Lithium: risk of toxicity when tricyclics given with **lithium**
- Methylthioninium: risk of CNS toxicity when clomipramine given with **methylthioninium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Moxonidine: tricyclics possibly antagonise hypotensive effect of **moxonidine** (manufacturer of moxonidine advises avoid concomitant use)
- Muscle Relaxants: tricyclics enhance muscle relaxant effect of **baclofen**
- Nicorandil: tricyclics possibly enhance hypotensive effect of **nicorandil**
- Nitrates: tricyclics reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Oestrogens: antidepressant effect of tricyclics antagonised by **oestrogens** (but side-effects of tricyclics possibly increased due to increased plasma concentration)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with **pentamidine isetionate**

**Antidepressants, Tricyclic** (continued)

Sodium Oxybate: increased risk of side-effects when tricyclics given with **sodium oxybate**

- Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with **adrenaline (epinephrine)** (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by **methylphenidate**; increased risk of hypertension and arrhythmias when tricyclics given with **noradrenaline (norepinephrine)** or **phenylephrine**

Thyroid Hormones: effects of tricyclics possibly enhanced by **thyroid hormones**; effects of amitriptyline and imipramine enhanced by **thyroid hormones**

Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by **cimetidine**; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by **cimetidine** (increased plasma concentration)

**Antidepressants, Tricyclic (related)**

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with **alcohol**
- Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of **apraclonidine** and **brimonidine**
- Antibacterials: plasma concentration of trazodone possibly increased by **clarithromycin**
- Anticoagulants: trazodone may enhance or reduce anticoagulant effect of **warfarin**
- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start **moclobemide** for at least 1 week
- Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); plasma concentration of mianserin and trazodone reduced by **carbamazepine**; metabolism of mianserin accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of mianserin reduced by **phenytoin**
- Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with **antihistamines**
- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**
- Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with **antimuscarinics**
- Antivirals: plasma concentration of trazodone increased by **ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with **squinavir**—avoid concomitant use; plasma concentration of trazodone possibly increased by **telaprevir**
- Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with **anxiolytics and hypnotics**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with **diazoxide**
- Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with **hydralazine** or **sodium nitroprusside**

**Antidiabetics**

**Note** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection,

**Antidiabetics** (continued)

or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption

- Note** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption
- ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by **ACE inhibitors**
- Alcohol: hypoglycaemic effect of antidiabetics enhanced by **alcohol**; increased risk of lactic acidosis when metformin given with **alcohol**
- Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by **anabolic steroids**
- Analgesics: effects of sulfonylureas possibly enhanced by **NSAIDs**; lixisenatide possibly reduces the absorption of **paracetamol** when given 1 to 4 hours before paracetamol
  - Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by **disopyramide**
  - Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by **neomycin**, also severity of gastro-intestinal effects increased; effects of repaglinide enhanced by **clarithromycin**; effects of glibenclamide possibly enhanced by **norfloxacin**; plasma concentration of canagliflozin and nateglinide reduced by **rifampicin**; effects of linagliptin possibly reduced by **rifampicin**; hypoglycaemic effect of repaglinide possibly antagonised by **rifampicin**; effects of sulfonylureas enhanced by **chloramphenicol**; metabolism of tolbutamide accelerated by **rifamycins** (reduced effect); metabolism of sulfonylureas possibly accelerated by **rifamycins** (reduced effect); effects of sulfonylureas rarely enhanced by **sulfonamides** and **trimethoprim**; hypoglycaemic effect of sulfonylureas possibly enhanced by **tetracyclines**; hypoglycaemic effect of repaglinide possibly enhanced by **trimethoprim**—manufacturer advises avoid concomitant use
  - Anticoagulants: exenatide possibly enhances anticoagulant effect of **warfarin**; hypoglycaemic effect of sulfonylureas possibly enhanced by **coumarins**, also possible changes to anticoagulant effect
- Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by **MAOIs**; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by **MAOIs**
- Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with **pioglitazone**
- Antiepileptics: tolbutamide transiently increases plasma concentration of **phenytoin** (possibility of toxicity); plasma concentration of metformin possibly increased by **topiramate**; plasma concentration of glibenclamide possibly reduced by **topiramate**
- Antifungals: plasma concentration of sulfonylureas increased by **fluconazole** and **micronazole**; hypoglycaemic effect of gliclazide and glipizide enhanced by **micronazole**—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by **fluconazole**; hypoglycaemic effect of repaglinide possibly enhanced by **itraconazole**; hypoglycaemic effect of glipizide possibly enhanced by **posaconazole**; plasma concentration of sulfonylureas possibly increased by **voriconazole**
- Antihistamines: thrombocyte count depressed when metformin given with **ketotifen** (manufacturer of ketotifen advises avoid concomitant use)
- Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by **phenothiazines**
- Antivirals: plasma concentration of tolbutamide possibly increased by **ritonavir**
- Appetitant: plasma concentration of tolbutamide reduced by **aprepitant**

**Antidiabetics** (continued)

- Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with **beta-blockers**; hypoglycaemic effect of insulin enhanced by **beta-blockers**
- Bosentan: increased risk of hepatotoxicity when glibenclamide given with **bosentan**—avoid concomitant use
- Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with **nifedipine**
- Cardiac Glycosides: canagliflozin and sitagliptin increase plasma concentration of **digoxin**; acarbose possibly reduces plasma concentration of **digoxin**
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by **ciclosporin**
- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by **corticosteroids**
- Cytotoxics: avoidance of repaglinide advised by manufacturer of **lapatinib**; plasma concentration of metformin possibly increased by **vandetanib** (consider reducing dose of metformin)
- Deferasirox: plasma concentration of repaglinide increased by **deferasirox**
- Diazoxide: hypoglycaemic effect of antidiabetics antagonised by **diazoxide**
- Diuretics: canagliflozin possibly enhances diuretic effect of **diuretics**; manufacturer of canagliflozin advises avoid concomitant use with **loop diuretics**; hypoglycaemic effect of antidiabetics antagonised by **loop diuretics** and **thiazides and related diuretics**; dapagliflozin possibly enhances diuretic effect of **loop diuretics** and **thiazides and related diuretics**
- Hormone Antagonists: requirements for antidiabetics possibly reduced by **lanreotide**, **octreotide** and **pasireotide**
- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by **leflunomide**
- Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by **colesvelam**; absorption of glimepiride reduced by **colesvelam**—manufacturer of glimepiride advises give at least 4 hours before colesvelam; hypoglycaemic effect of acarbose possibly enhanced by **colestyramine**; hypoglycaemic effect of nateglinide possibly enhanced by **gemfibrozil**; increased risk of severe hypoglycaemia when repaglinide given with **gemfibrozil**—avoid concomitant use; plasma concentration of glibenclamide possibly increased by **fluvastatin**; manufacturer of canagliflozin advises give at least 1 hour before or 4–6 hours after **bile acid sequestrants**; may improve glucose tolerance and an additive effect when insulin or sulfonylureas given with **fibrates**
- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by **oestrogens**
- Orlistat: avoidance of acarbose advised by manufacturer of **orlistat**
- Pancreatin: hypoglycaemic effect of acarbose antagonised by **pancreatin**
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by **progestogens**
- Sulfapyrazone: effects of sulfonylureas enhanced by **sulfapyrazone**
- Teriflunomide: plasma concentration of repaglinide increased by **teriflunomide**
- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by **testosterone**
- Ulcer-healing Drugs: excretion of metformin reduced by **cimetidine** (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by **cimetidine**

**Antiepileptics** *see* Carbamazepine, Eslicarbazepine, Ethosuximide, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenobarbital, Phenytoin, Pregabalin, Retigabine, Rufinamide, Stiripentol, Tiagabine, Topiramate, Valproate, Vigabatrin, and Zonisamide

**Antifungals** *see* Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin; Miconazole; Terbinafine

**Antifungals, Imidazole**

- Anticoagulants: miconazole enhances anticoagulant effect of **coumarins** (miconazole oral gel and possibly vaginal and topical formulations absorbed)
  - Antidepressants: avoidance of imidazoles advised by manufacturer of **erboxetine**
  - Antidiabetics: miconazole enhances hypoglycaemic effect of **glucicazide** and **glipizide**—avoid concomitant use; miconazole increases plasma concentration of **sulfonylureas**
  - Antiepileptics: miconazole possibly increases plasma concentration of **carbamazepine**; miconazole enhances anticonvulsant effect of **phenytoin** (plasma concentration of phenytoin increased)
- Antifungals: imidazoles possibly antagonise effects of **amphotericin**
- Antihistamines: imidazoles possibly inhibit metabolism of **mizolastine** (avoid concomitant use)
  - Antimalarials: avoidance of imidazoles advised by manufacturer of **piperaquine with arteminol** (possible risk of ventricular arrhythmias); avoidance of imidazoles advised by manufacturer of **artemether with lumefantrine**
  - Antipsychotics: increased risk of ventricular arrhythmias when imidazoles given with **pimozide**—avoid concomitant use; imidazoles possibly increase plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: imidazoles possibly increase plasma concentration of **saquinavir**
- Ciclosporin: miconazole possibly inhibits metabolism of **ciclosporin** (increased plasma concentration)
  - Ergot Alkaloids: increased risk of ergotism when imidazoles given with **ergotamine**—avoid concomitant use
  - Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with **atorvastatin**; possible increased risk of myopathy when miconazole given with **simvastatin**
- Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with **oestrogens**
- Sirolimus: miconazole increases plasma concentration of **sirolimus**
  - Tacrolimus: miconazole *oral gel* possibly increases plasma concentration of **tacrolimus**
- Antifungals, Polyene** *see* Amphotericin
- Antifungals, Triazole**
- Note** In general, fluconazole interactions relate to multiple-dose treatment
- Aliskiren: itraconazole increases plasma concentration of **aliskiren**—avoid concomitant use
  - Analgesics: fluconazole increases plasma concentration of **celecoxib** (halve dose of celecoxib); voriconazole increases plasma concentration of **diclofenac**, **ibuprofen** and **oxycodone**; fluconazole increases plasma concentration of **flurbiprofen**, **ibuprofen** and **methadone**; fluconazole increases plasma concentration of **parecoxib** (reduce dose of parecoxib); voriconazole increases plasma concentration of **alfentanil** and **methadone** (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of **alfentanil** (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of **alfentanil**; triazoles possibly increase plasma concentration of **fentanyl**; itraconazole possibly increases plasma concentration of **methadone** (increased risk of ventricular arrhythmias); itraconazole increases plasma concentration of **oxycodone**
- Antacids: absorption of itraconazole reduced by **antacids**
- Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with **disopyramide**; avoid-

**Antifungals, Triazole**

- Anti-arrhythmics (*continued*)
  - ance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●**dronedarone**
- Antibacterials: plasma concentration of itraconazole increased by ●**clarithromycin**; manufacturer of fluconazole advises avoid concomitant use with ●**erythromycin**; triazoles possibly increase plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of ●**rifabutin** (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of ●**rifabutin**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by ●**rifabutin** and ●**rifampicin**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of posaconazole reduced by ●**rifampicin**; plasma concentration of voriconazole reduced by ●**rifampicin**—avoid concomitant use; metabolism of fluconazole accelerated by ●**rifampicin** (reduced plasma concentration)
- Anticoagulants: avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●**apixaban**; fluconazole, itraconazole and voriconazole enhance anticoagulant effect of ●**coumarins**; avoidance of itraconazole advised by manufacturer of ●**dabigatran** and ●**rivaroxaban**; avoidance of posaconazole and voriconazole advised by manufacturer of ●**rivaroxaban**
- Antidepressants: avoidance of triazoles advised by manufacturer of ●**reboxetine**; fluconazole possibly increases plasma concentration of ●**amitriptyline** and ●**nortriptyline**; plasma concentration of voriconazole reduced by ●**St John's wort**—avoid concomitant use
- Antidiabetics: posaconazole possibly enhances hypoglycaemic effect of ●**glipizide**; fluconazole possibly enhances hypoglycaemic effect of ●**nateglinide**; itraconazole possibly enhances hypoglycaemic effect of ●**repaglinide**; voriconazole possibly increases plasma concentration of ●**sulfonylureas**; fluconazole increases plasma concentration of ●**sulfonylureas**
- Antiepileptics: fluconazole possibly increases plasma concentration of ●**carbamazepine**; plasma concentration of voriconazole possibly reduced by ●**carbamazepine** and ●**phenobarbital**—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ●**carbamazepine**; plasma concentration of itraconazole and posaconazole possibly reduced by ●**phenobarbital**; plasma concentration of posaconazole reduced by ●**phenytoin**; plasma concentration of itraconazole reduced by ●**phenytoin**—avoid concomitant use; fluconazole increases plasma concentration of ●**phenytoin** (consider reducing dose of phenytoin); voriconazole increases plasma concentration of ●**phenytoin**, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity)

Antifungals: triazoles possibly antagonise effects of ●**amphotericin**; monitoring for increased voriconazole side effects advised by manufacturer of ●**fluconazole** if voriconazole given after fluconazole; plasma concentration of itraconazole increased by ●**miconazole** (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by ●**terbinafine**

- Antihistamines: itraconazole inhibits metabolism of ●**mizolastine**—avoid concomitant use
- Antimalarials: avoidance of triazoles advised by manufacturer of ●**piperazine with arteminol** (possible

**Antifungals, Triazole**

- Antimalarials (*continued*)
  - risk of ventricular arrhythmias); avoidance of triazoles advised by manufacturer of ●**artemether with lumefantrine**
- Antimuscarinics: avoidance of itraconazole advised by manufacturer of ●**darifenacin** and ●**tolterodine**; manufacturer of fesoterodine advises dose reduction when itraconazole given with ●**fesoterodine**—consult fesoterodine product literature; itraconazole possibly increases plasma concentration of ●**solifenacin**—see Dose under Solifenacin, BNF section 7.4.2
- Antipsychotics: itraconazole possibly increases plasma concentration of ●**haloperidol**; itraconazole possibly increases plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); increased risk of ventricular arrhythmias when triazoles given with ●**pimozide**—avoid concomitant use; triazoles possibly increase plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use; itraconazole possibly increases side-effects of ●**risperidone**
- Antivirals: posaconazole increases plasma concentration of ●**atazanavir**; plasma concentration of voriconazole increased or decreased by ●**atazanavir** and plasma concentration of atazanavir also reduced; plasma concentration of itraconazole and posaconazole reduced by ●**efavirenz**; plasma concentration of voriconazole reduced by ●**efavirenz**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of both drugs may increase when itraconazole given with ●**fosamprenavir**; plasma concentration of posaconazole possibly reduced by ●**fosamprenavir**; itraconazole increases plasma concentration of ●**indinavir** (consider reducing dose of indinavir); plasma concentration of itraconazole possibly reduced by ●**nevirapine**—consider increasing dose of itraconazole; fluconazole increases plasma concentration of ●**nevirapine**, ●**ritonavir** and ●**tipranavir**; combination of itraconazole with ●**ritonavir** may increase plasma concentration of either drug (or both); plasma concentration of voriconazole reduced by ●**ritonavir**—avoid concomitant use; triazoles possibly increase plasma concentration of ●**saquinavir**; plasma concentration of voriconazole possibly affected by ●**telaprevir** (possible increased risk of ventricular arrhythmias); plasma concentration of posaconazole possibly increased by ●**telaprevir** (increased risk of ventricular arrhythmias); plasma concentration of itraconazole possibly increased by ●**telaprevir**; fluconazole increases plasma concentration of ●**zidovudine** (increased risk of toxicity)
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of ●**alprazolam**; fluconazole and voriconazole increase plasma concentration of ●**diazepam** (risk of prolonged sedation); fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of ●**midazolam** (risk of prolonged sedation); itraconazole increases plasma concentration of ●**bupirone** (reduce dose of buspirone)
- Bosentan: fluconazole possibly increases plasma concentration of ●**bosentan**—avoid concomitant use; itraconazole possibly increases plasma concentration of ●**bosentan**
- Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with ●**calcium-channel blockers**; itraconazole inhibits metabolism of ●**felodipine** (increased plasma concentration); avoidance of itraconazole advised by manufacturer of ●**lercanidipine**; itraconazole possibly inhibits metabolism of ●**dihydropyridines** (increased plasma concentration)

**Antifungals, Triazole** (*continued*)

- Cardiac Glycosides: itraconazole increases plasma concentration of ●**digoxin**
- Ciclosporin: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of ●**ciclosporin** (increased plasma concentration)
- Cilostazol: itraconazole possibly increases plasma concentration of ●**cilostazol** (see Dose under Cilostazol, BNF section 2.6.4)
- Clopidogrel: fluconazole, itraconazole and voriconazole possibly reduce antiplatelet effect of ●**clopidogrel**  
Cobicistat: plasma concentration of itraconazole possibly increased by ●**cobicistat**—manufacturer of cobicistat advises reduce dose of itraconazole
- Colchicine: itraconazole possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: itraconazole possibly inhibits metabolism of ●**corticosteroids** and ●**methylprednisolone**; itraconazole increases the plasma concentration of *inhaled* and *oral* (and possibly also *intranasal* and *rectal*) ●**budesonide**; itraconazole increases plasma concentration of *inhaled* ●**fluticasone**
- Cytotoxics: itraconazole inhibits metabolism of ●**busulfan** (increased risk of toxicity); fluconazole and itraconazole possibly increase side-effects of ●**cyclophosphamide**; itraconazole possibly increases the plasma concentration of ●**afatinib**—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours; itraconazole possibly increases plasma concentration of ●**axitinib** (reduce dose of axitinib—consult axitinib product literature); fluconazole, itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; itraconazole and voriconazole possibly increase plasma concentration of ●**crizotinib**—manufacturer of crizotinib advises avoid concomitant use; itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ●**everolimus**—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of ●**gefinitib**; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●**lapatinib**; avoidance of voriconazole advised by manufacturer of ●**nilotinib**; itraconazole and voriconazole possibly increase plasma concentration of ●**pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when fluconazole, itraconazole, posaconazole and voriconazole given with ●**ruxolitinib**—consult ruxolitinib product literature; avoidance of itraconazole advised by manufacturer of ●**temsirolimus** (plasma concentration of temsirolimus possibly increased); itraconazole and voriconazole possibly increase the plasma concentration of ●**cabazitaxel**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; increased risk of toxicity when itraconazole given with ●**irinotecan**—avoid concomitant use; posaconazole possibly inhibits metabolism of ●**vinblastine** and ●**vincristine** (increased risk of neurotoxicity); itraconazole possibly increases risk of ●**vinblastine**, ●**vindesine**, ●**vinflunine** and ●**vinorelbine** toxicity; itraconazole increases risk of ●**vincristine** toxicity
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fluconazole given with ●**dapoxetine** (see Dose under Dapoxetine, BNF section 7.4.6); avoidance of itraconazole advised by manufacturer of ●**dapoxetine** (increased risk of toxicity)
- Diuretics: fluconazole increases plasma concentration of ●**eplerenone** (reduce dose of eplerenone); itraconazole increases plasma concentration of ●**eplere-**

**Antifungals, Triazole**

- Diuretics (*continued*)  
●**none**—avoid concomitant use; plasma concentration of fluconazole increased by ●**hydrochlorothiazide**
- Ergot Alkaloids: manufacturer of itraconazole advises avoid concomitant use with ●**ergometrine** (increased risk of ergotism); increased risk of ergotism when triazoles given with ●**ergotamine**—avoid concomitant use
- 5HT<sub>2</sub>-receptor Agonists: itraconazole increases plasma concentration of ●**eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: fluconazole increases plasma concentration of ●**ivabradine**—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of ●**ivabradine**—avoid concomitant use
- Ivacaftor: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ●**ivacaftor** (see Dose under Ivacaftor, p. 165); fluconazole increases plasma concentration of ●**ivacaftor** (see Dose under Ivacaftor, p. 165)
- Lenalidomide: itraconazole possibly increases plasma concentration of ●**lenalidomide** (increased risk of toxicity)  
Leukotriene Receptor Antagonists: fluconazole increases plasma concentration of ●**zafirlukast**
- Lipid-regulating Drugs: increased risk of myopathy when itraconazole, posaconazole or voriconazole given with ●**atorvastatin**; possible increased risk of myopathy when fluconazole given with ●**atorvastatin** or ●**simvastatin**; fluconazole increases plasma concentration of ●**fluvastatin**—possible increased risk of myopathy; increased risk of myopathy when itraconazole or posaconazole given with ●**simvastatin** (avoid concomitant use); increased risk of myopathy when voriconazole given with ●**simvastatin**; avoidance of triazoles advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)  
Mirabegron: when given with itraconazole avoid or reduce dose of ●**mirabegron** in hepatic or renal impairment—see Mirabegron, BNF section 7.4.2  
Oestrogens: plasma concentration of voriconazole increased by ●**oestrogens**  
Progestogens: plasma concentration of voriconazole possibly increased by ●**progestogens**
- Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Retinoids: fluconazole and voriconazole possibly increase risk of ●**retinoin** toxicity  
Sildenafil: itraconazole increases plasma concentration of ●**sildenafil**—reduce initial dose of sildenafil
- Sirolimus: fluconazole and posaconazole possibly increase plasma concentration of ●**sirolimus**; itraconazole and voriconazole increase plasma concentration of ●**sirolimus**—avoid concomitant use
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of ●**tacrolimus** (consider reducing dose of tacrolimus)  
Tadalafil: itraconazole possibly increases plasma concentration of ●**tadalafil**
- Theophylline: fluconazole possibly increases plasma concentration of ●**theophylline**
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by ●**cimetidine**; voriconazole possibly increases plasma concentration of ●**esomeprazole**; voriconazole increases plasma concentration of ●**omeprazole** (consider reducing dose of omeprazole); absorption of itraconazole reduced by ●**histamine H<sub>2</sub>-antagonists** and ●**proton pump inhibitors**; manufacturer of posaconazole advises avoid concomitant use with ●**histamine H<sub>2</sub>-antagonists** and ●**pro-**

**Antifungals, Triazole**

- Ulcer-healing Drugs (*continued*)
  - **ton pump inhibitors** (plasma concentration of posaconazole possibly reduced)
  - Ulipristal: avoidance of itraconazole advised by manufacturer of **ulipristal**

- Vardenafil: itraconazole possibly increases plasma concentration of ●**vardenafil**—avoid concomitant use

**Antihistamines**

**Note** Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)

Alcohol: increased sedative effect when antihistamines given with **alcohol** (possibly less effect with non-sedating antihistamines)

- Analgesics: sedative effects possibly increased when sedating antihistamines given with ●**opioid analgesics**

Antacids: absorption of fexofenadine reduced by **antacids**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with ●**amiodarone**, ●**disopyramide** or ●**flecainide**—avoid concomitant use; manufacturer of mizolastine advises avoid concomitant use with **propafenone** (possible risk of ventricular arrhythmias)

- Antibacterials: plasma concentration of rupatadine increased by **erythromycin**; manufacturer of loratadine advises plasma concentration possibly increased by **erythromycin**; metabolism of mizolastine inhibited by ●**erythromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with ●**moxifloxacin**—avoid concomitant use; effects of fexofenadine possibly reduced by **rifampicin**; metabolism of mizolastine possibly inhibited by ●**macrolides** (avoid concomitant use)

- Antidepressants: avoidance of mizolastine advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); manufacturer of promethazine advises avoid for 2 weeks after stopping **MAOIs**; manufacturer of hydroxyzine advises avoid concomitant use with **MAOIs**; increased antimuscarinic and sedative effects when antihistamines given with **MAOIs** or **tricyclics**; cyproheptadine possibly antagonises antidepressant effect of **SSRIs**; possible increased antimuscarinic and sedative effects when antihistamines given with **tricyclic-related antidepressants**

Antidiabetics: thrombocyte count depressed when ketotifen given with **metformin** (manufacturer of ketotifen advises avoid concomitant use)

- Antifungals: metabolism of mizolastine inhibited by ●**itraconazole**—avoid concomitant use; metabolism of mizolastine possibly inhibited by ●**imidazoles** (avoid concomitant use)
- Antimalarials: avoidance of mizolastine advised by manufacturer of ●**piperquine with arteminol** (possible risk of ventricular arrhythmias)

Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with **antimuscarinics**

- Antivirals: plasma concentration of chlorphenamine possibly increased by **lopinavir**; plasma concentration of non-sedating antihistamines possibly increased by **ritonavir**; increased risk of ventricular arrhythmias when mizolastine given with ●**saquinavir**—avoid concomitant use

Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with **anxiolytics and hypnotics**

- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with ●**sotalol**—avoid concomitant use

**Antihistamines (continued)**

Betahistine: antihistamines theoretically antagonise effect of **betahistine**

- Cytotoxics: possible increased risk of ventricular arrhythmias when mizolastine given with ●**vandetanib**—avoid concomitant use
- Grapefruit Juice: plasma concentration of bilastine reduced by **grapefruit juice**; plasma concentration of rupatadine increased by ●**grapefruit juice**—avoid concomitant use

Histamine: antihistamines theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use

Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by **cimetidine**; plasma concentration of hydroxyzine increased by **cimetidine**

Ulipristal: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after **ulipristal**

**Antihistamines, Non-sedating** *see* Antihistamines**Antihistamines, Sedating** *see* Antihistamines**Antimalarials** *see* Artemether with Lumefantrine,

Chloroquine and Hydroxychloroquine, Mefloquine, Piperazine with Arteminol, Primaquine, Proguanil, Pyrimethamine, and Quinine

**Antimetabolites** *see* Cladribine, Cytarabine, Decitabine, Fludarabine, Fluorouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, and Tioguanine**Antimuscarinics**

**Note** Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation

Alcohol: increased sedative effect when hyoscine given with **alcohol**

Analgesics: possible increased risk of antimuscarinic side-effects when antimuscarinics given with **codeine**; increased risk of antimuscarinic side-effects when antimuscarinics given with **nefopam**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with ●**amiodarone**, ●**disopyramide** or ●**flecainide**; increased risk of antimuscarinic side-effects when antimuscarinics given with **disopyramide**

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with **clarithromycin** and **telithromycin**—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with **clarithromycin** and **erythromycin**; plasma concentration of darifenacin possibly increased by **erythromycin**; plasma concentration of active metabolite of fesoterodine reduced by **rifampicin**

Antidepressants: plasma concentration of darifenacin and procyclidine increased by **paroxetine**; increased risk of antimuscarinic side-effects when antimuscarinics given with **MAOIs** or **tricyclics**; possible increased antimuscarinic side-effects when antimuscarinics given with **tricyclic-related antidepressants**

- Antifungals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with **itraconazole**—consult fesoterodine product literature; manufacturer of darifenacin and tolterodine advises avoid concomitant use with **itraconazole**; plasma concentration of solifenacin possibly increased by ●**itraconazole**—*see* Dose under Solifenacin, BNF section 7.4.2

Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with **antihistamines**

Antipsychotics: antimuscarinics possibly reduce effects of **haloperidol**; increased risk of antimuscarinic side-effects when antimuscarinics given

**Antimuscarinics****Antipsychotics (continued)**

with **clozapine**; antimuscarinics reduce plasma concentration of **phenothiazines**, but risk of antimuscarinic side-effects increased

- **Antivirals**: manufacturer of fosetoderine advises dose reduction when fosetoderine given with **atazanavir**, **indinavir**, **ritonavir** and **saquinavir**—consult fosetoderine product literature; manufacturer of darifenacin advises avoid concomitant use with **atazanavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir**, **saquinavir** and **tipranavir**; manufacturer of tolterodine advises avoid concomitant use with **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir** and **saquinavir**; plasma concentration of solifenacin possibly increased by **ritonavir**—see Dose under Solifenacin, BNF section 7.4.2
- **Beta-blockers**: increased risk of ventricular arrhythmias when tolterodine given with **sotalol**
- Calcium-channel Blockers**: plasma concentration of solifenacin increased by **verapamil**; manufacturer of darifenacin advises avoid concomitant use with **verapamil**
- Cardiac Glycosides**: darifenacin possibly increases plasma concentration of **digoxin**
- Ciclosporin**: manufacturer of darifenacin advises avoid concomitant use with **ciclosporin**
- Domperidone**: antimuscarinics antagonise effects of **domperidone** on gastro-intestinal activity
- Dopaminergics**: antimuscarinics possibly reduce absorption of **levodopa**
- Hormone Antagonists**: possible increased risk of bradycardia when ipratropium or oxybutynin given with **pasireotide**
- Memantine**: effects of antimuscarinics possibly enhanced by **memantine**
- Metoclopramide**: antimuscarinics antagonise effects of **metoclopramide** on gastro-intestinal activity
- Nitrates**: antimuscarinics possibly reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Parasympathomimetics**: antimuscarinics antagonise effects of **parasympathomimetics**

**Antipsychotics**

**Note** Increased risk of toxicity with myelosuppressive drugs

**Note** Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis

**ACE Inhibitors**: enhanced hypotensive effect when antipsychotics given with **ACE inhibitors**

**Adrenergic Neurone Blockers**: enhanced hypotensive effect when phenothiazines given with **adrenergic neurone blockers**; higher doses of chlorpromazine antagonise hypotensive effect of **adrenergic neurone blockers**; haloperidol antagonises hypotensive effect of **adrenergic neurone blockers**

**Adsorbents**: absorption of phenothiazines possibly reduced by **kaolin**

**Alcohol**: increased sedative effect when antipsychotics given with **alcohol**

**Alpha-blockers**: enhanced hypotensive effect when antipsychotics given with **alpha-blockers**

- **Anaesthetics, General**: droperidol enhances effects of **thiopental**; enhanced hypotensive effect when antipsychotics given with **general anaesthetics**
- **Analgesics**: possible severe drowsiness when haloperidol given with **acemetacin** or **indometacin**; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **methadone**; increased risk of ventricular arrhythmias when amisulpride given with **methadone**—avoid concomitant use; increased risk of convulsions when antipsychotics given with **tramadol**; enhanced hypotensive and sedative effects when antipsychotics given with **opioid analgesics**

**Antipsychotics (continued)**

**Angiotensin-II Receptor Antagonists**: enhanced hypotensive effect when antipsychotics given with **angiotensin-II receptor antagonists**

**Antacids**: absorption of phenothiazines and sulpiride reduced by **antacids**

- **Anti-arrhythmics**: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **anti-arrhythmics** that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozone or zuclopentixol given with **amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **amiodarone**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **amiodarone** or **disopyramide**; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozone or zuclopentixol given with **disopyramide**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with **disopyramide**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with **disopyramide**; avoidance of phenothiazines advised by manufacturer of **dronedarone** (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with **flecainide**
- **Antibacterials**: increased risk of ventricular arrhythmias when pimozone given with **clarithromycin**, **moxifloxacin** or **telithromycin**—avoid concomitant use; plasma concentration of quetiapine possibly increased by **clarithromycin**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride given with **erythromycin**—avoid concomitant use; plasma concentration of clozapine possibly increased by **erythromycin** (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozone given with **erythromycin**—avoid concomitant use; plasma concentration of quetiapine increased by **erythromycin**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **parenteral erythromycin**; increased risk of ventricular arrhythmias when zuclopentixol given with **parenteral erythromycin**—avoid concomitant use; plasma concentration of clozapine increased by **ciprofloxacin**; plasma concentration of olanzapine possibly increased by **ciprofloxacin**; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopentixol given with **moxifloxacin**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **moxifloxacin**—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by **rifabutin** and **rifampicin** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine possibly reduced by **rifampicin**; metabolism of haloperidol accelerated by **rifampicin** (reduced plasma concentration); avoid concomitant use of clozapine with **chloramphenicol** or **sulfonamides** (increased risk of agranulocytosis); manufacturer of droperidol advises avoid concomitant use with **macrolides** (risk of ventricular arrhythmias); plasma concentration of quetiapine possibly increased by **telithromycin**; possible increased risk of ventricular arrhythmias when chlorpromazine given with **telithromycin**
- **Antidepressants**: plasma concentration of clozapine possibly increased by **citalopram** (increased risk of toxicity); avoidance of haloperidol, phenothiazines

## Antipsychotics

● Antidepressants (*continued*)

and pimozone advised by manufacturer of ●**citralopram** (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozone advised by manufacturer of ●**escitalopram** (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by ●**fluoxetine** and ●**paroxetine** (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by ●**fluoxetine**; manufacturer of droperidol advises avoid concomitant use with ●**fluoxetine**, ●**fluvoxamine**, ●**sertraline** and ●**tricyclics** (risk of ventricular arrhythmias); plasma concentration of asenapine and haloperidol possibly increased by ●**fluvoxamine**; plasma concentration of clozapine and olanzapine increased by ●**fluvoxamine**; asenapine possibly increases plasma concentration of ●**paroxetine**; plasma concentration of clozapine increased by ●**paroxetine** and ●**sertraline**; plasma concentration of risperidone possibly increased by ●**paroxetine** (increased risk of toxicity); metabolism of perphenazine inhibited by ●**paroxetine** (reduce dose of perphenazine); plasma concentration of haloperidol increased by ●**venlafaxine**; clozapine possibly increases CNS effects of ●**MAOIs**; plasma concentration of pimozone possibly increased by ●**SSRIs** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by ●**St John's wort** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); manufacturer of fluphenazine, haloperidol, sulpiride and zuclopenthixol advises avoid concomitant use with ●**tricyclics** (risk of ventricular arrhythmias); increased risk of antimuscarinic side-effects when phenothiazines given with ●**tricyclics**; possible increased antimuscarinic side-effects when clozapine given with ●**tricyclics**

Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of ●**sulfonylureas**

- Antiepileptics: antipsychotics antagonise anti-convulsant effect of ●**antiepileptics** (convulsive threshold lowered); plasma concentration of paliperidone reduced by ●**carbamazepine**; metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by ●**carbamazepine** (reduced plasma concentration); metabolism of clozapine accelerated by ●**carbamazepine** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by ●**carbamazepine** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine possibly reduced by ●**phenobarbital**; plasma concentration of aripiprazole possibly reduced by ●**phenobarbital** and ●**phenytoin** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); metabolism of haloperidol accelerated by ●**phenobarbital** (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with ●**phenobarbital**; plasma concentration of haloperidol reduced by ●**phenytoin**; chlorpromazine possibly increases or decreases plasma concentration of ●**phenytoin**; metabolism of clozapine and quetiapine accelerated by ●**phenytoin** (reduced plasma concentration); plasma concentration of clozapine possibly increased or decreased by ●**valproate**; increased risk of side-effects including neutropenia when olanzapine given with ●**valproate**
- Antifungals: plasma concentration of aripiprazole possibly increased by ●**itraconazole** (reduce dose of aripiprazole—consult aripiprazole product literature);

## Antipsychotics

● Antifungals (*continued*)

side-effects of risperidone possibly increased by ●**itraconazole**; plasma concentration of haloperidol possibly increased by ●**itraconazole**; plasma concentration of quetiapine possibly increased by ●**imidazoles** and ●**triazoles**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when pimozone given with ●**imidazoles** or ●**triazoles**—avoid concomitant use

- Antimalarials: avoidance of droperidol, haloperidol, phenothiazines and pimozone advised by manufacturer of ●**piperazine with arteminol** (possible risk of ventricular arrhythmias); avoidance of antipsychotics advised by manufacturer of ●**artemether with lumefantrine**; increased risk of ventricular arrhythmias when droperidol given with ●**chloroquine and hydroxychloroquine** or ●**quinine**—avoid concomitant use; manufacturer of amisulpride advises avoid concomitant use with ●**mefloquine**; possible increased risk of ventricular arrhythmias when haloperidol given with ●**mefloquine** or ●**quinine**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozone given with ●**mefloquine** or ●**quinine**—avoid concomitant use
- Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with ●**antimuscarinics**; plasma concentration of phenothiazines reduced by ●**antimuscarinics**, but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by ●**antimuscarinics**
- Antipsychotics: increased risk of ventricular arrhythmias when amisulpride, pimozone or sulpiride given with ●**droperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with ●**droperidol**—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of ●**flupentixol**, ●**fluphenazine**, ●**haloperidol**, ●**pipotiazine**, ●**risperidone** or ●**zuclopenthixol** as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with ●**haloperidol**; chlorpromazine possibly increases plasma concentration of ●**haloperidol**; increased risk of ventricular arrhythmias when droperidol given with ●**haloperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozone given with ●**phenothiazines**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozone given with ●**sulpiride**
- Antivirals: plasma concentration of pimozone possibly increased by ●**atazanavir**—avoid concomitant use; plasma concentration of aripiprazole possibly increased by ●**atazanavir**, ●**darunavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir**, ●**saquinavir** and ●**tipranavir** (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of quetiapine possibly increased by ●**atazanavir**, ●**boceprevir**, ●**darunavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir**, ●**saquinavir**, ●**telaprevir** and ●**tipranavir**—manufacturer of quetiapine advises avoid concomitant use; avoidance of pimozone advised by manufacturer of ●**boceprevir** and ●**telaprevir**; plasma concentration of aripiprazole possibly reduced by ●**efavirenz** and ●**nevirapine** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozone possibly increased by ●**efavirenz**, ●**indinavir** and ●**saquinavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozone increased by ●**fosamprenavir** and ●**ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of olanzapine reduced by ●**ritonavir**—consider increasing dose of olanzapine; avoidance of cloz-

**Antipsychotics**

- Antivirals (*continued*)
  - apine advised by manufacturer of ●**ritonavir** (increased risk of toxicity); plasma concentration of antipsychotics possibly increased by ●**ritonavir**; increased risk of ventricular arrhythmias when clozapine, haloperidol or phenothiazines given with ●**squinavir**—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when antipsychotics given with ●**anxiolytics and hypnotics**; plasma concentration of haloperidol possibly increased by ●**alprazolam**; increased risk of hypotension, bradycardia and respiratory depression when *intramuscular* olanzapine given with *parenteral* ●**benzodiazepines**; serious adverse events reported with concomitant use of clozapine and ●**benzodiazepines** (causality not established); plasma concentration of haloperidol increased by ●**bupropion**
- Aprepitant: avoidance of pimozone advised by manufacturer of ●**aprepitant**
- Atomoxetine: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●**atomoxetine**
- Beta-blockers: enhanced hypotensive effect when phenothiazines given with ●**beta-blockers**; plasma concentration of both drugs may increase when chlorpromazine given with ●**propranolol**; increased risk of ventricular arrhythmias when droperidol or zuclopenthixol given with ●**sotalol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with ●**sotalol**—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozone or sulpiride given with ●**sotalol**
- Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with ●**calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when phenothiazines given with ●**clonidine**
- Cobicistat: plasma concentration of pimozone possibly increased by ●**cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: avoid concomitant use of clozapine with ●**cytotoxics** (increased risk of agranulocytosis); possible increased risk of ventricular arrhythmias when haloperidol given with ●**bosutinib**; caution with pimozone advised by manufacturer of ●**erizotinib**; avoidance of pimozone advised by manufacturer of ●**lapatinib**; possible increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozone, sulpiride or zuclopenthixol given with ●**vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when haloperidol given with ●**arsenic trioxide**; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●**arsenic trioxide**
- Deferasirox: avoidance of clozapine advised by manufacturer of ●**deferasirox**
- Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with ●**desferrioxamine**; avoidance of prochlorperazine advised by manufacturer of ●**desferrioxamine**
- Diazoxide: enhanced hypotensive effect when phenothiazines given with ●**diazoxide**
- Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by ●**diuretics**; risk of ventricular arrhythmias with pimozone increased by hypokalaemia caused by ●**diuretics** (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with ●**diuretics**
- Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with ●**amantadine**; antipsychotics antagonise effects of ●**apomorphine**, ●**levodopa** and ●**pergolide**; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of

**Antipsychotics**Dopaminergics (*continued*)

- **bromocriptine** and ●**cabergoline**; manufacturer of amisulpride advises avoid concomitant use of ●**levodopa** (antagonism of effect); avoidance of antipsychotics advised by manufacturer of ●**pramipexole**, ●**ropinirole** and ●**rotigotine** (antagonism of effect)
  - Grapefruit Juice: plasma concentration of quetiapine possibly increased by ●**grapefruit juice**—manufacturer of quetiapine advises avoid concomitant use
  - Histamine: antipsychotics theoretically antagonise effects of ●**histamine**—manufacturer of histamine advises avoid concomitant use
  - Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with ●**tamoxifen** (risk of ventricular arrhythmias)
  - Ivabradine: increased risk of ventricular arrhythmias when pimozone given with ●**ivabradine**
  - Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol given with ●**lithium**; possible risk of toxicity when olanzapine given with ●**lithium**; increased risk of extrapyramidal side-effects when sulpiride given with ●**lithium**
  - Memantine: effects of antipsychotics possibly reduced by ●**memantine**
  - Methyldopa: enhanced hypotensive effect when antipsychotics given with ●**methyldopa** (also increased risk of extrapyramidal effects)
  - Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with ●**metoclopramide**
  - Moxonidine: enhanced hypotensive effect when phenothiazines given with ●**moxonidine**
  - Muscle Relaxants: promazine possibly enhances effects of ●**suxamethonium**
  - Nitrates: enhanced hypotensive effect when phenothiazines given with ●**nitrates**
  - Penicillamine: avoid concomitant use of clozapine with ●**penicillamine** (increased risk of agranulocytosis)
  - Pentamidine Isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with ●**pentamidine isetionate**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with ●**pentamidine isetionate**
  - Sodium Benzoate: haloperidol possibly reduces effects of ●**sodium benzoate**
  - Sodium Oxybate: antipsychotics possibly enhance effects of ●**sodium oxybate**
  - Sodium Phenylbutyrate: haloperidol possibly reduces effects of ●**sodium phenylbutyrate**
  - Sympathomimetics: antipsychotics antagonise hypertensive effect of ●**sympathomimetics**; antipsychotic effects of chlorpromazine possibly antagonised by ●**dexamfetamine**; chlorpromazine possibly reduces effects of ●**lisdexamfetamine**; side-effects of risperidone possibly increased by ●**methyphenidate**
  - Tacrolimus: manufacturer of droperidol advises avoid concomitant use with ●**tacrolimus** (risk of ventricular arrhythmias)
  - Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with ●**tetrabenazine**
  - Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by ●**cimetidine**; plasma concentration of clozapine possibly reduced by ●**omeprazole**; absorption of sulpiride reduced by ●**sucralfate**
  - Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with ●**hydralazine**, ●**minoxidil** or ●**sodium nitroprusside**
- Antivirals** see individual drugs

**Anxiolytics and Hypnotics**

ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with **adrenergic neurone blockers**

Alcohol: increased sedative effect when anxiolytics and hypnotics given with **alcohol**

Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with **alpha-blockers**

Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with **general anaesthetics**

Analgesics: metabolism of midazolam possibly inhibited by **fentanyl**; increased sedative effect when anxiolytics and hypnotics given with **opioid analgesics**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with **angiotensin-II receptor antagonists**

- Antibacterials: metabolism of midazolam inhibited by **clarithromycin**, **erythromycin** and **telithromycin** (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by **erythromycin** (reduce dose of buspirone); metabolism of zopiclone inhibited by **erythromycin**; metabolism of benzodiazepines possibly accelerated by **rifampicin** (reduced plasma concentration); metabolism of diazepam and zaleplon accelerated by **rifampicin** (reduced plasma concentration); metabolism of buspirone possibly accelerated by **rifampicin**; metabolism of zolpidem accelerated by **rifampicin** (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by **rifampicin**; metabolism of diazepam inhibited by **isoniazid**

Anticoagulants: chloral may transiently enhance anticoagulant effect of **coumarins**

- Antidepressants: plasma concentration of alprazolam increased by **fluoxetine**; plasma concentration of melatonin increased by **fluvoxamine**—avoid concomitant use; plasma concentration of some benzodiazepines increased by **fluvoxamine**; sedative effects possibly increased when zolpidem given with **sertraline**; manufacturer of buspirone advises avoid concomitant use with **MAOIs**; avoidance of buspirone for 14 days after stopping **tranylcypromine** advised by manufacturer of tranylcypromine; plasma concentration of oral midazolam possibly reduced by **St John's wort**; increased sedative effect when anxiolytics and hypnotics given with **mirtazapine**, **tricyclic-related antidepressants** or **tricyclics**

Antiepileptics: plasma concentration of clonazepam often reduced by **carbamazepine**, **phenobarbital** and **phenytoin**; plasma concentration of midazolam reduced by **carbamazepine** and **perampanel**; increased sedative effect when anxiolytics and hypnotics given with **phenobarbital**; diazepam increases or decreases plasma concentration of **phenytoin**; benzodiazepines possibly increase or decrease plasma concentration of **phenytoin**; plasma concentration of clobazam increased by **stiripentol**; increased risk of side-effects when clonazepam given with **valproate**; clobazam possibly increases plasma concentration of **valproate**; plasma concentration of diazepam and lorazepam possibly increased by **valproate**

- Antifungals: plasma concentration of diazepam and midazolam increased by **fluconazole** (risk of prolonged sedation); plasma concentration of alprazolam increased by **itraconazole**; plasma concentration of midazolam increased by **itraconazole**, **posaconazole** and **voriconazole** (risk of prolonged sedation); plasma concentration of buspirone

**Anxiolytics and Hypnotics**

- Antifungals (*continued*)

increased by **itraconazole** (reduce dose of buspirone); plasma concentration of diazepam increased by **voriconazole** (risk of prolonged sedation)

Antihistamines: increased sedative effect when anxiolytics and hypnotics given with **antihistamines**

- Antipsychotics: increased sedative effect when anxiolytics and hypnotics given with **antipsychotics**; alprazolam possibly increases plasma concentration of **haloperidol**; buspirone increases plasma concentration of **haloperidol**; serious adverse events reported with concomitant use of benzodiazepines and **clozapine** (causality not established); increased risk of hypotension, bradycardia and respiratory depression when *parenteral* benzodiazepines given with *intramuscular* **olanzapine**
- Antivirals: plasma concentration of midazolam possibly increased by **atazanavir**—avoid concomitant use of *oral* midazolam; plasma concentration of *oral* midazolam increased by **boceprevir**—manufacturer of boceprevir advises avoid concomitant use; increased risk of prolonged sedation when midazolam given with **efavirenz**—avoid concomitant use; plasma concentration of midazolam possibly increased by **fosamprenavir**, **indinavir**, **ritonavir** and **telaprevir** (risk of prolonged sedation)—avoid concomitant use of *oral* midazolam; increased risk of prolonged sedation when alprazolam given with **indinavir**—avoid concomitant use; plasma concentration of anxiolytics and hypnotics possibly increased by **ritonavir**; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by **ritonavir** (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of buspirone increased by **ritonavir** (increased risk of toxicity); plasma concentration of midazolam increased by **saquinavir** (risk of prolonged sedation)—avoid concomitant use of *oral* midazolam)

Aprepitant: plasma concentration of midazolam increased by **aprepitant** (risk of prolonged sedation)

Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with **calcium-channel blockers**; midazolam increases absorption of **lercanidipine**; plasma concentration of buspirone increased by **diltiazem** and **verapamil** (reduce dose of buspirone); metabolism of midazolam inhibited by **diltiazem** and **verapamil** (increased plasma concentration with increased sedation)

Cardiac Glycosides: alprazolam increases plasma concentration of **digoxin** (increased risk of toxicity)

Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with **clonidine**

- Cobicistat: avoidance of *oral* midazolam advised by manufacturer of **cobicistat**

- Cytotoxics: plasma concentration of midazolam increased by **crizotinib** and **nilotinib**

Deferasirox: plasma concentration of midazolam possibly reduced by **deferasirox**

Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with **diazoxide**

Disulfiram: metabolism of benzodiazepines inhibited by **disulfiram** (increased sedative effects); increased risk of temazepam toxicity when given with **disulfiram**

Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with **diuretics**; administration of chloral with *parenteral* **furosemide** may displace thyroid hormone from binding sites

Dopaminergics: benzodiazepines possibly antagonise effects of **levodopa**

**Anxiolytics and Hypnotics** (continued)

- Grapefruit Juice: plasma concentration of *oral* midazolam possibly increased by **grapefruit juice**; plasma concentration of buspirone increased by **grapefruit juice**
- Ivacaftor: plasma concentration of midazolam increased by **ivacaftor**
- Lipid-regulating Drugs: plasma concentration of midazolam possibly increased by **atorvastatin**
- Lithium: increased risk of neurotoxicity when clonazepam given with **lithium**
- Lofexidine: increased sedative effect when anxiolytics and hypnotics given with **lofexidine**
- Methylodopa: enhanced hypotensive effect when anxiolytics and hypnotics given with **methylodopa**
- Methylthioninium: possible risk of CNS toxicity when buspirone given with **methylthioninium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with **moxonidine**; sedative effects possibly increased when benzodiazepines given with **moxonidine**
- Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when anxiolytics and hypnotics given with **nitrates**
- Oestrogens: plasma concentration of melatonin increased by **oestrogens**; plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by **oestrogens**; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by **oestrogens**
- Probenecid: excretion of lorazepam reduced by **probenecid** (increased plasma concentration); excretion of nitrazepam possibly reduced by **probenecid** (increased plasma concentration)
- Progestogens: plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by **progestogens**; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by **progestogens**
- Sodium Oxybate: benzodiazepines enhance effects of **sodium oxybate** (avoid concomitant use)
- Theophylline: effects of benzodiazepines possibly reduced by **theophylline**
- Ulcer-healing Drugs: plasma concentration of melatonin increased by **cimetidine**; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by **cimetidine** (increased plasma concentration); metabolism of diazepam possibly inhibited by **esomeprazole** and **omeprazole** (increased plasma concentration)
- Vasodilator Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Apixaban**

- Analgesics: increased risk of haemorrhage when anticoagulants given with **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins)
- Antibacterials: plasma concentration of apixaban reduced by **rifampicin**
- Anticoagulants: increased risk of haemorrhage when apixaban given with other **anticoagulants** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with **dabigatran** and **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

**Apixaban** (continued)

- Antifungals: manufacturer of apixaban advises avoid concomitant use with **itraconazole**, **posaconazole** and **voriconazole**
- Antivirals: manufacturer of apixaban advises avoid concomitant use with **atazanavir**, **boceprevir**, **darunavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir**, **saquinavir** and **tipranavir**
- Sulfinpyrazone: increased risk of bleeding when apixaban given with **sulfinpyrazone**

**Apomorphine**

- Antipsychotics: effects of apomorphine antagonised by **antipsychotics**
- Dopaminergics: effects of apomorphine possibly enhanced by **entacapone**
- 5HT<sub>2</sub>-receptor Antagonists: possible increased hypotensive effect when apomorphine given with **ondansetron**—avoid concomitant use
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by **methylodopa**

**Apraclonidine**

- Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with **MAOIs**, **tricyclic-related antidepressants** and **tricyclics**
- Sympathomimetics: manufacturer of apraclonidine advises avoid concomitant use with **sympathomimetics**

**Aprepitant**

- Note** Fosaprepitant is a prodrug of aprepitant
- Antibacterials: plasma concentration of aprepitant possibly increased by **clarithromycin** and **telithromycin**; plasma concentration of aprepitant reduced by **rifampicin**
- Anticoagulants: aprepitant possibly reduces anticoagulant effect of **warfarin**
- Antidepressants: manufacturer of aprepitant advises avoid concomitant use with **St John's wort**
- Antidiabetics: aprepitant reduces plasma concentration of **tolbutamide**
- Antiepileptics: plasma concentration of aprepitant possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antipsychotics: manufacturer of aprepitant advises avoid concomitant use with **pimozide**
- Antivirals: plasma concentration of aprepitant possibly increased by **ritonavir**
- Anxiolytics and Hypnotics: aprepitant increases plasma concentration of **midazolam** (risk of prolonged sedation)
- Calcium-channel Blockers: plasma concentration of both drugs may increase when aprepitant given with **diltiazem**
- Corticosteroids: aprepitant inhibits metabolism of **dexamethasone** and **methylprednisolone** (reduce dose of dexamethasone and methylprednisolone)
- Cytotoxics: aprepitant possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when aprepitant given with **dapoxetine** (see Dose under Dapoxetine, BNF section 7.4.6)
- Lipid-regulating Drugs: manufacturer of lomitapide advises dose reduction when fosaprepitant given with **lomitapide** (see Dose under Lomitapide, BNF section 2.12)
- Oestrogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing **oestrogens** (alternative contraception recommended)
  - Progestogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing **progestogens** (alternative contraception recommended)

**Aripiprazole** *see* Antipsychotics

### Artenic Trioxide

- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with ●**amiodarone** or ●**disopyramide**
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with ●**erythromycin**, ●**levofloxacin** or ●**moxifloxacin**
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with ●**amitriptyline** or ●**clomipramine**
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with ●**amphotericin**
- Antimalarials: avoidance of arsenic trioxide advised by manufacturer of ●**piperquine with artemisol** (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with ●**antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with ●**haloperidol**; avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with ●**sotalol**
- Cytotoxics: possible increased risk of ventricular arrhythmias when arsenic trioxide given with ●**vandetanib**—avoid concomitant use
- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by ●**acetazolamide**, ●**loop diuretics** or ●**thiazides and related diuretics**
- Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with ●**lithium**

### Artemether with Lumefantrine

- Anti-arrhythmics: manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**amiodarone**, ●**disopyramide** and ●**flecainide** (risk of ventricular arrhythmias)
  - Antibacterials: manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**macrolides** and ●**quinolones**
  - Antidepressants: avoidance of antimalarials advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**antidepressants**
  - Antifungals: manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**imidazoles** and ●**triazoles**
  - Antimalarials: manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**antimalarials**; increased risk of ventricular arrhythmias when artemether with lumefantrine given with ●**quinine**
  - Antipsychotics: manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**antipsychotics**
  - Antivirals: manufacturer of artemether with lumefantrine advises caution with ●**atazanavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir**, ●**saquinavir** and ●**tipranavir**; avoidance of artemether with lumefantrine advised by manufacturer of ●**boceprevir**; plasma concentration of lumefantrine increased by ●**darunavir**; plasma concentration of artemether with lumefantrine reduced by ●**etravirine**
  - Beta-blockers: manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**metoprolol** and ●**sotalol**
  - Cytotoxics: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with ●**vandetanib**—avoid concomitant use
- Grapefruit Juice: plasma concentration of artemether with lumefantrine possibly increased by ●**grapefruit juice**

### Artemether with Lumefantrine (continued)

- Histamine: avoidance of antimalarials advised by manufacturer of ●**histamine**
- Ulcer-healing Drugs: manufacturer of artemether with lumefantrine advises avoid concomitant use with ●**cimetidine**
- Vaccines: antimalarials inactivate ●**oral typhoid vaccine**—see p. 626
- Ascorbic acid** *see* Vitamins
- Asenapine** *see* Antipsychotics
- Aspirin**
- Adsorbents: absorption of aspirin possibly reduced by ●**kaolin**
- Anaesthetics, General: aspirin possibly enhances effects of ●**thiopental**
- Analgesics: avoid concomitant use of aspirin with ●**NSAIDs** (increased side-effects); antiplatelet effect of aspirin possibly reduced by ●**ibuprofen**
- Antacids: excretion of aspirin increased by alkaline urine due to some ●**antacids**
- Anticoagulants: increased risk of bleeding when aspirin given with ●**coumarins** or ●**phenindione** (due to antiplatelet effect); aspirin enhances anticoagulant effect of ●**heparins**
  - Antidepressants: increased risk of bleeding when aspirin given with ●**SSRIs** or ●**venlafaxine**
- Antiepileptics: aspirin enhances effects of ●**phenytoin** and ●**valproate**
- Clopidogrel: increased risk of bleeding when aspirin given with ●**clopidogrel**
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with ●**corticosteroids**, also corticosteroids reduce plasma concentration of salicylate
- Cytotoxics: aspirin reduces excretion of ●**methotrexate** (increased risk of toxicity); aspirin possibly reduces renal excretion of ●**pemetrexed**—consult product literature
  - Diuretics: increased risk of toxicity when high-dose aspirin given with ●**acetazolamide**; aspirin antagonises diuretic effect of ●**spironolactone**; possible increased risk of toxicity when high-dose aspirin given with ●**loop diuretics** (also possible reduced effect of loop diuretics)
- Iloprost: increased risk of bleeding when aspirin given with ●**iloprost**
- Leukotriene Receptor Antagonists: aspirin increases plasma concentration of ●**zafirlukast**
- Metoclopramide: rate of absorption of aspirin increased by ●**metoclopramide** (enhanced effect)
- Probenecid: aspirin antagonises effects of ●**probenecid**
- Sulfapyrazole: aspirin antagonises effects of ●**sulfapyrazole**
- Atazanavir**
- Antacids: absorption of atazanavir reduced by ●**antacids** (give at least 2 hours before or 1 hour after antacids)
- Anti-arrhythmics: atazanavir possibly increases plasma concentration of ●**amiodarone** and ●**lidocaine**
  - Antibacterials: plasma concentration of both drugs increased when atazanavir given with ●**clarithromycin**; atazanavir increases plasma concentration of ●**rifabutin** (reduce dose of rifabutin); plasma concentration of atazanavir reduced by ●**rifampicin**—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of ●**telithromycin**
- Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of ●**warfarin**; avoidance of atazanavir advised by manufacturer of ●**apixaban** and ●**rivaroxaban**
- Antidepressants: plasma concentration of atazanavir reduced by ●**St John's wort**—avoid concomitant use
  - Antifungals: plasma concentration of atazanavir increased by ●**posaconazole**; atazanavir increases or

**Atazanavir**

- **Antifungals (continued)**  
decreases the plasma concentration of ●**voriconazole** and plasma concentration of atazanavir also reduced
- **Antimalarials:** caution with atazanavir advised by manufacturer of ●**artemether with lumefantrine**; atazanavir possibly increases plasma concentration of ●**quinine** (increased risk of toxicity)
- Antimuscarinics:** avoidance of atazanavir advised by manufacturer of ●**darifenacin**; manufacturer of fesoterodine advises dose reduction when atazanavir given with ●**fesoterodine**—consult fesoterodine product literature
- **Antipsychotics:** atazanavir possibly increases plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); atazanavir possibly increases plasma concentration of ●**pimozide**—avoid concomitant use; atazanavir possibly increases plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- **Antivirals:** plasma concentration of atazanavir reduced by ●**boceprevir**; absorption of atazanavir reduced by ●**didanosine tablets** (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with ●**efavirenz** (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of ●**elvitegravir** (reduce dose of elvitegravir); avoid concomitant use of atazanavir with ●**indinavir**; atazanavir increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by ●**nevirapine**—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with ●**saquinavir**—avoid concomitant use; atazanavir possibly reduces plasma concentration of ●**telaprevir**, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by ●**tenofovir**, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of ●**tipranavir** (also plasma concentration of atazanavir reduced)
- **Anxiolytics and Hypnotics:** atazanavir possibly increases plasma concentration of ●**midazolam**—avoid concomitant use of *oral* midazolam
- **Calcium-channel Blockers:** atazanavir increases plasma concentration of ●**diltiazem** (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of ●**verapamil**
- **Ciclosporin:** atazanavir possibly increases plasma concentration of ●**ciclosporin**
- **Colchicine:** atazanavir possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- **Cytotoxics:** atazanavir possibly increases plasma concentration of ●**axitinib** (reduce dose of axitinib—consult axitinib product literature); atazanavir possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of ●**crizotinib** and ●**everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases plasma concentration of ●**pazopanib** (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of ●**cabazitaxel**; atazanavir possibly inhibits metabolism of ●**irinotecan** (increased risk of toxicity)
- **Dapoxetine:** avoidance of atazanavir advised by manufacturer of ●**dapoxetine** (increased risk of toxicity)
- **Ergot Alkaloids:** atazanavir possibly increases plasma concentration of ●**ergot alkaloids**—avoid concomitant use

**Atazanavir (continued)**

- **Lipid-regulating Drugs:** possible increased risk of myopathy when atazanavir given with ●**atorvastatin** or ●**pravastatin**; possible increased risk of myopathy when atazanavir given with ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when atazanavir given with ●**simvastatin** (avoid concomitant use)
- Oestrogens:** atazanavir increases plasma concentration of ●**ethinylestradiol**
- **Orlistat:** absorption of atazanavir possibly reduced by ●**orlistat**
- Progestogens:** atazanavir increases plasma concentration of ●**norethisterone**
- **Ranolazine:** atazanavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- **Sildenafil:** atazanavir possibly increases side-effects of ●**sildenafil**
- **Sirolimus:** atazanavir possibly increases plasma concentration of ●**sirolimus**
- **Tacrolimus:** atazanavir possibly increases plasma concentration of ●**tacrolimus**
- **Ticagrelor:** atazanavir possibly increases plasma concentration of ●**ticagrelor**—manufacturer of ticagrelor advises avoid concomitant use
- **Ulcer-healing Drugs:** manufacturer of atazanavir advises adjust doses of both drugs when atazanavir given with ●**cimetidine** and ●**nizatidine**—consult atazanavir product literature; plasma concentration of atazanavir reduced by ●**famotidine** and ●**ranitidine** (adjust doses of both drugs—consult atazanavir product literature); plasma concentration of atazanavir reduced by ●**proton pump inhibitors**—avoid or adjust dose of both drugs (consult product literature)

**Atenolol** see Beta-blockers**Atomoxetine**

- **Analgesics:** increased risk of ventricular arrhythmias when atomoxetine given with ●**methadone**; possible increased risk of convulsions when atomoxetine given with ●**tramadol**
- **Anti-arrhythmics:** increased risk of ventricular arrhythmias when atomoxetine given with ●**amiodarone** or ●**disopyramide**
- **Antibacterials:** increased risk of ventricular arrhythmias when atomoxetine given with *parenteral* ●**erythromycin**; increased risk of ventricular arrhythmias when atomoxetine given with ●**moxifloxacin**
- **Antidepressants:** metabolism of atomoxetine possibly inhibited by ●**fluoxetine** and ●**paroxetine**; possible increased risk of convulsions when atomoxetine given with **antidepressants**; atomoxetine should not be started until 2 weeks after stopping ●**MAOIs**, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with ●**tricyclics**
- **Antimalarials:** increased risk of ventricular arrhythmias when atomoxetine given with ●**mefloquine**
- **Antipsychotics:** increased risk of ventricular arrhythmias when atomoxetine given with ●**antipsychotics** that prolong the QT interval
- **Beta-blockers:** increased risk of ventricular arrhythmias when atomoxetine given with ●**sotalol**
- Bupropion:** possible increased risk of convulsions when atomoxetine given with ●**bupropion**
- **Diuretics:** risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by ●**diuretics**
- Sympathomimetics, Beta<sub>2</sub>:** Increased risk of cardiovascular side-effects when atomoxetine given with *parenteral* ●**sabutamol**

**Atorvastatin** see Statins

**Atovaquone**

- Antibacterials: manufacturer of atovaquone advises avoid concomitant use with **rifabutin** (plasma concentration of both drugs reduced); plasma concentration of atovaquone reduced by **●rifampicin** (and concentration of rifampicin increased)—avoid concomitant use; plasma concentration of atovaquone reduced by **tetracycline**
- Antivirals: plasma concentration of atovaquone reduced by **●efavirenz**—avoid concomitant use; atovaquone possibly reduces plasma concentration of **indinavir**; plasma concentration of atovaquone possibly reduced by **ritonavir**—manufacturer of atovaquone advises avoid concomitant use; atovaquone increases plasma concentration of **zidovudine** (increased risk of toxicity)
- Cytotoxics: atovaquone possibly increases plasma concentration of **etoposide**
- Histamine: avoidance of atovaquone advised by manufacturer of **histamine**
- Metoclopramide: plasma concentration of atovaquone reduced by **metoclopramide**—avoid concomitant use

**Atracurium** *see* Muscle Relaxants

**Atropine** *see* Antimuscarinics

**Axitinib**

- Antibacterials: plasma concentration of axitinib possibly increased by **clarithromycin**, **erythromycin** and **telithromycin** (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly decreased by **rifabutin** (increase dose of axitinib—consult axitinib product literature); plasma concentration of axitinib decreased by **rifampicin** (increase dose of axitinib—consult axitinib product literature)
- Antidepressants: plasma concentration of axitinib possibly reduced by **St John's wort**—consider increasing dose of axitinib
- Antiepileptics: plasma concentration of axitinib possibly decreased by **carbamazepine**, **phenobarbital** and **phenytoin** (increase dose of axitinib—consult axitinib product literature)
- Antifungals: plasma concentration of axitinib possibly increased by **itraconazole** (reduce dose of axitinib—consult axitinib product literature)
- Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of axitinib possibly increased by **atazanavir**, **indinavir**, **ritonavir** and **saquinavir** (reduce dose of axitinib—consult axitinib product literature)
- Corticosteroids: plasma concentration of axitinib possibly decreased by **dexamethasone** (increase dose of axitinib—consult axitinib product literature)
- Grapefruit Juice: plasma concentration of axitinib possibly increased by **grapefruit juice**

**Azathioprine**

- ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with **captopril** especially in renal impairment; increased risk of anaemia when azathioprine given with **enalapril** especially in renal impairment
- Allopurinol: enhanced effects and increased toxicity of azathioprine when given with **●allopurinol** (reduce dose of azathioprine to one quarter of usual dose)
- Aminosalicylates: possible increased risk of leucopenia when azathioprine given with **aminosalicylates**
- Antibacterials: increased risk of haematological toxicity when azathioprine given with **●sulfamethoxazole** (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with **●trimethoprim** (also with co-trimoxazole)
- Anticoagulants: azathioprine possibly reduces anticoagulant effect of **●coumarins**

**Azathioprine (continued)**

- Antivirals: myelosuppressive effects of azathioprine possibly enhanced by **●zidovudine**
- Febuxostat: avoidance of azathioprine advised by manufacturer of **●febuxostat**
- Azilsartan** *see* Angiotensin-II Receptor Antagonists
- Azithromycin** *see* Macrolides
- Aztreonam**
  - Anticoagulants: aztreonam possibly enhances anticoagulant effect of **●coumarins**
  - Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626
- Baclofen** *see* Muscle Relaxants
- Balsalazide** *see* Aminosalicylates
- Bambuterol** *see* Sympathomimetics, Beta<sub>2</sub>
- Beclometasone** *see* Corticosteroids
- Belimumab**
  - Vaccines: avoid concomitant use of belimumab with live **●vaccines** (*see* p. 604)
- Bendamustine**
  - Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Bendroflumethiazide** *see* Diuretics
- Benperidol** *see* Antipsychotics
- Benzodiazepines** *see* Anxiolytics and Hypnotics
- Benzthiazide** *see* Diuretics
- Benzyloxyphenol** *see* Penicillins
- Beta-blockers**
  - Note** Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind
  - ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with **ACE inhibitors**
  - Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with **adrenergic neurone blockers**
  - Alcohol: enhanced hypotensive effect when beta-blockers given with **alcohol**
  - Aldesleukin: enhanced hypotensive effect when beta-blockers given with **aldesleukin**
  - Alpha-blockers: enhanced hypotensive effect when beta-blockers given with **●alpha-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
  - Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with **general anaesthetics**
  - Anaesthetics, Local: propranolol increases risk of **●bupivacaine** toxicity
  - Analgesics: hypotensive effect of beta-blockers antagonised by **NSAIDs**; plasma concentration of esmolol possibly increased by **●morphine**
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with **angiotensin-II receptor antagonists**
  - Anti-arrhythmics: increased myocardial depression when beta-blockers given with **●anti-arrhythmics**; increased risk of ventricular arrhythmias when sotalol given with **●amiodarone**, **●disopyramide** or **●dronedrone**—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with **●amiodarone**; plasma concentration of metoprolol and propranolol possibly increased by **dronedrone**; increased risk of myocardial depression and bradycardia when beta-blockers given with **●flecainide**; propranolol increases risk of **●lidocaine** toxicity; nadolol possibly increases risk of **lidocaine** toxicity; plasma concentration of metoprolol and propranolol increased by **propafenone**
  - Antibacterials: increased risk of ventricular arrhythmias when sotalol given with **●moxifloxacin**—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by **●rifampicin** (plasma concentration significantly reduced); plasma concentra-

**Beta-blockers**

- Antibericals (*continued*)  
tion of carvedilol, celiprolol and metoprolol reduced by **rifampicin**
- Antidepressants: plasma concentration of metoprolol increased by **citalopram** and **escitalopram**; increased risk of ventricular arrhythmias when sotalol given with **citalopram**—avoid concomitant use; avoidance of sotalol advised by manufacturer of **escitalopram** (risk of ventricular arrhythmias); plasma concentration of propranolol increased by **fluvoxamine**; plasma concentration of metoprolol possibly increased by **paroxetine**—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); labetalol and propranolol increase plasma concentration of **imipramine**; enhanced hypotensive effect when beta-blockers given with **MAOIs**; increased risk of ventricular arrhythmias when sotalol given with **tricyclics**
- Antidiabetics: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with **anti-diabetics**; beta-blockers enhance hypoglycaemic effect of **insulin**
- Antiepileptics: plasma concentration of propranolol possibly reduced by **phenobarbital**
- Antihistamines: increased risk of ventricular arrhythmias when sotalol given with **mizolastine**—avoid concomitant use
- Antimalarials: avoidance of sotalol advised by manufacturer of **piperquine with artemimol** (possible risk of ventricular arrhythmias); avoidance of metoprolol and sotalol advised by manufacturer of **artemether with lumefantrine**; increased risk of bradycardia when beta-blockers given with **mefloquine**
- Antimuscarinics: increased risk of ventricular arrhythmias when sotalol given with **tolterodine**
- Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with **droperidol** or **zuclopenthixol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with **haloperidol**—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with **chlorpromazine**; increased risk of ventricular arrhythmias when sotalol given with **amisulpride**, **phenothiazines**, **pimozide** or **sulpiride**; enhanced hypotensive effect when beta-blockers given with **phenothiazines**
- Antivirals: increased risk of ventricular arrhythmias when sotalol given with **saquinavir**—avoid concomitant use; avoidance of sotalol advised by manufacturer of **telaprevir** (risk of ventricular arrhythmias); avoidance of metoprolol for heart failure advised by manufacturer of **tipranavir**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with **anxiolytics and hypnotics**
- Atomoxetine: increased risk of ventricular arrhythmias when sotalol given with **atomoxetine**
- Calcium-channel Blockers: enhanced hypotensive effect when beta-blockers given with **calcium-channel blockers**; possible severe hypotension and heart failure when beta-blockers given with **nifedipine**; increased risk of AV block and bradycardia when beta-blockers given with **diltiazem**; asystole, severe hypotension and heart failure when beta-blockers given with **verapamil** (see p. 107)
- Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with **cardiac glycosides**
- Ciclosporin: carvedilol increases plasma concentration of **ciclosporin**
- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with **clonidine** (withdraw

**Beta-blockers**

- Clonidine (*continued*)  
beta-blockers several days before slowly withdrawing clonidine)
- Corticosteroids: hypotensive effect of beta-blockers antagonised by **corticosteroids**
- Cytotoxics: possible increased risk of ventricular arrhythmias when sotalol given with **bosutinib**; possible increased risk of bradycardia when beta-blockers given with **crizotinib**; possible increased risk of ventricular arrhythmias when sotalol given with **vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with **arsenic trioxide**
- Diazoxide: enhanced hypotensive effect when beta-blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when beta-blockers given with **diuretics**; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by **loop diuretics** or **thiazides and related diuretics**
- Dopaminergics: enhanced hypotensive effect when beta-blockers given with **levodopa**
- Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with **ergotamine**
- Fingolimod: possible increased risk of bradycardia when beta-blockers given with **fingolimod**
- Hormone Antagonists: possible increased risk of bradycardia when carteolol, metoprolol, propranolol or sotalol given with **pasireotide**
- 5HT<sub>1</sub>-receptor Agonists: propranolol increases plasma concentration of **rizatriptan** (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Ivabradine: increased risk of ventricular arrhythmias when sotalol given with **ivabradine**
- Methyldopa: enhanced hypotensive effect when beta-blockers given with **methyldopa**
- Mirabegron: plasma concentration of metoprolol increased by **mirabegron**
- Moxisylyte: possible severe postural hypotension when beta-blockers given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when beta-blockers given with **moxonidine**
- Muscle Relaxants: propranolol enhances effects of **muscle relaxants**; enhanced hypotensive effect when beta-blockers given with **baclofen**; possible enhanced hypotensive effect and bradycardia when beta-blockers given with **tizanidine**
- Nitrates: enhanced hypotensive effect when beta-blockers given with **nitrates**
- Oestrogens: hypotensive effect of beta-blockers antagonised by **oestrogens**
- Parasympathomimetics: propranolol antagonises effects of **neostigmine** and **pyridostigmine**; increased risk of arrhythmias when beta-blockers given with **pilocarpine**
- Prostaglandins: enhanced hypotensive effect when beta-blockers given with **alprostadil**
- Ranolazine: avoidance of sotalol advised by manufacturer of **ranolazine**
- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **adrenaline (epinephrine)**, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **dobutamine**; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **noradrenaline (norepinephrine)**
- Thyroid Hormones: metabolism of propranolol accelerated by **levothyroxine**
- Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by **cimetidine**

**Beta-blockers** (*continued*)

Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with **hydralazine**, **minoxidil** or **sodium nitropruside**

**Bethahistine**

Antihistamines: effect of bethahistine theoretically antagonised by **antihistamines**

**Betamethasone** *see* Corticosteroids**Betaxolol** *see* Beta-blockers**Bethanechol** *see* Parasympathomimetics**Bevacizumab**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)

**Bexarotene**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by ● **gemfibrozil**—avoid concomitant use

**Bezafibrate** *see* Fibrates**Bicalutamide**

Anticoagulants: bicalutamide possibly enhances anticoagulant effect of **coumarins**

**Biguanides** *see* Antidiabetics**Bilastine** *see* Antihistamines**Bile Acid Sequestrants** *see* Colesevelam, Colestipol, and Colestyramine**Bile Acids**

Antacids: absorption of bile acids possibly reduced by **antacids**

- Ciclosporin: ursodeoxycholic acid increases absorption of ● **ciclosporin**

Lipid-regulating Drugs: absorption of bile acids possibly reduced by **colestipol** and **colestyramine**

**Bisoprolol** *see* Beta-blockers**Bisphosphonates**

Antacids: absorption of bisphosphonates reduced by **antacids**

Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with **aminoglycosides**

Calcium Salts: absorption of bisphosphonates reduced by **calcium salts**

- Cytotoxics: sodium clodronate increases plasma concentration of ● **estramustine**

Iron: absorption of bisphosphonates reduced by **oral iron**

**Bleomycin**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: bleomycin possibly reduces absorption of **digoxin tablets**

- Cytotoxics: increased pulmonary toxicity when bleomycin given with ● **cisplatin**; increased risk of pulmonary toxicity when bleomycin given with ● **brentuximab vedotin**—avoid concomitant use

**Boceprevir**

Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with **buprenorphine**; boceprevir possibly affects plasma concentration of **methadone**

- Antibacterials: manufacturer of boceprevir advises avoid concomitant use with ● **rifampicin** (plasma concentration of boceprevir possibly reduced)
- Anticoagulants: avoidance of boceprevir advised by manufacturer of **apixaban**
- Antiepileptics: manufacturer of boceprevir advises avoid concomitant use with ● **carbamazepine**, ● **phenobarbital** and ● **phenytoin** (plasma concentration of boceprevir possibly reduced)
  - Antimalarials: manufacturer of boceprevir advises avoid concomitant use with ● **artemether with lumefantrine**
  - Antipsychotics: manufacturer of boceprevir advises avoid concomitant use with ● **pimozide**; boceprevir possibly increases plasma concentration of ● **quetia-**

**Boceprevir**● Antipsychotics (*continued*)

**pine**—manufacturer of quetiapine advises avoid concomitant use

- Antivirals: boceprevir reduces plasma concentration of ● **atazanavir**; avoid concomitant use of boceprevir with ● **darunavir**; effects of both drugs possibly reduced when boceprevir given with **etravirine**; avoidance of boceprevir advised by manufacturer of ● **fosamprenavir** and **nevirapine**; manufacturers advise avoid concomitant use of boceprevir with ● **lopinavir**; boceprevir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with ● **ritonavir**
- Anxiolytics and Hypnotics: boceprevir increases plasma concentration of oral ● **midazolam**—manufacturer of boceprevir advises avoid concomitant use

Cardiac Glycosides: boceprevir possibly increases side-effects of **digoxin**

- Ciclosporin: boceprevir increases plasma concentration of ● **ciclosporin**
  - Cilostazol: boceprevir possibly increases plasma concentration of ● **cilostazol** (see Dose under Cilostazol, BNF section 2.6.4)
- Cobicistat: avoidance of boceprevir advised by manufacturer of **cobicistat**

- Cytotoxics: boceprevir possibly increases the plasma concentration of ● **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of boceprevir advises avoid concomitant use with ● **dasatinib**, ● **erlotinib**, ● **gefitinib**, ● **imatinib**, ● **lapatinib**, ● **nilotinib**, ● **pazopanib**, ● **sorafenib** and ● **sunitinib**; manufacturer of ruxolitinib advises dose reduction when boceprevir given with ● **ruxolitinib**—consult ruxolitinib product literature

- Ergot Alkaloids: manufacturer of boceprevir advises avoid concomitant use with ● **ergot alkaloids**

- Lipid-regulating Drugs: boceprevir increases plasma concentration of **atorvastatin** (reduce dose of atorvastatin); boceprevir increases plasma concentration of **pravastatin**; manufacturers advise avoid concomitant use of boceprevir with ● **simvastatin**

Progestogens: boceprevir increases plasma concentration of **drospirenone** (increased risk of toxicity)

- Sirolimus: boceprevir increases plasma concentration of ● **sirolimus** (increased risk of toxicity—reduce sirolimus dose)
- Tacrolimus: boceprevir increases plasma concentration of ● **tacrolimus** (reduce dose of tacrolimus)

**Bortezomib**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)

**Bosentan**

- Antibacterials: plasma concentration of bosentan reduced by ● **rifampicin**—avoid concomitant use

Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of **coumarins**

- Antidiabetics: increased risk of hepatotoxicity when bosentan given with ● **glibenclamide**—avoid concomitant use

- Antifungals: plasma concentration of bosentan possibly increased by ● **fluconazole**—avoid concomitant use; plasma concentration of bosentan possibly increased by **itraconazole**

- Antivirals: avoidance of bosentan advised by manufacturer of **elvitegravir** and **tipranavir**; bosentan possibly reduces plasma concentration of **indinavir**; plasma concentration of bosentan increased by ● **lopinavir** and ● **ritonavir** (consider reducing dose of bosentan); bosentan possibly reduces plasma concentration of **telaprevir**; also plasma concentration of bosentan possibly increased

**Bosentan** (*continued*)

- Cyclosporin: plasma concentration of bosentan increased by ●**cyclosporin** (also plasma concentration of cyclosporin reduced—avoid concomitant use)
- Cobicistat: avoidance of bosentan advised by manufacturer of **cobicistat**
- Cytotoxics: bosentan possibly reduces plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid concomitant use
- Lipid-regulating Drugs: bosentan reduces plasma concentration of **simvastatin**
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing ●**oestrogens** (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing ●**progestogens** (alternative contraception recommended)
- Sildenafil: bosentan reduces plasma concentration of **sildenafil**, also plasma concentration of bosentan increased
- Tadalafil: bosentan reduces plasma concentration of **tadalafil**

**Bosutinib**

- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with ●**methadone**
- Antacids: manufacturer of bosutinib advises separating administration with **antacids** by about 12 hours
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with ●**amiodarone** and ●**disopyramide**; plasma concentration of bosutinib possibly increased by ●**dronedaron**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antibacterials: plasma concentration of bosutinib possibly increased by ●**ciprofloxacin**, ●**clarithromycin**, ●**erythromycin** and ●**telithromycin**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with ●**moxifloxacin**; plasma concentration of bosutinib possibly reduced by ●**rifabutin**—manufacturer of bosutinib advises avoid concomitant use; plasma concentration of bosutinib reduced by ●**rifampicin**—manufacturer of bosutinib advises avoid concomitant use
- Antidepressants: plasma concentration of bosutinib possibly reduced by ●**St John's wort**—manufacturer of bosutinib advises avoid concomitant use
- Antiepileptics: plasma concentration of bosutinib possibly reduced by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**—manufacturer of bosutinib advises avoid concomitant use
- Antifungals: plasma concentration of bosutinib possibly increased by ●**fluconazole**, ●**itraconazole**, ●**posaconazole** and ●**voriconazole**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antimalarials: possible increased risk of ventricular arrhythmias when bosutinib given with ●**chloroquine** and ●**hydroxychloroquine**
- Antipsychotics: possible increased risk of ventricular arrhythmias when bosutinib given with ●**haloperidol**; avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of bosutinib possibly increased by ●**atazanavir**, ●**boceprevir**, ●**darunavir**, ●**fosamprenavir**, ●**indinavir**, ●**ritonavir**, ●**saquinavir** and ●**telaprevir**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly reduced by ●**efavirenz** and ●**etravirine**—manufacturer of bosutinib advises avoid concomitant use
- Aprepitant: plasma concentration of bosutinib possibly increased by ●**aprepitant**—manufacturer of bosu-

**Bosutinib**

- Aprepitant (*continued*)  
nib advises avoid or consider reducing dose of bosutinib
- Beta-blockers: possible increased risk of ventricular arrhythmias when bosutinib given with ●**sotalol**
- Bosentan: plasma concentration of bosutinib possibly reduced by ●**bosentan**—manufacturer of bosutinib advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by ●**diltiazem** and ●**verapamil**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Cytotoxics: plasma concentration of bosutinib possibly increased by ●**imatinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Domperidone: manufacturer of bosutinib advises avoid concomitant use with ●**domperidone** (risk of ventricular arrhythmias)
- Grapefruit Juice: plasma concentration of bosutinib possibly increased by ●**grapefruit juice**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Modafinil: plasma concentration of bosutinib possibly reduced by ●**modafinil**—manufacturer of bosutinib advises avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of bosutinib reduced by **lansoprazole**

**Brentuximab vedotin**

- Antibacterials: effects of brentuximab vedotin possibly reduced by **rifampicin**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of pulmonary toxicity when brentuximab vedotin given with ●**bleomycin**—avoid concomitant use

**Brimonidine**

Antidepressants: manufacturer of brimonidine advises avoid concomitant use with **MAOIs**, **tricyclic-related antidepressants** and **tricyclics**

**Brinzolamide** *see* Diuretics**Bromocriptine**

Alcohol: tolerance of bromocriptine reduced by **alcohol**

Antibacterials: plasma concentration of bromocriptine increased by **erythromycin** (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by **macrolides** (increased risk of toxicity)

Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of bromocriptine antagonised by **antipsychotics**

Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by **domperidone**

Hormone Antagonists: plasma concentration of bromocriptine increased by **octreotide**

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by **metoclopramide**

- Sympathomimetics: risk of toxicity when bromocriptine given with ●**isometheptene**

**Bucilazine** *see* Antihistamines**Budesonide** *see* Corticosteroids**Bumetanide** *see* Diuretics**Bupivacaine**

Anti-arrhythmics: increased myocardial depression when bupivacaine given with **anti-arrhythmics**

- Beta-blockers: increased risk of bupivacaine toxicity when given with ●**propranolol**

**Buprenorphine** *see* Opioid Analgesics

**Bupropion**

- Antidepressants: bupropion possibly increases plasma concentration of **italopram**; manufacturer of bupropion advises avoid for 2 weeks after stopping
  - **MAOIs**; manufacturer of bupropion advises avoid concomitant use with **moclobemide**; bupropion possibly increases plasma concentration of **tricyclics** (possible increased risk of convulsions)
- Antiepileptics: plasma concentration of bupropion reduced by **carbamazepine** and **phenytoin**; metabolism of bupropion inhibited by **valproate**
- Antivirals: metabolism of bupropion accelerated by **efavirenz** (reduced plasma concentration); plasma concentration of bupropion reduced by **ritonavir**
- Atomoxetine: possible increased risk of convulsions when bupropion given with **atomoxetine**
- Dopaminergics: increased risk of side-effects when bupropion given with **amantadine** or **levodopa**
- Hormone Antagonists: bupropion possibly inhibits metabolism of **tamoxifen** to active metabolite (avoid concomitant use)
- Methylthionium: possible risk of CNS toxicity when bupropion given with **methylthionium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Bupirone** *see* Anxiolytics and Hypnotics

**Busulfan**

- Analgesics: metabolism of *intravenous* busulfan possibly inhibited by **paracetamol** (manufacturer of *intravenous* busulfan advises caution within 72 hours of paracetamol)
- Antibacterials: plasma concentration of busulfan increased by **metronidazole** (increased risk of toxicity)
  - Antiepileptics: plasma concentration of busulfan possibly reduced by **phenytoin**
  - Antifungals: metabolism of busulfan inhibited by **itraconazole** (increased risk of toxicity)
  - Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
  - Cytotoxics: increased risk of hepatotoxicity when busulfan given with **tioguanine**

**Butyrophenones** *see* Antipsychotics

**Cabazitaxel**

- Antibacterials: plasma concentration of cabazitaxel possibly increased by **clarithromycin** and **telithromycin**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises avoid concomitant use with **rifabutin**; plasma concentration of cabazitaxel reduced by **rifampicin**—manufacturer of cabazitaxel advises avoid concomitant use
- Antidepressants: manufacturer of cabazitaxel advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of cabazitaxel advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of cabazitaxel possibly increased by **itraconazole** and **voriconazole**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: manufacturer of cabazitaxel advises avoid concomitant use with **atazanavir**; plasma concentration of cabazitaxel possibly increased by **indinavir**, **ritonavir** and **saquinavir**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel

**Cabergoline**

Antibacterials: plasma concentration of cabergoline increased by **erythromycin** (increased risk of toxicity); plasma concentration of cabergoline possibly increased by **macrolides** (increased risk of toxicity)

**Cabergoline** (*continued*)

- Antipsychotics: hypoprolactinaemic and anti-parkinsonian effects of cabergoline antagonised by **antipsychotics**
- Dopergoline: hypoprolactinaemic effect of cabergoline possibly antagonised by **domperidone**
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by **methyl dopa**
- Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by **metoclopramide**

**Caffeine citrate**

- Anti-arrhythmics: caffeine citrate antagonises anti-arrhythmic effect of **adenosine**—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
- Antiepileptics: caffeine citrate possibly antagonises effects of **phenobarbital**; plasma concentration of caffeine citrate reduced by **phenytoin**
- Theophylline: manufacturer of caffeine citrate advises avoid concomitant use with **theophylline**
- Ulcer-healing Drugs: plasma concentration of caffeine citrate increased by **cimetidine**

**Calcitriol** *see* Vitamins

**Calcium Salts**

**Note** *see also* Antacids

- Antibacterials: calcium salts reduce absorption of **ciprofloxacin** and **tetracycline**
- Antivirals: calcium salts possibly reduce absorption of **dolutegravir**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts; manufacturer of rilpivirine advises give calcium salts 2 hours before or 4 hours after **rilpivirine**
- Bisphosphonates: calcium salts reduce absorption of **bisphosphonates**
- Cardiac Glycosides: large *intravenous* doses of calcium salts can precipitate arrhythmias when given with **cardiac glycosides**
- Corticosteroids: absorption of calcium salts reduced by **corticosteroids**
- Cytotoxics: calcium salts reduce absorption of **estramustine** (manufacturer of estramustine advises avoid concomitant administration)
- Diuretics: increased risk of hypercalcaemia when calcium salts given with **thiazides and related diuretics**
- Eltrombopag: calcium salts possibly reduce absorption of **eltrombopag** (give at least 4 hours apart)
- Fluorides: calcium salts reduce absorption of **fluorides**
- Iron: calcium salts reduce absorption of **oral iron**
- Thyroid Hormones: calcium salts reduce absorption of **levothyroxine**

Zinc: calcium salts reduce absorption of **zinc**

**Calcium-channel Blockers**

- Note** Dihydropyridine calcium-channel blockers include amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine
- ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when calcium-channel blockers given with **alcohol**; verapamil possibly increases plasma concentration of **alcohol**
- Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with **aldesleukin**
- Aliskiren: verapamil increases plasma concentration of **aliskiren**
- Alpha-blockers: verapamil increases plasma concentration of **tamsulosin**; enhanced hypotensive effect when calcium-channel blockers given with **alpha-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

**Calcium-channel Blockers** (continued)

- Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with **general anaesthetics** or **isoflurane**; hypotensive effect of verapamil enhanced by **general anaesthetics** (also AV delay)
- Analgesics: hypotensive effect of calcium-channel blockers antagonised by **NSAIDs**; diltiazem inhibits metabolism of **alfentanil** (risk of prolonged or delayed respiratory depression)
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with **angiotensin-II receptor antagonists**
- Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with **amiodarone**; increased risk of myocardial depression and asystole when verapamil given with **disopyramide** or **flecainide**; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with **dronedarone**; nifedipine increases plasma concentration of **dronedarone**
- Antibacterials: metabolism of calcium-channel blockers possibly inhibited by **clarithromycin**, **erythromycin** and **telithromycin** (increased risk of side-effects); manufacturer of lercanidipine advises avoid concomitant use with **erythromycin**; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by **rifampicin** (plasma concentration significantly reduced); plasma concentration of felodipine possibly reduced by **rifampicin**; metabolism of nicardipine possibly accelerated by **rifampicin** (possible significantly reduced plasma concentration)
- Anticoagulants: verapamil possibly increases plasma concentration of **dabigatran** (see Dose under Dabigatran, BNF section 2.8.2)
- Antidepressants: metabolism of nifedipine possibly inhibited by **fluoxetine** (increased plasma concentration); diltiazem and verapamil increase plasma concentration of **imipramine**; enhanced hypotensive effect when calcium-channel blockers given with **MAOIs**; plasma concentration of amlodipine and felodipine possibly reduced by **St John's wort**; plasma concentration of verapamil significantly reduced by **St John's wort**; plasma concentration of nifedipine reduced by **St John's wort**; diltiazem and verapamil possibly increase plasma concentration of **tricyclics**
- Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with **insulin**
- Antiepileptics: effects of felodipine reduced by **carbamazepine** and **phenytoin**; effects of dihydropyridines, nicardipine and nifedipine probably reduced by **carbamazepine**; diltiazem and verapamil enhance effects of **carbamazepine**; manufacturer of nimodipine advises avoid concomitant use with **carbamazepine** and **phenytoin** (plasma concentration of nimodipine possibly reduced); effects of calcium-channel blockers probably reduced by **phenobarbital**; manufacturer of nimodipine advises avoid concomitant use with **phenobarbital** (plasma concentration of nimodipine reduced); effects of verapamil reduced by **phenytoin**; diltiazem increases plasma concentration of **phenytoin** but also effect of diltiazem reduced
- Antifungals: negative inotropic effect possibly increased when calcium-channel blockers given with **itraconazole**; metabolism of dihydropyridines possibly inhibited by **itraconazole** (increased plasma concentration); metabolism of felodipine inhibited by **itraconazole** (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with **itraconazole**; plasma concentration of nifedipine increased by **micafungin**

**Calcium-channel Blockers** (continued)

- Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with **mefloquine**
- Antimuscarinics: avoidance of verapamil advised by manufacturer of **darifenacin**; verapamil increases plasma concentration of **solifenacin**
- Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with **antipsychotics**
- Antivirals: plasma concentration of diltiazem increased by **atazanavir** (reduce dose of diltiazem); plasma concentration of verapamil possibly increased by **atazanavir**; plasma concentration of diltiazem reduced by **efavirenz**; plasma concentration of calcium-channel blockers possibly increased by **ritonavir**; manufacturer of lercanidipine advises avoid concomitant use with **ritonavir**; caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil advised by manufacturer of **telaprevir**; plasma concentration of amlodipine increased by **telaprevir** (consider reducing dose of amlodipine)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when calcium-channel blockers given with **anxiolytics and hypnotics**; diltiazem and verapamil inhibit metabolism of **midazolam** (increased plasma concentration with increased sedation); absorption of lercanidipine increased by **midazolam**; diltiazem and verapamil increase plasma concentration of **bupropion** (reduce dose of bupropion)
- Aprepitant: plasma concentration of both drugs may increase when diltiazem given with **aprepitant**
- Beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with **beta-blockers**; increased risk of AV block and bradycardia when diltiazem given with **beta-blockers**; asystole, severe hypotension and heart failure when verapamil given with **beta-blockers** (see p. 107); possible severe hypotension and heart failure when nifedipine given with **beta-blockers**
- Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with **nifedipine**
- Cardiac Glycosides: verapamil increases plasma concentration of **digoxin**, also increased risk of AV block and bradycardia; diltiazem, lercanidipine and nicardipine increase plasma concentration of **digoxin**; nifedipine possibly increases plasma concentration of **digoxin**
- Cyclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of **cyclosporin**; combination of lercanidipine with **cyclosporin** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by **cyclosporin** (increased risk of toxicity including gingival hyperplasia)
- Cilostazol: diltiazem increases plasma concentration of **cilostazol** (consider reducing dose of cilostazol)
- Clonidine: enhanced hypotensive effect when calcium-channel blockers given with **clonidine**
- Colchicine: diltiazem and verapamil possibly increase risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by **corticosteroids**; diltiazem increases plasma concentration of **methylprednisolone**
- Cytotoxics: verapamil possibly increases plasma concentration of **doxorubicin**; verapamil possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosuti-

**Calcium-channel Blockers**

- **Cytotoxics** (*continued*)
  - nib; possible increased risk of bradycardia when diltiazem or verapamil given with **crizotinib**; plasma concentration of both drugs may increase when verapamil given with **everolimus** (consider reducing the dose of everolimus—consult everolimus product literature); nifedipine possibly inhibits metabolism of **vincristine**
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when diltiazem and verapamil given with **dapoxetine** (see Dose under Dapoxetine, BNF section 7.4.6)
- Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when calcium-channel blockers given with **diuretics**; diltiazem and verapamil increase plasma concentration of **eplerenone** (reduce dose of eplerenone)
- Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with **levodopa**
- Fidaxomicin: avoidance of verapamil advised by manufacturer of **fidaxomicin**
- **Fingolimod**: possible increased risk of bradycardia when diltiazem or verapamil given with **fingolimod**
- Grapefruit Juice: plasma concentration of felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by **grapefruit juice**; plasma concentration of amlodipine possibly increased by **grapefruit juice**
- Hormone Antagonists: diltiazem and verapamil increase plasma concentration of **datusteride**; possible increased risk of bradycardia when diltiazem or verapamil given with **pasireotide**
- **Ivabradine**: diltiazem and verapamil increase plasma concentration of **ivabradine**—avoid concomitant use
- **Lenalidomide**: verapamil possibly increases plasma concentration of **lenalidomide** (increased risk of toxicity)
- **Lipid-regulating Drugs**: diltiazem increases plasma concentration of **atorvastatin**—possible increased risk of myopathy; possible increased risk of myopathy when amlodipine and diltiazem given with **simvastatin** (see Dose under Simvastatin, p. 126); increased risk of myopathy when verapamil given with **simvastatin** (see Dose under Simvastatin, p. 126); avoidance of diltiazem and verapamil advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
- Lithium: neurotoxicity may occur when diltiazem or verapamil given with **lithium** without increased plasma concentration of lithium
- **Magnesium** (parenteral): profound hypotension reported with concomitant use of nifedipine and **parenteral magnesium** in pre-eclampsia
- Methyldopa: enhanced hypotensive effect when calcium-channel blockers given with **methyldopa**
- Moxisylyte: enhanced hypotensive effect when calcium-channel blockers given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when calcium-channel blockers given with **moxonidine**
- Muscle Relaxants: verapamil enhances effects of **non-depolarising muscle relaxants** and **suxamethonium**; enhanced hypotensive effect when calcium-channel blockers given with **baclofen** or **tizanidine**; manufacturer of verapamil advises avoid concomitant use of **intravenous dantrolene**; possible increased risk of ventricular arrhythmias when diltiazem given with **intravenous dantrolene**—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of **non-depolarising muscle relaxants**
- Nitrates: enhanced hypotensive effect when calcium-channel blockers given with **nitrates**

**Calcium-channel Blockers** (*continued*)

- Oestrogens: hypotensive effect of calcium-channel blockers antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with **alprostadil**
- Ranolazine: diltiazem and verapamil increase plasma concentration of **ranolazine** (consider reducing dose of ranolazine)
- Sildenafil: enhanced hypotensive effect when amlodipine given with **sildenafil**
- **Sirolimus**: diltiazem increases plasma concentration of **sirolimus**; plasma concentration of both drugs increased when verapamil given with **sirolimus**
- Sulfapyrazone: plasma concentration of verapamil reduced by **sulfapyrazone**
- **Tacrolimus**: diltiazem and nifedipine increase plasma concentration of **tacrolimus**; felodipine, nicardipine and verapamil possibly increase plasma concentration of **tacrolimus**
- **Theophylline**: calcium-channel blockers possibly increase plasma concentration of **theophylline** (enhanced effect); diltiazem increases plasma concentration of **theophylline**; verapamil increases plasma concentration of **theophylline** (enhanced effect)
- Ticagrelor: diltiazem increases plasma concentration of **ticagrelor**
- Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by **cimetidine** (increased plasma concentration)
- Ulipristal: avoidance of verapamil advised by manufacturer of **ulipristal**
- Vardenafil: enhanced hypotensive effect when nifedipine given with **vardenafil**
- Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with **hydalazine**, **minoxidil** or **sodium nitroprusside**
- Calcium-channel Blockers (dihydropyridines)** *see* Calcium-channel Blockers
- Canagliflozin** *see* Antidiabetics
- Candesartan** *see* Angiotensin-II Receptor Antagonists
- Cannabis Extract**
  - Antidepressants: possible increased risk of hypertension and tachycardia when cannabis extract given with **tricyclics**
- Capcitabine** *see* Fluorouracil
- Capreomycin**
  - Antibacterials: increased risk of nephrotoxicity when capreomycin given with **colistimethate sodium** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when capreomycin given with **aminoglycosides** or **vancomycin**
  - Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with **platinum compounds**
  - Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626
- Captopril** *see* ACE Inhibitors
- Carbamazepine**
  - Alcohol: CNS side-effects of carbamazepine possibly increased by **alcohol**
  - **Analgesics**: effects of carbamazepine enhanced by **dextropropoxyphene**; carbamazepine possibly accelerates metabolism of **fentanyl** (reduced effect); carbamazepine reduces plasma concentration of **methadone**; carbamazepine reduces effects of **tramadol**; carbamazepine possibly accelerates metabolism of **paracetamol** (also isolated reports of hepatotoxicity)
  - **Anti-arrhythmics**: carbamazepine possibly reduces plasma concentration of **dronedarone**—avoid concomitant use
  - **Antibacterials**: plasma concentration of carbamazepine increased by **clarithromycin** (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by **erythromycin**;

**Carbamazepine**

- **Antibacterials** (*continued*)  
plasma concentration of carbamazepine reduced by ●**rifabutin**; carbamazepine accelerates metabolism of ●**doxycycline** (reduced effect); plasma concentration of carbamazepine increased by ●**isoniazid** (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of ●**tellithromycin** (avoid during and for 2 weeks after carbamazepine)
- **Anticoagulants**: carbamazepine accelerates metabolism of ●**coumarins** (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of ●**dabigatran**—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of ●**rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- **Antidepressants**: carbamazepine possibly reduces plasma concentration of ●**reboxetine**; plasma concentration of carbamazepine increased by ●**fluoxetine** and ●**fluvoxamine**; carbamazepine reduces plasma concentration of ●**mianserin**, ●**mirtazapine** and ●**trazodone**; manufacturer of carbamazepine advises avoid for 2 weeks after stopping ●**MAOIs**, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics possibly antagonised by ●**MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered); plasma concentration of carbamazepine possibly reduced by ●**St John's wort**; carbamazepine accelerates metabolism of ●**tricyclics** (reduced plasma concentration and reduced effect)
- **Antiepileptics**: carbamazepine possibly reduces plasma concentration of ●**eslicarbazepine** but risk of side-effects increased; carbamazepine possibly reduces plasma concentration of ●**ethosuximide** and ●**retigabine**; carbamazepine often reduces plasma concentration of ●**lamotrigine**, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with ●**levetiracetam**; plasma concentration of carbamazepine sometimes reduced by ●**oxcarbazepine** (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine reduces plasma concentration of ●**perampanel** (see Dose under Perampanel, p. 226); carbamazepine possibly increases plasma concentration of ●**phenobarbital**; plasma concentration of both drugs often reduced when carbamazepine given with ●**phenytoin**, also plasma concentration of phenytoin may be increased; plasma concentration of both drugs possibly reduced when carbamazepine given with ●**rufinamide**; plasma concentration of carbamazepine increased by ●**stiripentol**; carbamazepine reduces plasma concentration of ●**tiagabine** and ●**zonisamide**; carbamazepine often reduces plasma concentration of ●**topiramate**; carbamazepine reduces plasma concentration of ●**valproate**, also plasma concentration of active metabolite of carbamazepine increased
- **Antifungals**: plasma concentration of carbamazepine possibly increased by ●**fluconazole** and ●**miconazole**; carbamazepine possibly reduces plasma concentration of ●**itraconazole** and ●**posaconazole**; carbamazepine possibly reduces plasma concentration of ●**voriconazole**—avoid concomitant use; carbamazepine possibly reduces plasma concentration of ●**caspofungin**—consider increasing dose of caspofungin
- **Antimalarials**: avoidance of carbamazepine advised by manufacturer of ●**piperquine with artemimol**;

**Carbamazepine**

- **Antimalarials** (*continued*)  
anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- **Antipsychotics**: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered); carbamazepine accelerates metabolism of ●**haloperidol**, ●**olanzapine**, ●**quetiapine** and ●**risperidone** (reduced plasma concentration); carbamazepine reduces plasma concentration of ●**aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); carbamazepine accelerates metabolism of ●**clozapine** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of ●**paliperidone**
- **Antivirals**: avoidance of carbamazepine advised by manufacturer of ●**boceprevir** and ●**rilpivirine** (plasma concentration of boceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of ●**darunavir**, ●**fosamprenavir**, ●**lopinavir**, ●**saquinavir** and ●**tipranavir**; avoidance of carbamazepine advised by manufacturer of ●**dolutegravir**, ●**elvitegravir**, ●**etravirine**, ●**sofosbuvir** and ●**telaprevir**; plasma concentration of both drugs reduced when carbamazepine given with ●**efavirenz**; carbamazepine possibly reduces plasma concentration of ●**indinavir**, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of ●**nevirapine**; plasma concentration of carbamazepine possibly increased by ●**ritonavir**
- **Anxiolytics and Hypnotics**: carbamazepine often reduces plasma concentration of ●**clonazepam**; carbamazepine reduces plasma concentration of ●**midazolam**
- **Appetitant**: carbamazepine possibly reduces plasma concentration of ●**aprepitant**
- **Bupropion**: carbamazepine reduces plasma concentration of ●**bupropion**
- **Calcium-channel Blockers**: carbamazepine reduces effects of ●**felodipine**; carbamazepine probably reduces effects of ●**dihydropyridines**, ●**nicardipine** and ●**nifedipine**; avoidance of carbamazepine advised by manufacturer of ●**nimodipine** (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by ●**diltiazem** and ●**verapamil**
- **Cyclosporin**: carbamazepine accelerates metabolism of ●**cyclosporin** (reduced plasma concentration)
- **Clopidogrel**: carbamazepine possibly reduces antiplatelet effect of ●**clopidogrel**
- **Cobicistat**: carbamazepine possibly reduces plasma concentration of ●**cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- **Corticosteroids**: carbamazepine accelerates metabolism of ●**corticosteroids** (reduced effect)
- **Cytotoxics**: carbamazepine possibly decreases plasma concentration of ●**axitinib** (increase dose of axitinib—consult axitinib product literature); carbamazepine possibly reduces plasma concentration of ●**bosutinib** and ●**crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of carbamazepine advised by manufacturer of ●**cabazitaxel**, ●**dabrafenib**, ●**gefitinib** and ●**vemurafenib**; carbamazepine reduces plasma concentration of ●**imatinib** and ●**lapatinib**—avoid concomitant use; avoidance of carbamazepine advised by manufacturer of ●**vandetanib** and ●**vismodegib** (plasma concentration of vandetanib and vismodegib possibly reduced); carbamazepine possibly reduces plasma concentration of ●**eribulin**; carbamazepine reduces plasma concentration of ●**irinotecan** and its active metabolite; manufacturer of procarbazine advises possible increased risk of

**Carbamazepine**

- Cytotoxics (*continued*)  
hypersensitivity reactions when carbamazepine given with **procarbazine**
- Diuretics: increased risk of hyponatraemia when carbamazepine given with **diuretics**; plasma concentration of carbamazepine increased by **acetazolamide**; carbamazepine reduces plasma concentration of **eplerenone**—avoid concomitant use
- Hormone Antagonists: carbamazepine possibly reduces plasma concentration of **abiraterone**—manufacturer of abiraterone advises avoid concomitant use; metabolism of carbamazepine inhibited by **danazol** (increased risk of toxicity); carbamazepine possibly accelerates metabolism of **toremifene** (reduced plasma concentration)
- 5HT<sub>2</sub>-receptor Antagonists: carbamazepine accelerates metabolism of **ondansetron** (reduced effect)
- Ivacaftor: carbamazepine possibly reduces plasma concentration of **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of **simvastatin**—consider increasing dose of simvastatin
- Lithium: neurotoxicity may occur when carbamazepine given with **lithium** without increased plasma concentration of lithium
- Macitentan: avoidance of carbamazepine advised by manufacturer of **macitentan**
- Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of **non-depolarising muscle relaxants** (accelerated recovery from neuromuscular blockade)
- Oestrogens: carbamazepine accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 402)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Progestogens: carbamazepine accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 402)
- Retinoids: plasma concentration of carbamazepine possibly reduced by **isotretinoin**
- Roflumilast: carbamazepine possibly inhibits effects of **roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
- Theophylline: carbamazepine accelerates metabolism of **theophylline** (reduced effect)
- Thyroid Hormones: carbamazepine accelerates metabolism of **thyroid hormones** (may increase requirements for thyroid hormones in hypothyroidism)
- Tibolone: carbamazepine accelerates metabolism of **tibolone** (reduced plasma concentration)
- Ticagrelor: carbamazepine possibly reduces plasma concentration of **ticagrelor**
- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by **cimetidine** (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vitamins: carbamazepine possibly increases requirements for **vitamin D**

**Carbapenems** *see* Ertapenem, Imipenem with Cilastatin, and Meropenem

**Carbonic Anhydrase Inhibitors** *see* Diuretics

**Carboplatin** *see* Platinum Compounds

**Carboprost** *see* Prostaglandins

**Cardiac Glycosides**

- ACE Inhibitors: plasma concentration of digoxin possibly increased by **captopril**
- Alpha-blockers: plasma concentration of digoxin increased by **prazosin**
- Aminosalicylates: absorption of digoxin possibly reduced by **sulfasalazine**

**Cardiac Glycosides** (*continued*)

- Analgesics: plasma concentration of cardiac glycosides possibly increased by **NSAIDs**; also possible exacerbation of heart failure and reduction of renal function
- Antacids: absorption of digoxin possibly reduced by **antacids**
- Anti-arrhythmics: plasma concentration of digoxin increased by **amiodarone**, **dronedrone** and **propafenone** (halve dose of digoxin)
- Antibacterials: plasma concentration of digoxin possibly increased by **gentamicin**, **telithromycin** and **trimethoprim**; absorption of digoxin reduced by **neomycin**; plasma concentration of digoxin possibly reduced by **rifampicin**; plasma concentration of digoxin increased by **macrolides** (increased risk of toxicity)
- Antidepressants: plasma concentration of digoxin reduced by **St John's wort**—avoid concomitant use
- Antidiabetics: plasma concentration of digoxin possibly reduced by **acarbose**; plasma concentration of digoxin increased by **canagliflozin** and **sitagliptin**
- Antiepileptics: plasma concentration of digoxin possibly reduced by **phenytoin**
- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with **amphotericin**; plasma concentration of digoxin increased by **itraconazole**
- Antimalarials: plasma concentration of digoxin possibly increased by **chloroquine** and **hydroxychloroquine**; possible increased risk of bradycardia when digoxin given with **mefloquine**; plasma concentration of digoxin increased by **quinine**
- Antimuscarinics: plasma concentration of digoxin possibly increased by **darifenacin**
- Antivirals: side-effects of digoxin possibly increased by **boceprevir**; plasma concentration of digoxin increased by **etravirine** and **telaprevir**; plasma concentration of digoxin possibly increased by **ritonavir**
- Anxiolytics and Hypnotics: plasma concentration of digoxin increased by **alprazolam** (increased risk of toxicity)
- Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with **beta-blockers**
- Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large **intravenous** doses of **calcium salts**
- Calcium-channel Blockers: plasma concentration of digoxin increased by **diltiazem**, **lercanidipine** and **nicardipine**; plasma concentration of digoxin possibly increased by **nifedipine**; plasma concentration of digoxin increased by **verapamil**, also increased risk of AV block and bradycardia
- Ciclosporin: plasma concentration of digoxin increased by **ciclosporin** (increased risk of toxicity)
- Cobicistat: plasma concentration of digoxin possibly increased by **cobicistat**—reduce initial dose of digoxin
- Colchicine: possible increased risk of myopathy when digoxin given with **colchicine**
- Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with **corticosteroids**
- Cytotoxics: absorption of digoxin **tablets** possibly reduced by **bleomycin**, **carbustine**, **cyclophosphamide**, **cytarabine**, **doxorubicin**, **melfalan**, **methotrexate**, **procarbazine** and **vincristine**; possible increased risk of bradycardia when digoxin given with **crizotinib**; plasma concentration of digoxin increased by **vandetanib**—possible increased risk of bradycardia
- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**; plasma concentration of digoxin

**Cardiac Glycosides**

- Diuretics (*continued*)
  - possibly increased by **potassium canrenoate**; plasma concentration of digoxin increased by
    - **spironolactone**
- Lenalidomide: plasma concentration of digoxin possibly increased by **lenalidomide**
- Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by **colestipol** and **colestyramine**; plasma concentration of digoxin possibly increased by **atorvastatin**
- Mirabegron: plasma concentration of digoxin increased by **mirabegron**—reduce initial dose of digoxin
- Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with **suxamethonium**; possible increased risk of bradycardia when cardiac glycosides given with **tizanidine**
- Penicillamine: plasma concentration of digoxin possibly reduced by **penicillamine**
- Ranolazine: plasma concentration of digoxin increased by **ranolazine**
- Sympathomimetics, Beta<sub>2</sub>: plasma concentration of digoxin possibly reduced by **salbutamol**
- Ticagrelor: plasma concentration of digoxin increased by **ticagrelor**
- Tolvaptan: plasma concentration of digoxin increased by **tolvaptan** (increased risk of toxicity)
- Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by **proton pump inhibitors**; absorption of cardiac glycosides possibly reduced by **sucralfate**
- Ulipristal: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after **ulipristal**

**Carmustine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: carmustine possibly reduces absorption of **digoxin tablets**
- Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by **cimetidine**

**Carteolol** *see* Beta-blockers**Carvedilol** *see* Beta-blockers**Caspofungin**

- Antibacterials: plasma concentration of caspofungin initially increased and then reduced by **rifampicin** (consider increasing dose of caspofungin)
- Antiepileptics: plasma concentration of caspofungin possibly reduced by **carbamazepine** and **phenytoin**—consider increasing dose of caspofungin
- Antivirals: plasma concentration of caspofungin possibly increased by **efavirenz** and **nevirapine**—consider increasing dose of caspofungin
- Ciclosporin: plasma concentration of caspofungin increased by **ciclosporin** (manufacturer of caspofungin recommends monitoring liver enzymes)
- Corticosteroids: plasma concentration of caspofungin possibly reduced by **dexamethasone**—consider increasing dose of caspofungin
- Tacrolimus: caspofungin reduces plasma concentration of **tacrolimus**

**Cefaclor** *see* Cephalosporins**Cefadroxil** *see* Cephalosporins**Cefalexin** *see* Cephalosporins**Cefixime** *see* Cephalosporins**Cefotaxime** *see* Cephalosporins**Cefradine** *see* Cephalosporins**Ceftaroline** *see* Cephalosporins**Ceftazidime** *see* Cephalosporins**Ceftriaxone** *see* Cephalosporins**Cefuroxime** *see* Cephalosporins**Celecoxib** *see* NSAIDs**Celiprolol** *see* Beta-blockers**Cephalosporins**

Antacids: absorption of cefaclor reduced by **antacids**

**Cephalosporins** (*continued*)

- Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with **aminoglycosides**
- Anticoagulants: cephalosporins possibly enhance anticoagulant effect of **coumarins**
- Probenecid: excretion of cephalosporins reduced by **probenecid** (increased plasma concentration)
- Teriflunomide: plasma concentration of cefaclor increased by **teriflunomide**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Certolizumab pegol**

- Abatacept: avoid concomitant use of certolizumab pegol with **abatacept**
- Anakinra: avoid concomitant use of certolizumab pegol with **anakinra**
- Vaccines: avoid concomitant use of certolizumab pegol with live **vaccines** (*see* p. 604)

**Cetirizine** *see* Antihistamines**Chenodeoxycholic Acid** *see* Bile Acids**Chloral** *see* Anxiolytics and Hypnotics**Chloramphenicol**

- Antibacterials: metabolism of chloramphenicol accelerated by **rifampicin** (reduced plasma concentration)
- Anticoagulants: chloramphenicol enhances anticoagulant effect of **coumarins**
- Antidiabetics: chloramphenicol enhances effects of **sulfonylureas**
- Antiepileptics: metabolism of chloramphenicol possibly accelerated by **phenobarbital** (reduced plasma concentration); chloramphenicol increases plasma concentration of **phenytoin** (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of chloramphenicol with **clozapine** (increased risk of agranulocytosis)
- Ciclosporin: chloramphenicol possibly increases plasma concentration of **ciclosporin**
- Clopidogrel: chloramphenicol possibly reduces antiplatelet effect of **clopidogrel**
- Hydroxocobalamin: chloramphenicol reduces response to **hydroxocobalamin**
- Tacrolimus: chloramphenicol possibly increases plasma concentration of **tacrolimus**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Chlordiazepoxide** *see* Anxiolytics and Hypnotics**Chloroprocaine**

- Antibacterials: chloroprocaine possibly inhibits effects of **sulfonamides** (manufacturer of chloroprocaine advises avoid concomitant use)

**Chloroquine and Hydroxychloroquine**

- Adsorbents: absorption of chloroquine and hydroxychloroquine reduced by **kaolin**
- Agalsidase Alfa and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of **agalsidase alfa and beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antacids: absorption of chloroquine and hydroxychloroquine reduced by **antacids**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with **amiodarone**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with **moxifloxacin**—avoid concomitant use
- Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**; increased risk of convulsions when chloroquine and hydroxychloroquine given with **mefloquine**

**Chloroquine and Hydroxychloroquine** (continued)

- Antipsychotics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ●**droperidol**—avoid concomitant use
- Cardiac Glycosides: chloroquine and hydroxychloroquine possibly increase plasma concentration of ●**digoxin**
- Ciclosporin: chloroquine and hydroxychloroquine increase plasma concentration of ●**ciclosporin** (increased risk of toxicity)
- Cytotoxics: possible increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ●**bosutinib**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Lanthanum: absorption of chloroquine and hydroxychloroquine possibly reduced by **lanthanum** (give at least 2 hours apart)
- Laronidase: chloroquine and hydroxychloroquine possibly inhibit effects of **laronidase** (manufacturer of laronidase advises avoid concomitant use)
- Parasympathomimetics: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of **neostigmine** and **pyridostigmine**
- Ulcer-healing Drugs: metabolism of chloroquine and hydroxychloroquine inhibited by **cimetidine** (increased plasma concentration)
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 626

**Chlorothiazide** see Diuretics**Chlorphenamine** see Antihistamines**Chlorpromazine** see Antipsychotics**Chlortalidon** see Diuretics**Ciclesonide** see Corticosteroids**Ciclosporin**

- ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with ●**ACE inhibitors**
- Aliskiren: ciclosporin increases plasma concentration of ●**aliskiren**—avoid concomitant use
- Allopurinol: plasma concentration of ciclosporin possibly increased by **allopurinol** (risk of nephrotoxicity)
- Ambrisentan: ciclosporin increases plasma concentration of ●**ambri-sentan** (see Dose under Ambrisentan, BNF section 2.5.1)
- Analgesics: increased risk of nephrotoxicity when ciclosporin given with ●**NSAIDs**; ciclosporin increases plasma concentration of ●**diclofenac** (halve dose of diclofenac)
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with ●**angiotensin-II receptor antagonists**
- Anti-arrhythmic: plasma concentration of ciclosporin possibly increased by **amiodarone** and **propafenone**
- Antibacterials: metabolism of ciclosporin inhibited by ●**clarithromycin** and ●**erythromycin** (increased plasma concentration); metabolism of ciclosporin accelerated by ●**rifampicin** (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by ●**sulfadiazine**; increased risk of nephrotoxicity when ciclosporin given with ●**aminoglycosides**, ●**polymyxins**, ●**quinolones**, ●**sulfonamides** or ●**vancomycin**; plasma concentration of ciclosporin possibly increased by ●**chloramphenicol** and ●**telithromycin**; increased risk of myopathy when ciclosporin given with ●**daptomycin** (preferably avoid concomitant use); metabolism of ciclosporin possibly inhibited by ●**macrolides** (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with ●**trimethoprim**, also plasma concentration of ciclosporin reduced by *intravenous* trimethoprim
- Anticoagulants: ciclosporin possibly increases plasma concentration of ●**dabigatran**—manufacturer of dabigatran advises avoid concomitant use

**Ciclosporin** (continued)

- Antidepressants: plasma concentration of ciclosporin reduced by ●**St John's wort**—avoid concomitant use
- Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of **repaglinide**
- Antiepileptics: metabolism of ciclosporin accelerated by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin** (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by **oxcarbazepine**
- Antifungals: metabolism of ciclosporin possibly inhibited by ●**miconazole** (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with ●**amphotericin**; metabolism of ciclosporin inhibited by ●**fluconazole**, ●**itraconazole**, ●**posaconazole** and ●**voriconazole** (increased plasma concentration); ciclosporin increases plasma concentration of ●**caspofungin** (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by **griseofulvin** and **terbinafine**; plasma concentration of ciclosporin possibly increased by **miconazole**
- Antimalarials: plasma concentration of ciclosporin increased by ●**chloroquine and hydroxychloroquine** (increased risk of toxicity)
- Antimuscarinics: avoidance of ciclosporin advised by manufacturer of **darifenacin**
- Antivirals: increased risk of nephrotoxicity when ciclosporin given with **aciclovir**; plasma concentration of ciclosporin possibly increased by ●**atazanavir** and ●**ritonavir**; plasma concentration of ciclosporin increased by ●**boceprevir**, ●**fosamprenavir** and ●**indinavir**; plasma concentration of ciclosporin possibly reduced by ●**efavirenz**; plasma concentration of both drugs increased when ciclosporin given with ●**saquinavir**; plasma concentration of both drugs increased when ciclosporin given with ●**telaprevir** (reduce dose of ciclosporin)
- Beta-blockers: plasma concentration of ciclosporin increased by ●**carvedilol**
- Bile Acids: absorption of ciclosporin increased by ●**ursodeoxycholic acid**
- Bosentan: ciclosporin increases plasma concentration of ●**bosentan** (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Calcium-channel Blockers: combination of ciclosporin with ●**lercanidipine** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by ●**diltiazem**, ●**nicardipine** and ●**verapamil**; ciclosporin possibly increases plasma concentration of **nifedipine** (increased risk of toxicity including gingival hyperplasia)
- Cardiac Glycosides: ciclosporin increases plasma concentration of ●**digoxin** (increased risk of toxicity)
- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with ●**colchicine**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Colestilan: manufacturer of colestilan advises give ciclosporin at least 1 hour before or 3 hours after **colestilan**
- Corticosteroids: plasma concentration of ciclosporin increased by high-dose ●**methylprednisolone** (risk of convulsions); ciclosporin increases plasma concentration of **prednisolone**
- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with ●**melphalan**; increased risk of neurotoxicity when ciclosporin given with ●**doxorubicin**; ciclosporin increases plasma concentration of ●**epirubicin** and ●**idarubicin**; ciclosporin reduces excretion of **mitoxantrene** (increased plasma concentration); risk of toxicity when ciclosporin given

**Ciclosporin**

- Cytotoxics (*continued*)
    - with ●methotrexate; ciclosporin possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours; caution with ciclosporin advised by manufacturer of ●crizotinib; ciclosporin increases plasma concentration of ●everolimus (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of ciclosporin possibly increased by imatinib; *in vitro* studies suggest a possible interaction between ciclosporin and docetaxel (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of etoposide (increased risk of toxicity)
  - Diuretics: plasma concentration of ciclosporin possibly increased by ●acetazolamide; increased risk of hyperkalaemia when ciclosporin given with ●potassium-sparing diuretics and aldosterone antagonists; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with thiazides and related diuretics
- Fidaxomicin: avoidance of ciclosporin advised by manufacturer of fidaxomicin
- Grapefruit Juice: plasma concentration of ciclosporin increased by ●grapefruit juice (increased risk of toxicity)
  - Hormone Antagonists: metabolism of ciclosporin inhibited by ●danazol (increased plasma concentration); plasma concentration of ciclosporin reduced by lanreotide and octreotide; plasma concentration of ciclosporin possibly reduced by ●pasireotide
  - Lenalidomide: ciclosporin possibly increases plasma concentration of ●lenalidomide (increased risk of toxicity)
  - Lipid-regulating Drugs: absorption of ciclosporin reduced by ●colesevelam; increased risk of renal impairment when ciclosporin given with bezafibrate or fenofibrate; increased risk of myopathy when ciclosporin given with atorvastatin (see Dose under Atorvastatin, p. 125); increased risk of myopathy when ciclosporin given with ●fluvastatin or ●pravastatin; increased risk of myopathy when ciclosporin given with ●rosuvastatin or ●simvastatin (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with ●ezetimibe
- Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with mannitol
- Metoclopramide: plasma concentration of ciclosporin increased by ●metoclopramide
- Mifamurtide: avoidance of ciclosporin advised by manufacturer of mifamurtide
- Modafinil: plasma concentration of ciclosporin reduced by ●modafinil
- Oestrogens: plasma concentration of ciclosporin possibly increased by oestrogens
- Orlistat: absorption of ciclosporin possibly reduced by ●orlistat
  - Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with ●potassium salts
- Progestogens: plasma concentration of ciclosporin possibly increased by progestogens
- Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with ranolazine
- Sevelamer: plasma concentration of ciclosporin possibly reduced by sevelamer
- Siroliimus: ciclosporin increases plasma concentration of siroliimus
- Sulfapyrazone: plasma concentration of ciclosporin reduced by ●sulfapyrazone
  - Tacrolimus: plasma concentration of ciclosporin increased by ●tacrolimus (increased risk of nephrotoxicity)—avoid concomitant use

**Ciclosporin (continued)**

- Ticagrelor: ciclosporin increases plasma concentration of ticagrelor
- Ulcer-healing Drugs: plasma concentration of ciclosporin possibly increased by ●cimetidine; plasma concentration of ciclosporin possibly affected by omeprazole
- Vitamins: plasma concentration of ciclosporin possibly affected by vitamin E
- Cidofovir**
- Antivirals: manufacturers advise avoid concomitant use of cidofovir with ●tenofovir
- Cilazapril** *see* ACE Inhibitors
- Cilostazol**
- Anagrelide: avoidance of cilostazol advised by manufacturer of ●anagrelide
  - Antibacterials: plasma concentration of cilostazol possibly increased by ●clarithromycin (see Dose under Cilostazol, BNF section 2.6.4); plasma concentration of cilostazol increased by ●erythromycin (see Dose under Cilostazol, BNF section 2.6.4)
  - Antifungals: plasma concentration of cilostazol possibly increased by ●itraconazole (see Dose under Cilostazol, BNF section 2.6.4)
  - Antivirals: plasma concentration of cilostazol possibly increased by ●boceprevir, ●ritonavir and ●telaprevir (see Dose under Cilostazol, BNF section 2.6.4)
- Calcium-channel Blockers: plasma concentration of cilostazol increased by diltiazem (consider reducing dose of cilostazol)
- Ulcer-healing Drugs: plasma concentration of cilostazol increased by ●omeprazole (see Dose under Cilostazol, BNF section 2.6.4)
- Cimetidine** *see* Histamine H<sub>2</sub>-antagonists
- Cinacalcet**
- Hormone Antagonists: cinacalcet possibly inhibits metabolism of ●tamoxifen to active metabolite (avoid concomitant use)
- Cinnarizine** *see* Antihistamines
- Ciprofibrate** *see* Fibrates
- Ciprofloxacin** *see* Quinolones
- Cisatracurium** *see* Muscle Relaxants
- Cisplatin** *see* Platinum Compounds
- Citalopram** *see* Antidepressants, SSRI
- Cladribine**
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
  - Antivirals: avoidance of cladribine advised by manufacturer of ●lamivudine
- Clarithromycin** *see* Macrolides
- Clemastine** *see* Antihistamines
- Clindamycin**
- Muscle Relaxants: clindamycin enhances effects of ●non-depolarising muscle relaxants and ●suxamethonium
- Parasympathomimetics: clindamycin antagonises effects of ●neostigmine and ●pyridostigmine
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 626
- Clobazam** *see* Anxiolytics and Hypnotics
- Clomethiazole** *see* Anxiolytics and Hypnotics
- Clomipramine** *see* Antidepressants, Tricyclic
- Clonazepam** *see* Anxiolytics and Hypnotics
- Clonidine**
- ACE Inhibitors: enhanced hypotensive effect when clonidine given with ACE inhibitors; previous treatment with clonidine possibly delays antihypertensive effect of captopril
- Adrenergic Neuron Blockers: enhanced hypotensive effect when clonidine given with adrenergic neuron blockers
- Alcohol: enhanced hypotensive effect when clonidine given with alcohol
- Aldesleukin: enhanced hypotensive effect when clonidine given with aldesleukin

**Clonidine** (continued)

- Alpha-blockers: enhanced hypotensive effect when clonidine given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when clonidine given with **general anaesthetics**
- Analgesics: hypotensive effect of clonidine antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with **angiotensin-II receptor antagonists**
- Antidepressants: enhanced hypotensive effect when clonidine given with **MAOIs**; hypotensive effect of clonidine possibly antagonised by **mirtazapine**; hypotensive effect of clonidine antagonised by **tricyclics**, also increased risk of hypertension on clonidine withdrawal
  - Antipsychotics: enhanced hypotensive effect when clonidine given with **phenothiazines**
  - Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with **anxiolytics and hypnotics**
  - Beta-blockers: increased risk of withdrawal hypertension when clonidine given with **beta-blockers** (withdraw beta-blockers several days before slowly withdrawing clonidine)
  - Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with **calcium-channel blockers**
  - Corticosteroids: hypotensive effect of clonidine antagonised by **corticosteroids**
  - Cytotoxics: possible increased risk of bradycardia when clonidine given with **crizotinib**
  - Diazoxide: enhanced hypotensive effect when clonidine given with **diazoxide**
  - Diuretics: enhanced hypotensive effect when clonidine given with **diuretics**
  - Dopaminergics: enhanced hypotensive effect when clonidine given with **levodopa**
  - Histamine: avoidance of clonidine advised by manufacturer of **histamine**
  - Methyldopa: enhanced hypotensive effect when clonidine given with **methyldopa**
  - Moxisylyte: enhanced hypotensive effect when clonidine given with **moxisylyte**
  - Moxonidine: enhanced hypotensive effect when clonidine given with **moxonidine**
  - Muscle Relaxants: enhanced hypotensive effect when clonidine given with **baclofen** or **tizanidine**
  - Nitrates: enhanced hypotensive effect when clonidine given with **nitrates**
  - Oestrogens: hypotensive effect of clonidine antagonised by **oestrogens**
  - Prostaglandins: enhanced hypotensive effect when clonidine given with **alprostadil**
  - Sympathomimetics: possible risk of hypertension when clonidine given with **adrenaline (epinephrine)** or **noradrenaline (norepinephrine)**; serious adverse events reported with concomitant use of clonidine and **methylphenidate** (causality not established)
  - Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Cloпамide** *see* Diuretics

**Clopidogrel**

- Analgesics: increased risk of bleeding when clopidogrel given with **NSAIDs** or **aspirin**
- Antibacterials: antiplatelet effect of clopidogrel possibly reduced by **chloramphenicol**, **ciprofloxacin** and **erythromycin**
  - Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with **warfarin**; antiplatelet action of clopidogrel enhances anticoagulant effect of **coumarins** and **phenindione**; increased risk of bleeding when clopidogrel given with **heparins**

**Clopidogrel** (continued)

- Antidepressants: antiplatelet effect of clopidogrel possibly reduced by **fluoxetine**, **fluvoxamine** and **moclobemide**
  - Antiepileptics: antiplatelet effect of clopidogrel possibly reduced by **carbamazepine** and **oxcarbazepine**
  - Antifungals: antiplatelet effect of clopidogrel possibly reduced by **fluconazole**, **itraconazole** and **voriconazole**
  - Antivirals: antiplatelet effect of clopidogrel possibly reduced by **etravirine**
- Dipyridamole: increased risk of bleeding when clopidogrel given with **dipyridamole**
- Iloprost: increased risk of bleeding when clopidogrel given with **iloprost**
- Prasugrel: possible increased risk of bleeding when clopidogrel given with **prasugrel**
- Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by **cimetidine**, **lansoprazole**, **pantoprazole** and **rabeprazole**; antiplatelet effect of clopidogrel reduced by **esomeprazole** and **omeprazole**
- Clozapine** *see* Antipsychotics
- Co-amoxiclav** *see* Penicillins
- Co-beneldopa** *see* Levodopa
- Cobicistat**
- Alpha-blockers: cobicistat possibly increases plasma concentration of **alfuzosin**—manufacturer of cobicistat advises avoid concomitant use
  - Anti-arrhythmics: cobicistat possibly increases plasma concentration of **amiodarone**—manufacturer of cobicistat advises avoid concomitant use
  - Antibacterials: plasma concentration of cobicistat reduced by **rifabutin** (adjust dose—consult product literature); plasma concentration of cobicistat possibly reduced by **rifampicin**—manufacturer of cobicistat advises avoid concomitant use
  - Anticoagulants: cobicistat possibly enhances anticoagulant effect of **rivaroxaban**—avoid concomitant use
  - Antidepressants: plasma concentration of cobicistat possibly reduced by **St John's wort**—manufacturer of cobicistat advises avoid concomitant use
  - Antiepileptics: plasma concentration of cobicistat possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**—manufacturer of cobicistat advises avoid concomitant use
  - Antifungals: cobicistat possibly increases plasma concentration of **itraconazole**—manufacturer of cobicistat advises reduce dose of itraconazole
  - Antipsychotics: cobicistat possibly increases plasma concentration of **pimozide**—manufacturer of cobicistat advises avoid concomitant use
  - Antivirals: manufacturer of cobicistat advises avoid concomitant use with **boceprevir**; cobicistat possibly increases plasma concentration of **maraviroc** (reduce dose of maraviroc); avoidance of cobicistat advised by manufacturer of **nevirapine**
  - Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with **oral midazolam**
  - Bosentan: manufacturer of cobicistat advises avoid concomitant use with **bosentan**
  - Cardiac Glycosides: cobicistat possibly increases plasma concentration of **digoxin**—reduce initial dose of digoxin
  - Ergot Alkaloids: cobicistat possibly increases plasma concentration of **ergot alkaloids**—manufacturer of cobicistat advises avoid concomitant use
  - Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of **atorvastatin**—manufacturer of cobicistat advises reduce dose of atorvastatin; manufacturer of cobicistat advises avoid concomitant use with **simvastatin**

**Cobicistat** (continued)

- Oestrogens: cobicistat accelerates metabolism of
  - **oestrogens** (reduced contraceptive effect—see p. 402)
- Progestogens: cobicistat increases plasma concentration of **norgestimate**
- Sildenafil: cobicistat possibly increases plasma concentration of **sildenafil**—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
- Sympathomimetics, Beta<sub>2</sub>: manufacturer of cobicistat advises avoid concomitant use with **salmeterol**
- Tadalafil: cobicistat possibly increases plasma concentration of **tadalafil**—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
- Vardenafil: cobicistat possibly increases plasma concentration of **vardenafil**—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)

**Co-careldopa** see Levodopa

**Codeine** see Opioid Analgesics

**Co-fluampicil** see Penicillins

**Colchicine**

- Anti-arrhythmics: possible increased risk of colchicine toxicity when given with **amiodarone**
- Antibacterials: possible increased risk of colchicine toxicity when given with **azithromycin**, **clarithromycin**, **erythromycin** and **telithromycin**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antifungals: possible increased risk of colchicine toxicity when given with **itraconazole**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with **atazanavir**, **indinavir**, **ritonavir** and **telaprevir**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with **diltiazem** and **verapamil**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiac Glycosides: possible increased risk of myopathy when colchicine given with **digoxin**
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with **ciclosporin**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Grapefruit Juice: possible increased risk of colchicine toxicity when given with **grapefruit juice**
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with **fibrates** or **statins**

**Colesevelam**

**Note** Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption

Antidiabetics: colesevelam reduces absorption of **glibenclamide** and **glipizide**; colesevelam reduces absorption of **glimepiride**—manufacturer of glimepiride advises give at least 4 hours before colesevelam; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **canagliflozin**

Antiepileptics: colesevelam possibly reduces absorption of **phenytoin**

- Ciclosporin: colesevelam reduces absorption of **ciclosporin**

**Colesevelam** (continued)

Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **lomitapide** (give at least 4 hours apart)

Oestrogens: colesevelam reduces absorption of **ethinylestradiol**

Thyroid Hormones: colesevelam reduces absorption of **levothyroxine**

**Colestilan**

**Note** Other drugs should be taken at least 1 hour before or 3 hours after colestilan to reduce possible interference with absorption

Ciclosporin: manufacturer of colestilan advises give **ciclosporin** at least 1 hour before or 3 hours after colestilan

Mycophenolate: manufacturer of colestilan advises give **mycophenolate** at least 1 hour before or 3 hours after colestilan

Tacrolimus: manufacturer of colestilan advises give **tacrolimus** at least 1 hour before or 3 hours after colestilan

Thyroid Hormones: manufacturer of colestilan advises give **levothyroxine** at least 1 hour before or 3 hours after colestilan

**Colestipol**

**Note** Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption

Antibacterials: colestipol possibly reduces absorption of **tetracycline**

Antidiabetics: manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **canagliflozin**

Bile Acids: colestipol possibly reduces absorption of **bile acids**

Cardiac Glycosides: colestipol possibly reduces absorption of **cardiac glycosides**

Diuretics: colestipol reduces absorption of **thiazides and related diuretics** (give at least 2 hours apart)

Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **lomitapide** (give at least 4 hours apart)

Thyroid Hormones: colestipol reduces absorption of **thyroid hormones**

**Colestyramine**

**Note** Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption

Analgesics: colestyramine increases the excretion of **meloxicam**; colestyramine reduces absorption of **paracetamol**

Antibacterials: colestyramine possibly reduces absorption of **tetracycline**; colestyramine antagonises effects of **oral vancomycin**

- Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of **coumarins** and **phenindione**

Antidiabetics: colestyramine possibly enhances hypoglycaemic effect of **acarbose**; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **canagliflozin**

Antiepileptics: colestyramine possibly reduces absorption of **valproate**

Bile Acids: colestyramine possibly reduces absorption of **bile acids**

Cardiac Glycosides: colestyramine possibly reduces absorption of **cardiac glycosides**

Diuretics: colestyramine reduces absorption of **thiazides and related diuretics** (give at least 2 hours apart)

Leflunomide: colestyramine significantly decreases effect of **leflunomide** (enhanced elimination)—avoid unless drug elimination desired

Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **lomitapide** (give at least 4 hours apart)

**Colestyramine** (*continued*)

Mycophenolate: colestyramine reduces absorption of **mycophenolate**

Raloxifene: colestyramine reduces absorption of **raloxifene** (manufacturer of raloxifene advises avoid concomitant administration)

Teriflunomide: colestyramine significantly decreases effect of **teriflunomide** (enhanced elimination)—avoid unless drug elimination desired

Thyroid Hormones: colestyramine reduces absorption of **thyroid hormones**

Vitamins: colestyramine possibly reduces absorption of **calcitriol** (give at least 1 hour before or 4 to 6 hours after colestyramine)

**Colistimethate Sodium** *see* Polymyxins

**Contraceptives, oral** *see* Oestrogens and Progestogens

**Corticosteroids**

**Note** Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified

**ACE Inhibitors:** corticosteroids antagonise hypotensive effect of **ACE inhibitors**

**Adrenergic Neurone Blockers:** corticosteroids antagonise hypotensive effect of **adrenergic neurone blockers**

- **Aldesleukin:** avoidance of corticosteroids advised by manufacturer of **aldesleukin**

**Alpha-blockers:** corticosteroids antagonise hypotensive effect of **alpha-blockers**

**Analgesics:** increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with **NSAIDs**; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with **aspirin**, also corticosteroids reduce plasma concentration of salicylate

**Angiotensin-II Receptor Antagonists:** corticosteroids antagonise hypotensive effect of **angiotensin-II receptor antagonists**

**Antacids:** absorption of deflazacort reduced by **antacids**

- **Antibacterials:** plasma concentration of methylprednisolone possibly increased by **clarithromycin**; metabolism of corticosteroids possibly inhibited by **erythromycin**; metabolism of methylprednisolone inhibited by **erythromycin**; corticosteroids possibly reduce plasma concentration of **isoniazid**; metabolism of corticosteroids accelerated by **rifamycins** (reduced effect)

- **Anticoagulants:** corticosteroids may enhance or reduce anticoagulant effect of **coumarins** (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of **phenindione**

**Antidiabetics:** corticosteroids antagonise hypoglycaemic effect of **antidiabetics**

- **Antiepileptics:** metabolism of corticosteroids accelerated by **carbamazepine**, **phenobarbital** and **phenytoin** (reduced effect)
- **Antifungals:** increased risk of hypokalaemia when corticosteroids given with **amphotericin**—avoid concomitant use unless corticosteroids needed to control reactions; metabolism of corticosteroids and methylprednisolone possibly inhibited by **itraconazole**; plasma concentration of *inhaled* and *oral* (and possibly also *intranasal* and *rectal*) budesonide increased by **itraconazole**; plasma concentration of *inhaled* fluticasone increased by **itraconazole**; dexamethasone possibly reduces plasma concentration of **caspofungin**—consider increasing dose of caspofungin
- **Antivirals:** dexamethasone possibly reduces plasma concentration of **indinavir**, **lopinavir**, **saquinavir** and **telaprevir**; avoidance of dexamethasone (except when given as a single dose) advised by manufacturer of **rilpivirine**; plasma concentration of *inhaled* and *intranasal* fluticasone increased by **ritonavir**—increased risk of adrenal suppression; plasma con-

**Corticosteroids**

- **Antivirals** (*continued*)

centration of budesonide (including *inhaled*, *intranasal*, and *rectal* budesonide) possibly increased by **ritonavir**—increased risk of adrenal suppression; plasma concentration of corticosteroids possibly increased by **ritonavir**—increased risk of adrenal suppression; plasma concentration of *inhaled* and *intranasal* budesonide and fluticasone possibly increased by **telaprevir**

**Apprepitant:** metabolism of dexamethasone and methylprednisolone inhibited by **apprepitant** (reduce dose of dexamethasone and methylprednisolone)

**Beta-blockers:** corticosteroids antagonise hypotensive effect of **beta-blockers**

**Calcium Salts:** corticosteroids reduce absorption of **calcium salts**

**Calcium-channel Blockers:** corticosteroids antagonise hypotensive effect of **calcium-channel blockers**; plasma concentration of methylprednisolone increased by **diltiazem**

**Cardiac Glycosides:** increased risk of hypokalaemia when corticosteroids given with **cardiac glycosides**

- **Ciclosporin:** high-dose methylprednisolone increases plasma concentration of **ciclosporin** (risk of convulsions); plasma concentration of prednisolone increased by **ciclosporin**

**Clonidine:** corticosteroids antagonise hypotensive effect of **clonidine**

**Cytotoxics:** possible increased risk of hepatotoxicity when dexamethasone given with **high-dose methotrexate**; dexamethasone possibly decreases plasma concentration of **axitinib** (increase dose of axitinib—consult axitinib product literature)

**Diazoxide:** corticosteroids antagonise hypotensive effect of **diazoxide**

**Diuretics:** corticosteroids antagonise diuretic effect of **diuretics**; increased risk of hypokalaemia when corticosteroids given with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**

**Histamine:** avoidance of corticosteroids advised by manufacturer of **histamine**

**Methyldopa:** corticosteroids antagonise hypotensive effect of **methyldopa**

**Mifamurtide:** avoidance of corticosteroids advised by manufacturer of **mifamurtide**

**Mifepristone:** effect of corticosteroids (including *inhaled* corticosteroids) may be reduced for 3–4 days after **mifepristone**

**Moxonidine:** corticosteroids antagonise hypotensive effect of **moxonidine**

**Muscle Relaxants:** corticosteroids possibly antagonise effects of **pancuronium** and **vecuronium**

**Nitrates:** corticosteroids antagonise hypotensive effect of **nitrates**

**Oestrogens:** plasma concentration of corticosteroids increased by oral contraceptives containing **oestrogens**

**Sodium Benzoate:** corticosteroids possibly reduce effects of **sodium benzoate**

**Sodium Phenylbutyrate:** corticosteroids possibly reduce effects of **sodium phenylbutyrate**

**Somatropin:** corticosteroids may inhibit growth-promoting effect of **somatropin**

**Sympathomimetics:** metabolism of dexamethasone accelerated by **ephedrine**

**Sympathomimetics, Beta<sub>2</sub>:** increased risk of hypokalaemia when corticosteroids given with high doses of **beta<sub>2</sub> sympathomimetics**—*see* Hypokalaemia, p. 136

**Theophylline:** increased risk of hypokalaemia when corticosteroids given with **theophylline**

**Ticagrelor:** dexamethasone possibly reduces plasma concentration of **ticagrelor**

**Corticosteroids** (*continued*)

- Vaccines: high doses of corticosteroids impair immune response to **vaccines**, avoid concomitant use with live vaccines (see p. 604)
- Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**

**Co-trimoxazole** *see* Trimethoprim and Sulfamethoxazole

**Coumarins**

**Note** Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of **alcohol**
- Allopurinol: anticoagulant effect of coumarins possibly enhanced by **allopurinol**
- Anabolic Steroids: anticoagulant effect of coumarins enhanced by **anabolic steroids**
- Analgesics: anticoagulant effect of coumarins possibly enhanced by **NSAIDs**; increased risk of haemorrhage when anticoagulants given with *intravenous* **diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by **tramadol**; increased risk of bleeding when coumarins given with **aspirin** (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of **paracetamol**
- Anti-arrhythmics: metabolism of coumarins inhibited by **amiodarone** (enhanced anticoagulant effect); anticoagulant effect of warfarin may be enhanced or reduced by **disopyramide**; anticoagulant effect of coumarins possibly enhanced by **dronedrone**; anticoagulant effect of coumarins enhanced by **propafenone**
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with **neomycin** (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by **azithromycin**, **aztreonam**, **cephalosporins**, **ciprofloxacin**, **levofloxacin**, **tetracyclines**, **tigecycline** and **trimethoprim**; anticoagulant effect of coumarins enhanced by **chloramphenicol**, **clarithromycin**, **erythromycin**, **metronidazole**, **nalidixic acid**, **norfloxacin**, **ofloxacin** and **sulfonamides**; an interaction between coumarins and broad-spectrum **penicillins** has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of coumarins accelerated by **rifamycins** (reduced anticoagulant effect)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with **apixaban**, **dabigatran** and **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: anticoagulant effect of warfarin possibly enhanced by **venlafaxine**; anticoagulant effect of warfarin may be enhanced or reduced by **trazodone**; anticoagulant effect of coumarins possibly enhanced by **SSRIs**; anticoagulant effect of coumarins reduced by **St John's wort** (avoid concomitant use); anticoagulant effect of warfarin enhanced by **mirtazapine**; anticoagulant effect of coumarins may be enhanced or reduced by **tricyclics**
- Antidiabetics: anticoagulant effect of warfarin possibly enhanced by **exenatide**; coumarins possibly

**Coumarins****Antidiabetics** (*continued*)

- enhance hypoglycaemic effect of **sulfonylureas**, also possible changes to anticoagulant effect
- Antiepileptics: metabolism of coumarins accelerated by **carbamazepine** and **phenobarbital** (reduced anticoagulant effect); plasma concentration of warfarin reduced by **eslicarbazepine**; metabolism of coumarins accelerated by **phenytoin** (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by **valproate**
- Antifungals: anticoagulant effect of coumarins enhanced by **miconazole** (miconazole oral gel and possibly vaginal and topical formulations absorbed); anticoagulant effect of coumarins enhanced by **fluconazole**, **itraconazole** and **voriconazole**; anticoagulant effect of coumarins reduced by **griseofulvin**
- Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by **proguanil**; plasma concentration of both drugs increased when warfarin given with **quinine**
- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by **atazanavir**, **nevirapine** and **ritonavir**; plasma concentration of coumarins possibly affected by **efavirenz**; anticoagulant effect of coumarins may be enhanced or reduced by **fosamprenavir**; anticoagulant effect of coumarins possibly enhanced by **ritonavir**; anticoagulant effect of warfarin possibly enhanced by **saquinavir**; plasma concentration of warfarin possibly affected by **telaprevir**
- Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by **chloral**
- Aprepitant: anticoagulant effect of warfarin possibly reduced by **aprepitant**
- Azithromycin: anticoagulant effect of coumarins possibly reduced by **azithromycin**
- Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of **bosentan**
- Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of **clopidogrel**; avoidance of warfarin advised by manufacturer of **clopidogrel**
- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by **corticosteroids** (high-dose corticosteroids enhance anticoagulant effect)
- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by **cranberry juice**—avoid concomitant use
- Cytotoxics: anticoagulant effect of coumarins possibly enhanced by **etoposide**, **ifosfamide** and **sorafenib**; anticoagulant effect of coumarins enhanced by **flourouracil**; anticoagulant effect of warfarin possibly enhanced by **gefitinib**, **gemcitabine** and **vemurafenib**; anticoagulant effect of coumarins possibly reduced by **mercaptopurine** and **mitotane**; increased risk of bleeding when coumarins given with **erlotinib**; replacement of warfarin with a heparin advised by manufacturer of **imatinib** (possibility of enhanced warfarin effect); increased risk of bleeding when warfarin given with **regorafenib**
- Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of **dipyridamole**
- Disulfiram: anticoagulant effect of coumarins enhanced by **disulfiram**
- Dopaminergics: anticoagulant effect of warfarin enhanced by **entacapone**
- Enteral Foods: anticoagulant effect of coumarins antagonised by vitamin K (present in some **enteral feeds**)
- Glucosamine: anticoagulant effect of warfarin enhanced by **glucosamine** (avoid concomitant use)

**Coumarins** (*continued*)

- Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by **bicalutamide** and **●toremifene**; metabolism of coumarins inhibited by **●danazol** (enhanced anticoagulant effect); plasma concentration of coumarins possibly reduced by **●enzalutamide**; anticoagulant effect of coumarins enhanced by **●flutamide** and **●tamoxifen**
- Iloprost: anticoagulant effect of coumarins possibly enhanced by **●loprost**
- Lactulose: anticoagulant effect of coumarins possibly enhanced by **●lactulose**
- Leflunomide: anticoagulant effect of warfarin possibly enhanced by **●leflunomide**
- Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by **●zafirlukast**
- Levamisole: anticoagulant effect of warfarin possibly enhanced by **●levamisole**
- Levocarnitine: anticoagulant effect of coumarins possibly enhanced by **●levocarnitine**
- Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by **●colestyramine**; anticoagulant effect of warfarin may be transiently reduced by **●atorvastatin**; anticoagulant effect of coumarins enhanced by **●fibrates**, **●fluvastatin** and **●simvastatin**; anticoagulant effect of coumarins possibly enhanced by **●ezetimibe** and **●rosuvastatin**; anticoagulant effect of warfarin possibly enhanced by **●lomitapide**
- Memantine: anticoagulant effect of warfarin possibly enhanced by **●memantine**
- Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by **●oestrogens**
- Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of **●orlistat**
- Prasugrel: possible increased risk of bleeding when coumarins given with **●prasugrel**
- Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by **●progestogens**
- Raloxifene: anticoagulant effect of coumarins antagonised by **●raloxifene**
- Retinoids: anticoagulant effect of coumarins possibly reduced by **●acitretin**
- Sulfinpyrazone: anticoagulant effect of coumarins enhanced by **●sulfinpyrazone**
- Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by **●methylphenidate**
- Testolactone: anticoagulant effect of coumarins enhanced by **●testolactone**
- Testosterone: anticoagulant effect of coumarins enhanced by **●testosterone**
- Thyroid Hormones: anticoagulant effect of coumarins enhanced by **●thyroid hormones**
- Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by **●ubidecarenone**
- Ulcer-healing Drugs: metabolism of coumarins inhibited by **●cimetidine** (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by **●esomeprazole** and **●omeprazole**; anticoagulant effect of coumarins might be enhanced by **●pantoprazole**; absorption of coumarins possibly reduced by **●sucralfate** (reduced anticoagulant effect)
- Vaccines: anticoagulant effect of warfarin possibly enhanced by **●influenza vaccine**
- Vitamins: anticoagulant effect of coumarins possibly enhanced by **●vitamin E**; anticoagulant effect of coumarins antagonised by **●vitamin K**

**Cranberry Juice**

- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of **●coumarins**—avoid concomitant use

**Crizotinib**

- Analgesics: manufacturer of crizotinib advises caution with **●alfentanil** and **●fentanyl**
- Antibacterials: plasma concentration of crizotinib possibly increased by **●clarithromycin** and **●telithromy-**

**Crizotinib****Antibacterials** (*continued*)

- **cin**—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by **●rifabutin**—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by **●rifampicin**—manufacturer of crizotinib advises avoid concomitant use
  - Antidepressants: plasma concentration of crizotinib possibly reduced by **●St John's wort**—manufacturer of crizotinib advises avoid concomitant use
  - Antiepileptics: plasma concentration of crizotinib possibly reduced by **●carbamazepine**, **●phenobarbital** and **●phenytoin**—manufacturer of crizotinib advises avoid concomitant use
  - Antifungals: plasma concentration of crizotinib possibly increased by **●itraconazole** and **●voriconazole**—manufacturer of crizotinib advises avoid concomitant use
  - Antimalarials: possible increased risk of bradycardia when crizotinib given with **●mefloquine**
  - Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with **●pimozide**
  - Antivirals: plasma concentration of crizotinib possibly increased by **●atazanavir**, **●indinavir**, **●ritonavir** and **●saquinavir**—manufacturer of crizotinib advises avoid concomitant use
  - Anxiolytics and Hypnotics: crizotinib increases plasma concentration of **●midazolam**
  - Beta-blockers: possible increased risk of bradycardia when crizotinib given with **●beta-blockers**
  - Calcium-channel Blockers: possible increased risk of bradycardia when crizotinib given with **●diltiazem** or **●verapamil**
  - Cardiac Glycosides: possible increased risk of bradycardia when crizotinib given with **●digoxin**
  - Ciclosporin: manufacturer of crizotinib advises caution with **●ciclosporin**
  - Clonidine: possible increased risk of bradycardia when crizotinib given with **●clonidine**
  - Ergot Alkaloids: manufacturer of crizotinib advises caution with **●ergot alkaloids**
  - Grapefruit Juice: plasma concentration of crizotinib possibly increased by **●grapefruit juice**—manufacturer of crizotinib advises avoid concomitant use
  - Oestrogens: manufacturer of crizotinib advises contraceptive effect of **●oestrogens** possibly reduced
  - Parasympathomimetics: possible increased risk of bradycardia when crizotinib given with **●pilocarpine**
  - Progestogens: manufacturer of crizotinib advises contraceptive effect of **●progestogens** possibly reduced
  - Sirolimus: manufacturer of crizotinib advises caution with **●sirolimus**
  - Tacrolimus: manufacturer of crizotinib advises caution with **●tacrolimus**
- Cyclizine** see Antihistamines  
**Cyclopenthiiazide** see Diuretics  
**Cyclopentolate** see Antimuscarinics  
**Cyclophosphamide**  
 Antifungals: side-effects of cyclophosphamide possibly increased by **●fluconazole** and **●itraconazole**- Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: cyclophosphamide possibly reduces absorption of **●digoxin tablets**
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with **●pentostatin**—avoid concomitant use
- Muscle Relaxants: cyclophosphamide enhances effects of **●suxamethonium**

**Cycloserine**

  - Alcohol: increased risk of convulsions when cycloserine given with **●alcohol**

**Cycloserine** (continued)

Antibacterials: increased risk of CNS toxicity when cycloserine given with **isoniazid**  
 Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Cyproheptadine** see Antihistamines**Cytarabine**

Antifungals: cytarabine possibly reduces plasma concentration of **flucytosine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: cytarabine possibly reduces absorption of **digoxin tablets**  
 Cytotoxics: intracellular concentration of cytarabine increased by **fludarabine**

**Cytotoxics** see individual drugs**Dabigatran**

- Analgesics: possible increased risk of bleeding when dabigatran given with **NSAIDs**; increased risk of haemorrhage when anticoagulants given with **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: plasma concentration of dabigatran increased by **amiodarone** (see Dose under Dabigatran, BNF section 2.8.2); plasma concentration of dabigatran increased by **dronedarone**—avoid concomitant use
- Antibacterials: possible increased risk of bleeding when dabigatran given with **clarithromycin**; plasma concentration of dabigatran reduced by **rifampicin**—manufacturer of dabigatran advises avoid concomitant use
- Anticoagulants: increased risk of haemorrhage when dabigatran given with other **anticoagulants** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with **apixaban** and **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: possible increased risk of bleeding when dabigatran given with **SSRI-related antidepressants** or **SSRIs**; plasma concentration of dabigatran possibly reduced by **St John's wort**—manufacturer of dabigatran advises avoid concomitant use
- Antiepileptics: plasma concentration of dabigatran possibly reduced by **carbamazepine** and **phenytoin**—manufacturer of dabigatran advises avoid concomitant use
- Antifungals: manufacturer of dabigatran advises avoid concomitant use with **itraconazole**
- Antivirals: plasma concentration of dabigatran possibly increased by **rilpivirine** and **telaprevir**
- Calcium-channel Blockers: plasma concentration of dabigatran possibly increased by **verapamil** (see Dose under Dabigatran, BNF section 2.8.2)
- Ciclosporin: plasma concentration of dabigatran possibly increased by **ciclosporin**—manufacturer of dabigatran advises avoid concomitant use
- Sulfinpyrazone: possible increased risk of bleeding when dabigatran given with **sulfinpyrazone**
- Tacrolimus: plasma concentration of dabigatran possibly increased by **tacrolimus**—manufacturer of dabigatran advises avoid concomitant use
- Ticagrelor: plasma concentration of dabigatran increased by **ticagrelor**
- Ulipristal: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after **ulipristal**

**Dabrafenib**

Antibacterials: manufacturer of dabrafenib advises avoid concomitant use with **rifampicin**

**Dabrafenib** (continued)

Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with **St John's wort**  
 Antiepileptics: manufacturer of dabrafenib advises avoid concomitant use with **carbamazepine, phenobarbital** and **phenytoin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
  - Oestrogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing **oestrogens** possibly reduced (alternative contraceptive recommended)
  - Progestogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing **progestogens** possibly reduced (alternative contraceptive recommended)
- Ulcer-healing Drugs: manufacturer of dabrafenib advises avoid concomitant use with **proton pump inhibitors** (plasma concentration of dabrafenib possibly reduced)

**Dacarbazine**

- Aldesleukin: avoidance of dacarbazine advised by manufacturer of **aldesleukin**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Dairy Products**

Antibacterials: dairy products reduce absorption of **ciprofloxacin** and **norfloxacin**; dairy products reduce absorption of **tetracyclines** (except doxycycline and minocycline)

Cytotoxics: dairy products possibly reduce plasma concentration of **mercaptopurine**—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products

Eltrombopag: dairy products possibly reduce absorption of **eltrombopag** (give at least 4 hours apart)

**Dalteparin** see Heparins**Danazol**

- Anticoagulants: danazol inhibits metabolism of **coumarins** (enhanced anticoagulant effect)
  - Antiepileptics: danazol inhibits metabolism of **carbamazepine** (increased risk of toxicity)
  - Ciclosporin: danazol inhibits metabolism of **ciclosporin** (increased plasma concentration)
  - Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with **simvastatin**—avoid concomitant use
- Tacrolimus: danazol possibly increases plasma concentration of **tacrolimus**

**Dantrolene** see Muscle Relaxants**Dapagliflozin** see Antidiabetics**Dapoxetine**

- Alcohol: increased sedative effect when dapoxetine given with **alcohol**
- Analgesics: possible increased risk of serotonergic effects when dapoxetine given with **tramadol** (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with **clarithromycin** and **erythromycin** (see Dose under Dapoxetine, BNF section 7.4.6); manufacturer of dapoxetine advises avoid concomitant use with **telithromycin** (increased risk of toxicity)
- Antidepressants: possible increased risk of serotonergic effects when dapoxetine given with **SSRIs**, **St John's wort**, **duloxetine**, **tricyclics** and **venlafaxine** (manufacturer of dapoxetine advises SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine); increased risk of serotonergic effects when dapoxetine given with

**Dapoxetine**

- Antidepressants (*continued*)
  - MAOIs (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- Antifungals: manufacturer of dapoxetine advises dose reduction when dapoxetine given with **fluconazole** (see Dose under Dapoxetine, BNF section 7.4.6); manufacturer of dapoxetine advises avoid concomitant use with **itraconazole** (increased risk of toxicity)
- Antivirals: manufacturer of dapoxetine advises avoid concomitant use with **atazanavir**, **ritonavir** and **saquinavir** (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with **fosamprenavir** (see Dose under Dapoxetine, BNF section 7.4.6)
- Aprepitant: manufacturer of dapoxetine advises dose reduction when dapoxetine given with **aprepitant** (see Dose under Dapoxetine, BNF section 7.4.6)
- Calcium-channel Blockers: manufacturer of dapoxetine advises dose reduction when dapoxetine given with **diltiazem** and **verapamil** (see Dose under Dapoxetine, BNF section 7.4.6)
- 5HT<sub>1</sub>-receptor Agonists: possible increased risk of serotonergic effects when dapoxetine given with **5HT<sub>1</sub> agonists** (manufacturer of dapoxetine advises 5HT<sub>1</sub> agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT<sub>1</sub> agonists)
- Lithium: possible increased risk of serotonergic effects when dapoxetine given with **lithium** (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with **sildenafil**
- Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with **tadalafil**
- Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with **vardenafil**

**Dapsone**

- Antibacterials: plasma concentration of dapsone reduced by **rifamycins**; plasma concentration of both drugs may increase when dapsone given with **trimethoprim**
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with **saquinavir**—avoid concomitant use
- Probenecid: excretion of dapsone reduced by **probenecid** (increased risk of side-effects)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Daptomycin**

- Ciclosporin: increased risk of myopathy when daptomycin given with **ciclosporin** (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with **fibrates** or **statins** (preferably avoid concomitant use)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Darifenacin** see Antimuscarinics

**Darunavir**

- Anti-arrhythmics: darunavir possibly increases plasma concentration of **lidocaine**—avoid concomitant use
- Antibacterials: darunavir increases plasma concentration of **rifabutin** (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: avoidance of darunavir advised by manufacturer of **apixaban** and **rivaroxaban**
- Antidepressants: darunavir possibly reduces plasma concentration of **paroxetine** and **sertraline**; plasma concentration of darunavir reduced by **St John's wort**—avoid concomitant use

**Darunavir (continued)**

- Antiepileptics: plasma concentration of darunavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antimalarials: darunavir increases plasma concentration of **lumefantrine**; darunavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)
- Antipsychotics: darunavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); darunavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of darunavir with **boceprevir** or **telaprevir**; manufacturer of darunavir advises take **dianosine** 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by **efavirenz** (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with **indinavir**; plasma concentration of darunavir reduced by **lopinavir**, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); increased risk of rash when darunavir given with **raltegravir**; plasma concentration of darunavir reduced by **saquinavir**
- Cytotoxics: darunavir possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; darunavir possibly increases plasma concentration of **everolimus**—manufacturer of everolimus advises avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when darunavir given with **ergot alkaloids**—manufacturer of darunavir advises avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when darunavir given with **atorvastatin**; darunavir possibly increases plasma concentration of **pravastatin**; possible increased risk of myopathy when darunavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; avoidance of darunavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of darunavir possibly reduced by **orlistat**
- Ranolazine: darunavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use

**Dasatinib**

- Antibacterials: metabolism of dasatinib accelerated by **rifampicin** (reduced plasma concentration—avoid concomitant use)
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: avoidance of dasatinib advised by manufacturer of **boceprevir**
- Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of **simvastatin**
- Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by **famotidine**

**Decitabine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Deferasirox**

- Antacids: absorption of deferasirox possibly reduced by **antacids** containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
- Antibacterials: plasma concentration of deferasirox reduced by **rifampicin**
- Antidiabetics: deferasirox increases plasma concentration of **repaglinide**
- Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with **clozapine**

**Deferasirox** (*continued*)

- Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of **midazolam**
- Muscle Relaxants: manufacturer of deferasirox advises avoid concomitant use with **tizanidine**
- Theophylline: deferasirox increases plasma concentration of **theophylline** (consider reducing dose of theophylline)

**Deferiprone**

Antacids: absorption of deferiprone possibly reduced by **antacids** containing aluminium (manufacturer of deferiprone advises avoid concomitant use)

**Deflazacort** *see* Corticosteroids

**Demeclocycline** *see* Tetracyclines

**Desferrioxamine**

Antipsychotics: avoidance of desferrioxamine advised by manufacturer of **levomepromazine**; manufacturer of desferrioxamine advises avoid concomitant use with **prochlorperazine**

**Desflurane** *see* Anaesthetics, General

**Desloratadine** *see* Antihistamines

**Desmopressin**

Analgesics: effects of desmopressin enhanced by **indometacin**

Loperamide: plasma concentration of *oral* desmopressin increased by **loperamide**

**Desogestrel** *see* Progestogens

**Dexamethasone** *see* Corticosteroids

**Dexamfetamine** *see* Sympathomimetics

**Dexibuprofen** *see* NSAIDs

**Dexketoprofen** *see* NSAIDs

**Dextromethorphan** *see* Opioid Analgesics

**Dextropropoxyphene** *see* Opioid Analgesics

**Diamorphine** *see* Opioid Analgesics

**Diazepam** *see* Anxiolytics and Hypnotics

**Diazoxide**

ACE Inhibitors: enhanced hypotensive effect when diazoxide given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when diazoxide given with **alcohol**

Aldesleukin: enhanced hypotensive effect when diazoxide given with **aldesleukin**

Alpha-blockers: enhanced hypotensive effect when diazoxide given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when diazoxide given with **general anaesthetics**

Analgesics: hypotensive effect of diazoxide antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with **angiotensin-II receptor antagonists**

Antidepressants: enhanced hypotensive effect when diazoxide given with **MAOIs** or **tricyclic-related antidepressants**

Antidiabetics: diazoxide antagonises hypoglycaemic effect of **antidiabetics**

Antiepileptics: diazoxide reduces plasma concentration of **phenytoin**, also effect of diazoxide may be reduced

Antipsychotics: enhanced hypotensive effect when diazoxide given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when diazoxide given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when diazoxide given with **clonidine**

**Diazoxide** (*continued*)

Corticosteroids: hypotensive effect of diazoxide antagonised by **corticosteroids**

Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with **diuretics**

Dopaminergics: enhanced hypotensive effect when diazoxide given with **levodopa**

Methyldopa: enhanced hypotensive effect when diazoxide given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when diazoxide given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when diazoxide given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when diazoxide given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when diazoxide given with **nitrates**

Prostaglandins: enhanced hypotensive effect when diazoxide given with **alprostadi**

Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Diclofenac** *see* NSAIDs

**Dicycloverine** *see* Antimuscarinics

**Didanosine**

**Note** Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart

- Allopurinol: plasma concentration of didanosine increased by **allopurinol** (risk of toxicity)—avoid concomitant use
  - Analgesics: plasma concentration of didanosine possibly reduced by **methadone**
  - Antibacterials: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after **norfloxacin**
  - Antivirals: didanosine *tablets* reduce absorption of **atazanavir** (give at least 2 hours before or 1 hour after didanosine *tablets*); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after **darunavir**; plasma concentration of didanosine possibly increased by **ganciclovir**; didanosine *tablets* reduce absorption of **indinavir** (give at least 1 hour apart); increased risk of side-effects when didanosine given with **ribavirin**—avoid concomitant use; manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after **rilpivirine**; manufacturer of ritonavir advises didanosine and **ritonavir** should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with **stavudine**; plasma concentration of didanosine increased by **tenofovir** (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by **tipranavir**—manufacturer of tipranavir advises tipranavir and didanosine *capsules* should be taken at least 2 hours apart
  - Cytotoxics: increased risk of toxicity when didanosine given with **hydroxycarbamide**—avoid concomitant use
  - Orlistat: absorption of didanosine possibly reduced by **orlistat**
- Dienogest** *see* Progestogens
- Digoxin** *see* Cardiac Glycosides
- Dihydrocodeine** *see* Opioid Analgesics
- Diltiazem** *see* Calcium-channel Blockers
- Dimethyl sulfoxide**
- Analgesics: avoid concomitant use of dimethyl sulfoxide with **sulindac**
- Dinoprostone** *see* Prostaglandins
- Diphenoxylate** *see* Opioid Analgesics
- Dipipanone** *see* Opioid Analgesics
- Dipyridamole**
- Antacids: absorption of dipyridamole possibly reduced by **antacids**
- Anti-arrhythmics: dipyridamole enhances and extends effect of **adenosine** (important risk of

**Dipyridamole**

- Anti-arrhythmics (*continued*)  
toxicity)—reduce dose of adenosine, see Dose under Adenosine, p. 82
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of ●**coumarins** and ●**phenindione**; dipyridamole enhances anticoagulant effect of ●**heparins**

Clopidogrel: increased risk of bleeding when dipyridamole given with ●**clopidogrel**

Cytotoxics: dipyridamole possibly reduces effects of ●**fludarabine**

**Disopyramide**

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with ●**bupivacaine**, ●**levobupivacaine**, ●**prilocaine** or ●**ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●**anti-arrhythmics**; increased risk of ventricular arrhythmias when disopyramide given with ●**amiodarone** or ●**dronedarone**—avoid concomitant use
- Antibacterials: plasma concentration of disopyramide possibly increased by ●**azithromycin** (increased risk of toxicity); plasma concentration of disopyramide possibly increased by ●**clarithromycin** (increased risk of ventricular arrhythmias); plasma concentration of disopyramide increased by ●**erythromycin** (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with ●**moxifloxacin**—avoid concomitant use; metabolism of disopyramide accelerated by ●**rifamycins** (reduced plasma concentration); possible increased risk of ventricular arrhythmias when disopyramide given with ●**telithromycin**

Anticoagulants: disopyramide may enhance or reduce anticoagulant effect of ●**warfarin**

- Antidepressants: avoidance of disopyramide advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with ●**tricyclics**

Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of ●**gliclazide**, ●**insulin** and ●**metformin**

Antiepileptics: metabolism of disopyramide accelerated by ●**phenobarbital** (reduced plasma concentration); plasma concentration of disopyramide reduced by ●**phenytoin**

- Antifungals: avoidance of disopyramide advised by manufacturer of ●**itraconazole**
- Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with ●**mizolastine**—avoid concomitant use
- Antimalarials: avoidance of disopyramide advised by manufacturer of ●**epiperquine with arteminol** (possible risk of ventricular arrhythmias); avoidance of disopyramide advised by manufacturer of ●**artemether with lumefantrine** (risk of ventricular arrhythmias)
- Antimuscarinics: increased risk of antimuscarinic side-effects when disopyramide given with ●**antimuscarinics**; increased risk of ventricular arrhythmias when disopyramide given with ●**tolterodine**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●**antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with ●**amisulpride**, ●**droperidol**, ●**pimozide** or ●**zuclopentixol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with ●**haloperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with ●**phenothiazines** or ●**sulpiride**
- Antivirals: plasma concentration of disopyramide possibly increased by ●**ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when

**Disopyramide**

- Antivirals (*continued*)  
disopyramide given with ●**saquinavir**—avoid concomitant use; avoidance of disopyramide advised by manufacturer of ●**telaprevir** (risk of ventricular arrhythmias)
- Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with ●**atomoxetine**
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ●**beta-blockers**; increased risk of ventricular arrhythmias when disopyramide given with ●**sotalol**—avoid concomitant use
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with ●**verapamil**
- Cytotoxics: possible increased risk of ventricular arrhythmias when disopyramide given with ●**bosutinib**; possible increased risk of ventricular arrhythmias when disopyramide given with ●**vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with ●**arsenic trioxide**
- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with ●**acetazolamide**, ●**loop diuretics** or ●**thiazides and related diuretics**
- Fingolimod: possible increased risk of bradycardia when disopyramide given with ●**fingolimod**
- Ivabradine: increased risk of ventricular arrhythmias when disopyramide given with ●**ivabradine**
- Nitrates: disopyramide reduces effects of sublingual tablets of ●**nitrates** (failure to dissolve under tongue owing to dry mouth)
- Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when disopyramide given with ●**pentamidine isetionate**
- Ranolazine: avoidance of disopyramide advised by manufacturer of ●**ranolazine**
- Sildenafil: manufacturer of disopyramide advises avoid concomitant use with ●**sildenafil** (risk of ventricular arrhythmias)
- Tadalafil: manufacturer of disopyramide advises avoid concomitant use with ●**tadalafil** (risk of ventricular arrhythmias)
- Vardenafil: manufacturer of disopyramide advises avoid concomitant use with ●**vardenafil** (risk of ventricular arrhythmias)

**Disulfiram**

Alcohol: disulfiram reaction when disulfiram given with ●**alcohol** (see B10F section 4.10.1)

Antibacterials: psychotic reaction reported when disulfiram given with ●**metronidazole**; CNS effects of disulfiram possibly increased by ●**isoniazid**

- Anticoagulants: disulfiram enhances anticoagulant effect of ●**coumarins**
- Antidepressants: increased disulfiram reaction with alcohol reported with concomitant ●**amitriptyline**; disulfiram inhibits metabolism of ●**tricyclics** (increased plasma concentration)
- Antiepileptics: disulfiram inhibits metabolism of ●**phenytoin** (increased risk of toxicity)
- Anxiolytics and Hypnotics: disulfiram increases risk of ●**temazepam** toxicity; disulfiram inhibits metabolism of ●**benzodiazepines** (increased sedative effects)
- Paraldehyde: risk of toxicity when disulfiram given with ●**paraldehyde**
- Theophylline: disulfiram inhibits metabolism of ●**theophylline** (increased risk of toxicity)

**Diuretics**

**Note** Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind

**Note** Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind

**Diuretics** (*continued*)

- ACE Inhibitors: enhanced hypotensive effect when diuretics given with **ACE inhibitors**; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when diuretics given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when diuretics given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when diuretics given with **aldesleukin**
- Aliskiren: plasma concentration of furosemide reduced by **aliskiren**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **aliskiren**
- Allopurinol: increased risk of hypersensitivity when thiazides and related diuretics given with **allopurinol** especially in renal impairment
- Alpha-blockers: enhanced hypotensive effect when diuretics given with **alpha-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Anaesthetics, General: enhanced hypotensive effect when diuretics given with **general anaesthetics**
- Analgesics: possible increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **NSAIDs**; diuretics increase risk of nephrotoxicity of **NSAIDs**, also antagonism of diuretic effect; Diuretic effect of potassium canrenoate possibly antagonised by **NSAIDs**; furosemide possibly increases the excretion of **acetaminophen**; effects of diuretics antagonised by **indometacin** and **ketorolac**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **indometacin**; occasional reports of reduced renal function when triamterene given with **indometacin**—avoid concomitant use; diuretic effect of spironolactone antagonised by **aspirin**; possible increased risk of toxicity when loop diuretics given with high-dose **aspirin** (also possible reduced effect of loop diuretics); increased risk of toxicity when acetazolamide given with high-dose **aspirin**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with **angiotensin-II receptor antagonists**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **angiotensin-II receptor antagonists**
- Anti-arrhythmics: plasma concentration of eplerenone increased by **amiodarone** (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with **amiodarone**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with **disopyramide**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with **flecainide**; hypokalaemia caused by loop diuretics or thiazides and related diuretics antagonises action of **lidocaine**
- Antibacterials: plasma concentration of eplerenone increased by **clarithromycin** and **tellithromycin**—avoid concomitant use; plasma concentration of eplerenone increased by **erythromycin** (reduce dose of eplerenone); plasma concentration of eplerenone reduced by **rifampicin**—avoid concomitant use; avoidance of diuretics advised by manufacturer of **lymecycline**; increased risk of toxicity when loop diuretics given with **aminoglycosides**, **polymyxins** or **vancomycin**; acetazolamide antagonises effects of **methanamine**; possible increased risk of hyperkalaemia when spironolactone given with **trimetho-**

**Diuretics**

- Antibacterials (*continued*)
  - prim**; increased risk of hyperkalaemia when eplerenone given with **trimethoprim**
- Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **reboxetine**; enhanced hypotensive effect when diuretics given with **MAOIs**; plasma concentration of eplerenone reduced by **St John's wort**—avoid concomitant use; increased risk of postural hypotension when diuretics given with **tricyclics**
- Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of **antidiabetics**; diuretic effect of diuretics possibly enhanced by **canagliflozin**; avoidance of loop diuretics advised by manufacturer of **canagliflozin**; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by **dapagliflozin**
- Antiepileptics: plasma concentration of eplerenone reduced by **carbamazepine**, **phenobarbital** and **phenytoin**—avoid concomitant use; increased risk of hyponatraemia when diuretics given with **carbamazepine**; acetazolamide increases plasma concentration of **carbamazepine**; increased risk of osteomalacia when carbonic anhydrase inhibitors given with **phenobarbital** or **phenytoin**; effects of furosemide antagonised by **phenytoin**; acetazolamide possibly increases plasma concentration of **phenytoin**; hydrochlorothiazide possibly increases plasma concentration of **topiramate**; avoidance of carbonic anhydrase inhibitors in children advised by manufacturer of **zonisamide**
- Antifungals: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **amphotericin**; hydrochlorothiazide increases plasma concentration of **fluconazole**; plasma concentration of eplerenone increased by **fluconazole** (reduce dose of eplerenone); plasma concentration of eplerenone increased by **itraconazole**—avoid concomitant use
- Antipsychotics: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with **amisulpride**; enhanced hypotensive effect when diuretics given with **phenothiazines**; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with **pimozide** (avoid concomitant use)
- Antivirals: plasma concentration of eplerenone increased by **ritonavir**—avoid concomitant use; plasma concentration of eplerenone increased by **saquinavir** (reduce dose of eplerenone)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when diuretics given with **anxiolytics** and **hypnotics**; administration of **parenteral** furosemide with **chlora** may displace thyroid hormone from binding sites
- Atomoxetine: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with **atomoxetine**
- Beta-blockers: enhanced hypotensive effect when diuretics given with **beta-blockers**; hypokalaemia caused by loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with **sotalol**
- Calcium Salts: increased risk of hypercalcaemia when thiazides and related diuretics given with **calcium salts**
- Calcium-channel Blockers: enhanced hypotensive effect when diuretics given with **calcium-channel blockers**; plasma concentration of eplerenone increased by **diltiazem** and **verapamil** (reduce dose of eplerenone)
- Cardiac Glycosides: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with **cardiac glyco-**

**Diuretics**

- **Cardiac Glycosides** (*continued*)  
sides; potassium canrenoate possibly increases plasma concentration of **digoxin**; spironolactone increases plasma concentration of **digoxin**
- **Ciclosporin**: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with **ciclosporin**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **ciclosporin**; acetazolamide possibly increases plasma concentration of **ciclosporin**
- **Clonidine**: enhanced hypotensive effect when diuretics given with **clonidine**
- **Corticosteroids**: diuretic effect of diuretics antagonised by **corticosteroids**; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **corticosteroids**
- **Cytotoxics**: alkaline urine due to acetazolamide increases excretion of **methotrexate**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with **arsenic trioxide**; avoidance of spironolactone advised by manufacturer of **mitotane** (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with **platinum compounds**
- **Diazoxide**: enhanced hypotensive and hyperglycaemic effects when diuretics given with **diazoxide**
- **Diuretics**: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **acetazolamide**; profound diuresis possible when metolazone given with **furosemide**; increased risk of hypokalaemia when thiazides and related diuretics given with **loop diuretics**
- **Dopaminergics**: enhanced hypotensive effect when diuretics given with **levodopa**
- **Hormone Antagonists**: increased risk of hypercalcaemia when thiazides and related diuretics given with **toremifene**
- **Lipid-regulating Drugs**: absorption of thiazides and related diuretics reduced by **colestipol** and **colestyramine** (give at least 2 hours apart)
- **Lithium**: loop diuretics and thiazides and related diuretics reduce excretion of **lithium** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of **lithium** (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of **lithium**
- **Methyldopa**: enhanced hypotensive effect when diuretics given with **methyldopa**
- **Moxisylyte**: enhanced hypotensive effect when diuretics given with **moxisylyte**
- **Moxonidine**: enhanced hypotensive effect when diuretics given with **moxonidine**
- **Muscle Relaxants**: enhanced hypotensive effect when diuretics given with **baclofen** or **tizanidine**
- **Nitrates**: enhanced hypotensive effect when diuretics given with **nitrates**
- **Oestrogens**: diuretic effect of diuretics antagonised by **oestrogens**
- **Potassium Salts**: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **potassium salts**
- **Progestogens**: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **drosiprenone** (monitor serum potassium during first cycle)
- **Prostaglandins**: enhanced hypotensive effect when diuretics given with **alprostadil**
- **Sympathomimetics, Beta<sub>2</sub>**: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses

**Diuretics**

- **Sympathomimetics, Beta<sub>2</sub>** (*continued*)  
of **beta<sub>2</sub> sympathomimetics**—see Hypokalaemia, p. 136
  - **Tacrolimus**: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **tacrolimus**
  - **Theophylline**: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **theophylline**
  - **Vasodilator Antihypertensives**: enhanced hypotensive effect when diuretics given with **hydralazine**, **minoxidil** or **sodium nitropruside**
  - **Vitamins**: increased risk of hypercalcaemia when thiazides and related diuretics given with **vitamin D**
- Diuretics, Loop** *see* Diuretics
- Diuretics, Potassium-sparing and Aldosterone Antagonists** *see* Diuretics
- Diuretics, Thiazide and related** *see* Diuretics
- Dobutamine** *see* Sympathomimetics
- Docetaxel**
- **Antibacterials**: *in vitro* studies suggest a possible interaction between docetaxel and **erythromycin** (consult docetaxel product literature)
  - **Antipsychotics**: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
  - **Antivirals**: plasma concentration of docetaxel possibly increased by **ritonavir** (increased risk of toxicity)
  - **Ciclosporin**: *in vitro* studies suggest a possible interaction between docetaxel and **ciclosporin** (consult docetaxel product literature)
  - **Cytotoxics**: possible increased risk of neutropenia when docetaxel given with **lapatinib**; plasma concentration of docetaxel increased by **sorafenib**
- Dolutegravir**
- **Antacids**: absorption of dolutegravir possibly reduced by **aluminium hydroxide** and **oral magnesium salts**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts
  - **Antibacterials**: plasma concentration of dolutegravir reduced by **rifampicin** (see Dose under Dolutegravir, p. 324)
  - **Antidepressants**: manufacturer of dolutegravir advises avoid concomitant use with **St John's wort**
  - **Antiepileptics**: manufacturer of dolutegravir advises avoid concomitant use with **carbamazepine**, **oxcarbazepine**, **phenobarbital** and **phenytoin**
  - **Antivirals**: plasma concentration of dolutegravir reduced by **efavirenz** and **tipranavir** (see Dose under Dolutegravir, p. 324); plasma concentration of dolutegravir reduced by **etravirine** (see Cautions under Dolutegravir, p. 324); plasma concentration of dolutegravir reduced by **fosamprenavir**; plasma concentration of dolutegravir possibly reduced by **nevirapine** (see Dose under Dolutegravir, p. 324)
  - **Calcium Salts**: absorption of dolutegravir possibly reduced by **calcium salts**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts
- Domperidone**
- **Analgesics**: effects of domperidone on gastro-intestinal activity antagonised by **opioid analgesics**
  - **Antibacterials**: plasma concentration of domperidone increased by **erythromycin**—possible increased risk of ventricular arrhythmias
  - **Antimalarials**: avoidance of domperidone advised by manufacturer of **piperazine with arteminimol** (possible risk of ventricular arrhythmias)
  - **Antimuscarinics**: effects of domperidone on gastro-intestinal activity antagonised by **antimuscarinics**
  - **Antivirals**: plasma concentration of domperidone possibly increased by **telaprevir**—manufacturer of telaprevir advises avoid concomitant use

**Domperidone** (continued)

- Cytotoxics: avoidance of domperidone advised by manufacturer of ●**bosutinib** (risk of ventricular arrhythmias)
- Dopaminergics: domperidone possibly antagonises hypoproloactinaemic effects of **bromocriptine** and **cabergoline**

**Donepezil** *see* Parasympathomimetics

**Dopamine** *see* Sympathomimetics

**Dopaminergics** *see* Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone

**Dopexamine** *see* Sympathomimetics

**Dorzolamide** *see* Diuretics

**Dosulepin** *see* Antidepressants, Tricyclic

**Doxapram**

- Anaesthetics, General: increased risk of arrhythmias when doxapram given with ●**volatile liquid general anaesthetics** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)

Antidepressants: effects of doxapram enhanced by **MAOIs**

Sympathomimetics: increased risk of hypertension when doxapram given with **sympathomimetics**

Theophylline: increased CNS stimulation when doxapram given with **theophylline**

**Doxazosin** *see* Alpha-blockers

**Doxepin** *see* Antidepressants, Tricyclic

**Doxorubicin**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: doxorubicin possibly inhibits effects of **stavudine**
- Calcium-channel Blockers: plasma concentration of doxorubicin possibly increased by **verapamil**
- Cardiac Glycosides: doxorubicin possibly reduces absorption of **digoxin tablets**
- Ciclosporin: increased risk of neurotoxicity when doxorubicin given with ●**ciclosporin**
- Cytotoxics: plasma concentration of doxorubicin possibly increased by **sorafenib**

**Doxycycline** *see* Tetracyclines

**Dronedarone**

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●**anti-arrhythmics**; increased risk of ventricular arrhythmias when dronedarone given with ●**amiodarone** or ●**disopyramide**—avoid concomitant use
- Antibacterials: manufacturer of dronedarone advises avoid concomitant use with ●**clarithromycin** (risk of ventricular arrhythmias); plasma concentration of dronedarone increased by ●**erythromycin** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedarone reduced by ●**rifampicin**—avoid concomitant use; increased risk of ventricular arrhythmias when dronedarone given with ●**telithromycin**—avoid concomitant use
- Anticoagulants: dronedarone possibly enhances anticoagulant effect of ●**coumarins** and ●**phenindione**; dronedarone increases plasma concentration of ●**dabigatran**—avoid concomitant use; avoidance of dronedarone advised by manufacturer of **rivaroxaban**
- Antidepressants: avoidance of dronedarone advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly reduced by ●**St John's wort**—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with ●**tricyclics** (risk of ventricular arrhythmias)

**Dronedarone** (continued)

- Antiepileptics: plasma concentration of dronedarone possibly reduced by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**—avoid concomitant use
  - Antifungals: manufacturer of dronedarone advises avoid concomitant use with ●**itraconazole**, ●**posaconazole** and ●**voriconazole**
  - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●**antipsychotics** that prolong the QT interval; manufacturer of dronedarone advises avoid concomitant use with ●**phenothiazines** (risk of ventricular arrhythmias)
  - Antivirals: manufacturer of dronedarone advises avoid concomitant use with ●**ritonavir**; increased risk of ventricular arrhythmias when dronedarone given with ●**saquinavir**—avoid concomitant use
  - Beta-blockers: increased myocardial depression when anti-arrhythmics given with ●**beta-blockers**; dronedarone possibly increases plasma concentration of **metoprolol** and **propranolol**; increased risk of ventricular arrhythmias when dronedarone given with ●**sotalol**—avoid concomitant use
  - Calcium-channel Blockers: plasma concentration of dronedarone increased by ●**nifedipine**; increased risk of bradycardia and myocardial depression when dronedarone given with ●**diltiazem** and ●**verapamil**
  - Cardiac Glycosides: dronedarone increases plasma concentration of ●**digoxin** (halve dose of digoxin)
  - Cytotoxics: dronedarone possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  - Fidaxomicin: avoidance of dronedarone advised by manufacturer of **fidaxomicin**
  - Fingolimod: possible increased risk of bradycardia when dronedarone given with ●**fingolimod**
  - Grapefruit Juice: plasma concentration of dronedarone increased by ●**grapefruit juice**—avoid concomitant use
  - Lipid-regulating Drugs: dronedarone possibly increases plasma concentration of **atorvastatin** and **rosuvastatin**; increased risk of myopathy when dronedarone given with ●**simvastatin**; avoidance of dronedarone advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
  - Sirolimus: manufacturer of dronedarone advises caution with **sirolimus**
  - Tacrolimus: manufacturer of dronedarone advises caution with **tacrolimus**
- Droperidol** *see* Antipsychotics
- Drospirenone** *see* Progestogens
- Duloxetine**
- Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with **fentanyl**; possible increased serotonergic effects when duloxetine given with **methidone** or **tramadol**
  - Antibacterials: metabolism of duloxetine inhibited by ●**ciprofloxacin**—avoid concomitant use
  - Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with ●**dabigatran**
  - Antidepressants: metabolism of duloxetine inhibited by ●**fluvoxamine**—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRI, **St John's wort**, **amitriptyline**, **clomipramine**, ●**moclobemide** or **venlafaxine**; duloxetine should not be started until 2 weeks after stopping ●**MAOIs**, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start ●**moclobemide** for at least 1 week

**Duloxetine** (*continued*)

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperaquine with arteminol**  
Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Dapoxetine: possible increased risk of serotonergic effects when duloxetine given with **dapoxetine** (manufacturer of dapoxetine advises duloxetine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping duloxetine)
- 5HT<sub>1</sub>-receptor Agonists: possible increased serotonergic effects when duloxetine given with **5HT<sub>1</sub> agonists**
- Methylthionium: risk of CNS toxicity when SSRI-related antidepressants given with **methylthionium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Dutasteride**

Calcium-channel Blockers: plasma concentration of dutasteride increased by **diltiazem** and **verapamil**

**Dyrogesterone** *see* Progestogens**Edrophonium** *see* Parasympathomimetics**Efavirenz**

- Analgesics: efavirenz reduces plasma concentration of **methadone**
- Antibacterials: efavirenz reduces plasma concentration of **clarithromycin**, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of **rifabutin**—increase dose of rifabutin; plasma concentration of efavirenz reduced by **rifampicin**—increase dose of efavirenz
- Anticoagulants: efavirenz possibly affects plasma concentration of **coumarins**
  - Antidepressants: plasma concentration of efavirenz reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with **carbamazepine**
- Antifungals: efavirenz reduces plasma concentration of **itraconazole** and **posaconazole**; efavirenz reduces plasma concentration of **voriconazole**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of **caspofungin**—consider increasing dose of caspofungin
- Antimalarials: efavirenz possibly affects plasma concentration of **proguanil**
- Antipsychotics: efavirenz possibly reduces plasma concentration of **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use)
  - Antivirals: avoidance of efavirenz advised by manufacturer of **atazanavir** (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of **darunavir** (adjust dose—consult product literature); efavirenz reduces plasma concentration of **dolutegravir** (*see* Dose under Dolutegravir, p. 324); avoidance of efavirenz advised by manufacturer of **elvitegravir**; efavirenz possibly reduces plasma concentration of **etravirine**—avoid concomitant use; efavirenz reduces plasma concentration of **indinavir**; efavirenz reduces plasma concentration of **lopinavir**—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of **maraviroc**—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by **nevirapine**—avoid concomitant use; toxicity of efavirenz

**Efavirenz****Antivirals** (*continued*)

- virenz increased by **ritonavir**, monitor liver function tests —manufacturer of **Atripla**® advises avoid concomitant use with **high-dose** ritonavir; efavirenz significantly reduces plasma concentration of **saquinavir**; efavirenz reduces plasma concentration of **telaprevir**—increase dose of telaprevir
  - Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with **midazolam**—avoid concomitant use
  - Atovaquone: efavirenz reduces plasma concentration of **atovaquone**—avoid concomitant use
  - Bupropion: efavirenz accelerates metabolism of **bupropion** (reduced plasma concentration)
  - Calcium-channel Blockers: efavirenz reduces plasma concentration of **diltiazem**
  - Cyclosporin: efavirenz possibly reduces plasma concentration of **cyclosporin**
  - Cytotoxics: efavirenz possibly reduces plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid concomitant use
  - Ergot Alkaloids: increased risk of ergotism when efavirenz given with **ergot alkaloids**—avoid concomitant use
- Grapefruit Juice: plasma concentration of efavirenz possibly increased by **grapefruit juice**
- Lipid-regulating Drugs: efavirenz reduces plasma concentration of **atorvastatin**, **pravastatin** and **simvastatin**
- Orlistat: absorption of efavirenz possibly reduced by **orlistat**
  - Progestogens: efavirenz possibly reduces contraceptive effect of **progestogens**
  - Tacrolimus: efavirenz possibly affects plasma concentration of **tacrolimus**

**Eletriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)**Eltrombopag**

- Antacids: absorption of eltrombopag reduced by **antacids** (give at least 4 hours apart)
- Antivirals: plasma concentration of eltrombopag possibly reduced by **lopinavir**
- Calcium Salts: absorption of eltrombopag possibly reduced by **calcium salts** (give at least 4 hours apart)
- Dairy Products: absorption of eltrombopag possibly reduced by **dairy products** (give at least 4 hours apart)
- Iron: absorption of eltrombopag possibly reduced by **oral iron** (give at least 4 hours apart)
- Lipid-regulating Drugs: eltrombopag increases plasma concentration of **rosuvastatin** (consider reducing dose of rosuvastatin)
- Selenium: absorption of eltrombopag possibly reduced by **selenium** (give at least 4 hours apart)
- Zinc: absorption of eltrombopag possibly reduced by **zinc** (give at least 4 hours apart)

**Elvitegravir**

- Antacids: absorption of elvitegravir reduced by **antacids** (give at least 4 hours apart)
- Antibacterials: plasma concentration of elvitegravir reduced by **rifabutin** also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elvitegravir advises avoid concomitant use with **rifampicin**
  - Antidepressants: manufacturer of elvitegravir advises avoid concomitant use with **St John's wort**
  - Antiepileptics: manufacturer of elvitegravir advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
  - Antivirals: plasma concentration of elvitegravir increased by **atazanavir** and **lopinavir** boosted with ritonavir (reduce dose of elvitegravir); manufacturer of elvitegravir advises avoid concomitant use with **efavirenz** and **nevirapine**

**Elvitegravir** (*continued*)

Bosentan: manufacturer of elvitegravir advises avoid concomitant use with **bosentan**

- **Orlistat**: absorption of elvitegravir possibly reduced by **orlistat**

Progestogens: elvitegravir increases plasma concentration of **norgestimate**

**Emtricitabine**

Antivirals: manufacturer of emtricitabine advises avoid concomitant use with **lamivudine**

- **Orlistat**: absorption of emtricitabine possibly reduced by **orlistat**

**Enalapril** *see* ACE Inhibitors**Enfuvirtide**

- **Orlistat**: absorption of enfuvirtide possibly reduced by **orlistat**

**Enoxaparin** *see* Heparins**Enoximone** *see* Phosphodiesterase Inhibitors**Entacapone**

- **Anticoagulants**: entacapone enhances anticoagulant effect of **warfarin**

- **Antidepressants**: manufacturer of entacapone advises caution with **moclobemide**, **tricyclics** and **venlafaxine**; avoid concomitant use of entacapone with non-selective **MAOIs**

Dopaminergics: entacapone possibly enhances effects of **apomorphine**; entacapone possibly reduces plasma concentration of **rasagiline**; manufacturer of entacapone advises max. dose of 10mg **selegiline** if used concomitantly

Iron: absorption of entacapone reduced by **oral iron**

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methylidopa: entacapone possibly enhances effects of **methylidopa**; antiparkinsonian effect of dopaminergics antagonised by **methylidopa**

Sympathomimetics: entacapone possibly enhances effects of **adrenaline (epinephrine)**, **dobutamine**, **dopamine** and **noradrenaline (norepinephrine)**

**Enteral Foods**

- **Anticoagulants**: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of **coumarins** and **phenindione**

Antiepileptics: enteral feeds possibly reduce absorption of **phenytoin**

**Enzalutamide**

Antibacterials: manufacturer of enzalutamide advises avoid concomitant use with **rifampicin**

- **Anticoagulants**: enzalutamide possibly reduces plasma concentration of **coumarins**

- **Lipid-regulating Drugs**: plasma concentration of enzalutamide increased by **gemfibrozil**—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide

**Ephedrine** *see* Sympathomimetics**Epinephrine (adrenaline)** *see* Sympathomimetics**Epirubicin**

- **Antipsychotics**: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

- **Ciclosporin**: plasma concentration of epirubicin increased by **ciclosporin**

- **Ulcer-healing Drugs**: plasma concentration of epirubicin increased by **cimetidine**

**Eplerenone** *see* Diuretics**Eprosartan** *see* Angiotensin-II Receptor Antagonists**Eptifibatide**

Ilprost: increased risk of bleeding when eptifibatide given with **ilprost**

**Ergometrine** *see* Ergot Alkaloids**Ergot Alkaloids**

- **Antibacterials**: increased risk of ergotism when ergotamine given with **macrolides** or **telithromycin**—avoid concomitant use; increased risk of ergotism when ergotamine given with **tetracyclines**

**Ergot Alkaloids** (*continued*)

Antidepressants: possible risk of hypertension when ergotamine given with **reboxetine**

- **Antifungals**: avoidance of ergometrine advised by manufacturer of **itraconazole** (increased risk of ergotism); increased risk of ergotism when ergotamine given with **imidazoles** or **triazoles**—avoid concomitant use

- **Antivirals**: plasma concentration of ergot alkaloids possibly increased by **atazanavir**—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of **boceprevir** and **telaprevir**; increased risk of ergotism when ergot alkaloids given with **darunavir**—manufacturer of darunavir advises avoid concomitant use; increased risk of ergotism when ergot alkaloids given with **efavirenz**—avoid concomitant use; increased risk of ergotism when ergotamine given with **fosamprenavir**, **indinavir**, **ritonavir** or **saquinavir**—avoid concomitant use

Beta-blockers: increased peripheral vasoconstriction when ergotamine given with **beta-blockers**

- **Cobicistat**: plasma concentration of ergot alkaloids possibly increased by **cobicistat**—manufacturer of cobicistat advises avoid concomitant use

- **Cytotoxics**: caution with ergot alkaloids advised by manufacturer of **crizotinib**

- **5HT<sub>2</sub>-receptor Agonists**: increased risk of vasospasm when ergotamine given with **almotriptan**, **rizatriptan**, **sumatriptan** or **zolmitriptan** (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with **eletriptan**, **frovatriptan** or **naratriptan** (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)

Sympathomimetics: increased risk of ergotism when ergotamine given with **sympathomimetics**

- **Ticagrelor**: plasma concentration of ergot alkaloids possibly increased by **ticagrelor**

- **Ulcer-healing Drugs**: increased risk of ergotism when ergotamine given with **cimetidine**—avoid concomitant use

**Ergotamine** *see* Ergot Alkaloids**Eribulin**

Antibacterials: plasma concentration of eribulin possibly reduced by **rifampicin**

Antidepressants: plasma concentration of eribulin possibly reduced by **St John's wort**

Antiepileptics: plasma concentration of eribulin possibly reduced by **carbamazepine** and **phenytoin**

- **Antipsychotics**: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Erlotinib**

- **Analgesics**: increased risk of bleeding when erlotinib given with **NSAIDs**

- **Antacids**: plasma concentration of erlotinib possibly reduced by **antacids**—give antacids at least 4 hours before or 2 hours after erlotinib

Antibacterials: plasma concentration of erlotinib increased by **ciprofloxacin**; metabolism of erlotinib accelerated by **rifampicin** (reduced plasma concentration)

- **Anticoagulants**: increased risk of bleeding when erlotinib given with **coumarins**

- **Antipsychotics**: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

- **Antivirals**: avoidance of erlotinib advised by manufacturer of **boceprevir**

Cytotoxics: plasma concentration of erlotinib possibly increased by **capecitabine**

- **Ulcer-healing Drugs**: manufacturer of erlotinib advises avoid concomitant use with **cimetidine**, **esome-**

**Erlotinib**

- Ulcer-healing Drugs (*continued*)
  - prazole, ●famotidine, ●lansoprazole, ●nizatidine, ●pantoprazole and ●rabeprazole; plasma concentration of erlotinib reduced by ●ranitidine—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by ●omeprazole—manufacturer of erlotinib advises avoid concomitant use

**Ertapenem**

- Antiepileptics: carbapenems reduce plasma concentration of ●valproate—avoid concomitant use
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 626

**Erythromycin** *see* Macrolides**Escitalopram** *see* Antidepressants, SSRI**Eslicarbazepine**

- Anticoagulants: eslicarbazepine reduces plasma concentration of warfarin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of eslicarbazepine possibly reduced by carbamazepine but risk of side-effects increased; manufacturer of eslicarbazepine advises avoid concomitant use with oxcarbazepine; plasma concentration of eslicarbazepine reduced by phenytoin, also plasma concentration of phenytoin increased
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)
- Lipid-regulating Drugs: eslicarbazepine reduces plasma concentration of rosuvastatin; eslicarbazepine reduces plasma concentration of simvastatin—consider increasing dose of simvastatin
- Oestrogens: eslicarbazepine accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 402)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat
- Progestogens: eslicarbazepine accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 402)

**Esmolol** *see* Beta-blockers**Esomeprazole** *see* Proton Pump Inhibitors**Estradiol** *see* Oestrogens**Estramustine**

- Antacids: absorption of estramustine possibly reduced by aluminium hydroxide and oral magnesium salts—manufacturer of estramustine advises avoid concomitant administration
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by ●sodium clodronate
- Calcium Salts: absorption of estramustine reduced by calcium salts (manufacturer of estramustine advises avoid concomitant administration)

**Estriol** *see* Oestrogens**Estrone** *see* Oestrogens**Etanercept**

- Abatacept: avoid concomitant use of etanercept with ●abatacept
- Anakinra: avoid concomitant use of etanercept with ●anakinra
- Vaccines: avoid concomitant use of etanercept with live ●vaccines (see p. 604)

**Ethinylestradiol** *see* Oestrogens**Ethosuximide**

- Antibacterials: metabolism of ethosuximide inhibited by ●isoniazid (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by carbamazepine and phenobarbital; plasma concentration of ethosuximide possibly reduced by ●phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by valproate
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat

**Etidronate Disodium** *see* Bisphosphonates**Etodolac** *see* NSAIDs**Etomidate** *see* Anaesthetics, General**Etonogestrel** *see* Progestogens**Etoposide**

- Anticoagulants: etoposide possibly enhances anticoagulant effect of ●coumarins
- Antiepileptics: plasma concentration of etoposide possibly reduced by phenobarbital and phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Atovaquone: plasma concentration of etoposide possibly increased by atovaquone
- Ciclosporin: plasma concentration of etoposide possibly increased by ciclosporin (increased risk of toxicity)

**Etoricoxib** *see* NSAIDs**Etravirine**

- Antibacterials: etravirine reduces plasma concentration of ●clarithromycin (but concentration of an active metabolite increased), also plasma concentration of etravirine increased; plasma concentration of both drugs reduced when etravirine given with ●rifabutin; manufacturer of etravirine advises avoid concomitant use with rifampicin
- Antidepressants: manufacturer of etravirine advises avoid concomitant use with St John's wort
- Antiepileptics: manufacturer of etravirine advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin
- Antimalarials: etravirine reduces plasma concentration of artemether with lumefantrine
- Antivirals: effects of both drugs possibly reduced when etravirine given with boceprevir; etravirine reduces the plasma concentration of ●dolutegravir (see Cautions under Dolutegravir, p. 324); plasma concentration of etravirine possibly reduced by ●efavirenz and ●nevirapine—avoid concomitant use; etravirine increases plasma concentration of ●fosamprenavir (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of ●indinavir—avoid concomitant use; etravirine possibly reduces plasma concentration of maraviroc; plasma concentration of etravirine reduced by ●tipranavir, also plasma concentration of tipranavir increased (avoid concomitant use)
- Cardiac Glycosides: etravirine increases plasma concentration of digoxin
- Clopidogrel: etravirine possibly reduces antiplatelet effect of ●clopidogrel

**Etravirine** (*continued*)

- Cytotoxics: etravirine possibly reduces plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid concomitant use
- Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of ●**atorvastatin**
- Orlistat: absorption of etravirine possibly reduced by ●**orlistat**
- Sildenafil: etravirine reduces plasma concentration of **sildenafil**

**Everolimus**

- Antibacterials: plasma concentration of everolimus possibly increased by ●**clarithromycin** and ●**telithromycin**—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by ●**erythromycin** (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of everolimus reduced by ●**rifampicin** (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature)
- Antidepressants: plasma concentration of everolimus possibly reduced by **St John's wort**—manufacturer of everolimus advises avoid concomitant use
- Antifungals: plasma concentration of everolimus possibly increased by ●**itraconazole**, ●**posaconazole** and ●**voriconazole**—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by ●**atazanavir**, ●**darunavir**, ●**indinavir**, ●**ritonavir** and ●**saquinavir**—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with ●**verapamil** (consider reducing the dose of everolimus—consult everolimus product literature)
- Ciclosporin: plasma concentration of everolimus increased by ●**ciclosporin** (consider reducing the dose of everolimus—consult everolimus product literature)
- Cytotoxics: plasma concentration of everolimus increased by ●**imatinib** (consider reducing the dose of everolimus—consult everolimus product literature)
- Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with **grapefruit juice**

**Exemestane**

Antibacterials: plasma concentration of exemestane possibly reduced by **rifampicin**

**Exenatide** *see* Antidiabetics**Ezetimibe**

Anticoagulants: ezetimibe possibly enhances anticoagulant effect of ●**coumarins**

- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with ●**ciclosporin**
- Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when ezetimibe given with **fibrates**—discontinue if suspected

**Famciclovir**

Probenecid: excretion of famciclovir possibly reduced by **probenecid** (increased plasma concentration)

**Famotidine** *see* Histamine H<sub>2</sub>-antagonists**Fampridine**

Ulcer-healing Drugs: manufacturer of fampridine advises avoid concomitant use with ●**cimetidine**

**Febuxostat**

- Azathioprine: manufacturer of febuxostat advises avoid concomitant use with ●**azathioprine**
- Cytotoxics: manufacturer of febuxostat advises avoid concomitant use with ●**mercaptopurine**

**Felodipine** *see* Calcium-channel Blockers**Fenofibrate** *see* Fibrates**Fenoprofen** *see* NSAIDs**Fentanyl** *see* Opioid Analgesics**Ferrous Salts** *see* Iron**Fesoterodine** *see* Antimuscarinics**Fexofenadine** *see* Antihistamines**Fibrates**

- Antibacterials: increased risk of myopathy when fibrates given with ●**daptomycin** (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with **insulin** or **sulfonylureas**; gemfibrozil possibly enhances hypoglycaemic effect of **nateline**; increased risk of severe hypoglycaemia when gemfibrozil given with ●**repaglinide**—avoid concomitant use
- Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with **ciclosporin**
- Colchicine: possible increased risk of myopathy when fibrates given with ●**colchicine**
- Cytotoxics: gemfibrozil increases plasma concentration of ●**bexarotene**—avoid concomitant use
- Hormone Antagonists: gemfibrozil increases plasma concentration of ●**enzalutamide**—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide
- Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of **montelukast**
- Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with ●**atorvastatin**, ●**fluvastatin** or ●**pravastatin** (preferably avoid concomitant use); increased risk of myopathy when fibrates given with ●**rosuvastatin** (*see* Dose under Rosuvastatin, p. 126); possible increased risk of myopathy when bezafibrate and ciprofibrate given with ●**simvastatin** (*see* Dose under Simvastatin, p. 126); increased risk of myopathy when gemfibrozil given with ●**simvastatin** (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with **ezetimibe**—discontinue if suspected; reduce maximum dose of fenofibrate when given with **statins**—*see* Dose under Fenofibrate, p. 128; increased risk of myopathy when fibrates given with ●**statins**

**Fidaxomicin**

Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with **amiodarone** and **dronedarone**

Antibacterials: manufacturer of fidaxomicin advises avoid concomitant use with **clarithromycin** and **erythromycin**

Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with **verapamil**

Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with **ciclosporin**

**Filgrastim**

**Note** Pegfilgrastim interactions as for filgrastim

Cytotoxics: neutropenia possibly exacerbated when filgrastim given with **flourouracil**

**Fingolimod**

- Anti-arrhythmics: possible increased risk of bradycardia when fingolimod given with ●**amiodarone**, ●**disopyramide** or ●**dronedarone**
- Beta-blockers: possible increased risk of bradycardia when fingolimod given with ●**beta-blockers**
- Calcium-channel Blockers: possible increased risk of bradycardia when fingolimod given with ●**diltiazem** or ●**verapamil**

**Flavoxate** *see* Antimuscarinics**Flecainide**

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●**anti-**

**Flecainide**

- Anti-arrhythmics (*continued*)
    - **arrhythmics**; plasma concentration of flecainide increased by ●**amiodarone** (halve dose of flecainide)
  - Antidepressants: plasma concentration of flecainide increased by ●**fluoxetine**; increased risk of ventricular arrhythmias when flecainide given with ●**tricyclics**
  - Antihistamines: increased risk of ventricular arrhythmias when flecainide given with ●**mizolastine**—avoid concomitant use
  - Antimalarials: avoidance of flecainide advised by manufacturer of ●**artemether with lumefantrine** (risk of ventricular arrhythmias); plasma concentration of flecainide increased by ●**quinine**
  - Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with ●**tolterodine**
  - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●**antipsychotics** that prolong the QT interval; increased risk of arrhythmias when flecainide given with ●**clozapine**
  - Antivirals: plasma concentration of flecainide possibly increased by ●**fosamprenavir**, ●**indinavir**, ●**lopinavir** and ●**ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with ●**saquinavir**—avoid concomitant use; caution with flecainide advised by manufacturer of ●**telaprevir** (risk of ventricular arrhythmias)
  - Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with ●**beta-blockers**; increased myocardial depression when anti-arrhythmics given with ●**beta-blockers**
  - Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with ●**verapamil**
  - Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with ●**acetazolamide**, ●**loop diuretics** or ●**thiazides and related diuretics**
- Ulcer-healing Drugs: metabolism of flecainide inhibited by ●**cimetidine** (increased plasma concentration)

**Flucloxacillin** *see* Penicillins

**Fluconazole** *see* Antifungals, Triazole

**Flucytosine**

Antifungals: renal excretion of flucytosine decreased and cellular uptake increased by ●**amphotericin** (toxicity possibly increased)

Cytotoxics: plasma concentration of flucytosine possibly reduced by ●**cytarabine**

**Fludarabine**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
  - Cytotoxics: fludarabine increases intracellular concentration of ●**cytarabine**; increased pulmonary toxicity when fludarabine given with ●**pentostatin** (unacceptably high incidence of fatalities)
- Dipyridamole: effects of fludarabine possibly reduced by ●**dipyridamole**

**Fludrocortisone** *see* Corticosteroids

**Fluorides**

Calcium Salts: absorption of fluorides reduced by calcium salts

**Fluorouracil**

**Note** Capecitabine is a prodrug of fluorouracil

**Note** Tegafur is a prodrug of fluorouracil

- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with ●**allopurinol**
- Antibacterials: metabolism of fluorouracil inhibited by ●**metronidazole** (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of ●**coumarins**
- Antiepileptics: fluorouracil possibly inhibits metabolism of ●**phenytoin** (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Fluorouracil** (*continued*)

Cytotoxics: capecitabine possibly increases plasma concentration of ●**erlotinib**

Filgrastim: neutropenia possibly exacerbated when fluorouracil given with ●**filgrastim**

- Temoporfin: increased skin photosensitivity when topical fluorouracil used with ●**temoporfin**

Ulcer-healing Drugs: metabolism of fluorouracil inhibited by ●**cimetidine** (increased plasma concentration)

**Fluoxetine** *see* Antidepressants, SSRI

**Flupentixol** *see* Antipsychotics

**Fluphenazine** *see* Antipsychotics

**Flurazepam** *see* Anxiolytics and Hypnotics

**Flurbiprofen** *see* NSAIDs

**Flutamide**

- Anticoagulants: flutamide enhances anticoagulant effect of ●**coumarins**

**Fluticasone** *see* Corticosteroids

**Fluvastatin** *see* Statins

**Fluvoxamine** *see* Antidepressants, SSRI

**Folates**

Aminosalicylates: absorption of folic acid possibly reduced by ●**sulfasalazine**

Antiepileptics: folates possibly reduce plasma concentration of ●**phenobarbital** and ●**phenytoin**

- Cytotoxics: avoidance of folates advised by manufacturer of ●**alitrexid**

**Folic Acid** *see* Folates

**Folinic Acid** *see* Folates

**Formoterol** *see* Sympathomimetics, Beta<sub>2</sub>

**Fosamprenavir**

**Note** Fosamprenavir is a prodrug of amprenavir

Analgesics: fosamprenavir reduces plasma concentration of ●**methadone**

- Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of ●**amiodarone**, ●**flecainide** and ●**propafenone** (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of ●**lidocaine**—avoid concomitant use
- Antibacterials: fosamprenavir increases plasma concentration of ●**rifabutin** (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by ●**rifampicin**—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of ●**telithromycin**

Anticoagulants: avoidance of fosamprenavir advised by manufacturer of ●**apixaban** and ●**rivaroxaban**; fosamprenavir may enhance or reduce anticoagulant effect of ●**coumarins**

- Antidepressants: plasma concentration of fosamprenavir reduced by ●**St John's wort**—avoid concomitant use

Antiepileptics: plasma concentration of fosamprenavir possibly reduced by ●**carbamazepine** and ●**phenobarbital**

Antifungals: plasma concentration of both drugs may increase when fosamprenavir given with ●**itraconazole**; fosamprenavir possibly reduces plasma concentration of ●**posaconazole**

- Antimalarials: caution with fosamprenavir advised by manufacturer of ●**artemether with lumefantrine**; fosamprenavir possibly increases plasma concentration of ●**quinine** (increased risk of toxicity)
- Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of ●**darifenacin** and ●**tolterodine**
- Antipsychotics: fosamprenavir possibly increases plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); fosamprenavir increases plasma concentration of ●**pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of ●**quetia-**

**Fosamprenavir**

- Antipsychotics (*continued*)
  - ◆ **pine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturer of fosamprenavir advises avoid concomitant use with ●**boceprevir** and ●**raltegravir**; fosamprenavir reduces plasma concentration of ●**adolutegravir**; plasma concentration of fosamprenavir increased by ●**etravirine** (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by ●**lopinavir**, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir reduced by ●**maraviroc**—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by ●**nevirapine**—avoid unboosted fosamprenavir; manufacturers advise avoid concomitant use of fosamprenavir with ●**telaprevir**; plasma concentration of fosamprenavir reduced by ●**tipranavir**
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of ●**midazolam** (risk of prolonged sedation)—avoid concomitant use of *oral* midazolam)
- Ciclosporin: fosamprenavir increases plasma concentration of ●**ciclosporin**
- Cytotoxics: fosamprenavir possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fosamprenavir given with ●**dapoxetine** (see Dose under Dapoxetine, BNF section 7.4.6)
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with ●**ergotamine**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with ●**atorvastatin**; possible increased risk of myopathy when fosamprenavir given with ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with ●**simvastatin**—avoid concomitant use; avoidance of fosamprenavir advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of fosamprenavir possibly reduced by ●**orlistat**
- Ranolazine: fosamprenavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: fosamprenavir possibly increases plasma concentration of ●**sildenafil**
- Tacrolimus: fosamprenavir increases plasma concentration of ●**tacrolimus**
- Tadalafil: fosamprenavir possibly increases plasma concentration of ●**tadalafil**
- Vardenafil: fosamprenavir possibly increases plasma concentration of ●**vardenafil**

**Fosaprepitant** *see* Aprepitant

**Foscarnet**

- Pentamidine Isetionate: increased risk of hypocalcaemia when foscarnet given with *parenteral* ●**pentamidine isetionate**

**Fosinopril** *see* ACE Inhibitors

**Fosphenytoin** *see* Phenytoin

**Framycetin** *see* Aminoglycosides

**Frovatriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)

**Furosemide** *see* Diuretics

**Fusidic Acid**

- Antivirals: plasma concentration of both drugs increased when fusidic acid given with ●**ritonavir**—avoid concomitant use; plasma concentration of

**Fusidic Acid**

- Antivirals (*continued*)
  - ◆ both drugs may increase when fusidic acid given with ●**saquinavir**
- Lipid-regulating Drugs: risk of myopathy and rhabdomyolysis when fusidic acid given with ●**statins**—avoid concomitant use and for 7 days after last fusidic acid dose
  - ◆ Sugammadex: fusidic acid possibly reduces response to ●**sugammadex**
  - ◆ Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Gabapentin**

- ◆ Analgesics: bioavailability of gabapentin increased by ●**morphine**
- ◆ Antacids: absorption of gabapentin reduced by ●**antacids**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ●**MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

**Galantamine** *see* Parasympathomimetics

**Ganciclovir**

- ◆ **Note** Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- ◆ **Note** Valganciclovir interactions as for ganciclovir
- Antibacterials: increased risk of convulsions when ganciclovir given with ●**imipenem with cilastatin**
- Antivirals: ganciclovir possibly increases plasma concentration of ●**didanosine**; profound myelosuppression when ganciclovir given with ●**zidovudine** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
  - ◆ Mycophenolate: plasma concentration of ganciclovir possibly increased by ●**mycophenolate**, also plasma concentration of inactive metabolite of mycophenolate possibly increased
  - ◆ Probenecid: excretion of ganciclovir reduced by ●**probenecid** (increased plasma concentration and risk of toxicity)
  - ◆ Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with ●**tacrolimus**

**Gefitinib**

- Antibacterials: plasma concentration of gefitinib reduced by ●**rifampicin**—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of ●**warfarin**
- ◆ Antidepressants: manufacturer of gefitinib advises avoid concomitant use with **St John's wort**
- ◆ Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**
- ◆ Antifungals: plasma concentration of gefitinib increased by ●**itraconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: avoidance of gefitinib advised by manufacturer of ●**boceprevir**
- Ulcer-healing Drugs: plasma concentration of gefitinib reduced by ●**ranitidine**

**Gemcitabine**

- ◆ Anticoagulants: gemcitabine possibly enhances anticoagulant effect of ●**warfarin**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Gemprost** *see* Prostaglandins

**Gemfibrozil** *see* Fibrates

**Gentamicin** *see* Aminoglycosides

**Gestodene** *see* Progestogens

**Glibenclamide** *see* Antidiabetics

**Gliclazide** *see* Antidiabetics

**Glimepiride** *see* Antidiabetics

**Glipizide** *see* Antidiabetics

**Glucosamine**

- Anticoagulants: glucosamine enhances anticoagulant effect of **warfarin** (avoid concomitant use)

**Glyceryl Trinitrate** *see* Nitrates

**Glycopyrronium** *see* Antimuscarinics

**Gold** *see* Sodium Aurothiomalate

**Golimimumab**

- Abatacept: avoid concomitant use of golimumab with **abatacept**
- Anakinra: avoid concomitant use of golimumab with **anakinra**
- Vaccines: avoid concomitant use of golimumab with live **vaccines** (see p. 604)

**Grapefruit Juice**

- Aliskiren: grapefruit juice reduces plasma concentration of **aliskiren**—avoid concomitant use
- Anti-arrhythmics: grapefruit juice increases plasma concentration of **amiodarone**; grapefruit juice increases plasma concentration of **dronedarone**—avoid concomitant use
- Antidepressants: grapefruit juice possibly increases plasma concentration of **sertraline**
- Antihistamines: grapefruit juice reduces plasma concentration of **bilastine**; grapefruit juice increases plasma concentration of **rupatadine**—avoid concomitant use

Antimalarials: avoidance of grapefruit juice advised by manufacturer of **piperazine with arteminol**; grapefruit juice possibly increases plasma concentration of **artemether with lumefantrine**

- Antipsychotics: grapefruit juice possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use

Antivirals: grapefruit juice possibly increases plasma concentration of **efavirenz**

Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of **oral midazolam**; grapefruit juice increases plasma concentration of **bupirone**

Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of **amlodipine**; grapefruit juice increases plasma concentration of **felodipine**, **lacidipine**, **lercanidipine**, **nicardipine**, **nifedipine**, **nimodipine** and **verapamil**

- Ciclosporin: grapefruit juice increases plasma concentration of **ciclosporin** (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of **colchicine** toxicity
- Cytotoxics: grapefruit juice possibly increases plasma concentration of **axitinib**; grapefruit juice possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; grapefruit juice possibly increases plasma concentration of **crizotinib** and **vinflunine**—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of **everolimus**, **lapatinib**, **nilotinib** and **pazopanib**
- Ivabradine: grapefruit juice increases plasma concentration of **ivabradine**
- Ivacaftor: grapefruit juice possibly increases plasma concentration of **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of **atorvastatin**; grapefruit juice increases plasma concentration of **simvastatin**—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of **lomitapide**

**Grapefruit Juice** (*continued*)

Pirfenidone: avoidance of grapefruit juice advised by manufacturer of **pirfenidone**

- Ranolazine: grapefruit juice possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of **sildenafil**
- Sirolimus: grapefruit juice increases plasma concentration of **sirolimus**—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of **tacrolimus**
- Tadalafil: grapefruit juice possibly increases plasma concentration of **tadalafil**
- Tolvaptan: grapefruit juice increases plasma concentration of **tolvaptan**—avoid concomitant use
- Ulipristal: avoidance of grapefruit juice advised by manufacturer of **ulipristal**
- Vardenafil: grapefruit juice possibly increases plasma concentration of **vardenafil**—avoid concomitant use

**Griseofulvin**

Alcohol: griseofulvin possibly enhances effects of **alcohol**

- Anticoagulants: griseofulvin reduces anticoagulant effect of **coumarins**
- Antiepileptics: absorption of griseofulvin reduced by **phenobarbital** (reduced effect)
- Ciclosporin: griseofulvin possibly reduces plasma concentration of **ciclosporin**
- Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with **oestrogens**

Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with **progestogens**

**Guanethidine** *see* Adrenergic Neurone Blockers

**Haloperidol** *see* Antipsychotics

**Heparin** *see* Heparins

**Heparins**

ACE Inhibitors: increased risk of hyperkalaemia when heparins given with **ACE inhibitors**

Aliskiren: increased risk of hyperkalaemia when heparins given with **aliskiren**

- Analgesics: possible increased risk of bleeding when heparins given with **NSAIDs**; increased risk of haemorrhage when anticoagulants given with *intravenous* **diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by **aspirin**

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with **angiotensin-II receptor antagonists**

- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with **apixaban**, **dabigatran** and **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Clopidogrel: increased risk of bleeding when heparins given with **clopidogrel**
- Dipyridamole: anticoagulant effect of heparins enhanced by **dipyridamole**
- Iloprost: anticoagulant effect of heparins possibly enhanced by **iloprost**
- Nitrates: anticoagulant effect of heparins reduced by *infusion of* **glyceryl trinitrate**

**Histamine**

Antidepressants: manufacturer of histamine advises avoid concomitant use with **MAOIs**; effects of histamine theoretically antagonised by **tricyclics**—manufacturer of histamine advises avoid concomitant use

**Histamine** (continued)

- Antihistamines: effects of histamine theoretically antagonised by **antihistamines**—manufacturer of histamine advises avoid concomitant use
- Antimalarials: manufacturer of histamine advises avoid concomitant use with **antimalarials**
- Antipsychotics: effects of histamine theoretically antagonised by **antipsychotics**—manufacturer of histamine advises avoid concomitant use
- Atovaquone: manufacturer of histamine advises avoid concomitant use with **atovaquone**
- Clonidine: manufacturer of histamine advises avoid concomitant use with **clonidine**
- Corticosteroids: manufacturer of histamine advises avoid concomitant use with **corticosteroids**
- Ulcer-healing Drugs: effects of histamine theoretically antagonised by **histamine H<sub>2</sub>-antagonists**—manufacturer of histamine advises avoid concomitant use

**Histamine H<sub>2</sub>-antagonists**

- Alpha-blockers: cimetidine and ranitidine antagonise effects of **tolazoline**
- Analgesics: cimetidine inhibits metabolism of **opioid analgesics** (increased plasma concentration)
- Anti-arrhythmics: cimetidine increases plasma concentration of **amiodarone** and **propafenone**; cimetidine inhibits metabolism of **flecainide** (increased plasma concentration); cimetidine increases plasma concentration of **lidocaine** (increased risk of toxicity)
- Antibacterials: cimetidine increases plasma concentration of **erythromycin** (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of **metronidazole** (increased plasma concentration); metabolism of cimetidine accelerated by **rifampicin** (reduced plasma concentration)
- Anticoagulants: cimetidine inhibits metabolism of **coumarins** (enhanced anticoagulant effect)
- Antidepressants: cimetidine increases plasma concentration of **citalopram**, **escitalopram**, **mirtazapine** and **sertraline**; cimetidine inhibits metabolism of **amitriptyline**, **doxepin**, **imipramine** and **nortriptyline** (increased plasma concentration); cimetidine increases plasma concentration of **moclobemide** (half dose of moclobemide); cimetidine possibly increases plasma concentration of **tricyclics**
- Antidiabetics: cimetidine reduces excretion of **metformin** (increased plasma concentration); cimetidine enhances hypoglycaemic effect of **sulfonylureas**
- Antiepileptics: cimetidine inhibits metabolism of **carbamazepine**, **phenytoin** and **valproate** (increased plasma concentration)
- Antifungals: histamine H<sub>2</sub>-antagonists reduce absorption of **itraconazole**; avoidance of histamine H<sub>2</sub>-antagonists advised by manufacturer of **posaconazole** (plasma concentration of posaconazole possibly reduced); cimetidine reduces plasma concentration of **posaconazole**; cimetidine increases plasma concentration of **terbinafine**
- Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of **loratadine**; cimetidine increases plasma concentration of **hydroxyzine**
- Antimalarials: avoidance of cimetidine advised by manufacturer of **artemether with lumefantrine**; cimetidine inhibits metabolism of **chloroquine** and **hydroxychloroquine** and **quinine** (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of **antipsychotics**, **chlorpromazine** and **clozapine**
- Antivirals: famotidine and ranitidine reduce the plasma concentration of **atazanavir** (adjust doses of both drugs—consult atazanavir product literature); manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with **atazanavir**—consult atazanavir product literature; famotidine increases plasma concentration of **raltegravir**; avoidance of histamine H<sub>2</sub>-

**Histamine H<sub>2</sub>-antagonists**

- Antivirals (continued)
    - antagonists for 12 hours before or 4 hours after **rilpivirine** advised by manufacturer of rilpivirine—consult product literature; cimetidine possibly increases plasma concentration of **saquinavir**
  - Anxiolytics and Hypnotics: cimetidine inhibits metabolism of **benzodiazepines**, **clomethiazole** and **zaleplon** (increased plasma concentration); cimetidine increases plasma concentration of **melatonin**
  - Beta-blockers: cimetidine increases plasma concentration of **labetalol**, **metoprolol** and **propranolol**
  - Caffeine citrate: cimetidine increases plasma concentration of **caffeine citrate**
  - Calcium-channel Blockers: cimetidine possibly inhibits metabolism of **calcium-channel blockers** (increased plasma concentration)
  - Ciclosporin: cimetidine possibly increases plasma concentration of **ciclosporin**
  - Clopidogrel: cimetidine possibly reduces antiplatelet effect of **clopidogrel**
  - Cytotoxics: cimetidine possibly enhances myelosuppressive effects of **caustine** and **lomustine**; cimetidine increases plasma concentration of **epirubicin**; cimetidine inhibits metabolism of **fluorouracil** (increased plasma concentration); famotidine possibly reduces plasma concentration of **dasatinib**; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of **erlotinib**; ranitidine reduces plasma concentration of **erlotinib**—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of **gefitinib**; histamine H<sub>2</sub>-antagonists possibly reduce absorption of **lapatinib**; histamine H<sub>2</sub>-antagonists possibly reduce absorption of **pazopanib**—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H<sub>2</sub>-antagonists
  - Dopaminergics: cimetidine reduces excretion of **pramipexole** (increased plasma concentration)
  - Ergot Alkaloids: increased risk of ergotism when cimetidine given with **ergotamine**—avoid concomitant use
  - Fampridine: avoidance of cimetidine advised by manufacturer of **fampridine**
  - Histamine: histamine H<sub>2</sub>-antagonists theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use
  - Hormone Antagonists: absorption of cimetidine possibly delayed by **octreotide**
  - 5HT<sub>1</sub>-receptor Agonists: cimetidine inhibits metabolism of **zolmitriptan** (reduce dose of zolmitriptan)
  - Lipid-regulating Drugs: manufacturer of lomitidine advises dose reduction when cimetidine given with **lomitidine** (see Dose under Lomitidine, BNF section 2.12)
  - Mebendazole: cimetidine possibly inhibits metabolism of **mebendazole** (increased plasma concentration)
  - Roflumilast: cimetidine inhibits the metabolism of **roflumilast**
  - Sildenafil: cimetidine increases plasma concentration of **sildenafil** (consider reducing dose of sildenafil)
  - Theophylline: cimetidine inhibits metabolism of **theophylline** (increased plasma concentration)
  - Thyroid Hormones: cimetidine reduces absorption of **levothyroxine**
  - Ulipristal: avoidance of histamine H<sub>2</sub>-antagonists advised by manufacturer of **high-dose ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Homatropine** *see* Antimuscarinics
- Hormone Antagonists** *see* Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flutamide, Lanreotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

**5HT<sub>1</sub>-receptor Agonists**

- **Antibacterials:** plasma concentration of eletriptan increased by ●**clarithromycin** and ●**erythromycin** (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by ●**quinolones** (reduce dose of zolmitriptan)
- **Antidepressants:** increased risk of CNS toxicity when 5HT<sub>1</sub> agonists given with ●**citalopram** (manufacturer of citalopram advises avoid concomitant use); increased risk of CNS toxicity when sumatriptan given with ●**citalopram**, ●**escitalopram**, ●**fluoxetine**, ●**fluvoxamine** or ●**paroxetine**; metabolism of frovatriptan inhibited by ●**fluvoxamine**; metabolism of zolmitriptan possibly inhibited by ●**fluvoxamine** (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with ●**sertraline**; possible increased serotonergic effects when 5HT<sub>1</sub> agonists given with ●**duloxetine** or ●**venlafaxine**; risk of CNS toxicity when zolmitriptan given with ●**MAOIs** or ●**moclobemide** (reduce dose of zolmitriptan); risk of CNS toxicity when rizatriptan or sumatriptan given with ●**MAOIs** (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when rizatriptan or sumatriptan given with ●**moclobemide** (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); possible increased serotonergic effects when naratriptan given with ●**SSRIs**; increased serotonergic effects when 5HT<sub>1</sub> agonists given with ●**St John's wort**—avoid concomitant use
- **Antifungals:** plasma concentration of eletriptan increased by ●**itraconazole** (risk of toxicity)—avoid concomitant use
- **Antivirals:** plasma concentration of eletriptan increased by ●**indinavir** and ●**ritonavir** (risk of toxicity)—avoid concomitant use

**Beta-blockers:** plasma concentration of rizatriptan increased by ●**propranolol** (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)

- **Dapoxetine:** possible increased risk of serotonergic effects when 5HT<sub>1</sub> agonists given with ●**dapoxetine** (manufacturer of dapoxetine advises 5HT<sub>1</sub> agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT<sub>1</sub> agonists)

**Dopaminergics:** avoidance of 5HT<sub>1</sub> agonists advised by manufacturer of ●**selegiline**

- **Ergot Alkaloids:** increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ●**ergotamine** (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when eletriptan, frovatriptan or naratriptan given with ●**ergotamine** (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)

**Lithium:** possible risk of toxicity when sumatriptan given with ●**lithium**

**Ulcer-healing Drugs:** metabolism of zolmitriptan inhibited by ●**cimetidine** (reduce dose of zolmitriptan)

**5HT<sub>2</sub>-receptor Antagonists**

- **Analgesics:** ondansetron possibly antagonises effects of ●**tramadol**
- **Antibacterials:** metabolism of ondansetron accelerated by ●**rifampicin** (reduced effect)
- **Antiepileptics:** metabolism of ondansetron accelerated by ●**carbamazepine** and ●**phenytoin** (reduced effect)
- **Cytotoxics:** increased risk of ventricular arrhythmias when ondansetron given with ●**vandetanib**—avoid concomitant use
- **Dopaminergics:** possible increased hypotensive effect when ondansetron given with ●**apomorphine**—avoid concomitant use

**Hydralazine** *see* Vasodilator Antihypertensives

**Hydrochlorothiazide** *see* Diuretics

**Hydrocortisone** *see* Corticosteroids

**Hydroflumethiazide** *see* Diuretics

**Hydromorphone** *see* Opioid Analgesics

**Hydroxalcite** *see* Antacids

**Hydroxocobalamin**

Antibacterials: response to hydroxocobalamin reduced by ●**chloramphenicol**

**Hydroxycarbamide**

- **Antipsychotics:** avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- **Antivirals:** increased risk of toxicity when hydroxycarbamide given with ●**didanosine** and ●**stavudine**—avoid concomitant use

**Hydroxychloroquine** *see* Chloroquine and Hydroxychloroquine

**Hydroxyzine** *see* Antihistamines

**Hyosicine** *see* Antimuscarinics

**Ibandronic Acid** *see* Bisphosphonates

**Ibuprofen** *see* NSAIDs

**Idarubicin**

- **Antipsychotics:** avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- **Ciclosporin:** plasma concentration of idarubicin increased by ●**ciclosporin**

**Ifosfamide**

- **Anticoagulants:** ifosfamide possibly enhances anticoagulant effect of ●**coumarins**
  - **Antipsychotics:** avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of toxicity when ifosfamide given with ●**cisplatin**

**Iloprost**

Analgesics: increased risk of bleeding when iloprost given with ●**NSAIDs** or ●**aspirin**

Anticoagulants: iloprost possibly enhances anticoagulant effect of ●**coumarins** and ●**heparins**; increased risk of bleeding when iloprost given with ●**phenindione**

Clopidogrel: increased risk of bleeding when iloprost given with ●**clopidogrel**

Eptifibatid: increased risk of bleeding when iloprost given with ●**eptifibatid**

Tirofiban: increased risk of bleeding when iloprost given with ●**tirofiban**

**Imatinib**

Analgesics: manufacturer of imatinib advises caution with ●**paracetamol**

- **Antibacterials:** plasma concentration of imatinib reduced by ●**rifampicin**—avoid concomitant use
  - **Anticoagulants:** manufacturer of imatinib advises replacement of ●**warfarin** with a heparin (possibility of enhanced warfarin effect)
  - **Antidepressants:** plasma concentration of imatinib reduced by ●**St John's wort**—avoid concomitant use
  - **Antiepileptics:** plasma concentration of imatinib reduced by ●**carbamazepine**, ●**oxcarbazepine** and ●**phenytoin**—avoid concomitant use
  - **Antipsychotics:** avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
  - **Antivirals:** avoidance of imatinib advised by manufacturer of ●**boceprevir**
  - **Ciclosporin:** imatinib possibly increases plasma concentration of ●**ciclosporin**
  - **Cytotoxics:** imatinib possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; imatinib increases plasma concentration of ●**everolimus** (consider reducing the dose of everolimus—consult everolimus product literature)
- Lipid-regulating Drugs:** imatinib increases plasma concentration of ●**simvastatin**

**Imatinib** (*continued*)

Tacrolimus: imatinib increases plasma concentration of **tacrolimus**

Thyroid Hormones: imatinib possibly reduces plasma concentration of **levothyroxine**

**Imidapril** *see* ACE Inhibitors**Imipenem with Cilastatin**

- Antiepileptics: carbapenems reduce plasma concentration of **valproate**—avoid concomitant use
- Antivirals: increased risk of convulsions when imipenem with cilastatin given with **ganciclovir**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Imipramine** *see* Antidepressants, Tricyclic**Immunoglobulins**

**Note** For advice on immunoglobulins and live virus vaccines, *see* under Normal Immunoglobulin, p. 628

**Indacaterol** *see* Sympathomimetics, Beta<sub>2</sub>**Indapamide** *see* Diuretics**Indinavir**

Aldesleukin: plasma concentration of indinavir possibly increased by **aldesleukin**

- Anti-arrhythmics: indinavir possibly increases plasma concentration of **amiodarone**—avoid concomitant use; indinavir possibly increases plasma concentration of **flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of **rifabutin** (also plasma concentration of indinavir reduced)—reduce rifabutin dose; metabolism of indinavir accelerated by **rifampicin** (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**

Anticoagulants: avoidance of indinavir advised by manufacturer of **apixaban** and **rivaroxaban**

- Antidepressants: plasma concentration of indinavir reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by **carbamazepine** and **phenytoin**, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by **phenobarbital**
- Antifungals: plasma concentration of indinavir increased by **itraconazole** (consider reducing dose of indinavir)
- Antimalarials: caution with indinavir advised by manufacturer of **artemether with lumefantrine**; indinavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)

Antimuscarinics: avoidance of indinavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when indinavir given with **fesoterodine**—consult fesoterodine product literature

- Antipsychotics: indinavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); indinavir possibly increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); indinavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of indinavir with **atazanavir**; plasma concentration of both drugs increased when indinavir given with **darunavir**; absorption of indinavir reduced by **didanosine tablets** (give at least 1 hour apart); plasma concentration of indinavir reduced by **efavirenz** and **nevirapine**; plasma concentration of indinavir possibly reduced by **etravirine**—avoid concomitant use; indinavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma

**Indinavir**• Antivirals (*continued*)

concentration of indinavir increased by **ritonavir**; indinavir increases plasma concentration of **saqueinavir**

- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with **alprazolam**—avoid concomitant use; indinavir possibly increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of *oral* midazolam)

Atovaquone: plasma concentration of indinavir possibly reduced by **atovaquone**

Bosentan: plasma concentration of indinavir possibly reduced by **bosentan**

- Ciclosporin: indinavir increases plasma concentration of **ciclosporin**
- Colchicine: indinavir possibly increases risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Corticosteroids: plasma concentration of indinavir possibly reduced by **dexamethasone**

- Cytotoxics: indinavir possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of **bosutinib** and **cabazitaxel**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of **crizotinib** and **everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of **pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with **ruxolitinib**—consult ruxolitinib product literature

- Ergot Alkaloids: increased risk of ergotism when indinavir given with **ergotamine**—avoid concomitant use

- 5HT<sub>1</sub>-receptor Agonists: indinavir increases plasma concentration of **eletriptan** (risk of toxicity)—avoid concomitant use

- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with **atorvastatin**; possible increased risk of myopathy when indinavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with **simvastatin** (avoid concomitant use); avoidance of indinavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)

- Orlistat: absorption of indinavir possibly reduced by **orlistat**

- Ranolazine: indinavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use

- Sildenafil: indinavir increases plasma concentration of **sildenafil**—reduce initial dose of sildenafil
- Tadalafil: indinavir possibly increases plasma concentration of **tadalafil**

- Vardenafil: indinavir increases plasma concentration of **vardenafil**—avoid concomitant use

**Indometacin** *see* NSAIDs**Indoramin** *see* Alpha-blockers**Infliximab**

- Abatacept: avoid concomitant use of infliximab with **abatacept**
- Anakinra: avoid concomitant use of infliximab with **anakinra**
- Vaccines: avoid concomitant use of infliximab with live **vaccines** (*see* p. 604)

**Influenza Vaccine** *see* Vaccines**Insulin** *see* Antidiabetics**Interferon Alfa** *see* Interferons

**Interferon Gamma** *see* Interferons

### Interferons

**Note** Peginterferon alfa interactions as for interferon alfa

- Antivirals: caution with peginterferon alfa advised by manufacturer of **adefovir**; increased risk of peripheral neuropathy when interferon alfa given with **telbivudine**
- Theophylline: interferon alfa inhibits metabolism of **theophylline** (consider reducing dose of theophylline)  
Vaccines: manufacturer of interferon gamma advises avoid concomitant use with **vaccines**

### Ipilimumab

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)  
Cytotoxics: manufacturer of ipilimumab advises avoid concomitant use with **vemurafenib**

**Ipratropium** *see* Antimuscarinics

**Irbesartan** *see* Angiotensin-II Receptor Antagonists

### Irinotecan

- Antidepressants: metabolism of irinotecan accelerated by **St John's wort** (reduced plasma concentration—avoid concomitant use)  
Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: increased risk of toxicity when irinotecan given with **itraconazole**—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: metabolism of irinotecan possibly inhibited by **atazanavir** (increased risk of toxicity)
- Cytotoxics: plasma concentration of active metabolite of irinotecan increased by **lapatinib**—consider reducing dose of irinotecan; plasma concentration of irinotecan increased by **regorafenib**; plasma concentration of irinotecan possibly increased by **sorafafenib**

### Iron

Antacids: absorption of *oral* iron reduced by **oral magnesium salts** (as magnesium trisilicate)

Antibacterials: *oral* iron reduces absorption of **ciprofloxacin**, **levofloxacin**, **moxifloxacin** and **ofloxacin**; *oral* iron reduces absorption of **norfloxacin** (give at least 2 hours apart); *oral* iron reduces absorption of **tetracyclines**, also absorption of *oral* iron reduced by tetracyclines

Bisphosphonates: *oral* iron reduces absorption of **bisphosphonates**

Calcium Salts: absorption of *oral* iron reduced by **calcium salts**

Dopaminergics: *oral* iron reduces absorption of **entacapone**; *oral* iron possibly reduces absorption of **levodopa**

Eltrombopag: *oral* iron possibly reduces absorption of **eltrombopag** (give at least 4 hours apart)

Methyldopa: *oral* iron antagonises hypotensive effect of **methyldopa**

Mycophenolate: *oral* iron reduces absorption of **mycophenolate**

Penicillamine: *oral* iron reduces absorption of **penicillamine**

Thyroid Hormones: *oral* iron reduces absorption of **levothyroxine** (give at least 2 hours apart)

Trientine: absorption of *oral* iron reduced by **trientine**  
Zinc: *oral* iron reduces absorption of **zinc**, also absorption of *oral* iron reduced by zinc

**Isocarboxazid** *see* MAOIs

**Isflurane** *see* Anaesthetics, General

**Isosmetheptene** *see* Sympathomimetics

### Isoniazid

Anaesthetics, General: increased risk of hepatotoxicity when isoniazid given with **isoflurane**

Analgesics: avoidance of isoniazid advised by manufacturer of **petidine**

**Isoniazid** (*continued*)

Antacids: absorption of isoniazid reduced by **antacids**

- Antibacterials: increased risk of hepatotoxicity when isoniazid given with **rifampicin**; increased risk of CNS toxicity when isoniazid given with **cycloserine**

- Antiepileptics: isoniazid increases plasma concentration of **carbamazepine** (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of **ethosuximide** (increased plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of **phenytoin** (increased risk of toxicity)

Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of **diazepam**

Corticosteroids: plasma concentration of isoniazid possibly reduced by **corticosteroids**

Disulfiram: isoniazid possibly increases CNS effects of **disulfiram**

Dopaminergics: isoniazid possibly reduces effects of **levodopa**

Theophylline: isoniazid possibly increases plasma concentration of **theophylline**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Isosorbide Dinitrate** *see* Nitrates

**Isosorbide Mononitrate** *see* Nitrates

**Isotretinoin** *see* Retinoids

**Itraconazole** *see* Antifungals, Triazole

### Ivabradine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with **amiodarone** or **disopyramide**

- Antibacterials: plasma concentration of ivabradine possibly increased by **clarithromycin** and **telithromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with **erythromycin**—avoid concomitant use

Antidepressants: plasma concentration of ivabradine reduced by **St John's wort**—avoid concomitant use

- Antifungals: plasma concentration of ivabradine increased by **fluconazole**—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by **itraconazole**—avoid concomitant use

- Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with **mefloquine**

- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with **pimozide**

- Antivirals: plasma concentration of ivabradine possibly increased by **ritonavir**—avoid concomitant use

- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with **sotalol**

- Calcium-channel Blockers: plasma concentration of ivabradine increased by **diltiazem** and **verapamil**—avoid concomitant use

Grapefruit Juice: plasma concentration of ivabradine increased by **grapefruit juice**

- Pentamidine Isetonate: increased risk of ventricular arrhythmias when ivabradine given with **pentamidine isetonate**

### Ivacaftor

- Antibacterials: plasma concentration of ivacaftor possibly increased by **clarithromycin**, **erythromycin** and **telithromycin** (see Dose under Ivacaftor, p. 165); plasma concentration of ivacaftor possibly reduced by **rifabutin**—manufacturer of ivacaftor advises avoid concomitant use; plasma concentration of ivacaftor reduced by **rifampicin**—manufacturer of ivacaftor advises avoid concomitant use

- Antidepressants: plasma concentration of ivacaftor possibly reduced by **St John's wort**—manufacturer of ivacaftor advises avoid concomitant use

- Antiepileptics: plasma concentration of ivacaftor possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**—manufacturer of ivacaftor advises avoid concomitant use

**Ivacaftor** (continued)

- Antifungals: plasma concentration of ivacaftor increased by ●**fluconazole** (see Dose under Ivacaftor, p. 165); plasma concentration of ivacaftor possibly increased by ●**itraconazole**, ●**posaconazole** and ●**voriconazole** (see Dose under Ivacaftor, p. 165)
- Anxiolytics and Hypnotics: ivacaftor increases plasma concentration of **midazolam**
- Grapefruit Juice: plasma concentration of ivacaftor possibly increased by **grapefruit juice**—manufacturer of ivacaftor advises avoid concomitant use

**Kaolin**

- Analgesics: kaolin possibly reduces absorption of **aspirin**
- Antibacterials: kaolin possibly reduces absorption of **tetracyclines**
- Antimalarials: kaolin reduces absorption of **chloroquine** and **hydroxychloroquine**
- Antipsychotics: kaolin possibly reduces absorption of **phenothiazines**

**Ketamine** see Anaesthetics, General

**Ketoprofen** see NSAIDs

**Ketorolac** see NSAIDs

**Ketotifen** see Antihistamines

**Labetalol** see Beta-blockers

**Lacidipine** see Calcium-channel Blockers

**Lacosamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

**Lactulose**

- Anticoagulants: lactulose possibly enhances anticoagulant effect of **coumarins**

**Lamivudine**

- Antibacterials: plasma concentration of lamivudine increased by **trimethoprim** (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- Antivirals: avoidance of lamivudine advised by manufacturer of **emtricitabine**
- Cytotoxics: manufacturer of lamivudine advises avoid concomitant use with ●**cladribine**
- Orlistat: absorption of lamivudine possibly reduced by ●**orlistat**

**Lamotrigine**

- Antibacterials: plasma concentration of lamotrigine reduced by ●**rifampicin**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of lamotrigine often reduced by **carbamazepine**, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by **phenobarbital** and **phenytoin**; plasma concentration of lamotrigine increased by ●**valproate** (increased risk of toxicity—reduce lamotrigine dose)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)

**Lamotrigine** (continued)

- Antivirals: plasma concentration of lamotrigine possibly reduced by **ritonavir**
- Oestrogens: plasma concentration of lamotrigine reduced by ●**oestrogens**—consider increasing dose of lamotrigine
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- Progestogens: plasma concentration of lamotrigine possibly increased by **desogestrel**

**Lanreotide**

- Antidiabetics: lanreotide possibly reduces requirements for **antidiabetics**
- Ciclosporin: lanreotide reduces plasma concentration of **ciclosporin**

**Lansoprazole** see Proton Pump Inhibitors

**Lanthanum**

- Antibacterials: lanthanum possibly reduces absorption of **quinolones** (give at least 2 hours before or 4 hours after lanthanum)
- Antimalarials: lanthanum possibly reduces absorption of **chloroquine** and **hydroxychloroquine** (give at least 2 hours apart)
- Thyroid Hormones: lanthanum reduces absorption of **levothyroxine** (give at least 2 hours apart)

**Lapatinib**

- Antibacterials: manufacturer of lapatinib advises avoid concomitant use with ●**rifabutin**, ●**rifampicin** and ●**telithromycin**
  - Antidepressants: manufacturer of lapatinib advises avoid concomitant use with ●**St John's wort**
  - Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with ●**repaglinide**
  - Antiepileptics: plasma concentration of lapatinib reduced by ●**carbamazepine**—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with ●**phenytoin**
  - Antifungals: manufacturer of lapatinib advises avoid concomitant use with ●**itraconazole**, ●**posaconazole** and ●**voriconazole**
  - Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with ●**pimozide**
  - Antivirals: avoidance of lapatinib advised by manufacturer of ●**boceprevir**; manufacturer of lapatinib advises avoid concomitant use with ●**ritonavir** and ●**saquinavir**
  - Cytotoxics: lapatinib increases plasma concentration of **pazopanib**; possible increased risk of neutropenia when lapatinib given with **docetaxel**; increased risk of neutropenia when lapatinib given with ●**paclitaxel**; lapatinib increases plasma concentration of active metabolite of ●**irinotecan**—consider reducing dose of irinotecan
  - Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with ●**grapefruit juice**
  - Ulcer-healing Drugs: absorption of lapatinib possibly reduced by **histamine H<sub>2</sub>-antagonists** and **proton pump inhibitors**
- Laronidase**
- Antimalarials: effects of laronidase possibly inhibited by **chloroquine** and **hydroxychloroquine** (manufacturer of laronidase advises avoid concomitant use)
- Leflunomide**
- Note** Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
- Antibacterials: plasma concentration of active metabolite of leflunomide possibly increased by **rifampicin**
  - Anticoagulants: leflunomide possibly enhances anticoagulant effect of **warfarin**
  - Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of **tolbutamide**
  - Antiepileptics: leflunomide possibly increases plasma concentration of **phenytoin**

**Leflunomide** (*continued*)

- Cytotoxics: risk of toxicity when leflunomide given with **●methotrexate**
- Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by **colestyramine** (enhanced elimination)—avoid unless drug elimination desired
- Vaccines: avoid concomitant use of leflunomide with live **●vaccines** (see p. 604)

**Lenalidomide**

- Antibacterials: plasma concentration of lenalidomide possibly increased by **●clarithromycin** (increased risk of toxicity)
- Antifungals: plasma concentration of lenalidomide possibly increased by **●itraconazole** (increased risk of toxicity)
- Calcium-channel Blockers: plasma concentration of lenalidomide possibly increased by **●verapamil** (increased risk of toxicity)
- Cardiac Glycosides: lenalidomide possibly increases plasma concentration of **digoxin**
- Ciclosporin: plasma concentration of lenalidomide possibly increased by **●ciclosporin** (increased risk of toxicity)

**Lercanidipine** *see* Calcium-channel Blockers

**Leukotriene Receptor Antagonists**

- Analgesics: plasma concentration of zafirlukast increased by **aspirin**
- Antibacterials: plasma concentration of zafirlukast reduced by **erythromycin**
- Anticoagulants: zafirlukast enhances anticoagulant effect of **warfarin**
- Antiepileptics: plasma concentration of montelukast reduced by **phenobarbital**
- Antifungals: plasma concentration of zafirlukast increased by **fluconazole**
- Lipid-regulating Drugs: plasma concentration of montelukast increased by **gemfibrozil**
- Theophylline: zafirlukast possibly increases plasma concentration of **theophylline**, also plasma concentration of zafirlukast reduced

**Levamisole**

- Alcohol: possibility of disulfiram-like reaction when levamisole given with **alcohol**
- Anticoagulants: levamisole possibly enhances anticoagulant effect of **warfarin**
- Antiepileptics: levamisole possibly increases plasma concentration of **phenytoin**

**Levetiracetam**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **●tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **●SSRIs** and **●tricyclics** (convulsive threshold lowered)
- Antiepileptics: levetiracetam possibly increases risk of **carbamazepine** toxicity
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **●mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **●antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **●orlistat**

**Levobunolol** *see* Beta-blockers

**Levobupivacaine**

- Anti-arrhythmics: increased myocardial depression when levobupivacaine given with **anti-arrhythmics**

**Levocarnitine**

- Anticoagulants: levocarnitine possibly enhances anticoagulant effect of **coumarins**

**Levocetirizine** *see* Antihistamines

**Levodopa**

- ACE Inhibitors: enhanced hypotensive effect when levodopa given with **ACE inhibitors**

**Levodopa** (*continued*)

- Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with **adrenergic neurone blockers**
  - Alpha-blockers: enhanced hypotensive effect when levodopa given with **alpha-blockers**
  - Anaesthetics, General: increased risk of arrhythmias when levodopa given with **●volatile liquid general anaesthetics**
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with **angiotensin-II receptor antagonists**
  - Antibacterials: effects of levodopa possibly reduced by **isoniazid**
  - Antidepressants: risk of hypertensive crisis when levodopa given with **●MAOIs**, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with **●moclobemide**
  - Antiepileptics: effects of levodopa possibly reduced by **phenytoin**
  - Antimuscarinics: absorption of levodopa possibly reduced by **antimuscarinics**
  - Antipsychotics: effects of levodopa antagonised by **antipsychotics**; avoidance of levodopa advised by manufacturer of **amisulpride** (antagonism of effect)
  - Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by **benzodiazepines**
  - Beta-blockers: enhanced hypotensive effect when levodopa given with **beta-blockers**
  - Bupropion: increased risk of side-effects when levodopa given with **bupropion**
  - Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with **calcium-channel blockers**
  - Clonidine: enhanced hypotensive effect when levodopa given with **clonidine**
  - Diazoxide: enhanced hypotensive effect when levodopa given with **diazoxide**
  - Diuretics: enhanced hypotensive effect when levodopa given with **diuretics**
  - Dopaminergics: enhanced effects and increased toxicity of levodopa when given with **selegiline** (reduce dose of levodopa)
  - Iron: absorption of levodopa possibly reduced by **oral iron**
  - Memantine: effects of dopaminergics possibly enhanced by **memantine**
  - Methyldopa: enhanced hypotensive effect when levodopa given with **methyldopa**; antiparkinsonian effect of dopaminergics antagonised by **methyldopa**
  - Moxonidine: enhanced hypotensive effect when levodopa given with **moxonidine**
  - Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with **baclofen**
  - Nitrates: enhanced hypotensive effect when levodopa given with **nitrates**
  - Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
  - Vitamins: effects of levodopa reduced by **pyridoxine** when given without dopa-decarboxylase inhibitor
- Levofloxacin** *see* Quinolones
- Levofolinic Acid** *see* Folates
- Levomepromazine** *see* Antipsychotics
- Levonorgestrel** *see* Progestogens
- Levothyroxine** *see* Thyroid Hormones
- Lidocaine**
- Note** Interactions less likely when lidocaine used topically
  - Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**
  - Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **●anti-arrhythmics**

**Lidocaine** (*continued*)

- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of lidocaine possibly increased by ●**atazanavir** and ●**lopinavir**; plasma concentration of lidocaine possibly increased by ●**darunavir** and ●**fosamprenavir**—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with ●**saquinavir**—avoid concomitant use; caution with *intravenous* lidocaine advised by manufacturer of ●**telaprevir**
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ●**beta-blockers**; possible increased risk of lidocaine toxicity when given with ●**nadolol**; increased risk of lidocaine toxicity when given with ●**propranolol**
- Diuretics: action of lidocaine antagonised by hypokalaemia caused by ●**acetazolamide**, ●**loop diuretics** or ●**thiazides and related diuretics**
- Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with ●**suxamethonium**
- Ulcer-healing Drugs: plasma concentration of lidocaine increased by ●**cimetidine** (increased risk of toxicity)

**Linagliptin** *see* Antidiabetics**Linezolid**

**Note** Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs

Antibacterials: plasma concentration of linezolid reduced by ●**rifampicin** (possible therapeutic failure of linezolid)

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Liothyronine** *see* Thyroid Hormones**Lipid-regulating Drugs** *see* Colesevelam, Colestipol, Colestyramine, Ezetimibe, Fibrates, Lomitapide, Nicotinic Acid, and Statins**Liraglutide** *see* Antidiabetics**Lisdexamfetamine** *see* Sympathomimetics**Lisinopril** *see* ACE Inhibitors**Lithium**

- ACE Inhibitors: excretion of lithium reduced by ●**ACE inhibitors** (increased plasma concentration)
- Analgesics: excretion of lithium reduced by ●**NSAIDs** (increased risk of toxicity); excretion of lithium reduced by ●**ketorolac** (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by ●**angiotensin-II receptor antagonists** (increased plasma concentration)
- Antacids: excretion of lithium increased by ●**sodium bicarbonate** (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of ●**amiodarone** (risk of ventricular arrhythmias)
- Antibacterials: increased risk of lithium toxicity when given with ●**metronidazole**
- Antidepressants: possible increased serotonergic effects when lithium given with ●**venlafaxine**; increased risk of CNS effects when lithium given with ●**SSRIs** (lithium toxicity reported); risk of toxicity when lithium given with ●**tricyclics**
- Antiepileptics: neurotoxicity may occur when lithium given with ●**carbamazepine** or ●**phenytoin** without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by ●**topiramate**
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with ●**clozapine**, ●**flupentixol**, ●**haloperidol**, ●**phenothiazines**, ●**risperidone** or ●**zucloptenthixol**; possible risk of toxicity when lithium given with ●**olanza-**

**Lithium**● Antipsychotics (*continued*)

●**pine**; increased risk of extrapyramidal side-effects when lithium given with ●**sulpiride**

Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with ●**clonazepam**

Calcium-channel Blockers: neurotoxicity may occur when lithium given with ●**diltiazem** or ●**verapamil** without increased plasma concentration of lithium

- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with ●**arsenic trioxide**
- Dapoxetine: possible increased risk of serotonergic effects when lithium given with ●**dapoxetine** (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Diuretics: excretion of lithium increased by ●**acetazolamide**; excretion of lithium reduced by ●**loop diuretics** and ●**thiazides and related diuretics** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by ●**potassium-sparing diuretics** and ●**aldosterone antagonists** (increased plasma concentration and risk of toxicity)

5HT<sub>1</sub>-receptor Agonists: possible risk of toxicity when lithium given with ●**sumatriptan**

- Methyldopa: neurotoxicity may occur when lithium given with ●**methyldopa** without increased plasma concentration of lithium

Muscle Relaxants: lithium enhances effects of ●**muscle relaxants**; hyperkinesia caused by lithium possibly aggravated by ●**baclofen**

Parasympathomimetics: lithium antagonises effects of ●**neostigmine**

Theophylline: excretion of lithium increased by ●**theophylline** (reduced plasma concentration)

**Lixisenatide** *see* Antidiabetics**Lofepamine** *see* Antidepressants, Tricyclic**Lofexidine**

Alcohol: increased sedative effect when lofexidine given with ●**alcohol**

Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with ●**anxiolytics and hypnotics**

**Lomitapide**

Alcohol: manufacturer of lomitapide advises avoid concomitant use with ●**alcohol**

- Anti-arrhythmics: manufacturer of lomitapide advises avoid concomitant use with ●**dronedarone** (plasma concentration of lomitapide possibly increased)
- Antibacterials: manufacturer of lomitapide advises avoid concomitant use with ●**clarithromycin**, ●**erythromycin** and ●**telithromycin** (plasma concentration of lomitapide possibly increased)

Anticoagulants: lomitapide possibly enhances anticoagulant effect of ●**warfarin**

- Antifungals: manufacturer of lomitapide advises avoid concomitant use with ●**triazoles** (plasma concentration of lomitapide possibly increased)
- Antivirals: manufacturer of lomitapide advises avoid concomitant use with ●**darunavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir**, ●**saquinavir**, ●**telaprevir** and ●**tipranavir** (plasma concentration of lomitapide possibly increased)

Aprepitant: manufacturer of lomitapide advises dose reduction when lomitapide given with ●**fosaprepitant** (see Dose under Lomitapide, BNF section 2.12)

- Calcium-channel Blockers: manufacturer of lomitapide advises avoid concomitant use with ●**diltiazem** and ●**verapamil** (plasma concentration of lomitapide possibly increased)

Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with ●**grapefruit juice**

- Lipid-regulating Drugs: lomitapide increases plasma concentration of ●**atorvastatin**; lomitapide increases plasma concentration of ●**simvastatin** (see Dose

**Lomitapide**

- Lipid-regulating Drugs (*continued*) under Simvastatin, BNF section 2.12); absorption of lomitapide possibly reduced by **bile acid sequestrants** (give at least 4 hours apart)
- Ranolazine: manufacturer of lomitapide advises dose reduction when lomitapide given with **ranolazine** (see Dose under Lomitapide, BNF section 2.12)
- Ulcer-healing Drugs: manufacturer of lomitapide advises dose reduction when lomitapide given with **cimetidine** (see Dose under Lomitapide, BNF section 2.12)

**Lomustine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by **cimetidine**

**Loperamide**

Desmopressin: loperamide increases plasma concentration of **oral desmopressin**

**Lopinavir**

**Note** In combination with ritonavir as **Kaletra**<sup>®</sup> (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir

- Anti-arrhythmics: lopinavir possibly increases plasma concentration of **flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of **lidocaine**
- Antibacterials: plasma concentration of lopinavir reduced by **rifampicin**—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
- Anticoagulants: avoidance of lopinavir advised by manufacturer of **apixaban**; manufacturers advise avoid concomitant use of lopinavir with **rivaroxaban**
- Antidepressants: plasma concentration of lopinavir reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antihistamines: lopinavir possibly increases plasma concentration of **chlorphenamine**
- Antimalarials: caution with lopinavir advised by manufacturer of **artemether with lumefantrine**
- Antimuscarinics: avoidance of lopinavir advised by manufacturer of **darifenacin** and **tolterodine**
- Antipsychotics: lopinavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturers advise avoid concomitant use of lopinavir with **boceprevir** and **telaprevir**; lopinavir reduces plasma concentration of **darunavir**, also plasma concentration of lopinavir increased (avoid concomitant use); plasma concentration of lopinavir reduced by **efavirenz**—consider increasing dose of lopinavir; lopinavir boosted with ritonavir increases plasma concentration of **elvitegravir** (reduce dose of elvitegravir); lopinavir reduces plasma concentration of **fosamprenavir**, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of lopinavir possibly reduced by **nevirapine**—consider increasing dose of lopinavir; increased risk of ventricular arrhythmias when lopinavir given with **saquinavir**—avoid concomitant use; lopinavir increases plasma concentration of **tenofovir**; plasma concentration of lopinavir reduced by **tipranavir**

**Lopinavir (continued)**

- Bosentan: lopinavir increases plasma concentration of **bosentan** (consider reducing dose of bosentan)
- Corticosteroids: plasma concentration of lopinavir possibly reduced by **dexamethasone**
- Cytotoxics: manufacturer of ruxolitinib advises dose reduction when lopinavir given with **ruxolitinib**—consult ruxolitinib product literature
- Eltrombopag: lopinavir possibly reduces plasma concentration of **eltrombopag**
- Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with **atorvastatin**; possible increased risk of myopathy when lopinavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when lopinavir given with **simvastatin**—avoid concomitant use; avoidance of lopinavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of lopinavir possibly reduced by **orlistat**
- Ranolazine: lopinavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sirolimus: lopinavir possibly increases plasma concentration of **sirolimus**
- Sympathomimetics, Beta<sub>2</sub>: manufacturer of lopinavir advises avoid concomitant use with **salmeterol**

**Loprazolam** see Anxiolytics and Hypnotics

**Loratadine** see Antihistamines

**Lorazepam** see Anxiolytics and Hypnotics

**Lormetazepam** see Anxiolytics and Hypnotics

**Losartan** see Angiotensin-II Receptor Antagonists

**Lumefantrine** see Artemether with Lumefantrine

**Lymericline** see Tetracyclines

**Macitentan**

- Antibacterials: plasma concentration of macitentan reduced by **rifampicin**—avoid concomitant use
- Antidepressants: manufacturer of macitentan advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of macitentan advises avoid concomitant use with **carbamazepine** and **phenytoin**

**Macrolides**

**Note** See also Telithromycin

**Note** Interactions do not apply to small amounts of erythromycin used topically

Analgesics: erythromycin increases plasma concentration of **alfentanil**; clarithromycin possibly increases plasma concentration of **fentanyl**

Antacids: absorption of azithromycin reduced by **antacids**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when **parenteral** erythromycin given with **amiodarone**—avoid concomitant use; erythromycin increases plasma concentration of **disopyramide** (increased risk of toxicity); clarithromycin possibly increases plasma concentration of **disopyramide** (increased risk of ventricular arrhythmias); azithromycin possibly increases plasma concentration of **disopyramide** (increased risk of toxicity); erythromycin increases plasma concentration of **dronedrone** (increased risk of ventricular arrhythmias—avoid concomitant use); avoidance of clarithromycin advised by manufacturer of **dronedrone** (risk of ventricular arrhythmias)
- Antibacterials: increased risk of ventricular arrhythmias when **parenteral** erythromycin given with **moxifloxacin**—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with **rifabutin**; clarithromycin increases plasma concentration of **rifabutin** (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of **rifabutin** (increased risk of toxicity—reduce

**Macrolides**

- **Antibacterials** (*continued*)  
rifabutin dose); plasma concentration of clarithromycin reduced by **rifamycins**
- **Anticoagulants**: azithromycin possibly enhances anticoagulant effect of ●**coumarins**; clarithromycin and erythromycin enhance anticoagulant effect of ●**coumarins**; possible increased risk of bleeding when clarithromycin given with **dabigatran**
- **Antidepressants**: avoidance of macrolides advised by manufacturer of ●**reboxetine**; avoidance of *intravenous* erythromycin advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of **trazodone**
- Antidiabetics**: clarithromycin enhances effects of **repaglinide**
- **Antiepileptics**: clarithromycin increases plasma concentration of ●**carbamazepine** (consider reducing dose of carbamazepine); erythromycin increases plasma concentration of ●**carbamazepine**; clarithromycin inhibits metabolism of **phenytoin** (increased plasma concentration); erythromycin possibly inhibits metabolism of **valproate** (increased plasma concentration)
- Antifungals**: avoidance of erythromycin advised by manufacturer of **fluconazole**; clarithromycin increases plasma concentration of **itraconazole**
- **Antihistamines**: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of **loratadine**; macrolides possibly inhibit metabolism of ●**mizolastine** (avoid concomitant use); erythromycin inhibits metabolism of ●**mizolastine**—avoid concomitant use; erythromycin increases plasma concentration of **rupatadine**
- **Antimalarials**: avoidance of macrolides advised by manufacturer of ●**piperaqueine** with **artemimol** (possible risk of ventricular arrhythmias); avoidance of macrolides advised by manufacturer of ●**artemether** with **lumefantrine**
- Antimuscarinics**: erythromycin possibly increases plasma concentration of **darifenacin**; manufacturer of fesoterodine advises dose reduction when clarithromycin given with **fesoterodine**—consult fesoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of **tolterodine**
- **Antipsychotics**: avoidance of macrolides advised by manufacturer of ●**droperidol** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**zuclopenthixol**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ●**amisulpride**—avoid concomitant use; erythromycin possibly increases plasma concentration of ●**clozapine** (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when erythromycin given with ●**pimozide**—avoid concomitant use; increased risk of ventricular arrhythmias when clarithromycin given with ●**pimozide**—avoid concomitant use; erythromycin increases plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use; clarithromycin possibly increases plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**sulpiride**
- **Antivirals**: plasma concentration of both drugs increased when clarithromycin given with **atazanavir**; plasma concentration of clarithromycin reduced by **efavirenz**, also plasma concentration of active metabolite of clarithromycin increased; plasma concentration of clarithromycin reduced by ●**etravirine** and **nevirapine** (but concentration of an active metabolite increased), also plasma concentration of

**Macrolides**

- **Antivirals** (*continued*)  
etravirine and nevirapine increased; clarithromycin possibly increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of ●**rilpivirine** (plasma concentration of rilpivirine possibly increased); plasma concentration of azithromycin and erythromycin possibly increased by **ritonavir**; plasma concentration of clarithromycin increased by ●**ritonavir** (reduce dose of clarithromycin in renal impairment); plasma concentration of both drugs possibly increased when clarithromycin given with ●**saquinavir** and ●**telaprevir** (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when erythromycin given with ●**saquinavir**—avoid concomitant use; plasma concentration of both drugs possibly increased when erythromycin given with ●**telaprevir** (increased risk of ventricular arrhythmias); plasma concentration of clarithromycin increased by ●**tipranavir** (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of **zidovudine** (give at least 2 hours apart)
- **Anxiolytics and Hypnotics**: clarithromycin and erythromycin inhibit metabolism of ●**midazolam** (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of **bupropion** (reduce dose of bupropion); erythromycin inhibits the metabolism of **zopiclone**
- Appetitant**: clarithromycin possibly increases plasma concentration of **aprepitant**
- **Atomoxetine**: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**atomoxetine**
- **Calcium-channel Blockers**: clarithromycin and erythromycin possibly inhibit metabolism of ●**calcium-channel blockers** (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of **lercanidipine**
- Cardiac Glycosides**: macrolides increase plasma concentration of **digoxin** (increased risk of toxicity)
- **Cyclosporin**: macrolides possibly inhibit metabolism of ●**cyclosporin** (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of ●**cyclosporin** (increased plasma concentration)
- **Cilostazol**: clarithromycin possibly increases plasma concentration of ●**cilostazol** (see Dose under Cilostazol, BNF section 2.6.4); erythromycin increases plasma concentrations of ●**cilostazol** (see Dose under Cilostazol, BNF section 2.6.4)
- **Clopidogrel**: erythromycin possibly reduces antiplatelet effect of ●**clopidogrel**
- **Colchicine**: azithromycin, clarithromycin and erythromycin possibly increase risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids**: erythromycin possibly inhibits metabolism of **corticosteroids**; clarithromycin possibly increases plasma concentration of **methylprednisolone**; erythromycin inhibits the metabolism of **methylprednisolone**
- **Cytotoxics**: erythromycin possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; clarithromycin and erythromycin possibly increase plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); clarithromycin and erythromycin possibly increase the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin possibly increases plasma concentration of ●**crizotinib** and ●**everolimus**—manu-

**Macrolides**● Cytotoxics (*continued*)

factor of crizotinib and everolimus advises avoid concomitant use; erythromycin increases plasma concentration of ●**everolimus** (consider reducing the dose of everolimus—consult everolimus product literature); avoidance of clarithromycin advised by manufacturer of ●**nilotinib**; clarithromycin possibly increases plasma concentration of ●**pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with ●**ruxolitinib**—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**vandetanib**—avoid concomitant use; clarithromycin possibly increases the plasma concentration of ●**cabazitaxel**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; *in vitro* studies suggest a possible interaction between erythromycin and ●**docetaxel** (consult docetaxel product literature); increased risk of ventricular arrhythmias when erythromycin given with ●**arsenic trioxide**; erythromycin increases toxicity of ●**vinblastine**—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with ●**vinorelbine**

Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with ●**dapoxetine** (see Dose under Dapoxetine, BNF section 7.4.6)

- Diuretics: clarithromycin increases plasma concentration of ●**eplerenone**—avoid concomitant use; erythromycin increases plasma concentration of ●**eplerenone** (reduce dose of eplerenone)
- Domperidone: erythromycin increases plasma concentration of ●**domperidone**—possible increased risk of ventricular arrhythmias

Dopaminergics: erythromycin increases plasma concentration of ●**bromocriptine** and ●**cabergoline** (increased risk of toxicity); macrolides possibly increase plasma concentration of ●**bromocriptine** and ●**cabergoline** (increased risk of toxicity)

- Ergot Alkaloids: increased risk of ergotism when macrolides given with ●**ergotamine**—avoid concomitant use
- Fidaxomicin: avoidance of clarithromycin and erythromycin advised by manufacturer of ●**fidaxomicin**
- 5HT<sub>1</sub>-receptor Agonists: clarithromycin and erythromycin increase plasma concentration of ●**eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of ●**ivabradine**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ●**ivabradine**—avoid concomitant use
- Ivacaftor: clarithromycin and erythromycin possibly increase plasma concentration of ●**ivacaftor** (see Dose under Ivacaftor, p. 165)
- Lenalidomide: clarithromycin possibly increases plasma concentration of ●**lenalidomide** (increased risk of toxicity)

Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of ●**zafirlukast**

- Lipid-regulating Drugs: clarithromycin increases plasma concentration of ●**atorvastatin** and ●**pravastatin**; possible increased risk of myopathy when erythromycin given with ●**atorvastatin**; erythromycin increases plasma concentration of ●**pravastatin**; erythromycin reduces plasma concentration of ●**rosuvastatin**; increased risk of myopathy when clarithromycin or erythromycin given with ●**simvastatin** (avoid concomitant use); avoidance of clarithromycin and erythromycin advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)

**Macrolides (*continued*)**

Mirabegron: when given with clarithromycin avoid or reduce dose of ●**mirabegron** in hepatic or renal impairment—see Mirabegron, BNF section 7.4.2

Oestrogens: erythromycin increases plasma concentration of ●**estradiol**

Parasympathomimetics: erythromycin increases plasma concentration of ●**galantamine**

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●**pentamidine isetionate**

Progestogens: erythromycin increases plasma concentration of ●**dienogest**

- Ranolazine: clarithromycin possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: clarithromycin increases plasma concentration of ●**sildenafil** (consider reducing dose of sildenafil); erythromycin increases plasma concentration of ●**sildenafil**—reduce initial dose of sildenafil
- Sirolimus: clarithromycin increases plasma concentration of ●**sirolimus**—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with ●**sirolimus**
- Tacrolimus: clarithromycin and erythromycin increase plasma concentration of ●**tacrolimus**

Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of ●**tadalafil**

- Theophylline: clarithromycin possibly increases plasma concentration of ●**theophylline**; erythromycin increases plasma concentration of ●**theophylline** (also theophylline may reduce absorption of *oral* erythromycin)
- Ticagrelor: clarithromycin possibly increases plasma concentration of ●**ticagrelor**—manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of ●**ticagrelor**

Ulcer-healing Drugs: plasma concentration of erythromycin increased by ●**cimetidine** (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with ●**omeprazole**

Ulipristal: avoidance of clarithromycin advised by manufacturer of ●**ulipristal**; erythromycin increases plasma concentration of ●**ulipristal**—manufacturer of ulipristal advises avoid concomitant use

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

Vardenafil: clarithromycin possibly increases plasma concentration of ●**vardenafil** (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of ●**vardenafil** (reduce dose of vardenafil)

**Magnesium (parenteral)**

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and ●**nifedipine** in pre-eclampsia
- Muscle Relaxants: parenteral magnesium enhances effects of ●**non-depolarising muscle relaxants** and ●**suxamethonium**

**Magnesium Salts (oral)** see Antacids

**Mannitol**

Antibacterials: avoidance of mannitol advised by manufacturer of ●**tobramycin**

Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with ●**ciclosporin**

**MAOIs**

**Note** For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor  
ACE Inhibitors: MAOIs possibly enhance hypotensive effect of ●**ACE inhibitors**

**MAOIs (continued)**

Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with **adrenergic neurone blockers**

- Alcohol: MAOIs interact with tyramine found in some beverages containing **alcohol** and some dealcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect

Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of **apraclonidine** and **brimonidine**

- Alpha-blockers: avoidance of MAOIs advised by manufacturer of **indoramin**; enhanced hypotensive effect when MAOIs given with **alpha-blockers**
- Analgesics: possible increased serotonergic effects when MAOIs given with **fentanyl**; CNS excitation or depression (hypertension or hypotension) when MAOIs given with **methidine**—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with **tramadol**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of **nefopam**; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with **opioid analgesics**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs

Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of **angiotensin-II receptor antagonists**

- Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with **reboxetine** (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start **citalopram**, **escitalopram**, **fluvoxamine**, **paroxetine** or **sertraline** for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start **fluoxetine** for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start **duloxetine** for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with **venlafaxine** (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other **MAOIs** (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start **moclobemide** for at least 1 week; MAOIs increase CNS effects of **SSRIs** (risk of serious toxicity); after stopping MAOIs do not start **mirtazapine** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start **tricyclic-related antidepressants** for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with **tricyclics**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine)

Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of **antidiabetics**; MAOIs enhance hypoglycaemic effect of **insulin**, **metformin** and **sulfonylureas**

**MAOIs (continued)**

- Antiepileptics: MAOIs possibly antagonise anti-convulsant effect of **antiepileptics** (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of **carbamazepine**, also antagonism of anti-convulsant effect

Antihistamines: avoidance of MAOIs advised by manufacturer of **hydroxyzine**; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of **promethazine**; increased anti-muscarinic and sedative effects when MAOIs given with **antihistamines**

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**
- Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with **antimuscarinics**
- Antipsychotics: CNS effects of MAOIs possibly increased by **clozapine**
- Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of **buspirone**; manufacturer of tranlycypromine advises avoid **buspirone** for 14 days after stopping tranlycypromine
- Atomoxetine: after stopping MAOIs do not start **atomoxetine** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with **atomoxetine**

Beta-blockers: enhanced hypotensive effect when MAOIs given with **beta-blockers**

- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of **bupropion**
- Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when MAOIs given with **clonidine**
- Dapoxetine: increased risk of serotonergic effects when MAOIs given with **dapoxetine** (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)

Diazoxide: enhanced hypotensive effect when MAOIs given with **diazoxide**

Diuretics: enhanced hypotensive effect when MAOIs given with **diuretics**

- Dopaminergics: avoid concomitant use of non-selective MAOIs with **entacapone**; risk of hypertensive crisis when MAOIs given with **levodopa**, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with **rasagiline**, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with **selegiline**—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with **tolcapone**

Doxapram: MAOIs enhance effects of **doxapram**

Histamine: avoidance of MAOIs advised by manufacturer of **histamine**

- 5HT<sub>1</sub>-receptor Agonists: risk of CNS toxicity when MAOIs given with **rizatriptan** or **sumatriptan** (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when MAOIs given with **zolmitriptan** (reduce dose of zolmitriptan)
- Methylodopa: avoidance of MAOIs advised by manufacturer of **methylodopa**
- Moxonidine: enhanced hypotensive effect when MAOIs given with **moxonidine**
- Muscle Relaxants: phenelzine enhances effects of **suxamethonium**
- Nicorandil: enhanced hypotensive effect when MAOIs given with **nicorandil**
- Nitrates: enhanced hypotensive effect when MAOIs given with **nitrates**

**MAOIs** (continued)

- Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of **pholcodine**
- Sympathomimetics: risk of hypertensive crisis when MAOIs given with
    - **adrenaline (epinephrine)**,
    - **dobutamine**,
    - **dopamine**,
    - **methoxamine**,
    - **noradrenaline (norepinephrine)** or **oxylometazoline**; risk of hypertensive crisis when MAOIs given with
      - **dexamfetamine**,
      - **ephedrine**,
      - **isometheptene**,
      - **lisdexamfetamine**,
      - **metaraminol**,
      - **methylphenidate**,
      - **phenylephrine** or **pseudoephedrine**, avoid dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with **oxymetazoline**, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs
  - Tetrabenazine: risk of CNS toxicity when MAOIs given with **tetrabenazine** (avoid tetrabenazine for 2 weeks after MAOIs)
- Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**MAOIs, reversible** see Moclobemide**Maraviroc**

- Antibacterials: plasma concentration of maraviroc possibly increased by **clarithromycin** and **telithromycin** (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by **rifampicin**—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by **St John's wort**—avoid concomitant use
- Antivirals: plasma concentration of maraviroc increased by **atazanavir**, **boceprevir**, **darunavir**, **indinavir**, **lopinavir**, **saquinavir** and **telaprevir** (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by **efavirenz**—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by **etravirin**; maraviroc reduces plasma concentration of **fosamprenavir**—avoid concomitant use; plasma concentration of maraviroc increased by **ritonavir**
- Cobicistat: plasma concentration of maraviroc possibly increased by **cobicistat** (reduce dose of maraviroc)
- Orlistat: absorption of maraviroc possibly reduced by **orlistat**

**Mebendazole**

Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by **cimetidine** (increased plasma concentration)

**Medroxyprogesterone** see Progestogens**Mefenamic Acid** see NSAIDs**Mefloquine**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with **amiodarone**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with **moxifloxacin**—avoid concomitant use; plasma concentration of mefloquine reduced by **rifampicin**—avoid concomitant use
- Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias)
- Antiepileptics: mefloquine antagonises anticonvulsant effect of **antiepileptics**
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**; increased risk of convulsions when mefloquine given with **chloroquine** and **hydroxychloroquine**; increased risk of convulsions when mefloquine

**Mefloquine****Antimalarials** (continued)

- given with **quinine** (but should not prevent the use of **intravenous quinine** in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with **haloperidol**—avoid concomitant use; avoidance of mefloquine advised by manufacturer of **amisulpride**; increased risk of ventricular arrhythmias when mefloquine given with **pimozide**—avoid concomitant use
- Antivirals: mefloquine possibly reduces plasma concentration of **ritonavir**
- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with **atomoxetine**
- Beta-blockers: increased risk of bradycardia when mefloquine given with **beta-blockers**
- Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with **calcium-channel blockers**
- Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with **digoxin**
- Cytotoxics: possible increased risk of bradycardia when mefloquine given with **crizotinib**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with **ivabradine**
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 626

**Megestrol** see Progestogens**Melatonin** see Anxiolytics and Hypnotics**Meloxicam** see NSAIDs**Melphalan**

- Antibacterials: increased risk of melphalan toxicity when given with **nalidixic acid**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: melphalan possibly reduces absorption of **digoxin tablets**
- Ciclosporin: increased risk of nephrotoxicity when melphalan given with **ciclosporin**

**Memantine**

- Anaesthetics, General: increased risk of CNS toxicity when memantine given with **ketamine** (manufacturer of memantine advises avoid concomitant use)
- Analgesics: increased risk of CNS toxicity when memantine given with **dextromethorphan** (manufacturer of memantine advises avoid concomitant use)

Anticoagulants: memantine possibly enhances anticoagulant effect of **warfarin**

Antimuscarinics: memantine possibly enhances effects of **antimuscarinics**

Antipsychotics: memantine possibly reduces effects of **antipsychotics**

- Dopaminergics: memantine possibly enhances effects of **dopaminergics** and **selegiline**; increased risk of CNS toxicity when memantine given with **amantadine** (manufacturer of memantine advises avoid concomitant use)

Muscle Relaxants: memantine possibly modifies effects of **baclofen** and **dantrolene**

**Mepacrine**

Antimalarials: mepacrine increases plasma concentration of **primaquine** (increased risk of toxicity)

**Meprobamate** see Anxiolytics and Hypnotics**Meptazinol** see Opioid Analgesics**Mercaptopurine**

- Allopurinol: enhanced effects and increased toxicity of mercaptopurine when given with **allopurinol** (reduce dose of mercaptopurine to one quarter of usual dose)

Aminosaliclates: possible increased risk of leucopenia when mercaptopurine given with **aminosalicylates**

**Mercaptopurine** (continued)

- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with **●sulfamethoxazole** (as co-trimoxazole); increased risk of haematological toxicity when mercaptopurine given with **●trimethoprim** (also with co-trimoxazole)
  - Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of **●coumarins**
  - Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Dairy Products: plasma concentration of mercaptopurine possibly reduced by **dairy products**—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products
- Febuxostat: avoidance of mercaptopurine advised by manufacturer of **●febuxostat**

**Meropenem**

- Antiepileptics: carbapenems reduce plasma concentration of **●valproate**—avoid concomitant use
- Probenecid: excretion of meropenem reduced by **probenecid**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Mesalazine** see Aminosalicylates

**Metranol** see Oestrogens

**Metaraminol** see Sympathomimetics

**Metformin** see Antidiabetics

**Methadone** see Opioid Analgesics

**Methenamine**

- Antacids: avoid concomitant use of methenamine with **antacids**
- Antibacterials: increased risk of crystalluria when methenamine given with **●sulfonamides**
  - Diuretics: effects of methenamine antagonised by **●acetazolamide**
- Potassium Salts: avoid concomitant use of methenamine with **potassium citrate**
- Sodium Citrate: avoid concomitant use of methenamine with **sodium citrate**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Methocarbamol** see Muscle Relaxants

**Methotrexate**

- Anaesthetics, General: antifolate effect of methotrexate increased by **●nitrous oxide**—avoid concomitant use
  - Analgesics: excretion of methotrexate probably reduced by **●NSAIDs** (increased risk of toxicity); excretion of methotrexate reduced by **●aspirin**, **●diclofenac**, **●ibuprofen**, **●indometacin**, **●ketoprofen**, **●meloxicam** and **●naproxen** (increased risk of toxicity)
  - Antibacterials: absorption of methotrexate possibly reduced by **neomycin**; excretion of methotrexate possibly reduced by **ciprofloxacin** (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with **●sulfamethoxazole** (as co-trimoxazole); increased risk of methotrexate toxicity when given with **doxycycline**, **sulfonamides** or **tetracycline**; excretion of methotrexate reduced by **penicillins** (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with **●trimethoprim** (also with co-trimoxazole)
- Antiepileptics: antifolate effect of methotrexate increased by **phenytoin**
- Antimalarials: antifolate effect of methotrexate increased by **●pyrimethamine**
  - Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: methotrexate possibly reduces absorption of **digoxin tablets**
- Ciclosporin: risk of toxicity when methotrexate given with **●ciclosporin**

**Methotrexate** (continued)

- Corticosteroids: possible increased risk of hepatotoxicity when **high-dose** methotrexate given with **dexamethasone**
- Cytotoxics: increased pulmonary toxicity when methotrexate given with **●cisplatin**
- Diuretics: excretion of methotrexate increased by alkaline urine due to **acetazolamide**
- Leflunomide: risk of toxicity when methotrexate given with **●leflunomide**
  - Probenecid: excretion of methotrexate reduced by **●probenecid** (increased risk of toxicity)
  - Retinoids: plasma concentration of methotrexate increased by **●acitretin** (also increased risk of hepatotoxicity)—avoid concomitant use
- Theophylline: methotrexate possibly increases plasma concentration of **theophylline**
- Ulcer-healing Drugs: excretion of methotrexate possibly reduced by **proton pump inhibitors** (increased risk of toxicity)

**Methoxamine** see Sympathomimetics

**Methyldopa**

- ACE Inhibitors: enhanced hypotensive effect when methyldopa given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when methyldopa given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when methyldopa given with **aldesleukin**
- Alpha-blockers: enhanced hypotensive effect when methyldopa given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when methyldopa given with **general anaesthetics**
- Analgesics: hypotensive effect of methyldopa antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with **angiotensin-II receptor antagonists**
- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with **●MAOIs**
  - Antipsychotics: enhanced hypotensive effect when methyldopa given with **antipsychotics** (also increased risk of extrapyramidal effects)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when methyldopa given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when methyldopa given with **clonidine**
- Corticosteroids: hypotensive effect of methyldopa antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when methyldopa given with **diazoxide**
- Diuretics: enhanced hypotensive effect when methyldopa given with **diuretics**
- Dopaminergics: methyldopa antagonises anti-parkinsonian effect of **dopaminergics**; increased risk of extrapyramidal side-effects when methyldopa given with **amantadine**; effects of methyldopa possibly enhanced by **entacapone**; enhanced hypotensive effect when methyldopa given with **levodopa**
- Iron: hypotensive effect of methyldopa antagonised by **oral iron**
- Lithium: neurotoxicity may occur when methyldopa given with **●lithium** without increased plasma concentration of lithium
- Moxisylyte: enhanced hypotensive effect when methyldopa given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when methyldopa given with **moxonidine**

**Methyldopa** (*continued*)

Muscle Relaxants: enhanced hypotensive effect when methyldopa given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when methyldopa given with **nitrates**

Oestrogens: hypotensive effect of methyldopa antagonised by **oestrogens**

Prostaglandins: enhanced hypotensive effect when methyldopa given with **alprostadi**

- Sympathomimetics, Beta<sub>2</sub>: acute hypotension reported when methyldopa given with *infusion of* **salbutamol**

Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Methylphenidate** *see* Sympathomimetics

**Methylprednisolone** *see* Corticosteroids

**Methylthioninium**

- Antidepressants: risk of CNS toxicity when methylthioninium given with **●SSRI-related antidepressants**, **●SSRIs** and **●clomipramine**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration); possible risk of CNS toxicity when methylthioninium given with **●mirtazapine**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Anxiolytics and Hypnotics: possible risk of CNS toxicity when methylthioninium given with **●buspirone**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Bupropion: possible risk of CNS toxicity when methylthioninium given with **●bupropion**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

**Metoclopramide**

Alcohol: metoclopramide possibly increases absorption of **alcohol**

Anaesthetics, General: metoclopramide enhances effects of **thiopental**

Analgesics: metoclopramide increases rate of absorption of **aspirin** (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by **opioid analgesics**; metoclopramide increases rate of absorption of **paracetamol**

Antidepressants: CNS toxicity reported when metoclopramide given with **SSRIs**

Antimuscarinics: effects of metoclopramide on gastro-intestinal activity antagonised by **antimuscarinics**

Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with **antipsychotics**

Atovaquone: metoclopramide reduces plasma concentration of **atovaquone**—avoid concomitant use

- Cyclosporin: metoclopramide increases plasma concentration of **cyclosporin**

Dopaminergics: metoclopramide antagonises hypoprolactinaemic effects of **bromocriptine** and **cabergoline**; metoclopramide antagonises antiparkinsonian effect of **pergolide**; avoidance of metoclopramide advised by manufacturer of **ropinirole** and **rotigotine** (antagonism of effect)

Muscle Relaxants: metoclopramide enhances effects of **suxamethonium**

Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with **tetrabenazine**

**Metolazone** *see* Diuretics

**Metoprolol** *see* Beta-blockers

**Metronidazole**

**Note** Interactions do not apply to topical metronidazole preparations

Alcohol: disulfiram-like reaction when metronidazole given with **alcohol**

- Anticoagulants: metronidazole enhances anticoagulant effect of **●coumarins**

Antiepileptics: metabolism of metronidazole accelerated by **phenobarbital** (reduced effect); metronidazole possibly inhibits metabolism of **phenytoin** (increased plasma concentration)

- Cytotoxics: metronidazole increases plasma concentration of **●busulfan** (increased risk of toxicity); metronidazole inhibits metabolism of **fluorouracil** (increased toxicity)

Disulfiram: psychotic reaction reported when metronidazole given with **disulfiram**

Lithium: metronidazole increases risk of **lithium** toxicity

Mycophenolate: metronidazole possibly reduces bioavailability of **mycophenolate**

Ulcer-healing Drugs: metabolism of metronidazole inhibited by **cimetidine** (increased plasma concentration)

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Mianserin** *see* Antidepressants, Tricyclic (related)

**Micafungin**

Antifungals: micafungin possibly increases plasma concentration of **amphotericin**; micafungin increases plasma concentration of **itraconazole** (consider reducing dose of itraconazole)

Calcium-channel Blockers: micafungin increases plasma concentration of **nifedipine**

Cyclosporin: micafungin possibly increases plasma concentration of **cyclosporin**

Sirolimus: micafungin increases plasma concentration of **sirolimus**

**Miconazole** *see* Antifungals, Imidazole

**Midazolam** *see* Anxiolytics and Hypnotics

**Mifamurtide**

Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of **NSAIDs**

Cyclosporin: manufacturer of mifamurtide advises avoid concomitant use with **cyclosporin**

Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with **corticosteroids**

Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with **tacrolimus**

**Mifepristone**

Corticosteroids: mifepristone may reduce effect of **corticosteroids** (including *inhaled* corticosteroids) for 3–4 days

**Milrinone** *see* Phosphodiesterase Inhibitors

**Minocycline** *see* Tetracyclines

**Minoxidil** *see* Vasodilator Antihypertensives

**Mirabegron**

Antibacterials: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with **clarithromycin**—*see* Mirabegron, BNF section 7.4.2

Antifungals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with **itraconazole**—*see* Mirabegron, BNF section 7.4.2

Antivirals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with **ritonavir**—*see* Mirabegron, BNF section 7.4.2

Beta-blockers: mirabegron increases plasma concentration of **metoprolol**

Cardiac Glycosides: mirabegron increases plasma concentration of **digoxin**—reduce initial dose of digoxin

**Mirtazapine**

- Alcohol: increased sedative effect when mirtazapine given with **alcohol**

Analgesics: possible increased serotonergic effects when mirtazapine given with **tramadol**

**Mirtazapine** (*continued*)

- Anticoagulants: mirtazapine enhances anticoagulant effect of **warfarin**
- Antidepressants: possible increased serotonergic effects when mirtazapine given with **fluoxetine**, **fluvoxamine** or **venlafaxine**; mirtazapine should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start ●**moclobemide** for at least 1 week
  - Antiepileptics: plasma concentration of mirtazapine reduced by **carbamazepine** and **phenytoin**
  - Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether with lumefantrine** and ●**piperazine with arteminol**
  - Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with **anxiolytics** and **hypnotics**
  - Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
  - Clonidine: mirtazapine possibly antagonises hypotensive effect of **clonidine**
  - Methylthionium: possible risk of CNS toxicity when mirtazapine given with ●**methylthionium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)
  - Ulcer-healing Drugs: plasma concentration of mirtazapine increased by **cimetidine**

**Mitomycin**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Mitotane**

- Anticoagulants: mitotane possibly reduces anticoagulant effect of ●**coumarins**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Diuretics: manufacturer of mitotane advises avoid concomitant use of **spironolactone** (antagonism of effect)

**Mitoxantrone**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Closporin: excretion of mitoxantrone reduced by **clisporin** (increased plasma concentration)

**Mivacurium** *see* Muscle Relaxants**Mizolastine** *see* Antihistamines**Moclobemide**

- Analgesics: possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with ●**dextromethorphan** or ●**petidine**—avoid concomitant use; possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with ●**opioid analgesics**—manufacturer of moclobemide advises consider reducing dose of opioid analgesics
- Antidepressants: moclobemide should not be started for at least 1 week after stopping ●MAOIs, ●SSRI-related antidepressants, ●**scitalopram**, ●**fluvoxamine**, ●**mirtazapine**, ●**paroxetine**, ●**sertraline**, ●**tricyclic-related antidepressants** or ●**tricyclics**; increased risk of CNS toxicity when moclobemide given with ●**escitalopram**, preferably avoid concomitant use; moclobemide should not be started until 5 weeks after stopping ●**fluoxetine**; possible increased serotonergic effects when moclobemide given with ●**duloxetine**
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether with lumefantrine** and ●**piperazine with arteminol**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Bupropion: avoidance of moclobemide advised by manufacturer of ●**bupropion**
- Clopidogrel: moclobemide possibly reduces antiplatelet effect of ●**clopidogrel**

**Moclobemide** (*continued*)

- Dopaminergics: caution with moclobemide advised by manufacturer of **entacapone**; increased risk of side-effects when moclobemide given with **levodopa**; avoid concomitant use of moclobemide with ●**selegiline**
  - 5HT<sub>1</sub>-receptor Agonists: risk of CNS toxicity when moclobemide given with ●**rizatriptan** or ●**sumatriptan** (avoid rizatriptan for ●**sumatriptan** for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with ●**zolmitriptan** (reduce dose of zolmitriptan)
  - Sympathomimetics: risk of hypertensive crisis when moclobemide given with ●**sympathomimetics**
  - Ulcer-healing Drugs: plasma concentration of moclobemide increased by **cimetidine** (halve dose of moclobemide)
- Modafinil**
- Antiepileptics: modafinil possibly increases plasma concentration of **phenytoin**
  - Closporin: modafinil reduces plasma concentration of ●**clisporin**
  - Cytotoxics: modafinil possibly reduces plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid concomitant use
  - Oestrogens: modafinil accelerates metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 402)

**Moexipril** *see* ACE Inhibitors**Mometasone** *see* Corticosteroids**Monobactams** *see* Aztreonam**Montelukast** *see* Leukotriene Receptor Antagonists**Morphine** *see* Opioid Analgesics**Moxifloxacin** *see* Quinolones**Moxisylyte**

- ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with **ACE inhibitors**
  - Adrenergic Neuron Blockers: enhanced hypotensive effect when moxisylyte given with **adrenergic neuron blockers**
  - Alpha-blockers: possible severe postural hypotension when moxisylyte given with ●**alpha-blockers**
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with **angiotensin-II receptor antagonists**
  - Beta-blockers: possible severe postural hypotension when moxisylyte given with ●**beta-blockers**
  - Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with **calcium-channel blockers**
  - Clonidine: enhanced hypotensive effect when moxisylyte given with **clonidine**
  - Diazoxide: enhanced hypotensive effect when moxisylyte given with **diazoxide**
  - Diuretics: enhanced hypotensive effect when moxisylyte given with **diuretics**
  - Methyldopa: enhanced hypotensive effect when moxisylyte given with **methyldopa**
  - Moxonidine: enhanced hypotensive effect when moxisylyte given with **moxonidine**
  - Nitrates: enhanced hypotensive effect when moxisylyte given with **nitrates**
  - Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Moxonidine**
- ACE Inhibitors: enhanced hypotensive effect when moxonidine given with **ACE inhibitors**
  - Adrenergic Neuron Blockers: enhanced hypotensive effect when moxonidine given with **adrenergic neuron blockers**
  - Alcohol: enhanced hypotensive effect when moxonidine given with **alcohol**
  - Aldesleukin: enhanced hypotensive effect when moxonidine given with **aldesleukin**

**Moxonidine** (*continued*)

Alpha-blockers: enhanced hypotensive effect when moxonidine given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when moxonidine given with **general anaesthetics**

Analgesics: hypotensive effect of moxonidine antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with **angiotensin-II receptor antagonists**

Antidepressants: enhanced hypotensive effect when moxonidine given with **MAOIs**; hypotensive effect of moxonidine possibly antagonised by **tricyclics** (manufacturer of moxonidine advises avoid concomitant use)

Antipsychotics: enhanced hypotensive effect when moxonidine given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with **anxiolytics and hypnotics**; sedative effects possibly increased when moxonidine given with **benzodiazepines**

Beta-blockers: enhanced hypotensive effect when moxonidine given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when moxonidine given with **clonidine**

Corticosteroids: hypotensive effect of moxonidine antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when moxonidine given with **diazoxide**

Diuretics: enhanced hypotensive effect when moxonidine given with **diuretics**

Dopaminergics: enhanced hypotensive effect when moxonidine given with **levodopa**

Methyldopa: enhanced hypotensive effect when moxonidine given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when moxonidine given with **moxisylyte**

Muscle Relaxants: enhanced hypotensive effect when moxonidine given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when moxonidine given with **nitrates**

Oestrogens: hypotensive effect of moxonidine antagonised by **oestrogens**

Prostaglandins: enhanced hypotensive effect when moxonidine given with **alprostadil**

Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with **hydralazine**, **minoxidil** or **sodium nitropruside**

**Muscle Relaxants**

ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with **adrenergic neurone blockers**

Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with **alcohol**

Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with **alpha-blockers**

- Anaesthetics, General: effects of atracurium enhanced by **ketamine**; increased risk of myocardial depression and bradycardia when suxamethonium given with **propofol**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **volatile liquid general anaesthetics**

Analgesics: excretion of baclofen possibly reduced by **NSAIDs** (increased risk of toxicity); excretion of baclofen reduced by **ibuprofen** (increased risk of toxicity); increased sedative effect when baclofen given with **fentanyl** or **morphine**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with **angiotensin-II receptor antagonists**

**Muscle Relaxants** (*continued*)

Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with **lidocaine**

- Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by **pipera-cillin**; plasma concentration of tizanidine increased by **ciprofloxacin** (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by **norfloxacin** (increased risk of toxicity); plasma concentration of tizanidine possibly reduced by **rifampicin**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **aminoglycosides**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **clindamycin**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **polymyxins**; effects of suxamethonium enhanced by **vancomycin**
- Antidepressants: plasma concentration of tizanidine increased by **fluvoxamine** (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by **phenelzine**; muscle relaxant effect of baclofen enhanced by **tricyclics**
- Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by **carbamazepine** (accelerated recovery from neuromuscular blockade); effects of non-depolarising muscle relaxants reduced by **long-term use** of **phenytoin** (but effects of non-depolarising muscle relaxants might be increased by **acute use** of phenytoin)

Antimalarials: effects of suxamethonium possibly enhanced by **quinine**

Antipsychotics: effects of suxamethonium possibly enhanced by **promazine**

Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when baclofen given with **beta-blockers**; possible enhanced hypotensive effect and bradycardia when tizanidine given with **beta-blockers**; effects of muscle relaxants enhanced by **propranolol**

Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with **calcium-channel blockers**; effects of non-depolarising muscle relaxants possibly enhanced by **calcium-channel blockers**; possible increased risk of ventricular arrhythmias when **intravenous** dantrolene given with **diltiazem**—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **verapamil**; avoidance of **intravenous** dantrolene advised by manufacturer of **verapamil**

Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with **cardiac glycosides**; risk of ventricular arrhythmias when suxamethonium given with **cardiac glycosides**

Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with **clonidine**

Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by **corticosteroids**

Cytotoxics: effects of suxamethonium enhanced by **cyclophosphamide** and **thiotepa**

Deferasirox: avoidance of tizanidine advised by manufacturer of **deferasirox**

Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with **diazoxide**

Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with **diuretics**

Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with **levodopa**

Lithium: effects of muscle relaxants enhanced by **lithium**; baclofen possibly aggravates hyperkinesia caused by **lithium**

**Muscle Relaxants** (continued)

Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by **parenteral magnesium**

Memantine: effects of baclofen and dantrolene possibly modified by **memantine**

Methyl dopa: enhanced hypotensive effect when baclofen or tizanidine given with **methyl dopa**

Metoclopramide: effects of suxamethonium enhanced by **metoclopramide**

Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with **moxonidine**

Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with **nitrates**

Oestrogens: plasma concentration of tizanidine possibly increased by **oestrogens** (increased risk of toxicity)

Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by **donepezil**; effects of suxamethonium possibly enhanced by **donepezil**; effects of non-depolarising muscle relaxants antagonised by **edrophonium**, **neostigmine**, **pyridostigmine** and **rivastigmine**; effects of suxamethonium enhanced by **edrophonium**, **galantamine**, **neostigmine**, **pyridostigmine** and **rivastigmine**

Progestogens: plasma concentration of tizanidine possibly increased by **progestogens** (increased risk of toxicity)

Sympathomimetics, Beta<sub>2</sub>: effects of suxamethonium enhanced by **bambuterol**

Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with **hydralazine**; enhanced hypotensive effect when baclofen or tizanidine given with **minoxidil**; enhanced hypotensive effect when baclofen or tizanidine given with **sodium nitroprusside**

**Muscle Relaxants, depolarising** *see* Muscle Relaxants**Muscle Relaxants, non-depolarising** *see* Muscle Relaxants**Mycophenolate**

Antacids: absorption of mycophenolate reduced by **antacids**

- Antibacterials: plasma concentration of mycophenolate possibly reduced by **co-amoxiclav**; bioavailability of mycophenolate possibly reduced by **metronidazole** and **norfloxacin**; plasma concentration of active metabolite of mycophenolate reduced by **rifampicin**

Antivirals: mycophenolate increases plasma concentration of **aciclovir**, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of **ganciclovir**, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Colestilan: manufacturer of colestilan advises give mycophenolate at least 1 hour before or 3 hours after **colestilan**

Iron: absorption of mycophenolate reduced by **oral iron**

Lipid-regulating Drugs: absorption of mycophenolate reduced by **colestyramine**

Sevelamer: plasma concentration of mycophenolate possibly reduced by **sevelamer**

**Mycophenolate Mofetil** *see* Mycophenolate**Mycophenolate Sodium** *see* Mycophenolate**Mycophenolic Acid** *see* Mycophenolate**Nabumetone** *see* NSAIDs**Nadolol** *see* Beta-blockers**Nalidixic Acid** *see* Quinolones**Nalmefene**

- Analgesics: manufacturer of nalmefene advises avoid concomitant use with **opioid analgesics**

**Nandrolone** *see* Anabolic Steroids**Naproxen** *see* NSAIDs**Naratriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)**Nateglinide** *see* Antidiabetics**Nebivolol** *see* Beta-blockers**Nefopam**

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with **MAOIs**; side-effects possibly increased when nefopam given with **tricyclics**

Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with **antimuscarinics**

**Neomycin** *see* Aminoglycosides**Neostigmine** *see* Parasympathomimetics**Nevirapine**

- Analgesics: nevirapine possibly reduces plasma concentration of **methadone**
- Antibacterials: nevirapine reduces plasma concentration of **clarithromycin** (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of **rifabutin**; plasma concentration of nevirapine reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of **warfarin**
- Antidepressants: plasma concentration of nevirapine reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of nevirapine reduced by **carbamazepine**
- Antifungals: plasma concentration of nevirapine increased by **fluconazole**; nevirapine possibly reduces plasma concentration of **casposfungin** and **itraconazole**—consider increasing dose of casposfungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)
- Antivirals: nevirapine possibly reduces plasma concentration of **atazanavir** and **etravirine**—avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with **boceprevir** and **rilpivirine**; nevirapine possibly reduces the plasma concentration of **dolutegravir** (*see* Dose under Dolutegravir, p. 324); nevirapine reduces plasma concentration of **efavirenz**—avoid concomitant use; avoidance of nevirapine advised by manufacturer of **elvitegravir**; nevirapine possibly reduces plasma concentration of **fosamprenavir**—avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of **indinavir**; nevirapine possibly reduces plasma concentration of **lopinavir** and **telaprevir**—consider increasing dose of lopinavir and telaprevir; increased risk of granulocytopenia when nevirapine given with **zidovudine**
- Cobicistat: manufacturer of nevirapine advises avoid concomitant use with **cobicistat**
- Oestrogens: nevirapine accelerates metabolism of **oestrogens** (reduced contraceptive effect—*see* p. 402)
- Orlistat: absorption of nevirapine possibly reduced by **orlistat**
- Progestogens: nevirapine accelerates metabolism of **progestogens** (reduced contraceptive effect—*see* p. 402)

**Nicardipine** *see* Calcium-channel Blockers**Nicorandil**

Alcohol: hypotensive effect of nicorandil possibly enhanced by **alcohol**

Antidepressants: enhanced hypotensive effect when nicorandil given with **MAOIs**; hypotensive effect of nicorandil possibly enhanced by **tricyclics**

- Sildenafil: hypotensive effect of nicorandil significantly enhanced by **sildenafil** (avoid concomitant use)

**Nicorandil** (*continued*)

- Tadalafil: hypotensive effect of nicorandil significantly enhanced by **tadalafil** (avoid concomitant use)
  - Vardenafil: possible increased hypotensive effect when nicorandil given with **vardenafil**—avoid concomitant use
- Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with **hydralazine**, **minoxidil** or **sodium nitropruside**

**Nicotine**

Anti-arrhythmics: nicotine possibly enhances effects of **adenosine**

**Nicotinic Acid**

**Note** Interactions apply to lipid-regulating doses of nicotinic acid

- Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with **statins** (applies to lipid regulating doses of nicotinic acid)

**Nifedipine** *see* Calcium-channel Blockers

**Nilotinib**

- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with **clarithromycin** and **telithromycin**; plasma concentration of nilotinib reduced by **rifampicin**—avoid concomitant use
- Antifungals: manufacturer of nilotinib advises avoid concomitant use with **voriconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: avoidance of nilotinib advised by manufacturer of **boceprevir**; plasma concentration of nilotinib possibly increased by **ritonavir**—manufacturer of nilotinib advises avoid concomitant use
- Anxiolytics and Hypnotics: nilotinib increases plasma concentration of **midazolam**
- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with **grapefruit juice**

**Nimodipine** *see* Calcium-channel Blockers

**Nitrates**

- ACE Inhibitors: enhanced hypotensive effect when nitrates given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when nitrates given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when nitrates given with **aldesleukin**
- Alpha-blockers: enhanced hypotensive effect when nitrates given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when nitrates given with **general anaesthetics**
- Analgesics: hypotensive effect of nitrates antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with **angiotensin-II receptor antagonists**
- Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by **disopyramide** (failure to dissolve under tongue owing to dry mouth)
- Anticoagulants: *infusion* of glyceryl trinitrate reduces anticoagulant effect of **heparins**
- Antidepressants: enhanced hypotensive effect when nitrates given with **MAOIs**; effects of sublingual tablets of nitrates possibly reduced by **tricyclic-related antidepressants** (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by **tricyclics** (failure to dissolve under tongue owing to dry mouth)
- Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by **antimuscarinics** (failure to dissolve under tongue owing to dry mouth)
- Antipsychotics: enhanced hypotensive effect when nitrates given with **phenothiazines**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with **anxiolytics and hypnotics**

**Nitrates** (*continued*)

- Beta-blockers: enhanced hypotensive effect when nitrates given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when nitrates given with **clonidine**
- Corticosteroids: hypotensive effect of nitrates antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when nitrates given with **diazoxide**
- Diuretics: enhanced hypotensive effect when nitrates given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when nitrates given with **levodopa**
- Methyl dopa: enhanced hypotensive effect when nitrates given with **methyl dopa**
- Moxisylyte: enhanced hypotensive effect when nitrates given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when nitrates given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when nitrates given with **baclofen** or **tizanidine**
- Oestrogens: hypotensive effect of nitrates antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when nitrates given with **alprostadil**
- Sildenafil: hypotensive effect of nitrates significantly enhanced by **sildenafil** (avoid concomitant use)
- Tadalafil: hypotensive effect of nitrates significantly enhanced by **tadalafil** (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nitrates given with **vardenafil**—avoid concomitant use
- Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with **hydralazine**, **minoxidil** or **sodium nitropruside**

**Nitrazepam** *see* Anxiolytics and Hypnotics

**Nitrofurantoin**

- Antacids: absorption of nitrofurantoin reduced by **oral magnesium salts** (as magnesium trisilicate)
- Antibacterials: nitrofurantoin possibly antagonises effects of **nalidixic acid**
- Probenecid: excretion of nitrofurantoin reduced by **probenecid** (increased risk of side-effects)
- Sulfapyrazone: excretion of nitrofurantoin reduced by **sulfapyrazone** (increased risk of toxicity)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Nitroimidazoles** *see* Metronidazole and Tinidazole

**Nitrous Oxide** *see* Anaesthetics, General

**Nizatidine** *see* Histamine H<sub>2</sub>-antagonists

**Nomegestrol** *see* Progestogens

**Noradrenaline (norepinephrine)** *see* Sympathomimetics

**Norelgestromin** *see* Progestogens

**Norepinephrine (noradrenaline)** *see* Sympathomimetics

**Norethisterone** *see* Progestogens

**Norfloracin** *see* Quinolones

**Norgestimate** *see* Progestogens

**Norgestrel** *see* Progestogens

**Nortriptyline** *see* Antidepressants, Tricyclic

**NSAIDs**

**Note** *See also* Aspirin. Interactions do not generally apply to topical NSAIDs

- ACE Inhibitors: increased risk of renal impairment when NSAIDs given with **ACE inhibitors**, also hypotensive effect antagonised
- Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of **adrenergic neurone blockers**
- Aliskiren: NSAIDs possibly antagonise hypotensive effect of **aliskiren**

**NSAIDs (continued)**

Alpha-blockers: NSAIDs antagonise hypotensive effect of **alpha-blockers**

- Analgesics: avoid concomitant use of NSAIDs with
  - **NSAIDs** or ● **aspirin** (increased side-effects); avoid concomitant use of NSAIDs with ● **ketorolac** (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of **aspirin**

Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with **angiotensin-II receptor antagonists**, also hypotensive effect antagonised

Antacids: absorption of acemetacin possibly reduced by **antacids**

- Antibacterials: indometacin possibly increases plasma concentration of **amikacin** and **gentamicin** in neonates; plasma concentration of celecoxib, diclofenac and etoricoxib reduced by **rifampicin**; possible increased risk of convulsions when NSAIDs given with **quinolones**
- Anticoagulants: increased risk of haemorrhage when *intravenous* diclofenac given with **anticoagulants** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with ● **anticoagulants** (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of ● **coumarins** and ● **phenindione**; possible increased risk of bleeding when NSAIDs given with ● **dabigatran** or **heparins**
- Antidepressants: increased risk of bleeding when NSAIDs given with ● **SSRIs** or ● **venlafaxine**
- Antidiabetics: NSAIDs possibly enhance effects of ● **sulfonylureas**

Antiepileptics: acemetacin possibly reduces excretion of **phenytoin** (increased risk of toxicity)

Antifungals: plasma concentration of paracetamol increased by **fluconazole** (reduce dose of paracetamol); plasma concentration of celecoxib increased by **fluconazole** (halve dose of celecoxib); plasma concentration of flurbiprofen and ibuprofen increased by **fluconazole**; plasma concentration of diclofenac and ibuprofen increased by **voriconazole**

Antipsychotics: possible severe drowsiness when acemetacin or indometacin given with **haloperidol**

- Antivirals: plasma concentration of NSAIDs possibly increased by **ritonavir**; plasma concentration of piroxicam increased by ● **ritonavir** (risk of toxicity)—avoid concomitant use; increased risk of haematological toxicity when NSAIDs given with **zidovudine**

Beta-blockers: NSAIDs antagonise hypotensive effect of **beta-blockers**

Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of **calcium-channel blockers**

Cardiac Glycosides: NSAIDs possibly increase plasma concentration of **cardiac glycosides**, also possible exacerbation of heart failure and reduction of renal function

- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with ● **ciclosporin**; plasma concentration of diclofenac increased by ● **ciclosporin** (halve dose of diclofenac)

Clonidine: NSAIDs antagonise hypotensive effect of **clonidine**

Clopidogrel: increased risk of bleeding when NSAIDs given with **clopidogrel**

Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with **corticosteroids**

- Cytotoxics: NSAIDs probably reduce excretion of ● **methotrexate** (increased risk of toxicity); diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of ● **methotrexate** (increased risk of toxicity); NSAIDs possibly reduce renal excretion of **pemetrexed**—consult product literature; increased risk of bleeding when

**NSAIDs**● **Cytotoxics (continued)**

NSAIDs given with ● **erlotinib**; avoidance of mefenamic acid advised by manufacturer of **regorafenib**  
Desmopressin: indometacin enhances effects of **desmopressin**

Diazoxide: NSAIDs antagonise hypotensive effect of **diazoxide**

- Dimethyl sulfoxide: avoid concomitant use of sulindac with ● **dimethyl sulfoxide**

- Diuretics: risk of nephrotoxicity of NSAIDs increased by **diuretics**, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of **diuretics**; excretion of acemetacin possibly increased by **furosemide**; NSAIDs possibly antagonise diuretic effect of **potassium canrenoate**; occasional reports of reduced renal function when indometacin given with ● **triamterene**—avoid concomitant use; increased risk of hyperkalaemia when indometacin given with **potassium-sparing diuretics** and **aldosterone antagonists**; possible increased risk of hyperkalaemia when NSAIDs given with **potassium-sparing diuretics** and **aldosterone antagonists**

Iloprost: increased risk of bleeding when NSAIDs given with **iloprost**

Lipid-regulating Drugs: excretion of meloxicam increased by **colestyramine**

- Lithium: NSAIDs reduce excretion of ● **lithium** (increased risk of toxicity); ketorolac reduces excretion of ● **lithium** (increased risk of toxicity)—avoid concomitant use

Methyldopa: NSAIDs antagonise hypotensive effect of **methyldopa**

Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of **mifamurtide**

Moxonidine: NSAIDs antagonise hypotensive effect of **moxonidine**

Muscle Relaxants: ibuprofen reduces excretion of **baclofen** (increased risk of toxicity); NSAIDs possibly reduce excretion of **baclofen** (increased risk of toxicity)

Nitrates: NSAIDs antagonise hypotensive effect of **nitrates**

Oestrogens: etoricoxib increases plasma concentration of **ethinylestradiol**

Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with **penicillamine**

- Pentoxifylline: possible increased risk of bleeding when NSAIDs given with **pentoxifylline**; increased risk of bleeding when ketorolac given with ● **pentoxifylline** (avoid concomitant use)

Prasugrel: possible increased risk of bleeding when NSAIDs given with **prasugrel**

- Probencid: excretion of acemetacin, dextropropofol, indometacin, ketoprofen and naproxen reduced by ● **probencid** (increased plasma concentration); excretion of ketorolac reduced by ● **probencid** (increased plasma concentration)—avoid concomitant use

- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with **tacrolimus**; increased risk of nephrotoxicity when ibuprofen given with ● **tacrolimus**

Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**

**Octreotide**

Antidiabetics: octreotide possibly reduces requirements for **antidiabetics**

- Ciclosporin: octreotide reduces plasma concentration of ● **ciclosporin**

Dopaminergics: octreotide increases plasma concentration of **bromocriptine**

Ulcer-healing Drugs: octreotide possibly delays absorption of **cimetidine**

**Oestrogens**

**Note** Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 402

ACE Inhibitors: oestrogens antagonise hypotensive effect of **ACE inhibitors**

Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of **adrenergic neurone blockers**

Alpha-blockers: oestrogens antagonise hypotensive effect of **alpha-blockers**

Analgesics: plasma concentration of ethinylestradiol increased by **etoricoxib**

Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of **angiotensin-II receptor antagonists**

- Antibacterials: plasma concentration of estradiol increased by **erythromycin**; metabolism of oestrogens accelerated by **rifamycins** (reduced contraceptive effect—see p. 402)

- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of **coumarins**; oestrogens antagonise anticoagulant effect of **phenindione**

- Antidepressants: contraceptive effect of oestrogens reduced by **St John's wort** (avoid concomitant use); oestrogens antagonise antidepressant effect of **tricyclics** (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Antidiabetics: oestrogens antagonise hypoglycaemic effect of **antidiabetics**

- Antiepileptics: metabolism of oestrogens accelerated by **carbamazepine**, **eslicarbazepine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rufinamide** and **topiramate** (reduced contraceptive effect—see p. 402); oestrogens reduce plasma concentration of **lamotrigine**—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of **valproate**

Antifungals: oestrogens increase plasma concentration of **voriconazole**; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with **griseofulvin**; anecdotal reports of contraceptive failure when oestrogens given with **imidazoles**; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with **terbinafine**

- Antivirals: plasma concentration of ethinylestradiol increased by **atazanavir**; metabolism of oestrogens accelerated by **nevirapine** and **ritonavir** (reduced contraceptive effect—see p. 402); plasma concentration of ethinylestradiol possibly reduced by **telaprevir**—manufacturer of telaprevir advises additional contraceptive precautions

Anxiolytics and Hypnotics: oestrogens possibly increase plasma concentration of **chlordiazepoxide**, **diazepam** and **nitrazepam**; oestrogens possibly reduce plasma concentration of **lorazepam**, **oxazepam** and **temazepam**; oestrogens increase plasma concentration of **melatonin**

- Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with **aprepitant** (alternative contraception recommended)

Beta-blockers: oestrogens antagonise hypotensive effect of **beta-blockers**

- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with **bosentan** (alternative contraception recommended)

Calcium-channel Blockers: oestrogens antagonise hypotensive effect of **calcium-channel blockers**

Ciclosporin: oestrogens possibly increase plasma concentration of **ciclosporin**

Clonidine: oestrogens antagonise hypotensive effect of **clonidine**

**Oestrogens (continued)**

- Cobicistat: metabolism of oestrogens accelerated by **cobicistat** (reduced contraceptive effect—see p. 402)

Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of **corticosteroids**

- Cytotoxics: possible reduction in contraceptive effect of oestrogens advised by manufacturer of **crizotinib** and **vemurafenib**; possible reduced contraceptive effect of hormonal contraceptives containing oestrogens advised by manufacturer of **dabrafenib** (alternative contraception recommended)

Diuretics: oestrogens antagonise diuretic effect of **diuretics**

- Dopaminergics: oestrogens increase plasma concentration of **ropinirole**; oestrogens increase plasma concentration of **selegiline**—manufacturer of selegiline advises avoid concomitant use

Lipid-regulating Drugs: absorption of ethinylestradiol reduced by **colesevelam**; plasma concentration of ethinylestradiol increased by **atorvastatin** and **rosuvastatin**

Methyl dopa: oestrogens antagonise hypotensive effect of **methyl dopa**

- Modafinil: metabolism of oestrogens accelerated by **modafinil** (reduced contraceptive effect—see p. 402)

Moxonidine: oestrogens antagonise hypotensive effect of **moxonidine**

Muscle Relaxants: oestrogens possibly increase plasma concentration of **tizanidine** (increased risk of toxicity)

Nitrates: oestrogens antagonise hypotensive effect of **nitrates**

Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of **somatropin**

Tacrolimus: ethinylestradiol possibly increases plasma concentration of **tacrolimus**

Teriflunomide: plasma concentration of ethinylestradiol increased by **teriflunomide**

Theophylline: oestrogens increase plasma concentration of **theophylline** (consider reducing dose of theophylline)

Thyroid Hormones: oestrogens may increase requirements for **thyroid hormones** in hypothyroidism

Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**

**Oestrogens, conjugated** *see* Oestrogens

**Ofloxacin** *see* Quinolones

**Olanzapine** *see* Antipsychotics

**Olmesartan** *see* Angiotensin-II Receptor Antagonists

**Olisalazine** *see* Aminosalicylates

**Omeprazole** *see* Proton Pump Inhibitors

**Ondansetron** *see* 5HT<sub>3</sub>-receptor Antagonists (under HT)

**Opioid Analgesics**

Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with **alcohol**

Anaesthetics, General: fentanyl inhibits metabolism of **etomidate** (consider reducing dose of etomidate); opioid analgesics possibly enhance effects of **intravenous general anaesthetics** and **volatile liquid general anaesthetics**

- Antibacterials: plasma concentration of fentanyl possibly increased by **clarithromycin**; plasma concentration of alfentanil increased by **erythromycin**; metabolism of alfentanil, codeine, fentanyl, methadone and morphine accelerated by **rifampicin** (reduced effect); metabolism of oxycodone possibly accelerated by **rifampicin**; manufacturer of pethidine advises avoid concomitant use with **isoniazid**; possible increased risk of ventricular arrhythmias when

**Opioid Analgesics**

- **Antibacterials** (*continued*)
  - methadone given with ●**telithromycin**; metabolism of oxycodone inhibited by **telithromycin**
- **Anticoagulants**: tramadol enhances anticoagulant effect of ●**coumarins**
- **Antidepressants**: plasma concentration of methadone possibly increased by **fluoxetine**, **fluvoxamine**, **paroxetine** and **sertraline**; possible increased serotonergic effects when pethidine or tramadol given with **duloxetine**; possible increased serotonergic effects when tramadol given with **mirtazapine** or **venlafaxine**; possible increased serotonergic effects and increased risk of convulsions when tramadol given with ●**MAOIs**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when pethidine given with ●**MAOIs**—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects when fentanyl given with **MAOIs**, **SSRI-related antidepressants** or **SSRIs**; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with ●**MAOIs**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with ●**moclobemide**—manufacturer of moclobemide advises consider reducing dose of opioid analgesics; possible CNS excitation or depression (hypertension or hypotension) when dextromethorphan or pethidine given with ●**moclobemide**—avoid concomitant use; increased risk of CNS toxicity when tramadol given with ●**SSRIs** or ●**tricyclics**; plasma concentration of methadone possibly reduced by **St John's wort**; sedative effects possibly increased when opioid analgesics given with **tricyclics**
- **Antiepileptics**: metabolism of fentanyl possibly accelerated by **carbamazepine** and **phenytoin** (reduced effect); dextropropoxyphene enhances effects of ●**carbamazepine**; effects of tramadol reduced by **carbamazepine**; plasma concentration of methadone reduced by **carbamazepine** and **phenobarbital**; morphine increases bioavailability of **gabapentin**; metabolism of methadone accelerated by **phenytoin** (reduced effect and risk of withdrawal effects); possible increased risk of pethidine toxicity when given with ●**phenytoin**
- **Antifungals**: metabolism of alfentanil inhibited by **fluconazole** (risk of prolonged or delayed respiratory depression); plasma concentration of methadone increased by **fluconazole**; metabolism of alfentanil possibly inhibited by **itraconazole**; plasma concentration of methadone possibly increased by ●**itraconazole** (increased risk of ventricular arrhythmias); plasma concentration of oxycodone increased by **itraconazole** and ●**voriconazole**; plasma concentration of alfentanil and methadone increased by ●**voriconazole** (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by ●**triazoles**
- **Antihistamines**: sedative effects possibly increased when opioid analgesics given with ●**sedating antihistamines**
- **Antimalarials**: avoidance of methadone advised by manufacturer of ●**piperquine with arteminol** (possible risk of ventricular arrhythmias)
  - Antimuscarinics: possible increased risk of antimuscarinic side-effects when codeine given with **antimuscarinics**
- **Antipsychotics**: enhanced hypotensive and sedative effects when opioid analgesics given with **antipsychotics**; increased risk of ventricular arrhythmias when methadone given with ●**antipsychotics** that prolong the QT interval; increased risk of con-

**Opioid Analgesics**

- **Antipsychotics** (*continued*)
  - **antipsychotics**; increased risk of ventricular arrhythmias when methadone given with ●**amisulpride**—avoid concomitant use
- **Antivirals**: plasma concentration of methadone possibly reduced by **abacavir**, **nevirapine** and **rilpivirine**; plasma concentration of methadone possibly affected by **boceprevir**; possible increased risk of prolonged sedation and respiratory depression when buprenorphine given with **boceprevir**; methadone possibly reduces plasma concentration of **didanosine**; plasma concentration of methadone reduced by **efavirenz**, **fosamprenavir** and **ritonavir**; plasma concentration of morphine possibly reduced by **ritonavir**; plasma concentration of alfentanil and fentanyl increased by ●**ritonavir**; plasma concentration of dextropropoxyphene increased by ●**ritonavir** (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by **ritonavir**; plasma concentration of pethidine reduced by ●**ritonavir**, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with ●**saquinavir**—avoid concomitant use; caution with methadone advised by manufacturer of ●**telaprevir** (risk of ventricular arrhythmias); buprenorphine possibly reduces plasma concentration of **tipranavir**; methadone possibly increases plasma concentration of **zidovudine**
- **Anxiolytics and Hypnotics**: increased sedative effect when opioid analgesics given with **anxiolytics and hypnotics**; fentanyl possibly inhibits metabolism of **midazolam**
- **Atomoxetine**: increased risk of ventricular arrhythmias when methadone given with ●**atomoxetine**; possible increased risk of convulsions when tramadol given with **atomoxetine**
- **Beta-blockers**: morphine possibly increases plasma concentration of **esmolol**
- **Calcium-channel Blockers**: metabolism of alfentanil inhibited by **diltiazem** (risk of prolonged or delayed respiratory depression)
- **Cytotoxics**: possible increased risk of ventricular arrhythmias when methadone given with ●**bosutinib**; caution with alfentanil and fentanyl advised by manufacturer of ●**crizotinib**; possible increased risk of ventricular arrhythmias when methadone given with ●**vandetanib**—avoid concomitant use
- **Dapoxetine**: possible increased risk of serotonergic effects when tramadol given with ●**dapoxetine** (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- **Domperidone**: opioid analgesics antagonise effects of **domperidone** on gastro-intestinal activity
- **Dopaminergics**: risk of CNS toxicity when pethidine given with ●**rasagiline** (avoid pethidine for 2 weeks after rasagiline); avoid concomitant use of dextromethorphan with ●**rasagiline**; hyperpyrexia and CNS toxicity reported when pethidine given with ●**selegiline** (avoid concomitant use); avoidance of opioid analgesics advised by manufacturer of **selegiline**
- **5HT<sub>2</sub>-receptor Antagonists**: effects of tramadol possibly antagonised by **ondansetron**
- **Memantine**: increased risk of CNS toxicity when dextromethorphan given with ●**memantine** (manufacturer of memantine advises avoid concomitant use)
- **Metoclopramide**: opioid analgesics antagonise effects of **metoclopramide** on gastro-intestinal activity

**Opioid Analgesics** (continued)

Muscle Relaxants: increased sedative effect when

fentanyl or morphine given with **baclofen**

- Nalmefene: avoidance of opioid analgesics advised by manufacturer of **nalmefene**

- Sodium Oxybate: opioid analgesics enhance effects of **sodium oxybate** (avoid concomitant use)

Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by **cimetidine** (increased plasma concentration)

**Orlistat**

Anti-arrhythmics: orlistat possibly reduces plasma concentration of **amiodarone**

Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of **coumarins**

Antidiabetics: manufacturer of orlistat advises avoid concomitant use with **acarbose**

- Antiepileptics: possible increased risk of convulsions when orlistat given with **antiepileptics**
- Antivirals: orlistat possibly reduces absorption of
  - **abacavir**, **atazanavir**, **darunavir**, **didanosine**, **efavirenz**, **elvitegravir**, **emtricitabine**, **enfuvirtide**, **etravirine**, **fosamprenavir**, **indinavir**, **lamivudine**, **lopinavir**, **maraviroc**, **nevirapine**, **raltegravir**, **rilpivirine**, **ritonavir**, **saquinavir**, **stavudine**, **tenofovir**, **tipranavir** and **zidovudine**
- Ciclosporin: orlistat possibly reduces absorption of **ciclosporin**

Thyroid Hormones: possible increased risk of hypothyroidism when orlistat given with **levothyroxine**

**Orphenadrine** *see* Antimuscarinics

**Oxaliplatin** *see* Platinum Compounds

**Oxandrolone** *see* Anabolic Steroids

**Oxazepam** *see* Anxiolytics and Hypnotics

**Oxcarbazepine**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)

- Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of **carbamazepine** (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; avoidance of oxcarbazepine advised by manufacturer of **elnicarbazepine**; oxcarbazepine reduces plasma concentration of **perampanel** (see Dose under Perampanel, p. 226); oxcarbazepine increases plasma concentration of **phenobarbital** and **phenytoin**, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by **valproate**

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Antivirals: avoidance of oxcarbazepine advised by manufacturer of **dolutegravir** and **sofosbuvir**; avoidance of oxcarbazepine advised by manufacturer of **rilpivirine** (plasma concentration of rilpivirine possibly reduced)

Ciclosporin: oxcarbazepine possibly reduces plasma concentration of **ciclosporin**

- Clopidogrel: oxcarbazepine possibly reduces antiplatelet effect of **clopidogrel**
- Cytotoxics: oxcarbazepine reduces plasma concentration of **imatinib**—avoid concomitant use
- Oestrogens: oxcarbazepine accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 402)

**Oxcarbazepine** (continued)

- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Progestogens: oxcarbazepine accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 402)

**Oxprenolol** *see* Beta-blockers

**Oxybutynin** *see* Antimuscarinics

**Oxycodone** *see* Opioid Analgesics

**Oxymetazoline** *see* Sympathomimetics

**Oxytetracycline** *see* Tetracyclines

**Oxytocin**

Anaesthetics, General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with **volatile liquid general anaesthetics**

Prostaglandins: uterotonic effect of oxytocin potentiated by **prostaglandins**

Sympathomimetics: risk of hypertension when oxytocin given with vasoconstrictor **sympathomimetics** (due to enhanced vasopressor effect)

**Paclitaxel**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of paclitaxel increased by **ritonavir**

- Cytotoxics: increased risk of neutropenia when paclitaxel given with **lapatinib**

**Paliperidone** *see* Antipsychotics

**Pamidronate Disodium** *see* Bisphosphonates

**Pancreatin**

Antidiabetics: pancreatin antagonises hypoglycaemic effect of **acarbose**

**Pancuronium** *see* Muscle Relaxants

**Pantoprazole** *see* Proton Pump Inhibitors

**Papaveretum** *see* Opioid Analgesics

**Paracetamol**

Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of **coumarins**

Antidiabetics: absorption of paracetamol possibly reduced when given 1 to 4 hours after **lixisenatide**

Antiepileptics: metabolism of paracetamol possibly accelerated by **carbamazepine**, **phenobarbital** and **phenytoin** (also isolated reports of hepatotoxicity)

Cytotoxics: paracetamol possibly inhibits metabolism of **intravenous busulfan** (manufacturer of **intravenous busulfan** advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of **imatinib**

Lipid-regulating Drugs: absorption of paracetamol reduced by **colestyramine**

Metoclopramide: rate of absorption of paracetamol increased by **metoclopramide**

**Paraldehyde**

- Alcohol: increased sedative effect when paraldehyde given with **alcohol**
- Disulfiram: risk of toxicity when paraldehyde given with **disulfiram**

**Parasympathomimetics**

Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by **propafenone**

- Antibacterials: plasma concentration of galantamine increased by **erythromycin**; effects of neostigmine and pyridostigmine antagonised by **aminoglycosides**; effects of neostigmine and pyridostigmine antagonised by **clindamycin**; effects of neostigmine and pyridostigmine antagonised by **polymyxins**

Antidepressants: plasma concentration of galantamine increased by **paroxetine**

Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for **chloroquine** and **hydroxychloroquine** to increase symptoms of myasthenia gravis

Antimuscarinics: effects of parasympathomimetics antagonised by **antimuscarinics**

**Parasympathomimetics** (continued)

Beta-blockers: increased risk of arrhythmias when pilocarpine given with **beta-blockers**; effects of neostigmine and pyridostigmine antagonised by **propranolol**

Cytotoxics: possible increased risk of bradycardia when pilocarpine given with **crizotinib**

Lithium: effects of neostigmine antagonised by **lithium**

Muscle Relaxants: donepezil possibly enhances effects of **suxamethonium**; edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of **suxamethonium**; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of **non-depolarising muscle relaxants**; donepezil possibly antagonises effects of **non-depolarising muscle relaxants**

**Parecoxib** see NSAIDs

**Paricalcitol** see Vitamins

**Paroxetine** see Antidepressants, SSRI

**Psireotide**

Antidiabetics: psireotide possibly reduces requirements for **antidiabetics**

Antimuscarinics: possible increased risk of bradycardia when psireotide given with **ipratropium** or **oxybutynin**

Beta-blockers: possible increased risk of bradycardia when psireotide given with **carteolol**, **metoprolol**, **propranolol** or **sotalol**

Calcium-channel Blockers: possible increased risk of bradycardia when psireotide given with **diltiazem** or **verapamil**

- Cyclosporin: psireotide possibly reduces plasma concentration of **cyclosporin**

**Pazopanib**

- Antibacterials: plasma concentration of pazopanib possibly increased by **clarithromycin** and **telithromycin** (reduce dose of pazopanib); plasma concentration of pazopanib possibly reduced by **rifampicin**

- Antifungals: plasma concentration of pazopanib possibly increased by **itraconazole** and **voriconazole** (reduce dose of pazopanib)

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

- Antivirals: plasma concentration of pazopanib possibly increased by **atazanavir**, **indinavir** and **ritonavir** (reduce dose of pazopanib); avoidance of pazopanib advised by manufacturer of **boceprevir**; increased risk of ventricular arrhythmias when pazopanib given with **saquinavir**—avoid concomitant use

Cytotoxics: plasma concentration of pazopanib increased by **lapatinib**

- Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with **grapefruit juice**

Ulcer-healing Drugs: absorption of pazopanib possibly reduced by **histamine H<sub>2</sub>-antagonists**—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H<sub>2</sub>-antagonists; absorption of pazopanib possibly reduced by **proton pump inhibitors**—manufacturer of pazopanib advises give at the same time as proton pump inhibitors

**Pegfilgrastim** see Filgrastim

**Peginterferon Alfa** see Interferons

**Pemetrexed**

Analgesics: renal excretion of pemetrexed possibly reduced by **NSAIDs** and **aspirin**—consult product literature

- Antimalarials: antifolate effect of pemetrexed increased by **pyrimethamine**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Penicillamine**

Analgesics: possible increased risk of nephrotoxicity when penicillamine given with **NSAIDs**

**Penicillamine** (continued)

Antacids: absorption of penicillamine reduced by **antacids**

- Antipsychotics: avoid concomitant use of penicillamine with **clozapine** (increased risk of agranulocytosis)

Cardiac Glycosides: penicillamine possibly reduces plasma concentration of **digoxin**

Gold: manufacturer of penicillamine advises avoid concomitant use with **sodium aurothiomalate** (increased risk of toxicity)

Iron: absorption of penicillamine reduced by **oral iron**

Zinc: penicillamine reduces absorption of **zinc**, also absorption of penicillamine reduced by zinc

**Penicillins**

Allopurinol: increased risk of rash when amoxicillin or ampicillin given with **allopurinol**

Antibacterials: absorption of phenoxymethylpenicillin reduced by **neomycin**; effects of penicillins possibly antagonised by **tetracyclines**

Anticoagulants: an interaction between broad-spectrum penicillins and **coumarins** and **phenindione** has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered

- Antiepileptics: manufacturer of pivmecillinam advises avoid concomitant use with **valproate**

Cytotoxics: penicillins reduce excretion of **methotrexate** (increased risk of toxicity)

Muscle Relaxants: piperacillin enhances effects of **non-depolarising muscle relaxants** and **suxamethonium**

Mycophenolate: co-amoxiclav possibly reduces plasma concentration of **mycophenolate**

Probenecid: excretion of penicillins reduced by **probenecid** (increased plasma concentration)

Sulfinpyrazone: excretion of penicillins reduced by **sulfinpyrazone**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Pentamidine Isetionate**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with **amiodarone**—avoid concomitant use; possible increased risk of ventricular arrhythmias when pentamidine isetionate given with **disopyramide**

- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with **parenteral erythromycin**; increased risk of ventricular arrhythmias when pentamidine isetionate given with **moxifloxacin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when parenteral pentamidine isetionate given with **tellithromycin**

- Antidepressants: avoidance of pentamidine isetionate advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when pentamidine isetionate given with **tricyclics**

Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with **amphotericin**

- Antimalarials: avoidance of pentamidine isetionate advised by manufacturer of **piperaquine with artemisininol** (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with **amisulpride** or **droperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with **phenothiazines**

- Antivirals: increased risk of hypocalcaemia when parenteral pentamidine isetionate given with **foscarnet**; increased risk of ventricular arrhythmias when pentamidine isetionate given with **saquinavir**—avoid concomitant use

**Pentamidine Isetionate** (*continued*)

- Cytotoxics: possible increased risk of ventricular arrhythmias when pentamidine isetionate given with
  - **vandetanib**—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with **ivabradine**

**Pentazocine** *see* Opioid Analgesics**Pentostatin**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased toxicity when pentostatin given with high-dose
  - **cyclophosphamide**—avoid concomitant use; increased pulmonary toxicity when pentostatin given with
    - **fludarabine** (unacceptably high incidence of fatalities)

**Pentoxifylline**

- Analgesics: possible increased risk of bleeding when pentoxifylline given with **NSAIDs**; increased risk of bleeding when pentoxifylline given with
  - **ketorolac** (avoid concomitant use)

Theophylline: pentoxifylline increases plasma concentration of **theophylline**

**Perampanel**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by
  - **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of perampanel reduced by
  - **carbamazepine**, **oxcarbazepine** and **phenytoin** (*see* Dose under Perampanel, p. 226); plasma concentration of perampanel reduced by **topiramate**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by
  - **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by
  - **antipsychotics** (convulsive threshold lowered)
- Anxiolytics and Hypnotics: perampanel reduces plasma concentration of **midazolam**
- Orlistat: possible increased risk of convulsions when antiepileptics given with
  - **orlistat**
- Progestogens: perampanel accelerates metabolism of
  - **progestogens** (reduced contraceptive effect—*see* p. 402)

**Pergolide**

- Antipsychotics: effects of pergolide antagonised by **antipsychotics**
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by **methylodopa**
- Metoclopramide: antiparkinsonian effect of pergolide antagonised by **metoclopramide**

**Pericyazine** *see* Antipsychotics**Perindopril** *see* ACE Inhibitors**Perphenazine** *see* Antipsychotics**Pethidine** *see* Opioid Analgesics**Phenelzine** *see* MAOIs**Phenindione**

**Note** Change in patient's clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of
  - **alcohol**
- Anabolic Steroids: anticoagulant effect of phenindione enhanced by
  - **anabolic steroids**
- Analgesics: anticoagulant effect of phenindione possibly enhanced by
  - **NSAIDs**; increased risk of haemorrhage when anticoagulants given with *intravenous*
    - **diclofenac** (avoid concomitant use, includ-

**Phenindione****Analgesics** (*continued*)

- ing low-dose heparins); increased risk of haemorrhage when anticoagulants given with
  - **ketorolac** (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with
    - **aspirin** (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by
  - **amiodarone** (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by
    - **dronedarone**
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with
  - **neomycin** (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by **levofloxacin** and **tetracyclines**; an interaction between phenindione and broad-spectrum **penicillins** has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of phenindione possibly inhibited by **sulfonamides**
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with
  - **apixaban**, **dabigatran** and **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antivirals: anticoagulant effect of phenindione possibly enhanced by
  - **ritonavir**
- Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of
  - **clopidogrel**
- Corticosteroids: anticoagulant effect of phenindione may be enhanced or reduced by **corticosteroids**
- Dipyridamole: anticoagulant effect of phenindione enhanced due to antiplatelet action of
  - **dipyridamole**
- Enteral Foods: anticoagulant effect of phenindione antagonised by vitamin K (present in some
  - **enteral feeds**)
- Iloprost: increased risk of bleeding when phenindione given with
  - **iloprost**
- Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by
  - **colestyramine**; anticoagulant effect of phenindione possibly enhanced by
    - **rosuvastatin**; anticoagulant effect of phenindione enhanced by
      - **fibrates**
- Oestrogens: anticoagulant effect of phenindione antagonised by
  - **oestrogens**
- Prasugrel: possible increased risk of bleeding when phenindione given with
  - **prasugrel**
- Progestogens: anticoagulant effect of phenindione antagonised by
  - **progestogens**
- Testolactone: anticoagulant effect of phenindione enhanced by
  - **testolactone**
- Testosterone: anticoagulant effect of phenindione enhanced by
  - **testosterone**
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by
  - **thyroid hormones**
- Vitamins: anticoagulant effect of phenindione antagonised by
  - **vitamin K**

**Phenobarbital**

**Note** Primidone interactions as for phenobarbital

**Alcohol:** increased sedative effect when phenobarbital given with **alcohol**

**Analgesics:** phenobarbital reduces plasma concentration of **methadone**; phenobarbital possibly accelerates metabolism of **paracetamol** (also isolated reports of hepatotoxicity)

- Anti-arrhythmics: phenobarbital accelerates metabolism of **disopyramide** (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of
  - **dronedarone**—avoid concomitant use; phenobarbital possibly accelerates metabolism of **propafenone**
- Antibacterials: phenobarbital accelerates metabolism of **metronidazole** (reduced effect); phenobarbital possibly reduces plasma concentration of **rif-**

**Phenobarbital**

- **Antibacterials** (*continued*)
  - **ampicillin**; phenobarbital accelerates metabolism of **doxycycline** (reduced plasma concentration); phenobarbital possibly accelerates metabolism of **chloramphenicol** (reduced plasma concentration); phenobarbital reduces plasma concentration of **tetracycline** (avoid during and for 2 weeks after phenobarbital)
- **Anticoagulants**: phenobarbital accelerates metabolism of **coumarins** (reduced anticoagulant effect); phenobarbital possibly reduces plasma concentration of **rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- **Antidepressants**: phenobarbital possibly reduces plasma concentration of **reboxetine**; phenobarbital reduces plasma concentration of **paroxetine**; phenobarbital accelerates metabolism of **mianserin** (reduced plasma concentration); anticonvulsant effect of antidepressants possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antidepressants antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); plasma concentration of phenobarbital possibly reduced by **St John's wort**—avoid concomitant use; phenobarbital possibly accelerates metabolism of **tricyclics** (reduced plasma concentration)
- **Antiepileptics**: plasma concentration of phenobarbital possibly increased by **carbamazepine**; phenobarbital possibly reduces plasma concentration of **ethosuximide**, **rufinamide** and **topiramate**; phenobarbital reduces plasma concentration of **lamotrigine**, **tiagabine** and **zonisamide**; plasma concentration of phenobarbital increased by **oxcarbazepine**, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital often increased by **phenytoin**, plasma concentration of phenytoin often reduced but may be increased; plasma concentration of phenobarbital increased by **stiripentol**; plasma concentration of phenobarbital increased by **valproate** (also plasma concentration of valproate reduced)
- **Antifungals**: phenobarbital possibly reduces plasma concentration of **itraconazole** and **posaconazole**; phenobarbital possibly reduces plasma concentration of **voriconazole**—avoid concomitant use; phenobarbital reduces absorption of **griseofulvin** (reduced effect)
- **Antimalarials**: avoidance of phenobarbital advised by manufacturer of **piperazine with arteminol**; anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- **Antipsychotics**: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered); phenobarbital accelerates metabolism of **haloperidol** (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with **chlorpromazine**; phenobarbital possibly reduces plasma concentration of **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenobarbital possibly reduces plasma concentration of **clozapine**
- **Antivirals**: phenobarbital possibly reduces plasma concentration of **abacavir**, **darunavir**, **fosamprenavir**, **indinavir**, **lopinavir** and **saquinavir**; avoidance of phenobarbital advised by manufacturer of **boceprevir** and **rilpivirine** (plasma concentration of boceprevir and rilpivirine possibly reduced); avoidance of phenobarbital advised by manufacturer of **dolutegravir**, **elvitegravir**, **etravirine**, **sofosbuvir** and **telaprevir**

Anxiolytics and Hypnotics: increased sedative effect when phenobarbital given with **anxiolytics and hyp-**

**Phenobarbital**

Anxiolytics and Hypnotics (*continued*)

- **notics**; phenobarbital often reduces plasma concentration of **clonazepam**
- **Aprepitant**: phenobarbital possibly reduces plasma concentration of **aprepitant**
- **Beta-blockers**: phenobarbital possibly reduces plasma concentration of **propranolol**
- **Caffeine citrate**: effects of phenobarbital possibly antagonised by **caffeine citrate**
- **Calcium-channel Blockers**: phenobarbital probably reduces effects of **calcium-channel blockers**; avoidance of phenobarbital advised by manufacturer of **nimodipine** (plasma concentration of nimodipine reduced)
- **Ciclosporin**: phenobarbital accelerates metabolism of **ciclosporin** (reduced plasma concentration)
- **Cobicistat**: phenobarbital possibly reduces plasma concentration of **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- **Corticosteroids**: phenobarbital accelerates metabolism of **corticosteroids** (reduced effect)
- **Cytotoxics**: phenobarbital possibly decreases plasma concentration of **axitinib** (increase dose of axitinib—consult axitinib product literature); phenobarbital possibly reduces plasma concentration of **bosutinib** and **crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of phenobarbital advised by manufacturer of **cabazitaxel**, **dabrafenib** and **gefitinib**; avoidance of phenobarbital advised by manufacturer of **vandetanib** (plasma concentration of vandetanib possibly reduced); phenobarbital possibly reduces plasma concentration of **etoposide**; phenobarbital reduces plasma concentration of **irinotecan** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenobarbital given with **procarbazine**
- **Diuretics**: phenobarbital reduces plasma concentration of **eplerenone**—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with **carbonic anhydrase inhibitors**
- **Folates**: plasma concentration of phenobarbital possibly reduced by **folates**
- **Hormone Antagonists**: phenobarbital possibly reduces plasma concentration of **abiraterone**—manufacturer of abiraterone advises avoid concomitant use; phenobarbital accelerates metabolism of **toremifene** (reduced plasma concentration)
- **Ivacaftor**: phenobarbital possibly reduces plasma concentration of **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- **Leukotriene Receptor Antagonists**: phenobarbital reduces plasma concentration of **montelukast**
- **Oestrogens**: phenobarbital accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 402)
- **Orlistat**: possible increased risk of convulsions when antiepileptics given with **orlistat**
- **Progestogens**: phenobarbital accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 402)
- **Roflumilast**: phenobarbital possibly inhibits effects of **roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
- **Sodium Oxybate**: avoidance of phenobarbital advised by manufacturer of **sodium oxybate**
- **Sympathomimetics**: plasma concentration of phenobarbital possibly increased by **methylphenidate**
- **Tacrolimus**: phenobarbital reduces plasma concentration of **tacrolimus**
- **Theophylline**: phenobarbital accelerates metabolism of **theophylline** (reduced effect)

**Phenobarbital** (*continued*)

Thyroid Hormones: phenobarbital accelerates metabolism of **thyroid hormones** (may increase requirements for thyroid hormones in hypothyroidism)

Ticagrelor: phenobarbital possibly reduces plasma concentration of **ticagrelor**

- Ullipristal: avoidance of phenobarbital advised by manufacturer of **•ullipristal** (contraceptive effect of ullipristal possibly reduced)

Vitamins: phenobarbital possibly increases requirements for **vitamin D**

**Phenothiazines** *see* Antipsychotics**Phenoxybenzamine** *see* Alpha-blockers**Phenoxymethylpenicillin** *see* Penicillins**Phentolamine** *see* Alpha-blockers**Phenylephrine** *see* Sympathomimetics**Phenytoin**

**Note** Fosphenytoin interactions as for phenytoin

Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of **alcohol**

- Analgesics: excretion of phenytoin possibly reduced by **•acemetacin** (increased risk of toxicity); phenytoin possibly accelerates metabolism of **•fentanyl** (reduced effect); phenytoin accelerates metabolism of **•methadone** (reduced effect and risk of withdrawal effects); phenytoin possibly increases risk of **•pethidine** toxicity; effects of phenytoin enhanced by **•aspirin**; phenytoin possibly accelerates metabolism of **•paracetamol** (also isolated reports of hepatotoxicity)

Antacids: absorption of phenytoin reduced by **antacids**

- Anti-arrhythmics: metabolism of phenytoin inhibited by **•amiodarone** (increased plasma concentration); phenytoin reduces plasma concentration of **•disopyramide**; phenytoin possibly reduces plasma concentration of **•dronedrone**—avoid concomitant use
- Antibacterials: metabolism of phenytoin inhibited by **•clarithromycin** (increased plasma concentration); metabolism of phenytoin possibly inhibited by **•metronidazole** (increased plasma concentration); plasma concentration of phenytoin increased or decreased by **•ciprofloxacin**; phenytoin accelerates metabolism of **•doxycycline** (reduced plasma concentration); plasma concentration of phenytoin increased by **•chloramphenicol** (increased risk of toxicity); metabolism of phenytoin possibly inhibited by **•isoniazid** (increased risk of toxicity); metabolism of phenytoin accelerated by **•rifamycins** (reduced plasma concentration); plasma concentration of phenytoin possibly increased by **•sulfonamides**; phenytoin reduces plasma concentration of **•telithromycin** (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by **•trimethoprim** (also increased antifolate effect)
- Anticoagulants: phenytoin accelerates metabolism of **•coumarins** (possibility of reduced anticoagulant effect, but enhancement also reported); phenytoin possibly reduces plasma concentration of **•dabigatran**—manufacturer of dabigatran advises avoid concomitant use; phenytoin possibly reduces plasma concentration of **•rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: plasma concentration of phenytoin increased by **•fluoxetine** and **•fluvoxamine**; phenytoin reduces plasma concentration of **•mianserin**, **•mirtazapine** and **•paroxetine**; plasma concentration of phenytoin possibly increased by **•sertraline**, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **•tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **•SSRIs** and **•tricyclics** (convulsive threshold low-

**Phenytoin**• Antidepressants (*continued*)

ered); plasma concentration of phenytoin possibly reduced by **•St John's wort**—avoid concomitant use; phenytoin possibly reduces plasma concentration of **•tricyclics**

Antidiabetics: plasma concentration of phenytoin transiently increased by **•tolbutamide** (possibility of toxicity)

- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with **•carbamazepine**, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of **•eslicarbazepine**, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by **•ethosuximide**, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of **•lamotrigine**, **•tiagabine** and **•zonisamide**; plasma concentration of phenytoin increased by **•oxcarbazepine**, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin reduces plasma concentration of **•perampanel** (see Dose under Perampanel, p. 226); phenytoin often increases plasma concentration of **•phenobarbital**, plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of **•retigabine**; phenytoin possibly reduces plasma concentration of **•rufinamide**, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased by **•stiripentol**; plasma concentration of phenytoin increased by **•topiramate** (also plasma concentration of topiramate reduced); plasma concentration of phenytoin increased or possibly reduced when given with **•valproate**, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by **•vigabatrin**
- Antifungals: anticonvulsant effect of phenytoin enhanced by **•miconazole** (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by **•fluconazole** (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of **•itraconazole**—avoid concomitant use; phenytoin reduces plasma concentration of **•posaconazole**; plasma concentration of phenytoin increased by **•voriconazole**, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of **•caspofungin**—consider increasing dose of caspofungin
- Antimalarials: avoidance of phenytoin advised by manufacturer of **•piperaquine with arteminol**; anticonvulsant effect of antiepileptics antagonised by **•mefloquine**; anticonvulsant effect of phenytoin antagonised by **•pyrimethamine**, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **•antipsychotics** (convulsive threshold lowered); phenytoin reduces plasma concentration of **•haloperidol**; plasma concentration of phenytoin possibly increased or decreased by **•chlorpromazine**; phenytoin possibly reduces plasma concentration of **•aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenytoin accelerates metabolism of **•clozapine** and **•quetiapine** (reduced plasma concentration)
- Antivirals: phenytoin possibly reduces plasma concentration of **•abacavir**, **•darunavir**, **•lopinavir** and **•saquinavir**; avoidance of phenytoin advised by manufacturer of **•boceprevir** and **•rilpivirine** (plasma concentration of boceprevir and rilpivirine possibly reduced); avoidance of phenytoin advised by manu-

**Phenytoin**

- Antivirals (*continued*)
  - factor of **dolutegravir**, **elvitegravir**, **etravirine**, **fosfobuvir** and **telaprevir**; phenytoin possibly reduces plasma concentration of **indinavir**, also plasma concentration of phenytoin possibly increased; phenytoin possibly reduces plasma concentration of **ritonavir**, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by **zidovudine**
- Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of **clonazepam**; plasma concentration of phenytoin increased or decreased by **diazepam**; plasma concentration of phenytoin possibly increased or decreased by **benzodiazepines**
- Aprepitant: phenytoin possibly reduces plasma concentration of **aprepitant**
- Bupropion: phenytoin reduces plasma concentration of **bupropion**
- Caffeine citrate: phenytoin reduces plasma concentration of **caffeine citrate**
- Calcium-channel Blockers: phenytoin reduces effects of **felodipine** and **verapamil**; avoidance of phenytoin advised by manufacturer of **nimodipine** (plasma concentration of nimodipine possibly reduced); plasma concentration of phenytoin increased by **diltiazem** but also effect of diltiazem reduced
- Cardiac Glycosides: phenytoin possibly reduces plasma concentration of **digoxin**
- Ciclosporin: phenytoin accelerates metabolism of **ciclosporin** (reduced plasma concentration)
- Cobicistat: phenytoin possibly reduces plasma concentration of **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: phenytoin accelerates metabolism of **corticosteroids** (reduced effect)
- Cytotoxics: phenytoin possibly reduces plasma concentration of **busulfan**, **eribulin** and **etoposide**; metabolism of **busulfan** possibly inhibited by **fluorouracil** (increased risk of toxicity); phenytoin increases antifolate effect of **methotrexate**; plasma concentration of phenytoin possibly reduced by **cisplatin**; phenytoin possibly decreases plasma concentration of **axitinib** (increase dose of axitinib—consult axitinib product literature); phenytoin possibly reduces plasma concentration of **bosutinib** and **crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of phenytoin advised by manufacturer of **cabazitaxel**, **dabrafenib**, **gefitinib**, **lapatinib** and **vemurafenib**; phenytoin reduces plasma concentration of **imatinib**—avoid concomitant use; phenytoin reduces plasma concentration of **irinotecan** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenytoin given with **procarbazine**; avoidance of phenytoin advised by manufacturer of **vismodegib** (plasma concentration of vismodegib possibly reduced)
- Diazoxide: plasma concentration of phenytoin reduced by **diazoxide**, also effect of diazoxide may be reduced
- Disulfiram: metabolism of phenytoin inhibited by **disulfiram** (increased risk of toxicity)
- Diuretics: plasma concentration of phenytoin possibly increased by **acetazolamide**; phenytoin antagonises effects of **furosemide**; phenytoin reduces plasma concentration of **eplerenone**—avoid concomitant use; increased risk of osteomalacia when phenytoin given with **carbonic anhydrase inhibitors**
- Dopaminergics: phenytoin possibly reduces effects of **levodopa**
- Enteral Foods: absorption of phenytoin possibly reduced by **enteral feeds**
- Folates: plasma concentration of phenytoin possibly reduced by **folates**

**Phenytoin (continued)**

- Hormone Antagonists: phenytoin possibly reduces plasma concentration of **abiraterone**—manufacturer of abiraterone advises avoid concomitant use; phenytoin possibly accelerates metabolism of **toremifene**
  - 5HT<sub>2</sub>-receptor Antagonists: phenytoin accelerates metabolism of **ondansetron** (reduced effect)
  - Ivacaftor: phenytoin possibly reduces plasma concentration of **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
  - Leflunomide: plasma concentration of phenytoin possibly increased by **leflunomide**
  - Levamisole: plasma concentration of phenytoin possibly increased by **levamisole**
  - Lipid-regulating Drugs: absorption of phenytoin possibly reduced by **colesevelam**; combination of phenytoin with **fluvastatin** may increase plasma concentration of either drug (or both)
  - Lithium: neurotoxicity may occur when phenytoin given with **lithium** without increased plasma concentration of lithium
  - Macitentan: avoidance of phenytoin advised by manufacturer of **macitentan**
  - Modafinil: plasma concentration of phenytoin possibly increased by **modafinil**
  - Muscle Relaxants: *long-term use* of phenytoin reduces effects of **non-depolarising muscle relaxants** (but *acute use* of phenytoin might increase effects of non-depolarising muscle relaxants)
  - Oestrogens: phenytoin accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 402)
  - Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
  - Progestogens: phenytoin accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 402)
  - Roflumilast: phenytoin possibly inhibits effects of **roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
  - Sulfinpyrazone: plasma concentration of phenytoin increased by **sulfinpyrazone**
  - Sympathomimetics: plasma concentration of phenytoin increased by **methylphenidate**
  - Tacrolimus: phenytoin reduces plasma concentration of **tacrolimus**, also plasma concentration of phenytoin possibly increased
  - Theophylline: plasma concentration of both drugs reduced when phenytoin given with **theophylline**
  - Thyroid Hormones: phenytoin accelerates metabolism of **thyroid hormones** (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
  - Tibolone: phenytoin accelerates metabolism of **tibolone**
  - Ticagrelor: phenytoin possibly reduces plasma concentration of **ticagrelor**
  - Ulcer-healing Drugs: metabolism of phenytoin inhibited by **cimetidine** (increased plasma concentration); effects of phenytoin enhanced by **esomeprazole**; effects of phenytoin possibly enhanced by **omeprazole**; absorption of phenytoin reduced by **sucralfate**
  - Ulipristal: avoidance of phenytoin advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
  - Vaccines: effects of phenytoin enhanced by **influenza vaccine**
  - Vitamins: phenytoin possibly increases requirements for **vitamin D**
- Pholcodine**
- Antidepressants: manufacturer of pholcodine advises avoid for 2 weeks after stopping **MAOIs**

**Phosphodiesterase Type-3 Inhibitors**

- Anagrelide: avoidance of enoximone and milrinone advised by manufacturer of **anagrelide**

**Physostigmine** *see* Parasympathomimetics**Pilocarpine** *see* Parasympathomimetics**Pimozide** *see* Antipsychotics**Pindolol** *see* Beta-blockers**Pioglitazone** *see* Antidiabetics**Piperacillin** *see* Penicillins**Piperazine** *see* Piperazine with Arteminol**Piperazine with Arteminol**

**Note** Piperazine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped

- Analgesics: manufacturer of piperazine with arteminol advises avoid concomitant use with **methadone** (possible risk of ventricular arrhythmias)
- Anti-arrhythmic: manufacturer of piperazine with arteminol advises avoid concomitant use with **amiodarone** and **disopyramide** (possible risk of ventricular arrhythmias)
- Antibacterials: manufacturer of piperazine with arteminol advises avoid concomitant use with **macrolides** and **moxifloxacin** (possible risk of ventricular arrhythmias); manufacturer of piperazine with arteminol advises avoid concomitant use with **rifampicin**
- Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); manufacturer of piperazine with arteminol advises avoid concomitant use with **antidepressants**

Antiepileptics: manufacturer of piperazine with arteminol advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**

- Antifungals: manufacturer of piperazine with arteminol advises avoid concomitant use with **imidazoles** and **triazoles** (possible risk of ventricular arrhythmias)
  - Antihistamines: manufacturer of piperazine with arteminol advises avoid concomitant use with **mizolastine** (possible risk of ventricular arrhythmias)
  - Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**
  - Antipsychotics: manufacturer of piperazine with arteminol advises avoid concomitant use with **droperidol**, **haloperidol**, **phenothiazines** and **pimozide** (possible risk of ventricular arrhythmias)
  - Antivirals: manufacturer of piperazine with arteminol advises avoid concomitant use with **sauquinavir** (possible risk of ventricular arrhythmias)
  - Beta-blockers: manufacturer of piperazine with arteminol advises avoid concomitant use with **sotalol** (possible risk of ventricular arrhythmias)
  - Cytotoxics: manufacturer of piperazine with arteminol advises avoid concomitant use with **arsenic trioxide** (possible risk of ventricular arrhythmias); manufacturer of piperazine with arteminol advises avoid concomitant use with **vinblastine**, **vincristine**, **vinflunine** and **vinorelbine**
  - Domperidone: manufacturer of piperazine with arteminol advises avoid concomitant use with **domperidone** (possible risk of ventricular arrhythmias)
- Grapefruit Juice: manufacturer of piperazine with arteminol advises avoid concomitant use with **grapefruit juice**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Pentamidine Isetionate: manufacturer of piperazine with arteminol advises avoid concomitant use with **pentamidine isetionate** (possible risk of ventricular arrhythmias)
  - Vaccines: antimalarials inactivate **oral typhoid vaccine**—*see* p. 626

**Piprotiazine** *see* Antipsychotics**Pirfenidone**

- Antibacterials: plasma concentration of pirfenidone increased by **ciprofloxacin**—*see* Cautions under Pirfenidone, BNF section 3.11
  - Antidepressants: plasma concentration of pirfenidone increased by **fluvoxamine**—manufacturer of pirfenidone advises avoid concomitant use
- Grapefruit Juice: manufacturer of pirfenidone advises avoid concomitant use with **grapefruit juice**

**Piroxicam** *see* NSAIDs**Pivmecillinam** *see* Penicillins**Pixantrone**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Vaccines: avoid concomitant use of pixantrone with live **vaccines** (*see* p. 604)

**Pizotifen**

Adrenergic Neuron Blockers: pizotifen antagonises hypotensive effect of **adrenergic neuron blockers**

**Platinum Compounds**

- Aldesleukin: avoidance of cisplatin advised by manufacturer of **aldesleukin**
  - Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with **aminoglycosides** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with **capreomycin**; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with **vancomycin**
- Antiepileptics: cisplatin possibly reduces plasma concentration of **phenytoin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of toxicity when cisplatin given with **ifosfamide**; increased pulmonary toxicity when cisplatin given with **bleomycin** and **methotrexate**

Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with **diuretics**

**Polymyxin B** *see* Polymyxins**Polymyxins**

- Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with **aminoglycosides**; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with **capreomycin**; increased risk of nephrotoxicity when polymyxins given with **vancomycin**; increased risk of nephrotoxicity and ototoxicity when colistimethate sodium given with **vancomycin**
- Antifungals: increased risk of nephrotoxicity when polymyxins given with **amphotericin**
- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with **ciclosporin**
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with **platinum compounds**
- Diuretics: increased risk of ototoxicity when polymyxins given with **loop diuretics**
- Muscle Relaxants: polymyxins enhance effects of **non-depolarising muscle relaxants** and **suxamethonium**
- Parasympathomimetics: polymyxins antagonise effects of **neostigmine** and **pyridostigmine**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Polystyrene Sulfonate Resins**

Antacids: risk of intestinal obstruction when polystyrene sulfonate resins given with **aluminium hydroxide**; risk of metabolic alkalosis when polystyrene sulfonate resins given with **oral magnesium salts**

Thyroid Hormones: polystyrene sulfonate resins reduce absorption of **levothyroxine**

**Pomalidomide**

- Antidepressants: plasma concentration of pomalidomide increased by **fluvoxamine**

**Ponatinib**

- Antipsychotics: avoid concomitant use of cytotoxics with **●clopazine** (increased risk of agranulocytosis)

**Posaconazole** *see* Antifungals, Triazole

**Potassium Canrenoate** *see* Diuretics

**Potassium Aminobenzoate**

Antibacterials: potassium aminobenzoate inhibits effects of **sulfonamides**

**Potassium Bicarbonate** *see* Potassium Salts

**Potassium Chloride** *see* Potassium Salts

**Potassium Citrate** *see* Potassium Salts

**Potassium Salts**

**Note** Includes salt substitutes

- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with **●ACE inhibitors**
- Aliskiren: increased risk of hyperkalaemia when potassium salts given with **aliskiren**
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with **●angiotensin-II receptor antagonists**
- Antibacterials: avoid concomitant use of potassium citrate with **methenamine**
- Ciclosporin: increased risk of hyperkalaemia when potassium salts given with **●ciclosporin**
- Diuretics: increased risk of hyperkalaemia when potassium salts given with **●potassium-sparing diuretics and aldosterone antagonists**
- Tacrolimus: increased risk of hyperkalaemia when potassium salts given with **●tacrolimus**
- Ulcer-healing Drugs: avoidance of potassium citrate advised by manufacturer of **sucralfate**

**Pramipexole**

Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of **antipsychotics** (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Ulcer-healing Drugs: excretion of pramipexole reduced by **cimetidine** (increased plasma concentration)

**Prasugrel**

Analgesics: possible increased risk of bleeding when prasugrel given with **NSAIDs**

Anticoagulants: possible increased risk of bleeding when prasugrel given with **coumarins** or **phenindione**

Clopidogrel: possible increased risk of bleeding when prasugrel given with **clopidogrel**

**Pravastatin** *see* Statins

**Prazosin** *see* Alpha-blockers

**Prednisolone** *see* Corticosteroids

**Prednisone** *see* Corticosteroids

**Pregabalin**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **●tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **●SSRIs** and **●tricyclics** (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **●mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Prilocaine**

Anti-arrhythmics: increased myocardial depression when prilocaine given with **anti-arrhythmics**

Antibacterials: increased risk of methaemoglobinemia when prilocaine given with **sulfonamides**

**Primaquine**

- Antidepressants: avoidance of antimalarials advised by manufacturer of **●citalopram** and **●escitalopram** (risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of **●artemether with lumefantrine**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Mepacrine: plasma concentration of primaquine increased by **mepacrine** (increased risk of toxicity)
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 626

**Primidone** *see* Phenobarbital

**Probenecid**

- ACE Inhibitors: probenecid reduces excretion of **captopril**
- Anaesthetics, General: probenecid possibly enhances effects of **thiopental**
- Analgesics: probenecid reduces excretion of **●acetaminolol**, **●dextetoprolol**, **●indometacin**, **●ketoprofen** and **●naproxen** (increased plasma concentration); probenecid reduces excretion of **●ketorolac** (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by **aspirin**
- Antibacterials: probenecid reduces excretion of **meropenem**; probenecid reduces excretion of **cephalosporins**, **ciprofloxacin**, **nalidixic acid**, **norfloxacin** and **penicillins** (increased plasma concentration); probenecid reduces excretion of **dapsone** and **nitrofurantoin** (increased risk of side-effects); effects of probenecid antagonised by **pyrazinamide**
- Antivirals: probenecid reduces excretion of **aciclovir** (increased plasma concentration); probenecid possibly reduces excretion of **famciclovir** (increased plasma concentration); probenecid reduces excretion of **ganciclovir** and **●zidovudine** (increased plasma concentration and risk of toxicity)
- Anxiolytics and Hypnotics: probenecid reduces excretion of **lorazepam** (increased plasma concentration); probenecid possibly reduces excretion of **nitrazepam** (increased plasma concentration)
- Cytotoxics: probenecid reduces excretion of **●methotrexate** (increased risk of toxicity)
- Sodium Benzoate: probenecid possibly reduces excretion of conjugate formed by **sodium benzoate**
- Sodium Phenylbutyrate: probenecid possibly reduces excretion of conjugate formed by **sodium phenylbutyrate**

**Procarbazine**

Alcohol: disulfiram-like reaction when procarbazine given with **alcohol**

Antiepileptics: manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when given with **carbamazepine**, **phenobarbital** and **phenytoin**

- Antipsychotics: avoid concomitant use of cytotoxics with **●clopazine** (increased risk of agranulocytosis)
- Cardiac Glycosides: procarbazine possibly reduces absorption of **digoxin tablets**

**Prochlorperazine** *see* Antipsychotics

**Procyclidine** *see* Antimuscarinics

**Progesterone** *see* Progestogens

**Progestogens**

**Note** Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 402. For further information on interactions of oral progestogen-only contraceptives, see also p. 408; parenteral progestogen-only contraceptives, see also p. 409; the intra-uterine progestogen-only device, see also p. 410; hormonal emergency contraception, see also p. 414

- Antibacterials: plasma concentration of dienogest increased by **erythromycin**; metabolism of progestogens accelerated by **rifamycins** (reduced contraceptive effect—see p. 402)

**Progestogens** (continued)

- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of **coumarins**; progestogens antagonise anticoagulant effect of **phenindione**
- Antidepressants: contraceptive effect of progestogens reduced by **St John's wort** (avoid concomitant use)
- Antidiabetics: progestogens antagonise hypoglycaemic effect of **antidiabetics**
- Antiepileptics: metabolism of progestogens accelerated by **carbamazepine**, **eslicarbazepine**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **rufinamide** and **topiramate** (reduced contraceptive effect—see p. 402); desogestrel possibly increases plasma concentration of **lamotrigine**
- Antifungals: progestogens possibly increase plasma concentration of **voriconazole**; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with **griseofulvin**; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with **terbinafine**
- Antivirals: plasma concentration of norethisterone increased by **atazanavir**; plasma concentration of drospirenone increased by **boceprevir** (increased risk of toxicity); contraceptive effect of progestogens possibly reduced by **efavirenz**; plasma concentration of norgestimate increased by **elvitegravir**; metabolism of progestogens accelerated by **nevirapine** (reduced contraceptive effect—see p. 402)
- Anxiolytics and Hypnotics: progestogens possibly increase plasma concentration of **chlordiazepoxide**, **diazepam** and **nitrazepam**; progestogens possibly reduce plasma concentration of **lorazepam**, **oxazepam** and **temazepam**
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with **aprepitant** (alternative contraception recommended)
- Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with **bosentan** (alternative contraception recommended)
- Ciclosporin: progestogens possibly increase plasma concentration of **ciclosporin**
- Cobicistat: plasma concentration of norgestimate increased by **cobicistat**
- Cytotoxics: possible reduction in contraceptive effect of progestogens advised by manufacturer of **crizotinib** and **vemurafenib**; possible reduced contraceptive effect of hormonal contraceptives containing progestogens advised by manufacturer of **dabrafenib** (alternative contraception recommended)
- Diuretics: risk of hyperkalaemia when drospirenone given with **potassium-sparing diuretics** and **aldosterone antagonists** (monitor serum potassium during first cycle)
- Dopaminergics: progestogens increase plasma concentration of **selegiline**—manufacturer of selegiline advises avoid concomitant use
- Lipid-regulating Drugs: plasma concentration of norethisterone increased by **atorvastatin**; plasma concentration of active metabolite of norgestimate increased by **rosuvastatin**; plasma concentration of norgestrel increased by **rosuvastatin**
- Muscle Relaxants: progestogens possibly increase plasma concentration of **tizanidine** (increased risk of toxicity)
- Sugammadex: plasma concentration of progestogens possibly reduced by **sugammadex**—manufacturer of sugammadex advises additional contraceptive precautions
- Teriflunomide: plasma concentration of levonorgestrel increased by **teriflunomide**

**Progestogens** (continued)

- Ulipristal: contraceptive effect of progestogens possibly reduced by **ulipristal**

**Proguanil**

- Antacids: absorption of proguanil reduced by **oral magnesium salts** (as magnesium trisilicate)
- Anticoagulants: isolated reports that proguanil may enhance anticoagulant effect of **warfarin**
- Antidepressants: avoidance of antimalarials advised by manufacturer of **escitalopram** and **escitalopram** (risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**; increased antifolate effect when proguanil given with **pyrimethamine**
- Antivirals: plasma concentration of proguanil possibly affected by **efavirenz**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 626

**Promazine** see Antipsychotics

**Promethazine** see Antihistamines

**Propafenone**

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**
  - Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**
  - Antibacterials: metabolism of propafenone accelerated by **rifampicin** (reduced effect)
  - Anticoagulants: propafenone enhances anticoagulant effect of **coumarins**
  - Antidepressants: metabolism of propafenone possibly inhibited by **fluoxetine** and **paroxetine**; increased risk of arrhythmias when propafenone given with **tricyclics**
  - Antiepileptics: metabolism of propafenone possibly accelerated by **phenobarbital**
  - Antihistamines: avoidance of propafenone advised by manufacturer of **mizolastine** (possible risk of ventricular arrhythmias)
  - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval
  - Antivirals: plasma concentration of propafenone possibly increased by **fosamprenavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by **ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with **sacquinavir**—avoid concomitant use; caution with propafenone advised by manufacturer of **telaprevir** (risk of ventricular arrhythmias)
  - Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**; propafenone increases plasma concentration of **metoprolol** and **propranolol**
  - Cardiac Glycosides: propafenone increases plasma concentration of **digoxin** (halve dose of digoxin)
  - Ciclosporin: propafenone possibly increases plasma concentration of **ciclosporin**
  - Parasympathomimetics: propafenone possibly antagonises effects of **neostigmine** and **pyridostigmine**
  - Theophylline: propafenone increases plasma concentration of **theophylline**
  - Ulcer-healing Drugs: plasma concentration of propafenone increased by **cimetidine**
- Propantheline** see Antimuscarinics
- Propiverine** see Antimuscarinics
- Propofol** see Anaesthetics, General
- Propranolol** see Beta-blockers

**Prostaglandins**

- ACE Inhibitors: enhanced hypotensive effect when alprostadil given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with **adrenergic neurone blockers**
- Alpha-blockers: enhanced hypotensive effect when alprostadil given with **alpha-blockers**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with **angiotensin-II receptor antagonists**
- Beta-blockers: enhanced hypotensive effect when alprostadil given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when alprostadil given with **clonidine**
- Diazoxide: enhanced hypotensive effect when alprostadil given with **diazoxide**
- Diuretics: enhanced hypotensive effect when alprostadil given with **diuretics**
- Methyldopa: enhanced hypotensive effect when alprostadil given with **methyldopa**
- Moxonidine: enhanced hypotensive effect when alprostadil given with **moxonidine**
- Nitrates: enhanced hypotensive effect when alprostadil given with **nitrates**
- Oxytocin: prostaglandins potentiate uterotonic effect of **oxytocin**
- Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with **hydralazine, minoxidil or sodium nitroprusside**

**Protein Kinase Inhibitors** *see* individual drugs

**Proton Pump Inhibitors**

- Antacids: absorption of lansoprazole possibly reduced by **antacids**
- Antibacterials: plasma concentration of both drugs increased when omeprazole given with **clarithromycin**
- Anticoagulants: esomeprazole and omeprazole possibly enhance anticoagulant effect of **coumarins**; pantoprazole might enhance the anticoagulant effect of **coumarins**
- Antidepressants: omeprazole increases plasma concentration of **escitalopram**; plasma concentration of lansoprazole possibly increased by **fluvoxamine**; plasma concentration of omeprazole possibly reduced by **St John's wort**
- Antiepileptics: omeprazole possibly enhances effects of **phenytoin**; esomeprazole enhances effects of **phenytoin**
- Antifungals: proton pump inhibitors reduce absorption of **itraconazole**; avoidance of proton pump inhibitors advised by manufacturer of **posaconazole** (plasma concentration of posaconazole possibly reduced); plasma concentration of esomeprazole possibly increased by **voriconazole**; plasma concentration of omeprazole increased by **voriconazole** (consider reducing dose of omeprazole)
- Antipsychotics: omeprazole possibly reduces plasma concentration of **clozapine**
- Antivirals: proton pump inhibitors reduce plasma concentration of **atazanavir**—avoid or adjust dose of both drugs (consult product literature); omeprazole increases plasma concentration of **raltegravir**; avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of **rilpivirine** (plasma concentration of rilpivirine possibly reduced); omeprazole reduces plasma concentration of **rilpivirine**—avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly increase plasma concentration of **saquinavir**—manufacturer of saquinavir advises avoid concomitant use; omeprazole increases plasma concentration of **saquinavir**—manufacturer of saquinavir

**Proton Pump Inhibitors**

- Antivirals (*continued*)
  - advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by **tipranavir**
  - Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of **diazepam** (increased plasma concentration)
  - Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of **digoxin**
  - Ciclosporin: omeprazole possibly affects plasma concentration of **ciclosporin**
  - Cilostazol: omeprazole increases plasma concentrations of **cilostazol** (see Dose under Cilostazol, BNF section 2.6.4)
  - Clopidogrel: esomeprazole and omeprazole reduce antiplatelet effect of **clopidogrel**; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of **clopidogrel**
  - Cytotoxics: proton pump inhibitors possibly reduce excretion of **methotrexate** (increased risk of toxicity); lansoprazole reduces plasma concentration of **bosutinib**; avoidance of proton pump inhibitors advised by manufacturer of **dabrafenib** (plasma concentration of dabrafenib possibly reduced); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of **erlotinib**; omeprazole reduces plasma concentration of **erlotinib**—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of **lapatinib**; proton pump inhibitors possibly reduce absorption of **pazopanib**—manufacturer of pazopanib advises give at the same time as proton pump inhibitors
- Tacrolimus: omeprazole possibly increases plasma concentration of **tacrolimus**
- Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by **sucralfate**
- Ulipristal: avoidance of proton pump inhibitors advised by manufacturer of **high-dose ulipristal** (contraceptive effect of ulipristal possibly reduced)

**Pseudoephedrine** *see* Sympathomimetics

**Pyrazinamide**

- Probenecid: pyrazinamide antagonises effects of **probenecid**
- Sulfapyrazone: pyrazinamide antagonises effects of **sulfapyrazone**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Pyridostigmine** *see* Parasympathomimetics

**Pyridoxine** *see* Vitamins

**Pyrimethamine**

- Antibacterials: increased antifolate effect when pyrimethamine given with **sulfonamides** or **trimethoprim**
- Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias)
- Antiepileptics: pyrimethamine antagonises anti-convulsant effect of **phenytoin**, also increased anti-folate effect
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**; increased antifolate effect when pyrimethamine given with **proguanil**
- Antivirals: increased antifolate effect when pyrimethamine given with **zidovudine**
- Cytotoxics: pyrimethamine increases antifolate effect of **methotrexate** and **pemetrexed**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—*see* p. 626

**Quetiapine** *see* Antipsychotics

**Quinagolide**

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methylidopa: antiparkinsonian effect of dopaminergics antagonised by **methylidopa**

**Quinapril** *see* ACE Inhibitors**Quinine**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with **amiodarone**—avoid concomitant use; quinine increases plasma concentration of **flecainide**
- Antibacterials: increased risk of ventricular arrhythmias when quinine given with **moxifloxacin**—avoid concomitant use; plasma concentration of quinine reduced by **rifampicin**
- Anticoagulants: plasma concentration of both drugs increased when quinine given with **warfarin**
- Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**; increased risk of ventricular arrhythmias when quinine given with **artemether with lumefantrine**; increased risk of convulsions when quinine given with **mefloquine** (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: increased risk of ventricular arrhythmias when quinine given with **droperidol** or **pimozide**—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with **haloperidol**—avoid concomitant use
- Antivirals: plasma concentration of quinine possibly increased by **atazanavir**, **darunavir**, **fosamprenavir**, **indinavir** and **tipranavir** (increased risk of toxicity); plasma concentration of quinine increased by **ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when quinine given with **saquinavir**—avoid concomitant use
- Cardiac Glycosides: quinine increases plasma concentration of **digoxin**
- Dopaminergics: quinine possibly increases plasma concentration of **amantadine**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Muscle Relaxants: quinine possibly enhances effects of **suxamethonium**
- Ulcer-healing Drugs: metabolism of quinine inhibited by **cimetidine** (increased plasma concentration)
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—*see* p. 626

**Quinolones**

- Analgesics: possible increased risk of convulsions when quinolones given with **NSAIDs**
- Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by **antacids**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with **amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with **disopyramide**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with **parenteral erythromycin**—avoid concomitant use; effects of nalidixic acid possibly antagonised by **nitrofurantoin**; possible increased risk of ventricular arrhythmias when moxifloxacin given with **teltromycin**
- Anticoagulants: ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of **coumarins**; nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of **coumarins**; levofloxacin possibly enhances anticoagulant effect of **phenindione**

**Quinolones (continued)**

- Antidepressants: avoidance of moxifloxacin advised by manufacturer of **ecitalopram** and **escitalopram** (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of **duloxetine**—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of **agomelatine**; increased risk of ventricular arrhythmias when moxifloxacin given with **tricyclics**—avoid concomitant use
- Antidiabetics: norfloxacin possibly enhances effects of **glibenclamide**
- Antiepileptics: ciprofloxacin increases or decreases plasma concentration of **phenytoin**
- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with **mizolastine**—avoid concomitant use
- Antimalarials: avoidance of moxifloxacin advised by manufacturer of **piperazine with arteminol** (possible risk of ventricular arrhythmias); avoidance of quinolones advised by manufacturer of **artemether with lumefantrine**; increased risk of ventricular arrhythmias when moxifloxacin given with **chloroquine** and **hydroxychloroquine**, **mefloquine** or **quinine**—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with **benperidol**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with **droperidol**, **haloperidol**, **phenothiazines**, **pimozide** or **zuclopenthixol**—avoid concomitant use; ciprofloxacin increases plasma concentration of **clozapine**; ciprofloxacin possibly increases plasma concentration of **olanzapine**
- Antivirals: manufacturer of norfloxacin advises give **didanosine** at least 2 hours before or after norfloxacin; increased risk of ventricular arrhythmias when moxifloxacin given with **saquinavir**—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with **atomoxetine**
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with **sotalol**—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by **calcium salts**
- Ciclosporin: increased risk of nephrotoxicity when quinolones given with **ciclosporin**
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of **clopidogrel**
- Cytotoxics: nalidixic acid increases risk of **melfalan** toxicity; ciprofloxacin possibly reduces excretion of **methotrexate** (increased risk of toxicity); possible increased risk of ventricular arrhythmias when moxifloxacin given with **bosutinib**; ciprofloxacin possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ciprofloxacin increases plasma concentration of **erlotinib**; possible increased risk of ventricular arrhythmias when moxifloxacin given with **vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with **arsenic trioxide**
- Dairy Products: absorption of ciprofloxacin and norfloxacin reduced by **dairy products**
- Dopaminergics: ciprofloxacin increases plasma concentration of **rasagiline**; ciprofloxacin inhibits metabolism of **ropinirole** (increased plasma concentration)
- 5HT<sub>1</sub>-receptor Agonists: quinolones possibly inhibit metabolism of **zolmitriptan** (reduce dose of zolmitriptan)
- Iron: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by **oral iron**; absorp-

**Quinolones****Iron** (*continued*)

tion of norfloxacin reduced by **oral iron** (give at least 2 hours apart)

**Lanthanum**: absorption of quinolones possibly reduced by **lanthanum** (give at least 2 hours before or 4 hours after lanthanum)

- **Muscle Relaxants**: ciprofloxacin increases plasma concentration of **tizanidine** (increased risk of toxicity)—avoid concomitant use; norfloxacin possibly increases plasma concentration of **tizanidine** (increased risk of toxicity)

**Mycophenolate**: norfloxacin possibly reduces bioavailability of **mycophenolate**

- **Pentamidine Isetonate**: increased risk of ventricular arrhythmias when moxifloxacin given with **pentamidine isetonate**—avoid concomitant use
- **Pirfenidone**: ciprofloxacin increases plasma concentration of **pirfenidone**—see Cautions under Pirfenidone, BNF section 3.1.1

**Probenecid**: excretion of ciprofloxacin, nalidixic acid and norfloxacin reduced by **probenecid** (increased plasma concentration)

**Sevelamer**: bioavailability of ciprofloxacin reduced by **sevelamer**

**Strontium Ranelate**: absorption of quinolones reduced by **strontium ranelate** (manufacturer of strontium ranelate advises avoid concomitant use)

- **Theophylline**: possible increased risk of convulsions when quinolones given with **theophylline**; ciprofloxacin and norfloxacin increase plasma concentration of **theophylline**

**Ulcer-healing Drugs**: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by **sucralfate**; absorption of norfloxacin reduced by **sucralfate** (give at least 2 hours apart)

**Vaccines**: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Zinc**: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by **zinc**; absorption of norfloxacin reduced by **zinc** (give at least 2 hours apart)

**Rabeprazole** *see* Proton Pump Inhibitors

**Rabies Vaccine** *see* Vaccines

**Raloxifene**

**Anticoagulants**: raloxifene antagonises anticoagulant effect of **coumarins**

**Lipid-regulating Drugs**: absorption of raloxifene reduced by **colestyramine** (manufacturer of raloxifene advises avoid concomitant administration)

**Raltegravir**

**Antacids**: absorption of raltegravir possibly reduced by **antacids** (give at least 2 hours apart)

- **Antibacterials**: plasma concentration of raltegravir reduced by **rifampicin**—consider increasing dose of raltegravir
- **Antivirals**: increased risk of rash when raltegravir given with **darunavir**; avoidance of raltegravir advised by manufacturer of **fosamprenavir**
- **Orlistat**: absorption of raltegravir possibly reduced by **orlistat**

**Ulcer-healing Drugs**: plasma concentration of raltegravir increased by **famotidine** and **omeprazole**

**Raltitrexed**

- **Antipsychotics**: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- **Folates**: manufacturer of raltitrexed advises avoid concomitant use with **folates**

**Ramipril** *see* ACE Inhibitors

**Ranitidine** *see* Histamine H<sub>2</sub>-antagonists

**Ranolazine**

- **Anti-arrhythmics**: manufacturer of ranolazine advises avoid concomitant use with **disopyramide**
- **Antibacterials**: plasma concentration of ranolazine possibly increased by **clarithromycin** and **telithro-**

**Ranolazine**● **Antibacterials** (*continued*)

**mycin**—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by **rifampicin**—manufacturer of ranolazine advises avoid concomitant use

**Antidepressants**: plasma concentration of ranolazine increased by **paroxetine**

- **Antifungals**: plasma concentration of ranolazine possibly increased by **itraconazole**, **posaconazole** and **voriconazole**—manufacturer of ranolazine advises avoid concomitant use
- **Antivirals**: plasma concentration of ranolazine possibly increased by **atazanavir**, **darunavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir**, **saquinavir** and **tipranavir**—manufacturer of ranolazine advises avoid concomitant use
- **Beta-blockers**: manufacturer of ranolazine advises avoid concomitant use with **sotalol**
- **Calcium-channel Blockers**: plasma concentration of ranolazine increased by **diltiazem** and **verapamil** (consider reducing dose of ranolazine)
- **Cardiac Glycosides**: ranolazine increases plasma concentration of **digoxin**
- **Ciclosporin**: plasma concentration of both drugs may increase when ranolazine given with **ciclosporin**
- **Grapefruit Juice**: plasma concentration of ranolazine possibly increased by **grapefruit juice**—manufacturer of ranolazine advises avoid concomitant use
- **Lipid-regulating Drugs**: ranolazine increases plasma concentration of **simvastatin** (see Dose under Simvastatin, BNF section 2.12); manufacturer of lomitapide advises dose reduction when ranolazine given with **lomitapide** (see Dose under Lomitapide, BNF section 2.12)
- **Tacrolimus**: ranolazine increases plasma concentration of **tacrolimus**

**Rasagiline**

**Note** Rasagiline is a MAO-B inhibitor

- **Analgesics**: avoid concomitant use of rasagiline with **dextromethorphan**; risk of CNS toxicity when rasagiline given with **pethidine** (avoid pethidine for 2 weeks after rasagiline)
- **Antibacterials**: plasma concentration of rasagiline increased by **ciprofloxacin**
- **Antidepressants**: after stopping rasagiline do not start **fluoxetine** for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start **fluvoxamine** for 2 weeks; risk of hypertensive crisis when rasagiline given with **MAOIs**, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with **SSRIs** or **tricyclics**
- **Dopaminergics**: plasma concentration of rasagiline possibly reduced by **entacapone**
- **Memantine**: effects of dopaminergics possibly enhanced by **memantine**
- **Methyldopa**: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**
- **Sympathomimetics**: avoid concomitant use of rasagiline with **sympathomimetics**

**Reboxetine**

- **Antibacterials**: manufacturer of reboxetine advises avoid concomitant use with **macrolides**
- **Antidepressants**: manufacturer of reboxetine advises avoid concomitant use with **fluvoxamine**; increased risk of hypertension and CNS excitation when reboxetine given with **MAOIs** (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)
- **Antiepileptics**: plasma concentration of reboxetine possibly reduced by **carbamazepine** and **phenobarbital**

**Reboxetine** (continued)

- Antifungals: manufacturer of reboxetine advises avoid concomitant use with **imidazoles** and **triazoles**
  - Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperaqueine with arteminol**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Diuretics: possible increased risk of hypokalaemia when reboxetine given with **loop diuretics** or **thiazides and related diuretics**
- Ergot Alkaloids: possible risk of hypertension when reboxetine given with **ergotamine**

**Regorafenib**

- Analgesics: manufacturer of regorafenib advises avoid concomitant use with **mefenamic acid**
- Antibacterials: plasma concentration of regorafenib reduced by **rifampicin**—manufacturer of regorafenib advises avoid concomitant use
  - Anticoagulants: increased risk of bleeding when regorafenib given with **warfarin**
  - Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cytotoxics: regorafenib increases plasma concentration of **irinotecan**

**Remifentanyl** see Opioid Analgesics**Repaglinide** see Antidiabetics**Retigabine**

- Alcohol: increased risk of blurred vision when retigabine given with **alcohol**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of retigabine possibly reduced by **carbamazepine** and **phenytoin**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
  - Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Retinoids**

- Alcohol: etretinate formed from acitretin in presence of **alcohol** (increased risk of teratogenicity in women of child-bearing potential)
  - Antibacterials: possible increased risk of benign intracranial hypertension when retinoids given with **tetracyclines** (avoid concomitant use)
  - Anticoagulants: acitretin possibly reduces anticoagulant effect of **coumarins**
- Antiepileptics: isotretinoin possibly reduces plasma concentration of **carbamazepine**
- Antifungals: possible increased risk of tretinoin toxicity when given with **fluconazole** and **voriconazole**
  - Cytotoxics: acitretin increases plasma concentration of **methotrexate** (also increased risk of hepatotoxicity)—avoid concomitant use
- Lipid-regulating Drugs: alitretinoin reduces plasma concentration of **simvastatin**
- Vitamins: risk of hypervitaminosis A when retinoids given with **vitamin A**—avoid concomitant use

**Ribavirin**

- Antivirals: effects of ribavirin possibly reduced by **abacavir**; increased risk of side-effects when ribavirin given with **didanosine**—avoid concomitant use; increased risk of toxicity when ribavirin given with **stavudine**; increased risk of anaemia when ribavirin given with **zidovudine**—avoid concomitant use
- Azathioprine: ribavirin possibly enhances myelosuppressive effects of **azathioprine**

**Rifabutin** see Rifamycins**Rifampicin** see Rifamycins**Rifamycins**

- Note** Interactions do not apply to rifaximin
- ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of **imidapril** (reduced anti-hypertensive effect)
- Aliskiren: rifampicin reduces plasma concentration of **aliskiren**
- Ambrisentan: rifampicin possibly increases plasma concentration of **ambrisentan**
- Analgesics: rifampicin reduces plasma concentration of **celecoxib**, **diclofenac** and **etoricoxib**; rifampicin accelerates metabolism of **alfentanil**, **codeine**, **fentanyl**, **methadone** and **morphine** (reduced effect); rifampicin possibly accelerates metabolism of **oxycodone**
- Angiotensin-II Receptor Antagonists: rifampicin reduces plasma concentration of **losartan** and its active metabolite
- Antacids: absorption of rifampicin reduced by **antacids**
- Anti-arrhythmics: rifamycins accelerate metabolism of **disopyramide** (reduced plasma concentration); rifampicin reduces plasma concentration of **dronedarone**—avoid concomitant use; rifampicin accelerates metabolism of **propafenone** (reduced effect)
  - Antibacterials: increased risk of side-effects including neutropenia when rifabutin given with **azithromycin**; rifamycins reduce plasma concentration of **clarithromycin** and **dapsone**; plasma concentration of rifabutin increased by **clarithromycin** (increased risk of toxicity—reduce rifabutin dose); plasma concentration of rifabutin possibly increased by **erythromycin** (increased risk of toxicity—reduce rifabutin dose); rifampicin possibly reduces plasma concentration of **tinidazole** and **trimethoprim**; rifampicin reduces plasma concentration of **doxycycline**—consider increasing dose of doxycycline; rifampicin accelerates metabolism of **chloramphenicol** (reduced plasma concentration); increased risk of hepatotoxicity when rifampicin given with **isoniazid**; rifampicin reduces plasma concentration of **linezolid** (possible therapeutic failure of linezolid); rifampicin reduces plasma concentration of **teli-thromycin** (avoid during and for 2 weeks after rifampicin)
  - Anticoagulants: rifampicin reduces plasma concentration of **apixaban**; rifamycins accelerate metabolism of **coumarins** (reduced anticoagulant effect); rifampicin reduces plasma concentration of  **dabigatran**—manufacturer of dabigatran advises avoid concomitant use; rifampicin reduces plasma concentration of **rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
  - Antidiabetics: rifamycins accelerate metabolism of **tolbutamide** (reduced effect); rifampicin reduces plasma concentration of **canagliflozin** and **neteglinide**; rifampicin possibly reduces effects of **linagliptin**; rifampicin possibly antagonises hypoglycaemic effect of **repaglinide**; rifamycins possibly accelerate metabolism of **sulfonylureas** (reduced effect)
  - Antiepileptics: rifabutin reduces plasma concentration of **carbamazepine**; rifampicin reduces plasma concentration of **lamotrigine**; plasma concentration of rifampicin possibly reduced by **phenobarbital**; rifamycins accelerate metabolism of **phenytoin** (reduced plasma concentration)
  - Antifungals: plasma concentration of rifabutin increased by **fluconazole** (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of **fluconazole** (reduced plasma concentration); rifabutin and rifampicin reduce plasma concentration of **itraconazole**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by **posaconazole**

**Rifamycins**● Antifungals (*continued*)

**zole** (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of ●**posaconazole** and ●**terbinafine**; plasma concentration of rifabutin increased by ●**voriconazole**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of ●**voriconazole**—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of ●**casprofungin** (consider increasing dose of casprofungin); plasma concentration of rifabutin possibly increased by ●**triazoles** (increased risk of uveitis—reduce rifabutin dose)

Antihistamines: rifampicin possibly reduces effects of ●**fenofenadine**

- Antimalarials: avoidance of rifampicin advised by manufacturer of ●**piperaqueine with arteminol**; rifampicin reduces plasma concentration of ●**mefloquine**—avoid concomitant use; rifampicin reduces plasma concentration of ●**quinine**

Antimuscarinics: rifampicin reduces plasma concentration of active metabolite of ●**fesoterodine**

- Antipsychotics: rifampicin accelerates metabolism of ●**haloperidol** (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of ●**aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of ●**clozapine**

- Antivirals: rifampicin possibly reduces plasma concentration of ●**abacavir**; rifampicin reduces plasma concentration of ●**atazanavir**, ●**lopinavir**, ●**nevirapine**

and ●**rilpivirine**—avoid concomitant use; plasma concentration of rifabutin increased by ●**atazanavir**, ●**darunavir**, ●**fosamprenavir** and ●**tipranavir** (reduce dose of rifabutin); avoidance of rifampicin advised by manufacturer of ●**boceprevir** (plasma concentration of boceprevir possibly reduced); rifampicin significantly reduces plasma concentration of ●**darunavir**, ●**fosamprenavir** and ●**telaprevir**—avoid concomitant use; rifampicin reduces the plasma concentration of ●**dolutegravir** (See Dose under Dolutegravir, p. 324); rifampicin reduces plasma concentration of ●**efavirenz**—increase dose of efavirenz; plasma concentration of rifabutin reduced by ●**efavirenz**—increase dose of rifabutin; avoidance of rifampicin advised by manufacturer of ●**elvitegravir**, ●**etravirine**, ●**sofosbuvir** and ●**zidovudine**; rifabutin reduces plasma concentration of ●**elvitegravir** also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; plasma concentration of both drugs reduced when rifabutin given with ●**etravirine**; plasma concentration of rifabutin increased by ●**indinavir** and ●**saquinavir** (also plasma concentration of indinavir and saquinavir reduced)—reduce rifabutin dose; rifampicin accelerates metabolism of ●**indinavir** (reduced plasma concentration—avoid concomitant use); rifampicin reduces plasma concentration of ●**maraviroc** and ●**raltegravir**—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin possibly increased by ●**nevirapine**; rifabutin decreases plasma concentration of ●**rilpivirine** (increase dose of rilpivirine—consult rilpivirine product literature); plasma concentration of rifabutin increased by ●**ritonavir** (increased risk of toxicity—reduce rifabutin dose); rifampicin reduces plasma concentration of ●**ritonavir**; rifampicin significantly reduces plasma concentration of ●**saquinavir**, also risk of hepatotoxicity—avoid concomitant use; avoidance of rifabutin advised by manufacturer of ●**sofosbuvir** and ●**telaprevir**; rifampicin possibly reduces plasma concentration of ●**tipranavir**—avoid concomitant use

**Rifamycins** (*continued*)

Anxiolytics and Hypnotics: rifampicin accelerates metabolism of ●**diazepam** and ●**zaleplon** (reduced plasma concentration); rifampicin possibly accelerates metabolism of ●**benzodiazepines** (reduced plasma concentration); rifampicin possibly accelerates metabolism of ●**buspirone**; rifampicin accelerates metabolism of ●**zolidem** (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of ●**zopiclone**

●**aprepitant**: rifampicin reduces plasma concentration of ●**aprepitant**

- Atovaquone: avoidance of concomitant rifabutin advised by manufacturer of ●**atovaquone** (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of ●**atovaquone** (and concentration of rifampicin increased)—avoid concomitant use

Beta-blockers: rifampicin accelerates metabolism of ●**bisoprolol** and ●**propranolol** (plasma concentration significantly reduced); rifampicin reduces plasma concentration of ●**carvedilol**, ●**celiprolol** and ●**metoprolol**

- Bosentan: rifampicin reduces plasma concentration of ●**bosentan**—avoid concomitant use

- Calcium-channel Blockers: rifampicin possibly reduces plasma concentration of ●**felodipine**; rifampicin possibly accelerates metabolism of ●**nifedipine** (possibly significantly reduced plasma concentration); rifampicin accelerates metabolism of ●**diltiazem**, ●**nifedipine**, ●**nimodipine** and ●**verapamil** (plasma concentration significantly reduced)

Cardiac Glycosides: rifampicin possibly reduces plasma concentration of ●**digoxin**

- Cyclosporin: rifampicin accelerates metabolism of ●**cyclosporin** (reduced plasma concentration)
- Cobicistat: rifabutin reduces plasma concentration of ●**cobicistat** (adjust dose—consult product literature); rifampicin possibly reduces plasma concentration of ●**cobicistat**—manufacturer of cobicistat advises avoid concomitant use

- Corticosteroids: rifamycins accelerate metabolism of ●**corticosteroids** (reduced effect)

- Cytotoxics: rifampicin reduces plasma concentration of ●**afatinib**, ●**roxolitinib** and ●**sorafenib**; rifabutin possibly decreases plasma concentration of ●**axitinib** (increase dose of axitinib—consult axitinib product literature); rifampicin decreases plasma concentration of ●**axitinib** (increase dose of axitinib—consult axitinib product literature); rifabutin possibly reduces plasma concentration of ●**bosutinib** and ●**crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; rifampicin reduces plasma concentration of ●**bosutinib**, ●**cabazitaxel**, ●**crizotinib**, ●**regorafenib** and ●**vandetanib**—manufacturer of bosutinib, cabazitaxel, crizotinib, regorafenib and vandetanib advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of ●**dabrafenib**, ●**lapatinib** and ●**vemurafenib**; rifampicin accelerates metabolism of ●**dasatinib** (reduced plasma concentration—avoid concomitant use); rifampicin accelerates metabolism of ●**erlotinib** and ●**sunitinib** (reduced plasma concentration); rifampicin reduces plasma concentration of ●**everolimus** (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature); rifampicin reduces plasma concentration of ●**gefitinib**, ●**imatinib** and ●**nilotinib**—avoid concomitant use; avoidance of rifabutin advised by manufacturer of ●**cabazitaxel**, ●**lapatinib** and ●**vemurafenib**; rifampicin possibly reduces plasma concentration of ●**eribulin** and ●**pazopanib**; rifampicin reduces plasma concentration of active metabolite of ●**temsirolimus**—avoid concomitant use; rifampicin possibly reduces effects of ●**brentuximab**

## Rifamycins

- Cytotoxics (*continued*)
  - **vedotin**; rifampicin possibly reduces plasma concentration of ●**vinflunine**—manufacturer of vinflunine advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of ●**vismodegib** (plasma concentration of vismodegib possibly reduced)
- Deferasirox: rifampicin reduces plasma concentration of **deferasirox**
- Diuretics: rifampicin reduces plasma concentration of ●**eplerenone**—avoid concomitant use
- Hormone Antagonists: rifabutin possibly reduces plasma concentration of ●**abiraterone**—manufacturer of abiraterone advises avoid concomitant use; rifampicin reduces plasma concentration of ●**abiraterone**—manufacturer of abiraterone advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of **enzalutamide**; rifampicin possibly reduces plasma concentration of **exemestane**; rifampicin accelerates metabolism of **tamoxifen** (reduced plasma concentration)
- 5HT<sub>2</sub>-receptor Antagonists: rifampicin accelerates metabolism of **ondansetron** (reduced effect)
- Ivacaftor: rifabutin possibly reduces plasma concentration of ●**ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use; rifampicin reduces plasma concentration of ●**ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- Leflunomide: rifampicin possibly increases plasma concentration of active metabolite of **leflunomide**
- Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of **atorvastatin** and **simvastatin**; rifampicin accelerates metabolism of **fluvastatin** (reduced effect)
- Macitentan: rifampicin reduces plasma concentration of ●**macitentan**—avoid concomitant use
- Muscle Relaxants: rifampicin possibly reduces plasma concentration of **tizanidine**
- Mycophenolate: rifampicin reduces plasma concentration of active metabolite of ●**mycophenolate**
- Oestrogens: rifamycins accelerate metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 402)
- Progestogens: rifamycins accelerate metabolism of ●**progestogens** (reduced contraceptive effect—see p. 402)
- Ranolazine: rifampicin reduces plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Roflumilast: rifampicin inhibits effects of ●**roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of ●**sirolimus**—avoid concomitant use
- Tacrolimus: rifabutin possibly reduces plasma concentration of **tacrolimus**; rifampicin reduces plasma concentration of ●**tacrolimus**
- Tadalafil: rifampicin reduces plasma concentration of ●**tadalafil**—manufacturer of tadalafil advises avoid concomitant use
- Teriflunomide: rifampicin reduces plasma concentration of **teriflunomide**
- Theophylline: rifampicin accelerates metabolism of **theophylline** (reduced plasma concentration)
- Thyroid Hormones: rifampicin accelerates metabolism of **levothyroxine** (may increase requirements for levothyroxine in hypothyroidism)
- Tibolone: rifampicin accelerates metabolism of **tibolone** (reduced plasma concentration)
- Ticagrelor: rifampicin reduces plasma concentration of ●**ticagrelor**
- Tolvaptan: rifampicin reduces plasma concentration of **tolvaptan**
- Ulcer-healing Drugs: rifampicin accelerates metabolism of **cimetidine** (reduced plasma concentration)

Rifamycins (*continued*)

- Ulipristal: avoidance of rifampicin advised by manufacturer of ●**ulipristal** (contraceptive effect of ulipristal possibly reduced)
  - Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626
- ### Rilpivirine
- Analgesics: rilpivirine possibly reduces plasma concentration of **methadone**
  - Antacids: manufacturer of rilpivirine advises give **antacids** 2 hours before or 4 hours after rilpivirine
  - Antibacterials: manufacturer of rilpivirine advises avoid concomitant use with ●**clarithromycin** and ●**erythromycin** (plasma concentration of rilpivirine possibly increased); plasma concentration of rilpivirine decreased by **rifabutin** (increase dose of rilpivirine—consult rilpivirine product literature); plasma concentration of rilpivirine reduced by ●**rifampicin**—avoid concomitant use
  - Anticoagulants: rilpivirine possibly increases plasma concentration of **dabigatran**
  - Antidepressants: manufacturer of rilpivirine advises avoid concomitant use with ●**St John's wort** (plasma concentration of rilpivirine possibly reduced)
  - Antiepileptics: manufacturer of rilpivirine advises avoid concomitant use with ●**carbamazepine**, ●**oxcarbazepine**, ●**phenobarbital** and ●**phenytoin** (plasma concentration of rilpivirine possibly reduced)
  - Antivirals: manufacturer of rilpivirine advises give **didanosine** 2 hours before or 4 hours after rilpivirine; avoidance of rilpivirine advised by manufacturer of **nevirapine**
  - Calcium Salts: manufacturer of rilpivirine advises give **calcium salts** 2 hours before or 4 hours after rilpivirine
  - Corticosteroids: manufacturer of rilpivirine advises avoid concomitant use with ●**dexamethasone** (except when given as a single dose)
  - Orlistat: absorption of rilpivirine possibly reduced by ●**orlistat**
  - Ulcer-healing Drugs: manufacturer of rilpivirine advises avoid concomitant use with **esomeprazole**, **lansoprazole**, **pantoprazole** and **rabeprazole** (plasma concentration of rilpivirine possibly reduced); plasma concentration of rilpivirine reduced by ●**omeprazole**—avoid concomitant use; manufacturer of rilpivirine advises avoid **histamine H<sub>2</sub>-antagonists** for 12 hours before or 4 hours after rilpivirine—consult product literature
- ### Risedronate Sodium
- see*
- Bisphosphonates
- ### Risperidone
- see*
- Antipsychotics
- ### Ritonavir
- Alpha-blockers: ritonavir possibly increases plasma concentration of ●**alfuzosin**—avoid concomitant use
  - Analgesics: ritonavir possibly increases plasma concentration of **NSAIDs** and **buprenorphine**; ritonavir increases plasma concentration of ●**dextropropoxyphene** and ●**piroxicam** (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of ●**alfentanil** and ●**fentanyl**; ritonavir reduces plasma concentration of **methadone**; ritonavir possibly reduces plasma concentration of **morphine**; ritonavir reduces plasma concentration of ●**pethidine**, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
  - Anti-arrhythmics: ritonavir increases plasma concentration of ●**amiodarone** and ●**propafenone** (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of ●**disopyramide** (increased risk of toxicity); avoidance of ritonavir advised by manufacturer of ●**dronedarone**; ritonavir possibly increases plasma concentration of

**Ritonavir**

- Anti-arrhythmics (*continued*)
  - **flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: ritonavir possibly increases plasma concentration of **azithromycin** and **erythromycin**; ritonavir increases plasma concentration of **clarithromycin** (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of **rifabutin** (increased risk of toxicity—reduce rifabutin dose); plasma concentration of ritonavir reduced by **rifampicin**; plasma concentration of both drugs increased when ritonavir given with **fusidic acid**—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
- Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of **warfarin**; avoidance of ritonavir advised by manufacturer of **apixaban**; ritonavir possibly enhances anticoagulant effect of **coumarins** and **phenindione**; ritonavir increases plasma concentration of **rivaroxaban**—avoid concomitant use
- Antidepressants: ritonavir possibly reduces plasma concentration of **paroxetine**; ritonavir increases plasma concentration of **trazodone** (increased risk of toxicity); ritonavir possibly increases plasma concentration of **SSRIs** and **tricyclics**; plasma concentration of ritonavir reduced by **St John's wort**—avoid concomitant use
- Antidiabetics: ritonavir possibly increases plasma concentration of **tolbutamide**
- Antiepileptics: ritonavir possibly increases plasma concentration of **carbamazepine**; ritonavir possibly reduces plasma concentration of **lamotrigine** and **valproate**; plasma concentration of ritonavir possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly affected
- Antifungals: plasma concentration of ritonavir increased by **fluconazole**; combination of ritonavir with **itraconazole** may increase plasma concentration of either drug (or both); ritonavir reduces plasma concentration of **voriconazole**—avoid concomitant use
- Antihistamines: ritonavir possibly increases plasma concentration of **non-sedating antihistamines**
- Antimalarials: caution with ritonavir advised by manufacturer of **artemether with lumefantrine**; plasma concentration of ritonavir possibly reduced by **mefloquine**; ritonavir increases plasma concentration of **quinine** (increased risk of toxicity)
- Antimuscarinics: avoidance of ritonavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when ritonavir given with **fesoterodine**—consult fesoterodine product literature; ritonavir possibly increases plasma concentration of **solifenacin**—see Dose under Solifenacin, BNF section 7.4.2
- Antipsychotics: ritonavir possibly increases plasma concentration of **antipsychotics**; ritonavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of ritonavir advises avoid concomitant use with **clozapine** (increased risk of toxicity); ritonavir reduces plasma concentration of **olanzapine**—consider increasing dose of olanzapine; ritonavir increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of both drugs reduced when ritonavir given with **boceprevir**; manufacturer of ritonavir advises ritonavir and **didanosine** should be taken 2.5 hours apart; ritonavir

**Ritonavir**

- Antivirals (*continued*)
  - increases the toxicity of **efavirenz**, monitor liver function tests—manufacturer of **Atripla**® advises avoid concomitant use with **high-dose** ritonavir; ritonavir increases plasma concentration of **indinavir**, **maraviroc** and **saquinavir**; ritonavir possibly reduces plasma concentration of **telaprevir**
- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of **anxiolytics** and **hypnotics**; ritonavir possibly increases plasma concentration of **alprazolam**, **diazepam**, **flurazepam** and **zolpidem** (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of **bupirone** (increased risk of toxicity)
- Appetit: ritonavir possibly increases plasma concentration of **aprepitant**
- Atovaquone: ritonavir possibly reduces plasma concentration of **atovaquone**—manufacturer of atovaquone advises avoid concomitant use
- Bosentan: ritonavir increases plasma concentration of **bosentan** (consider reducing dose of bosentan)
- Bupropion: ritonavir reduces plasma concentration of **bupropion**
- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of **calcium-channel blockers**; avoidance of ritonavir advised by manufacturer of **lercanidipine**
- Cardiac Glycosides: ritonavir possibly increases plasma concentration of **digoxin**
- Ciclosporin: ritonavir possibly increases plasma concentration of **ciclosporin**
- Cilostazol: ritonavir possibly increases plasma concentration of **cilostazol** (see Dose under Cilostazol, BNF section 2.6.4)
- Colchicine: ritonavir possibly increases risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ritonavir possibly increases plasma concentration of **corticosteroids**—increased risk of adrenal suppression; ritonavir possibly increases plasma concentration of **budesonide** (including **inhaled**, **intranasal**, and **rectal** budesonide)—increased risk of adrenal suppression; ritonavir increases plasma concentration of **inhaled** and **intranasal** **fluticasone**—increased risk of adrenal suppression
- Cytotoxics: ritonavir increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); ritonavir possibly increases the plasma concentration of **bosutinib** and **cabazitaxel**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of **crizotinib**, **everolimus**, **nilotinib** and **vinflunine**—manufacturer of crizotinib, everolimus, nilotinib and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of **lapatinib**; ritonavir possibly increases plasma concentration of **pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ritonavir given with **ruxolitinib**—consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of **docetaxel** (increased risk of toxicity); ritonavir increases plasma concentration of **paclitaxel**; ritonavir possibly increases plasma concentration of **vinblastine**

**Ritonavir** (*continued*)

- Dapoxetine: avoidance of ritonavir advised by manufacturer of **●dapoxetine** (increased risk of toxicity)
- Diuretics: ritonavir increases plasma concentration of **●eplerenone**—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when ritonavir given with **●ergotamine**—avoid concomitant use
- 5HT<sub>1</sub>-receptor Agonists: ritonavir increases plasma concentration of **●eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: ritonavir possibly increases plasma concentration of **●ivabradine**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with **●atorvastatin**; possible increased risk of myopathy when ritonavir given with **●rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with **●simvastatin** (avoid concomitant use); avoidance of ritonavir advised by manufacturer of **●lomitapide** (plasma concentration of lomitapide possibly increased)
- Mirabegron: when given with ritonavir avoid or reduce dose of **●mirabegron** in hepatic or renal impairment—see Mirabegron, BNF section 7.4.2
- Oestrogens: ritonavir accelerates metabolism of **●oestrogens** (reduced contraceptive effect—see p. 402)
- Orlistat: absorption of ritonavir possibly reduced by **●orlistat**
- Ranolazine: ritonavir possibly increases plasma concentration of **●ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: ritonavir significantly increases plasma concentration of **●sildenafil**—avoid concomitant use
- Sympathomimetics: ritonavir possibly increases plasma concentration of **●dexamfetamine**
- Sympathomimetics, Beta<sub>2</sub>: manufacturer of ritonavir advises avoid concomitant use with **●salmeterol**
- Tacrolimus: ritonavir possibly increases plasma concentration of **●tacrolimus**
- Tadalafil: ritonavir increases plasma concentration of **●tadalafil**—manufacturer of tadalafil advises avoid concomitant use
- Theophylline: ritonavir accelerates metabolism of **●theophylline** (reduced plasma concentration)
- Ticagrelor: ritonavir possibly increases plasma concentration of **●ticagrelor**—manufacturer of ticagrelor advises avoid concomitant use
- Ulipristal: avoidance of ritonavir advised by manufacturer of **●ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vardenafil: ritonavir increases plasma concentration of **●vardenafil**—avoid concomitant use

**Rivaroxaban**

- Analgesics: increased risk of haemorrhage when anticoagulants given with **●intravenous ●diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **●ketorolac** (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: manufacturer of rivaroxaban advises avoid concomitant use with **●dronedaron**
- Antibacterials: plasma concentration of rivaroxaban reduced by **●rifampicin**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Anticoagulants: increased risk of haemorrhage when rivaroxaban given with other **●anticoagulants** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with **●apixaban** and **●dabigatran** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

**Rivaroxaban** (*continued*)

- Antidepressants: plasma concentration of rivaroxaban possibly reduced by **●St John's wort**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antiepileptics: plasma concentration of rivaroxaban possibly reduced by **●carbamazepine**, **●phenobarbital** and **●phenytoin**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antifungals: manufacturer of rivaroxaban advises avoid concomitant use with **●itraconazole**, **●posaconazole** and **●voriconazole**
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with **●atazanavir**, **●darunavir**, **●fosamprenavir**, **●indinavir**, **●saquinavir** and **●tipranavir**; manufacturers advise avoid concomitant use of rivaroxaban with **●lopinavir**; plasma concentration of rivaroxaban increased by **●ritonavir**—avoid concomitant use
- Cobiciclat: anticoagulant effect of rivaroxaban possibly enhanced by **●cobiciclat**—avoid concomitant use

**Rivastigmine** *see* Parasympathomimetics**Rizatriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)**Rocuronium** *see* Muscle Relaxants**Roflumilast**

- Antibacterials: effects of roflumilast inhibited by **●rifampicin** (manufacturer of roflumilast advises avoid concomitant use)
- Antidepressants: metabolism of roflumilast inhibited by **●fluvoxamine**
- Antiepileptics: effects of roflumilast possibly inhibited by **●carbamazepine**, **●phenobarbital** and **●phenytoin** (manufacturer of roflumilast advises avoid concomitant use)
- Theophylline: manufacturer of roflumilast advises avoid concomitant use with **●theophylline**
- Ulcer-healing Drugs: metabolism of roflumilast inhibited by **●cimetidine**

**Ropinirole**

- Antibacterials: metabolism of ropinirole inhibited by **●ciprofloxacin** (increased plasma concentration)
- Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of **●antipsychotics** (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by **●memantine**
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by **●methyl dopa**
- Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of **●metoclopramide** (antagonism of effect)
- Oestrogens: plasma concentration of ropinirole increased by **●oestrogens**

**Ropivacaine**

- Anti-arrhythmics: increased myocardial depression when ropivacaine given with **●anti-arrhythmics**
- Antidepressants: metabolism of ropivacaine inhibited by **●fluvoxamine**—avoid prolonged administration of ropivacaine

**Rosuvastatin** *see* Statins**Rotigotine**

- Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of **●antipsychotics** (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by **●memantine**
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by **●methyl dopa**
- Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of **●metoclopramide** (antagonism of effect)

**Rufinamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **●MAOIs** and **●tricyclic-**

**Rufinamide**

- Antidepressants (*continued*)  
related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with ●carbamazepine; plasma concentration of rufinamide possibly reduced by ●phenobarbital; plasma concentration of rufinamide possibly reduced by ●phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of rufinamide possibly increased by ●valproate (reduce dose of rufinamide)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)
- Oestrogens: rufinamide accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 402)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat
- Progestogens: rufinamide accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 402)

**Rupatadine** see Antihistamines

**Ruxolitinib**

- Antibacterials: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with ●clarithromycin and ●telithromycin—consult ruxolitinib product literature; plasma concentration of ruxolitinib reduced by ●rifampicin
- Antifungals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with ●fluconazole, ●itraconazole, ●posaconazole and ●voriconazole—consult ruxolitinib product literature
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with ●boceprevir, ●indinavir, ●lopinavir, ●ritonavir, ●saquinavir and ●telaprevir—consult ruxolitinib product literature

**St John's Wort**

- Analgesics: St John's wort possibly reduces plasma concentration of ●methadone
- Anti-arrhythmics: St John's wort possibly reduces plasma concentration of ●dronedaron—avoid concomitant use
  - Antibacterials: St John's wort reduces plasma concentration of ●telithromycin (avoid during and for 2 weeks after St John's wort)
  - Anticoagulants: St John's wort reduces anticoagulant effect of ●coumarins (avoid concomitant use); St John's wort possibly reduces plasma concentration of ●dabigatran—manufacturer of dabigatran advises avoid concomitant use; St John's wort possibly reduces plasma concentration of ●rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis
  - Antidepressants: possible increased serotonergic effects when St John's wort given with ●duloxetine or ●venlafaxine; St John's wort reduces plasma concentration of ●amitriptyline; increased serotonergic effects when St John's wort given with ●SSRIs—avoid concomitant use
  - Antiepileptics: St John's wort possibly reduces plasma concentration of ●carbamazepine; St John's wort possibly reduces plasma concentration of ●phenobarbital and ●phenytoin—avoid concomitant use
  - Antifungals: St John's wort reduces plasma concentration of ●voriconazole—avoid concomitant use
- St John's Wort** (*continued*)
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether with lumefantrine and ●piperaquine with arteminol
  - Antipsychotics: St John's wort possibly reduces plasma concentration of ●aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)
  - Antivirals: St John's wort reduces plasma concentration of ●atazanavir, ●darunavir, ●efavirenz, ●fosamprenavir, ●indinavir, ●lopinavir, ●nevirapine, ●ritonavir and ●saquinavir—avoid concomitant use; avoidance of St John's wort advised by manufacturer of ●dolutegravir, ●elvitegravir, ●etravirine, ●sofosbuvir and ●telaprevir; St John's wort possibly reduces plasma concentration of ●maraviroc and ●tipranavir—avoid concomitant use; avoidance of St John's wort advised by manufacturer of ●rilpivirine (plasma concentration of rilpivirine possibly reduced)
- Anxiolytics and Hypnotics: St John's wort possibly reduces plasma concentration of oral ●midazolam
- Appetites: avoidance of St John's wort advised by manufacturer of ●aprepitant
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ●atomoxetine
- Calcium-channel Blockers: St John's wort possibly reduces plasma concentration of ●amlodipine and ●felodipine; St John's wort reduces plasma concentration of ●nifedipine; St John's wort significantly reduces plasma concentration of ●verapamil
  - Cardiac Glycosides: St John's wort reduces plasma concentration of ●digoxin—avoid concomitant use
  - Ciclosporin: St John's wort reduces plasma concentration of ●ciclosporin—avoid concomitant use
  - Cobicistat: St John's wort possibly reduces plasma concentration of ●cobicistat—manufacturer of cobicistat advises avoid concomitant use
  - Cytotoxics: St John's wort possibly reduces plasma concentration of ●axitinib—consider increasing dose of axitinib; St John's wort possibly reduces plasma concentration of ●bosutinib, ●crizotinib, ●everolimus and ●vinflunine—manufacturer of bosutinib, crizotinib, everolimus and vinflunine advises avoid concomitant use; avoidance of St John's wort advised by manufacturer of ●cabazitaxel, ●dabrafenib, ●gefitinib, ●lapatinib and ●vemurafenib; St John's wort reduces plasma concentration of ●imatinib—avoid concomitant use; avoidance of St John's wort advised by manufacturer of ●vandetanib and ●vismodegib (plasma concentration of vandetanib and vismodegib possibly reduced); St John's wort possibly reduces plasma concentration of ●eribulin; St John's wort accelerates metabolism of ●irinotecan (reduced plasma concentration—avoid concomitant use)
  - Dapoxetine: possible increased risk of serotonergic effects when St John's wort given with ●dapoxetine (manufacturer of dapoxetine advises St John's wort should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping St John's wort)
  - Diuretics: St John's wort reduces plasma concentration of ●eplerenone—avoid concomitant use
  - Hormone Antagonists: St John's wort possibly reduces plasma concentration of ●abiraterone—manufacturer of abiraterone advises avoid concomitant use
  - 5HT<sub>1</sub>-receptor Agonists: increased serotonergic effects when St John's wort given with ●5HT<sub>1</sub> agonists—avoid concomitant use
- Ivabradine: St John's wort reduces plasma concentration of ●ivabradine—avoid concomitant use
- Ivacaftor: St John's wort possibly reduces plasma concentration of ●ivacaftor—manufacturer of ivacaftor advises avoid concomitant use

**St John's Wort** (*continued*)

Lipid-regulating Drugs: St John's wort reduces plasma concentration of **simvastatin**

Macitentan: avoidance of St John's wort advised by manufacturer of **macitentan**

- Oestrogens: St John's wort reduces contraceptive effect of **oestrogens** (avoid concomitant use)
  - Progestogens: St John's wort reduces contraceptive effect of **progestogens** (avoid concomitant use)
  - Tacrolimus: St John's wort reduces plasma concentration of **tacrolimus**—avoid concomitant use
- Theophylline: St John's wort possibly reduces plasma concentration of **theophylline**
- Ulcer-healing Drugs: St John's wort possibly reduces plasma concentration of **omeprazole**
- Ulipristal: avoidance of St John's wort advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)

**Salbutamol** *see* Sympathomimetics, Beta<sub>2</sub>

**Salmeterol** *see* Sympathomimetics, Beta<sub>2</sub>

**Saquinavir**

- Analgesics: increased risk of ventricular arrhythmias when saquinavir given with **alfentanil**, **fentanyl** or **methadone**—avoid concomitant use
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir given with **amiodarone**, **disopyramide**, **dronedarone**, **flecainide**, **lidocaine** or **propafenone**—avoid concomitant use
  - Antibacterials: plasma concentration of both drugs possibly increased when saquinavir given with **clarithromycin** (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir given with **dapsone**, **erythromycin** or **moxifloxacin**—avoid concomitant use; saquinavir increases plasma concentration of **rifabutin** (also plasma concentration of saquinavir reduced)—reduce rifabutin dose; plasma concentration of saquinavir significantly reduced by **rifampicin**, also risk of hepatotoxicity—avoid concomitant use; plasma concentration of both drugs may increase when saquinavir given with **fusidic acid**; avoidance of saquinavir advised by manufacturer of **telithromycin** (risk of ventricular arrhythmias)
- Anticoagulants: saquinavir possibly enhances anticoagulant effect of **warfarin**; avoidance of saquinavir advised by manufacturer of **apixaban** and **rivaroxaban**
- Antidepressants: increased risk of ventricular arrhythmias when saquinavir given with **trazodone** or **tricyclics**—avoid concomitant use; plasma concentration of saquinavir reduced by **St John's wort**—avoid concomitant use
  - Antiepileptics: plasma concentration of saquinavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of saquinavir possibly increased by **imidazoles** and **triazoles**
- Antihistamines: increased risk of ventricular arrhythmias when saquinavir given with **mizolastine**—avoid concomitant use
  - Antimalarials: avoidance of saquinavir advised by manufacturer of **piperaquine** with **artemisinin** (possible risk of ventricular arrhythmias); caution with saquinavir advised by manufacturer of **artemether** with **lumefantrine**; increased risk of ventricular arrhythmias when saquinavir given with **quinine**—avoid concomitant use
- Antimuscarinics: avoidance of saquinavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when saquinavir given with **fesoterodine**—consult fesoterodine product literature
- Antipsychotics: increased risk of ventricular arrhythmias when saquinavir given with **clozapine**, **haloperidol** or **phenothiazines**—avoid concomitant use; saquinavir possibly increases plasma concentration

**Saquinavir**• Antipsychotics (*continued*)

of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); saquinavir possibly increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use

- Antivirals: increased risk of ventricular arrhythmias when saquinavir given with **atazanavir** or **lopinavir**—avoid concomitant use; saquinavir reduces plasma concentration of **darunavir**; plasma concentration of saquinavir significantly reduced by **efavirenz**; plasma concentration of saquinavir increased by **indinavir** and **ritonavir**; saquinavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of saquinavir reduced by **tipranavir**
  - Anxiolytics and Hypnotics: saquinavir increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam)
  - Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with **sotalol**—avoid concomitant use
  - Ciclosporin: plasma concentration of both drugs increased when saquinavir given with **ciclosporin**
- Corticosteroids: plasma concentration of saquinavir possibly reduced by **dexamethasone**
- Cytotoxics: saquinavir possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours; saquinavir possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); saquinavir possibly increases the plasma concentration of **bosutinib** and **cabazitaxel**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly increases plasma concentration of **crizotinib** and **everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of saquinavir advised by manufacturer of **lapatinib**; increased risk of ventricular arrhythmias when saquinavir given with **pazopanib**—avoid concomitant use; manufacturer of ruxolitinib advises dose reduction when saquinavir given with **ruxolitinib**—consult ruxolitinib product literature
  - Dapoxetine: avoidance of saquinavir advised by manufacturer of **dapoxetine** (Increased risk of toxicity)
- Diuretics: saquinavir increases plasma concentration of **eplerenone** (reduce dose of eplerenone)
- Ergot Alkaloids: increased risk of ergotism when saquinavir given with **ergotamine**—avoid concomitant use
  - Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with **atorvastatin**; possible increased risk of myopathy when saquinavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with **simvastatin** (avoid concomitant use); avoidance of saquinavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
  - Orlistat: absorption of saquinavir possibly reduced by **orlistat**
  - Pentamidine Isetonate: increased risk of ventricular arrhythmias when saquinavir given with **pentamidine isetonate**—avoid concomitant use
  - Ranolazine: saquinavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use

**Saquinavir** (continued)

- Sildenafil: increased risk of ventricular arrhythmias when saquinavir given with ●**sildenafil**—avoid concomitant use
- Tacrolimus: saquinavir increases plasma concentration of ●**tacrolimus** (consider reducing dose of tacrolimus)
- Tadalafil: increased risk of ventricular arrhythmias when saquinavir given with ●**tadalafil**—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by ●**cimetidine**; plasma concentration of saquinavir possibly increased by ●**esomeprazole**, ●**lansoprazole**, ●**pantoprazole** and ●**rabeprazole**—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir increased by ●**omeprazole**—manufacturer of saquinavir advises avoid concomitant use
- Vardenafil: increased risk of ventricular arrhythmias when saquinavir given with ●**vardenafil**—avoid concomitant use

**Saxagliptin** see Antidiabetics**Selegiline**

**Note** Selegiline is a MAO-B inhibitor

- Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with ●**methidine** (avoid concomitant use); manufacturer of selegiline advises avoid concomitant use with ●**opioid analgesics**
- Antidepressants: manufacturer of selegiline advises avoid concomitant use with ●**citalopram** and ●**escitalopram**; increased risk of hypertension and CNS excitation when selegiline given with ●**fluoxetine** (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●**fluvoxamine**, ●**sertraline** or ●**venlafaxine** (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●**paroxetine** (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with ●**MAOIs**—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with ●**moclobemide**; CNS toxicity reported when selegiline given with ●**tricyclics**
- Dopaminergics: max. dose of 10mg selegiline advised by manufacturer of ●**entacapone** if used concomitantly; selegiline enhances effects and increases toxicity of ●**levodopa** (reduce dose of levodopa)
- 5HT<sub>1</sub>-receptor Agonists: manufacturer of selegiline advises avoid concomitant use with ●**5HT<sub>1</sub> agonists**
- Memantine: effects of dopaminergics and selegiline possibly enhanced by ●**memantine**
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by ●**methyl dopa**
- Oestrogens: plasma concentration of selegiline increased by ●**oestrogens**—manufacturer of selegiline advises avoid concomitant use
- Progestogens: plasma concentration of selegiline increased by ●**progestogens**—manufacturer of selegiline advises avoid concomitant use
- Sympathomimetics: manufacturer of selegiline advises avoid concomitant use with ●**sympathomimetics**; risk of hypertensive crisis when selegiline given with ●**dopamine**

**Selenium**

● Eltrombopag: selenium possibly reduces absorption of ●**eltrombopag** (give at least 4 hours apart)

● Vitamins: absorption of selenium possibly reduced by ●**ascorbic acid** (give at least 4 hours apart)

**Sertraline** see Antidepressants, SSRI**Sevelamer**

● Antibacterials: sevelamer reduces bioavailability of ●**ciprofloxacin**

● Ciclosporin: sevelamer possibly reduces plasma concentration of ●**ciclosporin**

● Mycophenolate: sevelamer possibly reduces plasma concentration of ●**mycophenolate**

● Tacrolimus: sevelamer possibly reduces plasma concentration of ●**tacrolimus**

● Thyroid Hormones: sevelamer possibly reduces absorption of ●**levothyroxine**

● Vitamins: sevelamer reduces absorption of ●**calcitriol** (give at least 1 hour before or 3 hours after sevelamer)

**Sevoflurane** see Anaesthetics, General**Sildenafil**

- Alpha-blockers: enhanced hypotensive effect when sildenafil given with ●**alpha-blockers** (avoid alpha-blockers for 4 hours after sildenafil)—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5

● Anti-arrhythmics: avoidance of sildenafil advised by manufacturer of ●**disopyramide** (risk of ventricular arrhythmias)

- Antibacterials: plasma concentration of sildenafil increased by ●**clarithromycin** (consider reducing dose of sildenafil); plasma concentration of sildenafil increased by ●**erythromycin**—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by ●**telithromycin**—reduce initial dose of sildenafil

● Antifungals: plasma concentration of sildenafil increased by ●**itraconazole**—reduce initial dose of sildenafil

- Antivirals: side-effects of sildenafil possibly increased by ●**atazanavir**; plasma concentration of sildenafil reduced by ●**etravirine**; plasma concentration of sildenafil possibly increased by ●**fosamprenavir**; plasma concentration of sildenafil increased by ●**indinavir**—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ●**ritonavir**—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with ●**saquinavir**—avoid concomitant use; avoidance of sildenafil advised by manufacturer of ●**telaprevir**
- Bosentan: plasma concentration of sildenafil reduced by ●**bosentan**, also plasma concentration of bosentan increased

● Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with ●**amlodipine**

- Cobicistat: plasma concentration of sildenafil possibly increased by ●**cobicistat**—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature

● Dapoxetine: avoidance of sildenafil advised by manufacturer of ●**dapoxetine**

● Grapefruit Juice: plasma concentration of sildenafil possibly increased by ●**grapefruit juice**

- Nicorandil: sildenafil significantly enhances hypotensive effect of ●**nicorandil** (avoid concomitant use)
- Nitrates: sildenafil significantly enhances hypotensive effect of ●**nitrates** (avoid concomitant use)

● Ulcer-healing Drugs: plasma concentration of sildenafil increased by ●**cimetidine** (consider reducing dose of sildenafil)

**Simvastatin** see Statins**Sirolimus**

● Anti-arrhythmics: caution with sirolimus advised by manufacturer of ●**dronedarone**

- Antibacterials: plasma concentration of sirolimus increased by ●**clarithromycin** and ●**telithromycin**—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with ●**erythromycin**; plasma concentration of sirolimus

**Sirolimus**

- Antibericals (*continued*)  
reduced by ●**rifabutin** and ●**rifampicin**—avoid concomitant use
- Antifungals: plasma concentration of sirolimus increased by ●**miconazole**; plasma concentration of sirolimus possibly increased by ●**itraconazole** and ●**voriconazole**—avoid concomitant use
- Antivirals: plasma concentration of sirolimus possibly increased by ●**atazanavir** and ●**lopinavir**; plasma concentration of sirolimus increased by ●**boceprevir** (increased risk of toxicity—reduce sirolimus dose); plasma concentration of both drugs increased when sirolimus given with ●**telaprevir** (reduce dose of sirolimus)
- Calcium-channel Blockers: plasma concentration of sirolimus increased by ●**diltiazem**; plasma concentration of both drugs increased when sirolimus given with ●**verapamil**
- Cyclosporin: plasma concentration of sirolimus increased by ●**ciclosporin**
- Cytotoxics: caution with sirolimus advised by manufacturer of ●**crizotinib**
- Grapefruit Juice: plasma concentration of sirolimus increased by ●**grapefruit juice**—avoid concomitant use

**Sitagliptin** *see* Antidiabetics

**Sodium Aurothiomalate**

- ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with ●**ACE inhibitors**  
Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of **penicillamine** (increased risk of toxicity)

**Sodium Benzoate**

- Antiepileptics: effects of sodium benzoate possibly reduced by ●**valproate**
- Antipsychotics: effects of sodium benzoate possibly reduced by ●**haloperidol**
- Corticosteroids: effects of sodium benzoate possibly reduced by ●**corticosteroids**
- Probenecid: excretion of conjugate formed by sodium benzoate possibly reduced by ●**probenecid**

**Sodium Bicarbonate** *see* Antacids

**Sodium Citrate**

- Antibericals: avoid concomitant use of sodium citrate with ●**methenamine**
- Ulcer-healing Drugs: avoidance of sodium citrate advised by manufacturer of ●**sucralfate**

**Sodium Clodronate** *see* Bisphosphonates

**Sodium Nitroprusside** *see* Vasodilator Antihypertensives

**Sodium Oxybate**

- Analgesics: effects of sodium oxybate enhanced by ●**opioid analgesics** (avoid concomitant use)
- Antidepressants: increased risk of side-effects when sodium oxybate given with ●**tricyclics**
- Antiepileptics: manufacturer of sodium oxybate advises avoid concomitant use with ●**phenobarbital**
- Antipsychotics: effects of sodium oxybate possibly enhanced by ●**antipsychotics**
- Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by ●**benzodiazepines** (avoid concomitant use)

**Sodium Phenylbutyrate**

- Antiepileptics: effects of sodium phenylbutyrate possibly reduced by ●**valproate**
- Antipsychotics: effects of sodium phenylbutyrate possibly reduced by ●**haloperidol**
- Corticosteroids: effects of sodium phenylbutyrate possibly reduced by ●**corticosteroids**
- Probenecid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by ●**probenecid**

**Sodium Stibogluconate**

- Antifungals: possible increased risk of arrhythmias when sodium stibogluconate given before ●**amphotericin**—manufacturer of sodium stibogluconate advises giving 14 days apart

**Sodium Valproate** *see* Valproate

**Sofosbuvir**

- Antibericals: manufacturer of sofosbuvir advises avoid concomitant use with ●**rifabutin** and ●**rifampicin**
- Antidepressants: manufacturer of sofosbuvir advises avoid concomitant use with ●**St John's wort**
- Antiepileptics: manufacturer of sofosbuvir advises avoid concomitant use with ●**carbamazepine**, ●**oxcarbazepine**, ●**phenobarbital** and ●**phenytoin**

**Solifenacin** *see* Antimuscarinics

**Somatropin**

- Corticosteroids: growth-promoting effect of somatropin may be inhibited by ●**corticosteroids**
- Oestrogens: increased doses of somatropin may be needed when given with ●**oestrogens** (when used as oral replacement therapy)

**Sorafenib**

- Antibericals: bioavailability of sorafenib reduced by ●**neomycin**; plasma concentration of sorafenib reduced by ●**rifampicin**
- Anticoagulants: sorafenib possibly enhances anticoagulant effect of ●**coumarins**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: avoidance of sorafenib advised by manufacturer of ●**boceprevir**
- Cytotoxics: sorafenib possibly increases plasma concentration of ●**doxorubicin** and ●**irinotecan**; sorafenib increases plasma concentration of ●**docetaxel**

**Sotalol** *see* Beta-blockers

**Spirolactone** *see* Diuretics

**Statins**

- Antacids: absorption of rosuvastatin reduced by ●**antacids**
- Anti-arrhythmics: increased risk of myopathy when simvastatin given with ●**amiodarone** (*see* Dose under Simvastatin, p. 126); plasma concentration of atorvastatin and rosuvastatin possibly increased by ●**dronedarone**; increased risk of myopathy when simvastatin given with ●**dronedarone**
- Antibericals: plasma concentration of atorvastatin and pravastatin increased by ●**clarithromycin**; increased risk of myopathy when simvastatin given with ●**clarithromycin**, ●**erythromycin** or ●**telithromycin** (avoid concomitant use); plasma concentration of rosuvastatin reduced by ●**erythromycin**; possible increased risk of myopathy when atorvastatin given with ●**erythromycin**; plasma concentration of pravastatin increased by ●**erythromycin**; plasma concentration of atorvastatin and simvastatin possibly reduced by ●**rifampicin**; metabolism of fluvastatin accelerated by ●**rifampicin** (reduced effect); increased risk of myopathy when statins given with ●**daptomycin** (preferably avoid concomitant use); risk of myopathy and rhabdomyolysis when statins given with ●**fusidic acid**—avoid concomitant use and for 7 days after last fusidic acid dose; possible increased risk of myopathy when pravastatin given with ●**telithromycin**; increased risk of myopathy when atorvastatin given with ●**telithromycin** (avoid concomitant use)
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of ●**warfarin**; fluvastatin and simvastatin enhance anticoagulant effect of ●**coumarins**; rosuvastatin possibly enhances anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antidepressants: plasma concentration of simvastatin reduced by ●**St John's wort**
- Antidiabetics: fluvastatin possibly increases plasma concentration of ●**glibenclamide**

**Statins (continued)**

- Antiepileptics: plasma concentration of simvastatin reduced by ●**carbamazepine** and ●**eslicarbazepine**—consider increasing dose of simvastatin; plasma concentration of rosuvastatin reduced by ●**eslicarbazepine**; combination of fluvastatin with ●**phenytoin** may increase plasma concentration of either drug (or both)
- Antifungals: possible increased risk of myopathy when simvastatin given with ●**fluconazole** or ●**miconazole**; possible increased risk of myopathy when atorvastatin given with ●**fluconazole** or ●**imidazoles**; plasma concentration of fluvastatin increased by ●**fluconazole**—possible increased risk of myopathy; increased risk of myopathy when atorvastatin given with ●**itraconazole**, ●**posaconazole** or ●**voriconazole**; increased risk of myopathy when simvastatin given with ●**itraconazole** or ●**posaconazole** (avoid concomitant use); increased risk of myopathy when simvastatin given with ●**voriconazole**
- Antivirals: increased risk of myopathy when simvastatin given with ●**atazanavir**, ●**indinavir**, ●**ritonavir** or ●**saquinavir** (avoid concomitant use); possible increased risk of myopathy when atorvastatin or pravastatin given with ●**atazanavir**; possible increased risk of myopathy when rosuvastatin given with ●**atazanavir**, ●**darunavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir** and ●**saquinavir**—manufacturer of rosuvastatin advises avoid concomitant use; plasma concentration of atorvastatin increased by ●**boceprevir** (reduce dose of atorvastatin); manufacturers advise avoid concomitant use of simvastatin with ●**boceprevir** and ●**telaprevir**; plasma concentration of pravastatin increased by ●**boceprevir**; plasma concentration of pravastatin possibly increased by ●**darunavir**; possible increased risk of myopathy when atorvastatin given with ●**darunavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir** or ●**saquinavir**; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by ●**efavirenz**; plasma concentration of atorvastatin possibly reduced by ●**etravirine**; possible increased risk of myopathy when simvastatin given with ●**fosamprenavir** or ●**lopinavir**—avoid concomitant use; avoidance of atorvastatin advised by manufacturer of ●**telaprevir**; plasma concentration of simvastatin possibly increased by ●**tipranavir**—avoid concomitant use; increased risk of myopathy when atorvastatin given with ●**tipranavir** (see Dose under Atorvastatin, p. 125); plasma concentration of rosuvastatin possibly increased by ●**tipranavir**—manufacturer of rosuvastatin advises avoid concomitant use
- Anxiolytics and Hypnotics: atorvastatin possibly increases plasma concentration of ●**midazolam**
- Bosentan: plasma concentration of simvastatin reduced by ●**bosentan**
- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with ●**amlodipine** and ●**diltiazem** (see Dose under Simvastatin, p. 126); plasma concentration of atorvastatin increased by ●**diltiazem**—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with ●**verapamil** (see Dose under Simvastatin, p. 126)
- Cardiac Glycosides: atorvastatin possibly increases plasma concentration of ●**digoxin**
- Ciclosporin: increased risk of myopathy when rosuvastatin or simvastatin given with ●**ciclosporin** (avoid concomitant use); increased risk of myopathy when atorvastatin given with ●**ciclosporin** (see Dose under Atorvastatin, p. 125); increased risk of myopathy when fluvastatin or pravastatin given with ●**ciclosporin**
- Cobicistat: plasma concentration of atorvastatin possibly increased by ●**cobicistat**—manufacturer of cobicistat

**Statins**

- Cobicistat (continued)
    - stat advises reduce dose of atorvastatin; avoidance of simvastatin advised by manufacturer of ●**cobicistat**
  - Colchicine: possible increased risk of myopathy when statins given with ●**colchicine**
  - Cytotoxics: plasma concentration of simvastatin possibly increased by ●**dasatinib**; plasma concentration of simvastatin increased by ●**imatinib**
  - Eltrombopag: plasma concentration of rosuvastatin increased by ●**eltrombopag** (consider reducing dose of rosuvastatin)
  - Grapefruit Juice: plasma concentration of atorvastatin possibly increased by ●**grapefruit juice**; plasma concentration of simvastatin increased by ●**grapefruit juice**—avoid concomitant use
  - Hormone Antagonists: possible increased risk of myopathy when simvastatin given with ●**danazol**—avoid concomitant use
  - Lipid-regulating Drugs: possible increased risk of myopathy when simvastatin given with ●**bezafibrate** and ●**ciprofibrate** (see Dose under Simvastatin, p. 126); when given with statins reduce maximum dose of ●**fenofibrate**—see Dose under Fenofibrate, p. 128; increased risk of myopathy when atorvastatin, fluvastatin or pravastatin given with ●**gemfibrozil** (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with ●**gemfibrozil** (avoid concomitant use); increased risk of myopathy when rosuvastatin given with ●**fibrates** (see Dose under Rosuvastatin, p. 126); increased risk of myopathy when statins given with ●**fibrates**; plasma concentration of simvastatin increased by ●**lomitapide** (see Dose under Simvastatin, BNF section 2.12); plasma concentration of atorvastatin increased by ●**lomitapide**; increased risk of myopathy when statins given with ●**nicotinic acid** (applies to lipid regulating doses of nicotinic acid)
  - Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ●**ethinylestradiol**
  - Progestogens: atorvastatin increases plasma concentration of ●**norethisterone**; rosuvastatin increases plasma concentration of active metabolite of ●**norgestimate**; rosuvastatin increases plasma concentration of ●**norgestrel**
  - Ranolazine: plasma concentration of simvastatin increased by ●**ranolazine** (see Dose under Simvastatin, BNF section 2.12)
  - Retinoids: plasma concentration of simvastatin reduced by ●**alitretinoin**
  - Teriflunomide: plasma concentration of rosuvastatin increased by ●**teriflunomide** (consider reducing dose of rosuvastatin)
  - Ticagrelor: plasma concentration of simvastatin increased by ●**ticagrelor** (increased risk of toxicity)
- Stavudine**
- Antivirals: increased risk of side-effects when stavudine given with ●**didanosine**; increased risk of toxicity when stavudine given with ●**ribavirin**; effects of stavudine possibly inhibited by ●**zidovudine** (manufacturers advise avoid concomitant use)
  - Cytotoxics: effects of stavudine possibly inhibited by ●**doxorubicin**; increased risk of toxicity when stavudine given with ●**hydroxycarbamide**—avoid concomitant use
  - Orlistat: absorption of stavudine possibly reduced by ●**orlistat**
- Stiripentol**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ●**MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)

**Stiripentol** (continued)

- Antiepileptics: stiripentol increases plasma concentration of ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Anxiolytics and Hypnotics: stiripentol increases plasma concentration of ●**clonazepam**
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

**Streptomycin** *see* Aminoglycosides

**Strontium Ranelate**

Antibacterials: strontium ranelate reduces absorption of ●**quinolones** and ●**tetracyclines** (manufacturer of strontium ranelate advises avoid concomitant use)

**Sucralfate**

Antibacterials: sucralfate reduces absorption of ●**ciprofloxacin**, ●**levofloxacin**, ●**moxifloxacin**, ●**ofloxacin** and ●**tetracyclines**; sucralfate reduces absorption of ●**norfloxacin** (give at least 2 hours apart)

- Anticoagulants: sucralfate possibly reduces absorption of ●**coumarins** (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of ●**phenytoin**

Antipsychotics: sucralfate reduces absorption of ●**sulpiride**

Cardiac Glycosides: sucralfate possibly reduces absorption of ●**cardiac glycosides**

Potassium Salts: manufacturer of sucralfate advises avoid concomitant use with ●**potassium citrate**

Sodium Citrate: manufacturer of sucralfate advises avoid concomitant use with ●**sodium citrate**

Theophylline: sucralfate possibly reduces absorption of ●**theophylline** (give at least 2 hours apart)

Thyroid Hormones: sucralfate reduces absorption of ●**levothyroxine**

Ulcer-healing Drugs: sucralfate possibly reduces absorption of ●**lansoprazole**

**Sugammadex**

Antibacterials: response to sugammadex possibly reduced by ●**fusidic acid**

Progestogens: sugammadex possibly reduces plasma concentration of ●**progestogens**—manufacturer of sugammadex advises additional contraceptive precautions

**Sulfadiazine** *see* Sulfonamides

**Sulfadoxine** *see* Sulfonamides

**Sulfamethoxazole** *see* Sulfonamides

**Sulfasalazine** *see* Aminosalicylates

**Sulfipyrazone**

Analgesics: effects of sulfipyrazone antagonised by ●**aspirin**

Antibacterials: sulfipyrazone reduces excretion of ●**nitrofurantoin** (increased risk of toxicity); sulfipyrazone reduces excretion of ●**penicillins**; effects of sulfipyrazone antagonised by ●**pyrazinamide**

- Anticoagulants: increased risk of bleeding when sulfipyrazone given with ●**apixaban**; sulfipyrazone enhances anticoagulant effect of ●**coumarins**; possible increased risk of bleeding when sulfipyrazone given with ●**dabigatran**
- Antidiabetics: sulfipyrazone enhances effects of ●**sulfonylureas**

- Antiepileptics: sulfipyrazone increases plasma concentration of ●**phenytoin**

Calcium-channel Blockers: sulfipyrazone reduces plasma concentration of ●**verapamil**

- Ciclosporin: sulfipyrazone reduces plasma concentration of ●**ciclosporin**

Theophylline: sulfipyrazone reduces plasma concentration of ●**theophylline**

**Sulfonamides**

Anaesthetics, General: sulfonamides enhance effects of ●**thiopental**

- Anaesthetics, Local: effects of sulfonamides possibly inhibited by ●**chlorprocaine** (manufacturer of chlorprocaine advises avoid concomitant use); increased risk of methaemoglobinaemia when sulfonamides given with ●**prilocaine**

Anti-arrhythmic: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with ●**amiodarone**—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole

- Antibacterials: increased risk of crystalluria when sulfonamides given with ●**methenamine**

- Anticoagulants: sulfonamides enhance anticoagulant effect of ●**coumarins**; sulfonamides possibly inhibit metabolism of ●**phenindione**

Antidiabetics: sulfonamides rarely enhance the effects of ●**sulfonylureas**

Antiepileptics: sulfonamides possibly increase plasma concentration of ●**phenytoin**

- Antimalarials: increased antifolate effect when sulfonamides given with ●**pyrimethamine**

- Antipsychotics: avoid concomitant use of sulfonamides with ●**clozapine** (increased risk of agranulocytosis)

- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●**azathioprine**

- Ciclosporin: increased risk of nephrotoxicity when sulfonamides given with ●**ciclosporin**; sulfadiazine possibly reduces plasma concentration of ●**ciclosporin**

- Cytotoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●**mercaptopurine** or ●**methotrexate**; sulfonamides increase risk of ●**methotrexate** toxicity

Potassium Aminobenzoate: effects of sulfonamides inhibited by ●**potassium aminobenzoate**

Vaccines: antibacterials inactivate ●**oral typhoid vaccine**—see p. 626

**Sulfonylureas** *see* Antidiabetics

**Sulindac** *see* NSAIDs

**Sulpiride** *see* Antipsychotics

**Sumatriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)

**Sunitinib**

Antibacterials: metabolism of sunitinib accelerated by ●**rifampicin** (reduced plasma concentration)

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

- Antivirals: avoidance of sunitinib advised by manufacturer of ●**boceprevir**

**Suxamethonium** *see* Muscle Relaxants

**Sympathomimetics**

- Adrenergic Neuron Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypotensive effect of ●**adrenergic neuron blockers**; dexamfetamine and lisdexamfetamine antagonise hypotensive effect of ●**guanethidine**

Alcohol: effects of methylphenidate possibly enhanced by ●**alcohol**

Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of sympathomimetics advised by manufacturer of ●**apraclonidine**

- Alpha-blockers: avoid concomitant use of adrenaline (epinephrine) or dopamine with ●**tolazoline**

- Anaesthetics, General: avoidance of sympathomimetics advised by manufacturer of ●**isoflurane** (risk of ventricular arrhythmias); increased risk of hypertension when methylphenidate given with ●**volatile liquid general anaesthetics**; increased risk of arrhythmias when adrenaline (epinephrine) or

**Sympathomimetics**

- Anaesthetics, General (*continued*)  
noradrenaline (norepinephrine) given with **•volatile liquid general anaesthetics**
- Antacids: absorption of pseudoephedrine possibly increased by **aluminium hydroxide**
- Anticoagulants: methylphenidate possibly enhances anticoagulant effect of **•coumarins**
- Antidepressants: risk of hypertensive crisis when adrenaline (epinephrine), dobutamine, dopamine, methoxamine, noradrenaline (norepinephrine) or xylometazoline given with **•MAOIs**; risk of hypertensive crisis when dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine given with **•MAOIs**, avoid dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when oxymetazoline given with **•MAOIs**, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when sympathomimetics given with **•moclobemide**; methylphenidate possibly inhibits metabolism of **SSRIs** and **tricyclics**; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with **•tricyclics** (but local anaesthetics with adrenaline appear to be safe); increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) or phenylephrine given with **•tricyclics**
- Antiepileptics: methylphenidate possibly increases plasma concentration of **phenobarbital**; methylphenidate increases plasma concentration of **phenytoin**
- Antipsychotics: hypertensive effect of sympathomimetics antagonised by **antipsychotics**; effects of lisdexamfetamine possibly reduced by **chlorpromazine**; dexamfetamine possibly antagonises antipsychotic effects of **chlorpromazine**; methylphenidate possibly increases side-effects of **risperidone**
- Antivirals: plasma concentration of dexamfetamine possibly increased by **ritonavir**
- Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective **•beta-blockers**, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective **•beta-blockers**; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective **•beta-blockers**
- Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with **clonidine**; serious adverse events reported with concomitant use of methylphenidate and **•clonidine** (causality not established)
- Corticosteroids: ephedrine accelerates metabolism of **dexamethasone**
- Dopaminergics: risk of toxicity when isometheptene given with **•bromocriptine**; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by **entacapone**; avoid concomitant use of sympathomimetics with **•rasagiline**; avoidance of sympathomimetics advised by manufacturer of **selegiline**; risk of hypertensive crisis when dopamine given with **•selegiline**
- Doxapram: increased risk of hypertension when sympathomimetics given with **doxapram**
- Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with **ergotamine**
- Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with **oxytocin** (due to enhanced vasopressor effect)

**Sympathomimetics (continued)**

- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by **•dopexamine**; dopexamine possibly enhances effects of **•noradrenaline (norepinephrine)**
- Theophylline: avoidance of ephedrine in children advised by manufacturer of **theophylline**
- Sympathomimetics, Beta<sub>2</sub>**
- Antivirals: avoidance of salmeterol advised by manufacturer of **lopinavir**, **ritonavir** and **tipranavir**; avoidance of salmeterol advised by manufacturer of **•telaprevir** (risk of ventricular arrhythmias)
- Atomoxetine: Increased risk of cardiovascular side-effects when *parenteral* salbutamol given with **atomoxetine**
- Cardiac Glycosides: salbutamol possibly reduces plasma concentration of **digoxin**
- Cobicistat: avoidance of salmeterol advised by manufacturer of **cobicistat**
- Corticosteroids: increased risk of hypokalaemia when high doses of beta<sub>2</sub> sympathomimetics given with **corticosteroids**—see Hypokalaemia, p. 136
- Diuretics: increased risk of hypokalaemia when high doses of beta<sub>2</sub> sympathomimetics given with **aceta-zolamide**, **loop diuretics** or **thiazides and related diuretics**—see Hypokalaemia, p. 136
- Methyldopa: acute hypotension reported when *infusion* of salbutamol given with **•methyldopa**
- Muscle Relaxants: bambuterol enhances effects of **suxamethonium**
- Theophylline: increased risk of hypokalaemia when high doses of beta<sub>2</sub> sympathomimetics given with **theophylline**—see Hypokalaemia, p. 136

**Tacrolimus**

- Note** Interactions do not generally apply to tacrolimus used topically; risk of facial flushing and skin irritation with alcohol consumption (p. 580) does not apply to tacrolimus taken systemically
- Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with **NSAIDs**; increased risk of nephrotoxicity when tacrolimus given with **•ibuprofen**
  - Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when tacrolimus given with **angiotensin-II receptor antagonists**
  - Anti-arrhythmics: caution with tacrolimus advised by manufacturer of **dronedarone**
  - Antibacterials: plasma concentration of tacrolimus increased by **•clarithromycin** and **•erythromycin**; plasma concentration of tacrolimus possibly reduced by **rifabutin**; plasma concentration of tacrolimus reduced by **•rifampicin**; increased risk of nephrotoxicity when tacrolimus given with **•aminoglycosides**; plasma concentration of tacrolimus possibly increased by **•chloramphenicol** and **•telithromycin**; possible increased risk of nephrotoxicity when tacrolimus given with **vancomycin**
  - Anticoagulants: tacrolimus possibly increases plasma concentration of **•dabigatran**—manufacturer of dabigatran advises avoid concomitant use
  - Antidepressants: plasma concentration of tacrolimus reduced by **•St John's wort**—avoid concomitant use
  - Antiepileptics: plasma concentration of tacrolimus reduced by **•phenobarbital**; plasma concentration of tacrolimus reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased
  - Antifungals: plasma concentration of tacrolimus possibly increased by **•micronazole oral gel**; increased risk of nephrotoxicity when tacrolimus given with **•amphotericin**; plasma concentration of tacrolimus increased by **•fluconazole**, **•itraconazole**, **•posaconazole** and **•voriconazole** (consider reducing dose of tacrolimus); plasma concentration of tacrolimus reduced by **•caspofungin**

**Tacrolimus** (*continued*)

- Antipsychotics: avoidance of tacrolimus advised by manufacturer of ●**droperidol** (risk of ventricular arrhythmias)
- Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with ●**aciclovir** or ●**ganciclovir**; plasma concentration of tacrolimus possibly increased by ●**atazanavir** and ●**ritonavir**; plasma concentration of tacrolimus increased by ●**boceprevir** (reduce dose of tacrolimus); plasma concentration of tacrolimus possibly affected by ●**efavirenz**; plasma concentration of tacrolimus increased by ●**fosamprenavir**; plasma concentration of tacrolimus increased by ●**saquinavir** (consider reducing dose of tacrolimus); plasma concentration of both drugs increased when tacrolimus given with ●**telaprevir** (reduce dose of tacrolimus)
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by ●**felodipine**, ●**nicardipine** and ●**verapamil**; plasma concentration of tacrolimus increased by ●**diltiazem** and ●**nifedipine**
- Ciclosporin: tacrolimus increases plasma concentration of ●**ciclosporin** (increased risk of nephrotoxicity)—avoid concomitant use
- Colestilan: manufacturer of colestilan advises give tacrolimus at least 1 hour before or 3 hours after colestilan
- Cytotoxics: tacrolimus possibly increases the plasma concentration of ●**afatinib**—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours; caution with tacrolimus advised by manufacturer of ●**crizotinib**; plasma concentration of tacrolimus increased by ●**imatinib**
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with ●**potassium-sparing diuretics** and ●**aldosterone antagonists**
- Grapefruit Juice: plasma concentration of tacrolimus increased by ●**grapefruit juice**
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by ●**danazol**
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of ●**mifamurtide**
- Oestrogens: plasma concentration of tacrolimus possibly increased by ●**ethinylestradiol**
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with ●**potassium salts**
- Ranolazine: plasma concentration of tacrolimus increased by ●**ranolazine**
- Sevelamer: plasma concentration of tacrolimus possibly reduced by ●**sevelamer**
- Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by ●**omeprazole**

**Tadalafil**

- Alpha-blockers: enhanced hypotensive effect when tadalafil given with ●**doxazosin**—manufacturer of tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with ●**alpha-blockers**—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5
- Anti-arrhythmics: avoidance of tadalafil advised by manufacturer of ●**disopyramide** (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of tadalafil possibly increased by ●**clarithromycin** and ●**erythromycin**; plasma concentration of tadalafil reduced by ●**rifampicin**—manufacturer of tadalafil advises avoid concomitant use
- Antifungals: plasma concentration of tadalafil possibly increased by ●**itraconazole**
- Antivirals: plasma concentration of tadalafil possibly increased by ●**fosamprenavir** and ●**indinavir**; plasma concentration of tadalafil increased by ●**ritonavir**—manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with ●**saquinavir**—avoid concomitant use; avoidance of high doses of tadalafil advised by

**Tadalafil**

- Antivirals (*continued*)
  - manufacturer of ●**telaprevir**—consult product literature
- Bosentan: plasma concentration of tadalafil reduced by ●**bosentan**
- Cobicistat: plasma concentration of tadalafil possibly increased by ●**cobicistat**—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
- Dapoxetine: avoidance of tadalafil advised by manufacturer of ●**dapoxetine**
- Grapefruit Juice: plasma concentration of tadalafil possibly increased by ●**grapefruit juice**
- Nicorandil: tadalafil significantly enhances hypotensive effect of ●**nicorandil** (avoid concomitant use)
- Nitrates: tadalafil significantly enhances hypotensive effect of ●**nitrates** (avoid concomitant use)

**Tamoxifen**

- Antibacterials: metabolism of tamoxifen accelerated by ●**rifampicin** (reduced plasma concentration)
- Anticoagulants: tamoxifen enhances anticoagulant effect of ●**coumarins**
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by ●**fluoxetine** and ●**paroxetine** (avoid concomitant use)
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of ●**droperidol** (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by ●**bupropion** (avoid concomitant use)
- Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by ●**cinacalcet** (avoid concomitant use)

**Tamsulosin** see Alpha-blockers

**Tapentadol** see Opioid Analgesics

**Taxanes** see Cabazitaxel, Docetaxel, and Paclitaxel

**Tegafur** see Fluorouracil

**Teicoplanin**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Telaprevir**

- Alpha-blockers: manufacturer of telaprevir advises avoid concomitant use with ●**alfuzosin**
- Analgesics: manufacturer of telaprevir advises caution with ●**methadone** (risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of telaprevir advises avoid concomitant use with ●**amiodarone** and ●**disopyramide** (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with ●**fllecainide** and ●**propafenone** (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with **intravenous lidocaine**
- Antibacterials: plasma concentration of both drugs possibly increased when telaprevir given with ●**clarithromycin**, ●**erythromycin** and ●**telithromycin** (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with ●**rifabutin**; plasma concentration of telaprevir significantly reduced by ●**rifampicin**—avoid concomitant use
- Anticoagulants: telaprevir possibly affects plasma concentration of ●**warfarin**; telaprevir possibly increases plasma concentration of ●**dabigatran**
- Antidepressants: telaprevir possibly increases plasma concentration of ●**trazodone**; manufacturer of telaprevir advises avoid concomitant use with ●**St John's wort**
- Antiepileptics: manufacturer of telaprevir advises avoid concomitant use with ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**
- Antifungals: telaprevir possibly increases plasma concentration of ●**itraconazole**; telaprevir possibly increases plasma concentration of

**Telaprevir**

- **Antifungals (continued)**
    - **posaconazole** (increased risk of ventricular arrhythmias); telaprevir possibly affects plasma concentration of **voriconazole** (possible increased risk of ventricular arrhythmias)
  - **Antipsychotics:** manufacturer of telaprevir advises avoid concomitant use with **pimozide**; telaprevir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
  - **Antivirals:** plasma concentration of telaprevir possibly reduced by **atazanavir**, also plasma concentration of atazanavir possibly increased; avoid concomitant use of telaprevir with **darunavir**; plasma concentration of telaprevir reduced by **efavirenz**—increase dose of telaprevir; manufacturers advise avoid concomitant use of telaprevir with **fosamprenavir** and **lopinavir**; telaprevir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of telaprevir possibly reduced by **nevirapine**—consider increasing dose of telaprevir; plasma concentration of telaprevir possibly reduced by **ritonavir**; telaprevir increases plasma concentration of **tenofovir**
  - **Anxiolytics and Hypnotics:** telaprevir possibly increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam)
  - **Beta-blockers:** manufacturer of telaprevir advises avoid concomitant use with **sotalol** (risk of ventricular arrhythmias)
- Bosentan:** plasma concentration of telaprevir possibly reduced by **bosentan**, also plasma concentration of bosentan possibly increased
- Calcium-channel Blockers:** telaprevir increases plasma concentration of **amlodipine** (consider reducing dose of amlodipine); manufacturer of telaprevir advises caution with **diltiazem**, **felodipine**, **nicardipine**, **nifedipine** and **verapamil**
- Cardiac Glycosides:** telaprevir increases plasma concentration of **digoxin**
- **Ciclosporin:** plasma concentration of both drugs increased when telaprevir given with **ciclosporin** (reduce dose of ciclosporin)
  - **Cilostazol:** telaprevir possibly increases plasma concentration of **cilostazol** (see Dose under Cilostazol, BNF section 2.6.4)
  - **Colchicine:** telaprevir possibly increases risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids:** telaprevir possibly increases plasma concentration of **inhaled** and **intranasal budesonide** and **fluticasone**; plasma concentration of telaprevir possibly reduced by **dexamethasone**
- **Cytotoxics:** telaprevir possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with **ruxolitinib**—consult ruxolitinib product literature
  - **Domperidone:** telaprevir possibly increases plasma concentration of **domperidone**—manufacturer of telaprevir advises avoid concomitant use
  - **Ergot Alkaloids:** manufacturer of telaprevir advises avoid concomitant use with **ergot alkaloids**
  - **Lipid-regulating Drugs:** manufacturer of telaprevir advises avoid concomitant use with **atorvastatin**; manufacturers advise avoid concomitant use of telaprevir with **simvastatin**; avoidance of telaprevir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
  - **Oestrogens:** telaprevir possibly reduces plasma concentration of **ethinylestradiol**—manufacturer of telaprevir advises additional contraceptive precautions

**Telaprevir (continued)**

- **Sildenafil:** manufacturer of telaprevir advises avoid concomitant use with **sildenafil**
- **Sirolimus:** plasma concentration of both drugs increased when telaprevir given with **sirolimus** (reduce dose of sirolimus)
- **Sympathomimetics, Beta<sub>2</sub>:** manufacturer of telaprevir advises avoid concomitant use with **salmeterol** (risk of ventricular arrhythmias)
- **Tacrolimus:** plasma concentration of both drugs increased when telaprevir given with **tacrolimus** (reduce dose of tacrolimus)
- **Tadalafil:** manufacturer of telaprevir advises avoid concomitant use with high doses of **tadalafil**—consult product literature
- **Vardenafil:** manufacturer of telaprevir advises avoid concomitant use with **vardenafil**

**Telbivudine**

- **Interferons:** increased risk of peripheral neuropathy when telbivudine given with **interferon alfa**

**Telithromycin**

- **Analgesics:** possible increased risk of ventricular arrhythmias when telithromycin given with **methadone**; telithromycin inhibits the metabolism of **oxycodone**
  - **Anti-arrhythmic:** possible increased risk of ventricular arrhythmias when telithromycin given with **amiodarone** and **disopyramide**; increased risk of ventricular arrhythmias when telithromycin given with **dronedronarone**—avoid concomitant use
  - **Antibacterials:** possible increased risk of ventricular arrhythmias when telithromycin given with **moxi-floxacin**; plasma concentration of telithromycin reduced by **rifampicin** (avoid during and for 2 weeks after rifampicin)
  - **Antidepressants:** possible increased risk of ventricular arrhythmias when telithromycin given with **citalopram** and **tricyclics**; plasma concentration of telithromycin reduced by **St John's wort** (avoid during and for 2 weeks after St John's wort)
  - **Antiepileptics:** plasma concentration of telithromycin reduced by **carbamazepine**, **phenobarbital** and **phenytoin** (avoid during and for 2 weeks after carbamazepine, phenobarbital and phenytoin)
- Antimuscarinics:** manufacturer of fesoterodine advises dose reduction when telithromycin given with **fesoterodine**—consult fesoterodine product literature
- **Antipsychotics:** possible increased risk of ventricular arrhythmias when telithromycin given with **chlorpromazine**; increased risk of ventricular arrhythmias when telithromycin given with **pimozide**—avoid concomitant use; telithromycin possibly increases plasma concentration of **quetiapine**
  - **Antivirals:** manufacturer of telithromycin advises avoid concomitant use with **atazanavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir** and **tipranavir** in severe renal and hepatic impairment; telithromycin possibly increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); manufacturer of telithromycin advises avoid concomitant use with **saquinavir** (risk of ventricular arrhythmias); plasma concentration of both drugs possibly increased when telithromycin given with **telaprevir** (increased risk of ventricular arrhythmias)
  - **Anxiolytics and Hypnotics:** telithromycin inhibits metabolism of **midazolam** (increased plasma concentration with increased sedation)
- Aprepitant:** telithromycin possibly increases plasma concentration of **aprepitant**
- **Calcium-channel Blockers:** telithromycin possibly inhibits metabolism of **calcium-channel blockers** (increased risk of side-effects)
- Cardiac Glycosides:** telithromycin possibly increases plasma concentration of **digoxin**

**Telithromycin** (*continued*)

- Cyclosporin: telithromycin possibly increases plasma concentration of ●**cyclosporin**
- Colchicine: telithromycin possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: telithromycin possibly increases plasma concentration of ●**axitinib** (reduce dose of axitinib—consult axitinib product literature); telithromycin possibly increases the plasma concentration of ●**bosutinib** and ●**cabazitaxel**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; telithromycin possibly increases plasma concentration of ●**crizotinib** and ●**everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of ●**lapatinib** and ●**nilotinib**; telithromycin possibly increases plasma concentration of ●**pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when telithromycin given with ●**ruxolitinib**—consult ruxolitinib product literature
- Dapoxetine: avoidance of telithromycin advised by manufacturer of ●**dapoxetine** (increased risk of toxicity)
- Diuretics: telithromycin increases plasma concentration of ●**eplerenone**—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when telithromycin given with ●**ergotamine**—avoid concomitant use
- Ivabradine: telithromycin possibly increases plasma concentration of ●**ivabradine**—avoid concomitant use
- Ivacaftor: telithromycin possibly increases plasma concentration of ●**ivacaftor** (see Dose under Ivacaftor, p. 165)
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with ●**atorvastatin** or ●**simvastatin** (avoid concomitant use); possible increased risk of myopathy when telithromycin given with ●**pravastatin**; avoidance of telithromycin advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
- Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when telithromycin given with parenteral ●**pentamidine isetionate**
- Ranolazine: telithromycin possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: telithromycin possibly increases plasma concentration of ●**sildenafil**—reduce initial dose of sildenafil
- Sirolimus: telithromycin increases plasma concentration of ●**sirolimus**—avoid concomitant use
- Tacrolimus: telithromycin possibly increases plasma concentration of ●**tacrolimus**
- Ulipristal: avoidance of telithromycin advised by manufacturer of ●**ulipristal**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Telmisartan** *see* Angiotensin-II Receptor Antagonists

**Temazepam** *see* Anxiolytics and Hypnotics

**Temocillin** *see* Penicillins

**Temporfin**

- Cytotoxics: increased skin photosensitivity when temporfin given with **topical** ●**fluorouracil**

**Temozolomide**

Antiepileptics: plasma concentration of temozolomide increased by ●**valproate**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Temsirolimus**

**Note** The main active metabolite of temsirolimus is sirolimus—*see also* interactions of sirolimus and consult product literature

- Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by ●**rifampicin**—avoid concomitant use
- Antifungals: manufacturer of temsirolimus advises avoid concomitant use with ●**itraconazole** (plasma concentration of temsirolimus possibly increased)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Tenofovir**

- Antivirals: manufacturer of tenofovir advises avoid concomitant use with ●**adefovir**; tenofovir reduces plasma concentration of ●**atazanavir**, also plasma concentration of tenofovir possibly increased; manufacturers advise avoid concomitant use of tenofovir with ●**cidofovir**; tenofovir increases plasma concentration of ●**didanosine** (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by ●**lopinavir** and ●**tela-previr**
- Orlistat: absorption of tenofovir possibly reduced by ●**orlistat**

**Tenoxicam** *see* NSAIDs

**Terazosin** *see* Alpha-blockers

**Terbinafine**

- Antibacterials: plasma concentration of terbinafine reduced by ●**rifampicin**
- Antidepressants: terbinafine possibly increases plasma concentration of ●**paroxetine** and ●**tricyclics**
- Antifungals: terbinafine increases plasma concentration of ●**fluconazole**
- Cyclosporin: terbinafine possibly reduces plasma concentration of ●**cyclosporin**
- Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with ●**oestrogens** (when used for contraception)
- Progestogens: occasional reports of breakthrough bleeding when terbinafine given with ●**progestogens** (when used for contraception)
- Ulcer-healing Drugs: plasma concentration of terbinafine increased by ●**cimetidine**

**Terbutaline** *see* Sympathomimetics, Beta<sub>2</sub>

**Teriflunomide**

- Antibacterials: teriflunomide increases plasma concentration of ●**cefaclor**; plasma concentration of teriflunomide reduced by ●**rifampicin**
- Antidiabetics: teriflunomide increases plasma concentration of ●**repaglinide**
- Lipid-regulating Drugs: the effect of teriflunomide is significantly decreased by ●**colestyramine** (enhanced elimination)—avoid unless drug elimination desired; teriflunomide increases plasma concentration of ●**rosuvastatin** (consider reducing dose of rosuvastatin)
- Oestrogens: teriflunomide increases plasma concentration of ●**ethinylestradiol**
- Progestogens: teriflunomide increases plasma concentration of ●**levonorgestrel**
- Vaccines: avoid concomitant use of teriflunomide with live ●**vaccines** (see p. 604)

**Testolactone**

- Anticoagulants: testolactone enhances anticoagulant effect of ●**coumarins** and ●**phenindione**

**Testosterone**

- Anticoagulants: testosterone enhances anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antidiabetics: testosterone possibly enhances hypoglycaemic effect of ●**antidiabetics**

**Tetrabenazine**

- Antidepressants: risk of CNS toxicity when tetrabenazine given with ●**MAOIs** (avoid tetrabenazine for 2 weeks after MAOIs)

**Tetrabenazine** (continued)

Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with **antipsychotics**

Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with **amantadine**

Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with **metoclopramide**

**Tetracosactide** see Corticosteroids**Tetracycline** see Tetracyclines**Tetracyclines**

ACE Inhibitors: absorption of tetracyclines reduced by **quinapril** tablets (quinapril tablets contain magnesium carbonate)

Adsorbents: absorption of tetracyclines possibly reduced by **kaolin**

Antacids: absorption of tetracyclines reduced by **antacids**

Antibacterials: plasma concentration of doxycycline reduced by **rifampicin**—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of **penicillins**

- Anticoagulants: tetracyclines possibly enhance anticoagulant effect of **coumarins** and **phenindione**

Antidiabetics: tetracyclines possibly enhance hypoglycaemic effect of **sulfonylureas**

Antiepileptics: metabolism of doxycycline accelerated by **carbamazepine** (reduced effect); metabolism of doxycycline accelerated by **phenobarbital** and **phenytoin** (reduced plasma concentration)

Atovaquone: tetracycline reduces plasma concentration of **atovaquone**

Calcium Salts: absorption of tetracycline reduced by **calcium salts**

Cytotoxics: doxycycline or tetracycline increase risk of **methotrexate** toxicity

Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by **dairy products**

Diuretics: manufacturer of lymecycline advises avoid concomitant use with **diuretics**

Ergot Alkaloids: increased risk of ergotism when tetracyclines given with **ergotamine**

Iron: absorption of tetracyclines reduced by **oral iron**, also absorption of **oral iron** reduced by tetracyclines

Lipid-regulating Drugs: absorption of tetracycline possibly reduced by **colestipol** and **colestyramine**

- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with **retinoids** (avoid concomitant use)

Strontium Ranelate: absorption of tetracyclines reduced by **strontium ranelate** (manufacturer of strontium ranelate advises avoid concomitant use)

Ulcer-healing Drugs: absorption of tetracyclines reduced by **sucralfate** and **tripotassium dicitrate-bismuthate**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

Zinc: absorption of tetracyclines reduced by **zinc**, also absorption of zinc reduced by tetracyclines

**Theophylline**

Allopurinol: plasma concentration of theophylline possibly increased by **allopurinol**

Anaesthetics, General: increased risk of convulsions when theophylline given with **ketamine**

Anti-arrhythmic: theophylline antagonises anti-arrhythmic effect of **adenosine**—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine; plasma concentration of theophylline increased by **propafenone**

- Antibacterials: plasma concentration of theophylline possibly increased by **clarithromycin** and **isoniazid**; plasma concentration of theophylline increased by **erythromycin** (also theophylline may reduce absorption of **oral erythromycin**); plasma concentra-

**Theophylline**

## • Antibacterials (continued)

tion of theophylline increased by **ciprofloxacin** and **norfloxacin**; metabolism of theophylline accelerated by **rifampicin** (reduced plasma concentration); possible increased risk of convulsions when theophylline given with **quinolones**

- Anti-depressants: plasma concentration of theophylline increased by **fluvoxamine** (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by **St John's wort**

- Antiepileptics: metabolism of theophylline accelerated by **carbamazepine** and **phenobarbital** (reduced effect); plasma concentration of both drugs reduced when theophylline given with **phenytoin**

- Antifungals: plasma concentration of theophylline possibly increased by **fluconazole**

- Antivirals: plasma concentration of theophylline possibly increased by **aciclovir**; metabolism of theophylline accelerated by **ritonavir** (reduced plasma concentration)

Anxiolytics and Hypnotics: theophylline possibly reduces effects of **benzodiazepines**

Caffeine citrate: avoidance of theophylline advised by manufacturer of **caffeine citrate**

- Calcium-channel Blockers: plasma concentration of theophylline possibly increased by **calcium-channel blockers** (enhanced effect); plasma concentration of theophylline increased by **diltiazem**; plasma concentration of theophylline increased by **verapamil** (enhanced effect)

Corticosteroids: increased risk of hypokalaemia when theophylline given with **corticosteroids**

Cytotoxics: plasma concentration of theophylline possibly increased by **methotrexate**

- Deferasirox: plasma concentration of theophylline increased by **deferasirox** (consider reducing dose of theophylline)

Disulfiram: metabolism of theophylline inhibited by **disulfiram** (increased risk of toxicity)

Diuretics: increased risk of hypokalaemia when theophylline given with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**

Doxapram: increased CNS stimulation when theophylline given with **doxapram**

- Interferons: metabolism of theophylline inhibited by **interferon alfa** (consider reducing dose of theophylline)

Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by **zafirlukast**, also plasma concentration of zafirlukast reduced

Lithium: theophylline increases excretion of **lithium** (reduced plasma concentration)

Oestrogens: plasma concentration of theophylline increased by **oestrogens** (consider reducing dose of theophylline)

Pentoxifylline: plasma concentration of theophylline increased by **pentoxifylline**

Roflumilast: avoidance of theophylline advised by manufacturer of **roflumilast**

Sulfapyridone: plasma concentration of theophylline reduced by **sulfapyridone**

Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with **ephedrine** in children

Sympathomimetics, Beta<sub>2</sub>: increased risk of hypokalaemia when theophylline given with high doses of **beta<sub>2</sub> sympathomimetics**—see Hypokalaemia, p. 136

- Ulcer-healing Drugs: metabolism of theophylline inhibited by **cimetidine** (increased plasma concentration); absorption of theophylline possibly reduced by **sucralfate** (give at least 2 hours apart)

**Theophylline** (*continued*)

Vaccines: plasma concentration of theophylline possibly increased by **influenza vaccine**

**Thiazolidinediones** *see* Antidiabetics**Thiopental** *see* Anaesthetics, General**Thiotepa**

- Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Muscle Relaxants: thiotepa enhances effects of **suxamethonium**

**Thioxanthenes** *see* Antipsychotics**Thyroid Hormones**

Anticids: absorption of levothyroxine possibly reduced by **antacids**

Anti-arrhythmics: for concomitant use of thyroid hormones and **amiodarone** *see* p. 82

Antibacterials: metabolism of levothyroxine accelerated by **rifampicin** (may increase requirements for levothyroxine in hypothyroidism)

- Anticoagulants: thyroid hormones enhance anticoagulant effect of **●coumarins** and **●phenindione**
- Antidepressants: thyroid hormones enhance effects of **amitriptyline** and **imipramine**; thyroid hormones possibly enhance effects of **tricyclics**

Antiepileptics: metabolism of thyroid hormones accelerated by **carbamazepine** and **phenobarbital** (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by **phenytoin** (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased

Beta-blockers: levothyroxine accelerates metabolism of **propranolol**

Calcium Salts: absorption of levothyroxine reduced by **calcium salts**

Colestilan: manufacturer of colestilan advises give levothyroxine at least 1 hour before or 3 hours after **colestilan**

Cytotoxics: plasma concentration of levothyroxine possibly reduced by **imatinib**

Iron: absorption of levothyroxine reduced by **oral iron** (give at least 2 hours apart)

Lanthanum: absorption of levothyroxine reduced by **lanthanum** (give at least 2 hours apart)

Lipid-regulating Drugs: absorption of levothyroxine reduced by **colesvelam**; absorption of thyroid hormones reduced by **colestipol** and **colestyramine**

Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by **oestrogens**

Orlistat: possible increased risk of hypothyroidism when levothyroxine given with **orlistat**

Polystyrene Sulfonate Resins: absorption of levothyroxine reduced by **polystyrene sulfonate resins**

Sevelamer: absorption of levothyroxine possibly reduced by **sevelamer**

Ulcer-healing Drugs: absorption of levothyroxine reduced by **cimetidine** and **sucralfate**

**Tiagabine**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **●tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **●SSRIs** and **●tricyclics** (convulsive threshold lowered)

Antiepileptics: plasma concentration of tiagabine reduced by **carbamazepine**, **phenobarbital** and **phenytoin**

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **●mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **●antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **●orlistat**

**Tiaprofenic Acid** *see* NSAIDs**Tibolone**

Antibacterials: metabolism of tibolone accelerated by **rifampicin** (reduced plasma concentration)

Antiepileptics: metabolism of tibolone accelerated by **carbamazepine** (reduced plasma concentration); metabolism of tibolone accelerated by **phenytoin**

**Ticagrelor**

- Antibacterials: plasma concentration of ticagrelor possibly increased by **●clarithromycin**—manufacturer of ticagrelor advises avoid concomitant use; plasma concentration of ticagrelor possibly increased by **erythromycin**; plasma concentration of ticagrelor reduced by **●rifampicin**

- Anticoagulants: ticagrelor increases plasma concentration of **●dabigatran**

Antidepressants: possible increased risk of bleeding when ticagrelor given with **citalopram**, **paroxetine** or **sertraline**

Antiepileptics: plasma concentration of ticagrelor possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**

- Antivirals: plasma concentration of ticagrelor possibly increased by **●atazanavir** and **●ritonavir**—manufacturer of ticagrelor advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of ticagrelor increased by **diltiazem**

- Cardiac Glycosides: ticagrelor increases plasma concentration of **●digoxin**

Ciclosporin: plasma concentration of ticagrelor increased by **ciclosporin**

Corticosteroids: plasma concentration of ticagrelor possibly reduced by **dexamethasone**

- Ergot Alkaloids: ticagrelor possibly increases plasma concentration of **●ergot alkaloids**
- Lipid-regulating Drugs: ticagrelor increases plasma concentration of **●simvastatin** (increased risk of toxicity)

**Ticarcillin** *see* Penicillins**Tigecycline**

Anticoagulants: tigecycline possibly enhances anticoagulant effect of **coumarins**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Timolol** *see* Beta-blockers**Tinidazole**

Alcohol: possibility of disulfiram-like reaction when tinidazole given with **alcohol**

Antibacterials: plasma concentration of tinidazole possibly reduced by **rifampicin**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Tinzaparin** *see* Heparins**Tioguanine**

- Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when tioguanine given with **busulfan**

**Tiotropium** *see* Antimuscarinics**Tipranavir**

Analgesics: plasma concentration of tipranavir possibly reduced by **buprenorphine**

Antacids: absorption of tipranavir reduced by **antacids**

- Antibacterials: tipranavir increases plasma concentration of **●clarithromycin** (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of **●rifabutin** (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by **●rifampicin**—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of **●telithromycin**

Anticoagulants: avoidance of tipranavir advised by manufacturer of **apixaban** and **rivaroxaban**

**Tipranavir** (continued)

- Antidepressants: plasma concentration of tipranavir possibly reduced by ●**St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of tipranavir possibly reduced by ●**carbamazepine**
- Antifungals: plasma concentration of tipranavir increased by ●**fluconazole**
- Antimalarials: caution with tipranavir advised by manufacturer of ●**artemether with lumefantrine**; tipranavir possibly increases plasma concentration of ●**quinine** (increased risk of toxicity)
- Antimuscarinics: avoidance of tipranavir advised by manufacturer of ●**darifenacin**
- Antipsychotics: tipranavir possibly increases plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); tipranavir possibly increases plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: tipranavir reduces plasma concentration of ●**abacavir**, ●**fosamprenavir**, ●**lopinavir**, ●**saquinavir** and ●**zidovudine**; plasma concentration of tipranavir increased by ●**atazanavir** (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of ●**didanosine**—manufacturer of tipranavir advises tipranavir and didanosine *capsules* should be taken at least 2 hours apart; tipranavir reduces the plasma concentration of ●**dolutegravir** (see Dose under Dolutegravir, p. 324); tipranavir reduces plasma concentration of ●**etravirine**, also plasma concentration of tipranavir increased (avoid concomitant use)
- Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with ●**metoprolol** for heart failure
- Bosentan: manufacturer of tipranavir advises avoid concomitant use with ●**bosentan**
- Lipid-regulating Drugs: increased risk of myopathy when tipranavir given with ●**atorvastatin** (see Dose under Atorvastatin, p. 125); tipranavir possibly increases plasma concentration of ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; tipranavir possibly increases plasma concentration of ●**simvastatin**—avoid concomitant use; avoidance of tipranavir advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of tipranavir possibly reduced by ●**orlistat**
- Ranolazine: tipranavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sympathomimetics, Beta-: manufacturer of tipranavir advises avoid concomitant use with ●**salmeterol**
- Ulcer-healing Drugs: tipranavir reduces plasma concentration of ●**esomeprazole** and ●**omeprazole**
- Vardenafil: manufacturer of tipranavir advises caution with ●**varidenafil**
- Vitamins: increased risk of bleeding when tipranavir given with high doses of ●**vitamin E**

**Tirofiban**

- Iloprost: increased risk of bleeding when tirofiban given with ●**iloprost**

**Tizanidine** see Muscle Relaxants**Tobramycin** see Aminoglycosides**Tocilizumab**

- Vaccines: avoid concomitant use of tocilizumab with live ●**vaccines** (see p. 604)

**Tolazoline** see Alpha-blockers**Tolbutamide** see Antidiabetics**Tolcapone**

- Antidepressants: avoid concomitant use of tolcapone with ●**MAOIs**
- Memantine: effects of dopaminergics possibly enhanced by ●**memantine**

**Tolcapone** (continued)

Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by ●**methyl dopa**

**Tolfenamic Acid** see NSAIDs**Tolterodine** see Antimuscarinics**Tolvaptan**

Antibacterials: plasma concentration of tolvaptan reduced by ●**rifampicin**

Cardiac Glycosides: tolvaptan increases plasma concentration of ●**digoxin** (increased risk of toxicity)

- Grapefruit Juice: plasma concentration of tolvaptan increased by ●**grapefruit juice**—avoid concomitant use

**Topiramate**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ●**MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)
- Antidiabetics: topiramate possibly increases plasma concentration of ●**metformin**; topiramate possibly reduces plasma concentration of ●**glibenclamide**
- Antiepileptics: plasma concentration of topiramate often reduced by ●**carbamazepine**; topiramate reduces plasma concentration of ●**perampanel**; plasma concentration of topiramate possibly reduced by ●**phenobarbital**; topiramate increases plasma concentration of ●**phenytoin** (also plasma concentration of topiramate reduced); hyperammonaemia and CNS toxicity reported when topiramate given with ●**valproate**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Diuretics: plasma concentration of topiramate possibly increased by ●**hydrochlorothiazide**
- Lithium: topiramate possibly affects plasma concentration of ●**lithium**
- Oestrogens: topiramate accelerates metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 402)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- Progestogens: topiramate accelerates metabolism of ●**progestogens** (reduced contraceptive effect—see p. 402)
- Torsemide** see Diuretics
- Toremifene**
- Anticoagulants: toremifene possibly enhances anticoagulant effect of ●**coumarins**
- Antiepileptics: metabolism of toremifene possibly accelerated by ●**carbamazepine** (reduced plasma concentration); metabolism of toremifene accelerated by ●**phenobarbital** (reduced plasma concentration); metabolism of toremifene possibly accelerated by ●**phenytoin**
- Cytotoxics: possible increased risk of ventricular arrhythmias when toremifene given with ● **vandetanib**—avoid concomitant use
- Diuretics: increased risk of hypercalcaemia when toremifene given with ●**thiazides and related diuretics**
- Trabectedin**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Tramadol** see Opioid Analgesics
- Trandolapril** see ACE Inhibitors
- Tranylcypromine** see MAOIs
- Trastuzumab**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Trazodone** see Antidepressants, Tricyclic (related)
- Tretinoin** see Retinoids

**Triamcinolone** *see* Corticosteroids

**Triamterene** *see* Diuretics

### Trientine

Iron: trientine reduces absorption of **oral iron**

Zinc: trientine reduces absorption of **zinc**, also absorption of trientine reduced by zinc

**Trifluoperazine** *see* Antipsychotics

**Trihexyphenidyl** *see* Antimuscarinics

### Trimethoprim

ACE Inhibitors: possible increased risk of hyperkalaemia when trimethoprim given with **ACE inhibitors**

Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimethoprim given with **angiotensin-II receptor antagonists**

Anti-arrhythmics: possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with **amiodarone**—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole

Antibacterials: plasma concentration of trimethoprim possibly reduced by **rifampicin**; plasma concentration of both drugs may increase when trimethoprim given with **dapsone**

Anticoagulants: trimethoprim possibly enhances anticoagulant effect of **coumarins**

Antidiabetics: trimethoprim possibly enhances hypoglycaemic effect of **repaglinide**—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of **sulfonylureas**

- Antiepileptics: trimethoprim increases plasma concentration of **phenytoin** (also increased antileptile effect)

- Antimalarials: increased antifolate effect when trimethoprim given with **pyrimethamine**

Antivirals: trimethoprim (as co-trimoxazole) increases plasma concentration of **lamivudine**—avoid concomitant use of high-dose co-trimoxazole

- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with **azathioprine**

Cardiac Glycosides: trimethoprim possibly increases plasma concentration of **digoxin**

- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with **ciclosporin**, also plasma concentration of ciclosporin reduced by *intravenous* trimethoprim

- Cytotoxics: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with **mercaptopurine** or **methotrexate**

Diuretics: increased risk of hyperkalaemia when trimethoprim given with **eplerenone**; possible increased risk of hyperkalaemia when trimethoprim given with **spironolactone**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 626

**Trimipramine** *see* Antidepressants, Tricyclic

### Tripotassium Dicitratobismuthate

Antibacterials: tripotassium dicitratobismuthate reduces absorption of **tetracyclines**

**Tropicamide** *see* Antimuscarinics

**Trospium** *see* Antimuscarinics

**Typhoid Vaccine (oral)** *see* Vaccines

**Typhoid Vaccine (parenteral)** *see* Vaccines

### Ubidecarenone

Anticoagulants: ubidecarenone may enhance or reduce anticoagulant effect of **warfarin**

**Ulcer-healing Drugs** *see* Histamine H<sub>2</sub>-antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate

### Ulipristal

- Antacids: manufacturer of *high-dose* ulipristal advises avoid concomitant use with **antacids** (contraceptive effect of ulipristal possibly reduced)

### Ulipristal (continued)

- Antibacterials: manufacturer of ulipristal advises avoid concomitant use with **clarithromycin** and **telithromycin**; plasma concentration of ulipristal increased by **erythromycin**—manufacturer of ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with **rifampicin** (contraceptive effect of ulipristal possibly reduced)

Anticoagulants: manufacturer of ulipristal advises give **dabigatran** at least 1.5 hours before or after ulipristal

- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with **St John's wort** (contraceptive effect of ulipristal possibly reduced)

- Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin** (contraceptive effect of ulipristal possibly reduced)

Antifungals: manufacturer of ulipristal advises avoid concomitant use with **itraconazole**

Antihistamines: manufacturer of ulipristal advises give **fenofenadine** at least 1.5 hours before or after ulipristal

- Antivirals: manufacturer of ulipristal advises avoid concomitant use with **ritonavir** (contraceptive effect of ulipristal possibly reduced)

Calcium-channel Blockers: manufacturer of ulipristal advises avoid concomitant use with **verapamil**

Cardiac Glycosides: manufacturer of ulipristal advises give **digoxin** at least 1.5 hours before or after ulipristal

Grapefruit Juice: manufacturer of ulipristal advises avoid concomitant use with **grapefruit juice**

- Progestogens: ulipristal possibly reduces contraceptive effect of **progestogens**

- Ulcer-healing Drugs: manufacturer of *high-dose* ulipristal advises avoid concomitant use with **histamine H<sub>2</sub>-antagonists** and **proton pump inhibitors** (contraceptive effect of ulipristal possibly reduced)

**Ursodeoxycholic Acid** *see* Bile Acids

### Ustekinumab

- Vaccines: avoid concomitant use of ustekinumab with live **vaccines** (*see* p. 604)

### Vaccines

**Note** For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, *see* p. 604; for advice on live vaccines and immunoglobulins, *see* under Normal Immunoglobulin, p. 628

- Abatacept: avoid concomitant use of live vaccines with **abatacept** (*see* p. 604)
- Adalimumab: avoid concomitant use of live vaccines with **adalimumab** (*see* p. 604)
- Anakinra: avoid concomitant use of live vaccines with **anakinra** (*see* p. 604)
- Antibacterials: oral typhoid vaccine inactivated by **antibacterials**—*see* p. 626
- Anticoagulants: influenza vaccine possibly enhances anticoagulant effect of **warfarin**
- Antiepileptics: influenza vaccine enhances effects of **phenytoin**
- Antimalarials: oral typhoid vaccine inactivated by **antimalarials**—*see* p. 626
- Belimumab: avoid concomitant use of live vaccines with **belimumab** (*see* p. 604)
- Certolizumab pegol: avoid concomitant use of live vaccines with **certolizumab pegol** (*see* p. 604)
- Corticosteroids: immune response to vaccines impaired by high doses of **corticosteroids**, avoid concomitant use with live vaccines (*see* p. 604)
- Cytotoxics: avoid concomitant use of live vaccines with **pixantrone** (*see* p. 604)
- Etanercept: avoid concomitant use of live vaccines with **etanercept** (*see* p. 604)
- Golimumab: avoid concomitant use of live vaccines with **golimumab** (*see* p. 604)

**Vaccines** (continued)

- **Infliximab**: avoid concomitant use of live vaccines with **●infliximab** (see p. 604)
- Interferons: avoidance of vaccines advised by manufacturer of **interferon gamma**
- **Leflunomide**: avoid concomitant use of live vaccines with **●leflunomide** (see p. 604)
- **Teriflunomide**: avoid concomitant use of live vaccines with **●teriflunomide** (see p. 604)
- Theophylline: influenza vaccine possibly increases plasma concentration of **theophylline**
- **Tocilizumab**: avoid concomitant use of live vaccines with **●tocilizumab** (see p. 604)
- **Ustekinumab**: avoid concomitant use of live vaccines with **●ustekinumab** (see p. 604)

**Valaciclovir** see Aciclovir

**Valganciclovir** see Ganciclovir

**Valproate**

- Analgesics: effects of valproate enhanced by **aspirin**
- **Antibacterials**: metabolism of valproate possibly inhibited by **erythromycin** (increased plasma concentration); avoidance of valproate advised by manufacturer of **●pivmecillinam**; plasma concentration of valproate reduced by **●carbapenems**—avoid concomitant use
  - Anticoagulants: valproate possibly enhances anticoagulant effect of **coumarins**
  - **Antidepressants**: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **●tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **●SSRIs** and **●tricyclics** (convulsive threshold lowered)
  - **Antiepileptics**: plasma concentration of valproate reduced by **carbamazepine**, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of **ethosuximide**; valproate increases plasma concentration of **●lamotrigine** (increased risk of toxicity—reduce lamotrigine dose); valproate sometimes reduces plasma concentration of an active metabolite of **oxcarbazepine**; valproate increases plasma concentration of **phenobarbital** (also plasma concentration of valproate reduced); valproate increases or possibly decreases plasma concentration of **phenytoin**, also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of **rufinamide** (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when valproate given with **topiramate**
  - **Antimalarials**: anticonvulsant effect of antiepileptics antagonised by **●mefloquine**
  - **Antipsychotics**: anticonvulsant effect of antiepileptics antagonised by **●antipsychotics** (convulsive threshold lowered); valproate possibly increases or decreases plasma concentration of **clozapine**; increased risk of side-effects including neutropenia when valproate given with **●olanzapine**
  - Antivirals: plasma concentration of valproate possibly reduced by **ritonavir**; valproate possibly increases plasma concentration of **zidovudine** (increased risk of toxicity)
  - Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by **clobazam**; increased risk of side-effects when valproate given with **clonazepam**; valproate possibly increases plasma concentration of **diazepam** and **lorazepam**
  - Bupropion: valproate inhibits the metabolism of **bupropion**
  - Cytotoxics: valproate increases plasma concentration of **temozolomide**
  - Lipid-regulating Drugs: absorption of valproate possibly reduced by **colestyramine**
  - Oestrogens: plasma concentration of valproate possibly reduced by **ethinylestradiol**

**Valproate** (continued)

- **Orlistat**: possible increased risk of convulsions when antiepileptics given with **●orlistat**
- Sodium Benzoate: valproate possibly reduces effects of **sodium benzoate**
- Sodium Phenylbutyrate: valproate possibly reduces effects of **sodium phenylbutyrate**
- **Ulcer-healing Drugs**: metabolism of valproate inhibited by **●cimetidine** (increased plasma concentration)

**Valsartan** see Angiotensin-II Receptor Antagonists

**Vancomycin**

- Anaesthetics, General: hypersensitivity-like reactions can occur when **intravenous vancomycin** given with **general anaesthetics**
- **Antibacterials**: increased risk of nephrotoxicity and ototoxicity when vancomycin given with **●aminoglycosides**, **capreomycin** or **colistimethate sodium**; increased risk of nephrotoxicity when vancomycin given with **polymyxins**
  - Antifungals: possible increased risk of nephrotoxicity when vancomycin given with **amphotericin**
  - **Ciclosporin**: increased risk of nephrotoxicity when vancomycin given with **●ciclosporin**
  - Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with **cisplatin**
  - **Diuretics**: increased risk of ototoxicity when vancomycin given with **●loop diuretics**
  - Lipid-regulating Drugs: effects of **oral vancomycin** antagonised by **colestyramine**
  - **Muscle Relaxants**: vancomycin enhances effects of **●suxamethonium**
  - Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with **tacrolimus**
  - Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 626

**Vandetanib**

- **Analgesics**: possible increased risk of ventricular arrhythmias when vandetanib given with **●methadone**—avoid concomitant use
- **Anti-arrhythmics**: possible increased risk of ventricular arrhythmias when vandetanib given with **●amiodarone** or **●disopyramide**—avoid concomitant use
- **Antibacterials**: possible increased risk of ventricular arrhythmias when vandetanib given with **parenteral ●erythromycin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when vandetanib given with **●moxifloxacin**—avoid concomitant use; plasma concentration of vandetanib reduced by **●rifampicin**—manufacturer of vandetanib advises avoid concomitant use
- Antidepressants: manufacturer of vandetanib advises avoid concomitant use with **St John's wort** (plasma concentration of vandetanib possibly reduced)
- Antidiabetics: vandetanib possibly increases plasma concentration of **metformin** (consider reducing dose of metformin)
- Antiepileptics: manufacturer of vandetanib advises avoid concomitant use with **carbamazepine** and **phenobarbital** (plasma concentration of vandetanib possibly reduced)
- **Antihistamines**: possible increased risk of ventricular arrhythmias when vandetanib given with **●mizolastine**—avoid concomitant use
- **Antimalarials**: possible increased risk of ventricular arrhythmias when vandetanib given with **●artemether with lumefantrine**—avoid concomitant use
- **Antipsychotics**: possible increased risk of ventricular arrhythmias when vandetanib given with **●amisulpride**, **●chlorpromazine**, **●haloperidol**, **●pimozide**, **●sulpiride** or **●zuclopenthixol**—avoid concomitant use; avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)

**Vandetanib** (*continued*)

- Beta-blockers: possible increased risk of ventricular arrhythmias when vandetanib given with **•sotalol**—avoid concomitant use  
Cardiac Glycosides: vandetanib increases plasma concentration of **digoxin**—possible increased risk of bradycardia
- Cytotoxics: possible increased risk of ventricular arrhythmias when vandetanib given with **•arsenic trioxide**—avoid concomitant use
- Hormone Antagonists: possible increased risk of ventricular arrhythmias when vandetanib given with **•toremifene**—avoid concomitant use
- 5HT<sub>2</sub>-receptor Antagonists: increased risk of ventricular arrhythmias when vandetanib given with **•ondansetron**—avoid concomitant use
- Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when vandetanib given with **•pentamidine isetionate**—avoid concomitant use

**Vardenafil**

- Alpha-blockers: enhanced hypotensive effect when vardenafil given with **•alpha-blockers**—separate doses by 6 hours (except with tamsulosin)—see also under Phosphodiesterase type-5 inhibitors, BNF section 7.4.5  
Anti-arrhythmics: avoidance of vardenafil advised by manufacturer of **disopyramide** (risk of ventricular arrhythmias)  
Antibacterials: plasma concentration of vardenafil possibly increased by **clarithromycin** (consider reducing initial dose of vardenafil); plasma concentration of vardenafil increased by **erythromycin** (reduce dose of vardenafil)
- Antifungals: plasma concentration of vardenafil possibly increased by **itraconazole**—avoid concomitant use
- Antivirals: plasma concentration of vardenafil possibly increased by **fosamprenavir**; plasma concentration of vardenafil increased by **•indinavir** and **•ritonavir**—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with **•saquinavir**—avoid concomitant use; avoidance of vardenafil advised by manufacturer of **telaprevir**; caution with vardenafil advised by manufacturer of **tipranavir**
- Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with **nifedipine**
- Cobicistat: plasma concentration of vardenafil possibly increased by **•cobicistat**—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)
- Dapoxetine: avoidance of vardenafil advised by manufacturer of **dapoxetine**
- Grapefruit Juice: plasma concentration of vardenafil possibly increased by **•grapefruit juice**—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with **•nicorandil**—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with **•nitrates**—avoid concomitant use

**Varicella-zoster Vaccine** *see* Vaccines**Vasodilator Antihypertensives**

- ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **aldesleukin**

**Vasodilator Antihypertensives** (*continued*)

- Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **general anaesthetics**
- Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **angiotensin-II receptor antagonists**
- Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **MAOIs**; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with **tricyclic-related antidepressants**
- Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **phenothiazines**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **clonidine**
- Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **diazoxide**
- Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **levodopa**
- Methyldopa: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **methyldopa**
- Moxisylyte: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **baclofen**; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **tizanidine**
- Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **nicorandil**
- Nitrates: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **nitrates**
- Oestrogens: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alprostadiol**
- Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with **minoxidil** or **sodium nitroprusside**; enhanced hypotensive effect when minoxidil given with **sodium nitroprusside**

**Vecuronium** *see* Muscle Relaxants**Vemurafenib**

Antibacterials: manufacturer of vemurafenib advises avoid concomitant use with **rifabutin** and **rifampicin**

- Anticoagulants: vemurafenib possibly enhances anticoagulant effect of ●**warfarin**
- Antidepressants: manufacturer of vemurafenib advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of vemurafenib advises avoid concomitant use with **carbamazepine** and **phenytoin**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: avoidance of vemurafenib advised by manufacturer of **ipilimumab**
- Oestrogens: manufacturer of vemurafenib advises contraceptive effect of ●**oestrogens** possibly reduced
- Progestogens: manufacturer of vemurafenib advises contraceptive effect of ●**progestogens** possibly reduced

**Venlafaxine**

- Analgesics: increased risk of bleeding when venlafaxine given with ●**NSAIDs** or ●**aspirin**; possible increased serotonergic effects when SSRI-related antidepressants given with **fentanyl**; possible increased serotonergic effects when venlafaxine given with **tramadol**
- Anticoagulants: venlafaxine possibly enhances anticoagulant effect of ●**warfarin**; possible increased risk of bleeding when SSRI-related antidepressants given with ●**dabigatran**
- Antidepressants: possible increased serotonergic effects when venlafaxine given with **St John's wort**, **duloxetine** or **mirtazapine**; enhanced CNS effects and toxicity when venlafaxine given with ●**MAOIs** (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start ●**moclobemide** for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether with lumefantrine** and ●**piperquine with artemimol**
- Antipsychotics: venlafaxine increases plasma concentration of **haloperidol**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Dapoxetine: possible increased risk of serotonergic effects when venlafaxine given with ●**dapoxetine** (manufacturer of dapoxetine advises venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping venlafaxine)
- Dopaminergics: caution with venlafaxine advised by manufacturer of **entacapone**; increased risk of hypertension and CNS excitation when venlafaxine given with ●**selegiline** (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)
- 5HT<sub>1</sub>-receptor Agonists: possible increased serotonergic effects when venlafaxine given with 5HT<sub>1</sub> **agonists**
- Lithium: possible increased serotonergic effects when venlafaxine given with **lithium**
- Methylthioninium: risk of CNS toxicity when SSRI-related antidepressants given with ●**methylthioninium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

**Verapamil** *see* Calcium-channel Blockers**Vigabatrin**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-**

**Vigabatrin**

- Antidepressants (*continued*)

**related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)

- Antiepileptics: vigabatrin reduces plasma concentration of **phenytoin**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

**Vilanterol** *see* Sympathomimetics, Beta<sub>2</sub>**Vildagliptin** *see* Antidiabetics**Vinblastine**

- Aldesleukin: avoidance of vinblastine advised by manufacturer of **aldesleukin**
- Antibacterials: toxicity of vinblastine increased by ●**erythromycin**—avoid concomitant use
- Antifungals: possible increased risk of vinblastine toxicity when given with ●**itraconazole**; metabolism of vinblastine possibly inhibited by ●**posaconazole** (increased risk of neurotoxicity)
- Antimalarials: avoidance of vinblastine advised by manufacturer of ●**piperquine with artemimol**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinblastine possibly increased by **ritonavir**

**Vincristine**

- Antifungals: increased risk of vincristine toxicity when given with ●**itraconazole**; metabolism of vincristine possibly inhibited by ●**posaconazole** (increased risk of neurotoxicity)
- Antimalarials: avoidance of vincristine advised by manufacturer of ●**piperquine with artemimol**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by **nifedipine**
- Cardiac Glycosides: vincristine possibly reduces absorption of **digoxin tablets**

**Vindesine**

- Antifungals: possible increased risk of vindesine toxicity when given with ●**itraconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Vinflunine**

- Antibacterials: plasma concentration of vinflunine possibly reduced by ●**rifampicin**—manufacturer of vinflunine advises avoid concomitant use
- Antidepressants: plasma concentration of vinflunine possibly reduced by ●**St John's wort**—manufacturer of vinflunine advises avoid concomitant use
- Antifungals: possible increased risk of vinflunine toxicity when given with ●**itraconazole**
- Antimalarials: avoidance of vinflunine advised by manufacturer of ●**piperquine with artemimol**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinflunine possibly increased by ●**ritonavir**—manufacturer of vinflunine advises avoid concomitant use
- Grapefruit Juice: plasma concentration of vinflunine possibly increased by **grapefruit juice**—manufacturer of vinflunine advises avoid concomitant use

**Vinorelbine**

- Antibacterials: possible increased risk of neutropenia when vinorelbine given with ●**clarithromycin**
- Antifungals: possible increased risk of vinorelbine toxicity when given with ●**itraconazole**

**Vinorelbine** (continued)

- Antimalarials: avoidance of vinorelbine advised by manufacturer of ●**piperaquine with arteminol**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Vismodegib**

- Antibacterials: manufacturer of vismodegib advises avoid concomitant use with ●**rifampicin** (plasma concentration of vismodegib possibly reduced)
- Antidepressants: manufacturer of vismodegib advises avoid concomitant use with ●**St John's wort** (plasma concentration of vismodegib possibly reduced)
- Antiepileptics: manufacturer of vismodegib advises avoid concomitant use with ●**carbamazepine** and ●**phenytoin** (plasma concentration of vismodegib possibly reduced)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Vitamin A** see Vitamins

**Vitamin D** see Vitamins

**Vitamin E** see Vitamins

**Vitamin K (Phytomenadione)** see Vitamins

**Vitamins**

- Antibacterials: absorption of vitamin A possibly reduced by **neomycin**
- Anticoagulants: vitamin E possibly enhances anticoagulant effect of ●**coumarins**; vitamin K antagonises anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antiepileptics: vitamin D requirements possibly increased when given with **carbamazepine, phenobarbital** or **phenytoin**
- Antivirals: increased risk of bleeding when high doses of vitamin E given with **tipranavir**
- Ciclosporin: vitamin E possibly affects plasma concentration of **ciclosporin**
- Diuretics: increased risk of hypercalcaemia when vitamin D given with **thiazides and related diuretics**
- Dopaminergics: pyridoxine reduces effects of **levodopa** when given without dopa-decarboxylase inhibitor
- Lipid-regulating Drugs: absorption of calcitriol possibly reduced by **colestyramine** (give at least 1 hour before or 4 to 6 hours after colestyramine)
- Retinoids: risk of hypervitaminosis A when vitamin A given with ●**retinoids**—avoid concomitant use
- Selenium: ascorbic acid possibly reduces absorption of **selenium** (give at least 4 hours apart)
- Sevelamer: absorption of calcitriol reduced by **sevelamer** (give at least 1 hour before or 3 hours after sevelamer)

**Voriconazole** see Antifungals, Triazole

**Warfarin** see Coumarins

**Xipamide** see Diuretics

**Xylometazoline** see Sympathomimetics

**Zafirlukast** see Leukotriene Receptor Antagonists

**Zaleplon** see Anxiolytics and Hypnotics

**Zidovudine**

**Note** Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature

Analgesics: increased risk of haematological toxicity when zidovudine given with **NSAIDs**; plasma concentration of zidovudine possibly increased by **methadone**

Antibacterials: absorption of zidovudine reduced by **clarithromycin** tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with **rifampicin**

**Zidovudine** (continued)

- Antiepileptics: zidovudine increases or decreases plasma concentration of **phenytoin**; plasma concentration of zidovudine possibly increased by **valproate** (increased risk of toxicity)
- Antifungals: plasma concentration of zidovudine increased by ●**fluconazole** (increased risk of toxicity)
- Antimalarials: increased antifolate effect when zidovudine given with **pyrimethamine**
- Antivirals: profound myelosuppression when zidovudine given with ●**ganciclovir** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy); increased risk of granulocytopenia when zidovudine given with ●**nevirapine**; increased risk of anaemia when zidovudine given with ●**ribavirin**—avoid concomitant use; zidovudine possibly inhibits effects of ●**stavudine** (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by ●**tipranavir**
- Atovaquone: plasma concentration of zidovudine increased by **atovaquone** (increased risk of toxicity)
- Orlistat: absorption of zidovudine possibly reduced by ●**orlistat**
- Probenecid: excretion of zidovudine reduced by ●**probenecid** (increased plasma concentration and risk of toxicity)

**Zinc**

Antibacterials: zinc reduces absorption of **ciprofloxacin, levofloxacin, moxifloxacin** and **ofloxacin**; zinc reduces absorption of **norfloxacin** (give at least 2 hours apart); zinc reduces absorption of **tetracyclines**, also absorption of zinc reduced by tetracyclines

Calcium Salts: absorption of zinc reduced by **calcium salts**

Eltrombopag: zinc possibly reduces absorption of **eltrombopag** (give at least 4 hours apart)

Iron: absorption of zinc reduced by **oral iron**, also absorption of **oral iron** reduced by zinc

Penicillamine: absorption of zinc reduced by **penicillamine**, also absorption of penicillamine reduced by zinc

Trientine: absorption of zinc reduced by **trientine**, also absorption of trientine reduced by zinc

**Zoledronic Acid** see Bisphosphonates

**Zolmitriptan** see 5HT<sub>1</sub>-receptor Agonists (under HT)

**Zolpidem** see Anxiolytics and Hypnotics

**Zonisamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)
  - Antiepileptics: plasma concentration of zonisamide reduced by **carbamazepine, phenobarbital** and **phenytoin**
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
  - Diuretics: manufacturer of zonisamide advises avoid concomitant use with **carbonic anhydrase inhibitors** in children
  - Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- Zopiclone** see Anxiolytics and Hypnotics
- Zuclopenthixol** see Antipsychotics

# A2 Borderline substances

<b>A2.1</b>	<b>Enteral feeds (non-disease specific)</b>	<b>772</b>
<b>A2.1.1</b>	Enteral feeds (non-disease specific): less than 5 g protein/100 mL	772
<b>A2.1.2</b>	Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL	774
<b>A2.1.3</b>	Enteral feeds (non-disease specific): Child under 12 years	778

<b>A2.6.1</b>	Gluten-free foods	808
<b>A2.6.2</b>	Low-protein foods	810
<b>A2.7</b>	<b>Nutritional supplements for metabolic diseases</b>	<b>811</b>

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

**Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)** All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

**Note** Foods included in this appendix may contain cariogenic sugars and appropriate oral hygiene measures should be taken.

**Enteral feeds and nutritional supplements** For most enteral feeds and nutritional supplements, the main source of **carbohydrate** is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of **protein** or **amino acids** are included with each product entry. The **fat** or **oil** content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of **vitamins**, **minerals**, and **trace elements**—the manufacturer's product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2. Feeds containing vitamin K may affect the INR in children receiving warfarin; see **interactions**: Appendix 1 (vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

**Note** Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

### Standard ACBS indications:

Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

### Paediatric ACBS indications:

Disease-related malnutrition, intractable malabsorption, growth failure, pre-operative preparation of malnourished patients, dysphagia, short-bowel syndrome, bowel fistula

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in BNFC.

## A2.1 Enteral feeds (non-disease specific)

## A2.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

## A2.1.1.1 Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1–6 years

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® Original (Fresenius Kabi)	Liquid (sip or tube feed) <b>per 100 mL</b>	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 3.5 g <sup>1</sup> )	3.4 g	Nil	Gluten-free Residual lactose Contains fish gelatin Feed in flexible pack contains fish oil and fish gelatin	Standard, p. 771	Bottle: 200 mL = £2.07 Black currant, chocolate, nut, peach, vanilla Flexible pack: 500 mL = £4.02 1000 mL = £7.96 1500 mL = £11.95

## A2.3 Specialised formulas

### A2.3.1 Specialised formulas: Infant and child

Specialised formulas are suitable for infants from birth unless otherwise indicated (*see also* A2.1.3.1 Enteral feeds (non-disease specific): Child under 12 years)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
<b>Specialised formulas: Infant and child: Amino acid-based formula</b>									
<b>ACBS Indications:</b> Proven whole protein intolerance, short bowel syndrome, intractable malabsorption, or other gastro-intestinal disorders where an elemental diet is indicated									
Neocate <sup>®</sup> Active (SHS)	Standard dilution (21%) of powder <b>per 300 mL serving</b> (63-g sachet made up to 300 mL with water)	1255 kJ (300 kcal)	8.3 g protein equivalent (essential and non-essential amino acids)	34 g (sugars 3.1 g <sup>1</sup> )	14.5 g	Nil	Milk protein-free	See above Nutritional supplement only Not suitable for child under 1 year	Sachet: 15 × 63 g = £66.60 Black currant, unflavoured <sup>2</sup>
Powder provides: protein equivalent 13.1 g, carbohydrate 54 g, fat 23 g, energy 1992 kJ (475 kcal)/100 g									
Neocate <sup>®</sup> Advance (SHS)	Standard dilution (25%) of powder <b>per 100 mL</b>	420 kJ (100 kcal)	2.5 g protein equivalent (essential and non-essential amino acids)	14.6 g (sugars 1.3 g <sup>1</sup> )	3.5 g (MCT 35%)	Nil	Milk protein-free	See above Not suitable for child under 1 year	Sachet: 100 g = £4.94 Unflavoured <sup>2</sup> 15 × 50 g = £46.35 Banana-vanilla
Powder provides: protein equivalent 10 g, carbohydrate 58.5 g, fat 14 g, energy 1683 kJ (400 kcal)/100 g									
Neocate <sup>®</sup> LCP (SHS)	Standard dilution (14.7%) of powder <b>per 100 mL</b>	293 kJ (70 kcal)	1.9 g protein equivalent (essential and non-essential amino acids)	7.9 g (sugars 720 mg)	3.4 g	Nil	Milk protein-free	Cows' milk allergy, multiple food protein intolerance, and conditions requiring an elemental diet	Can: 400 g = £28.30 (4.9-g measuring scoop provided)
Powder provides: protein equivalent 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g									

1. Sugar content varies with flavour

2. Flavouring: see *Modjul*<sup>®</sup> Flavour System, p. 807

**A2.3.1 Specialised formulas: Infant and child** (*product list continued*)Specialised formulas are suitable for infants from birth unless otherwise indicated (*see also* A2.1.3.1 Enteral feeds (non-disease specific): Child under 12 years)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Neocate <sup>®</sup> Spoon (Nutricia Clinical)	Standard dilution (38%) of powder <b>per 97 g serving</b> (37-g sachet diluted with 60 mL water)	733 kJ (175 kcal)	3 g protein equivalent (essential and non-essential amino acids)	24.9 g (sugars 4.6 g)	7 g	Nil	Milk protein-free	Cows' milk allergy, multiple food protein intolerance, and conditions requiring an elemental diet Not suitable for child under 6 months	Sachet: 15 × 37 g = £39.30
Powder provides protein equivalent 8.2 g, carbohydrate 67.4 g, fat 18.8 g, energy 1981 kJ (472 kcal)/100 g									
Nutramigen <sup>®</sup> AA (Mead Johnson)	Standard dilution (13.6%) of powder <b>per 100 mL</b>	286 kJ (68 kcal)	1.89 g essential and non-essential amino acids	7 g	3.6 g	Nil	Gluten-free Lactose-free	Severe cows' milk protein intolerance, or multiple food intolerance, and other gastrointestinal disorders where an elemental diet is specifically indicated	Can: 400 g = £25.58 (4.5-g measuring scoop provided)
Powder provides: protein 13.9 g, carbohydrate 51 g, fat 26 g, energy 2092 kJ (498 kcal)/100 g									
<b>Specialised formulas: Infant and child: Hydrolysate formula</b>									
Althéra <sup>®</sup> (Vitafo)	Standard dilution (13.2%) of powder <b>per 100 mL</b>	280 kJ (67 kcal)	1.7 g whey hydrolysed	7.3 g (sugars 4 g)	3.4 g	Nil	Contains lactose	Complete nutritional support from birth to 3 years or supplementary feeding from 6 months to 3 years, in cow's milk protein allergy or multiple food protein allergies	Can: 450 g = £10.68 (4.4-g measuring scoop provided)
Powder provides: protein 12.5 g, carbohydrate 55.5 g, fat 26 g, energy 2117 kJ (506 kcal)/100 g									
Aptamil Pepti <sup>®</sup> 1 (Allergy) (Milupa)	Standard dilution (13.6%) of powder <b>per 100 mL</b>	280 kJ (67 kcal)	1.6 g whey hydrolysed	7.1 g (sugars 3.5 g)	3.5 g	600 mg	Contains lactose and fish oil	Established cows' milk protein intolerance, with or without secondary lactose intolerance	Can: 400 g = £9.54 900 g = £21.46 (4.5-g measuring scoop provided)
Formerly <i>Aptamil Pepti</i> <sup>®</sup> Powder provides: protein 11.6 g, carbohydrate 52 g, fat 25.6 g, energy 2025 kJ (484 kcal)/100 g									
Aptamil Pepti <sup>®</sup> 2 (Allergy) (Milupa)	Standard dilution (14.3%) of powder <b>per 100 mL</b>	285 kJ (68 kcal)	1.6 g	8 g (sugars 3.6 g)	3.1 g	600 mg	Contains lactose and fish oil	Established cows' milk protein allergy or intolerance Not suitable for child under 6 months	Can: 900 g = £20.48 (4.8-g measuring scoop provided)
Powder provides: protein 11.2 g, carbohydrate 56.1 g, fat 21.8 g, energy 1985 kJ (473 kcal)/100 g									

Cow & Gate Pepti-Junior® (Cow & Gate)	Standard dilution (12.8%) of powder <b>per 100 mL</b>	275 kJ (66 kcal)	1.8 g whey hydrolysed	6.8 g (sugars 1.1 g)	3.5 g	Nil	Residual lactose Contains fish oil	Disaccharide and/or whole protein intolerance, or where amino acids and peptides are indicated in conjunction with medium chain triglycerides	Can: 450 g = £12.58 (4.3-g measuring scoop provided)
Powder provides: protein 14 g, carbohydrate 53.4 g, fat 27.3 g, energy 2155 kJ (515 kcal)/100 g									
Infatrin® Peptisorb (Nutricia Clinical)	Liquid (sip or tube feed) <b>per 100 mL</b>	420 kJ (100 kcal)	2.6 g whey protein hydrolysate	10.3 g (sugars 2.7 g)	5.4 g (MCT 50%)	Nil	Gluten-free Residual lactose Contains fish oil	Disease-related malnutrition, intractable malabsorption, proven inflammatory bowel disease, short bowel syndrome, bowel fistula, and intolerance to whole protein feeds in child from birth to 18 months or body-weight up to 9 kg	Bottle: 200 mL = £3.32
Nutramigen® Lipil 1 (Mead Johnson)	Standard dilution (13.5%) of powder <b>per 100 mL</b>	280 kJ (68 kcal)	1.9 g casein hydrolysed	7.5 g	3.4 g	Nil	Gluten-free Lactose-free	Disaccharide and/or whole protein intolerance where additional medium chain triglycerides are not included	Can: 400 g = £10.38 (4.5-g measuring scoop provided)
Powder provides: protein 14 g, carbohydrate 55 g, fat 25 g, energy 2100 kJ (500 kcal)/100 g									
Nutramigen® Lipil 2 (Mead Johnson)	Standard dilution (14.6%) of powder <b>per 100 mL</b>	285 kJ (68 kcal)	1.7 g casein hydrolysed	8.6 g	2.9 g	Nil	Gluten-free Lactose-free	Established disaccharide and/or whole protein intolerance (where additional chain triglycerides are not indicated) Not suitable for child under 6 months	Can: 400 g = £10.38 (4.9-g measuring scoop provided)
Powder provides: protein 11.6 g, carbohydrate 59 g, fat 20 g, energy 1950 kJ (466 kcal)/100 g									
Pepdite® (SHS)	Standard dilution (15%) of powder <b>per 100 mL</b>	297 kJ (71 kcal)	2.1 g protein equivalent (non-milk hydrolysate)	7.8 g (sugars 700 mg)	3.5 g	Nil	Lactose-free Contains meat (pork) and soya derivatives	Disaccharide and/or whole protein intolerance	Can: 400 g = £17.89 (5-g measuring scoop provided)
Powder provides: protein equivalent 13.8 g, carbohydrate 52 g, fat 23.2 g, energy 1977 kJ (472 kcal)/100 g									

**A2.3.1 Specialised formulas: Infant and child** (*product list continued*)Specialised formulas are suitable for infants from birth unless otherwise indicated (*see also* A2.1.3.1 Enteral feeds (non-disease specific): Child under 12 years)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Pepdite® 1+ (SHS)	Standard dilution (22.8%) of powder per 100 mL	423 kJ (100 kcal)	3.1 g protein equivalent (non-milk hydrolysate, essential amino acids)	13 g (sugars 1.2 g)	3.9 g (MCT 35%)	Nil	Lactose-free Contains meat (pork) and soya derivatives	Disaccharide and/or whole protein intolerance, or where amino acids or peptides are indicated in conjunction with medium chain triglycerides Not suitable for child under 1 year	Can: 400 g = £18.78 Unflavoured <sup>1</sup>
Powder provides: protein equivalent 13.8 g, carbohydrate 57 g, fat 17.3 g, energy 1844 kJ (439 kcal)/100 g									
Pregestimil® Lipil (Mead Johnson)	Standard dilution (13.5%) of powder per 100 mL	280 kJ (68 kcal)	1.89 g casein hydrolysed	6.9 g	3.8 g (MCT 54%)	Nil	Gluten-free Lactose-free	Disaccharide and/or whole protein intolerance, or where amino acids or peptides are indicated in conjunction with medium chain triglycerides	Can: 400 g = £11.51 (4.5-g measuring scoop provided)
Powder provides: protein 14 g, carbohydrate 51 g, fat 28 g, energy 2100 kJ (500 kcal)/100 g									
Similac® Alimentum (Abbott)	Standard dilution (14%) of powder per 100 mL	283 kJ (67.6 kcal)	1.86 g casein hydrolysed	6.62 g (sugars 1.5 g)	3.75 g (MCT 33%)	Nil	Gluten-free Lactose-free Contains meat derivatives	Cows' milk protein allergy and other conditions where an extensively hydrolysed formula is indicated	Can: 400 g = £9.10 (4.2-g measuring scoop provided)
Powder provides: protein 14.4 g, carbohydrate 51.4 g, fat 29.1 g, energy 2196 kJ (525 kcal)/100 g									
<b>Specialised formulas: Infant and child: Residual lactose formula</b>									
Enfamil® O-Lac (Mead Johnson)	Standard dilution (13%) of powder per 100 mL	280 kJ (68 kcal)	1.42 g cows' milk	7.2 g	3.7 g	Nil	Gluten-free Residual lactose	Proven lactose intolerance	Can: 400 g = £4.70 (4.3-g measuring scoop provided)
Powder provides: protein 10.9 g, carbohydrate 55 g, fat 28 g, energy 2200 kJ (524 kcal)/100 g									
Galactomin 17® (SHS)	Standard dilution (13.6%) of powder per 100 mL	295 kJ (70 kcal)	1.7 g protein equivalent (cows' milk)	7.5 g (sugars 1.4 g)	3.7 g	Nil	Residual lactose	Proven lactose intolerance in pre-school children, galactosaemia, and galactokinase deficiency	Can: 400 g = £16.01 Unflavoured <sup>1</sup> (4.3-g measuring scoop provided)
Powder provides: protein equivalent 12.3 g, carbohydrate 55.3 g, fat 27.2 g, energy 2155 kJ (515 kcal)/100 g									
SMA® LF (SMA Nutrition)	Standard dilution (13%) of powder per 100 mL	281 kJ (67 kcal)	1.5 g casein, whey	7.2 g (sugars 2.6 g)	3.6 g	Nil	Residual lactose	Proven lactose intolerance	Can: 430 g = £5.06.
Powder provides: protein 12 g, carbohydrate 55.6 g, fat 28 g, energy 2185 kJ (522 kcal)/100 g									

1. Flavouring: see *Modjul*® Flavour System, p. 807

**Specialised formulas: Infant and child: MCT-enhanced formula**

Caprilon® (SHS)	Standard dilution (12.7%) of powder <b>per 100 mL</b>	277 kJ (66 kcal)	1.5 g cows' milk	7 g (sugars 1.3 g)	3.6 g (MCT 75%)	Nil	Contains lactose	Disorders in which a high intake of MCT is beneficial	Can: 420 g = £17.36 (4.2-g measuring scoop provided)
Powder provides: protein 11.8 g, carbohydrate 55.1 g, fat 28.3 g, energy 2184 kJ (522 kcal)/100 g									
Lipistart® (Vitafo)	Standard dilution (15%) of powder <b>per 100 mL</b>	282 kJ (68 kcal)	2.1 g protein equivalent (whey, soya)	8.3 g (sugars 700 mg)	3.1 g (MCT 81%)	Nil	Residual lactose	Dietary management of fat malabsorption, long-chain fatty acid oxidation disorders, and other disorders requiring a high MCT, low LCT formula	Can: 400 g = £18.67 (5-g measuring scoop provided)
Powder provides: protein equivalent 13.7 g, carbohydrate 55.3 g, fat 20.6 g, energy 1883 kJ (450 kcal)/100 g									
MCT Peptide® (SHS)	Standard dilution (15%) of powder <b>per 100 mL</b>	286 kJ (68 kcal)	2 g protein equivalent (non-milk peptides, essential amino acids)	8.8 g (sugars 1.2 g)	2.7 g (MCT 75%)	Nil	Gluten-free Lactose-free Contains meat (pork) and soya derivatives	Disorders in which a high intake of MCT is beneficial	Can: 400 g = £19.47 (5-g measuring scoop provided)
Powder provides: protein equivalent 13.8 g, carbohydrate 59 g, fat 18 g, energy 1903 kJ (453 kcal)/100 g									
MCT Peptide® +1 (SHS)	Standard dilution (20%) of powder <b>per 100 mL</b>	381 kJ (91 kcal)	2.8 g protein equivalent (non-milk peptides, essential amino acids)	11.8 g (sugars 1.6 g)	3.6 g (MCT 75%)	Nil	Gluten-free Lactose-free Contains meat (pork) and soya derivatives	Disorders in which a high intake of MCT is beneficial Not suitable for child under 1 year	Can: 400 g = £19.47 Unflavoured <sup>1</sup>
Powder provides: protein equivalent 13.8 g, carbohydrate 59 g, fat 18 g, energy 1903 kJ (453 kcal)/100 g									
Monogen® (SHS)	Standard dilution (17.5%) of powder <b>per 100 mL</b>	310 kJ (74 kcal)	2.2 g protein equivalent (whey)	12 g (sugars 1.2 g)	1.9 g (MCT 80%)	Nil	Residual lactose Supplementation with essential fatty acids may be needed	Long-chain acyl-CoA dehydrogenase deficiency (LCAD), carnitine palmitoyl transferase deficiency (CPTD), primary and secondary lipoprotein lipase deficiency, chylothorax, and lymphangiectasia	Can: 400 g = £19.35 Unflavoured <sup>1</sup> (5-g measuring scoop provided)
Powder provides: protein equivalent 12.5 g, carbohydrate 68 g, fat 11 g, energy 1769 kJ (420 kcal)/100 g									

1. Flavouring: see *Modjul*® Flavour System, p. 807

**A2.3.1 Specialised formulas: Infant and child** (*product list continued*)Specialised formulas are suitable for infants from birth unless otherwise indicated (*see also* A2.1.3.1 Enteral feeds (non-disease specific): Child under 12 years)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
<b>Specialised formulas: Infant and child: Soya-based formula</b>									
InfaSoy® (Cow & Gate)	Standard dilution (12.8%) of powder <b>per 100 mL</b>	275 kJ (66 kcal)	1.6 g soya	7 g (sugars 1 g)	3.5 g	Nil	Lactose-free	Proven lactose and associated sucrose intolerance in pre-school children, galactokinase deficiency, galactosaemia, and proven whole cows' milk sensitivity	Can: 900 g = £8.14 (4.3-g measuring scoop provided)
Powder provides: protein 12.8 g, carbohydrate 54.5 g, fat 27.3 g, energy 2150 kJ (514 kcal)/100 g									
Wysoy® (Wyeth)	Standard dilution (13.2%) of powder <b>per 100 mL</b>	280 kJ (67 kcal)	1.8 g soya protein isolate	6.9 g (sugars 2.5 g)	3.6 g	Nil	Lactose-free	Proven lactose and associated sucrose intolerance in pre-school children, galactokinase deficiency, galactosaemia, and proven whole cows' milk sensitivity	Can: 430 g = £5.05 860 g = £9.62
Powder provides: protein 14 g, carbohydrate 54 g, fat 27 g, energy 2155 kJ (515 kcal)/100 g									
<b>Specialised formulas: Infant and child: Low calcium formula</b>									
Locasol® (SHS)	Standard dilution (13.1%) of powder <b>per 100 mL</b>	278 kJ (66 kcal)	1.9 g cows' milk	7 g (sugars 6.9 g)	3.4 g	Nil	Contains lactose Calcium less than 7 mg/ 100 mL No added vitamin D	Conditions of calcium intolerance requiring restriction of calcium and vitamin D intake	Can: 400 g = £22.25 (4.4-g measuring scoop provided)
Powder provides: protein 14.6 g, carbohydrate 53.7 g, fat 26.1 g, energy 2125 kJ (508 kcal)/100 g									
<b>Specialised formulas: Infant and child: Fructose-based formula</b>									
Galactomin 19® (SHS)	Standard dilution (12.9%) of powder <b>per 100 mL</b>	288 kJ (69 kcal)	1.9 g protein equivalent (cows' milk)	6.4 g (fructose 6.3 g)	4 g	Nil	Residual lactose, galactose and glucose	Conditions of glucose plus galactose intolerance	Can: 400 g = £42.15
Powder provides: protein equivalent 14.6 g, carbohydrate 49.7 g, fat 30.8 g, energy 2233 kJ (534 kcal)/100 g									

**Specialised formulas: Infant and child: Pre-thickened infant feeds**

Note Not to be used for a period of more than 6 months; not to be used in conjunction with any other feed thickener or antacid products

Enfamil® AR (Mead Johnson)	Standard dilution (13.5%) of powder <b>per 100 mL</b>	285 kJ (68 kcal)	1.7 g cows' milk	7.6 g (lactose 4.6 g)	3.5 g	Nil	Contains lactose, pregelatinised rice starch	Significant gastro-oesophageal reflux	Can: 400 g = £3.52 (4.5-g measuring scoop provided)
Powder provides: protein 12.5 g, carbohydrate 56 g, fat 26 g, energy 2093 kJ (500 kcal)/100 g									
SMA® Staydown (SMA Nutrition)	Standard dilution (12.9%) of powder <b>per 100 mL</b>	279 kJ (67 kcal)	1.6 g casein, whey	7 g (lactose 5 g)	3.6 g	Nil	Contains lactose, pre- cooked corn starch	Significant gastro-oesophageal reflux	Can: 900 g = £7.29
Powder provides: protein 12.4 g, carbohydrate 54.3 g, fat 28 g, energy 2166 kJ (518 kcal)/100 g									

**A2.3.2 Specialised formulas for specific clinical conditions**

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Alicalm® (SHS)	Standard dilution (30%) of powder <b>per 100 mL</b>	567 kJ (135 kcal)	4.5 g caseinate whey	17.4 g (sugars 3.2 g)	5.3 g	Nil	Residual lactose	Crohn's disease Not suitable for child under 1 year; use as nutritional supplement only in children 1–6 years.	Powder: 400 g = £20.48 Vanilla
Powder provides: protein 15 g, carbohydrate 58 g, fat 17.5 g, energy 1889 kJ (450 kcal)/100 g									
Forticare® (Nutricia Clinical)	Liquid (sip feed) <b>per 100 mL</b>	675 kJ (160 kcal)	9 g cows' milk	19.1 g (sugars 13.6 g)	5.3 g	2.1 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement in patients with lung cancer undergoing chemotherapy, or with pancreatic cancer Not suitable in child under 3 years	Bottle: 4 × 125 mL = £8.84 Cappuccino, orange-lemon, peach-ginger
Generaid® (SHS)	Powder <b>per 100 g</b>	1586 kJ (374 kcal)	76 g protein equivalent (whey protein, plus branched chain amino acids)	5 g (sugars 5 g)	5.5 g	Nil	Electrolytes/100 g: Na <sup>+</sup> 6.1 mmol K <sup>+</sup> 10.8 mmol Ca <sup>2+</sup> 6.5 mmol P <sup>+</sup> 6.45 mmol	Nutritional supplement for use in chronic liver disease and/or porto- hepatic encephalopathy	Tub: 400 g = £58.32 Unflavoured <sup>1</sup>

1. Flavouring: see *Modjul*® Flavour System, p. 807

## A2.3.2 Specialised formulas for specific clinical conditions (product list continued)

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Generaid® Plus (SHS)	Standard dilution (22%) of powder <b>per 100 mL</b>	428 kJ (102 kcal)	2.4 g protein equivalent (whey protein, branched chain amino acids)	13.6 g (sugars 1.4 g)	4.2 g (MCT 32%)	Nil	Electrolytes/100 mL: Na <sup>+</sup> 0.7 mmol K <sup>+</sup> 2.7 mmol Ca <sup>2+</sup> 1.72 mmol P <sup>+</sup> 1.67 mmol	Enteral feed or nutritional supplement in children over 1 year with hepatic disorders	Can: 400 g = £20.86 Unflavoured <sup>1</sup> (5-g measuring scoop provided)
Powder provides: protein equivalent 11 g, carbohydrate 62 g, fat 19 g, energy 1944 kJ (463 kcal)/100 g									
Heparon® Junior (SHS)	Standard dilution (18%) of powder <b>per 100 mL</b>	363 kJ (86 kcal)	2 g cows' milk	11.6 g (sugars 2.9 g)	3.6 g	Nil	Contains lactose Electrolytes/100 mL: Na <sup>+</sup> 0.56 mmol K <sup>+</sup> 1.9 mmol Ca <sup>2+</sup> 2.3 mmol P <sup>+</sup> 1.6 mmol	Enteral feed or nutritional supplement for children with acute or chronic liver failure	Can: 400 g = £20.63 (4.5-g measuring scoop provided)
Powder provides: protein 11.1 g, carbohydrate 64.2 g, fat 19.9 g, energy 2016 kJ (480 kcal)/100 g									
KetoCal® (SHS)	Standard dilution (20%) of powder <b>per 100 mL</b>	602 kJ (146 kcal)	3.1 g cows' milk with additional amino acids	600 mg (sugars 120 mg)	14.6 g (LCT 100%)	Nil	Electrolytes/100 mL: Na <sup>+</sup> 4.3 mmol K <sup>+</sup> 4.1 mmol Ca <sup>2+</sup> 2.15 mmol P <sup>+</sup> 2.77 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of epilepsy resistant to drug therapy, in children over 1 year, only on the advice of secondary care physician with experience of ketogenic diet	Can: 300 g = £29.04 Vanilla, Unflavoured
Powder provides: protein 15.25 g, carbohydrate 3 g, fat 73 g, energy 3011 kJ (730 kcal)/100 g									
KetoCal® 3:1 (SHS)	Standard dilution (9.5%) of powder <b>per 100 mL</b>	276 kJ (66 kcal)	1.5 g	680 mg (sugars 570 mg)	6.4 g	Nil	Electrolytes/100 mL: Na <sup>+</sup> 1.3 mmol K <sup>+</sup> 2.4 mmol Ca <sup>2+</sup> 2 mmol P <sup>+</sup> 1.7 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of drug resistant epilepsy or other conditions for which a ketogenic diet is indicated in children from birth to 6 years; as a nutritional supplement in children over 6 years	Can: 300 g = £28.11 Unflavoured
Powder provides: protein 15.3 g, carbohydrate 7.2 g, fat 67.7 g, energy 2927 kJ (699 kcal)/100 g									
1. Flavouring: see <i>Modjul</i> ® Flavour System, p. 807									

KetoCal <sup>®</sup> 4:1 LQ (SHS)	Liquid (sip or tube feed) <b>per 100 mL</b>	620 kJ (150 kcal)	3.09 g casein and whey with additional amino acids	610 mg (sugars 230 mg)	14.8 g (LCT 100%)	1.12 g	Residual lactose Electrolytes/100 mL: Na <sup>+</sup> 4.9 mmol K <sup>+</sup> 4.7 mmol Ca <sup>2+</sup> 2.4 mmol P <sup>+</sup> 3.1 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of drug resistant epilepsy or other conditions for which a ketogenic diet is indicated in children 1–10 years; as a nutritional supplement in children over 10 years	Carton: 237 mL = £4.76 Vanilla
Kindergen <sup>®</sup> (SHS)	Standard dilution (20%) of powder <b>per 100 mL</b>	421 kJ (101 kcal)	1.5 g whey protein	11.8 mg (sugars 1.2 g)	5.3 g (LCT 93%)	Nil	Electrolytes/100 mL: Na <sup>+</sup> 2 mmol K <sup>+</sup> 0.6 mmol Ca <sup>2+</sup> 2.8 mmol P <sup>+</sup> 3 mmol Low Vitamin A	Enteral feed or nutritional supplement for children with chronic renal failure receiving peritoneal rapid overnight dialysis	Tub: 400 g = £27.69 (5-g measuring scoop provided)
Powder provides: protein 7.5 g, carbohydrate 59 g, fat 26.3 g, energy 2104 kJ (504 kcal)/100 g									
Modulen IBD <sup>®</sup> (Nestlé)	Standard dilution (20%) of powder (sip or tube feed) <b>per 100 mL</b>	420 kJ (100 kcal)	3.6 g casein	11 g (sugars 3.98 g)	4.7 g	Nil	Gluten-free Residual lactose	Crohn's disease active phase, and in remission if malnourished	Can: 400 g = £15.06 Unflavoured <sup>1</sup> (8.3-g measuring scoop provided)
Powder provides: protein 18 g, carbohydrate 54 g, fat 23 g, energy 2070 kJ (500 kcal)/100 g									
Nepro <sup>®</sup> (Abbott)	Liquid (sip or tube feed) <b>per 100 mL</b>	838 kJ (200 kcal) <sup>2</sup>	7 g cows' milk	20.6 g (sugars 3.26 g)	9.6 g	1.56 g	Gluten-free Residual lactose Electrolytes/100 mL: Na <sup>+</sup> 3.67 mmol K <sup>+</sup> 2.72 mmol Ca <sup>2+</sup> 3.43 mmol P <sup>+</sup> 2.23 mmol	Enteral feed or nutritional supplement in patients with chronic renal failure who are on haemodialysis or CAPD, or with cirrhosis, or other conditions requiring a high energy, low fluid, low electrolyte diet. Not suitable for child under 1 year; use with caution in child 1–5 years	Carton: 200 mL = £2.69 Strawberry, vanilla Flexible pack: 500 mL = £5.84 Vanilla
1. Flavouring: see <i>Flavour Mix</i> <sup>®</sup> , p. 807									
2. Nutritional values vary with flavour—consult product literature									

A2.3.2 Specialised formulas for specific clinical conditions <i>(product list continued)</i>									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
ProSure® (Abbott)	Liquid (sip or tube feed) <b>per 100 mL</b>	536 kJ (127 kcal) <sup>1</sup>	6.65 g cows' milk	18.3 g (sugars 2.95 g)	2.56 g	2.07 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement for patients with pancreatic cancer Not suitable for child under 1 year; use with caution in child 1–4 years	Carton: 240 mL = £3.29 Vanilla
Renamil® (KoRa)	Powder (sip or tube feed when reconstituted) <b>per 100 g</b>	2003 kJ (477 kcal)	4.6 g cows' milk	70.8 g	19.3 g	Nil	Contains lactose Gluten-free Electrolytes/100 g: Na <sup>+</sup> 1.04 mmol K <sup>+</sup> 0.13 mmol Ca <sup>2+</sup> 10.22 mmol P <sup>+</sup> 1.06 mmol Contains no vitamin A or vitamin D	Enteral feed or nutritional supplement for adults and children over 1 year with chronic renal failure	Sachet: 10 × 100 g = £25.40
Renapra® (KoRa)	Powder <b>per 100 g</b>	1580 kJ (372 kcal)	90 g whey protein	800 mg	1 g	Nil	Gluten-free Residual lactose Electrolytes/100 g: Na <sup>+</sup> 23 mmol K <sup>+</sup> 2 mmol Ca <sup>2+</sup> 4.99 mmol P <sup>+</sup> 4.84 mmol	Nutritional supplement for biochemically proven hypoproteinaemia and patients undergoing dialysis Not suitable for child under 1 year	Sachet: 30 × 20 g = £69.60
Powder provides: protein 18 g, energy 316 kJ (74 kcal)/20-g sachet									
Renastart® (Vitafo)	Standard dilution (20%) of powder <b>per 100 mL</b>	414 kJ (99 kcal)	1.5 g cows' milk soya	12.5 g (sugars 1.3 g)	4.8 g	Nil	Contains lactose Electrolytes/100 mL: Na <sup>+</sup> 2.1 mmol K <sup>+</sup> 0.6 mmol Ca <sup>2+</sup> 0.6 mmol P <sup>+</sup> 0.6 mmol	Dietary management of renal failure in child from birth to 10 years	Can: 400 g = £25.42 Unflavoured (7-g measuring scoop provided)
Powder provides: protein 7.5 g, carbohydrate 62.5 g, fat 23.8 g, energy 2071 kJ (494 kcal)/100 g									
Supleña® (Abbott)	Liquid (sip or tube feed) <b>per 100 mL</b>	840 kJ (200 kcal)	3 g caseinates	25.5 g (sugars 2.7 g)	9.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na <sup>+</sup> 3.39 mmol K <sup>+</sup> 2.87 mmol Ca <sup>2+</sup> 3.48 mmol P <sup>+</sup> 2.39 mmol	Enteral feed or nutritional supplement in patients with chronic or acute renal failure who are not undergoing dialysis, or with chronic or acute liver disease with fluid restriction; other conditions requiring high energy, low protein, low electrolyte, low volume enteral feed Not suitable for child under 1 year; use with caution in child 1–5 years	Can: 237 mL = £2.85 Vanilla
1. Nutritional values vary with flavour—consult product literature									

## A2.4 Feed supplements

### A2.4.1 High-energy supplements

#### A2.4.1.1 High-energy supplements: carbohydrate

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years

**ACBS Indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Caloreen® (Nestlé)	Powder <b>per 100 g</b>	1640 kJ (390 kcal)	Nil	96 g Maltodextrin	Nil	Nil	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Powder: 500 g = £3.69 Unflavoured (10-g measuring scoop provided)
Maxijul® Super Soluble (SHS)	Powder <b>per 100 g</b>	1615 kJ (380 kcal)	Nil	95 g Glucose polymer (sugars 8.6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Sachets: 4 × 132 g = £6.16 Can: 200 g = £2.48 2.5 kg = £19.25 25 kg = £148.21 Unflavoured
Polycal® (Nutricia Clinical)	Powder <b>per 100 g</b>	1630 kJ (384 kcal)	Nil	96 g Maltodextrin (sugars 6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £4.09 Neutral (5-g measuring scoop provided)
	Liquid <b>per 100 mL</b>	1050 kJ (247 kcal)	Nil	61.9 g Maltodextrin (sugars 12.2 g)	Nil	Nil		See above; liquid not suitable for child under 3 years	Bottle: 200 mL = £1.64 Neutral, orange
S.O.S.® (Vitafo)	Powder <b>per 100 g</b>	1590 kJ (380 kcal)	Nil	95 g (sugars 9 g)	Nil	Nil		For use as an emergency regimen in the dietary management of inborn errors of metabolism in adults and children from birth	Sachets <sup>1</sup> : 30 × 21 g (S.O.S. 10) = £7.05; 30 × 31 g (S.O.S. 15) = £10.40; 30 × 42 g (S.O.S. 20) = £14.09; 30 × 52 g (S.O.S. 25) = £17.44
Contents of each sachet should be reconstituted with water to a total volume of 200 mL									
Vitajoule® (Vitafo)	Powder <b>per 100 g</b>	1590 kJ (380 kcal)	Nil	95 g Dried glucose syrup (sugars 9 g)	Nil	Nil	Gluten-free Lactose-free	See above	Can: 500 g = £4.22 2.5 kg = £20.54 25 kg = £123.70 (10-g measuring scoop provided)

1. S.O.S. products are age-range specific—consult product literature

**A2.4.1.2 High-energy supplements: fat**

Liquid supplements should be diluted before use in child under 5 years

**ACBS indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Calogen <sup>®</sup> (Nutricia Clinical)	Liquid (emulsion) <b>per 100 mL</b>	1850 kJ (450 kcal) <sup>1</sup>	Nil	100 mg	50 g (LCT 100%)	Nil	Gluten-free Lactose-free	See above	Bottle: 200 mL = £4.36 500 mL = £10.72 Banana <sup>2</sup> , neutral, strawberry <sup>2</sup>
Fresubin <sup>®</sup> 5 kcal Shot (Fresenius Kabi)	Liquid (emulsion) <b>per 100 mL</b>	2100 kJ (500 kcal)	Nil	4.0 g (sucrose)	53.8 g	400 mg	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Bottle: 120 mL = £2.55 Lemon, neutral
Liquigen <sup>®</sup> (SHS)	Liquid (emulsion) <b>per 100 mL</b>	1850 kJ (450 kcal)	Nil	Nil	50 g (MCT 97%) Fractio- nated coco- nut oil	Nil	Gluten-free Lactose-free	Steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease, liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in epilepsy, and in type 1 lipoproteinaemia Not suitable for child under 1 year	Bottle: 250 mL = £8.83
Medium-chain Triglyceride (MCT) Oil (Nutricia Clinical)	Liquid <b>per 100 mL</b>	3515 kJ (855 kcal)	Nil	Nil	MCT 100%	Nil		Nutritional supplement for steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease and liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in management of epilepsy, type 1 hyperlipoproteinaemia	Bottle: 500 mL = £13.99
<b>Fat and Carbohydrate</b>									
Duocal <sup>®</sup> Super Soluble (SHS)	Powder <b>per 100 g</b>	2061 kJ (492 kcal)	Nil	72.7 g (sugars 6.5 g)	22.3 g (MCT 35%)	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £17.23 (5-g measuring scoop provided)

1. Nutritional values vary with flavour—consult product literature

2. Flavour not suitable for child under 3 years

Energivit® (SHS)	Standard dilution (15%) of powder <b>per 100 mL</b>	309 kJ (74 kcal)	Nil	10 g (sugars 900 mg)	3.75 g	Nil	Lactose-free With vitamins, minerals, and trace elements	For children requiring additional energy, vitamins, minerals, and trace elements following a protein- restricted diet	Can: 400 g = £20.95 (5-g measuring scoop provided)
Powder provides: carbohydrate 66.7 g, fat 25 g, energy 2059 kJ (492 kcal)/100 g									
MCT Duocal® (SHS)	Powder <b>per 100 g</b>	2082 kJ (497 kcal)	Nil	72 g (sugars 10.1 g)	23.2 g (MCT 83%)	Nil		See above	Can: 400 g = £18.07

### A2.4.1.3 High-energy supplements: protein

**ACBS indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
ProSource® Jelly (Nutrinovo)	Semi-solid <b>per 100 mL</b>	315 kJ (75 kcal)	16.9 g collagen protein hydrolysate whey protein isolate	Less than 1 g	Nil	Less than 1 g	Gluten-free Lactose-free Contains porcine derivatives	Hypoproteinaemia Not recommended for child under 3 years	Cup: 118 mL = £1.74 Fruit punch, orange
Protifar® (Nutricia Clinical)	Powder <b>per 100 g</b>	1580 kJ (373 kcal)	88.5 g cows' milk	less than 1.5 g	1.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na <sup>+</sup> 1.3 mmol K <sup>+</sup> 1.28 mmol Ca <sup>2+</sup> 33.75 mmol P <sup>+</sup> 22.58 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 225 g = £8.31 Unflavoured (2.5-g measuring scoop provided)
Powder provides: protein 2.2 g per 2.5 g									
Vitapro® (Vitafo)	Powder <b>per 100 g</b>	1632 kJ (390 kcal)	75 g whey protein isolate	9 g (sugars 9 g)	6 g	Nil	Contains lactose	Biochemically proven hypoproteinaemia	Tub: 250 g = £8.60 2 kg = £67.60 (5-g measuring scoop provided)

**A2.4.1.3 High-energy supplements: protein** (*product list continued*)**ACBS indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
<b>Protein and carbohydrate</b>									
Dialamine® (SHS)	Standard dilution (20%) of powder <b>per 100 mL</b>	264 kJ (62 kcal)	4.3 g protein equivalent (essential and non-essential amino acids)	11.2 g (sugars 10.2 g)	Nil	Nil	Contains vitamin C	Hypoproteinaemia, chronic renal failure, wound fistula leakage with excessive protein loss, conditions requiring a controlled nitrogen intake, and haemodialysis Not suitable for child under 6 months	Can: 400 g = £69.99 Orange
Powder provides: protein equivalent 25 g, carbohydrate 65 g, vitamin C 125 mg, energy 1530 kJ (360 kcal)/100 g									
ProSource® Liquid (Nutrinovo)	Liquid <b>per 30 mL</b>	420 kJ (100 kcal)	10 g collagen protein whey protein isolate	15 g (sugars 8 g)	Nil	Nil	Gluten-free Lactose-free May contain porcine derivatives	Biochemically proven hypoproteinaemia Not recommended for child under 3 years	Sachet: 100 × 30 mL = £94.19 Citrus-berry, neutral, orange creme
<b>Protein, fat, and carbohydrate</b>									
Calogen® Extra (Nutricia Clinical)	Liquid <b>per 100 mL</b>	1650 kJ (400 kcal) <sup>1</sup>	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Gluten-free Residual lactose Contains vitamins and minerals	See above Not suitable for child under 3 years; use with caution in child 3–6 years May require dilution for child 3–5 years	Bottle: 200 mL = £4.98 Neutral, strawberry
Calogen® Extra Shots (Nutricia Clinical)	Liquid <b>per 100 mL</b>	1650 kJ (400 kcal) <sup>1</sup>	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Gluten-free Residual lactose With vitamins and minerals	See above Not suitable for child under 3 years; use with caution in child 3–6 years May require dilution for child 3–5 years	Pot: 6 × 40 mL = £5.75 Neutral, strawberry
Calshake® (Fresenius Kabi)	Powder <b>per 87 g</b>	1841 kJ (439 kcal) <sup>1</sup>	4.1 g cows' milk	56.4 g (sugars 20 g)	22 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year	Sachet: 87 g = £2.01 Banana, neutral, strawberry, vanilla 90 g = £2.01 Chocolate
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 12 g									

1. Nutritional values vary with flavour—consult product literature

Enshake® (Abbott)	Powder <b>per 100 g</b>	1893 kJ (450 kcal) <sup>1</sup>	8.4 g cows' milk, soy protein isolate	69 g (sugars 14.5 g)	15.6 g	Nil	Residual lactose Contains vitamins and minerals	See above Not suitable for child under 1 year; use with caution in child 1–6 years	Sachet: 96.5 g = £1.98 Banana, chocolate, strawberry, vanilla
Powder: 96.5 g reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 16 g									
MCT Procal® (Vitafo)	Powder <b>per 100 g</b>	2742 kJ (657 kcal)	12.5 g cows' milk	20.6 g (sugars 3.1 g)	63.1 g (MCT 99%)	Nil	Contains lactose	Dietary management of disorders of long-chain fatty acid oxidation, fat malabsorption, and other disorders requiring a low LCT, high MCT supplement Not suitable for child under 1 year	Sachet: 30 × 16 g = £22.91
Powder 16 g provides: protein 2 g, carbohydrate 3.3 g, fat 10.1 g, energy 439 kJ (105 kcal)									
Pro-Cal® (Vitafo)	Powder <b>per 100 g</b>	2787 kJ (667 kcal)	13.6 g cows' milk	28.2 g (sugars 16 g)	55.5 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year; use with caution in child 1–5 years	Sachets: 25 × 15 g = £15.26 Tub: 510 g = £14.14 1.5 kg = £28.81 12.5 kg = £204.74 25 kg = £315.52 (15-g measuring scoop provided)
Powder 15 g provides: protein 2 g, carbohydrate 4.2 g, fat 8.3 g, energy 418 kJ (100 kcal)									
Pro-Cal® Shot (Vitafo)	Liquid <b>per 100 mL</b>	1385 kJ (334 kcal)	6.7 g cows' milk	13.4 g (sugars 13.3 g)	28.2 g	Nil	Contains lactose Gluten-free Contains soya	See above Not suitable for child under 3 years	Bottle: 6 × 250 mL = £26.76 Banana, neutral, strawberry Starter pack (mixed) 3 × 250 mL = £14.67
Pro-Cal® Singles (Vitafo)	Liquid <b>per 100 mL</b>	1385 kJ (334 kcal) <sup>1</sup>	6.7 g cows' milk soya	13.4 g (sugars 13.3 g)	28.2 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 3 years	Pot: 60 × 30 mL = £39.22 Neutral, strawberry Starter pack (mixed): 16 × 30 ml = £10.25
Scandishake® Mix (Nutricia Clinical)	Powder <b>per 100 g</b>	2099 kJ (500 kcal) <sup>1</sup>	4.7 g cows' milk	65 g (sugars 14.3 g)	24.7 g	Nil	Gluten-free Contains lactose	See above Not suitable for child under 3 years	Sachet: 85 g = £2.08 Banana, caramel, chocolate, strawberry, vanilla, unflavoured
Powder: 85 g reconstituted with 240 mL whole milk provides: protein 11.7 g, carbohydrate 66.8 g, fat 30.4 g, energy 2457 kJ (588 kcal)									
1. Nutritional values vary with flavour—consult product literature									

**A2.4.1.3 High-energy supplements: protein** (*product list continued*)**ACBS indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Vitasavoury® (Vitafo)	Powder <b>per 100 g</b>	2562 kJ (619 kcal) <sup>1</sup>	12 g cows' milk	22.5 g (sugars 1.4 g)	52 g	6.4 g	Contains lactose Contains soya (chicken flavour)	See above Not suitable for child under 3 years	Cup (200 kcal): 24 × 33 g = £29.97 Sachet (300 kcal): 10 × 50 g = £18.29 Chicken, leek and potato, mushroom, vegetable Starter pack (mixed): 4 × 33-g cups and 4 × 50-g sachets = £11.93

1. Nutritional values vary with flavour—consult product literature

**A2.4.2 Fibre, vitamin, and mineral supplements**

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
<b>High-fibre supplements</b>									
Resource® Optifibre® (Nestlé)	Powder <b>per 100 g</b>	323 kJ (76 kcal)	Nil	19 g guar gum, partially hydrolysed	Nil	78 g	Gluten-free Lactose-free	Standard, p. 771 except dysphagia Not suitable for child under 5 years	Sachet: 16 × 10 g = £8.35 Can: 250 g = £10.28 (5-g measuring scoop provided)
<b>Vitamin and Mineral supplements</b>									
Fruitivits® (Vitafo)	Powder <b>per 100 g</b>	133 kJ (33 kcal)	Nil	8.3 g (sugars 400 mg)	less than 100 mg	3.3 g		Vitamin, mineral, and trace element supplement in children 3–10 years with restrictive therapeutic diets	Sachets: 30 × 6 g = £61.92 Orange
Paediatric Seravit® (SHS)	Powder <b>per 100 g</b>	1275 kJ (300 kcal)	Nil	75 g (sugars 6.75 g <sup>1</sup> )	Nil	Nil		Vitamin, mineral, and trace element supplement in infants and children with restrictive therapeutic diets	Tub: 200 g = £18.17 Unflavoured <sup>2</sup> 200 g = £17.07 Pineapple <sup>3</sup> (5-g measuring scoop provided)

1. Sugar content varies with flavour

2. Flavouring: see *Modjul*® Flavour System, p. 807

3. Flavour not suitable for child under 6 months

## A2.5 Feed additives

### A2.5.1 Special additives for conditions of intolerance

#### Colief® (Forum)

**Liquid**, lactase 50 000 units/g, net price 7-mL dropper bottle = £8.40

For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature

#### Fructose

(Laevulose)

For proven glucose/galactose intolerance

#### Glucose

(Dextrose monohydrate)

Net price 500 g = £1.48

For use as an energy supplement in sucrase-isomaltase deficiency

### A2.5.2 Feed thickeners and pre-thickened drinks

#### Carobel, Instant® (Cow & Gate)

**Powder**, carob seed flour. Net price 135 g = £2.80  
For thickening feeds in the treatment of vomiting

#### Multi-thick® (Abbott)

**Powder**, modified maize starch, gluten- and lactose-free, net price 250 g = £4.83  
For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

#### Nutilis® Clear (Nutricia Clinical)

**Powder**, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free, net price 175 g = £8.46  
For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years

#### Nutilis® Powder (Nutricia Clinical)

**Powder**, carbohydrate 86 g, energy 1520 kJ (358 kcal)/100 g, modified maize starch, gluten- and lactose-free, net price 20 × 9-g sachets = £5.88, 225 g = £4.51  
For thickening of foods in dysphagia. Not suitable for child under 1 year except in cases of failure to thrive

#### Resource® Thickened Drink (Nestlé)

**Liquid**, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 376 kJ (89 kcal)/100 mL. Flavours: apple or orange, syrup or custard consistencies. Gluten- and lactose-free, net price 12 × 114-mL cups = £7.44  
For dysphagia. Not suitable for children under 1 year

#### Resource® ThickenUp® (Nestlé)

**Powder**, modified maize starch. Gluten- and lactose-free, net price 227 g = £4.55; 74 × 4.5-g sachet = £17.44

For thickening of foods in dysphagia. Not suitable for children under 1 year

#### Resource® ThickenUp® Clear (Nestlé)

**Powder**, maltodextrin, xanthum gum, gluten- and lactose-free, net price 125 g = £8.46; 24 × 1.2-g sachets = £5.28

For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years

#### SLO Drinks® (SLO Drinks)

**Powder**, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange; (hot drinks) chocolate, white coffee, white tea, net price 25 × 115 mL = £7.50  
Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years

#### Thick and Easy® (Fresenius Kabi)

**Powder**. Modified maize starch, net price 225-g can = £4.93; 100 × 9-g sachets = £30.00; 4.54 kg = £82.56

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

#### Thicken Aid® (M & A Pharmachem)

**Powder**, modified maize starch, maltodextrin, gluten- and lactose-free, net price 225 g = £3.71; 100 × 9-g sachets = £22.40

For thickening of foods in dysphagia. Not suitable for children under 1 year

#### Thixo-D® (Sutherland)

**Powder**, modified maize starch, gluten-free. Net price 375-g tub = £7.15

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

#### Vitaquick® (Vitafo)

**Powder**. Modified maize starch. Net price 300 g = £6.87; 2 kg = £37.93; 6 kg = £98.22

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

### A2.5.3 Flavouring preparations

#### Flavour Mix® (Nestlé)

**Powder**, flavours: banana, chocolate, coffee, lemon-lime, or strawberry, net price 60 g = £7.17

#### FlavourPac® (Vitafo)

**Powder**, flavours: black currant, lemon, orange, tropical or raspberry, net price 30 × 4-g sachets = £13.29

For use with Vitafo's range of unflavoured protein substitutes for metabolic diseases; not suitable for child under 1 year

#### Modjul® Flavour System (SHS)

**Powder**, carbohydrate-based flavours, black currant, orange, pineapple, 100 g = £11.60; cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £11.60  
For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months

## A2.6 Foods for special diets

### A2.6.1 Gluten-free foods

**ACBS indications:** established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

#### Bread

##### Loaves

##### **Barkat**<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Loaf, multigrain 500 g = £5.73. Loaf, sliced, wholemeal 500 g = £3.98. Loaf, sliced, part-baked, country-style 250 g = £4.35. Loaf, sliced, part-baked, white 300 g = £4.13, 550 g = £5.78. Rice bread, brown 500 g = £5.73; 500 g = £5.73

##### **Dietary Specials**<sup>®</sup> (Nutrition Point)

**Gluten-free.** Loaf, sliced, multigrain, brown 400 g = £3.24; white 400 g = £3.24

##### **Ener-G**<sup>®</sup> (General Dietary)

**Gluten-free.** Loaf, sliced Seattle brown 600 g = £6.04. Rice bread, sliced, brown 474 g = £5.25; white 456 g = £5.25. Rice loaf, sliced 612 g = £5.25. Tapioca bread, sliced 480 g = £5.25

##### **Genius Gluten Free**<sup>®</sup> (Genius Foods)

**Gluten-free.** Loaf, unsliced, brown 400 g = £2.59; white 400 g = £2.59. Loaf, sliced, brown 400 g = £2.69; white 400 g = £2.69. Sandwich bread, sliced, brown 535 g = £3.48; white 535 g = £3.48

##### **Glutafin**<sup>®</sup> (Nutrition Point)

**Gluten-free.** Loaf, sliced, fibre 400 g = £3.77; white 400 g = £3.77

##### **Glutafin**<sup>®</sup> **Select** (Nutrition Point)

**Gluten-free.** Loaf, sliced, fresh, brown 400 g = £3.43; white 400 g = £3.43. Loaf, sliced, fibre 400 g = £3.36; white 400 g = £3.36. Loaf, seeded 400 g = £3.65

##### **Juvela**<sup>®</sup> (Juvela)

**Gluten-free.** Loaf, sliced, fresh, fibre 400 g = £3.39; white 400 g = £3.69. Loaf, sliced, white 400 g = £3.59; fibre 400 g = £3.54. Loaf, white 400 g = £3.54; fibre 400 g = £3.54. Loaf, part-baked, fibre 400 g = £3.80; white 400 g = £3.95

##### **Lifestyle**<sup>®</sup> (Ultraparm)

**Gluten-free.** Loaf, sliced, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82. Loaf, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82

##### **Livwell**<sup>®</sup> (Livwell)

**Gluten-free.** Loaf, sliced, brown (seeded) 200 g = £2.25; white 200 g = £2.25

##### **Proceli**<sup>®</sup> (Proceli)

**Gluten-free.** Loaf, sliced, white 165 g = £2.30; sandwich 155 g = £2.32. Rice bread, brown 220 g = £3.71; sandwich 220 g = £2.30

##### **Ultra**<sup>®</sup> (Ultraparm)

**Gluten-free.** Loaf, white 400 g = £2.82; high fibre 500 g = £3.35

##### **Warburtons**<sup>®</sup> (Warburtons)

**Gluten-free.** Loaf, sliced, brown 400 g = £2.99; white 400 g = £2.99

##### **Wellfoods**<sup>®</sup> (Wellfoods)

**Gluten-free.** Loaf, sliced 600 g = £4.95; unsliced 600 g = £4.85

#### Baguettes, buns and rolls

##### **Barkat**<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Baguette, part-baked 200 g = £4.35. Rolls, part-baked 2 × 100 g = £3.98; 6 × 50 g = £4.35

##### **Ener-G**<sup>®</sup> (General Dietary)

**Gluten-free.** Rolls, dinner × 6 = £3.56; white, long 4 × 55 g = £2.86; round 4 × 55 g = £2.86

##### **Glutafin**<sup>®</sup> (Nutrition Point)

**Gluten-free.** Baguette 2 × 175 g = £3.44. Rolls, fibre 4 × 50 g = £3.61; white 4 × 50 g = £3.61

##### **Glutafin**<sup>®</sup> **Select** (Nutrition Point)

**Gluten-free.** Rolls, part-baked, white 4 × 50 g = £3.61; long 2 × 75 g = £2.76

##### **Juvela**<sup>®</sup> (Juvela)

**Gluten-free.** Rolls, fresh, fibre 5 × 85 g = £4.42; white 5 × 85 g = £4.42. Rolls, fibre 5 × 85 g = £4.77; white 5 × 85 g = £4.77. Rolls, part-baked, fibre 5 × 75 g = £4.94; white 5 × 75 g = £4.94

##### **Lifestyle**<sup>®</sup> (Ultraparm)

**Gluten-free.** Rolls, brown 5 × 80 g = £2.82; high fibre 5 × 80 g = £2.82; white 5 × 80 g = £2.82

##### **Livwell**<sup>®</sup> (Livwell)

**Gluten-free.** Baguette, white 140 g = £2.15. Buns, toasting 4 × 45 g = £2.40. Rolls, white 4 = £2.25. Rolls, part-baked, circle (bagel) 2 × 70 g = £2.30; dinner (square) 2 × 80 g = £2.09

##### **Proceli**<sup>®</sup> (Proceli)

**Gluten-free.** Baguette, part-baked 2 × 125 g = £3.24. Buns 4 × 50 g = £3.41. Lunch rolls, white 8 × 34 g = £3.26. Rolls, hotdog 3 × 35 g = £2.24

##### **Warburtons**<sup>®</sup> (Warburtons)

**Gluten-free.** Baguette, 2 × 75 g = £2.79. Rolls, brown 3 × 100 g = £2.49; white 3 × 100 g = £2.49

##### **Wellfoods**<sup>®</sup> (Wellfoods)

**Gluten-free.** Burger buns 4 × 75 g = £3.95. Rolls 4 × 70 g = £3.65

#### Specialty breads

##### **Livwell**<sup>®</sup> (Livwell)

**Gluten-free.** Flat bread (pitta) 4 = £3.00. Tear-drop shape (naan) 2 × 90 g = £3.00

#### Cereals

##### **Juvela**<sup>®</sup> (Juvela)

**Gluten-free.** Fibre flakes 300 g = £2.78; flakes 300 g = £2.78; pure oats 500 g = £2.78

##### **Nairns**<sup>®</sup> (Nairns)

**Gluten-free.** Oat porridge 500 g = £2.89

## Cookies and biscuits

### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

Gluten-free. Biscuits, coffee-style 200 g = £ 3.38; digestive 175 g = £2.61

### Ener-G<sup>®</sup> (General Dietary)

Gluten-free. Cookies, vanilla 435 g = £5.98

### Glutafin<sup>®</sup> (Nutrition Point)

Gluten-free. Biscuits, plain 200 g = £4.06; digestive 150 g = £2.09; savoury shorts 150 g = £2.75; shortbread 100 g = £1.69; sweet (without chocolate or sultanas) 150 g = £2.09; tea 150 g = £2.05

### Juvela<sup>®</sup> (Juvela)

Gluten-free. Biscuits, digestive 150 g = £3.05; savoury 150 g = £3.82; sweet 150 g = £2.88, tea 150 g = £3.05

## Crackers, crispbreads, and breadsticks

### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

Gluten-free. Crackers, round (matzo) 200 g = £3.52

### Dietary Specials<sup>®</sup> (Nutrition Point)

Gluten-free. Cracker bread 150 g = £2.09

### Glutafin<sup>®</sup> (Nutrition Point)

Gluten-free. Crackers, high fibre 200 g = £2.84; plain 200 g = £3.39; mini 175 g = £2.90

### Juvela<sup>®</sup> (Juvela)

Gluten-free. Crispbread, plain 200 g = £4.64

### Ultra<sup>®</sup> (Ultraparm)

Gluten-free. Crackerbread 200 g = £1.77

### Warburtons<sup>®</sup> (Warburtons)

Gluten-free. Crackers, bran 150 g = £2.29

## Flour mixes and xanthan gum

### Flour mixes

#### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

Gluten-free. Flour mix, bread 500 g = £6.81. Plain 750 g = £6.98

#### Finax<sup>®</sup> (Drossa)

Gluten-free. Flour mix, bread, fibre 1 kg = £9.92. Flour mix 900 g = £8.66; coarse 900 g = £8.66

#### Glutafin<sup>®</sup> (Nutrition Point)

Gluten-free. Flour mix, fibre 500 g = £6.53; white 500 g = £6.53

#### Glutafin Select<sup>®</sup> (Nutrition Point)

Gluten-free. Flour mix, bread, fibre 500 g = £6.53; white 500 g = £6.53. Fibre 500 g = £6.53; white 500 g = £6.53

#### Heron Foods<sup>®</sup> (Gluten Free Foods Ltd)

Gluten-free. Flour mix, organic, bread, standard 500 g = £8.96; high fibre 500 g = £8.96

#### Juvela<sup>®</sup> (Juvela)

Gluten-free. Flour mix, fibre 500 g = £7.35; plain 500 g = £7.35; harvest 500 g = £7.35

#### Mrs Crimbles<sup>®</sup> (Stiletto Foods)

Gluten-free. Bread mix, net price 275 g = £1.04. Pastry mix, net price 200 g = £1.04

### Orgran<sup>®</sup> (Community)

Gluten-free. Flour mix, bread 450 g = £3.10. Self-raising 500 g = £3.10. Pastry and pizza 375 g = £3.80

### Procelli<sup>®</sup> (Proceli)

Gluten-free. Flour mix, white 1 kg = £9.95

### Pure<sup>®</sup> (Innovative)

Gluten-free. Flour mix, blended 1 kg = £4.23. Potato starch 500 g = £1.68. Rice, brown 500 g = £1.58; white 500 g = £1.68. Tapioca starch 500 g = £2.26. Teff, brown 1 kg = £4.77; white 1 kg = £4.77

### Tobia<sup>®</sup> (Tobia Teff)

Gluten-free. Flour mix, teff, brown 1 kg = £3.30; white 1 kg = £3.30

### Tritamyl<sup>®</sup> (Gluten Free Foods Ltd)

Gluten-free. Flour mix, bread, brown 1 kg = £7.10; white 2 kg = £14.26. Plain 2 kg = £14.26

### Wellfoods<sup>®</sup> (Wellfoods)

Gluten-free. Flour mix, plain 1 kg = £7.65

### Xanthan gum

#### Ener-G<sup>®</sup> (General Dietary)

Gluten-free. Xanthan gum 170 g = £8.28

#### Pure<sup>®</sup> (Innovative)

Gluten-free. Xanthan gum 100 g = £6.66

## Pasta

### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

Gluten-free. Pasta, animal shapes 500 g = £5.88; macaroni 500 g = £5.88; spaghetti 500 g = £5.88; spirals 500 g = £5.88; tagliatelle 500 g = £5.88. Buckwheat, penne 250 g = £2.93; spirals 250 g = £2.93

### BiAlimenta<sup>®</sup> (Drossa)

Gluten-free. Pasta, acini di pepe 500 g = £5.97; formati misti 500 g = £5.97; penne 500 g = £5.97; sagnette 500 g = £5.97; spirali 500 g = £5.97; tubetti 500 g = £5.90; potato-based, gnocchi 500 g = £5.59; perle di gnocchi 500 g = £5.60

### Dietary Specials<sup>®</sup> (Nutrition Point)

Gluten-free. Pasta, fusilli 500 g = £3.44; penne 500 g = £3.44; spaghetti 500 g = £3.44

### Ener-G<sup>®</sup> (General Dietary)

Gluten-free. Pasta, rice-based, lasagne 454 g = £4.88; macaroni 454 g = £4.88; shells, small 454 g = £4.88 spaghetti 454 g = £4.88; vermicelli 300 g = £4.88

### Glutafin<sup>®</sup> (Nutrition Point)

Gluten-free. Pasta, lasagne 250 g = £3.46; macaroni penne 500 g = £6.60; shells 500 g = £6.60; spirals 500 g = £6.60; spaghetti, long 500 g = £6.60; tagliatelle 250 g = £3.46

### Juvela<sup>®</sup> (Juvela)

Gluten-free. Pasta, fusilli 500 g = £7.21; lasagne 250 g = £3.68; macaroni 500 g = £7.21; spaghetti 500 g = £7.21; tagliatelle 250 g = £3.47. Fibre, penne 500 g = £6.61

**Orgran®** (Community)

**Gluten-free.** Pasta, rice and corn, lasagne 200 g = £3.13; macaroni 250 g = £2.42. Spirals, buckwheat 250 g = £2.42; corn 250 g = £2.42; brown rice 250 g = £2.42; rice and corn 250 g = £2.42; rice and millet 250 g = £2.42

**Proceli®** (Proceli)

**Gluten-free.** Pasta, macaroni penne 250 g = £2.95; spirals 250 g = £2.59

**Rizopia®** (PGR Health Foods)

**Gluten-free.** Pasta, brown rice, fusilli 500 g = £2.72; lasagne 375 g = £2.72; penne 500 g = £2.72; spaghetti 500 g = £2.72

**Ultra®** (Ultraparm)

**Gluten-free.** Pasta, fusilli 250 g = £2.95; penne 250 g = £2.95; spaghetti 250 g = £2.95

**Pizza bases****Barkat®** (Gluten Free Foods Ltd)

**Gluten-free.** Pizza crust, rice, brown 150 g = £5.00; white 150 g = £5.00

**Dietary Specials®** (Nutrition Point)

**Gluten-free.** Pizza base 2 × 150 g = £5.68

**Glutafin®** (Nutrition Point)

**Gluten-free.** Pizza base 2 × 150 g = £6.43

**Juvela®** (Juvela)

**Gluten-free.** Pizza base 2 × 180 g = £8.78

**Proceli®** (Proceli)

**Gluten-free.** Pizza base 2 × 250 g = £3.90

**Ultra®** (Ultraparm)

**Gluten-free.** Pizza base 2 × 200 g = £2.65

**Wellfoods®** (Wellfoods)

**Gluten-free.** Pizza base 2 × 300 g = £8.95

**A2.6.1.1 Gluten- and wheat-free foods**

**ACBS indications:** established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

**Ener-G®** (General Dietary)

**Gluten-free, wheat-free.** Bread loaf, six flour 576 g = £4.41. Rolls, Seattle brown, round (hamburger) 4 × 119 g = £3.96; long (hot dog) 4 × 119 g = £3.96. Pizza base, 3 × 124 g = £4.60

**Glutafin®** (Nutrition Point)

**Gluten-free, wheat-free.** Flour mix, bread 500 g = £6.53; fibre 500 g = £6.53. Crispbread 150 g = £3.19

**Heron Foods®** (Gluten Free Foods Ltd)

**Gluten-free, wheat-free.** Flour mix, organic, bread, fibre 500 g = £8.96. Bread and cake mix 500 g = £8.96

**A2.6.2 Low-protein foods**

**ACBS indications:** inherited metabolic disorders, renal or liver failure, requiring a low-protein diet

**Bread****Ener-G®** (General Dietary)

**Low protein.** Rice bread, 600 g = £5.38

**Juvela®** (Juvela)

**Low protein.** Loaf, sliced 400 g = £3.64. Rolls 5 × 70 g = £4.52

**Loprofin®** (SHS)

**Low protein.** Loaf, part-baked, sliced 400 g = £3.80. Rolls, part-baked 4 × 65 g = £4.00

**PK Foods®** (Gluten Free Foods Ltd)

**Low protein.** Loaf, white, sliced 550 g = £4.75

**Cake, biscuits, and snacks****Harifen®** (Ultraparm)

**Low protein.** Cracker toast, 200 g = £2.75

**Juvela®** (Juvela)

**Low-protein.** Cookies, cinnamon 125 g = £7.62; chocolate chip 110 g = £7.62; orange 125 g = £7.62

**Loprofin®** (SHS)

**Low-protein.** Wafers, chocolate 100 g = £2.46; vanilla 100 g = £2.46. Crackers 150 g = £3.45, herb 150 g = £3.45

**PK Foods®** (Gluten Free Foods Ltd)

**Low-protein.** *Aminex®* biscuits 200 g = £5.04; cookies 150 g = £5.04. Cookies, chocolate chip 150 g = £5.04; cinnamon 150 g = £5.04; orange 150 g = £5.04. Rusks 200 g = £5.04. Crispbread 75 g = £2.42

**Promin®** (Firstplay Dietary)

**Low-protein.** Cooked and flavoured Pasta Snax, ready-salted 12 × 25 g = £9.84; salt and vinegar 12 × 25 g = £9.84; cheese and onion 12 × 25 g = £9.84; jalapeno 12 × 25 g = £9.84

**Taranis®** (Firstplay Dietary)

**Low-protein.** Cake bars, apricot 6 × 40 g = £5.91, lemon 6 × 40 g = £5.91, pear 6 × 40 g = £5.91

**Vita Bite®** (Vitaflo)

**Low protein.** Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g. Chocolate flavoured, 25 g = £1.02  
Not recommended for any child under 1 year

**Vitaflo Choices®** (Vitaflo)

**Low-protein.** Mini crackers, 40 g = £0.82  
Not suitable for child under 3 years

**Cereals****Loprofin®** (SHS)

**Low-protein.** Breakfast cereal flakes, apple 375 g = £7.60; chocolate 375 g = £7.60; strawberry 375 g = £7.60. Cereal loops 375 g = £7.88

**Promin®** (Firstplay Dietary)

**Low-protein.** Hot breakfast (powder sachets), apple and cinnamon 6 × 57 g = £7.87, banana 6 × 57 g = £7.87, chocolate 6 × 57 g = £7.87; original 6 × 56 g = £7.87

## Desserts

### Loprofin<sup>®</sup> (SHS)

**Low-protein.** Powder, chocolate 150 g = £4.65; strawberry 150 g = £4.65; vanilla 150 g = £4.65

### PK Foods<sup>®</sup> (Gluten Free Foods Ltd)

**Low-protein.** Jelly, orange 4 × 80 g = £8.03, cherry 4 × 80 g = £8.03

ACBS Indications

### Promin<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Dessert mix, caramel 6 × 36.5 g = £6.18; custard 6 × 36.5 g = £6.18; chocolate and banana 6 × 36.5 g = £6.18; strawberry and vanilla 6 × 36.5 g = £6.18. Rice pudding imitation, apple 4 × 69 g = £6.18; banana 4 × 69 g = £6.18; original 4 × 69 g = £6.18; strawberry 4 × 69 g = £6.18

## Flour mixes and egg substitutes

### Ener-G<sup>®</sup> (General Dietary)

**Low-protein.** Egg replacer 454 g = £4.96

### Fate<sup>®</sup> (Fate)

**Low protein.** All purpose mix 500 g = £6.97. Cake mix, 2 × 250 g = £6.97; chocolate-flavour 2 × 250 g = £6.97

### Juvela<sup>®</sup> (Juvela)

**Low-protein.** Mix 500 g = £7.79

### Loprofin<sup>®</sup> (SHS)

**Low-protein.** Mix, plain 500 g = £8.03; chocolate 500 g = £8.50; lemon 500 g = £8.50. Egg replacer 2 × 250 g = £14.78. Egg-white replacer 100 g = £9.50

### PK Foods<sup>®</sup> (Gluten Free Foods Ltd)

**Low-protein.** Flour mix 750 g = £10.71. Egg replacer 350 g = £5.04

ACBS Indications

## Pasta

### Loprofin<sup>®</sup> (SHS)

**Low-protein.** Pasta, animal shapes 500 g = £8.09; spirals 500 g = £8.41; lasagne 250 g = £4.09; macaroni elbows 250 g = £4.04; penne 500 g = £8.41; spaghetti, short-cut 500 g = £8.41; tagliatelle 250 g = £4.04; vermicelli 250 g = £4.17. Rice, imitation 500 g = £8.16

### Promin<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Pasta, alphabet shapes 500 g = £6.80; lasagne sheets 200 g = £2.95; macaroni 500 g = £6.80; noodles, flat 500 g = £6.80; shells 500 g = £6.80; spaghetti, short-cut 500 g = £6.80; spirals 500 g = £6.80. Rice, imitation 500 g = £6.80. Tricolour pasta, alphabet shapes 500 g = £6.80; shells 500 g = £6.80; spirals 500 g = £6.80

## Pizza bases

### Juvela<sup>®</sup> (Juvela)

**Low-protein.** Pizza base 2 × 180 g = £8.61

## Savoury meals and mixes

### Promin<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Burger mix 2 × 62 g = £6.18; lamb & mint 2 × 62 g = £6.18. Couscous 500 g = £6.80. Pasta elbows in cheese and broccoli sauce 4 × 66 g = £8.08. Pasta meal 500 g = £6.80. Pasta shells in tomato, pepper, and herb sauce 4 × 72 g = £8.08. Pasta spirals in Moroccan sauce 4 × 72 g = £8.08. Sausage mix, apple & sage 4 × 30 g = £6.95; original 4 × 30 g = £6.95; tomato & basil 4 × 30 g = £6.95. Mac pot, cheese 4 × 61 g = £18.60; tomato 4 × 61 g = £18.60. Potato pot, cabbage and bacon 4 × 50 g = £15.95; onion 4 × 50 g = £15.95; sausage 4 × 50 g = £15.95. Xpot, all day scramble 4 × 60 g = £20.36; beef and tomato 4 × 60 g = £20.36; chip shop curry 4 × 60 g = £20.36; rogan style curry 4 × 60 g = £20.36

## Spreads

### Taranis<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Spread, hazelnut 230 g = £7.65

## A2.7 Nutritional supplements for metabolic diseases

## Glutaric aciduria (type 1)

### GA1 Anamix<sup>®</sup> Infant (SHS)

**Powder,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided) Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years

### GA Gel<sup>®</sup> (Vitafo)

**Gel,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac*<sup>®</sup>, p. 807), net price 30 × 24-g sachets = £204.80 Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years

### <sup>1</sup>XLYS, Low TRY, Maxamaid<sup>®</sup> (SHS)

**Powder,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjuul*<sup>®</sup> Flavour System, p. 807), net price 500 g = £93.59 Nutritional supplement for dietary management of type 1 glutaric aciduria

1. Maxamaid products are generally intended for use in children 1–8 years

**XLYS, TRY, Glutaridon®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g, Lactose-free. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 2 × 500 g = £312.84

Nutritional supplement for type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals and trace elements

**HCU Express® 20** (Vitaflo)

**Powder**, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 807), net price 30 × 34-g sachets = £410.89

A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria

**HCU gel®** (Vitaflo)

**Powder**, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.3 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *FlavourPac®*, p. 807), net price 30 × 24-g sachets = £204.75

A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria

**Glycogen storage disease****Corn flour and corn starch**

For glycogen storage disease

**Glycosade®** (Vitaflo)

**Powder**, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g, net price 30 × 60-g sachets = £107.64

A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years

**HCU Lophlex® LQ 20** (Nutricia Clinical)

**Liquid**, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29

Nutritional supplement for the dietary management of homocystinuria in children over 3 years

**Homocystinuria or hypermethioninaemia****HCU Anamix® Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven vitamin B<sub>6</sub> non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years

**HCU LV®** (SHS)

**Powder**, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul®* Flavour System, p. 807), or tropical flavour (formulation varies slightly), net price 30 × 27.8-g sachets = £469.80

Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B<sub>6</sub> non-responsive homocystinuria in children over 8 years

**HCU cooler® 15** (Vitaflo)

**Liquid**, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/25 g, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL pouch = £277.20

A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria

**XMET Homidon®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids, except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 500 g = £171.63

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children

**HCU Express® 15** (Vitaflo)

**Powder**, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *FlavourPac®*, p. 807), net price 30 × 25-g sachets = £318.03

A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria

**1 XMET Maxamaid®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul®* Flavour System, p. 807), net price 500 g = £93.59

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

1. Maxamaid products are generally intended for use in children 1–8 years

**<sup>1</sup>XMET Maxamum®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 500 g = £150.02

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

**<sup>2</sup>XLEU Maxamaid®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 500 g = £93.59

Nutritional supplement for the dietary management of isovaleric acidemia

**Hyperlysinaemia****HYPER LYS Anamix® Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years

**<sup>2</sup>XLYS Maxamaid®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 500 g = £93.59

Nutritional supplement for the dietary management of hyperlysinaemia

**Isovaleric acidemia****IVA Anamix® Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven isovaleric acidemia or other proven disorders of leucine metabolism in children from birth to 3 years

**XLEU Faladon®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 200 g = £70.91

Nutritional supplement for the dietary management of isovaleric acidemia in children

**Maple syrup urine disease****MSUD Aid III®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 500 g = £177.29

Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

**MSUD Anamix® Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years

**MSUD Anamix® Junior** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul®* Flavour System, p. 807), net price 30 × 29-g sachets = £198.00

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

**MSUD Anamix® Junior LQ** (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Orange flavour, net price 125-mL carton = £8.59

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

**MSUD cooler® 15** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL = £277.20

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

1. Maxamum products are generally intended for use in children over 8 years
2. Maxamaid products are generally intended for use in children 1–8 years

**MSUD express<sup>®</sup> 15** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *FlavourPac<sup>®</sup>*, p. 807), net price 30 × 25-g sachets = £318.03

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

**MSUD express<sup>®</sup> 20** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *FlavourPac<sup>®</sup>*, p. 807), net price 30 × 34-g sachets = £410.89

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

**MSUD Gel<sup>®</sup>** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *FlavourPac<sup>®</sup>*, p. 807), net price 30 × 24-g sachets = £207.15

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

**MSUD Lophlex<sup>®</sup> LQ 20** (Nutricia Clinical)

**Liquid**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years

**<sup>1</sup>MSUD Maxamaid<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul<sup>®</sup>* Flavour System, p. 807), net price 500 g = £93.59

Nutritional supplement for the dietary management of maple syrup urine disease

**<sup>2</sup>MSUD Maxamum<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured, (flavouring: see *Modjul<sup>®</sup>* Flavour System, p. 807), net price 500 g = £150.02

Nutritional supplement for the dietary management of maple syrup urine disease

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years

**Methylmalonic or propionic acidaemia****MMA/PA Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years

**XMTVI Asadon<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul<sup>®</sup>* Flavour System, p. 807), net price 200 g = £70.91

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults

**<sup>1</sup>XMTVI Maxamaid<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul<sup>®</sup>* Flavour System, p. 807), net price 500 g = £93.59

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

**<sup>2</sup>XMTVI Maxamum<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul<sup>®</sup>* Flavour System, p. 807), net price 500 g = £150.02

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

**Other inborn errors of metabolism****Cystine500<sup>®</sup>** (Vitafo)

**Powder**, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**DocOmega<sup>®</sup>** (Vitafo)

**Powder**, protein (cows' milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals, net price 30 × 4-g sachets = £37.66

Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth

**EAA<sup>®</sup> Supplement** (Vitafo)

**Powder**, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 × 12.5-g sachets = £196.32

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders in children over 3 years

**Isoleucine50<sup>®</sup>** (Vitafo)

**Powder**, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**KeyOmega<sup>®</sup>** (Vitafo)

**Powder**, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 × 4-g sachet = £38.50

Nutritional supplement for the dietary management of inborn errors of metabolism

**Leucine100<sup>®</sup>** (Vitafo)

**Powder**, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**Low protein drink** (Milupa)

**Powder**, protein (cows' milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 400 g = £8.80 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year

**Note** Termed *Milupa<sup>®</sup> lp-drink* by manufacturer

**Phenylalanine50<sup>®</sup>** (Vitafo)

**Powder**, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £50.52

Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth

**ProZero<sup>®</sup>** (Vitafo)

**Liquid**, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose. Net price 18 × 250 mL = £22.50; 6 × 1 litre = £30.00

A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults

**Tyrosine1000<sup>®</sup>** (Vitafo)

**Powder**, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4-g sachet, net price 30 × 4-g sachets = £4.77

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**Valine50<sup>®</sup>** (Vitafo)

**Powder**, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**Phenylketonuria****Add-Ins<sup>®</sup>** (SHS)

**Powder**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 60 × 18.2-g sachets = £357.60

Nutritional supplement for the dietary management of proven phenylketonuria in children over 4 years

**Easiphen<sup>®</sup>** (SHS)

**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements. Flavours: forest berries, orange, or tropical fruit, net price 250-mL carton = £9.19

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years

**Lophlex<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange, or unflavoured, net price 30 × 27.8-g sachets = £276.00

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

**Loprofin<sup>®</sup> PKU Drink** (SHS)

**Liquid**, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 72p

Nutritional supplement for the dietary management of phenylketonuria in children over 1 year

**Loprofin<sup>®</sup> Sno-Pro** (SHS)

**Liquid**, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose. Net price 200 mL = £1.19

Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism

**Milupa PKU 2-prima<sup>®</sup>** (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £149.25

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

**Milupa PKU 2-secunda<sup>®</sup>** (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12  
Nutritional supplement for the dietary management of phenylketonuria in children 9–15 years

**Milupa PKU 3-advanta<sup>®</sup>** (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12  
Nutritional supplement for the dietary management of phenylketonuria in children over 15 years

**Phlexy-10<sup>®</sup> Exchange System** (SHS)

**Capsules**, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule, net price 200-cap pack = £40.55

**Tablets**, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet, net price 75-tab pack = £26.26

**Drink Mix**, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour, net price 30 × 20-g sachet = £122.40

Nutritional supplement for the dietary management of phenylketonuria

**Phlexy-Vits<sup>®</sup>** (SHS)

**Powder**, vitamins, minerals, and trace elements, net price 30 × 7-g sachets = £68.10

**Tablets**, vitamins, minerals, and trace elements, net price 180-tab pack = £77.35

For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities

**PK Aid 4<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured, (flavouring: see *Modiul<sup>®</sup> Flavour System*, p. 807), net price 500 g = £136.28 (5-g measuring scoop provided)  
Nutritional supplement for the dietary management of phenylketonuria in children and adults

**PKU Anamix<sup>®</sup> First Spoon** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 5 g, carbohydrate 4.8 g, fat 150 mg, fibre nil, energy 168 kJ (41 kcal)/12.5-g sachet, with vitamins, minerals, and trace elements, net price 30 × 12.5 g = £87.30

Nutritional supplement for the dietary management of proven phenylketonuria in children from 6 months to 5 years

**PKU Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £33.69 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years

**PKU Anamix<sup>®</sup> Junior** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 kJ (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Flavours: chocolate, pineapple-vanilla, or unflavoured (carbohydrate 11 g, energy 474 kJ (113 kcal)/29-g sachet), net price 30 × 29-g sachets = £120.30

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

**PKU Anamix Junior LQ<sup>®</sup>** (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: Berry, orange, or unflavoured, net price 125-mL carton = £5.35

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

**PKU cooler10<sup>®</sup>** (Vitaflo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 87-mL = £112.80

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

**PKU cooler15<sup>®</sup>** (Vitaflo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 130 mL = £168.00

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

**PKU cooler20<sup>®</sup>** (Vitaflo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 174 mL = £225.60

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

**PKU express15<sup>®</sup>** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 293 kJ (70 kcal)/25 g, with vitamins, minerals, and trace elements. Lemon, orange, tropical, or unflavoured (carbohydrate 3.4 g, energy 310 kJ (74 kcal)/25 g), (flavouring: see *FlavourPac*<sup>®</sup>, p. 807), net price 30 × 25-g sachets = £192.81

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

**PKU express20<sup>®</sup>** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 3.3 g, energy 389 kJ (93 kcal)/34 g, with vitamins, minerals, and trace elements. Lemon, orange, tropical, or unflavoured (carbohydrate 4.7 g, energy 416 kJ (99 kcal)/34 g), (flavouring: see *FlavourPac*<sup>®</sup>, p. 807), net price 30 × 34-g sachets = £249.10

Nutritional supplement for the dietary management of phenylketonuria in children over 3 years

**PKU gel<sup>®</sup>** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24 g, with vitamins, minerals, and trace elements. Orange, raspberry, or unflavoured (carbohydrate 10.3 g, energy 339 kJ (81 kcal)/24 g), (flavouring: see *FlavourPac*<sup>®</sup>, p. 807), net price 30 × 24-g sachets = £133.39

For use as part of the low-protein dietary management of phenylketonuria in children 1–10 years

**PKU Lophlex<sup>®</sup> LQ 10** (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 62.5-mL carton = £4.93; juicy berries, juicy orange (energy 246 kJ (58 kcal)/62.5 mL), 62.5-mL carton = £4.93

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

**PKU Lophlex<sup>®</sup> LQ 20** (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 125-mL carton = £9.84; juicy berries, juicy orange (fibre 500 mg, energy 493 kJ (116 kcal)/125 mL), 125-mL carton = £9.84

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

**PKU Lophlex<sup>®</sup> Sensation 20** (SHS)

**Semi-solid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 20.2 g, fibre 1 g, energy 706 kJ (166 kcal)/109 g, with vitamins, minerals, and trace elements. Flavours: berry or orange, net price 3 × 109-g pot = £31.44

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

**PKU squeeze<sup>®</sup>** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 22.5 g, fat 500 mg, energy 565 kJ (135 kcal)/85 g, with vitamins, minerals, and trace elements. Flavour: apple-banana, net price 30 × 85-g pouch = £127.52

Nutritional supplement for the dietary management of phenylketonuria in children from 6 months to 10 years

**PKU Start<sup>®</sup>** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £6.53

For the dietary management of phenylketonuria in children under 12 months

**L-Tyrosine** (SHS)

**Powder**, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g, net price 100 g = £20.87

Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations

**1<sup>XP</sup> Maxamaid<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour, or unflavoured (flavouring: see *Modjul*<sup>®</sup> Flavour System, p. 807), net price 500 g = £55.37

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

**2<sup>XP</sup> Maxamum<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange, or unflavoured (flavouring: see *Modjul*<sup>®</sup> Flavour System, p. 807), net price 30 × 50-g sachets = £256.80, 500 g = £85.63

Nutritional supplement for the dietary management of phenylketonuria in children over 8 years

**Tyrosinaemia****Methionine-free TYR Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years

**TYR Anamix® Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided). Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years

**TYR Anamix® Junior** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 30 x 29-g sachets = £196.50. Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years

**TYR Anamix® Junior LQ** (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals and trace elements. Orange flavour, net price 36 x 125-mL bottle = £272.79. Nutritional supplement for the dietary management of tyrosinaemia type I (when nitisinone (NTBC) is used, see section 9.8.1), type II, and type III, in children over 1 year

**TYR cooler® 15** (Vitaflo)

**Liquid**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 x 130-mL pouch = £277.20. Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years

**TYR express15®** (Vitaflo)

**Powder**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac*®, p. 807), net price 30 x 25-g sachets = £318.03. Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years

**TYR express20®** (Vitaflo)

**Powder**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac*®, p. 807), net price 30 x 34-g sachets = £410.89. Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years

**TYR Gel®** (Vitaflo)

**Gel**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals and trace elements. Unflavoured (flavouring: see *FlavourPac*®, p. 807), net price 30 x 24-g sachets = £204.75. Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

**TYR Lophlex® LQ 20** (Nutricia Clinical)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29. Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years

**1XPHEN TYR Maxamaid®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul*® Flavour System, p. 807), net price 500 g = £93.59. Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years

**XPHEN TYR Tyrosidon®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul*® Flavour System, p. 807), net price 500 g = £177.29. Nutritional supplement for the management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal

**XPTM Tyrosidon®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul*® Flavour System, p. 807), net price 500 g = £85.82. Nutritional supplement for the dietary management of tyrosinaemia type I in children and adults where plasma-methionine concentrations are above normal

## Conditions for which ACBS products can be prescribed

**Note** This is a list of clinical conditions for which the ACBS has approved toilet preparations. For details of the preparations see Chapter 13.

**Birthmarks**

See Disfiguring skin lesions, below

**Dermatitis**

*Aveeno*® Bath Oil; *Aveeno*® Cream; *Aveeno*® lotion; *E45*® Emollient Bath Oil; *E45*® Emollient Wash Cream; *E45*® Lotion

**Dermatitis herpetiformis**

See also Gluten-sensitive enteropathies, p. 808

1. Maxamaid products are generally intended for use in children 1–8 years

**Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)**

*Covermark*<sup>®</sup> classic foundation and finishing powder;  
*Dermablend*<sup>®</sup> Ultra corrective foundation;  
*Dermacolor*<sup>®</sup> Camouflage cream and fixing powder;  
*Keromask*<sup>®</sup> masking cream and finishing powder;  
*Veil*<sup>®</sup> Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded)

**Disinfectants (antiseptics)**

May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes

**Dry mouth (xerostomia)**

For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

*AS Saliva Orthana*<sup>®</sup>; *Biotène Oralbalance*<sup>®</sup>; *BioXtra*<sup>®</sup>; *Glandosane*<sup>®</sup>; *Saliveze*<sup>®</sup>

For details of preparations see section 12.3.5, p. 554

**Eczema**

See Dermatitis, above

**Photodermatoses (skin protection in)**

*Anthelios*<sup>®</sup> XL SPF 50+ Melt-in cream; *Sunsense*<sup>®</sup> Ultra; *Uvistat*<sup>®</sup> Lipscreen SPF 50, *Uvistat*<sup>®</sup> Suncream SPF 30 and 50

For details of preparations see section 13.8.1, p. 588

**Pruritus**

See Dermatitis, above

# A3 Cautionary and advisory labels for dispensed medicines

Preparations in the *BNF for Children* include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that, when necessary, pharmacists will counsel children or their carers.

Counselling needs to be related to the age, experience, background, and understanding of the child or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discoloration of urine or stools by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

**Original packs** Most preparations are now dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. The advice in patient information leaflets may be less appropriate when the medicine is for a child, particularly for unlicensed medicines or indications. Pharmacists should explain discrepancies to carers, if necessary. The patient information leaflet should only be withheld in exceptional circumstances because it contains other information that should be provided. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

**Scope of labels** In general, no label recommendations are provided for injections on the assumption that they will be administered by a healthcare professional or a well-instructed child or carer. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular child. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish addi-

tional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard . . . days after opening' and 'Do not use after . . .', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the *BNF for Children* these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the *BNF for Children* apply to medicines dispensed against a prescription. Children and carers should be made aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the *BNF for Children* does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The *BNF for Children* will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

## Recommended label wordings

For *BNF for Children* 2011–2012, a revised set of cautionary and advisory labels has been introduced. All of the existing labels have been user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the *BNF for children* and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

- 1 **Warning: This medicine may make you sleepy**  
To be used on *preparations for children* containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.
- 2 **Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol**  
To be used on *preparations for adults that can cause drowsiness*, thereby affecting the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. *It is an offence to drive while under the influence of drink or drugs.*  
Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.  
In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.  
Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient's doctor.  
Side-effects unrelated to drowsiness that may affect a patient's ability to drive or operate machinery safely include *blurred vision, dizziness, or nausea*. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.
- 3 **Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines**  
To be used on *preparations containing monoamine-oxidase inhibitors*, the warning to avoid alcohol and decaffeinated (low alcohol) drink is covered by the patient information leaflet.  
Also to be used as for label 2 but where alcohol is not an issue.
- 4 **Warning: Do not drink alcohol**  
To be used on *preparations where a reaction such as flushing may occur if alcohol is taken* (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.  
Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.
- 5 **Do not take indigestion remedies 2 hours before or after you take this medicine**  
To be used with label 25 on *preparations coated to resist gastric acid* (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.  
Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids.  
Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; where a manufacturer advises a different time period, this can be followed, and should be explained to the patient.
- 6 **Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine**  
To be used on *preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine*. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should

be taken at least 2 hours apart for the majority of medicines; where a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

- 7 **Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine**  
To be used on *preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc*, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; where a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).
- 8 **Warning: Do not stop taking this medicine unless your doctor tells you to stop**  
To be used on *preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit* (e.g. antituberculous drugs).  
Also to be used on *preparations that contain a drug whose withdrawal is likely to be a particular hazard* (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.
- 9 **Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop**  
To be used on *preparations where a course of treatment should be completed* to reduce the incidence of relapse or failure of treatment.  
The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.
- 10 **Warning: Read the additional information given with this medicine**  
To be used particularly on *preparations containing anticoagulants, lithium, and oral corticosteroids*. The appropriate treatment card should be given to the patient and any necessary explanations given.  
This label may also be used on other preparations to remind the patient of the instructions that have been given.
- 11 **Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds**  
To be used on *preparations that may cause phototoxic or photoallergic reactions* if the patient is exposed to ultraviolet radiation. Many drugs other than those listed (e.g. phenothiazines and sulfonamides) may on rare occasions cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.
- 12 **Do not take anything containing aspirin while taking this medicine**  
To be used on *preparations containing probenecid and sulfapyrazone* whose activity is reduced by aspirin.  
Label 12 should not be used for anticoagulants since label 10 is more appropriate.
- 13 **Dissolve or mix with water before taking**  
To be used on *preparations that are intended to be dissolved in water* (e.g. soluble tablets) or *mixed with water* (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.
- 14 **This medicine may colour your urine. This is harmless**  
To be used on *preparations that may cause the patient's urine to turn an unusual colour*. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).
- 15 **Caution: flammable. Keep your body away from fire or flames after you have put on the medicine**  
To be used on *preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame*.

- 16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening**  
To be used on *glyceryl trinitrate tablets* to remind the patient not to transfer the tablets to plastic or less suitable containers.
- 17 Do not take more than . . . in 24 hours**  
To be used on *preparations for the treatment of acute migraine* except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.  
It may also be used on preparations for which no dose has been specified by the prescriber.
- 18 Do not take more than . . . in 24 hours. Also, do not take more than . . . in any one week**  
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.
- 19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol**  
To be used on *preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night*. On the rare occasions (e.g. nitrazepam in epilepsy) when hypnotics are prescribed for daytime administration this label would clearly not be appropriate. Also to be used as an *alternative to the label 2 wording* (the choice being at the discretion of the pharmacist) *for anxiolytics prescribed to be taken at night*.  
It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.
- 21 Take with or just after food, or a meal**  
To be used on *preparations that are liable to cause gastric irritation, or those that are better absorbed with food*.  
Patients should be advised that a *small amount of food is sufficient*.
- 22 Take 30 to 60 minutes before food**  
To be used on some preparations *whose absorption is thereby improved*.  
Most oral antibacterials require label 23 instead (see below).
- 23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food**  
To be used on *oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach*.
- 24 Suck or chew this medicine**  
To be used on *preparations that should be sucked or chewed*.  
The pharmacist should use discretion as to which of these words is appropriate.
- 25 Swallow this medicine whole. Do not chew or crush**  
To be used on *preparations that are enteric-coated or designed for modified-release*.  
Also to be used on *preparations that taste very unpleasant or may damage the mouth* if not swallowed whole.  
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.
- 26 Dissolve this medicine under your tongue**  
To be used on *preparations designed for sublingual use*.  
Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.
- 27 Take with a full glass of water**  
To be used on *preparations that should be well diluted* (e.g. chloral hydrate), *where a high fluid intake is required* (e.g. sulfonamides), or *where water is required to aid the action* (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.
- 28 Spread thinly on the affected skin only**  
To be used on *external preparations* that should be applied sparingly (e.g. corticosteroids, dithranol).
- 29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours**  
To be used on containers of dispensed *solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis*. The dose form should be specified, e.g. tablets or capsules.  
This label has been introduced because of the serious consequences of overdosage with paracetamol.
- 30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well**  
To be used on all containers of dispensed *preparations containing paracetamol*.
- 32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine**  
To be used on containers of dispensed *preparations containing aspirin when the name on the label does not include the word 'aspirin'*.

# A4 Intravenous infusions for neonatal intensive care

**Intravenous policy** A local policy on the dilution of drugs with intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

## Guidelines

1. Drugs should only be diluted with infusion fluid when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be mixed with an infusion fluid in a syringe and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion syringe should be labelled with the neonate's name and hospital number, the name and quantity of drug, the infusion fluid, and the expiry date and time. If a problem occurs during administration, containers should be retained for a period after use in case they are needed for investigation.
6. Administration using a suitable motorised syringe driver is advocated for preparations where strict control over administration is required.
7. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

## Problems

**Microbial contamination** The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

**Incompatibility** Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

**Common incompatibilities** Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and parenteral nutrition). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates.

**Blood** Because of the large number of incompatibilities, drugs should not be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

**Intravenous fat emulsions** These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N*<sup>®</sup> (section 9.3) may be added to appropriate intravenous fat emulsions.

**Other infusions** Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

## Method

Ready-prepared infusions should be used whenever available. When dilution of drugs is required to be made extemporaneously, any product reconstitution

instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, further dilution with the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5).

When drug dilutions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed, a concentrated layer of the drug may form owing to differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions; if such a mixture is administered it may have a serious effect on the heart.

A time limit between dilution and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. sodium nitroprusside.

## Table of drugs given by continuous intravenous infusion to neonates

The table lists key drugs given by continuous intravenous infusion to neonates.

Covers dilution with *Glucose intravenous infusion 5%* and 10% and *Sodium chloride intravenous infusion 0.9%*. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided, therefore care should be taken if water for injections is used.

### Adrenaline/Epinephrine (p. 112)

Dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions.

**Note** Usually made up with adrenaline 1 in 1000 (1 mg/mL) solution; this concentration of adrenaline is not licensed for intravenous administration

### Alprostadil (*Prostin VR*) (p. 130)

Dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. Undiluted solution must not come into contact with the barrel of the plastic syringe; add the required volume of alprostadil to a volume of infusion fluid in the syringe, and then make up to final volume

### Atracurium besilate (p. 648)

Dilute 60 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 120 micrograms/kg/hour; minimum concentration of 500 micrograms/mL, max. concentration of 5 mg/mL

### Dobutamine (as hydrochloride) (p. 109)

Dilute 30 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of 5 micrograms/kg/minute; max. concentration of 5 mg/mL; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions

### Dopamine hydrochloride (p. 110)

Dilute 30 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.3 mL/hour provides a dose of 3 micrograms/kg/minute; max. concentration of 3.2 mg/mL; infuse higher concentration solutions through central venous catheter. Incompatible with bicarbonate and other alkaline solutions

### Epoprostenol (*Folan*) (p. 94)

Reconstitute the 500-microgram vial using the glycine buffer diluent provided to make a 10 micrograms/mL concentrate (pH 10.5); filter the concentrate using the filter provided; the concentrate can be administered via a central venous catheter, or it may be diluted further.

*Neonate body-weight under 2 kg*, using the concentrate, dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute.

*Neonate body-weight over 2 kg*, using the concentrate, dilute 60 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 2 nanograms/kg/minute.

**Note** Diluted solution stable for 12 hours at room temperature, although some units use for 24 hours and allow for loss of potency. Minimum concentration of 1.43 micrograms/mL

Intravenous infusion information for neonatal intensive care *only*; for information in other children, see individual drug monographs.

**Glyceryl trinitrate** (p. 103)

Dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute; max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter).

**Note** Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used

**Heparin (as sodium)** (p. 113)

*Maintenance of umbilical arterial catheter*, dilute 50 units to a final volume of 50 mL with Sodium Chloride 0.45% or use ready-made bag containing 500 units in 500 mL Sodium Chloride 0.9%; infuse at 0.5 mL/hour.

*Treatment of thrombosis*, dilute 1250 units/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 25 units/kg/hour

**Insulin (soluble)** (p. 359)

Dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.

**Note** Insulin may be absorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin

**Midazolam** (p. 238 and p. 643)

Dilute 15 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour

Intravenous infusion information for neonatal intensive care *only*; for information in other children, see individual drug monographs.

**Morphine sulfate** (p. 208)

Dilute 2.5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or 10% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour

**Noradrenaline/Norepinephrine** (p. 111)

Dilute 600 micrograms (base)/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride and Glucose; an intravenous infusion rate of 0.1 mL/hour provides a dose of 20 nanograms (base)/kg/minute; infuse through central venous catheter; max. concentration of noradrenaline (base) 40 micrograms/mL (higher concentrations can be used if fluid restricted). Discard if discoloured.

Incompatible with bicarbonate or alkaline solutions.

**Note** 500 micrograms of noradrenaline base is equivalent to 1 mg of acid tartrate. Dose expressed as the base

**Vecuronium** (p. 650)

Reconstitute each vial with 5 mL Water for Injections to give a 2 mg/mL solution. Dilute 5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of 50 micrograms/kg/hour; minimum concentration of 40 micrograms/mL

# Dental Practitioners' Formulary

## List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed **sugar-free** versions, where available, are preferred.

Licensed **alcohol-free** mouthwashes, where available, are preferred.

Aciclovir Cream, BP  
Aciclovir Oral Suspension, BP, 200 mg/5 mL  
Aciclovir Tablets, BP, 200 mg  
Aciclovir Tablets, BP, 800 mg  
Amoxicillin Capsules, BP  
Amoxicillin Oral Powder, DPF  
Amoxicillin Oral Suspension, BP  
Artificial Saliva Gel, DPF  
Artificial Saliva Oral Spray, DPF  
Artificial Saliva Pastilles, DPF  
Artificial Saliva Protective Spray, DPF

<sup>1</sup>Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS):

*AS Saliva Orthana*<sup>®</sup>  
*Glandosane*<sup>®</sup>  
*BioXtra*<sup>®</sup> Gel Mouthspray  
*BioXtra*<sup>®</sup> Moisturising Gel  
*Saliveze*<sup>®</sup>

<sup>2</sup>Aspirin Tablets, Dispersible, BP  
Azithromycin Capsules, 250 mg, DPF  
Azithromycin Oral Suspension, 200 mg/5 mL, DPF  
Azithromycin Tablets, 250 mg, DPF  
Azithromycin Tablets, 500 mg, DPF  
Beclomethasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:

*Clenil Module*<sup>®</sup>

Benzylamine Mouthwash, BP 0.15%  
Benzylamine Oromucosal Spray, BP 0.15%  
Betamethasone Soluble Tablets, 500 micrograms, DPF  
Carbamazepine Tablets, BP  
Cefalexin Capsules, BP  
Cefalexin Oral Suspension, BP  
Cefalexin Tablets, BP  
Cefradine Capsules, BP  
Cetirizine Oral Solution, BP, 5 mg/5 mL  
Cetirizine Tablets, BP, 10 mg  
Chlorhexidine Gluconate Gel, BP  
Chlorhexidine Mouthwash, BP  
Chlorhexidine Oral Spray, DPF  
Chlorphenamine Oral Solution, BP  
Chlorphenamine Tablets, BP  
Choline Salicylate Dental Gel, BP  
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF  
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF  
Clarithromycin Tablets, BP  
Clindamycin Capsules, BP

Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)  
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL  
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL  
Diazepam Oral Solution, BP, 2 mg/5 mL  
Diazepam Tablets, BP  
Diclofenac Sodium Tablets, Gastro-resistant, BP  
Dihydrocodeine Tablets, BP, 30 mg  
Doxycycline Tablets, Dispersible, BP  
Doxycycline Capsules, BP, 100 mg  
<sup>3</sup>Doxycycline Tablets, 20 mg, DPF  
Ephedrine Nasal Drops, BP  
Erythromycin Ethyl Succinate Oral Suspension, BP  
Erythromycin Ethyl Succinate Tablets, BP  
Erythromycin Stearate Tablets, BP  
Erythromycin Tablets, Gastro-resistant, BP  
Fluconazole Capsules, 50 mg, DPF  
Fluconazole Oral Suspension, 50 mg/5 mL, DPF  
Hydrocortisone Cream, BP, 1%  
Hydrocortisone Oromucosal Tablets, BP  
Hydrogen Peroxide Mouthwash, BP, 6%  
Ibuprofen Oral Suspension, BP, sugar-free  
Ibuprofen Tablets, BP  
Lansoprazole Capsules, Gastro-resistant, BP  
Lidocaine Ointment, BP, 5%  
Lidocaine Spray 10%, DPF  
Loratadine Syrup, 5 mg/5 mL, DPF  
Loratadine Tablets, BP, 10 mg

Metronidazole Oral Suspension, BP  
Metronidazole Tablets, BP  
Miconazole Cream, BP  
Miconazole Oromucosal Gel, BP  
Miconazole and Hydrocortisone Cream, BP  
Miconazole and Hydrocortisone Ointment, BP  
Nystatin Oral Suspension, BP  
Omeprazole Capsules, Gastro-resistant, BP  
Oxytetracycline Tablets, BP  
<sup>5</sup>Paracetamol Oral Suspension, BP  
Paracetamol Tablets, BP  
Paracetamol Tablets, Soluble, BP  
Penciclovir Cream, DPF  
Phenoxyethylpenicillin Oral Solution, BP  
Phenoxyethylpenicillin Tablets, BP  
Promethazine Hydrochloride Tablets, BP  
Promethazine Oral Solution, BP  
Saliva Stimulating Tablets, DPF  
Sodium Chloride Mouthwash, Compound, BP  
Sodium Fluoride Mouthwash, BP  
Sodium Fluoride Oral Drops, BP

3. May be difficult to obtain

4. This preparation does not appear in subsequent editions of the BP

5. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed

1. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome

2. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed

Sodium Fluoride Tablets, BP  
Sodium Fluoride Toothpaste 0.619%, DPF  
Sodium Fluoride Toothpaste 1.1%, DPF  
Sodium Fusidate Ointment, BP  
Temazepam Oral Solution, BP  
Temazepam Tablets, BP  
Tetracycline Tablets, BP

# Nurse Prescribers' Formulary

## Nurse Prescribers' Formulary for Community Practitioners

**Nurse Prescribers' Formulary Appendix** (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms FP10(CN) and FP10(PN) in Wales or, when available, WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers' list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

### Medicinal Preparations

Almond Oil Ear Drops, BP  
 Arachis Oil Enema, NPF  
<sup>1</sup>Aspirin Tablets, Dispersible, 300 mg, BP  
 Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)  
 Bisacodyl Tablets, BP  
 Catheter Maintenance Solution, Sodium Chloride, NPF  
 Catheter Maintenance Solution, 'Solution G', NPF  
 Catheter Maintenance Solution, 'Solution R', NPF  
 Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%  
 Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%  
 Choline Salicylate Dental Gel, BP  
 Clotrimazole Cream 1%, BP  
 Co-danthramer Capsules, NPF  
 Co-danthramer Capsules, Strong, NPF  
 Co-danthramer Oral Suspension, NPF  
 Co-danthramer Oral Suspension, Strong, NPF  
 Co-danthrusate Capsules, BP  
 Co-danthrusate Oral Suspension, NPF  
 Crotafaminon Cream, BP  
 Crotafaminon Lotion, BP  
 Dimeticone barrier creams containing at least 10%  
 Dimeticone Lotion, NPF  
 Docusate Capsules, BP  
 Docusate Enema, NPF  
 Docusate Oral Solution, BP  
 Docusate Oral Solution, Paediatric, BP  
 Econazole Cream 1%, BP  
 Emollients as listed below:  
 Aquadrate<sup>®</sup> 10% w/w Cream  
 Arachis Oil, BP  
 Balneum<sup>®</sup> Plus Cream  
 Cetaben<sup>®</sup> Emollient Cream  
 Dermamist<sup>®</sup>  
 Diprobace<sup>®</sup> Cream  
 Diprobace<sup>®</sup> Ointment  
 Doublebase<sup>®</sup>  
 Doublebase<sup>®</sup> Dayleve Gel

1. Max. 96 tablets; max. pack size 32 tablets

E45<sup>®</sup> Cream  
 E45<sup>®</sup> Itch Relief Cream  
 Emulsifying Ointment, BP  
 Eucerin<sup>®</sup> Intensive 10% w/w Urea Treatment Cream  
 Eucerin<sup>®</sup> Intensive 10% w/w Urea Treatment Lotion  
 Hydromol<sup>®</sup> Cream  
 Hydromol<sup>®</sup> Intensive  
 Hydrous Ointment, BP  
 Lipobase<sup>®</sup>  
 Liquid and White Soft Paraffin Ointment, NPF  
 Neutrogena<sup>®</sup> Norwegian Formula Dermatological Cream  
 Nutraplus<sup>®</sup> Cream  
 Oilatum<sup>®</sup> Cream  
 Oilatum<sup>®</sup> Junior Cream  
 Paraffin, White Soft, BP  
 Paraffin, Yellow Soft, BP  
 Ultrabase<sup>®</sup>  
 Unguentum M<sup>®</sup>

Emollient Bath and Shower Preparations as listed below:

Aqueous Cream, BP  
<sup>2</sup>Balneum<sup>®</sup>  
<sup>2</sup>Balneum Plus<sup>®</sup> Bath Oil  
 Cetaben<sup>®</sup> Emollient Bath Additive  
 Dermalol<sup>®</sup> Bath Emollient  
 Doublebase<sup>®</sup> Emollient Bath Additive  
 Doublebase<sup>®</sup> Emollient Shower Gel  
 Doublebase<sup>®</sup> Emollient Wash Gel  
 Hydromol<sup>®</sup> Bath and Shower Emollient  
 Oilatum<sup>®</sup> Emollient  
 Oilatum<sup>®</sup> Gel  
 Oilatum<sup>®</sup> Junior Bath Additive  
 Zerolatum<sup>®</sup> Emollient Medicinal Bath Oil  
 Folic Acid Tablets 400 micrograms, BP  
 Glycerol Suppositories, BP  
<sup>3</sup>Ibuprofen Oral Suspension, BP  
<sup>3</sup>Ibuprofen Tablets, BP  
 Ispaghula Husk Granules, BP  
 Ispaghula Husk Granules, Effervescent, BP  
 Ispaghula Husk Oral Powder, BP  
 Lactulose Solution, BP  
 Lidocaine Ointment, BP  
 Lidocaine and Chlorhexidine Gel, BP  
 Macrogol Oral Liquid, Compound, NPF  
 Macrogol Oral Powder, Compound, NPF  
 Macrogol Oral Powder, Compound, Half-strength, NPF  
 Magnesium Hydroxide Mixture, BP  
 Magnesium Sulfate Paste, BP  
 Malathion aqueous lotions containing at least 0.5%  
 Mebendazole Oral Suspension, NPF  
 Mebendazole Tablets, NPF  
 Methylcellulose Tablets, BP  
 Miconazole Cream 2%, BP  
 Miconazole Oromucosal Gel, BP  
 Mouthwash Solution-tablets, NPF

2. Except pack sizes that are not to be prescribed under the NHS (see Part XVIII of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)

3. Except for indications and doses that are (POM)

Nicotine Inhalation Cartridge for Oromucosal Use, NPF  
 Nicotine Lozenge, NPF  
 Nicotine Medicated Chewing Gum, NPF  
 Nicotine Nasal Spray, NPF  
 Nicotine Oral Spray, NPF  
 Nicotine Sublingual Tablets, NPF  
 Nicotine Transdermal Patches, NPF  
 Nystatin Oral Suspension, BP  
 Olive Oil Ear Drops, BP  
 Paracetamol Oral Suspension, BP (includes 120 mg/  
 5 mL and 250 mg/5 mL strengths—both of which are  
 available as sugar-free formulations)  
<sup>1</sup>Paracetamol Tablets, BP  
<sup>1</sup>Paracetamol Tablets, Soluble, BP (includes 120-mg  
 and 500-mg tablets)  
 Permethrin Cream, NPF  
 Phosphates Enema, BP  
 Povidone–Iodine Solution, BP  
 Senna Oral Solution, NPF  
 Senna Tablets, BP  
 Senna and Ispaghula Granules, NPF  
 Sodium Chloride Solution, Sterile, BP  
 Sodium Citrate Compound Enema, NPF  
 Sodium Picosulfate Capsules, NPF  
 Sodium Picosulfate Elixir, NPF  
 Spermicidal contraceptives as listed below:  
 Gygel<sup>®</sup> Contraceptive Jelly  
 Sterculia Granules, NPF  
 Sterculia and Frangula Granules, NPF  
 Titanium Ointment, BP  
 Water for Injections, BP  
 Zinc and Castor Oil Ointment, BP  
 Zinc Oxide and Dimeticone Spray, NPF  
 Zinc Oxide Impregnated Medicated Bandage, NPF  
 Zinc Oxide Impregnated Medicated Stocking, NPF  
 Zinc Paste Bandage, BP 1993  
 Zinc Paste and Ichthammol Bandage, BP 1993

### Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may **not** be prescribed by Nurses are annotated **Nx**.

**Appliances** (including Contraceptive Devices<sup>2</sup>) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)

**Incontinence Appliances** as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)

**Stoma Appliances and Associated Products** as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)

**Chemical Reagents** as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff)

The Drug Tariffs can be accessed online at:  
 National Health Service Drug Tariff for England and Wales:  
[www.ppa.org.uk/ppa/edt\\_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)  
 Health and Personal Social Services for Northern Ireland Drug Tariff:  
[www.dhsspsni.gov.uk/pas-tariff](http://www.dhsspsni.gov.uk/pas-tariff)  
 Scottish Drug Tariff: [www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/)

1. Max. 96 tablets; max. pack size 32 tablets

2. Nurse Prescribers in Family Planning Clinics—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms FP10(CN) and FP10(PN), or when available WP10CN and WP10PN, in Wales), they may prescribe using the same system as doctors in the clinic

# Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient's agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at [www.gov.uk/government/news/nurse-and-pharmacist-independent-prescribing-changes-announced](http://www.gov.uk/government/news/nurse-and-pharmacist-independent-prescribing-changes-announced).

For information on the mixing of medicines by Independent and Supplementary Prescribers, see *Mixing of medicines prior to administration in clinical practice—responding to legislative changes*, National Prescribing Centre, May 2010 (available at [www.npc.nhs.uk/improving\\_safety/mixing\\_meds/resources/mixing\\_of\\_medicines.pdf](http://www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing_of_medicines.pdf)).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 3.

---

## Nurses

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

For information on prescribing from the Nurse Prescribers' Formulary for Community Practitioners, see Nurse Prescribers' Formulary for Community Practitioners p. 828.

---

## Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

---

## Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

# Index of manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'special-order' manufacturers and specialist importing companies see p. 840.

# Special-order Manufacturers

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at <http://tinyurl.com/cdskle>

Licensed **hospital manufacturing units** also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (*Pro-File*; [www.pro-file.nhs.uk](http://www.pro-file.nhs.uk)) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies ([www.apsm-uk.com](http://www.apsm-uk.com)).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

## England

### London

#### **Barts and the London NHS Trust**

Mr J. Singh

COMMISSION ON HUMAN MEDICINES (CHM)

It's easy to report online at:  
[www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard)**REPORT OF SUSPECTED ADVERSE DRUG REACTIONS**

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNFC or [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard) for guidance. Do not be put off reporting because some details are not known.

**PATIENT DETAILS** Patient Initials: \_\_\_\_\_ Sex: M / F Is the patient pregnant? Y / N Ethnicity: \_\_\_\_\_  
Age (at time of reaction): \_\_\_\_\_ Weight (kg): \_\_\_\_\_ Identification number (e.g. Practice or Hospital Ref): \_\_\_\_\_

**SUSPECTED DRUG(S)/VACCINE(S)**

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

**SUSPECTED REACTION(S)** Please describe the reaction(s) and any treatment given. (Please attach additional pages if necessary):

**Outcome**

Recovered   
Recovering   
Continuing   
Other

Date reaction(s) started: \_\_\_\_\_ Date reaction(s) stopped: \_\_\_\_\_

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

Patient died due to reaction  Involved or prolonged inpatient hospitalisation  
 Life threatening  Involved persistent or significant disability or incapacity  
 Congenital abnormality Medically significant; please give details: \_\_\_\_\_

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

Mild  Unpleasant, but did not affect everyday activities  Bad enough to affect everyday activities

It's easy to report online: [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard)

**OTHER DRUG(S) (including self-medication and complementary remedies)**

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No

If yes, please give the following information if known:

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

**Additional relevant information** e.g. medical history, test results, known allergies, rechallenge (if performed). For reactions relating to use of a medicine during pregnancy please state all other drugs taken during pregnancy, the last menstrual period, information on previous pregnancies, ultrasound scans, any delivery complications, birth defects or developmental concerns.

Please list any medicines obtained from the internet:

# NEWBORN LIFE SUPPORT

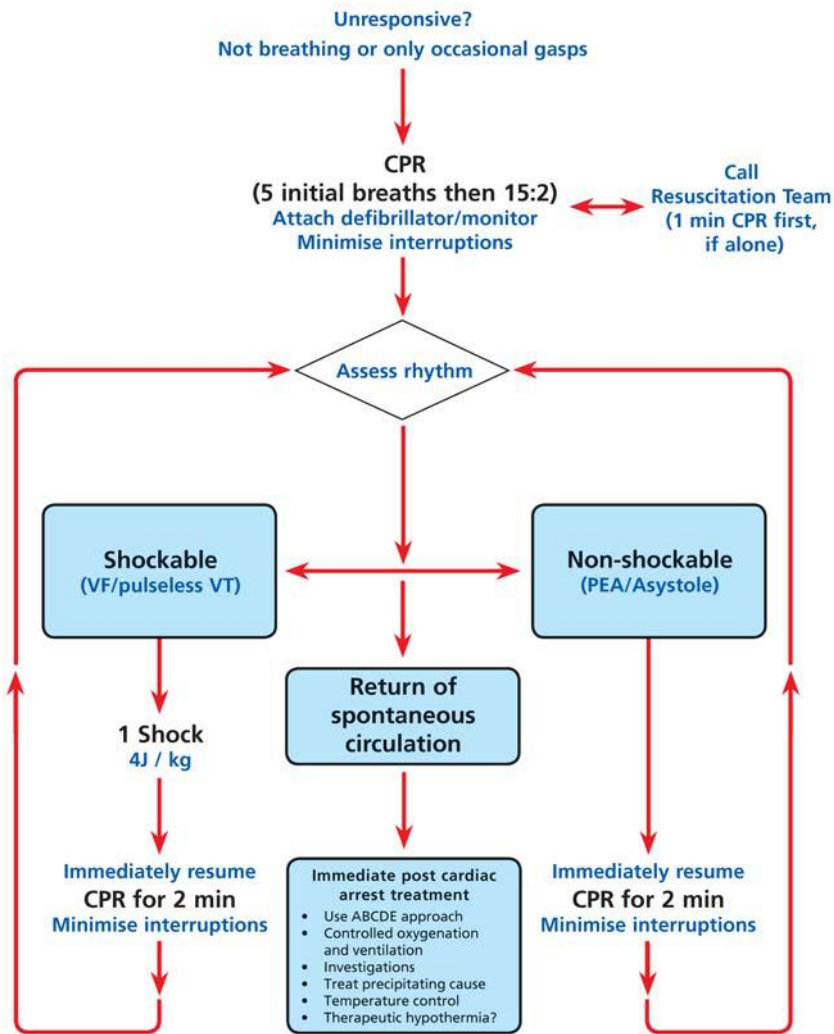

# PAEDIATRIC BASIC LIFE SUPPORT

(Healthcare professionals with a duty to respond)

# PAEDIATRIC ADVANCED LIFE SUPPORT

## During CPR

- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Correct reversible causes

## Reversible causes

- Hypoxia
- Hypovolaemia
- Hypo- / hyperkalaemia / metabolic
- Hypothermia
- Tension pneumothorax
- Toxins
- Tamponade - cardiac
- Thromboembolism

# BODY SURFACE AREA IN CHILDREN

## Body-weight under 40kg

## Medical emergencies in the community

Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the child's condition requires investigation and further treatment, the child should be transferred to hospital promptly.

### Anaphylaxis

(section 3.4.3)

**Adrenaline injection** (1 mg/mL (1 in 1000))

- By intramuscular injection
  - Child under 6 years 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  - Child 6–12 years 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  - Child 12–18 years 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal

High-flow oxygen (section 3.6) and intravenous fluids should be given as soon as available.

**Chlorphenamine injection** by intramuscular or intravenous injection (section 3.4.1) may help counter histamine-mediated vasodilation and bronchoconstriction.

**Hydrocortisone** (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but it should be given to severely affected children to prevent further deterioration.

### Asthma: acute

(section 3.1)

Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital

**Either salbutamol aerosol inhaler** (100 micrograms/metered inhalation)

- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
  - Child under 18 years 2–10 puffs each inhaled separately, repeated at 10–20 minute intervals or as necessary

or **salbutamol nebuliser solution** (1 mg/mL, 2 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  - Child under 5 years 2.5 mg every 20–30 minutes or as necessary
  - Child 5–12 years 2.5–5 mg every 20–30 minutes or as necessary
  - Child 12–18 years 5 mg every 20–30 minutes or as necessary

or **terbutaline nebulised solution** (2.5 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  - Child under 5 years 5 mg every 20–30 minutes or as necessary

Child 5–12 years 5–10 mg every 20–30 minutes or as necessary

Child 12–18 years 10 mg every 20–30 minutes or as necessary

**Plus** (in all cases)

**Either prednisolone tablets (or prednisolone soluble tablets)** (5 mg)

- By mouth
  - Child under 12 years 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if the child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
  - Child 12–18 years 40–50 mg once daily for at least 5 days

or **hydrocortisone (preferably as sodium succinate)**

- By intravenous injection
  - Child up to 18 years 4 mg/kg (max. 100 mg) every 6 hours, until conversion to oral prednisolone is possible; alternative dose if weight unavailable, Child under 2 years 25 mg, 2–5 years 50 mg, 5–18 years 100 mg

High-flow oxygen (section 3.6) should be given if available (via face mask)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta<sub>2</sub> agonist** (as above) and give with

**ipratropium nebuliser solution** (250 micrograms/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  - Child under 12 years 250 micrograms repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
  - Child 12–18 years 500 micrograms every 4–6 hours as necessary

### Convulsive (including febrile) seizures lasting longer than 5 minutes

(section 4.8.2 and section 4.8.3)

**Midazolam buccal solution**

- By buccal administration, repeated once after 10 minutes if necessary
  - Neonate 300 micrograms/kg
  - Child 1–3 months 300 micrograms/kg (max. 2.5 mg)
  - Child 3 months–1 year 2.5 mg
  - Child 1–5 years 5 mg
  - Child 5–10 years 7.5 mg
  - Child 10–18 years 10 mg

or **diazepam rectal solution** (2 mg/mL, 4 mg/mL)

- By rectum, repeated once after 10 minutes if necessary
  - Neonate 1.25–2.5 mg
  - Child 1 month–2 years 5 mg
  - Child 2–12 years 5–10 mg
  - Child 12–18 years 10–20 mg

---

## Croup

(section 3.1)

**Dexamethasone oral solution** (2 mg/5 mL)

- By mouth  
**Child 1 month–2 years** 150 micrograms/kg as a single dose

---

## Diabetic hypoglycaemia

(section 6.1.4)

**Glucose or sucrose**

- By mouth  
**Child 2–18 years** approx. 10–20 g (55–110 mL *Lucozade® Energy Original* or 100–200 mL *Coca-Cola®*—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps), repeated after 10–15 minutes if necessary

or if hypoglycaemia unresponsive or if oral route cannot be used

**Glucagon injection** (1 mg/mL)

- By subcutaneous, intramuscular or intravenous injection  
**Child body-weight under 25 kg** 500 micrograms (0.5 mL)  
**Child body-weight over 25 kg** 1 mg (1 mL)

or if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

**Glucose intravenous infusion** (10%)

- By intravenous injection into large vein  
**Child 1 month–18 years** 5 mL/kg (glucose 500 mg/kg)

---

## Meningococcal disease

(Table 1, section 5.1)

**Benzylpenicillin sodium injection** (600 mg, 1.2 g)

- By intravenous injection (or by intramuscular injection if venous access not available)  
**Neonate** 300 mg  
**Child 1 month–1 year** 300 mg  
**Child 1–10 years** 600 mg  
**Child 10–18 years** 1.2 g

**Note** A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of allergy to penicillin

**Cefotaxime injection** (1 g)

- By intravenous injection (or by intramuscular injection if venous access not available)  
**Neonate** 50 mg/kg  
**Child 1 month–12 years** 50 mg/kg (max. 1 g)  
**Child 12–18 years** 1 g

**Note** A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

**Chloramphenicol injection** (1 g)

- By intravenous injection  
**Child 1 month–18 years** 12.5–25 mg/kg  
**Note** A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

## Approximate conversions and units

lb	kg	stones	kg	mL	fl oz
1	0.45	1	6.35	50	1.8
2	0.91	2	12.70	100	3.5
3	1.36	3	19.05	150	5.3
4	1.81	4	25.40	200	7.0
5	2.27	5	31.75	500	17.6
6	2.72	6	38.10	1000	35.2
7	3.18	7	44.45		
8	3.63	8	50.80		
9	4.08	9	57.15		
10	4.54	10	63.50		
11	4.99	11	69.85		
12	5.44	12	76.20		
13	5.90	13	82.55		
14	6.35	14	88.90		
		15	95.25		

## Length

1 metre (m)	= 1000 millimetres (mm)
1 centimetre (cm)	= 10 mm
1 inch (in)	= 25.4 mm
1 foot (ft)	= 12 inches
12 inches	= 304.8 mm

## Mass

1 kilogram (kg)	= 1000 grams (g)
1 gram (g)	= 1000 milligrams (mg)
1 milligram (mg)	= 1000 micrograms
1 microgram	= 1000 nanograms
1 nanogram	= 1000 picograms

## Volume

1 litre	= 1000 millilitres (mL)
1 millilitre (1 mL)	= 1000 microlitres
1 pint	≈ 568 mL

## Other units

1 kilocalorie (kcal)	= 4186.8 joules (J)
1000 kilocalories (kcal)	= 4.1868 megajoules (MJ)
1 megajoule (MJ)	= 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg)	= 133.3 pascals (Pa)
1 kilopascal (kPa)	= 7.5 mmHg (pressure)

**Plasma-drug concentrations** in *BNF for Children* are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

## Prescribing for children

### Weight, height, and gender

The table below shows the **mean values** for weight, height and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of actual measurements. However, the child's actual weight and height might vary considerably from the values in the table and it is important to see the child to ensure that the value chosen is appropriate. In most cases the child's actual measurement should be obtained as soon as possible and the dose re-calculated.

Age	Weight kg	Height cm
Full term neonate	3.5	51
1 month	4.3	55
2 months	5.4	58
3 months	6.1	61
4 months	6.7	63
6 months	7.6	67
1 year	9	75
3 years	14	96
5 years	18	109
7 years	23	122
10 years	32	138
12 years	39	149
14 year-old boy	49	163
14 year-old girl	50	159
Adult male	68	176
Adult female	58	164

---

## Recommended wording of cautionary and advisory labels

For details see Appendix 3

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
21. Take with or just after food, or a meal
22. Take 30 to 60 minutes before food
23. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
24. Suck or chew this medicine
25. Swallow this medicine whole. Do not chew or crush
26. Dissolve this medicine under your tongue
27. Take with a full glass of water
28. Spread thinly on the affected skin only
29. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
30. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
32. Contains aspirin. Do not take anything else containing aspirin while taking this medicine

## Abbreviations and symbols

Internationally recognised units and symbols are used in the *BNF for Children* where possible.

ACBS	Advisory Committee on Borderline Substances, see Appendix 2
ACE	Angiotensin-converting enzyme
ADHD	attention deficit hyperactivity disorder
AIDS	Acquired immunodeficiency syndrome
approx.	approximately
AV	atrioventricular
BAN	British Approved Name
BMI	body mass index
BP	British Pharmacopoeia 2013, unless otherwise stated
BPC	British Pharmaceutical Codex 1973 and Supplement 1976, unless otherwise stated
CAPD	Continuous ambulatory peritoneal dialysis
 C02	preparation in Schedule 2 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
 C03	preparation in Schedule 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
 C04-1	preparation in Schedule 4 (Part I) of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
 C04-2	preparation in Schedule 4 (Part II) of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Prescribing Controlled Drugs
CHM	Commission on Human Medicines
CHMP	Committee for Medicinal Products for Human Use
CNS	central nervous system
CSM	Committee on Safety of Medicines (now subsumed under Commission on Human Medicines)
d. c.	direct current
DMARD	Disease-modifying antirheumatic drug
DPF	Dental Practitioners' Formulary
e/c	enteric-coated (termed gastro-resistant in BP)
ECG	electrocardiogram
EEG	electro-encephalogram
f/c	film-coated
G6PD	glucose 6-phosphate dehydrogenase
HIV	Human immunodeficiency virus
HRT	Hormone replacement therapy
i/m	intramuscular
i/v	intravenous
INR	international normalised ratio
MAOI	Monoamine-oxidase inhibitors
max.	maximum
MHRA	Medicines and Healthcare products Regulatory Agency
m/r	modified-release
NCL	no cautionary labels, see Appendix 3
NHS	National Health Service
 NHS	not prescribable under National Health Service (NHS)
NICE	National Institute for Health and Care Excellence
NPF	Nurse Prescribers' Formulary
NSAID	non-steroidal anti-inflammatory drug
PGD	patient group direction
PHE	Public Health England (formerly Health Protection Agency (HPA))
 PoM	prescription-only medicine, see Fig. 1, How to use <i>BNF for Children</i>
®	trade mark
rINN	Recommended International Non-proprietary Name
RSV	respiratory syncytial virus
s/c	sugar-coated

SLS	Selected List Scheme
SMC	Scottish Medicines Consortium
SPC	Summary of Product Characteristics
sp.	species
SSRI	Selective serotonin reuptake inhibitors
UK	United Kingdom
Units	for SI units see Prescription Writing
WHO	World Health Organization
▼	limited experience of the use of this product and the MHRA requests that all suspected adverse reactions should be reported, see Adverse Reactions to Drugs
◀	considered by the Paediatric Formulary Committee to be less suitable for prescribing, see Fig. 1, How to use <i>BNF for Children</i>

## Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing. The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c.	= ante cibum (before food)
b. d.	= bis die (twice daily)
o. d.	= omni die (every day)
o. m.	= omni mane (every morning)
o. n.	= omni nocte (every night)
p. c.	= post cibum (after food)
p. r. n.	= pro re nata (when required)
q. d. s.	= quater die sumendum (to be taken four times daily)
q. q. h.	= quarta quaque hora (every four hours)
stat	= immediately
t. d. s.	= ter die sumendum (to be taken three times daily)
t.i.d.	= ter in die (three times daily)

## E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102 Tartrazine	E211 Sodium Benzoate
E104 Quinoline Yellow	E223 Sodium Metabisulphite
E110 Sunset Yellow	E320 Butylated Hydroxyani- sole
E123 Amaranth	E321 Butylated Hydroxyto- luene
E124 Ponceau 4R	E322 Lecithins
E127 Erythrosine BS	E420 Sorbitol
E132 Indigo Carmine	E421 Mannitol
E142 Green S	E422 Glycerol
E171 Titanium Dioxide	E901 Beeswax (white and yellow)
E172 Iron oxides, Iron hydroxides	E1520 Propylene Glycol
E200 Sorbic Acid
