## Table of contents

Preface	xxi
Committees	xxiii
VOLUME 1	
<i>Section 1: Computer science and information engineering</i>	
A project-based approach for teaching C++ object-oriented programming language <i>C. He</i>	3
Research and design of NVT plug-in module-based network security detection system <i>H.L. Cai, L.Y.Q. Deng, T.M. Xue &amp; X. Yu</i>	7
Examining users' intention to continue using SNS based on an extended expectation-confirmation model <i>B. Dai &amp; Y.Z. Liu</i>	13
Axiomatization of Owen value for games with coalition structures under precedence constraints <i>H.X. Sun &amp; C.P. Nie</i>	19
A remote control system based on S3C2440 <i>Q. Li, K.J. Ren, Y.L. Wu &amp; R.M. Liu</i>	25
Design of access control system based on SEP4020 <i>K.J. Ren, Q. Li, Y.L. Wu &amp; R.M. Liu</i>	31
Study and practice on teaching mode in electric automation technology specialty of higher vocational colleges based on CDIO <i>L.Y. Fang, F.G. Wu, X. Zhang, X.Y. Zhou &amp; S.W. Fu</i>	37
The application of task-based approach in the teaching of broadcast media—the case of Video Creation course <i>H. Liu &amp; Y.J. Guan</i>	43
Research on “4 in 1” and “4D linkage” university—enterprise cooperation training base—taking the major of software technology in high vocational education as an example <i>Y.F. Liu &amp; C. He</i>	47
Based on coal mine internet of integration of the cloud computing platform architecture <i>H.W. Ding &amp; Y.B. Zhao</i>	51
Optimization of the internal accounting control based on the Internet of Things <i>Y.H. Dai &amp; X.Y. Ge</i>	55
Exploration on personalized information service mode of university digital library based on the network environment <i>L.H. Ma, N.N. Sun &amp; G.S. Zhang</i>	61

Computer network reliability analyses and optimization methods <i>Z. Wang</i>	65
Research on legal protection to the right to privacy based on network <i>L.P. Wang</i>	69
Using open source software and mobile devices for collecting research data in terrain <i>K. Myška, B. Celá &amp; K. Rybenská</i>	75
Study on the choice of the third-party logistics service provider based on fresh vegetables <i>J.H. Li</i>	79
Forecasting ability of alternative distance-to-default based on the Merton model <i>Y.L. Cai, CH.W. Chen &amp; X.J. Dong</i>	85
Research on warranty policies for the new-tech equipment <i>H.M. Wang &amp; Y.X. Jia</i>	93
Implementation of the demonstration center network ACL technology <i>F.H. Li &amp; X. Cao</i>	97
Study on human capital of farmers in poor areas in northwest China—from sustainable livelihoods angle <i>C.Y. Li, Q.F. Hou &amp; J.M. Han</i>	101
Analysis of sentiment transition of retweeting messages on Sina weibo <i>Y. Kang, C. Zhang &amp; X.T. Wang</i>	105
Construction of intramural practical training base based on Siemens PLC and configuration software <i>G. Li, W.T. Jin, J.Y. Gan, W.Q. You, H.W. Guo &amp; H.L. Xing</i>	111
Design of virtual platform in experiment course reform of principles and interface technique of microcomputer <i>Z. Zhang &amp; Z.Y. Liu</i>	115
Translation teaching of college English in China based on ESP teaching <i>S. Liu &amp; J.S. Ren</i>	119
Analysis and design of integrated task console software system of shipborne UAVs <i>P.F. Peng, L. Gong &amp; Q. Yu</i>	123
Skewed data learning algorithm based on multi-granularity <i>H.B. Fang</i>	127
Empirical research on relationship between ownership structure and cash dividend policy of Chinese listed companies—based on panel data <i>H. Liu &amp; J.M. Ye</i>	131
Performance evaluation of logistics enterprise based on DEA model <i>Y.Y. Ye</i>	137
Construction and exploration of the art design teaching platform based on scientific and technological information <i>Y. Liu, W. Tan &amp; H. Tan</i>	143
An exploration of open machinery training system <i>H. Tan</i>	147
Definition of the concept of Roliball and rheological study history <i>Y.T. Yang, Y.S. Liu &amp; Z.F. Chen</i>	151

LEEP combined with Matrine gel and ciprofloxacin hydrochloride suppository in the treatment of severe cervical erosion <i>L. Xu &amp; P. Xu</i>	155
Design and implementation of seafood cold-chain logistics monitoring system <i>H.R. Liu, M. Wang, Y.X. Liang &amp; Y.J. Yu</i>	159
Effect of family control on company's investment-cash flow sensitivity: Evidence from China's listed companies <i>Z.J. Zeng &amp; J.L. Li</i>	163
Discussion on optimization in information and computing science curricular of local universities against the background of universities and colleges' transformation <i>Z.Y. Hou</i>	167
Cloud ontology semantically improves cloud computing services <i>L.G. Deng &amp; X.Y. Liu</i>	171
Design and simulation of electric vehicle cruise control system based on MATLAB <i>W.J. Zhang, W.L. Niu, X. Wang &amp; T. Jin</i>	177
Development of intelligent vehicle test system based on mobile terminal platform <i>Y.C. Zhang, L.C. Tang, X.C. Huo, X.F. Zhao &amp; Y. Yin</i>	183
Application of Flash animation in power system relay protection teaching <i>J.T. Shi, Y.W. Tian &amp; H.Y. Wu</i>	189
Research on the vocational ability-oriented curriculum integration system of secondary vocational and undergraduate education of automobile service engineering major <i>H.M. Lv &amp; L.Y. Zhu</i>	193
Three-dimensional planning study of the urban outdoor advertisement on the basis of WebGis <i>R.H. Xie</i>	197
Enlightenment and teaching reflection of digital media technology to the education of modern graphic design <i>R.H. Xie &amp; M.S. Liu</i>	201
Research on the accounting risk and control strategy in network environment <i>T. Fei</i>	205
E-commerce curriculum development based on CGLC mode <i>G.R. Chen</i>	209
Modeling property price along the metro lines in China <i>Y.G. Xu &amp; G. Cheng</i>	213
A new image denoising method combining the contourlet transform and partial differential equation <i>R. Zhao &amp; T. Wang</i>	217
Optimal dividend and capital injection strategies in the perturbed classical risk model with transaction costs <i>Y.M. Yue</i>	221
Research of Half Fuzzy graph and its application <i>H. Wang &amp; X.F. Yu</i>	225
Comparative study on total flavonoids in different parts of <i>Aleuritopteris argentea</i> <i>X.W. Zhang &amp; B. Gao</i>	231

Steganalysis technology for adaptive embedding of GIF image <i>Y.H. He</i>	235
Tamper detection based on defocused image difference <i>Z.H. Wang</i>	239
Study of tampering detection based on image fusion <i>H.F. Huang</i>	243
Splicing detection based on consistency of color filter array's characteristics <i>Y.H. Chang</i>	247
Online detection and control of pulp concentration <i>B.J. Sun, S.J. Hu &amp; C. Zhang</i>	251
Research on opportunistic networks applied in remote areas <i>D.H. Gong</i>	255
PROFIBUS-DP interface development for intelligent instrument <i>G.X. Miao</i>	261
Research on network word-of-mouth marketing strategy under the environment of social media <i>L.B. Hu, S. Cao, Y. Cao &amp; Y.P. Wang</i>	265
A method of face recognition based on maximum margin criterion and difference vector <i>G. Cheng &amp; Y.Y. Liu</i>	271
Research and application of oil spill tracking buoy based on BeiDou satellite <i>R. Yang, W.W. Zhu &amp; Q. Gu</i>	275
Analysis on the age feature of the development of upper limb strength and lower limb strength in Chinese teenagers <i>Y.J. Lin, W. Chen, L.Q. Qiu, C.X. Cai &amp; J.H. Li</i>	279
Correlation between the standing long jump performance and the skinfold thickness and weight of teenagers <i>W. Chen, L.Q. Qiu Y.J. Lin, C.X. Cai &amp; J.H. Li</i>	283
Multi-attribute group decision-making model with interval-valued fuzzy number for personnel selection based on group's ideal solution <i>Z.S. Liu, J.J. Zhang &amp; H. Xue</i>	287
Research on the construction of electronic information engineering characteristic specialty <i>B. Guo, X.M. Bai &amp; G. Yang</i>	293
Research on measuring the corporate default willingness based on prospect theory <i>X.D. Lin, L. Cheng &amp; D.D. Zeng</i>	297
A novel fruit fly algorithm for solving the parallel test sheet generation problem <i>F.R. Wang, W.H. Wang &amp; J.X. Dong</i>	303
Discussion on promoting the development of multi-interdisciplinary research in the new type of research institutes <i>Y. Zhou, Y. Li, J.F. Chen, Q. Liao &amp; H.X. Song</i>	309
Study on construction and application of web-based course's evaluation index system <i>S.G. Xu &amp; Y. Zhang</i>	313
Appetite regulation network and obesity <i>D. Fu</i>	317

Construction of M-learning resources based on cloud-terminal integration <i>H. Zhao, Y. Shi &amp; X.P. Li</i>	323
Research and realization of pruning-branch to adopt data-stream <i>W. Lv</i>	327
Study on the traditional method for communication between VLANs of IoT based on education simulation technology <i>H.H. Shi, Y.J. Wang &amp; X. Xu</i>	333
Teaching the single arm routing method for communication between VLANs of IoT based on Packet Tracer <i>H.H. Shi, Y.J. Wang &amp; X. Xu</i>	337
Optimization of the plastic injection molding process using Taguchi method, RSM, and GA <i>W.C. Chen, M.H. Nguyen, H.S. Chiou &amp; T.N. Chen</i>	341
Application of modular teaching in computer public courses for art major <i>Y. Zhang &amp; J.M. Shuai</i>	347
Operating performance evaluation of listed companies in China's electric home appliance industry <i>F. Chen &amp; X.Q. Yan</i>	351
Building an "information service supermarket" of the university digital library in the information era <i>L.H. Ma, J. Zhao &amp; Y.L. Zhao</i>	357
Cloud computing-based KMS in comprehensive hospitals <i>Z.H. Luo, L.X. Yun &amp; X. Zhang</i>	361
Analysis on the application of database technology practice in information management <i>Y.X. Lan</i>	365
The application of database technology in urban traffic service information system <i>Z. Zhang &amp; J.L. Ren</i>	369
The application of multimedia technology in martial arts classroom <i>X.F. Zhao</i>	373
Exploration into resources sharing via the internet for sports information <i>X.H. Luo</i>	377
Research and exploration in computer experimental teaching for system capacity training <i>S.S. Li &amp; C.B. Quan</i>	381
A self-adaptive cooperative protocol in VANET <i>J.Q. Li, X.Q. Di, X. Liu, H. Qi, L.G. Cong &amp; H.Y. Yu</i>	387
Research on key technologies of remote network attack and defense teaching experimental platform <i>J.Q. Li, X.Q. Di, M. Wang, J. Qiu &amp; J.P. Zhao</i>	391
The design of a central node of the wireless sensor network used in seismic monitoring <i>Z.T. Li, J.H. Fu, Y.K. Guo &amp; Q. Tan</i>	395
The application of Logic Pro in music writing with multi-part <i>J.M. Zhang</i>	399
A study of use technology acceptance model of web-based digital learning environment for interior decoration labor safety education <i>Y.Y. Tian, H.Y. Chen &amp; Y.W. Wu</i>	403

Application of database technology in information society present situation and existing problems of analysis <i>F. Kong</i>	407
Analysis on characteristics of experimental video art <i>X. Wang</i>	411
Application of TRIZ and inherent safety in the design of a safety device for intravenous infusion tubing <i>Y.C. Lin, H.L. Hsiao, S.C. Yang &amp; K.Y. Li</i>	413
Design and realization of cloud computing network teaching platform <i>L.M. Wang</i>	417
The design and implementation of network courseware of “algorithm design and analysis” <i>C. Feng</i>	421
Psychological warfare’s influence on volleyball athletes’ performance based on multi-layer data analysis and sports media <i>X.H. An</i>	425
The application of computer image processing technology in arts creation <i>C.S. Liu</i>	429
The man-machine engineering design of a multimedia platform <i>C.L. Pan</i>	433
Electroencephalographic coherence for exposure to low-frequency noise <i>C.C. Yang &amp; C.Y. Chou</i>	437
The artistic expression analysis of animation technology based on three dimensions <i>H. Nie</i>	441
The impacts of computer graphics accessibility functions on ceramic paintings <i>Y. Gao</i>	445
Basketball tactics system design based on .NET platform <i>H. Jiang</i>	447
Author index	451
 <b>VOLUME 2</b>	
<i>Section 2: New technologies in education and sports</i>	
Research on the information literacy education of university embedded cognition <i>N.N. Sun &amp; L.H. Ma</i>	457
Problems and countermeasures of the cohesive models between secondary vocational education and undergraduate education system—a case of automotive major <i>P. Tang, R.Y. Zhu, H.M. Lv &amp; J.S. Xia</i>	461
Study on innovation in ideological and political education based on the internet age <i>H.X. Guo</i>	465
Study on solfeggio teaching under MIDI environment <i>Y.A. Wang</i>	469
A study on English language acquisition of bilingual children with different bilingual proficiency <i>F.C. An, Y.S. Wu &amp; Z.A. Zhang</i>	473

Exploitation on school-based traditional ethnic sports course in primary and middle schools of ethnic region in northwest Guangxi <i>L.C. Wei</i>	479
A discourse-based English passive voice teaching <i>X.F. Zhai &amp; G.F. Ding</i>	485
Study on the talent training model of safety engineering specialty based on career orientation <i>X.Y. Liu, G.H. Liu, Y.J. Xiong, H.S. Wang &amp; Z.Q. Xia</i>	489
The compared research of modern sports teaching mode in China and the USA <i>L.J. Wei</i>	495
Network information foraging behavior strategy of virtual scientific research team members <i>Q. Wang &amp; W.Y. Chen</i>	499
Exploration on adaptability education for college students <i>F. G. Meng, K. Wang &amp; M.X. Zhu</i>	503
An empirical analysis of competitiveness of foreign trade in Guizhou province <i>W. Liu &amp; Y. Shang</i>	507
Evaluating the function and effect of an educational game <i>J.J. Tang &amp; W.Q. Qu</i>	511
Research into validity of implementation of humanistic quality-based education in integrated English teaching of English major <i>Z.H. Wang</i>	515
A brief talk about harmonious ideological-education <i>Y.T. Dong</i>	521
Discussion on innovative talent cultivating mode under the ideology of CDIO engineering educational concept <i>Z.R. Bai, X.M. Liu, J.J. Liu &amp; Y. L. Wang</i>	525
The predicaments of specialized English listening and speaking bilingual teaching for international trade majors <i>Y.C. Han</i>	529
Comparative study of open source e-learning systems <i>V. Maněna, M. Maněnová &amp; K. Rybenská</i>	533
Transformation of higher vocational education in the context of economic transition <i>H.Q. Li &amp; P. Li</i>	537
Analysis on the Japanese language teaching reform in the institutions of higher learning <i>F. Wu &amp; Z. Chen</i>	541
Application and research of multimedia teaching technique <i>L. Xia</i>	545
Study on the needs of distance education in the development of the transportation industry <i>P.P. Tang &amp; M.B. Gao</i>	547
Research on the application of task-based language teaching for the English pronunciation course in high schools in China <i>Y.L. Nie</i>	551

Strategies on improving listening ability <i>H.M. Xing, L. Sun &amp; Y. Zeng</i>	555
Study on college students' learning motivation <i>H.M. Xing, L. Sun &amp; Y. Zeng</i>	557
Analysis and solutions to the private college students' mental health education <i>Y. Deng</i>	559
A survey of the reform of college physical education teaching <i>X.M. Zhao &amp; Q. Wei</i>	563
Study on the application of art education based on multimedia teaching <i>B.Q. Pan &amp; M.N. Xiong</i>	567
Research on higher art education based on the aesthetic intuition theory <i>H.J. Ji</i>	571
Application of new multimedia teaching in music education <i>N. Sun</i>	575
Study on ideological and political education under new media technology background <i>X.W. Wang</i>	579
Training model for young teachers based on competency for China's application-oriented universities <i>Y.F. Li, F.C. Liu &amp; Y.Y. Feng</i>	583
The problems and countermeasures of the practical application of case teaching <i>X.L. Gu</i>	589
Three mistakes of the teaching methods and means reform <i>X.L. Gu</i>	593
The utilization of question-guided teaching model in job-oriented education <i>X.L. Gu</i>	597
Listen-to-Write: A computer-assisted approach to improving college English writing in mainland China <i>Q.S. Gu &amp; J.L. Liu</i>	601
Problems existing in entrepreneurship education in colleges and universities under the new situation of employment and discussion on countermeasures <i>X. Yao &amp; L.C. He</i>	605
Study on middle school students' overweight lessons-burden in Gansu province <i>R.F. Zhao &amp; J.M. Han</i>	611
Teaching strategy on English major in China <i>R. Dai</i>	617
Research on innovation of teaching model of office advanced training <i>X. Cao &amp; F.H. Li</i>	621
A study on dimensions of university teachers' research performance <i>F. Ren</i>	625
The impact of network embeddedness to the enterprise's technological innovation performance in the environment uncertainty: Considering the mediation and adjustment <i>J.J. Duan</i>	629

Strategic analysis of the entrance of traditional ethnic sports into classrooms of higher educational institutions—taking Guangxi of China as an example <i>Z.F. Huang &amp; Y.Q. Wei</i>	635
The current situation in curriculum settings of physical education major and its future conceptions in new undergraduate colleges and universities—taking new undergraduate colleges and universities in Guangxi province of China as an example <i>Z.F. Huang &amp; Y.Q. Wei</i>	641
The past meets the future: The inheritance of ethnic opera and reform of opera teaching in local college—taking the “Mulam Opera” in Luocheng autonomous county as an example <i>H.Y. Wei</i>	645
Research on the value of establishing traditional ethnic sports course in colleges and universities of ethnic regions—taking Guangxi as an example <i>Q.S. Zhu</i>	651
An empirical study of the application of functional grammar theories to the teaching of the English passive voice <i>X.F. Zhai &amp; G.F. Ding</i>	655
The effect of teaching methodology on students’ interest in volleyball class <i>H. Wang</i>	659
The study of campus sports culture and its construction in higher education institutions <i>H. Wang</i>	663
Transformation and development strategies for EGP teachers in higher vocational colleges <i>X.M. Ping, S.H. Ma, Z.G. Liu &amp; A.M. Zhang</i>	667
Enlightenment of research themes on the Poyang Lake ecological economic zone on academic tourism research <i>C.P. Jin</i>	671
The integration of learning management system and other related information systems in open learning <i>M.J. Tan, P.J. Shao &amp; Y. Gong</i>	675
Research and practice on teaching and research team construction of a newly-built undergraduate academy <i>W. Wei &amp; J. Dai</i>	681
Study on ideological and political education of college students in the background of new media <i>A.B. Zheng</i>	685
Research on theory and practice of teaching mode and teaching design based on network environment <i>C.H. Liu &amp; H.L. Tang</i>	689
The application of ecological educational ideas to the English teaching activities <i>X. Tian</i>	693
The effect and practice research on the order-oriented personnel training mode <i>J.L. Zhou &amp; L.F. Xie</i>	697
Research of college student employability under the perspective of regional economic differences <i>S.X. Cui, G.H. Li &amp; W.H. Peng</i>	701

The research on the present state of college students' physical constitution and improvement measures <i>Y. Zhou</i>	707
The research of college English learning strategies based on networks <i>S.F. Wen &amp; W.S. Bao</i>	711
Improve the quality of applied talents based on strengthening mathematical culture teaching <i>H.S. Liu &amp; S.F. Yan</i>	715
Spoken English teaching strategies in colleges based on grammatical competence <i>L. Wang</i>	719
A study on function and application of culture context in translation teaching <i>X. Li</i>	723
On the curriculum setting, teaching mode and teacher allocation of ACCA in universities <i>S. Lv, Y. Feng &amp; H. Su</i>	729
Investigation of the present situation of Nanchang middle school football development <i>Q. Xiong, L.H. Chen, F. Chen, Y.H. Wang &amp; J.H. Li</i>	733
Construction of teaching faculty in the stratified teaching <i>H.Y. Huang, A.M. Gong &amp; C.Y. Hu</i>	737
The research of digital language feature extraction and recognition <i>Q.P. Zou</i>	741
The research and practice of project teaching method in the teaching of DSP applied technology <i>G. Yang &amp; B. Guo</i>	745
How corporate growth influences earnings management <i>L. Jiang</i>	749
Application of action-oriented teaching method in courses of art history and theory <i>H.Y. Liu</i>	753
Research on evaluation mechanism of university students' autonomous learning <i>L.Y. Jiang, L.P. Huang, H.J. Liu &amp; S. Ren</i>	757
An evaluation system for autonomous learning in the ubiquitous learning environment <i>H.J. Liu, L.P. Huang &amp; L.Y. Jiang</i>	763
Research on aesthetic teaching modes of basketball under new curriculum standards <i>S.Y. Yang</i>	767
Reform of basic chemistry experiment course for non-chemistry specialties in independent college <i>T. Liu &amp; B.Q. Jiang</i>	771
Cultivation of students' comprehensive quality during teaching of fundamental chemistry experiment course in independent college <i>Z.P. Chen &amp; B.Q. Jiang</i>	775
Exploration of physical education teaching reform from the perspective of multimedia <i>N. Qi &amp; L. Wang</i>	779
Study of the application of network resources in English reading teaching <i>H.Y. Jin</i>	783

The application of multimedia technology in college English teaching <i>N. Yang</i>	787
The timer design basketball competitions <i>J.X. Sun</i>	791
Analysis of the structure of university ideological and political online education platform <i>Y. Zhou</i>	795
Analysis of colleges' sports cultural patterns <i>H.Q. Lu &amp; H.J. Zhang</i>	799
Application of visual simulation technology in business English teaching <i>T. Yu</i>	803
Development and design of art multimedia teaching system platform <i>C. Jiang &amp; Q. Liu</i>	805
How mobile intervention education can revolutionize wellness market and patient self-efficacy <i>D.Y.P. Chao, T.M.Y. Lin &amp; Y.F. Yeh</i>	809
Issues and countermeasures of college English multimedia teaching <i>H.B. Li</i>	817
Multimedia college English listening and speaking class under meta-cognitive strategies theory <i>Y. Li &amp; Y. Song</i>	819
Multimedia network courseware development and application in preschool teacher training <i>Z.J. Lai</i>	823
Analysis on multimedia works and intellectual property protection issues <i>N. He</i>	827
Preliminary application of multimedia technology in teaching football <i>Z.Q. Cai</i>	831
Research of modern teaching long-distance system based on the streaming media technology <i>X.F. Liu</i>	835
Study on communication style and self-identity construction of vocational college students in English communities <i>D. Yan</i>	839
The application of communicative approach in English teaching based on the IELTS speaking test <i>J. Ma, Z.W. Huang &amp; X.Y. He</i>	843
The applied analysis of the multimodal PPT in the college English audiovisual course <i>S.H. Ling</i>	847
The discourse remodeling of ideological and political education in the new media age <i>N. Sha</i>	851
The optimization study of Chinese language teaching based on multimedia technology <i>X.J. Li</i>	853
Value of network language in linguistics perspective <i>L.W. Qu</i>	857

The content construction and use form of resources applicable to the fragmentation of learning <i>Y.F. Li</i>	861
Empirical study of user's behavior based on Folksonomy—taking Douban website as example <i>H.X. Xiong, C.L. Wang &amp; S.Y. Guo</i>	865
Ethical thinking on cognitive enhancement <i>J.F. Hu</i>	875
A study on elevator Braille graduation system of junior high school in Chang-Hua county <i>L. Tseng, C.M. Huang &amp; C.Y. Hsia</i>	879
Hypertext poetry creation under multimedia horizon <i>G.Y. Li</i>	883
Neuroaethetics issues on decision-making in different architecture <i>J.F. Hu</i>	885
Analysis of educational innovation and schools' classroom teaching reform <i>L.M. Zhao, Y. Xu &amp; H. Zhang</i>	889
Research and thinking on applied talent training modes <i>L.M. Zhao, Y. Xu &amp; H. Zhang</i>	893
Analysis on problems in strengthening the class teaching reform <i>L.M. Zhao, Y. Xu &amp; H. Zhang</i>	897
 <i>Section 3: Engineering management, production management, business and economics</i>	
Core technologies identification based on a citation-network model: A case of laser technology system <i>H.L. You, M.J. Li, J. Jiang, J.L. Luo, J.G. Xu &amp; F.Z. Chen</i>	903
Innovation and scientific breakthroughs in artificial intelligence methods <i>X. Zou</i>	909
Study on the application of artificial intelligent technology in intelligent building <i>S.X. Tang</i>	913
On the influence of Chinese paintings on ceramic paintings <i>Y. Gao</i>	917
Did capital control and financial depth affect the demand of foreign reserves? <i>D.L. Lu &amp; Z.X. Liu</i>	919
Study on relationship between debt financing and performance for non-state holding listed companies <i>J.R. Zhang &amp; W. Xu</i>	923
Obstacles in listening comprehension and its corresponding measures <i>H.M. Xing, L. Sun &amp; Y. Zeng</i>	927
Relationship between the ownership concentration and corporate performance of companies listed on gem <i>Z. Hu &amp; J.W. Zhang</i>	931

Problems and corresponding measures of real estate enterprises' capital structure <i>T. Wu</i>	935
Effects of the application of human care theory on the care of cancer patients <i>Y.L. Sun, L. Gao &amp; T.R. Yu</i>	939
A review of research on Huashan Rock Paintings and Huashan tourism <i>X.H. Ma</i>	943
An analysis for the new high-tech photoelectric equipment under the free-replacement & pro-rate warranty strategy <i>X. Zou, Y.X. Jia, X.Y. Li, X. Liu &amp; J. Zhou</i>	949
Effect of <i>Schisandrae chinensis</i> lignin on blood glucose of diabetic rats <i>X.T. Shao, G.Y. Xu, G.X. Yuan, H.Y. Li, P.G. Du, L.P. An, F.X. Ding &amp; M.Z. Fan</i>	953
The application of PCR-DGGE to study on the dominant bacteria of chilled mutton during storage time <i>Y.B. Zhou, W.S. Xu, Q.J. Ai &amp; D.Q. Zhang</i>	957

## Preface

The 2014 International Conference on Management, Information and Educational Engineering (MIEE 2014) was held in Xiamen, China, on November 22-23, 2014. The aim was to provide a platform for researchers, engineers and academics as well as industry professionals from all over the world to present their research results and development activities in Management, Information and Educational Engineering.

For this conference, we received more than 700 submissions by email and through the electronic submission system, which were reviewed by international experts, and some 346 papers have been selected for presentation, representing 12 national and international organizations. The papers were grouped into three sections, as follows:

**Computer science and information engineering:** This section mainly deals with the application of computer science and communications technology to design and development of information systems.

**New technologies in education and sports:** This section mainly covers the topics of Education and Sports, research into new educational technologies at schools and other educational institutions and other issues.

**Engineering management, production management, business and economics:** This section mainly covers Engineering Management and Economics Management and other issues.

Finally, our sincere thanks to the conference chairs, organization staff, the authors and the members of the International Technological Committees for their hard work.

We look forward to seeing all of you next year at MIEE 2015.

October, 2014

# A project-based approach for teaching C++ object-oriented programming language

Cheng He

*Department of Computer Engineering, Zhongshan Polytechnic, China*

**ABSTRACT:** This article outlines a model for the teaching of a project-based introductory curriculum for the C++ programming language and Object-Oriented Programming (OOP) skills and concepts. The educational methodology of the proposed curriculum comprises a set of home-produced projects for instilling in the students the essential C++ and OOP skills by gradually accomplishing large game applications. Finally, their evaluation about this educational approach is presented, and the outcomes from the study indicate that this approach can be successful because students find the project-based approach pleasurable, motivating, and challenging while they play a vigorous role in preparing these extensive software projects and in the entire development process.

**KEYWORDS:** Programming Education; Project-based Approach; Educational Methodology; Object Oriented programming (OOP); Project-based Learning.

## 1 INTRODUCTION

One of the primary functions of an academic institution that teaches computer science must be to instill in all its students the ability to program [1]. After all, in the contemporary information technology industries, in order for anyone who claims to have knowledge of computer science or for engineering graduates from computer software-related departments, the ability to write a working program is a definite prerequisite. In this circumstance, programming language has become a compulsory course in software technology specialty. Although the students have predominated sufficient grammar features of the object-oriented programming language after they take a curriculum of computer programming, the abilities of developing a large-scale software system to find the solution of the industrial and technical problems is still difficult for students to learn and the skills competent for the competitive job market also need to be intensified [2]. Furthermore, one of the most significant steps involved in mastering the essence of skilled programming is continuous practice during the whole process of language studying. Indeed, when it comes to learning computer programming, practice makes perfect. Therefore, a feasible lab-based or project-based curriculum that is closely related with practice is essential for developing students' practical engineering abilities on accomplishing some large-scale software projects by incorporating various object-oriented programming skills and a sound understanding of the logical design issues covered in the C++ programming course [3].

In order to achieve the requirements mentioned earlier, this research schemes a project-based curriculum to effectively train these learners in practice and theory with major C++ and object-oriented programming (OOP) techniques, as well as guides them to accomplish a set of consequent homemade software development projects, which will finally build up several medium-scale software systems or a large-scale industrial software application.

## 2 BENEFITS OF PROJECT-BASED PROGRAMMING LANGUAGE LEARNING

A current trend in technological and scientific education consists of the strong integration between learning with theoretical courses and with direct practical experience [4, 5]. Currently, Project-Based Programming Language Learning (PBPLL) is indeed a hot topic in education. PBPLL is where object-oriented programming language learning is mainly structured around a set of well-defined software projects. The programming language learners must learn what they need to complete the adversely designed industrial projects. They can find the necessary information directly involved with the tasks by themselves, or they may have formal classes and so on, which help them complete their assignments projects successfully while gaining a strong sense of accomplishment.

PBPLL is characterized with the advantages of effectiveness and feasibility, which have been investigated by researchers in a wide variety of disciplines and setting, in increasing students' motivation

and improving students' problem-solving and critical-thinking skills, addressing diverse learning approaches and supplying students with an incorporated learning situation [6]. First, the approach is extremely motivating, because the learners want to study hard in order to complete their projects and might even do extra work if it means their project will definitely succeed. Second, PBPLL can be a lot more hands-on and make the learners feel in control of their learning, which is much more engaging than listening to someone talk at you at the front of a classroom and answering some boring questions. Third, the programming language learning has been built up gradually with definite programming results, especially the learners have project accomplishments to show at the end of their learning. Moreover, PBPLL can encourage collaboration. It works well with learners split into project groups or teams. Collaboration is great for learning, and it is an important 21st-century skill. Last but not the least, PBPLL, unlike the traditional textbook approach, motivates the students to do supplementary homework, illustrates to the students the value of the material covered, and, most importantly, provides practical experiences that enhance the student's academic experiences [7].

### 3 CURRICULUM DESIGN AND HOMEMADE PROJECT ASSIGNMENTS

#### 3.1 Course assignment introduction

The whole course work is divided into three parts: The first work is composed of 100 online test system, this work is the student's individual work, and each student must complete this work independently; the second job is composed of three individual software project operations, and the operation is the student's personal work; the third part is composed of large-scale software project team assignments, each team consists of 5 following students forming a group, and the group members collaborate development projects.

An online judge is an online system that is used to test computer programs in programming contests. They are also used for practice in learning programming language. The system can compile and execute codes precisely, and it can test them accurately with a set of pre-built testing data. The detailed output of the submitted code will be captured automatically by the system and compared accurately with the standard output. The system will then show the comparison results, which indicate the correctness of the code. When mistakes were found in a standard output, retrial using the same method must be made.

#### 3.2 Project assignment 1: Completing 100 problems on program online judge system

In this first homemade project, students are asked to complete 100 well-defined problems on our online judge system. Our online judge is an online system that is used to test computer programs in programming contests. They are also used for practice in learning programming language. The system can compile and execute codes precisely, and it can test them accurately with a set of pre-built testing data. The detailed output of the submitted code will be captured automatically by the system and compared accurately with the standard output. The system will then show the comparison results, which indicate the correctness of the code. When mistakes were found in a standard output, retrial using the same method must be made. With the help of our online judge system, the grading of programming assignments can be automated. The first 100-problem pre-defined assignment can lead the students toward practicing the fundamental syntax of programming language, including general topics of basic data types, various variables, different string processing, all kinds of numerical computations, error handling, functions, managing source code files, I/O streams, file I/O processing skills, class design, encapsulation, inheritance hierarchy, polymorphism, and object-oriented program design.

#### 3.3 Project assignment 2: Developing a game program that plays "five-card stud"

The second homemade project is a well-defined assignment for developing a card program in C++ that plays "Five-Card Stud" by utilizing an enhanced console user interface as a response to the user command lines and displaying the processing results. The students need to develop 4 classes for this program, which are the Card, Deck, and Hand classes and the class containing your main method. The Card class must contain the functionalities for comparing the value of two cards according to the current suit and value of them at least. The Deck class must contain functions for initializing the deck of cards and functions for shuffling the deck to mix the cards before a hand while implementing the Deck as an array of cards. The Hand class must contain functions for making a comparison for two hands while implementing the Hand class as an array of five cards. The fourth class is the main method class that is implemented procedurally. The purpose of this assignment is to gain familiarity with the C++ control constructs and fundamental concepts of class by completing the design and implementation of classes that utilize a good programming style for the code, such as using meaningful variable names, using constants when appropriate, including a comment block before the program that describes what the program does,

including your name and the program name, and commenting before each function by describing what it does.

### 3.4 *Project assignment 3: Developing a game Tetris using OOP skills*

For project assignment 3, the students will build up a set of classes for Tetris. The goal of this exercise is to develop a C++ puzzle game that is a “variation” of the Tetris game. We are interested in seeing your code writing skills, style, and logic. This assignment will emphasize elemental OOP design—using encapsulation to divide a big scary problem into many friendly little independently testable problems. The first part of the assignment sets up the Piece class. The second part builds the Board class and some other fun bits. For reasons that will become clear later when the students really grow to be game programmers after their graduation from college, there is a theme of efficiency in this design. The students are especially encouraged to write classes that implement Tetris quickly rather than just writing classes that purely implement Tetris. This assignment makes a nice exercise in OOP decomposition—dividing the rather large Tetris problem into several nontrivial classes that cooperate to solve the whole thing.

### 3.5 *Project assignment 4: Building up a Sokoban game program*

In this 4th practical exercise, students will develop a C++ program to create a simple version of Sokoban game that is designed to run in a Win32 console using text characters, which is an interactive computer game developed in the early 1980s, while learning object-oriented software programs. Students will apply design process to identify objects agents and interactions operations. Throughout this assignment, students not only will be introduced to basic computational thinking, including basic object interaction, stacks, creating object instances, rule based programming, and message sending, but also will have the opportunities to practice the object-oriented programming skills and theories to work on something that is of interest to them, while also reinforcing what they have learned; thus, the students can learn how to solve the programming problems using essential OOP skills. Accompanying with the course lectures on the basics of object-orientation and Universal Modeling Language (UML) class diagrams, students are required to make an abstraction of the problems in order to stretch the class diagrams before they make the implementation of the application. Indeed, the first part of the practical exercise is focused on exercises with methods. In the second part of the exercise, students will not only implement the Sokoban game

by relying on classes and objects but also implement some exception handling classes in their built-up classes to provide error message reporting and handling functions.

### 3.6 *Project assignment 5: Implementing a Pacman game programming*

In this assignment, the students will develop a C++ implementation of the famous interactive game Pacman. The goal of this assignment set is for the programming learners to become familiarized with (I) applying existing knowledge to generate new products, (II) planning and managing activities to develop a solution or complete a project, (III) using multiple processes and diverse perspectives to explore alternative solutions., (IV) troubleshooting systems and applications, and (V) writing proper technical reports. Students will be implementing a final programming project to demonstrate all of the programming and computer science skills they have mastered throughout the course. This is a chance to work on something that is really challenging to students, because it is difficult for students to implement Dijkstra’s algorithm and the AI for ghosts. This part is designed for students to have fun with the project while experimenting with the different features of the C++ language.

## 4 RESULTS AND DISCUSSION

Project-based learning is an educational methodology that has considerable potential to transform teaching from a tedious and mundane practice of passive learning to one where students actively engage with the material, resulting in deeper learning and significantly other outcomes [8, 9]. Having started from the Fall 2009 semester, the project-based curriculum for implementing a set of practical game applications by incorporating C++ programming and OOP skills is introduced in this course as Zhongshan Polytechnic in China strives to incorporate experiential learning into a broader range of college programs. Evidently, the experience of the introduction of project-based learning to an introductory property course at Zhongshan Polytechnic has resulted in many positive outcomes for students and staff. For many students, the appeal of this learning style comes from the authenticity of the experience. For teachers, additional benefits include enhanced professionalism and collaboration among colleagues, as well as opportunities to build relationships with students. To analyze the effectiveness of a project-based approach in C++ programming learning, we performed two surveys, respectively, in years 2009 and 2010 in Zhongshan Polytechnic. The mean values of the grades obtained by students who had enrolled in C++ course in 2009 and 2010 are shown in

**Table 1.** The grades are defined on a scale from 0 to 100 with A between 90 and 100, B between 80 and 90, C between 70 and 80, D between 60 and 70, and F indicating failure to pass.

Table 1. Grade result from 2009 to 2010.

Grade rate	2009	2010	Average
A	16%	16%	16%
B	32%	34%	33%
C	26%	28%	27%
D	14%	12%	13%
F	12%	10%	11%

Table 2. Course improvement survey - results.

Survey questions	Result
1. The online judge problems are useful for understanding C++ programming concepts.	89.2%
2. The project-based programming language learning approach is effective for students.	92.0%
3. The projects can motivate students to study hard.	88.1%
4. The projects can be of importance for my career.	89.8%
5. The projects can be of interest for me.	88.8%

To evaluate the feasibility of project-based programming learning methodology, course surveys were performed at the end of the fall semester from 2009 to 2010, and average 50 students who enrolled in the course at fall each year completed the survey questionnaires. **Table 2** presents the survey results from five primary questions. As illustrated in **Table 2**, around 90% of students who enrolled in the course found it quite useful to apply their understanding of the C++ to these projects for them. It is obvious that the project-based course structure provides the effectiveness of the teaching and learning. Due to the limitation of pages, two other courses, Java Programming Language and C# Programming Language, that were taught using traditional pedagogy on the basis of textbooks were studied and evaluated by some other students, but have not yet been included in this article. However, we observe that the project-based approach has a primary advance than the conventional one in terms of the evaluation results. This offers an intuition that the project-based approach framework can enhance teaching and learning in terms of overall performance among the program study [9].

## 5 CONCLUSION

In conclusion, project-based-learning is an effective method of learning in the programming curriculum. It encourages involvement of the students in the learning process and conveys important information on project management. Most importantly, students find projects pleasurable, motivating, and challenging because they play an active role in preparing the software project and in the entire implementing process. As can be seen from the discussion and results, the purposely well-designed project-based curriculum and practical home-made game applications demonstrate its efficiency and practicability for encouraging the students to master C++ and OOP skills on their own initiative and incorporating these techniques for developing authentic industrial applications while also reinforcing what they have learned in the course.

## ACKNOWLEDGMENT

This work was funded by a project of Zhongshan Polytechnic, China under grant No. JYB1208.

# Research and design of NVT plug-in module-based network security detection system

Hong Liu Cai, Liu Yu Qin Deng, Ting Mei Xue & Xi Yu  
*Academy of Armored Force Engineering, Beijing, China*

**ABSTRACT:** Plug-in technology is widely used in network security detection. It has the advantages of being easy to upgrade and a high efficiency. NVT (Network Vulnerability Test) is a plug-in module focus in testing the loophole of a long-distance target. It is programmed by NASL script language, has a simple structure, and is easy to master. Based on the analysis of the structure of NVT, this article designed a security detection system to achieve the unified management of plug-in modules, which improved the present security detecting tools' management of large amounts of testing plug-in modules.

**KEYWORDS:** NVT; Network Security; Security Detection System.

## 1 INTRODUCTION

According to the statistical data of December 2013, the number of Internet users in China's reached 0.618 billion. Overall, 93.1% enterprises and public institutions in China use computers in work and 83.2% of the computers are connected to the Internet<sup>[1]</sup>. People use the Internet to enjoy the convenience associated with it, but simultaneously, people are suffering due to the influence of the vulnerability of the Internet. Any loophole in the network may become the entrance for the attack of the whole network.

To ensure the security of the network environment, we have to perform security detection on the network. There are two kinds of security detection: One is host-based detection, and the other is network-based detection. The host-based security detection tests long-distance targets by simulating attack. Compared with host-based security detection, this kind of detection does not set up any software on the target system and will not leave any effect on it. This kind of detection always use the plug-in module technology to detect some special loopholes, so we just need to develop the newest plug-in module to update the system. This makes the updating of the system easy and simple. So the network-based security detection is the trend of this field. The number of plug-in modules is an important index to measure security detection tools. But the management of thousands of testing plug-in modules is very hard for the administrator to manage. So aiming at solving this problem, this article designed a security detection system to manage the plug-in modules by using database technology.

## 2 RESEARCH AND ANALYSIS OF NVT

### 2.1 *An overview of NVT*

NVT is a set of free network testing plug-in modules offered by OpenVAS (Open Vulnerability Assessment System), and each plug-in module tests one or more known loopholes. Security detection services is the core of OpenVAS, and the OpenVAS system also has the modules of user management, task assignment, user interface, and so on<sup>[2]</sup>. This system can detect the security problems of local or long-distance systems, including the security of the system itself and application softwares. OpenVAS offers update for users everyday. Users can update systems online or download update package. The everyday update includes plug-in modules developed by a commercial company or an individual user.

NVT is programmed by NASL (Nessus Attack Scripting Language), which is a script language specialized in program plug-in module. The aim of this language is to program the testing plug-in module to some special loopholes quickly. NVT packages some common network testing operations such as structure IP data packages, as well as sends and receives IP packages. Users can program the general network testing plug-in module without the consideration of the details of different operating systems.

NVT has the following advantages<sup>[3]</sup>:

- 1 It sends messages to the target host only and does not have an impact on other hosts;
- 2 Ram occupancy rate is extremely low;

- 3 Testing plug-in modules are highly efficient in detection;
- 4 NVT is highly portable and easy to share.

## 2.2 Structure of NVT

### 2.2.1 Constitution of NVT file

A full NVT is constitutive of three kinds of files:

- 1 \*.inc file. It can be regarded as the head file in C language and packaged the common functions. Users just have to include the needed inc file to use these functions when programming NVT.
- 2 \*.nasl file. Source code for testing plug-in modules.
- 3 \*.asc file. Verification file. It is used to check whether the testing plug-in modules are modified in case of attacking by plug-in modules. Every .nasl file has a corresponding .asc file.

Testing plug-in modules comprise two parts: The first part is the register part, and the second part is the testing part. Their details are shown in [figure 1](#) as follows:

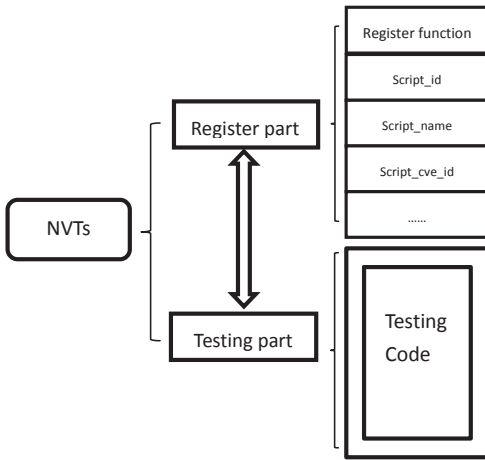

Figure 1. NVT structure.

### 2.2.2 NVT register part

The NVT register part is the description of some information of the testing plug-in modules. Its format is relatively unchangeable, because it mainly comprises a series of register functions as shown in [Table 1](#).

Every NVT must contain a CVSS base and a CVSS base vector. CVSS base ranks from 0 to 10, and CVSS base increases by the danger level of the loophole.

CVSS (Common Vulnerability Scoring System) is a loophole assessment system developed by US National Infrastructure Committee and maintained by FIRST (Forum of Incident Response and Security

Table 1. Functions of NVT register part.

Function name	Description
script_id	The unique id of testing plug-in module
script_oid	Similar to script_id. There are two numbering ways in NVT
script_name	Name of plug-in module
script_version	Version of plug-in module
script_copyright	Copyright of plug-in module
script_summary	Summary of plug-in module
script_description	Description to loophole in plug-in module
script_tag	Name and content in descriptions, such as cvss_base_vector
script_xref	Links cited by description information
script_cve_id	CVE id of testing loophole in plug-in module
script_bugtraq_id	BUGTRAQ id of testing loophole in plug-in module
script_category	Category of testing plug-in module
script_family	Family of testing plug-in module
script_require_ports	Ports of testing plug-in module
script_dependencies	Name of other plug-in modules that the testing plug-in modules depend on.

Teams). CVSS is an open system that every company and people can use for free. They can use it to assess the known loopholes. Users can know the danger of the loophole by the points given by CVSS and then fix priority for different loopholes.

CVSS comprises 3 Metric groups<sup>[4]</sup>: base group, temporary group, and environment group. Each group can assess a special attribute of loopholes. Temporary group and environment group are optional during the assess process. It means that users can choose a different group plan according to their needs to assess loopholes<sup>[5]</sup>. The assess process is as shown in [figure 2](#).

Figure 2. CVSS assess process.

According to Metric groups, users can get a CVSS base and a CVSS vector. The CVSS base can be calculated from the CVSS base computational formula.

The CVSS base group explains the basic information of loopholes. Its emphasis is a specialty of loopholes that loopholes do not change with time. The

base group contains six elements (as [table 2](#) shows): Access Vector, Access Complexity, Authentication, Confidentiality Impact, Integrity Impact, and Availability Impact.

Table 2. CVSS base group elements.

Name	Shortcut	Value	Branch value
Access Vector	AV	L/A/N (Local/ Adjacent/ Network)	0.395/0.646/ 1.000
Access Complexity	AC	H/M/L (High/ Middle/ Low)	0.350/0.61/ 0.710
Authentication	Au	M/S/N (Multiple/ Single/ None)	0.450/0.56/ 0.704
Confidentiality Impact	C	N/P/C (None/ Partly/ Completely)	0/0.275/ 0.660
Integrity Impact	I	N/P/C (None/ Partly/ Completely)	0/0.275/ 0.660
Availability Impact	A	N/P/C (None/ Partly/ Completely)	0/0.275/ 0.660

CVSS base computational formula<sup>[6]</sup>:

$$\text{BaseScore} = (((0.6 * \text{IMPACT}) + (0.4 * \text{EXPLOITABILITY}) - 1.5) * f(\text{IMPACT})) \quad (1)$$

$$\text{IMPACT} = 10.41 * (1 - (1 - C) * (1 - I * (1 - A))) \quad (2)$$

$$\text{EXPLOITABILITY} = 20 * AV * AC * Au \quad (3)$$

if Impact=0 f(impact)= 0 else f(impact)= 1.176

CVSS vector of loophole tibco spotfire is:

AV:N/AC:L/Au:N/C:P/I:P/A:P

CVSS base point can be calculated as 5.1.

### 2.2.3 NVT testing part

Testing part comprises a specific code. This part is relatively flexible that only ask the code fits the grammar. NVT is an important part that mainly detects targets by simulating attack. NVT provides a variety of functions for users, such as character string manipulate function, structure message function, and network function, which help users' programs be

convenient and fast<sup>[7]</sup>. In addition, if required, users can customize their own functions.

### 2.3 NVT classification

Till December 2013, NVT provides 33220 testing plug-in modules. They are managed by loophole level, self-risk level, and testing type according to their register information.

#### 2.3.1 Risk-level classification

According to the corresponding loophole's risk level, we can classify NVT into None, Low, Medium, High, and Critical as [table 3](#) shows:

Table 3. Risk level.

Risk level	Description	Plug-in modules Number	CVSS Point
None	Providing limited information of host-like starting-up state	1499	0.0
Low	Providing server information that may cause attack-like anonymous log-in	209	1.0–2.0
Medium	High-risk loopholes in hosts such as DoS loophole	9236	2.1–5.0
High	Unauthorized access by local users	13634	5.1–8.0
Critical	Critical risk loopholes in hosts such as buffer overflow loophole	8642	8.1–10.0

#### 2.3.2 Testing intension classification

This way of classification is shown as “script\_category” in the NVT register part. The use of the classification type is to ensure NVT can run well when numerous scripts run simultaneously. This can ensure NVT runs as the before-hand strategy and that low-risk plug-in modules runs first. Testing intension classification is shown in [table 4](#).

In practice, this method of classification shows the risk of the plug-in module itself so that testers can control the testing intension easily.

#### 2.3.3 Testing-type classification

This type of classification is shown as “script\_family” in NVT register part. It can be divided into 52 parts. This type of classification can tell the user the testing type of script so that the user can choose the script conveniently. Testing-type classification is shown in [table 5](#).

Table 4. Hazard rating.

Hazard rating	Description	Plug-in module number
ACT_ATTACK	Intrusive loophole testing module. No harm to system.	1661
ACT_GATHER_INFO	Information collective testing module. No harm to system.	30868
ACT_DENIAL	This type of script suspends long-distance service.	285
ACT_DESTRUCTIVE_ATTACK	It may affect target system such as user account lock.	46
ACT_SCANNER	Scanner modules. No harm to system.	15
ACT_MIXED_ATTACK	It may cause some damage to system such as buffer overflow.	114
ACT_FLOOD	It may have some potential impact on the network.	4
ACT_END	Storage of relevant information after testing. No harm to system.	18
ACT_SETTINGS	Modules of system settings. May remote log in hosts	16
ACT_KILL_HOST	This kind of script may cause system breakdown.	17
ACT_INIT	Initiation of testing. May reveal information of hosts such as system type.	176

### 3 DESIGN OF SYSTEM MODEL

#### 3.1 Design principles

- 1 High level of system security. As a network detection tool, system security must be guaranteed.
- 2 Wide range of application. Administrators and users should not be limited by the system so that they can work in any authorized host.
- 3 Unified management. Administrator can manage user limits of authority and testing modules in a unified way.
- 4 Diverse distribution of detector. With the more and more complicated and larger and larger network nowadays, the detector should be configured as dispersed and concurrent to release task burden on one detector.
- 5 With visible detecting results. Detection report can be generated by detecting results.

Table 5. Testing-type classification.

Testing type	Module number	Testing type	Module number
AIX Local Security Checks	1	CentOS Local Security Checks	2006
Fedora Local Security Checks	7025	Debian Local Security Checks	2848
Windows Microsoft Bulletins	89	FreeBSD Local Security Checks	1994
HP-UX Local Security Checks	242	Gentoo Local Security Checks	1728
Mac OS X Local Security Checks	66	Mandrake Local Security Checks	2092
Slackware Local Security Checks	534	Red Hat Local Security Checks	1356
VMware Local Security Checks	29	Ubuntu Local Security Checks	1812
SuSE Local Security Checks	1444	Solaris Local Security Checks	898
IT-Grundschutz	101	IT-Grundschutz-10	2
IT-Grundschutz-12	85	IT-Grundschutz-11	18
Malware	41	Netware	8
Nmap NSE net	176	Nmap NSE	154
Brute force attacks	8	Buffer overflow	488
CISCO	10	Compliance	4
Credentials	2	Databases	104
Denial of Service	862	Default Accounts	60
Finger abuses	6	Firewalls	20
General	1948	FTP	167
Port scanners	15	Product detection	258
RPC	10	Remote file access	61
Service detection	616	Settings	12
SNMP	5	SMTP problems	46
Useless services	13	Policy	8
Web Servers	236	Windows	136
Privilege escalation	49	Peer-To-Peer File Sharing	21
Gain a shell remotely	614	Web application abuses	2692

#### 3.2 Overall structure

This system comprises five modules. They are remote control module, administrator module, user module, detecting module, and database module.

This system use a combination of C/S and B/S to the construct system. The server uses the Linux system to ensure security and stabilization, because the Linux system is proved to be a secure and stable system.

#### 3.3 Design of each module

##### 3.3.1 Database module

Database module is the key part of the background of the system. This module provides a powerful support

for the security detection system. Database module contains four databases. They are user information database, plug-in module database, loophole module, and detect result database.

User information database is used to store user information, including user name, user password, limits of authority, register time, life span, and task id.

Plug-in module database is used to store plug-in modules and their information, which include testing plug-in module id, name, version number, CVSS base point, CVSS base vector, and so on.

Loophole database is used to store detailed information of loopholes such as flag number, loophole name, publication time, impact production, repair strategy, and several ids.

Detect result database is used to store user task id, detector id, and detector result.

### 3.3.2 Remote control module

Remote control module provides interfaces for client and browser, and it provides graphic user interface for administrator and user. Administrator and user can use the system on hosts with client or use the system on hosts without client by using a browser. This enables a wider use range of the system. The administrator can ensure the use of authorization by modifying the use of authorization value in the database.

### 3.3.3 Administrator module

Administrator module is the neural center of the whole security detection system. A system can have two administrator modules. One is meant for running in the system, and another is meant for backup to ensure the system can work well in emergency cases. Administrator module only can be used by administrators. Its main function is shown as follows:

- 1 User management. Manage user name, password, user limitation and verify new register user information. All user information is stored in the user information database.
- 2 Plug-in module verification. Verify plug-in modules developed by users. If these plug-in modules fit NVT structure and requests well, they will be added into plug-in modules library for other users' use.
- 3 Database update. Update plug-in module library and loophole library at regular intervals to ensure the synchronization between system and the newest NVT.

### 3.3.4 User module

User module is a module for users. It provides responses for user command. It also has a backup similar to the administrator module to advance system availability. Its main function is

- 1 User verification. Verify user identity by user information library. Check up user name and password when logging in to ensure user identity legality. Provide access for new user registration and pass it on to the administrator module for checking. New user information will be stored in user information library if the new user passes the verification.
- 2 Plug-in module report. Upload user plug-in module to the management center at regular time intervals and check by administrator.
- 3 Detector configuration. According to user's detection task, configure detector.
- 4 Report generation. Generate reports from all detectors based on the detection result library.

### 3.3.5 Detector module

Detector module is controlled by administrator module and user module. This module executes user detector tasks. At least one detector is distributed in the LAN, and every detector can run more than one detect engines. The detector includes the no plug-in module when it is first used. Then, the detector will download and store appropriate plug-in modules after accepting tasks to decrease impact on network. The detector will examine plug-in modules before every task. If there are new versions of local plug-in modules or plug-in modules not in the detector but task needs, the detector will update and download the plug-in modules required. When task is accomplished, user task id, detector id, and detection results will be stored in the detection result library. Detection result is shown by detecting the plug-in module to tell users whether there are loopholes to this plug-in module. If there are no loopholes, the detection result is "0."

## 4 CONCLUSION

Network security detection is developed from technical hacker attack. It is a new research field. The network security detection model put forward by this article aims at solving a problem where there is difficulty in overall plug-in module updating and management. This system is still not perfect, and its security should be improved. Detector execution and management should be researched more in the future.

# Examining users' intention to continue using SNS based on an extended expectation-confirmation model

Bao Dai & Ye Zheng Liu

School of Management, Hefei University of Technology, Hefei, Anhui, China

**ABSTRACT:** This article analyzed the influencing effect of SNS users' cognitive factors and experiential factors on their continuance intention to use SNS based on the expectation-confirmation model, social presence, and the flow theory. Empirical survey data were analyzed with structural equation modeling. The results show that the expectation-confirmation model can explain SNS users' continuance intention effectively; social presence and flow experience have significant indirect effects on SNS users' continuance intention.

**KEYWORDS:** Social Networking Sites (SNS); The expectation-confirmation model; Social presence; Flow experience; Continuance intention.

## 1 INTRODUCTION

With the arrival of the Web 2.0 era, Social Networking Sites (SNS) are experiencing rapid development around the world. For example, the number of SNS users in China reached 278 million in January 2014, accounting for 45 percent of the total amount of Internet users (CNNIC 2014). However, building SNS users' loyalty and retaining consumers are becoming more difficult due to intense competition among SNSs, and more and more new social media also grab some SNS users. Thus, realizing user retention is of great importance to SNS providers, because the eventual success of SNS depends on continuance usage rather than on first-time use.

Previous research has found the expectation-confirmation model (ECM) (Bhattacharjee 2001a) to be a robust model for continued IT adoption. Therefore, some researchers have employed ECM to examine the factors affecting SNS user loyalty (Chang & Zhu 2012, Kang et al. 2009). These studies focused on cognitive factors such as perceived usefulness, perceived ease of use, perceived enjoyment, and confirmation. However, an SNS user's continuance intention will also be affected by their experience, such as flow (Chang & Zhu 2012, Zhou et al. 2010). Thus, a theoretical model integrating the ECM and users' sense of social presence and flow experience is developed here in an effort to understand the key factors of SNS continuance intention determinants. The results of this work are expected to give both practitioners and academics an increased understanding of SNS users' continuance intention, which can then be used as a guideline to develop better SNS.

## 2 THEORETICAL BACKGROUND AND HYPOTHESIS

### 2.1 ECM and SNS users' continuance

The ECM was first proposed by Bhattacharjee (2001a) to study users' continued usage behavior of IS products/services. As Figure 1 shows, the ECM posits that continuance intention is a function of satisfaction and perceived usefulness of continued IS use, and user satisfaction is affected by two major determinants: the extent of a user's confirmation of expectations and post-usage perceived usefulness. Moreover, confirmation has an impact on perceived usefulness.

Figure 1. Expectation-confirmation model.

Till date, the ECM has been widely used to explore post-adoption behavior in various web-based service contexts, such as online banking (Bhattacharjee 2001b), online learning (Limayem & Cheung 2008), online shopping (Lee & Kwon 2011), blog (Shiau et al. 2011), social networking services (Kang et al. 2009), mobile Internet (Thong et al. 2006), and mobile data service (Kim 2010).

In general, these types of research have found ECM to be a robust model for continued IT adoption.

However, almost all research models in these studies were proposed by adding new constructs to ECM (Lee & Kwon 2011, Limayem & Cheung 2008, Kang et al. 2009, Thong et al. 2006) or combining the ECM and another theory or model (Chang & Zhu 2012, Kim 2010), because the ECM employs only three variables (satisfaction, perceived usefulness, and confirmation) to explain behavioral intention. Thus, an extended ECM model was developed by integrating social presence and flow experience of SNS users in this article so as to enhance the explanatory power of the model. In view of the effectiveness of ECM to explore post-adoption behavior in web-based service contexts, the following hypotheses about SNS users' continued usage behavior were proposed directly:

H1: SNS users' confirmation of expectation will positively affect their perceived usefulness.

H2: SNS users' confirmation of expectation will positively affect their satisfaction.

H3: SNS users' perceived usefulness will positively affect their satisfaction.

H4: SNS users' perceived usefulness will positively affect their continuance intention.

H5: SNS users' satisfaction will positively affect their continuance intention.

## 2.2 *Flow experience and SNS users' continuance*

Flow is a concept originally introduced by Csikszentmihalyi (1975). He defined it as "the holistic experience that people feel when they act with total involvement," characterized by concentration on the task at hand; a merging of action and awareness; a loss of self-consciousness; and a distorted sense of time. This concept has been extensively applied in studies in a broad range of contexts, such as online shopping (Koufaris 2002), online gaming (Choi & Kim 2004), and online learning (Lee 2010).

As an autotelic experience, flow is an important intrinsic motivation for performing an activity. If an individual "feels good" about an activity, it is intrinsically motivating, and he/she is more likely to engage in it. Previous studies have provided enough evidence to the effect of flow on IS users' perceived usefulness, satisfaction, and continuance intention. For example, Shiau et al. (2011) found that flow experience has a significant effect on blog users' satisfaction and continued usage intention. Zhou & Lu (2011) confirmed that flow experience affects mobile instant messaging users' loyalty via perceived usefulness and satisfaction. When people use SNS, there is potential for them to experience flow, as SNS not only supports users in performing social interaction and information exchange but also provides entertainment functions, all of which may result in the users' experience of enjoyment and concentration on the usage of SNS. Chang & Zhu (2012) have

found that SNS users' flow experience influences continuance intention both directly and indirectly by affecting satisfaction. Zhou et al. (2011) also indicated that flow experience is the strongest direct determinant of mobile SNS users' loyalty. Thus, we hypothesize that

H6: SNS users' flow experience will positively affect their perceived usefulness.

H7: SNS users' flow experience will positively affect their satisfaction.

H8: SNS users' flow experience will positively affect their continuance intention.

## 2.3 *Social presence and SNS users' continuance*

Short et al. (1976) proposed social presence first and defined it as "the degree of salience of the other person in the interaction." Thereafter, social presence was also defined as the sense of "being with others" (Heeter 1992), and the "level of awareness of the co-presence of another human, being or intelligence" (Biocca & Harms 2002). In general, the sense of social presence reflects the extent to which the system design reduces the social distance associated with computer-mediated communication and significant support exists for the value of this construct in studying online experience. So far, social presence has been studied in various online contexts, such as online shopping (Animesh et al. 2011, Shen & Khalifa 2012, Ogonowski et al. 2014), online learning (Zhan & Mei 2013), and online communication (Lin et al. 2014). Previous studies found that social presence affects web users' cognitive factors (e.g. perceived usefulness), affective factors (e.g. enjoyment, pleasure), attitudinal factors (satisfaction), and behavioral intention. For instance, Ogonowski et al. (2014) examined the effect of social presence in the B2C context on initial trust formation via perceived usefulness and enjoyment. Shen & Khalifa (2012) verified the positive influence of social presence on pleasure and arousal. Animesh et al. (2011) proved the impacts of social presence on 3D virtual world users' flow and intention to purchase virtual products. According to the media richness theory, SNS is a kind of social media with high richness due to its affordance of transferring rich social cues via text, picture, video, and so on, which easily facilitates SNS users' experience social presence. Lin et al. (2014) recently found that social presence was a strong determinant of user satisfaction and sense of belonging, and it positively influenced continuance intention of SNS. Hence, we propose that

H9: SNS users' sense of social presence will positively affect their perceived usefulness.

H10: SNS users' sense of social presence will positively affect their satisfaction.

H11: SNS users' sense of social presence will positively affect their flow experience.

Based on these analyses, the research model was developed as indicated in Figure 2.

Figure 2. Research model.

### 3 RESEARCH METHODOLOGY

#### 3.1 Measurement

The research model includes six factors. Each factor was measured with multiple items. All items were adapted from extant literature to improve content validity. The items of confirmation, perceived usefulness, satisfaction, and continuance intention were adapted from Zhou & Lu (2011). The items of social presence were adapted from Animesh et al. (2011) and Shen & Khalifa (2012). The items of flow were adapted from Chang & Zhu (2012) and Zhou et al. (2011). All items used five-point Likert scales anchored between “strongly disagree” and “strongly agree.”

#### 3.2 Data collection

In China, 40.5 percent of SNS users are between 20 and 29 years old, and 57.4 percent of them have an education at or above the college level (CNNIC 2014). Therefore, the empirical study used undergraduate students as subjects. First, we chose 20 undergraduate students majoring in business administration and registered users of SNS as the seed investigators based on the principle of convenience sampling. Second, these seed investigators sent the e-Questionnaire of this study to their best SNS friends who must be college students. One week later, the seed investigators handed in the e-Questionnaires returned by their friends. The final effective sample size is 242. The sample consisted of 50.4% male and 49.6% female participants between the ages of 17 and 24.

### 4 DATA ANALYSIS AND RESULTS

#### 4.1 Measurement reliability and validity

To validate the measurement model, reliability and validity analyses were performed by using SPSS 18.0 and AMOS 7.0. Construct reliability was assessed by using Cronbach’s alpha value. Nunnally (1978) recommends that the Cronbach’s alpha of a scale should be greater than 0.7 for items to be used together as a construct. As shown in Table 1, all constructs are in the

acceptable range, achieving acceptable internal consistency. For the convergent validity, all factors should have an average variance extracted (AVE) higher than 0.50 and a composite reliability (CR) higher than 0.70 (Fornell & Larcker 1981). As Table 1 shows, all AVE and CR values of the items are acceptable.

According to Fornell & Larcker (1981), discriminant validity is achieved if the squared root of the AVE for each construct exceeds the correlation between that and any other constructs. As shown in Table 2, all the square roots of the AVE scores were higher than the correlations among the constructs, and they demonstrate adequate discriminant validity of all constructs.

Table 1. AVE, CR, and Cronbach’s alpha value.

Construct	AVE	CR	Alpha
Social presence(SP)	0.666	0.889	0.833
Flow experience(FLOW)	0.684	0.897	0.845
Confirmation(CON)	0.726	0.888	0.810
Perceived usefulness(PU)	0.791	0.919	0.868
Satisfaction(SAT)	0.770	0.909	0.849
Continuance intention(CI)	0.690	0.870	0.774

#### 4.2 Structural model and hypothesis testing

The hypotheses were tested by using the maximum likelihood estimation technique by using AMOS 7.0. The SEM results show that  $\chi^2/df$  (2.849), GFI (0.946), CFI (0.914), and RMR (0.037) exceeded the cutoff values, whereas AGFI (0.850), NFI (0.879), and RMSEA (0.112) did not meet the recommended threshold criteria proposed by Bagozzi et al. (1991). In sum, the fit indices to the structural model were dissatisfactory. So it is necessary to modify the initial research model. According to the modification indices of AMOS, we found that the model fit will be better by adding the paths between social presence and confirmation and

between flow experience and confirmation. Considering social presence and flow are experiences during the SNS usage, and confirmation is ex post-evaluation, it is reasonable to assume there is a positive relationship between social presence (flow) and confirmation. Consequently, we added two new hypotheses:

H12: SNS users' social presence will positively affect their confirmation of expectation.

H13: SNS users' flow experience will positively affect their confirmation of expectation.

Test the modified structural model and the results show  $\chi^2/df$  (0.480), GFI (0.999), AGFI (0.986), NFI (0.998), CFI (1.000), RMR (0.006), and RMSEA (0.013). Because all of the fit indices meet Bagozzi et al. (1991)'s recommended threshold criteria, the modified structural model is good. Furthermore, as shown in Table 3, all hypotheses are supported, with the exception of two (H8, H12). In conclusion, SNS users' social presence and flow experience have a positive effect on confirmation and perceived usefulness, which further influence satisfaction and finally affect continuance intention. Moreover, SNS users' perceived usefulness has a direct impact on continuance intention, but the effect of flow experience on continuance intention is insignificant.

Table 3. Results of hypotheses testing.

## 5 DISCUSSION AND CONCLUSION

The results of this study provide support for the effectiveness of ECM to explain users' continued intention to use SNS. Satisfaction and perceived usefulness

are verified to be good predictors of SNS users' continuance intention. Accordingly, SNS operators are suggested to take steps to increase users' satisfaction and perceived usefulness. For example, SNS should increase the stock of useful information by offering rewards to users who generate high-quality information, which is helpful to users' perception of usefulness of SNS. In addition, SNS operators should enhance entertainment functions of SNS to provide more hedonic values to users, which will be able to contribute to users' satisfaction.

As previous studies have shown (Zhou & Lu 2011), SNS users' flow experience has an indirect influence on continuance intention via satisfaction and perceived usefulness. Thus, SNS should try their best to create the conditions for users to experience flow. Some studies have found that interface usability (Pace 2004), design attraction (Skadberg & Kimmel 2004), interactivity (Animesh et al. 2011), and system quality (Zhou et al. 2011) of IS significantly affect flow experience, so SNS operators can take the following measures to give users opportunities to experience flow: (1) Strengthening the aesthetic design and optimizing the layout of the website to improve the interface usability and design attraction of SNS information system; (2) Enhancing the level of customization, speeding up response to users' request, and innovating interaction tools to improve interactivity and the overall quality of SNS information system.

Surprisingly, the effect of social presence on SNS users' confirmation is not significant. The possible reason is that SNS is a kind of social media with high richness, and SNS users experience the sense of social presence very easily, resulting in social presence not affecting SNS users' confirmation significantly. But in consideration of social presence, it has a significantly positive effect on perceived usefulness, flow, and satisfaction. SNS need to take appropriate action to enhance SNS users' social presence, such as 3D virtual reality technology.

In conclusion, the purpose of this study was to apply the integration of ECM and users' flow experience and social presence to the study of continuance intention toward SNS in China, and the results of this study provide support for the research model and for most hypotheses.

However, this study is not without limitations. First, we conducted this research in China, where SNS is developing rapidly but is still in its infancy. Thus, our results need to be generalized to other countries that have a more fully developed SNS sector. Second, we selected university students as our sample, and the results need to be interpreted with caution. Although they represent a major group of SNS users in China,

future research needs to generalize our results to other samples, such as working professionals.

**ABSTRACT:** A new model of games endowed with both a coalition structure and a precedence relation on the set of a priori unions is considered, which is called games with coalition structures under precedence constraints. The Axiomatization of Owen value for this kind of games, which will be called restricted Owen value, is studied. The uniqueness of the restricted Owen value is proved using efficiency, symmetry within a priori unions, hierarchical strength across a priori unions applying to unanimity games, null player property, and linearity.

**KEYWORDS:** Cooperative game; Coalition structure; Owen value; Precedence constraint.

### 1 INTRODUCTION

“Coalition structure” is defined as a partition of the individual set into pairwise disjoint coalitions called “a priori unions.” An a priori union can be seen as a social group where it is easier for a particular player to cooperate with players in his or her own group than to cooperate with players from other groups. An important reference is Aumann and Dréze<sup>[1]</sup>. Later on, Owen<sup>[2]</sup> introduced and characterized coalition value, also called Owen value, as an extension of the Shapley value for games with coalition structures. The Owen value has been widely studied in many literatures<sup>[3-6]</sup>.

Coalition structures, however, do not adequately represent some bargaining situations, since it is assumed that a priori unions will cooperate with each other to obtain their worth. Due to different reasons, such as competition, politics, and economics, not all a priori unions agree or are able to cooperate with others. In many real situations, there is a priori information about the behavior of the a priori unions and only partial cooperation occurs. For example, when a priori unions are seen as political parties, it means that some coalitions of parties are unlikely to occur. When a priori unions are seen as companies, it may happen that some coalitions formed by companies are infeasible; for some reasons, it is impossible to cooperate among competitive companies. These situations suggest that it is necessary to study models with restricted cooperation among a priori unions.

Many models have been developed to confront the problem of feasible coalitions. The first model in which the feasible coalitions are defined by the connected subgraphs of a graph is introduced by Myerson<sup>[7]</sup>. Contributions on graph-restricted games include Owen<sup>[8]</sup>, Borm et al.<sup>[9]</sup>, and Hamiache<sup>[10]</sup>. In these models, the possibilities of coalition formation are determined by a communication graph between the players. Another type of model introduced by Gilles et al.<sup>[11]</sup> and van den Brink<sup>[12]</sup> is equivalent to a subclass of antimatroids. In their model, the possibilities of coalition formation are determined by the positions of the players in a so-called permission structure. Faigle and Kern<sup>[13]</sup> proposed another model for cooperative games under precedence constraints, which are defined by games on a lattice of feasible subsets. Bilbao and Ordóñez<sup>[14]</sup> introduced a combinatorial structure called “augmenting system,” which is a generalization of the antimatroid structure and the system of connected subgraphs of a graph. Sun and Zhang<sup>[15]</sup> studied the problem of profit allocation by introducing a lattice structure based on the situation that all the coalitions are not feasible, and they proposed the Owen value for games with coalition structures under precedence constraints, which will be called “restricted Owen value” for simplicity.

In this article, an axiomatic characteristic for the restricted Owen value is offered using efficiency, symmetry within a priori unions, hierarchical strength across a priori unions applying to unanimity games, null player property, and linearity.

## 2 PRELIMINARIES

We consider cooperative games with the set of players  $N = \{1, 2, \dots, n\}$ . A coalition is a subset of  $N$ , and the class of all coalitions of  $N$  is denoted by  $P(N)$ . Then, a cooperative game is defined by  $(N, v)$ , in which  $N$  is the set of players and the characteristic function  $v: P(N) \rightarrow \mathbb{R}$  satisfies that  $v(\emptyset) = 0$ . For any  $S \in P(N)$ ,  $v(S)$  represents an evaluation of the potential utility of any coalition. The set of all games with player set  $N$  is denoted by  $G^N$ .

A coalition structure  $\mathcal{B} = \{B_1, B_2, \dots, B_m\} \in C^N$  is a finite partition of  $N$ , that is,  $\bigcup_{i=1}^m B_i = N$  and  $B_i \cap B_j = \emptyset$  for  $i \neq j$ .  $B_i$  is called a priori unions.  $M = \{1, 2, \dots, m\}$  is the index set of the a priori unions. The set of all coalition structures of  $N$  is denoted by  $C^N$ . We write  $GC^N = G^N \times C^N$ .

Assume that the precedence relation on the set of a priori unions is the same as Faigle-Kern. Let  $\mathcal{M}$  denote the set of feasible coalitions of players in  $M$  under precedence constraints in the model of Faigle-Kern. Let  $N(\mathcal{M})$  denote the set of feasible coalitions of players in  $N$ .

A cooperative game on  $N(\mathcal{M})$  that will be called a restricted game with coalition structures is defined as a characteristic function  $v: N(\mathcal{M}) \rightarrow \mathbb{R}_+$  satisfying  $v(\emptyset) = 0$ . For any  $S \in N(\mathcal{M})$ ,  $v(S)$  represents an evaluation of the potential utility of any feasible coalitions, whereas non-feasible coalitions are totally ignored. The set of all games on  $N(\mathcal{M})$  is denoted by  $G(\mathcal{M})^N$ . We write  $CG_M^N = G(\mathcal{M})^N \times C^N$ .

**Definition 1** Let  $(N, v, \mathcal{B}) \in CG_M^N$ ,  $i \in B_t$  ( $t \in M$ ), the restricted Owen value of player  $i$  can be expressed by

$$Ow_i^r(N, v, \mathcal{B}) = \sum_{\substack{K \in \mathcal{M}/\{i\} \\ i \in (K \cup \{i\})^+}} \sum_{\substack{T \subseteq B_t \\ i \in T}} \frac{|\mathcal{O}(K)| \cdot |N(\mathcal{M}) \setminus (K \cup \{i\})| \cdot |T| \cdot (|B_t| - |T| - 1)!}{|N(\mathcal{M})| \cdot |B_t|!} \times \left[ v\left(\bigcup_{k \in K} k \cup T \cup \{i\}\right) - v\left(\bigcup_{k \in K} k \cup T\right) \right] \quad (1),$$

where  $t \in (K \cup \{i\})^+$  indicates that  $t$  is maximal in  $K \cup \{i\}$  and  $\mathcal{O}(\emptyset) = 1$  is understood to equal 1.

For any  $(N, v, \mathcal{B}) \in CG_M^N$ , let  $\varphi: CG_M^N \rightarrow \mathbb{R}_+^n$ , we will introduce five properties<sup>[15]</sup>.

- 1 Efficiency.  $\sum_{i \in N} \varphi_i(N, v, \mathcal{B}) = v(N)$ .
- 2 Symmetric within a priori unions. If  $v(S \cup \{i\}) = v(S \cup \{j\})$  for any  $i, j \in B_t$  ( $t \in M$ ) and  $S \in N(\mathcal{M})/\{i, j\}$ , then  $\varphi_i(N, v, \mathcal{B}) = \varphi_j(N, v, \mathcal{B})$ .

- 3 Hierarchical strength across a priori unions applies to unanimity game. For any  $t, q \in \mathcal{M}$ ,  $S \in N(\mathcal{M})$ , if  $B_t, B_q \subseteq S$ , then

$$h_{M_s}(q) \sum_{i \in B_t} \varphi_i(N, \mu_S, \mathcal{B}) = h_{M_s}(t) \sum_{i \in B_q} \varphi_i(N, \mu_S, \mathcal{B}).$$

where  $M_s$  is the subset of  $M$ .  $M_s$  denotes the union of the a priori unions that contain  $S$ ,  $\mu_S: N(\mathcal{M}) \rightarrow \mathbb{R}_+$  is a unanimity game defined for any  $S \in N(\mathcal{M})$  by

$$\mu_S(T) = \begin{cases} 1, & S \subseteq T \\ 0, & \text{otherwise} \end{cases}, \quad \forall S, T \in N(\mathcal{M})$$

- 4 Null player property. For any  $i \in B_t$  ( $t \in M$ ), if player  $i$  is a null player, that is,  $v(S \cup \{i\}) = v(S)$  for any  $S \in N(\mathcal{M})/\{i\}$ , then

$$\varphi_i(N, v, \mathcal{B}) = 0.$$

- 5 Linearity. For any  $(N, v_1, \mathcal{B}), (N, v_2, \mathcal{B}) \in CG_M^N$ ,  $\alpha, \beta \in \mathbb{R}$ , define a game  $(\alpha v_1 + \beta v_2)(S) = \alpha v_1(S) + \beta v_2(S)$  for any  $S \in N(\mathcal{M})$ ; then,  $\varphi_i(N, \alpha v_1 + \beta v_2, \mathcal{B}) = \alpha \varphi_i(N, v_1, \mathcal{B}) + \beta \varphi_i(N, v_2, \mathcal{B})$

**Property 1** The restricted Owen value  $Ow_i^r$  on  $CG_M^N$  satisfies efficiency, symmetry within a priori unions, hierarchical strength across a priori unions applying to unanimity game, null player property, and linearity.

## 3 CHARACTERIZATION OF THE RESTRICTED OWEN VALUE

In order to characterize the restricted Owen value, we will give a simple expression of the restricted Owen value for a unanimity game.

**Proposition 1** Let  $\mu_T$  be a unanimity game on the set of players  $T \in N(\mathcal{M})$ . For any  $C \in C^N$  and  $i \in N$ ,

$$Ow_i^r(N, \mu_T, \mathcal{B}) = \begin{cases} \frac{h_{M_T}(t)}{\left( \sum_{l \in M_T} h_{M_T}(l) \right) |B_t \cap T|} & i \in T \\ 0 & \text{otherwise} \end{cases}$$

**Proof.** For any  $T \in N(\mathcal{M})$ ,  $T \neq \emptyset$ ,  $\mu_T(S \cup \{i\}) - \mu_T(S) = \mu_T(\{i\})$ ; for any  $i \notin T$  and  $S \in N(\mathcal{M})/\{i\}$ . Therefore,  $i$  is a null player. From null player property,  $Ow_i^r(N, \mu_T, \mathcal{B}) = 0$ .

For any  $i, j \in T$ , if  $i, j \in B_p$ , then by the property of “symmetry within a priori unions,”

$$Ow_i^r(N, \mu_T, \mathcal{B}) = Ow_j^r(N, \mu_T, \mathcal{B}).$$

If  $i \in B_r, j \in B_q (q \neq t)$ . Let us consider four cases.

Case 1 If  $B_i \subseteq T, B_q \subseteq T$ , then

$$\begin{aligned} h_{M_r}(q) \sum_{i \in B_i} Ow_i^r(N, \mu_T, \mathcal{B}) \\ = h_{M_r}(t) \sum_{i \in B_q} Ow_i^r(N, \mu_T, \mathcal{B}) \end{aligned}$$

Case 2 If  $B_i \subseteq T, B_q \not\subseteq T$ , then  $B_q \cap T \subseteq T$  and

$$\begin{aligned} h_{M_r}(q) \sum_{i \in B_i} Ow_i^r(N, \mu_T, \mathcal{B}) \\ = h_{M_r}(t) \sum_{i \in B_q \cap T} Ow_i^r(N, \mu_T, \mathcal{B}). \\ = h_{M_r}(t) \sum_{i \in B_q} Ow_i^r(N, \mu_T, \mathcal{B}) \end{aligned}$$

Similarly, we have

Case 3 If  $B_i \not\subseteq T, B_q \subseteq T$ , then

$$\begin{aligned} h_{M_r}(q) \sum_{i \in B_i} Ow_i^r(N, \mu_T, \mathcal{B}) \\ = h_{M_r}(t) \sum_{i \in B_q} Ow_i^r(N, \mu_T, \mathcal{B}) \end{aligned}$$

Case 4 If  $B_i \not\subseteq T, B_q \not\subseteq T$ , then

$$\begin{aligned} h_{M_r}(q) \sum_{i \in B_i} Ow_i^r(N, \mu_T, \mathcal{B}) \\ = h_{M_r}(t) \sum_{i \in B_q} Ow_i^r(N, \mu_T, \mathcal{B}) \end{aligned}$$

Thus, for any  $i \in B_i$

$$\begin{aligned} & \prod_{l \in M_r} h_{M_r}(l) \left( \sum_{i \in N} Ow_i^p(N, \mu_T, \mathcal{B}) \right) \\ &= \prod_{l \in M_r} h_{M_r}(l) \left( \sum_{i \in M} \sum_{i \in B_i} Ow_i^r(N, \mu_T, \mathcal{B}) \right) \\ &= \prod_{\substack{l \in M_r \\ r \neq l}} h_{M_r}(l) \cdot \left( \sum_{i \in B_i} Ow_i^r(N, \mu_T, \mathcal{B}) \right) \cdot \left( \sum_{l \in M_r} h_{M_r}(l) \right) \\ &= \prod_{\substack{l \in M_r \\ r \neq l}} h_{M_r}(l) \cdot |B_i \cap T| \cdot Ow_i^r(N, \mu_T, \mathcal{B}) \cdot \left( \sum_{l \in M_r} h_{M_r}(l) \right) \quad (2) \end{aligned}$$

By efficiency, we have

$$\sum_{i \in N} Ow_i^p(N, \mu_T, \mathcal{B}) = 1. \quad (3)$$

Then, by Equations (2) and (3)

$$Ow_i^r(N, \mu_T, \mathcal{B}) = \begin{cases} \frac{h_{M_r}(t)}{\left( \sum_{l \in M_r} h_{M_r}(l) \right) |B_i \cap T|} & i \in T \\ 0 & \text{otherwise} \end{cases}$$

Any  $(N, v, \mathcal{B}) \in CG_M^N$  can be expressed on a unanimity basis  $\{\mu_T | T \in N(\mathcal{M})\}$ , that is,  $v = \sum_{\substack{T \in N(\mathcal{M}) \\ T \neq \emptyset}} \alpha_T \mu_T$ .

By linearity of  $v$ , we obtain the following corollary.

**Corollary 1** Let  $(N, v, \mathcal{B}) \in CG_M^N$ , then

$$Ow_i^r(N, v, \mathcal{B}) = \begin{cases} \sum_{\substack{T \in N(\mathcal{M}) \\ T \neq \emptyset}} \frac{\alpha_T h_{M_r}(t)}{\left( \sum_{l \in M_r} h_{M_r}(l) \right) |B_i \cap T|} & i \in T \\ 0 & \text{otherwise} \end{cases}$$

**Theorem 2** An operator  $\psi$  on  $CG_M^N$  satisfies efficiency, symmetry within a priori unions, hierarchical strength across a priori unions applying to unanimity games, null player property, and linearity if and only if it is the restricted Owen value.

**Proof.** By Proposition 1, the restricted Owen value satisfies all these properties. Now let us see whether it is the only solution that satisfies them.

Let  $\psi$  be a solution on  $CG_M^N$  satisfies these axioms. Any game can be presented on unanimity basis

$$\{\mu_T | T \in N(\mathcal{M}), T \neq \emptyset\}, \text{ i.e., } v = \sum_{\substack{T \in N(\mathcal{M}) \\ T \neq \emptyset}} \alpha_T \mu_T.$$

Assume that  $v = \sum_{r=1}^I \alpha_r \mu_r$ , where all  $\alpha_r \neq 0$ .

We proceed with the remaining part of the proof by induction on this index  $I$ .

If  $I=0$ , then  $v$  is identically zero in all feasible coalitions. All players in game  $(N, v, \mathcal{B}) \in CG_M^N$  are null players. Therefore, by null player property, for any  $i \in N, i \in C_p$

$$\psi_i(N, v, \mathcal{B}) = 0,$$

that is,  $\psi_i(N, v, \mathcal{B})$  coincides with the restricted Owen value if the index  $I$  is equal to 0.

Now assume that  $\psi_i(N, v, \mathcal{B})$  is the restricted Owen value whenever the index of  $(N, v, \mathcal{B})$  is at most  $I$ , and consider some  $(N, v, \mathcal{B}) \in CG_M^N$  with the index equal to  $I+1$ . Let  $T = \bigcap_{r=1}^{I+1} T_r$  and consider two cases.

Case 1. If  $i \notin T$ , consider the game

$$w = \sum_{r: n \in T_r} \alpha_r \mu_{T_r}.$$

Obviously, the index of  $w$  is at most  $I$  and, therefore, by induction hypothesis,

$$\psi_i(N, w, \mathcal{B}) = Ow_i^r(N, w, \mathcal{B}).$$

From the expression of  $v$  and  $w$ ,  $v(S \cup \{i\}) - v(S) = w(S \cup \{i\}) - w(S)$  for any  $S \in N(\mathcal{M}) / \{i\}$ , that is, player  $i$  has the same marginal contribution in game  $v$  and  $w$ , then by Equation (1)

$$Ow_i^r(N, v, \mathcal{B}) = Ow_i^r(N, w, \mathcal{B}).$$

Let  $\sigma = v - w$ ,  $\sigma(S \cup \{i\}) - \sigma(S) = 0$  for any  $S \in N(\mathcal{M}) / \{i\}$ , that is, player  $i$  is a null player in game  $\sigma$ , then by null player property and linearity of  $\psi$ ,

$$\begin{aligned} \psi_i(N, v, \mathcal{B}) - \psi_i(N, w, \mathcal{B}) \\ &= \psi_i(N, v - w, \mathcal{B}) \\ &= \psi_i(N, \sigma, \mathcal{B}) = 0 \end{aligned}$$

Thus for any  $i \notin T$  and  $i \in B_r$ ,

$$\psi_i(N, v, \mathcal{B}) = Ow_i^r(N, v, \mathcal{B}).$$

Case 2. If  $i, j \in T$ , then  $i, j \in T_r$  for any  $T_r$  ( $r = 1, 2, \dots, I+1$ ). For any  $S \in N(\mathcal{M}) / \{i, j\}$ ,  $\mu_{T_r}(S \cup \{i\}) = \mu_{T_r}(S \cup \{j\})$ .

a. If  $i, j \in B_r$ , by symmetry within a priori unions, we can obtain

$$\psi_i(N, \mu_{T_r}, \mathcal{B}) = \psi_j(N, \mu_{T_r}, \mathcal{B}).$$

b. If  $i \in B_r, j \in B_q$  ( $t \neq q$ ), then by hierarchical strength across a priori unions applying to unanimity game,

$$\begin{aligned} h_{M_r}(q) \sum_{i \in B_r} \psi_i(N, \mu_{T_r}, \mathcal{B}) \\ &= h_{M_r}(q) \sum_{i \in B_r \cap T_r} \psi_i(N, \mu_{T_r}, \mathcal{B}) \\ &= h_{M_r}(t) \sum_{i \in B_r \cap T_r} \psi_i(N, \mu_{T_r}, \mathcal{B}) \\ &= h_{M_r}(t) \sum_{i \in B_q} \psi_i(N, \mu_{T_r}, \mathcal{B}) \end{aligned}$$

Thus,

$$\begin{aligned} &\prod_{i \in M_r} h_{M_r}(I) \cdot \sum_{i \in N} \psi_i(N, \mu_{T_r}, \mathcal{B}) \\ &= \prod_{i \in M_r} h_{M_r}(I) \cdot \sum_{i \in M} \sum_{i \in B_r} \psi_i(N, \mu_{T_r}, \mathcal{B}) \\ &= \prod_{i \in M_r} h_{M_r}(I) \cdot \sum_{i \in B_r \cap T_r} \psi_i(N, \mu_{T_r}, \mathcal{B}) \cdot \left( \sum_{i \in M_r} h_{M_r}(I) \right) \\ &= \prod_{i \in M_r} h_{M_r}(I) \cdot |B_r \cap T_r| \cdot \psi_i(N, \mu_{T_r}, \mathcal{B}) \cdot \left( \sum_{i \in M_r} h_{M_r}(I) \right). \end{aligned} \quad (4)$$

By efficiency of  $\psi_i(N, \mu_{T_r}, \mathcal{B})$

$$\sum_{i \in N} \psi_i(N, \mu_{T_r}, \mathcal{B}) = 1. \quad (5)$$

By Equation (4), (5) and linearity

$$\psi_i(N, v, \mathcal{B}) = \begin{cases} \sum_{T \in N(\mathcal{M})} \frac{\alpha_r h_{M_r}(t)}{\left( \sum_{i \in M_r} h_{M_r}(I) \right) |B_r \cap T|} & i \in T \\ 0 & \text{otherwise} \end{cases}$$

which coincides with the restricted Owen value by Corollary 1.

## 4 CONCLUSIONS

In this article, the uniqueness of the restricted Owen value is proved using efficiency, symmetry within a priori unions, hierarchical strength across a priori unions applying to unanimity games, null player property, and linearity.

We assumed that the set of a priori unions is ordered by some precedence relation that was introduced by Faigle and Kern. Many other models are developed to confront the problem of feasible coalitions, such as communication graph, permission structure, and augmenting system. It will be interesting to take into account the other structure formed by a priori unions and extend games with coalition structures to a more general class of games.

## A remote control system based on S3C2440

Qiang Li, Ke Jia Ren, Yan Lin Wu & Rui Min Liu

*Faculty of Information Engineering and Automation, Kunming University of Science and Technology, Kunming, Yunnan, China*

**ABSTRACT:** This article expounds a kind of wireless remote control system structure based on ARM. The system uses the S3C2440 as the core control chip designing the sending and the receiving ends, as well as translating the collected analog signal into a sound signal that takes the robot as the control object. Then, we send the sound signal to the receiving ends through the mobile phone and convert them into the corresponding command to the controlled object<sup>[1]</sup>. The advantage of this design is that the sound signals emanated by the sending end can set themselves and they have great flexibility. The receiving end of the circuit is relatively simple and has a low cost, which is conducive to the use of mobile devices<sup>[2] [3]</sup>.

**KEYWORDS:** Remote control; S3C2440.

### 1 INTRODUCTION

Robots have been widely used in our daily work life. Some robots need to work in the area away from the operators because of the restrictions on the work environment. As a result, the remote control of robots<sup>[4]</sup> becomes very important.

Currently, the main use of the remote control of robots is cable remote control or special radio equipment. However, the length of the cable, the power of the equipment and the local environment, and the limits of these factors have led to the signal not being transmitted over a long distance.<sup>[5]</sup> For the mobile communication network, it can be super remote control communication between the mobile base stations that are separated by thousands of kilometers. Currently, the remote control is based on DTMF<sup>[6]</sup> and a single chip<sup>[7]</sup>. DTMF is only used in the fixed-line telephone system. Due to a large range of robotic movement, the control signals cannot be effectively connected by a fixed-line telephone signal to the robot. Compared with the traditional single chip, ARM using the reduced instruction set makes ARM more efficient. Its usability is greatly enhanced, and the signal acquisition and the precision of the control signal will also be improved. The system uses S3C2440 to discern the joystick control signals<sup>[8]</sup>, the on-chip PWM module, which emits a sound signal and then sends the sound signal to the phone transmitter. Through the phone transmitter connecting with the receiving end of the phone and then by the receiving end of the phone sending a sound signal to another receiving end that is based on S3C2440 processor. The receiving end identifies the sound signal

that is sent by the phone transmitter; through identifying the frequency of the signal, the meaning of the transmitted signal is determined; and then, the signal is sent to the robot to complete the control<sup>[9]</sup>.

This article introduces a remote control system based on S3C2440, and it elaborated the design and implementation of its hardware and software system.

### 2 HARDWARE DESIGN

#### 2.1 Introduction of the control chip S3C2440

S3C2440<sup>[10]</sup> is a 16-/32-bit RISC embedded microcontroller based on ARM920T kernel processor, which is launched by Samsung, and it is designed for handheld devices and the general types of applications that can satisfy the embedded system of low-power, high-performance, small-volume requirement. It uses a new bus design, namely the AMBA (Advanced Microcontroller Bus Architecture). The outstanding feature is that its core processor (CPU), a 32-bit RISC processor, implements MMU, AMBA BUS, and Harvard cache architecture. S3C2440 integrates a wealth of on-chip resources, allowing developers to reduce peripheral equipment parts as much as possible.

#### 2.2 Transmitter hardware design

Through the ADC module of S3C2440, the joystick of horizontal and vertical voltage signal is detected to obtain the direction signal, and then by the PWM module of S3C2440 a signal whose duty cycle is in line with sinusoidal trend variation is produced.

After the PWM signal output end, using the passive low-pass RC filter, high-frequency components of the PWM signal are filtered out, and a smooth sine wave signal is formed as a communication signal. In the design process, the initial idea is to use a square wave as the signal carrier. But in the process of the communication experiment, we found that after a mobile communication network, it had a great distortion due to plenty of high-frequency components. Much of the high-frequency components are amplified as interference signals, which have been unable to distinguish the valid signal. Therefore, we change carrier signal into sine wave in the latter experiment, which is at a different frequency of sine wave to present the different control signals, representing fast forward, slow forward, backward, turn left, and turn right. These frequencies generate a PWM signal of 46.8KHz after 256 divided in the PWM module due to S3C2440 using an external 12MHz crystal oscillator. The PWM signal of 46.8KHz is the carrier wave that generates the sine wave signal; then, respectively, 43, 28, 26, 32, 37, and 23 cycles of square wave form a complete cycle of sine wave; and the square wave is a duty ratio to the sine trend<sup>[11][12]</sup>. We use PWM register TCMPB0 and TCNTB0 to control the sine wave frequency changes due to the use of the same frequency carrier signal. In the passive low-pass RC filter circuit portion, due to the highest frequency sine wave signal being 1521Hz, the cut-off frequency of the passive low-pass RC filter should be greater than the maximum frequency of the sine wave. The cut-off frequency of the passive RC low-pass filter is calculated as (1)

$$f_c = \frac{1}{2\pi RC} \quad (1)$$

In order to attenuate the high-frequency component of the signal better, we use a second-order RC low-pass filter circuit in the circuit design.

$$R_1 = 470\Omega, C_1 = 0.2\mu F, f_{c1} = 1694Hz, R_2 = 1000\Omega, C_2 = 0.1F, f_{c2} = 1592Hz.$$

Processing on the transmitter of the phone, the phone's microphone transmitter inputs the communication signal. The signal generated by the microphone is 0~400mV, and the amplitude of the sinusoidal signal that is generated by S3C2440 is 3.3V; so, we need to access the microphone signal within 400mv. Here, we use a voltage divider circuit to convert the transmission signal to within 400mV, and the circuit consists of a 42KΩ resistor and a 510Ω resistor. The second-order low-pass filter circuit is illustrated next:

Figure 1. Second-order low-pass filter circuit.

### 2.3 Receiving end hardware design<sup>[13]</sup>

Because of the amplitude of the mobile phone sound signal being -1mV~100mV, and the signal strength being low that cannot be utilized for the after class, we use an LM358 amplifier that amplifies the sound signal. Using a reverse amplifier to connect to the negative feedback amplifier, and it can generate the signal whose magnification is 30, the signal can be used by the after class. When the receiver of the S3C2440 processes the sound signal, it uses the external capture function, which is composed by an external interrupt and timer to capture the rising edge of the amplified sound signal period. Then, it is converted to frequency so that we know the meaning of the control. Since the transmitter sends a sine wave signal to the mobile communication, in order to make the external interrupt capture the rising edge, it will receive a square wave signal that is converted by the sine signal after the signal amplification using a voltage comparator, and it can make S3C2440 capture the rising edge of the signal. In this section, the LM358 chip integrated two amplifiers as shown in Fig. 2. The first amplifier was used as 30 times the level before the reverse amplifier, and its output was connected to the input terminal of the second amplifier. The second amplifier was connected as a voltage comparator and compared with the amplified signal, and then a sine wave signal was converted to a square wave signal. The square wave signal obtained the control signal by measuring the S3C2440, which was sent to the controller chip of the robot via an asynchronous serial port. This will complete the transfer of a control signal.

Figure 2. Amplifiers and comparators.

### 3 SOFTWARE DESIGN

#### 3.1 Transmitter software design (Fig 3)

The software architecture of transmitter is divided into three parts: (1) Device Initialization; (2) Joystick control signal detection; and (3) PWM wave signal transmission. Figure 4 is the program of changing the PWM duty cycle.

Device Initialization needs to initialize the I/O ports, ADC module, and PWM timer initialization. The I/O ports initially set GPB0 port, namely the signal output of PWM for outputting. GPF0 to GPD3 is the input port with a pull-up resistor. GPC0 and GPC1 are the input port without a pull-up resistor. The initialization of ADC module involves choosing a reference voltage, which is VCC +5, setting GPB0 to PWM output, selecting the input signal channel, and setting the A/D converter clock. It should be noted that the A/D clock is a maximum of 2.5MHz and less than 1/5 of the PCLK. The initialization of PWM-bit timer is to set TCMPB0 and TCNTB0, and changing the size of TCNB0 can change the duty cycle of PWM. Joystick control signal detection section detects whether the A/D input is low.

It is believed that control joystick analog signals are ready to collect if the input is low. If is low, then it collects the joystick potentiometer analog signal by ADC. However, the control joystick uses two potentiometers that represent the horizontal and vertical, so it needs two module conversions to get the control signal completely and then determine the potentiometer signal. In the longitudinal direction, backward is less than 0x1FF; slow ahead is greater than 0x1ff and less than 0x2FF; forward faster is greater than 0x2FF; and in the lateral direction, left is greater than 0x1FF and right is less than 0x1FF. The joystick analog signal need to be detected and AD should be converted to S3C2440 after the joystick signal is detected. It needs to judge the meaning of the joystick signal after having obtained the analog joystick signal [14].

It can control the frequency of the sinusoidal signal after detecting the direction signal of the joystick control by PWM signal transmission section. PWM timer loads the TCNTB0 resistor, which is according to the trend of the duty cycle of the sine.

#### 3.2 Receiving-end software design (Fig.5)

The software architecture of the receiving end is divided into three parts: (1) Device Initialization section; (2) Frequency detection of the communication signal (Figure 6 is an input capture interrupt service routine); and (3) Serial communication.

Device Initialization needs to initialize I/O port, asynchronous serial port, and PWM-bit timer and externally interrupt EXTINT0. The initialization of I/O port is as an output port, and a pull-up resistor

    flag = 1;
  }
  else if (icp_n == 0)
  {
    cnt1 = ICRI;
  }
  icp_n++;
}
  
```

Figure 6. An input capture interrupt service routine.

is enabled. Asynchronous serial port baud rate is set by the initialization of the asynchronous serial port, which is transmitting and enabling the asynchronous data transmit mode, and it sets the parity in the asynchronous serial port baud rate<sup>[15]</sup>. External interrupt EXTINT0 is set to trigger the rising edge.

The frequency detection of communication signal is captured by using the rising edge, the trigger external interrupt, and then calling the PWM timer. When the first rising edge is captured, the value of the timer monitor TCNT0 is recorded. Then, when the second rising edge is captured, the value of the timer monitor TCNT0 is recorded. Seeking the difference between the two recorded values, we obtain the cycle of the input signal. Then, we come to know the frequency of the communication signal. After receiving the frequency of the communication signal, we must judge four times whether they are the same signals. If the judgment is passing, the control signal is set to send the robot through the serial communication section, and then the entire communication process will be received completely.

#### 4 EXPERIMENTAL ANALYSIS

First, when the transmitting terminal mobile phone calls the receiver, it sends the control instruction. Then, a computer serial port is used to receive the data of the asynchronous serial port on the receiving end. The following figure shows the waveform of the sound signal that it imports to the phone by transmitter. It can be seen from Fig. 7 that the transmitter of the remote control system can generate a standard sinusoidal signal that is smoother. The transmitter can send control signals effectively. Figure 8 shows a sound signal waveform of the receiving end. The frequency of the receiver and transmitter are controlled to a predetermined 1521Hz. It can be seen that the sound signal decreased only on amplitude, but the waveform details have better fidelity.

Figure 7. Waveform of the sound signal in transmitter.

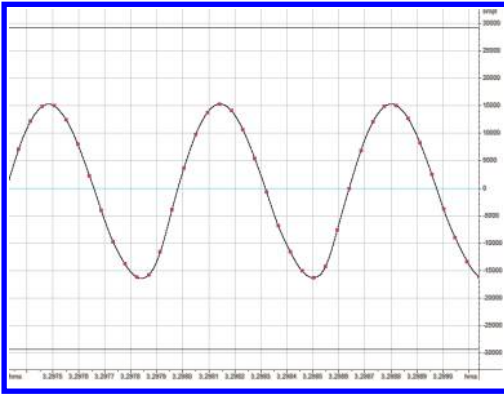

Figure 8. Waveform of the sound signal at receiving end.

## 5 CONCLUSION

The remote control system is based on ARM; its structure is simple, and it is easily accessible to the remote control. The system can increase the flexibility of the robot, especially in conjunction with a mobile network, and it compensates the shortcomings of traditional methods in practical applications. Later, we conducted a communication test: This test showed the feasibility of this method as well as the correctness and effectiveness of the remote control system.

## Design of access control system based on SEP4020

Ke Jia Ren, Qiang Li, Yan Lin Wu & Rui Min Liu

Faculty of Information Engineering and Automation, Kunming University of Science and Technology,  
Kunming, Yunnan, China

**ABSTRACT:** With the rapid development of computer technology, network technology, and growing demands of life and work, this kind of technology called “Access Control System” has penetrated into all fields of social life. The access control system belongs to Building Automation System (BAS). It plays a vital role in the field of intelligent buildings, property, and information, and its application has entered a better mature stage.

This article mainly expounds the research and design of access controller hardware circuit, and it implements the information storage, processing, storage, communication center, and other functions of the access control system. Finally, the design implements the communication control between the device and the network, which centralizes management and monitors all controllers by using access control system software. All the system data information of organization, storage, and management is according to the relational data structure via SQL database.

**KEYWORDS:** Access control system; SEP4020; Communication control.

### 1 OVERVIEW OF ACCESS CONTROL SYSTEM

Access control system<sup>[1][2]</sup> is also called the “gateway control system.” It is a management and control system that is in order to ensure people’s production, living, working, property safety, and important road entrances. Access control management is one of the main components in many contents of the modern security system. It has three features: advanced, security, and stability. The access control system realized the control of access by installing door contact, electric control lock, card reader, and other control devices in the building of entrances, elevators, warehouses, and other important departments and was monitored by a computer or a management person and porthole, the nature of the same object, and counterpart time real-time control. As the core of the access control, access controller completes the important work of field data collection, processing, transmission, and so on. Traditional access control is usually developed by SCM, using serial communication port to transmit data to a remote upper computer, and multiple access controller is usually composed of RS485 network.

This article proposes a new access controller architecture with Ethernet communication interface using embedded development. The CPU uses SEP4020, which is based on ARM7 core chip and designed by the Southeast University National ASIC System Engineering Research Center. In this article, each driver is designed and optimized by the building of Linux operating system development platform environment

in which the article is involved, and in accordance with the Linux2.6.16 kernel of SEP4020. It can achieve all functions of the intelligent access control system through the access controller hardware design and the development access management software<sup>[3]</sup>.

### 2 OVERALL DESIGN OF THE SYSTEM

The overall architecture program design<sup>[4]</sup> of the intelligent access control system that was based on embedded SEP4020 was shown in Figure 1. SEP4020 is the central controller of the system. The circuit design completes the control of the indicator, power, control power lock, access control button, and Ethernet communication.

Figure 1. Overall system architecture.

### 3 HARDWARE DESIGN OF THE SYSTEM

SEP4020<sup>[5]</sup> processor is the core of this design that is designed by the Southeast University National ASIC System Engineering Research Center. It uses a standard process design of 0.18  $\mu\text{m}$ , and it is embedded with ASIX CORE (32-bit RISC core, compatible with ARM729T, 8KB instruction data Cache and full-featured MMU). SEP4020 chip uses the Von Neumann structure, and it also integrates a variety of functions.

The hardware design of the access controller mainly includes the following<sup>[6]</sup>: First, SDRAM and NANA FLASH interface<sup>[7]</sup> circuit was designed standardized, in order to increase storage space and processing of the chip. Second, the design of watchdog can enhance the sensitivity of the entire circuit system. Later, the design of the communication circuit, where Ethernet and Ethernet communication are used, expands functions of the entire access control system to a great extent. The last, three kinds of ways to open the door (card reader, push button switch, and power lock) enable the whole access control system to support a variety of methods to open the door.

#### 3.1 SDRAM and NAND FLASH

##### 3.1.1 SDRAM Interface

Both nCSE and nCSF support SDRAM timing sequence. SDRAM read-write operation only uses the burst mode. When there is a plurality of read data or write data operations, a random access is continuous to read and write<sup>[8][9]</sup>. SDRAM random read sequence diagram is shown in Figure 2: The shaded part represents that the SDRAM is to be read by the system. But in these three cycles T0~T3, SDRAM has been in a state of looking for an address before a read command. Similarly, in the SDRAM random write sequence diagram shown in Figure 3, the shaded part represents the SDRAM is to be written. In these three cycles T0~T3, SDRAM has been in a state of looking for an address before a written command. This design uses a 32M byte of SDRAM; the model is K4S641632H, and it needs to continually be updated when it is used for temporary system data storage.

Figure 2. Random read operations.

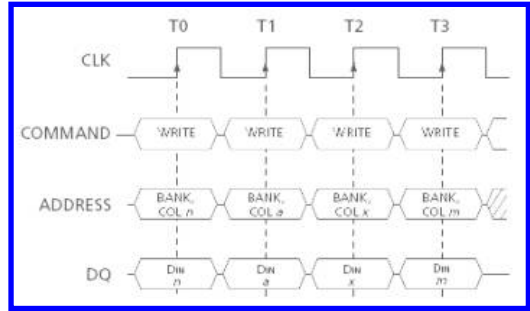

Figure 3. Random write operations.

##### 3.1.2 NAND FLASH Interface

SEP4020 provides a dedicated NAND FLASH<sup>[8][9]</sup> interface that can be compatible with a variety of NAND FLASH interfaces, and its single capacity is 512 byte, which can be compatible with the address for level 3 or level 4 of the interface. If its single capacity is 2K byte, it can be compatible with the address for level 4 or level 5. This design uses K9F1208U0C to connect with the main chip, which has a capacity of 512M bits and while it has a spare capacity of 16M.

The following will be a single-page capacity of 512byte: for example, which analyzes the relative timing NAND FLASH, and the shade part is configurable parameters. The relative timing of the single-page capacity of 2K byte is similar to the single-page capacity of 512 byte. A command word latch timing is shown in Figure 4, and an address latch timing is shown in Figure 5.

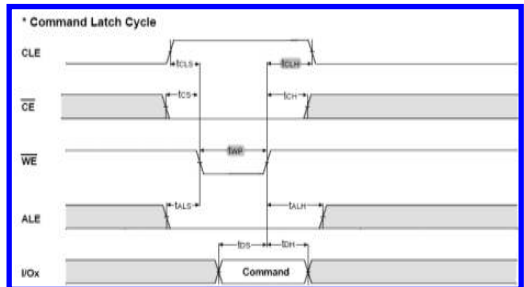

Figure 4. Command word latch timing.

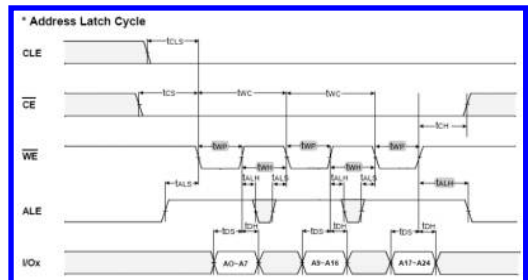

Figure 5. Address latch timing.

### 3.2 Design of the watchdog circuit

The main function of a watchdog circuit<sup>[8][9]</sup>: On the one hand, when the system is in the state of abnormal operation, the controller will restart automatically in order to improve the reliability of the system; on the other hand, when the program encounters an abnormal situation such as high-voltage electrostatic, etc, the watchdog circuit drives the controller and the system will restart automatically, thus protecting equipment. In this article, the monitoring circuit chip of PT7M7823 and three-state output bus buffer (SN74LVC125A) work together to achieve the function of watchdog of the access control system shown in Figure 6; that is, through this buffer gate to control whether the circuit is to be reset. The enable terminal (WD\_CTL (PB9)) of SN74LVC125A must remain at a low level to enable the buffer gate to work normally. When the control terminal (WDI (PB8)) is a high-level signal, the output signal is high, and when the control terminal (WDI (PB8)) is a low-level signal, the output signal is low.

Figure 6. Watchdog circuit.

### 3.3 Design of communication circuit

The access control system supports Ethernet communication interface; the circuit design is shown in Figure 7. The network controller chip of DM9161ELAN that is used in this article can adapt to the bandwidth of 10M and 100M, and it can support full-duplex and half-duplex communication. Its natural frequency of vibration is 50MHz, and its circuit of crystal oscillator is shown in Figure 8.

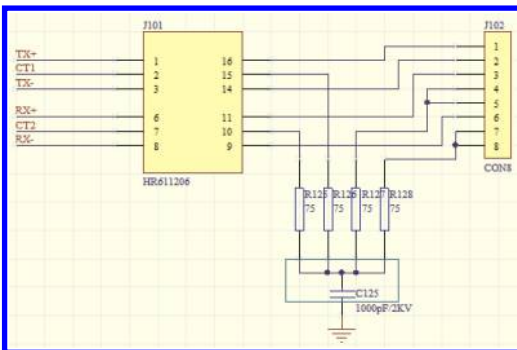

Figure 7. Ethernet interface circuit.

Figure 8. DM9161E crystal oscillator circuit.

### 3.4 Design of open circuit

#### 3.4.1 Reader control interface circuit

It uses a gate chip of 74LS08 that has four two-input. A 74LS08 logic chip can provide the same four-route card reader devices for the access control system to meet the need of readers in the access control system. The specific design of the circuit is shown in Figure 9.

Figure 9. Reader control circuit.

#### 3.4.2 Access button control circuit

It uses a gate chip of 74HC21 that has two four-input. It entirely meets the needs of four-route access button switches in the access control system. The specific design of the circuit is shown in Figure 10.

Figure 10. Button control circuit.

#### 3.4.3 Electric lock control circuit

It uses ULN2003A as a relay drive circuit, and ULN2003A is a seven-route inverter circuit chip. If its input is low, the output is high; if its input is high, the output is low. As shown in Figure 11, it adopts, respectively, ULN2003A to drive door relay of electric lock and its alarm relay. The electric lock relay is Falco's HK23F-DC 12V single-pole small signal relay, and the alarm relay of electric lock is HK3FF-DC 5V subminiature relay.

Figure 11. Electric lock control circuit.

## 4 SOFTWARE DESIGN OF THE SYSTEM

The section introduces the development of the driver<sup>[10][11]</sup> of the controller in the access control system and the development of PC management software.

### 4.1 Systems and drivers

The research of driver<sup>[10][11]</sup> in the access control system is very important. The system uses Linux<sup>[11]</sup> as the development platform, system version is Fedora 7, and kernel version is Linux2.6.16. In this design, the driver mainly includes electric lock relay control driver, alarm relay control driver, a single pin drivers of SEP4020, buttons driver, card driver, and PWM drivers. Their specific corresponding driver name is shown in Table 4-1.

Table 1. Margin settings for A4 size paper and letter size.

Driver name	Function
sep4020_door*.ko	Control the four black relays
sep4020_export*.ko	Control the four yellow relays
sep4020_gpio.ko	Reading, writing, single custom pin of 4020
sep4020_switch.ko	Read the states of four buttons
sep4020_wiegand2634.ko	Swipe card to read the serial number (follow Wiegand protocol, no parity )
sep4020_pwm.ko	PWM wave drive, realize voice function

### 4.2 Access control management software

The system uses the technology of Qt<sup>[12]</sup> to configure it, and development on VS2010<sup>[13]</sup>. The access control system management software mainly includes the following<sup>[14][15]</sup>: Controller setting unit, Information center unit, Permissions setting unit, Access control units, and advanced functionality modules.

- 1 Controller setting unit: Mainly for equipment management, the controller can increase

- information manually, such as the device serial number, name and address, and so on. This management software can also delete and modify the controller device;
- 2 Information center unit: This mainly includes department number, name, contact details, identity card number, and so on: after adding staff card data, it needs to be given the appropriate permission and upload to the controller;
- 3 Permissions setting unit: Permissions of access control system are divided into the default permission and custom permission. If the access card is default permission, it can swipe open within the effective date, and it can be used as a chief card. If it is custom permission, then all the items can be set free;
- 4 Access control units: Detect whether the communication of the controller in LAN is normal or abnormal; Calibration time; Operations management authority (under such circumstances); and so on;
- 5 Advanced functionality modules: These mainly include the device properties settings, chief card and management card settings, interlock function settings, super password function, emergency settings, alarm output settings, and timer task setting;

The specific classification and functional division is shown in Figure 12, which depicts the topology structure of system software function.

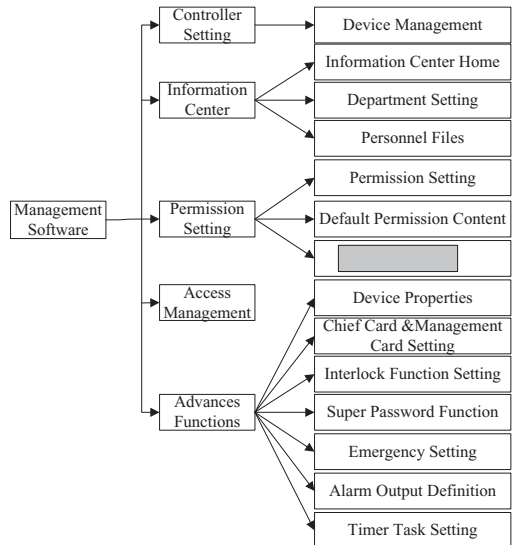

Figure 12. Topology structure of management software.

## 5 CONCLUSION

Through the research and analysis of the access control management system, we design the access control system, which has a fully functional and high reliability. We conducted hardware design and optimization of a series of related serial interface circuits based on SEP4020. The design implements the function of the access control system, such as information storage, processing, preservation, communication center, and so on. Finally, the design realizes entire devices of the access control system and network communication based on the access control system management software.

## Study and practice on teaching mode in electric automation technology specialty of higher vocational colleges based on CDIO

L.Y. Fang

*Guangdong AIB Polytechnic College, Guangzhou, China*

F.G. Wu & X. Zhang

*Guangdong University of Technology, Guangzhou, China*

X.Y. Zhou & S.W. Fu

*Guangdong AIB Polytechnic College, Guangzhou, China*

**ABSTRACT:** This article aims at solving the problems in current Electric Automation Technology Specialty (EATS) and the requirements of professional talents in the enterprise. In this article, taking “CDIO” as the guiding idea, we put forward a new teaching mode, which includes the construction of a double-qualified faculty team, the development of a professional curriculum system based on “professional tasks,” the systematized course development based on the working process, the progressive design of the practice teaching system, and the method of “3 + 1” teaching evaluation. Over the past three years, the teaching mode was applied in EATS of our college; we obtained a higher rate of employment of 98%, which was more than the 93% pass rate of skills training and the higher job satisfaction for the students and the enterprises. The practice demonstrates that it has a certain reference value for other higher vocational colleges.

**KEYWORDS:** CDIO; teaching mode; electric automation technology specialty (EATS).

### 1 INTRODUCTION

High vocational education undertakes the task of bringing up high-quality and high-technological experts who meet the need of the production, construction, administration, and service sectors. In the teaching mode, one can neither borrow regular higher education nor copy the method of secondary vocational education; we must set up the teaching system with higher vocational characteristics by the integration of higher basic education and vocational education<sup>[1]</sup>. The employment-oriented vocational education is a kind of vocational education that spans across occupational area and teaching area, and it is a kind of typical cross-border education<sup>[2]</sup>. The culture of vocational education or vocational colleges, which is integrated into the culture of enterprise culture, is a kind of campus culture and educational culture; in a word, it is a cross-border culture<sup>[3]</sup>. In recent years, most of the colleges and universities in our country are intensely aware that it is important for enterprises to incorporate into them, so they put forward some advanced teaching ideas, such as the “university-industry collaboration,”<sup>[4]</sup> <sup>[5]</sup> “interaction between colleges and enterprise,” “Cooperation of colleges and enterprises, combination of work and study,”<sup>[6]</sup> and so on. The teaching mode of “CDIO” is

developed during the period, and it is an entirely new engineering education mode. The CDIO <sup>[7,8,9]</sup> idea (CDIO is a trademarked initialism for Conceive — Design — Implement — Operate) is an innovative educational framework for producing the next generation of engineers. The framework provides students with an education that emphasizes engineering fundamentals set in the context of Conceiving-Designing-Implementing-Operating real-world systems and products. This teaching mode coincides with the ideas of the outline for talent development plan in the national medium and long term (2010–2020).

EATS in our college is a comprehensive and wide-caliber specialty covering science, engineering, art, management, and other disciplines; it demands the implementation of comprehensive training for students. It aims at improving professional skills and professional quality in all aspects. It is urgent that we give great impetus to the ideas of CDIO by reforming the traditional teaching mode. In this article, taking “CDIO” as the guiding idea, we put forward a new teaching mode. Through the practice in EATS of our college, it shows that an attempt has been made to improve students’ rate of employment and pass rate of skills training, and it also obtains higher job satisfaction for the students and the enterprises.

## 2 RESEARCH STATUS

In foreign countries: The CDIO concept was originally conceived at the Massachusetts Institute of Technology in the late 1990s. In 2000, MIT in collaboration with three Swedish universities—Chalmers University of Technology, Linköping University, and the Royal Institute of Technology—formally founded the CDIO Initiative. It became an international collaboration, with universities around the world adopting the same framework.<sup>[7,8,9]</sup>

At home: From December 14 to 15, 2008, the Department of higher education of science and Engineering Department and Shantou University jointly organized the pilot job conference of CDIO engineering education mode. In the conference, they chose 18 colleges and universities for the first pilot batch under which the education theory and practice research of CDIO would be carried out. With further research, more and more scholars have found that the CDIO idea is applied not only to universities but also to vocational colleges. However, vocational education still requires some time to explore a suitable “CDIO engineering-driven” road.<sup>[10,11]</sup>

In our specialty: After market investigation, professional requirements for the corresponding position in our specialty are as follows: repairers in power supply system and electrical installation; operator and designer in automatic control system. These jobs demand professional ability that is involved in the CDIO, but “CDIO Initiative” in the traditional teaching of EATS is lacking: There is no textbook and teaching equipment applies to the CDIO mode. The teachers’ ideas and methods are still traditional, the classroom and practical training room are not suitable for the CDIO teaching mode, and so on.

## 3 RECONSTITUTION OF THE “CDIO” TEACHING MODE

In this article, we take the EATS of Guangdong AIB Polytechnic College as an example. We analyze the construction of the double-qualified faculty team, the development of the professional curriculum system based on “professional tasks,” the systematized course development based on the working process, the progressive design of the practice teaching system, and the method of “3 + 1” teaching evaluation. These are specified as follows:

### 3.1 Construction of teaching staff

In the teaching mode reform, the teacher plays a decisive role. Without double-qualified teachers who possess practical technology of the first line, higher

vocational education would not be able to train vocational skilled and applied talents who are needed in the market. Thus, the cultivation of double-qualified teachers with solid theory knowledge and skilled operation is the key.

### 1 Building a perfect prompting system:

The major incentive means of teachers are target, policy, economic incentives, emotional incentives, and so on. In our college, the construction of double-qualified teachers has a clear incentive mechanism to encourage teachers actively involved in technology research and development service activities. The certain material rewards and a certain amount of compensation are given to the teacher who makes technology research and development service activities; sets up special funds for curriculum construction, professional construction, and building scientific research reward. Teachers who obtain double-qualified qualification will be given preferential access to study abroad and undertake advanced studies.

### 2 Training transformation work post-practice:

In the new teaching mode, teachers are required to transform from the internalization of subject knowledge structure to the externalization of technical ability structure. Many teachers in higher vocational colleges have a solid theoretical knowledge but lack work experience in enterprises. In order to solve these problems, we can conduct training programs in summer, serve temporary positions in enterprises, arrange lectures and discussions, conduct skill appraisal evaluation, learn new technology, and so on. Meanwhile, teachers are required to practice on the job, and the specialized courses are replaced every 2–3 years.

### 3.2 Development of professional curriculum system based on “CDIO”<sup>[3]</sup>

In the book, *To teach is to learn—teachers’ basic knowledge reader of higher vocational college*<sup>[1]</sup>, it is mentioned that the design of teaching tasks is derived from the enterprise and more than the enterprise, it will be upgraded to an educational process rather than repeat the working process simply in enterprises. In the development of a professional curriculum system, we conduct an analysis of the profession for the post (group); sum up the technical and operational capabilities that the students need; and design the working process as shown in [table 1](#):

### 3.3 Development of specialized course based on “CDIO”

After the development of a professional curriculum system is completed, according to the principles and

Table 1. Development of professional curriculum system for EATS.

Typical work tasks <sup>Ⓟ</sup>	Areas of action <sup>Ⓟ</sup>		Learning areas <sup>Ⓟ</sup>
1. use and maintenance of electronic instrument <sup>Ⓟ</sup> 2. selection, installation, debugging and use of electro-nic components <sup>Ⓟ</sup> 3. use and maintenance of electrical instrument <sup>Ⓟ</sup> 4. layout of the indoor lighting circuit <sup>Ⓟ</sup>	repairers in power supply system and electrical installation <sup>Ⓟ</sup>	1. testing and maintenance of Instrument <sup>Ⓟ</sup> 2. methods of the systematized course development based on the working process, we design the course elaborately—the design of the learning context. In this article, we take the course of inverter technology application as an example to design learning contexts (see table 2).

### 3.4 Progressive design of practice teaching system based on “CDIO”

On the basis of the design principles of the professional curriculum system, we carry out social

investigation, decompose and restructure professional knowledge, ability, and quality With regard to professional post (group), we optimize the practice teaching system and then set up a progressive practical teaching system based on “CDIO.” It mainly contains the professional basic skills, professional individual ability, professional comprehensive ability, and so on, corresponding with the basic experiment layer, engineering training layer, and comprehensive improvement layer, respectively. (see figure 1).

Table 2. Development of specialized course of inverter technology application for EATS.

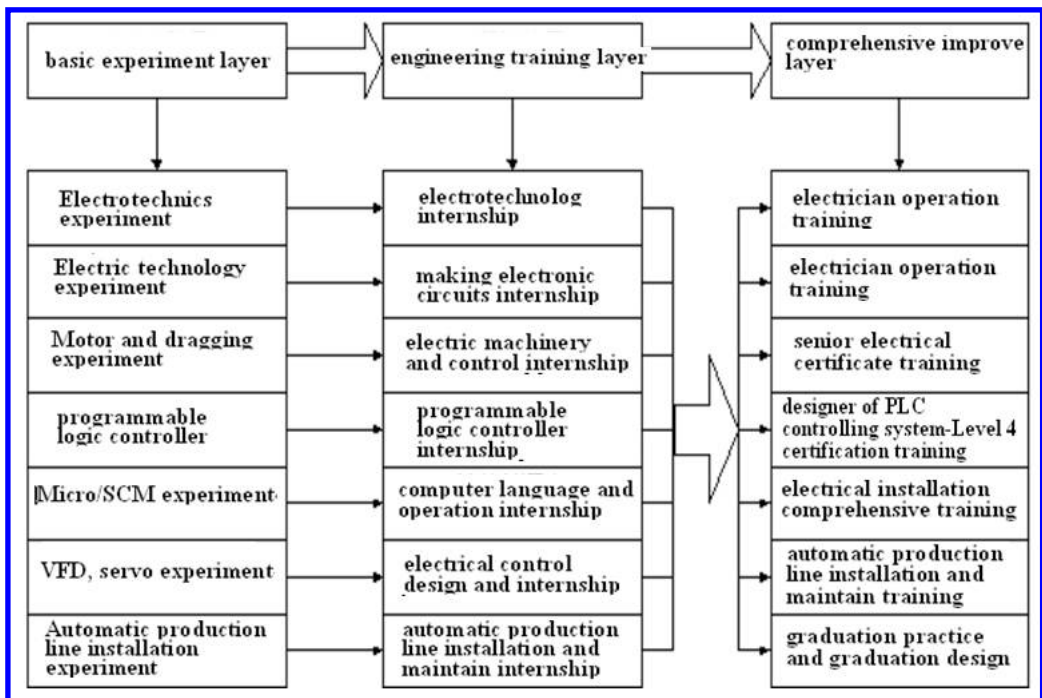

Figure 1. Progressive design of practice teaching system for EATS.

### 3.5 Method of teaching evaluation based on “CDIO”<sup>[14]</sup>

For higher vocational colleges, the “end product” is a graduate, and the ultimate object of service is employers. The quality of graduates has to be tested by employers, so we take “3 + 1” mode of evaluation in teaching evaluation. The “3” in the “3 + 1” evaluation mode refers to the following:

- The evaluations of students for the teacher in the learning course: Students are the direct experiencers of course view, so their evaluation has a certain fairness objectively; it accounts for 30% of the proportion of the whole evaluation.
- Teachers’ self evaluation: The purpose of evaluation is not to prove but to improve the teaching quality and to promote teachers’ personal

development as the ultimate goal. It accounts for 20% of the proportion of the whole evaluation.

- Internal evaluation of college: The evaluation is made by the supervisor, leadership, colleagues, and so on. It accounts for 20% of the proportion of the whole evaluation.

The “1” in the evaluation mode of “3 + 1” refers to the following:

- The evaluations of employers: To introduce the evaluation of employers in the students’ practice, skills training and evaluation, post-practice, and employment. Through tracking, social practice and internship situation, employment situation, and career development situation of students, we make the enterprises participate in the evaluation. We rely on these indirect means to gauge whether or not the positioning of talent cultivation is meeting the demand of talent for enterprises.

#### 4 SUMMARY

The new teaching mode based on “CDIO” discussed in this article breaks the guiding ideology of the traditional higher education course based on the subject system. It requires that teaching content should be geared to the needs of the workplace, and the method of teaching with the systematic work process should be built. It also emphasizes human’s all-round development based on employment as the guidance and profession as the career.

Currently, the teaching mode has been put into practice on a trial basis in EATS of our college. We own 1 excellent course in the province, 6 excellent courses in the college, 1 patent item, and 4 textbooks that have been published over the past three years. More than 15 students have won three prizes above province level in skills competitions. We also obtain a higher rate of employment of 98%, more than 93% pass rate of skills training, and higher job satisfaction for the students and the enterprises. The practice demonstrates that the new teaching mode has a certain reference value for other higher vocational colleges.

## The application of task-based approach in the teaching of broadcast media—the case of Video Creation course

Han Liu

*School of Media and Art Design, Wuhan Donghu University, China*

Yong Jun Guan

*School of Finance and Economics, Guangxi University of Science and Technology, China*

**ABSTRACT:** This article, based on the task-based approach as the core, combined with the practical teaching of Video Creation, discusses how to apply this method to the teaching content. The author put forward a set of perfect teaching design methods, ranging from the task goal, task content, task process, the roles between teachers and students, to the teaching environment, which can standardize the effective use of this method in the practice of Video Creation, and it can consolidate the teaching achievement of this method, thus forming a richly guiding teaching mode. We can conclude that the task-based approach is a kind of student-centered teaching method, which can greatly help the teaching reform in the future.

**KEYWORDS:** Task-based approach; Video Creation.

### 1 INTRODUCTION

The Video Creation course requests the students divided into groups to produce a complete video independently, under teachers' guidance. The process starts from the theme planning to material collection, shooting, and editing. Due to the particularity of the teaching content, the teaching method also puts forward special requirements. The research emphasizes how to apply task-based approach to these courses, and it puts forward a set of perfect teaching design methods, strengthening the teaching effect.

The task-based approach, originally called Task-based Language Teaching, was first used in a Language Teaching method, and it refers to completing the task by the teachers' guide in class. This method emphasizes "learning by doing," development of communicative teaching, which has increased since the 1980s, and it attracted widespread attention of entire language education. In recent years, the theory of "doing things" has gradually been introduced into other classroom teaching, is no longer confined to language teaching, and was introduced into our country, which has influenced our teaching reform of the course. In the process of its development, combining other teaching methods and absorbing the advantages of others makes an integration development.

"Task-based approach," as a kind of teaching method, forms a structure, consisting of goals, input, activity, teacher/student role, setting, and so on. Teaching is based on task, in the process of

task performance containing participation, experience, interaction, communication, and cooperation, which give complete cognitive ability to the learners. Although domestic scholars have different opinions about the operation process of this theory, the following consensus is reached: 1, The "task drive" is a kind of teaching model based on constructivism teaching theory, student-centered learning. It emphasizes the creation of the task situation and the team cooperation. 2, The task needs a specific target point. 3, The new knowledge is integrated into one or a few typical tasks. 4, Task is the center of the learning activities. 5, Students completely understand the meanings through the analysis, discussion, and achievement of the task.

In the traditional teaching of the Video Creation course, we emphasized the importance of practice teaching, but still paid more attention to classroom teaching, laying particular stress on the teacher-centered teaching mode. Theoretical teaching and practical training are set up. Their drawback makes it obvious that knowledge learning takes place in the classroom, whereas the practicing operation in the spot is isolated. Learning and practicing of students are passive, which is unfavorable to the cultivation of innovative thinking and innovative ability. We should be aware of the importance of the teaching model reform; we have used the task-based approach as the core, combining with the long-term teaching practice of the Video Creation course, and explored the concrete application of this teaching method from five

dimensions, respectively, to further explore a reasonable and effective “task-driven” teaching mode.

We based the specific process of teaching implementation on the theory of the task-based teaching, and applied it to the practical teaching of Video Creation from the five dimensions, respectively, in order to explore a reasonable and effective teaching model.

The research content is as follows:

## 2 RESEARCH OF THE TASK OBJECT

### 2.1 *Setting the teaching mode based on “task”*

The “task-based approach” mainly refers to designing or creating a kind of activity similar to the actual working situation. The students may acquire knowledge, use knowledge, practice skills, and improve the ability of such activities. It emphasizes that “real situation, learning by doing, doing by learning, mutually reinforcing.” It emphasizes the importance of practice and advocates the use of theory that cannot be divorced from reality.

### 2.2 *Setting the overall goal of teaching*

The task-based approach demands students to work in groups while playing different roles such as producer, cameraman, reporter, director, host, juicers, editor, effect artist, and so on. The whole process of teaching according to the basic order of career action asks students to complete the various tasks, with the feeling of a different experience. Each student must take a subjective initiative, fully cooperate in data collection, social investigation, and practicing, look for interviewees, contact shooting places, and so on, in order to construct the knowledge and skill system.

### 2.3 *Setting the career goal corresponding to teaching*

According to professional training goals and courses teaching purpose, taking the three aspects of professional ability, social ability, and method ability into account, researching extensively on the market of medium-sized film and television companies, we can form a mature designer’s professional standards: Complete a full digital video independently or cooperationally.

## 3 RESEARCH OF THE TASK CONTENT

### 3.1 *Teaching content would be divided into several tasks*

According to the requirements of the professional goals, we set a total of nine teaching units. Specific

tasks contain camera technology, shooting script creation, static shots, motion shots, studio shots, news shots, documentary shots, composite shots, and synthesis technology of video.

### 3.2 *Integrating the teaching task and the work task*

In the teaching process, taking film and television production center and co-operative project as their teaching career, students can complete their project tasks as well as teaching tasks simultaneously. The real work content is introduced into the teaching process, so that the students may improve their professional ability in a real work environment. The students should analyze and solve problems and complete their tasks in the process of practical work tasks, according to the enterprise standard.

### 3.3 *Putting the real material into the content of the task, to ensure a more operational task environment*

When the concept of “input material” is put forward in the task-based approach, it refers to the auxiliary materials used in the task. For example, studying camera technology, it is necessary to give students professional photographic equipment, as well as tape, microphone, tripod, rail, and so on; learning about lighting techniques, we need to provide a lighting environment in studios. Editing learning needs to be provided professional editing equipment and software, as well as material collection device. Providing these materials enables the task to be performed more operationally and combined with better teaching.

## 4 RESEARCH OF THE TASK PROGRAM

“Task program” refers to operation methods and steps used by learners in performing a task. To a certain extent, it is “how to do.” It includes the location of a task in the task sequence, the sequence and time distribution, and so on.

Teaching activities switch to “teaching” center from “learning” center, and then the students become the main body of teaching. The role of teachers changes to designing and organizing teaching activities, creating a situation, presenting problems, instructing the process, monitoring the operation, and evaluating the results instead of lectures only.

### 4.1 *Design and organization of the teaching task*

The whole teaching process comprises a task of nine units, not individuals, but a progressive unity. Following the rules of the growth of the television cameraman, the tasks should be arranged from

fostering special ability to integrated ability in actual projects. The difficulty of each single task should also be set from easy to difficult, conforming to the logical requirements of the curriculum system.

#### 4.2 *Creation of situation*

In a single task of teaching, a corresponding situation can be set. For example, static shots can simulate candid photos' situation; motion shots can simulate the following shots of life. The studio shooting can create the situation of the studio interview; news photography can set the situation of piece to camera.

#### 4.3 *Problems are put forward*

For each specific task, there will be some problems. These questions actually arise from the key points in the teaching content. For example, what should be noticed in swing shots? What kind of scenes should be used in the beginning and end of a paragraph? What are the advantages of the over-shoulder shooting method and how should it be used? How to operate the key technology of Blue Background? and so on. Problems are put forward that might have existed before the start of the task, also can be done in the missions and after tasks.

#### 4.4 *Process guidance*

The teacher should guide the implementation of the whole task. Combined with the task, knowledge points are transmitted to students in a timely manner; the problems of the students should be solved at any time.

#### 4.5 *Monitoring the action*

In the process of operation, teachers should monitor the whole task fully in respect of segregation of duties, role playing, overall progress, schedule, and participation enthusiasm; correct the act while not conforming to the requirements of the task in time.

#### 4.6 *Achievement evaluation*

Each task should have corresponding results after the completion. Students may report the experience and lessons in the process of task, and the teacher should finally give a comprehensive evaluation and corresponding suggestions.

### 5 RESEARCH OF ROLES BETWEEN TEACHERS AND STUDENTS

The teacher is the center in traditional teaching, and teaching activities are given priority to the lectures. This kind of situation in the relationship between

teachers and students is often unequal. Because teachers stand on high pulpits, this gives a sense of authority of the inviolability. Students are used to listening and memorizing, rather than thinking and judgment; thus, they fall short of independence. The task-based approach demands teachers to interact with students while standing on the platforms and making equal dialogue with them.

#### 5.1 *Students are the main body in the process of action*

According to the basic order of professional activity, students plays different roles such as producer, cameraman, reporter, director, host, and juicers in groups, and they complete various tasks, with the feeling of a different experience. Students must exhibit a conscious activity in autonomous learning, social investigation, and practice; contact interviewees; and shoot places.

#### 5.2 *Teachers are guides of action process*

In task-based teaching activities, the theory and practice are mixed. In the process of organizing students to complete a task, teachers should explain, demonstrate, provide guidance, and correct the non-standard acts or errors for students at the appropriate time. Simultaneously, teachers are organizers and evaluators of the whole work, as well as leaders of teaching, helping students acquire professional knowledge skills and develop their expertise.

#### 5.3 *Teachers are also participants of a task*

The teachers can be monitors and mentors as well as participants. Tasks need not make a clear distinction between the role of teachers and students, but they should imply or reflect the characteristics of teachers' and students' roles. In the design of the task, the roles of teachers and students can also be clearly defined, to promote the task more smoothly and effectively.

### 6 RESEARCH OF TEACHING ENVIRONMENT

In the process of the implementation of the task-based approach, we also should pay attention to the modern teaching technology. The use of the modern teaching technology not only promotes the development of teaching activities, inspires the students' interest in learning, but also improves the teaching effect.

#### 6.1 *Use of multimedia technology*

Multimedia technology, combined with audio, visual, pictures, and text as a vivid whole, is used to make the multimedia courseware and display outstanding

film and television works that can improve the teaching effect. Students also can understand the teaching content better.

### 6.2 *Establish VOD video network online*

Video-related courses require students to view a large amount of image data, in order to improve their expression ability in film and television language. The audio-visual department of the University collected a large number of films, television programs, and documentaries, to set up the campus VOD system that would enable students to study in the network. We can also set up an audio-video database in the teaching and research section, for the aim of teachers' learning.

### 6.3 *Develop online course platform*

The school's excellent course of "Radio and Television Program Production" group developed a website of the course, to set up a platform for the autonomous learning of students. We can also develop online courses on the website, providing learning guides, experts BBS, online answering of questions, network connections, video information, learning materials, examination papers, and other related contents for students. Thus, students can prepare for the learning tasks before the class and communicate after class.

## 7 CONCLUSIONS

From the practice of the task-based approach, we can see that this method organizes teaching, through mobilizing the learners' own cognitive ability to participate, experience, interact, communicate, and cooperate in the process of task performance. The method provides a new suitable means of practical teaching innovation by further strengthening the teaching idea of "learning by doing" and "learning by using," and it fosters a "task driven and real situation" teaching mode.

Using the task-based approach gives full play to the students' enthusiasm and initiative, due to the emphasis on students, who are the main part of the cognitive process. The students' learning is done in the process of task implementation, and also the

construction process of knowledge is driven by completing the task under the guidance of teachers.

So, in essence, it is a kind of student-centered teaching method that is consistent with the goal of teaching reform in our country. The theoretical and practical summary of this teaching method can further consolidate the achievements of the teaching methods used in the course, form a richly instructive teaching mode, and provide beneficial reference for other subjects of a school's teaching method reform.

## ACKNOWLEDGMENTS

# Research on “4 in 1” and “4D linkage” university—enterprise cooperation training base—taking the major of software technology in high vocational education as an example

Yan Fei Liu, Cheng He  
*Zhongshan Polytechnic, China*

**ABSTRACT:** Training base construction is an important breakthrough that promotes the cooperation between higher vocational school and enterprise, reforms modes of talent training, constructs the independent practice teaching system, and improves the quality of skilled person training. According to the characteristics of regional economy and the demand situation of talent, the major of software technology has built a “4 in 1” training base, which includes Teaching Training Center, Technical Service Center, Research Institute of Information Technology, and Student Innovation and Entrepreneurship Center, and a “4D Linkage” practice teaching system for training students to work in practice smoothly from school and providing more application-oriented software talent with a high quality for the local region.

**KEYWORDS:** Application-Oriented Talent, “4 in 1” Training Base, “4D Linkage” Practice Teaching System.

## 1 SITUATION AND PROBLEMS ON CULTIVATION OF PROFESSIONAL SOFTWARE TALENTS

In the background of talent demand on leap-forward development of the software and information service industry, software technology has become a popular major in higher vocational colleges. But in recent years, due to the fact that enterprise software talent is in short supply, graduates of software technology are suffering a depressing employment situation, and the reasons are as follows:<sup>[1]</sup>

- 1 Students cannot adapt to jobs quickly, getting into the role;
- 2 There is a certain gap between the needs of the enterprises and the students’ knowledge structure and ability
- 3 The students and enterprises cannot achieve “zero distance” employment;
- 4 Students are not proficient in their application of software development and development tools;
- 5 Students are lacking experience of project development, and their social practice ability needs to be improved.
- 6 The theoretical knowledge that the students acquire in school has a few associations with practical development, and the students are not familiar with the operation process.
- 7 The teamwork, innovative ability, and independent thinking of students will not get a workout.

Enterprises need integrated talents who have development experience, get into the task quickly, and ensure the quality as well as progress of the whole project development with a high quality. But higher vocational schools with this major focused more on the development of academic and professional research-oriented mode of talent training, attaching importance to students’ theoretical knowledge, instead of paying attention to the cultivation of practical application. Their target focused more on research model and academic model, lacking the ability to solve problems independently.

## 2 EXPLANATION OF “4 IN 1” AND “4DLINKAGE” UNIVERSITY-ENTERPRISE COOPERATION TRAINING BASE<sup>[2][3]</sup>

According to the talent demand situation, in order to cultivate the seamless joint between the study in school and practical work, providing qualified and applied software talents for local region, we have built the “4 in 1” training base system, including teaching training center, technical service center, research institute of information technology, Student Innovation and Entrepreneurship Center, and the 4D linkage practice teaching system.

### 2.1 “4 in 1” training base

The “4 in 1” training base consists of teaching training center, technical service center, research institute of

information technology, and Student Innovation and Entrepreneurship Center.

1) Teaching Training Center

Software profession includes four major directions, which are JAVA application direction, Microsoft application direction, mobile application development direction, and game development direction. According to these four professional directions, integrating existing training rooms' equipment, setting training applied and technical personnel as target, we should set up software development training rooms.

2) Technical Service Center

Information technology institute is a private non-enterprise entity established by the computer department. It consists of four studios: mobile game studio, fly-software design studio, Feifan development studio, and the android application development studio. The four studios, respectively, correspond to four professional directions of software technology: game development direction, development direction, Microsoft JAVA development direction, and the development direction, proving support for their own professional direction.

3) Research Institute of Information Technology

Relying on Software Industry Association in Zhongshan city, the Training Base cooperates with zhongshan network co., LTD and other enterprises that provide website construction service for small and medium-sized enterprises and promotes the achievements of software. Combined with the local industry development, the Training Base provides software technical support services for the economic development in Pearl River delta region.

4) Students' Innovative Entrepreneurship Center

Innovation entrepreneurship education is one of the features of the school, and the entrepreneurial practice is the only state-level entrepreneurial class with a high quality. In recent years, mobile apps and mobile game development and sales have boomed, bringing business opportunities for software technology professional students. In the background of entrepreneurship, the students majoring in software established Students' Entrepreneurial Works to encourage and support entrepreneurial activities.

2.2 "4D linkage" practice teaching system

Based on the "4 in 1" training base system, software technology adopted 4 linkage practice teaching systems to teach students. The teaching training center is responsible for the cultivation of student's ability of software development and practice exercise. Simultaneously, they are responsible for team cultivation of innovative ability. The research institute of

information technology is responsible for the technical guidance to the students' innovative entrepreneurial ability, making teaching design for the finished software products and providing teaching products for the teaching center. Simultaneously, it realizes the transformation of the project achievements and provides outgoing services project achievements for the technical service center. Students' innovative entrepreneurship center mainly provides a forum for the students' innovation ability and policy support. Simultaneously, it provides achievements for the technical service center. The technical service center transforms the part of achievements from Research Institute of Information Technology and the Students' Innovative Entrepreneurship Center and provides software service for the local region. "4D Linkage" practice teaching system is depicted in Figure 1.

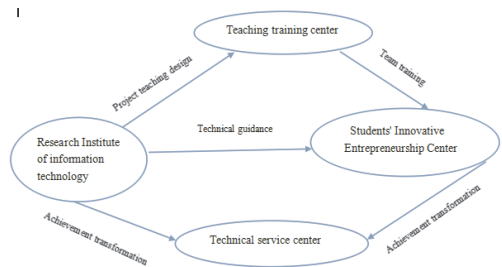

Figure 1. "4D Linkage" "4D Linkage" practice teaching system.

The freshmen majoring in software use a programming-based online test system to carry out the training; the sophomores focus on "product development"; and the juniors use the off-campus practice base enterprise to carry out comprehensive training ability. Through the three-stage training, the students will gradually improve their professional ability and smoothly get into the work.

3 CHARACTERISTICS AND INNOVATIONS OF "4 IN 1" AND "4D LINKAGE" UNIVERSITY-ENTERPRISE COOPERATION TRAINING BASE

Zhongshan city in Guangdong province possesses 24 national-level industrial towns, involving 26 industries, which means upgrading industries requires more and more information technology and software talents. In line with the unified plan of the institute, the major of software technique sets the professional direction to provide talent support for software development and information service. Among the four directions of software technology, the game development direction is in line

with the game industry base, zhongshan creative design industry and electronic education industry in Gangkou town in zhongshan city. Microsoft Java application development, application development, and mobile application development cultivate and transport IT talents for the enterprises related to the 26 industries. Docking local industries' characteristics, based on product development, software technology adopted the talent training mode of "one major one product." The professional directions of four subordinate representative software products are shown in table 1 A. Typical software products generally break down into four projects and a graduation design project of the term. After three years of study, students can better understand the working process of the product development, basically grasp product development and practical skills, and have the professional quality of IT personnel. Product details are provided in table 1.

Table 1. "Products" list of four major directions from major of software technology.

Major directions	Product	Achievement
Game development	Super Mario War	Game products, teaching document products of decomposition, teaching material.
Mobile application	Zhouheiya App	App of android version, teaching document products of decomposition, teaching material.
JAVA application	Formative assessment system	B/S System, teaching document products of decomposition, teaching material.
Microsoft application direction	Web bookshop system	B/S System, teaching document products of decomposition, teaching material

Relying on industry characteristics of "one town one product," "one town one industry," and economic development mode and development trend, software technology optimizes and improves the talent training scheme, achieves "one product one major" personnel training mode, improves the corresponding supporting training rooms, strengthens the construction of teaching staff and teachers training, sets the power of multiple training rooms to build a software technology training center, unified operation, effectively provides service for the zhongshan software technology transformation and upgrading of industry and enterprise technology innovation, and becomes the sustainable development of the software industry innovation, as well as the combination

of production, technology transfer, and business incubators.

- 1) Make comprehensive arrangement of the school resource to establish an experimental practice teaching platform.

Around the school characteristics of "one town-one product-one major" and the opportunity that we are building a provincial-level key major, we make comprehensive arrangement of the school resources, make cross with digital media; use the specialty of art in digital media and the feature that professional project development requires a lot of art resources to make deep fusion with digital media; develop cooperation together; and build functional intensive resource optimization, as well as an open and efficient professional training teaching experiment platform.

- 2) Combination of experiment practice teaching and scientific research of software development

Through the carrier of zhongshan institute of information technology, which was established by our department, we connect teaching and scientific research; make the practice of software development support practical training teaching; lead the students to the development of the actual software products; and improve the students' ability of product development and innovation ability.

- 3) Innovate university-enterprise cooperation mode and build the system and process based on enterprise management and operation.

Software technology, respectively, makes cooperation with institutions associated with the software technology (such as software association of zhongshan city, information industry association in zhongshan city etc) and enterprises related to software technology. A software technology professional council is set up, apart from the system of management and operation. The principle of shared principles and market-oriented operation are adhered to, and resource utilization and economic benefits of practice training bases are improved.

- 4) Conduct international exchange and cooperation, promote research achievement

The major of software technology actively absorbs the professional concept of vocational education professional qualification standards and the teaching standards in the developed countries and districts, such as Germany, Singapore, Hong Kong, and Taiwan; improves the vocational education curriculum system, curriculum, and assessment standard. The backbone teachers and students are regularly sent to Taiwan, Singapore, and other international cooperation schools for a month to half a year's study; academic curriculum reform of the teachers' teaching and professional communication and learning is

done. Foreign excellent software technology experts are hired to take part in the writing and construction of the training teaching material and to popularize the best training teaching material to other colleges and universities.

#### 5) Innovative Entrepreneurship

With the environment of school and market, we further encourage students of software technology to do business innovation and provide a good platform and environment for the students.

### 4 SAFEGUARDS OF “4 IN 1” “4D LINKAGE” UNIVERSITY-ENTERPRISE COOPERATION TRAINING BASE

In order to enable the practice base built to be the teaching center, research and development center, and technical service center, software technology will adopt the following measures:

#### 1) Improve the training base construction and operation management mechanism

Set up a university-enterprise cooperation executive committee, which is responsible for the base of production and management, student in post practice, and enterprise staff training. Giving priority to practical teaching, according to the cooperation agreement, the training base carries out the corresponding social services charging projects that were independently run by the training base. In accordance with the agreement, the training base pays the earnings ratio to the college, and turns it into a subsequent operation in a virtuous circle, making it a sustainable development.

#### 2) Deepen industry and enterprise cooperation

Relying on industry characteristics of “one town one product,” “one town one industry,” and economic development mode and development trend, we constantly deepen the cooperation with industries and enterprises and introduction of software enterprises in the campus, optimize and improve the talent training scheme, and conform the new training rooms that need to be improved.

#### 3) Strengthen the construction of teachers’ team in training base.

Strengthen the cultivation of the “double type” teachers, encourage teachers’ in-service education and professional qualification, through teachers construction mechanism, and make the teachers with enterprise working experience reach 80% and double-quality teacher ratio above 90%. Simultaneously, we employ related enterprise experts to take part in the construction and management of the base.

#### 4) Strengthen the training and deepen cultivating mode to carry out orders, the service of regional

economy. Based on “service is for the purpose, employment is the guidance” of school-running orientation, strengthen the cooperation with software industry association of zhongshan city, innovate university-enterprise cooperation, promote the software industry talents training, and provide high-quality practical software and technical personnel for the enterprise.

#### 5) Strengthen software technology research and development application

Based on existing research and development, use the favorable conditions of the training base to provide technical support on scientific research level of and joint research and development project for the enterprise; provide enterprises with a powerful technical guarantee and development.

### 5 CONCLUSION

The construction of university-enterprise cooperation improves the overall strength of software technology, makes it more distinctive, significantly improves the condition of the training base, and greatly improves the students’ professional skills. The construction of a training base is not only the requirement of higher vocational software technology development but also the urgent need to promote the industry development and cultivation of professional and technical talents.

### ACKNOWLEDGMENT

This work was supported by zhongshan polytechnic under Grant No. JYB1207.

## Based on coal mine internet of integration of the cloud computing platform architecture

Hong Wei Ding & Yong Bao Zhao

*Hebei Software Institute, Baoding, Hebei, China*

**ABSTRACT:** The important content of coal mine safety information system is to strengthen the coal mine safety production management, to prevent the occurrence of coal mine accidents. In the work of coal mine safety information system, therefore, it is important to improve the ability to cope with all kinds of accidents. Therefore, strengthening the construction of the coal mine safety information system of a professional quality is important; in addition, one should also strengthen the institutional norm management, constantly improve the level of coal mine safety information system design, and strengthen the patrol of the scene and indispensable links such as equipment maintenance. The author combined with the mining environment, on the safety information system based on Internet of things technology in the application of coal mine safety production supervision is analyzed.

**KEYWORDS:** security information system; Coal mine; Safety in production; The Internet of things.

### 1 TECHNIQUE, GROUPING PLAN, AND ORGANIZATION IN THE INTEGRATION OF THE INTERNET OF THINGS

Generally speaking, the Internet security work of the coal mine system is made up of many different kinds of grouped data. By means of assembling and cooperating mutually, grouped data can finally settle the mutual constraint relation. Therefore, in terms of the Internet security of the coal mine system's Internet of integration technique, the essence lies in the information's continuous transfer in grouped data made up of Internet security and the guarantee of some grouped data's technical content of the integration of Internet of things. This series includes several activity forms as follows: transfer of information, assessment of the type of grouped data, and reference values of grouped data. To guarantee the effectiveness and optimization of production, we ought to reasonably organize and plan the technical activities integration of the Internet of things in the coal mine Internet security system. During the technical period of integration of the Internet of things in the coal mine Internet security system, the essence of organization and plan is to define the technical activities set and logical structure of the integration of the Internet of things. The graph later shows the technical program and organizational structure of the integration of the Internet of things in the coal mine Internet security system, including 3 layers of content as follows:

First comes the description layer. The basic meaning of existence is to technically program the integration

of the Internet of things in the coal mine Internet security system; for example, the different describing techniques in the activities and process of the integration of the Internet of things. The diversification of the integration of the Internet of things is described as technical program, different data package forms' organizational structure, and Internet security system under different user-defined integration of the Internet of things' conditionals; the definition of switching activity data sets in diverse techniques in integration of the Internet of things, and it is the Internet security technique in integration of the Internet of things according to grouped data. Specific research and analyze process.

The next one is the model layer: The central content of the coal system's Internet security of the integration of the Internet of things is the data elements' technical communication stage. In this stage, according to all kinds of logical relationships of the activities in integration of the Internet of things, we build a structural model for the mine system's Internet security of integration of the Internet of things. In general, the logical structural model is at a configurable level.

The last one is the application layer. Based on the configuration principle system, standard and basic data handling method in the coal mine security techniques of integration of the Internet of things, according to the demand information of clients, we can set different activities of integration of the Internet of things—boot sequence, to make sure that we can optimize the solution of the integration technique of the Internet of things in the coal mine system group.

## 2 BASED ON COAL MINE INTERNET OF INTEGRATION OF THE CLOUD COMPUTING PLATFORM ARCHITECTURE

### 2.1 *Networking design*

To satisfy the demand of wireless bandwidth, we design the visualization model. It transmits in every wireless layer of the construction service port in the video, and it makes contact with monitoring center management, with every part of video decoder, television walls, and so on. The design and realization of the network communication model: In general, under relatively remote execution conditions, the bandwidth is not enough; we apply ultra-wide band wireless Internet not only to videos in WAN but also to the Internet platform of videos. Hence, the design of 2MB bandwidth is widely used nowadays, and it may lead to the unstable situation and unmoral use of wireless Internet monitoring. According to the design of the coal mine network node, by means of connecting the management service port and logging in video streaming, you can see the server production monitoring work in the video field. Regardless of whether this kind of design could add load to the front-end bandwidth, it shares image information with lots of users.

### 2.2 *Designing scheme*

Visualization model's technical security computing of integration in the Internet of things. Through 4 monitoring work stations or a D1 single picture round tour, the segmentation of images and uploading to the video streaming management service port make a unitize video signal. Then under the storage and release of video streaming service interface, it can effectively prevent the wireless jam of staff's direct access to the client. Working communication, the front video camera's video line, links to the front of the image processor, video server, and terminal; accepts and transfers to monitoring center via video signal cable. At the very first moment, the video information monitoring center accepts the information, remote control signal, and video server, and it transfers to camera clouding control line eventually.

### 2.3 *Network modeling*

According to the understanding of computer networks described earlier, this article emphasizes the introduction of application integration of coal mine in the Internet of things. The Internet is seen not only as an information model's processing enterprise but also as the foundation of realization, enterprise project cost, and schedule objective. In the computer network information management technology, mine surveying data are considered a time parameter of

the workflow model based on computer management; functional management in different stages of the implementation is closely related to the time; and different time as well as different tasks are completed in different conditions. Information collection, processing, and distribution exhibit difference in the mining area based on the measurement of the computer information management model under the computer information network model. According to every step of the work, we must implement the workflow model, and we should achieve the procedure of the computer management process eventually.

### 2.4 *Production safety information database design*

Production management information base of the Internet of things usually includes the following aspects: the core content library, which is the locus of control information table, the basic data and its time point, the task of security management, and the control information table; second, the original records, such as work platform, management level, and individual performance. It is the significant part of storing internal information security and also provides great convenience for future enquiries and filing. The third one is the graphical information table, which mainly aims at the creation of call safe production resources. Finally, the management table and information table are used to reserve employee information, respectively. In the design of the production management information base, it is not simple processing and data management, and it is directly applied management object to the database. The database security establishes a good relationship, and finally data sharing is realized.

### 2.5 *Determination of system decision-making model*

By identifying the model based on Internet of things, as to the coal mine security production management information system, it not only helps security decisions but also the invariable choice of mode in the construction process. In addition, the information system board is strictly limited, which is beneficial to the production management operation and mutual restriction in interaction; to ensure that each task is strictly controlled, we should implement the process step by step according to the requirements of the standard model, comprehensively implement safety guarantee system and measures to achieve the goals. In terms of the actual situation of coal mine security production management information system and production capacity, according to the safety of operation in different stages and different departments, the work is decomposed into different stages of the safety target analysis, in order to control the process of safety

dynamically, and, finally, complete the mission of coal mine safety. In this process, industrial TV monitoring and communication can not only combine but also get to use and meet different demand conditions. It is convenient for light transmission, as optical signal conversion can mix into light signals and then convert light signals into an underground working face via underground electrical signals, finally making the data and voice independent.

### 2.6 Video streaming management server design

The establishment of the video streaming management service port can not only support multiple users with simultaneous access to video management model but also because of the limitation of wireless bandwidth, it is a very good solution to remote video, in order to ensure that all department leaders can directly link at any time via the desktop computer communication model and browse the images while indulging in video monitoring. The server has passed by querying the database, and it realizes the function of the coal mine security production information. It can provide useful service to the remote computer. The connection of the video management server and spatial database can provide a large number of search services, such as attribute query service, vector and raster map service. Security computing visualization model is a very important video streaming cache server management module; if you can use the cached data development, database interactions can be deleted, and the data will improve the response speed to a larger extent. In general, providing video monitoring and a video streaming media server of security production management of the effective storage function can realize user management, automatic alarm, and security advice.

## 3 CONCLUSION

The security computing visualization model is applied to safety production and the establishment of the service port on the remote computer communication. Monitoring each stage of the implementation of 3d visualization monitoring and understanding the relative position of each node and the relationship between the actual environmental monitoring not only greatly reduces the difficulty of the enterprise management but also controls the cost of the enterprise well. Finally, it results in a optimal solution in security production management. Therefore, we must continuously explore its application in production safety strategy of integration of the Internet of things technology and wireless video technology, and we should accomplish beforehand control as a prevention treatment to be nipped in the bud. Wireless communication management level has strengthened in the round, which leads to safe and stable operation of the communication model, ensures it achieves zero fault, and serves the socialist modernization construction better.

## Optimization of the internal accounting control based on the Internet of Things

Yun Hui Dai

*The Bursar's Office of Hebei University, Baoding, Hebei, China*

Xue Ying Ge

*College of Management of Hebei University, Baoding, Hebei, China*

**ABSTRACT:** The reason that enterprises establish internal control mechanism is because it is a guarantee of enterprises operating safety, working efficiently, and maintaining financial records of the credibility of the consideration. For logistics enterprises who want to set up an internal accounting control mechanism, you need to use effective management means, management measures, management processes, and so on. Due to the rapid progress of modern information technology, the Internet gradually entered people's field of vision; it combined the intelligent sensor, electronic identification, and computer network technology. Besides the computer and the Internet, the information industry is the trend of the third. Based on information technology of the Internet of things, we can effectively achieve the accounting information electronically; as for the internal accounting control management of logistics enterprises, it plays an important supporting role.

**KEYWORDS:** The Internet of things; logistics enterprises; internal control; accounting.

To exert internal control, logistics enterprises need the cooperation of many departments, senior enterprises, and enterprise departments, upstream and downstream of enterprise institutions. All employees need to be involved, and such an ability can achieve the goal of enterprise internal control, setting up operations in accordance with enterprise development strategies. The concrete content includes the internal control of enterprise internal environment management, enterprise management risk evaluation, enterprise operational control measures, various aspects of information exchange and sharing, and the enterprise internal supervision mechanism. Logistics enterprises only have a scientific and efficient internal control mechanism, which is likely to achieve the high speed development of the stable and healthy.

Currently, the Internet of things technology has tended to scale up cooperation and intellectualization that companies need on the basis of establishing and perfecting internal control mechanisms. Based on the Internet of things, there is a big difference between internal accounting control and working in the traditional sense of the internal accounting control. Internet of things is convenient for the operation of the logistics enterprises to create a lot of conditions: first, the full display. Through RFID, electronic sensors, scan code,

and auxiliary equipment, such as real-time information can be extracted from items at any time; second, the transfer is worthy of trust. Now, our country has been basically covered with wireless network in most areas; wireless network is the important precondition for development of the Internet of things technology, equipped with electronic originals in plant, equipment, and goods digital signals and can transmit via wireless network simultaneously. Finally, we have the intelligent management. Through technical means such as cloud computing, batch processing can be processed in a timely manner from huge amounts of information of the item, so as to realize the interaction between person and person, content and content of interaction; realize the purpose to control the dynamic management of a large number of items. The best example of cloud computing technology in the real application is the process of enterprise operation.

Based on the Internet of things, the logistics company based on the implementation of internal accounting control can effectively promote the healthy development of the logistics industry in China and the logistics enterprise's core competitiveness. Not only in this manner, but also on the basis of the Internet of things, the logistics company on the implementation of the internal accounting control

---

The corresponding author of this paper is Dai Yunhui.

can effectively protect the enterprises to adopt the “overall management, diversity management, unified accounting” electronic management system, for the system set-up network security and firewall. All in all, the internal accounting control can promote the development of logistics enterprises, which makes the whole logistics industry healthier and could make progress more orderly.

## 1 BRIEF OF THE INTERNET OF THINGS AND INTERNAL ACCOUNTING CONTROL IN LOGISTICS ENTERPRISES

### 1.1 *Brief of the Internet of Things*

Iot is (IOT) to the Internet, as the basis of establishing, extends its own clients to all possible extents between items and items (M2M), and realizing the information interchange between objects and the shared network operation mode. Internet of things, with the help of radio frequency identification (RFID), infrared and electronic sensors, GPRS system, scanner, such as information acquisition, and transmission equipment, in accordance with the agreed in advance, the content of the agreement will be implanted into the electronic chip items and Internet connectivity; the exchange and sharing of information will be realized, thus realizing the items identified, positioning, monitoring, remote control, management, and other operations. The Internet of things includes the following three layers: induction layer, communication layer, and operational layer. Induction layer basic function involves identifying and collecting the dynamic information of the item. The fundamental role of the communication layer is extracted information transmission and processing the induction layer. The basic function of the operational layer is to effectively connect the Internet of things with the client, to meet the specific needs of the industry, so as to realize the application of intelligence.

### 1.2 *Brief of logistics enterprises' internal accounting control*

Accounting work is systematic, and it should enhance management efficiency, adapt to the economic macro-control economy, and adjust the structure of social resources. Scientific decision making is of great significance, and it is aims at ensuring the market economy efficiency and fair operation of information systems. As the core part of logistics internal control, accounting control should not be ignored. Accounting control refers to the specific logistics enterprises carrying out normal accounting work, for guaranteeing the authenticity of the data, business economics, and the integrity of the assets, and establishment of related specifications, regulations, regulatory measures, the floorboard of the management process, and so on. Currently, our country's accounting information

authenticity is generally not high: It severely reduces the effectiveness of accounting information and buries the hidden trouble of the economic development.

### 1.3 *Promotion of the Internet of Things to internal accounting control*

First, the Internet of things effectively promoted the logistics enterprises to realize the real goal of internal accounting control. The implementation of internal accounting control is in order to improve the effectiveness of accounting information, to ensure the integrity and security of the enterprise assets. The ministry of finance and related ministries announced instructive documents of the internal control of enterprise, and it put forward the new requirements of internal accounting control. With the help of the Internet of things technology, logistics enterprises can realize items of information sharing and exchange, thus achieving the true target of internal accounting control.

Second, Iot effectively promotes the enterprise accounting information process. The organic fusion of Internet technology and the accounting information can realize logistics enterprise business data and financial data synchronization; with the help of the Internet of things, any business data can be directly passed to the accounting information system, and it can form the business and financial situation.

Third, the Internet of things should promote the logistics enterprises to carry out the assets of the transparent process. By raw materials with the help of the Internet of things technology, the logistics enterprises can start configuration of electronic signature, and items in the repository, such as vehicles, loading and unloading machine equipment installation information, speaking, reading, and writing, at any time and electronic signature for “communication” could improve the transparency of assets.

The fourth one is that Iot strengthened supervision and internal control of logistics enterprises. The Internet of things can be used for enterprises to monitor their own internal control. Enterprises with the aid of technology can achieve business decision-making, decision-making, and supervision. Business scope covers all the logistics enterprises and the specific affairs, as well as the enterprise's production and sales link to supervise, promoting the practical efficiency of enterprises' internal accounting control.

## 2 DEFICIENCY IN LOGISTICS ENTERPRISES' INTERNAL ACCOUNTING CONTROL ON THE BASIS OF INTERNET OF THINGS

Although Internet technology is widely used and significantly improves socioeconomic efficiency, the technology for the government, enterprises, and the

general public information and privacy security bring great risks. Currently, the internal accounting control of logistics enterprises also has many shortcomings, which the authors mainly summarize as follows:

### 2.1 *Failing to correctly understand the importance of internal accounting control*

Nowadays, a lot of logistics enterprises have no mention of the degree of attention to the internal accounting control; moreover, it is also a perfect stranger in the Internet of things, I did not know it was so. Part of the logistics enterprises although made the internal accounting control of the related management system, but do not take the system of execution, the system can only become a business of foil, didn't play a proper role.

### 2.2 *Accounting personnel do not have perfect integrated service quality*

Under the condition of Internet of things technology, accounting personnel should not only have good accounting knowledge and skills but also have the corresponding application of computer and network technology. Unfortunately, however, the vast majority of current logistics enterprises accounting personnel, due to the limitation of their own knowledge, do not have much exposure to computer network knowledge and technology.

### 2.3 *Not establishing a scientific evaluation mechanism*

The vast majority of logistics enterprises have not established a scientific evaluation of internal accounting control mechanism. For an enterprise to have a perfect internal accounting control mechanism, the implementation of the various management systems, the effect of the system implementation, which control results are determined by what department, how to evaluate and use what kind of evaluation method, and so on have not yet become established norms to guide mechanisms.

### 2.4 *Failing to fully protect the accounting information system*

The Internet of things is actually based on RFID technology of computer network; the attribute of the accounting information system will face certain security risks, and there are some security hidden dangers at run time. No matter which link error, such as computer viruses, malicious attack, information management of wrong operation, and so on may bring a fatal blow to the system, the lead to accounting work cannot be carried out in accordance with the orderly plan.

### 2.5 *Failing to effectively protect the accounting information*

Because the accounting information system security is bad, the accounting information would be a loss of data or data theft. Logistics enterprises will own a lot of confidentiality of data in the process of operation and the information stored in the accounting information system, the data, and information for the enterprise have had a profound impact on the development of the future. Once the phenomenon of data appears to be lost or stolen, it will seriously affect the normal operation and development of the enterprise.

### 2.6 *Not effectively dealing with accounting information system error in the data*

In the Iot-based accounting information system, all of the business enterprises are with the aid of systems connected to each other; so, if a business submits the wrong data, then the other business will be using the wrong data as a basis for the work, leading to making the report data wrongs; the resulting data cannot reflect the reality of the enterprise management situation or report about a waste paper.

## 3 ADVICE ON CONSUMMATING THE ENTERPRISE INTERNAL ACCOUNTING CONTROL

### 3.1 *Strictly following the principle of internal accounting control*

Logistics enterprises should make clear that the internal accounting control needs to follow the following five principles: first, in combination with the operation and development of the enterprise itself, to establish related rules and laws of the internal control management system; second, the control system of management object is every enterprise accounting work personnel, and institutional constraints in the behavior of each accounting staff; third, the control of the content should include all business links of logistics enterprises; fourth, strictly implement the principle of cost and benefit, with the most reasonable cost to realize the optimum control effect; fifth, adjustable principle, according to the change of enterprise environment and their own conditions, to adjust and perfect the control system.

### 3.2 *Strengthening the training of accounting personnel*

The development and progress of the times require accounting personnel also wanting to improve their professional quality, with the deepening of the Internet of things, and accounting personnel to master the professional knowledge and skills before they

become somewhat out of place; they also do not meet the requirements of internal accounting control of accounting personnel. Therefore, logistics enterprises need to intensify training of accounting personnel and strengthen their consciousness of “Internet of things.”

### 3.3 *Consummating the evaluation mechanism of internal accounting control*

Enterprises should perfect internal accounting control evaluation mechanism and make its control system bring out the best in each other. The concrete evaluation index needs to be combined with the actual situation of the enterprise itself to choose, so that we can improve the effectiveness of the evaluation mechanism. We should improve the evaluation of the internal accounting control mechanism, and we need to consider the overall interests of the enterprise, to balance the relationship between the whole and partial. We should measure the costs and benefits.

### 3.4 *Interaction between enterprise and management behavior*

Internal accounting control needs to link to management activities. Logistics enterprises all the time in the management behavior, accounting business continues, too, so the internal accounting control should be able to timely reflect the business operation of the entire enterprise. Logistics enterprises in the process of internal accounting control should make its interaction and enterprise management behavior in a timely manner and effectively reflect the enterprise's operating conditions, which are convenient for subsequent operation and management of enterprises.

### 3.5 *Doing a good job of network security and protection*

Enterprises should improve the network security prevention and protection consciousness; through effective measures, they should ensure that the accounting information system is able to maintain a safe and stable operation. Enterprises should establish management norms, has not been authorized officers of the accounting information system can never be any read and write operations. We should improve the staff's computer skills, thus reducing the possibility of wrong operation, minimizing system malfunction caused by human factors, improving the protection of software and hardware, and using more secure technology to protect the system. Confidential information and data, and backup work, are constantly on the alert against the intrusion of the computer virus. We should make perfect the enterprise's internal management system and the code of conduct, to conform to the enterprise's development needs.

### 3.6 *Attaching great importance to the external supervision*

Enterprise supervision and internal accounting control can effectively improve the effectiveness and efficiency of internal accounting control. Corporate control reports submitted to the world and the auditing opinions of certified public accountants on the report can point out the problem in corporate control mechanisms, and encourage the enterprises to improve.

## 4 CONCLUSION

Under the modern enterprise management system, each enterprise's accounting information system should be supplemented by an efficient internal control system and the authentic accounting information. Only in this way, to ensure that each department within the enterprise is the most efficient, we should improve enterprise management efficiency, to obtain ideal results. In the actual management, we found that although a lot of logistics enterprises carry on the internal accounting control, there are still many shortcomings. Logistics enterprises need to understand that the internal accounting control is definitely not meant do the work of a period of time to go; rather, it is a continuous improvement of constantly adjusting and enterprise comprehensive conditions that meet the needs of continuous work should be in accordance with the enterprise itself, structure adjustment, the change in business scope, the changes in the external environment and audit of enterprises to improve work link, and so on, to constantly improve and adjust, so as to improve the pertinence and applicability of internal control. Under the condition of Internet, the logistics enterprises internal accounting control should be the reality of enterprises, for they can really meet the demand of enterprise operation and development of the internal accounting control system. Implementation of scientific and effective internal accounting control cannot happen overnight; it needs to experience its own perfect process, according to the actual process of enterprise environment change and face the problem of dynamic correction. With the constant improvement of the market economic system, the overall quality of the enterprise staff increases in the departments of legal supervision. Along with auditing the strength of the increase, the enterprise will gradually to do a good job of internal accounting control.

# Exploration on personalized information service mode of university digital library based on the network environment

Li Hua Ma, Ning Ning Sun & Gui Shan Zhang

*Jilin Agricultural University Library, Changchun, Jilin, China*

**ABSTRACT:** This article puts forward the concept of personalized information service of the university library in the network environment, and this will become the new service model of the digital library. This article analyzed the information service mode of the university library in the traditional environment, pointed out the necessity of building the personalized information service mode of the university digital library in the network environment, and established the specific mode of the current personalized information service of the university digital library based on the network environment.

**KEYWORDS:** Network environment; University digital library; Personalized information service mode.

## 1 INTRODUCTION

The development of network technology forces the university library to conform to the digital trend of development, beginning with the transition from traditional library to digital library, and then bringing about the changes of the information service mode. In the future, investigating the status and role of a library, ability and quality of information service will become an important indicator (Zheng, 2002) The personalized information service will provide new requirements for the university library. The personalized information service means the user for a service in terms of (Zhang, 2002). The personalized information service means the targeted service to users. It includes two aspects: (1) The user can customize their required information according to their own needs. (2) The repositories of the university library target the characteristics of the user in the network environment, selecting resources and services needed most for the user. According to the change of the needs of the user, the dynamic change of the information is provided, so that users get personalized service. Its purpose is “humanism, user first.” Personalized information service not only to the recipient of information — users, they can be obtained more easily information resources what the user “custom” according to its own characteristics, and improve the utilization efficiency of the library; and information provider — university library, they can understand the gap more directly, more scientific between to university libraries, provide information

and information needs of users, timely adjust the service strategy and the plan itself to meet the user’s information needs ( Xia, 2002).

## 2 TRADITIONAL UNIVERSITY LIBRARY INFORMATION SERVICE MODE

The material basis of the traditional information service of the university library contains printed reference books and retrieval reference tools, lag in technology, and rigid service mode. There are mainly two kinds of service mode.

### 2.1 *Position service mode*

The traditional information service of the university library in the paper document as the carrier, librarians service for user around the book and periodical borrowing or telephone consultation in the library, a single service model (He, Song& Zhao ,2012).

### 2.2 *Passive service mode*

The traditional library service object consists of mainly the readers to the library; the service mode is more passive; the service content is mainly borrowing and returning document resources, documentary reproduction, novelty search, and advice; and the information service belongs to the shallow face-to-face passive service mode, unable to effectively meet the needs of readers at different levels.

### 3 NECESSITY FOR BUILDING THE PERSONALIZED INFORMATION SERVICE MODEL OF UNIVERSITY DIGITAL LIBRARY IN THE NETWORK ENVIRONMENT

#### 3.1 *Changes of document carrier forces it to make inevitable the building of personalized information service mode of university digital library*

In the network environment, the university library document carrier develops from paper to paper, disk, network, and databases coexist, which will inevitably lead to the information service mode of the university library to change.

#### 3.2 *Changes of obtaining document force it to make inevitable the building of personalized information service mode of university digital library*

In the network environment, the methods of users obtaining documents develop from getting documents personally from the library through the network computer, mobile phone, Micro message, iPad, ipone, and so on; these will inevitably lead to the position service model of the university library changes. Otherwise, the library will cease to exist except in name.

#### 3.3 *Changes of transmission mode force it to make inevitable the building of personalized information service mode of university digital library*

In the network environment, the library is transmitted to the user literature by way of user door-to-door or librarian service for receiving the user through the QQ, MSN, Micro message, and E-mail; these will inevitably lead to passive changes in the information service mode of the university library.

### 4 PERSONALIZED INFORMATION SERVICE MODE OF UNIVERSITY DIGITAL LIBRARY BASED ON THE NETWORK ENVIRONMENT

The popularization of computers, the development of network technology, and digital information resources constantly emerging have led to great changes in the information service of the university library. The personalized information service mode based on the network environment is seen mainly in the following aspects.

#### 4.1 *Special service network*

According to the requirements of specific users' personalized information, the library and free digital resources are used in the network to collect related documents and to finally provide regularly or irregularly the required documents and information through E-mail, QQ, and WeChat.

#### 4.2 *Information push service*

Network-free information corresponding subject database information, user training subject librarians do not regularly for the teaching and scientific research of subject experts help library probation notice and retrieved through e-mail sent to you subject experts, for the literature information specialists in teaching and scientific research and provide valuable(Li, 2013). Subject librarians can also create users' personal gateway. Subject Librarians can be integrated through a variety of valuable free resources and network database resources to an information platform in the gateway to provide personalized information services to the path that users can choose (Jiang& Li, 2014).

#### 4.3 *Online user training*

With the development of information technology, some users do not want to personally go to the library to participate in relevant training; in order to meet the needs of these users, the library carries out online training with the aid of the network and provides the user with a virtual no physical space training environment for users. However, for a vast number of users, remote training has become an effective way to improve their literacy.

#### 4.4 *Subject navigation*

Information resources increase at exponential speed every day; these will bring great difficulties to choose and extract valuable documents from the vast number of users. Subject Librarians collect related disciplines of their own based on their professional knowledge and knowledge of library and information science by the library subscription database and network-free resources; this classification is made into subject gateway Webpage, linking to the library Webpage for different disciplines, user services, and it greatly saves the time of the user selected document.

#### 4.5 *Embedded teaching service*

Subject Librarian of the university library is embedded into the teacher's teaching in the classroom according to the teachers' needs, teaching the students

how to retrieve relevant documents of the profession, how to select the documents, as a teacher assistant, which will greatly reduce the time of the teacher's retrieval document, so that they can have more time to conduct teaching research.

## 5 CONCLUSION

In the network environment, the information service of the university library not only faced challenges but also ushered in opportunities. Personalized information needs of users is a source for the development of information services of the university library; the university library should comply with the tide of information era and continue to explore personalized information service mode suitable for this library, in order to better meet the needs and myriads of changes of users.

# Computer network reliability analyses and optimization methods

Zhen Wang

Langfang Polytechnic Institute, China

**ABSTRACT:** With China's rapid economic development, computers have gradually been used in every aspect of social life and computer networks have increasingly become an important part in people's lives. However, with the increasing application of the computer network technology, computer network reliability has gradually become a focus of attention. In order to meet its requirements, this paper makes an analysis of present situations of the computer network reliability and puts forward corresponding optimization methods.

**KEYWORDS:** Computer network; Reliability; Analysis; Optimization.

With the rapid development of economy, China has gradually entered information age which brings great changes to our life. So computer network reliability becomes one of the most important problems in the process that the computer develops. The reliability of computer networks has certain effect on computer security. So in order to avoid bad interference and destruction from the outside, it is necessary to ensure the reliability of computer networks.

## 1 DEFINITION AND PRINCIPLES OF COMPUTER NETWORK RELIABILITY

### 1.1 *Definition of computer network reliability*

The definition of computer network reliability is that within a certain period of time or under certain conditions, computer network system can ensure the smooth transmission of information and the stability of a computer network application system to complete the task in time.

### 1.2 *Principles of computer network reliability*

Workers for computer network construction have accumulated many principles to guarantee the computer network reliability, the principles are as follows:

First, constructing a computer network must follow international standards. For example, in the process of the computer network reliability construction, attention should also be paid to the selection of an open computer network structure system. In this way it can support links with other systems and equipment.

Second, the characteristics of the computer network reliability are reflected by selecting a mature network technology and by constructing a network structure

through the combination of computer network technology's practicality, universality and practicality.

Third, reliability and security of the computer network should be combined together. In the construction of the computer network reliability, security construction should be strengthened at the same time, which can make the computer have a higher degree of security and a higher fault-tolerant ability to ensure correctness and security of the data and a normal operation of the network system.

Fourth, a computer network should equip with management functions which can manage computers to ensure a smooth operation of the computer network and its reliability.

Fifth, choosing good computer network media can guarantee that the backbone network has certain bandwidth to improve the reaction rate of computer networks which further ensures the computer network reliability.

Sixth, making full use of existing resources to improve the computer network operating system can protect cyber source, which lays a solid foundation for the guarantee of the computer network security.

## 2 RESEARCH STATUS OF COMPUTER NETWORK RELIABILITY

In the 1950s, the damage to network components made telecommunication system's total amount of network transmission greatly decline and arose a user call congestion phenomenon which eventually led to a wide range of network paralysis and brought significant economic losses to people. American experts call it "network link failures" and further put forward measurable standards "network connectivity". Thereafter, with the continuing development of the computer network technology, computer network

reliability also makes a breakthrough. The research direction of the computer network reliability has changed from connectivity to reliability which is popularized with the development of computer networks. Computer network reliability has become a main research field in computer science.

### 3 ANALYTICAL METHODS OF COMPUTER NETWORK RELIABILITY

A general computing formula for reliability has not been found in the research process of the computer network system. At present, computing methods of the computer network reliability mainly include accurate and approximate computing methods. Accurate computing method is mainly applied to special topological structures or small and medium networks. It mainly includes state enumeration method and state spatial decomposition method. The approximate computing method can only be used by large and medium networks to estimate the reliability. It is mainly used to reduce accuracy and then reduce the difficulty of computing the reliability. It mainly includes simulation method, graph transformation method as well as the upper and lower bound method. Although the approximate computing method cannot accurately compute the exact value of reliability, it is more suitable for large scale networks to compute the reliability compared to accurate computing method.

### 4 DESIGN CRITERIA OF COMPUTER NETWORK RELIABILITY

The development of things should take a certain path. Similarly, the development of the computer network technology is also based on certain criteria. As the computer network technology has been widely used in various fields, it is inevitable for people to put forward higher requirements for reliability. Information is transmitted between different areas by means of the computer network system. And the coverage area of the computer network system is directly related to the range of transmission that the information can be transmitted. If the computer network reliability cannot be guaranteed, misinformation or a delay of transmitting information will be occurred in the process of information transmission which will not only bring huge economic losses to the society and individuals, but also make people lose trust and reliance on computer networks and then computer network technology will lose the value of existence. Therefore, it has become extremely urgent to strengthen the construction of the computer network reliability in today's world. Since computer network reliability is a scientific and

systematic concept, certain criteria should also be followed in the process of reliability design.

First, redundant design and fault-tolerant design need to be used. Computer network technology is a high-tech system. We know that the amount of information that the computer system needs to transmit is very great, so it is possible to have network link failures. Therefore, in order to ensure the computer network system's accurate and timely transmission of information, redundant design and fault-tolerant design will be adopted when constructing computer reliability. By operating two management concepts, each computer can use network space to be spare machines for each other. That is to say, when a computer cannot run normally, it will be replaced by a backup computer to complete the task. It can not only achieve the purpose of transmitting information and avoid delaying information, but also ensures the stability of computer networks.

Second, new technologies by careful selection will be applied to computer networks. With the progress of the times, more and more new technologies are quickly generated, some of which are applied to daily life. Although computer networks have had a rapid development, many relevant new technologies are still generated. That is to say, the newly generated technology is temporarily unable to be successfully applied to the computer network system. If the computer network system is unable to manipulate these new technologies, they may cause the computer network system not to run normally or even have a breakdown which will bring serious economic losses to the society and people.

Third, the cost generated in the period of computer network system's lifetime should be planned as a whole. When the computer network technology is used, computer network system's service life and expenses should also be considered and planned overall. In the process of using computers, an appropriate computer network system should be chosen to reduce network programming costs, maintenance and operating costs generated during the computer's service life. In this way, the users' quality in use won't be reduced but investment cost of the computer network is reduced which can protect the computer network reliability.

Fourth, network products of high quality should be chosen at the present stage. Computer network system is a system operated by both hardware and software. Therefore, if either the hardware or the software fails, computer network reliability will be affected. So network products of good quality at the present stage should be chosen to ensure the computer network reliability and provide a good network operating environment. But network products should also be chosen based on actual situations rather than a blind pursuit of high and low prices. Network products chosen based on actual situations can have their use value and meet our needs.

Fifth, constant inspection and maintenance of the operating network system are also important criteria of designing computer networks. When people use a computer network, some waste resources can be produced which sometimes will even bring different degrees of damage to the network system. If the hidden danger can't be repaired in time, security and reliability of the computer network will be under threat. The computer's hidden danger also means that people's property security is facing serious challenges. Therefore, regular inspection and maintenance of the computer network technology should be conducted in time in order to eliminate potential problems timely and remove computer network's security loopholes and ensure a normal operation of the entire network system.

## 5 ESTABLISHMENT OF A SET OF IMPROVED COMPUTER NETWORK MANAGEMENT SYSTEM

As we all know, a computer network system supported by both hardware and software operates normally. In addition to that, it is also supported by other components. But the study on how to ensure the computer network reliability can be probed into from two aspects including software and hardware which occupy a crucial position in computer networks.

### 5.1 *Hardware design*

All sorts of data will be constantly input and output the host system of the computer network. The level of a host computer's performance has an important effect on the reliability of the computer network. Generally speaking, the host device of a computer network system equipped with the characteristics of high scalability, high availability and high reliability can fully meet the requirements for reliability. In short, the devices of the network system have a higher reliability than the host subsystem. The reliability of the host subsystem is mainly achieved by cluster and backup technologies, while the reliability of the hardware is mainly maintained by way of dual host redundancy and dual host backup. Dual host redundancy refers to two hosts providing network services supervise each other. Once one has a breakdown, the other will take place of it to ensure the normal operation of information. Hot standby refers to the two hosts including an active host and a backup host. When the active host has problems, the backup host will take over its job to maintain the stability of the system.

### 5.2 *Software design*

70% of the computer's reliability problems arise from its internal system. When the computer connects to

the local area network (LAN), the reliability of the network system will face great challenges. At this point, we can establish a three-dimensional network topological structure to maintain the system's reliability. Specific details are as follows:

First of all, safety protection should be isolated. Internal system's firewall settings can form a reliable protective barrier with the LAN, the Internet and the cluster, so that the cluster's information access can match firewall rules. Only appropriate information can have the access which will improve the cluster's reliability to a large extent.

Secondly, network access should be controlled. Firewall settings can be used to limit the number of computers with open access and assess their legitimacy. So illegal attacks to computers can be fundamentally prevented, and the network system's security risks can also be reduced.

Thirdly, the node can be used for mapping. Port mapping is a key technology to guarantee the computer network reliability. It mainly adopts the way of transferring destinations to effectively hide the internal cluster's network information. When the external access port is changed, it's ok to modify the mapping to achieve direct access.

Last but not the least, other techniques can also be adopted in addition to the application of firewall technology.

## 6 CONCLUSIONS

People strongly rely on the computer network with its widely application. At the same time, requirements for its reliability have also become higher. In order to meet the users' requirements for the computer network reliability, it is necessary to carry out research and analysis to put forward suggestions for improvement on existing problems of the construction of the computer network reliability which will contribute to the development and construction of the computer network system and enhance people's confidence for computer networks and avoid economic losses.

## Research on legal protection to the right to privacy based on network

Lian Peng Wang

*Law College, Beihua University, Jilin, China*

**ABSTRACT:** The utilization and popularization of network brings people fortune while simultaneously placing their privacy into an embarrassing situation. The right to privacy in the environment of network is enduring unprecedented violation and severe consequences and facing unprecedented challenges. The academic circles and the legislators have not yet recognized this problem.

**KEYWORDS:** People's privacy; Environment of network; Challenges; Legal protection.

### 1 INTRODUCTION

In 1890, Brandeis and Warren, private law scholars in the United States, "Harvard Law Review" ("Harvard Law Review"), published the "theory of privacy," a paper that first proposed privacy (the right to privacy) concept. After nearly a hundred years, citizens' rights to privacy as an important personality content was gradually recognized and protected by law, and it showed a trend toward international harmonization. However, recently, with the rapid development in computer information network technology, makes privacy in cyberspace before being Unprecedented challenges, strengthen the legal protection of personal data and privacy in cyberspace, has become an international Urgent social legislation.

### 2 PRIVACY AND INTERNET PRIVACY

Privacy, as a basic personality right, means that citizens enjoyed the tranquility and private information while being protected by law in their private lives; this is not illegal intrusion, and it knows the collection, use, and disclosure of the right kind of personality. It is generally believed that the right to privacy holds good only if the subject is a human being; its content has authenticity and privacy, including the right to a peaceful personal life, private information confidentiality, personal communication secrets, personal privacy rights, and other uses. Privacy rights of citizens of personality are the most fundamental of the important contents, along with their human dignity, rights and recognizes the value of the produce.

The extreme importance of individual privacy is different from civil law countries of the European Civil Code, a chronic lack of privacy concept. Until the 1960s, with the rise of the civil rights movement,

the application of computer technology developed information and communication dissemination, and privacy began acquiring the status of the Constitution and private law, by the relatively complete legislative protection. France, Germany, and other countries have enacted laws and separate regulations, or in the case of individual citizens, in the form of right to privacy protection. Even in some yet to recognize civil rights to privacy as an independent country, such as Britain and Australia, the privacy of citizens also receives indirect protection to varying degrees under the name of reputation or other relevant civil rights.

With the development of society and economy, privacy object content is expanding. In the modern information society, the traditional areas of privacy extend to the network continuously and add new entity content. Seeking to maximize business benefits, operators often personalize collected data of citizens and apply it to for-profit business activities, a violation of consumers for their personal privacy enjoyed by concealment, domination, maintenance, and use of the right kinds of urgent law to regulate illegal phenomenon.

Economic activity in the privacy of the network is different from the general privacy features. Daily life for citizens, in general for violations of privacy perpetrator subjective malicious damage caused to the right holder, is mainly reflected in the spirit of respect, the performance of subjective mental anguish; this generally does not involve property content. Because mental pain is a subjective experience, it is difficult to be clearly defined, for the protection of privacy legislation to bring some difficulties. However, economic activity in the network, privacy, content that has economic value, due to the infringement action, operators are generally from the commercial purposes. For consumers, the consequences of the violation of privacy cause mental pain, for example, because

consumers do not have the opportunity to contact their personal data and make necessary corrections so that the true image of the individual consumer may be violated. But the most important thing leads to loss of property for the consumer or they may not benefit; for example, the user's mobile phone sending spam messages causes additional expenditure for consumers; the user's personal information such as identity card numbers and credit card numbers is more likely to be disclosed to a third person, resulting in huge losses for consumers. In addition, the scope of privacy object expanded to include the traditional economic activities that do not belong to the privacy of content, such as name, gender, age, and so on; consumers do not want to let others know about all the personal information that belongs to the era of network activity information privacy content.

### 3 INFRINGEMENT OF PRIVACY IN CYBERSPACE SITUATION

A report recently released by the Congressional Statistics Office said that 97 percent of the attempts by the U.S. government to develop the site cannot be achieved by privacy standards. The most current site with software to monitor user surfing habits, even in the case of unauthorized users to make the files, records the user's e-mail address and online shopping habits. This is undoubtedly a violation of a citizen's private information. In addition, many sites are often contrary to the commitments previously made on the rational use of customer personal information and do not share customer information with any third party's personal bankruptcy, though the sale of the customer's private information is hard to make the final sum. Some people think they can legally build customer personal data files of the website, causing the greatest threat to personal privacy; these data are likely to be or cannot be expected to monitor the consequences of some unethical companies and individuals' use.

Although there are a large number of sites with privacy statements categorically asking visitors to provide personal information, only a handful of sites do require a network security expert, explaining the customer data collection methods, scope, access to information, safety measures, and permission for information site data protection. Even if such privacy protection policies are often non-existent, some sites will not only ignore their provisions to protect the privacy of illegally collecting users' personal information, and even the user's sensitive information shared with third parties, in order to make huge profits. Internet users and the site have permission for private ownership and use of information in a fierce competition. But on the other hand, the majority of people in order to get free services and goods website, often

take the initiative to personal information leakage to the site, which will lead to many unforeseen consequences, and the site can be a defense to the victim by agreeing to block its access to personal illegality information.

### 4 MODE OF FOREIGN-RELATED LEGISLATION TO PROTECT

Continue to occur in the network analysis of the phenomenon of these violations of citizens' privacy, mainly because of interest inherent structural characteristics and e-commerce web development lead driver. Lagging users also lack awareness of privacy protection as well as related technical protection measures, which are aspects of reasons. A huge threat to the development of information networks of personal privacy caused by countries in terms of strengthening the legal protection of online privacy has reached a consensus. For example, in Taiwan, on August 21, 1995 the formal implementation of "Computer Processed Personal Data Protection Law" and its implementing rules, the European Common Market Council in October 1995 adopted the "Convention on the automatic processing of personal data protection," the United States in 1986 developed "electronic Communications Privacy Act," and Germany developed a "telecommunications service data Protection Act," which are all we can learn from. Based on this basic principle, "any regulation of the Internet should not hinder its development"; estimation of national norms because of the collection of personal data online, such as the use of e-commerce and network behavior, may impact the development of different network privacy be legal protection and relief patterns and focus is different. Industry self-regulation can be divided into two categories with the Legislation, respectively, such as the representative of the United States and the European Union.

### 5 U.S. SELF-REGULATORY LEGAL MODEL

American consciousness in terms of the privacy aspects of the measures is exhibited at the forefront of the world. In 1967 through the "Freedom of Information Act," in 1974 the formalized "Privacy Act" can be regarded as the United States' privacy protection Basic, which enables the U.S. federal government agencies to collect and use personal information purview and provisions shall not disclose any information related to the parties without the consent of the parties. In the 1970s and 1980s has formulated a series of laws and regulations to protect privacy. Such as Fair Credit Reporting Act of 1970, Right to Financial Privacy Act of 1978, the Federal

Cable Communication Policy Act, the Video Privacy Protection Act, and so on. In 1986, the Electronic Connection Policy Act of 1986 was an important bill processing network privacy. It provides through intercepted communications access or leakage of information stored in the case of infringement of personal privacy exception and responsibilities, prohibits “providing electronic communications services to the public”; the content of communications service providers will be generated in the process available to any unauthorized entities.

As the case law, the United States has established a number of principles through case network privacy protection. For example, in 1993, California Bourke V Nissan Motor Company’s case established the general principle of Email Privacy Protection: “The prior knowledge of company policies (known Email may be accessed by others) can be regarded as no reasonable expectation of privacy. And the owners, operator’s access to this network does not constitute intercepted.” In 1994, Steve Jackson Games V United States Secret Service’s case specifically, not secretly, read or deleted personal e-mail, e-mail intercepted by unauthorized data Nations agencies also need to have access to legal enforcement order rather than a search warrant.

## 6 EU LEGISLATION MODE

Compared with the United States, the European Union passed legislation to pay more attention to protect the security of personal data. EU Data Protection Directive of the European Parliament on 24 October 1995 included almost all of the adopted provisions on personal data processing. Its purpose is to protect individual freedom and basic human rights, and to ensure the free flow of personal data between the EU member states. According to the directive, the data controller’s duties are to ensure the quality of data, data processing legitimate prohibition dealing with sensitive information, and thus informing the parties. Contact data subject is entitled to the rights and opposition rights, and the right to correct, delete, or archive their personal data. On September 12, 1996, in “Electronic Communications Data Protection Directive,” the European Union adopted by the Council is the “EU Personal Data Protection Directive” supplementary and special provisions.

In October 1998, related to e-commerce, “Private Data Confidentiality Law” also came into force. In 1999, the European Commission developed a “general principle of personal privacy on the Internet,” and “invisible and automated recommendations on the Internet software, hardware, personal data processing carried out,” the collection of personal data on information highways “process rights of individuals

protection Guide” and other relevant laws and regulations, for users and Internet service providers (ISP). These provide clear privacy protection principles to follow, so that member states establish effective privacy protection in a network unified legal system.

In addition to these two legislative protection modes, there is a “self-led technology and consumer model”, emphasized as “personal privacy select the platform (P3P),” the right to use the software by strengthening protection awareness and integration of other ways to enable consumers to protect network privacy purposes. But because such a system or program for their own safety and reliability remains questionable, these software tools of technology cannot completely replace the legal framework for online privacy protection, and they play only a secondary role in protection.

## 7 CHINA’S ONLINE PRIVACY PROTECTION LEGISLATION MODE SELECTION AND SYSTEM CONSTRUCTION

Article 38 of our Constitution, Article 39 and Article 40 stipulates that citizens protect human dignity, private homes, freedom, and privacy of correspondence regarding the interpretation of the protection of privacy of individual citizens to leave a broad space for other branches of law and justice. Civil law, criminal law, procedural law and the “Law on the Protection of Minors,” “Women’s Rights Protection Law,” “Law on the Protection of Persons with Disabilities,” “statistics,” “Provisional Regulations on bank management,” and other separate regulations on privacy protection in both the fragmented regulations. But the civil law judicial protection of the privacy rights of citizens emerges mainly from the Supreme Court’s interpretation, such as “opinions on the implementation of a number of issues (Trial),” “to hear defamation case to answer several questions,” “on the determination of civil issues tort liability for damages spiritual interpretation,” and so on. These provisions deal with China and are currently the most important legal basis for privacy disputes.

“Opinion on the implementation of a number of issues (Trial)” on page 140 states: preached in written, oral, and other forms of another’s privacy, or fabricating facts to openly vilify others’ personality, as well as the use of insults, row, slander, and other means to damage the reputation of others; some impact of these should be recognized as acts of defamation against citizens. In addition, the Supreme Court “to hear defamation case to answer several questions,” also clearly pointed out: For without their consent, unauthorized material released about another’s privacy, or promoting the privacy of others in writing, orally, causing damage to the reputation

of others, in accordance with others are dealing with infringement of the right of reputation. Just before the two judicial interpretations, privacy rights of the citizens are classified as an indirect protection of reputation. However, the right to privacy as an independent development, and reputation, although closely linked, may occur in some cases cross, but there are two separate areas of mutual differences: The two subjects, the nature, the adjustment range, infringement way, and protection methods are different.

Defamation is concerned with the fact that honor-related civil subject statements are true and evaluate whether it is appropriate, and privacy concerns are the subject of civil tranquility of private life and private information secrets not to be violated. On February 26 of the same year, the Supreme Court "on the determined spirit of tort liability for damages number of issues of interpretation" will be privacy interests as an independent personality, after all, a progressive legislation. However, this interpretation has not been established as a right to privacy from the legal status of independent civil rights; privacy and personality rights are still not tied reputation, honor, image rights, and so on, which leads us to saying that is a pity. Interpretation of Article 1 states: "Violation of the public interest, public morality infringement of another's privacy or other personal interests of victims in the grounds of infringement to the people's court to seek compensation for moral damage, the people's court shall be accepted in accordance with law"; its first three also provides that unauthorized disclosure, using dead privacy, or in violation of the public interest, public morality in other ways against the deceased privacy, their close relatives and therefore mental suffering to the people's court to seek compensation for moral damage, the people's court shall accept the law.

China has not yet put privacy as an independent personality right to be provided for in the law; there is no specific law and regulations in terms of privacy protection; and privacy confirmation will be attributed in reputation only in the judicial practice of protection or as a general personality's interest content. Specialized legislation to protect the right to privacy can not only solve our traditional areas in the privacy problems (such as the right to protect the privacy and reputation of the cross, the boundaries of freedom of speech and freedom of expression and the press, publishing, etc.) but also can not face the information technology, the rapid development, and wide application of electronic products cyberspace privacy challenges raised.

In an increasingly convenient network utilization, network data storage exchange is becoming increasingly popular nowadays; with consumers' personal information and protection of personal privacy, service providers of personal data should be made how to use and circulation network and e-commerce development of China are important problems to be faced.

However, in fact, admitting that the network is a new concept of privacy as an Internet presence and is recognized in law and protected as not completely equivalent, it first involves the legislative model of choice. Some have argued against the select industry law model, but compared with Western countries, China has long been given little attention to the protection of personal privacy. In addition to whether it has commercial websites or the privacy of individual citizens, the concept is very weak; this is a historical tradition of legal culture accumulation caused by a short time and cannot be changed. Therefore, the author argues that European countries should learn from the Legislation model instead of American industry self-regulation model. In addition, for some scholars tend to have different regulations decentralized network privacy protection legislation system, we believe, for even dedicated privacy laws are not developed in our country, the protection of personal data of Internet users' tasks is particularly implications arduous; if network personal data and privacy protection legislation are more widely used, the resistance is greater. If the number does not depend on network privacy protection legislation in different sectors not only causes confusion and an imperfect system but also makes internet privacy legislation become a protracted task; therefore, it should not be implemented.

## 8 CONCLUSION

We should consider their national conditions while being actively concerned about legislative trends and legislative developments in the international arena; we should draw practical experience measures, the general approach, and principles of the formation of online privacy legislation. We should gradually move closer to international standards of privacy protection, gain access to international coordination for the initiative in the construction and development of electronic information network when just starting. First, the law should clearly separate status as a civil right of privacy, and thus develop "Privacy Act" as quickly as possible to strengthen the traditional legal protection of privacy. We should also use the important information age network privacy to adjust K to establish a complete set of privacy right protection laws and regulations.

# Using open source software and mobile devices for collecting research data in terrain

K. Myška & B. Celá

*Institute of Social Work, University of Hradec Králové, Czech Republic*

K. Rybenská

*Faculty of Education, University of Hradec Králové, Czech Republic*

**ABSTRACT:** Data collection in social work is most often implemented using paper questionnaires or paper record sheets. In some cases, it is also possible to use a voice recorder or video camera. Data obtained by these methods must later be further processed and analyzed. It has a number of drawbacks, including time delay. The article presents a new method of data collection in terrain using commonly available mobile devices. It shows the possibility of using open source software for data collection in terrain. The presented method has a number of advantages that can be used not only in social work.

This article is published thanks to the financial support of the project SPEV 2014 named “Entering research data in the field using mobile devices.”

**KEYWORDS:** Mobile devices; data processing; electronic survey; responsible design; open source software.

## 1 INTRODUCTION

Current methods of data collection in social work provide a number of disadvantages. Data obtained from paper questionnaires, video and audio recordings need to be further processed. Processing of these data is slow, inflexible, and can lead to inaccuracies. In some cases, it is however possible to process paper questionnaires using document scanner and a computer with software for processing form data, which includes technologies such as optical character recognition (OCR), isolated handprint (ICR), and mark sense (OMR). Typical examples of such a solution can be seen in Figure 1.

Figure 1. Scheme of typical system for automated data extraction from paper questionnaires, which is commonly used in social work for automated processing of big amount of printed questionnaires (ABBY, 2014).

This solution can serve very well in many cases, but it has two main disadvantages: The whole solution is

very expensive and data processing is time demanding (compared with online method). We tried to design a simple solution that could eliminate these disadvantages. Our solution makes heavy use of open source software and commonly used and cheap mobile devices.

## 2 THE PROJECT

### 2.1 Design of the system

The typical setup of the online data collecting system involves a physical or virtual server with application for making online questionnaires and collecting data from these questionnaires. The server is connected to the Internet in order to make application and questionnaires accessible from mobile devices and computers with Internet connection (see Figure 2).

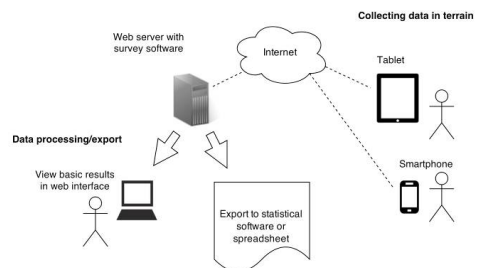

Figure 2. Scheme of online system for collecting data in terrain.

## 2.2 Server and software

We designed a cheap yet robust system that makes heavy use of open source software. Our virtual server runs in Proxmox Virtual Environment, which is easy-to-use and user-friendly virtualization platform for running MS Windows and Linux operating systems (Proxmox, 2014).

The operating system of virtual server is Debian Linux with Apache web server PHP scripting language and MySQL database. All these components are available in standard Debian installation. This combination is sometimes also referred to as “LAMP” (Linux, Apache, MySQL, PHP). All these software parts are freely available under open source license. It means, in short, that software can be used freely for commercial and non-commercial purposes. You can also modify open source software to your needs, but you must give modified software back to the open source community under the same license.

We chose open source software LimeSurvey and adapted it to our needs. Some main features of LimeSurvey are as follows (LimeSurvey, 2014):

- Unlimited number of survey participants.
- 28 different question types.
- Questionnaire can contain pictures and video.
- Creation of a printable questionnaire version.
- Conditions for questions depending on earlier answers.
- Questionnaires can be optionally set to anonymous mode.
- Sending of invitations, reminders, and tokens by email.
- Functions for exporting to CSV, PDF, SPSS, R, queXML, and MS Excel format.
- Basic statistical and graphical analysis.
- Open source software (can be modified to organization’s needs).

## 2.3 Tested mobile devices

When choosing mobile devices for our experiment, we came out from the actual market share in the Czech Republic and data that we collected from Google analytics (we analyzed devices that users employ to access website of the University of Hradec Králové and other web applications). The data were collected from 2013 to 2014. For our experiment, we chose devices that represent typical technical parameters of commonly used mobile devices in the Czech Republic. In the field of technical parameters, we focused mainly on display size and resolution. Given next are tested devices (display size and resolution are in the brackets behind device name).

- iPhone 4S (3.5”, 960 x 640)
- iPhone 5S (4”, 1 136 x 640)

- iPad mini (7.9”, 1 024 x 768)
- iPad Air (9.7”, 2 048 x 1 536)
- Sony Xperia L (4.3”, 854 x 480)
- LG Nexus 5 (4.95” 1 920 x 1 080)
- Samsung Galaxy S3 (4.8”, 720x1280)
- Lenovo IdeaTab A7-50L (7”, 1280 x 800)

Those devices were connected to the Internet through wifi or GSM connection (3G and EDGE). For displaying questionnaires and entering data, we used stock-in browsers, Apple Safari and Google Chrome.

## 2.4 Forms and responsible design

First of all, we designed a typical questionnaire in LimeSurvey. We used a standard template, without any modification. This questionnaire can be used very well on a standard computer or laptop screen, and it is optimized for entering data with the help of mouse and keyboard (Figure 3).

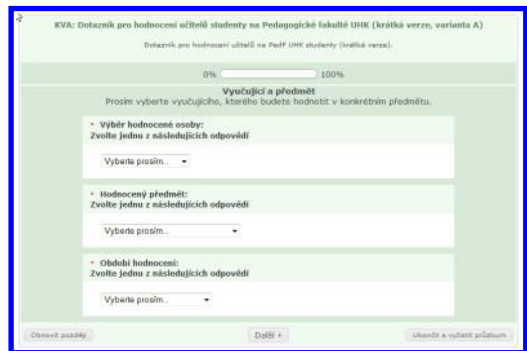

Figure 3. Screenshot of typical questionnaire with standard template in LimeSurvey.

If we display the same questionnaire in web browser on mobile device, the browser displays a whole page with the questionnaire (Figure 4 on the left). The questionnaire is almost unusable in this mode, so users have to double-tap on the screen to zoom the page. This is default behavior when browsing websites are not optimized for mobile phones. Even after the user zooms the page, the questionnaire is almost unusable for entering data. Form elements are too small for finger control and data entry (Figure 4 on the right).

If we want to use the questionnaire on a mobile device such a smartphone or tablet effectively and in a user-friendly way, we need to make use of responsible design. Shortly said, the responsibly designed site can adapt its layout according to the browser window (Marcotte, 2010). Principles of operating the responsible design can be demonstrated in the following example of the questionnaire that uses a responsible template. Figure 5 shows the questionnaire with a

Figure 4. Questionnaire with standard template for desktop computer or laptop, displayed on the screen of smartphone.

responsible template, which is displayed in the web browser on a standard PC or laptop. There is almost no difference against the desktop-only optimized template in Figure 3.

Figure 5. Questionnaire with responsible template displayed in desktop web browser.

If we resize the browser window (which has the same effect as displaying the page on narrow display of smartphone or tablet in portrait mode), the content adapts to the new browser's window size. This effect is illustrated in Figure 6.

In order to test real usability and user friendliness, we tested questionnaires with responsible templates on real hardware. This real-life testing involved users with no previous experience with collecting data using mobile devices. For most users, it was the first time they tried to fill in an electronic questionnaire with the help of a smartphone or tablet. Users involved in testing were student volunteers from the University of Hradec Králové.

Figure 7 shows the same questionnaire with a responsible template, displayed on a smartphone with Android operating system and Google Chrome browser. The questionnaire adapts to the display size of the smartphone and is big enough for controlling with the finger. When the user taps on form element, the browser displays its standard element for selecting or entering data, as shown in Figure 7 on the right.

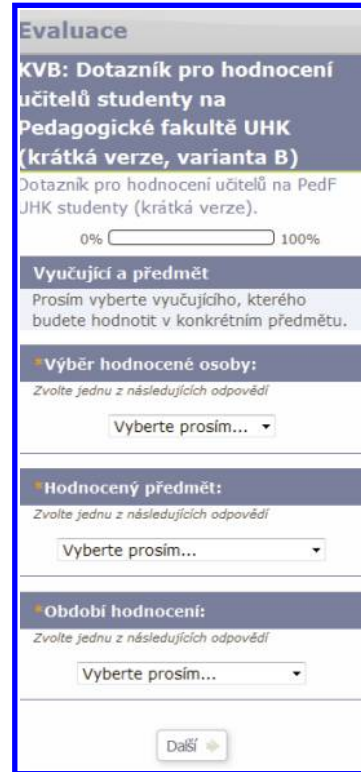

Figure 6. Questionnaire with responsible template, adapted to thin window size.

Figure 7. Questionnaire with responsible template, displayed on Android smartphone.

Situation is similar with the iPhone and its browser Safari. When the user taps on dropdown selection element, the browser displays options in the lower area of the screen (Figure 8 on the left). Form elements are big enough, and the questionnaire can be easily controlled with one finger.

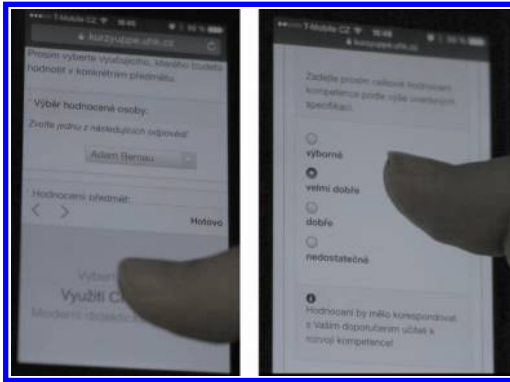

Figure 8. Questionnaire with responsible template, displayed on iPhone.

### 3 CONCLUSION

Collecting data in terrain and basic online data processing can be realized very well with open source software and common mobile devices. Our solution

can be used not only in social work but also in other sciences. When we design questionnaires for mobile devices such as tablets and smartphones, we must involve a responsible design in order to enable easy and user-friendly data to enter into the terrain. It is possible to program an own in-house solution or use open source software (for example Limesurvey) that can be adapted according to these needs. Almost all users in our real-life testing confirmed that collecting data with the help of an electronic questionnaire with a responsible template is more comfortable than filling in a paper questionnaire.

# Study on the choice of the third-party logistics service provider based on fresh vegetables

Jin Hua Li

*Yantai Nanshan University, Longkou, China*

**ABSTRACT:** Based on the analysis of the characteristics of fresh vegetables, this article set up the third-party logistics service provider selection index system, and it constructed the selection model based on fuzzy comprehensive evaluation. At the end of the article, the example analysis is introduced, to demonstrate the effectiveness and practicability of the model.

**KEYWORDS:** Fuzzy Comprehensive Evaluation Method; Fresh Vegetables; The Third Party Logistics Service Provider.

Data show that the fresh vegetables in picking, transportation, storage, distribution, and other logistics link loss rate at about 25% ~ 30%, the value of the loss of nearly 100 billion RMB. The quality and safety of vegetables is controversial<sup>[1]</sup>. In contrast, in the United States and other developed countries, vegetable quality is safe and reliable, where there is a low loss rate ~ between 1% and 2%, only because of using the entire cold chain management<sup>[2]</sup>. So how to choose the third-party logistics service provider, the smooth and efficient production of fresh vegetables from the field transmitted to consumers become research topics very worthy of attention. This article uses the method of fuzzy comprehensive evaluation; selection of third-party logistics service suppliers of fresh vegetables has important theoretical and practical significance.

## 1 ANALYSIS OF THE CHARACTERISTICS OF FRESH VEGETABLES

### 1.1 *Production characteristics of fresh vegetables*

Production characteristics of fresh vegetables involve the production of seasonal and dispersion. “Seasonal vegetables” mainly refers to the vegetables grown during the harvest season, which is basically fixed. “Dispersion” refers to the vast majority of vegetables and agricultural products that are operated by individual farmers, scattered. Individual farmers and dispersion represent the “small production” mode; the production increases the fresh vegetable logistics difficulty.

### 1.2 *The circulation characteristics of fresh vegetables*

Circulation characteristic is mainly displayed in timeliness, perishability, and so on. The timeliness requirements of fresh vegetables is meant to as far as possible shorten the radius of the logistics, improve the logistics technology, including transportation technology, handling technology, distribution technology, and so on, and achieve rapid logistics quality. Perishable characteristics of fresh vegetables are required to change the traditional constant temperature logistics. They put forward higher technical requirements on logistics service providers, and related factors should be considered when choosing.

## 2 THIRD-PARTY LOGISTICS SERVICE PROVIDER EVALUATION INDEX SYSTEM BASED ON FRESH VEGETABLES

The choice of logistics service suppliers is a very complicated process. Because logistics service providers’ selection goal often is not the only target, these many goals together constitute the index system. Taking into account that the fresh vegetables are perishable, possess easy loss characteristics, and usually need cold treatment, this article established a third-party logistics service providers’ evaluation system, combined with the requirements of the third-party logistics service providers in the fresh vegetables supply chain, as shown in [figure 1](#).

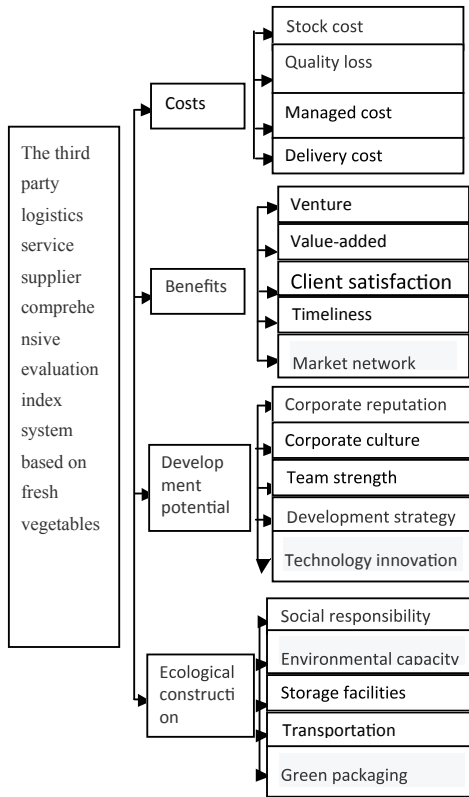

Figure 1. Third-party logistics supplier selection evaluation index system based on fresh vegetables.

### 3 CONSTRUCTION OF MODEL SELECTION

Fuzzy comprehensive evaluation method is a kind of comprehensive evaluation method that refers to the factors quantitatively; border is not clear, is not easy to be quantitative, and is based on fuzzy mathematics. It has the advantages of a concise analytic hierarchy system; simultaneously, the qualitative description and quantitative analysis come close together. This solves the problem of quantifying the qualitative evaluation index, which is difficult; it can be said to be an evaluation method that is more reasonable and scientific<sup>[3]</sup>. The specific evaluation process is as follows:

#### 3.1 Establishment of fuzzy sets

The evaluation factors set  $U$ , with  $m$  of evaluation factors, there are  $U = (u_1, u_2, \dots, u_m)$ , where  $u_i$  is the  $i$  evaluation factors.

Review the set  $V$ , with  $n$  ratings, which is composed of the following set of grade evaluation:  $V = (v_1, v_2, v_3, \dots, v_n)$ .

Evaluation of matrix  $R$  represents the fuzzy relationship between the evaluation factor set  $U$  and comments set  $V$ :

$$R = \begin{pmatrix} r_{11} & \cdots & r_{1m} \\ \vdots & \ddots & \vdots \\ r_{n1} & \cdots & r_{nm} \end{pmatrix}$$

where,  $r_{ij}$  represents the value corresponding to the evaluation factors of  $u_i$ , that is, the object of the comments comments. Matrix of the line,  $R_i = (r_{i1}, r_{i2}, r_{i3}, \dots, r_{im})$ , as the single-factor evaluation of the evaluation elements, is a comment on a subdomain on the set.

#### 3.2 AHP to determine the weight

In the fuzzy comprehensive evaluation, there is a need to determine the weight vector of evaluation factors. For the multi-factor evaluation, the influence degree of various factors should be considered in the overall evaluation, as well as the extent of influence of factors of formation in a fuzzy subset of  $A$ ,  $A = (a_1, a_2, a_3, \dots, a_n)$  on the factor set  $U$ , where  $a_i$  is  $u_i$  for  $A$  membership. This article uses the analytic hierarchy process (AHP) to determine the index between the relative importance of the order, so as to determine the weight coefficient.

First of all, establish the hierarchical structure and determine the objectives and evaluation factors. The problem of factors are grouped, with each a group as a hierarchy.

Second, construction of the judgment matrix. Two comparisons are adopted to establish the method of a paired comparison matrix, with 1-9 and its inverse as a general scale to assess the status of the relative importance of each element, as shown in table 1.

Table 1. Elements of relative importance scale.

Scale	Signification
1	Compared with two factors are equally important
3	Compared with two factors, the former is slightly more important than the latter
5	Compared with two factors, the former is obviously more important than the latter
7	Compared with two factors, the former is strongly more important than the latter
9	Compared with two factors, the former is extremely important than the latter
2'4'6'8	The middle of the adjacent judgment mentioned earlier

Third, the weight calculation. Approximate eigenvector corresponding to the largest judgment matrix

and its characteristic roots by square root method. To determine the calculation of product of each row of the matrix:

$$M_i = \prod_{j=1}^n b_{ij} (i = 1, 2, \dots, n) \quad (1)$$

The calculation of  $n$ -th root of  $M_i$ :

$$\bar{W} = \sqrt[n]{M_i} (i = 1, 2, \dots, n) \quad (2)$$

The normalized vector  $\bar{W}$  :

$$W_i = \bar{W}_i / \sum_{i=1}^n \bar{W}_i (i = 1, 2, \dots, n) \quad (3)$$

Then,  $W = [W_1, W_2, \dots, W_n]^T$  is the requested feature vector.

$$\lambda_{\max} = \sum_{i=1}^n \frac{AW_i}{nW_i} \quad (4)$$

For the test of consistency of judgment matrix, there is need to calculate consistency index  $CI = \frac{\lambda_{\max} - n}{n - 1}$  and the average random consistency index RI. When the random consistency ratio  $CR = \frac{CI}{RI} < 0.1$ , that is, weights allocation is reasonable. Otherwise, the pairwise comparison matrix is used to adjust the value to distribution coefficient values.

### 3.3 Fuzzy comprehensive evaluation

Fuzzy transform evaluation:

$$B = (b_1, b_2, \dots, b_n) = (a_1, a_2, \dots, a_n) \begin{pmatrix} r_{11} & \dots & r_{1m} \\ \vdots & \ddots & \vdots \\ r_{n1} & \dots & r_{nm} \end{pmatrix} \quad (5),$$

where B as the evaluation set is equivalent to V of the fuzzy subset;  $b_j$  is equivalent membership degree of fuzzy subset B. If making a decision, according to the maximum membership degree principle, the biggest  $b_j$  corresponding to grade V is the result of comprehensive evaluation.

## 4 EMPIRICAL STUDY

A vegetable enterprise is looking for logistics service providers to bear the corresponding logistics business. The existing four alternative suppliers, respectively, a, b, c, and d, establish the criterion of the evaluation

index system based on the cost, benefit, development potential, and ecological construction. The concrete analysis is as follows:

First, the establishment of fuzzy sets. Comments set  $V = (\text{excellent, good, general, poor})$ , regulations:

$$V_1 = 4, V_2 = 3, V_3 = 2, V_4 = 1.$$

Second, determine the weight. After the discussion leaders and experts group, combined with the actual situation of the enterprise, obtain the relative weight of four criteria, these are represented by the judgment matrix, as shown in Table 2:

Table 2. Judgment matrix of the general objective criteria.

Index	Costs	Benefits	Development potential	Ecological construction
Costs	1	3	5	5
Benefits	1/3	1	2	3
Development potential	1/5	1/2	1	1
Ecological construction	1/5	1/3	1	1

According to the formula (5),  $\lambda_{\max} = 4.304$ ,  $CR = 0.0126 < 0.1$  the judgment matrix has a relatively satisfactory consistency.

$$W = [0.566, 0.229, 0.108, 0.097]^T$$

Similarly, the weight of each secondary index can be worked out:

$$A_1 = (0.338, 0.358, 0.159, 0.145)$$

$$A_2 = (0.381, 0.368, 0.123, 0.089, 0.039)$$

$$A_3 = (0.340, 0.063, 0.178, 0.285, 0.134)$$

$$A_4 = (0.273, 0.235, 0.197, 0.165, 0.130)$$

Third, the fuzzy comprehensive evaluation. After experts conduct the objective evaluation of each supplier, and the "cost" factors in the primary index score, evaluation results are as shown in Table 3.

Thus, it can be concluded that the evaluation matrix R of cost index in the first-level index system of a supplier. According to the weight of each index, it is concluded that supplier a, b, c, and d costs in the

first layer of the index system of evaluation indicators secondary comprehensive evaluation:

Table 3. Evaluation results of costs.

Suppliers	Index	Excellent	Good	General	Poor
a	Stock cost	0.8	0.1	0.05	0.05
	Managed cost	0.5	0.3	0.1	0.1
	Quality loss	0.3	0.2	0.4	0.1
	Delivery cost	0.2	0.5	0.3	0.0
b	Stock cost	0.75	0.05	0.2	0.0
	Managed cost	0.8	0.2	0.0	0.0
	Quality loss	0.6	0.2	0.1	0.1
	Delivery cost	0.5	0.5	0.0	0.0
c	Stock cost	0.3	0.3	0.2	0.2
	Managed cost	0.4	0.3	0.1	0.2
	Quality loss	0.9	0.1	0.0	0.0
	Delivery cost	0.9	0.1	0.0	0.0
d	Stock cost	0.6	0.3	0.1	0.0
	Managed cost	0.5	0.3	0.1	0.1
	Quality loss	0.4	0.5	0.0	0.1
	Delivery cost	0.6	0.2	0.2	0.0

$$B_{1a} = (0.526, 0.245, 0.160, 0.069)$$

$$B_{1b} = (0.708, 0.193, 0.083, 0.016)$$

$$B_{1c} = (0.379, 0.280, 0.161, 0.180)$$

$$B_{1d} = (0.532, 0.317, 0.099, 0.052)$$

According to the primary index under “benefit,” the secondary indicators of their weight draw a secondary comprehensive evaluation of suppliers a, b, c, and d:

$$B_{2a} = (0.567, 0.229, 0.132, 0.072)$$

$$B_{2b} = (0.734, 0.166, 0.088, 0.012)$$

$$B_{2c} = (0.487, 0.250, 0.113, 0.150)$$

$$B_{2d} = (0.531, 0.323, 0.097, 0.049)$$

Similarly, it is concluded that the secondary comprehensive evaluation of a, b, c, and d belongs to the “development potential”:

$$B_{3a} = (0.494, 0.271, 0.180, 0.055)$$

$$B_{3b} = (0.675, 0.221, 0.086, 0.018)$$

$$B_{3c} = (0.664, 0.181, 0.074, 0.081)$$

$$B_{3d} = (0.531, 0.334, 0.111, 0.024)$$

In the same way, it is concluded that the secondary comprehensive evaluation of a, b, c, and d belongs to the “ecological construction”:

$$B_{4a} = (0.506, 0.259, 0.165, 0.070)$$

$$B_{4b} = (0.710, 0.196, 0.074, 0.020)$$

$$B_{4c} = (0.619, 0.201, 0.078, 0.102)$$

$$B_{4d} = (0.511, 0.349, 0.097, 0.043)$$

Considering the earlier evaluation vector as indicators of the upper evaluation matrix, the second floor of the evaluation results is shown in table 4.

Table 4. Second evaluation results.

Suppliers	Index	Excellent	Good	General	Poor
a	Costs	0.526	0.245	0.160	0.069
	Benefits	0.567	0.229	0.132	0.072
	Development potential	0.494	0.271	0.180	0.055
	Ecological construction	0.506	0.259	0.165	0.070
b	Costs	0.708	0.193	0.083	0.016
	Benefits	0.734	0.166	0.088	0.012
	Development potential	0.675	0.221	0.086	0.018
	Ecological construction	0.710	0.196	0.074	0.020
c	Costs	0.379	0.280	0.161	0.180
	Benefits	0.487	0.250	0.113	0.150
	Development potential	0.664	0.181	0.074	0.081
	Ecological construction	0.619	0.201	0.078	0.102
d	Costs	0.532	0.317	0.099	0.052
	Benefits	0.531	0.323	0.097	0.049
	Development potential	0.531	0.334	0.111	0.024
	Ecological construction	0.511	0.349	0.097	0.043

According to the weight of the first level of evaluation factors, it is concluded that the level of comprehensive evaluation of the four suppliers is as follows:

$$B_a = (0.5300, 0.2455, 0.1562, 0.0683)$$

$$B_b = (0.7106, 0.1901, 0.0836, 0.0157)$$

$$B_c = (0.4578, 0.2548, 0.1325, 0.1549)$$

$$B_d = (0.5296, 0.3233, 0.0997, 0.0474)$$

Using the formula:  $V = \sum_{j=1}^m V_j b_j (i=1, 2, 3, 4)$ , the conclusions are as follows:

$$V_a = 3.2372, V_b = 3.5956, V_c = 3.0155, V_d = 3.3351$$

Comparing the earlier value, B is the optimal supplier.

## 5 CONCLUSIONS

The third-party logistics providers more and more try to become enterprises and realize the inevitable choice for customer demand rapid response. This

article establishes an evaluation index system of the third-party logistics service supplier selection according to the characteristics of fresh vegetables, and it uses the fuzzy comprehensive evaluation method to select suppliers. Finally, the article selected cases for empirical analysis, which provides an effective decision basis for the enterprises to carry out the third-party logistics supplier evaluation and selection.

**ABSTRACT:** This paper is devoted to examining the forecasting ability of three types of Distance-to-Default(DD) based on the Merton model. The three DD are different either on the solving methodology or on the functional form. We have mainly used Logistic regression and ROC curves to program the prediction models. It concludes that the three DD all have some ability to forecast default, but DD proposed by Bharath & Shumway (2008) is slightly superior to that implied in the Merton model and defined by Moody's KMV. However, all the DD are insufficient statistics for default; it is necessary to add some accounting ratios if using them to predict default, and the EBITDA/total liabilities can supplement  $DD_{naïve}$  very well. Besides, they are not indispensable predictors as well for being completely replaced by accounting ratios. The Merton model may not be suitable for our stock market because of high simplification and generalization.

**KEYWORDS:** Distance-to-default; Forecasting ability; the Merton model.

### 1 INTRODUCTION

In recent years default risk modeling and measures have been of considerable interest to financial institutions and academics. This is due mainly to the following two aspects. First, the Basel II allows banks to use internal rating-based approaches to assess their default risk of portfolios. Second, the explosive growth in the credit derivatives market necessitate more developed credit analysis methods (Laajimi 2012).

There are two classical models in default prediction. One is the Altman (1968) Z-Score model which represents traditional accounting-based models, and the other is the Merton (1974) model that uses forward-looking market information to forecast default. Due to a strong theoretical foundation and overcoming some shortcomings of accounting-based models, the latter has been widely recognized by scholars (e.g. Vassalou & Xing 2004, Hillegeist et al. 2004, Reisz & Perlich 2007).

Since the Merton model was set up, various attempts have been made to modify and extend it. Prominent among these are the KMV model and the Bharath & Shumway (2008) model (Charitou et al. 2013). The KMV model was developed by Vasicek and Kealhofer, two founders of Moody's KMV, in a way of extending the framework of the Merton model (therefore it is also called the VK model). It can make

a prediction (and update) on the likelihood of default for all its major companies and banks that trade equities publicly (Ma 2006). However, the model uses more complex iterative procedures than Merton to estimate the firm value and its volatility. Besides, it relies on Moody's KMV proprietary large historical database and past experience to estimate default probabilities. Because of this, precisely replication the KMV model is impossible. However, the model has provided a feasible conceptual framework. Various studies following the framework have different assumptions and inputs. Bharath & Shumway (2008) collectively called them as "Merton distance-to-default(DD) model". They re-estimate the performance of different specifications of the Merton DD model and draw the following three important conclusions. First, the probability given by the Merton DD model is not a sufficient statistic for forecasting default. Second, the functional form used by the Merton DD model is a very important construct for predicting default. Three, the solution of the Merton DD model is not important for forecasting default. Bharath & Shumway creatively propose a naïve predictor which has the same functional form as the Merton DD predictor but is relatively simple in calculation. They demonstrate that the naïve predictor can capture much of the information in KMV estimates and is much better than the Merton DD measures. Since then, the

naïve DD model has been used in many studies (e.g. Campbell et al. 2008, Afik et al. 2012, Charitou et al. 2013, Bauer & Agarwal 2014).

In China, there have been a large number of studies on default risk modeling and measures based on the KMV framework. But we find that scholars seem to prefer using the DD pioneered by Moody's KMV ( $DD_{KMV}$ , details in section 2.2) when measuring default (e.g. Cheng & Wu 2002, Zhang et al. 2004, Ma 2006, Chen et al. 2008, Zhang & Zhang 2010, Pan & Ling 2012, Tang et al. 2013, Zeng & Xu 2014). This is different from foreign studies which just follow the framework of the KMV model and use the Merton-type DD ( $DD_{Merton}$ ). Shi & Ren (2005) argue that the consistency between  $DD_{KMV}$  and Z-Score is quite low, while references in above parentheses show  $DD_{KMV}$  performs quite well. However, some papers using  $DD_{Merton}$  argue that the power of the Merton model is not satisfactory. Su & Lin (2006) prove that  $DD_{Merton}$  is less powerful than the logistic model, Kong & Li (2012) confirm their conclusions and report that the forecasting accuracy of the Merton model is only 31.6%. Given this discrepancy, we wonder whether there is a great difference in forecasting default between the two DD? After all, both of them are based on the Merton model, and only slightly different in the functional form. Moreover, international studies have proven the forecasting ability of Bharath & Shumway (2008) model, but our researchers concerns little about it. We would like to know whether this naïve DD model ( $DD_{naïve}$ ) is also suitable for Chinese listed companies? Comparing with the above two measures, does the naïve DD has some superiority? If yes, how does it perform when compared to accounting variables? For these problems, we will use the data of 92 listed companies between 2012-2014 to answer by empirically comparing the forecasting power of the three DD.

The rest of the paper is organized as follows. Section 2 presents the default model and alternative measures. Section 3 discusses our data and methodology. Section 4 reports the empirical results with considering accounting ratios or not. Section 6 draws some conclusions from the analysis.

## 2 DEFAULT MODEL AND MEASURES

### 2.1 The Merton model

Related studies have detailed instructions on the Merton model, we will not elaborate it but only explain briefly according to our need. The model assumes that the market value of a firm's assets following a geometric Brownian motion (GBM):

$$dV = \mu V dt + \sigma_V V dW \quad (1)$$

where  $V$  is the market value of firm's assets;  $\mu$  is the expected continuously compounded return on  $V$ ;  $\sigma_V$  is the volatility of assets value and  $dW$  is a standard Wiener process. Solution to the above equation requires the Black-Scholes formula viewing the firm equity as a call option on  $V$  with time to maturity equal to  $T$ :

$$E = VN(d_1) - Fe^{-rT}N(d_2) \quad (2)$$

where  $E$  is the market value of firm's equity;  $F$  is the face value of the firm's debt;  $r$  is the free-risk rate;  $N(\cdot)$  is the cumulative density function of the standard normal distribution;  $d_1$  is given by:

$$d_1 = \frac{\ln(V/F) + (r + 0.5\sigma_V^2)T}{\sigma_V \sqrt{T}}$$

$$d_2 = d_1 - \sigma_V \sqrt{T} \quad (3)$$

Under the assumption of Merton,  $E$  must also meet the following elastic relations in addition to [equation \(2\)](#), that is:

$$\sigma_E = \frac{\partial E}{\partial V} \left( \frac{V}{E} \right) \sigma_V \quad (4)$$

where  $\sigma_E$  is the volatilities of firm's equity. Since  $\partial E / \partial V = N(d_1)$ , the [equation \(4\)](#) can be expressed as:

$$\sigma_E = N(d_1) \left( \frac{V}{E} \right) \sigma_V \quad (5)$$

Simultaneously solving [equations \(2\)](#) and [\(5\)](#) can calculate  $V$  and  $\sigma_V$ , then along with other inputs can estimate the Merton-type default:

$$DD_{Merton} = \frac{\ln(V/F) + (\mu - \frac{1}{2}\sigma_V^2)T}{\sigma_V \sqrt{T}} \quad (6)$$

Thus, the default probability is equal to  $N(-DD_{Merton})$  with the assumption of normal distribution.

For comparing purposes, we adopt the practice of many scholars that only calculate DD but without transforming it into the probability of default.

Note that [Equation \(2\)](#) doesn't depend on  $\mu$ , but  $DD_{Merton}$  does. The [Equation \(2\)](#) is derived under the assumption of risk-neutrality where all assets are expected to grow at the risk-free rate, while the

default probability depends on the actual distribution of future value of assets. Therefore,  $DD_{Merton}$  is a function of  $\mu$  (Vassalou & Xing 2004, Hillegeist et al. 2004).

## 2.2 Alternative default-to-distance

### 2.2.1 DD defined by Moody's KMV

Moody's KMV points out that there are three main elements that determine the default probability of a firm: value of assets, asset risk and leverage (see Crosbie & Bohn (2003)). They first measure DD as the number of standard deviations the asset value is away from default and then use empirical data to determine the corresponding default probability, the distance-to-default is calculated as:

$$DD_{KMV} = \frac{V - DP}{V \times \sigma_V} \quad (7)$$

where DP is the default point equivalent to F in  $DD_{Merton}$ . Clearly, the functional form of  $DD_{KMV}$  is slightly different from  $DD_{Merton}$ . There is no  $\mu$  in  $DD_{KMV}$  since Moody's KMV believes  $\mu$  has little default discriminating power. So  $DD_{KMV}$  can be estimated as long as figuring out  $V$ ,  $\sigma_V$  and DP. Moody's KMV uses the option-pricing equations derived in the VK framework to derive a firm's market value of assets and its associated asset volatility. Due to the VK model is proprietary to Moody's KMV, our scholars generally follow the solution method of  $DD_{Merton}$ , that is, by simultaneous nonlinear equations (2) and (5) to derive  $V$  and  $\sigma_V$ . We will use the Matlab software to achieve this. For DP, Moody's KMV points out it generally lies on somewhere between total liabilities and current liabilities, and often set it as firm's current liabilities plus one-half of long-term debt. Most international studies have adopted this setting. Afik et al. (2012) argue that the accuracy of the Merton model is not very sensitive to default boundary. Zhang et al. (2004) and Shi & Ren (2005) also claim different settings of weight number on long-term liabilities have no significant effect on the estimates. According to usual practice, we will use  $F = \text{current liabilities} + 0.5 \times \text{long-term liabilities}$  in all types of DD.

### 2.2.2 Naïve DD of Bharath & Shumway (2008)

Bharath and Shumway (2008) argue that the Merton model requires a number of assumptions, how well it performs in forecasting depends on how realistic its assumptions. If the model's strong assumptions are violated, it is possible to construct a reduced-form model with more accuracy. In order to construct their

naïve probability, they first approximate the market value of each firm's debt with the face value of its debt, namely:

$$naiveD = F \quad (8)$$

Then, the volatility of each firm's debt can be approximated as:

$$naive\sigma_D = 0.05 + 0.25\sigma_E \quad (9)$$

After that,  $\sigma_V$  can be estimated by the following weighted algorithm:

$$\begin{aligned} naive\sigma_V &= \frac{E}{E + naiveD} \sigma_E + \frac{naiveD}{E + naiveD} naive\sigma_D \\ &= \frac{E}{E + F} \sigma_E + \frac{F}{E + F} (0.05 + 0.25\sigma_E) \end{aligned} \quad (10)$$

Next, they set  $\mu$  equal to the firm's stock return over the previous year:

$$naive\mu = r_{it-1} \quad (11)$$

Finally, the naïve DD can be derived from substituting the inputs  $naive D$ ,  $naive \sigma_V$ ,  $naive \mu$  into the Equation(6), that is:

$$DD_{naive} = \frac{\ln \frac{E + F}{F} + (r_{it-1} - 0.5naive\sigma_V^2)T}{naive\sigma_V \sqrt{T}} \quad (12)$$

It is clear that the  $DD_{naive}$  is easy to calculate versus  $DD_{Merton}$  and  $DD_{KMV}$ . Afik et al.(2012) show that it is just the simple calculation that makes the model attractive, the power of the naïve probability only comes from its special estimate of  $\sigma_V$ .

## 3 DATA AND METHODOLOGY

### 3.1 Sample and data

By convention, we view companies that are special treated (ST) for financial abnormality as default samples. There are 89 initial defaults covering the period January 1, 2012 to June 30, 2014 in the JuYuan database. We then delete the following companies that:(1) issue B shares and H shares simultaneously; (2) are special treated for other non-financial reasons, including operating impaired, illegal

guarantee, violations of information disclosure, etc; (3) the trading days is too short, such as not more than 100 days;(4) recover after being ST for several month. There are left 62 samples after these deletion. Next, we match each of ST company with a non-ST firm by the standard that fiscal year and industry sector are strictly equal and difference of their asset size does not exceed 10%. We find there are 15 ST companies that can't be paired. So the final samples consist of 46 pairs of ST and non-ST companies (one company is removed for incomplete data), where 15 ST companies are in 2012, 13 ones are in 2013 and 18 ones are in 2014. Following the approach of Shi et al.(2012) and Tang et al.(2013), we use the data of the last two year of ST occurred when we call the T-2 year for empirical analysis. All data are derived from the CSMAR and JuYuan database.

The inputs of the three DD include  $E$ ,  $\sigma_E$ ,  $F$ ,  $r$ ,  $T$ . Given the existence of non-tradable shares in our stock market, we use weighted method to calculate the market value of equity, that is,  $E$ =the closing price $\times$ the number of shares outstanding+the net worth per share $\times$ the number of non-tradable shares.  $\sigma_E$  is estimated from historical stock returns(for details, see Tang et al.(2013)). For  $r$ , we use the one-year bank deposit rate.  $T$  is set for 1 year according to usual practice. For  $\mu$ , Bharath and Shumway use the firm's stock return over the previous year, we use the return on stock without considering the cash dividend reinvestment in the CSMAR.

Table 1 gives the descriptive statistics of the three DD. Obviously, the average value of all the DD of ST companies is significantly less than that of non-ST companies. For ST group, the standard deviation of  $DD_{naive}$  is the lowest and not much different from the non-ST companies, but the other two are relatively large, which demonstrate that  $DD_{naive}$  is more concentrated but  $DD_{Merton}$  and  $DD_{KMV}$  have larger volatility. In total,  $DD_{naive}$  is a bit larger while  $DD_{KMV}$  shows the opposite.

Table 1. Descriptive statistics.

		Mean	Std. dev.	Min	Max
ST	$DD_{Merton}$	0.36	2.26	-6.13	5.18
	$DD_{KMV}$	0.47	2.20	-10.75	2.12
	$DD_{naive}$	2.16	1.65	-0.50	6.58
NST	$DD_{Merton}$	1.96	1.84	-1.57	6.87
	$DD_{KMV}$	1.43	0.62	0.25	2.84
	$DD_{naive}$	3.47	1.73	0.16	8.11

### 3.2 Empirical methodology

We find that most of our researchers just use the simple hypothesis testing to assess the forecasting power of  $DD_{KMV}$ , a few of them using ROC curves do not report AUC(the area under the ROC curves), while AUC reported by Zeng & Wang(2013) is only 0.68. Given this, we will adopt Logistic regression and ROC analysis to prove our expectations.

Since Ohlson (1980) pioneers the use of logistic regression to predict business failure, Logit model has become one of the methods commonly used in international studies. As we know, the most basic tool for understanding the performance of a default prediction model is the "percentage right", which is derived from a contingency table or confusion matrix. However, Stein(2005, 2007) argue that using contingency tables(or indices derived from them) to evaluate models can be challenging due to the relatively arbitrary nature of cut-off definition, while ROC curves generalize contingency table analysis by providing information on the performance of a model at any cut-off. They recommend using the ROC curve to analysis the result of model's prediction. Nowadays, ROC curves is widely used in the comparison of different models for forecasting. Sobehart & Keenan(2001) argue that the AUC is the decisive indicator of a model's predictive ability. Engelmanne et al. (2003) transform the AUC into the accuracy ratio(AR), the index of cumulative accuracy profiles(CAP), as following:  $AR=2(AUC-1)$ . In this paper, we will plot the ROC curve of each model by the SPSS soft to compare the AUC, and evaluate the prediction power of all the DD along with other indictors produced by our model.

## 4 RESULTS

### 4.1 Paired samples test

To further illustrate whether the difference between ST and non-ST companies is significant, we perform a paired-sample t-test supplemented by the Wilcoxon's Sign Rank Test. Table 2 shows the result. We can see the mean difference and the Z value between the two groups are significant at the 1% level, which indicates the three types of DD all have some discriminatory power. In general, the mean difference of  $DD_{KMV}$  is relatively small, while the other two are similar. This is because the small value of  $DD_{KMV}$  and the potential relevancy of  $DD_{naive}$  and  $DD_{Merton}$ .

### 4.2 The correlations

Table 3 shows the correlations of the three types of DD. From which, we can see any two of them have a significantly positive correlation, especially the correlation between  $DD_{naive}$  and  $DD_{Merton}$  is up to 0.957.

Table 2. Paired samples test.

		$DD_{Merton}$	$DD_{KMV}$	$DD_{naive}$
Mean	ST	0.36	0.47	2.16
	NST	1.96	1.43	3.47
T-test*	ST-NST	-1.59	-0.96	-1.30
Wilcoxon**	Z	-4.38	-3.96	-3.86

\* All the result are significant at the 1% level or lower.

\*\* The Z value is based on negative signed rank, and all the results are significant at 1% level or lower.

They can completely substitute for each other as our expectation. Leaving aside the same functional form, this may mean the solving method of the Merton model is not very important. Besides,  $DD_{Merton}$  also has a high correlation with  $DD_{KMV}$ . This may derive from the same method to calculate  $V$  and  $\sigma_V$ . Comparing with the former correlation, we can think that the functional form of Merton distance-to-default is more important than its solution method.

Table 3. Correlations.

Correlation	Estimate
Pearson Corr( $DD_{Merton}$ , $DD_{KMV}$ )	0.755
Pearson Corr( $DD_{Merton}$ , $D_{Dnaive}$ )	0.957
Pearson Corr( $DD_{naive}$ , $DD_{KMV}$ )	0.596

All correlations are significant at the 1% level (two-tailed).

### 4.3 Logistic regression

Given the above results, we can say the three types of DD all has some forecasting ability,  $DD_{naive}$  can substitute for  $DD_{Merton}$  and  $DD_{KMV}$ , and will be more effective than  $DD_{KMV}$ . In order to facilitate our results, we perform 6 logistic regressions with the dependent variable as whether the listed company is ST (ST=1, NST=0). As shown in table 4, all three DD are significant at the 1% level and have the expected sign, which indicates that DD is a significant predictor for forecasting default. The coefficients and standard deviation of  $DD_{naive}$  and  $DD_{Merton}$  are very close but relatively large in  $DD_{KMV}$ , which means the change of  $DD_{KMV}$  may have a greater impact on the predictions. In three unreported models which include a combination of any two of DD, we find there exists some substitutional relation among the three types of DD, because they are not significant in any combination. All the models' -2LL (loglikelihood) are extremely close, but the chi-square values of HL test are very different, and the smallest chi-square value is only in model 3. This demonstrates that  $DD_{naive}$  better fits the data. Using  $DD_{naive}$  would produce better prediction than the other two alternatives. So there is no need to choose the index calculated relatively

complexity but abandon the simple one. For  $DD_{KMV}$ , the chi-square value is the worst. Meanwhile, table 5 shows the AUC of  $DD_{KMV}$  is the smallest despite that all the AUC are significant greater than 0.5 and very similar. Its lower limit in the 95% confidence interval is not more than 0.6, and the upper limit is also just 0.8, which is similar to the result of Zeng & Wang(2013). Therefore, although we recognize  $DD_{KMV}$  has significant predictive power, it is not as optimistic as our scholars have found.

It must be noted that in fact the forecasting power of all the DD is not very high. All the AUC are only about 0.7, and the largest AR is not more than 45%. Obviously, only relying on DD to forecast default is not sufficient. That is why some researchers (e.g.Liu et al. 2005; Tan 2005) only consider it as one of predictors.

Table 4. The results of Logistic regression.

Model	M1	M2	M3
$DD_{Merton}$	-0.402*** (0.124)		
$DD_{KMV}$		-1.056*** (0.364)	
$DD_{naive}$			-0.461*** (0.141)
-2LL	114.14	113.42	114.62
$\chi^2$ (HL)	6.346 (0.608)	10.725 (0.218)	3.594 (0.892)

This table reports the result of regressions with DD as a predictor. We omit the constant term for limited space. Standard errors are in parentheses, while the last line represents the significance of chi-square.(\*\*\* significant at the 1% level).

Table 5. The area under the ROC curve.

	AUC	SE.	Sig.	95% confidence interval	
				lower limit	upper limit
M1	0.714	0.054	0.000	0.608	0.820
M2	0.696	0.055	0.001	0.589	0.804
M3	0.710	0.054	0.001	0.604	0.816

This table presents the AUC of each model. Note that the Sig. is progressive. The test is under the non-parametric assumption, and the hill hypothesis is that the real area equals to 0.5.

### 4.4 Comparing with accounting ratios

From section 4.3, we know  $DD_{naive}$  can completely replace  $DD_{Merton}$  and  $DD_{KMV}$ , but still its forecasting ability is limited. The inconsistent performance of

Table 6. The logistic regression for comparing accounting ratios.

	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
$DD_{naïve}$	-0.50 (0.31)		-0.43 (0.33)		-0.12 (0.40)		-0.45 (0.28)		-0.48* (0.28)	
ROA	-70.16*** (16.34)	-70.30*** (15.49)	-78.13*** (19.7)	-80.95*** (19.27)	-78.64*** (20.45)	-79.23*** (20.35)				
LTA					5.52* (3.282)	5.97** (2.957)				
STA			-2.28** (1.16)	-2.48** (1.12)	-2.97** (1.34)	-3.05** (1.31)	-1.44* (0.83)	-1.54* (0.08)		
ETL							-28.29*** (6.43)	-29.29*** (6.42)	-28.42*** (6.17)	-28.31*** (5.93)
-2LL	43.72	46.61	38.17	39.93	34.99	35.08	48.52	51.28	52.08	55.36
C&S. R	0.60	0.59	0.62	0.61	0.63	0.63	0.58	0.56	0.56	0.54
N. R	0.80	0.78	0.83	0.82	0.85	0.85	0.77	0.75	0.75	0.73
$\chi^2$ (HL)	10.08 (0.26)	18.24 (0.02)	2.52 (0.96)	2.4 (0.97)	4.43 (0.82)	2.39 (0.97)	7.65 (0.47)	1.89 (0.98)	3.47 (0.90)	3.91 (0.87)
AUC	0.96	0.96	0.98	0.97	0.98	0.98	0.96	0.95	0.95	0.94

The table gives the results of comparing with accounting ratios. We omit all the constant term. C&S.R and N.R are abbreviations of *Cox&Snell R square* and *Nagelkerke R square*. Standard errors are in parentheses, while the line above AUC is the significant level of HL test ( \*\*\* significant at 1% level; \*\*significant at 5% level; \* significant at 10% level).

$DD_{Merton}$  and  $DD_{KMV}$  shown by our scholars is not because of  $DD_{Merton}$ 's poor ability, but  $DD_{KMV}$  itself is not a good predictor. Given this, we select several financial indicators into the model to illustrate: (1) which financial indicator has supplementary role on the DD; (2) whether traditional accounting-based model is really worse than the Merton model. In the beginning, we select eight indicators: the current ratio, the return total assets (ROA), the return on equities, the ratio of total liabilities to total assets (LTA), the ratio of total sales to total assets (STA), the growth rate of sales, the cash flows divided by total liabilities, the EBITDA divided by total liabilities (ETL), where EBITDA is the net income before interest, taxes, depreciation, and depletion. Through various combinations and attempts, we find that only ROA, LTA, STA and ETL can satisfy our expectations. We summarize 10 models whose AUC is about 0.95 and relevant variables are significant as shown in table 6.

In generally, the table shows ROA plays a decisive role in forecasting default. The coefficients of all models including ROA is highly significant at the 1% level, and its absolute value is between 70 and 80, being the largest among all the coefficients. When ROA enters into the model alone, the AUC can achieve 0.96 (M1 and M2), which means that ROA can replace  $DD_{naive}$  completely. If considering STA (M3 and M4), there are not only some increase in the AUC but also apparent improvement for the fitting degree (the likelihood value and chi square value of HL reduce greatly). However, the best model is constituted by a combination of ROA, LTA and STA. This three variables are significant in Model 5 and 6, and the sign of their coefficients is in perfect accordance with our expectations. Meanwhile, the AUC is close to 0.98, up to the highest. Besides, the performance of likelihood values and HL test are quite good. The difference is that model 5 contains  $DD_{naive}$ , but it is not significant. When we remove  $DD_{naive}$ , the chi-square value of HL test drops significantly in model 6. It is clear that appropriate combinations of different variables can provide more information, and accounting ratios have still strong forecasting ability, they can predict the likelihood of company's default accurately without considering  $DD_{naive}$ . We can say  $DD_{naive}$  is not a sufficient statistic for default, traditional accounting-based model is better than the Merton model in Chinese stock market. This is consistent with the study of Su & Lin (2006) and Kong & Li (2012).

We also find that  $DD_{naive}$  is only significant when ETL enters into the model. Model 9 and 10 show that not only ETL itself is very powerful, but also it can improve  $DD_{naive}$  obviously. When this two indicators both come into the model, the performance is better than they enter respectively. However,  $DD_{naive}$  just makes the result even better. In the absence of

$DD_{naive}$ , the forecasting ability of ETL is quite good. While model 8 and 9 are almost equivalent, showing that STA has the same effect as  $DD_{naive}$ . Again, this indicates that  $DD_{naive}$ , which is based on forward-looking market information, can be replaced by accounting index.

Comparing all models containing ETL and ROA, we find that ETL ranks only second to ROA. The coefficients of ETL in model 7 to 10 are all around a absolute value 28 and significant at the 1% level, which shows that ETL is very important to firm's default. STL plays a significant complementary role on ETL and ROA, it makes model performs better than those only include these two indicators. We find that the effect of STA and ETL is next only to the combination of STA and ROA if not considering the role of LTA. Therefore, any of ETL and ROA can make model perform quite well when selecting STA as a predictor. However, the best model is still the combination of ROA, LTA and STA. ROA represents the ability of making profit of firm's assets; LTA expresses the size of firm's debt risk; while STA shows the efficiency of using assets. The three indicators reflect firm's ability to manage risk and the ability of using assets to create value in different aspects. Although  $DD_{naive}$  also contains measures of leverage, profitability and business risk, just as Shi & Chen (2004) say, it can't reflect the complexity of Chinese stock market because of high simplification and generalization (Shi & Chen 2004). As a result, the Merton model is not suitable for Chinese practice.

## 5 CONCLUSIONS

This paper compares the forecasting ability of three types of distance-to-default (DD) based on the Merton model. They are  $DD_{Merton}$  implied in the Merton model,  $DD_{KMV}$  defined by Moody's KMV and  $DD_{naive}$  proposed by Bharath & Shumway (2008). After a series of statistical and econometric analysis, we conclude that first, all the DD can significantly distinguish ST companies from non-ST companies, they do have some but limited ability to predict default. In our sample, the area under the ROC curve of the three DD is only about 0.7, and the accuracy is not more than 45%. Second,  $DD_{naive}$ , which retains the same functional form as  $DD_{Merton}$  but is relatively simple, can replace  $DD_{Merton}$  and  $DD_{KMV}$  completely.  $DD_{KMV}$  is actually not the best measure of default for Chinese listed companies. It has a special context that can't be duplicated exactly. We should follow its framework to use the functional form of  $DD_{Merton}$ . Third, it is necessary to consider some accounting ratios when using the DD indicator. As stated above, the forecasting ability of all the DD is limited. We find that the ratio of EBITDA to total liabilities

(ETL) can supplement  $DD_{naive}$  very well. This agrees the view of those supporting firm's cash flows, and reminds us to pay more attention to firm's operating cash flows. However, DD is not a sufficient statistic for default, it can be perfectly replaced by accounting ratios. The ETL itself is quite powerful in default forecasting,  $DD_{naive}$  just make it even better. Fourth, the return on assets plays a decisive role in company's default, and the best forecasting model is the combination of it and the ratio of total liabilities to total assets as well the ratio of total sales to total assets. The mutual effect of the three variables can make the area under the ROC curve achieve 0.98, and produce 0.9 or higher accuracy (AR). It is clear that although  $DD_{naive}$  has some power for default, it is highly simplified and generalized that some information is lost. The Merton model has no superiority in our Chinese stock market.

## Research on warranty policies for the new-tech equipment

H.M. Wang

*Hebei University of Economics and Business, Shijiazhuang, China*

Y.X. Jia

*Shijiazhuang Mechanical Engineering College, Shijiazhuang, China*

**ABSTRACT:** Although the maintenance support capability of the army was already enhanced after several years continual construction, it is still unable to handle the in-deep repair and major special support task of the equipments alone. In China, the manufacturers of the New-tech equipments often have more technical advantages than the army. In order to bring more high-quality support capability of the manufacture into the construction process of the army maintenance support capability, the Military-Civil-Integration maintenance support capability for the on-active-duty equipments of China has been studied thoroughly. Then the warranty modes for the equipments of the army are analyzed and designed systematically based on the foreign research results. Furthermore, the mathematics model of the one-dimensional warranty policy combining the pro-rate replacement warranty and free-repair warranty is proposed considering the preventive maintenance actions of the manufacturer. Finally, the model is proved to be effective and practical by a case study.

**KEYWORDS:** Military-Civil Integration; New-tech equipment; Manufacturer; Warranty.

### 1 INTRODUCTION

In recent years, the army of China has been equipped by a large amount of the new-tech equipments. These equipments not only improve the fighting capability of the army but also put forward more requirements to the maintenance support strength of the army. Although the maintenance support strength of the army was already enhanced after several years continual construction, it is still unable to handle the in-deep repair and major special support task of the equipments alone. Warranty is a significant tool to introduce the technical power of the manufacturer into the equipment support system of the army. The suitable warranty policy could make full use of the advantages of the manufacturers to satisfy the need for the equipment operational readiness from the army in peace time and war time. However, there is little warranty based study in China. As a result, there is no rule to follow in the practical operational process and in dealing with the conflict of interest between the manufacturer and the army. This paper is themed by exploring the regular pattern of the warranty policies for the new-tech equipments. The Military-Civil-Integration maintenance support capability, the characteristics of the civil maintenance strength and the disadvantages of the current warranty policy are analyzed in Section 2. Then based on the analysis results, the warranty policies suitable for the new-tech

equipment are studied in Section 3. According to the requirements of the army and the manufacturers in China, the model of the one-dimensional combination warranty policy including the pro-rate replacement warranty (PRW) and free-repair warranty (FRW) is proposed in Section 4.

### 2 MILITARY-CIVIL-INTEGRATION MAINTENANCE SUPPORT CAPABILITY

#### 2.1 Construction of the MCI support capability

New-tech equipments are usually more complicated and difficult to be maintained. And the military maintenance support strength hardly catches up the upgrading pace of the equipments. There are two tough questions when the maintenance support tasks for the equipments are accomplished by the army alone. One is the independent support effectiveness of the army is becoming lower as the maintenance cost of the new-tech equipments is becoming higher. The other is the advantages of the civil maintenance support strength which couldn't be made full used of. Obviously, the construction of the independent maintenance support by the army alone is unable to enhance the maintenance support capability effectively, and even results in serious waste of resources. So the Military-Civil-Integration maintenance support strength should include military support strength and civil support

strength, which is shown as Figure 1. Although the civil support strength is a supplement to the military support capability, it plays an important role in the construction of the maintenance support strength.

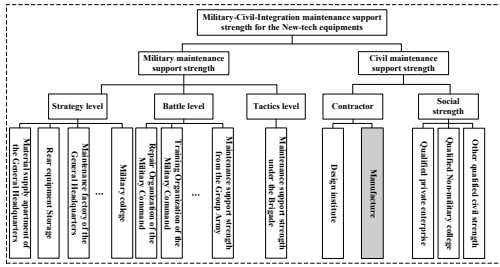

Figure 1. Construction of the MCI maintenance support strength.

### 2.2 Analysis of civil maintenance support strength

The civil maintenance support strength includes contractor support strength and social general support strength. The contractor support strength usually means the strength from the design institution or the manufacturer of the new-tech equipments. When the military support strength is insufficient, the based or extended warranty contract is signed. Then the manufacturer will take the charge of the maintenance tasks and spare supply. The social general support strength means the strength from the enterprises which produce the general equipments. The qualified private enterprises, qualified non-military colleges and other qualified civil strength belong to this kind of support strength. Currently the contractor support strength is the main strength of the civil support strength. And the manufacturer has more auxiliary facilities and is more familiar with the designed performance of the equipment. So the strength from the manufacturer is the key strength needs to be introduced in. Warranty as the only effective way to bring in the strength of the manufactures could deepen the development of Civil-Military Integration.

### 2.3 Warranty policies for the new-tech equipments

The warranty policies suitable for the new-tech equipments, which are proposed by reference to the warranty suitable for the civil products, are shown in Figure 2.

The warranty policies could be divided into two categories: renewing and non-renewing. Then these two types of warranty could be further divided into simple warranty policy and combined warranty policy. Simple warranty policy only has one policy in the warranty period. On the other hand, combined policy has at least two policies to implement at the different phases in the

warranty period. Then according to the units of measurement, the warranty policy could be separated into one-dimensional warranty policy and two-dimensional warranty policy. One-dimensional warranty is limited by time. On the contrary, two-dimensional warranty is limited by time and usage. At last, the simple warranty policies could be divided into FRW, PRW and rebate warranty. The equipments procured by the army are different to the industrial products, which are required optimal cost as well as performance. So the decision model of the warranty policy for the equipments should take the equipment performance (such as availability or mean time between failures) into account. So here consider the combined warranty policy including FRW and PRW to model the reality.

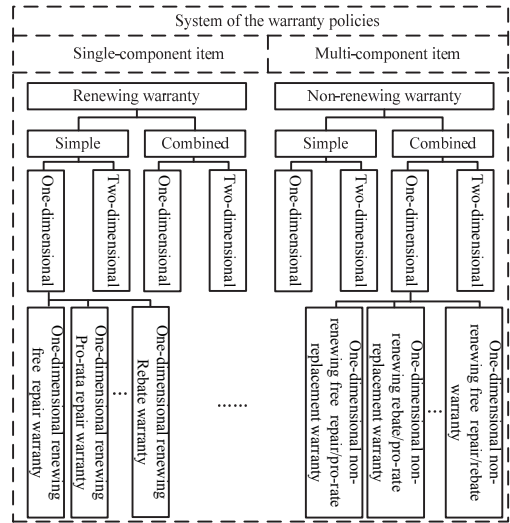

Figure 2. System of the warranty policies.

## 3 ONE-DIMENSIONAL WARRANTY POLICY COMBINING THE PRO-RATE WARRANTY AND FREE-REPLACE WARRANTY

### 3.1 Hypothesis

In the warranty period  $W$ , the preventive maintenance is implemented at  $T_j (j=1,2,\dots,N)$ . When the equipment breaks down, the corrective maintenance is minimal to repair. And the preventive maintenance is imperfect maintenance.  $\theta (0 \leq \theta \leq 1)$ , which means the maintenance degree of PM. The case where  $\theta = 0$  corresponds maintenance as good as old, and the case where  $\theta = 1$  corresponds maintenance as good as new. After implementing the preventive maintenance at  $t$ , the recovery degree of the equipment is:

$$\lambda(t^+) = \lambda(t^- - \theta(m) \times t^-) \quad (1)$$

The cost of the preventive maintenance is shared by the army and the manufacturer. When the cost-share factor of PRW policy is  $\alpha$ , the cost for the manufacturer is:

$$C_1 = C_p(1 - t/W) \quad (2)$$

### 3.2 Mathematics models

#### (1) Cost model

Assuming the preventive maintenance is implemented at regular interval  $T$ . And  $T_p$  is the time duration of the each preventive maintenance.  $C_f$  is the cost of each corrective maintenance and  $C_p$  is the cost of each preventive maintenance. The cost in the warranty period  $C$  is:

$$C = \sum_{j=1}^n C_p \left(1 - \frac{jT + (j-1)T_p}{W}\right) + \sum_{i=1}^n \int_{(i-1)(T+T_p)}^{iT+(i-1)T_p} \lambda_i(t) dt C_f + \int_{n(T+T_p)}^W C_f \lambda_{(n+1)}(t) dt \quad (3)$$

$n$  is the number of the preventive maintenance tasks in the warranty period  $W$ , and  $n = \lfloor W / (T + T_p) \rfloor$ . “ $\lfloor * \rfloor$ ” is the integer part of a real number.  $\lambda_i(t)$  is the failure rate in the  $i$ th preventive maintenance period.

$$\lambda_i(t) = \lambda(t - (i-1) \times \theta(m) \times T) \quad (4)$$

#### (2) Availability model

$T_f$  is corrective maintenance time. Expected availability in the warranty period is:

$$A = \frac{W - (nT_p + \sum_{i=1}^n \int_{(i-1)(T+T_p)}^{iT+(i-1)T_p} T_f \lambda_i(t) dt + \int_{n(T+T_p)}^W T_f \lambda_{(n+1)}(t) dt)}{W} \quad (5)$$

## 4 NUMERICAL EXAMPLES

The propeller shaft of certain equipment is taken as an example, and we use the same data of Wang(2010). The original warranty policy of the propeller shaft doesn't have preventive maintenance, and the warranty period is three years. The warranty cost and the equipment availability of this warranty policy is:

$$T = W = 1080 \text{ Days (Tree years)}, C = 29160 \text{ RMB}, A = 0.8650.$$

However, when the failure of the propeller shaft costs great loss to the army, the preventive maintenance should be implemented. So the models of

Section 3.2 are applied. The maintenance degree of the imperfect preventive maintenance  $\theta$  is 0.9. The warranty cost and equipment availability are shown as Figure 3 and Figure 4.

Obviously, if  $W$  is specified as certain fixed value, the warranty cost will decrease before increasing when the imperfect preventive maintenance interval  $T$  is increasing. At the same time, the equipment availability will increase before decreasing. So the warranty policy could be optimized. Because the manufacturer is inclined to pay more attention to the warranty cost, we obtain the following data by minimizing the warranty cost shown as Table 1 (approximate one year to 360 days).

Figure 3. Cost function.

Figure 4. Availability function.

The above data shows the imperfect preventive maintenance which could effectively decrease the warranty cost and improve the item's availability. For example, if the warranty period is three years, the warranty cost of the policy with PM will decrease by 92% compared to the warranty cost

Table 1. The data of the optimal warranty policy.

$W$	$T$	$C$	$A$
1080 (3 years)	126	8405	0.9567
1440 (4 years)	124	12784	0.9513
1800 (5 years)	128	19118	0.9450
2160 (6 years)	129	23714	0.9411
2520 (7 years)	134	30266	0.9361
2880 (8 years)	132	37537	0.9309
3240 (9 years)	136	45522	0.9260
3600 (10 years)	140	54229	0.9210

of the policy without PM. At the same time, the item's availability will also increase by 10%. If the warranty cost of the policy using PM equals to the warranty cost of the policy without PM, the warranty period could be extended to six years. The army could use the data above to evaluate the items in the warranty contract, and then obtain more help from the manufacturer. And the item similar to the propeller shaft could also apply the models to optimize the warranty policy.

# Implementation of the demonstration center network ACL technology

Fa Hai Li & Xia Cao

*School of Electrical and Information Engineering, Hubei University of Automotive Technology, Shiyan, China*

**ABSTRACT:** We propose the implementation method of the Access Control List (ACL) technology in the network. First, we introduce the working principle of the ACL and outline the network topology structure of the demonstration center. We finally implement ACL-specific technology by combining with the picture from the access control, banning or allowing some network services, forbidding access to the Internet at a certain period of time, prevention of virus attacks, and protection of special ports. Thus, we improve the security of the network.

**KEYWORDS:** Network; ACL; Switch; Router; Security.

## 1 INTRODUCTION

With the progress of the demonstration center construction projects at the provincial level, our school invested a lot into the hardware of laboratories in original basic computer, computer technology, computer control, computer network, and so on. The number of computers rose from several hundreds in the past to about two thousand currently. Faced with so many computers, the biggest headache is how to manage them. In order to better maintain the teaching order, we must use the network to manage. However, in the process of actual use, many problems appear, mainly the following ones.

First, teachers worry about their computers being accessed by students. In order to prevent their data being stolen by students, we do not allow students to visit the teachers' machine.

Second, some students play online games or watch online movies during class, because of which the teacher called for a ban on the service.

Third, during the class, students are not allowed to surf the Internet in the lab.

Finally, the laboratory was attacked by a virus.

In order to solve these problems, we use access control list (ACL) to the network, use IP standard control list or expand the list in the layer 3 switches and routers, control the broadcast storm, and improve the network security effectively [1].

## 2 WORKING PRINCIPLE OF THE ACCESS CONTROL LIST (ACL)

The ACL uses Packet filter technology, reads the information such as source address, destination address, source port, destination port, and so on

in the packet head of the third and fourth layers. According to the predefined rules, we filter the packet to achieve the purpose of access control [2]. Among them, the standard control list only reads the source address information of the data packet. However, the extended access control list will also read the destination address, source port, destination port, protocol type, and other information in the packet [3]. The ACL determine whether a packet conforms to defined rules. Allow the data packets that meet the requirements to the destination address and let them finally enter into the internal network. The data packets that do not conform to the rules are discarded [4]. Simultaneously, it informs the data packets sender that the packets do not pass through the router successfully. Through the ACL, we can simply refuse the dangerous data packet that meets the requirements and deny it access to the internal network [5].

## 3 IMPLEMENTATION OF THE ACCESS CONTROL LIST (ACL)

In order to study the application problem of access control list (ACL) in the local area network (LAN), we must select the network in which the network information flow is large [6]. Simultaneously, we consider the network security and stability. In this article, we take the network of the computer experimental teaching demonstration center in Hubei University of Automotive Technology as an example, and we better design the access control list (ACL) in order to ensure the needs of practical application.

Figure 1 is the demonstration center network topology structure, in which layer three switches Ruijie S5750 is used in the convergence layer switches,

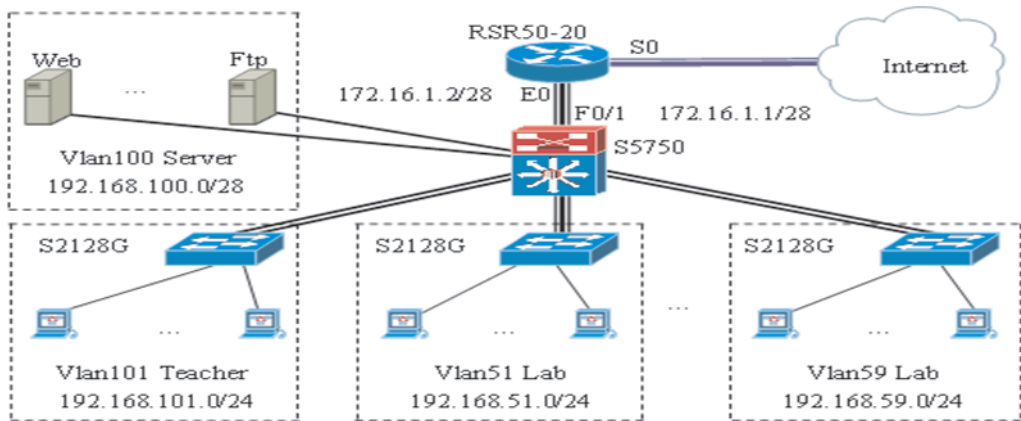

Figure 1. Demonstration center network topology structure.

ruijie S2128G [7] is used in access layer switches, and ruijie RSR50-20 is used in routers. The demonstration center has more than one subnet, namely the teachers' office, the server area, and multiple student laboratories. In order to ensure the stability and availability of the network, the servers directly get access to the convergence layer switches on port 0/3-12. The access layer switches cascade port get access to the convergence layer switches on port 0/13-36. The convergence layer switch port 0/1 is connected to a router interface E0, and router interface S0 is connected to the ISP service providers (campus network center) [8]. Combining with the actual requirement of the demonstration center, the IP address for each subnet and the network equipment is distributed as in Figure 1.

In conclusion, teacher office, the server area, and students' laboratory have different requirements for Internet use. So using ACL technology to build the following security policy solves the problem.

### 3.1 Reflexive access control

The host in the area of teachers' offices (network segment is 192.168.101.0/24) cannot be visited by the host (network segment is 192.168.51.0/24) in the computer basic laboratory. However, the host in the area of teacher' offices can visit the host in the computer basic education laboratory.

In order to implement the one-way access control [9] from network segment 192.168.101.0/24 to the network segment 192.168.51.0/24, we must use the ACL configuration strategies to implement this requirement. The specific configurations in the layer 3 switches S5750 are shown in Table 1.

This strategy adopts reverse ACL to forbid the TCP active connections of the segment 192.168.51.0.

Table 1. Table design.

S5750 (config)#access-list 111 permit tcp 192.168.51.0 0.0.0.255 192.168.101.0 0.0.0.255 established
S5750 (config)#access-list 111 permit ip any any
S5750 (config)#int vlan 51 // Enter into Vlan 51
S5750 (config)#ip access-group 111 in // Apply the ACL label for 111 to 51 Vlan

After this configuration, students in the computer basic education laboratory cannot visit the host in the area of teachers' offices, but the teachers' host can still visit the students' host. The setting methods in other laboratory are the same as the basic computer laboratory, and they are omitted here.

### 3.2 Prohibit or allow some of the network services

Once the demonstration center gets connected to the Internet, we can visit a lot of resources, including playing online games or watching online movies,. Assume that most of the movie resources are placed on the FTP server of the Internet in segment 202.168.100.0/24. First, the segment 192.168.52.0/24 in the computer technology laboratory is not accessible for the FTP service in segment 202.168.100.0/24. Second, we visit the WWW service normally. In the layer 3 of switches S5750, ACL configuration strategies can be used to implement this requirement. Specific configurations are shown in Table 2 such as the service telnet, udp, ping, and so on; the same principle can be used to prohibit the service [10]. First, we need to find the IP address of the provided services. Then, we use the ACL command for prohibition between the laboratory network 192.168.52.0/24 and the IP address of the server to connect to the network.

Table 2. Table design.

---

```
S5750 (config)#access-list 112 permit tcp 192.168.52.0
0.0.0.255 202.168.100.0 0.0.0.255 eq www
S5750 (config)#access-list 112 deny tcp 192.168.52.0
0.0.0.255 202.168.100.0 0.0.0.255 eq ftp
S5750 (config)#access-list 112 permit ip any any
// Allowing other network segment to get to the Internet
S5750 (config)#int vlan 52 // Enter into Vlan 52
S5750 (config)#ip access-group 112 in // Apply the ACL
label for 112 to 52 Vlan
```

---

### 3.3 Forbid surfing the internet at certain periods of time

We need to prevent the students from surfing the Internet during the class and make them only visit resources within the demonstration center. However, the area of teachers' office and the server are not restricted simultaneously. Assume that the computer control laboratory's network segment is 192.168.53.0/24: This semester lasts from March to June, and the next from nine to December: 8 o'clock to 11:30 in the morning and 2 o'clock to 5:30 in the afternoon, every Monday to Friday are the time of class, and surfing the internet is not permitted during this time. In order to implement the earlier requirements [11], ACL configuration strategy can be used on the router RSR50-20; the details are shown in Table 3.

Apply control list to a router on the E0; what we control is the whole demonstration center internal network, and the outside network is not affected.

### 3.4 Prevention of virus attacks

Assuming that the host (IP address is 192.168.53.12) in the computer control laboratory is infected with the virus, and is crazily sending packets to other hosts in Local area network (LAN), we can take the following ACL policy to limit the data transmission of the host to prevent the virus spreading to other network segments. Thus, we can minimize the impact of the virus on the network [12]. The specific configurations in the layer 3 switches S5750 are shown in Table 4.

### 3.5 Protection of special port

By default, the operating system opens some ports, such as 135, 136, 137, 138, 139, 445, 1025, 1434, 3127, 5554, 4444, and so on. Hackers and network virus attack the network system through these ports [13], and finally prevent them from firing normally. To solve the problem of the earlier port, we can design the ACL strategy against virus attacks on router RSR50-20. Specific configurations are shown in Table 5.

The earlier strategy is based on port 445, and the configuration strategies of other ports are the same.

Table 3. Table design.

## 4 CONCLUSIONS

The implementation of the demonstration center network ACL technology has a unique significance to the management work of the network in a school, which improves the security of the network resources to a certain extent [14]; reduces the workload of teacher' maintenance, and ensures the normal order of teaching. The technology was used in the computer experimental teaching demonstration center in Hubei University of Automotive Technology for three years and gained obvious effects, which is of a highly practical value.

# Study on human capital of farmers in poor areas in northwest China—from sustainable livelihoods angle

Cheng Ying Li & Qing Feng Hou & Jian Min Han

College of Humanities, Gansu Agriculture University, Lanzhou, Gansu, China

**ABSTRACT:** Human capital situation of Longnan farmers is more representative throughout Gansu Province and even in poor areas in northwest China. A study on human capital situation of local farmers from the perspective of sustainable livelihoods is comparatively lacking. Human capital is investigated from four aspects, such as gender, age, health status, and education level. Then, the relationship between human capital and livelihood strategies and sustainable livelihoods mode is analyzed.

Human capital is generally inadequate in poor areas in northwest China, and overall, labor quality is not high. Agricultural and non-agricultural production coexist among livelihood strategies.

**KEYWORDS:** Longnan; Human capital; Livelihood strategies; sustainable livelihoods.

## 1 THEORETICAL BASIS

### 1.1 Sustainable livelihoods theory

The study on poverty initially focused on the lack of consumption capacity but did not delve into the causes. Su (2009), with the understanding of poverty deepening, started the sustainable livelihoods approach, which emerged in the early 1980s to the 1990s. He (2013) stated that the “Copenhagen Declaration” passed in 1995 at the World Summit on Social Development in Copenhagen summarized the sustainable livelihoods as “all men and women through freely chosen productive employment and work, access to reliable and stable livelihood.” Some bilateral or multilateral international aid organizations such as the World Bank, the Department for International Development (DFID), and the development research institutions gradually developed sustainable livelihoods as a way to study the problems of poverty and development in developing countries. Collier (1998) Research was based on the Sustainable Analysis Framework (SLA) of DFID.

### 1.2 Sustainable Analysis Framework (SLA)

The Department for International Development (DFID) divided the livelihood capital in its Sustainable Analysis Framework (SLA) into Natural capital, Financial capital, Physical capital, Human capital, and Social capital. Human capital represents the knowledge, skills, abilities, and health status. These enable people to pursue different livelihoods and obtain the homologous livelihood goals. The intrinsic value of

human capital is that it can make better use of the other four kinds of livelihood capital to obtain positive livelihoods results. So it is the most basic livelihood capital. Livelihood strategy refers to how people choose asset allocation and business activities to achieve their livelihood goals. Su (2009) states that different occupancies of livelihood capital have a profound impact on livelihood strategy. In backward and remote countryside and poor areas, farmers depend more on natural resource-based production to sustain livelihoods. But often products relying on natural resources is not enough to sustain livelihoods, then taking other action to sustain livelihoods, such as employed by others, migrant workers. Su (2009) stated that in the case of farmers in poor areas selecting livelihood strategy, such as employed by others or migrant workers, it is closely linked to its specific human capital situation.

## 2 STUDY AREA AND DATA ANALYSIS

### 2.1 Study area

Longnan City is located in the southeastern of Gansu Province, in the Qinba Mountain poverty belt, and it is characterized by poor natural conditions, deep poverty, and frequent natural disasters. Farmers’ human capital situation is more representative throughout the Gansu Province and even in the poor areas of northwestern China. Research data are from the 2009 National Social Science Fund of China Project in Western Research on Gansu Province earthquake-stricken countryside recovery and reconstruction, project number 09XJY014.

## 2.2 Data analysis

### 2.2.1 Data analysis from gender perspective

Questionnaire use household as a unit, with a total of 343 valid questionnaires involving a population of 1595, 1026 labor, households average with 4.65 members, 3 labors. Statistics show that farmers accounted for 58.09% of the total labor force, concurrent business accounted for 13.45%, and workers accounted for 27.58%. A total of 563 male labor force accounted for 54.87% of all. Among them, farmers accounted for 46.71%, concurrent business accounted for 15.99%, and workers accounted for 36.23%. A total of 463 female labor force accounted for 45.13% of all. Among them, farmers accounted for 71.92%, concurrent business accounted for 10.37%, and workers accounted for 17.06%. Among farmers, men accounted for 44.13%, and women accounted for 55.87%. Among concurrent business, men accounted for 65.22%, and women accounted for 34.78%. Among workers, men accounted for 72.08%, and women accounted for 27.92%. Data show that women accounted for a larger proportion in agricultural production activities; efficiency of agricultural production is far lower compared with workers in the region now, leading to a deeper level of female poverty. Through analyzing the state Poverty Monitoring Survey data, Li Xiao Yun shows whether economic status, employment, education, health, and social status are measured. Levels of poverty in poor areas are more serious for women. Li (2005) cites the reasons for this phenomenon, which include female lacking the necessary financial support and imperfect social networks, low education levels, fewer training opportunities, health level not being high, and the lack of willingness to participate in public affairs, relative to men in poor areas.

### 2.2.2 Data analysis from age

A total of 243 laborers' age between 16 and 30 years accounted for 23.68% of all laborers. Among them, farmers accounted for 29.63%, concurrent business accounted for 13.17%, and workers accounted for 56.79%. A total of 392 laborers' age between 31 and 45 years accounted for 38.21% of all laborers. Among them, farmers accounted for 50.51%, concurrent business accounted for 20.15%, and workers accounted for 28.32%. A total of 222 laborers' age between 46 and 60 years accounted for 21.64% of all laborers. Among them, farmers accounted for 77.03%, concurrent business accounted for 9.91%, and workers accounted for 11.71%. A total of 169 laborers' age beyond 61 years accounted for 16.47% of all laborers. Among them, farmers accounted for 91.72%, concurrent business accounted for 2.96%, and workers accounted for 4.73%. Farmers are mainly between 46 and 60 years: They accounted for 54.7%, and the age beyond 61 years accounted for 26.01%. Concurrent business takes place mainly between 31 and 45 years: It accounted for 57.25%, and the age beyond 61 years accounted for 3.62%. Workers are mainly between 16 and 30 years: They accounted for 48.76%, and the age beyond 61 years accounted for 2.83%. Data show that most workers are young.

### 2.2.3 Data analysis from health

A total of 752 laborers are healthy, and they accounted for 73.29% of all laborers. Among them, farmers accounted for 51.86%, concurrent business accounted for 14.23%, and workers accounted for 32.98%. A total of 196 laborers suffered from chronic diseases, and they accounted for 19.10% of all laborers. Among them, farmers accounted for 77.55%, concurrent business accounted for 9.69%, and

Table 1. Human capital and career.

Indicator	Career	Farmers	Concurrent	Workers	Official
Gender	Male	263	90	204	6
	Female	333	48	79	3
Age	16-30	72	32	138	1
	31-45	198	79	111	4
	46-60	171	22	26	3
	above	155	5	8	1
Health	Health	390	107	248	7
	Disable	18	5	3	0
	Disease	152	19	23	2
	Other	36	7	9	0
Education	Illiteracy	261	19	37	1
	Primary	195	52	89	2
	Junior	107	47	106	1
	High School	23	8	22	1
	University	10	12	29	4

workers accounted for 11.73%. A total of 26 laborers are disabled, and they accounted for 2.53% of all laborers. Among them, farmers accounted for 69.23%, concurrent business accounted for 19.23%, and workers accounted for 11.54%. Among farmers, healthy population accounted for 65.44%, and disability and chronic diseases population accounted for 28.52%. In concurrent business, healthy population accounted for 77.54%, and disability and chronic diseases population accounted for 17.39%. Among workers, healthy population accounted for 87.63%, and disability and chronic diseases population accounted for 9.19%. Data show that most workers are healthy.

#### 2.2.4 Data analysis from education

A total of 318 laborers are illiterate, and they accounted for 30.99% of all laborers. Among them, farmers accounted for 82.08%, concurrent business accounted for 5.97%, and workers accounted for 11.64%. A total of 338 laborers received primary education, and they accounted for 32.94% of all laborers. Among them, farmers accounted for 57.69%, concurrent business accounted for 15.38%, and workers accounted for 26.33%. A total of 261 laborers received junior secondary education, and they accounted for 25.44% of all laborers. Among them, farmers accounted for 41%, concurrent business accounted for 18.01%, and workers accounted for 40.61%. A total of 54 laborers received secondary education, and they accounted for 5.26% of all laborers. Among them, farmers accounted for 42.59%, concurrent business accounted for 14.81%, and workers accounted for 40.74%. A total of 54 laborers received university education, and they accounted for 5.36% of all laborers. Among them, farmers accounted for 18.18%, concurrent business accounted for 21.82%, and workers accounted for 52.73%. Among farmers, the illiteracy rate is 43.79%, higher than 13.77% in concurrent business and 13.07% among workers; the highly educated rate is 1.68%, lower than 8.7% in concurrent business and 10.25% among workers. Data show that most workers are highly educated.

### 3 CONCLUSIONS AND DISCUSSION

Human capital is generally inadequate in poor areas in northwest China; overall, labor quality is not high. Female human capital occupancy is at a relative disadvantage, because of the limitations of physiological basis and ideology. Elderly laborers are over-represented, health status is not optimistic, poverty and

returning to poverty caused by illness is widespread, and overall, educational level is not high. Scarcity and lack of investment in human capital is a major cause of low agricultural productivity. Migrant workers are confined to heavy physical labor, which is not sustainable. Agricultural and non-agricultural production coexist among livelihood strategies. Local agricultural production has typical peasant economy characteristics. Relative to workers, agricultural production has low economic efficiency. With the continuous improvement of agricultural efficiency, migrant workers are increasing, concentrating arable land through a reasonable form, and modernization of agriculture may be achieved. Groups of human capital occupancy are at a disadvantage, because female, elderly, unhealthy, and low education level have the highest proportion of farmers. Human capital occupancy is at an advantage, because male, young, healthy, and high education level have the highest proportion of workers.

Human capital as the most basic livelihood capital can help farmers in poor areas using other four kinds of livelihood capital better. We need to establish and improve livelihood strategies, achieve the goal of sustainable livelihoods, pay more attention to gender equality, improve and guarantee lives of elderly laborers, and increase investment to improve sanitary conditions and health insurance. We should promote healthy lifestyles, improve the education support system, and strengthen vocational training to enhance the farmers' human capital.

# Analysis of sentiment transition of retweeting messages on Sina weibo

Yue Kang

*International School of Beijing University of Posts and Telecommunications Beijing, China*

Chuang Zhang & Xiao Tian Wang

*School of Information and Communication Engineering of Beijing University of Posts and Telecommunications, Beijing, China*

**ABSTRACT:** The sentiment of any text can be classified as positive, central, and negative. This article is intended to collect the retweeting messages on sina weibo and analyze the rules of sentiment transition of retweeted messages. It is found that the sentiment of retweeting messages is more likely to be influenced by original messages if the original ones are positive. In contrast, retweeted messages have more profound influence on the retweeting messages if the original messages are negative. Besides, this theory applies well to events of different categories: politics, sports, and entertainment.

**KEYWORDS:** sentiment transition, retweeting messages, Sina weibo.

## 1 INTRODUCTION

With the development of social network, weibo has gained its popularity in China. Many people use it to communicate with friends or they publish their opinions about public events on it. It is reported that there are more than 556,000,000 users of Sina weibo.<sup>[1]</sup> The ways in which people respond to a message of Sina weibo include retweet, like, comment, and add to favorite. Individuals can publish their opinions when they retweet the message. They may agree on the original message, have distinct opinions, or make more objective comments. There are many factors that may contribute to the sentiment polarity of the comments: the attributes of the original message, from whom the messages are retweeted, the standpoint of the author, and so on.

In this research, some problems tended to be resolved:

- How to classify the sentiment of messages?
- Is the sentiment of the message affected by the sentiment of the original message?
- Is the sentiment of the message affected by the types of events they are talking about? (see [Table 1](#))

## 2 BACKGROUND

### 2.1 *Methods to classify the sentiment of texts*

Machine learning is often used to classify the sentiment of messages. The methods include Rocchio

algorithm, Naïve Bayes, Maximum Entropy, K-Means Algorithm, and Support Vector Machine (SVM). These methods are well applied in English reviews.

Many researchers in recent years have conducted Chinese reviews. According to the research of Tang Huifeng, high performance will be achieved if bigrams representation and SVM are used in the experiment.<sup>[2]</sup> Xia Huosong applied the method of TF-IDF weighing assignment methods and SVM with the RBF kernel function to categorize the 4,000 Chinese customer reviews.<sup>[3]</sup> Chen Junjie introduced FSVM by applying fuzzy theory to SVM, and he testified the validity of this model.<sup>[4]</sup>

### 2.2 *Researches on the sentiment of messages*

The analysis of the sentiment of weibo is useful in terms of investigating architecture of the user network, collecting feedback about products or promotions, and predicting the outcomes of elections and so on. Such an analysis will provide an effective aid to research in assortments of fields.

Many researchers have investigated the issue about the sentiment of messages disseminated on Weibo. Anatoliy Gruzd found that users have the tendency to retweet positive messages by using the data of 2010 Winter Olympics for experiments. The author draws the conclusion about what kind of messages a user tends to retweet is irrelevant to his position in the network.<sup>[5]</sup> Murphy Choy applies techniques of sentiment divisions to predict the outcome of presidential

election in 2011<sup>[6]</sup>. Song Shuangyong monitors and analyzes the users' emotion trend on hot events and builds a sentiment analysis prototype system.<sup>[7]</sup> They identify the Sina microblog emotional orientation of text and obtain three characteristics: precision, long tail of public opinion, time and reputation, diffusion, and resonance.<sup>[8]</sup>

### 3 SENTIMENTS CLASSIFICATION

#### 3.1 Messages collection

The samples for analysis is collected from Sina Weibo using Sina API. These samples are the retweet messages published on the Sina. To get a large amount of samples, this research focuses on the popular events that owns a large amount of retweet messages. In this research, all the samples are retweeted by more than 1000 users. Besides, since one of the purposes of this research is to find out the relationship between the types of events and sentiments transitions, messages of different events are collected, including sports, entertainments, and politics.

#### 3.2 Sentiment classification

ICTCLAS (Institute of Computing Technology, Chinese Lexical Analysis System) is applied in this research to segment the messages, which adopts the Hierarchical Hidden Markov Model.

As for the classification of the sentiment of the messages, WEKA (Waikato Environment for Knowledge Analysis) with the method of K-means is used to identify the sentiment of the messages collected. In this research, the sentiments of messages are classified as positive, central, and negative.

### 4 SENTIMENTS TRANSITION

This research compares the sentiment of retweet messages and the sentiment of original messages to find out whether there is sentiment transition between them.

By comparing the percentage of the messages that do not change their sentiment, we can identify individuals' psychological reaction to messages of different sentiments.

#### 4.1 Sentiment transition and sentiment of original messages

To clarify the relationship between messages, the model is presented in figure1 for a further explanation.

Figure 1. Model of messages retweeting.

Once an individual is exposed to a message, how they feel and how they think is affected not only by the sentiment of original messages but also by the sentiment of messages that they retweeted. Following is the relevant result gained if the original message is positive.

It can be seen from Table 1 that more than 50% messages hold the same sentiment as the messages they are retweeted from if the original messages are positive. Besides that, if we pay attention to the indicators nn, np, and nc, which means messages are tweeted from users who hold different standpoints of the original messages, the probability of these situations is extremely low. Such a situation means that the sentiment of an individual is more influenced by the original messages than by the sentiment of the message that they retweeted from if the original message is positive.

As for the neutral messages (Table2), less than 50% messages hold the same sentiment as the messages they retweet from. What should be noted is that the largest proportion of sentiment transition is cc, cp, which means an individual may switch to a positive attitude even though both the original message and the message it retweets from hold an objective view

Table 1. Sentiment distribution of retweeting messages whose original message is positive.

Events	Sentiments of original messages	nn	nc	np	nn + cc + pp
Bike competition	Positive	0.000	0.000	0.003	0.853
Marathon	Positive	0.007	0.001	0.018	0.643
Winter Olympic	Positive	0.000	0.000	0.052	0.903
Real Madrid	Positive	0.002	0.000	0.006	0.564
Ricardo	Positive	0.002	0.000	0.002	0.741
LinDan	Positive	0.000	0.000	0.000	0.795

of the event. However, if the retweeted message holds different ideas (positive, negative) compared with the original message, the retweeting messages are barely influenced by the original messages or retweeted messages (proved by pp,pc,nn,nc). This situation is also because most of the retweeted messages are central if the original messages are central.

If the original message is negative, the sentiment distribution of retweeting messages is shown in Table 3. It can be seen that the percentage of messages that have the same sentiment as the retweeted messages accounts for nearly 50%. Besides, retweeting messages are more likely to be affected by the retweeted messages when retweeted messages hold different sentiments with the original ones (indicated by pp). In other words, when exposed to a negative message, an individual will choose to favor the people who they retweet the message from. One of the possible causes may be that these people are the individuals they are aware of such as friends, families, or the ones they adore such as celebrities.

## 5 RELATIONSHIP BETWEEN THE SENTIMENT TRANSITION AND THE TYPES OF ORIGINAL MESSAGES

This section mainly explores whether sentiment distribution is related to the type of event they focus on such as entertainment, politics, and sports. Generally, citizens adopt more serious attitudes to the political events and they may still support their favorite stars

even if there is some negative news. But can we prove our earlier guesses by statistical results? Following is the relevant statistics:

It can be seen from Tables 4, 5, and 6 (shown later), in all three kinds of events, the sentiment of an individual is more influenced by the original messages than by that of the retweeted messages if the original message is positive (indicated by nn, np, nc). Original messages or retweeted messages have little influence on the retweeting messages (proved by pp, pc, nn, nc) if the original message is central. Besides, if the original message is negative, retweeting messages are more likely to be affected by the retweeted messages that own different sentiments (indicated by pp). Therefore, we can draw the conclusion that the sentiment distribution is irrelevant to the types of event they are discussing.

## 6 SUMMARY

In conclusion, we can see that the sentiment of retweeting messages is closely related to the sentiments of original messages: Positive messages have more influence on retweeting messages, whereas negative messages do not bias the standpoints of retweeting messages. This is partly because people tend to favor the views of people who they are familiar with such as the owners of retweeted messages. Besides, this research proves that the sentiment distribution has no relationship with the type of event they focus on.

Table 2. Sentiment distribution of retweeting messages whose original message is central.

Events	Sentiments of original messages	Sentiments of original messages

## Construction of intramural practical training base based on Siemens PLC and configuration software

Guan Li, Wen Tao Jin, Jin Ying Gan, Wen Qiang You & Hai Wen Guo

*North China Institute of Science and Technology, Beijing, China*

Hua Lu Xing

*Northwestern Polytechnical University School of Aeronautics, Xi'an, China*

**ABSTRACT:** This article introduced the construction process of a practical training base based on SIEMENS PLC and FameView configuration software; focusing on the needs of professionals in the coal industry, a mine production monitoring system integrated training projects is designed. Through nearly three years of operating practice, better teaching results and social benefits have to be achieved.

**KEYWORDS:** PLC; practical training base; Configuration monitoring.

### 1 INTRODUCTION

Currently, in the context of implementation of the “Excellence engineer training program” of China, training applied, technology-based, and innovative talents has become a major goal of the university professional training (JIA 2008).

After a period of visits by other universities and research, most universities adopted the practice that set comprehensive and designing experiments, internships, practical training, and students’ creative activities in the talent training scheme. Although this can improve the practical ability of students, there are still shortcomings in terms of practice content, focus on curriculum, not being closely connected with engineering. Students do not operate over the practical application of engineering equipment, away from industrial reality and this brings more difficulty for enterprises’ employers and student employment.

Programmable Logic Controller (PLC) has become the most important in the field of industrial automation and is the most widely used control device. “The whole plant integrated automation,” “nobody duty (fewer people on duty),” and other technical requirements and goals have become the major trends in many industries. Many college graduates cannot have a system design capability, which is a considerable gap between the employer’s expectations of enterprises.

Currently, some scholars and universities have already started researching this phenomenon and practice, and better teaching results have been

achieved (Gao 2008, Cao 2007, Zhou 2011). After a full investigation, drawing on the experience of the university, combined with the actual running of our school, Siemens PLC training base of automation was built in 2010. The purpose is to strengthen the cultivation of students’ ability for design and application engineering, new technology application development capabilities, creativity, innovation, and so on.

By building close to the actual training platform, PLC application skills practical training was carried out through six months each academic year. Each student is able to independently design a practical industrial control system by using control components that are actually consistent with the project. Assessment requirements are executed in accordance with the requirements of project acceptance. These training projects enable our school students to have the ability to design and construct industrial projects without leaving school.

### 2 CONSTRUCTION OF TRAINING BASE

#### 2.1 *The necessity*

PLC is widely used in industrial automatic, electronic, and electromechanical integration equipment. It is urgently needed for students to master integrated skills, including PLC control system hardware design, software programming, and installation of debugging (LIU 2013, XU 2012). Our college is an educational institution that has the characteristics of

servicing in safety production. It is our responsibility for training qualified personnel in the field of safety production monitoring.

Computer monitoring system is nowadays used in the industrial field, and there has been extensive use of a high degree of integration not only using PLC but also with configuration software and touch screen. Therefore, construction of a training base in our school must be consistent with the plant control equipment. Curriculum reform idea is the integration of theory and practice of teaching of “Electrical Control and PLC applications,” with practice teaching as the core, highlighting the technical proficiency training.

Construction of PLC school training base is one important part of provincial quality courses, such as Course Construction of “Electrical Control and PLC applications” and automation, which is a professional specialty by the Ministry of Education building.

## 2.2 Construction ideas

Currently, there are Automation, Intelligent Building Electrical, Electrical, and Automation professionals in our school. Through the investigation, the professional needs, combined with the school characteristics, typical projects are determined for a number of industries (Tang 2013).

They are surface coal mining production monitoring system, mine drainage control system, mine ventilation control system, mine hoist control system, water supply and drainage system, monitoring system, touch-screen control system, motor variable frequency speed control system, multi-level conveyor belt monitoring system, and so on. Each training project is related to system hardware design and layout, project configuration, PLC programming, debugging software, PC monitoring, and so on. Each project has different emphases.

## 2.3 Teaching methods and forms

The purpose of practical training is to simulate the control of the industrial field. Practical Training Teaching was carried out by an actual project. In the teaching process, the procedure is explained in detail which using paper material, PPT, and video described in the scene data. The progressive approach to practical engineering gradually covers the knowledge points. A hardware system was placed in a common control cabinet. Input and output devices were used as possible field devices.

After mastering the basic application of PLC, we should gradually become familiar with network communications, configuration software, and so on. Then, wradually move to the advanced stage of industrial control.

## 3 PROJECT SHOWCASE

Analog data acquisition is conducted through the actual coal mine production monitoring system in-depth research and analysis; for clues to the flow of coal, each coal production chain is set to a subsystem (YIN 2012). They are surface coal mining production monitoring system, mine drainage control system, mine ventilation control system, mine hoist control system, water supply and drainage system monitoring system, touch-screen control system, motor variable frequency speed control system, multi-level conveyor belt monitoring system, and so on.

Practical training requirements are provided for the detailed design of each subsystem, including PLC program design, monitoring screen design, and communication connection. Then, these subsystems are strung together, such as coal Mine Safety Production Monitoring System was completed. PLC communicated with the host computer through the industry Ethernet monitoring software. By mine production monitoring system screen, each production process has been monitored online. The system main screen is shown in Figure 1.

Figure 1. Main screen of Mine Production Monitoring System.

In the system, each subsystem is an independent field control system. Students can practice hands-on skills and design capabilities by selecting a subsystem of interest. For example, figure 2 shows a subsystem: water supply and drainage control system. In the subsystem, PLC programming skills, inverter control, data communication technology, and monitor screen design can be practiced. Students selecting the same system will form a team. Team members learn together to discuss and work. Students’ team cooperation ability is trained. In the training process, all of the equipment selected Siemens industrial automation products, to ensure that students learn about advanced and universal technology.

Figure 2. Water supply and drainage control system.

In a word, hardware system design, installation and software program, configuration and development, as far as possible comply with the field control requirements. Teaching contents in practical training changes from the ability to develop a single application, to an integrated, creative ability. Students' ability and professional skills were improved when solving practical problems. Requirements were satisfied with professional and technical personnel in the coal production industry.

#### 4 RESEARCH PLATFORM FOR TEACHERS

These experimental training equipment that are close to the practical application provide not only a real place for students to practice teaching but also a powerful platform for teachers to carry out research activities. Some experiments were carried out on this platform. Some PLC control problems in coal mines and industrial production line are resolved. Laboratory technology can serve the mining industry.

Some teachers completed a number of research projects by taking full advantage of the platform resources. They try to develop new experimental projects and training projects. They carry out scientific research, such as coal intelligent automatic loading system, Underground Coal Gasification remote monitoring system, high-power laser cutting machine control system, and so on. Some scientific papers were published and certain influence was achieved.

#### 5 CONCLUSION

The PLC Training Base has been in operation for nearly three years. More than 500 students participated in the practical training here. Better teaching effectiveness was achieved despite the maintenance

needing a larger workload and high consumable costs. Students who trained in the base participate in national competitions and have won numerous awards. The best score is second in the nation.

In a word, with the construction of the PLC-campus training base, the expected purpose is achieved and better socioeconomic benefits are obtained. More and more students will benefit from here and contribute for the realization of China's dream in the future.

# Design of virtual platform in experiment course reform of principles and interface technique of microcomputer

Zhen Zhang & Zhao Yu Liu

Zhengzhou Institute of Aeronautical Industry Management, Zhengzhou, China

**ABSTRACT:** Principle and interface technique of microcomputer is an essential part of computer science education in the university of technology. The soundness of its experiments and whether such experiments could match the theory of the course will greatly affect the knowledge system of the whole computer-related majors. Based on an in-depth study of principles and interface technique of computers, this article proposes a virtual experiment platform of principles and interface technique of computer, which consists of computing kernel, kernel drivers, virtual experiment platform cores, and virtual experiment platform. It simulates the 8086 processor widely used in undergraduate teaching and other common experimental processors. This platform can not only complete the basic principles and interface technique of computer experiments but also design new experiments according to the experimental requirements.

**KEYWORDS:** Principles and interface technique of computer; experiment course reform; virtual platform.

## 1 INTRODUCTION

With the development of computer, network and multimedia technology, network-based teaching model has become an effective means of popularizing education. As an important part, virtual experimental teaching system through the establishment of a virtual laboratory allows the student to experience the actual hardware experiment on the local computer. Besides, it could also present the results that are consistent with the actual hardware experiment, thus completing the process of experimental teaching.

## 2 IMPORTANCE OF THE EXPERIMENTAL COURSE

In experimental teaching theoretical courses, as an important part, to highlight its importance, many colleges and universities have already conducted “Principles and interface technique of computer” experiment as a separate course; this is followed by the theory course, and a separate calculation of credits explicitly requires students to master use of a common programmable interface chip. Chip designers can utilize a comprehensive experiment, with basic capabilities of hardware and software development, training practical scientific attitude and a good work style, improve the ability to analyze and solve problems for future employment, and lay some foundation. Therefore, how to improve experimental

teaching, teaching quality test, and students’ comprehensive ability is extremely important.

Principle and interface technique of microcomputer is an essential part of computer science education in the university of technology. The soundness of its experiments and whether such experiments could match the theory of the course will greatly affect the knowledge system of the whole computer-related majors. However, due to the huge cost of hardware and software and the innovation and expansion restrictions of the teaching platform, the traditional embedded system experiment platform with the experimental box suffers from great limitations in ensuring the time that students participate in the experiment, construction, and maintenance costs of the experimental teaching platform and the evaluation of teaching effectiveness.

## 3 SITUATION OF THE EXPERIMENTAL COURSE

### 3.1 *Small number of experimental class*

This course requires analog circuits, and digital circuits do preamble, especially when students first learn assembly language. So, many institutions develop teaching plans to arrange the course than the rearward time, usually taught in the sixth semester. Many theoretical and experimental class engineering professional arrangements are compressed, with less hardware gate count lessons, class compression,

limited class, the number of theoretical teaching classes for 48 hours, and the number of hours of practice teaching for 16 hours. Because of fewer hours of arrangements, the teaching content is less than normal, especially as closely associated with the computer interface class assembly language, usually 2 hours per week, resulting in too few students to learn content, deep enough, poor use of assembly language programming skills required during programming interface experiment, due to fewer class sections, time enough, and the teacher had given experimental procedure, and then explain to the students.

### 3.2 Poor learning initiative of students

Active student learning as interesting lessons unlike poor hardware debugger software programming classes, most students think the hardware lessons are hard to learn, boring, and therefore are not enthusiastic about learning. During the experiment, Microcomputer Principle and Interface Technology need to connect not only the lines but also programming; if the experiment does not succeed, then, from hardware and software aspects to troubleshooting the cause of failure, which is time consuming and laborious. Sometimes may be due to a wire not turning, it will lead to even more time being spent on two classes, and there is no way to complete the test. So students had a mental weariness due to difficulties; some students had a resentment of the course; the students' class enthusiasm was either not high or they were even not interested; they learned to cope with trouble; there is no way a teacher; and, finally, considering the students' graduate employment and other issues only reduces the requirements.

### 3.3 Outdated teaching methods

Microcomputer Principle and experimental process interface technology course usually involves teachers talking about the theory, then given the experimental program, and then allowing students to connect the line to run the experimental procedure. The final results are observed on the end; time is available; then write lab reports, and some students even in the lab do nothing to deal with the matter. In addition, with experimental materials equivalent to the operating manual, students rarely take the initiative to think and are in a completely passive learning state. There is a lack of innovation; in this way, it is difficult to apply the practical knowledge to the design and development, and students do not reach a comprehensive design for the purpose capabilities. Experimental and theoretical simultaneously, leading to the theory of content is often needed when doing experiments that have not

been talked about. So the experimental class teacher can only take a long time to explain the theory of knowledge used in this experiment; students cannot have a good grasp over the experimental principle; and leaving students' hardware and software programming and debugging time connection is not enough. So the teacher can only give the experimental program; the students in the connected circuit are given the experimental program that is running; and the students simply connect and import procedures. Students do not have to think at the time of the experiment, programming time.

### 3.4 Experimental equipment updates slower

To save money, some institutions' equipment are updated in a slower manner. Often only do a few stationary experiments can not be extended, even a small number of laboratory instruments, several students share one instrument, one can not do manually. This situation caused some students to produce psychological dependence; as long as the same group of students have hands-on ability to do the experiment, the other students would have a direct copy as a result, and the experimental class effect will not be fully exploited. The contrastive flow chart between the microcomputer principle and the real example is shown in Figure 1.

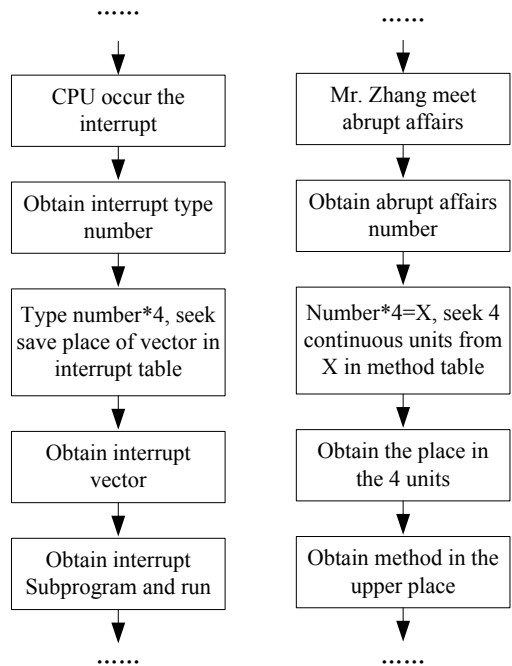

Figure 1. Contrastive flow chart.

### 3.5 *Unreasonable assessment methods*

Experimental teaching students in a secondary position usually operate under the instruction of teachers, so students cannot mobilize the enthusiasm and initiative, and they can only be the result of mechanical operation, limiting the initiative of students, making the practical ability of students to not improve, while suppressing the cultivation of students' innovative ability. Assessments, often using student attendance, discipline, and classroom experiments to determine whether the report is near students' last experiment results, lead us to seriously consider the experimental class; students often do not get the mental and physical scores, inhibiting the students' learning motivation.

## 4 REFORM PROGRAM OF EXPERIMENT COURSE

### 4.1 *Establishing an open lab environment*

To ensure that students do not use class time to complete the experiment, the laboratory should be open to students at a selected time. This allows students after school time to continue their unfinished experimental lessons; teachers can also arrange some experimental subject; the student can choose and experiment and research, to further enhance their ability under laboratory conditions; with the help of open learning, poor students can always make do with some basic training experiments; learning can be designed for outstanding, comprehensive, research experiments; students' practical ability is enhanced, so that they engage in innovation activity conditions. This facilitates students' ability to innovate.

### 4.2 *Focus on students' interest in learning*

Interest is the best teacher. Teachers should try to improve students' interest in learning hardware courses, so that students understand the "Microcomputer Principle and Interface Technology" course is not a simple hardware, but a combination of hardware and software; this course is not only able to exercise their software programming skills but also helps broaden students' employment channels to adopt experimental teaching and teaching methods, such as electronic design contest extracurricular activities in science and technology combined to guide students to participate in national and provincial electronic Design Contest held. Electronic Design Contest will be held next year, from the selection of the best students in the National Undergraduate Electronic Design Contest. During the preliminaries, the requirements of each class is to elect a certain number of students. In addition, students are encouraged to select the hardware as a graduate design topic.

### 4.3 *Flexible teaching methods*

Take a combination of theoretical and experimental approaches to teaching, the use of flexible modes of attendance, in the laboratory theory class teaching. With the total hours unchanged, flexibility is required to adjust the number of experimental teaching sections and time. According to the theory of teaching schedule, timely arrangements are made for experimental, theoretical, and experimental teaching lesson plans to develop a flexible, teachers' textbook with chapters that are in a reasonable adjustment order, breaking the original teaching content curriculum framework that can be used in an experiment finished theory, and then doing experiments. This not only saves time but also enables students to master the theoretical knowledge of the experiment. The experimental class of students require plenty of time for programming. Debugger to troubleshoot circuits analyzes and solves problems, which helps the successful completion of the experiment, to enhance students' confidence and improve their ability. Nearly the end of the time, we give students a comprehensive experimental arrangement, according to the completion of the count as a part of the experimental results, whereas teachers should be carefully prepared to do the experiment and arrange next experiment course topics and requirements on theory courses, so that students have sufficient time to be familiar with the experimental class that uses theoretical knowledge. This would enable students to think for themselves and to generally believe they can complete the experiment.

### 4.4 *Purchasing versatile experimental equipment*

In order to prevent individual students from becoming lazy, if a few people or students are doing experiments in class, they could be in the same group; if there are more students, they should be divided into several groups, and the experimental batches should ensure the experimental class staffing on an experimental apparatus, so that every student has the opportunity to get hands-on experience. Require students to take good care of laboratory equipment; damaged experimental box should be timely maintained, so that students do not have to be limited to a few common experimental subjects. You can also try to experiment outside the classroom. For example, to replace the previous experiments, do LED display experiments, showing the school name, student class school, and professional name, so that students not only feel funny but this also broadens the students' exposure to the new devices and also their knowledge.

### 4.5 *Attention to the dominant position of students*

Experimental teaching enables students to adhere to the main principles of the teachers supplemented.

Student-centered teaching and learning activities fully mobilize the enthusiasm of students to ensure that students have a dominant position and role, so that students are always engaged in independent thinking, active exploration; stimulate students' enthusiasm, initiative, and creativity. More than the increase in class time for discussion on the spot to resolve the doubts of students, after-school arrangements, and online Q & A Q & A, so that students move from passive learning to active learning, we need to cultivate the students to ask questions to analyze problems and problem-solving skills, strengthen students' imagination ability and creativity, which are designed to increase students' opportunities for yourself brains and encourage innovation.

## 5 DESIGN OF VIRTUAL EXPERIMENT PLATFORM

In the teaching of the microcomputer principle and interface technique, the fitting usage is compared with the method to explain in detail the relevant concept, not only hanging up since the student's interest in the study but also carrying out the knowledge to teach with joy and letting students comprehend and control these concepts more easily. As time passes, they will gradually know, in fact, the thing that the calculator is hard to cut and polish not, contrary on a lot of principles it is similar to us work the method is very. Having such an understanding, in the study and fulfillments of the after-time, the student runs into the problem, and the ability considers the problem in many ways from many angles.

Detection apparatus is the key to the inspection system. It is not only with the Inspection Management Workbench wired communications but also with each inspection point for wireless communications that storage capacity requires to ensure that the data does not overflow. Data logging devices overall structure of the ARM processor, memory, power, reset, system JTAG interface, network interface, man-machine interface, RFID reader modules, GPS signal receiver module circuit. The overall structure of the hardware is shown in [Figure 2](#).

## 6 CONCLUSIONS

Based on an in-depth study of principles and interface technique of computer, this article proposes a virtual experiment platform of principles and interface technique of computer, which consists of computing kernel, kernel drivers, virtual experiment platform cores, and virtual experiment platform. It simulates the 8086 processor widely used in undergraduate teaching and other common experimental processors. This platform can not only complete the basic principles and interface technique of computer experiments

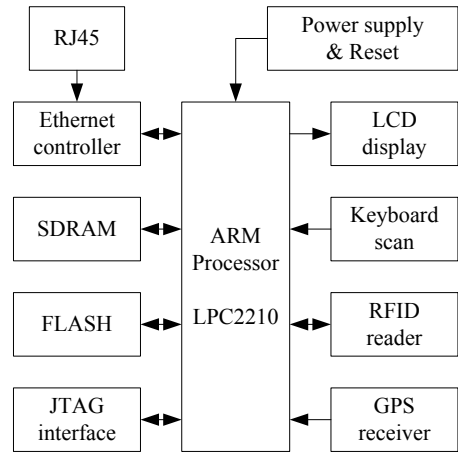

Figure 2. Hardware structure of the virtual platform.

but also design new experiments according to the experimental requirements.

By deepening teaching reform, "Microcomputer Principle and Interface Technology" teaching experiment compared with the traditional teaching model has achieved some success. To further improve the teaching effect of this course, students' comprehensive experimental ability to continuously improve and enhance their practical ability, innovation and application ability, teachers should constantly adjust teaching content, improve teaching methods for students to work and learn in the future, and lay a solid foundation.

## ACKNOWLEDGMENT

The authors would like to thank the fund for the education scientific research of Zhengzhou institute of aeronautical industry management.

## Translation teaching of college English in China based on ESP teaching

Sha Liu

*Anhui Sanlian University, Hefei, Anhui, PR China*

Jing Sheng Ren

*Hefei University of Technology, Hefei, Anhui, PR China*

**ABSTRACT:** Translation teaching is one of the most vital parts in College English education in China, but contrary to the fact, its importance has been neglected to some extent. Compared with research on the competence of listening, speaking, reading, and writing, translation teaching is always placed in the subordinate position. Based on the teaching approach of ESP, this article explores some existing problems, analyzes them in this field, and then holds the opinion that translation teaching should adopt the method of Content-Based Instruction (CBI) or apply the model, English + Subject, under the guidance of ESP theory to effectively cultivate inter-disciplinary talents.

**KEYWORDS:** ESP; translation teaching in College English; CBI problems and countermeasures.

### 1 INTRODUCTION

The analysis of research on College English education in the past decade in China, made by ZHAO Yongqing et al. (2014), shows that the research papers on writing, listening, reading, and comprehensive ability account for 42%, 32%, 16%, and 6%, respectively, whereas papers regarding translation teaching for non-English majors only account for 3%. However, the situation has changed in recent years. Increasing attention has been paid to translation teaching in College English education in China. And accordingly, research on the issue has been enhanced. In the field of English teaching, some scholars and teachers have pointed out the weaknesses of translation teaching; for instance, the position is undefined, the teaching objectives cannot be achieved, teaching materials and methodology are not suitable, and so on. They have also put forward some constructive suggestions to improve the translation teaching in College English education, by means of designing relevant syllabuses according to students' English level, updating teaching materials, adopting creative teaching methodology, and providing teacher training (WANG 2010, Li 2007, LIU 2013). But there are few research papers on translation teaching based on ESP (English for Specific Purpose). The author has searched China Academic Journals Full-text Database with both "Translation teaching of College English education" and "ESP" as the keywords, only to find that there is no matching result. This article will discuss and analyze some problems in translation teaching of College

English education from the perspective of ESP teaching mode and try to present some countermeasures.

### 2 FEATURES AND SIGNIFICANCE OF ESP TEACHING

#### 2.1 *Features of ESP teaching*

English for Specific Purpose (ESP) refers to a kind of English language related to a specific profession or subject, in which the English courses are designed according to the special needs of learners, aiming at improving learners' ability to use English in their actual work environment and in specific work fields, such as Business English, Medical English, and Financial English. Strevens (1988) has pointed out four distinctive features of ESP teaching: The course design must meet learners' specific needs; the teaching content must be related to particular disciplines, occupations, and activities; the language used in teaching must be appropriate for those activities in syntax, lexis, discourse, and semantics; and ESP should be also in contrast with General English (GE).

So, in translation teaching, the courses should meet the requirements in their future careers and content-based instruction (CBI) should be employed with authentic materials to gain the best teaching effectiveness; whereas the vocabulary used in translation teaching should be related to learners' majors. Translation practice should be based on the contents

of learners' future professions. In brief, translation teaching under ESP theory differs greatly from that in GE.

With the improvement of English teaching quality in primary, middle, and high schools in China, college English education in China is gradually attaching great importance to ESP. The English teaching is combining with a specific area or a special discipline in the 21st century, and ESP is becoming the mainstream in college English education (CAI 2012a). Based on the analysis of ESP teaching, this article will discuss the problems in translation teaching in college English education in China and will attempt to present some countermeasures.

## 2.2 Significance of translation teaching under ESP teaching

With the economic globalization, China's contact with the outside world has been becoming more and more frequent. A great number of multi-national businesses and organizations have established their headquarters or branches in China, whereas more and more Chinese enterprises and establishments have invested or intend to invest in foreign countries. Such activities cannot be successfully conducted without inter-disciplinary talents who have both acquired professional knowledge and a good command of English. What the job market needs is college graduates with professional English instead of those with only basic general English in listening, reading, speaking, and writing. What the job market needs is people who can use English with ease in their working fields immediately after graduation, including translation between English and Chinese higher levels.

Consequently, foreign languages are the best instruments in economic cooperation and culture communication with foreign countries, especially English language. A translator has to be equipped with professional knowledge largely because a qualified translator's ability lies in his or her good command of the target languages as well as his or her professional knowledge (FANG 2012). Therefore, graduates in English language and translation cannot sufficiently meet some special needs of globalization without several years' practice in an actual work environment because of their lack of professional knowledge (LI 2007). Thus, the translation teaching under ESP theory in college English education in China has been becoming more and more significant and ESP teaching has gradually been adopted in college English teaching. A great number of colleges and universities in China have come to realize the significance of translation teaching under the ESP teaching model, but still some problems exist in translation teaching.

## 3 PROBLEMS AND COUNTERMEASURES

### 3.1 Problems

As previously stated, there exist some problems in translation teaching in college English education in China, such as the undefined position of translation teaching, the disconnection of teaching practice and training objective, unsuitable teaching contents and teaching methods, and so on, and from the perspective of ESP teaching, there are also the following problems:

1) Both the courses and the teaching materials of translation teaching cannot meet students' needs, which should comply with the needs of modern society. Along with globalization, undergraduates are expected to do their work by using English immediately after graduation, such as translating equipment instructions, technical manuals, and contract documents and participating in business talks. So student-centered teaching strategies should be adopted in translation teaching and courses should be designed according to students' majors and their future careers.

However, the fact is that the teaching hour for translation in college English education is limited, and the teaching materials are not sufficient to meet the needs of training inter-disciplinary talents. There is no systematic introduction of translation theories and translation techniques in textbooks used by most colleges and universities in China. For instance, *New Horizon College English* (second edition), published by Foreign Language Teaching and Research Press, is a set of textbooks, including Book I to Book IV, and is adopted by many colleges and universities in China. Each book consists of 10 units, and each unit consists of Section A and Section B. Contents regarding translation learning only appear in the exercises in Section A, asking students to translate six sentences from Chinese into English and six from English into Chinese, respectively. That is to say, there are altogether 60 sentences for students to practice translation exercises from Chinese into English and another 60 sentences from English into Chinese in each book. There are no more contents about translation. There are altogether 480 sentences throughout Book I to Book IV for students to learn translation. Actually, the purpose of the translation exercises is to review the phrases and expressions appearing in each unit and it has little to do with translation theory and translation technique. Besides, these translation exercises are not related to real life, not to mention to students' professional knowledge. Due to such reasons, students lack interest in learning translation.

Moreover, with the improvement of students' English language competence, translation exercises are not changed into paragraphs or passages in the

textbooks. Throughout the set of textbooks, students are only asked to do sentence translation practice and teachers are not likely to introduce translation techniques such as amplification, simplification, conversion, and so on. So it is impossible for non-English major students to grasp proper translation strategies and techniques with such kind of textbooks.

2) Teachers lack relevant professional knowledge. Considering Strevens' features of ESP teaching, relevant syllabus should be designed related to specific knowledge or particular disciplines, occupations, and activities. And content-based instruction (CBI) should be employed in the process of translation teaching because when language teaching is combined with disciplines and when language functions as a tool for acquiring subject knowledge, the most optimal teaching efficiency can be obtained and students' competence of target language can be developed quickly (Stryker & Leaver 1997). Thus, teachers should be equipped with relevant professional knowledge. However most teachers in China are graduates in linguistics or English Literature or Translation Study. Although they are equipped with linguistic knowledge and teaching skills, due to the lack of professional knowledge, teachers may face difficulties when dealing with topics regarding some particular areas.

3) Teachers and students are not aware of the significance of translation learning in college English education. Attention has been paid to training students' ability in listening and reading for many years. Translation teaching is not well designed in college English education due to the fact that teachers and students strictly follow the instructions of English Syllabus issued by the Ministry of Education of the People's Republic of China. The syllabus pays less attention to translation teaching compared with listening, speaking, reading, and writing skills in college English education. According to the syllabus, students are supposed, after two years' study of English in college, to translate a passage at 300 words per hour from English into Chinese and at 250 words per hour from Chinese into English (general requirement).

The low expectation of students' translation ability makes teachers and students think that translation teaching is the least important part of college English teaching. Teachers consider it unnecessary to introduce translation theories and translation skills to students, whereas students are just eager to enhance their listening and reading ability for College English Test (CET). The reason is that the score for translation in CET only accounts for 5 percent. Until 2013, the percentage of translation in CET was increased to 15 percent. Even so, most college students do not have a thorough understanding of the significance of translation learning and do

not realize that it is translation skill that will play a vital part in their future work. CAI Jigang has pointed out that such a phenomenon shows that students do not take social needs or professional needs into consideration while learning English, and that it is the responsibility of colleges and universities to foresee future needs and to guide students in the right direction. (2012b, 2014)

### 3.2 Countermeasures

In order to solve these problems the following measures can be taken:

1) Textbooks for translation learning should consist of contents related to students' professional knowledge, and the contents should serve students' needs in their future work. Nowadays, many Chinese businesses are on the way to internationalization and some job posts require high English ability. For example, candidates for a generator engineer's post are required to have the ability of reading technical specification smoothly, procedure documents, and translate professional documents with the help of a dictionary. Graduates with professional knowledge and great translation ability are the most popular in the job market. Therefore, class hours for translation teaching should be increased and CBI should be adopted in translation teaching. It is urgent to set up sufficient teaching programs. Teachers should pay more attention to introducing translation skills and techniques in college English education.

2) College English teachers should always update their knowledge, especially the knowledge related to some professional areas, meeting the needs of students, the country, and the society (CAI, 2012c). Besides, the teachers should do the following: ①to absorb ESP teaching methods and grasp the features of ESP in teaching objective, content, and methods; ②to employ professional contents as examples when introducing translation theory and technique; ③ to study the latest research results about ESP teaching at home and abroad, especially those about translation teaching, and apply the results to teaching practice; ④ to cooperate with teachers who teach professional courses and be familiar with relevant specialized vocabulary as soon as possible; ⑤to know well what the students have already acquired about professional knowledge so as to design translation teaching.

3) Various measures should be taken to make both teachers and students realize that translation has become a key instrument for exchange of science and technology and for communication of different cultures, that it is essential for college students to grasp necessary translation skills and techniques for their future work, and that it is students with scientific and technical backgrounds who play a key role in many

business cooperation and negotiations (LU 2011). Teachers should change their method of teaching translation by encouraging students' participation in learning translation in class, and they should have an understanding of students' professional knowledge so as to design translation class according to students' knowledge and interests and introduce similarities and difference between English language and Chinese language and between Chinese culture and Western culture.

#### 4 CONCLUSION

Translation teaching is an inseparable part of college English education in China, and it has been playing a vital role in cultivating inter-disciplinary talents. This article has discussed some problems existing in translation teaching in college English education in China and attempted to present some countermeasures to these problems. The effectiveness of these measures will be tested and improved with application, and more research on translation teaching of college English education is expected.

# Analysis and design of integrated task console software system of shipborne UAVs

Peng Fei Peng, Li Gong & Qian Yu

*School of Electronic Engineering, Navy University of Engineering, Wuhan, China*

**ABSTRACT:** Based on characteristics of shipborne UAV system and tasks of the command and control system, universal requirements of integrated task console software system of shipborne UAVs are analyzed from the aspect of architecture, function, and operation. And then, the system architecture design, function module design, and software architecture design are carried out. The universal requirement analysis and design of integrated task console software system of shipborne UAVs will provide a reliable theory basis for further development and application of practical equipment. The result of the study has very good application prospects.

**KEYWORDS:** Shipborne UAV; Integrated Task Console; Components.

## 1 INTRODUCTION

Shipborne UAV is a type of unmanned aircraft that is driven by power, unmanned, and reusable. With the continuous emergence of new technologies and new equipment, shipborne UAVs have been widely used in military and civilian fields (Walter et al. 2004). Integrated task console of UAV system is put forward during the process of development and application of UAVs. As the nerve center of UAV system, the integrated task console achieves the effective control of the UAV flight path, the efficient completion of the fight mission, airborne mission equipment control, the normal operation of the communication link, and the UAV body's status monitoring and launch / recovery (Hsiao Feibin et al.).

Integrated task console is an important part of the UAV system, and its main mission is to accept combat tasks transmitted by superiors, make appropriate task plans according to mission requirements, organization and command system-wide coordination, control UAV flight, perform tasks, and get battlefield information (Ying-cong Ma et al. 2013). It usually completes the task associated with ground data terminal systems, UAV platform, task payload, and other systems together. In this article, the system architecture design, function module design, and software architecture design of integrated task console software system were carried out based on the design requirements of the system software architecture, software functional requirements, and software operation requirements.

## 2 SYSTEM REQUIREMENT ANALYSIS

### 2.1 *Software architecture design requirements*

In order to meet the requirements of various types of UAV command and control, the universal software architecture of integrated task console software needs to be adapted to the input and output interfaces of different configurations and fit all the task functions. Specific requirements are as follows:

- 1 Able to adapt to all types of shipborne UAV platform requirements, including reconnaissance / surveillance type, electronic counter type, integration type of reconnaissance and hit, unmanned combat type, and so on;
- 2 Able to adapt to various load options, including: surveillance cameras, optical reconnaissance systems, synthetic aperture radar, infrared line scan, electronic warfare systems, and so on;
- 3 Able to adapt to a variety of equipped options of data link, including C chain, U chain, satellite communications, and so on;
- 4 Easy to update / expand the information of UAV platform performance, load performance, and data link performance;
- 5 Provide users with auxiliary functions, such as user management, information inquiry, file operations, log browsing services, database management, and so on;
- 6 UI can be customized and decoupled with the function of the software;

- 7 Easy to adapt to the interface expansion;
- 8 Provide personalized function achievement and integration.

### 2.2 Software functional requirements

Generally, a shipborne UAV task console software should generally complete at least these functions: ①Data link communications; ②Route planning; ③Task equipment use planning; ④Emergency planning; ⑤Integrated situation display; ⑥Task execution and repeat; ⑦Digital map work.

Function modules are complex inside but independent from each other. Although the process of realization and the content varies, the functional characteristics are similar. Each specific functional module is developed by support of the basic algorithm or universal function modules.

### 2.3 Software operation requirements

For shipborne UAV integrated task console software, the operation should meet the following criteria:

- ①Receive combat missions;
- ②Receive relevant intelligence information;
- ③Provide operator interface and auxiliary functions for the operator to plan;
- ④Confirm the reasonableness of the task scheduler before deduction of tasks;
- ⑤Distribute and report task scheduler;
- ⑥Complete the task load;
- ⑦During the execution of the task, the command and control software is required to comprehensively monitor and display the process of task performing, and record the relevant data.
- ⑧Adjust requirements according to external temporary tasks, adjust the task plan, and upload the aircraft via the link;
- ⑨After completion of the task, assess and repeat the effectiveness of the task performance.

It can be seen that as a typical command and control software, shipborne UAV task console software has a certain operation process. Generally speaking, its input information is battle intentions, tasks, and intelligence information, and its output information is task scheduler.

## 3 SOFTWARE SYSTEM ARCHITECTURE DESIGN

According to requirements analysis, the architecture of shipborne UAV integrated task console software is shown in Figure 1. The software architecture is represented by structure models. Each component is represented by a block diagram. Connection is represented by arrow lines. The software architecture reflects the hybrid style with client-server, database, pipeline filters, and hierarchical style. The broken line arrows in the figure represent access connections

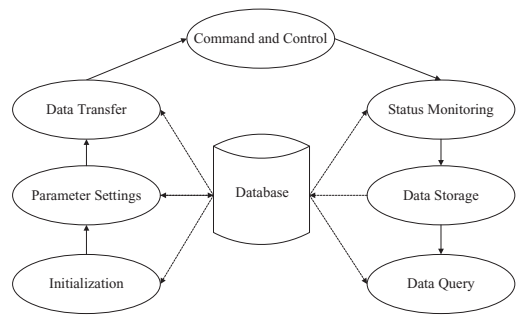

Figure 1. Software architecture figure.

between components and the database. This access includes reading and writing data to the database, and data exchange between the member and the database is implemented in this way. The solid line arrows in the figure represent connections between components, including the pipe, the client-server protocol, and so on. Pipeline can be a good way to ensure one-way links between components. If the parameter setting component sent the data to data transfer component by pipeline, the data transfer component can only read data from the pipeline but cannot write data to the pipeline; whereas the parameter setting component can only write data to the pipeline but cannot read data from the pipeline. Client-server protocol is mainly reflected between the status monitoring component and the compute and control component. Status monitoring can get services provided by compute and control component by client-server protocol.

## 4 DESIGN OF SOFTWARE SYSTEM FUNCTIONAL MODULE

Shipborne UAV integrated task console software is developed by object-oriented language Visual C++. Hierarchical menu calls are used in the software. With the use of the tool bar, status bar, and so on, all the functions are completed. The man-machine interface of software is friendly. The software can be divided into the following five major functional modules:

### 4.1 Flight status monitoring

Flight status monitoring is one of the core functions of integrated task console with monitoring and control capabilities to the whole process of UAV flight. Telemetry data frame can be formed by packaging the posture of the position, speed, rudder angle, fault codes, and other flight status information in a specific format. Telemetry data are transmitted to the ground

control station in real time via an air-ground data link and is used for flight status monitoring of UAV. Meanwhile, the control command of the UAV flight posture adjustment can be uploaded to the UAV platform via a data link.

Received telemetry data are decoded by integrated task console. A portion from decoding is used for driving different displays of graphical interface. Another portion is used to display the UAV status in status bar of software interface, including communication response, flight mode, GPS status, power voltage, the device voltage, the temperature, and so on. PID parameter adjustment provides the function of flight control parameter online adjustment. UAVs usually have CPV, RPV, UAV, PIC, and other flight modes. Finally, all the information with the data contained in the real-time telemetry is displayed at the bottom of the view area via lists. The ground operators have an intuitive understanding of the whole information, which is convenient for adjusting the body's flight posture and device status at any time.

#### 4.2 Task planning and command and control

This function module mainly completes UAV task assignment and the corresponding UAV route planning. Task assignment is mainly based on the requirements of combat tasks, and then specific task and time scheduling of one or more UAVs is formulated. Task assignment will dynamically be displayed in the form of UAV interface. Route planning and setting of UAV flight path is according to the assigned task situation and the geographical environment, including setting goal waypoints, automatically route generating, route formulating, route real-time adjusting, and so on (Guodong Wang et al. 2007). These command and control instructions are uploaded to the UAV to be performed in real time. Route planning uses World Wind's three-dimensional map of NASA's software open source map. The three-dimensional map display is very obvious. The flight position of UAVs can be displayed on the three-dimensional map in real time.

#### 4.3 Use and control of task payload

Task payload is the key sensor of battlefield information access, situation awareness, and guided weapons' guiding of UAVs. And its operation and control has been the important function of UAV integrated task console. Function interface of task payload consists of EO / IR payload, radar load, communication relay payload, guided weapons payload, and so on. According to different types of payloads and performance, the function interface of operation and control software is designed to display obtained information of payload, monitor the status of payload operation, and control payload equipment (Huawei Li et al. 2012).

#### 4.4 Use and control of task payload

Instruction information and data information is transferred by the data link between the integrated task console and UAV platform. Due to the work feature of the data link system, communication between transmitter and receiver may be disturbed by external factors and then may result in data errors. Real-time data link status monitoring is necessary to ensure the effectiveness and reliability of communication information transmission and reception. Data link status monitoring can display uplink and downlink communication status of data link in real time, and it can adjust the modes and parameters in time (C.Silvestre. & A.Pascoal. 2006).

### 5 PREFERENCES, SYMBOLS, AND UNITS

Universal architecture design of shipborne UAV integrated task console software based on components adopts the design method of component type. The appropriate software architecture design is carried out based on the architecture design process following the system architecture design principles. Figure 2 shows typical components of shipboard UAV integrated task console software framework based on components.

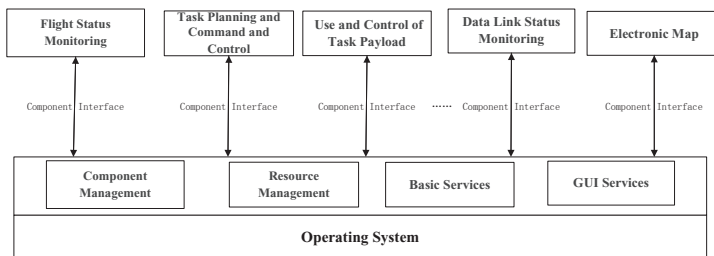

Figure 2. Typical components of shipboard UAV integrated task console software framework based on components.

Specific functions of each module are as follows:

- 1 Component interface: define a set of interface modules, including necessary implementation interface of each function component;
- 2 Component management: responsible for commanding and controlling registration, loading, positioning, recording, query, switching, and unloading of specific function plug-in unit;
- 3 Resource management interface: through this interface, the framework allocates and manages the corresponding resource allocation, memory, file handles, and so on for each plug-in unit;
- 4 Basic services: provide some service components of platform built-in, which are convenient for developing function components;
- 5 GUI services: provide graphic interface support of command and control components, which is convenient for dynamic generation of graphic interface.

## 6 CONCLUSIONS

The universal requirements of shipborne UAV integrated task console are analyzed based on characteristics of shipborne UAV system and tasks of the command and control system. And then, the system architecture design, function module design, and

software architecture design are carried out. A technology support and reliable theory basis is provided for further development and application of practical equipment by the universal requirement analysis and design of integrated task console software systems of shipborne UAVs.

# Skewed data learning algorithm based on multi-granularity

Hong Bin Fang

Nanchang Normal College, Nanchang City, P.R. china

**ABSTRACT:** Over-sampling classing algorithm based on granularity is put, namely SDCAMG algorithm, in order to improve classification validity of a skewed data set; whereas a skewed data set is often intended to process machine learning and classification. Majority samples of the training set are classified by clustering structure in light of the algorithm; simultaneously, the outcome combined with minority samples are learned by SVM, in order to support vectors of majority samples and to obtain sample granularity of error classification.

**KEYWORDS:** Skewed Data; Multi-granularity; Over-sampling.

## 1 INTRODUCTION

Skewed data set is when samples belonging to some class are larger or more than other samples in the set and the negative class is the majority class holding a large number of samples as well as the positive class otherwise positive class (namely minority class) [1]. Classification problem of skewed data set is one of the key research areas in machine learning and pattern recognition and is a large challenge to traditional algorithms, so theory and application value are presented for new machine learning methods to solve the problem. The problems are met regularly in the real world, such as disease diagnosis and tumor recognition in medical image as well as credit card defraud detection in which important information is lost because minority samples are not considered by traditional classification methods. In fact, information of minority samples is more important than majority samples in the problems.

New methods by which algorithms and data processing are presented usually appear when the classification problem of the skewed data set is focused on by many scholars. Algorithm performance in the field is improved, such as literature [2] and [3] in which SVM performance of the skewed data set is improved by optimizing parameters in view of SVM; moreover, BPM model based on MPM was presented to process skewed data problem in literature [4]. Data processing in the field, such as literature [5] and [6], is over-sampling and down-sampling, but it cannot supply a rational interpretation of how to construct compression; simultaneously, the algorithm improvement did not include the structure of the data set. In order to improve defects of the methods mentioned, a new over-sampling algorithm basing on SVM is presented

under the condition of multi-granularity, by which the data set is first partitioned in light of its structure and balanced again for the skewed data set.

## 2 ALGORITHM DESIGN

Some samples of minority class are classified to majority class because of data set imbalance so that important information of data set is ignored when classification of skewed data set is processed by traditional SVM. Samples of majority class are clustered in view of similarity in order to avoid the earlier problem, and the concrete method is as follows:

Samples of majority class (namely negative class  $X^-$ ) are clustered by K-means; then every clustering center is the unique deputy sample of all samples of the cluster, so that the training set is compressed. Negative class  $X^-$  is compressed according to what has been said earlier, and compressed set is  $[X^-]$ . The set  $[X^-]$  and  $X^+$  are trained by SVM in order to support vectors and for other error-classification samples to be obtained. The support vectors and other error-classification samples from set  $[X^-]$  are some clustering centers represented clusters, so they are released and samples of the corresponding clusters are obtained; meanwhile, the samples consist of set  $X1^-$ . The support vectors and other error-classification samples from set  $X^+$  consist of set  $X1^+$ , further data balance about set  $X^-$  and set  $X^+$  is considered by SMOTE over-sampling of set  $X1^+$ .

SDCAMG algorithm:

Step 1 Input skewed data set  $X$ ;

Step 2 Compressed set  $[X^-]$  is obtained by clustering samples of majority class under the condition of similarity; moreover, element number of  $[X^-]$  is equal to the element number of  $X^+$ ;

Step 3 The set  $[X^-]$  and  $X^+$  are trained by SVM in order to support vectors, and other error-classification samples are obtained.

Step 4 The support vectors and other error-classification samples from set  $[X^-]$  are some clustering centers represented clusters, so they are released and samples of the corresponding clusters are obtained; meanwhile, the samples consist of set  $X1^-$ .

Step 5 The support vectors and other error-classification samples from set  $X^+$  consist of set  $X1^+$ ; on the other hand, new set  $X1^+$  is obtained by SMOTE<sup>[5]</sup> over-sampling of the earlier set  $X1^+$  so that element number of set  $X1^+$  is equal to set  $X1^-$ . Set  $X1$  consists of  $X1^+$  and  $X1^-$ .

Step 6 Rational SVM is obtained by the trained set  $X1$ .

Step 7 end

### 3 EVALUATION INDEX OF CLASSIFICATION ABOUT SKEWED DATA SET

#### 3.1 Accuracy (Correct classification ratio)

General quality of learning algorithm is represented by accuracy, which is defined as:

$$accuracy = \frac{TP + TN}{TP + FP + TN + FN}$$

Every sign about the earlier accuracy definition is expressed as list 1. TP, FP, FN, and TN are sample numbers from the trained set.

Table 1. Sign definition.

	True positive samples	True negative samples
Forecasted positive samples	TP	FP
Forecasted negative samples	FN	TN

Table 2. UCI database.

Data name	Sample number of majority class	Sample number of minority class	Dimension	Balance ratio
Spambase	1500	30	57	50:1
pima	500	268	8	1.87:1
blood-transfusion	570	178	4	3.20:1

Accuracy cannot present real significance while dealing with an imbalance data set, because it represents mainly classification testing result of the majority class; so the two other improved accuracy are defined by  $g\_means$  and  $acc^+$ .

#### 3.2 g\_means

$g\_means$  value is a measurement method dealing with the skewed data set; moreover, the skewed data can be effectively measured if it is large.  $g\_means$  value is defined as follows:

$$g\_means = \sqrt{\frac{TP}{TP + FN} \times \frac{TN}{TN + FP}}$$

#### 3.3 acc+

$acc^+$  is a correct ratio about classification of positive class, and it is defined as the following manner:

$$accr^+ = \frac{TP}{TP + FN}$$

Obviously, the correct ratio of classification of positive class is high if  $acc^+$  value is high.

## 4 TEST VERIFICATION AND ANALYSIS

### 4.1 Data set illustration

UCI data base and artificial data set are applied to verify performance of SDCAMG algorithm. The artificial data set is composed of 1000 samples of majority class and 20 samples of minority class; meanwhile the majority class and minority class are correspondingly generated by a two-dimension normal distribution in which covariance matrix is a diagonal matrix  $\{0.2, 0.2\}$  but mathematical expectation vector is, respectively,  $(0 \ 0)^T$  and  $(1.2 \ 1.2)^T$

#### 4.2 Test validation and analysis

Ten-fold cross-validation is used, and test results are presented as the following lists. SDCAMG algorithm is better than CSVM algorithm and GSVM algorithm of literature [6] under the condition of the artificial data set and UCI database.

Table 3. Test result of artificial data set.

	SVM	CSVM	GSVM	SDCAMG
<i>accuracy</i>	0.9941	0.9088	0.941	0.9892
<i>g_means</i>	0.8118	0.185	0.8818	0.9372
<i>acc<sup>+</sup></i>	0.75	0.2	0.75	0.9

Table 4. Test result of spambase.

	SVM	CSVM	GSVM	QMSVM
<i>accuracy</i>	0.4124	0.7882	0.3837	0.4078
<i>g_means</i>	0.2803	0	0.4649	0.4792
<i>acc<sup>+</sup></i>	0.7	0.2	0.7667	0.8

Table 5. Test result of blood transfusion.

	SVM	CSVM	GSVM	QMSVM
<i>accuracy</i>	0.5054	0.5541	0.4054	0.45
<i>g_means</i>	0.1737	0	0.2656	0.1737
<i>acc<sup>+</sup></i>	0.5647	0.4	0.7118	0.6235

Table 6. Test result of pima.

	SVM	CSVM	GSVM	QMSVM
<i>accuracy</i>	0.5145	0.5382	0.3592	0.45
<i>g_means</i>	0.4689	0.1996	0.1413	0.4105
<i>acc<sup>+</sup></i>	0.5923	0.3615	0.9538	0.6731

Based on the earlier test results, the performance of SDCAMG algorithm is better than other algorithms

when imbalance ratio of trained data set is higher or attributes of trained data set are fewer.

## 5 CONCLUSION

SDCAMG algorithm based on granularity is presented for classification of the skewed data set in the research field of machine learning and pattern recognition. Based on test results, the performance of SDCAMG algorithm is better than other algorithms when imbalance ratio of trained data set is higher or attributes of trained data set are fewer.

## Empirical research on relationship between ownership structure and cash dividend policy of Chinese listed companies—based on panel data

Hong Liu & Jian Mu Ye

*School of Management, Wu Han University of Technology, Wuhan, China*

**ABSTRACT:** Against the background of “reform of the shareholder structure of Chinese listed companies” basically finished in 2006, this article aimed at exploring the new relationship between ownership structure and cash dividend policy of Chinese listed companies using Agent Cost Theory, Signaling Theory, and Entrenchment Hypothesis. This article applied fixed-effects regression model to analyze the influence of ownership structure on cash dividend policy using panel data rather than cross-section data, and then tested the results’ robustness by eliminating abnormal dividend data. Results indicate that largest shareholders’ holdings ratio and ownership restriction degree, respectively, has a negative and positive correlation with the cash dividend policy; as to the ownership composition, management share proportion and corporate share proportion are negatively correlated with cash dividend per share, besides, state-owned share proportion has a positive correlation with cash dividend; with respect to ownership liquidity, a negative correlation exists between circulating share proportion and cash dividend per share.

**KEYWORDS:** Ownership Structure; Cash Dividend Policy; Panel Data.

### 1 INTRODUCTION

Cash dividend, as a general dividend method, has an important influence not only on individual economic benefit but also on a firm’s investment and financing policy, as well as, companies’ market image and enterprise value. Actually, dividend policy is decided by specific investors, because according to the hypothesis of rational humans, each one tries best to seek the best dividend policy for themselves, that is to say, the cash dividend policy is the result of a dynamic game. The ownership structure just reflects the relationship and power distribution of all interest parties. So ownership structure must have an effect on the cash dividend policy.

In April 2005, the CSRC started the reform of non-tradable shares by releasing “the notice about the questions of pilot split-share reform.” By 2006, most Chinese listed companies completed the reform and ownership structure greatly changed.

Against the background of “the reform of the shareholder structure of listed companies” basically finished in 2006, this article systematically described ownership structure from the points of ownership distribution, composition, as well as liquidity and explored the relationship between ownership structure and cash dividend policy of Chinese listed companies using Agent Cost Theory, Signaling Theory, and Expropriation Hypothesis.

### 2 ASSUMPTION

Hypothesis 1: “U” correlation between ownership concentration degree and cash dividend level.

When the ownership concentration degree is below a certain degree, agency conflict mainly exists between manager and shareholder. As holdings of large shareholder increases, the agency conflict decreases and there will be less need for the cash dividend—a kind of agency cost-reducing mechanism.

When the ownership concentration degree rises and is above a certain degree, the above agency conflict will become very low and change to mainly exist between controlling shareholders and small and medium shareholders. With the improvement of supervision for the securities market and requirement of the information disclosure, substantial shareholders have an increasing difficulty for personal gains in the form of connected transaction, embezzlement, and so on. Based on the situation, the cash dividend becomes a “legal” tool for entrenchment. In addition, cash dividend expresses the information of development to the securities market. Yuan hongqi (2001), Yuan tianrong & Su hongliang (2004), and Man yi & Zhang bingcai (2006) believed that controlling shareholders preferred a higher cash dividend.

Hypothesis 2: Negative correlation between restriction degree and cash dividend level.

Substantial shareholders tend to tunnel a company in the way of higher cash dividend. The existence of restriction shareholders can impact dividend policy and control the tunneling behavior. Tang Yuejun & Xie Rengming (2006) and Zhang Reiwun et al (2007) found that restriction shareholders can restrict the higher cash dividend.

Hypothesis 3: Positive correlation between the state-owned shares and cash dividend level.

Due to the vacancy of the state-owned shareholders, the higher of the state-owned share proportion, there is more serious agency problem between the managers and the substantial shareholders. In order to restrict the behavior of managers, state-owned shareholders tend to pay higher cash dividend. The study of Wu Xiaochun (2003) and Wang ping & Sun Shixia (2009) showed that there was a positive correlation between the state-owned shares and cash dividend level.

Hypothesis 4: Positive correlation between corporate shares and cash dividend level.

Corporate shares are important components of non-tradable shares. Before the reform of non-tradable shares, corporate shares cannot be traded and after the reform of non-tradable shares, it cannot be sold in a long period. Therefore, corporate shareholders prefer higher cash dividend and corporate shares have a positive correlation with cash dividend level. Wei & Xiao (2009) indicated the preference of the cash dividend for the corporate shareholders.

Hypothesis 5: Negative correlation between management shares and cash dividend level.

Management shares contribute to the convergence of the benefits of managers and shareholders. Consequently, the higher the management shares, the lower the dividend-payout ratio. Yang Hanming (2008) indicated the negative correlation between them.

Hypothesis 6: Negative correlation between circulating shares and cash dividend level.

Because of the higher holding cost of circulating shareholders, circulating shareholders prefer the capital gains to the cash dividend. They hope firms can reinvest using their capital to develop further to drive stock prices up. Wang Ping & Sun Shixia (2009) and Wei & Xiao (2009) expressed a negative correlation that existed between circulating shares and cash dividend level.

### 3 RESEARCH METHOD

#### 3.1 Sample selection

This article chose Chinese A to share data in Shanghai and Shenzhen Securities Exchanges functioned as the study object. To insure the data validity, we selected the sample as follows: (1) Choose companies listed before December 31, 2005; (2) eliminate samples including ST, PT, financial companies, and companies without enough information; (3) eliminate loss listed firms. As a result, 755 listed companies remain in the sample.

All data came from annual reports of listed companies and CSMAR.

#### 3.2 Variables design

Dependent variable: cash dividend per share (CD).

Explanatory variable: ownership distribution, composition, and liquidity. In the article, ownership distribution contains two aspects: ownership concentration degree (CON which means the largest shareholders' holdings ratio and CONb2, which means the Square of CON) and ownership restriction degree (ZH, which means the sum of second to fifth shareholders' share ratio divided by the largest shareholders' holdings ratio). Likewise, we describe ownership composition using the index of state-owned share proportion (SO), corporate share proportion (CS), and management share proportion (MS). We use the index of circulating share proportion (LI) to describe ownership liquidity.

Control variables: earning per share (Earning), asset-liability ratio (Debt), natural logarithm of assets (Size), Net cash flow from operating activities divided by assets (CA), reserve fund per share (RES), and growth rate of main business (Grow).

#### 3.3 Research models

Cross-section data used largely both at home and abroad contain little information and cannot reflect the dynamic adjustability of data. So, applying cross-section data to study cash dividend policy is not reasonable and in this article, I used the panel data to analyze the relationship between ownership structure and cash dividend policy.

$$CD_{it} = \alpha_0 + \alpha_k \text{concentration}_{it} + \alpha_k + 3 \text{CV}_{it} + \mu_i + \varepsilon_{it} \quad (1)$$

$$CD_{it} = \alpha_0 + \alpha_k \text{composition}_{it} + \alpha_k + 3 \text{CV}_{it} + \mu_i + \varepsilon_{it} \quad (2)$$

$$CD_{it} = \alpha_0 + \alpha_k \text{liquidity}_{it} + \alpha_{k+1} CV_{it} + \mu_i + \varepsilon_{it} \quad (3),$$

where concentration, including CON, CONb2, and ZH; composition, including SO, CS, and MS; liquidity=LI; CV=control variables; K=1,2,...,6; variables with the subscripts “it” represent the corresponding indexes of company t in year i;  $\mu_i$  represents heterogeneity of different companies; and  $\varepsilon_{it}$  is a stochastic error term.

## 4 EMPIRICAL ANALYSIS

### 4.1 Stationary test

In order to avoid spurious regression, we adopted unit root tests, including LLC, Breitung, ADF, IPS, and PP to check the stationarity of sequences. If more than 3 indexes pass the corresponding checks, the sequence is stationary.

All the variables passed at least 3 unit root tests. Therefore, all the sequences are stationary under 5% (sig).

### 4.2 Regression analysis

The result of Hausman test showed in table 2 indicated that it is reasonable to establish the fixed-effects model for all the values of P less than 0.001.

We used Eviews to run regression analysis, and results are shown in table 2.

Model 1: There is a significant negative correlation between CD and CON, but no marked correlation between CD and CONb2. The results prove hypothesis 1 only to a certain degree. The ZH is significantly and positively correlated with CD ( $P < 0.001$ ). Reject the null hypothesis 2.

Model 2: SO is significantly and positively correlated with CD, which is consistent with the hypothesis that 3.CS have a negative correlation with CD, which is contrary to hypothesis 4. The regression coefficient of MS is negative and significant under 1%, which supports hypothesis 5.

Table 1. Stationary test results (p).

	CD	CON	CONb <sup>2</sup>	ZH	SO	CS	MS	LI
LLC	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Breitung	1.00	1.00	1.00	1.00	1.00	1.00	1.00	1.00
ADF	0.00	0.00	0.00	0.01	0.01	0.00	0.00	0.96
IPS	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
PP	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

Owning to space constraints, this article only presents the dependent and explanatory variables in table 1.

Table 2. Regression results.

	Regression coefficients (p)		
	Model1	Model2	Model3
C	0.024(0.125)	-0.014(0.353)	-0.016(0.284)
CON	-0.142*(0.000)	-----	-----
CONb <sup>2</sup>	0.002(0.962)	-----	-----
ZH	0.115*(0.000)	-----	-----
SO	-----	0.009*(0.000)	-----
CS	-----	-0.009*(0.004)	-----
MS	-----	-0.140*(0.009)	-----
LI	-----	-----	-0.002*(0.002)
Hausman	113.103(0.000)	92.554(0.000)	-93.354(0.000)
R <sup>2</sup>	0.868	0.861	0.859
DW	1.749	1.756	1.749
DW	1.749	1.756	1.749

\* The correlation is significant at 0.01 level.

Table 3. Robustness test results

	Regression coefficients (p)		
	Model1	Model2	Model3
C	-0.095(0.379)	-0.049(0.576)	-0.019(0.769)
CON	-0.425*(0.000)	-----	-----
CONb <sup>2</sup>	0.280(0.297)	-----	-----
ZH	0.1127(0.259)	-----	-----
SO	-----	0.0211*(0.015)	-----
CS	-----	-0.342(0.229)	-----
MS	-----	-0.029*(0.024)	-----
LI	-----	-----	-0.035*(0.002)
Hausman	113.103(0.000)	92.554(0.000)	-93.354(0.000)
R <sup>2</sup>	0.868	0.861	0.859
DW	1.749	1.756	1.749

\* The correlation is significant at 0.05 level.

Model3: LI is significantly and negatively correlated with CD, which is consistent with hypothesis 6.

#### 4.3 Robustness test

A large number of Chinese listed companies pay out abnormal high and low cash dividend. This phenomenon may be connected with ownership structure, but in a greater degree, it may be attributed to the special semi-mandatory cash dividend policy from the year 2000, the uncertainty of operation environment, and other specific reasons. Many scholars proved the thoughts to a certain degree; for instance, Huang Guijie (2012), Wu Lina et al (2003), and Wang Zongjun & Dong yujun (2006). Therefore, we run the regression analysis again by eliminating this abnormal sample to test the earlier results' robustness. Abnormal high cash dividend means the pay-out ratio is above EPS or net cash flow per share from operating activities and cash dividend per share is above 0.1; on the contrary, abnormal low cash dividend implies cash dividend per share is below 0.1 and pay-out ratio is below 50% (Dong Liming, 2004).

After eliminating this abnormal sample, there is a negative correlation between CD and CON, a positive correlation between CD and ZH; SO is positively correlated with CD. CS and MS are negatively correlated with CD; LI has a negative correlation with CD. It is noteworthy that the main research results are consistent with the earlier results. Therefore, the results are robust.

## 5 CONCLUSION AND FORECAST

### 5.1 Conclusion

- 1 There is a negative correlation between largest shareholders' holdings ratio and the cash dividend per share. Most Chinese listed companies have high shareholding concentration and the main conflict of interest and the agency problem exists between controlling shareholders and small and medium shareholders. Cash dividend may play a role of transferring funds and the companies seeking gain for themselves.
- 2 Ownership restriction degree is positively correlated with cash dividend per share. In China, controlling shareholders do not have enough power to supervise and restrain the behavior of substantial shareholders' entrenchment. They may join up together to occupy the benefits of small and medium shareholders by high cash dividend.
- 3 State-owned share proportion has a positive correlation with cash dividend per share. The absence of state-owned shares owners results in the serious agency cost. To decrease the cost, state-owned shareholders prefer high cash dividend.
- 4 A negative correlation exists between corporate share proportion and cash dividend per share. To some degree, corporate shareholders can act as checks and balances on substantial shareholders' power.
- 5 Management share proportion is negatively correlated with cash dividend per share. The management shareholder can contribute to the convergence of the benefits of managers and shareholders.

- 6 There is a negative correlation between circulating share proportion and the cash dividend per share. Circulating shareholders want the cash of companies to remain in the company and prefer capital gains (income).

## 5.2 Forecast

This article uses panel data instead of cross-section data to analyze the relationship between ownership structure and cash dividend policy, select samples as completely as possible, and tries its best to describe the ownership structure fully. But, due to the limitation of time and energy, this article still has some limitations.

- 1 The description of ownership composition is not comprehensive. We simply use state-owned shares, corporate shares, and management shares to describe ownership composition according to Chinese listed companies' conditions. For the future, there is a need to further explain it in detail.
- 2 The index of the largest shareholders' holdings ratio ignores the ultimate controlling shareholders. In the next research, it is necessary to find out the ultimate controlling shareholders to study further.

## Performance evaluation of logistics enterprise based on DEA model

Yi Yong Ye

*School of Economics & Management, Wuyi University, Jiangmen, Guangdong, China*

**ABSTRACT:** Logistics enterprise's performance evaluation involves many factors; because of the subjective factor's influence from evaluator, the evaluation results are not satisfied with the use of the evaluation method based on parameter assumptions. This article summarized the basic principle of data envelopment analysis, and it pointed out the feasibility and superiority of DEA that is applied in the enterprise's logistics performance evaluation. Then, we use the C<sup>2</sup>R model and C<sup>2</sup>GS<sup>2</sup> model to make a comparative analysis. The example indicated that this method can appraise effectively with a relative scale benefit and the technical validity between different enterprises and logistics systems, and it can identify its non-DEA effective factors. Finally, we get the corresponding improvements.

**KEYWORDS:** DEA, Logistics, Performance evaluation.

### 1 INTRODUCTION

With the rapid development of China's market economy and the acceleration of the process of economic integration in the world, the logistics industry is playing an important role increasingly in the national economy as "the third profit source," but it also has to face more intense and brutal competition<sup>[1]</sup>. How they can meet the needs of the community better, and adapt to the competitive environment better, has become the problem that logistics enterprises must face and solve.

However, due to the development of the logistics industry in China that started relatively late, coupled with lack of policies, regulations, and other external environment, resulting in the development process, there are some inevitable problems, such as inadequate infrastructure, logistics management concepts backward, imperfect industry regulations system, low information level of management, the overall level of development being not high, and so on. In order to solve these common problems, which requires the establishment of logistics enterprises with a suitable performance evaluation index system on objective, and determine the appropriate method of performance evaluation, so as to reflect the operations of logistics enterprises scientifically and objectively, and as a basis for strengthening and improving enterprise management, enterprise development strategy from the result. Only then would enterprises be helped to strengthen capital, technology, markets, personnel, and other aspects of management; logistics efficiency and service levels would be improved; the direction for logistics enterprises would be specified; and healthy development would be sustained<sup>[2]</sup>.

Therefore, the study of logistics enterprises performance evaluation problem has a very important practical significance; there are many business executives and scientists who have undertaken in-depth research in this respect, for example, Jianghong Ning has conducted a study by building an evaluation index system, and using a fuzzy comprehensive evaluation method on the performance of third-party logistics enterprises<sup>[3]</sup>; Qin Yao used the analytic hierarchical process and principal component analysis to study the cold chain logistics performance issues<sup>[4]</sup>; Chen XiaoLi use the improved genetic algorithms and neural networks to study logistics performance comprehensive evaluation; and so on<sup>[5,6]</sup>.

Based on previous research, and combining with the characteristics of the logistics performance evaluation, this article would uses data envelopment analysis (DEA) for its research and analysis.

### 2 DEA THEORY AND FEASIBILITY USED IN LOGISTICS ENTERPRISE PERFORMANCE EVALUATION

Data envelopment analysis is a multi-objective decision-making method that was first proposed by U.S. scientist A. Charnes and W. W. Cooper in the foundation of "relative efficiency appraisal" in 1978. This method is the application of the linear programming model, which can be used to analyze input and output data of the decision-making unit, and obtain each appraisal object's relative efficiency to judge which one is DEA effective, and the non-effective reason and degree of the other appraisal object also can be pointed out simultaneously. Thus, it can provide useful

management information to the department managers, so many scholars would like to make research on the DEA<sup>[7,8]</sup>.

Combined with the characteristics of modern logistics enterprises, it is feasible to apply the DEA method in logistics enterprise performance evaluation, and it has great advantages; the DEA method has a good adaptability to the dynamic system of multi-targets and complex structure. First, it does not need to consider the problem of same dimension in index; second, before the data processing, the function does not need to assume any relationship between the input data and output data; third, the data processing without any influence of subjective factors has a strong objectivity; fourth, the use of the DEA method can evaluate the results of the analysis, to understand the impact of logistics technology on effective and non-effective major factors, which can provide a basis for the business manager. Moreover, the DEA method is purely technical, and has nothing to do with the market prices. So since its advent, it is widely used in many fields, such as business performance, competitiveness evaluation, investment analysis and evaluation, risk analysis and evaluation, and so on. <sup>[9,10]</sup>.

### 3 MODEL OF DEA

#### 3.1 Model of C<sup>2</sup>R<sup>[11]</sup>

Suppose there are n units (DMU called decision-making units), and each decision-making unit has multiple inputs and outputs:

$$X_j = (x_{1j}, x_{2j}, \dots, x_{mj})^T \geq 0$$

$$Y_j = (y_{1j}, y_{2j}, \dots, y_{sj})^T \geq 0, (j = 1, 2, \dots, n)$$

This means the input and output data of DMU<sub>j</sub>. Based on the ordinary axiom, convexity axiom, invalid axiom, awl axiom, and minimality axiom, the C<sup>2</sup>R model with non-Archimedes infinitely great is established:

$$(D_{C^2R}^2) \left\{ \begin{array}{l} \min[\theta - \varepsilon(\hat{e}^T s^- + e^T s^+)] = V^0 \\ \sum_{j=1}^n X_j \lambda_j + s^- = \theta X_0 \\ \sum_{j=1}^n Y_j \lambda_j - s^+ = Y_0 \\ \lambda_j \geq 0, j = 1, 2, \dots, n \\ s^+ \geq 0, s^- \geq 0 \\ \hat{e} = (1, 1, \dots, 1)^T \in E_m \\ e = (1, 1, \dots, 1)^T \in E_s \end{array} \right. \quad (1)$$

This model can appraise each DMU's comprehensive efficiency (including scale and technology efficiency); suppose the model's optimal solution is  $\theta_0, \lambda_0, s_0^+, s_0^-$ , its appraisal criterion is as follows:

- 1 If  $\theta_0 = 1, s_0^+ \neq 0$  or  $s_0^- \neq 0$ , then this decision-making unit is weak DEA effective.
- 2 If  $\theta_0 = 1, s_0^+ = 0$  and  $s_0^- = 0$ , then this decision-making unit is DEA effective.
- 3 If  $\theta_0 < 1, s_0^+ \neq 0$  or  $s_0^- \neq 0$ , then this decision-making unit is non-DEA effective.
- 4 If  $\sum_{j=1}^n \lambda_j^* = 1$ , then this decision-making unit is invariable in scale benefit; if  $\sum_{j=1}^n \lambda_j^* < 1$ , then this decision-making unit has an increase in the scale benefit; if  $\sum_{j=1}^n \lambda_j^* > 1$ , then this decision-making unit is the scale benefit degression.

#### 3.2 Model of C<sup>2</sup>GS<sup>2</sup>[11]

Through the C<sup>2</sup>R model, we can judge whether the decision-making unit is DEA effective. If it is DEA effective, then we can make sure this DMU is simultaneously at the scale and technology effective condition. But if the DMU is non-DEA effective, then it is unable to judge whether it is effective in technology, so the C<sup>2</sup>GS<sup>2</sup> model is established to appraise the relative technical effective:

$$(D_{C^2GS^2}^2) \left\{ \begin{array}{l} \min[\theta - \varepsilon(\hat{e}^T s^- + e^T s^+)] = V^0 \\ \sum_{j=1}^n X_j \lambda_j + s^- = \theta X_0 \\ \sum_{j=1}^n Y_j \lambda_j - s^+ = Y_0 \\ \sum_{j=1}^n Y_j \lambda_j = 1 \\ \lambda_j \geq 0, j = 1, 2, \dots, n \\ s^+ \geq 0, s^- \geq 0 \\ \hat{e} = (1, 1, \dots, 1)^T \in E_m \\ e = (1, 1, \dots, 1)^T \in E_s \end{array} \right. \quad (2)$$

This model calculated the purely technical efficiency of the DMU; suppose the model's optimal solution is:  $\theta_0, \lambda_0, s_0^+, s_0^-$ , its appraisal criterion is as follows:

- 1 If  $\theta_0 = 1, s_0^+ \neq 0$  or  $s_0^- \neq 0$ , then this decision-making unit is weak DEA effective.
- 2 If  $\theta_0 = 1, s_0^+ = 0$  and  $s_0^- = 0$ , then this decision-making unit is DEA effective.
- 3 If  $\theta_0 < 1, s_0^+ \neq 0$  or  $s_0^- \neq 0$ , then this decision-making unit is non-DEA effective.

### 3.3 Projection adjustment method for Non-DEA effective DMU [11]

Suppose  $(X_0, Y_0)$  is the decision-making unit's input and output data, and  $(X'_0, Y'_0)$  is the projection in the DEA relative active surface, then the input and output's adjustment is as follows:

$$\Delta X = X'_0 - X_0 = (\theta_0 - 1) * X_0 - S_0^- \quad (3)$$

$$\Delta Y = Y'_0 - Y_0 \quad (4)$$

After adjustment, the data could serve as forecast data for the decision-making in the next stage, so we could find out the inputs that in the system need to improve from projection and then instruct the system to adjust investment.

## 4 EMPIRICAL ANALYSIS

### 4.1 Construction of evaluation index system

Currently, the research on the Logistics Performance Evaluation theory and method is still in the exploratory stage, pending the formation of mature theory and perfect evaluation system, mainly in the classification index system is inconsistent, there are no unified standards and evaluation specifications; technical, qualitative evaluation of economic and other quantitative evaluation and management, organizational efficiency, agility, and so on, which is not unified. The existing evaluation system was designed mainly from the financial performance indicators, customer management performance indicators, internal operational process performance indicators, and learning and growth performance indicators in four categories; to be considered, each category can be subdivided into a number of continuing indicators, and then use the principal component analysis, analytic hierarchy process, and fuzzy comprehensive evaluation method for data processing [12,13].

This article combined with the characteristics of logistics enterprises and logistics data availability, selected the total number of employees, fixed assets investment, and annual operating expenses as input index, and selected the net asset profitability, market share, and average satisfaction rate afterward as output indicators as the data processing object of the DEA model.

### 4.2 Data processing

The following are the partial logistics data of 8 enterprises [14]; according to the DEA method principle,

this article selected total staff, fixed asset investment, operating expenses as input target, and net assets profit margin, market share, average rate of satisfaction afterward as the output target.  $X_1 \sim X_6$  separately represents total staff, fixed asset investment, operating expenses, net assets profit margin, market share, and average rate of satisfaction afterward; the data are depicted in Table 1:

According to the two models previously introduced, we use MATLAB7.0 to solve this optimized question by linear programming procedure; the results are shown in table 2:

As can be seen from Table2, DMU1and DMU6 are scale effective and technology effective, but other technical validity of the six decision-making units needs to use the C<sup>2</sup>GS<sup>2</sup> model to make a further judgment; the computed result is shown in table 3:

### 4.3 Evaluation result analysis

#### 1 Total validity analysis

From Table 2, we know that, under enterprise existing technology and management level, only DMU1 and DMU6 are on the DEA effective production front surface, which means these two logistics enterprise's input element has achieved the best combination, and obtained the biggest output, but other several enterprises are non-DEA effective, and all have the redundancy of resources to varying degrees.

#### 2 Scale benefit and technical validity analysis

As can be seen from Table 2, DMU1and DMU6 achieve the economy of scale condition, but in other decision-making units the scale income increases progressively, which means most logistics enterprises have not achieved the best proportion between input and output. From table 2, we also know that, except DMU5, other enterprises do not have redundancy in fixed asset investment, but regarding the staff population and operating expenses, most enterprises have the resources surplus, so these enterprises must reduce the staff population and reduce the operating expenses. Only then will there be the possibility to achieve the best scale income.

Table 1. 8 Enterprise's logistics data.

INDEX	$X_1$	$X_2$	$X_3$	$X_4$	$X_5$	$X_6$
DMU1	85	100	25	20	5	85
DMU2	95	98	30	17.40	3.90	73.10
DMU3	98	90	28	11.80	3.45	55.25
DMU4	120	96	35	9	4.30	46.75
DMU5	80	105	25	9.40	3	56.10
DMU6	75	100	32	10.60	4.75	42.50
DMU7	100	80	30	13.60	2.80	39.95
DMU8	75	70	20	8	2	34

Table 2. Result solved by C2R model.

C <sup>2</sup> R	$\theta$	$s_1^-$	$s_2^-$	$s_3^+$	$s_1^+$	$s_2^+$	$s_3^-$	$\sum \lambda_j^*$	Performance of scale
DMU1	1	0	0	0	0	0	0	1	Unchanged
DMU2	0.888	10.387	0	4.883	0	0.45	0.85	0.87	Increasing
DMU3	0.767	16.483	0	4.217	2	0	3.4	0.69	Increasing
DMU4	0.896	34.4	0	9.854	8.2	0	26.35	0.86	Increasing
DMU5	0.701	0	7.631	1.031	3.8	0.3	0	0.66	Increasing
DMU6	1	0	0	0	0	0	0	1	Unchanged
DMU7	0.85	27.2	0	8.5	0	0.6	17.85	0.68	Increasing
DMU8	0.571	8.8571	0	1.429	0	0	0	0.4	Increasing

Table 3. Result solved by C2GS2 model.

DMU	DMU1	DMU2	DMU3	DMU4	DMU5	DMU6	DMU7	DMU8
$\theta$	1	0.9521	0.9389	0.9688	0.9870	1	1	1
Technique effectiveness	Effective	Invalid	Invalid	Invalid	Invalid	Effective	Effective	Effective

From Table 3, DMU1, DMU6, DMU7, and DMU8 are technology effective, which explained that these four enterprises' technical efficiency is at the optimum condition, and the other four enterprises are invalid at the scale and technology. According to the projection adjustment method, we need to make the same percentage compression to the invalid unit's inputs, but maintain delivers invariably.

### 3 The projection analysis of DMU on effective production front surface

The projection of non-DEA effective decision-making unit on production front surface is DEA effective; therefore, it can finally achieve DEA effective through adjustment (such as Table 4); take DMU3 as an example to analyze the following:

$$\begin{aligned}
 X_{21} &= 0.7667 \times 98 - 16.483 = 58.6536 \approx 59 \\
 Y_{21} &= 11.80 + 2 = 13.80 \\
 X_{22} &= 0.7667 \times 90 - 0 = 69.003 \approx 69 \\
 Y_{22} &= 3.45 + 0 = 3.45 \\
 X_{23} &= 0.7667 \times 28 - 4.2167 = 17.2509 \approx 18 \\
 Y_{23} &= 55.25 + 3.4 = 58.65
 \end{aligned}$$

According to the computation, if DMU4 reduces the staff population from the original 98 people to 59 people, the fixed asset investment reduced from 900,000 Yuan to 690,000 Yuan, the operating expenses reduced from 280,000 Yuan to 180,000 Yuan; correspondingly, this enterprise's net assets profit margin from 11.8% was enhanced to 13.8%, the market share maintained 3.45% invariably, and the satisfaction rate afterward from 55.25% increased equally to 58.65%. At this time, the enterprise will achieve the DEA effective condition.

Table 4. Non-DEA effective DMU projection results in the production of the front surface.

DMU	$X_1$	$X_2$	$X_3$	$X_4$	$X_5$	$X_6$
DMU2	74	87	22	17.85	4.75	73.97
DMU3	59	69	17	13.8	3.45	58.65
DMU4	74	87	22	17.2	4.3	73.1
DMU5	57	66	17	13.2	3.3	56.1
DMU7	58	68	17	13.6	3.4	57.8
DMU8	34	40	10	8	2	34

Compared with table1 and table4, we may find that around adjustment, the data's difference is quite big. It means these enterprises' proportion of original input and output is extremely unreasonable; after projection adjustment, its relative performance can be markedly improved.

In summary, the DEA method can be suitable for the logistics system performance evaluation and discover their own weaknesses, thus facilitating enterprises to take measures to improve their economic efficiency. Simultaneously, by changing a target and analyzing how much changes in effectiveness, we can find out each target's influence on the appraisal object, thereby the performance evaluation target system of enterprise logistics system can be restructured continuously, which will play a positive role in raising the enterprise management level effectively.

## 5 CONCLUSION

Logistics enterprise performance evaluation is a typical multi-index problem; many factors are involved, and multi-index also brings the problems of complexity of analysis, multiple correlation, and interference between index on inter. This article uses DEA method to carry on the transverse evaluation analysis for enterprise's logistics performance, and obtained a good effect, which not only has obtained each enterprise's relative performance of scale and the technical validity but also proposed the reasonable suggestion to the question as to which enterprise existed. So it is helpful for enterprise decision-makers in the next step of development.

Of course, the development of enterprises is influenced by a number of external factors, and the model parameters discussed in this article are quantitative. In the actual process of business management operations, we also need to fully consider the impact of such laws, policies, competition, and other qualitative indicators, in order to make comprehensive and rational decisions.

# Construction and exploration of the art design teaching platform based on scientific and technological information

Yuan Liu & Wei Tan

*Hubei Institute of Fine Arts, China*

Han Tan

*Wuhan Vocational College of Software and Engineering, Wuhan, China*

**ABSTRACT:** By constructing and exploring the art design teaching platform based on scientific and technological information, we study how to turn the dull academic and technological information such as texts, data, and charts into books, animation demo, or virtual test program, which bring order and visualization to the presence of the scientific information, and achieve interdisciplinary penetration into the subject.

**KEYWORDS:** Scientific and technological information; art design; interdisciplinary; teaching research.

## 1 INTRODUCTION

### 1.1 *Art design teaching platform*

The art design teaching platform based on the scientific and technological information is initially constructed by the print graphic design major of Hubei Institute of Fine Arts. Through the trial cooperation with a part of universities and enterprises, a comprehensive research platform is constructed between scientific and technological information and art design. The talents in the universities and enterprises offer the creative technologies and topics that are from bioscience, plant science, rear livestock project, machine design, and geographic information. On the platform, these technologies and topics are presented by means of informational art design in a good visual form, which achieve interdisciplinary penetration into subjects, share the resource, and provide the conditions for exchange and cooperation of interdisciplinary talents.

### 1.2 *Purpose of the art design teaching platform*

The research platform is mainly used for scientific and technological information in various subjects, including medicine, physics, biology, chemistry, and machine manufacturing. The scientific and technological information is presented again by visual language, so the dull academic and technological information, including texts, data, and charts, is integrated into books (including text editing, information chart design, and technological chart drawing), PowerPoint, animation demonstration, and virtual test program on

this research platform to present the scientific information in an orderly and vivid visual form for more efficient presentation and exchange and to realize interdisciplinary exchange and permeation. On this teaching platform, the real scientific and technological projects can be introduced in the art design teaching for teaching and scientific research activities oriented by projects to cultivate comprehensive design talents with planning ability, integration ability, and innovation ability. In addition, the design demand of researchers can be satisfied. The art design is actually used in the visual presentation of creative technology study and academic result for society.

## 2 RESEARCH SITUATION OF SCIENTIFIC AND TECHNOLOGICAL INFORMATION-ORIENTED ART DESIGN

### 2.1 *Domestic research of the art design teaching platform*

Art design is a comprehensive, marginal, and interdisciplinary subject. The research on interdisciplinary design teaching is the key topic for education development and innovation of art design major, which is of great realistic meaning. College of Fine Arts in Tsinghua University is the college that carried out research on Art and Science early in China. The Department of Information Art Design, established in July 2005, is mainly related to the application of movie and TV cartoon, digital entertainment, internet game, interactive interface design, media art, digital library, and news media.

Currently, a few talents are engaged in scientific information chart design and technological chart drawing. The art design research platform oriented by scientific information for the presentation of technological result and satisfying design demand of scientific and technological researchers is not yet established. There is no platform for the sharing of interdisciplinary graduation designs and results. Numerous academic results in various universities and colleges are presented by means of theses and PowerPoint. However, with no specific optimal design, the visual presentation is simple and dull with no structure and numerous texts. The drawings are simple, and the cartoon images are not vivid. The comprehensive art design research platform oriented by scientific and technological information is constructed based on design talents in the colleges of fine arts for the exchange with various disciplinary fields. Thus, the scientific and technological information is presented by vivid, bright, direct, comprehensive, and consistent visual elements for resource sharing among universities and colleges.

## 2.2 *Research aboard the art design teaching platform*

International scientific and technological information-oriented designs are popular with great acceptance. For example, the studies and applications related to information design, information visualization, data design, and scientific drawings are very mature. In foreign book design expos, including the highest-level election for “Most Beautiful Book in the World” in Leipzig of German, a lot of scientific and technological books are elected. However, in domestic book design expos, almost all rewarded works are literature and cultural books. There are very few scientific and technological books with good visual form and characteristics.

## 3 CONSTRUCTION OF SCIENTIFIC AND TECHNOLOGICAL INFORMATION-ORIENTED ART DESIGN TEACHING PLATFORM

The scientific and technological information-oriented art design teaching platform is constructed initially. In early stage, the graduation designs of various universities and colleges are combined with the graduation designs of the colleges of fine arts. For example, the graduates from the colleges of science and engineering provide the creative technological topic, research information, and design demand. A team is established by graduates from the colleges of fine arts. Based on the earlier scientific information, the real scientific research is regarded as the theme of

graduation design for overall planning and design practice. In the end, the graduation design is completed. Meanwhile, the graduates from the colleges of science and engineering present the design results of good visual form in their graduation presentation.

Through the research in the early stage, the result and experience is summarized for further development of the teaching research platform. Based on the research platform, the scientific projects, academic achievements, and teaching resources of various universities and colleges or relevant research departments are combined with the scientific research team of the colleges of fine arts. The director of the scientific research projects or the applicant of boutique courses provides the scientific research information. The scientific research design team is made of undergraduates, postgraduates, and teachers from colleges of fine arts to present the scientific information in a vivid and direct visual form.

In a later stage, according to different design demands of scientific studies, the website is designed and established, on which scientific research talents and design talents communicate with each other directly. Therefore, the interdisciplinary research platform crossing the regions and satisfying various design demands is established for the cooperation of various research talents.

## 4 COOPERATION MODE AND RESEARCH CONTENT AMONG UNIVERSITIES AND COLLEGES

### 4.1 *Cooperative mode*

Topic: Initially, the comprehensive research platform of scientific information and art design is constructed with the comprehensive university, Huazhong Agricultural University. Among the graduation topics related to biology, plant science, machine design, and geographic information from Huazhong Agricultural University, through the communication of both parties’ tutors, the topics are determined for the comprehensive research.

Exchange: The art design graduation team and the students of graduation designs from Huazhong Agricultural University carry out the disciplinary exchange under the guidance of teachers.

Demand: The students of graduation designs from Huazhong Agricultural University provide concept test, research chart, sheet, data, and design demand.

Design: The students from the college of fine arts carry out the graduation design based on provided scientific information and complete the visual presentation of scientific information.

Presentation of graduation design: The students from the college of fine arts take the real scientific research projects as the topics of their graduation

designs and complete the graduation designs. The design results include scientific and technological book design, e-book design, scientific and technological illustration, and animation presentation. The students from Huazhong Agricultural University take the graduation results for their graduation presentation.

#### 4.2 Content of art design

The visual presentation of the scientific and technological research project is completed by design forms, including book (including research report and introduction manual), e-book, PowerPoint, and animation presentation. Main design projects include the following:

**Book design:** The overall planning is made based on features, attributes, and various design elements of scientific research projects. Basic design elements include book size, book jacket, cover, lining paper, title paper, text, illustration creation, production, and bookbinding. The theoretical information of the scientific project is integrated into the orderly text with good visual structure, including structure, grid system, level, readability, color, comparison, and font design.

**Info graphic design:** Info graphic design is a comprehensive visual and readable system consisting of image, text, and data. Thus, the information can be exchanged more efficiently. People can read the visual elements better and establish corresponding relationships directly, vividly, simply, consistently, and comprehensively from the visual element system of specific text, so the information is again presented. There are many classification methods for infographic design. Seen from the angles including image, font, and data system organization mode, the infographic design can be classified into time sequence image, space relationship image, deduction image, systematic organization image, and relationship image.

**Technology information rendering:** The technology image rendering is to draw the object by scientific view from the angle of scientific research in a scientific way. The rendering shall be subject to the reality. People should have relevant professional technological knowledge and certain art quality to render the technological image. The objective rendering is insufficient. Under the scientific premise, the information shall be with beautiful visual form and art form to reach the combination of function and beauty appreciation. Technology image can be used for scientific research and teaching. In the book design, technology image rendering must be subject to the printing size.

**Animation/visual test:** By means of relevant software and hardware technologies, the flash animation and visual test program are used to simulate the systematic structure of the realistic environment. In

the virtual test, technologies including multimedia, simulation, and virtual reality are used to create the software and hardware operation environment in the computer that can aid, partly replace, or even fully replace various operation links of traditional experiments. The participants can complete various experiments in the nearly realistic environment. The experiment effect is equal to or even better than the effect in the realistic environment. The interactivity of experimental operation and simulation of experimental result are emphasized.

## 5 ESTIMATED VALUE REALIZED BY THE TEACHING PLATFORM

The scientific and technological information-oriented art design teaching platform will make up the blank in China and realize the integration and permeation of scientific research and art design. The bridge therein speeds up the integration process of disciplines. An effective channel is provided for the exploration of new art design and for design diversification. Meanwhile, the platform is very important for cultivating technology-oriented comprehensive design talents, satisfying design demand of scientific researchers, realizing and strengthening the connection of scientific research talents and art design talents, and presenting scientific information efficiently. The platform will promote the interdisciplinary education, the cooperation of multiple majors, multiple subjects, multiple systems, and the sharing of graduation design results of colleges of fine arts and other universities and colleges. The construction of scientific information and art design platform will further realize the exchange of scientific research talents and art design talents based on the realization of a part of cooperation projects.

# An exploration of open machinery training system

Han Tan

Wuhan Vocational College of Software and Engineering, Wuhan, China

**ABSTRACT:** The open machinery training system is proposed based on the “leveled” machinery training course system. It focuses on the comprehensively interdisciplinary program set with training contents and on-line courses available to the whole college. Students can select training programs and study the courses online in their fragmented time. This training system emphasizes the combination of course content and occupational standards. It establishes new teaching materials to form a teaching system through the optimization and combination of faculty, training platform, assisted instruction system, and MOOC, thereby comprehensively improving the efficiency and effectiveness of the training.

**KEYWORDS:** Open, Training Program.

## 1 REVIEW OF RESEARCH STATUS AT HOME AND ABROAD

According to the investigation carried out by the International Institute for Management Development in Lausanne, Switzerland, China has the largest number of engineering and technical personnel. However, it ranks the 36th place in the world by the index of qualified engineers, which is directly related to the existing problems in the teaching and practice of engineering personnel in China. [1]

The Decision on Major Issues Concerning Comprehensively Deepening Reforms approved by the Third Plenary Session of the 18th CPC Central Committee pointed out that vocational education constitutes an important foundation for national economic and social development strategy, whereas the modern vocational education system is a crucial part of the modern education system. According to the Ministry of Education, vocational education reform has to keep pace with the society by rapidly accelerating the development of modern vocational education and establishment of modern vocational education system as the strategic starting point for education restructuring. It centers on promoting employment and takes quality improvement as the focus of vocational education reform. [2]

Currently, although the domestic machinery training education includes the production process-based project and modular research, it actually fails to satisfy the actual needs of the society as it is difficult to nurture complex technical personnel with the following problems: for machinery training, “its actual operation is independent and simple,” without comprehensive and design programs provided to

train students; the integration of training courses and students’ majors needs to be strengthened; the conflict between limited training hours and increasingly higher training requirements becomes more prominent; and so on.

## 2 EXPLORATION OF OPEN MACHINERY TRAINING SYSTEM

### 2.1 Design idea

The open machinery training system scientifically and reasonably sets training programs based on different majors; its training time and content are completely open to the entire college; and students can flexibly reserve the time, location, and programs of training through the online reservation subsystem. In this way, the training will evolve from single to diversity with full use of training equipment; whereas for students, their operational skills can be individualized and developed, instead of being taught in class.

Teachers construct a training program and upload it to the learning system. Before training, students are required to choose their training program in advance through the internship system; then, they analyze the process of the chosen training program and write craftsman, process cards as well as the various needed cutlery, measuring tools and fixtures that will be submitted to teachers. Teachers check and correct these cards and arrange the unified training equipment and timing through the learning system, thus approving of students engaging in the training. During the process of training, students independently complete the relevant training

programs where teachers play a dominant role; after training, teachers make assessments on the performance of students in line with their preparation, attitudes, and results, thereby achieving a production process-oriented diversified assessment mechanism.

The establishment of the training makes teaching contents closely related to the real production activities and constantly enriches the training content; through the process from craftsmanship and process cards, teacher review the training operation and summary and report process, thereby making the teaching process simulate the production process; through query and distribution of the training equipment by the system, equipment can be fully used. Therefore, students can comprehensively improve their operation skills. Due to training project set including contents at different levels, students can study in accordance with their individual differences, which is conducive to the training of personalities. Meanwhile, MOOC can be established for class videos of teachers both inside and outside schools, corporate pre-service training, product processing, and equipment operation videos, which enables students to consolidate what they have learned in classes at anytime and anywhere, expand their horizons, and improve the overall quality.

## 2.2 *Open machinery training system*

### 2.2.1 *Open machinery training system centers*

Open machinery training system centers on an open machinery training system project set, which is based on project, video, equipment, and work sets (Winning entries, small inventions, innovative works of students, and excellent training products). It includes teacher, student, work exhibition, and online Q & A modules. Through this learning system, good relationships are formed, such as teacher-project-student, teacher-video-student, teacher-equipment-student, and teacher-Q&A-student.

### 2.2.2 *Machinery training-based MOOC*

mechanical specialty is characterized by a variety of work, strong practice, great difficulty, and high risk. Due to limited time and a small number of equipment, there are limited contents for students to learn during the learning phase, which leads to students' inability to grasp all skills. MOOC has been introduced into the open machinery training assisting system by making videos regarding teachers (classes inside and outside of the school), students (interpretation of excellent works, lectures on learning methods), and enterprises (pre-service training and interpretation of production process) that are available to the entire college, thereby facilitating them to study.

The open machinery training system is used to promote the combination of paper textbooks and

shared digital resources of classes to form the new machinery training materials with an integration of teaching philosophy and material design, of shared class resources and material development, and of basic requirements and personalized demands.

### 2.2.3 *Open machinery training system project set*

The open machinery training system program set constitutes the core of the teaching system. This article proposes the "student-centered and employment orientated" idea. Based on the layered training teaching system, it integrates curriculum knowledge and constructs the interdisciplinary training programs.

The open machinery training courses are divided into three levels, namely, basic, professional, and innovative training. In addition, the innovation activities are integrated into the training system, including competition, entrepreneurship, new product designs, and innovation courses. All these activities help students gain credits and rewards, thus inspiring students to explore, learn, and innovate.

Based on the curriculum system, this system is work process oriented and project (curriculum) centered, supported by the goal of acquiring vocational qualification certificates. It optimizes and adjusts the practice teaching contents and emphasizes the relationship between projects (curriculums) to construct an interdisciplinary training program set (through all curriculums), write an overall training guide book, and train students comprehensively to equip themselves with the ability of applying the acquired skills to the practice.

Currently, "Project Approach" has achieved some results in training the thinking skills of students, mobilizing their initiatives and improving their ability to analyze and solve problems. Yin Kai and Xia Hongmei et al carried out program-based teaching reform in clinical classes and mechanical courses, respectively [3–5]. Lu Ling et al proposed to take part craft project as the mainline of teaching, thereby reforming the traditional mechanical manufacturing technology curriculums. [6]

However, for the existing training, it is not well organized with little expansion in horizontal span, which causes students to fail in integrating the learnt knowledge and comprehensively using knowledge to solve problems. In order to strengthen the horizontal relationship between relevant knowledge, strengthen the cohesion between courses and knowledge cohesion, and enhance students' ability to comprehensively use the learnt knowledge, a large interdisciplinary training project subset will be constructed for the five professional directions mentioned earlier. In other words, several interdisciplinary comprehensive and design training programs will be established under each major; therefore, the tasks are assigned to every

course. Through the training of the large training program, it can well achieve the goal of training students to enjoy comprehensive, design, and innovation abilities.

There are a large number of programs to be established in the large training programs with different levels of difficulties. Therefore, students are enabled to choose programs in line with their own conditions to improve their interest in learning and inspire their competition awareness. In this way, students will be transformed from a passive knowledge receiver into an active explorer; a variety of faculty teams study on how to set up a large training program (horizontal integration of knowledge, how to connect courses and the vertical integration of knowledge) to improve students' comprehensive application abilities. Thus, teachers are transformed from a single knowledge imparter into an ability and quality trainer and meanwhile, it also can enhance the cohesion of the faculty.

### 3 ADVANTAGES OF OPEN MACHINERY TRAINING SYSTEM

With the proposition of the “layered” machinery training curriculum system, we will construct an open machinery training teaching system that is “employment-oriented, student-centered and layered ability training targeted.” It emphasizes the combination of curriculum content and occupational standards, and a new teaching material series will be established through the optimization and combination of faculty, training platform, assisted teaching system, and MOOC to establish new forms of teaching materials, thus forming a new teaching system. In this way, it comprehensively improves the efficiency and effectiveness of the training as well as the ability of students to comprehensively and creatively use professional knowledge to solve practical problems, finally achieving the goal that “machinery training serves the talent training that the industry demands.”

## 4 CONCLUSION

This article, based on the current status of machinery training teaching, discusses the way in which the machinery training system trains professional personnel while meeting the requirements of the market. Software and Engineering of Wuhan Vocational College introduces the open teaching philosophy and has made useful attempts in knowledge optimization, curriculum system optimization, organization and management of teaching, new forms of teaching materials, assisting teaching systems, and MOOC.

## Definition of the concept of Roliball and rheological study history

Yu Ting Yang, Yun Sheng Liu & Zhi Fang Chen

*Wen Hua College, China*

**ABSTRACT:** This article, first of all, is based on a concept analysis, a case study method that attempts to deepen the cognition of the importance of the concept and mobility of people. Then it attempts through its Roliball movement theory and practice, the literature material method, expert interview method to examine the concept of Roliball movement case prototype, development and rheology, the rationality of the concept of rheological Quan interpretation of the basic national sports, scientific development for the national sports value concept research, and innovation to provide a theoretical reference.

**KEYWORDS:** Roliball; Definition of concept; The rheological history.

According to the example, the concept “reflects a specific attribute of the object form of thinking,” so the concept is similar to distinguish things and reflect the essential attribute of the object mode of thinking. As the starting point of logic reasoning, the concept is a prerequisite for the theoretical research. In questions for any national sports that are discussed, the first needs clear concepts related to the sports project. It should be simultaneously noted that due to historical cognition and expression level of development and changes, the concept itself is in constant development and change. With soft power ball movement as a case, the concept of Roliball movement from prototype to form has been relatively stable and changing; the future will certainly have the new concept of Roliball movement, showing that national sports scientific and normative definition of development is bound to need attention and innovation.

### 1 CLEAR CONCEPT IS THE BASIS OF A RELEVANT ACADEMIC DISCOURSE AND THE PREMISE

So many different things are in the objective world. In the process of understanding objective things, people gradually realize that different things have different properties. Things will have different properties, respectively, and will belong to a distinguished class, through the senses and on the basis of the overall impression, through the analysis of related things, comprehensive, screening, abstraction, and generalization, the highly generalization and abstraction. By means of language, people who are gradually formed reflect the different concepts of different things. It is

to build a scientific theory system of “logic cells,” because the science comes from the concept of a theoretical system, or the concept of generalization and abstraction from objective and specific things. Through grasping the concept, people get to know unit things basically.

The concept of Roliball movement formed after rising from the perceptual stage to the rational stage of the product. First, Roliball audience study and practice performance, teaching, communication, and study the process of Roliball movement for a long time. Through the feeling, they gradually understand arc led the Roliball movement, swinging, round ring, turn, turn around, such as the project properties. And as the Roliball movement properties of Roliball movement sports audience perceptions of accumulation, gradually form impression, then the general Roliball audience is still at the stage of perceptual knowledge of Roliball movement. On this basis, the soft power ball audience analyzes the various properties of the Roliball movement and the Roliball routines, and it pays attention to the problem that arise with the new routines with kinds of sports, such as wushu, artistic gymnastics, sports dance project, the netting of competitive Roliball with tennis, badminton, volleyball, and other sporting netting ball games. The audience then makes a comprehensive generalization as a whole, and in accordance with the high generalization and abstraction of language expression, forms a reflection of the characteristics of the Roliball movement essence of Roliball name concept, from a number of specific Roliball routines, and customizes title routines, singles and doubles, and Roliball against the athletics content of abstract.

## 2 CONCEPT HAS RHEOLOGICAL CHARACTERISTICS ALONG WITH DEEPENING THE COGNITION ON PEOPLE

What has been described now combined with the Roliball case simple process of concept formation, to use concept analysis and comparative research from the Angle of logic, which is a general description. With Roliball as a case, in the different historical period, due to the development of productive forces and the different historical condition, the social value of Roliball is also different; under a certain historical condition, the Roliball itself is a qualitative change that will happen. When we discuss the concept of Roliball, we should pay attention to the development of Roliball routines and change; this is also an important feature of the concept of study objects, and we cannot turn a blind eye to or avoid attitude to this. So we cannot use today to the understanding of the concept of Roliball to treat the Roliball in the past, because it is likely to ignore the Roliball in the past the main social value and the technical characteristics, and overly stress the fitness value of Roliball routines, nor use in the past, people understanding of Roliball to look at today's Roliball, because it may make us overly emphasizes the art value of Roliball, and ignore the result of the development of history to promote Roliball caused by the social values change Roliball technical innovation. If argument some thinking on Roliball concept into chaos, as one of main reason may be is not in view of the development of Roliball, caused the deviation of conceptual understanding. In this sense, Roliball itself emerged as an omni-directional, multilevel, and wide dimension of cultural care, and how to better clear the concept of Roliball is particularly timely, urgent, and important.

## 3 PROTOTYPE OF THE ROLIBALL CASE AND FORM AND THE CONCEPT OF RHEOLOGICAL

Roliball in 1991 to research and development, to the plait project 1992, Roliball routines 2002 formally with Roliball double form development. So far, it has developed into a national sports science, but the name of the related project title, name, title, and academic argument on the definition of relative lag. The basic link is shown as follows: On the one hand, Roliball routines movement from the plait to today, has been and Roliball across the net competitive general a name appellation. On the other hand, even for generic name appellation, definition of the concept of "Roliball" is not clear, and the specification remains for further scientific argumentation.

### 3.1 *Prototype of Roliball appellation*

To solve the contradiction between boxing combat training and sports injuries, shanxi jinzhong college in 1992 and boxing coaches Bai Rong teacher in the process of improving boxing training equipment developed the "tai chi ball entertainment" and "bat" two invention patents, marks as soft power ball routines of soft power project was born. Entertainment ball in 1991, "tai chi" as the name of Roliball movement first, no specific definition of the concept, the corresponding definition of Roliball routines are not, but Roliball "To soften , Introduced , Unarmed counter move" fits the characteristics of tai chi exercise idea thorough popular feeling, Too polarization ball games" is the prototype of the concept. By 1992, the project of soft power ball plait group was formally entitled to the sport "tai chi Roliball."

### 3.2 *Definition of soft power ball movement*

Early on July 5, 1994, the national federation of trade unions will Roliball as the third session of the national workers sports meet. To September 2001, October the elderly in Beijing and north China area and national Roliball games more than provinces or cities, Roliball tournament buds appear Roliball, presented the vitality. However, Roliball associated name and definition of the concept of relative lag; performance in titled "tai chi Roliball" name in 1992, but given its first concept is defined, in 2002 the tai chi Roliball teaching and learning work: the advent of "Roliball is an emerging, with characteristic of national sports, it is by activists hold a special meter, the meter is composed of a handle and a frame, the frame has a buffer role, rubber soft face, with the wind hole by using the methods for preparation of arc led to go to the ball. It can to cast, single practice alone, several people each other, or across the network, to achieve fitness, entertainment, performance and competitive sports. This is one invention of the BaiRong teacher group and created the first clear soft force of the ball to first define of the concept of "tai chi Roliball," which marks the formation of the concept of Roliball.

### 3.3 *Concept of Roliball rheological*

As Roliball in the promotion and popularization of the national, Roliball-related multi-dimensional scientific research achievements followed one after another, which in the name of Roliball also has the rheological concept. With Roliball, one invention Bai Rong teacher published in 2004 in shanxi agricultural university journal club teaching and research of Roliball to the people's sport publishing house in January 2009 version of the book "tai chi Roliball", tai chi and Roliball concept can be interpreted as "tai

chiRoliball is an invented by the Chinese, with deep cultural connotation and philosophy, combines traditional way (tai chi) movement and the modern athletics dual characteristics at an organic whole, emphasize the inside and outside of the body and mind cultivation, pursuit of man and nature, human and the harmony between man and the ball, with distinctive ethnic characteristics emerging sports project.” This pattern also prompted soft power ball routines of the connotation of the “tai chi” that are more exquisite; simultaneously, the pursuit of “tai chi” style gradually fades, because there is more cultural connotation in the eclecticism movement for Roliball routines. In 2008, Beijing sports university student Tong Bao Ming “wrote the article” recognition of the concept of soft power ball movement. Roliball is defined as “the soft power is based on the theoretical basis of principle of tai chi ball movement, and led to meet, and for the technical characteristics of routine drills and netting against as the main form of movement, with national characteristics, pay attention to the inside and outside and repair the emerging sports.” In 2012, Beijing sports university in an article in the doctoral Li Enjing discussed the basic concept of Roliball in the concept of Roliball is defined as:” Roliball refers to the practitioners with soft power, to buffer rolled the ball on the racket do the movement of the arc or circle as the main technical characteristics of a national sport.”Roliball is divided into soft power competition and Roliball routines and how to give the related terms definition has not been unified understanding of the concept of the concept of “Roliball” appellation interpretation although increasingly reasonable, but it is still in the schools of thought contend, this case reflection on the rheological characteristics of the concept of historical rationality.

### 3.4 *Enlightenment on the research of national sports scientific developing concept*

To sum up, the concept is that people attribute to the thing and differentia of abstract expression, by defining academic cognitive-level differences in specific historical limitations and rheological characteristics of social development. Roliball since research and development, definition of its name appellation and although increasingly to clear, and the specification, but outstanding scientific and rational to national sports culture remains to be the general soft golf experts, scholars and colleagues to force into cultivation. With soft strength ball movement for the case review of the national sports scientific road, great importance not only is attached to the basic concept of research as the only important way and method but also is necessary for national sports development and innovation.

## LEEP combined with Matrine gel and ciprofloxacin hydrochloride suppository in the treatment of severe cervical erosion

Li Xu

First Affiliated Hospital, BeiHua University, China

Ping Xu

Department of Obstetrics and Gynecology, Hospital of Jiutai, Jiutai, China

**ABSTRACT:** Objective: To study the clinical effect of LEEP combined with Matrine gel and ciprofloxacin hydrochloride suppository in the treatment of severe cervical erosion. Methods: 200 patients diagnosed with severe cervical erosion were randomly divided into two groups. The treatment group is given Matrine gel and ciprofloxacin hydrochloride suppository inside the vagina after the LEEP. The other group is the control group, which does not receive Matrine gel and ciprofloxacin after LEEP. The two groups are analyzed to determine the clinical effectiveness of the drugs. Results: In 3 months' time, the cure rate of the treatment group was 94%, and that of the control group was 81%, with a significant difference ( $P < 0.05$ ). The amount of vaginal discharge and vaginal bleeding time between the two groups also showed a significant difference ( $p < 0.05$ ). Conclusion: LEEP combined with Matrine gel and ciprofloxacin hydrochloride suppository in the treatment of severe cervical erosion demonstrates high cure rate, good curative effect, reduced side effects, shorter course, easy to use, and is proved to be a safe and effective method. It is worthy of clinical promotion.

**KEYWORDS:** Severe cervical erosion; LEEP, Matrine gel, ciprofloxacin hydrochloride suppository, treatment.

Cervical erosion is one of the most common clinical classifications of chronic cervicitis. It is one of the most common frequently occurring diseases among married women, as well as a risk factor for cervical cancer; especially severe cervical erosion, if not promptly treated or if is not treated with the correct therapy, can lead to Cervical intraepithelial neoplasia or cervical cancer due to prolonged inflammation. Therefore, aggressive treatment of cervical erosion is particularly important. Our hospital by LEEP (Loop Electrosurgical Excision Procedure) combined with Matrine Hydrogel and ciprofloxacin hydrochloride suppository in the treatment of severe cervix erosion and is remarkable in its curative effect, which is described here:

### 1 CLINICAL DATA

#### 1.1 Cases sources

January 2013 – January 2014 visits of the hospital gynecological outpatient of severe cervical erosion patients, total 200 cases, aged between 26 and 52, course of 1–5 years, research object met following conditions (1)All study subjects have normal sexual history and history of given normal, live birth. No subjects are pregnant or lactating during the course of study. (2) By colposcope and cervical liquid-based

cytology test and cervical biopsy, except Cervical intraepithelial neoplasia and cervical cancer. (3) No other gynecological disease (as vaginitis, pelvic inflammation, etc.). (4)Without other physical therapy in cervix within 6 months (5)timely follow-up.

#### 1.2 Diagnostic criteria and classification

According to the literature[1]. Cervical erosion will be divided into 3 levels of severity (degrees) according to cervical erosion area. Mild: The erosion area is less than 1/3 the entire cervical area; Moderate: The erosion area of entire cervical area is 1/3-2/3; Severe: The erosion area is more than 2/3 the cervical area. Degree by erosion area can be divided into 3 types: simplex, granular, and papillae.

#### 1.3 Group

The 200 cases of cervical erosion patients were randomly divided into 2 groups, with each group of 100 cases. The treatment group: LEEP combined with Matrine gel and ciprofloxacin hydrochloride suppository; The control group: LEEP treatment alone. The two groups have no significant difference in types of cervical erosion and in age, there is comparability; see [table 1](#).

Table 1. Groups of patients in General.

Group	Cases (n)	age (x± s)	lesion type		
			simple	granular	papillae
Treatment group	100	37.3 ± 5.6	31	56	13
Control group	100	37.6 ± 7.4	30	56	14

#### 1.4 Treatments

All patients were carried out in the 3–7 days of menses, 24 hours before surgery, no intercourse. During surgery, the patients had to take lithotomy position, were routinely sterilized, the cervix was exposed, and cervical surface iodine test was conducted to determine the transition zone. LEEP set removal power 70W, from the cervical 6 to 12 points, from bottom to top, from left to right, loop excision of lesion, cutting depth 1.5cm to ensure specimen integrity. Any initial or additional tissue specimen is labeled (up and down, front and back, in and out...) before sending to the pathology department. Conduct electrocautery hemostasis with an 80W spherical electrode. When hemostatic is invalid, suture the tissue to stop bleeding. Put the probe into the cervical canal after surgery to prevent adhesions of cervix, conventional iodophor disinfection of wounds and vagina. For the treatment group, Matriline gel, ciprofloxacin hydrochloride suppository, and cotton ball are placed into the vagina after operation. Cotton ball will be taken out after 24 hours, respectively 1, 2, and 3 months after surgery after menstruation while using the two drugs 7 times, into the vagina before bedtime once every other day. Evaluation of the effectiveness of the treatment is done in 3 months' time. The control group did not receive medicine into the vagina. Both groups keep the vulva clean after surgery; sexual activities and bathing was prohibited for 10 weeks. Within 2 weeks of treatment, follow up once a week, from 2 weeks to 2 months after treatment, follow up once every 3 week, 2–3 months after treatment, and follow up once a month. The contents of the follow-up: observation of scab, vaginal discharge color, odor, vaginal bleeding, and cervical repairs.

#### 1.5 Effect of determination

Healing: erosion disappeared, cervical smooth. Excellence: clinical symptoms disappeared and erosion surface reduced >50%. Effective: clinical symptoms improved, erosion surface <50% from the granules to simple, from the nipples to granular. Invalid: no change or serious.

#### 1.6 Statistical method

Take the X2 test.  $P < 0.05$  is the difference and has statistical significance.

## 2 RESULTS

### 2.1 Comparison of the two groups

The treatment group is 100%, and the control group is 91%; there was a statistically significant difference ( $P < 0.05$ ) as shown in table 2.

Table 2. Comparison n = 100 (%).

Group	Heal	Effectively	Invalid	Total efficiency
Treatment group	94 (94%)	6 (6%)	0 (0%)	100 (100%)
Control group	81 (81%)	10 (10%)	9 (9%)	91 (91%)

Compared with the control group  $P < 0.05$ .

### 2.2 Comparison

Group 2 could be compared with postoperative vaginal bleeding and discharge time as shown in table 3.

Table 3. Comparison (n = 100, X ± s).

Groups	Vaginal bleeding (ml)	Vaginal discharge time (d)
Treatment group	16 ± 5*	7.2 ± 1.9*
Control group	31 ± 5	11.3 ± 2.1

Compared with the control group \* $P < 0.05$ .

## 3 DISCUSSION

A pathological type of cervical erosion is chronic cervicitis, especially severe cervical erosion; it is associated with increased vaginal discharge, lower abdominal pain, contact bleeding during intercourse, and so on. It disturbs women's physical and mental health. Its common pathologies are cervical injury such as childbirth, miscarriage, or cervical surgery[2] and infection caused by pathogen. When long-term inflammatory lesion material easily causes cancer, the proper treatment of cervical erosion is particularly important. Cervical erosion has physical, medical, and surgical methods of treatment[3]. But for moderate and severe cervical erosion, erosion of the deeper involvement of the cervical canal, the LEEP

(loop electrosurgical excision procedure) is preferred. It is done by using the principle of electro-surgical diathermy; high-frequency electromagnetic waves generated by a circle-shaped lesion occur in the cervical tissue resection, partial protein denaturation, and tissue of the cervix cells irreversible necrosis to stop bleeding and promote the organization reconstruction, and postoperative healing uncovered by the new squamous epithelium. Because of the use of colposcope, diseased tissue can be resected in its entirety, therefore significantly reducing missed diagnosis of cervical cancer. Although surgery time is short, accompanied by light pain, small trauma, and simple security operation, there is less blood during the operation and fast recovery. It is not injured cervical function and patients are easily accept, It is a more ideal treatment method[4,5]. However, it also leads to more vaginal discharge and fluid after operation, wound eschar shedding hemorrhage and produced infection after the operation in 7–10 days. The treatment group used Matrine gel and ciprofloxacin hydrochloride suppository after LEEP, so it overcomes the control group's shortcomings.

Matrine gel is a new type of gynecological vaginal gel; it was dominated by Matrine, adding appropriate hydrophilic gel matrix and antioxidants. Matrine can effectively inhibit sunzaoyun, and its antigen caused the mast cell to release transmitters such as histamine and leukotriene. It plays a good antibacterial and anti-inflammatory role, has a myogenic effect and convergence, protects the vaginal mucosa, and promotes the growth of epithelial cells[6,7]. It enhanced phagocyte in phagocytosis, promoted immune response, and increased the cell numbers that are in line in the peripheral vascular, promoting inflammation injury of mucosal repair and renewal; it can directly inhibit and destroy cancer cells and help prevent against cervical cancer. It has strong adhesion to the mucosa. After putted cervical surface, it is easily absorbed in deep mucosal folds, does not drain, and produces sustained efficacy. It does not depress the normal flora of the vagina and does not inhibit the spontaneous vaginal immune function.

Ciprofloxacin hydrochloride suppository is a kind of bactericidal antibiotic used in the vagina. It is composed by ciprofloxacin hydrochloride and a water-soluble matrix. Ciprofloxacin directly affects the production of the A subunit of bacterial DNA gyrase and inhibits synthesis and replication of DNA[8], so it results in bacteria dying. Therefore, it may have powerful antibacterial and antibacterial

activity, especially in Gram-positive and gram-negative bacteria such as Staphylococcus, streptococcus, and Escherichia coli. So the drug that is placed in the vagina has good permeability. The concentration of drug is higher in the cervix than in the serum. It has quick absorption in local, fast, and curative effects, and it avoids adverse reactions in an oral way to the gastrointestinal system and central nervous system.

LEEP combined with Matrine gel and ciprofloxacin hydrochloride suppository in the treatment of severe cervical erosion is efficacious, with a fewer side effects and short course of treatment. It is a safe and effective treatment for severe cervical erosion methods and is worthy of clinical application.

# Design and implementation of seafood cold-chain logistics monitoring system

Hong Ri Liu, Min Wang, Yong Xian Liang & Ya Jun Yu

RongCheng Campus, Harbin University Of Science And Technology, WeiHai, China

**ABSTRACT:** This system aims at fulfilling the needs of the real-time monitoring in seafood transportation and utilizes the wireless network that tends to deploy and is low-cost, low-power consumption to design an effective system to monitor the entire process of seafood cold-chain logistics transportation. This system realized the ultralow-power end node that can measure the temperature and humidity and then send the information with a wireless to the wireless gateway, which utilized BDS (BeiDou Navigation Satellite System), acceleration transducer, GPRS, and other modules to realize the functions that are monitoring the status of the vehicle and transmitting the information about the vehicle and the freights. This system also exploited server application with the GIS technology to display the information of the running vehicle in the map.

**KEYWORDS:** real-time monitoring; cold-chain logistics transportation; GIS.

## 1 INTRODUCTION

Rongcheng, China's fisheries big city, is known as the Chinese fishing village that has formed the ocean, near the ocean fishing, mariculture, and deep processing of a combination of modern fishing patterns. The seafood is transported to various places of China every day. With seafood as a special production, freshness is one of the most important goals that consumers pursue. It needs a rigorous temperature control from processing to eating, especially live or frozen is mostly used modes. Taking ice-cold seafood cold-chain transportation as an example, it should make sure that the food is transported in proper low-temperature circumstances, avoiding the food soaked in ice water for a long time. Currently, cold-chain logistics company usually place a temperature recorder in the cab. The owner of the cargo only checks up the recorder to confirm whether the temperature is in the range of demanding temperature in the end. Although this method can make sure that the abnormal which will be a large lost for corporation can be found after happened, it cannot support the early warning to avoid the occurrence. According to the issues of cold-chain transport, this article presents a monitoring system to support early warning to the driver, administrator, and owner of the cargo. GPRS network, WSN and GIS technology were used to realize the system.

## 2 GETTING STARTED

### 2.1 Architecture of the system

The entire system consists of end nodes, wireless gateway, and server application. The structure drawing is shown in Fig. 1.

The end nodes with the utilization of measuring the temperature and humidity of the cab were installed in the cab of refrigerated truck, and the wireless gateway that gets the information from end nodes by wireless together with the status of the refrigerated truck was sent to server application by GPRS network; then, the application server analyzed the trucks' status, including humidity, acceleration and location, speed, and so

Figure 1. Structure drawing.

on; and finally, the data were stored in the database. The user can login the application to see the motion status about the refrigerated truck in a real-time manner. With regard to the abnormality of the truck, the user can send a message to the wireless gateway, which can display the information in the LCD monitor in front of the driver.

## 2.2 Hardware scheme of end node

The main function of the end node is to gauge the humidity and transmit the data to the wireless gateway by a ZigBee module. Because of the limitation that we cannot drill in the cab and change the circuit in the cab, the end node's power supply is button cell with 3.3V. So, TI's ultralow power 16bit MSP430F149 was selected as the MCU with low supply-voltage rang, which is from 1.8V to 3.6V and when clock pulse rate is 1MHz, operating current is from 0.1 $\mu$ A to 400 $\mu$ A, and during Standby Mode, the operating current is 1.6 $\mu$ A. All in all, MSP430F149 can satisfy the demands of power consumption with a long time. We choose SENSIRION's SHT75 as the humidity sensor, which is a single-chip relative humidity and temperature multi-sensor module comprising a calibrated digital output. Application of industrial CMOS processes with patented micro-machining ensures highest reliability and excellent long-term stability. The humidity measurement range of SHT75 is 0–100%RH with an accuracy of  $\pm 1.8\%$ RH and temperature measurement range is  $-40$ – $+123.8^\circ\text{C}$  with an accuracy of  $\pm 0.3^\circ\text{C}$ . The data transmitting module is ZigBee module with TI's CC2530 SoC in which ZigBee protocol stack is successfully implemented. The architecture of the end node is shown in Fig 2. Especially, the length of some refrigerated trucks is longer than 6 meters under some condition in which two or even more end nodes are necessary. The end nodes gauge the humidity and the remnant of the button cell every 10 minutes and then send the data to the wireless gateway by polling. The end nodes also write the data in local SD

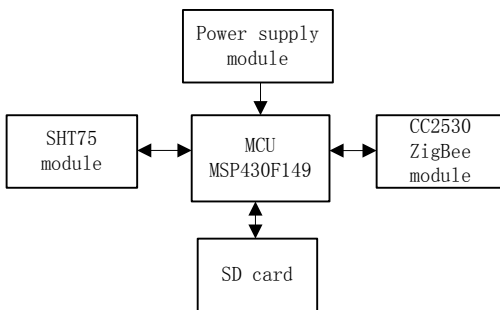

Figure 2. Architecture of end node.

card for data safety. The system enters into sleep mode after the measurement for a long-term stable working.

## 2.3 Design of gateway

Except regarding the temperature and humidity, the manager of the logistics corporation is concerned with the position and the basic status such as velocity and acceleration of the refrigerated truck. Hence, the wireless gateway not only receives data from the end nodes but also measures the status of the truck and then transmits this information to server application by GPRS network. In the meanwhile, it receives the information such as real-time road condition and other information from the server application and displays the humidity of the cab and remaining battery capacity in the LCD monitor. It is necessary for the driver to notice that the remaining batter capacity is lower than 20%. About the localization of the truck, UM220-III N, a BDS/GPS dual-system module is one of the best selections. Both localization and time service are supported precisely. We utilize MPU6050, which has an embedded 3-axis MEMS gyroscope, a 3-axis MEMS accelerometer to calculate the status of the truck. All of the earlier data are transmitted to a network port of a fixed IP address assigned to a server. The wireless gateway consists of Cortex-A9 platform using transplanted Linux OS, GPS module, GPRS module, and ZigBee module. Under the OS, we developed driver programming to utilize these functions. The programming flow chart is shown as Fig. 3.

## 2.4 Design of server application

The server application consists of two parts: One is service process, and the other is web application. The service process that starts together with OS is developed in C# programming language in Visual Studio 2012. Considering that the number of the trucks is too large to process the data by one thread, we utilize multithread technique. The main thread listens to the network and receives the data from a fixed network port. The child thread inserts the data processed by the main thread into the database. The web application makes use of GIS technology such as Baidu LBS open platform to realize the function that the trucks' information such as velocity, acceleration, and location can be real-time displayed in Baidu map. The Baidu LBS open platform supplies a large number of API libraries to develop application in the Baidu map freely. The functions that the web application supplies are as follows:

- Refresh the running trucks' status in a real-time manner.
- Support the query of trucks' history data, including the humidity of the cab and the status of the truck.

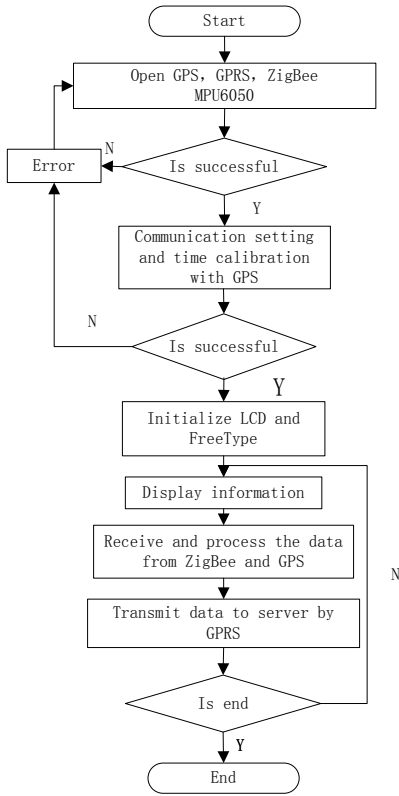

Figure 3. Programming flow chart.

- Instruct the driver by SMS messages such as road condition, weather forecast, and so on.
- Record the traffic violation in the database to evaluate the driver.

### 3 FIELD TEST

Field testing was implemented in April 2014. A refrigerated truck whose maximum load was 4 tons was tested with double-end nodes. Experiments show that in four hours of continuous testing, power consumption is less than 1%, using ZigBee to transmit and receive data; the accuracy rate reached above 98.9% and using web application to receive data, the accuracy rate reached above 99.6%. We can draw a conclusion that the system can meet the need of cold-chain logistics.

### 4 CONCLUSION AND FUTURE WORK

The result shows that this system can gauge the humidity and the status of the refrigerated truck and then display them in the map with GIS technology in a real-time manner. As a result, the administrator can manage the history data of the trucks easily. In the future, taking into account that a large number of refrigerated trucks install this system, we can get data from this system to collect the fuel consumption and depreciation in order to work out even better routes and driving skills with the data mining algorithm.

# Effect of family control on company's investment-cash flow sensitivity: Evidence from China's listed companies

Zhi Jian Zeng & Jia Li Li

*College of Business Management, Hunan University, Changsha, Hunan, China*

**ABSTRACT:** Based on the sample of Chinese A-share listed companies for the time period 2010 to 2012, this article empirically investigates the influence of the family control on company investment-cash flow sensitivity. The empirical result is shown as follows: Compared with companies that are not family controlled, investment is more sensitive to cash flow in family-controlled companies; the characteristics of family control rights, such as its model selection, the way of realization, and management participation degree affect a family-controlled listed company's investment-cash flow sensitivity at different levels.

**KEYWORDS:** Family control; investment-cash flow sensitivity; the characteristics of family control rights.

## 1 INTRODUCTION

Investment-cash flow sensitivity refers to the sensitive degree of investment spending on its internal cash flow. Regardless of under-investment resulting from financing constraint (the financing constraints hypothesis under the theory of asymmetric information) or over-investment caused by free cash flow (free cash flow hypothesis under the principal-agent model), both contributes to rising the sensitive degree that one company's investment spending is on its cash flow; thus, many scholars such as Fazzari et al (1988) or Firth et al (2012) consider that the higher one company's investment-cash flow sensitivity is, the lower its capital investment efficiency is.

The research on family-controlled enterprises is also high profile. Pindado et al (2011) find that family control can reduce the tendency of over-investment and under-investment in the Europe area, and then depress company's investment-cash flow sensitivity, but Hung and kuo (2011) reach the opposite conclusion using data from Taiwan area, that family-controlled companies have higher investment-cash flow sensitivity.

With the gradual opening of Chinese capital market and introduction of various policies that government supports the development of private economy, family-controlled enterprises, as the representative of private economy, have exceeded the state-owned economy in share of GDP, the number of quoted firms, and so on, and they have become an indispensable component of Chinese market economy. The effect of family control on a company's investment-cash flow sensitivity is urgently researched.

## 2 THEORY AND HYPOTHESES

It is generally considered that the holding family controls the equity of enterprises and takes part in company management to do good for restraining behavior of a listed company's management such as maximizing personal profit and then bringing down the agency cost between traditional shareholders and management. However, similar to other big controlling shareholders, shareholders of family-controlled enterprises have the motivation of sacrificing minority shareholder benefits at the cost of obtaining private interests of controlling rights. Especially, under the situation of our present law is lack of sufficient protection of small shareholders' profit; controlling families universally adopt Pyramid or cross-shareholding governance mode to control enterprises, which enlarges their motivation and probability of seizing the property of listing corporation, namely family control cannot alleviate problems of investment-cash flow sensitivity resulting from agency conflicts.

Family control can also influence the asymmetric degree between company and external capital market. Financial resources are always preferentially allocated to the central enterprises and big local state-owned enterprises in China, whereas family-controlled listed firms suffer more institutional discrimination in debt financing and equity financing of these two aspects. Facing financing restraints, compared with a non-family controlled listed corporation, a family-controlled listed corporation will present higher investment-cash flow sensitivity. Based on this analysis, we predict that:

Hypothesis 1: Compared with a non-family controlled listed corporation, investment-cash flow sensitivity of a family-controlled corporation is higher.

The effect that family control has on investment-cash flow sensitivity may have some difference, as the characters of family controlling rights are diverse. This article takes the impact of the following three important control characters into consideration:

First, the influence of character of the way of obtaining family controlling rights. In direct listed enterprises (IPO corporations), most of the founding families are still effectively operating and managing business of their company, and considering the investment risk cannot be dispersed and the willing nature of inter-generational inheritance, its inclination of inefficient investment is far less important than buying a shell company. In summary, we predict that:

Hypothesis 2: Compared with indirect listed family-controlled enterprises, the investment-cash flow sensitivity of family controlled enterprises listed by direct ways is lower.

Second, the influence of character of the mode that family control rights realize. Pyramidal holding and cross-holding these two realizing approaches, their mixed mode may result in the dispersion of control rights and cash flow rights, which will spur the majority shareholders to have the impulsion of seizing minority shareholders benefits; what is more, the higher dispersion of cash flow rights and control rights is, the more power they would have to abuse free cash flow of the company to over-invest. In summary, this article proposes that:

Hypothesis 3: In general, the effect of dispersion between family control rights and cash-flow rights on investment-cash flow sensitivity is positive.

Last, the influence of controlling the family taking part in the listed company's management. Under the situation that listed company in Chinese is lack of efficient internal and external supervision at the present stage, controlling-family strengthen their control of the company by participating the management directly to enhance their motivation and ability of stealing private profit from controlling rights. It is likely that the controlling family makes financial decisions that "maximize family profit" rather than "maximize the value of enterprise." Therefore, we predict that:

Hypothesis 4: The involvement of the controlling family in the listed company's management has a positive effect on its investment-cash flow sensitivity.

### 3 RESEARCH DESIGN

#### 3.1 Data sources and sample

This article is based on the sample of Chinese A-share listed companies for the time period 2010 to 2012. According to the need of this research, we select the basic samples that eliminate the following

companies: financial or insurance firms; the financial distress companies; companies that have abnormal or default-related data; and so on. After dealing with the final data, we get the yearly observed data of 3429 companies. Referencing to the former research, the definition of a family-controlled listed company in this article is standard for the following: The ultimate controller can date back to a natural person or a family who must be attributed to the blood or marriage relationship and must be the largest shareholder of the controlled listed company. In this research, the related data come from the CSMAR database, annual reports of Chinese-listed companies and their prospectus.

#### 3.2 Proxies for investment-cash flow sensitivity

We proxy for cash flow sensitivity of investment (CFSI) using the measure proposed by Hovakimian and Hovakimian (2005), Lee (2012), specific as follows:

$$CFSI = \sum_{t=1}^n \left( \frac{(CF/K)_{i,t}}{\sum_{t=1}^n (CF/K)_{i,t}} \times (I/K)_{i,t} \right) - \frac{1}{n} \sum_{t=1}^n (I/K)_{i,t}$$

where  $I_{i,t}$  is the investment spending, which means the capital payment of firm  $i$  on the construction of fixed assets, intangible assets, and other long-term assets in the year of  $t$ ;  $CF_{i,t}$  is the cash flow, and it is equal to net income plus depreciation and amortization of intangible assets and other assets and income tax minus financial expenses;  $K_{i,t}$  means total assets at the start of the year; and  $N$  means number for sample companies. In order to avoid the extreme values, when the  $CF_{i,t}$  is negative, the negative value is set to 0. Combining the domestic reality and the validity and availability of the data, this study uses a successive four years of time window to measure the index of CFSI (set  $n$  equals 4). For example, the company's CFSI value in 2010 is treated with continuous financial data from 2007 to 2010.

#### 3.3 Empirical models

We apply the following model to test the effect of family control on the company's investment-cash flow sensitivity:

$$CFSI = \alpha_0 + \alpha_1 Family + \sum_{i=1}^4 \lambda_i Control_i + \varepsilon \quad (1)$$

$$CFSI = \beta_0 + \beta_1 FFC + \beta_2 Div + \beta_3 MG + \sum_{i=1}^4 \gamma_i Control_i + \varepsilon \quad (2)$$

Detailed explanation follows next: Model (1) is used to test the influence of family control on corporate investment-cash flow sensitivity with the whole sample and it can be presented as coefficient of Family ( $\alpha_1$ ), when the listed company is family-controlled firms. Family is 1; otherwise, it is 0; Model (2) is used to examine the influence of different family-controlled listed companies on the investment-cash flow sensitivity, which is mainly reflected by the coefficient  $\beta_1 \sim \beta_3$ , composed by FFC (a dummy valuable, when the listed company is controlled by family acquired through IPO, FFC is 1, otherwise it is 0), Div (equal to divide the family control rights by cash-flow rights, of which the measurement standard of the family control rights and cash flow right is referenced by La Porta et al), and the MG (a dummy valuable, when members of the family is a President, chairman of the board of directors, or general manager of the listed companies, the Manager is 1, otherwise 0). Control is present for the control variables, including divide Q (proxy for investment opportunities, which is equal to total liabilities plus share price multiplied by number of shares outstanding plus net assets per share multiplied by non-tradable shares by year-end total assets), Size (proxy for the company scale, the natural logarithms of the total assets in the end of the year), and Year (based on 2010 years, set two dummy variables: Year<sub>11</sub> and Year<sub>12</sub>).

## 4 EMPIRICAL RESULTS

### 4.1 Descriptive statistics and analysis

Table 1 is the descriptive statistics of variables. From it, we can find that the average of the corporate investment-cash flow sensitivity (CFSI) of all the samples is 0.038 and the standard deviation is 0.065; from the average of family-controlled Dummy variable (Family), we can know that 30% of the sample companies are family-controlled listed companies.

### 4.2 Regression results and analysis

In the regression analysis, the value of the inspection of the multicollinearity variance inflation factor (VIF) is far less than 10.0, which demonstrates that the models do not have multicollinearity.

The regression results of Model (1) are shown in table 2. Thus, the regression coefficient of the family is positive. The empirical results show that in terms of overall sample companies, family-controlled firms have a more serious sensitivity problem in investment-cash flow, which verifies Hypothesis 1.

The regression results of Model (2) are shown in table 3. First, the regression coefficient of FFC is positive, which is just opposite to hypothesis 2. This may

Table 1. Descriptive statistics of variables.

	Mean	Max	Min	SD
CFSI	0.038	0.564	-0.094	0.065
Family	0.300	1.000	0.000	0.459
Q	1.935	14.915	0.420	1.267
Size	21.996	27.203	18.833	1.153
FFC	0.391	1.000	0.000	0.488
Div	1.501	8.714	1.000	0.868
MG	0.719	1.000	0.000	0.450

Table 2. Impact of family control on company's investment-cash flow sensitivity.

Variable	Model (1)
Family	0.005(2.87***)
Q	0.005(7.88***)
Size	0.003(4.44***)
cons	-0.086(-4.76***)
Time effect	Controlled

Number	3429

\*Notes: \*, \*\*, and \*\*\* indicate significance at the 10%, 5%, and .1% levels, respectively.

Table 3. Regression results for family-controlled sub-sample.

Variable	Model(2)
FFC	0.007(2.29**)
Div	-0.003(-1.70*)
MG	0.004(1.32)
Q	0.004(3.73***)
Size	0.003(1.80*)
Cons	-0.07(-1.96**)
Time effect	Controlled
Adj-R <sup>2</sup>	0.539
Number	1038

\*Numbers in bracket is t statistic; \*, \*\*, and \*\*\* indicate significance at the 10%, 5%, and .1% levels, respectively.

be because the present family control listed companies through IPO in the Chinese market are mostly from the small and medium-sized board or GEM. Most of them are in the growth time of the enterprise life cycle, which enables them to more likely face financing constraints, leading to more sensitivity problems in investment-cash flow.

Second, the coefficients of division are significantly negative, which means empirical results are contrary to hypothesis 3. Reasons may come from the following two aspects: On the one hand, it is related

to the institutional defects of securities market; on the other hand, in recent years, with the impact of macro-economic environment such as the depression of the Chinese stock market, the depression of Europe, and the U.S. economy, the tendency of family control people to use the pyramid structure support-listed companies is more significant.

Last, CFSI has a positive correlation with Management, but there is no significant positive correlation, which means the empirical results partly prove hypothesis 4. It may be because the final effects of the controlling family participating in the management of the company on the investment-cash flow sensitivity are also affected by other control right features.

## 5 CONCLUSIONS

Based on the sample of Chinese A-share listed companies for the time period 2010 to 2012, we conducted a detailed study of the influence of the family control on firm investment-cash flow sensitivity. We find that: family control exacerbates investment-cash flow sensitivity in China. And different features of family control right on corporate investment-cash flow sensitivity have different effects, such as family-controlled enterprises listed by direct ways have higher investment-cash flow sensitivity than indirect listed family-controlled enterprises; The effect of dispersion between family control rights and cash-flow rights on investment-cash flow sensitivity in family-controlled enterprises is negative. The active involvement of controlling family in a listed company's management has no significant positive effect on its investment-cash flow sensitivity. There are two reasons: On the one hand, the institutional defects of securities market, such as the listed enterprises in China, are facing the situation of our present law, which is lack of sufficient protection of minority shareholders' benefits; on the other hand, in recent years, with the impact of macro-economic environment such as the depression of China's stock market, the depression of Europe, the U.S. economy, and so on.

# Discussion on optimization in information and computing science curricular of local universities against the background of universities and colleges' transformation

Zong Yi Hou

*School of Mathematics and Statistics, Hechi University, Guangxi, Yizhou, P. R. China*

**ABSTRACT:** Against the background of universities and colleges' transformation, how should local universities establish a rational curriculum of Information and Computing Science? To cultivate the students to be practical personnel with excellent skills of practice and market competitiveness is the key in the subject establishment of universities and colleges. This article will discuss, taking local universities as examples, how to optimize a curricular system of Information and Computing Science.

## 1 INTRODUCTION

Information and Computing Science is a new major, mainly aiming at cultivating mathematical personnel with Information technology as their core in the development layout of the global economy. Owing to its late establishment, the major in local universities was vaguely positioned when run, with an irrational curricular system and an incomplete practical teaching section, which resulted in negative employment prospects of its graduates. Local universities are transformed into ones featuring practical skills or vocational education, particularly serving local economy and society. Advancement of the transformation of universities should be that of the subject as well. The optimization of curriculum should highlight practical characteristics in the curricular structure and setting. Based on these, the author will study the optimization of the curricular structure of Information and Computing Science, integrating the current situation of local universities.

## 2 CURRENT PROBLEMS IN INFORMATION AND COMPUTING SCIENCE IN LOCAL UNIVERSITIES

### 2.1 *Indefinite professional training goal and insufficient subject characteristics*

In setting up the school of Information and Computing Science, local universities mostly reinvent the wheel of others with a longer history, instead of laying out a training goal corresponding to local socioeconomic demand. As a result, the curricular settings are often very tanglesome without any essence or

characteristics of their own. The graduates are lacking in market competitiveness, and their job prospects are usually pretty limited.

### 2.2 *Curricular settings emphasize theory, paying little attention to practical teaching*

In the first place, local universities that have undergone top-up process, in short of qualified teachers and basic teaching conditions, even if they have sufficient knowledge of the subject, establish the school of Information and Computing Science on the basis of Mathematics and Applied Maths. Due to the lack of funding and input in professional laboratory, math courses predominate in curricular settings, so much so that the theory is divorced from practice, and professional teaching lags behind the development of computer and software technology. Second, the courses and textbook contents have not attached due importance to training the comprehensive abilities in practical activities. Those newly promoted top-up universities, for lack of qualified teachers with a majority of young teachers, set the curricular in a manner of repetitive operation. Consequently, the curricular settings are detached from reality, the students cannot catch up with social development, and the renewal of knowledge is dragged slow. They cannot adapt to the developing needs of the information society. Third, problems appear in the practical teaching aiming at training the abilities in practical activities, that is, in social practice, professional internship, and graduation project (thesis). In this aspect, each procedure separates from the other, the continuity and consistency of professional knowledge cannot be maintained, resulting in students' lack of senses of innovation and hindrance in cultivating standard professionals.

### 2.3 *Student's insufficient learning motivation, understanding, and concern about the major*

Overall, 80% of students in the newly promoted universities were transferred to their current majors in spite of their first choices. As a result, they are ignorant of their majors and their future plans, which leads to their insufficient learning motivation and psychology of utilitarianism. Meanwhile, as the popularization of higher education goes on, students in local colleges and universities have a weak foundation of knowledge, are inactive in studying, and study passively at the command of their teachers.

## 3 BUILDING A RATIONAL CURRICULAR SYSTEM FOR INFORMATION AND COMPUTING SCIENCE

To achieve breakthroughs in cultivating graduates of Information and Computing Science to be advanced in professional skills, innovation, and entrepreneurship, local colleges and universities are supposed to update the perceptions, reinforce the reform in teaching goals and curriculum setting, and intensify the construction of experimenting, practicing, and training bases.

### 3.1 *Adjust the professional training goal and highlight the subject characteristics*

In the professional training scheme of various universities, the foundation curricular and professional basic curricular are much the same, and differences lie in professional elective curricular courses of major orientation. Therefore, local universities should adjust the professional training goal and steer the cultivating direction, in accordance with local socioeconomic demands, consider the versatility of personnel cultivation, while simultaneously highlighting the characters and advantages of science majors. Local universities should pay close attention to the current employment situation and timely adjust the professional training goals, matching their personnel cultivation with the demands of social development.

Our university, promoted five years ago, has witnessed five years of graduation in Information and Computing Science, of which only four students chose to further their study; 90% of the graduates took up occupations related to information system's design and management, application software development, computer application, and information industry. Therefore, our cultivating goal is to educate practical personnel supplemented with a focus on information science by computing science, featuring on advanced skills in engineering practice and manual operations in the backdrop of information

industry. After ten years of exploration, we defined our cultivating pattern to be "2+1+1" pattern, which means the initial two years of public basic and major basic courses, the third of professional foundation course, and the last year of sending students to study in enterprises according to the current situation and market demands of the subject. Some professional courses can be arranged based on the working sports, and students can finish their graduation design under the guidance of school and enterprises in their engineering practice. Through reforms in subject construction, curriculum establishment, practice base foundation, and management system, students will be able to get access to systematic and complete opportunity of practice training with more time, which will consolidate their engineering consciousness, improve their capability of analyzing, and solving problems, as well as of innovation.

### 3.2 *Optimize curricular settings and highlight the cultivation of students' practical skills*

#### 3.2.1 *Reasonable arrangement of the class hour and contents of elementary courses and professional courses*

The information industry has entered a stage with application as its mainstream, which requires the students to possess not only basic professional ability but also the ability to extract and transform practical problems into computing-related ones and solve them. Consequently, math courses ought not to take insignificant portion in elementary courses, and the arrangement of curricular settings should be reasonable. Teachers must be concerned with instilling in students the mathematical thinking and training their logic, apart from the skills of working out certain problems. Based on this compacted theory, local universities should set up the professional courses according to specific training goal and realize the essential and concise structure. In the basic math course, teachers are supposed to select and adjust the teaching contents in line with students' genuine knowledge foundation, avoiding discouraging students' activeness and initiatives in studying by excessively profound contents. Rational setting of professional and basic courses in junior grades will be of great importance to cultivating recognition of their major and build up their professional skills.

#### 3.2.2 *Restructure the contents and modes of practical courses and train students' practical skills*

Universities can invest social forces into some courses. Teaching can go along with the characteristics of specific companies, putting practical teaching in place. Universities should strengthen the relationship with

companies, establishing the university–enterprise cooperative system. Schools can take the path of “Send for external assistance and go out”; let us say, schools can send for staffs of companies, who can bring in practical projects and work process into schools, to guide the students in practical operation. Universities can schedule suitable programs in third and fourth academic years so as to allow the students to dip deeper into specific projects in companies and experience enterprise culture ahead, consolidating a favorable foundation for the students to get engaged sooner in their future organizations.

### 3.3 *Intensify the reform on practical curriculum*

Training of practical skills is a significant process in building up students’ excellent disposition and proficiency. It is through it that the skills of analyzing and solving problems are cultivated, and the comprehensive qualities are developed. It is the urgent task for local universities to set up a practical curriculum that fits market needs and fosters students’ operational abilities.

#### 3.3.1 *Consolidate students’ sense of practice and teachers’ practice skills in teaching*

Improvements in students’ practice skills are achieved by practice teaching. We should intensify the education on their skills and professional consciousness, making them understand the importance of professional practice and training skill development. Simultaneously, the quality and practice skills in teaching of the teacher groups is an indispensable section in the process. We encourage to construct a bi-polar teaching group by a transformation, select professional teachers to study in enterprises and the industry, helping them get hold of the latest practice skills in information industry. Teachers should master the newest developing direction and information related to the major, achieve all-round cultivation toward their students and an improvement of their own qualities in the virtuous interaction between education and research.

#### 3.3.2 *Scheme of practical training should highlight the school-running characteristics*

With the diversified trend of the social demands in personnel of Information and Computing Science, universities should reinforce the reform in practice courses. We should highlight the substances of computing and application software, organically integrate computing courses with control courses, pay close attention to the employment situation in society, promptly adjust teaching plans, match cultivation of

personnel with social demands, and make cultivation on practice skills the priority in practice teaching plans.

## 4 SUMMARY

Information and Computing Science is a competitive and wide-caliber major with brilliant prospects. With the social and technological development, local colleges and universities will have to explore continuously in their school running how they could successfully run on the Information and Computing Science faculty with distinctive characteristics. Curriculum setting is an important part of transformation and development of colleges and universities, whose scientificity will influence the effects of studying, the situation of employment, and the future enrollment of this major. Henceforth, the analysis and reform of the curriculum system in local colleges and universities is a constant and continuous process, a project worth perpetual discussion and profound study.

## ACKNOWLEDGMENT

*Shenyang City Water Company, China*

**ABSTRACT:** To gain profit of cloud services is an emergency process growing along with the population and exposure; it involves users' ability to select appropriate services in these emergency situations, and it can be tackled through communication mechanisms of annotation for cloud services and resources over cloud service layers. Cloud services are on demand over the network as a service style of cloud computing. How can we meet users' access to a shared pool of resources? So this work focuses on proposing a method for annotation and searching the services over an open cloud computing source environment, that is constituting group communication entities using an open source platform. To access the services more intelligently, therefore we should explore the availability of machine readable and web service semantics expressed by ontology. This article presents an ontology annotation and methodology-based cloud service layers, demonstrated by using ontology-based cloud architecture, which will assist the implementation of services discovered and accessed intelligently using semantic web queries; administrative burden of the cloud is considerably reduced, and the final algorithm implementation is based on ontology.

**KEYWORDS:** Cloud ontology; Cloud computing; Cloud services; Semantic web; Grid.

## 1 INTRODUCTION

Cloud computing is based on a few of concepts in several research fields, such as service-oriented architectures (SOA), distributed and grid computing. The cloud computing is potentially one of the breakthrough advances in computing<sup>[1,2]</sup>. The cloud infrastructure services is based on hardware and software resources to virtualized cloud hosted services, that is, a web service that provides resizable compute capacity in the cloud. It is designed to make web-scale computing easier for developers. The simple web service interface allows you to obtain and configure minimal capacity; thus, it provides you with complete control of your computing resources and lets you run on a cloud computing environment. It reduces the time required to obtain and boot new server instances to minutes, allowing you to quickly scale capacity, both up and computing requirements change. Cloud computing changes the economics of computing, which allows you to pay only for the capacity that you use. It provides developers the tools to build failure resilient applications and isolate themselves from common failure scenarios. This presents a true virtual computing environment, allowing you to use web service interfaces to launch instances with a variety of systems, load them with your custom application

environment, manage your network's access permissions, and run your image using as many or few systems as you desire<sup>[3]</sup>.

Cloud computing services can be abstracted into three layers: Software as a Service (SaaS), Platform as a Service (PaaS), and Infrastructure as a Service (IaaS)<sup>[4]</sup>. The virtualized resources are provided as a service over the cloud layers through web portals. Cloud services identification and discovery are due to different service descriptions and features of cloud services. Consumers of cloud computing move their programs and data to clouds consisting of computation and storage utilities provided by publish cloud services through web portals. Till date, there is no discovery mechanism for searching different kinds of cloud services<sup>[5]</sup>. The point of the cloud service discovery is the selection process on the cloud layers based on a finite set of functional and nonfunctional configuration by multiple providers. The providers include Amazon Web Services, Microsoft Azure, Rackspace, GoGrid, and others. The users options will be deployed for the application over pool of virtually infinite services with practically and modest operating costs proportional to actual use. Service description models and discovery mechanisms for cloud resource/services selection are important and could be used in an emergency<sup>[6]</sup>. To solve the problems, the

methodology of ontology annotation for description services/resources is proposed as a novel method of a Grid resource description represented relation among resources semantically<sup>[7,8]</sup>.

The rest of this article is organized as follows. Section 2 contain the research related to ontology on cloud. Section 3 explains the service environment layer. Section 4 introduces the cloud ontology to the web implementation base on cloud ontology and services selection on ontology. Section 5 deals with Web implementation by an ontology developed framework of cloud computing. Section 6 is the conclusion and future work is mentioned along with last references.

## 2 MOTIVATION

The growing up of cloud computing application derives from its basics of other computing fields and engineering concepts. The inception of cloud computing technology is Grid Computing, Cluster, SOA, P2P, and virtualization.

An ontology of cloud computing will allow a better understanding of the inter-relations between the different cloud component and make the current systems based on cloud computing extensibility, flexibility, availability, optimization, and better cost efficiency<sup>[4]</sup>. It is a technological challenge for dealing with engineers and researchers of the cloud computing system, to postulate an understanding of the components of the cloud computing. To date, the experiment of cloud ontology for cloud computing layers, services, and resources is limited to concept. The target applications of annotation on cloud entities effectively are our goal.

## 3 SERVICE ENVIRONMENT LAYER

The Services Layer is one of the horizontal layers in the Web application environment that provides the business functionality supported in the SOA, where you have a number of options at each layer that you can implement. Logically, the layers in a Web environment are client layer, network layer, TCP server layer, Web application server layer, and host server layer.

Green data center efficiency, large-scale distributed storage, and computing that can support different Internet applications are the most basic core technology to create the next-generation Internet service platform.

Cloud OS is a smart cloud operating system fusion cloud storage, cloud computing services, and cloud operating system as a whole.

Open platform is responsible for the management physical resources of data center Linux cluster, distributed control program running, hide fault recovery the underlying, data redundancy, and other details.

The cloud application layer, the most important and utilized layer of cloud computing, is the most visible layer to the end users of the cloud.

Building a unified application framework for the integration of cloud, terminal resources, and services helps developers to easily access Internet services, and it enables cloud application to have the same fluency and local application of user experience. It provides computational, storage, and scheduling aspects of the underlying support for the open service layer.

The virtual machine design instruction set for communication equipment provides a Java running environment and supports LEX byte code format.

The cloud space is cloud storage and management service for the personal data cloud OS terminal user.

Cloud of Internet infrastructure services, including maps, search, email, cloud space, account, payment, weather, translation, and so on, are the basis of cloud services; the cloud website should provide uniform access to the service entrance.

The cloud market is a new service model of cloud and partners launched, the application and service partners to build an open platform, and providing a one-stop service for the vast number of users more abundantly.

## 4 CLOUD ONTOLOGY

Ontology as a way of representation and reasoning about artificial intelligence knowledge, and it is a formal explicit specification of a shared conceptualization; through it, data semantics can describe meta-information. The communication among human and computer agents can be achieved with a shared understanding of the domain by ontology, which can be applied to information retrieval to deal with the relationship between clouds and concepts divided into three different levels. It is the key work representing the relations among cloud services for facilitating the cloud reasoning on relations among cloud service concepts. It aims at defining a robust interaction model between the different cloud service entities over the cloud computing system, at the functional and semantic levels, that facilitate the inter-dependency between the different cloud systems, as composable services, for collaboration of different services and it enhances analysis techniques that can result in better service levels of different cloud systems<sup>[4]</sup>.

### *A. Ontology Web Language*

The Web Ontology Language (Web Ontology Language, OWL) is a component of the semantic web activity. Application of OWL is designed to handle information content rather than just presenting information.

### B. Cloud Ontology Framework

The objective of this article is to provide ontology-based service layers over the cloud that support the intelligent system in handling service and application in cloud computing. The aim of this objective, a service-layer architecture, is shown in Fig. 1 (Service-layered architecture on cloud ontology).

### C. Web Implementation Based on Cloud Ontology

#### a. Elastic Computing Services

Elastic computing services (ECS) can help the user simplify the development process, reduce operation and maintenance costs, be involved in construction of on-demand scalability site architecture, which is more adapt to rapidly changing characteristics of Internet applications.

#### b. Open Storage Service

Open storage service (OSS) is the cloud that provides massive safety, low cost, and high reliable cloud storage service.

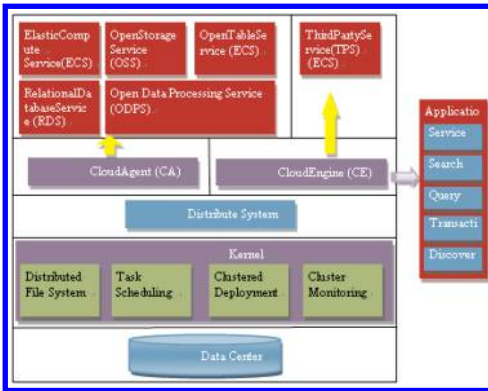

Figure 1. Service-layered architecture on cloud ontology.

#### c. Open Structured Data Service

Open data services (OTS) build massive structured and semi-structured data storage and real-time access service above the kernel.

#### d. Relational Database Service

Relational database service (RDS) provides instant access, elastic, available, and reliable database service; it helps users based on traditional relational database applications to the cloud.

#### e. Open Data Processing Service

Open Data Processing Service (ODPS) is a platform for large-scale distributed data processing services, which in the form of API support the declarative query language of data processing based on SQL, and it provides a parallel computing framework MapReduce.

#### f. Cloud Service Engine

Cloud service engine (CSE) is a set of computing services based on flexible Web application

hosting environment; it can greatly simplify the complexity of the development and deployment of applications.

#### g. Inference of Similar Resource by Ontology

We propose a framework and method cloud service discovery based on ontology, a technique of resource virtualization using merged and sorted ontologies. Figure 2 mainly consists of the following parts:

- The Web interface.
- Preprocessing module.
- Ontology storage.
- Registration center.
- Matching module.
- Sorting module.

## 5 ALGORITHM IMPLEMENTATION

### 5.1 To show the proof of the algorithm

#### A. Selected Service Corresponding Parameters

- 1 According to their own needs, users select service corresponding parameters through the user interface, namely the user first submits to the system the service request. Such the user can submit as CPU models, the frequency of the size, hard disk size, memory size, operating system type and so on each request.

#### B. Pretreatment Module by Users

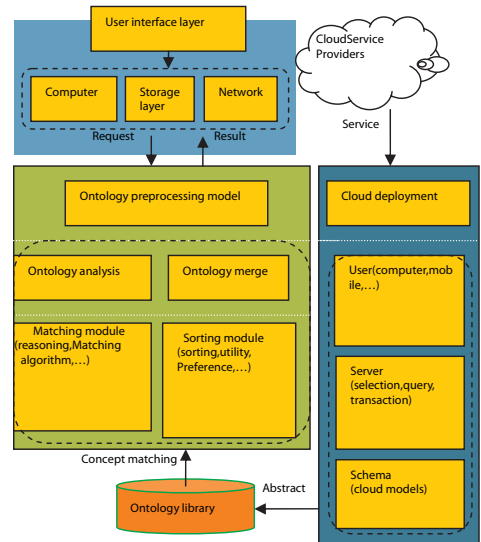

Figure 2. Cloud service discovery framework based on Ontology.

- 2 The system will send requests submitted by users to the pretreatment module to preprocess request, will convert the user's request into an appropriate form; when the matching module does recognition and processing, the user requests are converted into a vector of the form, such as: R (AMDCPU, 4G, HDD, 500G,..., Win7). After going through the preprocessing module, a user request vector will be sent to the matching module for service.
- C. *Matching Module Fetch Cloud Services*
- 3 The matching module fetches cloud services from the registration center. If cloud service providers are in accordance with the unified service description by which they have already published their services to the registration center, cloud services to vector S (CPU, Frequency, Storage, Devices, Capacity,..., OS) are stored in the registry, matching modules of the system for cloud services and users from the registry request are matched one by one. In this article, type CPU, hard disk, memory, OS, and component vector of the user request vector R and cloud service vector S are called "concept vector," and the frequency, size, and capacity are called the "property of concept."
- D. *Compare Concept Attribute of Request Vector*
- 4 First, compare the concept attribute of request vector R and cloud service vector S. For example, for the request vector R and CPU concept of cloud service vector S, first match its frequency meeting the user request. If the match is successful, goto (5) compared the concept attribute. If the property does not match and does not meet the threshold of TP users, a comparison of concepts and attributes vector R and the other S is no longer, then to (3).
    - a. *Proceed Matching the Attribute of the Concept.*
  - 5 If you succeeding in concept attribute matching, then proceed with matching the attribute of the concept. For example, the frequency of CPU of concept matching coming through, make use of the matching method for matching of the concept of CPU. If the match is not successful, to (3), to match other cloud services. If the match is successful, to (4), match vector of other concepts and attributes until all the concepts and attributes of a service vector S are matched successfully.
    - b. *Service Sorting.*
  - 6 If the matching of all the vectors of S and all the user requests is successful, the service will be sent to the sorting module for sorting. Check all services of last registration center as to whether all matching is complete. If the match is finished, go to the end of cloud services to find, or go to (3), to match other cloud services and continue.
    - c. *Selection by the Service Utility or User Preferences.*
- 7 Sorting module according to sortord of user selection, according to the service utility or user preferences for service ranking, after format conversion and processing, return to the user through the Web interface.
- ## 5.2 Design of the cloud ontology
- A. *Scope of Application and Objective*
- 1 To determine the reasonable scope of application and objective, according to the ontology application domain, domain ontology is constructed correspondingly; if the application scope of ontology is more, the domain ontology is to create greater, and the ontology is likely to be not perfect. Therefore, to restrict the research scope, prevent the body of ontology from being too large, control and operation is not reasonable. Cloud service is found to be related to cloud services as a service mode. We should create a cloud ontology in order to find the cloud service; is not only a simple keyword matching, but the reference semantic information of cloud ontology is added, so that the computer can understand the meaning of the concept of human expression and find out how to meet the needs of the user service.
- B. *Understanding in the Application of Ontology*
- 2 To create a perfect ontology, we should have a complete understanding of the application of ontology. In the query and search based on the domain of service knowledge, we need to seriously study the main function of cloud service and define significance and the relationship between the terms in the cloud ontology.
- ## 6 CONCLUSION AND FUTURE WORK
- In this article, we have proposed ontology for cloud service layers, including compute, storage, and network. Simultaneously, we have designed a cloud service discovery framework based on ontology, which enhances performance of the cloud service discovery and retrieves information about cloud resources. To achieve this aim, Cloud service discovery on cloud ontology is realized, while supporting the algorithm of automated, under-controlled conditions, and composition of both information gathered and cloud services is altered. In future work, we will promote the use of semantically well-founded reasoning about services. Then, we are expected to conduct an experiment in the cloud computing environment.

# Design and simulation of electric vehicle cruise control system based on MATLAB

Wen Juan Zhang

*Institute of Information, Beijing Union University, Beijing*

Wen Liang Niu

*College of Applied Science and Technology, Beijing Union University, Beijing*

Xue Wang & Tong Jin

*Institute of Information, Beijing Union University, Beijing*

**ABSTRACT:** The design and simulation of electric automobile cruise control system based on MATLAB is presented in this article. The longitudinal dynamics model of BAIC electric vehicle C30 is proposed in this article, and it will be used as a fuzzy PID controller object on SIMULINK of MATLAB. The BAIC electric vehicle C30 cruise control system is implemented using a parameter self-turning fuzzy PID controller based on MATLAB, and simulation results show its superiority at the end of this article.

**KEYWORDS:** BAIC C30, Dynamics model, Cruise control system, Fuzzy PID, MATLAB.

With the development of the industry, people have higher requirements for automobile driving in aspects of safety, comfort, intelligence, and environmental protection. Automobile cruise control system reduces the driver fatigue and improves driving safety while increasing driving comfort. Cruise control system abbreviated to CCS is also known as the constant speed cruise drive device, speed control system, automatic driving system, and so on. The principle of automobile cruise control system (Yueming. 2011) is after pressing the “on” switch of cruise control system, the driver does not step on the accelerator pedal, and the car will be automatically maintain its cruise speed.

Cruise control system is also designed to save fuel or electric energy. In the low-energy consumption and low emissions of new energy automobile field, pure electric cars have a characteristic of zero emission, and they do not use oil fuel (Zhenjun. 2013). This kind of vehicle has good prospects for development. Then ,the longitudinal dynamics model of BAIC pure electrics C30 will be used as the PID controller object in the cruise control system.

## 1 INTRODUCTION OF PID

PID control algorithm a classical control algorithm in the industry and it has a wide application in the process control system because of the advantages

of simple principle and convenient operation. As a controller, it only needs a simple calculation of proportion, integral, and differential of system error and its rate of change in order to achieve the object of fast, stable, and accurate control. The equation of PID controller is

$$u(t) = k_p \left[ e(t) + \frac{1}{T_i} \int_0^t e(t) dt + T_d \frac{de(t)}{dt} \right] \quad (1)$$

$k_p$  is coefficient of proportionality,  $T_i$  is integral time constant, and  $T_d$  is differential time constant.

The characteristics of three kinds of control of PID controller, which are proportional control, integral control, and differential control, will be discussed in the next three chapters (Kefei. 2012).

### 1.1 Characteristic of proportional control

The proportional controller will immediately have an effect on the controlled object and enable it to be controlled to the direction of reducing the error when the control system runs. And the strong or weak degree of control effect depends on the big or small size of the proportional coefficient  $k_p$ . It can reduce the error with increasing the size of the proportional coefficient  $k_p$ . But if the  $k_p$  is set too large, it will lead to an increase in the system overshoot and destroy the dynamics balance of the system.

### 1.2 Characteristic of integral control

The integral controller is capable of storing and integrating the system error and is propitious to eliminate the static error of the system. But it has a strong delay characteristic and if the integral effect is too strong, it will lead to lower control precision of the controlled object and make the system become unstable under closed loop control.

### 1.3 Characteristic of differential control

The differential controller differentiates the system error. The differential controller could increase differential effect to accelerate the system reaction speed and make the overshoot reduce gradually with predicting the system error trend.

Currently, the conventional PID controller is widely used in industrial process control, and it achieves a good control effect. But the conventional PID regulator does not have the online tuning parameters function, therefore it cannot meet the requirements of system parameter self-tuning in different working conditions, leading to affecting the further enhancement of the control effect.

Fuzzy controller has the advantages of no requirement of accurate mathematical model, the weaker dependence on the object model, and good robust performance. It is very suitable for control systems of nonlinear, large delay and time varying. Given the characteristics of PID control algorithm and fuzzy control algorithm, electric automobile cruise control system in this article is composed of a parameter self-tuning fuzzy PID controller based on MATLAB.

## 2 FUZZY PID CONTROLLER

### 2.1 Fuzzy PID control algorithm

Fuzzy PID controller is based on traditional PID controller, and its control process is complicated. First, it uses fuzzy sets to represent control rules' conditions and operation; then, it stores the knowledge of fuzzy control rules and related information (such as the initial PID parameters) in a computer knowledge base. Finally, the computer automatically adjusts optimal PID parameters using fuzzy inference according to the actual response of the control system.

In the automobile cruise control system, the cruise control system consists of a classic PID and a two-dimensional controller. The frame of the vehicle cruise control system with a fuzzy PID controller (Min et al. 2005) is shown in Figure 1.

The two-dimensional fuzzy controller considers the error  $e(t)$  and the error rate  $ec(t)$  as input signals and  $\Delta k_p$ ,  $\Delta k_i$ , and  $\Delta k_d$  as output signals. We can get the fuzzy PID final adjustment parameters by correcting the PID parameters online; here is the calculation formula:

$$\begin{aligned} k_p &= k'_p + \Delta k_p; \\ k_i &= k'_i + \Delta k_i; \\ k_d &= k'_d + \Delta k_d \end{aligned} \quad (2)$$

In order to implement PID parameters tuning, we have to figure out the fuzzy relation among three PID parameters, the error  $e(t)$  and the error rate  $ec(t)$ . Then, we could carry out online correction of three PID parameters according to the fuzzy control

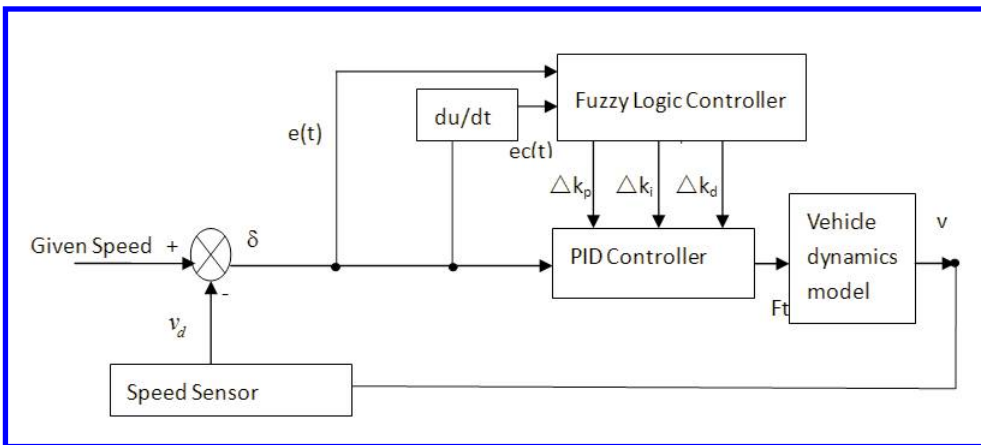

Figure 1. Frame of vehicle cruise control system.

principle with continuously monitoring the error  $e(t)$  and the error rate  $ec(t)$ . This kind of tuning PID parameters online can meet requirements of different error  $e(t)$  and different error rate  $ec(t)$ , so that the controlled object will have a good dynamic and static performance. And it is easy to tune PID parameters online because of a small amount of calculation.

### 2.2 Fuzzy logic controller

Seven linguistic variables, which are NB, NM, NS, Z, PS, PM, and PB, are considered as input and output parameters. The quantization domain of input and output parameters could be  $(-A, A)$ , and the size of  $A$  affects accuracy of the system. Here, the quantization domain of the error  $e(t)$ , the error rate  $ec(t)$ , and three output parameters of fuzzy controller could be  $[-5, 5]$ . The membership function of input and output parameters (Houguei. 2010) is shown in Figure 2-4.

The effect of  $k_p$ ,  $k_i$ , and  $k_d$  on the system has been discussed in Chapter 1. The proportional  $k_p$  coefficient can not only accelerate response speed of system but also improve regulation accuracy of the system. The integral coefficient  $k_i$  can eliminate the steady error of the system. The differential coefficient  $k_d$  can improve dynamic characteristics of the system and predict the variation trend of the error signal, namely while predicting a big variation trend of the error signal, the system will generate an effective correction signal to accelerate the movement speed and reduce the adjusting time.

The fuzzy control rules that engineering staff's gains through technical knowledge and practical experience are shown in Table 1. And the control rules of fuzzy controller should be described in the following manner: If ( $e(t)$  is NB) and ( $ec(t)$  is NB), then ( $\Delta k_p$  is PB) ( $\Delta k_i$  is NB) ( $\Delta k_d$  is PS). Here, the fuzzy controller totally has 49 rules, which are edited in the rule editor of GUI.

The internal structure of the PID controller is shown in Figure 5.

Figure 2. Membership function of  $e(t)$ .

Figure 3. Membership function of  $ec(t)$ .

Figure 4. Membership function of output parameters.

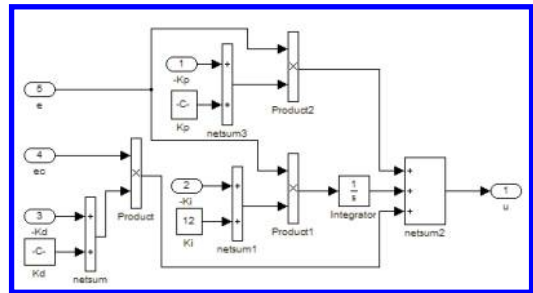

Figure 5. Internal structure of PID controller.

### 3 VEHICLE DYNAMICS MODEL

Vehicle longitudinal dynamic model is based on the transmission system, driving system, and vehicle motion system. This model takes into account only the vehicle longitudinal motion (Xiaoju. 2014).

There are some assumptions during establishing the vehicle longitudinal dynamics model.

- 1 The transmission shaft and transmitting gear of power transmission system are rigid;
- 2 The nonlinear factors such as tire slip could not be considered when the road is good and the ground adhesion is big enough.

The force analysis in the running process of vehicle is shown in Figure 6 and the force balance relation is shown in the following equation:

Figure 6. Force analysis in the running process of vehicles.

$$F_t = F_f + F_w + F_l + F_h \quad (3)$$

$F_t$  is driving force,  $F_h$  is gradient resistance,  $F_l$  is accelerating resistance,  $F_w$  is air resistance, and  $F_f$  is rolling resistance. Here are their definitions.

$$F_t = \frac{T_d}{r} = \frac{T_o i_o \eta_t}{r} \quad (4)$$

$$F_h = mg \sin \vartheta \quad (5)$$

$$F_l = \delta m \dot{v} \quad (6)$$

$$F_w = \frac{1}{2} C_d A \rho v^2 \quad (7)$$

$$F_f = mgf \cos \vartheta \quad (8)$$

We can get formula (9) after combining formula (3) with formula (4) ~ (8).

$$\delta m \dot{v} = \frac{T_o i_o \eta_t}{r} - mg \sin \vartheta - mgf \cos \vartheta - \frac{1}{2} C_d A \rho v^2 \quad (9)$$

In the formula (3) ~ (8):  $\delta$  is vehicle rotating mass transfer coefficient,  $m$  is gross vehicle weight,  $v$  is absolute velocity,  $i_o$  is the main reducer transmission ratio,  $\theta$  is slope,  $f$  is rolling resistance coefficient,  $C_d$  is air resistance coefficient,  $A$  is front face area,  $\rho$  is air density, and  $u$  is relative velocity.

According to Newton's Law, we can get formula (10) and formula (11) (Fan. 2010).

$$m \dot{v} = F_t - (F_f + F_w + F_l + F_h) \quad (10)$$

$$m \dot{v} = F_t - mg \sin \vartheta - mgf \cos \vartheta - \frac{1}{21.15} C_d A (v - v_a)^2 - \delta m \dot{v} \quad (11)$$

Finally, we have

$$m v + \delta m \dot{v} = F_t - \frac{1}{21.15} C_d A (v - v_a)^2 - mg \sin \vartheta - mgf \cos \vartheta \quad (12)$$

The vehicle dynamics model of BAIC electric vehicle C30 that considers driving force  $F_t$  as input signal and absolute velocity  $v$  as output signal can be established in SIMULINK of MATLAB according to formula (12) and it is shown in Figure 7.

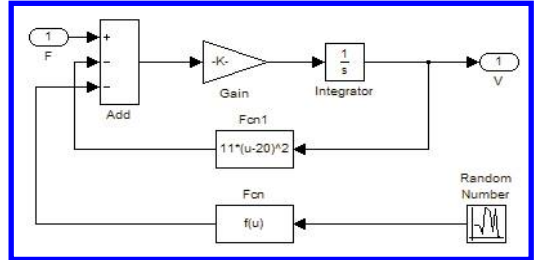

Figure 7. Vehicle's dynamics model.

Random signal will be used to simulate the road slope in order to truly reflect the influence that roads have on vehicles when vehicles are running.

### 4 SIMULATION OF PARAMETERS SELF-TUNING FUZZY PID CONTROLLER

The vehicle cruise control system that is shown in Figure 8 on MATLAB will be gained combined with fuzzy PID controller and vehicle dynamics object. First, the error  $e(t)$  and the error rate  $ec(t)$  are processed by the fuzzy logic controller and then fuzzy logic controller outputs  $\Delta k_p$ ,  $\Delta k_i$  and  $\Delta k_d$  parameters. These output parameters will be considered the input parameters of the PID controller after amplifying these three parameters.

The simulation results of fuzzy PID controller are shown in Figure 9.

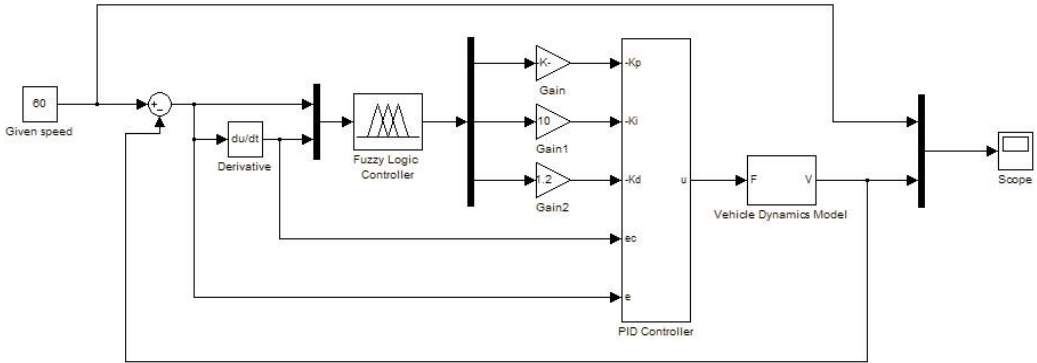

Figure 8. Vehicle cruise control system on MATLAB.

Figure 9. Simulation results of fuzzy PID controller.

It can be seen from simulation results that output parameters' response time that self-tuning fuzzy PID controller outputs is very fast. It can be seen that the output signal has a small overshoot and reaches a stable state in short time. It turns out that parameters self-tuning the fuzzy PID controller could control the object well.

## 5 CONCLUSION

The conventional PID controller cannot adapt to systems that have complex conditions and whose object's parameters often change. Sometimes it even exacerbates the instability of system. But the fuzzy PID controller could adapt to these systems according to different input conditions, so that parameters of the system can adapt to changes of the error and error rate of the system in real time. Moreover, the fuzzy PID controller has a weak dependence of the controlled object model and can timely adjust its parameters according to information of the input signal. With the increasing industrial demand, the fuzzy control

algorithm will be widely used in the industry based on the PID control algorithm and the control rules also will be more perfect with industrial experience.

## Development of intelligent vehicle test system based on mobile terminal platform

Yu Chen Zhang, Long Cheng Tang, Xiong Cheng Huo, Xiao Fang Zhao & Yuan Yin  
*The Information College of Beijing Union University, Beijing, China*

**ABSTRACT:** With the increasingly maturing of intelligent vehicle technology, intelligent vehicles are also gradually to the market<sup>[4][5][6]</sup>. When intelligent vehicles are tested in the test bench of factory, due to the narrow space and the safety, the entire test has a certain risk. This article describes the overall design ideas and methods of the research and development of an intelligent auto test system based on the mobile terminal platform, through the general structure of the automobile detection system design based on CAN bus, using the mobile terminal development technology and wireless mobile terminal connection method. Eventually, the system has completed the intelligent vehicle bench test data in a remote test.

**KEYWORDS:** Intelligent Vehicle; Mobile Terminal; Remote Test.

### 1 INTRODUCTION

With the development of the intelligent vehicle, the testing technique for the intelligent vehicle is becoming crucial. During the process of intelligent vehicles' modifying and testing, it is the vehicle bench experiment that becomes the commonly used method, which includes recording and analyzing in real time the orders that were sent by multiple controllers and vehicle states. However, some kinds of intelligent vehicles in the current market are of a high price, few in types, and not portable. Simultaneously, due to the special testing environment (narrow space, high requirement on security), testers are unable to test the vehicle for a long time. An unmanned vehicle is also necessary when having an intelligent vehicle test. Therefore, the R&D on intelligent vehicle test system based on mobile terminal platform shows its importance.

An Android OS (Operating System)-based tablet enables testers to analyze and test intelligent vehicles at a safety distance during the testing process. This device is also equipped with the function of data transmission, sharing, counting, analyzing, and storing. Thanks to this testing system, testers can test intelligent vehicles regardless of time, space, and pace, thus making this test more convenient, more economical and improving the efficiency, quality, and safety of the testing process. Meanwhile, this system demonstrates the efficiency and human-oriented management of the intelligent vehicle test in the trend of technology boom.

### 2 SYSTEM DESIGN

The test system is using the single-chip processor and mobile terminal platform (based on the Android OS ) as the basic equipment through GPRS (General Wireless Grouping Service) or WLAN (Wireless Local Area Network) and other wireless data transmission platforms mainly to complete the main operation parameters of the remote testing and analysis in vehicle bench testing. The system data flow diagram is shown in Figure 1.

Figure 1. System data flow diagram.

#### 2.1 Structure and functions of intelligent vehicle test system

The overall structure of the intelligent vehicle test system is made from hardware design and software design. Function modules of the hardware system includes the minimum system of embedded processor, CAN serial communication bus, different kinds of sensors, the Wi-Fi module, the voice chip control module, and LCD (Liquid Crystal Display) module. The software part can perform functions for receiving and data acquisition, collection, analysis and storage, and so on as shown in Figure 2.

Corresponding Author: Yuan Sheng Liu *The Information College of Beijing Union University, Beijing, China*

Figure 2. Overall structure diagram of intelligent vehicle test.

Among them, CAN serial communication bus, all kinds of sensors, the Wi-Fi module, the voice chip control module, and LCD are controlled by minimum system, and the collected data will be sent to the mobile terminals through wireless LAN (Local Area Network) transmission.

### 2.2 Key technologies of the intelligent vehicle test system

First of all, the system is the test system overall structure based on CAN bus. The whole system is divided into on-board monitoring center subsystem and test group monitoring center. The on-board monitoring center subsystem with the single-chip processor as the core includes CAN bus interface and wireless data transmission module.

The system mainly reads the auto test parameters from the vehicle CAN bus, and it translates the data into wireless data formats to send, receive the command sent form mobile terminals. The test group monitoring center with WIFI function mainly includes a mobile terminal; it is compiled by the software of wireless data transmission module, is sent to auto test data display function, and provides the human-computer interaction interface, in order to let testers send data query command as shown in Figure 3.

Second, another key technology is the mobile terminal development technology. "Mobile terminal" refers to computers that can be used in mobile devices, in the broad sense including mobile phones, laptops, POS machine, tablet, or even vehicle-mounted computers. But in most cases, they perform a variety of applications of intelligent phones or tablets. The main application is for Android tablets.

In addition, the wireless connection is also one of the key technologies. So-called wireless networks not only include global voices and data networks that allow users to establish wireless connection over long distances but also include as close to optimizing the infrared wireless connection technology and radio frequency technology. Compared with the wired network, the biggest difference is that the transmission medium uses wireless technology to replace cables, with cable networks backing up each other.

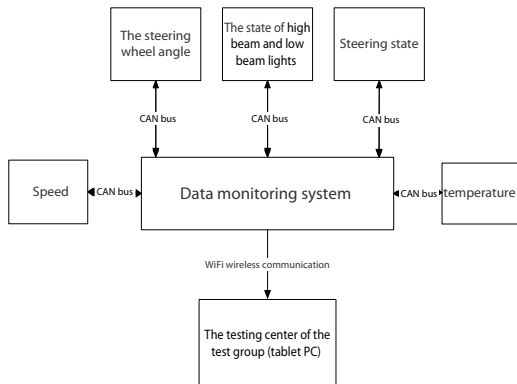

Figure 3. Basic block diagram of intelligent vehicle test system.

## 3 HARDWARE DESIGN

### 3.1 Overall structure of hardware design

The hardware design mainly consists of the minimum system, temperature sensor module, the acceleration sensor module, wireless communication module, LCD module, Can bus serial communication module, and voice chip control module. The overall frame is shown in Figure 4, and the physical map of the hardware is shown in Figure 5.

### 3.2 Introduction of each module's function

#### 3.2.1 A Temperature sensor module

A car's drive actually has a deposit with two states, so you need to discuss the temperature range, including

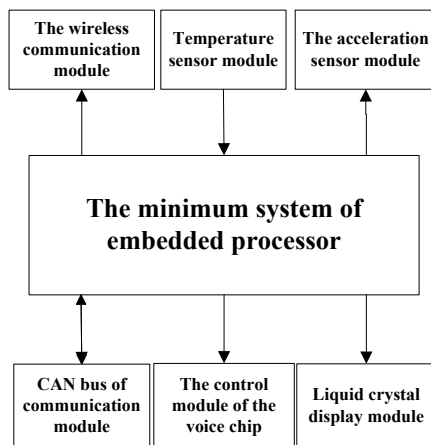

Figure 4. Data flow graph of the hardware design.

Figure 5. Physical map of intelligence vehicle test system.

low temperature and high temperature state. Enabling the car to be stored in a low temperature condition or a state of high temperature, requires automotive electronic modules in storage after a certain time, which do not affect car launch and moving function<sup>[2]</sup>.

The temperature sensor that the system uses is DS18B20, being used in single unique interface mode, and accessing through the I2C digital interface, and its measurement ranges from 55 DEG to +125 DEG.

In this system, DS18B20 measures the temperature inside the vehicle through the CAN bus. When the temperature inside the vehicle goes beyond the default system temperature, it will be alarmed by voice control module in order to maintain the vehicle in a comfortable environment.

### 3.2.2 Acceleration sensor

ADXL345 acceleration sensor was used in the system, an electronic device to measure the acceleration forces, whose digital output data are the 16 binary formats, accessing through the I2C digital interface.

In this system, ADXL345 measures acceleration through the CAN. When the acceleration of the vehicle is beyond the default system acceleration, it will be alarmed by voice control module in order to keeps the bus in the range of safe driving.

### 3.2.3 Wireless communication module

The wireless communication module of this system used for HLK-RM04 is a kind of embedded UART-ETH-WIFI (serial Ethernet and wireless network) module. This module is embedded in the module with a network standard universal serial interface based on TCP/IP protocol stack, built-in, which can achieve the conversion between user serial, Ethernet, and wireless network (WIFI)<sup>[3]</sup>.

In the system, the module can achieve the conversion between user serial or TTL level and wireless networks.

### 3.2.4 Liquid crystal display module

The system uses a 128\*64 graphic dot matrix liquid crystal display module; it displays high quality

and is inexpensive and widely used in the electronic market. In the system, it was used for real-time display of the data collected from the intelligent vehicle, such as temperature and acceleration. Thus, testers are able to easily see driving changes of the vehicle, which can bring convenience for intelligent vehicle testing.

### 3.2.5 Serial communication module of CAN bus

CAN, the abbreviation of Controller Area Network, is the ISO international standard serial communication protocol. In the current automotive industry, out of the requirements of safety, comfort, convenience, low pollution, and low cost, various kinds of electronic control systems have been developed. Nowadays, automobile communication basically takes the form of event trigger communication controller local area network (LAN). The arbitration mechanism also sends messages according to the priority of identifier, and the news of the highest priority are able to send messages without interference. The CAN bus with high reliability and low price advantage will have the larger share of the car network<sup>[1]</sup>.

CAN bus serial communication module in this system includes two parts. One is the CAN interface on the circuit board—CAN\_H and CAN\_L interface; the other one is—The CAN card, which is actually an interface converter turning USB interfaces into CAN interfaces in communication. In this system, various kinds of state data of the intelligent vehicle will be sent to the single-chip microcomputer using the CAN card as the mediation and passing through the CAN bus, and then they will be sent to the mobile terminal passing through the WIFI module.

### 3.2.6 Control module of the voice chip

The voice chip control module is going to be the alarm device for the testing system, composed of a voice chip and a 2W horn. In this system, when the data from the temperature sensor and acceleration sensor exceeds a preset range, it will be detected by the voice chips that will timely alarm, feed backed to the testers. Thus, it helps the province's convenience and safety for testing of the intelligent vehicle.

## 4 SOFTWARE DESIGN

### 4.1 Establishment of mobile terminal platform

The intelligent vehicle testing system, developed on android mobile terminal platform, is mainly used in the vehicle-mounted system to collect current vehicle information. Vehicle users get information such as speed, inner temperature of the vehicle, and the maximum engine power through mobile terminal

platform. In so doing, vehicle users can find out if there is any problem existing during driving, in order to drive the vehicle properly and elongate the lifetime of the vehicle. The purpose of designing this software is to help users learn more about the vehicle, thus helping users drive the vehicle more properly.

#### 4.2 Realization of function modules

First, this system realizes the function of data sharing, counting, analyzing, and storing. Second, testers can easily test the vehicle's functions in a more comprehensive way. For instance, vehicle maintenance workers can test the vehicle's main functions, monitor the current vehicle's situation, store all kinds of data, and put main parameters and arrange main performance parameters and their related properties automatically.

Meanwhile, this App has a good user experience. For example, a beautiful user interface is easy to use and then the system is very stable. This system is equipped with intelligence, security, and safety as shown in Figure 6.

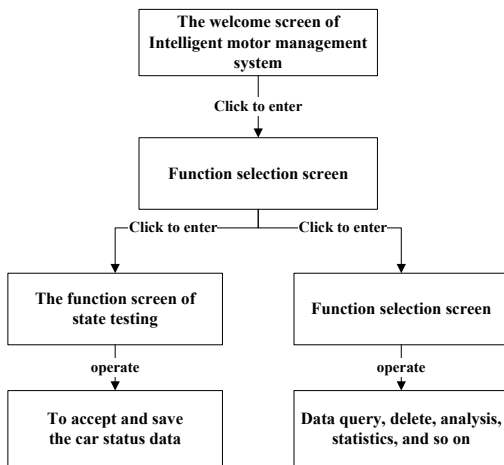

Figure 6. Mobile terminal design flow chart.

### 5 ANALYSIS OF ACTUAL TEST DATA

After the minimum system obtained the relevant state data of the auto mobile, the relevant data will be transmitted to the mobile terminal platform through a wireless local area network, and it will be managed or processed on the mobile terminal platform.

The temperature sensor can measure the temperature inside the vehicle, and the acceleration sensor

can measure the steering wheel angle of the intelligent vehicle. In addition, the speed of the vehicle and the states of each light can be concluded by the dashboard of the vehicle itself.

The test interface will display the state of the received data. Once you click the “open” button, it displays a group of data, and several groups of data are obtained with more clicks, as shown in Figure 7.

Entering the data management page, the data can be queried or deleted and so on, as shown in Figure 8.

From Figure 7 and Figure 8, the concrete analyses were shown as follows:

- 1 The boot speed of the vehicle will increase with time increasing, and when the specified speed (such as 28km/h) is arrived at, the vehicle will keep moving at a constant speed.
- 2 The temperature inside the vehicle mainly remained constant.
- 3 When the vehicle needs to turn or lane change, turn on the turn signal in advance; then, the steering wheel begins to rotate and the speed begins to reduce slightly.
- 4 Through the corner, the steering wheel will be back to 0 degrees, the speed will increase, and steering lamps will be turned off.
- 5 At night, the dipped beam will be turned on.

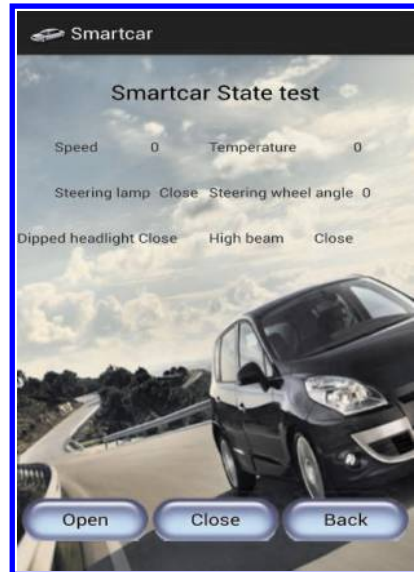

Figure 7. Interface of state testing.

Figure 8. Interface of data management.

## 6 CONCLUSION

The research results of this article: First, conduct an in-depth analysis and study of the CAN bus serial communication protocol and develop a minimum system based on CAN bus serial communication. Second, complete Android development of mobile terminal, the establishment of the database and realize the function of data processing. Finally, achieve the wireless communication transmission between the minimum system and mobile terminal. After improvement and refining, the research results of this article can be more widely applied in automobile

testing and other industrial tests, so this study has certain forward-looking and the research results have certain market prospects. In future research, the research direction proposed in this article can be an in-depth study and further discussion.

# Application of Flash animation in power system relay protection teaching

Jun Ting Shi & You Wen Tian\* & Hao Yan Wu  
*Shenyang Agricultural University, Shenyang, China*

**ABSTRACT:** According to the course of power system relay protection content and features, advantages of the relay protection teaching of the Flash animation that was applied were analyzed through a comparison with ordinary teaching. Combined with the teaching of relay protection, making a series of Flash courseware, such as the current relay, the differential relay, the three-phase current protection principle, the direction over-current protection, the automatic reclosure, and the high-frequency locking direction protection. These production and application of Flash animation courseware were helpful for the relay protection teaching, and they can be popularized in other schools in the teaching of power system relay protection.

**KEYWORDS:** Delay protection; Flash animation; Teaching; Making.

## 1 INTRODUCTION

“The electric power system relay protection” is the professional backbone course of electrical engineering curriculum; the course content is rich, has a wide range, strong practicality, to cultivate students to form correct troubleshooting skills and it is very important to protect the consciousness of the equipment maintenance. The course involves a lot of in the concept, principle analysis, the process of decomposition, it needs to have some of the information about pictures, movements and sounds, (Benbouzid et al. 1999) also needs to be discovered by the students’ learning. Can the Flash animation image, vivid, lifelike expression movement forms, the spatial displacement, relationship, and shape the process of change, to meet the knowledge of power system relay protection features, according to the lively animation, bright colors? So, Relay Teaching Excellence Flash animations can be applied to stimulate students’ interest in learning, teaching atmosphere rendering, set configuration-specific teaching situation, and, more importantly, can be heavy and difficult to effectively break through teaching, effective practical ability and creative ability of students, thus having a multiplier effect. Flash animations can be easily used in the classroom broadcast multimedia devices and can also be embedded in web pages, for use in a local area network or the Internet. They can also be effective in promoting the application of power system protection and promotion of teaching.

## 2 EXISTING PROBLEMS OF THE COURSE OF RELAY PROTECTION

Power System Relay Protection course should be divided into several parts, such as the current protection of the power grid, the distance protection, the differential protection, the high frequency protection, the automatic reclosure, and the power transformers protection (He Jiali et al. 2010). It studies the abnormal operating conditions of power system fault and endangers the safe operation in order to explore its anti-accident countermeasures and automated measures. Several major problems are existing in the teaching process.

The content of the Power System Relay Protection course is abstract complex, and traditional teaching methods cannot meet the requirements. The relay device teaching of Power System Relay Protection course mainly describes the various types and characteristics of the relay, operation principle, and so on. This part of the contents of the current teaching method is mainly used in multimedia-assisted teaching, by collecting a variety of images to improve the students’ interest and enhance the impression, but these pictures are flat static rather than a dynamic diagram as shown in the figure. Students can only understand their process of action from the books introduction. The principle of relay protection is explained by its wiring diagram. These part contents are abstract. Most of the existing materials keep on repeating at great length on relay protection principle of text introduction; they are boring, and it is difficult to understand some action process. Some of the

students cannot understand the principle of the relay protection until the course end; all hope to recite the question bank to cope with examinations, completely out of the original intention of teaching.

The teaching resources are lacking, and the theory teaching is separated from practice teaching. The principle of relay protection is the focus content of the power system relay protection course. There are three-phase current protection principle, direction over-current protection, zero sequence current protection, distance protection, longitudinal differential protection, high-frequency protection, transformer differential protection, and so on. Then, the key point of this course is to master protection device composition, role and fault action process, and the right operation methods. These contents are difficult to be completed in the classroom, so practical teaching is required (Shao Zhifang. 2009). Currently, the practice teaching of relay protection of power system is the main practice in class experiments and substation practice. But the experiment equipment is limited, only some simple illustrative experiment can be done, and it cannot meet the demand of practice teaching. The practice is to visit the substation. But business concerns for safety do not allow students to put into operation and learning a variety of equipment. So the effect of practice teaching is only that students have some perceptual knowledge of the protection device, and the quality of practice teaching is difficult to be ensured.

### 3 ADVANTAGES OF FLASH COURSEWARE TEACHING

Flash is developed by Macromedia company for animation creation and application as a creative software, and it is a very good vector animation software. It is the core of the flow control technology and vector technology with animated short and pithy, easy to spread. Flash technology is one of the advantages of teaching among much information technology, which has been favored in College teaching. (Niu Yong et al. 2006)

Application of Flash animation will show relay devices and relay protection action process of action principle vividly. These Flash animation are shown to the students through the projector in the classroom, and they stimulate students' eyes, ears, and brain through the sound video. The equipment using method that requires a great deal of language to be described is getting simple and easy to understand so that the students can understand. This will reduce the students' burden and improve teaching effect while simultaneously improving student interest in learning.

In addition, the relay protection Flash courseware can get rid of the limitations of traditional teaching, show the teaching information about the sound, the image, and the text flexibly, interact with the viewer

to stimulate students' awareness of curiosity, and create and enhance their understanding of knowledge (Yang Hui. 2001). When pressing the function button, the corresponding element function and principle can be elaborated in relay protection devices. When you press the button of normal operation or fault, animations are conducted. Simultaneously, Flash animation can be played through the reset button repeatedly to solve the problem without understanding in the classroom. In addition, Flash swf files are generated by Flash animation for relay protection with a small footprint, so it requires smaller space and a lower requirement for computer playback, and it can be embedded in web pages to publish communication on the Internet. It can maximize the value of the animation to play courseware, and it is conducive to the sharing of resources.

### 4 ANIMATION PRODUCTION AND RUNNING EFFECT

This course is mainly produced through various relays and protection principles animation by using Flash. It includes more than 30 animations, such as a solenoid coil current relay, attracting armature current relay, turn the tongue-in-current relay, polarized relay, gas relays, differential relays, inductive current relay, three-stage over-current protection, directional current protection, zero-sequence current protection, differential protection, phase differential high-frequency protection, automatic reclosing principle, transformer over-current protection, and so on. Here are a few typical animations.

#### 4.1 Current relay

Flash animation current relay interface is shown in Fig. 1, which describes the main components and operation process of the current relay, including the operation process of increasing current, forming magnetic flux, generating action, and reducing the current.

Figure 1. Current relay animated interface.

### 4.2 Differential relay

Differential relay is one of the main components of the transformer differential protection, whose animation interface is shown in Fig. 2. This animation shows the various components of the differential relay and various magnetic flux variations when the line is normal operation and short-circuit state of BCH-2 differential relay.

Figure 2. Differential relay animated interface.

### 4.3 Three-phase current protection

Three-phase current protection is one of the important parts of the Power System Relay Protection course, which is animated and shown in Fig. 3. The animation shows the action situation of protection device for three section current protection devices in the normal operation and when a fault occurs at any point of the line. When d1 point in line happens in the short circuit, all of the phase current I protection, current II protection, and current III protection are starting, but eventually QF will off by the current I protection movements. Then, it cuts off the fault line. Finally the protection device is returned. When short circuit happens in a d2 point in line, both of the phase current II protection and current III protection are starting, but eventually QF will off by the current II protection movement. Then, it will cut off the fault line. Finally, the protection device is returned. When short circuit happens in d3 point in line, only current III protection starts and acts. Then, QF is disconnected, cutting off the fault line. Finally, the protection device is returned.

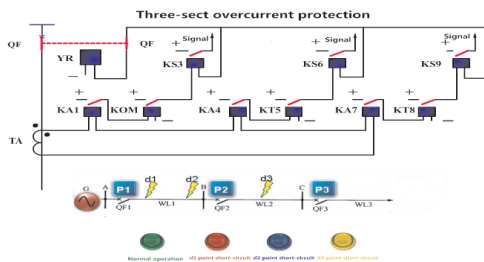

Figure 3. Three-sect overcurrent protection animation interface.

### 4.4 Directional over-current protection

Directional over-current protection is set for the ring network or the more power supply network. Its animation interface is shown in Fig. 4. This animation shows the action situation of the protection device when line is in the normal operation, external fault, or internal fault. When line is in the external fault, the current can increase. Then, the current relay KA acts, but power direction relay KW judges in the opposite direction, so it does not act. Finally, the protective device does not work. When line is in the internal fault, the current can increase. Then, the current relay KA acts, and power direction relay KW judges the positive direction. Finally the protective device works and disconnects QF, and it cuts off the fault. The protection device returns.

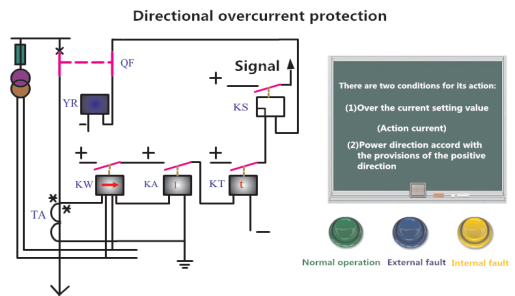

Figure 4. Directional over-current protection animation interface.

### 4.5 Automatic reclosing

Automatic reclosing is one of the important automatic devices in the relay protection devices. Its animation interface is shown in Fig. 5. This animation shows internal components of automatic reclosing device and the action process-related components in normal operation, failure, instantaneous failure, permanent fault, manual trip, and manual closing.

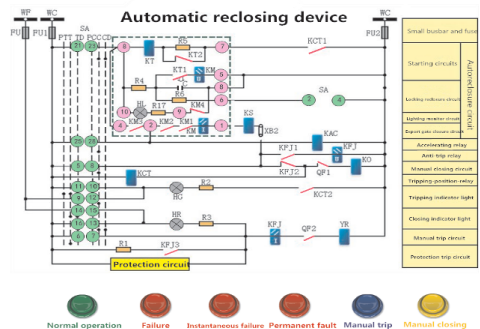

Figure 5. Automatic reclosing animated interface.

#### 4.6 High-frequency locking direction protection

High-frequency locking direction is one of the main forms of high-frequency protection. Its animation interface is shown in Fig. 6. This animation shows the movement of the high-frequency locking direction of the protection device about the normal operation, the external failure, and the internal fault. When a fault occurs outside the protection region, one side of the short-circuit power is negative. At this moment, power direction relay KPD does not act, so the transmitter does not stop signal transition. Both sides of the receiver received the high-frequency signal, so the protection device locks; QF cannot trip. When a fault occurs in the protection region, both sides of the KPD withstand the positive direction short-circuit power and start, so the transmitter stops signal transition. Simultaneously, the latching relay starts and sends out a trip pulse. Then, it cuts both sides of the QF and removes the fault. At last, the protection device returns.

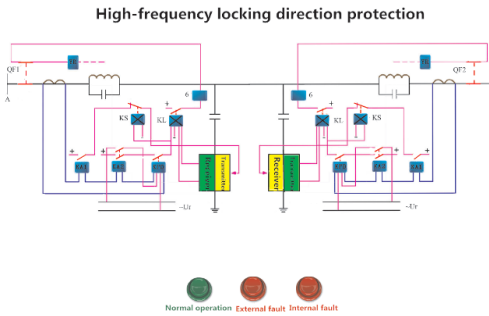

Figure 6. High-frequency locking direction protection animated interface.

#### 5 CONCLUDING REMARKS

The main essence of the relay protection of the animation process is that the performance of the whole action enables students to learn how the relay

protection devices can operate. Power system protection is a course with a highly practical requirement. It plays a decisive role for students' future employment and development regardless of whether they have superior ability to practice. A set of relay protection courseware is produced by using Flash animation, which sets text, graphics, images, animations, video, and audio into one. The teaching practical application shows that the courseware can stimulate student interest in learning this course, which enables diversification of teaching methods, visualization of teaching content, and practice of teaching process. The courseware can simulate principle and the equipment movement process of the relay protection; simultaneously, it is easy to solve the teaching key and difficult, and it can enhance the students' practical and innovative ability. So it can greatly enhance teaching effectiveness. In addition, the electric power system protection Flash animations can be embedded on an excellent course free sharing platform to be applied in other colleges.

# Research on the vocational ability—oriented curriculum integration system of secondary vocational and undergraduate education of automobile service engineering major

H.M. Lv & L.Y. Zhu

*Yancheng Institute of Technology, Yancheng, People's Republic of China*

**ABSTRACT:** Currently, China has entered the popular stage of higher education. In order to cultivate more qualified vocations who can adapt to the socioeconomic development, the modern vocational education system is in the process of progress. Recently, the curriculum integration system of secondary and higher vocational education is in the start-up phase. This article analyzes the existing problems of the secondary vocational and undergraduate education for the automobile service engineering major, introduces the training system of vocational ability and the main content of proposed curriculum system, and puts forward the “3+4” teaching model of secondary vocational, undergraduate education to integrate their teaching effectively.

**KEYWORDS:** Secondary vocational education; Undergraduate education; Integration; Automotive service engineering.

## 1 INTRODUCTION

Since entering the 21st century, the vocational education has developed rapidly in China. The education conditions of vocational schools increase significantly. The combination of manufacturing and teaching, the cooperation of school and enterprise are strengthened while the government support system is improved. The function of vocational education in the transformation of economic development way and the supporting of an industrial structure are more important than ever, which helps improve the people's livelihood and promotes the socioeconomic development.

Currently, the modern vocational education system has entered the stage of implementation. Vocational education rules and regulations are in construction, and the vocational education levels and specialty structure are continuously improved. The secondary and higher vocational education (including applied undergraduate education) are developed as a whole[1]. However, as the key link and the important foundation of the modern vocational education system, the different stages and levels of education have failed to integrate effectively. The concept of systematic training is still not formed. Most students of vocational schools cannot continue their further-education. Inconsistent problems still exist in the aspects of major setting, curriculum system, and teaching evaluation between the secondary and

applied undergraduate education, which has become the primary factor restricting the construction of the modern and the prominent impediment to developing modern vocational education [2]. It must be settled as soon as possible.

There exist two main problems in the integration of secondary and undergraduate teaching. One is that the secondary vocational education pays more attention to a student's vocational ability training, which leads to students being weak in mastering subject knowledge and vocational theory. So their occupation development potential is restricted. The second is that the undergraduate education pays more attention to theoretical teaching, but less to vocational ability training. Since China has entered the popularization stage of higher education, the vocational ability of many undergraduate students cannot meet the job requirements after graduation.

In order to cultivate more vocational talents to adapt to the social development, it is an effective way to integrate the secondary vocational and undergraduate education. Their training objectives should be clarified individually, while the student's growth law of vocational ability should be followed. The vocational ability-oriented hierarchical training system of vocational ability needs to be designed. This article takes the major of automobile service engineering as the example to investigate the curriculum integration system of secondary-vocational/ applied undergraduate education.

## 2 ESTABLISH A HIERARCHICAL VOCATIONAL ABILITY TRAINING SYSTEM

### 2.1 *Definite the training objectives of secondary vocational and undergraduate education*

The secondary vocational education and the applied undergraduate education have the same attribute but belong to different levels of education. The objectives should be definite for the different levels of education. The secondary vocational education is intended to train skilled workers and service personnel for the production line and service occupation. The training goal of applied undergraduate education is to cultivate senior specialized talents for production, management, and service. So the personnel training specification is neither the pure researchers nor the skilled operators and technicians, but mainly the talents of technology application [3, 4].

For the automobile service engineering major, the curriculum integration system of the secondary vocational and undergraduate education should follow the student's growth law of vocational skill from simple to complex, and from intuition to abstract. The secondary vocational education student should mainly cultivate the automobile mechanics who have the basic knowledge of automobile application and maintenance while having a strong practical ability. After graduation, they mainly work on the jobs of automobile maintenance,

diagnosis, repair, and service. The applied-type undergraduate education is intended to train the vocational specialists who have a solid theoretical foundation, master the modern information technology and management knowledge, and are familiar with relevant laws and regulations on automobile service. They will be the applied-type talents who have the basic ability of automobile service engineering. After graduation, students work on the automobile service areas of technology, marketing, finance, insurance, and so on [5,6].

### 2.2 *Establish a hierarchical vocational ability training system of automobile service*

Establishing hierarchical vocational ability training system of automobile service is the foundation of building the curriculum integration system of secondary vocational and undergraduate education. If the vocational ability training objectives are classified according to different cultivation levels, the hierarchical vocational ability training system of automobile service for the secondary vocational and undergraduate education is formed, as shown in Figure 1.

It can be seen that the secondary vocational education mainly cultivates students in the following vocational abilities: (1) Master the automobile maintenance skills of primary maintenance and repair.

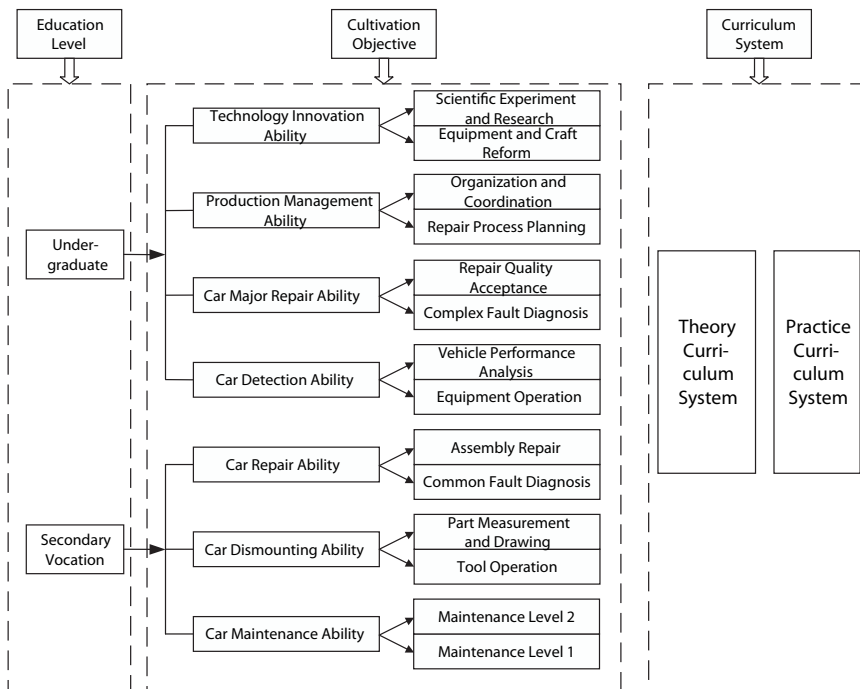

Figure 1. Hierarchical vocational ability training system of automobile service engineering.

(2) Master the usage of auto maintenance tools, disassemble and assemble various auto parts and assembly, and make the right drawing of complex auto parts. (3) Grasp the common automobile repair skills, can diagnose and eliminate the common auto faults.

In the undergraduate education stage, the following vocational abilities should be promoted. (1) Master the skills of automobile performance test, including the usage of test equipment and the analysis of vehicle performance. (2) Have the ability of automobile major repair. Students can diagnose and repair complex faults and can inspect the repair quality. (3) Develop the students' ability of workshop management. They can plan the automobile repair process and organize the repair work. (4) Have the capability of technology reform and innovation. Students can put forward the advice of equipment technology improvement, participate in the introduction, promotion, and using of new equipment, technology, and craft.

### 3 DESIGN THE VOCATIONAL ABILITY-CENTERED CURRICULUM INTEGRATION SYSTEM

Design the vocational ability-centered curriculum and teaching content to construct the theory curriculum system with “three levels and three modules” and then construct the “3+4” practical teaching system to meet the requirement of vocational ability, we should form the automobile service vocational ability-oriented curriculum integration system of secondary vocational and undergraduate education.

#### 3.1 Construct the theory curriculum system of three levels and three modules

Three levels refer to dividing the whole teaching program into three phases, including secondary vocation education, integration education, and undergraduate education. Three modules refer to public courses, vocational foundation courses, and vocational ability courses, respectively, as shown in Figure 2.

The public basic courses are grouped into three modules. Module 1 of secondary vocational education mainly includes the courses of Civilization, Chinese, Math, PE, Computer application, and so on. Module 2 includes the integration courses such as English, Math, Physics, and Chemistry in the transition stage. The module is set for strengthening the student's discipline foundation. Module 3 refers to the undergraduate public foundation courses, including College English, Engineering mathematics, Physics, and Politics.

Module 1 of Vocational foundation courses refers to the vocational courses of secondary vocational education, and it mainly includes Mechanical Drawing, Mechanical Basics, to cultivate students' ability of reading mechanical drawing. Module 2 is also set for promoting undergraduate students' mechanical design basics, including Engineering Graphics, Mechanical Design Basics, and Hydraulic Transmission. Module 3 is set to strengthen students' mechanical and electronic foundation, including Electronics, Engineering Mechanics, Manufacturing Process, Engineering Materials and Heat treatment Precision Design and standardization, Testing Technology, and Signal Processing.

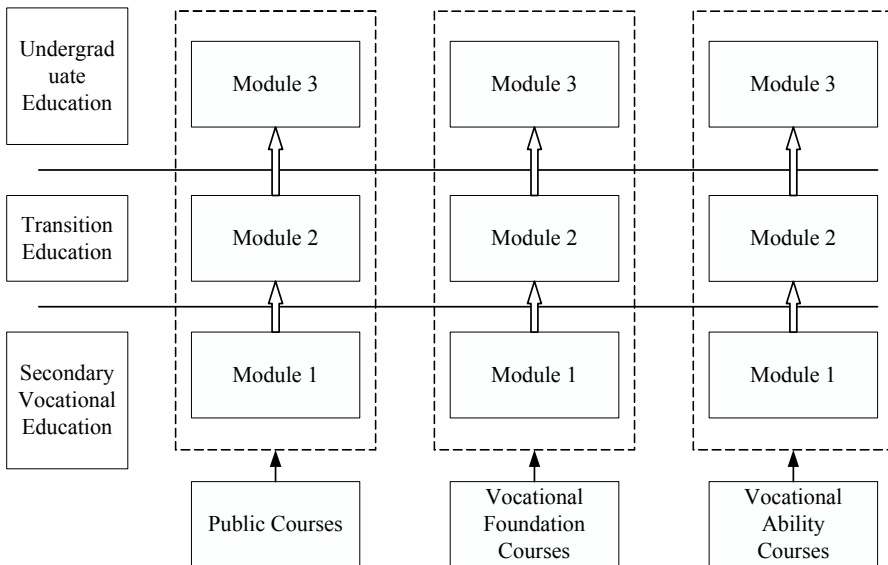

Figure 2. Theory curriculum integration system of secondary vocational and undergraduate education.

Module 1 of vocational ability courses is mainly about the automobile application and maintenance courses, including Engine Structure and Maintenance, Chassis Structure and Maintenance, Car Electrical Equipment and Maintenance, Automotive Single-chip Computer (SCM) and Local Area Network (LAN), Automobile Fault Diagnosis Technology, Auto Detection Technology, and Vehicle Body Repair Technology. Module 2 is the senior curriculum of automobile structure and maintenance, mainly including Automobile Structure, Automobile Electrical and Electronic Technology, Automobile Detection and Diagnosis Technology, Automobile Repair Engineering, and so on. Module 3 is the automobile service module, including automobile Manufacturing Technology, Engine Principles, Vehicle Dynamics, Automobile Service Enterprise Design and Management, Automotive Marketing, Car Insurance and Claims, the Used Automobile Evaluation, and Automobile Advanced Technology.

### 3.2 Construct the “3+4” practical teaching system

In the practical teaching system, 3 means three basic practical skill modules in secondary vocational education, including information technology basics, metal working, and primary automobile maintenance and repair. The information technology practice module cultivates in students the common application ability of computer and software. The metal working practice module makes students familiar with common hot and cold manufacturing processes. The car maintenance and repair module enables to make students master the main content stipulated by national vocational ability assessment exam (NVAAE) committee, including four parts of maintenance, repair, diagnosis, and measurement.

“4” refers to four skill modules for undergraduate students. They are information technology training module, mechanical foundation training module, senior automotive repair training module, and graduation project practice module, respectively. The information technology module instils in students the skill of applying computer program language for further specialty studies. The mechanical foundation module trains students to master the working principles and design methods of mechanical parts through a curriculum project design. The senior car repair training module enables students to master the content national senior occupational assessment, including four parts of diagnosis, repair, related skills, and training guidance. The graduation project design module is focused mainly on automobile typical malfunction analysis, maintenance process design, testing equipment development, auto parts design, auto maintenance enterprise management, car sales, finance, insurance, and so on to cultivate students’ comprehensive application ability of knowledge.

## 4 APPLY THE “3+4” INTEGRATION TEACHING MODULE

The “3+4” integration teaching module is an effective way for theory and practical teaching of secondary vocational and undergraduate education. In this section, “3” means three years of secondary vocational education. The main task is to teach the basic theory knowledge and practical skills. Compared with conventional secondary vocational education, it needs to add some important courses of English, Math, and Chemistry for further education. “4” means four years of undergraduate education. The main task of this stage is to teach advanced theory knowledge and practical skills. Due to the reason that students have studied some courses in secondary vocational school, the teaching hours can be reduced. Students still need to add the teaching hours of senior repair practice to meet the requirement of NVAAE.

## 5 CONCLUSIONS

Integrating the teaching resources of secondary vocational and undergraduate education is helpful for cultivating high-skilled talents. Both level schools can find their position in the integration education if they communicate frequently and deeply. The high-skilled talents that satisfied the automobile service requirement can be cultivated if the hierarchical integration teaching system of secondary vocational and undergraduate education is constructed and applied.

# Three-dimensional planning study of the urban outdoor advertisement on the basis of WebGIS

Ru Hong Xie

Art School, Shandong Women's University, Jinan, China

**ABSTRACT:** This thesis is the three-dimensional planning study to the urban outdoor advertisement on the basis of the Website Geographic Information System. The key point of the planning is to solve the three-dimensional display and distribution of the urban outdoor advertisement point, connection among advertisement points, establishment of primary and secondary positions, nature and characters, macroscopic problems in technology and human activities, and system problems for outdoor advertisements. It also defines factors such as art, technology, and economy from the microscopic view. For the target of creating the urban quality and good urban space, it is a right hand for the management and transaction of outdoor advertisements, and it will finally help the three parties, the advertiser, advertising agency, and advertising management department, gain profits.

**KEYWORDS:** WebGIS System, Outdoor Advertisement, Three-Dimensional Planning.

As a symbol of the environment and prosperity of the whole city, outdoor advertisement attracts the fervent attention of advertisers with low advertising costs and high products promotion efficiency.

## 1 BACKGROUND FOR THE THREE-DIMENSIONAL AND STEREOSCOPIC PLANNING OF URBAN OUTDOOR ADVERTISEMENT

Under the premise of confirming to the urban strategic positioning, for standardizing the set of the outdoor advertisements, people should make use of the urban space resources reasonably, beautify the visual environment, coordinate the relationship between the advertisement and environment, improve the urban image and value of the outdoor advertisement, and promote the economic development (as shown in Figure 1. Designing Framework for the Outdoor Advertisement Planning). Specifically speaking, it means that under the premises of satisfying basic requirements of various urban functions and requirements of scenery aesthetics, people should adopt advanced designing concepts, forms, processes, materials, and technologies to conduct a unified allocation plan and personal setting to outdoor advertisements, shops' signboards and sceneries; make them harmonious and unified with the surrounding environment; and fully reflect the urban characteristics and cultures. In this way, advanced and efficient digital management platform becomes effective and urgent.

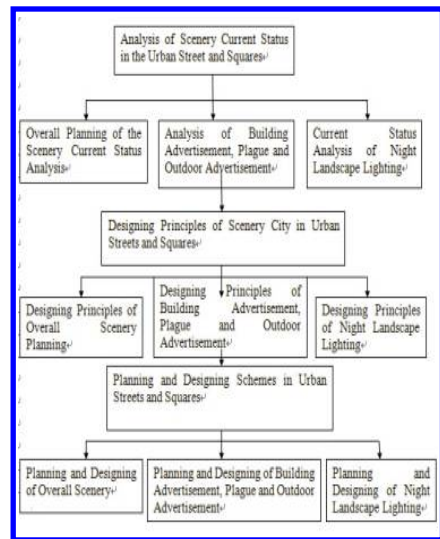

Figure 1. Designing framework for the outdoor advertisement planning.

The three-dimensional and stereoscopic planning to urban outdoor advertisements can be relied on in three-dimensional and stereoscopic cities, based on Web GIS (Geographical Information System based on website) and VR (Virtual Reality), applied with network topological method and Database Management System (DBMS) technology to make mathematical modeling to the coordinate storage,

positioning, searching, and attributing information of the urban entity; adopted 3D panoramic imaging technology, graphics engine model technology, and SM real-time interactive technology to implement a dynamic planning platform of electronic map for outdoor advertisement with the expression method of three-dimensional diorama following the path of the advertisement releasing contents and positions. The times and urban backgrounds are very clear. Web GIS is the product of Internet technology applying to the development of GIS (Geographical System). GIS can be extended through the functions of WWW and become a tool actually used for the public. From any node of WWW, Internet users can browse the spatial data in the Web GIS station to make the thematic map, conduct various spatial researches and analysis and, thus, make GIS enter into thousands of households.

## 2 THREE MODELS OF THREE-DIMENSIONAL STEREOSCOPIC PLANNING

The three-dimensional and stereoscopic planning of the urban outdoor advertisement includes the two-dimensional outdoor advertisement model, three-dimensional outdoor advertisement model, and Web GIS model.

### 1 Basic Functions of the Two-dimensional Outdoor Advertisement Model

- 1 Figure Pulling Function: figures can be pulled out according to the sheet designation of 1: 500, 1: 100 and 1: 2000 in this region. This function can also find the corresponding location on the local background figure by the fast research of geographical names and draw a box on the figure with the mouse and pull out the outdoor advertisement figure within the box scope.
- 2 Task Management Function: In the task, this function allows people to conduct random operations (such as compiling rules and designing drawing) to the figure according to different requirements and store them without influencing the data in the database; it can also invoke previous tasks to complete the business required.
- 3 Display Functions: Display and hide the operating targets and display and hide the geographical background targets.
- 4 Query, Search and Report Functions: In GIS system, people can query the targets according to custom conditions and generate reports.
- 5 Data Updating and Maintaining and Aided Designing Functions: With this function, people can complete the inputting and editing of figures and attribute data and designing of outdoor advertisement figures.

### 2 Functions of the Three-dimensional Outdoor Advertisement Model

- 1 Founding and Editing of the Three-dimensional Outdoor Advertisement. It is convenient to complete the inputting (scanning and digitalizing) and modifying of the outdoor advertisement drawing; to input various outdoor advertisement and equipment information; to intuitively express and display corresponding types of geographical data with dot, line, zone, color, and map symbols confirming to standard specifications and generate, manage, and display various hierarchical maps, vertical and horizontal profiles, and three-dimensional stereogram that users need and automatically mark and zoom the generated figures. People can also hierarchically organize, manage, and query various information.

- 2 The information query and space analysis of the outdoor advertisement include three methods of clicking query, drop-down box query, and attribute query. As long as users click the dot or section of the outdoor advertisement that they need to query in the map, all kinds of the attributes of the dot or section of the outdoor advertisement will be displayed such as the content, size, effect, and attachments. The figure positioning mainly includes three manners such as sheet positioning, coordinate positioning, and street name positioning. It can timely and accurately display the positions of various outdoor advertisements in the map. As long as the users input the sheet designation for positioning, XY coordinates, street name, and the outdoor advertisement to be positioned, the system can quickly display corresponding views.

- 3 Statistic Analysis: The system can make analysis and statistics of all kinds of information and provide the decision support for administrative departments. It can automatically generate, display, and output documents, forms, and thematic maps.

- 4 Three-dimensional Navigating of the Outdoor Advertisement. It can fly and navigate along with the arrangement direction of the outdoor advertisement.

### 3 Web GIS Model

- 1 It can release the figure data and its attribute data for the two-dimensional and three-dimensional outdoor advertisements mentioned earlier on the website.
- 2 With Browser/ Server structures, people can adopt IE or other Browsers to browse the two-dimensional and three-dimensional outdoor advertisements and the landscape scenery along the way.

- 3 It can realize the inline interactions such as zooming in and out, translation and rotation.
- 4 It can realize the online searching of figure and attribute information.
- 5 It can realize the online navigating query, analysis and maintenance functions. With the Web server, people can release the information of the outdoor advertisement here, introduce the virtual reality technology into the planning field of urban outdoor advertisement, and fully apply characters of the digital three-dimensional city, such as flexible man-machine interaction, real construction space feeling, large-area three-dimensional terrain simulation, building elevation of the outdoor advertisement, and fixed-point effects simulation and other characters, which will surely present a new appearance to the planning of the urban outdoor advertisement.

### 3 THREE-DIMENSIONAL PLANNING GOALS OF THE URBAN OUTDOOR ADVERTISEMENT

The object scope for the three-dimensional planning of the outdoor advertisement includes independent outdoor advertising equipment such as console mode advertisement, anti-aircraft gun advertisement, and urban furniture and attached advertisements such as roof advertisement, façade advertisement, and shop signboards. The three-dimensional planning of the outdoor advertisement is based on Web GIS technology. In the virtual 3D cities, various outdoor advertisements attached to the main constructions at the road sides are inlaid into the planning schemes and illustrated. The specific planning goals should include clearing the specified indicators for the outdoor advertisements, which mean that in the planning, designing, and setting of the outdoor advertisements, people should strictly follow the controlling elements, including four indicators such as the position, area, interval, and density.

The instructive indicators to establish the outdoor advertisements refer to the controlling elements, including four indicators: color, material, lighting, and model, which should be adopted during the planning, designing, and setting of the outdoor advertisements.

- 1 **Balancing People’s Requirements:** It provides people with a comfortable environment; historic preservation comes along with the city; protects and strengthens traditional customs in the city; protects the valuable historic elements in the city and carry forward.
- 2 **Integrating and Synthesizing Functions:** It provides convenient integrating and synthesizing functions for office, shopping, service, living, and cultural

- 3 **Reflecting Artistic Values:** Advertising forms or environmental artistic forms reflect the characteristics of times and are suitable for urban functions; they create the overall beauty of the city. The overall concept is the basis for beauty appreciation. There is no individual beauty and only the overall beauty is the true beauty. Dots can be integrated to form the overall concept of cities.

### 4 KEY TECHNOLOGY FOR THREE-DIMENSIONAL PLANNING, EXAMINATION, AND APPROVAL OF OUTDOOR ADVERTISEMENT

The network frame of the planning, examination, and approval system for outdoor advertisements is show in [figure 2](#). The system entirety is deployed at the Government Administration Extranet. All two-dimensional and three-dimensional geographical information involved in the system can be called for the basic data in the system through the API interface in the public service platform; while the planning data of the outdoor advertisement is deployed inside of the Administration Department of Afforestation and City Appearance and it is managed and maintained by the Information Center of Afforestation and City Appearance.

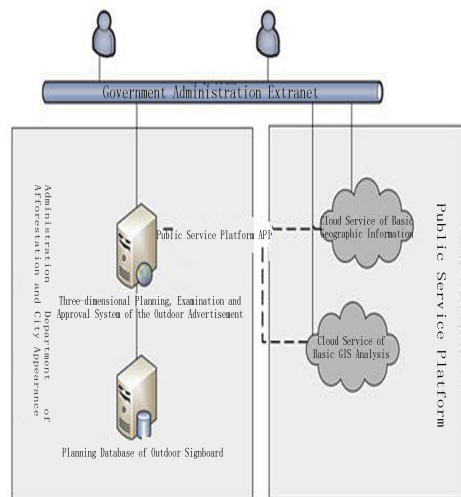

Figure 2. Network structure figure of the planning, examination, approval, and management system.

Targeting at the requirements for the planning and management of the outdoor advertisement, the system has realized the data superimposed analysis of the outdoor advertisement, and it has queried the planning of the advertisement post-attribute and the three-dimensional landscape review for the planning of the outdoor advertisement.

## 5 SUMMARY

With the economic development, building a harmonious and ecological city has become the primary goal and important task for every urban management department. The construction of the harmonious and ecological city cannot leave the excellent shaping of the urban landscape. As an important carrier of the urban landscape, the outdoor advertisement and constructions in the urban commercial zones are intercrossed and combined in different times and spaces. Three-dimensional planning study of the urban outdoor

advertisement on the basis of WebGis is aimed at creating the urban quality and good urban space. It carries out landscape planning to the outdoor advertisement in the urban commercial zone. It is the important way to purify the urban landscape, improve the urban influence, enlarge the urban expression, and mold the city's unique charms, and it is the inevitable requirement to the building of the harmonious and ecological city.

## Enlightenment and teaching reflection of digital media technology to the education of modern graphic design

Ru Hong Xie

*Art School, Shandong Women's University, Jinan, China*

Mu Sen Liu

*Art School, Qilu University Of Technology, Jinan, China*

**ABSTRACT:** With the development of information network technology, the digital media technology has been widely applied to social aspects, which makes an impact on the teaching contents, methods, measures, and processes of the modern graphic design. Not satisfied with previous teaching of knowledge and skills, graphic design education should pay more attention to the thinking manner and process, and it should lead students to establish new thinking habits. This thesis reflects and states the meaning of the reform to the educational model of the modern graphic design in the environment of information network technology. During the changing and reforming period for the graphic design education, people obtain thoughts and enlightenment and thus set up new models for the teaching of graphic design.

**KEYWORDS:** Information Network Technology, Graphic Design Education, Digital Media Technology.

As one of the information technologies with the fastest development speed, computer network technology nowadays has become the necessary measure for all industries to obtain information because of its features of high speed and great capacity. The term "New Media" is used to describe various digital media that appear in recent years, including social network, games, mobile equipment, and other media communication channels in digital forms. The continuous development and advances of new media are the requirements of the era; however, Chinese higher education institutions still take graph, design, advertisement, and television as the principal axis of the graphic design education currently and they still follow traditional thinking ways for teaching. Faced with the impact of these new technologies, how should we reform the teaching contents, methods, and measures of the modern graphic design to promote its own development?

### 1 DEVELOPMENT AND APPLICATION OF MODERN DIGITAL MEDIA TECHNOLOGY

The information network technology with high development speed is changing our lives and impacting our sense organs. Information spread by new media brings great changes to people's lives, and the information network technology has made a great influence to the process of human civilization in the new century.

- 1 It is the fourth media with the interactive communication information by visual and auditory senses. Digital media technology is the fourth media that appears after the paper media (newspaper, book and magazine), broadcast, and television and it is a new stage for graphic design. The appearance of digital media brings people into a gorgeous virtual world. Pictures, music, animation, and many other forms assist in displaying the information content, which makes the picture beautiful and straightforward with combinations of picture and word, voice and affection, and it is more pleasant and humanized; simultaneously, new messages and frontier information are updated quickly that no matter from the aspects of leisure and entertainment or obtaining information, they can well satisfy the needs of users.
- 2 The digital media technology is developing and enlarging with the assistance of science and technology. Traditional items are also reviving with the "shell of science and technology." The audio-visual technology, digital technology, and network technology brought by the digital media technology maximally satisfy the requirements of people's sense organs. The digital media technology is profited from the crossing functions of multiple subjects such as computer, network, and software, and the audio-visual effect is combined with traditional arts; for example, graph, sculpture, music, dance, drama, and film, which are the deep

integration of classic arts and contemporary digital technology. Take the digital media technology for example; digital films are developing quickly, and in films, the audiovisual effects and momentum of large-scale scenes will be greatly weakened without the application of CG special effects. The famous director, Cameron, once said that, "we will enter the new era of filmdom by adopting 3D technology to make films, and people will enjoy scenes with special effects unreachable by any technologies before the digital time."

- 3 Development of the digital media in the new era and requirements of the new era for the graphic design: changes of medium bring the appearance of many new media forms. In recent years, "digital paper" is first seen in Japan. It can transfer every advertising board, signpost, or hanging movable advertisement into digital screens and provide diversified materials and marketing functions close to websites. Words and audiovisual messages can contact consumers crossing regions, even including those places that previous traditional graphic designs cannot reach. All of these show that our graphic design space is changing from monomedia to multimedia and from two-dimensional plane extending to three-dimensional spaces. Therefore, not satisfied with previous teaching of knowledge and skills, graphic design education should be better combined with the network era, lead students to focus the design basis, and establish the observing method and thinking habits of the new media.

## 2 PROBLEMS EXISTING IN MODERN GRAPHIC DESIGN EDUCATION

In nowadays, the market competition is fierce, and the improvement of the graphic design level is taken as the measure to promote the market competitiveness no matter whether in the domestic sphere or in the world. The functions of graphic design are continuously enlarging from newspapers to magazines, television to network, brand to packaging, and advertisement to image design. The influence of graphic design has involved various aspects and industries in social life, which accelerates the competitiveness of graphic design industry.

The problems that existed in contemporary college education of graphic design are as follows: 1. The positioning of graphic design subject and major is not clear. 2. The education system of graphic design is not complete. 3. There is reforming limit of the graphic design education faced with trends of times. 4. The aim for design education is to improve the students' abilities of creative thinking. 5. The education of graphic design lacks the cultivation of the operational capacity for actual design. 6. Chinese education

reform of graphic design will be developed by different levels from popularization to specialization. The stuffy model of the education contents and structures should be changed, and great reform should be made according to the society and market to bring the change of new technologies, thoughts and designing ideology. The quality-oriented education reform for the new type of graphic design is of great urgency.

## 3 EXPLORATION OF EDUCATION REFORM TO GRAPHIC DESIGN UNDER INFORMATION NETWORK TECHNOLOGY

Paul Devautour of École Nationale Supérieure d'Art de Bourges in France indicates that "all art fields have been influenced by network and we can say that computers change our traditional arts. We are more used to making previous arts with new tools and new things will appear after only a little change." For adapting to the rapid development of digital media industries, the system of college graphic education should organically integrate their respective educational resources and actively explore the interdisciplinary teaching though the complementation of advantages and characteristics to promote the interdisciplinary talents cultivation of the digital media. "Take capacity cultivation as the purpose and employment as the orientation and follow the path of university-industry cooperation development" is the thought and position for reform of the disciplinary talents cultivation model of digital media.

### 1 Conclude Education Subjects and Establish New Systems

In educational concept, the field of digital media should be perfectly combined with computer technology and graphic design to cultivate interdisciplinary talents that meet the requirements of social development and cultivate a great number of practical and internationalized technical talents on digital media design in different levels; demand-oriented and open-ended school running should be taken as the guiding ideology and fearless exploration and practice should be carried to the school-running mechanism and teaching model. Basic courses of graphic design should be studied to cultivate the student's humanistic quality and motivate creative vitality. Great importance should be attached to the basic research to the design, and an attempt should be made to combine Chinese culture with international modern design.

### 2 Changing ideas is the premise of implementing the creative education.

The most important educational problem in graphic design is to establish students' concepts of modern graphic design. In the two-dimensional or three-dimensional spaces during the practical

process of design, designers should spread their limitless imaginations and achieve the aim of accurately conveying and communicating messages. The practical experiences of teaching tell us that students with a stronger art modeling ability have richer imagination. As a result, the college system for graphic education should take the implementation of creative education as the premise and change students' designing concepts and habits of information technology application.

### 3 Add Soul Elements to Traditional Industries

The teaching contents of graphic design should be rich and colorful. The types and forms should closely follow the pace of information network technology, reflect the characteristics of information network technology, and help and lead students to find the accurate breakthrough point of design. The right leading and cultivation of teachers can add soul elements to traditional industries, break stiff thinking ideas, motivate students' creative passions, develop students' perceptions to a new phenomenon and new things, and, thus, help students create good works.

### 4 The teaching of graphic design should face the globalization and seek for differentiation.

The challenge that the teaching of graphic design is facing in modern China is the network environment brought by the digital media. It should face globalization and seek differentiation. We need to improve the position of originality, which is the soul element, and realize the recreation of value with cultural originality. If the creative industry can be combined with other industries, it can surely create the effect that  $1 + 1 > 2$ . The teaching of graphic design should take talents cultivation of digital media as the core, highlight the interdisciplinary capacity cultivation of computer technology and art, and set the highly qualified and skilled interdisciplinary creative talents with the combination of computer technology and arts as the goal. The teaching should be closely connected with the requirements of social development and

digital media industry. Colleges should become the cultivation cradle of creative talents in the majors of digital media technology, digital art design, and animation and the foundation for college students' innovative experiments and teaching practices.

## 4 CONCLUSION

Chinese economy is entering into the new developing stage. We can say that "design" in the future is the important core competitiveness for a country and the rise of innovative industry will surely drive the rapid development of the whole economy. Innovative thoughts must be adopted to re-imagine and reconsider the way of Chinese graphic design to integrate into the world, face the needs of modern society, create values, inherit cultures, and excite lives. Graphic design has been transferred from static expression to dynamic delivery, crossed from monomedia to multimedia, extended from two-dimensional plane to three-dimensional space, and transformed from traditional printing and designing of products to spreading of virtual information and images. From this angle and requirement, a gap still exists in our graphic design nowadays. Making the graphic design education keep pace with the change and development of the era is closely connected with the realization of the national policy and goal of an "innovation-oriented country."

## Research on the accounting risk and control strategy in network environment

Teng Fei

*Business School of Central South University, Changsha, China*

**ABSTRACT:** Due to the application of computer technology and network communication technology, we make an accounting risk of the new changes. Open the main reason accounting risk formation is authorized to alter the way under network environment, separation of duties is not sufficient, under the network environment changes the way business records and the network environment, and business operation loopholes etc.. This article mainly introduces the main means using the computer fraud and the formation of the risk, and then is based on the analysis of the methods to control these risks and measures.

**KEYWORDS:** Accounting risk; Network environment; Information construction; Control these risks and measures.

### 1 INTRODUCTION

With the development of computer technology and network communication technology, the network accounting information system has become increasingly popular; the application of computer network technology and the corresponding security technology, which is based on electronic commerce, network platform and remote management is gradually accepted by people, and developed quickly.

In the face of enterprise accounting, information network environment includes two parts: One is the external network environment of enterprise, and another is the internal enterprise network environment. The open Ding - network has brought a qualitative leap simultaneously to the management of the enterprise, and it also has brought the use of high-tech crime opportunities for high intelligent thoughts not healthy, especially a few large enterprises, finance, securities and other accounting personnel, obtain ill gotten gains using the network defects, caused a great loss to the state, the collective, or other enterprise. Therefore, how to effectively control the accounting risk under network environment has attracted more and more attention. Now, let us talk about a few view risks of accounting service under the network environment and control measures.

### 2 MAIN MEANS USING THE COMPUTER FRAUD AND THE FORMATION OF RISK

Authorized the way change, increasing the possibility that the accounting personnel and relevant personnel

fraud: In the traditional accounting system, mainly through the transaction authorization signature has administrative privileges to handle on the internal control. The traditional way, although the efficiency is low, but because of the book and signed and sealed procedures carefully, transfer process, and can play the role of mutual supervision, so it can effectively prevent the accountants cheating. In the network system, transaction authorization is often embedded in the program with a password trigger procedure that is completed; the authorization process has the characteristics of automation. In addition, under the network environment, authorization is often done in the design and implementation of network system; the licensing process is not obvious; and managers find it hard to control effect evaluation of authorization of transactions, so that the possibility of accounting personnel and relevant personnel fraud increases.

Under the network environment, the separation of duties is not sufficient, so that the internal control difficulty increases: The role of internal control is to urge enterprises to effectively achieve business objectives, provide reliable financial statements and information, and ensure that all procedures are in compliance with the relevant laws and regulations. The enterprise accounting department documentation, audit and management, and information system development, maintenance, operation, and other activities should be separated from each other, but for small and medium-sized enterprises and some lack of manpower accounting department, to achieve full separation of duties, there are certain difficulties, resulting in the enterprise implementation of computerized accounting, operations are mostly operated by

the same people completed, this will give the illegal operation has created opportunities, which brought to the enterprise operation risk.

Changes in business record mode of 3 under the network environment make the audit work harder: Under the network environment, the manual ledger, journal does not exist; voucher data are stored on magnetic media; financial treatment process is automatically completed in the computer; visible to the naked eye, audit clues are greatly reduced; and the accounts are checked to the past now convenient, this gave the auditing workers brought difficulty.

Network environment is the accounting information and it is very difficult to avoid the illegal intrusion, the external control difficulty increases: The Internet is an open environment, whether it is IT or in a local area network, wide area network, network environment with all information in theory is accessible, unless they are physically disconnected connection. Therefore, the accounting information system under network is very vulnerable to unauthorized access, even hackers and viruses. This attack may come from outside the system or may come from within the system, and once that happens, it will cause huge loss.

This is the most common method in computer fraud. Fictitious business data; modify the business data; delete transaction data. Alternative input: This fraud is mainly due to the weakness of internal control as follows: one is the division of responsibilities that is not clear, incompatible duties without the proper division of labor; two is the contact control is not perfect; three is no strict operation permission control; and four is not complete control log. If this kind of control method is not perfect, it is because there is no fraud molecular evidence left of fraud and of doing as one pleases.

Stolen or tampered with commercial secret, illegal electronic funds transfer and data leak: Leak to the accounting data mainly refers to the system user or data storage staff to the enterprise accounting information through the disk, tape, or CD to reveal the network media to rival; eavesdropping or tampering with the business secret is the system of illegal transfer of user information, the use of abnormal means of obtaining enterprises' important secrets act. Since the transmission route of data information in the transmission process is random, it may thus means eavesdropping, wiretapping, physical induction password test, information theft, and counterfeiting identity fraud. The data in the output process, cheating can put the sensitive data hiding in the output report had the problem of.

Modification programs: "Tamper" refers to the procedures for illegal changes to procedures, to achieve a certain purpose of fraud. This kind of fraud is mainly done by using the following internal control weaknesses: a) computer and user departments'

separation of duties is not appropriate; b) the development of control system of strict; c) system maintenance of strict control.

### 3 COUNTERMEASURES TO STRENGTHEN THE ACCOUNTING RISK MANAGEMENT

To carry out the outlook on life, values education should be given. Under the market economy, strengthening the accounting personnel of the ideal and life outlook education are very necessary. Enterprise accounting work leadership should pay close attention to the accounting personnel, especially the concept of dynamic, important position of staff behavior change and job status, patiently do ideological work to change the backward financial personnel, be timely for resolving the difficulties in life and work, so that each of the accounting staff maintains a good attitude. On the important position of accounting, personnel should strictly conduct periodic evaluation, continuous rotation; timely will not be suitable for accounting personnel transferred from the accounting post. Two is to carry out the risk awareness education. To reverse the accounting, the department has been emphasizing accounting, light regulation of thought will prevent the accounting risks referring to an important position to catch up; the daily accounting business in the non-normal circumstances should be vigilant and careful investigation should be done to prevent the occurrence of accounting risk.

Perfecting the accounting system is to strengthen the risk prevention, basic links to the accounting work. The enterprise internal accounting control according to the effective, comprehensive, timely, and effective principle, standardized business operation, solve the accounting system lags behind relatively caused the problem, enterprises should regularly revise and improve the accounting rules, a new accounting management approach promulgated, it is necessary to timely carry out investigations and studies, timely supplement and improvement to the the enterprise accounting system. Due to the strict implementation of the accounting system, the enterprise internal control is in the center, and it established a relatively perfect accounting system; the key is to implement the plan. For the illegal operation of the staff, regardless of whether they cause losses, they should be held responsible for serious losses.

To the extent possible, the existence of the business risks included within the scope of accounting norms. From at present has issued China accounting standards, although has been the International Accounting Standards Board approval, but it contains the content or incomplete, this has become the problem of accounting standards in china. For example, our country about the financial instruments

accounting standards, even if made up of our country never regret exclusively about recognition of financial instruments, accounting measurement standard, but compared with the international accounting standards, China's accounting standards of financial instruments have many shortcomings. The international accounting standards fully take into account the new risk management concept of financial instruments disclosure requirements, combining recent risk of enterprise in the world entity measurement tools, disclosure mechanism, and the risk that enterprises suffer due to the use of financial instruments being more transparent; they help provide better quality information to investors and the financial report users, which is conducive to the actual operating performance of enterprises and accounting risk and for making more scientific and reasonable judgment. Visible, the international accounting standards are very focused on the financial instrument to the entity's financial status, financial instruments risk, and the extent of the impact of disclosure. We should continue to improve the work in this area, to expand the scope of regulation of accounting risk, so that accounting can better discovery and management of enterprise accounting risk.

#### 4 CONTROL METHODS AND MEASURES OF ACCOUNTING RISK UNDER THE NETWORK ENVIRONMENT

a. Control for the information management of risk. Process 1 business restructuring: Establish a scientific and reasonable system of internal control: whether it is developed by the enterprise accounting software, or purchased software, in the construction of enterprise accounting computerization system must carry on the business process reengineering. Be especially on the core part of the business process is added in the control means, the implementation of the internal control system. In addition, business process reengineering must also have appropriate information systems for support and maintenance. 2 is formed by multi contain online notarization: because the original document under the network environment is still as data stored on magnetic media, leaving no transaction tracks available for inspection. To strengthen the control of the "intangible" of the original certificate, a feasible approach is taken by the multi contain online notarization, namely the use of the function of real-time transmission and Internet authentication organization network to receive the digital signature and the private key. 3 separate monitoring and operation, realize the effective containment of the internal system: an effective approach in computerized system

separate the operation and monitoring of two jobs, while multi backup for each transaction. When the accounting personnel of accounting treatment, the operation data were also simultaneously recorded in the monitoring personnel on the machine, by the monitoring personnel immediately or periodically reviewed, so as to find problems in time; this is clearly a post division, and realizes the effective containment. 4 realize the online test software, timely solve possible gaps: for example, computer software, its internal errors, or shortcomings cannot be avoided. Therefore, the solution of only two: one is to strengthen exchanges, in the development process to fully test; two is in the found problems solved in time. In network times, even thousands of miles away can also establish a connection in a few seconds, real-time and high quality communication or transmission of software. To solve these problems, it brings convenience. If a problem is found, we can notify users through a timely and online update, the existing control in the shortest possible time of BUG, and improve the robustness of the system.

b. Control sub network of environmental risk. 1 physical prevention measures: to establish a computer network reliable accounting system, and establish the network computer room and equipment management system of job responsibility and operating procedures. No not contact system, do a special plane, key hardware device to adopt double backup system. 2 data encryption measures: data encryption is one of the most basic protection technologies for preventing the distortion of accounting information in network accounting. 3 software control measures: installation and modification of strict control system software, the system file attribute can take the hidden, read-only encryption measures, such as authority, password confidential access to one operating point or use the network settings of the software, to avoid the documents, and accounting data are accidentally deleted or damaged. Simultaneously, to carry on the forecast to check periodically for system software. System failure requires emergency response, forced backup and rapid reconstruction, and rapid recovery of the function of the system software. 4 system intrusion prevention measures: to prevent illegal users of accounting system under the environment of network intrusion, can take port technology and firewall technology. The system adopts only allow information one-way flow of the router to protect local network, registered to the local net external users are not allowed. Thus, even a "hacker" is used to break through the door into the file server, because the barrier with a one-way to configure the router, it also cannot get into the local network protected in the.

- c. Operational risk control. 1 to strengthen the organization and management: strict control to formulate and implement the relevant accounting data input, processing operation system and procedures. Operation control common include: one is the implementation of classification authorized user rights management, establish the accounting information system under network environment to the post responsibility system; two is the strict rules of operation control; three is the strict control system development.

## 5 EXISTING PROBLEMS IN THE IMPLEMENTATION OF ACCOUNTING RISK MANAGEMENT

According to the comprehensive risk management system requirements, the four targets of the enterprise strategic target, target, and management should report the target and supervision target. According to the strategic objectives design of each business risk business objectives, clear reporting objectives to make reporting accurate and effective, made a clear regulatory objectives and ensure compliance. The enterprises of our country although there is a strategic targets, a clear business objective and reporting objectives and regulatory objectives, but the coordination of strategic objectives and the lack of overall business objectives.

Risk identification of enterprises is the combination of both past and future recognition technology, at the same time to the corresponding support as auxiliary tool. In order to improve the response speed of risk management and initiative, improve the economic capital allocation efficiency, we must establish the mechanism of risk identification system and systematic.

The perfect corporate governance structure is on internal control mechanism to be effective. The internal control of enterprises in our country has many problems, which mainly have four aspects: first, understanding of internal control of uncertain, incomplete, senior management self discipline is not enough; second, our country enterprise cognition deviation in internal control and development, the relationship between internal control and risk, focusing on the immediate benefits, catch grasping the scale, relax the prevention and management of risk, illegal phenomenon is serious; third, belongs to the branch control ineffective, task arrangement, light inspection management, lack of the implementation of internal control regulations, serious formalism; fourth, internal control rules and regulations are not perfect, assessment indicators, assessment content and method and

modern enterprise business development and risk control, do not meet.

In China, the focus of the work is still focused on the risk of post management, less control work in advance, against the risk of. At present, still lack the risk monitoring and early warning system of effective most enterprises, for the existence of blank on the early risk prevention.

## 6 CONCLUSION

To sum up, in the control of accounting risk under the network environment, we must strengthen the comprehensive accounting system in the programming, the front desk operation, backstage authorization, remote monitoring, and control each link of computer hardware control; continuously improve the general accounting practitioners' network risk awareness and prevention and control ability; avoid and eliminate information loss and operation risks; and ensure that the network under the environment of accounting computerization works to realize the sustained and healthy development.

## E-commerce curriculum development based on CGLC mode

Guo Rong Chen

*Jiangning District of Nanjing, China*

**ABSTRACT:** Electronic commerce post-course in a series of planned steps and methods is a marketed offer into four parts by CGLC mode Cognizance, Goal, Ladder, Cohesion. The curriculum development based on the “CGLC” mode refers to the following: Start by an understanding of e-commerce post-course in many aspects and establish the effective implementation of curriculum objectives; then establish an effective stepwise process of moving; simultaneously, we must form the concept “field” point of view and integrate a number of factors, to achieve the electronic commerce post-course goal.

**KEYWORDS:** CGLC model; Curriculum Development; E-commerce; Post course training; Education.

The meaning of CGLC mode: Founded by Mr. Chen Guorong, CGLC mode is being constantly refined, finished, and developed in a series of corporate training time from since 1997. The achievements of CGLC pattern are as follows: The official publication “CGLC career planning,” “CGLC professionals accomplishment,” “CGLC model of mental health self-help tutorials,” and other books, which were cited and developed by many researchers. Researchers have published papers and courseware officially and made some impact in the field of management practices and academics.

Electronic commerce post-course in a series of planned steps and methods is a marketed offer into four parts by CGLC mode: Cognizance, Goal, Ladder, and Cohesion. The curriculum development based on the “CGLC” mode refers to the following: Start by an understanding of e-commerce post-course in many aspects and establish the effective implementation of curriculum objectives; then establish an effective stepwise process of moving; simultaneously, we must form the concept “field” point of view and integrate a number of factors, to achieve the electronic commerce post-course goal.

Recently, on the post-curriculum development of e-commerce, application of the CGLC model has good has good adaptability and maneuverability. The meaning of this topic: Make post-curriculum development of electronic commerce a working process; the result of the blueprint of the process is to form a series of implementation plans for electronic commerce post-teaching training.

### 1 COGNIZANCE, RECOGNITION, AND KNOWN FOR ELECTRONIC COMMERCE COURSE

Electronic commerce is mainly composed of three parts:

- 1 Information transmission system, namely the hardware infrastructure, which is the information transmission route provided by different network together;
- 2 Transmission of information in the system (software);
- 3 The business activities of receiving, processing, and production of information again.

These three elements the core, and the key are still the business activities of enterprises. Only the information produced by enterprise operation and management activities can be effectively spread and used, in order to create business value.

Through research and analysis of electronic commerce, enterprise of choose and employ person, it implies that, according to the specific business types and the different positions, there is a need to master the knowledge and ability; have the corresponding quality; and the quality also varies. See the following classification:

- 1 Technical categories: e-commerce platform design (site planning / editor), e-commerce website design (web design / developer), and e-commerce platform art design (websites artists).
- 2 Business categories: enterprise network marketing business (network marketers), online international trade (foreign trade e-commerce personnel), new network service providers of content services (site operator / supervisor), and e-commerce support system of promotion (website promotion staff): Responsible for sales e-commerce system and providing e-commerce support services, customer management, and e-commerce business.
- 3 Comprehensive categories: e-commerce platform integrated management (e-commerce project

manager), integrated management of business e-commerce (e-commerce manager).

## 2 GOAL, SET GOALS OF E-COMMERCE COURSE CONSTRUCTION

Customer needs, customer value, customer loyalty, integrated marketing, marketing positioning, and global marketing concept were widely circulated in the country, and gradually became popular; many companies have been or are into the “customer-oriented” enterprise transformation. Development of electronic commerce curriculum must be able to keep up with the development of the overall management of the enterprise target.

E-commerce training goal is intended to master the current Internet marketing communication channels operating techniques, skills, methods, and insights into the transmission channel of the propagation rules, laws, and marketing planning, data analysis ability, and practical ability of the network marketing talents.

Most companies place great emphasis on graduates for work experience, so the development of electronic commerce post-program will completely be carried out based on the working process of the spirit; let the students perceive workplace atmosphere in 3 years, and even real tasks directly using a year for work, and make up the lack of work experience or experience.

Specifically, higher vocational jobs for e-commerce professional counterparts: E-commerce commissioner, commissioner of foreign trade e-commerce, network information collectors, website management and maintenance Commissioner, website content editors, web shop C2C / B2C Trader, site art commissioner, online customer service, channel customers commissioner, product sales specialist / representatives, telephone sales representatives, sales assistants, and other positions. And according to the research, the university graduation e-commerce professional student's main jobs are as follows: website editor, the personnel of the service, network marketing staff, site technicians, and administrators.

Basic business capabilities: customer development and maintenance capabilities, e-commerce logistics and distribution business processing capabilities, website image processing capabilities, network formation and maintenance capabilities, e-procurement capabilities, negotiation skills, and business web design capability.

## 3 THREE, LADDER, ESTABLISHED GROWTH OF E-COMMERCE PROFESSIONAL LADDER

Including professions public course platform, professional qualifications and professional development

platform, professional foundation course platform (basic technology, professional skills training platform), and learning field curriculum four parts. Based on the current education environment and teaching conditions, simultaneously, in order to guarantee the students' ability of diversified development and sustainable development, through professional field platform of public courses, professional foundation courses and professional development courses platform, professional foundation course platform, and basic technology, the professional skills training platform of the three platform to support learning field curriculum.

The curriculum must match the task (process), according to the work needs to be divided into the specialized direction; design course according to the requirements of task (process), for students to experience the working process of the complete learning opportunities; and gradually play the role of transforming the learners to workers.

Curriculum content should serve based on the construction of ability. To form the organization of content of courses around the occupation ability, professional ability should be the center to integrate the corresponding knowledge, skills, and attitudes, to realize the unification of the theory and practice. To avoid the professional ability of the simple understanding for the operation skills, course content should reflect the professional field new knowledge, new technology, new technology, and new methods.

The curriculum should cover the requirements of professional standards, to choose the social acceptance, to the student employment and strong professional qualification certificate, specific analysis of the skill examination contents and requirements, optimize training conditions, improve the training effect, make the student of a certificate simultaneously, and obtain appropriate professional qualification certificates.

Professional courses include the following: electronic commerce foundation, image processing, web design, network formation and maintenance, e-commerce procurement, business communication and negotiation, e-commerce logistics distribution, and so on.

E-commerce is based on the teaching idea according to the working process. From the field of action, learning field to the conversion of the learning situation, it is also the concrete curriculum in the learning field; the electronic commerce professional occupation ability closely, in the scenario design, pays attention to students' practical ability, training objectives and teaching content of the learning domain description, for the creation of a learning environment to be able to let the students' ability reach the target described and to cover the teaching content.

According to the selected carrier, for each field of study “learning environment” for the design, in the selection of learning situation to consider student’s cognition rule (from simple to complex) and occupation (to the growth rule of experts from the apprentice).

Design “learning situation” and “Learning environment design.” According to the choice of “learning environment,” learning fields provide, in accordance with the “learning environment” name, professional name, learning time, occupation ability of action, professional content, teaching theory, and teaching methods of suggestions, in the content, more specific, developed the field of learning environment based on learning.

#### 4 COHESION, INTEGRATION OF CURRICULUM-RELATED FACTORS

Integration is action oriented. From the organizational form of teaching, action-oriented learning is always in a specific situation of team learning, and it is conducive to the development and promotion of students’ interaction ability, self reflection and action regulation ability, and collaborative learning ability. In the teaching process, we should establish the subject status of students in teaching and learning activities, emphasizing student-independent autonomous participation in plans to complete learning activity process of evaluation, help in forming the student comprehensive analysis, timely decisions, and systematic problem solving skills. Based on the selection of teaching content, we should break the bondage of the teaching course of classification, according to the needs of the development of ability to act; inculcate the flexibility to arrange learning content, organizational learning activities. Do not pay attention to the integrity of the teaching content but emphasize the teaching of “unconventional” cross-major (e.g., project teaching), and give demonstration study, the generative learning, and discovery learning activities more significance.

Action-oriented learning can promote the expansion of cooperation between different professional

teachers and training teachers and promote the school to a better cooperation and training base.

From the perspective of “student-centered” learning, the learning areas covered by the “action field” were analyzed, and the collect and design the corresponding “situation” (such as tasks, projects, case, etc.). When collecting and during design learning situations, always pay attention to the working process of the principles of integrity, that is to say, a learning situation must include information, decision-making, planning, implementation, inspection, and evaluation of 6 process.

The implementation of the “learning situation” of each selected teaching method put forward the implementation of each “learning situation” need of the environment. For each learning situation, some can be implemented in the classroom, some can be implemented in the laboratory, and some need to be carried out in the enterprise’s real working environment, which requires design and development of learning situations and a clear learning situation of the implementation of the environment. A full range of assessment in the assessment and evaluation of student ability: evaluation combined with theory and practice, combined with the results of simulation and field, and the process of combining dynamic and static combinations, professional achievement, and ability, according to the structure of the combination of education examination and for the graduation examination combined structure.

Carried out in accordance with the CGLC pattern, the curriculum development of electronic commerce can adapt to work in the field of requirements, determine the learning areas, and design learning situations, through effective feedback and integration, to achieve the teaching goal.

# Modeling property price along the metro lines in China

Y.G. Xu & G. Cheng

*School of Management, Xi'an University of Architecture and Technology Xi'an, China*

**ABSTRACT:** Since the reform and open-up, the national economy of China has made a great development, and so has China's urbanization progress. After the quick increase in population comes the growing severe congestion of transportation, which accordingly leads to more difficult commutation for the working class. In some metropolis, such as Beijing and Shanghai, traffic jam is not a surprising thing nowadays. For merits such as fastness, convenience, safety, and so on, the subway has become the core of the urban public transport system. Meanwhile, China's real-estate market has been undergoing a rapid development since the market-oriented reform. In this background, this article takes Metro Line 1 program for an example and exploits the Hedonic Price Model to analyze the distribution traits of real-estate prices along the metro lines, having testified the metro's appreciation effect on the property price. In the end, this article summarizes the general laws of the metro's influence on the surrounding real estates and proposes some proposals aiming at municipal development, metro construction, and real-estate development.

**KEYWORDS:** Real estate price; Metro transportation; Hedonic Price Model; Real estate values.

## 1 INTRODUCTION

Socioeconomic development and urbanization process is escalated while being led by China's reform and open-up policy, as well as the hyper-density development and population flocking in the downtown badly increases the traffic flow. In addition, economic radiation of the center area to the outer city stimulates the demand to long-distance transport as well. Urban Rail Transit System, as one kind of fast, effective, safe, and unpolluted public transport, possesses great significance to ease the transportation pressure and initiate a new developmental pattern. As one way among them, the subway has incomparable advantages. Nevertheless, the high cost and strict geological conditions demanded make the metro to not be as common as cars. Viewing the development history of metros, the exterior benefits brought by the metro development have not been converted and employed efficiently. Put it in another way, most metro operations do not realize positive profits. Actually, as far as I have known, only Hong Kong metro firms can get operating profits so far in the world. They make joint development of metros and the real estate and earn money through appreciation of the property caused by the metros. Consequently, the metro is closely associated with the real-estate development. This article researches the regulations between the metro development and the real estate, and it is very meaningful to adjust the transportation plans and municipal function structures, as well as the real-estate market bloom.

## 2 MODEL ESTABLISHMENT

### 2.1 *Variables settings*

The factors affecting the property values generally include four facets: economics, location, neighborhood, and structures. Economic factors contain the economic status, saving and investment levels, and price variation and interest rates; location factors include market supplies and demands, relative location and transport convenience degree; and neighborhood includes environmental factors, community humanities, streets, and the demographic equality and public facilities. This article mainly considers how the metro affects the property values, so just take the neighborhood and the structural traits of the house itself as major comparative variables, and macro-economic factors and consumers' purchasing power do not count. Based on the earlier considerations, the variables are finally decided to be the distance from metro station to the house, real-estate price, the distance from main roads and stations to the house, the distance from shopping centers, hospitals, parks, and schools to the house, decorating degree, plot ratio, and greening rate.

### 2.2 *Collection of sample data*

The houses this article dealt with are along the metro stations and transacted after 2008, and the price is the current value of the dealing price. Other detailed data comes from the Internet.

### 2.3 Election of model variables

Out of too much primitive data to be analyzed, this article extracts three factors, respectively, being location, neighborhood, and structures, considering them as the variables of real-estate price.

Table 1. Variables of real-estate price.

Variables	Content
MR/m	The distance from a certain house to the nearest metro station
BU/m	The distance from a certain house to the nearest bus station
MS/m	The distance from a certain house to the nearest main road
CO	Comprehensive values of structural factors
AR	Comprehensive values of neighborhood factors

### 2.4 Model analysis

Through data processing, we get the model of metro station effects on the house price as given next:

$$\ln P = 9.57341 - 0.0003MR - 0.00054MS + 0.2627ICO$$

Seen from the formula, all the coefficients possess logic with theoretical expectancy. The coefficient of MR is negative, denoting that the price has a negative relationship with the distance from the nearest metro station, namely, assuming other conditions are not changing, the longer distance between the house and metro station, the lower the price is. The value of MR is  $-0.00031$ , and that means under other conditions that are not changed, every meter the house moves to the station would lead to the price of per square meter increase by 0.031%, representing appreciating effects of the metro station. In the same way, the variable of MS has a negative relationship with the price. The variable of CO indicates that the better the quality is, the higher the price is, presenting a positive relationship between the structure and the price. What needs to be noticed is that the model gets rid of the BU and AR, two variables in the calculating course, as a result of unnoticeable effects.

## 3 CONCLUSION AND ANALYSIS OF MERITS AND DRAWBACKS

### 3.1 Merits and drawbacks

Urban metro, as a kind of efficient, inexpensive, high-capacity, and safe traffic mode, could highly

improve the accessibility degree of its built-up area. Besides, it can also stimulate economics in the district, which would inflate the real-estate price along the metro lines. The merits and drawbacks of this article are as follows:

- 1 This article introduces the research state of the influence that MTR lines exert on the real-estate price both here and abroad, and it points out that this kind of research is very mature in foreign countries whereas they were just starting in China.
- 2 On the basis of introducing the characteristic price theory, this article gave a real knockdown of how MTR lines affected real-estate price for us, and set Dalian city as an example.
- 3 We are aiming at simplifying the computational process the author has assigned to all the variations. But in the process of the assignment, the author has not well considered all the influence factors. In the future, more work should be done in the field.
- 4 The author has tried to systemically think about the appreciation of real estate from the angle of the time sequence, but unfortunately the data of real-estate price changes are not enough.

### 3.2 Research significance

This article revealed the numerical relationship between the underground traffic condition and the real-estate price and analyzed the mutual influence of the real-estate price and location. We then find rules in it; after that, the author used the rules to deepen the understanding of the real estate along MTR lines. For Dalian city, the research significance is as follows:

- 1 In city construction, land-use program and traffic planning are important parts of urban lives. And these two variations also influence the location and price of the real-estate industry so that research in this domain provides scientific support to the policymakers and makes great contribution to the sustainable development of Dalian city.
- 2 After the increased development of urbanization, the construction of the urban metro system has presented great positive externality. And quantifying this externality by using the data of the added value of the real estate along the lines is a kind of novel method, which makes efforts to formulate the urban layout in the future.
- 3 Improve and perfect the understanding of the influencing factors of the real-estate price formation mechanism and in the meanwhile discussing the roles that the urban metro system plays in the formation process of the real-estate price from the quantitative perspective.

#### 4 CONCLUSIONS

After the continuation of the housing system reform, the market-based degree of the real-estate industry is gradually increasing, and the value of the study is rising. Urban communication is one important influencing factor of the real-estate price. And the urban metro, as a newly developing mode of transportation, has played a more and more important role in this domain. But research on connection of the real-estate price and the urban metro development level is still insufficient, as the collection of market transaction data is not enough, which would lead to the great measuring errors in the long-term trend analysis.

In addition, summarization of the rule of the price and location is not so sufficient in course of the analysis of the real-estate price along the MTR lines, owing to the overabundance of the influence factors and the insufficient relevant knowledge reserve of the author.

As the urban subway system has an important influence on the real-estate industry, this article investigated and took the matter from the mutual influence of the estate price and location, thus reflecting the general rule of the distribution of the real-estate price and location. But it fell short in the domain of the dynamic changes of the two variations. In addition, economy, society and the system changes will also influence the association between the two variations, and this could also be the direction of further study.

# A new image denoising method combining the contourlet transform and partial differential equation

Rui Zhao

*Institute of Mathematics, Shangluo University, Shangluo, Shaanxi, China*

Ting Wang

*Shangzhou District Middle School, Shangluo, Shaanxi, China*

**ABSTRACT:** This article presents a new image denoising method combined with the contourlet transform and partial differential equation. The contourlet transform is first used to decompose the noising image into a low-frequency sub-band and a series of high-frequency sub-bands. Then, the threshold denoising method based on the inter-scale correlation is carried on the high-frequency sub-bands; after the inverse contourlet transform, a PDE-based approach is then iteratively used to obtain the denoised image. Experiments show that the proposed scheme can remove image noise effectively. Besides, it outperforms the existing schemes in both the Peak-Signal-to-Noise-ratio (PSNR) and the edge preservation ability.

**KEYWORDS:** Contourlet transform; Partial differential equations; Image denoising.

## 1 INTRODUCTION

Images are often degraded by imaging devices and external environmental noise when they are being collected, transformed, and transmitted. So most images in reality are noisy images. Research shows that in an analog image, with the SNR below 14.2dB, the probability of false detection is greater than 0.5% in the segmentation, and the estimation error parameter is greater than 0.6% in the parameter estimation. Therefore, image denoising is very necessary.

In the field of the computational harmonic analysis, wavelet is a perfect tool for one-dimensional (1-D) piecewise smooth signal and it can provide an optimal representation for these signals. However, this excellent characteristic in 1-D case cannot be easily extended to 2-D and even higher-dimension cases. These limitations of wavelet have led to the development of multiscale geometric analysis (MGA) theory. M.N.Do and Martin Vetterli (2002) proposed “true” two-dimensional sparse representations: contourlet transform[1].

This article presents a new image denoising method combined with the contourlet transform and partial differential equation.

## 2 IMAGE DENOISING BASED ON CONTOURLET TRANSFORM

As the latest development of wavelet transform, most image denoising methods based on contourlet transform have followed the wavelet denoising methods.

The wavelet de-noising related algorithm was proposed by Xu [2] (Spatially Selective Noise Filter, SSNF) and is a denoising algorithm based on edge detection of a representative. Contourlet transform has a similar characteristics, so the algorithm can also be extended to the domain of contourlet transform. After the outline of image wavelet transform coefficients after quite sparse, the large amplitude coefficient is relatively small, often gathered in the vicinity of the contour edges, and in between there is a certain correlation between the scale and continuity, the magnitude of most of the coefficient is close to 0[3].

The denoising algorithm based on contourlet transform with the correlation of scales is as follows:

- 1 Calculate the amount of each directional sub-band scale correlation contourlet coefficient. The product of the two adjacent directional sub-band coefficients corresponding to the spatial position on the scale as the amount of correlation, that is, the amount of correlation coefficients for sub-bands of the position  $(x, y)$  with the scale  $j$  and  $i$ -th sub-bands is as follows:

$$corr_{j,i}(x, y) = c_j^i(x, y) \cdot \max(c_{j+1}^{2i}(x, y), c_{j+1}^{2i+1}(x, y)) \quad (1)$$

- 2 After having normalized the related amount, making it comparable, we can get

$$corr'_{j,i}(x, y) = corr_{j,i}(x, y) \cdot \left( \frac{PC_{j,i}}{Pcorr_{j,i}} \right)^{1/2} \quad (2)$$

where  $PC_{j,l}$  and  $Pcorr_{j,l}$  are the scale of the energy coefficient and the corresponding correlation coefficients of the first two directional sub-bands:

$$PC_{j,l} = \sum_x \sum_y c_j^l(x, y)^2 \quad (3)$$

$$Pcorr_{j,l} = \sum_x \sum_y corr_{j,l}(x, y)^2 \quad (4)$$

3 For the position  $(x, y)$  with the scale  $j$  and  $i$ -th sub-bands, use the hard-thresholding model

$$c_j^l(x, y)' = \begin{cases} 0 & |corr_{j,l}'(x, y)| < k |c_j^l(x, y)| \\ c_j^l(x, y) & otherwise \end{cases} \quad (5)$$

where  $k$  is the decreasing power factor caused by the increases of scale.

When correlation coefficients are calculated, the number of adjacent scales generally takes 2 or 3. The weight factor ranges from 0.9 to 1.3.

### 3 IMAGE DENOISING BASED ON PARTIAL DIFFERENTIAL EQUATIONS

The basic form of image denoising model based on partial differential equations is as follows:

Let  $u_0: R^2 \rightarrow R$  represent the initial image,  $u_0(x, y)$  represents the ray value,  $t$  represents a time parameter, and then a partial evolution equation will be given as follows:

$$\frac{\partial u}{\partial t} = T[u(x, y, t)] \quad (6)$$

where  $u(x, y, t) :: R^2 \times [0, \tau] \rightarrow R$  is the evolutionary image, and  $T: R \rightarrow R$  represents the corresponding operator of a particular algorithm.

Let  $\xi f$  represent the result of the image  $f$  that has been processed by contourlet transform, and  $\xi$  represents the operator in this process. Letting  $T = \xi - I$ , we can get

$$Tf = \xi f - If = \xi f - f \quad (7)$$

and

$$Tu = \frac{u_{t=1} - u_{t=0}}{1 - 0} \quad (8)$$

Then, the partial differential equation based on contourlet transform can be represented as

$$\frac{\partial u}{\partial t} = Tu \quad (9)$$

Eq. (9) can be discretized as

$$\frac{u^{n+1} - u^{n-1}}{2t} = Tu^n \quad (10)$$

or

$$\begin{aligned} u^{n+1} &= u^{n-1} + 2tTu^n \\ &= u^{n-1} - 2tu^n + 2t(u^n + Tu^n) \end{aligned} \quad (11)$$

According to  $Tf = \xi f - f$ , we can get  $\xi u^n = u^n + Tu^n$  and

$$u^{n+1} = u^{n-1} - 2tu^n + 2t\xi u^n \quad (12)$$

And then, letting  $u^{-1} = u^0$ , we can get

$$u^1 = u^0 - 2tu^0 + 2t\xi u^0 \quad (13)$$

$$u^2 = u^0 - 2tu^1 + 2t\xi u^1 \quad (14)$$

## 4 IMAGE DENOISING METHOD COMBINING THE CONTOURLET TRANSFORM AND PARTIAL DIFFERENTIAL EQUATION

### 4.1 Steps of the algorithm

The steps of the image denoising method combining the contourlet transform and partial differential equation can be described as follows:

Initialization: First, let  $u^0$  represent the noisy image, then apply contourlet transform to the noisy image. Second, denoised high frequency sub-band coefficients according to Eq.(1)—(5), we can get  $\xi u^0$  by applying inverse contourlet transform;

Initial evolution: Get  $u^1$  by putting  $u^0$  and  $\xi u^0$  into Eq. (13), get  $\xi u^1$  from  $u^1$ , and then get  $u^2$  by putting  $u^1$  and  $\xi u^1$  into Eq.(13);

Evolution: Using iterative evolution according to Eq.(12), obtain the final denoised image at last.

### 4.2 Experimental results and discussion

To investigate the effectiveness of the proposed image denoising methods, we compare wavelet soft thresholding method (WT) [4], contourlet soft thresholding method (CT) [5], and the method combining the contourlet transform and partial differential equation (CTPDE) proposed in this article. In wavelet thresholding method and contourlet thresholding method, we employ 3-level wavelet decomposition and 3-level contourlet transform to the noisy image. The numbers of high frequency sub-bands in the 3 levels of contourlet frequency are 4, 8, and 16,  $Th = 3\sigma * \sqrt{n}$  var [6], where  $n$  var represents the deviations of the noised image.

Figure 1 shows the noisy Barbara image and denoised images. The test image is grayscale

Figure 1a is the noise-free image; Figure 1b and Figure 1c show the noisy image that is produced by adding additive white Gaussian noise with standard deviations  $\sigma = 0.01, 0.02$ . Figure 1d, Figure 1e, and Figure 1f show denoised images obtained using WT, CT, and CTPDE to the noise image. Figure 1b, Figure 1g, Figure 1h, and Figure 1i show denoised images obtained using WT, CT, and CTPDE to the noise image Figure 1c. The comparison of PSNR and SNR obtained with these three denoising methods can be seen in Table 1.

Figure 2 shows the noisy Tank image and denoised images. Figure 2a is the noise free image; Figure 2b and Figure 2c show the noisy image that is produced by adding additive white Gaussian noise with standard deviations  $\sigma = 0.01, 0.02$ . Figure 1d, Figure 2e, and Figure 2f show denoised images obtained using WT, CT, and the method proposed in this article to the noise image. Figure 2b, Figure 1g, Figure 2h, and Figure 2i show denoised images obtained using WT, CT, and the method proposed by this article to the noise image in Figure 2c. The comparison of PSNR and SNR obtained with these three denoising methods can be seen in Table 2. Experiments show that the new method outperforms other denoising methods both visually and in terms of the PSNR and SNR value. Compared with contourlet thresholding methods and wavelet denoising thresholding methods, we can see that both PSNR and SNR obtained with the new method is (CTPDE) enhanced more than 0.5–1 dB. On the other hand, the new denoising method (CTPDE) and the method can compensate the Gibbs phenomenon.

## 5 CONCLUSION

In this article, a new image denoising method combined the contourlet transform and partial differential equation is presented. Experiments show that the new image method can remove noise from the image effectively, and it outperforms other denoising methods both visually and in terms of the PSNR value.

# Optimal dividend and capital injection strategies in the perturbed classical risk model with transaction costs

Yi Meng Yue

School of Mathematics and Computer Application, Shangluo University, Shangluo, Shaanxi, China

**ABSTRACT:** Considering the classical risk model perturbed by diffusion with dividend payments and capital injections in the presence of transaction costs, we want to maximize the discounted dividend payments minus the penalized discounted capital injections. By stochastic control theory and the corresponding Hamilton–Jacobi–Bellman equation, we derive the solution of the optimal strategy to the HJB equation.

**KEYWORDS:** Transaction costs; Hamilton–Jacobi–Bellman equation; Capital injection.

## 1 INTRODUCTION

Dividends problem was first proposed by De Finetti at the 15th International Congress of Actuaries in 1957, then it became a hot issue that was discussed by many scholars. With the development of dividend strategy, people begin considering such a problem as the shareholders get the dividend profit, whether they should be obliged to help the company when it encounters difficulties. Dickson&Waters (2004) pointed that the shareholders should cover the deficit at ruin, that is, inject capital. So the surplus at the time of ruin is then 0 and the company survives. Capital injection strategy provides an approach to keep the company running smoothly. Gerber et al. (2006), Kulenko&Schmidli (2008), and He&Liang (2009) had discussed such a strategy. The literature[1] discussed that the optimal dividend of the classical risk model is band dividend strategy, When the company deficit occurs, it allows shareholders to invest. The literature[2] derived the optimal dividend and capital injection strategy of the compound Poisson model with interference. Based on the previous studies, this article discussed dividends problem of the classical risk model with minimum surplus and fixed transaction costs constraints.

## 2 MODEL CONSTRUCTION

We suppose that the surplus of an insurance company is described by a perturbed classical risk process

$$X_t = x + ct - \sum_{i=1}^{N_t} Y_i + \sigma W_t$$

defined on a filtered probability space  $(\Omega, \mathcal{F}, \{F_t\}_{t \geq 0}, \mathbb{P})$ , where  $c > 0$  is the premium rate. The number of claims is modeled as a Poisson process  $\{N(t)\}_{t \geq 0}$  with rate  $\lambda > 0$ . The occurrence times of claims are denoted by  $\{T_i\}_{i \geq 0}$  with  $T_0 = 0$ . Claim sizes  $\{Y_i\}_{i \geq 0}$  are an iid sequence of positive random variables with distribution function  $F(y)$ , independent of  $\{N_i\}$ .

We assume that the insurer controls its reserve process by paying dividends to the shareholders. Furthermore, the shareholders are supposed to inject capital if the surplus ever becomes negative. Considering the strategy  $\pi = \{(D_t, Z_t)\}$  on the basis of the original model, which is said to be admissible if:

- 1 The accumulated dividends process  $\{D_t\}_{t \geq 0}$  is an adapted, non-decreasing, càdlàg process with  $D_{0-} = 0$ ;
- 2 The accumulated capital injections are denoted by  $\{Z_t\}_{t \geq 0}$ , which also is an adapted, non-decreasing, pure jump process with  $Z_0 = 0$ .

Then, the controlled surplus process becomes

$$X_t^\pi = X_t + \sigma W_t - D_t + Z_t, \quad X_0^\pi = x.$$

The supposition is a minimum surplus requirement  $m > 0$  for insurance companies. So the bankruptcy moment is defined as

$$T^\pi = \inf\{t \geq 0, X_{t+}^\pi < m\}$$

This article mainly discusses unconstrained dividend strategy. For all admissible strategies

$\pi$ , the value of a strategy is defined as

$$V^\pi(x) = E_x[\beta \int_{0-}^{\tau^\pi} e^{-\delta t} dD_t - \phi \int_0^{\tau^\pi} e^{-\delta t} dZ_t],$$

where  $\phi > 1$  is a penalizing factor,  $\delta > 0$  is a discounting factor, and  $\beta < 1$  is a proportion factor of transaction costs. Our goal now is to maximize  $V^\pi(x)$  and to find an optimal strategy  $(D^*, Z^*)$  that leads to the maximal value. The value function of our problem is

$$V(x) = \sup_{\pi \in S_x} V^\pi(x),$$

where  $S_x$  denotes the sets of all admissible strategies.

### 3 HJB EQUATION AND OPTIMAL STRATEGY

Lemma 1: The function  $V(x)$  is increasing with  $V(x) - V(y) \geq \beta(x - y)$  for  $0 \leq y \leq x$  and Lipschitz continuous on  $[m, \infty)$ ,  $1 \leq V'(x) \leq \phi$ .

By spirit of the literature[3], we use the stochastic control theory, when  $x \geq m$ , to get the following formula:

$$V^\pi(x) = \sup_{\pi} E_x[\beta \int_{0-}^{\tau^\pi \wedge \tau} e^{-\delta t} dD_t - \phi \int_0^{\tau^\pi \wedge \tau} e^{-\delta t} dZ_t + e^{-\delta(\tau^\pi \wedge \tau)} V(X_{\tau^\pi \wedge \tau}^\pi)]$$

where  $\tau$  denotes arbitrary stopping time. Then, we use the formula to  $e^{-\delta \tau} V(X_\tau^\pi)$  and get

$$e^{-\delta \tau} V(X_{\tau^\pi}^\pi) = V(X_{0-}^\pi) + \int_0^{\tau^\pi} e^{-\delta s} cV'(X_{s-}^\pi) - \delta V(X_{s-}^\pi) ds + \sum_{\substack{0 \leq s \leq \tau^\pi \\ X_s^\pi \neq X_{s+}^\pi}} e^{-\delta s} [V(X_s^\pi) - V(X_{s+}^\pi)] + \sum_{\substack{0 \leq s \leq \tau^\pi \\ X_s^\pi = X_{s+}^\pi}} e^{-\delta s} [V(X_{s+}^\pi) - V(X_s^\pi)]$$

where  $X_s^\pi \neq X_{s+}^\pi$  occurs only at the moment of capital injection, so

$$\sum_{\substack{0 \leq s \leq \tau^\pi \\ X_s^\pi \neq X_{s+}^\pi}} e^{-\delta s} [V(X_{s+}^\pi) - V(X_s^\pi)] = \phi \int_0^{\tau^\pi} e^{-\delta s} dZ_s$$

When  $X_{s-}^\pi \neq X_s^\pi$ ,

$$M(\tau^\pi) = M(\sigma^\pi \wedge h) = \sum_{\substack{0 \leq s \leq \tau^\pi \\ X_s^\pi = X_{s+}^\pi}} e^{-\delta s} [V(X_s^\pi) - V(X_{s+}^\pi)] - \lambda \int_0^{\tau^\pi} \int_0^{\infty} e^{-\delta s} (V(X_{s-}^\pi - y) - V(X_{s-}^\pi)) dF(y) ds$$

is a martingale whose initial value is 0.

The jump caused by dividends is equal to  $-\beta \int_{0-}^{\tau^\pi} e^{-\delta s} dD_s$ , using the principle of dynamic programming, we get

$$V(x) \geq E_x[\beta \int_{0-}^{\tau^\pi} e^{-\delta s} dD_s - \phi \int_0^{\tau^\pi} e^{-\delta s} dZ_s + V(x) + \int_0^{\tau^\pi} e^{-\delta s} [\frac{1}{2} \sigma^2 V''(x) + cV'(X_{s-}^\pi) - \delta V(X_{s-}^\pi) + \phi \int_0^{\tau^\pi} e^{-\delta s} dZ_s + \lambda \int_0^{\infty} V(X_{s-}^\pi - y) - V(X_{s-}^\pi) dF(y)] ds - \beta \int_{0-}^{\tau^\pi} e^{-\delta s} dD_s]$$

which is equivalent to

$$E_x \int_0^{\tau^\pi} e^{-\delta s} [\frac{1}{2} \sigma^2 V''(x) + cV'(X_{s-}^\pi) - (\lambda + \delta)V(X_{s-}^\pi) + \lambda \int_0^{\infty} V(X_{s-}^\pi - y) dF(y)] ds \leq 0.$$

When  $T^\pi > 0$ , we choose properly  $\varepsilon$  to meet  $E\tau^\pi > 0$ . And letting  $h \rightarrow 0$ , we get

$$\frac{1}{2} \sigma^2 V''(x) + cV'(x) - (\lambda + \delta)V(x) + \lambda \int_0^{\infty} V(x - y) dF(y) \leq 0 \Leftrightarrow \frac{1}{2} \sigma^2 V''(x) + cV'(x) - (\lambda + \delta)V(x) + \lambda \int_0^{x+\varepsilon} V(x - y) dF(y) \leq 0 \quad (1)$$

where  $z \in R_+$ .

Moreover, supposing the shareholder injects capitation  $\phi\varepsilon$ , then dividends will occur when the surplus changes from  $x$  to  $x + \varepsilon$ . Thus,  $V(x) \geq V(x + \varepsilon) - \phi\varepsilon$ . And letting  $\varepsilon \rightarrow 0$ , we get

$$V'(x) \leq \phi. \quad (2)$$

If the insurance company draws extra dividends  $\varepsilon$ , then the initial value will decrease from  $x$  to  $x - \varepsilon$ . We have  $V(x) \geq V(x - \varepsilon) + \beta\varepsilon$  and  $V'(x) \geq \beta$ . (3)

At least one of these expressions is correct. So  $V(x)$  satisfies HJB equations in  $[m, \infty)$ , thus

$$\max \left\{ \frac{1}{2} \sigma^2 V''(x) + cV'(x) - (\lambda + \delta)V(x) + \lambda \int_0^{x+\varepsilon} V(x - y) dF(y), \beta - V'(x), V'(x) - \phi \right\} = 0 \quad (4)$$

Lemma 2: If the function  $V(x)$  is concave in  $[m, \infty)$ , then the optimal injection is  $a = m$ , where  $a := \sup\{x : V'(x) \geq \phi\} \vee m$  and  $b := \inf\{x : V'(x) \leq \beta\}$ .

The strategy  $\tilde{\pi} = (\tilde{D}, \tilde{Z})$  is defined as follows:

$$\tilde{D}_0 = \max(x - b, 0)$$

$$\tilde{D}_t = \tilde{D}_0 + \int_0^t c 1_{\{X_s = b\}} ds \quad (t > 0)$$

$$\tilde{Z}_t = \max\{-\inf_{0 \leq s < t} (X_s - m - \tilde{D}_s), 0\} \quad (t > 0).$$

Let  $T^* = \inf\{t \geq 0: X_t^* < -z^*\}$  and considering the strategy  $\tilde{\pi}$  stops in  $T^*$ , we have  $(D^*, Z^*)$  :

$$D_t^* = \begin{cases} \tilde{D}_t, & t < T^* \\ \tilde{D}_{T^*}, & t \geq T^* \end{cases}, \quad Z_t^* = \begin{cases} \tilde{Z}_t, & t < T^* \\ \tilde{Z}_{T^*}, & t \geq T^* \end{cases} \quad (5)$$

This part  $x - b$  will be distributed under the strategy (5) when the initial capital  $x > b$ . These dividend and capital injection do not occur when the capital change in  $(m, b)$ .

The shareholder is willing to inject for what initial capital can arrive at  $m$  when the deficit is less than  $z^*$ . The shareholder does not inject capital and so the company goes bankrupt when the deficit is greater than  $z^*$ . Under this strategy, the corresponding surplus process is described by  $X_t^* = X_t - D_t^* + Z_t^*$ .

Theorem 1: If the function  $V(x)$  is concave in  $[m, \infty)$ , then the optimal strategy is (5), that is,  $V^{\pi^*}(x) = V(x)$ . Proof: let  $X^*$  is the control process by the  $(D^*, Z^*)$ , so

$$\begin{aligned} & V(X_{t \wedge T^*}^*) e^{-\delta(t \wedge T^*)} \\ &= V(x) + \int_0^{t \wedge T^*} e^{-\delta s} \left[ \frac{1}{2} \sigma^2 V''(X_s^*) + cV'(X_s^*) - \delta V(X_s^*) \right] ds \\ &+ \sigma \int_0^{t \wedge T^*} e^{-\delta s} V'(X_s^*) dW_s - \beta \int_0^{t \wedge T^*} e^{-\delta s} V'(X_s^*) dD_s^{*C} \\ &+ \int_0^{t \wedge T^*} e^{-\delta s} V'(X_s^*) dZ_s^{*C} + \sum_{0 < T_i \leq t \wedge T^*} e^{-\delta T_i} [e^{-\delta s} [V(X_{T_i}^* - Y_i) \\ &- V(X_{T_i}^*)] + \sum_{\substack{0 < s \leq t \wedge T^* \\ X_s^* \neq X_{T_i}^*}} e^{-\delta s} [V(X_{s-}^* - \Delta D_s^*) - V(X_{s-}^*)] \\ &+ \sum_{\substack{0 < s \leq t \wedge T^* \\ X_s^* \neq X_{T_i}^*}} e^{-\delta s} [V(X_{s-}^* + \Delta Z_s^*) - V(X_{s-}^*)] \end{aligned}$$

where  $D_s^{*C}, Z_s^{*C}$  denote, respectively, the continuous part of  $D_s^*, Z_s^*$ , and  $V'(X_s^*) = 1$  if dividend occurs;  $V'(X_s^*) = \phi$  if capital is injected.

Then  $\sum_{0 < T_i \leq t \wedge T^*} e^{-\delta T_i} [V(X_{T_i}^*) - V(X_{T_i-}^*)] - \lambda \int_0^{t \wedge T^*} \int_0^{X_{s-}^* + Z_s^*} e^{-\delta s} [V(X_{s-}^* - y) - V(X_{s-}^*)] dF(y) ds$  and  $\sigma \int_0^{t \wedge T^*} e^{-\delta s} V'(X_s^*) dW_s$  are martingale that their mean are 0. Because of

$$\begin{aligned} V(X_{s-}^* - \Delta D_s^*) - V(X_{s-}^*) &= - \int_0^{\Delta D_s^*} V'(X_s^* - u) du = -\beta \Delta D_s^* \quad \text{and} \\ V(X_s^* + \Delta Z_s^*) - V(X_s^*) &= \int_0^{\Delta Z_s^*} V'(X_s^* + v) dv = \phi \Delta Z_s^*, \end{aligned}$$

we can get

$$\begin{aligned} E[e^{-\delta(t \wedge T^*)} V(X_{t \wedge T^*}^*)] &= V(x) + E \left[ \int_0^{t \wedge T^*} e^{-\delta s} \left[ \frac{1}{2} \sigma^2 V''(X_s^*) \right. \right. \\ &+ cV'(X_s^*) - \delta V(X_s^*) \left. \left. \right] ds + \lambda \int_0^{t \wedge T^*} \int_0^{X_{s-}^* + Z_s^*} e^{-\delta s} [V(X_{s-}^* - y) \right. \\ &- V(X_{s-}^*)] dF(y) ds \left. \right] - E \left[ \beta \int_0^{t \wedge T^*} e^{-\delta s} dD_s^* - \phi \int_0^{t \wedge T^*} e^{-\delta s} dZ_s^* \right] \\ &\Rightarrow E \left[ \beta \int_0^{t \wedge T^*} e^{-\delta s} dD_s^* - \phi \int_0^{t \wedge T^*} e^{-\delta s} dZ_s^* \right] \\ &= V(x) - E[e^{-\delta(t \wedge T^*)} V(X_{t \wedge T^*}^*)] \end{aligned}$$

$$\begin{aligned} &\Rightarrow V(x) = E[e^{-\delta(t \wedge T^*)} V(X_{t \wedge T^*}^*)] \\ &+ \beta \int_0^{t \wedge T^*} e^{-\delta s} dD_s^* - \phi \int_0^{t \wedge T^*} e^{-\delta s} dZ_s^* \end{aligned}$$

therefore  $\lim_{t \rightarrow \infty} E[V(X_{t \wedge T^*}^*) e^{-\delta(t \wedge T^*)}] = 0$

$$\begin{aligned} \therefore V(x) &= \lim_{t \rightarrow \infty} E \left[ \beta \int_0^{t \wedge T^*} e^{-\delta s} dD_s^* - \phi \int_0^{t \wedge T^*} e^{-\delta s} dZ_s^* \right] \\ &= E \left[ \beta \int_0^T e^{-\delta s} dD_s^* - \phi \int_0^T e^{-\delta s} dZ_s^* \right] = V^*(x) \end{aligned}$$

#### 4 CHARACTERISTICS OF SOLUTIONS

Theorem 2:  $V(x)$  is the minimal solution to (4).

Proof: Let  $f'(x) \geq \beta$ , then  $f(x)$  is increasing monotonically. Suppose  $X^*$  is the control process of the optimal strategy; by using the formula Itô, we have

$$\begin{aligned} f(X_{t \wedge T^*}^*) e^{-\delta(t \wedge T^*)} &= f(x) + \int_0^{t \wedge T^*} e^{-\delta s} \left[ \frac{1}{2} \sigma^2 f''(X_s^*) + cf'(X_s^*) \right. \\ &- \delta f(X_s^*) \left. \right] ds + \sigma \int_0^{t \wedge T^*} e^{-\delta s} f'(X_s^*) dW_s - \beta \int_0^{t \wedge T^*} e^{-\delta s} f'(X_s^*) dD_s^{*C} \\ &+ \int_0^{t \wedge T^*} e^{-\delta s} f'(X_s^*) dZ_s^{*C} + \sum_{0 < T_i \leq t \wedge T^*} e^{-\delta T_i} [e^{-\delta s} [f(X_{T_i}^* - Y_i) - f(X_{T_i}^*)] \\ &= f(x) + \int_0^{t \wedge T^*} e^{-\delta s} \left[ \frac{1}{2} \sigma^2 f''(X_s^*) + cf'(X_s^*) - \delta f(X_s^*) \right] ds \\ &+ \sigma \int_0^{t \wedge T^*} e^{-\delta s} f'(X_s^*) dW_s - \beta \int_0^{t \wedge T^*} e^{-\delta s} f'(X_s^*) dD_s^{*C} \\ &+ \int_0^{t \wedge T^*} e^{-\delta s} f'(X_s^*) dZ_s^{*C} + \sum_{0 < T_i \leq t \wedge T^*} e^{-\delta T_i} [e^{-\delta s} [f(X_{T_i}^* - Y_i) \\ &- f(X_{T_i}^*)] - \sum_{\substack{0 < s \leq t \wedge T^* \\ X_s^* \neq X_{T_i}^*}} e^{-\delta s} \int_0^{X_{s-}^*} f'(X_{s-}^* - u) du \\ &+ \sum_{\substack{0 < s \leq t \wedge T^* \\ X_s^* \neq X_{T_i}^*}} e^{-\delta s} \int_0^{X_{s-}^*} f'(X_{s-}^* + v) dv \end{aligned}$$

$$\begin{aligned}
&\Rightarrow E[f(X_{\wedge T}^*)e^{-\delta(\wedge T^*)}] = f(x) + E\left[\int_0^{\wedge T^*} e^{-\delta s} \left[\frac{1}{2}\sigma^2 f''(X_s^*) + cf'(X_s^*) - \delta f(X_s^*)\right] ds + \lambda \int_0^{\wedge T^*} \int_0^{X_s^*+Z^*} e^{-\delta s} [f(X_s^*-y) - f(X_s^*)] dF(y) ds \right. \\
&\quad \left. - E[\beta \int_0^{\wedge T^*} e^{-\delta s} f'(X_s^*) dZ_s^{*C} + \sum_{\substack{0 < s \leq \wedge T^* \\ X_s^* \neq X_{s+}^*}} e^{-\delta s} \int_0^{X_s^*} f'(X_s^*-u) du] \right. \\
&\quad \left. + E[\phi \int_0^{\wedge T^*} e^{-\delta s} f'(X_s^*) dZ_s^{*C} + \sum_{\substack{0 < s \leq \wedge T^* \\ X_s^* \neq X_{s+}^*}} e^{-\delta s} \int_0^{X_s^*} f'(X_s^*+v) dv] \right] \\
&\Rightarrow E[\beta \int_0^{\wedge T^*} e^{-\delta s} dD_s^* - \phi \int_0^{\wedge T^*} e^{-\delta s} dZ_s^*] = -E[f(X_{\wedge T^*}^*)e^{-\delta(\wedge T^*)}] \\
&\quad + f(x) + E\left[\int_0^{\wedge T^*} e^{-\delta s} \left[\frac{1}{2}\sigma^2 f''(X_s^*) + cf'(X_s^*) - \delta f(X_s^*)\right] ds \right. \\
&\quad \left. + E[\phi \int_0^{\wedge T^*} e^{-\delta s} f'(X_s^*) dZ_s^{*C} + \lambda \int_0^{\wedge T^*} \int_0^{X_s^*+Z^*} e^{-\delta s} [f(X_s^*-y) - f(X_s^*)] dF(y) ds - E[\beta \int_0^{\wedge T^*} e^{-\delta s} f'(X_s^*) dD_s^{*C} \right. \right. \\
&\quad \left. \left. + \sum_{\substack{0 < s \leq \wedge T^* \\ X_s^* \neq X_{s+}^*}} e^{-\delta s} \int_0^{X_s^*} f'(X_s^*-u) du\right] + \sum_{\substack{0 < s \leq \wedge T^* \\ X_s^* \neq X_{s+}^*}} e^{-\delta s} \int_0^{X_s^*} f'(X_s^*+v) dv\right] \\
&\Rightarrow E[\beta \int_0^{\wedge T^*} e^{-\delta s} dD_s^* - \phi \int_0^{\wedge T^*} e^{-\delta s} dZ_s^*] \leq f(x)
\end{aligned}$$

Therefore,  $V(x) \leq f(x)$ .

## 5 CONCLUSION

Optimal dividend and capital injection strategies of the perturbed classical risk model with transaction costs have been discussed under the condition of minimum surplus constraints in this article. The corresponding optimal solution has been shown by using stochastic control theory. Those previous research findings are further promoted and provide a theoretical support for insurance companies.

# Research of Half Fuzzy graph and its application

Hui Wang & Xian Feng Yu

*Institute of Mathematics and Computer Application, Shangluo University, Shangluo, China*

**ABSTRACT:** The aim of this article is to establish a Half Fuzzy graph model. The limitative accessibility and gross accessibility of the path of a Half Fuzzy graph is defined, and these are used to calculate the congestion situation of a path. The definition about strongest accessible path of a Half Fuzzy graph is introduced. The calculation algorithm of the strongest accessible path is given. The algorithm can be used to calculate an optimum path when congestion is regarded as the main limiting factor. The rationality of the algorithm is proved, and its complexity is analyzed. The calculation result shows that the algorithm is reasonable and efficient and has a high degree of automation.

**KEYWORDS:** Half Fuzzy Graph; path accessibility; strongest accessible path.

## 1 INTRODUCTION

Computing the optimal path is one of the most practically significant hotspot study problems in classic graph theory [1–8]. Classic graph theory can only be used to describe objects that have a determinate relationship. But a lot of relationships between objects in the real world are uncertain. Fuzzy sets [9] naturally expressed uncertain subordinate relations between objects. In 1975, Rosenfeld defines Fuzzy Graph, and corresponding to some preliminary conclusions in classical graph are generalized to fuzzy graph [10]. Now, Fuzzy Graph theory has important applications in clustering analysis, data theory, network analysis, and information theory [11–12]. Half fuzzy graph model is defined in this article, using vertexes expressing objects, and the connection between the objects is expressed as fuzzy edges. The path in a Half Fuzzy Graph is studied. The limitative accessibility and gross accessibility of the path of a Half Fuzzy graph is defined; these are used to calculate the congestion situation of the path. The definition about the strongest accessible path of a Half Fuzzy graph is introduced. The calculation algorithm of the strongest accessible path is given. The algorithm can be used to calculate an optimum path when congestion is regarded as the main limiting factor. The rationality of the algorithm is proved and its complexity is analyzed. Finally, we combine a practical example that uses the algorithm to calculate the optimal paths that Shangluo University to other 10 places in Shangluo city.

## 2 BASIC THEORY OF HALF FUZZY GRAPH

**Definition 1** [Half Fuzzy Graph, HFG]: A Half Fuzzy Graph is a fuzzy relation set  $\tilde{G} = \langle V, \tilde{E} \rangle$  here,

- 1  $V = \{v_1, v_2 \dots v_n\}$  is the set of vertexes that is used to express objects in the real world;
- 2 Fuzzy relation  $\tilde{E}: V^2 \rightarrow (0,1)$  is the set of edges that is used to express connection between the objects,  $\forall e_{ij} \in \tilde{E}$  is expressed by the correlation  $\mu_{ij}$  between the start vertex  $v_i$  and the finish vertex  $v_j$ . Here,  $\mu_{ij} \in (0,1)$ .

**Definition 2** [The path of Half Fuzzy Graph]: Set  $\tilde{G} = \langle V, \tilde{E} \rangle$  is a HFG, if there is an alternating sequence about vertexes and edges,  $v_0 e_1 v_1 e_2 \dots v_k e_k$ , s.t.  $\forall i = 1, 2, \dots, k, v_{i-1}$  is the start vertex of edge  $e_i$ , and  $v_i$  is the finish vertex,

- 1 Sequence  $v_0 e_1 v_1 e_2 \dots v_k e_k$ , is called pathway or path of  $v_0$  to  $v_k$ , denoted as  $path(v_0, v_k)$ ;
- 2  $k$  is called the characteristic length of  $path(v_0, v_k)$ , denoted as  $pt(v_0, v_k)$ ;
- 3 If all the edges in  $path(v_0, v_k)$  are different, called  $path(v_0, v_k)$ , it is a simple pathway. If all the vertexes in  $path(v_0, v_k)$  are different, called  $path(v_0, v_k)$ , it is a basic pathway;
- 4 If  $v_0 = v_k$  called  $path(v_0, v_k)$ , it is a loop pathway. If  $path(v_0, v_k)$  not only is a simple pathway but also is a loop pathway, then it is called  $path(v_0, v_k)$  and is a simple loop path. If all the vertexes in  $path(v_0, v_k)$  are different except  $v_0$

and  $v_k$ , simultaneously  $path(v_0, v_k)$  is a loop path-way, and then  $path(v_0, v_k)$  is called a basic loop path.

**Definition 3** [path accessibility, PA] Set  $\tilde{G} = \langle V, \tilde{E} \rangle$  is a HFG, if there is path from  $v_0$  to  $v_k$ ,

$$path(v_0, v_k) = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k$$

Then, PA of  $path(v_0, v_k)$  is defined as

- 1  $pl(v_0, v_k) = \bigwedge_{i=1}^k \mu_{e_i}$ , is called limitative accessibility (LA) of  $path(v_0, v_k)$ ;
- 2  $pll(v_0, v_k) = \prod_{i=1}^k \mu_{e_i}$ , is called gross accessibility (GA) of  $path(v_0, v_k)$ .

**Theorem 1**  $pl(v_0, v_k)$  depict the minimum flow situation of  $path(v_0, v_k)$ . And  $pll(v_0, v_k)$  calculate the overall situation of  $path(v_0, v_k)$  according to multiplication principle.

The realistic meaning of  $pl(v_0, v_k)$  is that  $pl(v_0, v_k)$  calculate the PA of  $path(v_0, v_k)$  in the most conservative situation. That is,  $path(v_0, v_k)$  can be reached at least according to  $pl(v_0, v_k)$ . The realistic meaning of  $pll(v_0, v_k)$  is seeing association degree of the edge as the reach probability, then calculate the overall situation

$$path(\bullet_{v_0, v_k})_1 = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k,$$

$$path(\bullet_{v_0, v_k})_2 = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k,$$

⋮

$$path(\bullet_{v_0, v_k})_m = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k,$$

of  $path(v_0, v_k)$  according to multiplication principle.

When congestion was regarded as the main limiting factor, we chose LA to calculate the optimal path. Under normal circumstances, we use GA.

**Definition 4** [strongest accessible path, SAP] Set  $\tilde{G} = \langle V, \tilde{E} \rangle$

is an HFG, if there are  $m$  path from  $v_0$  to  $v_k$ ,

Define the strongest accessibility from  $v_0$  to  $v_k$  as

- 1  $PL(v_0, v_k) = \bigvee_{j=1}^m pl(v_0, v_k)_j$  is called the strongest LA;
- 2  $PLL(v_0, v_k) = \bigvee_{j=1}^m pll(v_0, v_k)_j$  is called the strongest GA;

Here, the path  $path(v_0, v_k)_j = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k$ , which has the strongest accessibility, is called SAP from  $v_0$  to  $v_k$  denoted as  $PATH(v_0, v_k)$ .

**Theorem 2** Set  $\tilde{G} = \langle V, \tilde{E} \rangle$  is an HFG,  $\forall v_0, v_k \in V$  have,

- 1  $PL(v_0, v_k)$  is the maximum PA of all the path that from  $v_0$  to  $v_k$  and calculated by LA;
- 2  $PLL(v_0, v_k)$  is the maximum PA of all the paths from  $v_0$  to  $v_k$  and calculated by GA.

**Theorem 3** If  $\mu_1, \mu_2$  are the PA of two adjacent edges  $e_1, e_2$  of a HFG.; then, the PA of path  $e_1, e_2$  is not more than  $\mu_1, \mu_2$ .

**Proof:** Because  $\mu_1, \mu_2 \in (0, 1)$  so

$$pl(e_1, e_2) = \mu_1 \wedge \mu_2 \leq \mu_1, \mu_2;$$

$$pll(e_1, e_2) = \mu_1 \cdot \mu_2 \leq \mu_1, \mu_2 \cdot \square$$

**Theorem 3** shows that the longer prefix paths have smaller PA than other prefix paths in the same path.

**Theorem 4** If  $\mu_1, \mu_2, \mu_3$  are the PA of the edges  $e_1, e_2, e_3$  of an HFG, and there are paths  $e_1, e_2$  and  $e_1, e_3$ . If  $\mu_2 \geq \mu_3$ , then the PA of  $e_1, e_2$  is bigger than  $e_1, e_3$ .

**Proof:** Because  $\mu_2 \geq \mu_3$ ,  $\mu_1, \mu_2, \mu_3 \in [0, 1]$ , so

$$pl(e_1, e_2) = \mu_1 \wedge \mu_2 \geq \mu_1 \wedge \mu_3 = pl(e_1, e_3);$$

$$pll(e_1, e_2) = \mu_1 \cdot \mu_2 \geq \mu_1 \cdot \mu_3 = pll(e_1, e_3). \square$$

**Theorem 4** shows that if two paths have the same characteristic length, then if one of them has an edge that has a bigger PA, the path will simultaneously have a bigger PA.

**Theorem 5** Set  $\tilde{G} = \langle V, \tilde{E} \rangle$  is an HFG,  $\forall v_0, v_k \in V$ , if  $PATH(v_0, v_k) = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k$ ; then,

$$PATH(v_0, v_{k-1}) = v_0 e_1 v_1 e_2 \cdots v_{k-2} e_{k-1} v_{k-1} \cdot$$

**Proof:** Proof by contradiction.

$PATH(v_0, v_k) = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k$  according to definition 4, we get  $path(v_0, v_k) = v_0 e_1 v_1 e_2 \cdots v_{k-1} e_k v_k$ , has the biggest LA.

Suppose  $path(v_0, v_{k-1}) = v_0 e_1 v_1 e_2 \cdots v_{k-2} e_{k-1} v_{k-1}$ , is not a SAP. But there is an SAP from  $v_0$  to  $v_{k-1}$ , set

this SAP as  $path(v_0, v_{k-1})' = v_0 e_1' v_1' e_2' \dots v_{k-2}' e_{k-1}' v_{k-1}$ , and its LA is denoted as  $pl(v_0, v_{k-1})'$ . Then according to the definition of ASP, we get that  $pl(v_0, v_{k-1})' = PL(v_0, v_{k-1}) \geq pl(v_0, v_{k-1})$ . Denote LA of  $path(v_0, v_k)' = v_0 e_1' v_1' e_2' \dots v_{k-2}' e_{k-1}' v_{k-1} e_k v_k$  as  $pl(v_0, v_k)'$

According to Theorem 3, we get that  $pl(v_0, v_k)' = pl(v_0, v_{k-1})' \circ \mu_{e_k} \geq pl(v_0, v_{k-1}) \circ \mu_{e_k} = pl(v_0, v_k)$ . This contradicts with the fact that  $pl(v_0, v_k)$  is the biggest. So the assumption is not established, that is,  $path(v_0, v_{k-1}) = v_0 e_1 v_1 e_2 \dots v_{k-2} e_{k-1} v_{k-1}$ , is SAP. If we use GA to calculate and prove the process is the same as LA,

$$PATH(v_0, v_{k-1}) = v_0 e_1 v_1 e_2 \dots v_{k-2} e_{k-1} v_{k-1} \quad \square$$

Theorem 5 shows that the prefix path of an SAP is also an SAP.

### 3 A CALCULATION ALGORITHM OF SAP

Set  $\tilde{G} = \langle V, \tilde{E} \rangle$  is a HFG,  $s \in V$  is any vertex of  $\tilde{G}$ . Now give an algorithm about calculating the SAP from  $s$  to the other vertexes in  $\tilde{G}$  based on breadth-first search  $\tilde{G}$ .

- 1 Initialize the logo;
- 2 Marked  $s$  as  $\langle 1, \phi \rangle$ , set  $L = \{s\}$ ;
- 3  $\forall v \in V - L$  remarked by  $\langle \mu_{s,v}, s \rangle$ . The first component is AP, called accessibility logo (ALO). And the second component is progenitor vertex of  $v$  in SAP from  $s$  to  $v$ , called progenitor logo (PLO).
- 4 Update logo:

- 1 Find out  $u$ , which is a vertex in  $V - L$ , s.t.  $u$  has the biggest ALO. And join  $u$  to  $L$ ;
- 2 Update the ALO of the vertex in  $V - L$  and adjacent to  $u$  as the bigger one of the following: The old ALO of  $x$  and  $\mu \circ \mu_{u,x}$ . Which is the compose of  $u$  and  $\mu_{u,x}$  which are the ALO of  $u$  and the ALO of the edge  $e_{u,x}$ . Here,

$$\mu \circ \mu_{u,x} = \begin{cases} \mu \wedge \mu_{u,x} & pl(u, x) \\ \mu \cdot \mu_{u,x} & pll(u, x) \end{cases}$$

If the ALO of  $x$  changes, then the PLO is updated by  $u$ . If  $L \neq V$ , then implementing the (2)-th step consecutively.

### 3 Generate SAP:

If  $\forall v \in V$  the ALO of  $v$  is "0," there is no SAP from  $s$  to  $v$ . Otherwise, the strongest accessibility of  $s$  to  $v$  is the ALO of  $v$ . And the SAP of  $s$  to  $v$  is the reverse column of the sequence composed by  $v$ , the PLO of  $v$ , the PLO of the PLO of  $v \dots$  and  $s$ .

**Theorem 6** Set  $\tilde{G} = \langle V, \tilde{E} \rangle$  is a HFG,  $\forall s \in V$ ; the calculation results of SAP that used the algorithm are the ASPs of  $s$  to each other vertex in  $\tilde{G}$

**Proof:** We only need to prove that  $\forall v \in L$ , the ALO of  $v$  is  $PL(s, v)$  or  $PLL(s, v)$ .

The conclusion will be proved by mathematical induction.

- 1 The start state is  $L = \{s\}$ ,  $s$  is remarked by  $\langle 1, NULL \rangle$ . In this case, because  $PL(s, s) = PLL(s, s) = 1$ , the conclusion is true.
- 2 Set  $u_1, u_2, \dots, u_m \in L$  are the ALOs of  $u$  in  $L$ . Then, the logo of  $u$  has been updated by  $u_1, u_2, \dots, u_m$ . And the SAPs that from  $s$  to  $u_1, u_2, \dots, u_m$  have been found. Because the ALO of  $u$  is the largest of all the vertexes in  $V - L$ , we might as well put  $\langle PL(s, u_1) \circ \mu_{u_1, u}, u_1 \rangle$ , which is the ALO of  $u$  updated by  $u_1$  and is the largest one.
- 3 Now we prove that the final ALO of  $u$  is  $\langle PL(s, u_1) \circ \mu_{u_1, u}, u_1 \rangle$

By theorem 5, we know that the prefix path of a SAP is also an SAP. So SAP from  $s$  to  $v$  at least through one vertex is  $u_1, u_2, \dots, u_m$ . Then,  $u_1, u_2, \dots, u_m$  are divided into 2 categories. One category is  $u_1$ , which can make the ALO of  $u$  as the largest one by updating its logo. Another category is composed by  $u_2, \dots, u_m$ . Now we divided all the possible SAP that can reach  $u$  into 4 kinds.

The first kind:  $s, \dots, u_1, u$ ;

The second kind:  $s, \dots, u_1, x, u$ ,  $x \in V - L$  and  $x$  is the progenitor vertex of  $u$  in the path from  $s$  to  $u$ ;

The third kind:  $s, \dots, u_2, u$ ;

The fourth kind:  $s, \dots, u_2, x, u$ ,  $x \in V - L$ , and  $x$  is the progenitor vertex of  $u$  in the path from  $s$  to  $u$ .

Now, we only need to prove that the PA of the first kind path is the largest. By theorem 3,  $pl(s, \dots, u_1, u) \geq pl(s, \dots, u_1, x, u)$  and  $pl(s, \dots, u_2, u) \geq pl(s, \dots, u_2, x, u)$  are true. Through

the precondition that  $\langle PL(s, u_1) \circ \mu_{u_1, u}, u_1 \rangle$  which is the ALO of  $u$  updated by  $u_1$  is the largest one. So  $pl(s, \dots, u_1, u) \geq pl(s, \dots, u_2, u)$ . Thus, we prove the accessibility of the first kind path is the largest. Summarized by (1), (2), and (3), we get  $\forall s \in V$ ; the calculation results of SAP used in the algorithm are the ASPs of  $s$  to each other vertex in  $\tilde{G}$ .  $\square$

**Theorem 7** All the space complexity and time complexity of the calculation algorithm of SAP are  $o(n^2)$ .

**Proof:** The input of the algorithm is an HFG. The space complexity of its vertex and edge sets are  $o(n)$  and  $o(n^2)$ . Intermediate calculations need to store the logo, and the size of the logo is  $o(n)$ . So the space complexity of the algorithm is  $o(n^2)$ .

The main computation time of the algorithm is in the (2) th step, that is, updating the logo. The complexity of finding the current vertex that has the largest ALO is  $o(n)$ . And the complexity of updating the logo of the other vertexes in  $V - L$  is also  $o(n)$ . We need to add  $n-1$  times vertex. According to multiplication principle, the total time complexity is  $o((n-1) \cdot o(n)) = o(n^2)$ .

#### 4 AN EXAMPLE OF THE OPTIMAL PATH SELECTION BASED ON IFG

Computing the accessibility and optimal path selection in classical graph theory without considering the path unobstructed, such as how to roads, the road is crowded or has traffic jams. The AP of the edges of a HFG can naturally describe this information. An example is given next. Figure 1 is a part of the urban traffic map of Shang Luo city.

There are 14 edges that represent 14 streets in Figure 1. Generate the statistical dates of the street's unobstructed situation to the correlation of the edges of Figure 1. Get an HFG as shown in Figure 2.

Now use the calculation algorithm of SAP computing the SAP from  $v_0$  to  $v_9$ , that is  $PATH(v_0, v_9)$ .

The calculation result based on LA is given as follows:

PATH	PL
$v_0v_1$	0.88
$v_0v_1v_3$	0.86
$v_0v_1v_3v_5$	0.72
$v_0v_1v_3v_5v_6$	0.71
$v_0v_1v_3v_5v_6v_4$	0.71
$v_0v_1v_3v_5v_6v_4v_2$	0.71
$v_0v_1v_3v_5v_6v_8$	0.71
$v_0v_1v_3v_5v_6v_8v_7$	0.71
$v_0v_1v_3v_5v_6v_8v_{10}$	0.71
$v_0v_1v_3v_5v_6v_8v_7v_9$	0.63

The calculation result based on GA is given as follows:

PATH	PLL
$v_0v_1$	0.88
$v_0v_1v_3$	0.76
$v_0v_1v_2$	0.57
$v_0v_1v_3v_5$	0.55
$v_0v_1v_2v_4$	0.52
$v_0v_1v_2v_4v_6$	0.45
$v_0v_1v_2v_4v_6v_8$	0.37
$v_0v_1v_3v_5v_7$	0.36
$v_0v_1v_2v_4v_6v_8v_{10}$	0.31
$v_0v_1v_3v_5v_7v_9$	0.23

The result shows that the SAP computing based on LA is path  $v_0v_1v_3v_5v_6v_8v_7v_9$ , and its AP is 0.63. This shows us that in the worst cases, this path is 63% open. The result shows that the SAP computing based on GA is path  $v_0v_1v_3v_5v_7v_9$ , and its AP is 0.23.

Figure 1 Part of the urban traffic map of Shang Luo city.

Figure 1. Part of the urban traffic map of Shang Luo city.

Figure 2 in model of a HFG based on figure 1t

Figure 2. In model of a HFG based on figure 1t.

This shows us that in the overall situation this path is 23% open. Because of the relative congestion of the urban road of Shang Luo city is not serious. So SAP computing is based on GA, that is, path  $v_0v_1v_3v_5v_7v_9$  is the optimal path from  $v_0$  to  $v_9$ .

## 5 SUMMARY

An HFG model is established. LA and GA are defined, respectively. From two aspects of the most conservative conditions and overall situation, the road congestion situation is depicted in reality. The concept of SAP is introduced. SAP is the optimal path when congestion is the main factor of path selection. Given an algorithm for SAP computation, the rationality of the algorithm is proved. The complexity of the algorithm is analyzed, and the detailed proof process is given. Given an example of computing SAP, the result shows that the algorithm is efficient and reasonable and has a high degree of automation.

The real road unobstructed situation is impacted by road conditions, traffic, time, and so on. For instance, the road unobstructed situation on a holiday is worse than it is on a workday. Even on a workday, the road unobstructed situation during commuting time will be worse than at other times. So path accessibility is difficult to determine. The solution is divided into different situations to be solved, such as according time period given to road unobstructed situation and calculating the optimal path in a certain time period. The optimal path is related to the length of the path; considering this main factor, we can define a half-edge weighted fuzzy graph and then calculate the optimal weighted path. These problems will be solved in a follow-up study.

## Comparative study on total flavonoids in different parts of *Aleuritopteris argentea*

Xiao Wen Zhang & Bei Gao

Shangluo University, Shangluo, Shanxi, China

**ABSTRACT:** In this experiment, 70% ethanol was the solvent extraction, the temperature was 60°C, the ratio of solid to liquid was 1: 30, the extraction method involved immersion in *Aleuritopteris argentea* first, and the water was boiled and ultrasounded at last. Rutin was used as the reference substance, and spectrophotometry was used to determine the content of total flavonoids in different parts of *Aleuritopteris argentea* at the wavelength of 500nm, respectively. The regression equation was  $Y=11.875X-0.028$ ,  $R^2=0.9975$ ; flavonoids within the concentration of 0.008~0.048mg/mL had a linear relation with absorbance. The contents of total flavonoids in the root, stem, and leaf were 2.37%, 3.05%, and 5.10%, respectively.

**KEYWORDS:** *Aleuritopteris argentea*; Different parts; Spectrophotography; Total flavonoids.

*Aleuritopteris argentea* grows in a gap between rock<sup>[1]</sup>, which is all dry grass of Chinese fern powder back fern genera *Aleuritopteris argentea* (Gmel.)Fee. It has efficacies, such as being used in an expectorant cough, invigorating the circulation of menstruation, for relieving convulsion, and so on. The drug attending a cough, menoxenia, leucorrhoea with red, wounds fester, fracture, eyelid dry erosion, red eyes, confused and other symptoms<sup>[2]</sup>. This study shows that *Aleuritopteris argentea* contains flavonoids, Aleuritopteris acid<sup>[3]</sup>, alkaloids<sup>[4]</sup>, chlorogenic acid<sup>[5]</sup>, and other ingredients. Yumin Bao<sup>[6]</sup> confirmed that *Aleuritopteris argentea* flavonoids had strong antioxidant activity. Flavonoids have anti myocardial ischemia, anti cerebral ischemia, free radical scavenging, antibacterial, antiviral, antitumor, anti-inflammatory, and other effects; it is also a hot research field with regard to medicine, food, and so on. This article aims at exploring the content of total flavonoids in various parts of medicinal herbs, providing a reference basis for further studies on *Aleuritopteris argentea*.

### 1 INSTRUMENTS AND REAGENTS

#### 1.1 Instruments and equipment

KQ - 250 - e type ultrasonic cleaners (Kunshan ultrasonic instrument co.), FW200A type high-speed universal grinder (Beijing wei yongxing instrument co.), 7230G visible spectrophotometer (Shanghai precision scientific instrument co.), and so on were used.

#### 1.2 Drugs and reagents

*Aleuritopteris argentea* was taken from Dai Yun mountain in Shangluo city in October 2013, and the

pharmacists Xiao-ling li of Shangluo University identified as which was all dry grass of Chinese fern powder back fern genera *Aleuritopteris argentea* (Gmel.) Fee. Rutin reference substance (batch number 110715-200815, China's pharmaceutical and biological products offices shall), concentrated hydrochloric acid, magnesium powder, anhydrous ethanol, sodium nitrite, aluminum sulfate, sodium hydroxide, distilled water, etc.

### 2 METHODS AND RESULTS

#### 2.1 Preparation of the reference substance solution

Precision-weighed dry (difference between before and after drying under 0.3mg) rutin reference substance, 20.0mg, was placed in a 100mL volumetric flask; an appropriate amount of 95% ethanol solution was added to the water bath and it was heated, dissolved, cooled, and refilled to the permitted level with the 95% ethanol solution. The mixture was shaken well, which was 0.2 mg/mL of rutin reference substance solution.

#### 2.2 Detection of wavelength selection

First, exactly 1.0mL rutin standard solution was measured and placed into a 25mL volumetric flask; 6.0mL of distilled water was added, 5% sodium nitrite solution and 1.0 mL were shaken well, allowed to stand for 6 min, and then pulsed with 10% aluminum sulfate solution 1.0mL, and let to stand again for 6 min. Finally, 4% of 10.0mL sodium hydroxide solution was added, diluted with distilled water to the scale, shaken well, and allowed to stand for 15 min, and a 7230G visible light photometer scanning between 400

and 600nm was used<sup>[7-10]</sup>. We referenced the method of measuring total content of flavonoids of *sophora japonica* in the 2005 edition of China pharmacopoeia (a), because there were slight changes in 495 ~ 505 nm of the absorbance; then, we determined the maximum absorption wavelength was 500 nm, and both the reference substance solution and the sample solution were on this wavelength to be measured.

### 2.3 Establishment of the standard curve

Exactly measured rutin reference substances that were 0.0, 1.0, 2.0, 3.0, 4.0, and 5.0mL, respectively, were placed into a 25mL volumetric flask; the concentrations of rutin solution were 0.000mg/mL, 0.008mg/mL, 0.016mg/mL, 0.024mg/mL, 0.032mg/mL, 0.040mg/mL, and 0.048mg/mL. Each one joined distilled water to 6.0mL, added 5% sodium nitrite solution 1 ml to blending, let stand for 6 min, then added 10% aluminum sulfate solution 1 ml to blending, let stand for 6 min again, finally added 4% sodium hydroxide solution 10 ml, refilled to permitted level with distilled water, shaken well, let stand for 15 min<sup>[11-12]</sup>. With water as the blank control, we measured absorbance at a wavelength of 500nm; with rutin reference substance solution concentration of C (mg/mL) as the abscissa and the absorbance of A as the ordinate, we obtained the regression equation. Rutin in 0.008 ~ 0.048mg/mL range of concentration showed a good linear relationship, as shown in Table 1 and Figure 1:

Table 1. Rutin solution standard curve.

Number	Concentration (mg/mL)	Absorbance (A)
1	0.008	0.072
2	0.016	0.165
3	0.024	0.255
4	0.032	0.340
5	0.040	0.440
6	0.048	0.555

Figure 1. Rutin solution standard curve.

### 2.4 Sample solution preparation

After cleaning and drying, *Aleuritopteris argentea* was separated from the root, stem, and leaf, and then, it was crushed over a 60-mesh drug screen, respectively. Each weighed accurately 1.0g then putted into cone flask with plug, added 70% 30mL of ethanol, a low temperature of 60 DEG C to fully soak for 24 hours, 60 DEG C water bath heating 10 minutes, ultrasonic treatment 30min, after filtration then transferred it to a 50mL volumetric flask, refilled to permitted level with 70% ethanol, which were extraction liquids of *Aleuritopteris argentea* different parts.

### 2.5 Determination of total flavonoids content

According to the 2.3 method, the calculation of total flavonoids in different parts of *Aleuritopteris argentea* linear regression equation is shown. The calculation formula is as follows:

$$\text{Total flavonoid content (\%)} = C \times 25 \times 50/W$$

C is based on the measured absorbance solution value into the regression equation to calculate the concentration of total flavonoids (mg/mL), W is the sampling volume (mg).

Table 2. Total flavonoids contents in different parts of *Aleuritopteris argentea*.

Parts	Root	Stem	Leaf
Absorbance	0.198	0.262	0.453
Content(%)	2.37	3.05	5.10

The results showed that *Aleuritopteris argentea* total flavonoids content was higher in the leaf, followed by the stem, and the least in the root.

### 2.6 Methodological study

#### 2.6.1 Precision test

On rutin standard solution (concentration of 0.048mg/mL) for 5 parallel determination, we got 5 absorbance, the standard deviation values were 0.0064, and the RSD value was calculated to be 1.15%. The results showed that the precision of the instrument was good.

#### 2.6.2 Stability test

Every 1 hour, the absorbance of various parts of *Aleuritopteris argentea* extraction was measured; each part was measured 5 times, calculating the value of RSD.

Table 3. Stability test of the extracted liquid of *Aleuritopteris argentea* in different parts.

Number	1	2	3	4	5
Root absorbency A1	0.210	0.200	0.195	0.197	0.198
RSD			2.94%		
Stem absorbanceA2	0.260	0.265	0.263	0.263	0.259
RSD			0.93%		
Leaf absorbanceA3	0.450	0.457	0.453	0.460	0.456
RSD			0.66%		

The results showed that the samples in the treatment after 4 hours maintained the basic stability.

### 2.6.3 Repeatability test

Table 4. Repeatability test of the extracted liquid of *Aleuritopteris argentea* in different parts.

Number	1	2	3	4	5
Root absorbency A1	0.200	0.206	0.195	0.195	0.199
RSD			0.17%		
Stem absorbanceA2	0.261	0.265	0.259	0.264	0.260
RSD			0.12%		
Leaf absorbanceA3	0.460	0.451	0.454	0.461	0.450
RSD			1.08%		

The results showed that the samples had good reproducibility.

### 2.6.4 Recovery rate test

Table 5. Recovery rate test of the extracted liquid of *Aleuritopteris argentea* in different parts.

Parts	Root	Stem	Leaf
The average recovery rate (%)	100.4	100.6	99.90
RSD(%)	1.95%	1.48%	1.60%

The results showed the rate of recovery results was satisfactory.

## 3 CONCLUSION

This experiment is a safe and feasible method; the contents of *Aleuritopteris argentea* total flavonoids in the root, stem, and leaf are 2.37%, 3.05%, and

5.10%, respectively. The content of total flavonoids from top to bottom presents a decreasing trend. We get the same conclusion from Zhu Xiaofeng that light is helpful for the synthesis of plant flavonoids<sup>[13]</sup>.

## Steganalysis technology for adaptive embedding of GIF image

Yong Hui He

Shandong Yingcai University, Shandong, China

**ABSTRACT:** From the point of view of steganalysis method, this article presents a specific steganalysis algorithm for adaptive embedding of GIF image, putting the goal forward of taking the ciphertext extracted by steganalysis as court evidence.

**KEYWORDS:** steganalysis, GIF image, digital forensics.

### 1 INTRODUCTION

Widespread on the Internet GIF format images, the page, the ad universal application, is an excellent secret carrier. The GIF image information hiding algorithm can be classified into three cases: change in the color palette, change in the color palette and the index value, and change in the index value. Change the color palette is relatively simple and easy to implement. Typical of these algorithms is freeware Gif-Shume. The idea is to rearrange the color palette, with different combinations of colors to hide information. After the image data are hidden, the information is not changed, only the palette of colors is sequentially changed. This algorithm is limited by the capacity of the size of the palette, GIF image palette with approximately 256 colors, regardless of the image file size; the maximum capacity of only  $\log_2(256!) = 210$  hidden bytes, so the usefulness of this method is not strong. With the same principle, the method changes the color palette and index values are as follows: First, the extract color palette by dithering algorithm, and then slightly modified color extended to the entire palette, according to the index value and the information bit comparison, the index value represents information with the same information bit is not to be replaced, otherwise, the index value is replaced with the index value to another. This method is also referred to as jitter modulation method. S-Tools software applications and Hide & Seek is this principle, but these methods cause a significant reduction in the color palette and reduce the quality of the image. Using a common software, the image palette can easily find abnormality of such an algorithm and thus secure poor. In addition, these indexed color images are the secret method for resistance and the band training wavelet detection algorithm is weak.

Based on these three types of algorithm weaknesses, a secret algorithm-based GIF image is now generally considered according to the image content adaptive algorithm to compare the safety of secret algorithms. These algorithms maintain the same color palette, by pre-allocation index, modifying the value of the image data to embed the index information, whose embedded features are so dense and the content of the image signal together. Such algorithms are typical Fridrich optimal parity distribution method<sup>[1]</sup>, and by several methods involving joint embedding, a bit pixel common approach is used to improve the visual effect of their algorithms. BPCS algorithm based on the color palette of the image<sup>[2]</sup> is a typical method based on image content; the computational complexity of the algorithm by the image block is used as block-embedded information to determine the basis for, and then replace the entire block elements. Thus, the content of the information embedded in the image is an optimized combination of losing the visual effect of the good method, but these methods are at the expense of the capacity of the embedded algorithm to enhance the visual effect, which is a drawback of such algorithms. For this shortcoming, Chin-Chen Chang proposed in the literature<sup>[3]</sup> the use of the adaptive coding group Steganography based on image content, The algorithm and image content is a combination of the image palette first pre-classification, in accordance with the thresholds set by the palette of elements classified into three categories on the palette of elements. The first category is the group of four elements, the second category is the group of two elements, and the third category is an element of the group. The principle is to make each group smaller than the distance between colors specified by closing values artificially. Due to the third color class, the other colors in the palette do not close, and the process of embedding of these elements is not

suitable for embedding the information, thus ensuring the visual effect. In addition, there is the sub-four-tuple of elements, where each element can represent two bits of information (00,01,10,11); sub-tuple of elements in each element can only represent one bit of information (the 0, 1), where  $Ez\_stego^{[4]}$  the method is the same. As a result of the four-tuple of elements in the phase to replace the two-bit information that can be embedded, this can amount to improving the embedding capacity.

## 2 USE IMAGE ADAPTIVE CODING ALGORITHM SECRET GROUP

Chin-Chen Chang proposed adaptive encoding group Steganography based on image content based on pre-set closing value (TH) of the index values that are classified into three types. First, identify the index value of the first class, the index value of the first four in each category, the four index values correspond to Euclidean distance between any two colors being less than TH; then, find the second category index value, each group has two index values, which correspond to the Euclidean distance between colors being less than TH second category; for the remaining third category index value, the third category in each group has only one index value.

Specific process classification is as follows:

Step one: Calculate the palette index values corresponding to any two colors of the Euclidean distance;

Step Two: If the index value of the corresponding color is not classified, select the index value two recent color as the first two index values in the first category group  $i$ , where the index is smaller first and the larger the index value of the second;

Step Three: Calculate the index values corresponding to the two color cluster centers, such as  $(R_1, G_1, B_1)$  and  $(R_2, G_2, B_2)$  of the cluster centers  $((R_1+R_2)/2, (G_1+G_2)/2, (B_1+B_2)/2)$ ;

Step Four: The index value is not classified in the corresponding color. Select the color above the nearest cluster center, and to ensure that the distance is less than TH, the index value of the color index is defined as the value of the first class of the first group  $i$ , that is, the third index value;

Step Five: Calculate the three first class cluster centers with the same index value that corresponds to the first three color group  $i$ , methods, and procedures;

Step Six: If the index value, is not classified in the corresponding color, select the color above the nearest cluster center, and to ensure that the distance is less than TH, the index value of the color index is defined as the value of the first class of the first group  $i$ , which is the fourth index value.

Repeat step two to step six, until you cannot find the close proximity of the four colors. You can find all

being first class and get a unique index value grouping and sorting.

Then look for the second category index value; the specific process is as follows: Step One: The index value is not corresponding to the classification of colors; select the color index value of the two most recent values of two indices as a second index value of the first class of the group  $j$ , wherein the smaller the index value of the first, the larger the index value of the second;

Step Two: Repeat steps until the index value of the corresponding color is not classified into any two of the Euclidean distance is greater than TH.

In this way, you can find all of the second class and get a unique index value grouping and sorting. The remaining value is not classified in the third category of the index value index.

In terms of threshold selection, if TH is bigger, the greater the maximum embedding capacity of the image, and the image effect is worse; conversely, the smaller the maximum embedding capacity of the image, the better is the image. The maximum capacity of the embedded image can theoretically reach 2bit/pixel. When the experiment according to the maximum embedding capacity and the visual effects obtained by stego graph, as the TH 500, with an average maximum capacity 1.6bti / pixel so.

## 3 INDEX VALUE DUE TO CHANGES IN THE ADAPTIVE EMBEDDED DISTRIBUTION

Compared with the original image, the distribution density map of the mask set of index values with the degree of similarity is increased. A set (or two) of the four index values located in the same distribution area group is  $S$ ; due to the process of embedding information interchangeably between them, being a quarter of the probability, the embedded information is evenly distributed in the  $S$  inside, which makes them very similar to the distribution area.

## 4 ADAPTIVE EMBEDDED SECRET IMAGE ANALYSIS ALGORITHMS

To determine the distribution of the three values closest to the index value is larger than an area to identify the distribution of  $(m * n * x\%)$  of the index value, the index value by the number of  $x$  control, generally 20 or more. Their distribution to the respective horizontal and vertical axes enable the projection to give a two-dimensional distribution of the index values. Calculating the distribution of the similarity between points, we need to find the distribution of the three closest index values. If the Gif figure is stego graph, then each pair of index values is very likely to belong to the same group.

Then, calculating the distribution of similarity, the two-dimensional size of the image set of pixels  $M \times N$  and  $K_1$  to  $P_1(x, y)$  and  $K_2$  distributions  $P_2(x, y)$ ,  $K_1$  and the distribution of the similarity of  $K_2$  is defined as follows:

$$\delta = \left\{ \sum_{y=1}^M \left[ \sum_{x=1}^N P_1(x, y) - \sum_{x=1}^N P_2(x, y) \right] \right\}^2 + \left\{ \sum_{x=1}^N \left[ \sum_{y=1}^M P_1(x, y) - \sum_{y=1}^M P_2(x, y) \right] \right\}^2 \quad (1)$$

Finally, based on the threshold value determination, the threshold value TH in a certain range, and the classification of the index value, a TH value is used to detect the presence of the three index values such that the two index values for each pair are assigned to a group, if exist, the penalty for stego map, whether the sentence is cover map. The program is set in the range of 200–1000. If  $TH < 200$ , the maximum embedding capacity cover map is too small and thus not suitable for embedding information; if  $TH > 1000$ , we get poor stego map visuals.

## 5 SUMMARY

JPEG images using 500 Sony DSC F828 camera are directly taken, which gives us the size of 24bits true color image 1280x960 natural landscapes and figures; then, we use the network to download githide\_embed program; select a different random number embedding rate (the experiments were chosen to be 0%, 20%, 50%, and 100%) for an image embedded in a random number that is generated with different embedding capacity of the image density test.

After a total of 1809 images in batches of statistical samples were tested for a specific image source (24bits true color JPEG image GIF image converted Sony DSC F828 digital camera), the adaptive information hiding method was used to embed different amounts of secret information for embedded amounts in more than 20% full embedded image steganography capacity as well as the original image, the detector false alarm rate of 7.4%, far less than 25% of the minimum steganography image detection rate was 86%.

# Tamper detection based on defocused image difference

Zhi Hong Wang

Shandong Yingcai University, Shandong, China

**ABSTRACT:** The camera parameters and scene structure determine the image blur degree, and the consistency of fuzzy reflects the consistency of the camera parameters and scene structure. Tampering could undermine the consistency. The purpose of the article is to judge whether the image is tampered based on the analysis of the relationship between the defocused image from focus blur and scene structure.

**KEYWORDS:** Defocus, tamper detection, consistency.

## 1 INTRODUCTION

The main factor in the digital image acquisition devices causing image quality is image noise, image blur, and brightness and color distortion. Image blur is determined by the degree of camera parameters and scene structure; consistency reflects the consistency of fuzzy camera parameters and scene structure; and tampering threatens to undermine this consistency. Image blur also does not have a uniform definition of angles and measure; this article analyzes the image blur and focus away from the relationship between landscape structure and determination tampering.

## 2 DISK DEFOCUS MODEL

Defocus disk model is the use of geometrical optics knowledge of the phenomena studied defocus, light source through the ideal imaging system into the image of a point close to the  $\delta$  functions. However, when the object surface, when the distance between the lens and the image plane does not satisfy the Gaussian image, the image point is no longer a point source but a disk-shaped diffusion plate, a uniform gray value distribution of the dispersion disc.

By Gaussian imaging formula known:

$$\frac{1}{f'} = \frac{1}{l'} - \frac{1}{l} \quad (1)$$

where  $f'$  is the lens focal length,  $f$  is the object distance, and  $l'$  is the ideal image distance, according to a similar triangle theorem:

$$\frac{D}{l'} = \frac{d}{\Delta}$$

where  $D$  is a diameter,  $d$  is defocus blur diameter, and  $\Delta$  is the error.

Powder dispersion defocus distance from the diameter of the disc material, the size of the focal distance, the image distance of the optical system determines the common aperture<sup>[1]</sup>, the disc defocus model is:

$$h(x,y) = \begin{cases} \frac{1}{\pi R^2} & x^2 + y^2 \leq R^2 \\ 0 & \text{Other} \end{cases} \quad (2)$$

## 3 GAUSSIAN MODEL DEFOCUS

Due to frequency domain transformation of the disc, there are too many zeros function models so that little practical application of this model, commonly used for the Gaussian model of defocus, which is not derived from the knowledge of optics, is a number of a degradation factor. In considering obtaining an approximate model<sup>[2]</sup>, the model is

$$h(x,y) = \frac{1}{2\pi\sigma^2} \exp\left(-\frac{x^2 + y^2}{2\sigma^2}\right) \quad (3)$$

where  $\sigma$  is the amount of defocus model parameters needed to defocus blur the image to determine the model<sup>[3]</sup>.

The defocus model has the following advantages:

- 1 Gaussian frequency-domain transformation from coke function model has a handful of zeros, and inverse filtering can eliminate the singularity;
- 2 Continuous two-dimensional Gaussian function is equivalent to the convolution of two consecutive two-dimensional Gaussian functions; two-dimensional discrete Gaussian function can be approximated by the equivalent of two-dimensional discrete convolution of Gaussian function. Diffusion prevents the image from determining parameters of a slight error due to the time.

The continuous Fourier transform of the Gaussian function is still a Gaussian function, and there is no zero Gaussian function or a discrete support restricted Fourier transform is approximated Gaussian function and has a zero crossing, but it is difficult to decide the position of the zero crossing from Gaussian function parameters. The defocus Gaussian model is assumed from the point spread function of coke Gaussian distribution; the latter of its functions was also integral diffusion of a Gaussian distribution:

$$I(x) = \frac{1}{2\sqrt{\pi\sigma^2}} \exp\left(-\frac{x^2}{2\sigma^2}\right) \quad (4)$$

After the integral of the marginal function:

$$e(x) = \frac{1}{2\sqrt{\pi\sigma^2}} \int_{-\infty}^{\infty} \exp\left(-\frac{x^2}{2\sigma^2}\right) \quad (5)$$

#### 4 BASIS FOR TAMPERING IDENTIFICATION

If the picture is real, the picture content corresponds to the camera for a shot of the scene. With constant aperture radius  $r$ , the distance from the lens to the imaging plane of  $s$ , the focal length  $f$  of the lens on the image side, and an optical system formed by the correction value of  $\kappa$  in the shooting are the same,  $u$  different degree of blur difference region:

$$\Delta_1 - \Delta_2 = krs \left( \frac{1}{v_1} - \frac{1}{v_2} \right) \quad (6)$$

In the tampering process, in order to make tampering with the background image portion and better integration, the image often tampers with the edge blur manual operation portion. Another consequence of tampering and to bring the content of the original content tampering imaging condition is, in most

cases, inconsistent. These factors undermine the corresponding relationship between  $v$  and blur, and therefore, the correspondence between the depth and the degree of blurring can be used as the basis for detection of tampering.

Only in locations with high-frequency information, blurring measure in order to be healthy, we choose  $v$  similar images containing image edge pieces, with the ambiguity of the image blur estimation methods and measure the block of each edge pixel. Because  $v$  is similar, the degree of blurring in the image can assume that the pixel block boundary is in accordance with the Gaussian distribution, that is,

$$g(m) = A + q(m) \quad (7),$$

where  $A$  is the blur image block,  $q(m)$  is Gaussian white noise,  $m$  is an edge pixel sequence number, and the mean edge pixels within an image block indicate ambiguity  $A$  minimum variance is unbiased estimation. If  $v$  is similar to the two blur, the edges of the image block contain significant inconsistencies, and you can determine the picture is fake.

#### 5 METHOD OF AMBIGUITY ESTIMATION

In order to identify the blurred image caused by tampering, requires a suitable measure of the estimated blur the image. Blur estimation methods suitable for image tampering identification must meet the following conditions:

- 1 Estimation method is local. Because the degree of blurring needs to be measured at different locations in the same image, rather than a measure of the overall degree of blurring, it should be a partial metric.
- 2 Ability to handle the complex structure of a scene. Scene structures of natural images are more complex, so the requested ambiguity estimation method can accurately estimate the position of the edge and ambiguity in complex scenes.
- 3 Robust to noise interference. Digital camera ISO sensitivity setting different noise levels will produce a different image tampering process, in order to increase the realism, which will add the appropriate amount of noise tampering. Therefore, the fuzzy estimation method requires robustness to noise.

According to these requirements, we chose Elder and Zucker<sup>[4]</sup> The control method proposed a local scale to estimate the degree of blurring of the image. Elder-Zucker approach stated that the edge of the image is modeled as an ideal step function and will be modeled as a Gaussian blur blur kernel; calculated

image noise can resist minimum reliable scales corresponding to each point on the scale to get the smallest reliable location and blurred edges reliability volume level. Because of its good ability to estimate the local blur, Elder-Zucke method is used to estimate the depth of field blur information<sup>[5-6]</sup>.

Elder-Zucke method steps are as follows:

The first step: To estimate the noise variance of the image, here is a robust median estimate:

$$t_m = \frac{\text{median} |x_{diag}|}{\lambda} \quad (8)$$

Step two: Calculate the minimum controllable and reliable scale to a first-order Gaussian filter of the first order; on this scale, gradient values are calculated for each point. To improve accuracy, each fold is scaled to treat the election process and again subdivided.

The third step: Calculate a controllable second-order filter to the second-order Gaussian minimum reliability standards, calculating the second derivative values at each point in the gradient direction on this scale.

Step Four: Locate the second derivative of the zero-crossing point, which marks the presence of the image edges.

Step Five: Determine the location of the second derivative of the interpolation positioning extreme points and calculate the degree of blurring edges.

## 6 SUMMARY

According to the defocused image block model, with a similar distance, optical lens should have a similar

degree of defocus blur. We choose a depth close to the edge of the image blocks containing the image to be detected, using the Elder-Zucker local scale control method for measurement of local image blocks and the degree of blurring of the edge points. the degree of defocus blur, focus blur degree of inconsistency from the tamper indicating exist.

# Study of tampering detection based on image fusion

Hui Fen Huang

*Shandong Computing Science Center, Shandong, China*

*Shandong University of Science and Technology, Shandong, China*

*Shandong Yingcai University, Shandong, China*

**ABSTRACT:** In order to detect the presence of tampering images after down-sampling or low-quality JPEG compression, this article presents the tampering detection method based on image fusion. The tampered regions are located coarsely by using the SIFT feature points, the SIFT matching feature points are selected as the seed points, and the tampered region is gradually grown out.

**KEYWORDS:** Fusion, tamper detection.

## 1 INTRODUCTION

In real life, the most common image tampering has three main sources: forensic images, photojournalism, and network image. Forensic range of digital images can be doctored very strict definition, until the thought of a pixel changes also belong to tampering. However, considering the limitations of layout constraints and network storage space on network, news photos and images making the same stringent requirements are inappropriate. In other words, the definition of tampering applications depends on the image and image editing of the appropriate agency requirements; there is no uniform standard. Common news agency allows the operator to adjust the size of photographic images and the appropriate brightness adjusts the image; the picture image on the network is mostly assessed through down-sampling and low-quality JPEG compression to save storage space. Different applications of digital image tampering detection method also propose different requirements; robust detection method needs to take into account the reasonable operation of the image. That the image has been tampered with reasonable operation is still able to detect tampering. We consider the down-sampling and low-quality JPEG compression and reasonable suitable brightness adjustment operation, image fusion using the method proposed to compensate the loss of information caused by reasonable operation to ensure the stability of the algorithm.

## 2 IMAGE FUSION CONCEPT

Level image fusion can be divided into pixel-level, feature-level, and decision-making-level fusion:

### 1 Pixel-level fusion

Pixel-level fusion is a low level of integration, that is, before the original information from various sensors is integrated without treatment and analysis of information. Pixel-level fusion under strict registration conditions directly uses information from each sensor fusion method, and the pixel associated with the image can be used to improve the sensitivity and signal to noise ratio; the level of integration provided by the other remote information cannot be provided with high accuracy. Since the foundation of this approach is the integration of strict pixel alignment, the different sensors capture site registration, demanding a large amount of information processing, thus long processing time and really poor, poor anti-interference ability.

### 2 Feature-level fusion

Feature-level fusion idea is intended to first extract useful features from the original multi-sensor imaging and then fuse them. Feature-level fusion is based on the pixel-level fusion, using the parameter template, statistical analysis, and other methods of geometric pattern-related association, target recognition, and feature extraction fusion method. Feature-level fusion intends to achieve an objective information compression, real-time processing in favor of and directly related to the features provided by the decision-making, but it is lower than the pixel accuracy of the integration stage.

### 3 Decision-making-level fusion

Judgment decision-level fusion associated sensors were provided to increase the confidence of identification. Decision-level fusion methods are mainly based on the cognitive model method and require the use of large databases and expert judgment system

simulation analysis, reasoning, recognition, and decision process, in order to increase the reliability of intelligence and decision-making. Decision-level fusion has strong fault tolerance and good opening, but intelligent and efficient decision-making-level fusion algorithm research is still a relatively weak link.

### 3 FUSION METHOD BASED ON MULTI-SCALE TRANSFORMATION

The advantages of the fusion algorithm based on the multi-scale transformation are that it provides visual contrast information primarily to the human eye, as well as its ability to space and being localized in the frequency domain. In a nutshell package, the fusion method is based on multi-scale transformation of three main steps: ① multiple sensors source images were multi-scale decomposition to obtain a series of sub-image transform domains; ② the use of certain fusion rules, extracting each scale transformation domain as the most effective feature to obtain a composite multi-scale representation; and ③ multi-scale representation of a complex multi-scale anti-transformation, fused image. According to the different forms of multi-scale transformation, image fusion algorithm based on multi-scale transformation of the image fusion method can be divided into pyramid transform and the fusion method based on wavelet transform.

The image pyramid includes Laplace transform, low-pass ratio, gradient, morphology, and other pyramid transformation. Laplacian pyramid is a similar band-pass filtering technique. Burt proposed a spatial domain. Pyramid is a low-pass ratio that Toet proposed in 1989 based on the local contrast pyramid. Gradient pyramid was proposed in 1993 by Burt<sup>[1,2]</sup>, and it is through a Gaussian pyramid for each gradient computation get. Burt was first proposed the fusion method based on the Laplace transform pyramid. The method uses Laplacian pyramid-based fusion rules and carries out human eye pixel maximum binocular stereo vision integration. In fact, this method aims at selecting the local brightness differences larger point; this process is used to roughly simulate the human eye binocular things in the process. However, precisely, the human eye is more sensitive to the local luminance contrast rather than the local luminance difference sensitivity. So, the Laplacian pyramid image fusion was not well positioned to meet the human visual psychology. The ratio of the low-pass pyramid and maximum principle is used for the fusion of visible and infrared images. Although in line with the ratio of the low-pass pyramid visual features of the human eye, but because of the local contrast of noise being generally larger, so the ratio of

the low-pass pyramid-based fusion algorithm is sensitive to noise and instability. To solve this problem, Burt proposed the gradient pyramid and matched the image fusion method based on significant measures. Sims and Phillips<sup>[3]</sup> gave three kinds of pyramid image fusion for qualitative and quantitative results.

A different spatial resolution may be used in a targeted manner to highlight important features and details of each image related to pyramid transformation based on the fusion method; compared with the simple image fusion method, it obtains a significant improvement fusion effect. However, the image pyramid decomposition is a redundant decomposition of the image, that is, redundant data between the layers after decomposition. Meanwhile, the high-frequency information in image fusion results in greater losses that may appear vague and unstable while rebuilding the pyramid. In addition, the image of Laplace, the ratio of the low-pass, and no direction of morphological pyramid decomposition could be better to extract image features. The wavelet transform technology that developed in the 1980s has many other time (empty) frequency domains but does not have excellent characteristics, such as orientation selectivity, orthogonal variable time-frequency domain resolution, local support adjustable data analysis, as well as smaller amounts. These excellent properties make the wavelet transform become a powerful tool for image fusion. Multi-scale wavelet transform properties are more in line with the human visual system, and computer vision is transformed from a coarse to a finer, more similar understanding of the process and is more suitable for image fusion. The basic steps of image fusion method based on discrete wavelet transform are as follows: ① a source image separately for each wavelet transform, build the image of the wavelet pyramid decomposition; ② high to low for each decomposed layer fusion process, the different frequency components of each layer can be decomposed into different fusion operator processes, and, ultimately, get the wavelet pyramid fused; ③ obtained after fusion inverse wavelet transformation of wavelet pyramid, and the resulting reconstructed image is fused images. In the image fusion process, fusion rules, and fusion operators, the choice of fusion quality is essential. In order to obtain better visual characteristics, richer detail prominent fusion effect, fusion rules, and fusion using operators are described as follows: ① low-frequency part of the decomposition, that the image is "rough like," using the weighted average fusion rules or grayscale value selection fusion rule. ② For the high-frequency components, the use of regional characteristics is measured based on the amount of options and the weighted average operator. ③ For the high-frequency band in three directions, choose different characteristics based on the selected operator.

#### 4 PREPROCESSING THE IMAGE-TO-BE-DETECTED FUSION

D. Lowe<sup>[4]</sup> uses a strong feature point information; with the feature points of weak image matching method localized, this approach requires the information-rich part of an image. Down-sampling and lower-quality JPEG compression caused by the loss of local information are based on the feature points matching algorithm to find an SIFT point that causes difficulties. In commonly used detection methods, SIFT RGB color image is detected by a linear transformation to convert the image to grayscale values, and not take full advantage of the three channels of information. In order to deal with the local information of the image missing tamper, fuller use of the multi-channel color image information location tampered area treated by the method of image fusion detected image preprocessing, and the details are fused to the plurality of channels in an image. The algorithm used by Tao et al proposed an image fusion method based on weighted multi-scale basic form; WMFF expresses a continuous multi-value image formula, which is as follows:

$$\|dH\|^2 = \sum_{i=1}^N a_i \left( \frac{\partial H_i}{\partial x} \right)^2 d^2x + 2 \sum_{i=1}^N a_i \frac{\partial H_i}{\partial x} \frac{\partial H_i}{\partial y} dx dy + \sum_{i=1}^N a_i \left( \frac{\partial H_i}{\partial y} \right)^2 d^2y \quad (1)$$

Among them,

$$a_i = \frac{\left( \frac{\partial H_i}{\partial x} \right)^2 + \left( \frac{\partial H_i}{\partial y} \right)^2}{\sum_{k=1}^n \left( \frac{\partial H_k}{\partial x} \right)^2 + \left( \frac{\partial H_k}{\partial y} \right)^2} \quad (2)$$

Detection algorithm based on image fusion

After the integration of multi-channel images, the image luminance channel makes copies - Transform - Mobile tamper detection, in general, local brightness adjustment in two ways: One is proportional to the luminance channel adjustment; visual effects of this adjustment are more blunt; another is to adjust the RGB channels of the same value, and the visual effect of this approach is more gentle. Taking into account the local image brightness adjustments possible, there is a need for a simple calculation of regional growth guidelines so that it can be detected by the local brightness adjustment area. We chose the brightness histogram as the feature region area. If the histogram characteristics of the two areas  $u, v$  satisfies

$$\text{cov}(u, v) = \frac{\sum_{i=1}^s (u_i - \bar{u})(v_i - \bar{v})}{\sqrt{\sum_{i=1}^s (u_i - \bar{u})^2} \sqrt{\sum_{i=1}^s (v_i - \bar{v})^2}} > T$$

Two areas are considered similar in which  $s$  is a histogram of the number, and  $T$  is the threshold value.

Image fusion-based algorithm steps are as follows:

The first step: to be detected through a color image down-sampling operation or after a reasonable multi-channel image fusion;

Step Two: The image fusion is performed after SIFT point detection and fast matching;

The third step: to determine whether the presence of SIFT point, without the image without tampering, is the next step;

Step four: the area looking for similar images and masked morphological operations, and to further determine tampering.

#### 5 SUMMARY

This article presents an image tampering detection method based on SIFT feature points; the algorithm to use SIFT feature points out the initial coarse positioning of the tampered region, then matches the SIFT feature points as seed points, and gradually grows the tampered area. In order to perform down-sampling or prepare a low-quality JPEG image after compression, we need to tamper with detection and resolve high-resolution color image tampering detection volume problem, a color image based on tamper detection image fusion.

# Splicing detection based on consistency of color filter array's characteristics

Yu Hong Chang

Shandong Yingcai University, Shandong, China

**ABSTRACT:** In this article, a new interpolation model is established to the step edge caused by splicing based on the analysis of the interpolation of color filter array of step-type boundary signals in the imaging process. We need to design the measure amount of interpolation features consistency of color filter array, so as to identify the difference between gray distribution of the two ends of the histogram. We should classify pixels on splicing boundary by threshold decision method and realize the positioning of the splicing boundaries.

**KEYWORDS:** Image forensics; splicing detection, filter array, histogram.

## 1 INTRODUCTION

Image mosaic image is currently a common method that is tampered with and is often used maliciously as well as modified the true content of the original photographs, mostly using a variety of image editing software from two or multiple different target areas in the original image into a mosaic amplitude new synthesized image. How to successfully achieve the splicing operation Blind digital image forensics has become an important topic in research; existing digital image mosaic detection technology, including a light source based on the estimated direction of inconsistency<sup>[1]</sup>, based on the edge of bipolar signals modeling<sup>[2]</sup> and phase consistency<sup>[3]</sup>, using the noise distribution in the camera CCD or CMOS sensors inherent<sup>[4]</sup>, the consistency of the estimated camera response function at the edge of the area on both sides and other methods. Although these methods can achieve splice detection tasks in simple scenarios, but are needed during the execution of a large number of statistical learning algorithms and human intervention, they cannot be fully automated and rapid and effective. These methods are characterized by the presence of the robustness of the estimated difference in accuracy rate, lower boundary location, and splicing defects such as lack of precision; in order to overcome the earlier shortcomings, we propose a color filter array image mosaic based on consistency analysis features of the rapid detection algorithm.

## 2 INTERPOLATION PROPERTY MODELING THE COLOR FILTER ARRAY

In general, in digital cameras, each pixel is used only to record data with a CCD sensor. Therefore, in the R, G, and B three color channels, information related to each of the pixels can be recorded in only one color channel, and the color information is for a complete record, usually in the form to cover the CCD color filter array, that is, a color filter array. The most commonly used is the Bayer color filter array: The basic unit comprises a blue and a red component, and the two components are arranged along the diagonal direction of the green filter. Only a single record red CCD cell (r), green (g), or blue (b) color components in one, the missing color information where the information is recorded in the neighborhood of the channel approximation is obtained, that is, a color filter array interpolation, which is a digital imaging process is an important step.

A natural edge in the image is a discontinuity in the visual scene luminance reflected light, wherein the step shaped edges are the most common type of imaging process; the edge of the step-type optical color filter array, including the inner filter and the color filter array interpolation of two steps. Step the natural scene optical edge; the transition zone due to its luminance certain width must be set to  $w$ ; the CCD sensor is provided as the physical size of the unit  $\delta$ , the luminance signals of the optical sampling interval for  $\delta$ . For step-index optical edges of different

intensity in the corresponding digital imaging results, the distribution may exist in pixel gray edge transition zone with corresponding figures for the following two situations:

- 1 Presence of luminance transition zone corresponds to the optical edge  $w > \delta$  visual effects when there is a certain width and fuzzy situation. Color recording mode based on the color filter array; the luminance corresponding to the transition region has at least one distribution within CCD sensing unit. Thus, in a digital photograph, the final image must be recorded at one or more pixels in the transition zone luminance information; the recorded values of these pixels will be apparent between the gradation level where the ends of the edge.
- 2  $w \leq \delta$  Brightness corresponds to the optical edge transition zone is relatively narrow, less than the minimum resolvable size CCD, which is often encountered in the case of high-resolution imaging. If the luminance corresponds to the transition region within a CCD, a CCD sensor is just a distribution unit, with the latter corresponding to the digital gray scale image as the edge of the cable is equivalent to the transition zone 1, as in the case, if the luminance corresponding to the transition region the CCD domain, there is no distribution of CCD sensor unit, the transition zone corresponding luminance record information is missing, the missing values are obtained by interpolating color filter array. Thus, in the final imaging results, the corresponding figures near the edge of the transition zone will exist in a certain neighborhood of two or more gray-scale distribution.

### 3 MOSAIC COLOR FILTER ARRAY BOUNDARY CHARACTERISTIC INCONSISTENCY MEASURE

Position coordinates in a digital photo image, gray-scale characteristics of the statistical distribution of the quantitative measure of the step-type edge transition zone located the edge of a step-like cable point  $\epsilon$  to  $(x_\epsilon, y_\epsilon)$ , and its local histogram statistics for

$$L_\epsilon(i) = I_\delta[p(x)] \quad (1)$$

where  $i = 1, 2, \dots, N$ ,  $p(x)$  represents a pixel to the center  $\epsilon$ , along a direction perpendicular to the edge where a single pixel is an extracted gradation sequence;  $I_\epsilon$  is histogram of local statistical functions; and  $\delta$  is the statistical accuracy of the histogram width.

Based on this, we have designed within a color filter array corresponding to the edge of the pixel interpolation characteristic values  $\epsilon$

$$g_\epsilon = L_\epsilon(q(A) + L_\epsilon(q(L+A))) / \sum_{i=1}^N L_\epsilon(i) \quad (2)$$

where  $q(A)$  and  $q(L+A)$  represent the amplitude value of the histogram bin number  $A$  and  $L + A$  to be quantized into. The interpolation step in the real scene, whether optical edge card within what resolution algorithm processing via the image sensor and color filter array, the edge point corresponding to the image of a color filter array will be much smaller than a characteristic amount, which is the digital camera imaging inherent laws of the decision.

The digital image stitching operation will usually have a clear outline of some object to copy and paste from one image to another image; the stitching boundaries often form a new step edge that we call "step-edge stitching class." In the case of other types of follow-up operation that does not appear, the step-edge stitching class type can be directly modeled as a step sequence:

$$v(x) = \begin{cases} A & x \leq x_1 \\ L + A & x > x_1 \end{cases} \quad (3)$$

Among them,  $x$  represents a discrete integer coordinates local coordinate system, and  $A$  and  $L$  denote the magnitude of the edge of unilateral and bilateral between the relative height. Transition zone width is of only one pixel unit scale, namely  $w = x_2 - x_1 = 1$ . Splicing operation itself is only due to the different two-dimensional matrix of combinations of numbers, similar to the estimates at the boundaries of the processing within the non-color filter array interpolation. A step-shaped edge is in accordance with the analysis method of the color filter array, where such a local histogram of the edge point will appear in a clear distribution of binarization, that is, grayscale levels  $q(A)$  and  $q(L + A)$  in the formation of a very prominent peak, so that the appropriate color filter array eigenvalues are close to 1. This natural photo image demonstrated that the edges of the step-type characteristics are completely different, so we achieve an accurate identification of the type of stitching the edge of the step class.

Strength of weak fuzzy operations and JPEG compression is often used to smooth mosaic border and hide stitching marks. From the point of view of signal processing, such processing is equivalent to the low-pass filtering process. Class-type splicing step edge signal experiences a weak model before and after the low-pass filtering process. At this point, the pixel will be disturbed close to the boundary, and the gray-level value of  $A + 0.5L$  is close to the middle. When the blur intensity is limited within a certain range, gray-scale variation will be limited to a certain extent, as

long as the gray histogram precision variable does not exceed a color filter array features measure adopted, traces can still be accurate splicing operation detected.

#### 4 BASED ON THE CONSISTENCY OF THE COLOR FILTER ARRAY STITCHING FEATURE DETECTION ALGORITHM

Interpolation step color filter array-type edge characteristic quantities of several consistencies in the global image can be used as an effective measure to identify and locate the splicing operation stitching traces; complete image stitching is mainly divided into the following four steps:

- 1 Edge detection. Treatment using Canny operator edge detection test images [5], to generate an edge pixel set  $\psi = \{(x_i - y_i) | i = 1, 2, \dots, q\}$ , where  $(x_i - y_i)$  denotes an edge pixel  $i$  location coordinates,  $q$  represents the total number of edge points. If the test object is a color image can be the green channel, images are analyzed.
- 2 Step-type edge location. In position  $\psi$  as the center coordinates of each one, the edge is perpendicular to the direction of extraction of a single band of pixels. And then along the left and right sides, respectively, calculate the set of pixels away from the center point  $\eta$  within the range of the mean and variance of  $\zeta$ , respectively, for the  $(\mu_r, \sigma_r)$  and  $(\mu_l, \sigma_l)$ , as here,  $w$  and  $\zeta$  is a preset value of the experience, and we set the edge of the constraints to be step type: ①  $|\mu_l - \mu_r| >$  ensure the edge strength control threshold; ②  $\sigma_r <$  smoothing factor  $t$ ; and ③  $\sigma_l <$  smoothing factor  $r$ .
- 3 The calculation of the amount of the color filter array interpolation feature. For each edge pixel point  $(x_i, y_i)$ , denoted as point  $\epsilon$ , the first of its center, along with a single-pixel location perpendicular to the direction of  $2(\omega + \zeta)$  length of the edge, the statistics of the local histogram  $L_\epsilon$ , for the purposes of ordinary 24-bit color images; the width of each element in the histogram is  $W_b = 256/N_b$ , to calculate the inner edge of the color filter array interpolation characteristic values at the point  $g_\epsilon$ .
- 4 Locate the splicing operation marks. Using the threshold method, each edge set  $\psi$  pixel, after splicing condition assessment: If  $g_\epsilon > 1 - \tau_p$ ,  $\epsilon$  can be considered a mosaic border points.

Using binary image records, the location of all splice boundary points, enabling the positioning of stitching full marks, if a judgment is the number of the test image stitching boundary points accounted step - the proportion of the total number of edge pixels exceeds a predetermined threshold, the image will be classified as a mosaic image, and they will be otherwise classified as natural images.

#### 5 SUMMARY

Through a detailed analysis and discussion of the impact on the splicing operation interpolation property within the photo image color filter array, we discuss the operation of the imaging process of stitching at the edge of a local histogram features consistent damage and present a step-type edge color filter array interpolation characteristic abnormal splicing operation to detect methods positioning.

**ABSTRACT:** To solve and study the problem of online detection of pulp concentration and the real-time control, using the relationship between the ultrasonic amplitude attenuation and the slurry concentration to achieve the online detection of the slurry concentration so that then we can design a detection system to measure the pulp concentration. The results show that the detection results are basically in agreement with the actual values. According to the characteristics that the pulp concentration control system exists, such as the big lag, nonlinear, and time varying, it is difficult to achieve the ideal control effect in the conventional PID controller. In order to improve the system performance of pulp concentration control, we put forward a kind of control method of PID controller based on improved neural network adaptive. The simulation result shows that the controller has a fast response speed, stable adjustment, and anti-jamming ability of control performance than the conventional PID controller, to achieve the requirements of the pulp concentration's real-time control.

**KEYWORDS:** Neural network; pulp concentration; ultrasonic attenuation; PID controller.

### 1 INTRODUCTION

Pulp concentration is one of the important process parameters that determines the paper quality in pulp and papermaking process, detection and control of pulp concentration can accurately stabilize the beating effect, reduce paper quantitative fluctuation, and increase the stability of paper production, so as to improve the quality of papers.

The control of pulp concentration is a large hysteretic and an uncertain mathematical model system. Therefore, when some parameters of the system have been changed in the processing, using the fixed PID controller is difficult to maintain the optimal control effect. In order to obtain the optimal control effect, we usually use the real-time online method for tuning the PID control parameters.

Through the combination of BP neural network and PID phase, getting the neural network controller, it can be used for pulp concentration control [1]. We should take advantage of self-learning, the function of adaptive neural network, and adjust PID parameters according to the actual conditions of real time online, which makes the control of pulp concentration in an optimal state, to achieve better control quality.

### 2 PULP CONCENTRATION IN ONLINE DETECTION SYSTEM

The measuring principle is mainly based on plane wave ultrasonic in slurry to spread.

Suppose a plane longitudinal wave propagation in slurry, when  $x$  is distance, its amplitude with distances by an exponential decay, namely as follows:

$$\xi_m = \xi_{m0} e^{-\alpha x} \quad (1)$$

As shown in Equation (1),  $X$  is distance from the ultrasonic transducer,  $\xi_{m0}$  is the initial amplitude, and  $\alpha$  is ultrasonic attenuation coefficients of paste.

The amplitude of the sound wave is proportional to the amplitude of the transducer signal, so Equation (2) is available:

$$\alpha = \frac{1}{X} \ln \left( \frac{\xi_{m0}}{\xi_m} \right) = \frac{1}{X} \ln \left( \frac{V_0}{V} \right) \quad (2)$$

As shown in Equation (2),  $V_0$  is signals (Signal Stimulus) amplitude added to the transmitting transducer and  $V$  is the signal amplitude on the receiving transducer receives.

In addition, the slurry solids concentration is proportional to, and, predictably, by measuring the combined emission transducers on the amplitude of the signal V0 and receives transducer output signal amplitude V; we need to calculate their relative attenuation and measure concentration of the slurry.

### 3 SYSTEM DESIGN

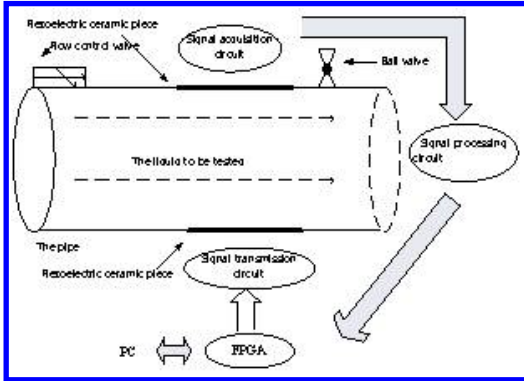

Figure 1. System hardware design block diagram.

It works as follows: The main control chip gives a start signal; the control signal transmitter transmits analog signals, amplification, and analog signal processing, loaded into an ultrasonic transducer transmitter, and sends signals to the signal processing circuit. The signal processing circuit is controlled by the main control chip to convert, and the results are sent to the main control chip to handle conversion.

### 4 CONTROL OF PULP CONCENTRATION

#### 4.1 Pulp concentration control system of the working principle and mathematical model

In the pulp and paper production process, the pulp concentration control system consists of a pulp concentration meter and electric valves. The PID controller is composed of three parts, as shown in Figure 2. PID controllers based on concentration of concentration sensors signal are compared with configuration settings adjusted by the difference of the two signals to regulate the electric valve opening in order to adjust by diluting white water dilution to a specified concentration of pulp and, finally, the production.

Pulp consistency control system transfer function can be expressed as

$$\frac{Y(s)}{U(s)} = \frac{k}{Ts+1} e^{-\tau s} \quad (3)$$

Figure 2. Pulp concentration automatic control system.

The next section will introduce the dynamic characteristics of value, the dilution and mixing of water, and pulp consistency of dynamic properties for inertial sensors.

#### 4.2 Principle and algorithm of PID neural network

In order to obtain better results, PID control must adjust the proportion (p), points (I), and differential (d) three-control functions; form and control the relationship of mutual coordination and restraint. Due to the features of the paper-making process, it generally belongs to the non-line relationship [2]. Therefore, in order to find optimal tuning parameters, the traditional PID parameters tuning method is not adapted to PID control. Neural networks with arbitrary nonlinear expressiveness can be achieved by learning the system performance with the best combinations of the PID controller.

Due to BP networks for optimization of parameters and slow convergence, target function exists at multiple extreme points, is easy into local minimum value, and RBF network by entered to output of mapping is nonlinear of, implied layer space to output space of mapping is linear of, thus greatly accelerated has learning speed and avoid local minimum problem, so BP network adjustment PID parameter of based Shang joined RBF network also can accelerated PID parameter of adjustment, and enhanced its anti-interference sex and robustness.

Figure 3. Controller setting structure.

Figure 3 shows the RBF Neural network PID controller tuning chart.

The controller consists of the following three components:

- 1 PID controller, closed-loop control on the charged object directly, online tuning of three of them;
- 2 The identification of RBF network, used for online identification of an object model so that there is a timely observation of control objects of Jacobian information, and provide BP networks;
- 3 Jacobian BP network using RBF networks regulate their weights and three of its output of the PID controller parameters so as to realize the adjustment of parameters of PID controller in order to achieve an optimal index.

#### 4.3 Control algorithm

Classic increment PID controller is used, take control error  $e(k) = r(k) - y(k)$  control algorithm.

$$u(k) = u(k) = \Delta u(k) \quad (4)$$

$$\Delta u(k) = K_p[e(k) - e(k-1)] + K_i e(k) + K_d[e(k) - 2e(k-1) + e(k-2)] \quad (5)$$

The three input values of PID controller are as follows:

$$\begin{aligned} x_1 &= e(k) - e(k-1), \quad x_2 = e(k), \\ x_3 &= e(k) - 2e(k-1) + e(k-2) \end{aligned} \quad (6)$$

If the performance indexes of the neural networks adjustment are set as  $E(k) = \frac{1}{2}e(k)^2$ , then the information of the Jacobian controlled process can be derived through identification of RBF network[4].

There are three adjustable parameters corresponding to the output node of the BP network.

$$O_1^{(3)}(k) = K_p, \quad O_2^{(3)}(k) = K_i, \quad O_3^{(3)}(k) = K_d \quad (7)$$

Based on RBF identification PID parameters' Automatic adjustment control algorithm can be divided into the following steps.

- 1 First to determine the RBF identification network input node number M, the hidden layer number P learning rate O, and inertial coefficient, the initial value is given to the hidden nodes center vector  $c_j$ , base width parameter  $b_j$  and weight coefficient of  $w_j$ ;
- 2 To determine the BP network structure, automatically adjust the PID controller
- 3 By sampling, we can get the  $y(k)$ ,  $r(k)$ , calculated  $e(k)$ . Then, we calculate the input value and the output value of BP neural network of neurons in

- each layer; the third layer's output values are the three adjustable parameters of PID controller and then calculate to get the  $u(k)$ , and  $u(k)$  is transferred to the controlled object. We also need real-time control; simultaneously, we should import it to the RBF identification network so that we get the Jacobian information. When we get the control object, the next step is outputting  $y(k+1)$ ;
- 4 The adjustment of RBF identification network weight coefficient, the hidden node centers vector, and the base width parameter are usually adjusted by gradient descent method of weight coefficients.
- 5 The method to adjust the weight coefficient of BP neural network is similar to the adjustment of RBF network, and all methods are approached by gradient descent method.
- 6 Let  $k = k + 1$ , return to step①, and continued.

## 5 SYSTEM SIMULATION INSTANCE

Follow a typical pulp concentration control system for the simulation of the control object model with delay of the first-order model:  $G(s) = \frac{3}{2s+1}e^{-3s}$ . Using BP network structure of 4-5-3, learning rates  $\eta = 0.29$ , inertia coefficient  $\alpha = 0.45$ , and the weight value  $[-1,1]$  random number in the range. RBF Neural network identification of the structure of 2-8-1,  $\eta_0=0.31$  learning rate, inertia coefficient  $\alpha_0=0.06$ , and  $\beta_0 = 0.045$ . For the optimization of the PID controller with a neural network setting  $K_p$ ,  $K_i$ ,  $K_d$ , control parameters, to control the pulp concentration, compared with the traditional PID setting method, response to the turmoil in the pulp concentration is faster, transition time is shorter, and we can get a better control effect[3].

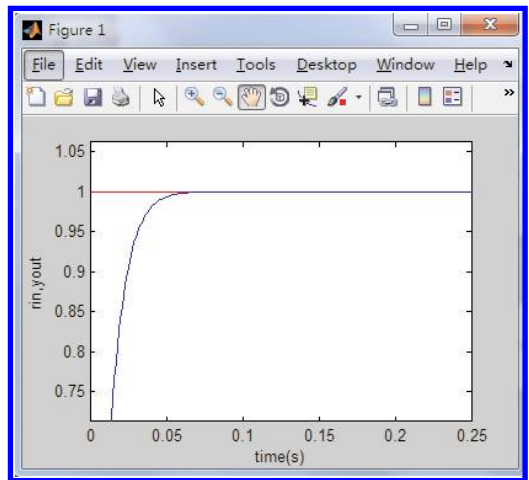

Figure 4. Step response curve.

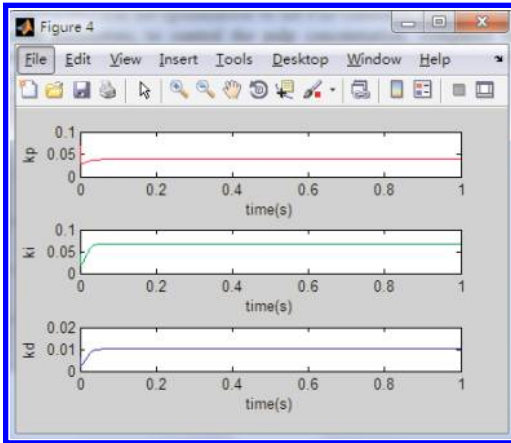

Figure 5. Adaptive parameters for curve.

## 6 SUMMARY

This article develops a mathematical model of the pulp concentration control system based on an online detect system designed to detect concentrations of values sent to the concentration of neural

PID controller for improved control and testing. Simulation result of neural PID controller is in pulp consistency; control system performance is greatly improved, responsive to pulp concentration fluctuations, and takes less time to transition, to get better control.

## Research on opportunistic networks applied in remote areas

Ding Hai Gong

*School of Mathematics and Statistics, Hechi University, Guangxi Yizhou, China*

**ABSTRACT:** For the future of the opportunity networks applied in remote areas, we analyze the six well-known routing protocols for Opportunity networks, such as Direct Delivery, Epidemic, First Contact, MaxProp, Prophet, and SprayAndWait. We emulate the application of the six routing protocols in the network scenario that simulated the remote areas, and we evaluate the performance of these routing protocols in this scenario from four aspects: delivery rate, routing overhead, transmission latency, and buffer time. The simulation results show that MaxProp and SparyAndWait perform well in this scenario, multiple-copy forward mechanism is superior to the single copy in delivery rate and transmission latency, and multiple-hop routing mechanisms increase the routing overhead.

**KEYWORDS:** Opportunistic Networks; Remote Areas; Emulate; Routing protocol.

### 1 INTRODUCTION

AS the popularity of various wireless handheld devices with Bluetooth or WiFi increases, the networks are usually disconnected in many practical network environments, because the nodes are sparse and move frequently. Therefore, an end-to-end path between the source and the destination can never be built completely, and MANET (Mobile Ad hoc Network)[1] cannot apply the network to the network. Opportunistic network[2] is an extension of the Ad hoc network; it takes advantage of the encountering opportunity created by moving of nodes to realize communication and effectively solves the issue discussed. Opportunistic networks are mainly applied in such networks that lack communication infrastructure and have a bad network environment. For example, pocket exchange network and wireless Internet access in remote areas. [2].

It is not available or difficult to use the Internet in remote areas due to limited network infrastructure, and opportunistic networks can provide these areas with non-real-time, low cost of communication services. DakNet[3] project is an opportunistic network deployed in India's remote areas, in order to supply rural communication links. Similarly, there is Saami Network Connectivity[4], Tier[5] and Wizzy[6]. On the basis of the characteristics of the opportunistic network and the potential application in remote areas, a network scenario similar to the features of remote areas is set in this article. Analysis and comparison are made for the functions and characteristics of some typical routing protocols in opportunistic networks applied in this scenario, in order to evaluate the performance of each algorithm.

### 2 RELATED WORK

DirectDelivery[7] is a typical single-copy routing protocol, and it is also the most simple routing mechanism. The message is carried by the source node until it encounters the destination node and the message is delivered to the destination. This routing protocol has the least overhead, but it has a lower delivery rate and higher transmission delay.

Epidemic is essentially a flood strategy. The basic idea is random pair-wise exchanges of messages among mobile hosts [8]. In theory, each node will receive all messages by enough exchange between nodes; message delivery rate can be maximized, and transport latency can be reduced [9]. However, resource will be cost fast because of flood, and it increases the number of message copies.

FirstContact is a single-copy routing protocol. The source node carries messages to move and forwards the message to the first encountered node called relay node, which continues to carry and forward the message to the first encountered node, and so forth, until the message is forwarded to the destination node.

MaxProp[10] is improved on the basis of Epidemic. The improvement is that the source node sets TTL (Time-to-Live) for the message. Through the forwarding process when the expiration of the message TTL comes or the node receives an ACK (Acknowledgment of receipt), or the node's buffer is full, the node will discard the message.

Prophet [11] (Probabilistic Routing Protocol using History of Encounters and Transitivity) is a routing protocol based on the probability. Each node estimates the probability of encountering other

nodes, and probability increases with inter-node encounter and then decreases with time when not met. Nodes update the reachable probability with other nodes by probability transitive, so as to evaluate the probability of encountering with a destination node.

By setting replications of messages in the network, SprayAndWait (SAW for short) protocol controls the extent of the flood [12]. There are two phases: Source node originates  $L$  message copies for every message and they are spread – forwarded to  $L$  relay nodes in spray phase. In wait phase, if the destination is not found in the spraying phase, each of the  $L$  nodes carries a message and transmits the message to the destination node directly. In Binary mode, the source node will send half of the packets to the encountered relay nodes, and then the source node and the relay node repeat the above operations until only one packet is left in all the nodes, and then the node comes to Wait stage, with direct transmission to the destination node.

### 3 SIMULATION SETTING

We use the ONE (Opportunistic Network Environment) simulator [13-14] to simulate. This scenario consists of a  $4500m \times 3500m$  area, simulation time is 12 hours. A new message is generated in every 25 to 35 seconds and the message sizes is uniformly distributed between 500KB and 1 MB. We simulate 310 node moving scenes that consist of pedestrians, motorcycles, cars, and buses and all carrying Bluetooth, including 270 pedestrians (Divided into two groups), 20 motorcycles, 8 cars, and 12 buses. The mobile nodes are set as shown in Table 1.

Table 1. Characteristics of mobile nodes.

Mobile nodes	Buffer size	Wait time	Moving speed	Transmission range
	Mb	s	m/s	m
pedestrian1	30	0~120	1~2	10
motorcycle	50	60~180	5~17.5	10
car	80	100~300	10~25	500
bus	150	100~300	10~25	500
pedestrian2	30	60~240	1~2	10

In the following simulation experiments, one group of pedestrians use Random Waypoint mobility model. Map Route Movement mobility model is used for motorcycles, cars, and buses. Another group of pedestrian use Shortest Path Map-Based Movement mobility model.

## 4 SIMULATION RESULTS AND ANALYSIS

The simulation chooses the number of message and message TTL (Time to Live) as a parameter, and it then analyzes the performance of various routing algorithms.

### 4.1 Impact of the message TTL

In the first set of simulations, we vary the message TTL of pedestrians, motorcycle, cars, and buses from 60minutes to 600minutes.

As shown in Figure 1, as message TTL increases, the delivery rate increases, of which MaxProp and SAW increase significantly. However, DirectDelivery and FirstContact increase slowly, because both are a single-copy delivery mechanism. However, when the message TTL grows to a certain extent, the delivery successful transitive rate of each routing protocol to transmit slows down, suggesting that under some scenarios, improving message TTL to a certain value does not significantly increase the delivery rate. As a message TTL till 300, the rate of Epidemic and Prophet showed a downward trend. This is because when the message TTL grows to a certain value, the redundant copy of the message caused by the flooding will buffer a long time, so there is not enough free storage space to store the message generated by itself or received from other nodes. Therefore, the delivery rate began to decline.

Figure 1. Various delivery ratios with message TTL.

Figure 2 shows the average overhead in this scenario under various message TTL. From this figure, we can see that the overhead varies with message

TTL, except DirectDelivery. The reason is that the source node carries one message until it encounters the destination node and forwards the message to the destination node and forwards the message to the destination node in DirectDelivery. The overhead of MaxProp and SAW decreases with increased message TTL and tends to maintain a relatively stable range. When message TTL is till 300, the overhead of Epidemic and Prophet increases significantly because the number of message copies increases with message TTL.

Figure 2. Overhead various with message TTL.

Figure 3 shows that the message TTL significantly influences the average delay in this scenario. When the message TTL reaches a certain value, the delay growth eases. Taking MaxProp as an illustration, when the message TTL reaches 500, the latency does not change substantially and is relatively stable. The reason is that when the message TTL expires or the node has received an ACK or there is no buffer space for storing, the message will be dropped. So when message TTL reaches a certain value, it has lesser effects on MaxProp protocol message delay.

#### 4.2 Impact of the network traffic

In the second set of simulations, considering that the number of message in networks (also called network traffic) is various in scenarios, we fix the message TTL to 300 minutes and increase the number of message from 1000 to 11000.

Figure 3. Latency\_avg various with message TTL.

Figure 4. Various delivery ratios with network traffic.

Figure 4 illustrates that network traffic has little influence on single-copy mechanism routing algorithm such as FirstContact and DirectDelivery, whereas it has a significant effect on other algorithms. When network traffic is small, MaxProp delivery rate is better than the other protocol. With the increase of network traffic, Epidemic, MaxProp, Prophet, and SAW delivery rate decreases gradually and when network traffic increases to a certain extent, the gap between the delivery rate of the four routing protocol gradually decreases.

Figure 5. Overhead various with network traffic.

Figure 5 shows the routing overhead of SAW and DirectDelivery maintains a relatively stable range, which indicates that the overheads of both the routes are largely independent of network traffic; that is, because SAW adopts a similar stage of forwarding mechanism with DirectDelivery in Wait phase. It waits for the destination node and forwards the message to the destination node. When network traffic increases, the overhead of Prophet is gradually close to Epidemic, because the former uses the limited multi route replication; thus, the time of forward message increases as network traffic increases.

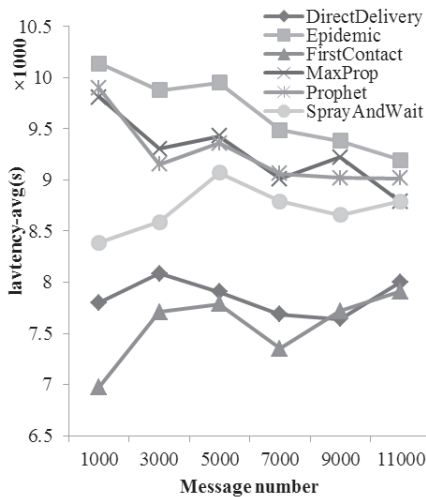

Figure 6. Latency\_avg various with network traffic.

Figure 6 shows that the network traffic affects the latencyavg of all the routing protocols, but the effect is not obvious. The latencyavg of single-copy mechanism routing algorithm is less than other routing protocols.

## 5 CONCLUSION

To explore opportunistic networking applications in remote areas, in this article, by setting specific network scenarios, several typical opportunistic network routing protocols are simulated, and each routing protocol in the scene changing with the message TTL and network traffic situations is analyzed. From integrating the performance of delivery rate, routing overhead, average transmission latency, and the average of buffer time, we can draw some conclusions :

- 1 MaxProp and SAW have higher delivery rate and lower routing overhead as message TTL increases. For larger network traffic, SAW is superior to MaxProp. As for limited buffer space, MaxProp is better than SAW.
- 2 Multiple copies of the routing mechanism are superior to a single copy in the delivery rate and transmission latency.

In future work, we will further study SAW and MaxProp protocols, improve both of the algorithms, further improve the delivery ratio, and reduce the transmission latency of opportunistic network in this kind of scenario.

# PROFIBUS-DP interface development for intelligent instrument

Guang Xiang Miao

Baoding Electric Power Vocational and Technical College, China

**ABSTRACT:** This article studies the basic theory of PROFIBUS-DP and the structure and function of Bus communication protocol chip SPC3 of Siemens, and DPV1 and DPV2's extended functions were analyzed. Then, based on the Intelligent analysis instrument, the hardware and software design and the implementation method of DPV1 intelligent slave station interface were presented. Adopting “ARM board and the interface board” method, and the modularization technology and top-down method, at last, the embedded PROFIBUS-DP intelligent slave station has been realized.

**KEYWORDS:** Intelligent analysis instrument, PROFIBUS-DP protocol, SPC3, Intelligent slave station.

## 1 INTRODUCTION

PROFIBUS is a Fieldbus international standard TYPE3 and the only national fieldbus standard of China that has been approved. PROFIBUS-DP is a low-cost communication protocol in high speed, and it is applied to a unit control system and distributed I/O. PROFIBUS-DPV1 is a kind of extended version. In the combination of fieldbus and industrial Ethernet to realize totally integrated automation (TIA) development, PROFIBUS-DP/DPV1 still plays a fundamental and core role.

This article uses the ARM board and AT89S52 interface board, to implement the interface PROFIBUS-DP intelligent slave station. The system diagram is shown in figure 1. A conventional instrument with RS485 communication interface, the RS485 interface can be connected with the ARM board or AT89S52 interface board, and the user can accordingly need a flexible configuration.

Configure 1: A conventional instrument is directly connected with the interface board through RS485, realizes the transparent data transmission on the PROFIBUS bus.

Configure 2: A conventional instruments communicates with ARM board through RS485; ARM microprocessor communicates conventional instrument through RS485 and will be responsible for the processing, analysis, and classification of on-site collection signal. ARM will transmit data to the AT89S52 interface board microprocessor by asynchronous serial communication mode of UART; on the other hand, through the SPI bus, it will write data to the backup of Large Capacity SD card. The data message is transmitted to the PROFIBUS-DP bus by AT89S52 microprocessor through protocol conversion chip, and monitoring, receiving DP master sent instructions and data, and the feedback to the ARM microprocessor to fault diagnosis treatment and corresponding operation.

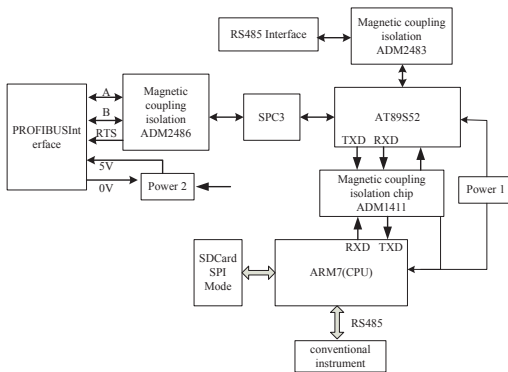

Figure 1. System chart.

## 2 COMMUNICATION PROTOCOL CHIP SPC3 INTRODUCTION

Siemens SPC3 chip, based on the DP-V1 protocol, supports non-cyclic communication and alarm information. According to DP-V2 protocol, it provides from the slave station and slave station communication, including data exchange broadcast (DXB) and synchronous mode (IsoM).

You should allocate the address pointer to the buffer segment. Service access point SAP can automatically create DP communication, appearing in front of users of various message is different buffer internal data. Users can access the internal RAM through bus interface.

Control SPC3 chip microprocessor does not need to consider the state of the structure; according to the generated interrupt, the main task is processing the received SPC3 master output data, processing through SPC3 sent to the master data, and completing a variety of diagnostic functions.

### 3 HARDWARE DESIGN

This article uses the ARM board + interface board, ARM board, and interface board connect through the cord, taking UART asynchronous serial communication mode. The interface board using AT89S52 series microprocessor, which contains 128KB on-chip programmable Flash, JTAG interface, supports on-chip debugging and programming, programmable serial USART, meets the control of the SPC3 chip and the speed of data transmission requirements.

#### 3.1 SPC3 external circuit design

The interface circuit of AT89S52 single-chip computer and SPC3 chip are shown in Figure 2; the SPC3 of dual port RAM in CPU address space allocation, an external RAM, is equivalent to the MCU expansion. In order to be compatible with the SPC3 chip, we designed the SPC3 work in 2K RAM mode; the XCS pin has two functions, when there is a need for the chip to work in 2K mode, which is CPU controller mode selection, the 4K XCS pin is configured as an AB11 address line.

The PA port for SPC3 multiplexed data / address bus, PC port as the SPC3 address bus AB0~AB7, which only AB0~AB2 for the effective high address, the rest of the address bus for low. The address bus of AB12 reverse, for single side external RAM address is 0X1000~0X15FF (2K). SPC3 has an internal address decoding circuit, and ALE pin is connected directly, without a latch.

#### 3.2 RS485 transmission interface circuit

PROFIBUS-DP bus protocol is based on RS485, which is the high-speed transmission media. In field application, the input and output differential signal must be isolated.

iCoupler-coupled magnetic isolation technology of ADI company is a transformer isolation technology based on chip size; its core is the planar transformer across the isolation barrier transmit and receives signals, and the non light emitting diode and the photosensitive triode combination of traditional uses a photoelectric coupler. Because the magnetic isolation transformer is essentially a two way, as long as the transformer proper circuit signal can be from any one direction, it can provide all kinds of

transmission channels or receive channel configuration of a multi-channel isolator.

ADM2486 is an isolated RS485 transceiver chip based on magnetic isolation technology of iCoupler. It integrates the digital isolators of three channels, differential driver with three states of output, and one with three inputs of RS485 differential receiver. The number of nodes that can be allowed are 50, and the highest transfer rate is till 20Mbps.

In this article, the design of electrical isolation part in PROFIBUS input /output the channel using ADM2486 chip principle is shown in figure 3. The chip has a power supply monitoring function, thermal shutdown function, and high input impedance (30K), which allows till 50 transceiver access bus. The required external components are less, and the interface circuit is very simple. The 4 pins of SPC3 serial communication are XCTS, RTS, TXD, and RXD. XCTS effective representation allows SPC3 to send data, so it needs to maintain a low effective level. RTS signals of SPC3 requests RXD and TXD, respectively, for the serial receiving and sending port.

#### 3.3 Other interface circuit

Interface board provides power from the ARM board, through the DC-DC isolation module: One way provides power for AT89S52 interface board, and another way provides power for PROFIBUS bus.

For data communication between two matching modules, we adopt ADuM1301 magnetic isolation chip, in order to ensure the communication of UART and signal. The interface part occupies a UART interface of the ARM chip and two general I/O ports as communication signal.

Reset control circuit using the TI company TL7705, which can monitor power, instantaneous short circuit, and instant pressure drop and reset signal, which is generated and can be set the width as recovery. When the RESIN pin is low effective, can also reset MCU and SPC3 chip, so as to effectively monitor the AT89S52 interface board.

In addition, with AT89S52 interface board to construct the RS485 interface, using ADM2483 coupled magnetic isolation chip, its use has the short-circuit current limited slew rate limited drive, low slew rate reduces the error terminal inappropriate matching and joint produced. Integrated thermal shutdown circuit can be the driver outputs to a high impedance state, to prevent excessive power dissipation.

### 4 SOFTWARE DESIGN

The software is designed according to the different configuration, the ARM board software adopts UC/OS-II embedded real-time operation system, using

the top-down design method, mainly to complete the following functions:

Serial port to receive the task: receiving and processing data message of intelligent analysis instrument.

D card operation tasks: Data files write large-capacity SD card, to backup.

Serial port to send tasks: Data packets are sent to the microprocessor AT89S52, sent to the PROFIBUS through SPC3 protocol chip and the program of PROFIBUS interface, including ARM initialization, AT89S52 initialization, and cyclic exchange of data between the two programs. AT89S52 interface board also includes SPC3 initialization procedure, the data cycle, and various interrupt events.

SPC3, the initialization process, includes the following: SPC3 interrupt configuration, user timer configuration, device address, manufacturer ID setting, and various buffer addresses and length calculations of SPC3. SPC3 only provides an interrupt, the user program in the response interrupts from the interrupt request register (IRR) to determine the content of what type of interrupt events specifically happen. Interrupt processing module to check and deal with new PRM message, CFG packets, and SSA packets.

ARM initialization packet is sent to the interface board according to the baud rate settings, waiting to receive the LPU's answer. After the interface board's answer is successful, ARM enters data exchange. In data exchange, ARM takes initiative to send PROFIBUS input data to the interface board, receiving master state PROFIBUS output data. After the corresponding interface board receives the initialization packets, it needs to detect and determine the accuracy of the baud rate, check the initialization messages, and send the success or failure of messages to the ARM, until the initialization process successfully changes into the data exchange state.

Under data exchange state, their program flow is shown in Figures 5 and 6. Semaphore reflects the state of the AT89S52 interface board, including the interface board and whether exchanging data and data can be received in the state. ARM board can communicate with interface board by state signal, reliably ensure data exchange without interruption, not allow a deadlock situation to occur, and if SPC3 unexpectedly quits data exchange, ARM board promptly re-initializes the interface to re-enter the data exchange state.

In addition, the interface board is preset on another RS485 interface, which can connect the analysis instrument equipment, and it can directly transport the received data on the PROFIBUS bus. Program design of this part is relatively simpler. In the industrial field, we often need to set some parameters that do not need change in the operation of the equipment by real-time field application, such as the current limit

of frequency converter and the alarm value. The use of user parameters of user\_prm technology only need to write GSD file, make the choice of parameters in the station configuration; when connecting master, parameters can be passed once to the slave state, and the slave station can use these parameters for the parametric. The intelligent analysis instrument also has the corresponding setting value and the alarm value, which will be treated as user parameters, will reduce the communication message length, shorten the communication time with PROFIBUS master station, and improve the bus communication efficiency.

The message of using DP master to test software analysis is as follows:

The first step: query whether the existence of the slave station.

Master sent to the slave station message: 10 03 01 49 4D 16.

The response message from the slave station: 10 01 03 00 04 16.

The second step: the slave station diagnosis.

The master asked the slave station message: 68 05 05 68 83 81 6D 3C 3EEB 16.

The response of slave station: 68 0B 0B 68 81 83 08 3E 3C 02 05 00FF 00 08 94 16

The third step: setting parameters of the slave station.

The master sends the message: 68 11 11 68 83 81 5D 3D 3E B819 1A 0B 00 08 00 01 02 03 04 05 E9 16.

A short response of the slave station: E5H.

The fourth Step: check the configuration data.

The master asked the slave station: 68 07 07 68 83 81 7D 3E 3E 1121 2F 16.

From the slave station response: E5H.

The fifth step: another diagnosis.

The master asked the slave station: 68 05 05 68 83 81 5D 3C 3E DB16.

The slave station response: 68 0B 0B 68 81 83 08 3E 3C 00 0C 00 01 00 08 9B 16.

The sixth step: the data exchange.

The master sends the data: 68 05 05 68 03 01 7D 00 00 81 16.

The slave station transmits data: 68 05 05 68 01 03 08 02 03 1116.

The first five steps passed, entering the data exchange, serial debugging assistant repetitively shows the sixth step master station and slave station message. The six steps of the master station and the slave station communication are executed sequentially; if any one of them could not obtain the correct response, master station will not go to the next stage, and this stage will only send the polling message.

Developing the slave station debugging board, PC machine, and the host computer PLC can be composed of simple PROFIBUS-DP the debugging system. By writing the system GSD file of the slave

station, the slave station can be identified in the STEP7 software's hardware configuration.

## 5 DP PROTOCOL ANALYSIS OF EXTENSION FUNCTION

PROFIBUS-DP has three functional versions. DPV0 only allows the master station exchange the periodic data with the slave station and does not support non-periodic data transmission, which makes the control process lack flexibility. Although many embedded field devices need to change the original working state in the control of certain tasks, they need to achieve non-periodic data transmission.

DPV1 can be used to achieve this requirement, is intended to extend the function of DP, is a supplement to the basic functions of DPV0, and is compatible with the DPV0. The function of the extended DPV1: DPM1 and the DP slave station can transmit data between non-circulation; with DDLM read and write non-cyclic DDLM read/write function, we can read and write from the station to any required data and allow the alarm response. The new DDLM-ALAM-ACK functions are used to direct response alarm data received from the station at DP; DPM1 and from non-cyclic data transmission between stations.

PROFIBUSDP-V2 can realize the circulation of communication, non-cyclic communication, and from the communication between stations. Introduction of the bus cycle can be achieved when there is pulse synchronization regulation in master slave station. Two from the communication time

between stations is greatly shortened, the clock synchronization for event time tracking. Contribute to the control of time sequence in multi-master network, using the command data that can be loaded into a field instruments.

Extended DP function is optional in terms of standard protocol, which ensures that the PROFIBUS-DP field devices in the past and has extended function of the equipment working together to ensure interoperability. In the debug system, S7 300 PLC as the main station, integrated cycle to read and write and non-periodic writing service.

## 6 CONCLUSION

This article, from the development, describes the hardware and software design method of PROFIBUS-DP interface in the intelligent instrument analysis. The intelligent slave station based on SPC3+C chip has strong controllability and operation ability. The development board provides an open communication protocol interface, can be embedded in various industrial control instruments, is a convenient access of PROFIBUS bus communication, and realizes the data communication process control layer.

# Research on network word-of-mouth marketing strategy under the environment of social media

Liu Bo Hu, Sheng Cao, Yu Cao & Ya Peng Wang  
*Wu Donghu University, Wuhan, China*

**ABSTRACT:** With the overall rise of social media and the rapid development of e-commerce, more and more network consumers refer to word of mouth before buying or releasing word of mouth into social media after consuming. Therefore, the study on network word-of-mouth marketing under the environment of social media is of great practical significance. First, this article reviews the research on social media and network word of mouth. Second, it analyzes the influence of network word of mouth on network consumption behavior and the propagation mechanism of strong ties and weak ties in social media. Finally, this article puts forward some suggestions about the strategy of network word-of-mouth marketing combined with social media for enterprises. We hope that these can bring some inspiration to enterprises.

**KEYWORDS:** Network Word-of-Mouth Marketing; Social Media; Strategy.

## 1 INTRODUCTION

### 1.1 *Research background*

In the recent ten years, more and more people in China have participated in virtual spaces, which has resulted in forming network social groups quickly. Network also plays the role of social media and has a great impact on people's life. Social media such as micro-blog, Micro-message, and social network sites (SNS) are also showing a trend of rapid expansion. With Micro-message as an example, the 2014 second quarter financial report released by Tencent showed that active users (including the overseas Wechat users) reached 438 million in the financial consolidation month. Active users grew fast on a monthly basis. So, the growing trend of users using social media shows that the network socialization is quickly penetrating into their daily life.

E-commerce such as online shopping and online payment is also growing rapidly. The data released by CNIT-Research show that the overall online shopping market size in the first quarter of 2014 in China amounted to 647.85 billion RMB, and its link relative growth rate was 11.7%, which presented the fast development momentum. In addition, the number of online shopping consumers in China was more than 310 million users. And nowadays, network shopping is penetrating from PC terminal to mobile terminal. In the year 2014, till June, the monitoring data from 100EC.CN showed that mobile payment users increased rapidly, the scale reached 205 million RMB, and the growth rate in the first half of 2014 was 63.4%

and 5.2 times that of the overall online payment market. It is expected that in 2015 mobile shopping market scale will be more than 350 billion RMB and user size will be more than 520 million in China.

In addition, the investigation showed that the composition of network mainstream groups is similar to that of network consumer groups in China. Network consumers are accustomed to frequently visiting Micro-message, SNS, micro-blog, and other social networks to obtain information and communicate with friends (Yu Tingting, 2013). So, social media have become important channels of word of mouth or information communication between network consumers. The rise of network consumers further highlights great marketing value of social media.

### 1.2 *Problem presentation*

Tang Xingtong (2011) pointed out that there are three fusion trends between social networks and business: trading in social networks; online communication after offline purchase; and social networks bringing offline orders. In recent years, Millet mobile phone caught the trend of social media and business fusion each other and was the successful case doing network word-of-mouth marketing with the help of social media. From this case, we know that on the one hand, the company established communication form of enterprise-consumers-consumers through building their own network community or using other social media for realizing customer loyalty and maintaining sustainable income. On the other hand, consumers

collect product information and discussions from other consumers making use of forum, micro-blog, Micro-message, and other social media, and share their own experiences, opinions, and related knowledge with others through social media. With help of rapid network propagation, positive network word-of-mouth detonated network buying spree. In addition, using other effective marketing means, Millet mobile phone become a great strength in Chinese mobile phone industry in just a few years. So, how to combine the network word-of-mouth marketing with social media will is a new subject e-commerce enterprises must pay attention to.

## 2 LITERATURE REVIEW

### 2.1 *Social media research*

The investigation data show that 88% of online consumers often search for word-of-mouth evaluation from others, 80% often search for product or service information they need, which has become a necessary precondition for their consumption decision. In addition, according to the statistics, 84% of online consumers often share shopping information with their friends, and this information becomes an important content that other consumers search for. The repeating cycle forms social media (Sheng Zhenzhong, 2011).

Antony Mayfield (2008) gave the definition that social media is a new online media for users participating in a great space and that has the following characteristics: participation, openness, communication, dialogue, communization, and connectivity. Therefore, the essence of social media is a combination of media and interpersonal relationship, except for dissemination of information, also including interaction between people in the media (Yu Tingting, 2013). Currently, the most common social media are blog, micro-blog, Micro-message (Wechat), video website, forum, social networks, content community, and so on.

A large number of scholars and industry experts believe that social media has a powerful influence. Sun Nannan (2009) believed that social media has resulted in the changes of traditional discourse and public opinion mechanism, which makes public opinion quickly turn from decentralization and small scale to centralized network public opinion and quickly generates strong word-of-mouth propagation effects. It is not difficult to see that, due to the interaction between people, the most prominent characteristic of social media is the ability to allow users to create and disseminate contents. How to make full use of social media and generate strong positive word-of-mouth effects is the subject this article studies.

### 2.2 *Network word of mouth and its influence on network consumer behavior research*

With the rapid development of e-commerce and the substantial increase of network consumers, many scholars and industry experts paid attention to the field of network word-of-mouth research. Buttle (1998) believed that network not only provides new tools for marketing but also, more importantly, creates a new platform where consumers communicate with each other, so network word of mouth is an important form of social interaction between consumers. Henning (2004) believed that network word of mouth is positive or negative comments that previous, actual, or potential customers release about products or companies and that is transmitted to the public or organizations through network. Litvin (2008) believed that network word of mouth is the information and communication about using and characteristics of a product or service through Internet technology and that all communicators are consumers.

But the domestic scholar Zhang Ying (2008) more completely and clearly explained the definition of network word of mouth. She believed that consumers can collect product information that other consumers provide and relevant discussions by use of a variety of communication media such as network bulletin board, forums, and chat rooms and share their own experience, opinions, and related knowledge about specific products through Internet, which creates a new form of word of mouth, namely network word of mouth. From the earlier discussion about definitions, we can summarize that network word of mouth consists of three basic characteristics: The main body of communication is consumers; communication channels are social media; and the contents of communication are comments and exchanges about products and services.

From the earlier analysis, it is seen that network word of mouth must have a significant impact on product sales. The studies demonstrated that at least 16% of consumer purchase decision is mainly affected by network word of mouth compared with traditional media (Goldsmith, 2006). The study found the higher the mean score of a book review, the bigger the book sales by studying the book reviews from Amazon and Barnes Noble. However, some scholars drew different conclusions. For example, Chen (2004) pointed out that review scores of online products could not have a significant impact on future sales, but the amount of posted comments could. And some scholars studied the negative influence of word of mouth. For example, Gong Ling (2008) pointed out that it is proved by the experiment that the influence of negative comments is twice one of the positive comments. Besides, the experiments showed that the effect of negative network word of mouth on purchase decision of consumers is significantly higher than that of the positive word of mouth (Jin Liyin, 2007).

### 3 STRONG TIES AND WEAK TIES IN SOCIAL MEDIA

From the earlier conclusions these scholars studied, there is a close relationship between social media and network word of mouth. Social media is propagation medium of word of mouth and the relationship ties between word of mouth transmitters and recipients. Network word of mouth makes information spread to the place network can reach through social media such as propagation medium, so the effect of communication and visibility of network word of mouth is more than traditional word of mouth.

Why is the propagation effect of network word of mouth so great? We need to explain it from strong ties and weak ties theory. Granovetter (1974) put forward strong ties and weak ties theory. But weak ties play a key role in social network media. Brown, Broderick, and Lee (2007) believed that when a word of mouth is published in a network community, other members pay attention to it. There is a state of weak ties between transmitters and recipients. Furthermore, the recipients have similar and close perception of the transmitters (Wallace, 1999). Because each netizen often is in different circles and multiple social media, a word of mouth will spread in different circles and social media; people in different circles can get this information through weak ties. These weak ties become a bridge of the spread of word of mouth. In social network media, although weak ties are not as strong as strong ties, weak ties have quick and efficient communication efficiency with low cost, which is the power of weak ties.

In addition, weak ties can also be transformed into strong ties. In the same social media, users may find others with common interests, which can produce topics and resonance. The more are common topics, the more are interactions, the more it is likely to become strong friends with each other. Brawn and Reingen (1987) believed that the effect of strong ties on behavior of recipients is much larger than that of weak ties. When the state of being is in strong ties, transmitters and recipients are in close contact, further more close contact and will know each other better. The recipients will have more trust in the transmitters, so word-of-mouth influence is greater.

### 4 STRATEGIES SUGGESTION OF WORD-OF-MOUTH MARKETING USING SOCIAL MEDIA

Millet mobile phone made full use of popular social media and mobilized the enthusiasm of participation and experience from netizens. First, Millet mobile phone efficiently gathered loyal users by use of setting up strong ties with them. Second, it did

efficient word-of-mouth marketing by use of weak ties between loyal users and others, so the market was detonated quickly and Millet mobile phone rapidly rose. Therefore, how to make use of social media and strong and weak ties for efficient network word-of-mouth marketing is very meaningful for enterprises.

#### 4.1 *Prerequisite: Ensuring product quality*

Above all, it needs to be clear that the basic premise of using social media for word-of-mouth marketing is to ensure product quality. The purpose of doing network word-of-mouth marketing by use of social media is to communicate positive word-of-mouth to consumers and reduce negative word of mouth. If the quality of a product itself is not good, then the reputation from consumers is negative. The word of mouth of losing consumers' trust makes enterprises lose consumers in the end. So before network word-of-mouth marketing, enterprises must ensure the quality of products and have a solid foundation for positive word-of-mouth marketing, and then the enterprises select suitable social media to spread positive word of mouth and meanwhile properly handle negative word of mouth.

#### 4.2 *Mining positive word-of-mouth*

Enterprises should use social media to provide channels for word of mouth of consumers. For example, enterprise website building user comment area; using micro-blog, Micro-message to initiate experience topics such as free trial; establishing official micro-blog and Micro-message to collect user comments; focusing on other comment websites to mine point of view from consumers; using social networks to invite consumers with high rate of repeated selling to pay close attention and leave message; and providing appropriate incentives for customers writing some pertinent quality evaluations. Therefore, the enterprises use social media effectively to collect user positive word of mouth, and at the first time understand their own shortcomings and improve products in time for avoiding the bad consequences that are not controlled because of negative word of mouth.

#### 4.3 *Fully displaying positive word of mouth*

How to utilize the existing word of mouth to affect other consumers' decisions must be carefully taken into consideration, but showing word of mouth needs to be objective. For example, basic information of an author is displayed on prominent places in social media, including user grade of membership and IP address to reduce other consumers' worries. Second, the evaluations from consumers on the product are fully demonstrated, including advantages and

disadvantages. Once again, consumers can mark the parameters of products and the total scores are shown to provide reference for other consumers' shopping. Finally, according to consumers' browsing preferences, the enterprises can build the word-of-mouth push mechanism and select the most suitable reputation information to give consumers for a convenient search.

#### 4.4 *Establishing relationship circle*

Users in social media are often involved in multiple virtual circles. Interactions about a topic for a long time make them agree with each other. When the users are the actual or potential consumers of own products, the enterprises can build a good relationship circle with them and do word-of-mouth marketing in the inner circle. The enterprises can encourage consumers to publish their experience evaluation. Because the circle has strong share motivation, so reputation evaluation will soon spread to other members. When all consumers spread reputation evaluations to other circles, this communication power is increased in geometric series.

#### 4.5 *Using influence of opinion leaders*

Wasko (2005) found that the stronger is professional ability of a member identifying products, the more they are inclined to contribute more knowledge, including answering and forwarding related topics or airing actively their opinions in the virtual community. Their opinions will greatly affect others' purchase decisions. Therefore in social media, opinion leaders' influence cannot be ignored. When group members discuss some topics with common interest more thoroughly, opinion leaders will come to the fore. Enterprises can establish a good relationship with opinion leaders, which will eventually make them become an important force of word-of-mouth marketing. Through their information channels, the enterprises can publish relevant information in order to conveniently opinion leaders forming the topic to meet their psychological status needs in the circle and have the aid of their influence for word-of-mouth communication.

#### 4.6 *Being good at creating topics*

By creating some attractive topics, enterprises appropriately guide users to prompt consumers to publish or communicate word-of-mouth evaluations related to products. Usually, these topics spending low cost can manufacture the greater influence of word of mouth. However, what needs to be paid attention to is that the topic must not challenge the bottom line of the public value and aesthetic taste. Otherwise, it will

cause a great negative impact on the image of product word of mouth.

#### 4.7 *Listening carefully and properly responding*

In social media, the influence of negative word of mouth is stronger than the positive one. Dissatisfaction with product experience from consumers through network catharsis and several rounds of communication greatly affects purchasing decisions of other consumers, which causes a great negative impact on the image of products and enterprises. Therefore, if enterprises want to establish a positive network word of mouth, they must properly deal with negative word of mouth. In fact, a number of negative word-of-mouth communications often are derived from the lag of tracks of enterprises' countermeasures. For example, providing proposed complaint channels; reasonably and quickly making solutions; establishing crisis management mechanism; and so on.

## 5 CONCLUSION

Social media have affected the people's living and working in all aspects. Network consumers often refer to evaluation of other consumers and express their shopping experience through social media. Some cases shows that word-of-mouth effect with help of social media creates a strong influence on brand image of products. So enterprises must pay more attention to social media and network word-of-mouth marketing. Moreover, the enterprises can also do creative network marketing through social media for achieving rapid development. Based on these, this article puts forward some strategies of network word-of-mouth marketing and we hope that they bring some help for enterprises.

# A method of face recognition based on maximum margin criterion and difference vector

Guo Cheng & Ya Ya Liu

College of Mathematics and Computer Application, Shangluo University, Shangluo Shaanxi, China

**ABSTRACT:** For face recognition of small sample size and high-dimension data dimension reduction problem, this article proposes a method of combining maximum margin criterion and difference vector for face recognition. First, we use the “Gram-Schmidt” orthogonal transformation to obtain the common vectors for each type of images. Then, we get the difference vector between the common vector and original image. Using MMC method of optimal projection axe for the difference vector, we calculate the training sample, testing sample of difference vector on the shaft of the optimal projection feature vector. Finally, we use third-order neighbor classifier to classify identification. The experimental results on ORL and Yale face database show that the method has good recognition performance.

**KEYWORDS:** maximum margin criterion; difference vector; common vector; face recognition.

## 1 INTRODUCTION

Face recognition is one of the hot issues in the field of computer vision and pattern recognition. Due to the face image being very sensitive to illumination, facial expression, posture change, and the image dimension being higher, these factors make face recognition more difficult. How to effectively reduce the face data dimension and extract the effective identification features is a major problem to be urgently solved in face recognition.

Linear discriminant analysis (LDA) has been used widely in face recognition. LDA seeks the optimal projection directions that can maximize the between-class scatter and minimize the within-class scatter[1]. However, LDA always encounters the small sample size (SSS) problem. In this case, the number of training samples is less than the dimension of feature vectors, so the within-class scatter matrix is singular[2]. To avoid the singularity problem of LDA, Li et al.[3] used the difference of both between-class scatter and within-class scatter as discriminant criterion, called maximum margin criterion (MMC). Since the inverse matrix does not need to be constructed, the SSS problem in traditional LDA is alleviated. MMC has the advantages of effectiveness and simplicity[4–6]. Cevikalp et al.[7] addressed the discriminative common vectors (DCV) method, which shows better face recognition effects than some commonly used linear discriminant methods, including Eigenface, Fisherface. The foundation of the DCV is the common vectors theory proposed by M.B. Gulmezoglu

et al[8–9]. In this article, a DV-MMC method is proposed, which combines MMC with difference vector (DV) for face recognition.

This article is organized as follows: The MMC method is discussed briefly in Section 2. In Section 3, we describe the DV method. Our DV-MMC algorithm is presented in Section 4. Experiments are reported in Section 5, and some conclusions are drawn in Section 6.

## 2 MAXIMUM MARGIN CRITERION

Suppose there are  $c$  known pattern classes  $\omega_1, \omega_2, \dots, \omega_c$ ; the between-class scatter matrix and within-class scatter matrix can be denoted as follows:

$$S_b = \sum_{i=1}^c \frac{M_i}{M} (\mu_i - \mu)(\mu_i - \mu)^T \quad (1)$$

$$S_w = \frac{1}{M} \sum_{i=1}^c \sum_{j=1}^{M_i} (X_j - \mu_i)(X_j - \mu_i)^T \quad (2)$$

where  $M$  is the total number of training samples, and  $M_i$  is the number of training samples in class  $i$ . In class  $i$ , the  $j$ th training sample is denoted by  $X_j$ , the mean vector of training samples in class  $i$  is denoted by  $\mu_i$  and the mean vector of all training samples is  $\mu$ . MMC-based discriminant rule is

defined as follows, which is based on the difference between-class scatter matrix and within-class scatter matrix[3]:

$$J(W) = \text{tr}(W^T (S_b - S_w) W) \quad (3)$$

By the property of the extreme value of generalized Rayleigh quotient, the optimal projection axe is the eigenvector corresponding to the maximal eigenvalue of Eq.3. In fact, the optimal projection axes  $\omega_1, \omega_2, \dots, \omega_k$  can be selected as the orthonormal eigenvectors corresponding to the first  $k$  largest eigenvalues  $\lambda_1, \lambda_2, \dots, \lambda_k$ , i.e.,

$$(S_b - S_w)\omega_j = \lambda_j \omega_j \quad (4)$$

where  $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_k$ .

Comparing the MMC with the classical Fisher discriminant criterion, we find that the former avoids calculation of the inverse within-class scatter, that is,  $S_w^{-1} S_b$  is substituted by  $S_b - S_w$ . This is not only computationally more efficient but also avoids the singular problem of the within-class scatter.

### 3 DIFFERENCE VECTOR

Assume there are  $C$  classes, and  $N_C$  face image samples in class  $c$ . Let  $x_m^i \in R^d$  be  $m$ th sample in  $i$ th class. The matrix  $B_i$  whose columns span a difference subspace  $L(B_i)$  for  $i$ th class is defined as follows[8]:

$$B_i = \text{span}\{\bar{b}_1^i, \bar{b}_2^i, \dots, \bar{b}_{N_i-1}^i\} \quad (5)$$

where  $\bar{b}_k^i = \bar{x}_{k+1}^i - \bar{x}_1^i, (k=1, 2, \dots, N_i-1)$ . The  $x_1^i$  is called ‘‘reference vector,’’ which can be randomly selected from  $i$ th class and here the first sample is selected. By performing Gram–Schmidt orthogonalization procedure, the orthonormal vector set  $\{\bar{y}_1^i, \bar{y}_2^i, \dots, \bar{y}_{N_i}^i\}$  that spans the difference subspace  $L(B_i)$  is obtained. Then, a sample  $x_k^i$  randomly selected from class  $i$  is projected on the orthonormal vector  $\bar{y}_k^i$ , and the summation of the projection is computed as follows:

$$\begin{aligned} \bar{s}^i = & \langle \bar{x}_k^i, \bar{y}_1^i \rangle \bar{y}_1^i + \langle \bar{x}_k^i, \bar{y}_2^i \rangle \bar{y}_2^i + \\ & \dots + \langle \bar{x}_k^i, \bar{y}_{N_i-1}^i \rangle \bar{y}_{N_i-1}^i \end{aligned} \quad (6)$$

Then, the common vector  $\bar{x}_{common}^i$  of  $i$ th face class is derived as follows:

$$\bar{x}_{common}^i = \bar{x}_k^i - \bar{s}^i, (k=1, 2, \dots, N) \quad (7)$$

It was proved that the common vector  $\bar{x}_{common}^i$  is unique and independent of the randomly selected sample  $\bar{x}_k^i$ . Thus, the common vector  $\bar{x}_{common}^i$  can be used to represent the common invariant properties of  $i$ th face class.

A difference vector  $\bar{x}_{diff}^i$  that represents the specific properties of the face image  $x_j^i$  due to the specific pose and expression variations in this face image is as follows[9]:

$$\bar{x}_{diff}^i = x_j^i - \bar{x}_{common}^i, (i=1, 2, \dots, C; j=1, 2, \dots, N) \quad (8)$$

We can get the training sample image set of difference image set.

## 4 COMBINE MAXIMUM MARGIN CRITERION WITH DIFFERENCE VECTOR FOR FACE RECOGNITION

Suppose there are  $c$  known pattern classes  $W_1, W_2, \dots, W_c$ , and  $N_C$  difference face image samples in class  $c$ . The between-class scatter matrix and within-class scatter matrix can be re-denoted as follows:

$$S_b^d = \sum_{i=1}^c \frac{M_i}{M} (\mu_i^d - \mu^d)(\mu_i^d - \mu^d)^T \quad (9)$$

$$S_w^d = \frac{1}{M} \sum_{i=1}^c \sum_{j=1}^{M_i} (X_j^d - \mu^d)(X_j^d - \mu^d)^T \quad (10)$$

where  $M$  is the total number of training difference samples, and  $M_i$  is the number of training difference samples in class  $i$ . In class  $i$ , the  $j$ th training difference sample is denoted by  $X_j^d$ , the mean vector of training difference samples in class  $i$  is denoted by  $\mu_i^d$ , and the mean vector of all training difference samples is  $\mu^d$ . DV-MMC based discriminant rule is defined as follows:

$$J'(W) = \text{tr}(W^T (S_b^d - S_w^d) W) \quad (11)$$

where the optimal projection axe is the eigenvector corresponding to the maximal eigenvalue of Eq.11.

The proposed DV-MMC-based feature extraction method can be summarized as follows:

Step1: Construct the difference image set using the approach in Section 3.

Step2: Compute the matrix  $S_b^d$  and  $S_w^d$  using Eqs. (9) and (10).

Step3: Calculate the optimal projection axe  $W$  using Eq. (11).

Step4: Extract the training sample feature using  $Y_{train} = W^T X_{train}$ . Extract the testing sample feature using  $Y_{test} = W^T X_{test}$ .

Step5: Use third-order neighbor classifier to classify.

## 5 EXPERIMENTAL RESULTS

In order to test the effectiveness of the DV - MMC algorithm, use the ORL and Yale face image database. All experiments are conducted in PC for P4 2.0 GHz CPU, 1024 MB of memory, MATLAB7.5 platform for testing.

### 5.1 Results on ORL database

The ORL database is a set of pictures taken between 1992 and 1994 at AT&T Laboratories Cambridge. There are images of 40 different people, and 10 images were taken of each person. Each image was taken with the size of  $112 \times 92$  and the gray level of 256. Some samples are shown in Fig. 1.

Figure 1. Some samples from ORL face database.

In ORL face database, each training sample is 2,3,4,5,6,7,8,and 9, respectively. If we remove image as the training sample, the samples of the remaining faces act as a test sample set. The experimental results are shown in Table 1, and the average recognition rate is 10 times experiments.

Table 1. Average recognition rate for ORL face database.

Number of training samples per class	Each method the average recognition rate(%)		
	LDA	MMC	DV-MMC
2	60.00	65.31	68.13
3	63.21	67.14	70.00
4	68.75	77.08	79.58
5	71.50	80.50	83.00
6	75.00	86.88	89.38
7	75.00	85.83	92.5
8	75.00	86.25	93.75
9	70.00	85.00	90.00

Table 1 compares the classification performance of all methods. DV-MMC is an effective discriminant algorithm. When we use the same classifier, DV-MMC outperforms LDA and MMC. Due to the small sample size problem, the recognition rate of LDA methods is low and the performance is not very stable. Moreover, DV-MMC achieves the best classification effect.

### 5.2 Results on Yale database

The Yale Face Database contains 165 grayscale images of 15 individuals. The face images are cropped and resized to  $100 \times 100$ . Some samples are shown in Fig. 2.

Figure 2. Some samples from Yale face database.

In Yale face database, each training sample is 2,3,4,5,6,7,8, and 9, respectively. If we remove image as the training sample, the samples of the remaining faces act as a test sample set. The experimental results are shown in Table 2, and the average recognition rate is 10 times experiments.

Table 2 shows the average recognition rate. MMC is the improvement of the LDA method, and it avoids the between-class scatter matrix inversion calculation. In the same training sample, the advantages are more apparent than LDA. It can be seen that DV-MMC achieves better results than LDA and

MMC. The better performance is achieved in MMC and DV-MMC when the number of training samples per class increases.

Table 2. Average recognition rate for Yale face database.

Number of training samples per class	Each method the average recognition rate(%)		
	LDA	MMC	DV-MMC
2	46.67	55.56	59.26
3	54.17	62.5	65.83
4	56.19	71.43	73.33
5	58.89	76.67	80.00
6	67.33	84.00	86.67
7	76.67	93.33	93.33
8	81.11	95.56	97.78
9	83.33	93.33	96.67

## 6 CONCLUSION

In this article, we present a new face recognition method DV-MMC, which combines the maximum margin criterion (MMC) with difference vector (DV). We use the “Gram-Schmidt” orthogonal transformation to obtain the common vectors for each type of images. Then, we get the difference vector between the common vector and original image. Using MMC method of optimal projection axe for the difference vector, we calculate the training sample, testing samples of difference vector based on the shaft of the optimal projection feature vector. Finally, we use third-order neighbor classifier to classify identification. The experimental results show the effectiveness of our proposed method.

# Research and application of oil spill tracking buoy based on BeiDou satellite

Rui Yang, Wei Wei Zhu & Qun Gu

EAIC Department, China Waterborne Transport Research Institute, Beijing, P.R.China

**ABSTRACT:** This article aimed at optimizing the technique parameters of tracking buoy by a hydrodynamic method through an experiment on the sea. A survey was created based on the study of technical characters of an oil spill tracking buoy to achieve an all-weather whole procedure monitoring propose for oil spill by using satellite positioning communication mode, which can provide an effective technical method for the rapid response of oil spill emergency.

**KEYWORDS:** Tracking Buoy; BeiDou Satellite; Marine Oil Spill.

## 1 INTRODUCTION

According to statistics from the relevant organizations, in the past 30 years, more than 2100 oil spill events have occurred in China's offshore areas, 70 of which are more than 50 tons. With the rapid economic development, our energy demand sustains high growth and crude oil import records are refreshed constantly. China's crude oil imports reached 285 million tons in 2013, which rose by 6.8% from a year earlier. China's crude oil import dependence may top 60 percent, meaning that the risk of the oil spill accidents is obvious. The oil spill accidents have a significant impact on marine environment, property, and people health, and will cause serious pollution damage to the marine ecological environment and fishery resources.

Currently, tracking and monitoring methods for oil spill mainly depend on satellite remote sensing[1], radar, aircraft or ship searching, computer simulation, and buoy tracking[2,3]. However, satellite remote sensing can be limited by the time with lagging reaction. Radar and aircraft searching are too expensive, and ship searching has low efficiency. Besides, most of them are limited by the weather conditions. The results of computer simulation are under the influence of people, technology, and complex sea states, which will easily lead to larger deviations. After oil spill events, timely and accurately tracking the location of the oil spill and predicting the drift direction can effectively reduce the harm of pollution of oil spill. Therefore, the tracking is of great importance.

The oil tracking buoy is a kind of water surface drifting buoy. It utilizes satellite positioning

communication techniques and can effectively track the oil under different sea states. The tracking buoy provides an effective technical measure for the oil spill events. It can track the oil spill drift location fast and accurately, which enables us to take measures earlier to reduce accident damage and warn the sensitive areas, reducing or avoiding pollution. Through the buoy, the contingency cleaning plans can be launched immediately and the effective commands can be made, effectively stopping the spread the spill oil. Simultaneously, the oil track buoy can also improve the cleaning efficiency, reducing the pollution and the cleaning cost.

## 2 MAIN TECHNICAL PARAMETERS AND CHARACTERS

### 2.1 Main technical parameters

Based on its hydrodynamic utilized satellite positioning communication technique, the oil tracking buoy has a good tracking ability in different regions, under different sea states and for different oil films. The main technical parameters are shown in [Table 1](#).

### 2.2 Main technical characters

1 Simple structure, light weight, good tracking result  
Marine oil spill tracking and positioning buoy has the advantages of simple structure, light weight, which could be transported and stored easily. It also has a strong tracking ability to realize all-weather and all-round tracking, and high positioning accuracy with meter-level localization effect.

Table 1. Main technical parameters of oil tracking buoy.

Subject	Parameter
Outer surface diameter	25cm
Quality	4kg
Material	Modified PP
Manufacturing	Integrating plastic
Communication	Beidou
Process	Injection molding
Platform	Satellite
Work environment	-2°C~+50°C
Temperature	-2°C~+45°C
Free fall	From ca.10 meter high
Battery life	Ca. 20 days
Communication period	Once per min.

Figure 1. 3D effect design of tracking positioning buoy.

## 2 Flexible positioning communication platform

The use of Beidou satellite positioning communication system can achieve an integrated oil spill information tracking and transmission function. And depending on the application situations, the “maritime satellite communication system + GPS positioning system” and other methods could also be used to track and position the oil spill information.

## 3 Advanced technology and good reliability

We use small OEM communication positioning integrated module to improve the system reliability efficiently; select external magnetic proximity switch to realize a reliable and convenient operation. The C/S architecture-based network service model could ensure the system stability, high efficiency, and good maintainability.

## 3 MAIN TECHNIQUES

### 3.1 Buoy structure analysis and parameters optimization

Maritime Tracking and positioning buoy must have the similar drift characteristics of the spilled oil it tracks with simple structure, light weight, and good drift property as far as possible. According to the specific characteristics of buoy satellite communication module, battery and sensing element, and the technical requirements of sealing, transmission capacity, impact resistance, self-centering ability, balance, and other characteristics of buoy, the overall parameters of the buoy are as follows: Water area, frontal area, water height, and mass balance should be optimized and modified basing on the hydrodynamic performance of the drift buoy. The positioning of the buoy's overall structure design of tracking oil, as well as the overall 3D effect design of tracking positioning buoy are shown in Fig. 1.

### 3.2 Hydrodynamic performance of buoy

The tracking motion of a buoy in the sea water will be affected by wind and water below the surface of water. This article assumes that the buoy is tracking the spilled oil film perfectly, and achieves a force balance when it has the same velocity as the oil film. And if the two velocities are not equal, acceleration will be generated by an unbalanced force to adjust the velocity to recover the force balance [4].

If the buoy could follow the spilled oil film perfectly, then the buoy velocity is equal to the velocity of oil film. The sea water force on the buoy could be expressed as follows:

$$F_{water} = \frac{1}{2} \rho_{water} (V_o - V_{water})^2 A_1 C_{Dc} \quad (1)$$

$A_1$  : water area,  $C_{Dc}$  : sea water resistance coefficient of buoy.

With the equivalent wind velocity of  $V_{10}$  and current velocity:

$$F_{water} = \frac{1}{2} \rho_{water} [(\zeta - \alpha) V_{10}]^2 A_1 C_{Dc} \quad (2)$$

$\zeta$ : wind coefficient with an area of 1.6%-3.5%, mainly depending on the depth of oil film.

The direction of resistance applied on the buoy by different sea water is opposite to the relative

velocity of buoy and seawater. From the wind force on buoy point of view, taking the uniform motion of buoy into consideration, the wind force and water resistance should be equal:

$$\begin{aligned} & \rho_{water} [(\zeta - \alpha)V_{10}]^2 A_1 C_{Dc} \\ &= \rho_{air} \left[ (1 - \zeta)V_{10} \left( \frac{8h}{150} \right)^{1/7} \right]^2 A_2 C_{Da} \end{aligned} \quad (3)$$

For  $\alpha < \zeta < 1$ , then:

$$\frac{\zeta - \alpha}{1 - \zeta} = \left( \frac{\rho_{air} A_2 C_{Da}}{\rho_{water} A_1 C_{Dc}} \right)^{1/2} \left( \frac{8h}{150} \right)^{1/7} \quad (4)$$

The equation could be simplified as follows:

$$\zeta = \frac{k + \alpha}{1 + k} \quad (5)$$

It could be found that the tracking characters (wind coefficient) of the buoy are mainly decided by its design parameters (the height of buoy above water, the shape of buoy above and below water etc.). The required high tracking accuracy could be optimized by the geometric parameters of buoy and sea state parameters in the design process.

### 3.3 Positioning communication system of buoy

Oil spill tracking and positioning buoy uses the Beidou satellite positioning system to achieve its positioning and communication function. Beidou satellite is a satellite communication positioning system developed in China with a variety of functions such as fast positioning, short message communication, precision timing, and so on, which can fulfill the current navigation and positioning requirements across all land, sea, and air transport domains.

Oil spill tracking and positioning buoy system consists of Beidou satellite, network management center, and user terminal. The user terminal (oil spill tracking positioning buoy) sends the data to the Beidou satellite through the embedded Beidou terminal in accordance with a given report mode. The Beidou satellite will transfer the data to the ground civil network station, and then finally send to the Beidou command terminal (buoy monitoring center).

### 3.4 Geographic information management system for buoy drifting

The development of sea drift geographical information system for oil spill tracking buoy based on the Beidou satellite system realizes the fast display for oil spill tracking and positioning micro buoy, and accurate and timely collection, storage, playback, and monitor for tracking communication messages, device information, and positioning messages.

The information processing system is built on GIS Server geographic information platform with a C/S structure, which has set a sea drift state geographic information platform for oil spill buoy by using data exchange technology, distributed technology, GIS technology, and satellite positioning technology. The platform includes data layer, service layer, and application layer. Data layer is mainly used for the storage of geographic information (such as administrative area, water, and other geographic information), equipment information (such as equipment sign, equipment trace etc.), and to save the user information retrieval. Service layer provides the application-oriented services, including electronic map service, positioning information receiving service, and Beidou information-based map display service. Application layer is application service oriented, mainly including equipment information retrieval, equipment historical trace playback and retrieval, equipment positioning, as well as some preset information such as user information, trace color, and line shape.

## 4 EXPERIMENT AND APPLICATION

Based on the hydrodynamic study of buoy, the micro sea oil spill positioning and tracking buoy has been developed and practiced in an oil spill emergency test, which achieved good experimental results and practical experience.

The drift state, sealing, self-centering ability, satellite signal receiving, the reliability and accuracy of communication link at sea, and the oil film tracking ability of buoy have been tested in the North China Sea oil and gas drilling platform area from August 11 to 15, 2014.

The experiment [5] is equipped with the Cosmo-Skymed Radarsat remote sensing satellite, micro-oil spill tracking and positioning buoy, "oil spill forecasting support system," oil spill drift tracing device, and so on. The oil spill tracking and positioning buoy has been launched in a high-risk area of oil spill accidents (oil and gas platforms). After 43 hours of continuous testing, the oil spill tracking buoy can reflect a high matched trace and trend of marine oil spill in a timely manner. The results can meet the sea application requirements.

The experiment procedure and the buoy trace are shown next:

a) Launch

b) Drift

c) Buoy trac

Figure 2. Experiment and buoy drift trace in the North China Sea.

The oil spill tracking and positioning buoy has been launched in high-risk area of oil spill accidents. The experiment buoy coordinates, and the buoy trace distances are shown.

The Beidou-based oil spill tracking and positioning buoy could realize an all-weather whole procedure monitoring for marine oil spill drifting state with high reliability, low cost, and real-time rapid information transmission velocity at sea. By using this buoy, the accurate oil spill drift trend and oil drift position could be predicted perfectly and defined timely in order to take the corresponding measures, reduce the accident damage, form the oil spill emergency clearance action decision, effectively prevent oil spread, improve the efficiency of oil spill clean-up operation, reduce pollution, reduce the clean-up cost, protect the marine environment, and promote the fishery production, which also have remarkable socioeconomic benefits.

## 5 CONCLUSION

The oil tracking buoy developed by the project has good features of working in all weather and monitoring in the entire process. It is a fast, effective approach for the oil spill events, which is also stable, reliable, and inexpensive. The oil spill track buoy utilizes satellite positioning communication techniques, which makes it have good tracking ability under different sea states.

The ocean environment is very complicated. The environment and climate are different at different areas in different seasons under different weather conditions. The differences of environment and climate have influences on the drift of spill oil. Although the test is performed in certain waters, it has some limitations. We will closely track the use of buoy products and continue to study technical characteristic of the oil track buoy to improve the performance, making it an excellent product of the oil spill emergency rapid response system and serving for marine environmental protection.

## Analysis on the age feature of the development of upper limb strength and lower limb strength in Chinese teenagers

Y.J. Lin, W. Chen, L.Q. Qiu, C.X. Cai & J.H. Li

*Key Laboratory of the State Sports General Administration, Nanchang, China*  
*Institute of Physical Education, Jiangxi Normal University, Nanchang, China*

**ABSTRACT:** Purpose: Analyzing the relationship of the score of the age, push-ups, and standing long jump by measuring the age, height, weight, push-ups, and standing long jump of 49 teenagers who come from The Sunshine Sports Center, Nanchang, Jiangxi Province, to further explore the correlation between the age, strength, and explosive force, which will help the teenagers in the aspect of scientific strength training and posture correction. Method: Measure and analyze the score of push-ups and standing long jump, the height, and the weight of the 49 teenagers aged 11 to 16 years by taking advantage of the Tape measure meter, Weight measure meter, and height measuring gauge. Result: The subjects with an average age of  $11.53 \pm 2.45$ , a height of 170.6 cm, and a weight of  $56.44 \pm 10.07$ . The correlation coefficient between the age and the score of standing long jump is 0.630 ( $p < 0.01$ ), and the correlation coefficient between the age and the score of push-ups is 0.197. Conclusion: For the teenagers, there was no positive correlation between the age and the score of standing long jump, and there was no obvious relationship between the age and the score of push-ups.

**KEYWORDS:** Weight; Age; Standing long jump; Push-ups.

### 1 INTRODUCTION

In our country, there are two hundred and ten million children and teenagers, and adolescents' growth level and athletic ability is not only a reflection of national physique condition of students and their comprehensive national strength but also an important symbol of a nation's prosperity. In childhood, muscle percentage is low, muscle protein is less, muscle fiber is relatively thin, and motion system development is not perfect. In the teenager, the function of sports system had the preliminary development mainly displayed in the muscles of the percentage of weight gain, muscle fiber cross-section increases, increased calcification of bone and bone enlargement, the contraction of muscle force, and robustness enhancement of bone and joint. Therefore, it has been basically studied; however, at this time, the condition of complex technical action is good period of development of strength and speed (Xu 2006). During the teenage years, their bodies grow rapidly and are in a critical stage of shape and posture. Because of the burdensome curriculum and the lack of enough attention of parents to students' exercise, this leads to many teenagers lacking exercise. Because of the effect of the poor posture of daily sitting, standing, or walking and bad habits, the body posture of the teenagers tends to sag, with a bent vertebral column, height and low shoulder, and screwed

legs, which affects their external beauty. We could either avoid these problems or correct them through timely prevention and treatment. Corresponding covering strength training, improving the muscle strength training, which takes the spine as the core, and strengthening the strength on their ligaments play a critical role in the aspect of the posture and gesture for teenagers. In this article, we learned the difference between strength and explosive force in various phases of age of the teenagers. This is available for drafting the exercise programs for the teenagers at the corresponding age. It can also help the teenagers form good posture and gestures by combining with development rule of the body (Anthony et al. 2002).

On the other hand, the difference of sport ability between individuals usually could show in youth. Early founding of the teenagers whose sports ability is outstanding, and cultivating those whose sports ability is outstanding in some respects in time, could provide strong support on the aspect of athletes' selection. The growth and physical condition of the teenagers is worthy of our attention. Their bodies are undergoing physical development, so the functional levels of all aspects of the physical have great potentials. There is considerable difference between the upper body strength and lower limb strength in various phases of age of the teenagers. We can explore the functional levels of the teenagers by combining with the characteristics

of their age, weight, and height and assessing the corresponding function. And we can try to find out the similarities and differences between strength and explosive force of this age of juveniles. It provides reference for the athletes who are searching for the sports that are related to strength and explosive force.

## 2 OBJECTS AND METHODS

### 2.1 Research objects

As shown in table 1, the research object of the 49 teenagers aged 7 to 19 years of this article are that they are in good health and have no physical defects. The average age is 11.53 years. The average height is 160.50cm, and the average weight is 56.44Kg. The score of standing long jump is 168.34cm, and the score of push-ups is 12.09.

Table 1. Basic situation table of the research object (aged 7 to 19).

Factor	Standard Deviation
Number Of people	49
Age	11.53±2.45
Height(cm)	160.50±8.03
weight(kg)	56.44±10.07
Standing long jump(cm)	168.34±30.91
push-ups	12.09±7.14

### 2.2 Research method

We provide a theory basis for this article by searching the professional literature related to this article from the internet, the library, and the reference room.

We can obtain the general conditions between their age characteristics and strengthen by talking with the research object. This helps the latter part of the test run. Meanwhile, we can learn about the basic physical condition by talking with them and eliminate the individual who is not fit to participate in the test.

All data were analyzed using SPSS 21.0 software for statistical processing. The results of related questionnaire using n represent frequency of occurrence and the metabolism data expressed in average  $\pm$ standard level is  $p < 0.05$  when using the  $\chi^2$  test method. Difference in significance level is  $p < 0.05$ , significant in significance level is  $p < 0.01$ , and extremely significance level is  $p < 0.001$  when using the independent-sample T-test method. Difference in significance level is  $p < 0.05$  when using the Bivariate correlation analysis.

### 2.3 Experimental apparatus and methods

The main apparatus used in this research are HK6000-TY Standing long jump test instrument, Height gauge, and Weight meter.

The main goal of push-up is to build muscle of the waist, forearm, and abdomen, especially the chest. The push-up is an important element for strength quality training. It is usually used in the physical education, exercise, and personal practice. This kind of practice has universality and practical efficiency, needs relatively less room, and does not need to purchase any instrument, so it is a simple and easy-to-do but very efficient method for the strength training and appraisals. Push-up can reflect the ability of continue working, the strength of the upper limbs and shoulder muscles. We should use a cushion for test. During the tests, subjects were told that both hands supporting ground, the fingers pointing straight forward, the hands should be about shoulder-width apart, bicep should be curled in order to make the body straight down to the shoulder and elbow in the same horizontal plane, and then straightly support the body. Getting back to the starting position is completed.

In 2014, National Student Physical Health Standard set that standing long jump is the necessary project in the physical test annually for junior middle school, high school, and college. HK6000TY was chosen for the test. Standing long jump was mainly measuring the lower limbs muscles' explosive effort when jumping forward. It is an index of evaluating lower limb explosive.

Measurement methods: The subjects were naturally standing at an attention posture, standing on the bottom plate (the arms hang down naturally, Heel Toe closer, separated by about 30 DEG -40 DEG), heel, sacrum, and a two-scapular-column contact. They had to keep the ear and eye level, the test will be horizontal plate down, light pressure of the head vertex, eyes and the pressure plate a level reading and recording, record height with "cm" (CM) as a unit, accurate to one decimal place, and then look at the instrument digital and recorded.

The weight is to describe human transverse development index; it can reflect the human bone, muscle, subcutaneous fat, and visceral organs of comprehensive development to some extent.

Measuring instruments: The lever-type weight meter, instrument error is less than 0.1%, in which each 100kg error is less than 0.1kg. Sensitivity accuracy and calibration weight should be tested earlier.

Measurement methods: Measurement before will swim yards to zero, to assume scale-level position. Measuring scales should be placed on the flat ground, make the light on the subjects, according to the stage. Testers moving rider to scale stability after level reading and record accurate to 0.1 kg, subjects take off shoes and socks, without incidental goods, standing on the weighing machine, after smooth pointer check data and recorded.

### 3 EXPERIMENTAL RESULTS

#### 3.1 Relationship among youth age, standing long jump, and push-ups

It is seen from [table 2](#) that age and standing long jump and the correlation coefficient of 0.630 is far greater than the age push-ups correlation coefficient of 0.197, indicating that the age and standing long jump have a close relationship; in teenagers of different ages, standing long jump achievement has a very big difference. The correlation coefficient of age and push-up is very small, and push-up scores and age are not much related. No matter whether people are young or old, it does not mean that push-up is the quality of performance; even though youth may be of the same age, the push-up results are very different.

Table 2. Youth age and standing long jump and the relationship between the push-ups.

The correlation coefficient of age and standing long jump (r)	The correlation coefficient of age and push-ups (r)
0.630**	0.197

Note: \*\* p < 0.01

#### 3.2 Comparison of different age youth standing long jump performance

Data showed that older people's jump average value is greater than the younger people's jump: This is the mechanics principle. It can be seen from [table 3](#) that long jump results of teenagers younger than the age of 12 standing below older than 12 years old adolescents. Generally speaking, young people, older, the better the performance of standing long jumps. Thus, standing long jump performance was affected by age.

Table 3. Comparison of different age youth standing long jump performance.

Grouping	The number of people	Standing long jump results (cm)
Age < 12	23	151.43±18.43
Age >=12	26	183.31±32.24

Note: with age < 12 years, old group comparison, \*\* p < 0.01

#### 3.3 Comparison of different age youth's push-ups performance

It is seen from [table 4](#) can be, no matter how large the age, the performance difference of little push ups. Under the age of 12 years, the average score is 11.26 push ups. For age greater than 12 years, adolescents' push up average score is 12.88. That push up performance influenced by age is very small.

Table 4. Comparison of different age youth's push-ups performance.

Grouping	The number of people	push-ups
Age < 12	23	11.26±6.88
Age >=12	24	12.88±7.44

### 4 DISCUSSION AND ANALYSIS

The experimental results show that the height of high standing long jump performance preference. In [table 3](#), teenagers younger than the age of 12 have 23, whereas their average score was 151.43 + 18.43 or 151.43 - 18.43; 26 teenagers older than the age of 12 had an average score of 183.31 + 32.24 or 183.31 - 32.24. Experimental results clearly show that the standing long jump performance of height slightly and older teenagers is better than height lowly and younger teenagers. The experiment has proved that standing long jump results among adolescents are affected by one's height. Within a certain range, the standing long jump is proportional to the relationship between grades and height, the figure is higher, the score is better, stature is short, and grades are bad. Teenagers are in a stage of rapid growth; nutritional status, genetic factors, and many other factors contribute to height, so the established in the age when measuring height can reflect the height relationship for standing long jump performance in general (Bblake et al. 2004).

From a biomechanical perspective, as the growth of the age, the power of youth gradually increases, power and explosive of older teens than younger teens, so the older group performance will be better than age slightly team performance (Haff et al. 1997).

From the aspects of physical quality, usually older children in less height will rate is higher than age group, the advantage that the physical quality, also can appear more obvious advantage in the standing long jump clear advantage. At the same time, the older children for the long jump technique level, factors influencing the standing long jump performance far more than a height. Key factors associated with the power of the individual, in less than 12 years old group, some people jump out of the 180cm score, in more than 12 years old group is also on the achievements in. Push ups according to each person's physical quality, something is not the same. Physical overload is the main reason for the low number of movement quality. For the teenagers in the growth and development period, with their increase in height weight will also increase, or lean body mass will increase and promote muscular contraction so that the movement of the quality of the individual will improve. For overweight and obesity, as well as lower weight of teenagers, weight is a significant influence

on push-ups grades. Under low weight, overweight or more subjects under the condition of the same height, weight is heavier or lighter, its physical qualities are poorer, and push-ups result is also worse. Because these objects are in growth phase, the older they are, the heavier they are. So although their power is growing with age, they may not be able to increase the achievement of push-ups.

## 5 CONCLUSION

After the release of the new national physical exercise standard, standing long jump is listed as the third type of exercise standard test item. Push-ups, standing long jump of development speed, strength, agility, and coordination have a larger value of exercise(Xu 2006). For the teenagers, there was no positive correlation between the age and the score of standing long jump, and there was no obvious relationship between the age and the score of push-ups.

# Correlation between the standing long jump performance and the skinfold thickness and weight of teenagers

W. Chen, L.Q. Qiu Y.J. Lin, C.X. Cai & J.H. Li

Key Laboratory of the State Sports General Administration, Nanchang, China  
Institute of Physical Education, Jiangxi Normal University, Nanchang, China

**ABSTRACT:** The aim of this research is to analyze the correlation between the teenagers' skin fold thickness, weight, height, and standing long jump achievements in the physical sports center of Nanchang, Jiangxi Province. The skinfold thickness, height, weight, and performance of standing long jump of twenty-eight teenagers, aged from 11 to 16 years, were tested with a skinfold thickness gauge, weight measuring gauge, and height measuring gauge. Results show that these teenagers' average age is 12.86 years, mean values of height and weight were 160.5 cm and 56.44 kg, and the correlation coefficient of skinfold thickness and performance of standing jump was  $-0.608$  ( $p < 0.01$ ); whereas the correlation coefficient of weight and standing jump was  $0.185$  ( $p > 0.05$ ). The result of standing jump of the teenagers with skinfold thickness less than 15mm is  $194.46 \pm 34.41$  cm, which is significantly longer than those with skinfold thickness more than 15 mm or equal to 15 mm ( $171.27 \pm 24.9$ ) ( $p < 0.05$ ). However, no significant differences were found between the groups with different body weights. The result of the standing long jump of the teenagers with a body weight larger than 56 kg or equal to 56kg is  $186.20 \pm 37.09$  cm and for those less than 56 kg, it is  $177.23 \pm 23.84$  cm ( $p > 0.05$ ). Therefore, for teenagers, their body weight cannot necessarily affect the performance of standing long jump, but too much subcutaneous fat can affect the results of their standing long jump.

**KEYWORDS:** Skinfold Thickness, Weight, Standing Long Jump.

## 1 INTRODUCTION

With the development of the times and the increasingly competition among the society, school entrance pressure result in exercise fell sharply, further leading to the overall decline in teenagers' physical quality. People pay more and more attention to physical deterioration to the harm of teenagers, and the physical condition plays an important role in the development of teenagers. Nowadays, many people mistakenly assume that weight is closely related to the relationship between the standing long jump; the greater the weight, the greater the standing long jump performance is poor. In this article, we attempt to solve this myth through the actual measurement of data from a detailed analysis.

## 2 OBJECTS AND METHODS

### 2.1 Research objects

Subjects are randomly selected from the sunlight sports center in 2010: There were 28 teenagers; subjects, regardless of nationality, had a healthy body,

the development was normal, there were no physical defects, students can engage in sports, between the ages of 11 and 16 years, and height was between 1.52 m and 1.68 m. Their basic situation is shown in [table 1](#); average age was 12.86, average height was 160.5 cm; and weight was 56.44 kg on average.

Table 1. Research objects of the basic table.

The number of test	Age	Height	Weight
8	12.86 $\pm 1.51$	160.50 $\pm 8.03$	56.44 $\pm 10.07$

### 2.2 Experimental instruments

Crease thickness gauge, weight measuring gauge, and height measuring gauge.

### 2.3 Measuring the skinfold thickness

Skinfold method aims at using a crease thickness gauge measuring skinfold from certain parts of the body, to calculate the volume density, body fat percentage, body fat, and lean body mass (Hough et al. 2009).

Test parts: upper arm, shoulder peak connected to the upper arm behind chick midpoint, crease to parallel to the humerus.

Testing equipment: crease thickness gauge (squared pressure should be kept in 10 g/mm), before the measurement should be verified, farmer passionless jaw, adjust the pointer to the red scale range of 15 to 25 mm, dispatch pointer to zero before every test.

Method: subjects were standing naturally, with exposure to test site. Testers to choose standard measurement point, around with your thumb and forefinger and middle finger pinch crease, right hand to hold crease thickness gauge, open the calipers, stuck in picked parts below 1 cm, with a pointer to a complete stop, immediately read and make a record. Measuring three times, take intermediate value or take twice the same value. Measurement error should not exceed 5%, record with remove a decimal places.

#### 2.4 Height measurement

Height refers to the human body having an upright bearing surface (height measure plate) to the top of the head (height measure leveling board) between the vertical distance.

Measuring instruments: sitting height block (instrument error must not exceed 0.2 cm) per meter. Use should be checked before zero; at the same time, check whether the column is vertical, joint closely, whether with or without shaking, parts with and without loose, and so on. If there is a fault, it should be promptly corrected.

Method: the subjects to take natural stand at attention posture standing on the floor (two arms natural prolapse, heel, toe about 30°, 40°) separately, heel, sacrum and two pillar contact between shoulder blade, keep the ears pierced level, level of testers will clamp down and gently press the point above, two eyes and clamp levels in reading and record, record height in "cm" (cm) as the unit, accurate to one decimal places, fill in the table.

#### 2.5 Weight measurement

Weight is an index to describe the human body horizontal development; it can reflect to some extent human bones, muscles, subcutaneous fat, and comprehensive development status of the internal organs (Komi 1973).

Measuring instrument: leveraged the scales, the instrument error of less than 0.1%, the error is less than 0.1 kg per 100 kg. Before test, the scales of the sensitivity and accuracy should be checked.

Methods: measurement before will swim yards to zero, to assume scale-level position. Measuring the scales should be placed on the flat ground, make the

light on the subjects, according to the stage. Testers move rider to scale stability after level reading and record accurate to 0.1 kg.

#### 2.6 Standing long jump measurement

Standing long jump are mainly lower limb muscle explosive in the measurement of a forward leap, it is the evaluation index of lower limbs explosive power (Berenson et al. 2004).

Test method: two feet nature separate standing, standing after the jump line, tiptoe may not be on line. Two feet in situ jump simultaneously cannot have step mat or even beating. Measures jump line trailing edge to the trailing edge location recently vertical distance. Each student can jump thrice and take the best one. In centimeters, ignore the decimal.

### 3 EXPERIMENTAL RESULTS

Table 2 shows the youth in skinfold weight the relationship between the two aspects respectively and standing long jump results, from the table shows skinfold and standing long jump. Results show a significant inverse relationship ( $R = 0.608$ ), and statistical analysis shows that the results are very significant, namely skinfold is, the greater the standing long jump performance is poor, and vice versa. And weight and standing long jump results of correlation analysis show that the correlation is very weak, the correlation coefficient is only 0.185, and the results have no statistical significance.

Table 2. Teenagers standing long jump and the relationship between skinfold and weight.

The number of test	Correlation coefficient of skinfold and standing long Jump performance(r)	Correlation coefficient of weight and Standing long jump performance(r)
28	-0.608**	0.185

Note: \*\*  $p < 0.01$

Table 3 shows the different skinfold youth standing long jump performance comparison, first of all to average skinfold 15 mm as comparison standard, 13 below 15 mm average green children standing long jump results are in 194.46 cm, and the other 13 skinfold is greater than or equal to 15 mm adolescents, standing long jump results are in 171.27 cm, compared two groups, the results are very significant ( $p < 0.01$ ). The more visible skinfold thickness, standing long jump performance is poor.

Table 3. Different skinfold youth standing long jump performance comparison.

Group	Number of people	Standing long jump results (cm)
Skinfold < 15 mm	13	194.46 ±34.41
Skinfold ≥15 mm	15	171.27 ±24.90*

Note: \*\* p<0.01

Look at [Table 4](#) for the different weight of green children in the standing long jump performance of comparative data, with 56 kg weight as a standard, 13 below 56 kg were standing long jump results in 177.23 cm, and the other 13 56 kg weight is greater than or equal to the subjects of standing long jump results in 186.20 cm. That is to say, weight big, weight big standing long jump results are relatively a bit better, but there are no significant differences.

Table 4. Different weight youth standing long jump performance comparison.

Group	Number of people	Standing long jump results (cm)
The<56kg weight	13	177.23±23.84
The≥56kg weight	15	186.20±37.09

## 4 ANALYSIS AND DISCUSSION

### 4.1 Influence of skinfold on standing long jump results

Subcutaneous fat thickness and the proportion of total body fat has a certain relationship (Barsh & Farooqi 2003), therefore, skinfold measurement can not only reflect the distribution of body fat but also can from skinfold calculated from different parts of the total body fat. We can learn by [table 2](#) that the skinfold and standing long jump results showed a negative correlation relationship. And [table 3](#) is more specific to the relationship. Skinfold below 15 mm subjects of standing long jump performance is superior to skinfold being greater than or equal to 15 mm of subjects. The same available skinfold thickness can according to body fat more, but the increase in body fat can increase inertia (Fletcher & Anness 2007), the various parts of our body to reduce the speed of muscle contraction and explosive force; the action of flexibility and coordination is damaged, resulting in standing long jump result being not ideal.

### 4.2 Influence of weight on standing long jump results

Standing long jump depends on each person's physical quality, and jumping out of the performance is not the same (Puente et al. 1994). [Table 2](#): According to the weight and the correlation of standing long jump, performance is very weak, and correlation coefficient is only 0.185. And we see from [table 4](#) that 56 kg weight is less than the standing long jump results being greater than or equal to 177.23 ± 23.84 cm and weight of 56 kg subjects standing long jump performance of 186.20±37.09 cm. Weight of standing long jump results is only relative. But it is not hard to see in [table 3](#); the size of the weight on the impact of standing long jump results not skinfold standing long jump with the size of the achievement gap to clear (Bobbert 1998). So we can say that weight big standing long jump record is not necessarily bad. As is known for all overweight, body load involves a number of movements of the main causes of low quality. But the increase of weight gain is not just a fat; in developing teenagers, as the growth of the height and weight will increase, or lean body mass increases muscular, contraction force enhancement, thus improving various sports makings of the individual (Yamaguchi et al. 2007). For overweight and obesity, as well as lower weight subjects, standing long jump performance influence is significant. Under low weight, overweight or more subjects under the condition of the same height, weight is heavier or lighter, its physical qualities, standing long jump performance will be poor (Comuzzie et al. 1994).

### 4.3 Relationship between skinfold and weight

All parts of the body weight (bone and skeletal muscles, joints, ligaments and adipose tissue, etc.) are the total weight of the units of weight, that is, the sum total of human body each component, including organs of human body, each organization, the total composition, body composition, and the total quality of weight. Based on the physiological effect of the human body, each component is different, often put into fat weight (that is, the body fat weight) and the removal of the fat weight. It is worth noting: With the same height and weight, body fat percentage is not necessarily the same, the body fat is about two-thirds the storage in the subcutaneous tissue; by measuring the thickness of subcutaneous fat, we can not only understand the thickness of subcutaneous fat but can also use the measured thickness of the leather fat to speculated the amount of body fat, to evaluate the personal proportion.

In general, the increase of skinfold can lead to weight gain (Wu & Xu 2004), but increased weight

gain does not necessarily make skinfold (Vette et al. 2007). Obese weight is bigger, but the weight is not fat, muscular body weight may be also big, and teenagers are in the physical development stage (Hassan et al. 1997). For instance, skeletal muscle is constantly growing. Weight is affected by the height and is also great, and height is beneficial to the improvement of the standing long jump results, so our results show that the weight of standing long jump performance is slightly better.

## 5 CONCLUSION

For teenagers, height and weight increase with the growth of the age. According to the results in this research, the increase of body weight does not necessarily affect the standing long jump performance; only too much or too less subcutaneous fat will truly affect its normal performance in the standing long jump.

## Multi-attribute group decision-making model with interval-valued fuzzy number for personnel selection based on group's ideal solution

Ze Shuang Liu & Juan Juan Zhang

*Xi'an University Of Technology, Shanxi Xi'an, China*

Hui Xue

*Shenzhen Mindray Bio- Medical Electronic Co. Ltd, Guangdong Shenzhen, China*

**ABSTRACT:** In the personnel selection process, it is particularly difficult to evaluate people because of the vagueness of subjective assessment and comments difference. This article proposes a multi-attribute group decision-making model with interval fuzzy number for personnel selection, which is based on the group's ideal solution. The model is capable of handling both qualitative data and quantitative data. The model uses interval fuzzy number to express the uncertainty of thinking under subjective attributes and evaluator's weight, which depends on the evaluator, comment's similarity, and decision preference and it calculates the similarity of all the candidates and selects the ideal candidate. Finally, an example is given to illustrate the feasibility of the model.

**KEYWORDS:** Personnel Selection; Multi-attribute Group Decision-making; Interval Fuzzy Number; Group's Ideal Solution.

### 1 INTRODUCTION

Personnel selection is a process that aims at selecting those who meet the needs of the job and can exhibit good performance in the specified positions. Personnel selection plays a key role in human resource management and determines the quality of the enterprise talent. Worldwide, increasingly fierce competition has forced companies to pay more attention to personnel selection process, but many evaluation indexes are fuzzy and there is uncertainty in the process of personnel selection, leading to the evaluation results not being accurately expressed, such as organizational sensitivity, tolerance for stress, creativity, personality, and so on. So a good decision-making model for personnel selection should be able to handle both quantitative data and qualitative data; the emergence of the fuzzy set theory provides an important tool to build a decision-making framework that can deal with uncertainty of personnel selection.

Currently, researchers are trying to use the fuzzy set theory in the related research of personnel selection and have obtained certain achievements. Hu Rui-qing proposed to use fuzzy comprehensive evaluation method to evaluate the innovative ability of scientific and technological personnel<sup>[1]</sup>. Li Bingjun put forward the personnel selection method based on the fuzzy rough set theory<sup>[2]</sup>. Li Jinqiu and Yu Jingxian proposed a selection scheme based on fuzzy AHP and fuzzy TOPSIS<sup>[3]</sup>. Liang,

G. S., & Wang put forward a kind of talent selection method using the fuzzy multi-attribute decision-making algorithm<sup>[4]</sup>. Karsak, E. E proposed the personnel selection method of fuzzy multi-attribute decision-making based on positive and negative ideal solutions<sup>[5]</sup>. Chen, L. S., & Cheng, C. H proposed a fuzzy group decision-making system for personnel selection based on the method of distance metrics<sup>[6]</sup>. Güngör, Z., Serhadlioglu designed a personnel selection method based on the fuzzy analytic hierarchy process<sup>[7]</sup>. Sheng Xiaojuan put forward an evaluation method of innovative talents quality based on interval-valued fuzzy sets<sup>[8]</sup>. To some extent, these methods solved the problem of fuzziness in the personnel selection process, but there are still insufficiencies; for example, literature [1] is lacking in terms of subjective intention expression of evaluation personnel. Literature [1-8] did not consider the similarity between the evaluation opinions.

Interval number is a kind of fuzzy number; it can not only describe the qualitative problem but also has the advantage of numerical processing. On the other hand, currently, the related study of interval numbers is more mature. Fan Zhiping researched the method of standardization for the decision matrix of interval Numbers<sup>[9]</sup>. Hu Ming-li analyzed the properties of standardization for the decision matrix of interval numbers<sup>[10]</sup>. XU Rui-li and XU Ze-shui studied the similarity of interval numbers<sup>[11]</sup>. LI Wei-xiang studied

the uncertainty decision theory and method based on interval numbers<sup>[12]</sup>. From the current related studies, no related research is applied to the talent selection in enterprises that combine the fuzzy set theory and multi-attribute group decision-making method. On the basis of relevant research results of interval numbers, this article will build a multi-attribute group decision-making model with interval-valued fuzzy number for personnel selection based on the group's ideal solution.

## 2 CONCEPT OF INTERVAL NUMBERS

Defnion1:  $\tilde{a} = [a^L, a^U] = \{x \mid a^L \leq x \leq a^U, a^L, a^U \in R\}$  said  $\tilde{a}$  is an interval number, particularly, if  $a^L = a^U$ ,  $\tilde{a}$  degradation is a real number.

Definition 2: Set interval number  $\tilde{a} = [a^L, a^U]$ ,  $\tilde{b} = [b^L, b^U]$ , Algorithms for the interval is:

- 1  $\tilde{a} = \tilde{b}$  If and only if  $a^L = b^L$  and  $a^U = b^U$
- 2  $\tilde{a} + \tilde{b} = [a^L, a^U] + [b^L, b^U] = [a^L + b^L, a^U + b^U]$
- 3  $\lambda \tilde{a} = [\lambda a^L, \lambda a^U]$ , Among them,  $\lambda \geq 0$ . if  $\lambda = 0$ , so  $\lambda a = 0$
- 4  $\frac{1}{\tilde{a}} = [\frac{1}{a^U}, \frac{1}{a^L}]$

Definition 3: Set  $\tilde{a} = [a^L, a^U]$  and  $\tilde{b} = [b^L, b^U]$  as two interval numbers, says  $d(\tilde{a}, \tilde{b}) = \sqrt{\frac{1}{2}[(a^L - b^L)^2 + (a^U - b^U)^2]}$  is the distance of interval Numbers  $\tilde{a}, \tilde{b}$ .

## 3 MATHEMATICAL MODEL OF MULTI-ATTRIBUTE GROUP DECISION-MAKING WITH INTERVAL-VALUED FUZZY NUMBER FOR PERSONNEL SELECTION

The multi-attribute group decision-making model with interval-valued fuzzy number for personnel selection is made up of evaluation group  $E = \{e_1, e_2, e_3, \dots, e_K\}$ , the set of all candidates evaluated  $A = \{a_1, a_2, a_3, \dots, a_m\}$ , and the set evaluation attributes  $C = \{c_1, c_2, c_3, \dots, c_n\}$ . Each evaluation personnel  $e_k$  has corresponding weight  $w_k$ , and constitute weight vector  $W = \{w_1, w_2, w_3, \dots, w_m\} (\sum w_i = 1)$ ; each evaluation attribute also has corresponding weight  $v_j$ , and constitute weight vector  $V = \{v_1, v_2, v_3, \dots, v_n\} (\sum v_i = 1)$ . In the process of selecting personnel, the evaluation value of each evaluation personnel  $e_k (k = 1, 2, 3, \dots, K)$  is  $x_{ij}$  ( $x_{ij} = [x_{ij}^L, x_{ij}^U]$ ) under the set of evaluation

indicators  $c_j (j = 1, 2, 3, \dots, n)$  for candidate evaluated  $a_i (i = 1, 2, 3, \dots, m)$ , and evaluation results of each evaluation personnel for the candidates make a decision matrix  $X^k = (x_{ij}^k)_{m \times n} (k = 1, 2, 3, \dots, K)$ .

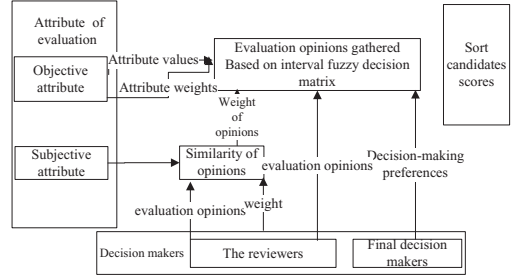

Figure 1. Personnel selection and decision-making model framework.

The key of solving multi-attribute group decision-making model with interval-valued fuzzy number for personnel selection has two aspects: ① Many decision-making matrixes of evaluation staff are concentrated into a group decision-making matrix. ② The solving process of the group decision-making matrix is expressed by using the form of interval number, in order to evaluate the candidates and to sort based on the evaluation results, select the best employee who has the largest score. When concentrated, we need to consider the similarity of opinions from the evaluation personnel under different subjective attributes, and reflect it in the weight of individual evaluation. Due to the final decision-making matrix being based on the interval-valued fuzzy number representation, this article needs to use the relevant solving method of the decision-making matrix with interval-valued fuzzy number.

### 3.1 Aggregation method of group decision-making matrix

#### 3.1.1 Standardization of evaluation attributes

In the decision-making matrix, due to the difference of attribute dimension, type, and magnitude of evaluation attribute, the matrix needs to be normalized before the assembly. The attribute gets a comparable scale by standardization. According to the different ways in which attributes influence evaluation results, they can be divided into two types of benefit and cost. Benefit attribute  $I_0$  is the evaluation value, the greater the better; cost attributes  $I_1$  is the evaluation value, the smaller the better. Normalization method is as follows:

If evaluation attribute is subjective, normalization method is as follows:

$$r_{ij}^{kL} = \begin{cases} \frac{x_{ij}^{kL} - \min_{i=1,2,\dots,m}(x_{ij}^{kL})}{\max_{i=1,2,\dots,m}(x_{ij}^{kL}) - \min_{i=1,2,\dots,m}(x_{ij}^{kL})} & x_{ij}^k \in I_0 \\ \frac{\max_{i=1,2,\dots,m}(x_{ij}^{kU}) - x_{ij}^{kU}}{\max_{i=1,2,\dots,m}(x_{ij}^{kU}) - \min_{i=1,2,\dots,m}(x_{ij}^{kL})} & x_{ij}^k \in I_1 \end{cases} \quad (1)$$

$$r_{ij}^{kU} = \begin{cases} \frac{x_{ij}^{kU} - \min_{i=1,2,\dots,m}(x_{ij}^{kL})}{\max_{i=1,2,\dots,m}(x_{ij}^{kU}) - \min_{i=1,2,\dots,m}(x_{ij}^{kL})} & x_{ij}^k \in I_0 \\ \frac{\max_{i=1,2,\dots,m}(x_{ij}^{kU}) - x_{ij}^{kL}}{\max_{i=1,2,\dots,m}(x_{ij}^{kU}) - \min_{i=1,2,\dots,m}(x_{ij}^{kL})} & x_{ij}^k \in I_1 \end{cases} \quad (2)$$

If evaluation attribute is objective, normalization method is as follows:

$$r_{ij} = \begin{cases} \frac{x_{ij} - \min_{i=1,2,\dots,m}(x_{ij})}{\max_{i=1,2,\dots,m}(x_{ij}) - \min_{i=1,2,\dots,m}(x_{ij})} & x_{ij} \in I_0 \\ \frac{\max_{i=1,2,\dots,m}(x_{ij}) - x_{ij}}{\max_{i=1,2,\dots,m}(x_{ij}) - \min_{i=1,2,\dots,m}(x_{ij})} & x_{ij} \in I_1 \end{cases} \quad (3)$$

Standardized handle by the earlier equation, decision-making matrix  $X^k = (x_{ij}^k)_{m \times n}$  is converted into standardized decision-making matrix  $R^k = (r_{ij}^k)_{m \times n}$  ( $r_{ij}^k = [r_{ij}^{kL}, r_{ij}^{kU}]$ ). All the attribute values are in the range of [0, 1], and the normalization method involves putting the low index (cost index) into high index (benefit index), that is to say, the bigger the value, the better.

### 3.1.2 Determine the weights of evaluators

When assembled, the opinion of evaluators, in addition to considering importance of individuals in the group and the similarity of views from individuals and other members of a group, is also an aspect of the important degree of evaluation and decision. Not only we should respect the authority of individuals but also we should take care of consistency of the opinions from the evaluation group.

Because of the evaluation attributes after standardization, all values under subjective evaluation attribute are converted into interval [0, 1]. So we can use similarity of Vague fuzzy set to calculate the similarity  $S_{ij}(e_k, e_x)$  of between views from any two evaluators  $e_k$  and  $e_x$ :

$$S_{ij}(e_k, e_x) = 1 - \frac{|r_{ij}^{kL} - r_{ij}^{xL}| + |r_{ij}^{kU} - r_{ij}^{xU}|}{2} \quad (4)$$

By using the similarity of views from evaluator  $e_k$  and all the other evaluation personnel, we can calculate the average similarity  $AS_{ij}(e_k)$  of the evaluator opinion in the group:

$$AS_{ij}(e_k) = \frac{1}{K-1} \sum_{\substack{x=1 \\ x \neq k}}^K S_{ij}(e_k, e_x) \quad (5)$$

Then, by using average similarity of views from all the evaluators, we can calculate the relative similarity  $RS_{ij}(e_k)$  of views from evaluator  $e_k$  in the group:

$$RS_{ij}(e_k) = \frac{AS_{ij}(e_k)}{\sum_{x=1}^K AS_{ij}(e_x)} \quad (6)$$

Considering the authority of the individual and similarity of evaluation from individual and group, we can get individual comprehensive important degree based on the evaluating value of evaluator  $e_k$  about candidate  $a_i$  under the evaluating attribute  $c_j \in c_s$ :

$$w_{ij}(e_k) = t \cdot w_k^i + (1-t) \cdot RS_{ij}(e_k) \quad (7)$$

In the formula 7,  $t$  represents decision preference coefficient, and  $0 \leq t \leq 1$ : The bigger is on behalf of decision makers tending to the authority of the individual; the less is on behalf of decision makers tending to the opinion of the whole evaluation group.

### 3.1.3 Concentrating of evaluation opinions

When concentrating individual opinion, evaluation value of each individual under the subjective evaluation attribute is assembled into a comprehensive evaluation opinion about the plan, and we should consider the importance of the individual in the process of gathering. After the earlier steps, the decision-making matrix of all evaluation personnel has been standardized as  $R^k = (r_{ij}^k)_{m \times n}$ , and has calculated weight  $w_{ij}(e_k)$ , which is each evaluator  $e_k$  for the candidate  $a_i$  under evaluation attributes  $c_j$ . By using the following aggregation method, we get the evaluation value  $r_{ij}$  of evaluated groups for program  $a_i$  under the subjective evaluation attribute  $c_j$ :

$$r_{ij} = \sum_{k=1}^K w_{ij}(w_k) \cdot r_{ij}^k \quad (8)$$

After processing of the earlier steps, decision-making matrixes of all personnel evaluation are assembled into a group decision-making matrix.

In the matrix, evaluation value of subjective attributes is interval numbers on  $[0, 1]$ , and value of objective attributes is a precise number on  $[0, 1]$ .

### 3.2 Solving method based on group's ideal solution

After completing aggregation of evaluators' views, the evaluation value of each solution set of the group decision-making matrix under each attribute carried out the empowerment process, and we get decision-making matrix empowered  $Z = (z_{ij})_{m \times n}$ :

$$z_{ij} = v_j \cdot r_{ij} = [v_j r_{ij}^L, v_j r_{ij}^U] + z_{ij} = v_j \cdot r_{ij} = v_j r_{ij} \quad (9)$$

Because the value under the objective attributes is a precise number, under the subjective attributes we have interval numbers. In order to calculate the unification, objective attribute values will be rewritten in the form of interval numbers by using the definition 1 when calculating, where the numbers of the upper and lower interval are equal and form is  $[z_{ij}, z_{ij}]$ . Then, we calculate the similarity between each scheme and ideal scheme using TOPSIS methods. As a result of the decision-making matrix, standardization is to low index into high index, calculation methods of the decision-making matrix of the standardization based on group ideal solution are as follows:

Under the attribute  $c_j$ , positive ideal solution is  $Z_j^*$ :

$$Z_j^* = [z_j^{*L+}, z_j^{*U+}] = [\max_i z_{ij}^L, \max_i z_{ij}^U] \quad (10)$$

Under the attribute  $c_j$  negative ideal solution is  $Z_j^*$ :

$$Z_j^* = [z_j^{*L-}, z_j^{*U-}] = [\min_i z_{ij}^L, \min_i z_{ij}^U] \quad (11)$$

Then calculate the distance between each scheme and the positive and negative ideal solution according to definition 3:

$$s_{ij}^+ = \sqrt{\sum_{k=1}^K (d_{ij}^{k+})^2} \cdot d_{ij}^{k+} \quad (12)$$

$$= \sqrt{\frac{1}{2} \left( |z_{ij}^L - z_j^{*L+}|^2 + |z_{ij}^U - z_j^{*U+}|^2 \right)}$$

$$s_{ij}^- = \sqrt{\sum_{k=1}^K (d_{ij}^{k-})^2} \cdot d_{ij}^{k-} \quad (13)$$

$$= \sqrt{\frac{1}{2} \left( |z_{ij}^L - z_j^{*L-}|^2 + |z_{ij}^U - z_j^{*U-}|^2 \right)}$$

Finally, calculate relatively close to alternative and positive ideal solution:

$$S(a_i) = \frac{s_{ij}^-}{s_{ij}^+ + s_{ij}^-} \quad (14)$$

On the basis of  $S(a_i)$ , from big to small to rank alternatives,  $S(a_i)$  is larger, and it is the more optimal.

## 4 EXAMPLE OF ALGORITHM AND ANALYSIS

Assuming that evaluation indexes for the job are  $C = \{ \text{thinking ability, team spirit, communication skills, , professional knowledge} \} = \{C_1, C_2, C_3, C_4\}$ , the thinking ability, team spirit, and communication skills are subjective efficiency index, professional knowledge is objectivity efficiency index, the evaluators are  $E = \{e_1, e_2, e_3, e_4\}$ , weight of index is  $[0.3, 0.3, 0.3, 0.1]$ , weight of evaluators is  $[0.2, 0.2, 0.3, 0.3]$ , and candidates are  $a_1 \sim a_3$ , the evaluation result of four evaluators for three candidates is shown in [table 1](#):

Table 1. Evaluation result of candidates.

Evaluators	Candidate	C <sub>1</sub>	C <sub>2</sub>	C <sub>3</sub>	C <sub>4</sub>
e <sub>1</sub>	a <sub>1</sub>	[5,6]	[4,6]	[6,8]	80
	a <sub>2</sub>	[4,6]	[5,6]	[7,8]	72
	a <sub>3</sub>	[4,7]	[6,6]	[6,7]	78
e <sub>2</sub>	a <sub>1</sub>	[3,5]	[4,5]	[6,8]	80
	a <sub>2</sub>	[5,7]	[5,7]	[4,6]	72
	a <sub>3</sub>	[5,6]	[3,5]	[5,7]	78
e <sub>3</sub>	a <sub>1</sub>	[4,7]	[5,8]	[5,6]	80
	a <sub>2</sub>	[5,6]	[4,7]	[4,5]	72
	a <sub>3</sub>	[6,7]	[5,7]	[5,5]	78
e <sub>4</sub>	a <sub>1</sub>	[6,8]	[4,8]	[5,7]	80
	a <sub>2</sub>	[5,6]	[6,7]	[5,6]	72
	a <sub>3</sub>	[5,7]	[5,6]	[4,6]	78

We carried out standardization in accordance with the formula 1–3; the decision-making matrix of standardization is shown in [table 2](#):

Table 2. Specification table of candidate evaluation views.

Evaluator	Candidate	C1	C2	C3	C4
e <sub>1</sub>	a <sub>1</sub>	[0.4,0.6]	[0.2, 0.6]	[0.5, 1]	1.0
	a <sub>2</sub>	[0.2,0.6]	[0.4, 0.6]	[0.75, 1]	0.0
	a <sub>3</sub>	[0.2,0.8]	[0.6, 0.6]	[0.5, 0.75]	0.75
e <sub>2</sub>	a <sub>1</sub>	[0.0,0.4]	[0.2, 0.4]	[0.5, 1.0]	1.0
	a <sub>2</sub>	[0.4,0.8]	[0.4, 0.8]	[0.0, 0.5]	0.0
	a <sub>3</sub>	[0.4,0.6]	[0.0, 0.4]	[0.25, 0.75]	0.75
e <sub>3</sub>	a <sub>1</sub>	[0.2,0.8]	[0.4, 1.0]	[0.25, 0.5]	1.0
	a <sub>2</sub>	[0.4,0.6]	[0.2, 0.8]	[0.0, 0.25]	0.0
	a <sub>3</sub>	[0.6,0.8]	[0.4, 0.8]	[0.25, 0.25]	0.75
e <sub>4</sub>	a <sub>1</sub>	[0.6,1.0]	[0.2,1.0]	[0.25, 0.75]	1.0
	a <sub>2</sub>	[0.4,0.6]	[0.6, 0.8]	[0.25, 0.5]	0.0
	a <sub>3</sub>	[0.4,0.8]	[0.4, 0.6]	[0.0, 0.5]	0.75

Then, let us assume decision-making preference coefficient  $t = 0.5$ ; we calculated the weight of each evaluation personnel under a different subjective attribute, according to the formula 4–7; the result is shown in table 3.

Table 3. Subjective attribute evaluation weight table.

	$w_1$	$w_2$	$w_3$	$w_1$	$w_2$	$w_3$	$w_1$	$w_2$	$w_3$
$e_1$	0.2375	0.2204	0.2225	0.2304	0.2225	0.2278	0.2284	0.1776	0.2214
$e_2$	0.2125	0.2204	0.2225	0.2196	0.2324	0.2056	0.2284	0.2466	0.2357
$e_3$	0.2875	0.2796	0.2725	0.2696	0.2725	0.2778	0.2649	0.2793	0.2714
$e_4$	0.2625	0.2796	0.2824	0.2804	0.2725	0.2889	0.2784	0.2966	0.2714

$w_{ij}$ , candidates' subjective attribute;  $i$ , Candidate sequence number;  $j$ , Subjective attribute sequence number.

Using the formula 8–9 to rally empowerment for evaluation matrix, the decision-making matrix of empowerment is shown in table 4:

Table 4. Decision-making matrix.

Candidate	C1	C2	C3	C4
$e_1$	[0.0930, 0.2160]	[0.0762, 0.2328]	[0.1093, 0.2394]	0.1000
$e_2$	[0.1068, 0.1932]	[0.1200, 0.2266]	[0.0622, 0.1557]	0.0000
$e_3$	[0.1236, 0.2268]	[0.1090, 0.1843]	[0.0713, 0.1639]	0.0750

Then, using formula 10–14 to calculate the distance between each scheme and the ideal scheme, we get  $s(a1) = 0.7667$ ,  $s(a2) = 0.2629$ ,  $s(a3) = 0.5364$ ,  $s(a1) > s(a2) > s(a3)$ . So, the candidate a1 is the best solution.

## 5 CONCLUSION

Talents play a vital role in the management and development of the enterprise of human resources management. In order to achieve competitive advantage by the human resource, the success of personnel selection is duty bound to become one of the key factors of enterprises to thrive. In this article, starting from the practice of personnel selection, in order to solve the plight of the personnel selection, we put forward the decision-making model for personnel selection, which is combined with the interval multi-attribute group decision-making model and interval-valued fuzzy number. The model has a solid theory and a clear and concise algorithm. In order to guarantee the feasibility and reliability of the model, the model based on the multi-attribute group decision theory

fully absorbs the theoretical research results into the interval numbers, and at the end of this article, a personnel selection example is given to illustrate the process of solving the model.

In this article, the model is established based on interval fuzzy number and multi-attribute group decision making; it mainly discussed how to calculate the similarity of evaluation and the individual weight and was assembled to solve the decision matrix. However, personnel selection is an extremely complex decision-making process; sometimes, it cannot be finished at once and requires multiple phase-loop iteration. There is an internal connection in different stages of the decision-making method of phases. Therefore, the proposed model in the stages of decision making is a direction worth studying in the future.

## ACKNOWLEDGMENT

In this article, the research was sponsored by a major social problems investigation project of the United Front Work Department of the CPC Shanxi Provincial Committee in 2013.

## Research on the construction of electronic information engineering characteristic specialty

Bin Guo, Xue Mei Bai & Guang Yang

College of Electronics and Information Engineering, Changchun University of Science and Technology, Changchun, Jilin, China

**ABSTRACT:** Beginning from the connotation of electronic and information engineering specialty, this article combines the characteristic specialty construction with the excellence personnel training plan and discusses the consistency between the characteristic specialty construction and outstanding professional talents training in mutual promotion and supplementing each other. The construction of the specialty should take the outstanding talents training as the final goal to strengthen the characteristic construction of specialty and deepen the reform of the teaching system and practical teaching methods, all of which will play a great promoting role in the undergraduate teaching.

**KEYWORDS:** characteristic specialties; practical teaching; excellence engineering training; specialty construction.

### 1 CONNOTATION OF ELECTRONIC AND INFORMATION ENGINEERING SPECIALTY

The major of electronic and information engineering is a dominant and characteristic specialty in Changchun University of Science and Technology, and it is also the defense specialty approved together by the State Commission of Science and Technology for National and Ministry of Education, which has distinct characteristics in digital image processing, embedded systems, microcontroller, and other applications. Specialty construction must establish the clear personnel training goals, reasonable scientific personnel training program, and distinctive curriculum system (Shen,2010).

Our electronic and information engineering major is to develop students' practical ability and innovation as the core starting point, adhere to integrating the theory teaching with the practice teaching, integrate engineering training with the curriculum experiments, integrate innovation experiments with scientific research, and focus on the transformation knowledge imparting ability and quality cultivation. Teaching students according to their aptitude and personalized credit training programs are employed to further update teaching concepts and clarify reform ideas and the three-level experimental platforms of foundation, profession, and research are strengthened to improve the innovation system and the innovation bases. We try to create a first-class teaching and learning

environment and improve the quality of teaching to cultivate application, adaptive, innovative talents for building goals.

There are three professional models in the specialty of electronic and information engineering, and they are the intelligent embedded system model, sensor network technology application model, and photoelectric detection models.

### 2 EXCELLENT PROFESSIONAL TRAINING GOALS

#### 2.1 Excellence engineers education

Excellence Engineers Education Training Program is a major reform project that is used to implement the Long-term Education Reform and Development Plan (2010-2020) and Long-term Talent Development Plan (2010-2020). It is also a major initiative to promote engineering education by major powers toward engineering education powers. Its aim is to train a number of various types of high-quality engineering and technical personnel with powerful innovative ability and adaptive ability for socioeconomic development while serving for the stratagem strong country with talent. It will improve the higher education for the social needs, and it has an important demonstration and guidance for improving the quality of engineering education personnel training (Li, 2011).

## 2.2 Outstanding talent

Excellence engineers are the requirements and planning for the technical personnel in the engineering applications. However, the professional technical personnel training in institutes and universities of engineering should also be attributed to the outstanding talent training objectives and the training objectives and implementation should be based on it. The electronic and information engineering major in our university integrates the education of knowledge, ability, quality, and innovation into a coherent whole. Humanistic education is the basis, the professional education and applied education is the platform, the cultivation of practical ability, innovation, entrepreneurship, and system comprehensive capabilities is the core, and the training mode is to cultivate the talents with thick foundation, wide profession, more practice, high quality, and comprehensive ability. The aim is to train students with the basics of electronic technology and information systems, with integrated skills with strong electronic system design, analysis, and solving problems and the students will be qualified for the advanced engineering technology and management personnel engaged in all kinds of electronic and information technology research, design, and manufacture industry.

## 3 IMPLEMENTATION SCHEME FOR SPECIALTY CONSTRUCTION AND OUTSTANDING PERSONNEL TRAINING

### 3.1 Teaching system's reform and optimization

The teaching system is dominant and critical during the specialty construction, and the teaching system should be reasonable and guided by the scientific and perfect teaching ideas. Under the guidance of innovative talents training objectives, we put the practical teaching and theoretical teaching into the same curriculum teaching system to achieve the coordination between practical teaching and theoretical teaching and multi-ability training, in accordance with the models of connections between theory and practice, curricular and extra-curricular, and campus and off-campus (Ye, 2012). Professional excellence personnel training's requirements for practical teaching is consistent with the objectives and implementations of the innovative personnel training. Electronic and information engineering major focuses on the combination between theory teaching and experiment teaching in the teaching system construction and puts the experimental teaching in an important position. Teachers carry out both theoretical and experimental teaching to break the teaching limits between theoretical teaching and experimental teaching. The appropriate experimental outlines are developed

based on professional characteristics, and the experimental course is divided into a five-knowledge system such as sensor technology, image processing, microcontrollers and digital signal processor applications, embedded systems, and optical information processing according to the course nature and inter-related relationships, which effectively promoted the resource optimization during the convergence process among different experimental curriculums.

### 3.2 Improving practical teaching at all levels

Generally speaking, there are three levels of practical teaching. The first level is the basic practice teaching. The training objective is intended to cultivate the basic practical ability; the core is to cultivate the basic knowledge, experimental methods, and skills; and the key is to broaden the knowledge and comprehensively improve the basic experimental ability. It focuses on mastering basic instruments and device performance, basic experimental skill and methods to deepen the understanding of the related theory and techniques.

The second level is the advanced practical teaching. Its objective is to cultivate the comprehensive knowledge, practical methods, and practical skills and the key is to cultivate students' comprehensive experimental ability. It focuses on comprehensive ability and overall quality of design, integration, and testing to improve students' integrated design capabilities at circuit level and the application development capabilities at system level.

The third level is the technological innovation practice teaching. Its objective is to cultivate the personnel with innovative spirit and practical ability and its core is to cultivate the engineering practice capabilities, innovation capabilities, and exploration spirit to highlight the optical characteristics, train the innovative talents, and comprehensively improve the quality of students' science and technology. More independent choices are provided to students through skill training, integration of curriculum design, experimental teaching, scientific research, and other practical teachings, which will encourage students to develop expertise and personality, to stimulate the formation of students' innovative ability.

Our school has established a campus practice teaching base. Establishing campus practice teaching base is complementary with a variety of functions, and the campus practice teaching base is a training base that is used to improve students' engineering skills and innovative ideas (Jiang, 2012). Theoretical training and research innovative experiments can be implemented in a campus practice teaching base to complement innovative practice teaching. The theoretical training mainly focuses on the operating principles, analysis, and design of basic devices and basic circuit, which is an extension and deepening of the normal classroom

teaching. Innovative research experiments aimed at all kinds of national and provisional competitions, such as Undergraduate Electronic Design Contest and some competitions organized by our university. The competitions are carried out at different levels with different targets.

### 3.3 *Highlighting the characteristics of professional direction*

Electronic and information engineering specialty of our university inherited photoelectric characteristics of Changchun University of Science and Technology. It has formed stable and distinctive research directions in the field of digital image processing, embedded systems technology application, and sensor technology application relying on Electronic Technology Research Institute, Electronic Technology Innovation Base, and Electronic and Information Engineering Characteristics Laboratory. Currently, electronic and information engineering specialty has the support of some key national research projects in every specialty direction and this research greatly contributed to professional laboratory building. Meanwhile, the theoretical research of the cutting-edge subjects and research practice have trained teachers and created good teaching and experimental conditions for the development of electronics and information engineering specialty.

## 4 CONCLUSION

Any professional construction should be based on the established ideal target as a starting point. Building characteristic professionalism should highlight the features and in the meantime, the professional excellence personnel training should be the ultimate goal. The major construction must be consistent with the excellence objectives of the personnel training and only in this way can the characteristic professionalism take advantage of the quality of undergraduate teaching and the training of personnel can be improved.

# Research on measuring the corporate default willingness based on prospect theory

Xu Dong Lin & Lin Cheng & Dan Dan Zeng

College of Management, Shenzhen University, Shenzhen, Guangdong, China

**ABSTRACT:** Based on prospect theory, we have measured three main factors of affecting corporate default willingness and established the simulation model to calculate them. As a result, with the change of reference point of three main factors, that is, degree of government regulation and penalties, and default rate of enterprises, the corporate default willingness will be altered accordingly. What is more, function curve of corporate default willingness is nonlinear and complex. Finally, we briefly analyzed reasons for these results.

**KEYWORDS:** prospect theory; default willingness; reference point; simulation model.

## 1 INTRODUCTION

Corporate default is affected not only by its financial status but also by its willingness. We should measure corporate default willingness and understand the influence factors of default willingness, which will be conducive to preventing the occurrence of default events. This article puts forward three main factors that affect corporate default willingness, then measures each influence factor based on prospect theory, and establishes simulation model to calculate corporate default willingness. The purpose is to explore the intrinsic relation between three influencing factors and corporate default willingness, further getting the internal mechanism between three factors and the default willingness.

From the view of prospect theory, corporate default or not, it does not depend on the status of absolute return but depends on its relative gains<sup>[1]</sup>. Besides, the external environment of enterprises will affect default willingness, such as government regulation, other corporate defaults, and so on<sup>[2, 3]</sup>. In detail, we could inspect it from the following three aspects.

First, the corporate default willingness does not depend on their own absolute gains and losses of operating conditions, but instead relies on relative gains and losses under a reference point<sup>[4]</sup>. It is highlighted that different enterprises may have a different reference target. For example, the level of gains may be selected as a reference point under performance situation or under default situation. Second, corporate default willingness will be inevitably affected by the government regulation<sup>[5]</sup>. However, in terms of regulatory costs, government needs to pay a high cost if every enterprise is to be regulated. Therefore, the strategy of government regulation usually is as follows: When there is a certain percentage of the

corporate default, the government begins to regulate the enterprises and punishes the enterprise that has been found to default, including direct or indirect financial penalties. Third, companies default willingness may also be affected by other enterprises' default behavior<sup>[6]</sup>, such as enterprise community in the same area, or enterprises in the supply chain upstream and downstream. It is often that default behavior of an enterprise leads to default occurrence of the associated enterprise. In the same way, a different enterprise may have a different default threshold at heart. For example, when corporate default rate of community is 20%, an individual enterprise within the community may choose to default, or when corporate default rate of the community is 50%, an individual enterprise chooses to default.

## 2 THE MODEL

Based on the earlier analysis, we put forward three main factors that affect corporate default willingness, namely their relative gain and loss situation, other corporate default situation, and government regulate situation, then establish a simulation model of corporate default willingness based on prospect theory. The three influence factors and corresponding strategies are shown in [table 1](#).

Among them, factor 1 is relative gains and losses, factor 2 is government regulation, factor 3 is other enterprises default,  $s$  is strategy,  $R$  is the return rate of enterprise,  $r$  is the loan interest rate,  $p_1$ ,  $p_2$ , and  $p_3$  are three reference points of factors, respectively,  $w_1$ ,  $w_2$ , and  $w_3$  are effect weight of factors, respectively,  $P$  is the fine if being captured default, and  $d$  and  $D$  are corporate default rate of the community.

Table 1. Three influence factors and corresponding strategies.

Factors	$s_1$ : no default	$s_2$ : default	$p$	$w$
Factor 1	$R-r$	$R$	$p_1$	$w_1$
Factor 2	0	$-P$	$p_2$	$w_2$
Factor 2	0	0	$p_2$	$w_2$
Factor 3	$d$	$D$	$p_3$	$w_3$

Assuming that an enterprise within enterprise community has performance ability, it depends on its default willingness regardless of whether default or not. Based on that, under the framework of prospect theory and combined with the table mentioned earlier, we will give the method that measures the three main factors.

### 2.1 Effect of relative gain and loss

If the enterprise does not choose to default, namely performance, then its relative gain and loss is difference value between profitability and interest costs, denoted by  $O_1=R-r$ . If  $O_1 - p_1 \geq 0$ ; then, the performance value caused by relative gain and loss is  $Ov_1 = (O_1 - p_1)^\alpha$ . If  $O_1 - p_1 < 0$ , then  $Ov_1 = -\lambda(p_1 - O_1)$ . If the enterprise chooses to default, then its relative gains and losses is the return rate, denoted by  $own_2=R$ . If  $O_2 - p_1 \geq 0$ , then the default value caused by relative gain and loss is  $Ov_2 = (O_2 - p_1)^\alpha$ . If  $O_2 - p_1 < 0$ , then  $Ov_2 = -\lambda(p_1 - O_2)^\beta$ .  $p_1$  is the reference point of measurement of relative gain and loss that the enterprise chooses.

### 2.2 Effect of government regulation

If government finds that the enterprise defaults, then it will be fined  $P$ ; there is no punishment if the government does not find the enterprise to default, and then the government's revenue is zero. If the enterprise does not default, then it will not be punished. Regardless of whether there is government regulation or not, the government's revenue is zero at the same.

In detail, if the enterprise does not choose to default, then the fine caused by government regulation is  $G_1=0$ . If  $G_1 - p_2 \geq 0$ , then the performance value caused by government regulation is  $Gv_1 = (G_1 - p_2)^\alpha$ . If  $G_1 - p_2 < 0$ , then  $Gv_1 = -\lambda(p_2 - G_1)^\beta$ . If the enterprise chooses to default, then there are two situations: One is no being caught, then the fine caused by government regulation is  $G_{21}=0$ . If  $G_{21} - p_2 \geq 0$ , then

the default value caused by government regulation is  $Gv_{21} = (G_{21} - p_2)^\alpha$  in the situation of not being caught. If  $G_{21} - p_2 < 0$ , then  $Gv_{21} = -\lambda(p_2 - G_{21})^\beta$ . The other

one is being caught and fined  $P$ , then the fine caused by government regulation is  $G_{22}=-P$ . If  $G_{22} - p_2 \geq 0$ , then the default value caused by government regulation is  $Gv_{22} = (G_{22} - p_2)^\alpha$  in the situation of being caught. If  $G_{22} - p_2 < 0$ , then  $Gv_{22} = -\lambda(p_2 - G_{22})^\beta$ .

Therefore, the default value caused by government regulation is  $Gv_2 = (1-D) \cdot Gv_{21} + D \cdot Gv_{22}$ .  $p_2$  is the punished reference point that the enterprise set under government regulation.

### 2.3 Effect of other enterprises' default

If the enterprise does not choose to default, the rate of corporate default is denoted by  $E_1=d$  within the corporate community. If  $E_1 - p_3 \geq 0$ , then the performance value caused by other enterprises' default is  $Ev_1 = (E_1 - p_3)^\alpha$ . If  $E_1 - p_3 < 0$ , then  $Ev_1 = -\lambda(p_3 - E_1)^\beta$ . If the enterprise chooses to default, the rate of corporate default is denoted by  $E_2=D$  within the corporate community. If  $E_2 - p_3 \geq 0$ , then the default value caused by other enterprises' default is  $Ev_2 = (E_2 - p_3)^\alpha$ . If  $E_2 - p_3 < 0$ , then  $Ev_2 = -\lambda(p_3 - E_2)^\beta$ .

### 2.4 Measure the default willingness

The performance value of Strategy  $s_1$  is:

$$Perv = w_1 \cdot Ov_1 + w_2 \cdot Gv_1 + w_3 \cdot Ev_1 \quad (1)$$

The default value of Strategy  $s_2$  is:

$$Defv = w_1 \cdot Ov_2 + w_2 \cdot Gv_2 + w_3 \cdot Ev_2 \quad (2)$$

Among them,  $w_1+w_2+w_3=1$ .  $Perv$  is performance value,  $Defv$  is default value.

It shows that the default willingness depends on the difference value between performance value and default value. When performance value is greater than default value, corporate performance willingness is larger, or corporate default willingness is larger. In order to facilitate discussion, let us take 0.5 as cutoff point of willingness size. Therefore, corporate default

willingness = 0.5+ (default value - performance value), namely:

$$\text{Default will} = 0.5 + (\text{Defv} - \text{Perv}) \quad (3)$$

### 3 SIMULATION RESULTS AND ANALYSIS

In the simulation model, for the value of the prospect theory value function parameters, in order to match the actual situation in China, we adopt the recommendations of Jianmin Zeng<sup>[7]</sup> to take  $\alpha = 1.21, \beta = 1.02, \lambda = 2.25$ . To be realistic, we set  $R=0.2$  and  $r=0.1$ . While keeping the other parameters constant, we change the value of the parameter  $p_1, p_2, p_3, d, D,$  and  $P,$  respectively, to explore the law of the performance value and default values as they change, then to get the function curve of default willingness. All the cases of the simulation models are completed in Matlab7.0.

#### 3.1 Situation one

First, we set  $p_2 = -0.1, p_3 = 0.6, d = 0.5, D = 0.7,$  and  $P = 0.1,$  and make  $p_1$  vary from 0 to 1. Then, we can get the simulation results shown in Figure 1. Red indicates default willingness function curves. Blue dashed line indicates default value function curve. Solid blue line represents the performance value function curve.

Figure 1 shows that the performance value curve and default value curve are almost the same downward trend, whereas the default willingness curves exhibit a complex evolution, namely they first increase and then decrease until they are stabilized. When  $p_1$  is 0.2, the default willingness is maximum, and the likelihood of corporate default is greater at this time. This indicates that it has an important effect to guide enterprises establish a reasonable profit view, to reduce willingness defaults. Government, banks, and the community should widely publicize correct profit philosophy, to prevent enterprises from establishing high profitability goals.

#### 3.2 Situation two

Second, we set  $p_1 = 0.1, p_3 = 0.6, d = 0.5, D = 0.7$  and  $P = 0.1,$  and make  $p_2$  vary from -1 to 0. Then, the simulation results are shown in Figure 2.

Figure 2 shows that the performance value curve and default value curve present the opposite trend and default willingness curve increases with  $p_2$

Figure 1. Relationship between default willingness and  $p_1$ .

Figure 2. Relationship between default willingness and  $p_2$ .

increasing. This suggests that it plays a key role in maintaining the government's proper supervision, to prevent the occurrence of an event of corporate default. Once the government's supervision is zero, the punished reference point set by enterprises will be zero, which obviously increases the probability of corporate default.

#### 3.3 Situation three

Third, we set  $p_1 = 0.1, p_2 = -0.1, d = 0.5, D = 0.7$  and  $P = 0.1,$  and make  $p_3$  vary from 0 to 1. Then, the simulation results are shown in Figure 3.

Observing Figure 3, we know that no matter what the value of  $p_3$  is, the default willingness is at a higher position and the variation is relatively small. This indicates that the rate of corporate defaults within the corporate community is an important factor affecting

the corporate default and it must be valued. Therefore, in addition to the assessment of their financial situation, it is very necessary to master the ratio of default within their corporate community business.

Figure 3. Relationship between default willingness and  $p_3$ .

### 3.4 Situation four

Fourth, we set  $p_1=0.1$ ,  $p_2=-0.1$ ,  $p_3=0.6$ ,  $D=0.7$ , and  $P=0.1$ , and make  $d$  vary from 0 to 1. Then, the simulation results are shown in Figure 4.

Figure 4 shows that when companies choose performance, with the number of corporate defaults within the corporate community increasing, performance value increases and the default willingness declines. Because the enterprises have chosen to perform, whereas other companies within the community have chosen to default, it could ensure that enterprises obtain the relative performance gains, and thus their default willingness declines.

### 3.5 Situation five

Fifth, we set  $p_1=0.1$ ,  $p_2=-0.1$ ,  $p_3=0.6$ ,  $d=0.5$ , and  $P=0.1$ , and make  $D$  vary from 0 to 1. Then, the simulation results are shown in Figure 5.

Figure 5 tells us that with the number of defaults within the corporate community increasing, the probability of the enterprise choosing to default increases. The reason is that the corporate default value is gradually improving, and performance value has not changed, which led to a greater willingness of enterprises to select default. We should control the number of corporate defaults within the corporate community, which is conducive to reducing the willingness of corporate default.

Figure 4. Relationship between default willingness and  $d$ .

Figure 5. Relationship between default willingness and  $D$ .

### 3.6 Situation six

Finally, we set  $p_1=0.1$ ,  $p_2=-0.1$ ,  $p_3=0.6$ ,  $d=0.5$ , and  $D=0.7$ , and make  $P$  vary from 0 to 1. Then, the simulation results are shown in Figure 6.

As we can see from Figure 6, when enterprise chooses performance, regardless of government regulation or not, this does not have a substantial impact on the enterprise. When an enterprise chooses to default, it will likely be punished; with the penalties increasing, the probability of default is reduced. Therefore, for the government, if it finds that there is a serious phenomenon of corporate default, punishment should maintain a high level of intensity, so as to reduce the corporate default willingness.

Figure 6. Relationship between default willingness and  $P$ .

#### 4 CONCLUSION

With the change of reference point of the three factors, degree of government regulation and penalties, and the rate of the corporate default, the corporate default willingness will change, and the function curve is nonlinear and complex. The research conclusions are consistent with reality, confirming that the prospect theory could be better closer to reality in the study of corporate default willingness. The results show that, in order to reduce the corporate default willingness, government, banks, and the community should widely promote the correct view of profit to guide enterprises toward establishing a reasonable profit target. Meanwhile, they should understand the rate of corporate default within the corporate community and increase the default penalty intensity of corporate default, to improve the cost of default.

In the analysis process of the three main factors, we do not consider the dynamic change of default willingness and rate of the corporate default within the corporate community. Therefore, we should further excavate and incorporate more factors that affect corporate default willingness and analyze them in a dynamic condition, which is the next step in the research work. In a word, as a powerful tool for explaining individual decision behavior, prospect

theory has been recognized by many theorists. How to apply prospect theory into corporate default willingness combinations will be the focus of future research.

# A novel fruit fly algorithm for solving the parallel test sheet generation problem

Feng Rui Wang

*School of Media and Communications Technology, Liaocheng University, China*

Wen Hong Wang & Jin Xin Dong

*School of Computer Science, Liaocheng University, China*

**ABSTRACT:** This paper presents a novel Fruit Fly Algorithm (FFA) for solving the Parallel Test Sheet Generation (PTSG) problem, which is a NP-hard constrained combinatorial optimization problem. In the FFA, an effective encoding and decoding method is used to represent the solution of the PTSG problem. To enhance the local searching ability of FFA, a new control parameter is introduced to oosphresis food searching operator. Meanwhile, a repair operator is designed to guarantee the feasibility of the solutions. In the experiments conducted on a series of item banks with different scales, the proposed FFA is compared with the popular used Particle Swarm Optimization algorithm (PSO), which demonstrates the effectiveness and the efficiency of the proposed FFA in solving the PTSG problem.

**KEYWORDS:** parallel test sheets generation; fruit fly algorithm; control parameter; computer-aided test.

## 1 INTRODUCTION

In the formal large-scale test, such as national certification tests, parallel test sheets must be composed at the same time to handle emergency event or prevent cheating. Parallel test sheets are a set of test sheets generated according to similar test specifications, which not only paralleled in content but also paralleled in structure. Recently, as the efficiency and effectiveness of computer-based test sheet generation have been confirmed by many early studies, automatic generation of parallel test sheets attracts the attention of many scholars.

The goal of the PTSG problem is to find a subset of test items from the test item bank to compose a series of parallel test sheets, which can meet the user's multiple parallel test sheets assessment requirements (such as number of parallel test sheets, difficulty degree and etc. ) simultaneously. Parallel test-sheet generation (PTSG) is a challenging NP-hard problem with multiple-objective and multiple constraints [1, 2, 3].

For solving this large scale constraint optimization problem, evolutionary algorithms are attractive option for their simplicity and computational efficiency. Automatic test sheet generation has become an important and interesting research issue of computer-aided testing (CAT). However, Most of the existing approaches for test item selection focus on the composition of a single test sheet, such as genetic

algorithm [4], particle swarm optimization [5], Tabu [6]. Little research has been reported about PTSG problem, which is important in the implementation of formal large-scale test.

Recently, a new meta-heuristic optimization method, fruit fly algorithm (FFA), is proposed by PAN in 2011[7, 8], which referring to the food finding behavior of the fruit flies. The advantages of FFA include fewer adjust parameters, simple evolution procedure, easy to understand and implement. At present, it has been applied successfully to solve several practical optimization problems, such as financial distress, multidimensional knapsack problem, analysis of service satisfaction in web auction logistics service, continuous function optimization problems and so on[8,9,10,11]. To the best of our knowledge, the FFA has not been used to solve any computer-aided testing problem, not mention to solve PTSG problem. In this paper, a new approach based on FFA for solving PTSG problem is presented.

## 2 PROBLEM SPECIFICATION FOR PTSG

In the PTSG problem, we assume that there are  $N$  test items in the test item bank  $B = \{Q_1, Q_2, \dots, Q_N\}$ ,  $M$  course-related concepts  $C = \{C_1, C_2, \dots, C_M\}$  to be tested and  $K$  parallel test sheets with specific difficulty degree and similar discrimination need to be

composed out of test item bank  $B$ . In addition, the  $K$  parallel test sheets will involve  $M$  concepts and not include same test items.

### 2.1 Test item attributes and test sheets specification

The variables used in the model are defined as follows.

Num\_id, it is used to store the question identity.

$discr_i$ ,  $1 \leq i \leq N$ : discrimination degree of  $Q_i$ .

$dif_i$ ,  $1 \leq i \leq N$ : difficulty degree of  $Q_i$ .

$time_i$ ,  $1 \leq i \leq N$ : time needed for answering  $Q_i$ .

$relation_{ij}$ ,  $1 \leq i \leq N$ ,  $1 \leq j \leq M$ : degree of association between  $Q_i$  and concept  $C_j$ .

$K$ , number of parallel test sheets that will be composed simultaneously.

$Dif$ , target degree of difficulty for parallel test design.

$h_j$ ,  $1 \leq j \leq M$ : lower bound ratio on the expected relevance of  $C_j$  for each test sheet.

$time_{upper}$ , upper bound on the expected time needed for answering each test sheet.

$time_{lower}$ , lower bound on the expected time needed for answering each test sheet.

$S$ , number of test items that each parallel test sheets must contain.

### 2.2 Problem model

The goal of the parallel test sheets composition is to minimize the following objection function:

$$\text{Min } Z(x) = \alpha \varphi f(x) + \beta \varphi g(x) \quad (1)$$

$$\text{Where } f(x) = \max_{1 \leq k, l \leq K} \left\{ \frac{\sum_{i=1}^N discr_i x_{ik}}{\sum_{i=1}^N x_{ik}} - \frac{\sum_{i=1}^N discr_i x_{il}}{\sum_{i=1}^N x_{il}} \right\} \quad (2)$$

$$g(x) = \frac{1}{K} \sum_{k=1}^K \left| \frac{\sum_{i=1}^N dif_i x_{ik}}{\sum_{i=1}^N x_{ik}} - dif \right| \quad (3)$$

Subject to

$$\frac{\sum_{i=1}^N relation_{ij} x_{ik}}{\sum_{j=1}^M \sum_{i=1}^N relation_{ij} x_{ik}} \geq h_j, 1 \leq j \leq M, 1 \leq k \leq K \quad (4)$$

$$\sum_{i=1}^N time_i x_{ik} \geq time_{lower}, 1 \leq k \leq K \quad (5)$$

$$\sum_{i=1}^N time_i x_{ik} \leq time_{upper}, 1 \leq k \leq K \quad (6)$$

$$\sum_{i=1}^N x_{ij} x_{ik} = 0, 1 \leq j \neq k \leq K \quad (7)$$

$$\sum_{i=1}^N x_{ik} = S, 1 \leq k \leq K \quad (8)$$

This model aims to choose a fixed number of test items so that the maximum difference of discrimination degrees between any pair of the parallel test sheets is minimized and the difficulty degrees of all of the test sheets are the closest to the specified target difficulty. If test item  $Q_i$  is included in the test sheet  $k$ , then the decision variable  $x_{ik} = 1$ , otherwise  $x_{ik} = 0$ .

Constraint (4) guarantees that the selected test items in each generated test sheet must have a degree of relevance no less than the expected degree of relevance to each specified concept. Equation (5) and (6) indicates that total expected test time of each generated test sheet must be in its specified range. Constraint (7) requests that no pair of test sheets can contain any identical test item. Finally, equation (8) ensures that all of the parallel test sheets must contain  $S$  test items.

## 3 FRUIT FLY ALGORITHM FOR PTSG PROBLEM

Inspired by the intelligent foraging behavior of fruit flies in food finding, fruit fly algorithm [7, 8] was proposed to solve global optimization problems. The steps of fruit fly optimization algorithm can be summarized as follows:

**Step 1.** Initialize the parameters of the algorithm, i.e. the fruit fly population size, the maximum number of interactions.

**Step 2.** Initialize fruit fly population location  $X$ -axis and  $Y$ -axis randomly in the search space.

**Step 3.** In osphresis food finding period, generate the fruit fly population randomly around the fruit fly population location.

**Step 4.** Evaluate the smell concentration of each fruit fly. Then find out the best fruit fly with maximum (or minimum) smell concentration among the swarm and record its location in the search space.

**Step 5.** In vision food searching period, refresh the current population location with the best fruit fly location, then make the fruit fly swarm fly toward it.

**Step6.** End the algorithm if the maximum number of interactions is reached; otherwise, go back to Step 3.

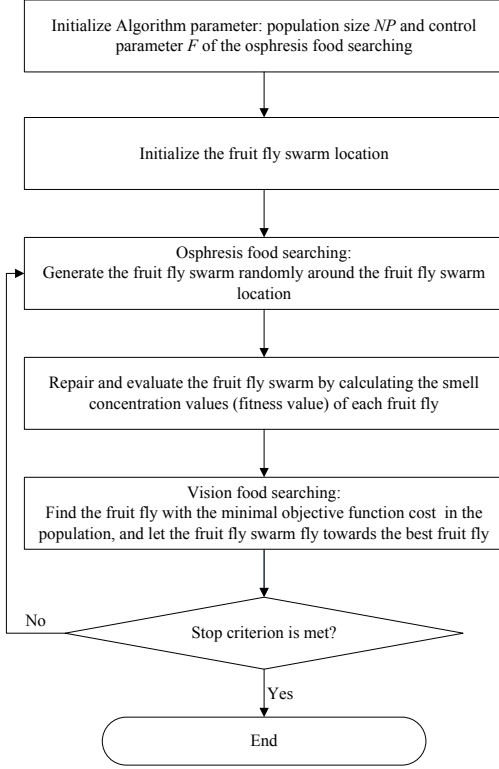

Figure 1. Flowchart of the proposed fruit fly algorithm.

We present a novel fruit fly algorithm to solve PTSG problem, with the following specific design, the flowchart of it is illustrated in Figure 1.

### 3.1 Encoding scheme and population initialization

In the proposed FFA, a fruit fly is used to represent a solution of the PTSG problem. The population of the algorithm is composed of  $NP$  fruit flies and  $NP$  does not change in the evolution. In the  $g$  th generation population, the  $i$  th fruit fly is denoted by two  $D$ -dimensional vectors  $x_i^g = (x_{i,1}^g, x_{i,2}^g, \dots, x_{i,D}^g)$  and  $y_i^g = (y_{i,1}^g, y_{i,2}^g, \dots, y_{i,D}^g)$ . For the pair of vectors  $x_i^g$  and  $y_i^g$ ,  $i = 1, 2, \dots, NP$ , their  $j$  th component  $x_{i,j}^g$  and  $y_{i,j}^g$ ,  $j = 1, 2, \dots, D$  are decision variables of real number in the interval of  $[-\infty, \infty]$ .

In the start of the fruit fly algorithm (the 0th generation), the fruit fly swarm location vectors  $xPosition^0$  and  $yPosition^0$  are initialized, in general, randomly in the search space by

$$xPosition_j^0 = rand(), \quad (9)$$

$$yPosition_j^0 = rand(), \quad (10)$$

where  $j = 1, 2, \dots, D$ ,  $rand()$  is a function to generate random number with outcome  $\in [-\infty, \infty]$ . In addition, the population size  $NP$  and the algorithm control parameter  $F$ , which will be introduced later, are also initialized at first.

### 3.2 Decoding strategy

The basic FFA was designed to solve continuous optimization problems. However, the PTSG problem is a kind of combinational optimization problem, in which each component of the population individual is used to denote an item number of the item bank. To solve the PTSG problem effectively, the devcoding scheme that map a fruit fly to the solution of the PTSG is designed specially in this paper as follows.

**Step1.** The distance vector  $dis_i^g$ , in which each component  $dis_{i,j}^g$  record the distance of point  $(x_{i,j}^g, y_{i,j}^g)$  to the origin point  $(0, 0)$ , is calculated by

$$dis_{i,j}^g = \sqrt{(x_{i,j}^g)^2 + (y_{i,j}^g)^2}. \quad (11)$$

**Step2.** The smell concentration vector  $s_i^g$  corresponding to the distance vector is obtained by

$$s_{i,j}^g = \frac{1}{dis_{i,j}^g}. \quad (12)$$

For the purpose of transforming the smell concentration vector to the solution, each element  $s_{i,j}^g$  of the smell concentration vector is required to be in the range of  $[0, 1)$ . If  $s_{i,j}^g \notin [0, 1)$ , a repair operator given later will be employed so that it is belong to  $[0, 1)$ .

**Step3.** The smell concentration vector  $s_{i,j}^g$  is mapped to the corresponding PTSG problem solution  $tn = (tn_1, tn_2, \dots, tn_D)$  as follows:

$$tn_j = floor(s_{i,j}^g \times itemNum) \quad (13)$$

where  $floor()$  is a function for truncating a floating-point number to a integer,  $itemNum$  is the total test item number in the test item bank.

As each element of  $tn$  represent an item number, the solution  $tn$  is sequentially divided into  $K$  segment

with equal length, in which each sub-segment represent a dependent test-sheet.

### 3.3 Oosphresis food searching with local search

As PTSG is a complex combinatorial optimization problem, the basic FFA has poor local searching ability at the later optimization stage, such that it is hard to find feasible solutions. To tackle this problem, we design a new oosphresis food operator that can balance the global and local search ability. In detail,  $NP$  fruit flies can be yield by

$$x_{i,j}^g = \begin{cases} xPosition_j + (2 \times rand[0,1] - 1), & \text{if } (rand_j[0,1] \leq F) \\ xPosition_j, & \text{otherwise} \end{cases} \quad (14)$$

$$y_{i,j}^g = \begin{cases} yPosition_j + (2 \times rand[0,1] - 1), & \text{if } (rand_j[0,1] \leq F) \\ yPosition_j, & \text{otherwise} \end{cases} \quad (15)$$

where  $i = 1, 2, \dots, NP, j = 1, 2, \dots, D$ ,  $F$  is the algorithm parameter  $\in [0, 1]$  to control the probability that each dimension of a fruit fly is changed by the oosphresis food searching operator.

### 3.4 Vision food searching

In vision food searching, the smell concentration vector corresponding to each fruit fly is evaluated by (1), and the best fruit fly with minimum objective function cost among the population is chosen. Then, the fruit fly population location is updated by the best fruit fly as

$$xPosition^g = x_{bestIndex} \quad (16)$$

$$yPosition^g = y_{bestIndex} \quad (17)$$

where  $bestIndex$  is the index of the best fruit fly in the population.

### 3.5 Repair Operator

As aforementioned, the decoding schema requires that each element  $s_{i,j}^g$  of the smell concentration vector must located in the range of  $[0, 1]$ . If the fruit fly individual cannot satisfy this requirement after oosphresis food searching, a repair operator will be used to alter it until the newly refreshed  $s_{i,j}^g \in [0, 1]$ .

Here, the repair operator is given as

$$x_{i,j}^g = x_{i,j}^g * (1 + rand[0,1]) \quad (18)$$

$$y_{i,j}^g = y_{i,j}^g * (1 + rand[0,1]) \quad (19)$$

Where  $rand[0,1]$  is a function to generate random number in the range of  $[0, 1]$

## 4 SIMULATION EXPERIMENTS RESULTS

To test the performance of the proposed FFA and the improved oosphresis food searching schema, simulation experiments were conducted on a set of item banks with different scales. All algorithms are implemented using C language in Microsoft Windows 2008 server (32bit) operating system on a PC with 2.7GHz CPU, 2G RAM. There are 20 concept topics in each item bank and all the item banks have the same table structure.

The proposed FFA is compared with the basic particle swarm optimization (PSO) algorithm on five different scale item banks firstly. Each algorithm is executed 20 times on each test item bank independently. Three parallel test sheets with sixty test items will be generated at the same time. The parameters of the two algorithms were set empirically in the following. We set  $w = 0.5, c1 = 2.05, c2 = 2.05, MAXV = 1.5$  and  $NP = 20$  for PSO algorithm. For the FFA, we set  $F = 0.05$  and  $NP = 10$ . All algorithms stopped when the fitness value is smaller than 1 or the running time reach 10 minutes.

The comparison of success ratio for two approaches on five item banks is shown in table 1. In table 1, "SR" is the success ratio, which denotes the ratio number of successful runs to that of total runs. According to practical parallel test sheets composition requirements, a run is considered to be successful if it stops after the fitness value of the algorithm is smaller than one, and at the same time the running time is not more than 10 minutes.

Table 1. Margin success ratio of the two algorithms.

Item bank scale	SR	
	PSO	FFA
1000	20%	100%
2000	90%	100%
5000	100%	100%
10000	100%	100%
20000	100%	100%

It can be seen from table 1 that the FFA performs much better than PSO algorithm, especially on small scale item banks. As shown in table 1, in all test cases, the success ratios of the FFA are all 100%. However,

PSO has lower success ratio on small scale item bank, such as on item bank 1000 and 2000, the success ratios of the PSO are 20% and 90%.

The time efficiency of the two compared algorithms running successful on three item banks is given in table 2, which is reflected by the execution time of the algorithm in searching for the optimal solution. The shorter the execution time, the fast the algorithm find the optimal solution. In table 2, “Max”, “Avg”, and “Std” respectively denote the maximum value, average value, and standard deviation of the execution time of algorithms in 20 runs.

Table 2. Execution time results of the two algorithms on various item banks.

Item bank scale	PSO			FFA		
	Max	Avg	Std	Max	Avg	Std
5000	349.74	85.19	99.32	7.36	2.29	2.31
10000	528.28	120.22	167.32	5.67	1.49	1.30
20000	399.12	135.99	151.10	3.84	1.21	0.99

It is clear from table 2 that the FFA turns out to be very competitive in time efficiency compared to PSO algorithm. The execution time results show the high efficiency of the FFA in searching for the optimal solution. For all test cases, FFA could find optimal solutions with the average execution time not more than 3 seconds, while the PSO algorithm will consume 85.19 seconds and more. In addition, the robustness of FFA in term of execution time is implied by the small standard deviation in all cases.

In the second experiment, the FFA and PSO were used to generate two and three parallel test sheets respectively and simulated on an item bank with scale 10000. Each algorithm is executed 20 times on each test sheet specification. The stopping criterion is the same with experiment one. The experimental results are given in table 3, in which “NOPTS” denote the number of parallel test sheets, “Max”, “Avg”, and “Std” respectively denotes the maximum value, average value, and standard deviation of the execution time of algorithms in 20 runs.

Table 3. Experiment results on the specified number of parallel test sheets.

NOPTS	PSO			FFA		
	Max	Avg	Std	Max	Avg	Std
2	18.45	11.75	6.47	0.34	0.13	0.09
3	528.28	120.22	167.32	5.67	1.49	1.30

It can be observed from table 3 that the FFA has superior computational performance than PSO in terms of the average value and the standard deviation of the execution time when generating two or three parallel test sheets simultaneously. In addition, the average execution time of the two compared algorithms will both increase when the number of parallel test sheets grows. The reason lies in the following factors. The dimension of the decision variable will increase when the number of parallel test sheets grows. Furthermore, according to PTSG problem model, all the parallel test sheets should have no item overlap and meet every other constraint, which will increase the computational complexity of the algorithm drastically.

We further conduct  $F$  parameter analysis of the FFA. The convergence curves based on different values of  $F$  are shown in Fig. 2. It is obvious that parameter  $F$  has significant influence on the convergence of the FFA. From Fig. 2, we can see that the parameter  $F$  with smaller values, by which less dimensions of a fruit fly vector are changed around the swarm location, can balance the global and local search ability of the algorithm effectively.

Figure 2. The influence of the control parameter  $F$  to the FFA.

## 5 CONCLUSION

To the best of our knowledge, this was the first reported work of using fruit fly optimization to solve the PTSG problem in CAT systems. A new control parameter is introduced to osphesis food searching, which can balance the algorithm’s global and local searching ability effectively. Besides, one repair operator is designed to accelerate the searching for the feasibility of solutions. The effectiveness of the proposed algorithm was demonstrated by several experiments conducted on a series of item banks with different scales.

## Discussion on promoting the development of multi-interdisciplinary research in the new type of research institutes

Ying Zhou, Ye Li, Jie Feng Chen, Quan Liao & Hui Xue Song

*Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences, Shenzhen, China*

**ABSTRACT:** Promoting the development of multi-interdisciplinary research has important significance for the level of discipline construction and effective competitiveness model of the new type of research institutes. By the science and technology management system and the influence of organizational system of single subjects, at present, the development of multi-interdisciplinary research on the new type of research institutes face a lot of difficulties and obstacles. A pressing matter of the moment is to be referred to a strategic height of the development of multi-interdisciplinary research, increase the multi-interdisciplinary research support, regulate the establishment of cooperative research unit multi-interdisciplinary innovation mechanism, set up a special multi-interdisciplinary academic committee, establish scientific and reasonable evaluation system, build a platform for academic exchanges and multi-interdisciplinary talents training base, construction of the management and operation mechanism of diversification.

**KEYWORDS:** The new type of research institutes; Multi-interdisciplinary; Collaborative innovation; Operation mechanism.

### 1 INTRODUCTION

The rapid development of economy of science and technology, requirements to break the discipline between compartmentalization, promotes interdisciplinary integration. The importance of multi-disciplinary winner who has been clearly confirmed in Nobel award. Some scholars have knowledge background of 466 Nobel Natural Science Award in twentieth Century 100 years were investigated, to 25 years for a period of time, the number of knowledge has cross background in the twentieth Century, and the second largest increase in 25 years, rising from 29.73% to 42.5%; 60, 70 years after the adjustment, in recent years, a ratio of Nobel Prize laureates with cross knowledge background rose to 49.07% at the end of the century. Proposed collaborative innovation thought, opened the way for the multi-interdisciplinary development, the establishment of cooperative innovation system between government, universities and research institutes, enterprises can effectively promote the development of multi-interdisciplinary, this new type of research institutes in the establishment and development process has been verified. Therefore, it has important practical significance to promote multi-interdisciplinary research, development model of the new type of research institutes.

### 2 THE ORIENTATION AND DEVELOPMENT CHARACTERISTICS OF THE NEW TYPE OF RESEARCH INSTITUTES

The new type of research institutes refers to a group of aiming at the international forefront, gathering the international top talent and team, has the international first-class R & D conditions and the level of innovation platform, to support the leading strategic emerging industry development as the goal, set science and technology innovation and industrialization in one, master discourse right of the development of new industries and industry. From the division of system mechanism, the new type of research institutes can be divided into “state-owned new system”, “governmental support”, “corporate and union founded”. This paper mainly discusses the “state-owned new system” model of the new type of research institutes, the typical representatives: Shenzhen Research Institute of Tsinghua University, Shenzhen Institutes of advanced technology, Chinese Academy of Sciences. Though this new type of scientific research institutes to build by the traditional colleges and universities, scientific research institutes or local government, its nature is the state-run institution, but Dean of the Council under the leadership responsibility system, adopt the entire staff appointment system, take new management and operation mechanism, through competition and

scientific research strength for government research funding, do technical services for enterprises, incubate high growth enterprises of science and technology, become an important platform for extension of technology and industrialization of colleges and universities and scientific research institutions.

This new type of research institutes take promoting scientific research achievements transformation as the goal guidance, the main characteristics of the development are:

With the interdisciplinary feature, reflect the multi- interdisciplinary features in the main research fields and institutions, by establishing a public technology platform to support enterprise incubator and promote multidisciplinary, lead strategic emerging industry development.

Use the Production - Learning - Research - Funding “four in one” synergic development mode. Use mainly in scientific research, micro collaborative innovation development mode of education, industry, capital supplement to create a first-class international research institutes.

Attention to the introduction and cultivation of talents. Pay attention to team construction, intensify the introduction of high-level innovative and entrepreneurial talents from overseas, pay attention to build from basic research to industry and then to the commercial promotion of comprehensive team.

### 3 THE PRESENT SITUATION AND PREDICAMENT OF MULTI-INTERDISCIPLINARY DEVELOPMENT OF THE NEW TYPE OF RESEARCH INSTITUTES

#### 3.1 *For emerging industries of strategic importance, in multi-interdisciplinary features of institutional settings*

The institutional setting of new research institutes face the strategic emerging industry, exert the comprehensive scientific research institutions and public R & D service platform function, reflected multi-interdisciplinary characteristics. For example, Shenzhen Research Institute of Tsinghua University built the four major research institutes and the public research and development platform involve electronic information technology, optical electromechanical and advanced manufacturing, new materials and biomedicine, new energy and environmental protection technology, has become a model of high-tech business incubator. Shenzhen Institutes of advanced technology, Chinese Academy of Sciences establish the “three breakthrough” – low-cost health and high-end medical imaging, service robots, electric cars. And the “five breeding” – CIGS thin film solar cell equipment and technology, large data and wisdom City, advanced electronic packaging materials, nano drug

carrier with monoclonal antibody drug, neural engineering and bone joint materials, set up six research institutes and a number of laboratories and public technology service platform, reflect the integrated multi-interdisciplinary innovation characteristics.

#### 3.2 *The Production - Learning - Research - Funding “four in one” synergic development mode providing a platform for the development of multi-interdisciplinary research*

Some complex scientific, practical problems often involve multiple professional knowledge, content is complex, difficult to solve by single subject, even by temporary cooperation of several disciplines are difficult to resolve, but the multi- interdisciplinary can cover different discipline-related knowledge, and in accordance with the internal logic to understand and study, therefore, the multi- interdisciplinary will contribute to the solution of complex research and practice of the problem. The Production - Learning - Research - Funding “ four-in-one” synergic development mode is different from the traditional cooperative informal, personal way, it can provide a good platform for development of large, exploratory multi-interdisciplinary research.

#### 3.3 *The national science and technology management system is not perfect, due to lack of multi-interdisciplinary research investment*

The current constraints and coordination mechanism of science and technology resource allocation in China is not perfect, poor communication between departments, major scientific and technological projects, lack of organic linking, the limited state science and technology resource is distributed to every corner, low-level redundant construction, low utilization rate of resources of science and technology. The supervision and management mechanism, evaluation of science and technology is not perfect, lack of the reasonable, justice and science evaluation method. The multi-interdisciplinary research investment in research funding is less and the management system is not perfect. Therefore, supporting from the management system, funding, policy and other aspects of the multi-interdisciplinary will mobilize the enthusiasm of researchers.

#### 3.4 *The assessment system of multi-interdisciplinary research needs to be further improved*

The current evaluation system takes as the base point, lack of flexibility and flexibility. Multi-interdisciplinary research results varied and has the difference, the different evaluation standard is not the same. The current evaluation system is a relatively rigid discipline that does not apply to evaluation of

multi-interdisciplinary research. Because of the multi-interdisciplinary research involving more than two subjects, which is highly comprehensive and extensive cross-border, identification and peer review in multi-interdisciplinary research results often encounter the expert assessment of the review may not fully understand the situation, it is difficult to reach a consensus, is not conducive to the development of multi-interdisciplinary research and researchers.

### 3.5 *To subject differentiation based academic barriers limits the multi-interdisciplinary development*

At present, the science and technology resources allocation mode in China base in the mature, relative curing professional subject, as a new research field does not belong to a subject category. They can easily be excluded, plus the multi-interdisciplinary research of high risk, long cycle. The funding of multi-interdisciplinary research becomes less. Scientific research personnel limits professional restrictions, and other disciplines of scientific research personnels are very difficult to have a high degree of cooperation. Multi-interdisciplinary research is difficult to identify the subject position in the existing management mechanism to discipline-based differentiation, which make the multi-interdisciplinary research teams do not have the advantage in the project application, personnel and resources.

### 3.6 *Lack of multi-interdisciplinary resources in personnel training*

China is still in the implementation of professional settings, clear subject refinement, according to the professional personnel training, colleges and scientific research institute's resources were not effectively shared, which is not conducive to multi-interdisciplinary research talents, but also makes the use of resources not up to the maximum. Graduate recruit professional reference issued by the Ministry of Education discipline catalogue formulated, because of cross disciplines has no specific setting of the current professional disciplines directory, make the multi-interdisciplinary training high-level personnel lack the most basic platform.

## 4 STRATEGY OF PROMOTING THE NEW TYPE OF RESEARCH INSTITUTES IN THE MULTI-INTERDISCIPLINARY DEVELOPMENT

### 4.1 *Science and technology management departments should increase the multi-interdisciplinary research support, new institutes set up within special multi-interdisciplinary innovation funding*

In countries at all levels of the project should be in a separate multi-interdisciplinary (class), to promote and

support the new scientific research institutes to set up multi-interdisciplinary research organization structure reform, multi-channel financing, establish fund management standard system, promote the development and construction of multi-interdisciplinary research. The new institutes set up special multi-interdisciplinary funding, pay attention to the combination of Production - Learning - Research, for strategic emerging industry funded multi-interdisciplinary develop direction.

### 4.2 *Set up a special multi-interdisciplinary academic committee*

In order to guarantee the smooth progress of multi-interdisciplinary research, new scientific research institutes should implement the "multi-interdisciplinary academic committee, chief scientist, a research team" management mode. Multi-interdisciplinary academic committee by the hospital leadership and functional departments responsible persons and experts in different fields, responsible for multidisciplinary research macro planning and allocation of resources, personnel appointment and assessment work. The chief scientist is multi-interdisciplinary project person in charge, by the academic committee of the selection and hiring and evaluation, which is the core characters from the characteristic research, chief scientist must be a senior expert to enjoy very high reputation, also have extensive cross subject knowledge, but also have the strong cohesive force, resource mobilization ability and social activity ability. The research team of personnel selection and assessment was performed by the chief scientist. In the multi-interdisciplinary research management system, giving prominence to the expert, professor at the center of the governance model, avoid too much administrative intervention.

### 4.3 *The establishment of scientific and reasonable evaluation system*

New research institutes should build the evaluation mechanism and management mode of a crossover study of multi-interdiscipline development, innovation mechanism of distribution of interests and disciplines of management mechanism, the qualitative and quantitative evaluation, combining the importance of individual achievements, appraisal standards in addition to outside, should also examine the multi-interdisciplinary research team as a whole, to enhance the team cohesion. Because of the interdisciplinary research result, so multiple subject matter experts shall be both jury review. In the examination, appointment, rewards should tilt to multi-interdisciplinary research teams.

4.4 *Set the direction of cross discipline, recruit selectivity interdisciplinary postgraduates, build the academic exchange platform and multi-interdisciplinary talents training base*

New research institutes can set the direction of cross discipline, recruit selectivity interdisciplinary postgraduates, regularly hold different disciplines of academic exchange activities, such as academic report, academic salon, lectures, create different ways of disciplines and professional communication and opportunities, create a conducive environment for multi-interdisciplinary research, the construction of communication and cooperation mechanism, build the base for cultivating interdisciplinary talent, and the attention of major science and technology and social issues around the national strategic emerging industry, cultivation of wide caliber of compound talents.

4.5 *Constructing reasonable and feasible diversification operation mechanism, the introduction of academic masters as chief scientist, training the full-time research team, dynamically adjust the personnel structure*

Firstly, constructing the reasonable flow of talent mechanism, buliding the evaluation system for multi-interdisciplinary research personnel, the introduction of academic masters as chief scientist, ensuring multi-interdisciplinary research team to enhance the overall strength and development. Secondly, the construction of the capital investment mechanism, driven by the project primarily, encourages team for multi-interdisciplinary research projects. Finally, build a resource sharing platform mechanism, to improve resource utilization efficiency.

## 5 CONCLUSION

“The students and teachers, researchers and scholars together in the complexity of the issues require special skills, but also need to integrate the skills to solve world, living in a culture of the world generally weakened, level, category, cancel the confusion institutional boundaries increasingly blurred era. This process is called for the development of the discipline of postmodern stage, namely ‘university science times’”, With the advent of “university science times”, New research institutes of managers and researchers should establish the concept of University Science, to break the discipline barriers, integration

of academic resources, to develop new areas of research, to support the new multi-interdisciplinary research which meet the national strategic demand.

## Study on construction and application of web-based course's evaluation index system

Si Gui Xu

*College of Physics and Electronic Engineering, QuJing Normal University, China*

Yan Zhang

*College of Foreign Languages, QuJing Normal University, China*

**ABSTRACT:** As Information Communication Technology (ICT) has been applied in the field of education more and more widely and web-based course is an important application form, so it's necessary to formulate an evaluation standard about that. One survey said that: The majority of the existing evaluation index system is based on the expertise, and using by the relevant department to check the Web-based course, students are not participating in these evaluations; In the second place, most of the evaluation models about web-based course are still linear model. This research from the perspective of evaluation after using, that means evaluate the web-based course after trial them. Using the Delphi method and AHP method, to construct the judgment matrix, establish the evaluation index system, introduced the fuzzy mathematical theory of evaluation data processing. And evaluated the web-based course "modern education technology". The results show that the evaluation index system is consistently well with the real situation of this web-based course.

**KEYWORDS:** Web-based course; Evaluation system; Delphi methods; AHP methods; The fuzzy comprehensive evaluation method.

### 1 INTRODUCTION

The web-based teaching is an important way to solve the problem of education development in the information era, and the quality of the web-based course has directly affected the instructional effectiveness. The focus of the evaluation of The web-based Course is the development of The evaluation standard, such as The United States instruction design and apply professional committee's E-learning certification standard, America Training & Development Association's (ASTD) courseware certification standard, American higher education policy institute and Blackboard company jointly issued, Quality On The Line, Monterrey international study institute's OCEP engineering, etc. Analysis of the existing standards, we found: The index system for evaluation more as are the expertise, this kind of evaluation standard is used more for the relative departments to check the web-based course, evaluation data sources not form students. This paper suggests that, the web-based course Certification should pay attention to the actual teaching effect, which the check should be after the applying of web-based course work, but not the reverse, we should give full consideration to the student evaluation and the relevant data about students' E-learning. Second, many web-based course Certification models, are still

given priority to the linear model, experts evaluate each specific index to the quantitative estimation, and weighted average calculation for the last comprehensive evaluation result, its core thought based on the assumption that the evaluation results can be stacked, evaluation factors are linearity. In reality, however, in the evaluation standard of web-based course, many indexes often with a degree of ambiguity, which is of nonlinear characteristics, it has no very clear boundaries that are not absolute affirmation and negative [1].

### 2 FUZZY COMPREHENSIVE EVALUATION METHOD

Fuzzy comprehensive evaluation method is making a general assessment conclusion to the things and phenomena, which affected by many factors, it is a kind of method that evaluated things in membership grade comprehensive evaluation the assessment of all the objects, according to the provided conditions, give each object a nonnegative real number-evaluation index, then according to the selected sort to choose the better [2] [3]. Fuzzy comprehensive evaluation is widely used in the information evaluation area, applied this method to web-based course of evaluation, can control the subjective

factor's effect in smaller limit, so make the evaluation comprehensive and scientific.

Applied the fuzzy theory to educational evaluation, can overcome the faults that education information is fuzzy and uncertainty. In addition, it is worth paying attention that education is a kind of information flow process, education evaluation is a complex, systematic information processing process. E-learning evaluation system is influenced by many factors, including evaluation index.

### 3 CONSTRUCTION OF INDEX SYSTEM

Based on the clear purpose of construction of the index system, we first application Delphi method to determine the web-based course certification index system structure, after make sure good index system constitution, we use the AHP method determines the index weight, as the AHP will involve many data processing, especially that the more experts engage in the bigger the calculation will be, so it's better to put into software to help auxiliary calculation.

#### 3.1 Construction methods

##### 3.1.1 Delphi methods determine the index system

This paper used the Delphi method (the Delphi method) to determine the composition of an evaluation index system of web-based course. Delphi method is popular experts assess technology. This kind of means is applicable to assess the past and future in the case of without historical data. It encourages participants to discuss problems together. There is a requirement that variety experience people participation with each other, and try to convince each other [4].

Delphi method steps are: Step 1: Coordinators provide project specifications and estimate form to the experts; Step 2: Coordinators call up the expert group to discuss the factors related to the scale; Step 3: The experts anonymous fill in the iterative form; Step 4: Coordinators sort out a summary estimate, return to experts in the iterative form; Step 5: Coordinators call up group meeting, discuss the larger estimate differences; Step 6: Experts estimate the summary and submit another anonymous estimate in the iterative form; Step 7: Repeat step4-6, until reach agreement of the lowest and highest estimation.

##### 3.1.2 The AHP method determines the index weight

AHP (Analytic Hierarchy Process hereinafter referred to as the AHP) was raised by US planning and management professor T.L. Saaty in the early 70 s. The AHP is a simple, flexible and practical multiple criterion decision method which quantitative analysis the qualitative problem. The characteristic of it is making the various factors from a complex problem

into an interconnected orderly hierarchy, make it organized. According to certain objective reality of subjective judgment structure (multiple comparison), combining the experts' advice with the analysis' objective judgment directly and effectively, quantitatively described the importance of multiple comparison between the same level of the two elements. Then, using mathematical methods to reflect each level elements' weight of relative importance order, through the total sort between all levels, computing all elements' relative weight and sorting. The method of AHP implementing process can be divided into the following four steps: (1) Establish a hierarchy model; (2) Tectonic judgment matrix; (3) Levels and consistency single sort check; (4) Hierarchy total sort and consistency check.

#### 3.2 The content of index system

reference related web-based course Certification standard (E-Learning Certification Standards [5], A Framework for Pedagogical Evaluation of Virtual Learning Environments [6], Quality On The Line and South China Science and Technology University, Beijing Normal University and other schools' web-based course Certification standard) and use Delphi method, construct web-based course Certification index system. The Evaluation index system is divided into 2 primary indexes, four secondary indexes, and 26 level 3 indexes.

Four experts had been invited to grade for the index scale, using the AHP method ascertain the index

weight software to stats the play table, finally take average to determine the weight coefficient of each index. During CR inspection, if any expert's scoring cannot pass, we need to ask the expert to examine afresh after scoring. To get the weight coefficients of each index, and then calculated synthetic weight (synthetic weight = level3 weight · the corresponding level2 · corresponding level 1 weight), the result is shown in table 1 and table 2.

This study of the assessment is divided into four levels: V = {excellent, good, average, poor}, the

corresponding level score set to take F = (90, 80, 65, 50). For example, the evaluation results is 82 points, that means the web-based course is good, and we can analyze what should be strengthened according to each index in each level of membership.

#### 4 A CASE STUDY

Complete web-based course after the establishment of the evaluation index system, this paper take web-based

course “modern education technology” as an example to empirical research to construct the index system of inspection, the 77 use Moodle platform as the course management platform. Data acquisition based on Moodle web-based curriculum management platform, finishing the download form Moodle official website of feedback plug-in and installation, we just need to import the edited questionnaire.

Experts’ data: a total of 10 experts been invited to marking, the results is shown in table 1; Students’ data: by stratified sampling method, the 16 class 906 students for sampling survey, a total of 450 students to participate in the survey, of the 450 questionnaire recovery, the effective questionnaire was 450, and the results as shown in table 2; The application of fuzzy comprehensive evaluation: get membership set R based on the investigation data.

Index weight set  $W = (0.0299, 0.0139, 0.0438, 0.0148, 0.0096, 0.0694, 0.1645, 0.0980, 0.0725, 0.0420, 0.0460, 0.0163, 0.0658, 0.0184, 0.0466, 0.0221, 0.0522, 0.0112, 0.0214, 0.0138, 0.0113, 0.0209, 0.0224, 0.0280, 0.0241, 0.0204)$ . Processing the synthesis of

matrix computation, choosing model  $M(\cdot, \oplus)$ , that

$$\text{is } b_j = \sum_{i=1}^n \oplus(a_i \cdot r_{ij})b_j, \text{ according to } H=W \cdot R =$$

$(h_1, h_2, \dots, h_m)$ , we got that  $H = (0.6726, 0.2688, 0.0544, 0.0035)$ , To assign a value to comment set and calculate the evaluation results, if  $F = (90, 80, 65, 50)$ , that  $Z = H \cdot F = 85.75$  points.

Analysis the evaluation result: from the calculation above we got that  $H = (0.6726, 0.2688, 0.0544, 0.0035)$ , this suggests that fuzzy evaluation qualitative results for the modern education technology web-based course is excellent, that means 67.26% of the respondents thought this web-based course is excellent, 26.88% of respondents thought the this web-based course is good, 5.44% of respondents thought this web-based course is average, 0.35% of respondents thought it is poor; And we can also get the this web-based course quantitative evaluation score is 85.75 points. This result is consistent with the objective reality.

## 5 CONCLUSION

Because of various factors, the index system could one pace, not reach the designated position, and the final data processing is cumbersome. Therefore, we will do further research on index system completion, and develop corresponding evaluation software, make the evaluation fully automated.

## **Appetite regulation network and obesity**

**Dong Fu**

*Department of Physical Education, Shang-luo University, Shang-luo, Shaanxi, China*

**ABSTRACT:** The formation of the obesity has a close relationship with appetite. People's appetite usually influences by two regulation systems: appetite regulation system and cognitive regulation system. Appetite regulation system plays a significant role in ingestion and energy balance. It can be divided into two groups: promoting appetite which includes MCH, Ghrelin, GHSR, Gal, and so on; Restraining appetite which includes PYY, CCK, CART,  $\alpha$ -MCH. They make up the appetite regulation network and adjust the balance of energy and obesity. If one of the chains broken, it will cause greediness or anorexia, which results in obesity or losing weight. Also, lacking the self-understanding is a reason for the obesity.

**KEYWORDS:** Appetite Regulation; Cognitive Regulation; Obesity.

Recent studies show that, obesity is by and their own understanding and incorrect caused a series of regulation of diet and energy metabolism disorder. However, research on the mechanism of obesity and drug treatment lingers long. In 1994 the leptin found that makes peoples' understanding of obesity has made breakthrough progress in<sup>[1]</sup>. And found that in recent years the appetite regulatory factors that people have more understanding the mechanism of obesity, provide a new way for the treatment of obesity, and thus become the new hot spot in obesity research by the composed of appetite regulation network. In several appetites regulating factor found in recent years and people's self understanding of obesity in the development of obesity might modulate the effect of the review.

### **1 RECOGNIZE THE REGULATORY SYSTEM AND OBESITY**

Recent studies show that, obesity is a kind of die regulation and energy metabolism disorder, a disease caused by specific biochemical factors and incorrect cognition. However, most research lingers long on the mechanism of obesity and drug treatment. In 1994, they found of the leptin makes people's understanding of obesity get breakthrough<sup>[1]</sup>. And in recent years they found of the appetite regulatory factors make people have more understanding about the mechanism of obesity, and provides a new way for the treatment of obesity, thus it becomes the new hot spot in obesity research, the appetite regulation network mainly composed by the appetite regulatory factors and understanding the regulation system. This paper

reviewed the several appetite regulating factors found in recent years and people's self understanding of obesity in the development of obesity.

In the different social class and cultural background, the people have different psychological identity to the obesity, this kind of different attitude to obesity directly affects the incidence of obesity. In some developing countries, obesity is a symbol of wealth, they think the wealthiest people should be the fattest people; Obesity is the people's heart's desire. Obese older America black and Hispanic women in the high incidence of obesity, they agree that obesity is a symbol of motherhood and noble. On the contrast, the rich America and western people, they are usually resistant to obesity<sup>[2]</sup>. He Danjun's<sup>[3]</sup> survey find, 95% obese people believe "they have easier fat physique than others", 81% think that "the water will increase fat", 60% of people think that "eating less doesn't mean thin", "eating more from the childhood", because these error cognitive on the physical, resulting in the subconscious of "dieting or not has no concern to the fat", directly affect feeding behavior, may be a factor in obesity. At the same time eating behavior and human emotion related. Psychologists believe that obesity can increase appetite in anxiety; the reason may be related to the experience infant period. And that the anxiety increased appetite, eating is a kind of method to relieve anxiety, by chewing food, can make the person facial muscle tension decreased, thereby indirectly release anxiety<sup>[4]</sup>. In addition, emotional, nocturnal insomnia and other factors can also lead to obesity. Parenting view is a cause of children's obesity, many parents think that children is the fatter are better, and often proud to show to others, the parents will also compete with each other.

Many obese people think less water can prevent weight gain, so even in very thirsty case, still insist on not drink or drink less, this may gain weight faster. The American obesity treatment expert said: because of water shortage, many people will lead to accumulation of fat, muscle atrophy and elasticity, indigestion, organ dysfunction, in vivo virus content increased, joint and muscle pain. Someone says, drinking would lead to be fat. This argument is clearly not correct. Water accounts for a large proportion in the human body, it plays the delivery of nutrients and oxygen effect in different organs of the human body, and CO<sub>2</sub> waste discharged from water, no water, the human will die because of its waste poisoning. Therefore, the person general demand for the 2500mg water per day in order to maintain the water balance of the body, the normal water-drinking does not cause weight gain.

## 2 APPETITE PROMOTING FACTOR AND OBESITY

### 2.1 *The Melanin Concentrating Hormone (MCH)*

MCH is a cyclic peptide containing 19 amino acids, binding to MCH-1 receptors and MCH-2 receptors. MCH mainly existed in the hypothalamus and the zonal inset area. The MCH mechanism has been basically clear, that MCH is mainly through receptor play a regulatory role. The research proved that, the receptor distribution, concentration and appetite, and energy metabolism related functions. The current study focus on MCH's functions on the regulation of feeding behavior and energy metabolism. MCH has the effect of increasing feed, so far it is the only one gene leads to remove the hypothalamic peptides emaciated. Direct injection of MCH can cause food intake transient increase<sup>[5]</sup>; Chronic ICV injection of MCH can stimulate the rats increased food intake, weight gaining, leading to obesity<sup>[6]</sup>. Transgenic mice with over expression of MCH and the emergence of hyper phage eventually develop a centripetal obesity<sup>[7]</sup>. On the contrary, the long-term infusion of a MCH-1 receptor antagonist can reduce appetite, lead to sustained weight loss<sup>[8]</sup>. Marsh got the MCHR<sub>1</sub> deficient mice and MCH deficient mice, the results showed that MCHR<sub>1</sub> deficient mice were eating more but thinner, MCH deficient mice were eating less but thin, also found that the former weight loss is caused by excessive exercise and enhance the metabolism, and eating may is to use a high metabolic rate and low energy a compensatory reaction rate, leading to overeating but fat obtained although amount less than the wild type mice. The latter is mainly because the MCH gene knockout, MCHR<sub>2</sub> effect is lost, by its code does not change the phenotype expression of neuropathies and complicated, because eating less and metabolic rate is high and thin. The further study on MCH is carrying on; Research achievements will make the majority of obese patients benefit. So far, MCH in

clinical and animal nutrition has not been effectively applied.

### 2.2 *Gremlin*

Gremlin is a small molecular polypeptide composed of 28 amino acids, found by Kojima in 1999<sup>[9]</sup>, mainly in the gastric secretion, the arcuate nucleus of the hypothalamus, placenta, kidney also have a small amount of secretion. Gremlin is a unique peripheral appetite stimulating factor. Tsehop's<sup>[10]</sup> study of Gremlin peripheral and central regulation effect on rats' energy balance found that peripheral injection of gremlin may lead to reduction in fat utilization caused by obesity; continuous central administration of gremlin produced a dose-dependent feeding, cause weight gain; intraventricular injection will appear a dose-dependent increase feeding and weight gain. Lindeman<sup>[11]</sup> found that plasma gremlin and body mass index (BMI) was negatively correlated, and positively correlated with visceral fat area. In the central, fasting CSF gremlin levels also negative correlated with BMI. Compared with the thin obese individuals, fasting CSF gremlin level decreased about 16%<sup>[12]</sup>. On a diet induced weight loss after the plasma gremlin level increased significantly. Research shows that gremlin was pulse 24 hour rhythm of release, before the meal gremlin levels rise sharply, while dessert dips<sup>[13]</sup>. To explain this phenomenon, gremlin may be a physiological meal start signal<sup>[14]</sup>. In recent years in severely obese patients undergoing gastric bypass surgery, on plasma gremlin level change research results are not consistent. Holds tock<sup>[15]</sup> found that 6-12 months after surgery, with the weight loss of about 30%, fasting plasma gremlin level was significantly increased by 67%, this change and BMI decreased significantly correlated, that lead to negative energy balance of the metabolism level of Ghrelin increased after the operation of feedback. The Cummings<sup>[16]</sup> study showed 6-after operation 12 months, surgery group 24 h total Ghrelin secretion compared with the normal control group and obese control group were obviously decreased, and forms a flat curve, elevated fasting and postprandial decrease loss of circadian rhythm, thus draws the conclusion, surgery induced weight loss was attributed in part to the gastric bypass surgery after the secretion of Ghrelin cells decreased, resulting in the decrease of Ghrelin level, decreased appetite, decreased intake. A large number of studies have suggested that Ghrelin and obesity are closely related, Ghrelin stimulates feeding and reduce fat utilization, while obese patients shows low level expression. This question has not yet been well explained, pending further study. Some scholars think probably because Ghrelin is the secondary changes rather than the start of factors, namely obesity hyperinsulinism

or high serum leptin makes Ghrelin downregulation of mRNA expression. The effect of the mechanism of Ghrelin still needs further research on.

### 2.3 Growth hormone and obesity

#### 2.3.1 Growth Hormone Secretagogue Receptor (GHSR)

GHSR and food intake are closely related to body weight regulation, it is the receptor of growth hormone secretagogue (GHS) and growth promoting factor (Ghrelin), gene located in a third of the long arm of chromosome 26.31 region<sup>[17]</sup>. The experiment found that mammalian central or peripheral injection of GHS or Ghrelin, will cause the increase in food intake, fat oxidation reduction caused by obesity<sup>[18]</sup>. GHSR mRNA express in the feeding center (hypothalamic arcuate nucleus, ventral nucleus and pituitary). Loss of GHSR function in transgenic rats compared with the control group, weight loss, reduced adipose tissue<sup>[19]</sup>. Mechanism of GHSR gene in the pathogenesis of obesity is not clear still needs further exploration.

#### 2.3.2 Galanin (Gal)

Gal was originally isolated from pig intestines, composed of 30 amino acid neuropeptide 29-. Gal is widely distributed in the central and peripheral nervous system, pituitary gland, gastrointestinal tract and pancreas, especially in the paraventricular nucleus of the anterior cell area (aPVN) have a higher concentration of Gal neurons. Fasting state, the region of the Gal expression increased. Gal can promote appetite, reduce the energy consumption effect. Gal is adopted and three receptor subtype combination plays a role, named the galanin receptor 1, 2, and 3 (GALR1, GALR2, and GALR3). In animals, paraventricular nucleus (PVN) infusion of Gal can promote fat intake and absorption, induced animals appeared positive energy balance due to obesity; at the same time, high fat diet can increase the expression of the PVN in Gal. This positive feedback phenomenon explains the high fat diet easily lead to obesity<sup>[20]</sup>.

## 3 APPETITE SUPPRESSANT AND OBESITY

### 3.1 Peptide YY (PYY)

PYY is secreted by intestinal L cells of a gastrointestinal peptide hormones and neuropeptides, composed of the PP family with pancreatic polypeptide. In the circulation system, PYY exists in PYY3-31 and PYY3-36 two forms. PYY3-36 as the regulation of appetite hormones was known in recent 2 years. In 2002, Batterham<sup>[21]</sup> found that PYY3-36 is located in the arcuate nucleus of the hypothalamus through inhibit feeding, the body gastrointestinal secretion of

PYY3-36 increased after eating, PYY3-36 can cross the blood brain barrier into the hypothalamic arcuate nucleus and inhibits Orexigenic neurons by the Y2 receptor, thus suppressing appetite.

Batterham R L conducted double blind control tests on the 24 volunteers, intravenous injection PYY3-36 which the concentration closed to the amount of after meal and physiological saline. The results found that, regardless of the obesity and the control, after the injection of PYY3-36 2H, average food consumption reduces food intake near 1/3, 10h later, then after saline injection, obese and normal weight people' calories were reduced by 26% and 34%; 24h later, obesity reduced 17% in calorie intake. A further study found that the content of PYY3-36 in vivo, obesity significantly offsets in the normal population, and found no PYY3-36 resistant phenomenon, suggesting that promote the PYY3-36 secretion may be one of the important means to control obesity. PYY concentration changes with disease and body mass. In morbidly obese patients, the serum level of PYY decreased, suggesting that PYY deficiency may lead to obesity formation<sup>[22]</sup>. Line - morbidly obese patients with ileal bypass surgery or vertical gastroplasty postoperative elevation of PYY level, which may reduce food intake and reduce appetite and about <sup>[23]</sup> of patients after. At present, is not clear decrease serum PYY is the cause of obesity or results. Le Roux CW<sup>[24]</sup> study found that obese patients are lack of PYY, which may be related to the patient appetite enhancement, thus promoting obesity. At present, the PYY application is limited to short-term medication, whether long-term drug PYY3-36 can achieve long-term weight loss purposes, there is no research in this area. Therefore, the role and mechanism of PYY3-36 should be more comprehensively studied.

### 3.2 Cholecystokinin (CCK)

CCK is widely distributed in the gastrointestinal tract and brain tissue, is a short-term inhibition of feeding the strongest effects of peptide hormone, and also is a kind of peripheral saturated molecules. CCK has a very important role in the body of feeding behavior, digestive function, and metabolic regulation. CCK reduced food intake and produced early full behavior <sup>[25]</sup>. With it through its receptors play a role. CCK receptors are widely distributed in the peripheral and central, divided into CCKA and CCKB receptors. Intraperitoneal injection of CCK significantly inhibited the food intake of mice, this effect is mediated by CCK-A receptors<sup>[26]</sup>. Reidelberger<sup>[27]</sup> think CCK not through peripheral endocrine pathways to produce satiety, human and animal after eating CCK levels were significantly lower than those of CCK doses can produce satiety, using CCK monoclonal antibody CCK-MAB specific neutralizing circulating CCK

could not increase the feeding. Geeberg also support this view, inhibition of feeding the same dose CCK intraperitoneal injection, intravenous injection had no effect on feeding, so CCK may through paracrine or neuroendocrine satiety. Recent evidence suggests that peripheral CCK at least for the role of<sup>[28]</sup> people can play a satiety signal. CCK-A receptor gene knockout rat showed obesity, easy to hunger, eating too much. With the specific CCKA receptor antagonist devazepide invention, before the beginning of the study of feeding effect on the real significance of endogenous CCK, devazepide injection alone can make many animal feeding quantity increased. It was found that CCK inhibits feeding effect increase with age, its full role in male rats than in female rats more sensitive, sensitive to normal weight in rats than in obese rats, suggesting that the biological effects of CCK by age, sex and nutritional status of effects<sup>[29]</sup>. CCK is mainly involved in the regulation of food intake, but the exact mechanism is still not clear and need further study.

### 3.3 Cocaine - Amphetamine Regulated Transcript (CART)

CART is a new kind of neuropeptide Douglass<sup>[30]</sup> discovered in 1995 when the study drug addiction. Kristensen found<sup>[31]</sup> CART mainly in the hypothalamic arcuate nucleus and median eminence ventral lateral region of the lateral band. CART has many important physiological functions, involved in drug addiction, withdrawal, feeding behavior, stress response, immune function, self regulating, fluid balance, metabolism, function and endocrine regulation<sup>[32]</sup>. CART is an endogenous inhibiting food factor, can be expressed in the hypothalamus and many nuclei, when injected into the hypothalamus can inhibit the normal and hunger caused by eating, can completely prevent the neuropeptide Y (NPY) induced by feeding<sup>[33]</sup>. The current study shows that CART may be involved in regulating food intake and body from these aspects of energy metabolism: through the interaction with leptin and NPY; through the hypothalamic pituitary adrenal axis; according to the insulin regulated by the autonomic nervous system. In recent years on the CART gene polymorphism and obesity research, Chinese researchers showed that CART-A variation and Chinese Han obese no significant association. No significant association with consistent absence of obesity research results in China and Challis CART in the UK in the white gene A results. CART is involved in the inhibition of food intake and body energy metabolism regulation of human obesity is associated with CART dysfunction, CART gene variation is associated with human obesity. These are questions worth discussing.

### 3.4 Alpha Melanocyte Stimulating Hormone (alpha-MCH)

Alpha-MSH is a former copied corticotrophin raw derived peptides, mainly produced by the hypothalamus, pituitary and a variety of tissue cells, widely distributed. A large number of experiments show that, there is a close correlation between the alpha MSH and obesity. Alpha MSH main role is to regulate endocrine function, control of obesity, such as regulation of the immune. MC-4 is the alpha-M SH endogenous receptors, play an important role in the regulation of appetite and energy stability scale. Alpha -MSH mainly inhibited by MC-4 receptor feed. Ludwig to rat cranial cavity injection of alpha -M SH to make rats decreased feed intake and increased glucocorticoid levels. Injection of a -MSH congener MT- II in mouse lateral ventricle (MC3R and MC4R strong agonist), can inhibit the normal fasting and NPY stimulation leads to increased food intake of mice, also can inhibit the over expression of agouti and ob/ob (lack of leptin) feeding obese mice, while using the alpha -M SH antagonist SHU9119 then the animal food intake increased significantly in the mice, intracerebroventricular injection of SHU9119 also increased the night fasting food intake<sup>[34]</sup>. Recently, the use of which has stronger selective antagonists on MC<sub>4</sub>R (such as HS104 and HS024) increased satiety in rats Bai Zhou food intake, such as long-term in intracerebroventricular injection of these two antagonists with the increase in food intake, body weight of rats increased gradually due to the fat<sup>[35]</sup>. For the MC4R gene knockout mice, inhibit appetite agonist MT-II had no response, also confirmed the endogenous alpha -MSH on feeding effects are via MC4R. It has also been reported in human that autosomal dominant mutation will cause the loss of MC4R function, associated with obesity symptoms<sup>[36]</sup>.

## 4 SUMMARY

To sum up, building obesity science outlook and improving understanding can reduce the incidence of obesity as far as possible. While MCH, Ghrelin and other appetite-promoting factor are the key factor in energy homeostasis system, and related to the incidence of obesity syndrome, the block the signal drugs is an effective drug for the treatment of obesity, but the exact mechanism of these factors is still unclear, so the new promising slimming medicine also need to grope in the continuous experiment. PYY, CCK and other appetite suppressant mostly through the receptors to suppress appetite, and at present very few research considered the drug from the receptor mechanism, so drug development and clinical application

still need to do further study. The present factors regulated appetite study are mostly limited to animal experiments and in vitro experiments, but research in human experiments is rare and human obesity mechanism is very big difference in animals and people, so it needs further study.

# Construction of M-learning resources based on cloud-terminal integration

H. Zhao, Y. Shi & X.P. Li

*Beijing Institute of Technology, Beijing, China*

**ABSTRACT:** Mobile learning is very popular among people now, and the construction of resource is also on the agenda gradually. The paper introduces the cloud-terminal integration, and the problems of mobile learning resources at the present stage. Then it puts forward the m-learning architecture under cloud-terminal integration and requirements on m-learning resources construction.

**KEYWORDS:** Cloud computing; M-learning; Learning resource; cloud-terminal integration.

## 1 INTRODUCTION

With the development of mobile computing technology and wireless communication technology, mobile learning, as a branch of digital learning, attracted much attention. At the same time, in many fields it has put into practice and made many achievements. But so far, the development of mobile learning is still in its primary stage, there are many problems need to be solved. The cloud - terminal integration offers a new way for the development of m-learning. The distributed computing and large-scale heterogeneous system resource sharing are the keys to solving the technical problems of the mobile learning system.

## 2 CLOUD-TERMINAL INTEGRATION

Cloud computing is a kind of super computing model based on the Internet, putting plenty of information stored in the PC, mobile devices <sup>[1]</sup>. The cloud is network. It can make each application system to acquire computing power, storage space and software service as required, and then provide users with the quickest and most accurate information. Since Google in 2006 formally proposed the “cloud computing”, its development is very rapid. After combined with the intelligent mobile terminal, the concept of the cloud-terminal integration is gradually formed. The cloud-terminal integrated platform aims to meet the needs of application access and data management through heterogeneous terminals, anytime and anywhere. It also reduces dependence on operating system platforms, hardware equipments and the application installation management <sup>[2]</sup>.

The cloud-terminal integrated platform can be seen as bridge, by which connecting the cloud and heterogeneous mobile terminals. Its features below:

### 2.1 *Intelligentization*

In the face of difference of the user's requests, as well as the heterogeneous terminals, the platform is inquired to match the requests intelligently. According to the different needs to make the most rapid and accurate reply, it meets the needs of users as much as possible. At the same time, it offers an exclusive virtual storage area for learning records and related information, which is good for providing convenience for learners.

### 2.2 *Cooperativity*

The two ends of the platform are data server clusters and ubiquity of mobile terminals. A large number of information resources and requests need to be solved. These tasks can be accomplished without delay under the platform. It should connect the two ends and transmit information according request and coordinate different user's requests, to improve the efficiency of resource utilization.

### 2.3 *Independence*

Cloud-terminal integration aims to solve those problems, such as resources cannot cross-platform, low sharing rate, etc. This platform can carry out hardware independence, resource sharing and reuse, eventually learning will have nothing to do with the platform between different terminals.

## 2.4 Convenience

After realizing resources sharing, users can access the learning resources through any mobile terminals. If you were the user, you can get what you want. This platform can satisfy your demands of studying without the restriction of time and space.

## 3 MOBILE LEARNING RESOURCES

Recently, M-Learning as a new approach to learning is becoming more and more popular, and it is also one of the hot research topics. With more than ten years of development and research, m-learning resource as one of the key factors attracts much more attention. M-learning resource refers to the variety of information resources on mobile devices to support mobile learning [3]. The characteristics of m-learning resources differ from the traditional learning resources: contextualization, mobility, fragmentation, individuation and interactivity and so on. According to one's own interest and demand, learners can carry out self-directed learning at the right time and place.

However, at present the development and application of m-learning resources still exist many problems, affecting its development and learning effect [4]. The main problems are as follows:

### 3.1 Lack of interactivity

Recently, mobile learning resources' presentation has been given priority to text or animation display, ignoring the interaction between learners and learning resources. Then it becomes difficult for learners to remain attentive. Also, learners' learning records are difficult to track and record by the mobile learning management system, which not conducive to the further development of M-learning.

### 3.2 Poor portability

Portability is too poor. Mixed technology of development results to some resources can only display in some specific system. And, because of lack of unified standard for resource construction, it is difficult to achieve resource sharing between different systems, resulting in poor portability and interoperability.

### 3.3 Insufficient personalization

When learning on mobile terminals, the learners select learning content and learning process by themselves. Nevertheless, to their aptitude, the form of existing learning resources is unitary, and the teaching content

and strategy cannot adapt to the specific needs of individual learners.

The design and development is one of the important influence factors on the development of m-learning resources. One scholar pointed that "should analysis the learning content in detail in the interactive resources design process, so the content must be suitable for M-learning[5]." As is known, neither did all of the contents suitable for mobile learning, nor the resource could be put on the mobile device. The problems mentioned above can be solved by design and development based on cloud-terminal integrated platform.

## 4 THE DESIGN OF M-LEARNING RESOURCES UNDER THE CLOUD-TERMINAL INTEGRATION

Under cloud computing, computing fabric of the Internet has turned from "servers + terminal" into "cloud + terminal", and then into "the cloud integration platform". Cloud-terminal integrated platform as the main support of m-learning, puts vast amounts of resources in the large storage cluster, which effectively solves the problems of m-learning resources at the present stage. It makes the learners' learning really achieve seamless state by providing faster, more secure information storage and network service. The platform not only provides powerful support for mobile learning, sharing resources cross-platform, also provides reliable learning experience for learners [6]. It also will reduce learning costs and improve the learning efficiency.

The Internet and mobile intelligent terminals connect through the cloud-terminal integrated platform, and visit each other. As shown in Figure 1.

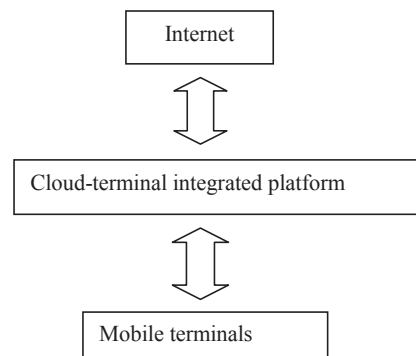

Figure 1. Triadic relation.

For the characteristics and requirement of mobile learning under cloud environment, the cloud-terminal integrated platform is divided into three levels. The concrete structure as shown in figure 2:

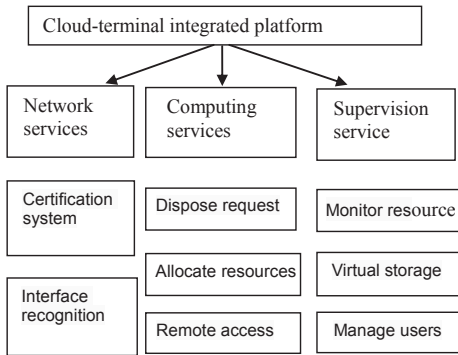

Figure 2. The structure of cloud-terminal integrated platform.

The layer of network services is mainly responsible for user registration, certification and interface identification. Among them, the certification system provides the user's identity identification, certificate authority, and other functions, which is the most basic work. Due to the service provider may provide their own authentication system, so it needs an interface to get the data after transforming the mode<sup>[7]</sup>.

Computing services layer's main job is handling users' requests, allocate resources and realize the interaction between the remote and local. After received and processed the user's request, it will dispatch requests to the appropriate computing nodes according to certain scheduling algorithm. The remote access' goal is to realize the local interaction experience, emphasizing the interactive performance among users.

The third layer includes three functions: monitoring resource, virtual storage and users' management. Resource monitoring is to monitor the computer nodes, including the CPU, memory, and node configuration state, etc, these information are the important reference clues about system scheduling. Users' management and the virtual storage are mainly to record the trace of studying and stored in virtual space, and then promote related information for learners.

Based on the above model, to achieve M-learning under the environment of cloud-terminal integration, should obey the following requirements:

#### 4.1 *Learner-centered, meet the requirements of learners as far as possible*

The demands and characteristics of learners are the foundation of design and development of m-learning

resources. Resource developers should make full use of technological advantages, to realize the learning resources sharing cross-platform seamlessly. To meet the personalized needs of learners, must according to the learners' needs and interests to give the most quick and accurate feedback.

#### 4.2 *Based on the characteristics of mobile learning*

M-learning has many striking features, such as contextualization, interactivity, fragmentation, etc. So take this as starting point, to design a short duration, situational, interactive micro-learning content, to meet the needs of learners learning at anytime, anywhere.

#### 4.3 *Uniform resource construction standards*

At present, the construction of mobile learning resources, lack of unified standards and norms, leads to resources repetition, low utilization rate. Currently, it can draw lessons from relevant models, such as SCORM, to develop m-learning resources construction standard<sup>[8]</sup>. It is convenient for resource management and calls, further improving the learning experience on cloud-terminal integration platform.

## 5 CONCLUSION

The M-learning mode on cloud-terminal integration platform will be dominant in the near future. This platform will enable the "cloud" and the heterogeneous terminals become integrated, sharing resources among different platforms. Also, it will reduce the limits of operating system platform, hardware equipment, application, etc, and make m-learning to become the next learning<sup>[9]</sup>.

# Research and realization of pruning-branch to adopt data-stream

Wei Lv

Hangzhou Cigarette Factory of China Tobacco Zhejiang Industrial Co. Ltd, Zhejiang, Hangzhou, China

**ABSTRACT:** In scene manage process, diagnosing each problem through use of a problem tree, it is able to find these correlations by itself, and carry continuous improvement according to PDCA. But with the problems accumulating, inevitably there will be a data redundancy, which will cause intervening of branch and leaves, and the complexity increases. Therefore, we adopt the method of data-stream, pruning with the problem tree, it can control the pose and adjust the shape of trees, and make the figure more beautiful, looks to flourish.

**KEYWORDS:** data-stream; pruning model; splitting algorithm; ID3; C4.5; CART.

## 1 BACKGROUND OF RESEARCH

In the problem tree, when the each problem transformed into data, the data exist redundancy, with the data accumulation, the redundancy will augment, non-conductive to upper diagnosis<sup>[1]</sup>. Therefore, the research content of this paper as follows:

- 1 Creating pruned model high- effectively. This model has lesser time and space complexity. Because of the data are unlimited and the store of computer is limited, they are an unavoidable conflict, so how to take advantage of both is the research content of this paper.
- 2 Creating high-dimension of data-stream. In the problem tree, data have the character of high-dimension, how to reduce the dimension effectively and process again is constructing is a problem cannot be ignored.
- 3 Real-time monitor and identify the change of data. In the problem tree, data are updated in real-time and dynamically changing, analyzing these data need to identify the hypostasis of change while monitoring their changes.
- 4 Reducing demand from model to class-mark-data. If data exist the problem of concept drift, then it needs to update or reconstruct an effective pruned-model according to new data to adapt these phenomena. But we need more clear class-mark-data when we constructed new model, so how to reduce the demands of known class-mark-data is also a key issue to be resolved.

In summary, whereas the own characteristics of the problem tree, traditional methods cannot solve these problems, because of the data probability distribution of the data gather is uniform basically, but in the problem tree, there is very likely

non-uniform. So we solve these problems must design corresponding model to adapt this characteristic from the data.

## 2 METHOD BROUGHT FORWARD

There exists a redundancy of data after creating problem tree, so in the tree, data is prone to the over-fitting phenomenon. The tree pruned is using the pruned model, pruning unwell branch, the tree becomes smaller through pruning, complexity is lower, and more easily understandable. The figure 1 is intuitive understanding between before-pruned and after-pruned. There are two methods of pruning method usually: the one is front-pruning, the other is back-pruning.

The method of front-pruning is intervened constructing advanced of problem tree through choice parameters. If the parameters satisfy predetermined

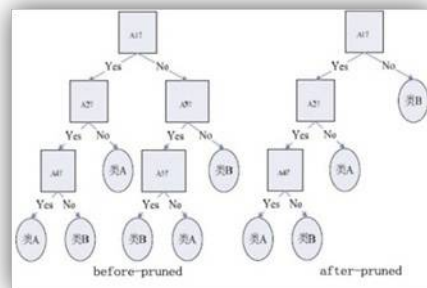

Figure 1. The comparison between before-pruned and after-pruned.

conditions, then we stop constructing, the point of stopping become a leaf-point, this leaf-point may be hold most frequent class of buck – group in subset or probability distributions of these buck-group. The set of parameters is very important, because they will decide splitting degree between branch and leaf, if the value of set higher, the split become slowly until tree dead, contrarily, it will faster, and it will cause tree collapse. So how to balance in both, only according as actual situation to deal.

The method of back-pruning more use than front-pruning relatively, the back-pruning use C4.5 and CART model usually. It disposed data centralized after we have finished constructing the problem tree. The method is that we deleted the branch of a point and replaced leaf to pruned-branch.

### 3 METHOD RESEARCH

We combine the method of front-pruning and back-pruning, this paper's innovative bring forward a kind of prune-model through adopting data-stream about problem tree.

Model: the expression of prune-model

Input: the gather of data-stream(S), the gather of attribute(A).

Output: problem tree.

Process:

- Creating the corresponding node;
- If the swatch in S belong to same category(C), then we use Node as the leaf-point to return;
- If A is empty, we will define C from numerous stylebook sort in S, and we use Node as the leaf-point to return.
- we choice the information gain the greatest attribute( $a_i$ ) in A relative S as the test attribute of Node.
- The part of program as follow:

```

Generate_pruned_tree(S,A)
Create tree(S, Node)
  If S[Node, point]==C[Node, point]
  Then input C[point, number]
  Else if reset S[Node, point]
Return
  If Boole A == empty
  Then Node[ $\underline{a}_i$ ]=S[Node, C]
  Else If  $\underline{a}_i$ =S[Node,  $\underline{a}_i$ ]
  Return S[Node, point]
Choose Test[Node] = S[Node,  $\underline{a}_i$ ]
  
```

### 4 ALGORITHM EVOLUTION

The learning of decision trees from class-labeled training tuple is called decision tree induction. A decision tree is a flowchart-like tree structure comprising a root node, the topmost node, with internal (non-leaf) node denoting a test on an attribute where, each branch represents an outcome of the test and each leaf (terminal) node holds a class label. This implies that, the decision tree emanates from nodes that form a rooted tree since the root node is one without incoming edges; all other nodes have exactly one incoming node with internal nodes having two or more outgoing edges.

Generally machine learning methods that represent their mined knowledge as decision trees grow their decision tree recursively by partitioning the training records into successively purer subsets, a recursive definition known as “splitting algorithm”. A generic tree growing algorithm can thus be described.

The part of program as follows:

```

Inputs: training records-TR
Attributes set - Attribs {A1, A2, ..., An}
Tree_Growth(TR, Attribs)
  If stopping_condition(TR, Attribs)=true then
    leaf.Label=Classify(TR)
    return leaf;
  Else
    root=Create_node()
    root.test.condition = find_best_split(TR, Attribs)
    let V = {v | v is a possible outcome of root.test.condition}
    For each v ∈ V do
      TRv = {tr | root.test.condition(tr) = v and tr ∈ TR}
      child = Tree_Growth(TRv, Attribs)
      Add child as descendant of root and label the edge
      (root→child) as v
    End for
  End if
Return tree
  
```

The governing concept for tree owing is basically the same for all decision tree algorithms, with the criteria used in the *find\_best\_split()* function providing the major difference between them. The *find\_best\_split()* splits the records based on attribute test that optimizes a certain criterion. Normally nodes with homogeneous class distribution are preferred, hence the need for a measure of a node impurity.

In “traditional” decision tree algorithms the widely used measures are entropy, the index, and the  $\chi^2$  statistic[n].

The tree growing process continues and stops expanding (stopping-condition) when any of the following conditions is triggered :

- The given node records all belong to—the same class or all have similar attribute values and can no longer be differentiated from each other.
- When the maximum tree depth is reached.
- The number of cases in the terminal node is less than the minimum number of cases for parent nodes.
- If the node were split, the number of cases in one or more child nodes would be less than the minimum number of cases for child nodes.
- The numbers of splitting criteria does not exceed a certain threshold.

Full grown trees in the presence of noise or outliers are susceptible to the problem of over fitting. This occurs when a decision tree is so “specialized” on training data that it performs poorly on previously unseen data. To overcome this problem, tree pruning procedures are used. Two common approaches are used; pre-splitting and after-pruning. Pre-splitting is when a tree is “pruned” by halting its construction early whereas after-pruning allows a full grown tree to be developed which is then pruned by removing its branches and replacing it with a leaf node. Simple threshold-based mechanisms can be used to achieve preprinting whilst more complex, cost complexity and pessimistic pruning approaches are used for post-pruning.

#### 4.1 Discretization and non-discretization of pruning process

Discretization is generally a process of classifying or clustering numerical attribute values in a dataset into distinct ranges i.e. [2]. It maps a set of numeric values to some categorical values. Discretization is used here to refer to any method used for discretization that does not utilize instance class labels in setting partition boundaries. For the experiments an equal width E-binning mechanism was used to develop the partition boundaries, where E-represents the different number of bins experimented with. Discretization on the other hand, refers to the process of discredited numeric attributes based on minimal entropy heuristic that takes into account the instance class labels during the partitioning process. The method proposed by Fayyad uses the class information entropy of candidate partitions to select bin boundaries for discretization. Given a set of instances S, a feature A, and a partition boundary T, the class information entropy of the partition induced by T denoted E (A, T; S) is given by;

$$E(A, T; S) = \frac{|S_1|}{|S|} Ent(S_1) + \frac{|S_2|}{|S|} Ent(S_2)$$

Where  $S_i$  is a partition induced by T.

For a given feature A, the boundary  $T_{min}$ , that minimizes the entropy function over all partitions is selected as the discretization boundary. This method can then be applied recursively to both the partitions induced by  $T_{min}$  until some stopping condition is achieved. In the experiments a Minimal Description Length (MDL) is used to determine a stopping criterion for the recursive partitioning. When we recurred and prune the data in a problem tree, the expression as follows. Where N is the number of instances in the set S, and  $k_i$  is the number of class labels represented in the set  $S_i$ .

$$Gain(A, T; S) < \frac{\log_2(N-1)}{N} + \frac{\Delta(A, T; S)}{N}$$

$$Gain(A, T; S) = Ent(S) - E(A, T; S)$$

$$\Delta(A, T; S) = \log_2(3^k - 2) - [k \cdot Ent(S) - k_1 \cdot Ent(S_1) - k_2 \cdot Ent(S_2)]$$

#### 4.2 Dealing with missing values

Missing values are a common experience in real-world data sets which complicates both induction (a training set where some of its values are missing) and classification (a new instance that miss certain values). Over years, this problem has been addressed by several researchers for example. Generally, missing values in the training set can be handled in the following ways; If  $\sigma_{a_i = s}$  represents the subset of instances missing values in attribute  $a_i$  in a set S then one way is to ignore all instances in S whose  $a_i$  values are missing when calculating the splitting criteria i.e.

In this case the splitting criteria should be reduced in proportion to the missing values instances. Thus instead of using  $\Delta\phi(a_i, S)$  splitting criteria should be calculated based on, evolution expression follow as:

$$\frac{|S - \sigma_{a_i = s}|}{|S|} \Delta\phi(a_i, S - \sigma_{a_i = s})$$

$$res(a_i, dom1(a_i), dom2(a_i), a_j, dom1(a_j), dom2(a_j), S) = \frac{|\sigma_{a_i \in dom1(a_i)} \text{ AND } a_i \in dom2(a_i)|S|}{|S|} + \frac{|\sigma_{a_i \in dom2(a_i)} \text{ AND } a_i \in dom1(a_i)|S|}{|S|}$$

Where attribute  $a_i$  represents the original split, splitting  $dom(a_i)$  into  $dom_1(a_i)$  and  $dom_2(a_i)$  while attribute  $a_j$  represents a surrogate split with its associated split domains as  $dom_1(a_j)$  and  $dom_2(a_j)$ .

The missing value experiments also looked at different ways where missing values were estimated based on other instances. As a pre-processing step, if the value of a nominal attribute  $a_i$  in tuple  $q$  was missing, then it was estimated by the modal value over all instances having the same target attribute value or class. Expression given by;

$$estimate(a_i, y_q, S) = \arg \max_{v_i, j \in dom(a_i)} |\sigma_{a_i = v_i, j \text{ AND } y = y_q} S|$$

Where  $y_q$  denotes the value of the class attribute in the tuple  $q$  or using the modal value for the given attribute in the whole data set given by;

$$estimate(a_i, S) = \arg \max_{v_i, j \in dom(a_i)} |\sigma_{a_i = v_i, j} S|$$

### 4.3 Dealing with attribute selection and reduction

Experiments involving development of decision tree models based on the full set of attributes were undertaken and compared to some other models developed based on a subset of the attributes. This was particularly important for those cases where there was a considerable number of attributes present in the dataset. The idea was to evaluate how closely they approximated the full-set model and the effects of using different strategies in selecting the subset to be used for the development of the model. The attribute selection mechanisms used include:

- Info-gain evaluates the worth of an attribute based on the information gain with respect to a class, i.e., info-gain (class, attribute)= H(class)- H(class, attribute).
- Gain ratio-similar argument as in infogain only that gain ratio is calculated as detailed in section 4.
- Consistency-looks for the smallest subset of attributes with consistency equal to that of the full set of attributes, i.e., evaluate the worth of a subset of attributes by the level of consistency in the class values when the training data are projected onto the subset of attributes.
- Chi-square selection calculates the  $\chi^2$  value of a given subset with respect to the class attribute.

## 5 SIMULATION EXPERIMENT

### 5.1 Experiment flow

The results of the various experiments described in the previous chapter have been recorded and a descriptive analysis provided in this chapter. A general flowchart outlining the sequence of the experiments undertaken in this study has been summarized in Figure 2.

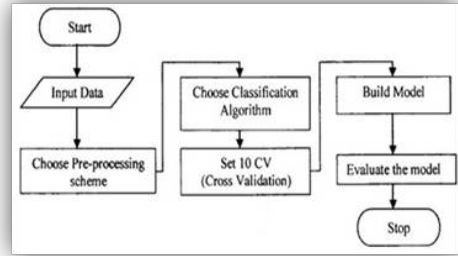

Figure 2. Flow chart of experiment.

### 5.2 Experiments and simulation for missing values

The pruning model (abbreviation: PM) as noted in Section 3, three different mechanisms were compared<sup>[3]</sup>. With no replacement involved, it meant both C4.5 and CART were tested for modified splitting criteria calculation, i.e., they had to use a splitting criterion that normally accounts for missing attribute values. The other methods first required replacement of the missing values with the modal values either; for a given attribute across all classes or within the given class<sup>[4]</sup>. From Figure 3, it can be deduced that when no replacement had been done for three algorithms (requiring a modified splitting criteria calculation), their accuracy was well above 94% for the initial dataset chosen, on replacing missing data using the modal attribute value for a given attribute in the dataset, CART performance improved and a small reduction was noted for C4.5. Replacement based on modal class value resulted in insignificant changes on C4.5 while it gave a significant drop in performance in the case of CART. Since replacements based on the modal value for the given attribute based on the whole dataset produced better results, the same was used for  $a_{11}$  datasets and the performance compared to cases when no replacement was done, simulated results shown in table 1.

Table.1. Simulated results of PM, C4.5 and CART model.

## 6 SUMMARY

This chapter presented a series of experiments undertaken in trying to investigate certain aspects of pre-processing strategies. The aspects addressed include; effects of different discretization approaches, effects of missing data handling/replacement strategies, effects of the type of data and their distribution, effects of increased work, effects of attribute selection and reduction and finally, an overall performance comparison of the algorithms.

**ABSTRACT:** Communication technology between VLANs is a very important point in the study of the Internet of Things (IoT). We introduce an education simulation technology such as Packet Tracer, and simulate a network topology. In the simulation network topology, we study the traditional method for communication between VLANs. The results show that we can configure communication technology between VLANs, and it is easier and more efficient in the education simulation technology than in actual network equipments.

**KEYWORDS:** VLAN; Traditional Method; Internet of Things; Packet Tracer; Education Simulation Technology.

## 1 INTRODUCTION

All of different Internet of Things (IoT) is connected with each other through a network such as a computer network. The most important technology of computer network, including IoT [1] is the connection technology. In undergraduate and graduate student education, more and more colleges and universities have the classes for learning and teaching for the communication technology such as between VLANs.

In this paper, we introduce an education simulation technology, such as Packet Tracer, and simulate a network topology. We study on the traditional method for communication between VLANs in the simulation network topology. Then, we analyze the simulation results and the advantage of the education simulation technology.

## 2 THE EDUCATION SIMULATION TECHNOLOGY

There are a lot of network tools and software based on the education simulation technology such as Packet Tracer [2], GNS3 [3], OPNET [4], NS2 [5], etc.

Packet Tracer is one of the most popular and the easiest simulation tools for Cisco Systems, Inc. It is a powerful network simulation program that allows students to experiment with network behavior, and provides simulation, visualization, and authoring, assessment, and collaboration capabilities and facilitates the teaching and learning of complex technology concepts.

Packet Tracer supplements physical equipment in the classroom by allowing students to create a network with an almost unlimited number of devices, encouraging practice, discovery, and troubleshooting. The simulation-based learning environment helps students develop 21st century skills such as decision making, creativity and critical thinking, and problem solving.

## 3 COMMUNICATION BETWEEN VLANS

### 3.1 VLAN

The VLAN is virtual local area network or virtual LAN. In computer networking, a single layer-2 network may be partitioned to create multiple distinct broadcast domains as VLAN, which are mutually isolated so that packets can only pass between them via one or more routers.

Network architects set up VLANs to provide the segmentation services traditionally provided only by routers in LAN configurations. VLANs address issues such as scalability, security, and network management. Routers in VLAN topologies provide broadcast filtering, security, address summarization, and traffic-flow management. By definition, Switches may not bridge IP traffic between VLANs as doing so would violate the integrity of the VLAN broadcast domain.

### 3.2 Communication technology between VLANs

For Switches may not bridge IP traffic between VLANs, there need Routers to provide communication

between VLANs. There is two communication technology between VLANs.

The first one is the traditional method. In this method, there are some access links between Switch and Router, and the amount of access links is the same as that of VLANs. For example, there are two VLANs in network topology. Then, there need two access links between Switch and Router. The second one is the single arm routing method. In this method, there is only one trunk link between Switch and Router for more VLANs.

For the traditional method is the basic method and more easily to learning, we make some simulation practices and study the tradition method between VLANs in this paper.

## 4 SIMULATION PRACTICES

### 4.1 Simulation network topology configuration

In this paper, we make some simulation practices based on Packet Tracer. The simulation network topology includes two PCs, one Switch and one Router as in Figure 1. We configure IP address for PCs and Router with Table 1.

We configure two VLANs such as VLAN 10 and VLAN 20, make Fa0/1, Fa0/10 in VLAN 10 with access mode, and make Fa0/2, Fa0/20 in VLAN 20 with access mode in the simulation network topology. Then, we configure the two links between Switch0 and Router0 as access link. For the default link mode is access mode, we do not configure and use the default link mode. The command on Switch0 and Router0 is as follows:

```
Switch0(vlan)#vlan 10 name v10
VLAN 10 added:
Name: v10
Switch0(vlan)#vlan 20 name v20
```

Figure 1. The simulation network topology.

Table 1. The IP address of network topology.

255.255.255.0

Router0(config-if)#no shutdown

Router0(config-if)# interface fastEthernet 0/1

Router0 (config-if)#ip address 192.168.20.1  
255.255.255.0

Router0(config-if)#no shutdown

### 4.2 Simulation results and analyses

We ping from PC1 to PC2, and analyze the communication way between VLAN 10 and VLAN 20. For the ping command is based on ICMP [6], we get an ICMP packet transform process to show the communication way between VLAN 10 and VLAN 20. ICMP packet transform process is as Figures 2–9.

After analyzing the ICMP packet transform process, we can see the GO process of the ping command is from Figures 2–5, and the RETURN process of the ping command is from Figure 6–9. The direction of packet transforms direction in Figure 2 is the reverse direction in Figure 9. It is also in Figures 3–8. All ICMP packets between VLAN 10 and

Figure 2. Packet from PC1 to Fa0/1 of Switch0.

Figure 5. Packet from Fa0/2 of Switch0 to PC2.

Figure 3. Packet from Fa0/10 of Switch0 to Fa0/0 of Router0.

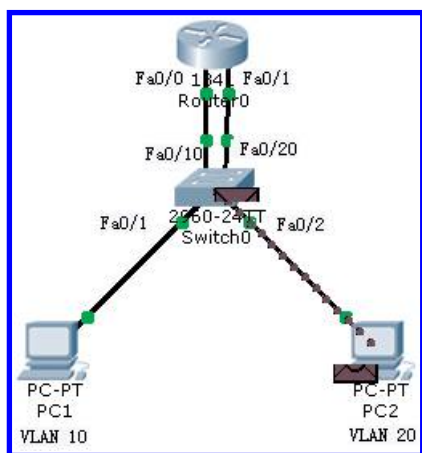

Figure 6. Packet from PC2 to Fa0/2 of Switch0.

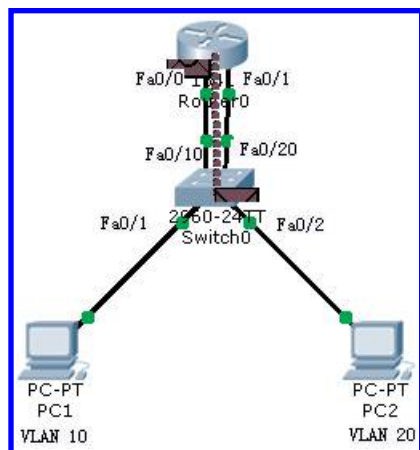

Figure 4. Packet from Fa0/1 of Router0 to Fa0/20 of Switch0.

Figure 7. Packet from Fa0/20 of Switch0 to Fa0/1 of Router0.

Figure 8. Packet from Fa0/0 of Router0 to Fa0/10 of Switch0.

Figure 9. Packet from Fa0/1 of Switch0 to PC1.

VLAN 20 need be transformed by Router 0. It is because that Switches may not bridge IP traffic between VLANs, and Routers can provide communication between VLANs. So, the communication between VLANs in the network must deploy Router.

## 5 CONCLUSIONS

The simulation result shows we can study the traditional method for communication between VLANs very easy. Based on the education simulation technology, we can configure the network topology more efficient than in actual network equipments. For many colleges and universities have not enough actual network equipments, we can learn and teach some network knowledge and technology with the education simulation technology such as Packet Tracer.

**ABSTRACT:** With the development of network technology, more and more various equipments occur, such as the Internet of Things (IoT). The communication technology between VLANs is a very important point in the study of the network including IoT. We study Packet Tracer as one education simulation technology, and simulate a network topology to teach the single arm routing method for communication between VLANs. The simulation results show that we can more easily and efficiently configure network topology for learning the single arm routing method in Packet Tracer than in actual network equipments.

**KEYWORDS:** VLAN; Single Arm Routing Method; Internet of Things; Packet Tracer; Simulation Technology; Actual Network Equipment.

## 1 INTRODUCTION

The Internet of Things (IoT) is expected to offer advanced connectivity of devices, systems, and services that goes beyond machine-to-machine communications (M2M) and covers a variety of protocols, domains, and applications [1]. The most important technology of computer network, including IoT [2] is the connection technology. More and more colleges and universities have the classes for teaching the communication technology such as between VLANs.

Teaching the communication technology between VLANs needs many actual network equipments such as Switch and Router. But, many colleges and universities have not enough actual network equipments for the network experiment.

In this paper, we study education simulation technology, and select Packet Tracer for the simulation network experiment. Then, we teach the single arm routing method for communication between VLANs in the simulated network topology and analyze the simulation result.

## 2 PACKET TRACER

Packet Tracer [3] is one of the simulation technologies for education and research. Others are also widely used such as OPNET [4], NS2 [5], GNS3 [6], etc. But, for Packet Tracer is one of the most popular and the easiest simulation tools for Cisco Systems, Inc.

many teachers of colleges and universities teach network technology with it. Packet Tracer supplements, physical equipment in the classroom by allowing students to create a network with an almost unlimited number of devices, encouraging practice, discovery, and troubleshooting. The simulation-based learning environment helps students develop 21st century skills such as decision making, creativity and critical thinking, and problem solving.

## 3 VLAN TRUNK AND COMMUNICATION BETWEEN VLANS

### 3.1 VLAN trunk

VLAN is virtual local area network or virtual LAN. VLAN Trunk [7] is the key and difficult points in the VLAN. In one Switch, we can make the switch port mode of all the ports in the same VLAN as *Access*, and the hosts in the same VLAN can connect with each other with those ports. However, in the different Switches or Switch to Router, we need make the switch port mode of all the ports in the same VLAN as *Trunk*. VLAN Trunk Line is to connect the different Switches or Switch to Router, and allow all the hosts in the same VLAN to communicate with each other.

The sent Switch can make one VLAN data packet with a mark as the appropriate VLAN Tag, and the received Switch can identify that the data packet belongs to which VLAN by the specified VLAN Tag. Thus, All of VLAN data packets sent out from one

Switch to another Switch or Router through VLAN Trunk Line, and are identified by the VLAN Tag in the each data packet. There are two standards for VLAN Trunk: ISL and IEEE 802.1Q [8]. ISL is a Cisco proprietary technology, and IEEE 802.1Q is the international standard by IEEE. In addition to Cisco both support, other vendors only support IEEE 802.1Q.

IEEE 802.1Q uses an internal tagging mechanism which inserts a 4-byte tag field in the original Ethernet frame. The Ethernet frame structure with IEEE 802.1Q frame tagging is shown as Figure 1, and the detailed descriptions of IEEE 802.1Q frame tagging structure is shown as Figure 2.

Figure 1. The Ethernet frame structure with IEEE 802.1Q frame tagging.

Figure 2. IEEE 802.1Q frame tagging structure.

Tag Protocol Identifier (TPID) field is 16 bits, and is set to a value of 0x8100 in order to identify the frame as an IEEE 802.1Q tagged frame. After TPID field is Tag Control Information (TCI) field, and TCI is further divided into User Priority, DEI, and VID fields. User Priority field is 3 bits, and refers to the IEEE 802.1Q priority. The field indicates the frame priority level, which can be used for the prioritization of traffic and can represent 8 levels from 0 to 7. Canonical Format Indicator (DFI) field is 1 bit. If the value of this field is 1, the MAC address is in no canonical format. If the value is 0, the MAC address is in canonical format. VLAN Identifier (VID) field is 12 bits.

### 3.2 Communication technology between VLANs

The VLAN is virtual local area network or virtual LAN. In computer network, only Routers in VLAN topologies provide broadcast filtering, security, address summarization, and traffic-flow management. By definition, Switches may not bridge IP traffic between VLANs. So, there need Routers to provide communication between VLANs. There is two communication technology between VLANs.

The first one is the traditional method. In this method, there are some access links between Switch and Router, and the amount of access links is the same as that of VLANs. The second one is the single arm routing method. In this method, there is only one trunk link between Switch and Router for more VLANs.

Comparing the two communication technology between VLANs, we can see the single arm routing method is more advanced for only one trunk link between Switch and Router for more VLANs.

## 4 SIMULATION EXPERIMENT

### 4.1 Simulation network topology

Based on Packet Tracer, we simulate a simulation network topology includes two PCs, one Switch and one Router as in Figure 3.

Figure 3. The simulation network topology.

### 4.2 Configuration

The configuration information including IP address is in Table 1.

Table 1. The IP address of network topology.

Device	Interface	IP address/ Subnet Mask	Default Gateway
PC1	NIC	172.17.10.10/24	172.17.10.1
PC2	NIC	172.17.20.20/24	172.17.20.1
Router0	Fa0/1.10	172.17.10.1/24	NA
	Fa0/1.20	172.17.20.1/24	NA
Switch0	Fa0/1	NA	NA
	Fa0/10	NA	NA
	Fa0/20	NA	NA

\* /24 means 255.255.255.0

We configure IP address for PC1, PC2 with Table 1, and configure two VLANs, such as VLAN 10 and VLAN 20. We make Fa0/10 in VLAN 10 and Fa0/20 in VLAN 20 with access mode, and make F0/1 with trunk mode for transmission the traffic

from VLAN 10 and VLAN 20. In this way, the link between Switch0 and Router0 is as trunk link. The command on Switch0 is as following:

```
Switch0(vlan)#vlan 10 name v10
VLAN 10 added:
  Name: v10
Switch0(vlan)#vlan 20 name v20
VLAN 10 added:
  Name: v20
Switch0(vlan)#exit
APPLY completed.
Exiting...
Switch0#conf t
Switch0(config)#interface fastEthernet 0/10
Switch0(config-if)#switchport mode access
Switch0(config-if)#switchport access vlan 10
Switch0(config-if)#interface fastEthernet 0/20
Switch0(config-if)#switchport mode access
Switch0(config-if)#switchport access vlan 20
Switch0(config-if)#interface fastEthernet 0/1
Switch0(config-if)#switchport mode trunk
```

Then, we configure IP address for sub-interface Fa0/1.10, Fa0/1.20 of Router0 with Table1, and set encapsulation standard as IEEE 802.1Q. The command on Router0 is as following:

```
Router0(config)#interface fastEthernet 0/1.10
Router0(config-subif)#
%LINK-5-CHANGED: Interface FastEthernet
0/1.10, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on
Interface FastEthernet0/1.10, changed state to up
Router0(config-subif)#encapsulation dot1Q 10
Router0(config-subif)#ip address 172.17.10.1
255.255.255.0
Router0(config-subif)#interface fastEthernet
0/1.20
Router0(config-subif)#
%LINK-5-CHANGED: Interface FastEthernet
0/1.20, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on
Interface FastEthernet0/1.20, changed state to up
Router0(config-subif)#encapsulation dot1Q 20
Router0(config-subif)#ip address 172.17.20.1
255.255.255.0
```

### 4.3 Simulation results and analyses

We ping from PC1 to PC2, and get the ICMP packet transform process to show the communication way between VLAN 10 and VLAN 20 for the ping command is based on ICMP. We can see ICMP packet transform process from PC1 to PC2 is as Figure3 to Figure7, and can know the ICMP packet transform process from PC2 to PC1 is the back way.

Figure 4. Packet from PC1 to Fa0/10 of Switch0.

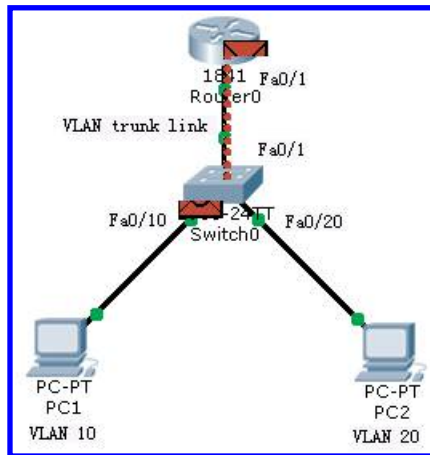

Figure 5. Packet from Fa0/10 of Switch0 to Fa0/1 of Router0.

Figure 6. Packet from Fa0/1 of Router0 to Fa0/1 of Switch0.

Figure 7. Packet from Fa0/20 of Switch0 to PC2.

Then, the import thing is to analyze the detailed information of IEEE 802.1Q frame in a VLAN trunk link between Swith0 and Router0. We get the Ethernet frame structure with IEEE 802.1Q frame tagging of IN and OUT Router0 are shown as Figure 8 and Figure9.

Ethernet 802.1q					Bytes
0	4	7	8	14	19
PREAMBLE: 1010 1010		S	F	DEST ADDR: 0001.64C8.AE02	SRC ADDR: 0000.BCE8.0B8A
TPID: 0x810	TCI: 0xa	TYPE: 0x1	DATA (VARIABLE LENGTH)		FCS: 0x0

Figure 8. IEEE 802.1Q frame tagging of IN Router0.

Ethernet 802.1q					Bytes
0	4	7	8	14	19
PREAMBLE: 1010 1010		S	F	DEST ADDR: 0000.BABE.CEAA	SRC ADDR: 0001.64C8.AE02
TPID: 0x810	TCI: 0x14	TYPE: 0x1	DATA (VARIABLE LENGTH)		FCS: 0x0

Figure 9. IEEE 802.1Q frame tagging of OUT Router0.

Comparing TCI field of Figure8 and Figure9, we can see the value of TCI is 0xa with the hexadecimal in Figure8, and is 0000000000001010 with the binary. For the last 12 bits of TCI is VID field, VID is 000000001010 with the binary, and is 10 with the decimal. So the packet of IN Router0 is belongs to VLAN 10. In the same way, we can see the packet of OUT Router0 in Figure9 is belongs to VLAN 20. Then, we know the packet of VLAN 10

and VLAN 20 is transform each other on Router0 and can all through VLAN trunk link.

## 5 CONCLUSIONS

In this paper, we analyze the packet transform process between VLANs through Switch and Router with the single arm routing method. Base on Packet Tracer, the simulation results show we can teach the single arm routing method more easily and efficiently than teach it in actual network. By this way, we can teach more and more network knowledge and technology base on Packet Tracer replace the actual network equipments, and solve the problem of many colleges and universities have not enough actual network equipments.

**ABSTRACT:** This paper proposes an optimization model of process parameters in Plastic Injection Molding (PIM). Firstly, the Taguchi method is employed for experiment and data analysis in which the quality characteristics for the plastic injection product are length and warpage. Besides, the control factors for the process are melt temperature, injection velocity, packing pressure, packing time, and cooling time. Moreover, the signal-to-noise (S/N) ratio and analysis of variance (ANOVA) are used to obtain a combination of parameter settings. Experimental data are set for the Response Surface Methodology (RSM) to analyze and create two quality predictors. Two quality predictors, length and warpage, are associated with Genetic Algorithm (GA) to search for an optimal combination of process parameters that meets multiple-objective quality characteristics. The confirmation results show that the approach not only enhances the stability in the injection molding process including the quality in length and warpage but also saves the cost and time spent from the mold design to manufacturing.

**KEYWORDS:** PIM, Taguchi method, ANOVA, RSM, GA.

## 1 INTRODUCTION

With the progress throughout times, plastic injection molding has become one of the important methods in producing plastic parts. It is noted from previous experience that many engineers and those with experiences of the field have considered plastic injection molding as a simple manufacturing process which does not need to make any adjustment. However, since plastic injection molding is actually a complex manufacturing process and manufactured product quality depends on the choice of materials, mold design and process parameter setting decision, optimal set of parameters has been considered a very important issue. As such, there has been a great need to seek quick and effective solutions, especially for global optimal process parameters. Therefore, parameter setting optimization has been recognized as the most important step in plastic injection molding for improving product quality.

Nonetheless, in order to reach individual product process parameter setting, engineers must often rely on experiences of the field to conduct trial-and-error method or Taguchi approach to determine the process parameters, which is time-consuming to achieve the suitable parameter combinations throughout various experiments. Additionally, the Taguchi method in the extant literature just mainly utilizes S/N ratio to seek the initial process parameters (Wu and Chen, 2006; Teng and Xu, 2008; Aggarwal et al., 2008; Kurt et al., 2009; Altan, 2010; Zhai and Xie, 2010; Ng et al., 2011; Öktem, 2012; Wang et al., 2013). However, the results of Taguchi experiments which aimed at seeking the optimal process parameters remained discrete combinations, which in turns failed to find the optimal process parameters. In practice, it has been noted that inappropriate process parameter combination would lead to product defects and process instability phenomenon and so on.

In order to solve these problems, many scholars have used CAE simulation software (e.g., Moldex3D, Moldflow, C-MOLD, etc.) to carry out injection molding simulation experiments or through the combination of simulation software, experimental design, and algorithms to conduct optimizations. For instance, Shi et al. (2003) applied Moldflow software to carry out simulations in which experimental data were processed using back-propagation neural network (BPNN) combined with genetic algorithms (GA); additionally, mold temperature, melt temperature, injection time and injection pressure were taken as control factors and maximum shear stress was referred to as quality characteristics to identify the optimal injection molding process parameters. Concerning warpage, Ozcelik et al. (2006) applied Moldflow software with warpage as quality characteristics and seven factors of mold temperature, barrel temperature, packing pressure, packing time, cooling time, runner type, and nozzle location to conduct Taguchi orthogonal array optimal experimental parameters and ANOVA analysis to investigate the impacts of control factors on quality characteristics as well as employ neural networks and genetic algorithms to search for the optimal parameter combinations. In consideration of product warpage, Kurtaran (2006) integrated experimental design, response surface methodology and genetic algorithms to obtain the optimal thin plastic warpage parameters and utilized ANOVA analysis to find more important factors as well as combined the response surface method and genetic algorithm to find the optimal process parameters. Recently, Park and Dang (2010) through integrating experimental design and response surface method as well as using ANOVA analysis and numerical simulations conducted optimization experiments. Similarly, Sun et al. (2010) utilized simulation software combined with response surface method and genetic algorithm to find the optimal injection molding parameters. Noteworthy, Zhao et al. (2010) through proposing the fast strip analysis model combined with PSO has effectively reduced the cooling time in the same packing pressure as well as shortened the declining time of injection molding temperature. Akbarzadeh and Sadeghi (2011) indicated that the shrinkage size change during the plastic injection molding process is an important issue. This study used regression and analysis of variance (ANOVA) to explore the relationships between input and output with main experimental parameters of melt temperature, injection pressure, packing pressure, and packing time. Moreover, Chen et al. (2012) employed experimental design, response surface method and genetic algorithm in the plastic injection molding process optimization experiments, in which CAE simulation software and DOE experiment data were first used to conduct ANOVA analysis to select more important

parameters, and then the regression model combined with genetic algorithm was utilized to obtain the best combination of process parameters. Furthermore, Chen et al. (2013) applied the Moldflow analysis software to conduct LED lens module optical design development optimization experiments. However, the CAE simulation has neglected the internal and external noise interference control factors and the actual injection error still exists. Therefore, this study utilizes the actual injection experiments to collect data to establish a multi-objective optimization model in the plastic injection molding process, then employs Taguchi method to carry out experiments and data analysis as well as utilizes the response surface analysis in combination with quality regression model and genetic algorithms (GA) to seek the optimal process parameter combination which is compliant with multi-objective product quality values.

## 2 PROPOSED OPTIMIZATION MODEL, EXPERIMENTAL WORK, AND NUMERICAL ANALYSIS

This study proposed a multi-objective quality optimization model for the injection molding process to maintain the product quality and reduce the quality variance. Accordingly, this study integrated Taguchi method, ANOVA, response surface methodology, and genetic algorithms to carry out the optimization procedure.

First of all, experimental factors as well as quality characteristics were determined by engineers from previous experiences and the Taguchi's orthogonal array was arranged. Since the injection-molded piece in this study is plastic, its slight warpage would possibly cause products to become unable to use or defective. Therefore, in the multi-objective quality optimization model, this study was in accordance with manufacturing specifications to select length and warpage, additionally via product appearance and specifications as well as vendor requirements to set length and warpage as two major quality characteristics. Experimental control factors included melt temperature (MT), injection velocity (IV), packing pressure (PP), packing time (PT), and cooling time (CT). Noteworthy, once the process parameter values in the control factors' standard settings exceeded the range setting, short shots or overflow shot situations would easily occur. To prevent this phenomenon, references from the field engineers' viewpoints and field experimental results were employed to determine the experimental control factors' standard range. Accordingly, the control factors' range settings were allocated into five levels as revealed in [Table 1](#).

In the next step, Taguchi method was utilized to conduct experiments and data analysis, followed

Table 1. Control factors in different levels.

	Melt temperature (°C)	Injection velocity (mm/s)	Packing pressure (Mpa)	Packing time (s)	Cooling time (s)
Level 1	249	30	27	0.9	11
Level 2	252	34	31	1.2	14
Level 3	255	38	35	1.5	17
Level 4	258	42	39	1.8	20
Level 5	261	46	43	2.1	23

by the signal-to-noise ratio (S/N ratio) method and analysis of variance (ANOVA) to identify the most significant process parameters for the optimal process parameter combinations. The experimental data were then used to carry out the response surface methodology analysis, consequently via the multi-quality regression model (quality predictor) combined with genetic algorithms (GA) to find out the optimal process parameter combinations in compliance with multi-objective product quality. Therefore, the achieved process parameter combinations were expected to not only enhance the stability of the injection molding process and ensure that the product length met the specifications but also effectively reduce product warpage.

### 2.1 Experimental equipment and finished product

In this study, Victor Taichung VS-80 injection molding machine was used for carrying out injection molding experiments. The PBT-2100 plastic material was utilized due to its characteristic of high hardness, low shrinkage, and being more resistant to high temperature. The target product length is 170.5 mm and warpage is as smaller as possible. The finished product is shown as in Figure 1. Product length was measured using Mitutoyo electric caliper with its range of 300mm and precision of 0.01mm. Warpage was measured using the NEW VISION-II automatic optical image measuring instrument with precision of 0.001mm.

Figure 1. Finished experimental product.

### 2.2 Taguchi experiments and ANOVA analysis

This study employed Taguchi parameter standard setting values to arrange an  $L_{25}(5^6)$  orthogonal array experiment, in which No.1~No.25 was Taguchi experimental data and No.26~No.30 was Taguchi within-range randomly generated testing data. Length and warpage are quality characteristics. As apparent from the achieved  $L_{25}(5^6)$  Taguchi orthogonal array experiment, the optimal length quality characteristic was the parameter combination 4. Similarly, the optimal warpage quality characteristic was parameter combination 22. The parameter combinations were shown in Table 2. In the next step, experimental data for length and warpage were respectively used to conduct ANOVA analysis. Accordingly, the significant influential factors towards length and warpage were respectively identified, and then the significant values were utilized to pick out Taguchi optimal parameter combinations, being shown as in Table 2. It was noted that it could be observed from ANOVA tables the factors with significant levels towards quality characteristics. The significant or non-significant factors were identified using the average value method; then, based on Taguchi's optimal standard method, the standard values of significant levels were taken out to be the optimal parameters. The optimal parameters are MT=255, IV=38, PP=33, PT=1.95, and CT=20.

Table 2. Length and warpage parameter combination of highest S/N ratio.

No.	MT	IV	PP	PT	CT	Average	Standard Deviation	Highest S/N Ratio
4	249	42	39	1.8	20	170.51	0.00837	36.6959
22	261	34	27	2.1	20	0.082	0.02883	21.2553

### 2.3 RSM

In accordance with the response surface methodology, the second-order model analysis was conducted to construct the quality regression model  $L(X)$  and  $W(X)$ , where  $x_1$  was melt temperature,  $x_2$  was injection velocity,  $x_3$  was packing pressure,  $x_4$  was packing

time,  $x_5$  was cooling time,  $L(X)$  was the length quality predictor, and  $W(X)$  was the warpage quality predictor. The quality regression equations were shown as in Equations (1) and (2).

In this study, product length and warpage were viewed as quality characteristics measurements, in which target length was 170.5mm and warpage values were expected to be the smaller the better throughout the experiment range. This study through response surface methodology attempted to find the optimal process parameter setting combinations for the best quality specification. Consequently, process parameter combination optimization was obtained, being presented as in Table 3.

$$L(X) = -1.14146 + 1.30857x_1 + 0.46305x_2 \quad (1)$$

$$\begin{aligned} & -0.11675x_3 + 1.31403x_4 - 0.42655x_5 \\ & -0.00171x_1x_2 + 0.00027x_1x_3 - 0.0092x_1x_4 \\ & +0.00222x_1x_5 + 0.00027x_2x_3 - 0.00112x_2x_4 \\ & -0.00097x_2x_5 + 0.02673x_3x_4 + 0.00002x_3x_5 \\ & +0.0277x_4x_5 - 0.0025x_1^2 - 0.00015x_2^2 \\ & +0.00005x_3^2 - 0.04241x_4^2 - 0.00372x_5^2 \end{aligned}$$

$$W(X) = -48.3015 + 0.28623x_1 + 0.07625x_2 \quad (2)$$

$$\begin{aligned} & +0.10492x_3 - 0.58078x_4 + 0.9682x_5 \\ & -0.00032x_1x_2 - 0.00063x_1x_3 + 0.00545x_1x_4 \\ & -0.00387x_1x_5 + 0.00035x_2x_3 - 0.00307x_2x_4 \\ & +0.0005x_2x_5 + 0.00423x_3x_4 + 0.00021x_3x_5 \\ & -0.03524x_4x_5 - 0.00036x_1^2 - 0.00011x_2^2 \\ & +0.00042x_3^2 - 0.11096x_4^2 + 0.00116x_5^2 \end{aligned}$$

Table 3. Optimization process parameters for RSM.

	MT	IV	PP	PT	CT
Length	249.3265	46	43	2.1	14.8031
Warpage	261	30	32.0303	2.1	23

#### 2.4 Multi-objective quality optimization

In this section, the response surface methodology (RSM) along with its established quality predictors was combined with genetic algorithms (GA) to carry out the injection molding process parameter optimization. As such, the RSM optimal parameter setting combination was utilized as initial process parameter setting values; additionally, search range settings for parameter were determined using length

and warpage process parameter settings, in which each of the max and min values were added to or subtracted  $\frac{1}{2}$  standard in case these max and min values reached standard values. The normalized range was 0.1 ~ 0.9, crossover point was 100 and the single point as well as crossover rate of 0.8 were employed for crossover operation. The mutation operation was processed using mutation points with mutation rate of 0.7 and convergence threshold of 1.000e-006 or after 50,000 iterations. As such, for this phase, the Matlab Optimization Toolbox software was utilized. The fitness function is defined as follows:

$$\text{Min } F(X) = (L(X) - 170.5)^2$$

$$\text{Min } W(X)$$

s.t.

$$249 \leq x_1 \leq 261, 30 \leq x_2 \leq 46, 28 \leq x_3 \leq 43$$

$$1.95 \leq x_4 \leq 2.1, 12 \leq x_5 \leq 23$$

where  $X = (x_1, x_2, x_3, x_4, x_5)$ ,  $L(X)$  is the predicted value of length response,  $W(X)$  is the predicted value of warpage response, 170.5 is the target value of length quality characteristics,  $x_1$  is melt temperature,  $x_2$  is injection velocity,  $x_3$  is packing pressure,  $x_4$  is packing time, and  $x_5$  is cooling time. The obtained optimal parameters are  $x_1 = 250.7$ ,  $x_2 = 32.05$ ,  $x_3 = 35.92$ ,  $x_4 = 2.1$ , and  $x_5 = 23$ .

### 3 CONFIRMATION EXPERIMENT

In this study, after conducting the injection molding process parameters optimization, the Taguchi parameter design method, and response surface optimization methodology, and the optimal parameter combinations were respectively utilized to carry out confirmation experiments. The obtained process parameters were then rounded to two decimals. However, due to potential precision mistakes of machine settings, the optimal parameter values were in compliant with the machine setting restrictions concerning rounding modes to carry out settings, as being shown in Table 4. Additionally, machine setting parameters were employed to carry out injection experiments for 25 treatments, during which the length and warpage were measured. Process capability index ( $C_{pk}$ ) is a very important indicator of process stability assessment. In manufacturing industries, the threshold for practical minimum  $C_{pk}$  is 1.33. Values less than 1.33 are unable to help achieve effective output and may cause bad products throughout manufacturing processes. Therefore, this study attempted to take length in conjunction with  $C_{pk}$  to conduct analysis; additionally, the product specifications were in accordance with industry

product length standards to set  $170.5 \pm 0.2\text{mm}$  as length quality specifications.

After conducting measurements and calculations through 25 actual experimental treatments, in terms of length quality characteristics, the optimized length average value (170.46) was acknowledged to be closest to the target value (170.5). Additionally, the  $C_{pk}$  value increased from 1.53 to 2.6 and the standard deviation decreased from 0.022 to 0.02. Concerning warpage quality characteristics, warpage average value decreased from 0.092 to 0.033 and the standard deviation reduced from 0.021 to 0.013, indicating that after optimization not only the length value approached the target value and the warpage values were lower but also the process became more stable.

Table 4. Machine parameter setting values.

	MT	IV	PP	PT	CT
Taguchi with ANOVA	255	38	33	1.95	20
Machine Setting	255	38	33	1.95	20
RSM-GA	250.7	32.05	35.92	2.1	23
Machine Setting	251	32	36	2.1	23

#### 4 CONCLUSION

Injection molding parameter setting is affected by the cost of production. According to previous studies, pre-manufacturing parameter settings have mostly been created by engineers of the field with practical experiences or through empirical methods, trial-and-error methods and experimental designs to find out the optimal process parameter combinations. Nonetheless, these methods tend to waste too much time and are costly. Additionally, the obtained process parameters have been non-optimal. Noteworthy, since Taguchi method of discrete optimization, the achieved parameters remained non-optimal. Therefore, this study along with the proposed two-stage optimization system for identifying the best process parameter combination, in which length and warpage are two major quality characteristics, has not only stabilized the compliant length throughout the manufacturing process but also reduced product warpage degree. Through the two-stage optimization parameter combination, this study has carried out actual 25 injection molds. Consequently, the results show that the parameter combination for  $C_{pk}$  length values for Taguchi approach and RSM optimization are 1.53 and 2.60, respectively. For the Taguchi method, warpage average value is 0.092 with standard deviation of 0.021 whereas warpage average value is 0.033 with standard deviation of 0.013 for RSM-GA optimization. Hence, it can be assumed that the achieved results of

this study not only help enhancing the overall stability of the injection molding process, generating much greater  $C_{pk}$  value than the values of the the Taguchi method and industry standard, and reducing overall warpage but also effectively reduce injection cost and time-consuming issues from mold design to manufacturing processes.

## Application of modular teaching in computer public courses for art major

Yi Zhang

*Department of Mathematics & Computer Science, Nanchang Normal University, Nanchang, Jiangxi China*

Jin Ming Shuai

*Training Department, Nan Chang Military Academy, Nanchang, Jiangxi, China*

**ABSTRACT:** This paper describes the current teaching situation in computer public courses for art majors, analyzes the advantages of the application of modular teaching in computer public courses for art majors, introduces the specific approaches in teaching practice through investigation of the effect of modular teaching applied to computer public courses for art majors, and sums up the application issues, shortcomings and limitations that should be noted.

**KEYWORDS:** Modular Teaching; Computer Public Courses; Education Reform.

### 1 INTRODUCTION

Application of modular teaching is popular presently, and its application in computer public courses is also common, such as *Exploration of Modular Graded Teaching in College Computer Basic Courses* by Liwei and Penghuiqin, *Teaching Reform and Practice of Computer Basic Course Directed by Application of Major* by Wangxiaoyong. These papers study, teaching methods of modular teaching applied to computer basic courses for non-computer major. Computer public courses for art major refer to computer public courses set up for students in art major, who have certain particularity in comparison to other major students. This paper chooses the computer public courses for art major as the study object; by adopting the modular teaching in computer public courses, it makes the study of the advantages of modular teaching applied to the computer public course for art major, introduces specific approaches in teaching practice, and finally draws a conclusion of teaching effectiveness and disadvantages of this study.

### 2 THE CURRENT SITUATION AND PROBLEM ANALYSIS IN THE COMPUTER PUBLIC COURSES FOR ART MAJORS

Form analysis of teaching contents, computer courses are divided into three modules. The first module is the basic knowledge of computer, which makes an

introduction to the history of computer development, the components of a computer, the representing methods of computer internal data, and computer networks, etc. The second module is the operational knowledge of common software, such as the operating system of system software and basic operation of office application software. The third one is computer language, such as VC and VB, etc. The first two modules generally belong to the course of Introduction to Computer Technology. The third one is exclusively regarded as Computer Language or Program Design. The period of these two courses would be set at 72 or 56 class hours, half of which is occupied for lectures and the other half computer practice. Lessons are commonly arranged in multi-media classroom, in which teachers do lectures on the platform while demonstrating to students copying them off stage. When in computer operation, students do some practices under the instructions of teachers. Teaching mode is generally “concepts”and “examples”mode, with which teachers arrange their lesson plan into a traditional way of “3-step approaches”to lecture every knowledge points: No.1 is introduction to knowledge points; No.2 verification of these points by examples; No.3 consolidation of knowledge points by practice.

From the analysis of teaching objects, students in the art major are included into a group of comparatively special teaching objects. There are two reasons. One is because their intellectual base is relatively worse than students of other majors. Their scores in college entrance examination are not very high. The other is because they are not

quite accustomed to large-scale class teaching. Their specialized courses are on a small scale, for the reason that students in small-scale class will obtain more chances to participate in class activity and more attention from their teachers.

Such large-scale class teaching causes art students' low learning enthusiasm and teachers of computer public courses reflect that bad class teaching efficiency and students' poor concentration often happen in class teaching for art major. In recent years, their examination results and passing rate in the National Computer Rank Examination (abbreviated to NCRE) are much worse than students in other majors.

There are two reasons for the above problems:

Firstly, the relevance between teaching contents and art major is not strong. From the aspect of the goal of talent cultivation, students training for art majors in colleges is to help them find relative jobs with their major in the future. They have to gain the knowledge of basic operation of common office software and grasp some relative software operation with their major as well. The operation of this software is quite different from common office software, which would be hard for students to learn by themselves. Teachers in fine arts and music major often make use of such software to instruct their lessons in specialized courses, but they won't systematically introduce the usage and operation of this software. Therefore, students in the art major have a strong need of learning these relative software with their majors.

Secondly, knowledge input has been laid importance and ability cultivation has been ignored considering teaching methods, and participation passion of students in teaching is not high. A great emphasis of courses has been placed on lecturing operation rules, rather than cultivating students' ability of problem-solving. A large amount of examples and experiments in books is to prove the correctness of knowledge, which has great differences from real problems in life, and goes against the students' ability of making analysis and then solving rather comprehensive and difficult problems in real life. The pattern of processing knowledge is single and students' participation degree is low with the result of boring courses. According to "3-step approaches" arrangement, students only get involved in the step of practice, the results of which give no much anticipation of them. In the rest of the steps, teachers are making instructions and demonstrations causing students' low enthusiasm.

Based on the above problem analysis, it is quite necessary that a teaching program of computer public courses should be specially drawn up for an art major, and teaching contents and teaching methods, etc. should be adjusted to adapt to teaching demands for students in art major.

### 3 THE ADVANTAGES OF INTRODUCING MODULAR TEACHING INTO COMPUTER PUBLIC COURSES FOR ART MAJORS

Firstly, its own characteristics of computer public courses fit modular teaching. The contents of these courses are divided into five parts: No.1 is basis of computer software and hardware; No.2 is office information processing; No. 3 is multi-media tech; No.4 is computer network; No.5 is programming. These contents have their own systems, and there is no much relevance between them, which shows the feature of "high cohesion and low coupling". They suit for the independent teaching module, which does not affect their integration.

Secondly, modular teaching enhances flexibility of curriculum organization. According to the teaching goal, after teaching contents have been divided by different modules, compulsory and elective modules will be set up. It is flexible for students, following their own interests, to study by combining different teaching modules. Such course organization is particularly suitable for art major now that art major can be subdivided into fine art, music and other fields, each of them has their own cultivation purposes. Modular teaching allows students in an art major to choose course contents suitable for themselves by assessing their own major field.

Thirdly, the introduction of self-directed learning enhances students' enthusiasm. The ultimate goal of teaching is "teaching one to fish is better than giving him fish". Only when students realize study is what they want to do in their whole life, they can spend much time on study enthusiastically and would be active to improve their learning methods for gaining more knowledge, thus teaching effect can be better. The consciousness for self-directed learning will be accomplished by the combined effort of teachers and students. And in modular teaching, such teaching concept is involved.

Fourthly, on the basis of projects, teaching contents should be closely connected with practical work, and student's work must be meaningful. According to this, teachers can combine several knowledge points into the application of a project, which they will explain to make students grasp these points with the purpose of cultivating their comprehensive ability of applying knowledge and their awareness of utilizing these points into real work.

### 4 THE SPECIFIC APPROACHES TO THE INTRODUCTION OF MODULAR TEACHING INTO COMPUTER PUBLIC COURSES FOR ART MAJORS

Firstly, add more teaching contents

Based on the three available teaching modules, the fourth one will be added, the content of which is

about the basic operations of software related with art major. In practical teaching experiments, overtrue and cooledit pro have been chosen for music field, photoshop and flash for fine art. There are numerous relative software with an art major. Therefore, some standards have been made for a good selection: No.1, it must be universally used in this field; No.2, it is quite easy to operate; No.3, it must have powerful functions; No.4, it is easy to get access to on the Internet or in the library; No. 5, it has to be recommended by most teachers in art major. The above four kinds of software are qualified for these five features, and the added part is so welcomed among students whose enthusiasm for learning has been enhanced.

Secondly, introduce “self-directed learning”

If every knowledge point of computer public courses is lecturing in the original way, class hours are far less than enough. On the other hand, students will easily get bored with study, their learning, enthusiasm keeps low, and there will be the bad teaching effect if they do never really participate learning process and become subjects of “knowledge-input”. The new teaching module is concluded as “retaining the large and releasing the small, teachers questioning and students answering, mutual improvement”. “retaining the large and releasing the small” refers to that teachers only explain larger knowledge points while smaller ones are left for students to study and summarize. Every small point attaches itself to large one. When larger point is lectured, its learning process will become the explanation of related small points one by one. This new module goes like this: relevant question put forward ( teachers questioning ) → answers found by students themselves ( students answering ) → class discussion, induction and conclusion ( mutual improvement ). The key point of this module is “ teachers questioning”, whose questions are all about large points. Students first make their own efforts to answer these questions, and make self-study reports, which will be evaluated in class by teachers who at the same time conclude these questions so as to reach the goal of mutual improvement.

The first result of such arrangement is strengthening students’ awareness of self-directed learning. They become the masters of class, whose study has turned from knowledge input into active learning. And their enthusiasm for study can be greatly increased. The second is improving teaching effect. Students look for every knowledge point on their own, and testify by programming, which deepens their understanding of these points. The third is cultivating students’ ability of posing, analyzing and solving a question. In order to grasp new knowledge, they influentially get to know how to raise a question, then analyze and settle it. This module reaches the aim of “teaching one to fish is better than giving him fish”. The fourth is extending class outside

and mitigating the shortage of class hours. Students spend their spare time looking for answers, and in class they just need to finish two stages of “teachers questioning” and “mutual improvement”. The fifth is beneficial for both teachers and students. Many of students’ ideas can inspire their teachers. Teaching is no longer like teacher pouring water into a student’s cup, but looking for resources together.

Thirdly, select real problems at work as teaching examples and carry out cooperative learning. In class, students can be divided into several learning teams on the basis of their interests and specialties, each of which can learn to make some comprehensive project. These examples and projects originate from real work, such as teachers once contacted the advertisement company to use their design of print ads as examples to present an explanation; they got in touch with some print shop, and asked a learning team to work there for a day. Benefiting from such arrangement, students can have the idea of which software is often used in real work and know how to deal with the real problem with the knowledge of software operation they learn in class.

Fourthly, carry out “multiple assessment” with a variety of evaluation means

Examination index for teachers includes their morality, style, appearance, teaching attitude, ability and competence, and degree of familiarity with teaching contents; index for students contains their learning attitude, competence, operational ability and degree of grasping course knowledge. The assessment is meant consists of formative and summative assessments. First, the formative assessment is mainly undertaken by office of teaching affairs, which will send out teaching supervisors to inspect and evaluate class teaching. Secondly, summative assessment can have many evaluation modes. No. 1 is an exhibition competition of students’ works. At the end of term, there will be an exhibition of students’ works of computer public courses from art major, where students present their works and get evaluations from other students. All students communicate their learning experiences with each other, from which they will acquire the basic ideas about their own learning situation, understand their own disadvantages and set an explicit aim for future learning. No. 2 is a students’ midterm and final examinations. Teachers will assess students’ learning situations by analyzing passing rate, variance, grade distributions and other parameters of students’ papers. They will also find out their problems in class teaching by assessing each knowledge point on papers. Students can know their grade ranking and disadvantages. No. 3 is questionnaires and interviews with teachers and students, through which satisfaction degree of both sides with courses will be made clear, and so do satisfaction degree of students with teachers

and teachers' assessments of other teachers and their students.

Final score of students consists of examination result and regular grades on a weighted average. First, exam result includes midterm score (30%) and final score (70%). Secondly, regular score can be given by teachers who will judge the students' performance of work and roles in the process of accomplishing small projects in each lesson and large projects at the end of term. Thirdly, the final score is composed by exam result (50%) and regular grades (50%) on a weighted average.

The assessment designed like this will avoid a single evaluation mode to judge students by only one examination and combined with students' regular performance, can give a rather objective and overall assessment to them. Teachers can employ parameters like passing rate of exams, variance, and their score distribution of all students in final examination to inspect the students' learning state and paper quality.

## 5 THE SURVEY FINDINGS OF STUDENTS' FINAL SCORE AND LEARNING ENTHUSIASM AFTER COURSE REFORM

The course reform has begun in April of 2012. Experiment data (table No.1, No.2 No.3) show that after several years of reform, students' grade has been improved to some degree, and their learning enthusiasm has also enhanced steadily. Respondents are all students in the art major of our college. The survey period lasts one year from September of 2012 to September of 2013.

Table 1. Correlation data of students' scores in computer culture foundation after reform.

grade2011	difficulty coefficient	0.51
	average score	56.4
	the highest score	84
grade2012	difficulty coefficient	0.50
	average score	58.3
	the highest score	87
grade2013	difficulty coefficient	0.52
	average score	60.6
	the highest score	87

Table 2. Data of sampling survey of learning enthusiasm of sophomores in programming courses.

2011year	unwilling to study	11.3
	average	54.2
	strong desire to study	34.5
2012year	unwilling to study	8.8
	average	55.6
	strong desire to study	35.6
2013year	unwilling to study	7.6
	average	52.3
	strong desire to study	40.1

Difficulty coefficient is  $P=1-x/w$ ,  $x$  is the average score of exam paper, and  $w$  is the full mark. Exam paper will be easy if parameter of difficulty is small, vice versa. Minimum is 0, and maximum is 1.

## 6 DISADVANTAGES OF COMPUTER PUBLIC COURSE REFORMS

First, this reform is suitable for small scale of class teaching with at most 30 students. When employed in the larger scale of class teaching with more than 3, effect is not desired in group study, and teaching quality is also affected.

Secondly, we should have more communications with teachers in art major, and explanation scale and depth of relative software operations with an art major to better serve teachers in this major and help students fast grasp major knowledge and adapt themselves to teaching contents of major courses.

## Operating performance evaluation of listed companies in China's electric home appliance industry

Fang Chen

*School of Economics and Management, Hubei University of Science and Technology, Xianning, China*

Xing Quan Yan

*Planning and Finance Department, Hubei University of Science and Technology, Xianning, China*

**ABSTRACT:** Based on the performance evaluation methods at home and abroad, this paper firstly structures a performance evaluation system of a listed company. The system consists of five abilities including debt paying ability, operation ability, profitability, growth ability and cash flow ability and 15 indexes. Then an empirical analysis is made using the factor analysis method according to the data of the annual report 2013 of a listed company in China's electric home appliance industry. The analytic result shows that the business performance of the listed companies can be increased through improving profit and growth ability, short-term debt paying ability and cash flow ability.

**KEYWORDS:** Operating performance evaluation; Electric home appliance industry; Factor analysis method.

With the development of China's securities market, the listed company's operating performance has become an important issue of common concern by investors, creditors and other stakeholders, and how to scientifically and reasonably evaluate listed companies have also become hot issues in the current investment theory and practice. It empirical analysis 2013's annual report data of listed company in China's home appliance industry with factor analysis, In order to find the main factors to the performance of listed companies in China's home appliance industry, to put forward the corresponding counter measures and suggestions for improving the operating results of listed companies in China's home appliance industry.

### 1 BUILDING A COMPREHENSIVE EVALUATION INDEX SYSTEM

Operating performance evaluation is a complex system by a lot of mutual restraint organic elements, creating a scientific, structured, actionable evaluation system is an important foundation and prerequisite work to evaluate the business' performance. In order to design a scientific and reasonable evaluation index system (Chen 2012), Based on a comprehensive reference company performance

evaluation index system, combining with the actual situation of the development of China's listed companies, to a certain extent, cash flow ability index can really reflect the listing company's profit quality and debt paying ability. Based on debt paying ability, profitability, operation ability and growth ability, 3 indexes are selected in this performance evaluation system (Ma et al. 2011), there is an evaluation system, including 15 indicators in cash flow ability, debt paying ability and other five areas. They are shown in [Table 1](#).

### 2 ANALYSING EMPIRICALLY OPERATING PERFORMANCE OF LISTED COMPANIES IN HOME APPLIANCE INDUSTRY

In order to evaluate the home appliance industry listed company's operating performance. The author collected 2013 annual report data of listed companies in household electrical appliance industry. It selected 38 listed companies in the electrical appliance industry as samples. According to the front performance evaluation system, It used Factor analysis to comprehend evaluate the 38 samples' operating performance, the whole analysis is accomplished using SPSS17.0, finally achieved using four principal component factors instead of 15 original variables.

### 2.1 Standardizing data

To standardize 38 samples' original data of 14 variables  $X_{ij}$  ( $i=1, 2, \dots, 38, j=1, 2, \dots, 15$ ) standardized, It can get a new variable  $Zx_{ij}$  as the following (1):

$$Zx_{ij} = \frac{X_{ij} - \bar{x}_j}{\sqrt{\text{var}(x_j)}}$$

$$\text{where } \bar{x}_j = \frac{1}{38} \sum_{i=1}^{38} x_{ij}$$

$$\text{var}(x_j) = \frac{1}{38} \sum_{i=1}^{38} (x_{ij} - \bar{x}_j)^2$$

$$i = 1, 2, \dots, 38; j = 1, 2, \dots, 15$$

### 2.2 Testing correlation

Before using factor analysis, to study whether there is a linear correlation in 15 operating performance evaluation indexes, It generally uses Kaiser-Meyer-Olkin

test and Bartlett test of sphericity to judge whether it is suitable doing factor analysis or not. In this paper, It analyzes the standard variable  $ZX_{ij}$  by SPSS17.0 to judge whether it exists some linear correlation between 15 evaluation indicators of the financing structure, the results are shown on KMO and Bartlett's Test table (table Omitted). KMO and Bartlett's Test table shows the sphericity test statistic Bartlett is 742.912. A test P value close to 0, It indicates that there is a strong correlation between 15 variables (Li et al. 2013). The KMO test is used to measure partial correlation between variables, the value of KMO is 0.702, It's higher than 0.7, and the common factor variance shows that all the variables are measured in more than 75%, therefore, the common factor extraction has strong explanatory power of the primitive variables, It's suitable doing factor analysis.

### 2.3 Extracting and naming factor

In this paper, It uses the principal component method to extract the first 4 common factors whose feature root exceeds 1 and the cumulative variance contribution rate achieves 79.94% common factors, each factor's characteristic root and variance contribution are shown in Table 2.

In order to simplify the factor loading matrix, using the Varimax most solution (variance) to rotation of factor loading matrix, so that each of the columns or rows element square values to the polarization of 0 and 1, It can be obtained (table Omitted) according to the results of the rotating factor loading matrix, Factor 1 has high weights in X7 (Operating profit growth rate), X8 (Net profit growth rate), X9 (Operating margin ratio), X10 (Business net interest ratio), X11 (Return on equity), Factor 1 is on behalf of the company's profitability and growth ability, profit ability and growth ability of home appliance industry listed companies has the biggest contribution to operating performance, factor contribution rate reached 30.02%, earnings and growth can be the primary factors influencing the home appliance industry listed companies operating

Table 1. Performance evaluation system of listed companies.

Index type	Code	Index name
Debt paying ability	x1	Asset-liability ratio
	x2	Current ratio
	x3	Quick ratio
	x4	Turnover of total assets
Operation ability	x5	Turnover of accounts receivable
	x6	Turnover of inventory
Growth ability	x7	Operating profit growth rate
	x8	Net profit growth rate
Profit ability	x9	Operating margin ratio
	x10	Business net interest ratio
	x11	Return on equity
Cash flow ability	x12	Return on total assets
	x13	Net operating cash flow per share
	x14	Now sales ratio
	x15	Operating cash ratio

Table 2. Total variance explain.

Component	Initial Eigen values			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	5.55	36.97	36.97	5.55	36.97	36.97	4.50	30.02	30.02
2	2.95	19.69	56.66	2.95	19.69	56.66	3.04	20.28	50.30
3	2.19	14.59	71.25	2.19	14.59	71.25	2.42	16.12	66.42
4	1.31	8.70	79.95	1.31	8.70	79.95	2.03	13.53	79.95
...	...	...	...						
15	0.00	0.01	100						

performance. Factor 2 has a bigger weight in X2 (Current ratio) and X3 (Quick ratio), so Factor 2 is on behalf of the company's short-term debt paying ability, factor contribution rate reached 20.75%, short-term solvency risk is also an important factor influencing the home appliance industry listed companies operating performance. Factor 3 has bigger weight in X5(Turnover of accounts receivable), X15 (Operating cash ratio) and X13 (Net operating cash flow per share), so Factor 3 represents the company's cash flow ability, factor contribution rate reached 16.12%, Factor 4 has bigger weight in X4 (Turnover of Total assets), Factor 4 representative operating capacity, factor contribution rate is 13.53%, It also has bigger impact on the home appliance industry listed companies operating performance. Four factors represent the economic meaning of profit and growth ability, short-term debt paying ability, cash flow and operating ability.

#### 2.4 Calculating factor scores and composite score

Factor score is a linear combination of variables, it determines the factor score function from Component

Score Coefficient Matrix table (table Omitted):

$$F1=-0.024ZX1-0.047ZX2+...-0.042ZX15$$

$$F2=-0.263ZX1+0.379ZX2+...+0.007ZX15$$

$$F3=0.013ZX1-0.098ZX2+...+0.329ZX15$$

$$F4=-0.013ZX1+0.084ZX2+...+0.018ZX15$$

Each sample's four factor scores are calculated based on the factor score function, Composite factor score is the average of four factor scores weighted by the size of each common factor variance:  $FT=(4.50 * F1+3.04 * F2+2.42 * F3+2.03 * F4) / (4.50+3.04+2.42+2.03)$

Each sample factor score and composite score are shown in Table 3.

### 3 ANALYTIC RESULTS

Through sample companies' factor analysis composite score calculation, It can be seen impact operating results and major factors of listed companies in China's home appliance industry:

#### 3.1 Operating performance is different between listed companies in China's electric home appliance industry

Table 3 shows the performance of listed companies in China's home appliance industry has big difference, such as Changshu Tianyin Electro-mechanical Co., Ltd. (300342), Shenzhen Fenda Technology Co., Ltd. (002681), Zhejiang Meida Industrial Co., Ltd. (002677), Hangzhou Robam Appliances Co., Ltd. (002508), VATTI STOCK CO., LTD. (002035),

Table 3. Samples' factor scores and comprehensive scores.

NO	F1	F2	F3	F4	FT
000651	0.24	-1.10	2.03	1.06	0.24
002508	0.72	0.43	0.89	-0.46	0.72
000100	0.16	-0.86	-0.22	-0.20	0.16
600690	-0.02	-0.61	0.76	1.43	-0.02
000521	0.20	-0.41	-0.45	0.86	0.20
002242	0.05	0.14	0.79	-0.26	0.05
600983	0.41	-0.94	0.69	-0.63	0.41
600060	0.10	-0.18	-0.06	0.82	0.10
002035	0.60	-0.39	0.43	1.45	0.60
002429	0.12	0.06	-0.74	0.07	0.12
002705	0.00	-0.86	0.17	0.58	0.00
002032	0.35	-0.13	0.16	0.02	0.35
000418	0.22	-0.15	0.15	0.90	0.22
002686	0.43	1.04	-0.12	0.00	0.43
000921	0.53	-0.50	-0.85	2.85	0.53
002614	0.20	0.36	-0.10	-0.24	0.20
002723	0.10	-0.46	-0.11	-0.17	0.10
300342	0.27	3.01	-0.44	0.17	0.27
002668	0.28	-0.54	-0.09	0.59	0.28
603366	-0.57	0.99	1.69	-0.16	-0.57
002543	0.37	0.35	-0.23	0.47	0.37
002005	0.09	-0.81	-0.39	-1.28	0.09
000801	-0.17	-0.13	-0.77	-0.04	-0.17
002519	0.33	0.62	-0.50	-0.44	0.33
600839	0.06	-0.76	-0.45	-0.36	0.06
002677	-0.21	1.04	3.60	-1.98	-0.21
002616	-0.03	-0.67	0.32	-0.91	-0.03
002473	-0.66	3.34	-1.23	-0.03	-0.66
002681	0.31	1.56	0.15	0.94	0.31
600854	0.41	-0.39	-0.19	-2.08	0.41
600870	-5.78	-0.44	-0.27	0.25	-5.78
002260	0.04	0.25	-0.71	0.62	0.04
000909	0.32	-0.94	-2.78	-2.38	0.32
000016	-0.05	-0.99	0.14	0.16	-0.05
000533	0.29	-0.17	-0.39	-1.01	0.29
002670	0.21	0.13	-1.06	0.29	0.21
002403	0.13	0.22	-0.14	-0.52	0.13
600336	-0.05	-1.10	0.28	-0.40	-0.05

each of them five factor points higher than other companies, ranking in the top five. And Xiamen Overseas Chinese Electronic Co., Ltd. (600870), Soyea Technology Co., Ltd.(000909), Elec-Tech International Co., Ltd. (002005),Jiangsu Chunlan Refrigerating Equipment Stock Co., Ltd. (600854), Sichuan Changhong Electric Co., Ltd. (600839), their each factor score relatively low, result in ranking at the end of them. Comparison of scores can be seen from the top five and last five enterprises, listed company's operating performance good or bad is not determined by a factor (Zhang et al. 2013), but by the balanced development of all the factors. Even if the individual scores high and low scores in other

consolidated results of operations will not have a high score in the score, so the appliance industry companies need balanced development.

### 3.2 *Profitability and growth capacity are the primary factors to operating results of listed companies in the appliance industry*

It can be seen from Table 3, Hangzhou Robam Appliances Co., Ltd. (002508), Hisense Kelon Electrical Holdings Co., Ltd. (000921), VATTI STOCK CO., LTD. (002035), Shenzhen Fenda Technology Co., Ltd. (002681), Zhejiang Yilida Ventilator Co., Ltd. (002686), their profit factor significantly higher than other companies, but also in various Factor in the biggest share of the weight, they are also in the forefront of the ranking. Such as Xiamen Overseas Chinese Electronic Co., Ltd. (600870), Soyea Technology Co., Ltd. (000909), Elec-Tech International Co., Ltd. (002005), Chunlan Refrigerating Equipment Stock Co., Ltd. (600854), Changhong Electric Co., Ltd. (600839) and other listed companies who has low or even negative score in the ability of Profitability and growth, their composite score are in the end of ranking. Therefore, profitability and growth capacity are important indicators to determine the level of performance of the company, they are primary factors affecting the operating results of listed companies appliance industry, improve profitability and growth capacity are the most important aspects to improve business performance.

### 3.3 *Short-term debt risk is an important factor to operating performance of listed companies in the appliance industry*

From the short-term debt risk factor analysis, Changshu Tianyin Electromechanical Co., Ltd.(300342), Shenzhen Fenda Technology Co., Ltd.(002681), Zhejiang Meida Industrial Co., Ltd. (002677), Zhejiang Yilida Ventilator Co., Ltd. (002686), Ningbo Sunlight Electrical Appliance Co., Ltd. (002473), these several listed companies' short-term solvency are stronger. But while Xiamen Overseas Chinese Electronic Co., Ltd. (600870), Soyea Technology Co., Ltd. (000909), Elec Tech International Co., Ltd. (002005), Jiangsu Chunlan Refrigerating Equipment Stock Co., Ltd. (600854), Changhong Electric Co., Ltd (600839), their weak short-term solvency result in listed companies ranked by the performance evaluation. But such as Changshu Tianyin Electromechanical Co., Ltd.(300342), Sunlight Electrical Appliance Co., Ltd.(002473), Shenzhen Fenda Technology Co., Ltd (002681), they have strong short-term solvency and weak long-term solvency, it results their Comprehensive operations forefront ranking in the listed company(Wang et al.

2013). Therefore, China's home appliance industry, companies listed on the company's development strategy can be considered to improve the company's debt structure to improve business management.

### 3.4 *Asset Trading appliance industry has little effect on the operating results of listed companies*

As can be seen from the asset operating capacity factor score results, like Tianyin Electromechanical Co., Ltd. (300342), Zhejiang Yilida Ventilator Co. Ltd.(002686), Zhejiang Meida Industrial Co., Ltd. (002677), Hangzhou Robam Appliances Co., Ltd. (002508), Shenzhen Fenda Technology Co., Ltd. (002681), The score of assets operating capacity factor analysis is lower in these companies, but in the operating results of the evaluation composite score is higher, but as Xiamen Overseas Chinese Electronic Co., Ltd.(600870), Guangdong Homa Appliances Co., Ltd.(002668),Guangdong Elecpro Electric Appliance Holding Co., Ltd. (002260), Guang dong Xinbao Electrical Appliances Holdings Co., Ltd. (002705), Hefei Meiling Co., Ltd. (000521) and other companies operating capacity factor analysis in assets scored relatively high, but in the evaluation of operating performance composite score ranking has been more on the list. It can be seen operating assets have little effect on China's home appliance industry, the ability of listed companies' operate performance evaluation.

## 4 CONCLUSIONS AND SUGGESTIONS

The operating performance evaluation of listed companies is a complex process referring to many evaluation indexes and methods. The five abilities including debt paying ability, operation ability, profit ability, growth ability and cash flow ability and 15 indexes of listed companies are has selected to analyze the data of the annual report 2013 of the listed companies in China's electric home appliance industry using the descriptive statistics and the factor analysis method. The analytic result shows that the main factors affecting the performance of the listed companies in China's electric home appliance industry include profit and growth ability, short-term debt paying ability and cash flow ability. The research may provide some useful guidance for the listed companies of the electric home appliance industry to improve their business performance. The shortcoming of the research is that the data of only a listed company in a recent fiscal year is analyzed, and so in the future the research will be continued to valid the evaluation method evaluation system using the data of listed companies of deferent industries in several years.

# Building an “information service supermarket” of the university digital library in the information era

Li Hua Ma, Jing Zhao & Yan Li Zhao

*Jilin Agricultural University Library, Changchun, Jilin, China*

**ABSTRACT:** In the information era, the storage medium of library resources has gradually changed from paper to photosensitive materials, magnetic materials and the Internet. The traditional information service can no longer meet the information requirements of users nowadays. On this basis, the author builds an “information service supermarket” by adopting the idea of “supermarket” and information technology to provide “one-stop” service for the users of university digital library.

**KEYWORDS:** Information era; Digital library; Information service supermarket.

## 1 INTRODUCTION

In the information era, digital information resources have enjoyed rapid growth. Papery libraries gradually develop into digital ones, so that traditional information service can no longer satisfy the information demands of the users. According to “Information Demand Theory (Hu & Chen, 1995)”, in order to provide information services for users at different levels with their demand characteristics, setting up “one-stop” service platform is the problem that university digital library must pay attention to and implement as a serious consideration.

## 2 MEANING AND FEATURES OF THE “INFORMATION SERVICE SUPERMARKET”

### 2.1 *Meaning of “information service supermarket”*

Information supermarket is the combination of information productization and servitization, that is to integrate scattered information with information service currently effectively, and put them in the supermarket for the users to select, thus to become the Wal-Mart in the information field. The information product has not only the general features of service, but also the following features: (1) time-validity, strong sharability; (2) there are trends of large scale, specialization, individuation in information service; (3) the information service is a knowledge-intensive, technology-intensive, intelligence-intensive service of the new type. “Information service supermarket” means to collect the different information products, items, contents, methods, etc. together as commodities to build an information service “market” of open type for users to freely select service items, service contents,

product forms, etc., further to accept information service. “Information service supermarket” is an information service mode put forward through the example of “supermarket” which is familiar with everyone.

### 2.2 *Features of the “information service supermarket”*

“Information service supermarket” (1) is to let the users feel equal and relaxed service mode while receiving digital information service (Liang, 2008). (2) It is a service mode, providing different arrangement for special information contents of various users. (3) It is a service mode, giving play to the initiative and individuation as far as possible according to the personal information of users. (4) It is a service mode paying full attention to individual difference between users and focusing on their personalities and strengths, so that the initiative of library staff and users can be fully expressed, and allowing users to take the initiative to obtain information, training users to develop a good independent analysis of issues, problem-solving habits reference service mode, continue to enrich and strengthen service content reference service mode.

## 3 THE NECESSITY OF BUILDING AN “INFORMATION SERVICE SUPERMARKET” OF THE DIGITAL LIBRARY

### 3.1 *The scope and means of information service in traditional libraries*

The material basis of information service in traditional libraries is a reference book and retrieval tool in printed form, with old-fashioned technological means

and inflexible service mode—waiting for face-to-face passive service; move mode: email and telephone. The work characteristic is to provide basic single-level service for teaching and scientific research on the basis of papyry information resources in libraries. The main supply modes include: verbal solution; paper duplicates checking (papyry resources); selective dissemination of information service and on-topic information service (limited by space-time and literature type).

### 3.2 *The revolution of information service of the digital library in the information era*

The rapid development of information technology has greatly changed the material basis of information service in modern digital libraries—including not only the subsistent collections of libraries, but also “virtual collections of library” which can be used and searched by the users through intangible Internet. In the new historical period, information service has developed by leaps and bounds—the changes of information service concept lead to a large transformation in the range, object and service mode of information service, etc. Specific performance: service mode: active service; transmitting mode: E-mail, QQ online; service items: online consultant, paper duplicate checking (digital resources), selective dissemination of information service and on-topic information service (not limited by space-time and literature type).

In conclusion, the traditional library can only provide passive “position” services with the library resources, which cannot satisfy the maximum personalized information demands of users. In order to eliminate the disadvantages of information services in traditional libraries, activate the advantages of information services in digital libraries, the construction of “information service supermarket” in digital libraries is the best choice, thus to gradually develop the information service of digital library into personalized and deep services to finally realize the active push of information. In this way, it will have great significance to further deepen personalized information service of libraries.

## 4 THE CONSTRUCTION OF AN “INFORMATION SERVICE SUPERMARKET” IN DIGITAL LIBRARIES

### 4.1 *Regional design of the “information service supermarket”*

According to characteristics of document information service including systematicness, effectiveness, practicability and specialty, the “information service supermarket” will be designed into five regions as follows as shown in [Figure 1](#).

### 4.2 *Design of the area content*

Design the contents according to the characteristics of five regions of “information service supermarket”, and details are as follows: (1) Information desk: E-mail consultation and advices, electronic resource answer, books and periodicals retrieval answer, common problem answer. (2) Resource development of network information: periodical area, free patent, standard and agricultural information resources. (3) Information resource reorganization: database of reference books for teaching use, subject guidance, SCI acquisition information, free foreign websites. (4) Personalized information service: personal digital library, information transfer. (5) Information resource utilization training: Duxiu Knowledge Search Database, CNKI, OA, Guodao Special Subject Database, EBSCO.

### 4.3 *Implementation of the area content*

Implementation steps: (1) Integrate all kinds of consultation answer record into the area “information desk”; (2) Sum up and reorganize free websites of electronic journals, finally make available URL for a specific subject—periodical area, integrate free patents, standard and agricultural information resources of relevant subjects into the region of “network information resource development”. (3) At first, retrieve the paper books relevant to the subject

Figure 1. The design of an area.

and extract them according to the titles and ISBN of the teaching reference books provided by the teachers, by using the library collection system of Jilin Agricultural University, and then process them into electronic edition and build the database of teacher's teaching reference books according to different subjects of different categories. Secondly, collect the free resources of key subjects and make a subject guidance chain. Thirdly, collect and arrange SCI acquisition information. Finally, integrate these three products mentioned above into the region of "information resource reorganization". (4) According to the personal digital library platform of CNKI, to build a personal digital library for teachers, and then integrate the login interface and information transfer mode into the region of "personalized information service"; (5) Integrate the training course materials for information resources every time and "database operating guide" made by staff in the reference department into the region of "training of information resource utilization for users".

## 5 CONCLUSION

In the information era, the explosive growth of quantity of information resources brings great difficulties

to users to select the literature they need. The construction of "information service supermarket" can provide one-stop retrieving service for users to select required literature, with the inconvenience of selecting literature relieved. In this way, their time will be saved and used into more teaching and scientific research.

## ACKNOWLEDGMENTS

# Cloud computing-based KMS in comprehensive hospitals

Zhong Hua Luo, Li Xin Yun & Xiang Zhang

*Department of Economics and Business Management, Gansu College of Traditional Chinese Medicine, Lanzhou, China*

**ABSTRACT:** Knowledge Management System (KMS) in comprehensive hospitals is complicated. It becomes necessary to perfect the management information platform. Analyzing the definition of complication-oriented KMS and its factors that affect its construction, the paper introduces cloud computing-based KMS and gives the abstract means to construct the knowledge management system in comprehensive hospitals.

**KEYWORDS:** Comprehensive hospital, Complication-oriented knowledge management system, Cloud computing, Construct system.

## 1 INTRODUCTION

Nowadays, knowledge and information have replaced capital and energy sources and become the principal resources [1]. Whether enterprises require succeeding or not, they have to rely on the knowledge quality of their own, which make managing knowledge effectively become a very important means to improve their competition [2]. If a comprehensive hospital wants to realize the sustainable development in the competition, it must require high quality knowledge as more than possible by all means, and share the knowledge to enhance the transformation efficiency of knowledge, and then promote the innovative ability and the ability meeting an emergency. Complication-oriented hospital knowledge management has been attached great importance in comprehensive hospitals by the governors.

There are no common ideas about the definition of knowledge management in the scholastic circles [3,4]. Qitas in 1997 thought that knowledge management means it is a successive process of settling and mining knowledge to meet all the needs from now and the future. Bassi in 1997 gave the definition that it is a process to get, create and use knowledge in order to boost organizational performance. Wiig in 1997 concluded that it is a kind of inspection and promotion the action related to knowledge from top to bottom, and it is an active process that creating and maintaining knowledge infrastructure and updating the structure and transforming knowledge capital and then using knowledge to increase its value. Allee in 1998 summarized that knowledge management should include the reflection to knowledge, which means to reflect and reconstruct of the style of communication, technique and organizational structure and then to acquire and communication more effectively. Frappuolo in 1998 recognized

that knowledge management means that organizations enhance their ability of meeting an emergency and the innovative ability, and it should include the four functions of externalization, internalization, intermediation and cognition. Externalization means to get knowledge from exterior and class the knowledge in some style. Internalization defines the transformation to knowledge, that is, to filter the knowledge from exterior and extract the useful knowledge. Intermediation means to seek the best sources to meet the demand. Cognition applies knowledge of the three functions above to practice. Based on the views above, we summarized that knowledge management means a process that organizations get, settle, save, transform, share and innovate and apply knowledge to enhance their competition and get more benefit.

## 2 COMPLICATION ORIENTED HOSPITAL KMS IN COMPREHENSIVE HOSPITALS

Many views about knowledge management are static [5], not evolution and lack for analyzing and mining the complication and uncertainty. A comprehensive hospital involves multifactor supply and demand network, which make it face more challenge than a general organization. Knowledge management in a comprehensive hospital should be complication-oriented and dynamic, it collects the collective knowledge and technique, and integrates them and then distributes to any nodes where can help to realize the most benefit including organization or individuals, meanwhile sharing the knowledge and creating maximum value.

Complication-oriented KMS in a comprehensive hospital should have some contents as follows, under

dynamic environment, mining available information after analyzing the enterprise stratagems and targets, and storing the knowledge resources, that is knowledge repository, knowledge environment to prefect knowledge, and knowledge channel to convey knowledge effectively. So some characteristics as follows should be satisfied.

A. Dynamic characteristics

Since a comprehensive hospital involves many aspects and is also easily affected by the environment, matching its surroundings has become one of the key factors for its future existence and development. KMS should have the ability to face and answer the varied surroundings and can collect the knowledge and store it for the future.

B. Self-study

KMS in comprehensive hospitals should have the ability to reconstruct their structure to conform the surroundings, developing knowledge configuration of their own, which is not only the conciliation but also the enterprising.

C. Knowledge share

Knowledge should be shared in KMS by all the nodes in the same network or the neighbor nodes, which will help to accumulate and spread knowledge.

3 KEY ELEMENTS TO CONSTRUCT COMPLICATION-ORIENTED KMS

With the complexity and the uncertainty, constructing KMS in comprehensive hospitals involves a good many

factors not limited to some special program module [6, 7]. The contents and characteristics having been studied, some elements below are essential to construct KMS.

- 1 Many elements should be involved, such as subsidiary organizations, patients, related departments, the cooperative alliances and all the benefit-related organizations, including government, which means the constructing is from various aspects, making it not only multi-side participation but also mutual check.
- 2 Affected by the operating environment, KMS should update the data betimes. Since the stored knowledge is not static, the system should develop and update itself constantly in time.
- 3 Knowledge in comprehensive hospital should be a knowledge group formed by different nodes in the network, which is a macro concept or concept network consisting of several ideas. Since one of all the ideas show a fact, they react and complement each other. So the system is an open one.
- 4 Describing the frontiers of knowledge in the system is usually affected by the accepted location or by some special aims, and by a sub-system belongs to more than one group. An enterprise KMS should not be looked as fixed or isolated from the outside, and it is a knowledge evolutionary process, can develop or contract, can be decomposed or be absorbed, also react with other knowledge groups which is not only direct but also share with other members.
- 5 Since there exists many kinds of flow, such as funds flow, technique flow, human resources flow, establishment flow, product flow, service flow and culture flow,

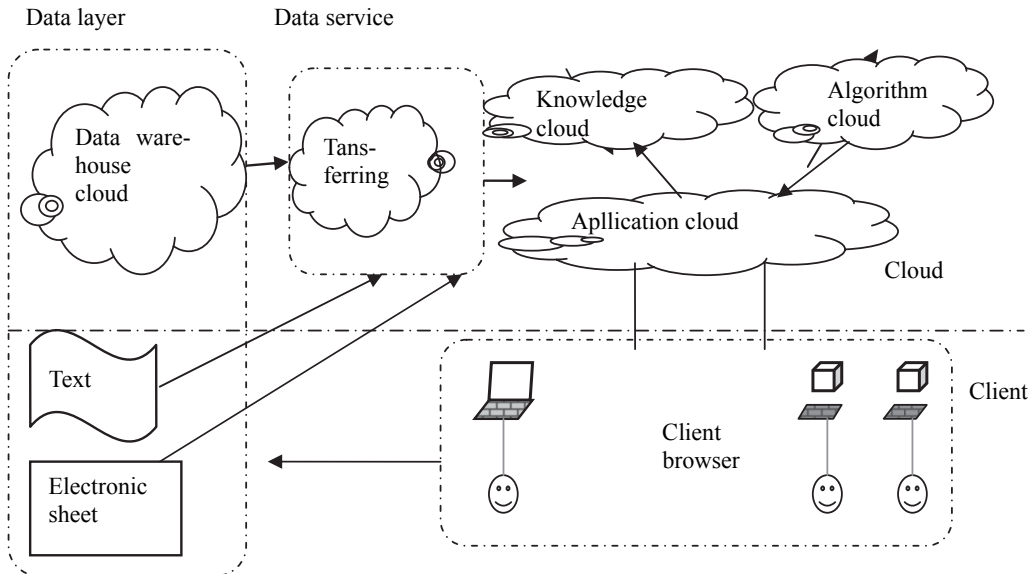

Figure 1. Cloud computing based knowledge mining system.

the relationship between the meeting nodes become complex, thus the information carried in the system should be changeable unceasing, and the process of transferring, inheriting and developing is nonlinear.

- 6 The complication-oriented KMS is historical, not developing with time, meanwhile the saved knowledge will affect the status quo.

#### 4 CONSTRUCTING KMS

The construction is realized from two sides, knowledge mining system (database) and self-service platform [8].

##### 4.1 Knowledge mining system

since the system has some special characteristics as described above, cloud computing based knowledge mining system is introduced [9] as [Figure 1](#).

- 1 Cloud port. Cloud port means an aggregate that consists of the computers participating in cloud computing, it is a self-maintenance virtual resource, usually is a big server group including computing server, storage server, broad band resources and so on. Comprehensive hospitals

can construct independently or integrate resources from sub-department, according to their own, and they also can cooperate with some hospital associations.

- 2 Client. Under the cloud computing platform, client can involve all kinds of terminal units, such as common PCs, hand phones and other sharing facilities. Clients visit cloud computing platform by general browser.
- 3 Data layer. The data mining system need data source and the data come from two sides, one is the data stored in sharing cloud or private cloud, the other is the texts, electronic sheets and other database files uploaded by local clients. The two sides of data consist the data layer under the platform of cloud computing.
- 4 Data service layer. Since the data from data layer are nonstandard and noisy, only by filtering, transferring and processing, can they become the useful data according with the data mining algorithm.
- 5 Application cloud. The module is the kernel of the system supporting all kinds of service.
- 6 Algorithm cloud. In order to make the system have universal applicability, all the data from mining algorithms are saved in the algorithm cloud.

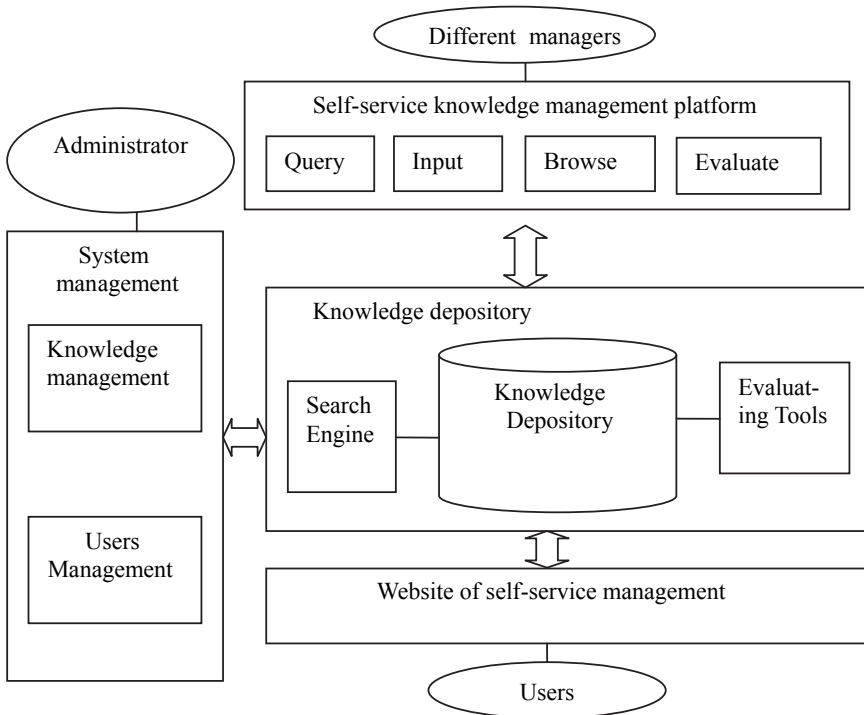

Figure 2. Self-service knowledge manage platform.

Application cloud submits the requests to algorithm cloud, when clients request some knowledge mining, and then the request-answer system will select a certain algorithm to mine the data.

- 7 Knowledge cloud. Some related data from the data mining are stored in the knowledge cloud with other useful knowledge, and the new and old knowledge update each other. Knowledge cloud includes a series of knowledge management tools, that is, knowledge query, knowledge update and knowledge modification.

The arrows in the framework mean the direct to applying resources and different modules are in different clouds, in which transferring data are in the standard format of XML.

#### 4.2 Self-service platform

it is also the user's operating platform supporting self-service technique, which guarantees the users have more freedom, that is, whatever tasks they are, input information, classify knowledge or design interface, the users can set up and finish by themselves. Some users can build up and maintain the knowledge management system, though they do not know how to program on the website. The platform can be designed as [Figure 2](#).

## 5 CONCLUSION

Knowledge is a kind of productive element resources, which is the dominant to deploy the labors and the capitals. Only in the state of dynamic, can knowledge management give enterprises vital energy. The process in KMS is different from information management, enterprises get knowledge from individual units and move it among individuals, groups and corporations and then become the enterprises' knowledge capitals, which is the groundwork of

sustainable development to increase benefits. Since the process is in the complex system, actively and openly, the system is complicated too. As the environment that comprehensive hospitals face is more intricate and more changeable than other organizations, only by complication-oriented system, can they maintain vigor.

# Analysis of the application of database technology practice in information management

Ya Xun Lan

Guangzhou Science and Technology Vocational College, Guangzhou, Guangdong, China

**ABSTRACT:** The present is an era of information technology and major companies and units are beginning to use information management. Computer digital technology, as an important means of information management technology, is more and more followed by people. The applications of database technology make enterprise business information and data storage work more convenient, which improve the efficiency of information management. However, with the extensive application of database technology, security become the issues people have to pay attention and solve problems. This paper analyzes the characteristics of database technology, to improve the security of the database system, promote the integration of database and information management issues conducted in-depth discussion.

**KEYWORDS:** Information management; database technology; safety; practical application.

## 1 INTRODUCTION

With the development of network technology, we are facing an enormous amount of information every day, which is stored in the database by form of data into. Only continuous improvement can effectively improve information management efficiency and better adapt to the rapid development of this information era. Database technology can store large amounts of data and classify and organize data to achieve effective management. With the continuous development of database technology, it has not only the responsibility of storing data, but to help people quickly and effectively manage data information. However, with the development of network technology, numerous important information stored in the database is also facing security threats, once confidential information has been leaked or damaged, which will result in serious consequences.

## 2 THE CONCEPT AND CHARACTERISTICS OF DATABASE TECHNOLOGY

### 2.1 *The concept of database technology*

The concept of database is introduced by the western countries, which is information management core and can effectively assist information management work to extract data structures and data management information and process them in certain running program to achieve data accuracy and security. Large amounts of database aggregation to establish database can

combine and classify, analysis and processing database to improve information management efficiency, which is widely used in corporate transactions, searching for information resources, computer-aided and provides a convenient information and data resources.

### 2.2 *Features of database technology*

#### 2.2.1 *Organization*

Data in the database has a tight structure and has a large association with each other, in which data is divided into different collections and each one contains a large collection of similar data. This makes the data structure clear and coherently organized.

#### 2.2.2 *Independence*

Independence of the database can be divided into logical independence and physical independence. Logical independence means that with the logical change of database logic, the logic of information stored in the logic of the data it is also changing. Physical independence refers to the impact of the physical database applications on the system will not change with information storing location and way.

#### 2.2.3 *Sharing*

Sharing is the key to improve information management efficiency, using its share of the enterprise internal users can jointly view and even process the server to data, saving repeatedly time of information passing through the Internet.

#### 2.2.4 Flexibility

Flexibility of the database lies in that it is not just a tool to store data, but also can help users quickly find the data they want and intelligently look for a class auxiliary tool of similar information.

#### 2.2.5 The redundancy controllability

It is unavoidable that a large amount of data there will be some duplication of data is stored in the database, and the database but they can quickly find out the user's command is repeated, redundant data, and in accordance with the user's wishes to remove it, can effectively save system space, improve query efficiency.

### 3 THE STATUS QUO OF THE APPLICATION OF DATABASE TECHNOLOGY IN INFORMATION MANAGEMENT

#### 3.1 Increasingly wide range of applications

With today's deepening society informatization and digitization, computer database technology is more and more valued. Database technology has a strong store, analysis and processing capacity for large amounts of data and its importance and practical significance in information management gradually unfolded. With its powerful storage and management capabilities for text and images, database technology has been widely applied in industry, commerce, agriculture, science and technology, and education career.

#### 3.2 The growing security

Information security is an issue that people have been most concerned about, in order to solve this problem, database technology continues to be strengthened and upgraded. For confidential information, database technology can encrypt through computer network technology and prevent data theft. Meanwhile, database information system can also automatically back up and manage information data, and prevent information accidentally deleted. You can also retrieve information via the original backup. Continuous improvement improves the security of information management and effectively prevent the loss of corporate data and improve the management efficiency.

#### 3.3 Currently used structural model

The most commonly used database structure models are hierarchical model, network structure model and the relationship structure model. First, the hierarchical structure model mainly takes the form of a data information tree. Representing grade orientation relationship

between data by tree branches makes the level of structure will arrange. Second, the mesh structure model introduces related other data through an important data radial leads, which realizes the data exchange and sharing on the basis of expressing the data directional relationship. Third, the main point of the relationship structure model is to reflect the dual focus on the relationship between the internal data structures so that data has great potential for secondary development.

Database structure model diversity makes database technology to meet the different needs of different users, expand the scope of application of database technology, but also provides users with a variety of information storage and analysis and processing methods.

### 4 THE DEVELOPMENT TREND AND IMPROVEMENT MEASURE OF DATABASE TECHNOLOGY

Only continuous improvement and perfection can better meet the needs of information management work. With extensive use of database technology, make the database technology to, the need to improve also gradually revealed.

#### 4.1 To promote the integration of database and information management

Integration allows users to maintain a database through information management systems, efficient use and regulate information. The information management system can easily and quickly extract information in the database. Analyzing the information by information management systems can improve the information utilization.

#### 4.2 Speed the combination of database theory and practice

With the in-depth study of professional and technical personnel, database theory has constantly innovated and developed, however, most theoretical results have not been applied in practice. This requires that we strengthen the combination of theory and practice and guide the reformation and innovation of database technology. Meanwhile, time is the sole criterion for testing truth, the theory should be in close connection with practice in the study course.

#### 4.3 To enhance data integrity

The client is the main way to ensure data integrity, which can detect and eliminate invalid data. In order to improve system efficiency and ensure system stability and system data security, you can also maintain data consistency.

## 5 CONCLUSION

In summary, in the information age, using database technology for information management has been widely recognized, but there is still a huge innovation and development space of database technology. Only constant innovation can make database technology better plays an important role in accelerating its information storage and processing speed, protecting information security and improve management efficiency. Only by constantly improving database technology can we better adapt to the rapid development of the information age.

# The application of database technology in urban traffic service information system

Zheng Zhang & Jian Lan Ren

*Jiangxi Vocational and Technical College, Nanchang, Jiangxi, China*

**ABSTRACT:** database technology is an important means of completing information service developed in recent years. The technology is convenient to information timely updating when sharing public resources, thus it has been widely used in urban traffic information service system and more effectively improve the efficiency and quality of urban transport planning services, and promote the further development of urban transport.

**KEYWORDS:** Database technology; urban transportation; information service system; applications.

## 1 INTRODUCTION

Database, as one of the main information core technology in the 21st century, has got good development in recent years. With the continuous improvement of urban traffic information service systems, the application of data technology tree in city traffic information service systems has increasingly widespread. From the perspective of urban traffic management and planning, strengthening the applications of database in urban traffic information systems is undoubtedly an important way to improve urban transport planning and decision-making service level. Therefore, we must continue to improve and innovate and apply more advanced database technology to urban traffic information service system to improve the quality and efficiency of transportation services and provide a powerful driving force for the city's comprehensive transportation platform and the development of comprehensive traffic information service system.

## 2 THE COGNITION OF DATABASE TECHNOLOGY AND URBAN TRAFFIC INFORMATION SERVICE SYSTEM

### 2.1 *Connotation of database technology*

Database technology is an IT rapidly developing in recent years. The main study and management object is data, that is, the emerging technologies manage, add, integrate, resolute, output and replicate data and

information through the rational use of computer technology.

In terms of the development history, data management technology has mainly gone through labor management stage, file systems stage and database systems stage. The use of database technology can not only timely process relative data, but also strengthen the organization and storage function of large amounts of data in the database, thus further slowing the burden of running the database and can also achieve, effective sharing and mutual exchanges between information and data and ensure data security and also can greatly facilitate the work of data retrieval and processing.

### 2.2 *The connotation of urban traffic information service system*

Urban traffic information service system is built on the basis of urban transport integrated system and bus terminal field management information resources and an information system for facilitating the daily lives of urban residents and a service system in favor of benefiting traffic staff to manage. The system mainly provided walkers relative comprehensive information services such as road conditions, stop station, construction, emergencies, weather and environment through the Internet, call centers, mobile phones and other mobile terminals and radio traffic, road side radio, teletext, car terminal, warning signs and other display devices and give people more convenient travel, which also greatly enhance the management level and service quality in the transport sector.

### 3 ANALYSIS ON THE APPLICATION OF DATABASE TECHNOLOGY IN URBAN TRAFFIC INFORMATION SERVICE SYSTEM

#### 3.1 *The application of database collection technology in urban traffic information service system*

The primary function of the database technology is to collect data and information. The process of data and information collections mainly rely on data acquisition unit. Data acquisition system use a variety of effective means in like an external camera, microphone, and scanner to collect all kinds of relevant data and information all kinds through the internal system interface input. The database can also convert collected electrical signals like valid data, temperature, velocity and pressure to a variety of analog or digital physical quantity. This needs sample collection, which means the repetitive data collection in the same collection points and during a particular sampling period. However, this kind of data collection has been just a momentary value with a characteristic of certain time. Thus, further accurately measurement is needed on the basis of sample acquisition data. There are two main accurate measurement, sub-contact and non-contact detection. No matter which measurement is used to measure, the final measurement results will not have the excessive deviations phenomenon significantly affected by measurement state or measurement environment, thus ensure that the maximum degree of data accuracy and objectivity.

#### 3.2 *The application of data mining technology in urban traffic information service system*

Generally speaking, database mining technology is implemented on the basis of data acquisition technology. Carrying out data and information will dig out useful information added to the database through data collection technology and thus rationally and effectively using the information. The database mining techniques throughout the entire process are not only able to directly extract useful information from the database, but also in large part, avoid the information loss or accident and to some extent, reduced the workload of database cleanup work and greatly reduce the database running burden.

#### 3.3 *The application of data fusion in urban traffic information service system*

Database data fusion technology refers to the information collected through the integration of multiple sensors to strengthen the data supervision and management and achieve the integration and deepening of the human-machine interface. Data fusion

technology will first extract and analyze sensors collecting information by stages. Second, data fusion technology needs to further match or compare processed data to provide basic information for fault diagnosis and decision-making and also have certain reference value of urban transport information service systems. In addition, with the continuous development of science and constantly updated technology traffic information, if some outdated information sensors collected cannot timely update, the information hysteresis phenomenon will easily happen, which prevents people's thinking and accurate judgment and cause unnecessary waste and loss and even traffic accidents. The use of data fusion technology can effectively avoid such situations. This is because the data fusion technique owns the function of automatic update information, thereby to real-time process and record the changing information. Therefore, the application of data fusion technology in city traffic information services is increasingly common.

#### 3.4 *The application of data warehouse technology in sharing information service platform*

In fact, data integration, mining, collection techniques we mentioned before are database-based data warehouse techniques. The source data warehouse has the characteristics of distribution and heterogeneity, and therefore can be used as the main information source. Data warehouse technology can physically store information such as data, views and so on, and process them in accordance with their respective needs. That is to say, data warehouse mainly has two functions: one is information processing and conversion function, i.e., the data warehouse will process classification, summation, and count for different source data. The second is providing decision support or accordance function through data analysis, that is, observing, analyzing, and treating problems through warehouse multidimensional and three-dimensional data to observe, analyze and process problems from different angles to improve work efficiency.

## 4 CONCLUSION

In summary, with the continuous progress and rapid development of database technology, the application of database technology in urban traffic information service systems is bound to become increasingly important. Therefore, it is an important aspect of improving urban transport service quality that is studying the status quo of database technology application in urban traffic information service system and make it further improved and strengthened.

# The application of multimedia technology in martial arts classroom

Xue Feng Zhao

*The Central Institute for Correctional Police, HeBei, Baoding, China*

**ABSTRACT:** In the process of science development and technology reform, martial arts teaching has changed accordingly. In this paper, by teaching Taekwondo, the video and CAI course-ware courses combines with each other, conducts practical research on multimedia teaching methods, analyzes whether it can effectively enhance the quality and effectiveness of teaching by combining the multimedia technology in teaching martial arts. The main research methods include: interviews, questionnaires, and comparative experiments. The survey finds that adding multimedia technology in martial arts teaching breaks the original teaching restrictions, effectively increasing the quality and effectiveness of teaching.

**KEYWORDS:** Taekwondo, multimedia technology, application.

## 1 INTRODUCTION

Through the rapid development of science and technology, the modern multimedia technology has been applied to a variety of industries, increasing the convenience of industry learning. This is especially true for education. Currently, many classrooms have adopted a multi-media teaching method, its method is very different from the traditional teaching method, increase students' curriculum impressions through visual and auditory senses, breaking the simple teaching of traditional teaching model. And Physical Education of students also needs to recognize the superiority of the appropriate method, this technology is applied to the usual teaching, promoting the scientific and effective development of teaching.

## 2 RESEARCH OBJECTS AND METHODS OF THE APPLICATION OF CURRICULUM MULTIMEDIA TECHNOLOGY

The martial arts class multimedia applications chose our school's taekwondo as the main object of study, first, divide 90 students of the three classes into two groups for the study group and the control group. The research method is taken through domestic computer multimedia literature investigation. The main content of this study is the technical subjects for our school's taekwondo general course syllabus content. In the same content of teaching practice, conduct conventional teaching methods and teaching methods combining multimedia CAI for the study group and the control group respectively. After the practice, compare the results of the two methods. At the same

time, in order to make this experiment more fair, the teacher's selection of students in the study group and the control group is the same, the same instructor uses the quantitative criteria for evaluation. In order to achieve an objective, impartial, and true teaching efficiency. The main equipment used in the experiment includes a laptop, two cameras. After the end of the experiment, the corresponding questionnaire work is needed, two groups of students were given a staff, use anonymous way to fill in the questionnaire, distribute 90 parts and recover for 90 copies, the valid questionnaires is 100%. Finally, conduct statistical analysis of the relevant data through SPSS 8.0 statistical software, take this comparative analysis as the final data.

## 3 THE THEORETICAL ANALYSIS OF CURRICULUM MULTIMEDIA TECHNOLOGY APPLICATIONS

### 3.1 *Traditional teaching mode problem*

The main problem of the traditional teaching model has two aspects: ① teacher's own factors, sports teaching is through listening and looking to perceive teaching essentials. This in turn requires that teachers need to have a good demonstration of teaching skills and solid technical standards, and that is restricted by age correspondingly. With age, the standard of the action is constantly reduced. If the performance cannot be precise for some tough teaching actions, the students find it hard to truly appreciate the essentials. The mere verbal explanation process is not able to effectively help students build a better action mode of thinking. And this will not only lead to slow progress of teaching, as well as the possible danger because

of a non-standard action by teacher or student. If this situation exists for a long time, it is bound to affect the development of students. ② “teach” teaching limits the personality development of students, “teach” subjective teaching method is more serious in traditional teaching mode, teachers in teaching tend to focus only on their dominant talk, while ignoring the objective acceptance degree of student. Change student-centered teaching activities into a teaching model which teaches for teaching. Such mechanized teaching methods in order to complete the task of teaching for the purpose seriously hinder the development work of the student’s own characteristics. Over time students will appear rigid thinking and stereotypes.

### 3.2 The advantage of the combination of CAI course-ware and video teaching curriculum mode

CAI course-ware teaching mode is through image and sound manner to convey fresh, vivid, specific teaching content for people. Fully mobilize the enthusiasm of students. But there is also a corresponding disadvantage of CAI course-ware, that is, although the other outstanding action works can be seen from it, but it cannot have a corresponding reaction for students’ action in teaching, there is no difference in contrast, makes it difficult for students to measure the standard degree of their movement. Feedback is poor, resulting in a relatively low efficiency of teaching. For this problem, people have adopted appropriate video teaching curriculum measures, carry out a detailed analysis by shooting down the technology action of related courses of students. Compare with the professional CAI course-ware to find their own shortcomings and deficiencies, and conduct a positive correction. Effectively improve teaching efficiency.

The main advantages include: ① standardized student movement; using CAI course-ware to conduct a decomposition operation for teaching action, deepen students’ actions impression. By contrast with the professional course of action, find their own action problems and solve them in the exchange. ② create autonomous, harmony and relaxed learning atmosphere; much experience tells us that teaching for students cannot be carried out forcefully, it needs to conduct specific, scientific and systematic targeted teaching according to each student’s own characteristic. By actively creating a harmonious atmosphere in the classroom, increase student’s interest in learning, it is the key to carry out teaching. In CAI course-ware figurative features, break the traditional teaching mode restrictions both in space and time correspondingly, and actively guide students in subjective and active learning. Take efforts to create a happy learning atmosphere featuring in love learning, need to learn and want to learn. On the basis of a combination of video curriculum and CAI course strengthening the learning environment of students, improve their creative thinking skills.

## 4 THE RESULTS’ ANALYSIS OF CURRICULUM MULTIMEDIA TECHNOLOGY

In the experiment, by comparing test results of technical work of two groups of students, people can see that the score of the study group is significantly higher than that of the control group; questionnaire analysis finds that all the students express great approval in the use of multimedia technology. Of these, 98.7% of students believe that the traditional teaching model is less favorable than multimedia technology teaching.

Table 1. Comparison of technical movements’ assessment scores of two groups of students.

Group classes	Cross kick	Side kick	Front kick	After kick	Downward kick	Average score
Study group	74	73	73.5	75	76	74.3
Control group	65	64.5	63	64	66	64.5

Table 2. Multimedia technology teaching questionnaire (%).

Survey items	Number	Percentage
Interest in learning	90	100
Knowledge comprehension ability	88	98.9
Focus	87	98.5
Acquire knowledge	89	99
Teaching Satisfaction	90	100
Teaching agree degree	87	98.5

## 5 CONCLUSION

Teaching with CAI course-ware combined with video curriculum technology can effectively improve the students' interest in learning, make up for the deficiencies of traditional teaching. Through the analysis of the relevant action essentials by CAI technology, and in good intuitive, it enables students to master the moves learning points faster, deepens students' knowledge level efforts. Through comparison with their own video actions, people can understand the problems of their own, greatly reduce the extent of student misconceptions for tough action, reduce the risk, but also enhance the standard of teaching. Therefore, people need to actively use it in the current teaching activities, adequately reflect the value of its secondary education. In the era of increasingly rapid technological development, our teaching mode should be standardized with the social era. Some high-tech products will be applied to the

teaching activities, through the organic combination with teaching content to increase the effectiveness of teaching.

## Exploration into resources sharing via the internet for sports information

Xiao Hong Luo

Beijing Sport University, Beijing, China

**ABSTRACT:** This essay starts with the demonstration of the value of internet sports information sharing, and by analyzing the advantages and the growing process of music, art, cars and other professional internet sharing platforms, we can gain enlightenment and as well as get comprehension to the current situation of sports information: sports information sharing platform far behind, the lack of professional websites, the serious fragmented of sports information and so on. Therefore, this essay proposes the scheme of the integration of sports information resources sharing, which aims at offering suggestions for relevant department when building sports sharing platform, and providing services for more sports enthusiasts, practitioners and academics.

**KEYWORDS:** Internet; Resource integration; share; sports information.

### 1 THE VALUE OF INTERNET SPORTS INFORMATION SHARING

#### 1.1 *Value analysis of Internet sports information*

As such national slogans as Life Means Constant Movement and Strong Build Through exercise would have it, sports enjoys far-reaching significance for a people as well as a nation. At the same time, sports can never afford to be ignored in life and society as it accounts for, with its derivatives, 7% of china's GDP, a ratio high enough to speak for itself.

Human wisdom holds the key to the potential and value of the Internet, a tool for information transmission and sharing, the intrinsic attribute of which paves way for integration within circles and exchanges among industries. Furthermore, transmission efficiency is rendered possible via the Internet so that information delay and dislocation would no longer be problems. It is of great significance that we use the Internet as a platform to promote sports and the cooperation among its practitioners while boosting its cohesion. And the Internet acts as the only choice for the practitioners who are pursuing extensive exchanges of expertise and access to the up-to-date information. Therefore, sports stays relevant only when the Internet can be given full play for its development and resources integration and sharing.

#### 1.2 *Value of information resources sharing within the Internet*

Certain websites stand out since they attach importance to the market and social demands. Success relies on visionary team players and their insight, passion

and perseverance. In this regard, Yin Yue Tai provides a very illustrative example. As a late bloomer, Yin Yue Tai was first introduced in 2009 and then Prevalled as the largest music sharing platform in China with its professionalism and devotion. Its specialized website overcame homogeneity and fragmentation to make it a platform for advertising music lovers and practitioners. Take Mei-Shu. com as another example. This non-profit website was introduced by students and teachers of fine arts in China with the purpose to promote communication among arts enthusiasts and practitioners. It further distinguishes schools of arts, provides functions for exchanges and sharing and also associates itself with business to act as a stepping-stone for early practitioners in that sales transactions are made possible.

#### 1.3 *Value analysis of building a platform for sports resource sharing*

As China deepens its reform and opens wider to the outside world, sports has been, more than ever, lending impetus in the economic development. The 2010 Guidance to accelerating development of sports industry issued by the General Office of the State Council (No.22/2010) recognizes the important role of the sports industry in both social and economic development and also states clear the basic policies, major targets and key tasks for developing the sports industry. The twelfth Five Year Plan witnessed the emergence of the sports industry with the total output of 400 billion RMB and more than 4 million practitioners. It is imperative, against such background, that we put in place a superior platform for better sports communication and development.

## 2 ANALYSIS OF CURRENT SITUATION FOR SPORTS INFORMATION

### 2.1 *Information fragmentation intensified*

Baidu produces about 100 million clicks for the key word sports, most of which with higher rankings belong to major news portals, media mainly for news reporting and broadcast. It is evident that professional sports websites are in short supply, let alone those with brand effect. Furthermore, it is common that information available from those search engines is fragmented into an advertisement of sports equipment and fitness clubs, training cooperation, recruitment and small forums. Overlapping and fragmentation means much more time, higher cost and decreased efficiency.

### 2.2 *Incompetent information professionalism*

Intellectual property rights protection can always be a severe problem when placed in the context of the Internet due to the underdeveloped legal system. Information homogeneity is thus rampant, for websites tend to process certain information at the expense of its faithfulness. Sometimes smaller websites would even choose to plagiarize. Such information integration as these gives rise to chaos, lower value, poor authenticity and higher repetition rate for visitors in a sharp contrast against well developed markets for music, fine arts and literature. This can be attributed to the nature of sports resources and the lack of market tapping.

### 2.3 *Less information inter-connectivity as a hindrance to circle culture*

Information inter-connectivity breeds similarity of the attributes of different information resources in which value is to be created. In such case, visitors who are searching for this value are apt to be more dependent on the Internet information. It is widely acknowledged that the Internet should be developed to provide brand new circle culture for better communication among people. During this process, people with similar values have more opportunities, finding each other, thus communication and transmission are made easier. Only in this way could the Internet be more instrumental and really bring about changes to our life.

Currently, however, sports information resources scatter with a relatively low degree of inter-connectivity, which means they are not presented properly and professionally. Now if we type fitness on Baidu what's available is all about information of advertisements for some fitness club. We are not surprised to find that useful information is hard to get this way for the indistinguishable and lengthy search results.

## 3 IMPLICATIONS OF SPORTS INFORMATION INTEGRATION

Development and then integration of information, involving the following steps as information collection, processing, release, later-stage management, serve the purpose that the information could be rendered the carrier of uses and commercial value. Yet for the time being sportscasts account for the lion's share of all sports services online. That is to say, more efforts should be made to satisfy popular needs such as fitness, outward bound training and bodybuilding. And admittedly, websites with professionalism, learning opportunities and information sharing are only numbered.

Sports has inherent rules to follow and can be acquired and shared. Its information is presented through pictures, videos and scripts. Up till now, sports information online has been fragmented and unprofessional. It has not yet been widely utilized hence trifling value. All this has been a long time constrained sports information sharing on the Internet. That is why we should create more value for sports information sharing to win public approval at home. Effective information resource sharing, which marks China's modernization of sports service and information application, is also quite necessary for it better promotes sports and helps to gain insight of it.

## 4 PROPOSALS FOR SPORTS INFORMATION RESOURCES INTEGRATION AND SHARING

### 4.1 *Data collection for sports information platforms*

A sports platform building cannot be separated from the support of professional web sites. Information inter-connectivity breeds similarity of the attributes of different information resources in which value is to be created. In such case, visitors who are searching for this value are apt to be more dependent on the Internet information. It is widely acknowledged that the Internet should be developed to provide brand new circle culture for better communication among people. During this process, people with similar values have more opportunities, finding each other, thus communication and transmission are made easier. Only in this way could the Internet be more instrumental and really bring about changes to our life. Currently, however, sports information resources scatter with a relatively low degree of inter-connectivity, which means they are not presented properly and professionally. To solve those problems, we need to accomplish better website categorization and redistribution through sports

resources reorganization so that websites become more efficient. Under such circumstance, sports enthusiasts and practitioners can promptly spot what they need or upload what they have to corresponding modules. Besides, website staff should manage to provide information sharing and acquisition through collating data from the massive resources for doing so can avoid overlapping of information and save visitors a lot of time. The following is only a sketch. Details are needed for specific needs.

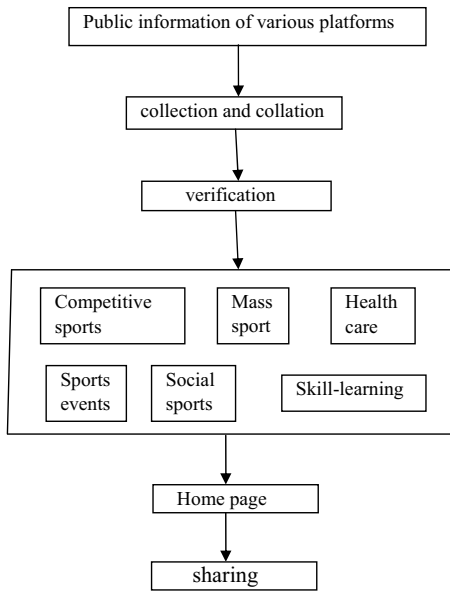

Chart-1

#### 4.2 Analysis after information collection

As resources analysts, platform providers need to examine, verify, process, and recommend sports information uploaded by others. It is their duty to ensure availability of the resources by recommending or deleting certain information. At the same time, personal file system is indispensable. A person verified as a sports practitioner online is then allowed to share his or her experience and knowledge with the public. Authentication, it is believed matters a great deal in terms of seriousness and professionalism for a qualified website for sports opens to all. In this regard, MOKO does a good job. It introduces sports stars using authentication or directly invites some of them to offer expertise. MOKO also categorizes the information it collects. Billiards information can be labeled as recreational and basketball as competitive.

#### 4.3 Full integration of sports information

Human wisdom holds the key to the potential and value of the Internet, a tool for information transmission and sharing, the intrinsic attribute of which paves way for integration within circles and exchanges among industries. Furthermore, transmission efficiency is rendered possible via the Internet so that information delay and dislocation would no longer be problems. Resources integration helps to build information platforms online, where information can be given a full play. It is based on not only the information from others, but also that the websites need to collect. The core value of the Internet as a platform is communication among people as Microblog and Blog have best illustrated. People use them to express themselves and they expect answers. It is during such process that information transmission is enhanced. It will be more promising for the professional sports platforms considering their visitors are mostly enthusiasts and practitioners. There are three approaches towards information integration.

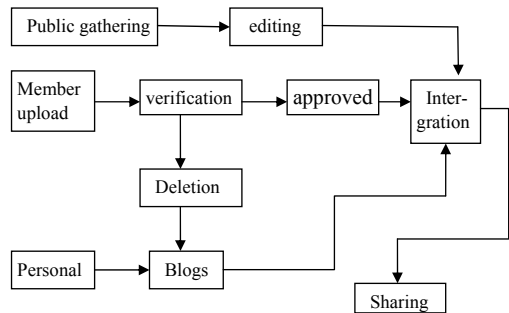

Chart-2

#### 4.4 Construction of sharing platform for sports information

Sports distinguishes itself from music or fine arts in that it comprises senses of both narrow and broad form which subbranches stem respectively. A qualified platform needs to be interactive to inspire initiative of visitors. Besides, platform providers should be responsible for verifying and editing information resources rather than providing them considering no one can afford such workload. Concrete steps for implementation as in Chart 3.

#### 4.5 Construction analysis

Successful platforms should be sustainable. They need to be lucrative and benefit the society while attribute of the sports industry should also be taken into account. Website structure as in Chart 4.

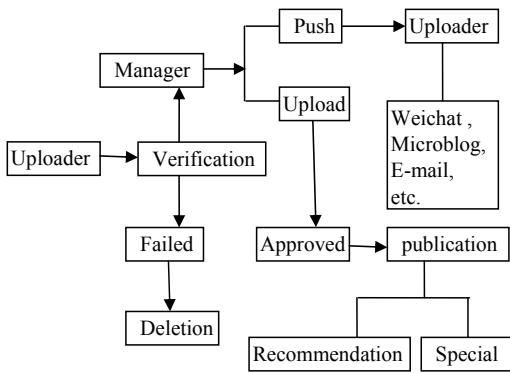

Chart-3

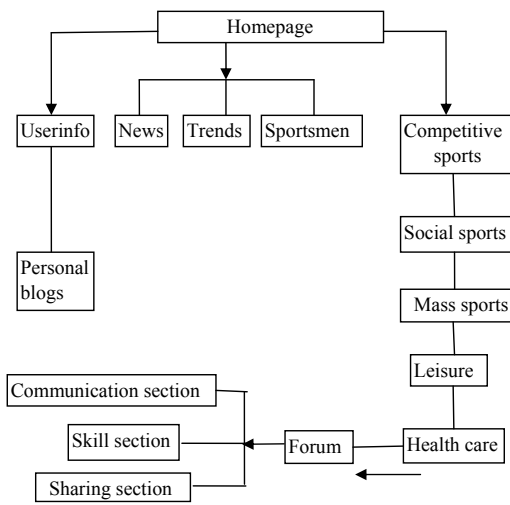

Chart-4

#### 4.6 Brand building

Websites of different trades are not only functioning as an information sharing platform. They may be developing as bridges. Autohome excels for its original comments on the auto shows it reports and the first-hand consulting service for the auto enthusiasts and consumers. It is safe to say that service and insight have the final say of an online platform. And a sports information platform is no exception. It always

pays close attention on sports reports and comments, offers superior services for the public and fulfills its duty of information integration and sharing. It does this with enthusiasm and devotion.

## 5 CONCLUSION

People nowadays are deluged with information online as the Internet popularization makes resources more accessible than ever. This has brought with it a gradual segmented market more professional and free from useless information. Needless to say, Internet enterprises and websites tend to benefit and this in turn could help exploit all sports resources so that sports promotion and development are enhanced and its spirit will obtain universal value.

Convenience for the public comes first when we are building sports resources sharing platforms. While industrial norms and free flow of information need to be guaranteed. We should remain committed to providing helpful and refined information, excluding overlapping information so that it can be effectively employed in a wide range. The cause of sports information sharing entails well-informed platform providers to push it to a new high.

# Research and exploration in computer experimental teaching for system capacity training

Shan Shan Li & Cheng Bin Quan

*Department of Computer Science and Technology, Tsinghua University, Beijing, China*

**ABSTRACT:** Computer system capability training is an important target for the computer professional undergraduate education, and computer system design experiment is the key method to achieve this target. This paper introduces the exploration in training the computer system capability of the Department of CS&T of Tsinghua University, which made some progress in the experimental teaching for the above target. This paper illustrates the exploration in various aspects, mainly the experimental teaching system and the design of the computer system experiment. And this paper presents some key points for the computer system experiment, and gives a sample experiment embodiment of the computer system experiment for the computer system capability training.

**KEYWORDS:** Computer System Capacity; Experimental Teaching.

## 1 INTRODUCTION

In order to meet the needs of computer professionals in the new era, computer professional students are required to have the capabilities of the system design and system application. These capacities require the students to master basic computer system knowledge, understand the interaction between computer hardware and software systems, which are the core requirements of the computer professional, and that is just the computer system capacity training requirements<sup>1</sup>. The computer system capacity includes conscious use of the systems view, understanding the integrity of computer systems, relevance, hierarchy, dynamic and open, and use a systematic approach to mastering the computer hardware and software, and understand the mechanism of interaction between them<sup>2</sup>. In order to meet the needs of computer system capacity training, the core courses of the computer science undergraduate curriculum system should be adjusted, to make the correlation closer between the course content, and smoother in course connections. Similarly, the experimental teaching in these courses should commence around the computer system capacity training, making course experiments connected seamlessly, so it need the course experiment to undertake the content of the previous course experiments and at the same time prepare for the subsequent course experiment, then all these experiments will eventually form an integrated experimental teaching system.

## 2 EXPERIMENTAL TEACHING

The current computer science curriculum system has many computer systems-related courses, such as Digital Logic Circuits, Assembly Language, Computer Organization, Computer Architecture, Compile Theory, Operating Systems, Embedded Systems, etc. Each of these courses has its own separated experiment, but these experiments are not good and enough on helping students to build systematic knowledge for the computer hardware and software systems. For each subsystem of the computer students have in-depth understanding, but they have not such understanding of the interaction between the various subsystems or on how these subsystems converging.

The main reasons for this situation are the following two aspects:

- 1 In the teaching, these course plans and carry out independently, and they emphasize the integrity and systematic for their own self-knowledge system, thus it causes the redundancy of the knowledge, and meanwhile it also leads to the poor convergence between the consequent courses, so it is difficult to form a complete computer system knowledge system.
- 2 In the experiment, these courses focus on the study of their own content, so the experiment is lack of the convergence of the leading course experiment, as well as the supports for subsequent courses

experiment. Most of the experiments are mainly the simple verification of the principle, which lack the practice for complex integrated system design.

Computer experiment teaching is an integrated process, which need high correlation between the courses. The experiments need overall planning for systematic level, in order to effectively develop and training students in computer system capabilities<sup>3</sup>. Therefore, it is needed to adjust the experiment teaching system.

First of all, on the teaching principle, it is needed to implement system capability training, based on the idea of “focus system, emphasizing experiment, building capacity”.

Second, experiment teaching content need to be planned unified, in order to set up a complete knowledge system in systematic level of the student, from the underlying hardware to the operating system, to form a complete experimental teaching system.

Furthermore, it is needed to establish a unified teaching experiment platform, thus each course experiment will be on the same implementation carrier, which is helpful for the coherence in these experiments, and also convenient to carry out the experiments.

Finally, the target of the experiments is that the students can design and implement an educational computer based on a certain instruction set, on which they can run an operating system kernel and implement a compiler. The computer hardware, OS and compiler are all implemented by the students themselves. Through the practice on the system experiment, the students will comprehend the computer on systematic view and the system capability will be improved.

### 3 COMPUTER SYSTEM EXPERIMENT

#### 3.1 *Unified planning experimental teaching*

The computer system experiment mainly involves Digital Logic Circuit, Assembly Language, Computer Organization, Operating System, Compiler Theory, these five courses. In order to meet the requirements of the computer system experiment, the experiments of these courses were analyzed and adjusted, focusing on the interconnections of the contents between the course experiments. The detail adjustment contents are shown in [Table 1](#).

Above adjustment of the entire experiments is intended to link up the experimental teaching contents in each course to form a complete computer system experiment. This system experiment will strengthen the training of computer system capability.

Table 1. Adjustment and optimization in experiments.

Course Name	Adjustment or optimization content
Digital Logic Circuit	Strengthening the experiments of using programmable logic device, including the gate level to component level design, as well as the corresponding EDA tool using.
Assembly Language	<ol style="list-style-type: none"> <li>1. Add MIPS32 instruction set experiments, including interrupt and exception handling, virtual memory management, etc.</li> <li>2. Add the experiment of typical C code expressed in assembly level and the disassembly experiment.</li> </ol>
Computer Organization	<ol style="list-style-type: none"> <li>1. The design and implementation of a simple computer system, in which the CPU at least supports the subset of the MIPS instruction set with Multi-cycle or pipeline. The CPU should support interrupts, including soft interrupt and hardware interrupt.</li> <li>2. Add the experiment of the virtual memory management.</li> </ol>
Operating System	<ol style="list-style-type: none"> <li>1. The MIPS32 instruction set/processor is the target platform of the operating system.</li> <li>2. Strengthen the combination of operating system theory and experiment. Require to complete a simplified mini OS that can be able to work on the real hardware platform.</li> <li>3. Emphasize that the core algorithms of each experiment can form an organic whole. The experiment will use its previous experiments code, and eventually form a complete small operating system.</li> </ol>
Compiler Theory	<ol style="list-style-type: none"> <li>1. The MIPS32 instruction set/processor is the target platform of the compiler.</li> <li>2. Implement a compiler that supports the experimental platform used in previous courses.</li> <li>3. Add the experiment of optimization for the specific experimental system.</li> </ol>

#### 3.2 *System experiment design*

The computer system experiment is a complex system-level experiment. The students need to design and implement a complete computer system. They should complete several stages in each course, and

at a comprehensive experiment course they will eventually integrate previous experiments to form a complete computer system. So, the relevant courses should adjust the experimental system and experimental content, treat the experiment as the module or base for the final comprehensive experiment. Assembly Language and Digital Logic Circuit are the experimental foundation courses, providing an experimental basis for other courses; the experiments of Computer Organization, Operating System and Compiler Theory will become the parts of computer systems, in which the experiment of Computer Organization will implement the basic hardware and Operating System will be the software. The following were introduced the experimental design of these two courses.

The experiments of Computer Organization will implement the hardware part of the system experiment, with three-level experiment contents: verification level, design level and comprehensive level experiment content. The final experiment is to design a computer hardware which can run an assembly program.

- 1 Instruction Set Lab. This is a verification experiment, writing the assembler in the simulator in order to let the students be familiar with the instruction set and understand the function of the simulator and monitor program.
- 2 Component Lab. Design and implement the ALU. Let the students learn the basic ALU design methods and data path, and to be familiar with the hardware experiment platform. The designed ALU will be used as an important component of the CPU in following experiment.
- 3 Memory & IO Lab. Design a state machine to access the memory and IO on the platform. It is a design level experiment, which will help the students to comprehend the memory access timing and learn how the data exchanged on the bus.
- 4 Hardware System Lab. Design and implement a complete computer hardware system on the platform, and the monitoring program can run upon the designed computer. A data transfer program will load the binary code of the monitor program directly into the memory, and then the designed computer will run the monitor program, which will communicate with the PC. This experiment is a comprehensive experiment that allows students to learn how to design an underlying hardware of the education computer, and this computer will support the OS in Operating System course.

Operating System is the basic software in the computer system, and it is tightly integrated with the hardware<sup>4</sup>.

- 1 Lab 0 (experimental operating system environments and tools). It aims to understand and become familiar with the tools and process in the whole course experiments, including kernel debugging, simulator, etc.
- 2 Lab 1 (startup process). It will implement the boot-loader for loading and running the operating system, in order to understand the process of starting the boot-loader, boot-loader's files, the boot process of the ucore OS, and interrupt handling mechanism.
- 3 Lab 2 (physical memory management) & Lab 3 (virtual memory management). These labs will help the student to understand how the system manages the memory.
- 4 Lab 4 (kernel thread management) & Lab 5 (user process management) & Lab6 (scheduler) & Lab 7 (synchronous mutex). These labs will help the students understand the process of the kernel thread creation and execution, and understand how to implement the context switching.
- 5 Lab 8 (File System). It requires the students to understand the file system and its implementation technique.

### 3.3 System experiment platform

For the unified planned system experiment, we need a unified platform to support the experimental deployment. This platform needs to support each course experiment, and can support the comprehensive computer system experiment as well. The platform includes not only the actual hardware circuit board, but also the software tools, which contains the debugging tools, simulator, assembler, compiler and other tools. All the platforms should support a simple, standardized instruction set. So we choose about 50 MIPS like instructions as our instruction set, and designed the circuit board, named THINPAD (TsingHua MiNi PAD)<sup>5</sup>, as the hardware carrier. We also developed some software tools, including system simulator, assembler, compiler, terminal program and etc. And we have run the teaching operating system ucore on this platform. In addition, the corresponding compiler was developed. The program generated by this compiler can be run in the ucore. Thus the system experiment platform was established and has been used in course teaching.

- 1 Hardware platform. The circuit board uses the programmable logic device as the experiment carrier. This programmable device is an FPGA, which is the experiment chip. Other devices like SRAM memory, Flash memory and other peripherals are all connected to the experiment chips via several buses. The following diagram 1 is the basic composition of the hardware platform.

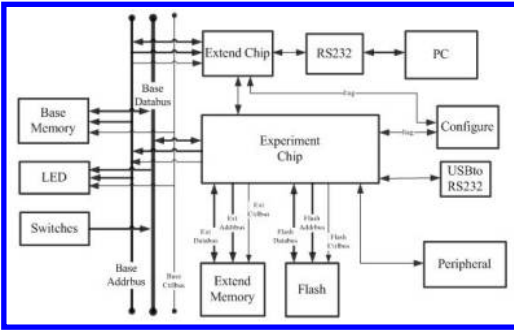

Figure 1. Composition of the hardware platform.

- 2 MIPS instruction simulator. This simulator can help students complete software simulation and debugging.
- 3 MIPS assembler. This assembler can convert assembly language to binary.
- 4 Data communication program. This program can load/store the data or program into the memory on the board.
- 5 Monitor program. Before running the operating system on the hardware, this program is a relatively complex program which can be a preliminary test on the hardware system implementation. It can work as a mini operating system to manage the platform's resources and testing programs.
- 6 GCC compiler. As the operating system is written in C, the GCC compiler can compile the operating system to our instruction set. Of course, this GCC compiler was modified for out the platform, and it is only used for the operating system (ucore) compilation.

### 3.4 Computer system design course

In the curriculum, the Computer System Design was added as a new course, which is an experimental open course. After completion of previous courses, the students will use the knowledge learned in Digital Logic Circuit, Assembly Language, Computer Organization, Operating System and Compiler Theory, etc. to design and implement an integrated simple computer system independently in this course. This course will improve the students' problem-solving skills and the computer capacity.

## 4 ACHIEVEMENTS

The computer system experiment has gradually carried out in the undergraduate teaching of the Department of Computer Science & Technologies, Tsinghua

University. The teaching experimental platform has been used in the course experiments, and got good results. Some students have completed the system experiment: the ucore has run on their designed CPU, and some applications can be compiled by their own compiler for running successfully on the system. After complete the real first computer system, the students have an enormous sense of achievement. Following is a computer system implemented in the experimental course, which is running a slide shown program.

Figure 2. Computer system implemented in the experiment.

Through the computer system experiment, the students generally reflect that they understand the computer system more deeply and this experiment is good for their comprehending the knowledge in these corresponding courses. All courses use the unified experiment platform brings more convenient for the student experiments. The computer system experiment gave them a stage to use their knowledge and skills, and it helps them get more profound understanding of the mechanisms and principles of computer system.

## 5 SUMMARY

Computer system capacity training is an important target for computer undergraduate teaching, in which experimentally teach plays an important role. Dept. CS&T Tsinghua University explored several years on it and established an experimental system, which has been deployed and got some achievement in the teaching process. Through this experimental system, the students' computer system capability has effectively improved.

# A self-adaptive cooperative protocol in VANET

J.Q. Li, X.Q. Di, X. Liu, H. Qi, L.G. Cong & H.Y. Yu

*School of Computer Science and Technology, Changchun University of Science and Technology, Changchun, China*

**ABSTRACT:** According to the study of VANET routing protocol, a novel protocol called SAC-AODV (self-adaptive cooperative AODV protocol) has been put forward based on AODV. In a crossroads scenario, we design a vehicular mobility model and simulate it by NS-2. By analyzing the simulated results, in terms of network performance parameters such as delay, throughput, and other parameters, the SAC-AODV is better than the AODV.

**KEYWORDS:** VANET; crossroads; SAC-AODV; NS-2.

## 1 INTRODUCTION

### 1.1 General introduction

With the rapid development of network architecture, mobile Ad-hoc network is widely favored by factories and research institutions. VANET (Vehicular Ad-hoc NETWORK) which is a form of MANET (Mobile Ad-hoc NETWORKs) is the potential core of ITS (Intelligent Transportation System). It is aimed at providing direct wireless communications between vehicles and that between vehicles and infrastructure.

A vehicular mobility model about the crossroads proposed in this paper. Through collaborative communication, the network nodes can make some data links by using multi-path routing adaptively. Based on AODV protocol, SAC-AODV routing protocol is designed to improve the performance of VANET.

### 1.2 VANET

In 2002, Chisalita and Shahmehri proposed the VANET's architecture [3]. In support of vehicular networking and traffic-related communications, US FCC (Federal Communications Commission) allocates 75 MHz spectrum Dedicated Short Range Communications (DSRC) [8].

On account of the huge potential of VANET, both institute and industry have shown great interest in implementation of VANET prototypes. Vehicles equipped with wireless communication devices can communicate with each other as well as the roadside infrastructure [10]. Therefore, it is available to exchange information for vehicles in real time.

VANET nodes have the characteristics of large volume and fast movement, so the energy of nodes is sufficient and fortunately the network topology changes frequently. In the urban traffic application, with the

increasing demand for vehicular service, drivers want to know the road conditions, weather conditions, current location and traffic safety in order to improve road traffic safety and management efficiency effectively, thus improve the quality of people's life.

### 1.3 AODV protocol

In 2003, the IETF (Internet Engineering Task Force) announced the standards of Ad-hoc network routing officially [6]. As a typical on-demand routing protocol, AODV is widely used in the scenes where the node is sparse and movement is fast.

The main idea of the AODV protocol is that a node needs a new communication which sends a RREQ (route request packet) through broadcast. Neighbor nodes receive RREQ and judge whether they are target nodes or not according to the destination address. If they are the target nodes, a RREQ will be returned by unicasting. If not, the neighbor nodes will find out whether there is another route to the destination node in the routing table. If the routing table contains such a route, when a node receives RREQ and has a route to the destination node, RREQ will be responded back, otherwise they continue to forward RREQ [7].

## 2 THE DISADVANTAGES AND IMPROVEMENTS OF AODV

AODV protocol combines DSDV (Destination Sequenced Distance Vector) and DSR (Dynamic Source Routing) protocol appropriately. RREQ is indicated by the TTL in the IP header to avoid the routing loops. However, some disadvantages are also showed in the vehicular network and urban scenario.

### 2.1 The disadvantages of AODV

Firstly, AODV is a feedback routing protocol, the routing won't update automatically if there is no routing interruption. Secondly, AODV has only unicasting capability and it depends on the established link excessively. It leads to a decline in the performance of the networks. Thirdly, In the process of discovering route, AODV broadcast a large number of RREQs, it can lead to unnecessary bandwidth consumption and heavy control overhead.

### 2.2 The improvements of AODV

SAC-AODV protocol proposed in the paper uses a strategy of adaptive cooperative communication. The cooperative communication is shown in the following Figure 1.

Figure 1. Caption of a schematic diagram of cooperative communication.

When the source node sends a message to the destination node, the message is broadcasted to the surrounding neighborhoods firstly and all forward to the destination node together. The destination node processes multiple signals by using the mixing information method.

Through the establishment of adaptive routing, the operation of SAC-AODV protocol is shown as follows.

#### 2.2.1 Routing establishment

When the source node sends data, the RREQ will be broadcasted if there is no link to desired node. There are two fields FIRST\_HOP and BROADCAST\_COUNT which are added in RREQ to describe the "First Jump" and "Broadcast hops" respectively. The source node saves the first jump of the routing. The nodes which receive RREQs save different arriving RREQs from nodes, until they receive the returned RREQ. So an adaptive multi-path routing is created.

#### 2.2.2 Routing maintenance

The routing updates according to the signal strength. The signal strength is defined as MP which is calculated by the following formula<sup>[4]</sup>.

$$MP = \prod \frac{P_{SD} - P_{\min}}{P_{\min}} \quad (1)$$

Where MP is signal strength between the source node and the destination node, and is the minimum values of received signal strength values.

$$P_{\min} = \min(P_1, P_2, P_3, \dots, P_n) \quad (2)$$

The MP value of source node is one. Every node accumulates MP with the message transmitting information. While reaching the destination node, the total value of MP is the product of the integrated value of all nodes on the link.

When the signal strength is less than the threshold of metric MP, the nodes give up this route proactively. This mechanism ensures a reliable multi-path routing. The choice and its routing update detail is shown in Figure 2.

```

Input: A RREQ or RREP packet P from Node[j].
1: IF (Node[j] TTL > Node[i] TTL)
2: Add Node[i] TTL to Node[j];
3: set BROADCAST_COUNT ∞;
4: Empty List of paths;
5: IF (Node[j] == Destination Node)
6: Add path to Table Path; (Next hop is j, the last hop is i, the number of hops is 1)
7: ELSE
8: Add new path to Table Path; (Next hop is j, the last hop is the first hop of RREP, The number of hops is BROADCAST_COUNT and plus 1)
9: END IF
10: ELSE IF (Destination Node TTls equal && the Node[i]'s number of BROADCAST_COUNT is greater than received);
11: IF (Node[j] == Destination Node)
12: IF (the path next hop is i and last hop is j Does not exist);
13: The path list to add a new path (next hop is j, last hop is i, hops number is 1);
14: END IF
15: ELSE IF (the path next hop is j and last hop is RREQ or RREP Does not exist)
16: The path list to add a new path (next hop is j, last hop is RREQ or RREP, hops number is BROADCAST_COUNT and plus 1);
17: END IF
18: END IF
    
```

Figure 2. Caption of mechanism of routing update.

#### 2.2.3 Reassembly of frames

The routing uses the mechanism of cooperative communication. There is a "start" tag added in the header and an "end" tag added in the tail of the frame. The reception side joint the tag based on mark bits. The mechanism can avoid disorder phenomena and ensure the correctness of the receiving information.

## 3 SCENARIO DESIGNING

In urban traffic environment, crossroads is a common scenario. This paper designs a crossroads with two vehicles mobility model, which is shown in Figure 3.

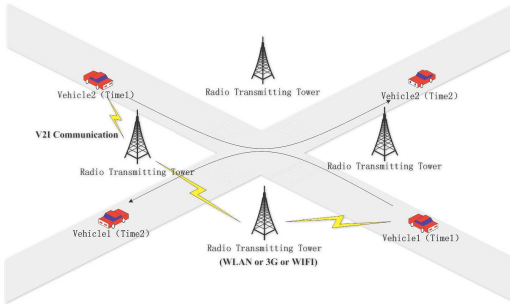

Figure 3. Caption of schematic crossroads scene.

In Figure.3, the space is divided into four quadrants by the crossroads. There is a base station (BS) for communication in each quadrant. The width of the road is 60m. The BS is 10 meters from the near edge of roads, so the distance between two neighbor BSs is 80m. The communication range of network node is 100m just like that of vehicles and BSs.

Two vehicles move closely in the opposite side from the far away, and turn left at the crossroads, then move away. In the whole movement, firstly, two vehicles create a relaying connection with BS; secondly, direct link between two vehicles is created. Subsequently the contrary movement leads to an increasing distance between vehicles, the direct communication turns to the relaying communication by BS. Two vehicles move far away and the communication link will be interrupted at the end of the movement.

The scenario is very common in urban traffic movement. There are important theoretical and practical significance in the research.

## 4 PROTOCOL SIMULATIONS

### 4.1 Simulation environment

In this paper, the simulation software of VANET routing protocol is a free simulate tool [5]—NS-2 (Network Simulator Version 2). It combines the two programming languages, C++ and OTCL. The C++ can process bytes and packets efficiently, and its operation is appropriate algorithms in a large number of data sets. The OTCL is a kind of script, so it is able to change the parameters of network environment quickly. The network environment could be simulated in a short time. The simulation parameters are shown in Table 1.

### 4.2 Analysis of simulation results

According to writing the trace file, we use a tool called “AWK” to analyze the result. With the velocity of mobile nodes increasing, the parameters such as packet loss, average end-to-end delay are changed. The average end-to-end delay is shown in Figure 4.

Table 1. Simulation parameters.

The number of nodes	6
Scenario size	400m × 400m
Propagation Model	Free space propagation channel
Frequency	2.4GHz
Antenna	Omni Antenna
Longest Communication Distance	100m
MAC Protocol	IEEE802.11
Routing Protocol	AODV,SAC-AODV
Application layer	CBR
	packets,512Kbytes
Range of Speed	10km/h-100 km/h
Simulation Time	100s

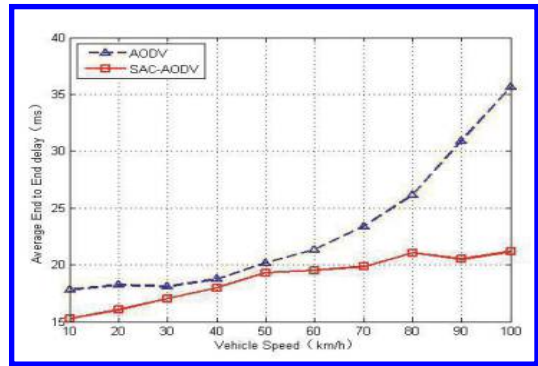

Figure 4. Caption of average end to end delay.

From the Figure.4, we can conclude that the average end-to-end delay is increasing with the speed of the vehicle speed. The delay of AODV ranges from 17.782ms to 35.642ms and SAC-AODV ranges from 15.260ms to 21.170ms. In all situations, SAC-AODV protocol keeps a lower value than AODV, and this trend means a remarkable improvement of the network’s efficiency. The package loss ratio of Network is shown in Figure 5.

Figure 5. Caption of package loss ratio.

As can be seen from Figure 5, packet loss ratio increases with the growth of vehicle speed. SAC-AODV changes more violently than the AODV. When the speed is less than 90km/h, the packet loss rate of AODV is higher, and as the speed is more than 90km/h, the SAC-AODV's parameter is higher.

However, in the urban scenario, the driver should obey the rules of the road. Speed of driving faster than 70km/h is not very common. SAC-AODV protocol still has a strong guiding significance. In the whole process, the majority of the packet loss rate is less than 10 percent. This property reflects a great universal application. The packet delivery ratio is shown in Figure 6.

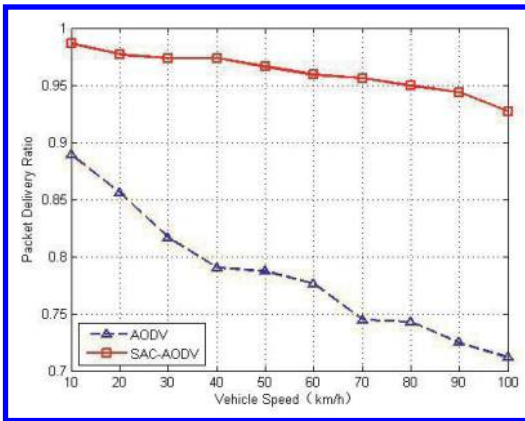

Figure 6. Caption of packet delivery ratio.

The Figure 6 incarnates that the packet delivery ratio is declining with the speed increasing. At the speed of 100km/h, the AODV protocol packet delivery rate falls to about 70 percent, while the SAC-AODV is still above 90 percent. The SAC-AODV shows better stability, trend of decrease is far less than AODV protocol.

In a word, SAC-AODV protocol not only enhances the efficiency of the packet transmission, but also minimizes the average end-to-end delay and package loss ratio. Compared to the AODV protocol, SAC-AODV exhibits better performance.

## 5 CONCLUSION

This paper presents an improved SAC-AODV routing protocol using mechanism of multi-path and collaborative communication. We optimize AODV and

simulate the two protocols in a crossroads scenario using NS-2. Comparing the result of simulation, the SAC-AODV is better than traditional AODV in the urban scenario. SAC-AODV increases the performances such as delay, packet delivery ratio and other parameters.

It is an important issue to research an efficient stable routing protocol in VANET. The research will make a construction for the ITS<sup>[2]</sup>. As research continues, traffic distribution, application services and location information still need to be considered in the future<sup>[1]</sup> to form a useful reference for the key technologies in VANET.

## Research on key technologies of remote network attack and defense teaching experimental platform

J.Q. Li, X.Q. Di, M. Wang, J. Qiu & J.P. Zhao\*

*School of Computer Science and Technology, Changchun University of Science and Technology, Changchun, China*

**ABSTRACT:** With the high development of computer network technology, the network security issues, such as various network attacks, are drawing more and more concern. It is highly expected that an experimental platform could be built up in order to virtualize the environment where to act network attack and defense. However, the existing experimental platforms only tend to present the scenarios where some simple intrusions would be occurring. So the service efficiency of the existing platforms do not take full advantages of the hardware resource yet. In this paper, we introduce an innovative architecture of the experimental platform for acting network attack and defense relying on the cloud computing and virtualization technologies. Then we continue to present the hardware implementation of the platform and analyze the concerned key technologies with stating the roadmap of our contribution. As the exploratory research result, the platform proposed and built up by our team is not only able to compose a variety of offensive and defensive scenarios occurring during the network attack and defense experiments, but it also allows for being accessed remotely to act the experiments, which improve the service efficiency of the experimental equipment.

**KEYWORDS:** Cloud computing, virtualization technology, network attack and defense.

### 1 INTRODUCTION

In general, it is difficult to act the experiments of network attack and defense during teaching and researching the computer security and other subjects due to the potential destructiveness brought in by the experiments. Currently these experiments are usually acted through simulating the real network environment with plenty of hardware devices. However, on one hand, it is a huge investment that building up such an experimental platform requires. On the other hand, configuring the experimental environment is quite complicated and required a large scale network to be deployed with various structures corresponding to the different experiment. Moreover, using the real physical devices to act the experiments would bring in some risks. Therefore, it is highly expected that building up an experimental platform to implement a virtualized environment to act network attack and defense that bring in some risks, such as setting network leak to configure the experimental environment.

Existing products of network attack and defense which are based on virtual simulation technology play a good role in promoting for information security and network teaching. But there are some problems: due to the complexity and diversity of real network environment only relying on virtualization technology or hardware equipment, it is difficult to achieve for a variety of network topology and offensive scene simulation,

not be carried out offensive experiment through by the remotely network. The experimental equipment utilization rate is low. So how to make use of virtualization and cloud technologies, how to develop the solution that can be used to remote users, and how to keep the flexibility to configure a variety of network topology experimental platform are focused in this paper.

### 2 THE NETWORK ARCHITECTURE OF DEFENSIVE EXPERIMENT PLATFORM

In this paper, the design of the experimental platform concerns the virtualization technology. During experiment courses, the students can establish their own virtual attack and virtual drone to carry out network attack and defense experiments according to the experiment assignments. The platform consists of seven modules which are the remote access module, the virtual attack aircraft cloud module, the virtual drone cloud module, the extended device configuration module, the control center module, the central management module, the experimental configuration module. The architecture is illustrated in [Figure 1](#).

- 1 The access control module enables users to access the platform and carry out experiment remotely;
- 2 The virtual drone cloud module can generates a virtual drone with different vulnerabilities;

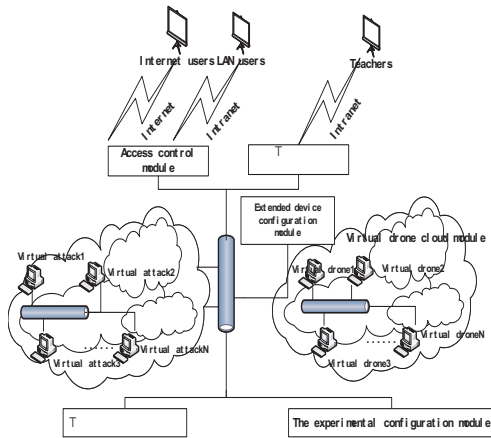

Figure 1. Caption of the overall program about remote network attack and defense virtual simulation experimental teaching platform.

- 3 The extended device configuration module allows users to configure firewall, intrusion detection systems, security auditing systems and other hardware devices for a virtual attack aircraft cloud platform;
- 4 The control center module captures network traffic automatically, and users can download the data packet information for their analysis;
- 5 The central management module accounts maintenance platform and operating system image library;
- 6 The experimental configuration module allows users to configure virtual machines and network topology.

### 3 THE TOPOLOGY OF NETWORK ATTACK AND DEFENSE EXPERIMENTAL TEACHING PLATFORM

The topology structure of the network attack and defense is shown in figure 2, in which the involved hardware mainly includes VPN gateways, switches, firewalls, application servers, the first network and the second network cloud storage.

Experiment description: Application Server is installed in Ubuntu operating system, OpenStack, JDK, Apache Tomcat and MySQL, and is deployed with JSP/Servlet program. The Application Server connects to the switch, the first network and the second network cloud storage.

The first network cloud storage connects the switch through the firewall, which is an optional network protection device. Users can also use other network devices to replace firewall or directly connect to

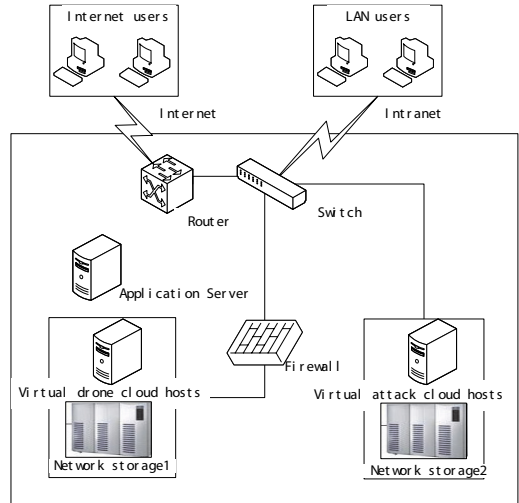

Figure 2. Caption of the hardware structure of virtual simulation experiment teaching platform on remote network attack and defense.

the switch. In this paper, it is suggested that a firewall is used to configure a variety of network protection environments. The first network cloud storage holds the operating system image files with the operating systems and application software vulnerabilities, and these image files can be created out of instances and that is 64 windows or Linux virtual drone.

The second network cloud storage directly connects to the switch, and stores the attack tools which have already been installed of the operating system image files. With these image files, it can be created out of instance that is 64 Windows or Linux virtual attack plane.

Internet users connect the virtual simulation system through VPN gateway, LAN users through the switch.

### 4 KEY TECHNOLOGIES

In this paper, we list the key technologies as hierarchical authority and management, dynamic installation and configuration of the virtual machine, dynamic management and maintenance, attack tools and protective tools, dynamically configured network connected devices and protective equipment . network equipment via cloud computing and virtualization technology. These are the research goals to achieve through our work.

- 1 Management center module allows administrators to set up the virtual simulation system of experimental classes, the attack tools, the

operating system image files, the protection tools of virtual drone cloud within a module with the operating system vulnerabilities and the application of software vulnerabilities.

- 2 Experimental configuration module allows users to set up the network in which the instances of virtual strike and the virtual experiment drone instance categories are included, the module also allows users to configure the virtual drone attack instances and the instances of network topology set by users.
- 3 Strike aircraft cloud module adopting virtualization and cloud technology, according to the experiment of configuration module setting categories, dynamically creates and installs the corresponding attack tool for Windows or Linux operating system virtual attack instances;
- 4 The monitoring center module automatically captures the network data communication packets between the virtual attack aircraft cloud module and the virtual drone cloud module. Users can download network packets when completing offensive and defensive experiment.

## 5 PROCESS OF EXPERIMENTS

The acting process of network attack and defense experimental teaching platform in this paper is shown in Figure 3.

When network attack and defense experimental platform is during initialization, the administrator being responsible for maintaining the account information database including user name, password and experimental categories may operate. Referring to the account of disk space allocated in the first and second network cloud storage, a user will be specified who can operate the experimental class.

Administrators maintain the virtual drone of Window and Linux operating system image files of the first network in the cloud storage, the virtual attack of Windows and Linux operating system image files of the second network in the cloud storage, the attack software the virtual attack instances and the vulnerability database resources used on the virtual drone instance.

LAN users provide the correct user name and password to access the virtual simulation system; Internet users identify the connection established by the experiment platform through the VPN. When the LAN and Internet users are connected to the platform, they can use the disk space in the first cloud storage and the second network cloud storage assigned by administrator in advance.

The LAN and Internet users, according to the experimental class, choose the corresponding virtual carriers and virtual drone image file, and then

create them in their own disk space. They will configure the instances of the IP, subnet mask, default gateway and DNS server of virtual carriers, virtual drone image file and set up a network connection between virtual carriers instances and virtual drone instances. Then the users login the virtual drone instance which were created by themselves, uses software with security vulnerabilities provided by the first network on cloud storage to configure the virtual drone instance, and make it under the condition of being attacked.

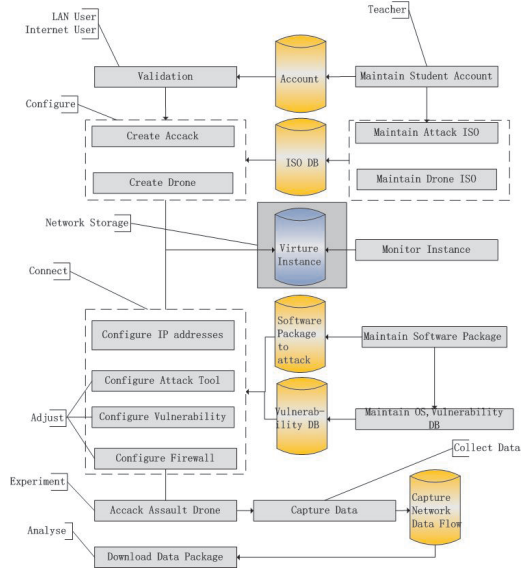

Figure 3. Caption of the experiment process of virtual simulation experiment teaching platform on remote network attack and defense.

The users login to create your own instance of virtual strike, use the second network attack on cloud storage tool to configure the virtual attack instances and make it have the ability to attack.

Users can install other attacks in the virtual attack instances tools and install on other protective tools in virtual drone instance by themselves according to the experimental need.

In order to simulate the complex real network environment, users can configure the firewalls for the virtual drone instance by which the virtual drone instance can be incorporated into the firewall safety within the scope of protection. When users login the virtual carriers within the instance, they can use the configured virtual drone attack to attacks.

The monitoring center module captures network packets through the instances between virtual drone

and virtual attack, and saves operation system log and the log of relevant software tools of the virtual drone from these instances. Internet users can download the network packets captured by the monitoring center module for the analysis of experimental results at any time. When completing the experiment, the users can close the virtual attack instance and the virtual drone instance. The monitoring center module described above will monitor the instances of virtual strike and virtual drone, if they take no activity long time automatically, and close them to release resources.

## 6 CONCLUSION

Referring to the problems identified and stated at the beginning in this paper, the authors adopt the building plan of cloud computing and the virtualization technology to design the platform of network attack and defense. In this paper, the plan is used with the virtual machine as the attack and drone in the offensive and defensive test, which have avoided the physical destruction of offensive and defensive experiments on equipments. At the same time, configuring firewalls and other security protection equipments for the drone, the router for the virtual machine and other network connection device is allowed. So, it is possible to be achieved that building a variety of network topology and defense scenarios for students to do experiments of information security and network attack and defense.

## ACKNOWLEDGMENT

We thank the director of the School of Computer Science and Technology (Changchun University of Science and Technology), Jianping Zhao who is also the corresponding author of this paper.

# The design of a central node of the wireless sensor network used in seismic monitoring

Z.T. Li, J.H. Fu, Y.K. Guo & Q. Tan

Key Laboratory of Crustal Dynamics, Institute of Crustal Dynamics, China Earthquake Administration, Beijing, China

**ABSTRACT:** Due to its self-organizing, self-healing, and self-recovery features, the Wireless Sensor Network has been used in seismic monitoring successfully. In order to promote the performance and reliability of the suspect network, this paper introduces the design of the new central node adopting the modular design idea, which has multi access modes, dual protocol stacks, low power cost, and high processing ability. This design had been used in the development of the central node equipment.

**KEYWORDS:** Earthquake, low-power, multi modes, seismonastic.

## 1 INTRODUCTION

Earthquake brings serious harm to human survival security, economic development and social stability because of its sudden and huge destructiveness [1]. In order to minimize the casualties, property damage and social impacts caused by earthquake, it's sure to do many works. The Seismic Monitoring is one of the things that we should make an effort to do.

The Earthquake Monitoring refers to suspect the vibration signals, and send the obtained information to the monitoring center as quickly as possible. Apart from the good performance of seismic observation instruments, the appropriate distribution of monitoring stations, efficient data processing system, stable, reliable and fast data communication between the station and the data processing center are indispensable parts to realize rapid earthquake monitoring [2].

The wired network is an important way of data communication, but it is limited by topography, geomorphology, environment and other factors, and tends to be destroyed in case of emergency. Compared with traditional wired network and other wireless networks, wireless sensor network has self-organizing, self-healing, self-recovery and other features that can realize the effective connection in order to provide efficient data communication mode for seismic monitoring under the condition of normal and disaster situations [3]. In the wireless sensor networks the central node is particularly important because it is responsible for the collection and transmits the data to the server. Therefore, to design a central node which has multi-protocol communication modes, intelligent selection which can switch automatically according to the appropriate network timely and reliably is very urgent [4].

This paper is organized as follows: the second part interprets the design of the central node in detail, the third part explains the workflow and data flow of the central node, the last part gives a conclusion.

## 2 THE COMPONENTS OF THE CENTRAL NODE

### 2.1 The general design

As shown in Figure 1, the central node is composed of the processor module, the mobile communication module, GPS/Beidou satellite position and communication module, ZigBee module, IPv4 / IPv6 network module, the power management module.

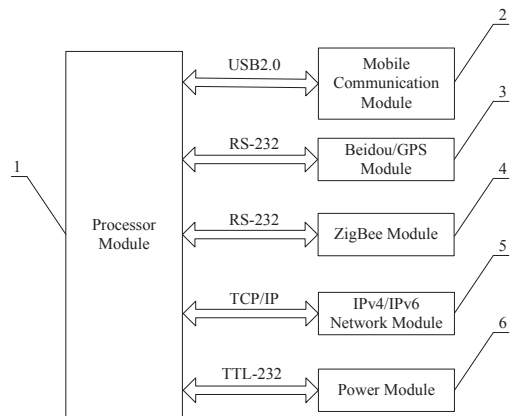

Figure 1. The general block diagram of the central node equipment.

The processor module integrates the low power ARM processor, NOR Flash and NAND Flash storage medium.

The Mobile Communication Module supports a variety of communication modes such as CDMA20001x EV-DO, TD-SCDMA and WCDMA 3G.

The ZigBee Module is responsible for node to node communication. The mode of the network includes the star network, the tree network, the mesh network.

## 2.2 The detail design

The processor module uses the low-power ARM processor, integrates NOR flash and NAND flash. For the earthquake wireless sensor network, the processor's selection not only needs to consider the processing capability, but also the power dissipation and the volume, so the Marvell PXA2270 is the better choice. The function of the NOR Flash is storing the embedded Linux operating system, including boot loader, kernel and root file system. The role of the NAND Flash is storing applications and disaster data. It supports embedded Linux applications, and qualifies for accessing, collecting, storing and uploading large amount of disaster data. At the same time, it is used for integration and application of other modules to realize the functions of acquiring, storing, displaying and uploading the on-site monitoring data.

Mobile Communication Module which supports a variety of communication modes, such as WiFi, CDMA20001X EV-DO, TD-SCDMA, WCDMA 3G network etc., makes the central node to access wireless network and communicate with the server. The mobile communication module can select a specific single access mode according to the signal quality of the network. This not only saves the cost of the central node, but also guarantees the monitoring information stable and reliable uploads.

GPS/Beidou Satellite Communication Module is used for satellite communication in order to obtain the monitor sensor's location and time information, to provide a unified time reference for the central node. The time and location information obtained from the GPS/Beidou Satellite navigation system, the seismic intensity transferred by ZigBee module compose the whole information of earthquake motion. In addition, the Beidou Satellite Communication has the short message feature which can complete reliable data transmission if the other wireless network shut down after a serious earthquake occurrence.

ZigBee Module that can provide wireless ZigBee network data transfer functionality for the central

node equipments, support point to point network, star network, tree network, mesh network, etc., can meet the various standards and non-standard network topology and guarantee reliable transmission of seismic disaster information to the central node equipments via ZigBee network.

IPv4/IPv6 network module supports wired, WiFi wireless network (IEEE802.11x) and other network transmission medium, supports IPv4/IPv6 dual stacks to make the seismic disaster monitor to access a wired/wireless network. IPv4/IPv6 network module realizes a redundant design of multiple transport protocols. It provides reliable data channel for uploading seismic disaster information.

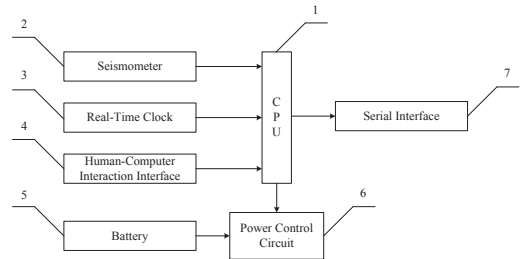

Figure 2. The hardware block diagram of the power supply module.

The Power Management Module as Shown in Figure 2 is based on the Cortex-M3 processor as the core. It is composed of a seismometer, real-time clock, human-computer interaction interface, battery, the power control circuit and a serial interface. Due to configuring multiple communication modes, the power dissipation of the central node is very high, so the battery may not guarantee the central node working continuously for a long time. When there is no earthquake occurrence, only the Power Control Circuit works. It cuts down the connection between the battery and the other parts of the central node via the Power Control Circuit, the central node turns into a dormant state. When the Cortex-M3 processor receives the starting request from the seismometer, the real-time clock, or the human-computer interaction interface, the power control circuit will build the connection between the battery and the power of the other parts of the central node. The central node will exit the dormant state, and become the monitoring state. The request of the seismometer and the real-time clock is automatic, but the request of the human-computer interaction interface is manual. There are many kinds of start request of the power. For example, when an earthquake happens, the seismometer sends the

start request. When the real-time clock reaches a certain set time, it sends the start request. When system settings are required, the interface sends the start request. After the Cortex-M3 processor receives the start request, the Power Control Circuit provides the power service for the central node via the Power Control Circuit. At the same time, it sends startup type to the processor module via the serial interface. The power module realizes the state-switch of the central node, achieves the purpose of the power management, and realizes automatic acquisition of the seismic disaster information.

### 2.3 The workflow of the central node

Figure 3 shows the overall workflow of the central node. The power module produces three kinds of startup request. They are Seismonastic startup, timing startup and manual startup. When the central node initiates, the power module powers the whole equipment via the power control circuit. The processor module starts the operating system after power on, then the operating system transfers control commands to the applications running on the processor module. The application procedures coordinate various modules of the central node equipment for acquiring, processing, storing and uploading the disaster data. The application procedures first receive startup type from the power module (seismonastic startup, timing startup and manual startup), then execute control commands based on the startup type, send acquisition command to the seismic monitor node via ZigBee module, save disaster information locally and upload these data to the monitoring center via the mobile communication module GPS/Beidou Satellite Position and communication module or IPv4 / IPv6 network module.

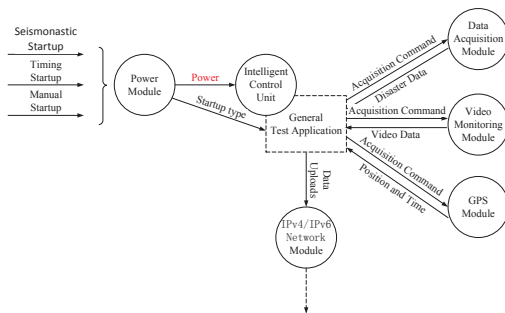

Figure 3. The overall workflow diagram of the central node equipment.

Figure 4 shows the dataflow of the central node. The applications running on the processor module initialize various modules, obtain the modules' state information, and analysis the startup type of the central node. When it is seismonastic startup, the applications will read the disaster data and judge whether the monitoring task is completed. If the task has been done, it will exit the program and shut down the equipment, otherwise, it will read and upload the disaster data continuously. When it is timing startup, the applications will read and upload the state of the sensor as well as the disaster data, and then exit the program and shut down the equipment. When it is manual startup, the applications will complete the manual setting of the disaster monitor's software and hardware, and then exit the program and shut down the equipment.

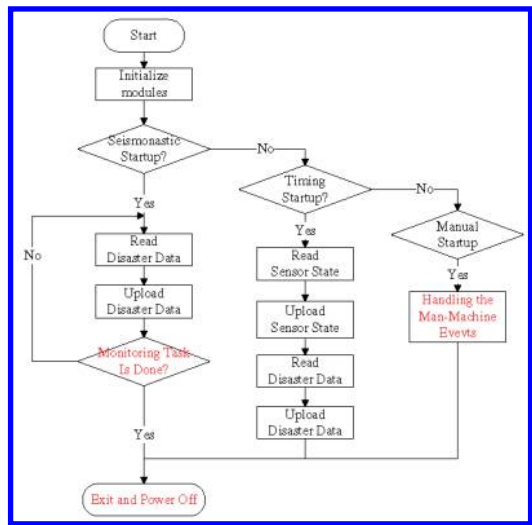

Figure 4. The workflow diagram of the central node.

As shown in Figure 5, the flow of the disaster uploading data is based on the site network. It attempts to connect with the monitoring center in the order of wired communication, wireless communication, mobile communication, satellite communication from the highest priority to the lowest one. After the connection is established, the data transfer in a certain mode. If the data transmission is interrupted during the procession, it will switch to a low-priority communication mode automatically in order to ensure the link connection.

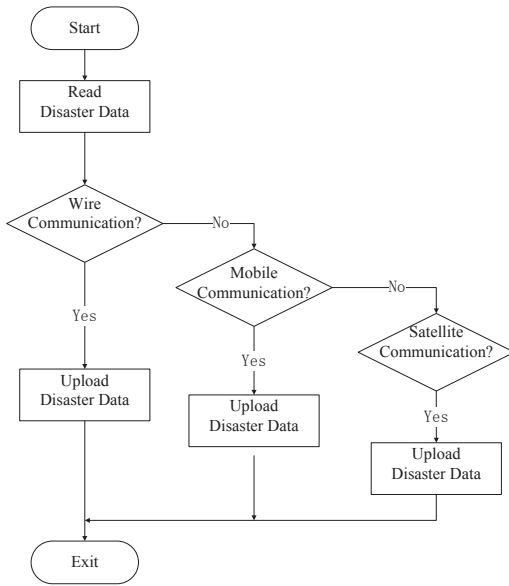

Figure 5. The flow of the disaster uploading data.

### 3 CONCLUSIONS

The design of the central node has been used in the development of the Seismic Intensity Reporting System. Compared with the traditional design, this

has many advantages which have been verified on the field applications, such as low power consuming, high processing performance, multiple communication mode, dual protocol stack, reliable and stable link.

### ACKNOWLEDGEMENT

This paper is supported by the research grant from Institute of Crustal Dynamics, China Earthquake Administration (No.ZDJ 2012–18).

## The application of Logic Pro in music writing with multi-part

Jia Ming Zhang

City Express, Zhejiang, Hangzhou, China

**ABSTRACT:** With the development of computer music technology, the use of computer music technology in music is not a new thing. Logic Pro X software multi-voice music writing is the favorite of many composers and studied composition teachers and students because of its friendly interface and powerful auxiliary function composition. This paper described the method and advantages of Logic Pro X software multi-voice music writing.

**KEYWORDS:** computer music, MIDI, sequencer.

### 1 INTRODUCTION

#### 1.1 Background

In traditional music and playing, the musical instruments have occupied a pivotal position that they have depended on well-designed structure, rigorous precision production, division of their duties and each has its own merits. Musical instruments accompanied mankind has long years, they have created more refulgence in art history, it helped culture of human for the development, it played majestic movement with one after another. The writing of traditional and multi-part music given posterity abundant and precious experience and theory, though continuous progress and improvement after hundreds of years, these still have their indelible brilliance in different time of human development, different cultural background and different nation<sup>[2]</sup>. With the development of science and technology, the computer technology has become an indispensable tool in people's daily lives contemporarily, for example, we can use computers to create multi-part and wonderful music.

This paper researches based on a professional production software (it is named Logic Pro X) as background, and we carried out a detailed description of it through the combine handle of writing multi-part music as a sample.

#### 1.2 Software introduction

Logic Pro X is a professional software for production audio of Apple's, it as a professional and fully functional recording studio of Mac, it has provided everything of creating from first note to finish end note for musicians. It provided the soft-musical-instrument and audio processing plug-ins that they can make any style of music enough, for example, from POP to R&B, form Blues to HIP-POP, form House Dance to Dubstep<sup>[2]</sup>.

Logic Pro X also is powerful and full-function music application at the same time, equipping all tools with creation musical works of professional quality, it can transcribe, arrange and edit audio, adding high-quality effect, make a music mix to stereo or surround sound, then exporting the final mix-audio to more format-files for publishing. The interface as shown Fig. 1.

Figure 1. Major-window interface of Logic Pro X.

#### 1.3 Flow summarizing

Logic Pro X provide a set of workflow, as shown Fig. 2.

##### 1 Creation Item

At first, we save music folder and all changes through creating new items. We can storage media file and other resources to item, we can also excerpt them from their location currently.

##### 2 Transcribing Fodder

We can add the music fodder through transcribe performance in sound-track area. We can

transcribing music, musical instrument and other sound in sound-track through using USB-keyboard or MIDI controller. Based on the above, we can play the musical instruments and transcribe various software-instruments, transcribing MIDI segment and playback it on an external MIDI device, for example they are synthesizers and sound modules.

### 3 Adding Apple Loops And Other Media File

There are a lot of Apple Loops on adding Logic Pro. Apple Loops transcribes audio beforehand and MIDI file, we can create scalable and repeated mode to fill any length of time. We can also add audio, film and transcribing media file beforehand to item.

### 4 Creating Scheme

Cleaning records and other media can create scheme in the audio-path. Recording, cycle and other media file as segment as shown in the audio-part area, we use it to copy, move, resize, circle and other fashion of editing, we can also use the edit marker to define and re-edit all-parts in the item.

### 5 Editing Segment

Logic Pro X provide an editor, it can use each way to edit for audio and MIDI segment. For the MIDI segment, we can also use “Flex Time” to edit single note and timing of other events accurately, and adjusting the pitch of note by using Flex Time”.

### 6 Mix-audio And Adding Effects

After forming the project, we may mix-sound the item to balance each sound-part, and inoculate them to a coherent whole. In the mixer, we may adjust the volume and pan (balance) position, and controlling signal flow through using to send and group. Logic Pro X has a set of professional-quality results, it can enhance given composition of music, thus we can make a perfect mix-sound finally. We may control mix-sound, effects and other parameters through using automatization to change along with time.

### 7 Global Changes

We can use the global-track to operate different aspect of the whole item, include collocate-track, sign-track, number-track, speed-track, change-track and beat-mapping-track. For the item of film, we may also visit film-track to see video frame and synchronizing with the music events.

### 8 Share Item

When the item is ready to share time, we can use one of the multiple standard audio file to export stereo files of final mix-sound, and also generates multiple stems files. These files adopt most and the current format of surround encoding scheme, we can burn the item to CD or DVD directly. The flow chart as shown Fig. 2.

Figure 2. Flow chart of Logic Pro X.

## 2 NOTE INPUT MODE COMPLETELY

Logic Pro X provide a note input mode completely, it satisfies most users by their habits.

### 2.1 Input notes through adopting keyboard of USB

This method is relatively simple. At first, we clicked time-value of the note or pause on the keypad’s keyboard of software interface when we have inputted, then we move the mouse to a high-sound location of appropriate music, and we have inputted. Bring to bear the keyboard to input note, this method is a very practical and accurate, we use C, D, E, F, G, A, B or 1,2,3,4,5,6,7 of keyboard when inputting, the seven key-press delegate seven musical alphabets, the numeric keypad to represent notes, pause and lifting mark of keyboard’s right side, we copulate use left and right hand when inputting.

### 2.2 Inputting note of using MIDI-keyboard

At first, we must hold a MIDI-keyboard or electronic organ with MIDI-interface when we have inputted with using this method, after making a simple input and output settings, we can be carried out in real-time input. We must choice note-value when we inputted, then we played directly on the MIDI-keyboard, the note will be written on the Logic Pro X.

### 2.3 Inputting note by using a scanner

This method adopts to put the music-paper into the scanner, we will open the commendatory scanning software of Apple’s company, for example, scanning input by adopting PhotoScore software, it scans the music-paper in the software to transform editable format. But in this way the papyry music-paper for higher demand.

### 3 POWERFUL ROUNDING SOUND EDITING FUNCTIONS

Logic Pro X as painting software by itself, simultaneously, it also has powerful editing function of surround sound, as shown Fig. 3. All audio signals can locate mix-sound, we can locate them to anywhere location of surround sound, and it can insert plug-in of surround sound in audio and musical instrument, sending to auxiliary or output surround.

Logic Pro X include effect and musical instrument of much surround sound and multicenter. When we can create surround item, Logic Pro X will record multi-channels audio to multi-channel files. The import files of splitting multi-channels will converse automatically.

In addition, we can make the surround item to use any fadders through we mix up and down signal un-relatively. For example, if we will use surround sound in Logic Pro X, we need an audio interface of the output channels that they have chosen surround format requirements, we may adopt 5.1 surround sound format, it needs six output channels, its edit flow as follows:

At first, the sequencer can exert executants to MIDI-keyboard what can play the note, cadence, methods, speed and change of voices, they are edited and stored.

Second, songster also can rework and edit of editing for each information, they can send to sound-source anytime after editing the information, the sound-source basis on timbre information of sequencer demanding to choice correct virtual instruments, it can automatic performance and play.

At last, by this technology, one person can complete the equivalent of a band for multi-voices what a performance, command and recording, it can reach the aim that it creates multi-voices of using Logic Pro X.

### 4 ABUNDANT ASSISTANT OF MUSIC CREATION

Logic Pro X not only be able to record music, perfect, playback, but also it holds abundant auxiliary tools for music creation. Respectively, increase drum loop, add harmony, inverted image, pitch mapping, melody identification mark, bass identification mark, retro-grade, shows handbell notation style and etc. These are very useful auxiliary tools, for instance Add Simple Harmony, as shown Fig. 4.

If we want to add harmony to the melody, as long as a few simple steps.

At first, we choice this cantus. Second, we choice Add Simple Harmony in Composing tools of the Plug-ins menu. At last, we choice the confirm-button of pop-up dialog box. Logic Pro X will add harmony part for above melody part, as shown Fig. 5.

Figure 3. Surround sound editing window of Logic Pro X.

Figure 4. Sheet music sample.

Figure 5. Adding music map of harmony part.

### 5 AUTOMATIC MIX-SOUND TECHNOLOGY

Logic Pro X has an excellent mix-sound technology automatically, it's able to transcribe, edit and playback, Using automation to create the volume, pan, and other settings with time process of changes.

After adding automation of track type in the project, each track has an automatic curve of volume and pan, it can set the curve of automatic plug-in, if we will create it, then it will occur change automatically with time, as shown Fig.6.

When we write the multi-part music of automatic mix-sound by using Logic Pro X, each note and the intensity of its corresponding symbol, phrase speed will be heard by the composer in real-time. Logic Pro X will add a variety of musical instruments according to the needs of the composer, and it will be added to a variety of musical instruments to load it's relatively sound automatically, it can economize most of time and energy when the composer writes multi-part music. Through the function of playback, the composer can hear the performance effect of their works directly, thereby, he can perfect.

Figure 6. Show track automation curve.

## 6 OUTPUT FUNCTION OF MUSIC-SCORE AND MUSICAL INSTRUMENT SUB-SPECTRA

For the completion of a multi-part musical works, Logic Pro X provide the output function of complete music-score and musical instrument sub-spectra, and it's ready for bank rehearsal.

In the process of multi-part music writing, The providing help of multi-part musical editing by using Logic Pro X is very obvious, not only a conversion note by paper records to use computer software records currently, but also more far-reaching impact is that many multi-part works are finished by Logic Pro X now, for example, music creation, playing music, export music and burn CD. Although it was suggested that the software exist some shortage, but we believe that these problems will be solved in the near future.

# A study of use technology acceptance model of web-based digital learning environment for interior decoration labor safety education

Yaw Yauan Tyan & Huang Yu Chen

*Department of Civil Engineering and Hazard Mitigation Design, China University of Technology, Taipei, Taiwan*

Yun Wu Wu

*Department of Architecture, China University of Technology, Taipei, Taiwan*

**ABSTRACT:** In this study, a Web-based digital learning environment was developed for interior design labor safety education. Through situated learning with simulation of actual situations, the environment allows students to learn more possible safety hazards and prevention measures for interior design workers.

**KEYWORDS:** Interior decoration; digital learning; Technology Acceptance Model (TAM); safety education.

In this study, the ADDIE curricular develop process was used in the development of the environment and a TAM-based questionnaire survey was conducted to explore the behavior and willingness among students toward the use of this environment. According to the questionnaire result analysis results, the average of the perceived usefulness of this environment (2.75) is higher than the perceived ease of use of the system. According to the Cronbach's  $\alpha$  coefficients, the perceived usefulness has a direct influence on the students' willingness to continue using the system (0.984) while the perceived ease of use has an indirect influence on the students' willingness (0.616). Generally, the students have positive opinions of the environment, believing that it can help them to improve their learning of interior design labor safety.

## 1 INTRODUCTION

As people are now requesting better living environments, the interior decoration industry is growing exponentially and becoming an important part of the construction industry. However, due to the unique characteristics of the working environment and workers, there have been frequent major safety accidents and disputes caused by interior decoration work [1].

To promote more knowledge of labor safety in the interior decoration, a Web-based digital learning environment was developed in this study for students to learn about labor safety for interior design workers anytime and anywhere. The ADDIE curricular development process [2] was used in this study to develop

curricular materials for this digital learning environment. Then the technology acceptance model (TAM) was used to develop questionnaires for the analysis of the behaviors, willingness and learning effects of the users in their use of the environment.

## 2 LITERATURE REVIEW

### 2.1 *Situated learning*

Situated learning focuses on the use of incidents or problems in actual situations to help learners understand how to use knowledge in solving problems in real-life situations [1]. For situated learning, visualization technology can be helpful to simulate real-life situations for students [3]. In this study, the building information modeling (BIM), a visualization technology for architecture design, was used to simulate real-life construction situations for students, demonstrating to them the safety notices as illustrated in the following [Figure 1](#), characteristics of the materials and related standards [5].

### 2.2 *Digital learning environment*

The curricular design process of Analysis, Design, Development, Implement and Evaluation (ADDIE) [5] was applied in this study with the incorporation of the situated learning theory to develop a Web-based digital learning environment for labor safety education. This environment is composed of the following elements: Homepage (introduction and latest

Figure 1. Simulation of the construction site.

information); Labor Safety Information (cases and legal regulations); Situated Learning (tests and videos); and Discussion Area (discussions about related knowledge and questions).

### 2.3 Research framework

Furthermore, the technology acceptance model (TAM) was used in this study to explore how the students have accepted this learning environment from the perspectives of perceived usefulness and perceived ease of use of the environment in the eyes of the students as well as the attitude and behavior of the students toward the environment. Totally six hypotheses were proposed in this study: H1: Perceived ease of use ( $X_1$ ) has a positive influence on perceived usefulness ( $X_2$ ); H2: Perceived ease of use ( $X_1$ ) has a positive influence on perceived usefulness ( $X_2$ ) and attitude ( $X_3$ ); H3: Perceived ease of use ( $X_1$ ) has a positive influence on attitude ( $X_3$ ); H4: Attitude ( $X_3$ ) has a positive influence on behavior ( $X_4$ ); H5: Perceived ease of use ( $X_1$ ) has a positive influence on perceived usefulness ( $X_2$ ) and behavior ( $X_4$ ); and H6: Perceived ease of use ( $X_1$ ) has a positive influence on behavior ( $X_4$ ).

The teaching experiments using the digital learning environment developed in this study were the soon-to-graduate senior students in the Civil Engineering Department, Architecture Department and Interior Design Departments of China University of Technology. Totally 150 questionnaires were randomly given to the students and 147 were returned with a return rate of 98%. Among them, 142 were valid samples with a valid return rate of 94.6%. The scale in the questionnaire was based on the scale developed by Davis(1989) with some revisions. There were totally 15 items in the scale, covering the four dimensions of perceived

ease of use, perceived usefulness, attitude and behavior.

The Cronbach's  $\alpha$  coefficients of the four dimensions are -0.098 (perceived ease of use), 0.816 (perceived usefulness), 0.847 (attitude) and 0.964 (behavior). Only the Cronbach's  $\alpha$  coefficient of perceived ease of use is a negative value. According to Xi and Wang, there are two scenarios in which Cronbach's  $\alpha$  coefficients can be negative-when the total score variance is lower than the score variance of each item, i.e., the item average used in the total test or sub-test; or when the covariance total of all the items or some of the items is a negative value, which indicates the Cronbach's  $\alpha$  coefficient formula is a failure [8]. The negative Cronbach's  $\alpha$  coefficient in this study belongs to the second scenario and can be explained as a result caused by inconsistent internal coefficients. It is probably because the learners found it difficult to connect to the Web-based environment developed in this study. However, the Cronbach's  $\alpha$  coefficients of the other dimensions are all larger than 0.7, indicating certain reliability of the questionnaire. The negative Cronbach's  $\alpha$  coefficient of the perceived ease of use dimension indicates the necessity to review and improve the items in this dimension and/or the learning environment.

### 2.4 Path analysis

According to the path analysis in Figure 1 and analysis results in Table, the total effects of H1 to H6 are respectively 0.616, 0.984, 0.401, 0.942, 0.945, and 0.239. Among them, the total effect of H3 (Path  $X_1 \rightarrow X_3$ ) is only 0.401, indicating only 40% of the students agree that the perceived ease of use of the environment has a positive influence on their attitudes to the environment. The total effect of H6 ( $X_1 \rightarrow X_4$ ) is only 0.239, indicating only 20% of the students agree that the perceived ease of use of the environment has a positive influence on their behavior of using the environment. These two low total effects are probably attributable to the room for improvement in the interface design of the environment.

Figure 2. Path analysis.

Table 1. Path analysis results based on the questionnaire results.

Path	Hypothesis	$\beta$	P	Result	Total Effect
$X_1 \rightarrow X_2$	H1	1.090	3.63***	Supported	0.616
$(X_1 \rightarrow X_2) \rightarrow X_3$	H2	1.489	1.80***	Supported	0.984
$X_1 \rightarrow X_3$	H3	1.065	4.65***	Supported	0.401
$X_3 \rightarrow X_4$	H4	1.127	1.23***	Supported	0.942
$(X_1 \rightarrow X_2) \rightarrow X_4$	H5	1.904	2.04***	Supported	0.945
$X_1 \rightarrow X_4$	H6	0.960	2.03***	Supported	0.239

\*P<0.05, \*\*P<0.01, \*\*\*P<0.001

### 3 CONCLUSION

This study is intended to develop a Web-based digital learning environment for interior design labor safety. Through a TAM-based questionnaire survey, this study explored the acceptance among learners of this digital learning environment. The conclusion of this study is as follows:

- 1 The ADDIE curricular development process is indeed helpful for the content design of the digital learning environment in this study.
- 2 According to the TAM analysis results, it is found in this study that:
  - a. 98.4% of the students indicate the learning environment is helpful;
  - b. 98.4% of the students hope to continue their learning using this environment and 94.2% will continue to use this environment in their learning; and
  - c. The students are satisfied with the environment.

Based on the above-mentioned findings, it can be concluded that the environment developed in this study is helpful for the promotion of knowledge about interior design labor safety. However, whether the knowledge can be translated into effective reduction of safety hazards for interior design workers, it requires more long-term investigation.

It is suggested that follow-up research be conducted to compare students (novices) and actual workers (experienced workers) in their use, perception and satisfaction of the environment developed in

this study to provide more references for teaching at school and on-the-job training.

# Application of database technology in information society present situation and existing problems of analysis

Fang Kong

Zaozhuang Vocational College of Science & Technology, Tengzhou, Shandong, China

**ABSTRACT:** Database technology has become an information society, based on a large amount of data organization and management of the important technology and software technology; it is the basis for the network information management system. It not only has a complete theoretical foundation, but with the rapid development of hardware technology and software technology, its application is becoming ever more widely used. This paper briefly describes the research of multimedia database technology and the existing problems in the design of the database management system.

**KEYWORDS:** Research on the new technology of database, multimedia database technology, MMDBMS, the existing problems.

## 1 INTRODUCTION

With the development of the computer application domain, the development of multimedia technology and network communication technology, the database is the fastest growing, most widely used in computer science and technology, one of the important branches of database technology research has made significant breakthroughs, he has become a computer information system and a computer application system of the important technical foundation and pillar. Multimedia database technology is an important component of computer technology, it can simultaneously access, processing, editing, storage, and display different media such as text, voice, video, graphics, and it has the characteristic such as diversity, integration and interaction. Can only solve a lot of key technical problems with the media, is widely used, promote the development of it's faster.

### 1.1 *The database of new technology*

All kinds of the combination of science technology and database technology, so that the database field new content, new application, new technology emerge in endlessly, formed a new database system: distributed database system, knowledge database system, fuzzy database, parallel database systems, multimedia database system, etc.; Database technology has been applied to a specific application domain, and the engineering database, deductive database, temporal database, statistics database, spatial database, scientific database, literature database, etc., they have inherited the traditional theory and technology of database, but

is not in the traditional sense of the database, based on the existing achievements and traditional database technology, to develop, thus forming the new database system, some call it the “evolution” database system; Based on the new application requirements and the development of the computer in the future, developed a new database system, some call it “innovation” of the database system. Can say a new generation of database technology research, the development of a new generation of database system presented flowers. As showed in [figure 1](#):

## 2 MULTIMEDIA DATABASE

The database is for some special purpose organized collection of records and files. The traditional database management system in the treatment of structured data, text and numeric information is very successful. However, with the passage of time, the multimedia information are also proliferating in: the Internet has increasingly produced and store huge amounts of image and video, to facilitate the processing, distribution and preservation, many printing forms of painting and pictures were converted to digital form; Many televisions and newspaper pictures were transformed into digital form. People in everyday collect a large amount of medical images; Also constantly produce more of the satellite images. With the development of storage technology and digital technology, the trend will continue, to manage and use these small increase of multimedia information and data information, just create a stack them “warehouse” is useless, if does not carry on multimedia information organization for

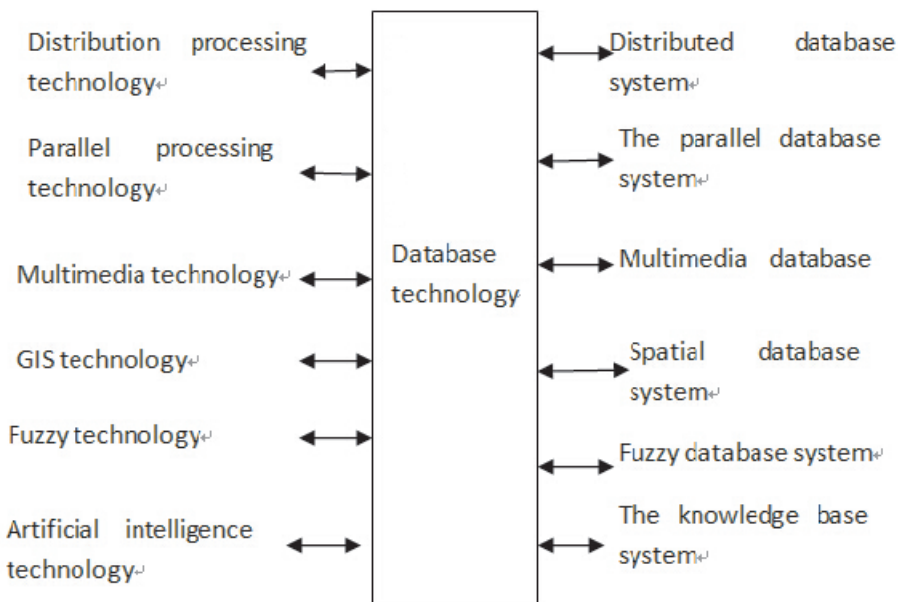

Figure 1. The database of new technology.

quick retrieval, it is impossible to effectively use the multimedia information, how about the information correlation is large, complex structure, high media processing requirements of multimedia data for effective management and oil, become major technical problems in the multimedia information system. So you need to research and establishing a new database can handle unstructured data, multimedia database.

### 2.1 Multimedia data management system (MMDBMS)

Multimedia database management system (MMDBMS) can efficiently store and multimedia data operation, the multimedia data in the database are represented as text, images, voice, graphics and video image, the user can regularly update the multimedia data, so that the information contained in the database that accurately reflect reality. With the development of database technology, some MMDBMS is capable of storing and operating various types of data, the user can through MMDBMS to browse or query of data, and can be in a very short period to visit many relevant data. This kind of MMDBMS for various applications, is very useful. Such as CAI, CAD/CAM and air traffic control and so on. Development of MMDBMS involves many problems. These problems, mainly include data representation, data manipulation, transaction processing, metadata management, data distribution, storage, management, service quality, ensure

data integrity and security, user interfaces, heterogeneity, and real-time processing, etc.

Multimedia database is usually carried out through the network remote access. Been identified as related to the query of multimedia objects must be obtained from the server and to the client for display. In order to realize high quality multimedia display, must meet the quality of service (QoS), and other factors in a series of demands. In a multimedia database management system (key performance indicators are in MMDBMS) efficiency. Has the following features:

- 1 MMDBMS must be able to represent and deal with all kinds of multimedia data, the focus is on irregular data such as graphics, images, voice, video, etc.
- 2 MMDBMS must be able to reflect and manage diverse characteristics of multimedia data, or data between a variety of media space or time.
- 3 MMDBMS exception must satisfy the physical data independence and logical data independence, should also meet the media data independence.
- 4 MMDBMS data operation functions.
- 5 MMDBMS network functions.
- 6 MMDBMS should have unrestricted function, provides the MDB application program interface API, and provide independent of peripheral interface and format.
- 7 MDBMS should also provide transaction and version management functions.

## 2.2 Multimedia

- 1 The amount of difference between the great amount of data and media also is notable, which affects the database organization and storage methods.
- 2 The increasing of the media types increased the difficulty of data processing
- 3 Of database query, the exact and similarity query will account for a considerable proportion of
- 4 The support of the user interface
- 5 The distribution of multimedia information of multimedia database system has brought the colossal impact.
- 6 Short transaction and long transaction processing: traditional transaction is generally short. Also should be as far as possible in a multimedia database management system using short transactions.
- 7 Due to the multimedia sound. Figure, a variety of data to be processed, the quality of service demanded is higher and higher.
- 8 Multimedia data management system and take into consideration the issue of version control.

## 3 SOME PROBLEMS IN THE DESIGN OF THE DATABASE

The extension and development of database technology for a variety of different types of database construction provides a strong support, in the near future and in the construction of the use of the following technology and absorption is useful and necessary:

- 1 A large information system should be based on a distributed multimedia database system. He should be based on C/S structure and support remote multimedia data storage, management and query.
- 2 The system should be a rich data resources and provide advanced for data resource development tools, such as providing aid design, statistical analysis, expert consulting, multimedia display hardware and software support.
- 3 System development can be used for new technology and methodology as the instruction, the object-oriented technology, multimedia technology should be the next generation of database and its information system development technology can be applied.
- 4 In the construction of the database fully uses the scientific methods of analysis and design. On the organization and management of the data from the specification, give full play to the modern database technology support for engineering.
- 5 Choose in the development process of the development trend of database technology with

international standards, developed to support the national macro economic decision-making, support enterprise overall management and support Internet sharing database, real database circulation, improve the utilization rate of the database.

## 4 CONCLUSION

A database for the majority of the users, there are two major aspects of requirements: on the one hand, they want to take what you need data or information; On the other hand, they can easily accept and use these data or information. Before class requirement shall be through the engineering environment of hardware and software support and database design to achieve high quality; after a request is for users provide a good user interface and application support to achieve perfection. But it is important to note that any database system construction, the most fundamental problem is the recognition of application in the field of basic data and organization, if can't do it, it's difficult to make customer satisfaction and recognition of the database system. As a result, the data in the database system construction planning, comprehensive database for application in the field of inclusive data analysis and design, will be a top priority in the construction of the system. 多媒体数据库技术随着计算机技术的发展,应用将更加广泛,现在通信技术的发展已经突飞猛进,在此基础上多媒体数据库技术将改变我们的生活。

## Analysis on characteristics of experimental video art

Xia Wang

Harbin University College of Art and Design, China

**ABSTRACT:** With the continuous development of science and technology, modern media technology has got into a rapid progress, various imaging has become a matter of life force, and experimental video is an emerging art in recent years, providing people with a lot of strange feelings. This paper mainly analyzes the characteristics of experimental video art, hoping to bring some help to the relevant personnel.

**KEYWORDS:** experimental video; characteristics; uncertainty.

### INTRODUCTION

At present, in China's art field, experimental video is mostly considered as a video art, mainly expresses an individual, including experimental films as well as some new media art works, etc., the paper briefly explains related knowledge of experimental video, focuses on the characteristics of experimental video.

### 1 EXPERIMENTAL VIDEO OVERVIEW

The term "experiment" is commonly used in scientific research, such as aspects of the experimental environment, operation, etc., "experiment" in the present study is in the medium of positive and negative, there is no preset image of the experimental video formation, but can be explained, in specific experimental works, it will not pursue a comprehensive and perfect type, thus the creating of experimental video has a lot of possibilities.

Beginners Zhu Qingsheng think component of modern art has four important steps, these steps also consistent with the experimental spirit of experimental art, experimental art goal is to be able to be fixed by art from me, but in reality the experimental implementation process, experimental art more inclined to art precipitation behavior. In entering our country in the 1990s began to use the word image, the current experimental video art mostly refers dynamic artistic effect. The experimental images just appear more individual expression, slowed to a single screen in the show form, each image can be able to bring people jumping point of view. With the popularity of computers, data technology has been applied in experimental images, specifically in video editing and interactive technology.

### 2 EXPERIMENTAL VIDEO ART FEATURES

People have understanding of a certain object, but do not deny that in different situations, other understand also exists, in the revealing process of different understanding of something, there are many people who do not participate, that is to say the truth is in forever yin and yang cycle, the artist is more sensitive to the world, has been in pursuit of alternative desire, false digging through the same thing different was to show their full, rich life, experimental video people have this feature on, the language itself has a variety of possibilities, greatly enriched people's perception of another world.

#### 2.1 *Difference between experimental video and media images*

It should be noted here is that people generally think that means a document imaging technology such as the television, film formed by the mass media, of course, many of the experimental images is shaped by the tool through the media. The narrative media tool is one of the main features, including news, entertainment, and consumer and other narratives in the narrative. Assist these elements have to be a capable real reaction out, so the mass media have the narrative is a kind of people's perception of the traditional narrative, in full accordance with the case of what happened to show life. Social media has the characteristics of simulation and virtual reality, so the image has the characteristics of authenticity, as real people to share these things, these facts affect the closing of the arrangement by the way people think and behave, etc., pulling people's sensibility, gradually lose the ability to judge, I do not know what is reality and what is virtual. In some people, the image

is real, simply because image can bring them a sense existence, they can feel real.

The existence of experimental video art, cannot be said to be a critical view that say something wrong, but you want to experiment this expression image perception ability to inspire people's minds, and more understanding of their own. In common image art, usually by way of traditional narrative, so the resulting work seems to be derived from the text, compared with it, the experimental images are more uncertain, can not imagine what the image will appear next.

## 2.2 Exploratory narrative characteristics

Traditional narrative text all individuals are serving center will eventually point to a particular meaning, a certain type of artist, writer, or a certain type of text, the works have a specific meaning, the audience itself is able to imagine the work space is very small. The experiment uses a heuristic image narrative style, exploratory narrative hope embodied by dismantling asked chant structure of local significance, the use of more novel or are open to other ways to express different meanings that may exist, and to encourage audiences to participate, research the significance of the works.

In the traditional narrative style adopted, the structure and the text have significance in itself has a lot of the priory, that is to say, a lot of images, there is no end, people have been able to see the results of the image, there is no what novelty, or more possibilities. But the use of exploratory narrative way in the process of dismantling the structure, to break this view, completely prevented the generation of a priory, the audience can see some different meaning of the familiar works, bring other sensory experience.

The traditional narrative approach can bring to the audience an immense experience, and this feeling materialized, brought to life in immerse refers here to be the audience into the narrative, rather than technology brings sensory experience. Experimental video uses the exploratory narrative style, it will distance the audience with images, can stimulate the limitless imagination.

## 2.3 Interactive features

Compared with the general video art, experimental video has more imagination, it is possible to promote audience interaction, video art in general, the

structural characteristics of the works are all relatively fixed, works can bring influence and appeal, etc. are entirely dependent on the artists themselves, the audience can play a role that is sure or denied. There are a lot of experimental video art works are large uncertainties exist, the use of open architecture and fully mobilize the life experience and imagination of the audience and so on. Relations experimental video art works can offer a lot and are very complex, the audience can express their understanding of art during the appreciation in imagination space, the artistic effect is more easily achieved.

In experimental video art works can be achieved in the interactive space and time, in an interactive video installation will provide a relatively novel space for the audience, the audience cannot stop the action, such as by beating, sound and touch other ways to interact with the works, as time goes on, the audience will improve their perception and the meaning of the original works while enjoying the like. Experimental video art in the interaction can be achieved through Internet technology, through a perfect combination of procedures and image, audiences and artists together complete the works of art programs, to achieve the interaction between the audience, works and artists.

## 3 CONCLUSION

This article briefly describes related knowledge of experimental video, focuses on the characteristics of the experimental images, as documented form, experimental video art has great uncertainty, compared to text, images are more able to directly restore arts scene, this study does not relate to the generation of experimental video and its effect, it still needs more people to make an effort to complete it.

# Application of TRIZ and inherent safety in the design of a safety device for intravenous infusion tubing

Yin Chi Lin, Hui Ling Hsiao & Shu Chen Yang

*Graduate Institute of Biotechnology, Taichung, Taiwan, ROC*

Kuo Yi Li

*National Chin-Yi University of Technology, Taichung, Taiwan, ROC*

**ABSTRACT:** This study proposed an innovative design of a safety device for intravenous infusion tubing to address the problem of the vulnerability of intravenous infusion tubing (IV set) to being infected by nursing staffs. The research method adopted in this study was the inherent safety design technology. The preventive hazard elimination design method was employed to eliminate the possible infection caused by intravenous injection. Moreover, the TRIZ systematic, innovative method was applied to improve and worsen parameters by conflict matrix to determine the feasible inventive principles for systematic innovative design. The safety device for intravenous infusion tubing was realized by linking an IV set with an elastic sleeve cap. When performing intravenous injection, the nursing staff may hold the intravenous injection position and push slightly the sleeve cap by the thumb of another hand to expose IV set. The IV set thread can be securely connected to the IV catheter, which can effectively avoid the infection caused by hand touching. It is an excellent auxiliary equipment for intravenous injection. The feature of this invention is to reduce the infection and reduce pain. The present invention is suitable for intravenous injection of patients in hospital and home care or even students learning intravenous injection technology. The proposed design has great market potentials.

**KEYWORDS:** Intravenous infusion tubing, TRIZ, Inherent safety.

## 1 INTRODUCTION

Intravenous infusion therapy is one of the most common invasive treatments that is performed by nurses. Intravenous catheter tubing failure can often delay treatment and affect patient safety and comfort, increasing medical resources and human time cost. Steps of administering the IV catheter tubing are: puncture IV catheter into the vein and take back the needle when the blood returns while slowly push the plastic catheter into the blood vessel, release the tourniquet; pressure from one hand on the place of injection and remove the intravenous infusion tubing cap by another hand; press the intravenous infusion tubing (IV set) to connect with the intravenous plastic catheter to fix the injection location. During the process, the operation of pushing the cap by a single hand can often result in the easy contact with sleeve joints to trigger the contamination crisis. Hence, the structure that can be easily contaminated is to be improved by designing the contamination free sleeve cap that can be removed by a single hand. Coupled with the internal and external helical structure to enhance the stability of the catheter [1,2,3,4]. The 2011 U. S. Disease Control Center Intravascular

Catheter-related Infection Prevention Guidance emphasizes the correct placement of the intravascular catheter, catheter maintenance and proper infection control steps to avoid intravascular catheter infections [5]. For clinical intravenous infusion therapy, catheter loosening, non-fixed injection site or aseptic technique negligence often cause re-injection to increase the pain of the patients, the workload of the nursing staff and medical costs [6]. To enhance the patient intravenous injection safety, hospitals achieve their goals through intravenous injection technology skills training and proper care guidance and other methods [7]. By applying the TRIZ method, this study aims to design the safety device for intravenous infusion tubing. During the injection process, the solid connection of IV catheter and IV set can reduce the pain of the patients caused by the needle.

## 2 METHODOLOGY

The inherent safety design concept is to consider the process hazards in the early stage of design. The main purpose is to avoid hazards rather than control

them. In the factory of inherent safety design, even the operational errors and damaged equipment do not cause casualties, thus greatly increasing the plant's security [8]. Inherent safety is the ability to avoid or reduce personal injury during the equipment failure process. It is an important technological means to root out the crisis factors from the very source and the true way for the improvement of the safety management effect. Common inherent safety technologies include Intensification, Substitution, Attenuation, Limitation of Effects, Simplification, Avoiding Knock-on Effect, Making Incorrect Assembly Impossible, Making Status Clear, Tolerance, Ease of Control, Software, Isolation and Interlock to achieve the goal of inherent safety in the manufacturing process [9–11].

The application of TRIZ in design should determine problems and contradictions. The contradictions should be determined as the physical contradiction or a technical contradiction. The technical contradiction means: when the parameter is improved, the other parameter will become worse. For example, the vehicle horsepower and gas consumption; physical contradiction means: the same parameter has the two conflicting properties such as being light and being heavy. For technical contradiction, 39 engineering parameters and 40 invention principles are applied to solve the problem. For physical contradiction, extraction is applied to solve the problem. The technical contradiction is the conflict of two parameters. The two-dimensional matrix represented by 39×39 engineering parameters displays the possible conflict: the vertical axis represents the parameter to be improved and the horizontal axis represents the parameter that will become worse. The matrix elements are the suggested innovative rules for the condition, consisting of 40 invention principles [12]. This study applies technical contradiction in the analysis of the design of a safety device for intravenous infusion tubing to get two solutions as illustrated below.

### 2.1 *Program 1: The problem of contamination caused by nursing staff slightly pushing the cap by thumb and its solution*

For intravenous injection, the nursing staff should hold the blood vessel at the injection site with one hand and open the IV set cap by another hand to integrate IV set and IV catheter. During the processing, hands and fingers can easily cause the contamination of tubing and materials. By the simplification and ease of control applications of inherent safety technology, a sleeve cap can be controlled by a single hand is designed. The cap material of elasticity and flexibility can be fixed on the injection tubing sleeve. The cap can be opened to the injection tubing

sleeve by the finger to effectively eliminate the contamination problem. In the TRIZ conflict matrix, the parameter to be improved is defined as NO.33 usability, that is, the degree of ease in the operation of the system or object; the parameter to be prevented from becoming worse is defined as NO.30 harmful factors acting on object from outside, that is, the harmful effect on the object from the external environment. Four inventive principles can be obtained from the conflict matrix including (1) NO.2 extraction: Separation of the necessary object by removing the sleeve cap from IV set, which can be connected with the elastic plastic with the catheter upper end. The operator can remove the cap by a single hand to make the operation more convenient; (2) NO.25 self-service: the object has the function of self-diagnosis and repair, the principle is not suitable for the program; (3) NO.28 mechanical interaction substitution: the use of sound and light systems and thermal system for mechanical interaction substitution, this principle does not apply to this program; (4) NO.39 inert environment: to replace the inert environment by normal environment, this principle does not apply to this program.

### 2.2 *Program 2: The problem of pain caused by unstable connection of IV set and IV catheter and its solutions.*

During the process of intravenous injection, if IV catheter and IV set are not combined stably, it may cause pain by the contact of the needle with the patient body. Hence, the inherent safety intensification technology is adopted to strengthen the combination strength by thread connection; it can effectively solve the problem. In TRIZ conflict matrix, the parameter to improve is NO.13 stability of object's composition, that is the ability to remain unchanged of object or system under the external influence; the parameter to be prevented from becoming worse is defined as NO.31 harmful factors developed by object, namely, the hazards of the object. Four inventive principles can be obtained by using conflict matrix including (1) NO.35 parameter changes: change the system physical state, this principle does not apply to this program; (2) NO.40 composite materials: internal laminated corrugated layer can more easily withstand high strength extrusion. IV catheter and IV set are joined by thread to significantly improve the stability and decrease the pain of patients; (3) NO.27 cheap disposables: replace the cheap object by expensive object, this principle does not apply to this program; (4) NO.39 (Mechanical interaction substitution): inert environment: to replace the inert environment by normal environment, this principle does not apply to this program.

### 3 PRODUCT DESIGN

When performing intravenous injection, the thumb and index fingers have to perform the action of pressing the blood vessels and the rest three fingers have to remove the infusion tubing cap. Therefore, during the removal process, the hand is quite unstable and the fingers can easily slip or contact the injection part. Hence, it is vulnerable to infection as shown in Fig. 1. Therefore, by the above mentioned inherent safety technologies, including simplification method and the ease of control method, this study designs the infusion sleeve cap of elasticity and flexibility to allow the nursing staff to easily open the infusion sleeve cap; another intensification method of inherent safety, by the combination of the internal and external threads, can improve the infusion tubing connection stability to reduce the pain of patient injection. Regarding the technology of TRIZ, by the use of modification parameters and deterioration parameters of technical contradiction, the possible invention principles can be deduced for product innovative design. Regarding the infusion tubing cap, this study uses the connection part to get connected with the sleeve cap and infusion sleeves. The nursing staff needs only to open the infusion tubing cap easily to effectively avoid chaotic situation. Hence, the infection can be considerably reduced and it is a safe device to IV tubing device. The product consists of combination end, external thread, cap, joint connection, sleeve, groove and internal thread. The overall structure, configuration and sectional diagrams are as shown in Figs. 2-4. The product structural and configuration data are mainly described by using Solidworks software.

Figure 1. Intravenous injection may result in infection.

Figure 2. IV Set and IV catheter integration.

Figure 3. IV Set structural diagram.

Figure 4. Section of IV set and IV catheter integration.

### 4 CONCLUSION

The proposed invention is a safety design of intravenous injection tubing connection to solve the problems of pain and infection of intravenous injection. Through the analysis of inherent safety technology, this study adopts simplification, ease of control and intensification technology of the 13 inherent safety technologies. Additionally, the TRIZ technical contradiction analysis is adopted. Among engineering parameters, the parameters to improve include usability and stability of object's composition. The selected parameters of deterioration parameters include harmful factors acting on object from outside and harmful factors developed by object. The corresponding useful invention principle is extraction and composite materials. This study applies Solidworks in prototype product design. After test and improvement, this study can perform the commercialized product design. The features of the present invention include (1) reduce infection: by changing the buckle and cap integration of conventional infusion tubing into the flexible and elastic cap, the cap of elastic and flexible materials can be closer to the infusion sleeve. Hence, by externally flickering open, the cap can be opened from the sleeve infusion to effectively avoid the infection problem; (2) reduce pain: regarding the integration of the catheter and infusion sleeves, the present invention changes the conventional sloped sleeve integration into the thread integration by locking the external thread of the intravenous infusion tubing (IV set) and the thread inside the groove of the catheter. Hence, during the entire infusion tubing process, the hand movements are considerably stable and the pressure on blood vessels can be avoided. Hence, the pain of the patients receiving intravenous injections can be considerably reduced to effectively improve injection quality.

## Design and realization of cloud computing network teaching platform

Li Mei Wang

Engineering Institute, Mudanjiang Normal University, China

**ABSTRACT:** Cloud computing is to take the Internet technology as the main processing capacity of information technology to integrate. Its purpose is to realize the expansion with great scale and offer service to multiple external customers, which can make different application systems be able to obtain computing power, storage space and software service in accordance with the requirements. In the whole process of designing the teaching, the creation of educational environment should be paid attention to, which has a huge role in giving full play to the educational function of cloud computing can help learners effectively learn and use cloud computing resources. This paper mainly starts from the relationship of cloud computing and education and proposes a concrete design scheme of cloud computing network teaching platform.

**KEYWORDS:** Cloud Computing, Network teaching platform, Design.

### INTRODUCTION

Cloud computing technology has made profound changes on people's work, learning and life. For instance, Office tools can assist people to reduce the complicated calculation in the paper and e-mail can send letters to the hands of people thousands of miles away. In the era of cloud computing, with the help of network technology, computers are not restricted by their own conditions and software bottlenecks and can achieve fast and efficient handling of computing tasks.

### 1 CLOUD COMPUTING AND EDUCATION

#### 1.1 *Emergence of the combination of cloud computing and education*

The combination of cloud computing and education first emerged in a state of the United States, North Carolina. Graham Elementary School in the state, the project of cloud computing was first carried out. The main purpose of the project was to meet the requirements of students and teachers' digital teaching. Simon Company carried out the use of virtual computer desktop in 600 students and teachers of the school. It mainly used large amounts of cloud services to make the virtual desktop be achieved. This project was improved later and provided plenty of learning materials. Its purpose was to make students not limited by space and time when they were learning and be able to access to the virtual desktop anytime and anywhere without additional computers for learning. The combination of cloud computing and

education in China first emerged in the cloud computing academic cooperation plan carried out by Google and Chinese Mainland. This project was about the academic cooperation which promoted the popularity and development of Cloud Services in China. The first appeared website, Social Learning Lab, was the famous instance of the mediation. It mainly used free tool services, such as a Google group, in Google code. The focus of the entire Cloud Services was the use degree of the connection of teachers and resources in the education technology. A specialized research community was formed to drive the further development of related practice of project remainder education workers in the community.

#### 1.2 *Education auxiliary advantage of cloud computing*

The largest characteristics of cloud computing were its cheapness and convenience. An increasing number of schools and personal information will be attracted on Cloud. It can speed up the development strategy in the information technology application in education. At this time, forward-looking vision is required to set about the exploration of the era of cloud computing in advance. Studying the cloud application in the process of education informationization can make the network center be changed into the education technology center. One of the main application of cloud computing is in the field of teaching. Its advantage is very apparent. It can reduce the cost of the hardware and software construction in school education resources construction. Teaching activities can be conducted without being restricted by time and space and the data safety of school teachers and students

can be guaranteed. Construction personnel in various education institutions and information resources also can use the strong cooperative working ability of cloud computing and realize the joint establishment of information resources.

## 2 DESIGN OF NETWORK TEACHING PLATFORM BASED ON CLOUD COMPUTING

### 2.1 System model

In the network platform of cloud computing, development tools and software are adopted to carry out the cloud computing system and development of software is mainly PHP, NET, etc. The software of ASP.NET is mainly used in this paper. The application of cloud computing is cloud computing is carried out on the cloud platform in the operating system and the cloud computing service platform is the main architecture of cloud computing system. There are usually three kinds of forms: Software as a Service, Platform as a Service and Infrastructure as a Service. The pyramid architecture of cloud computing is formed from top to bottom and the one at the top is Software as a Service.

### 2.2 System implementation

#### 2.2.1 Management of cloud computing data

The data system in the cloud computing is very huge. In the process of carrying out analysis and processing, efficient service should be implemented and efficient technological operation in data management needs to be surely realized. Meanwhile, fixed-point data should be quickly found out. The advantages of cloud computing are that data can be read quickly and then analyzed and the data update frequency is less than the frequency of data read operation. For instance, in data management, the most typical example of China is the Big Table data management project in Google Company [1].

#### 2.2.2 Data storage

In the data storage and utilization, the main way of cloud computing is distributed storage and redundant storage is used to ensure effectiveness on the basis of reliability, which can provide an efficient, reliable, economic and safe data storage run. On the network teaching platform, cloud computing can satisfy the situation with large quantity of customers. When the cloud computing system needs to serve and meet the requirements of many users, in the implementation process of cloud computing storage technology, larger throughput capacity and higher transmission rate technique should be realized.

#### 2.2.3 Streaming media video display technology

According to the network teaching platform design of cloud computing, its network teaching platform design of cloud computing is to make real-time or non real-time services on the network teaching videos that users give, carry out network multimedia video display technology and streaming media technology support and realize the format transmission to change multimedia files into multiple shrunken data packets.

#### 2.2.4 Information confidentiality and security

On the network teaching platform of cloud computing, the key of confidentiality and security is to use the connection relationship of local data and network to conduct exchanges with external data. The most important one is problem solving. Some non-technical factors are mainly used to overcome, such as concepts, systems and so on. Technology is not the only factor. At this time, cloud security in cloud computing should be considered.

#### 2.2.5 Charging problems

The service objects of network teaching system are students and others. Charging is made based on the use of rental resources provided by the services. On the basis of service consumption, the cost is calculated [2]. Users only need to pay for the cloud resources they use and the cost is produced when consumption is going on. Charging technology should be a particular technology to carry out the calculation.

### 2.3 Construction of cloud services

The use of cloud service specific structures and language designed by developers can make students learn systematic modules in loose models, make modules achieve better interactions, make the standard unified in the development of cloud computing, realize the encapsulation of cloud services and fastest release in the operation of cloud computing. Thus, users can study more conveniently in web browsers and outstanding teaching resources can be shared through the network platform of cloud computing [3].

## 3 CONCLUSION

The use of cloud computing platform can make teachers design, teaching activities more convenient and quickly create a personalized teaching environment. On the other hand, it also can help students realize the autonomous learning without the restrictions of time and space. The cloud computing platform can provide a strong support and become a convenient learning

tool for students whose learning abilities have been improved rapidly. Network education platform of cloud computing is worth of widespread promotion and use.

# The design and implementation of network courseware of “algorithm design and analysis”

Chuan Feng

WeiFang University of Science and Technology, Shou Guang, China

**ABSTRACT:** As an online teaching platform, the teaching website can facilitate the communication between teachers and students and improve the teaching quality and efficiency. This project developed an “Algorithm Design and Analysis” Course Website. Through the practical demand analysis, the subject adopts Dream weaver 8, ASP and Access 2003 database management system as tools to develop the teaching website. The website serves three different users: teachers, students and administrators. They are following the users’ needs of simple operation, beautiful and vivid interface and practical request. This website implements the teaching resource management, operations management; data download and upload, teaching evaluation, course forums, online surveys and other functions. The website provided a good platform for the interaction between teachers and students. It not only enhanced the students’ learning motivation for this course greatly, but also improved the teaching efficiency largely.

**KEYWORDS:** Teaching website, Web-based courseware, Interactive teaching, ASP technology.

## INTRODUCTION

With the development of the Internet and the wide-spread dissemination of network information, modern education has broken through the traditional education model, and the combination of network, network courseware is one form of the combination. In network teaching environment, can provide a large number of topics for learners learning resources and collaborative learning communication tool, can make teachers and students widely participation, interactive online, cultivate students’ autonomous learning ability, innovation ability and practice ability.

## 1 SITE TECHNICAL ANALYSIS

Dream weaver is most users in the field of web design and production, the most widely used, the most powerful software, it sets the web page design, site development and site management functions in one, with the characteristics of visualization, support for multiple platforms and across browsers, is currently the website design, development, production of the tool of choice. It has a flexible way of writing, visual editing interface, dynamic cross browser validation, powerful WEB site management functions, etc. Also use the Microsoft Active Server Pages, Access, black wind ASP Server.

The hardware configuration:

CPU: P41.8 GHz. Memory: 256 MB or more.

The software configuration:

Operating system: Windows XP Professional;  
Database: Access 2003; The Web server: Black wind server; Browser: IE7.0 or above versions.

## 2 DATABASE DESIGN

### 2.1 *The concept of database structure design*

The site USES the Access database, altogether creates the table 5, respectively is: The member information table, the administrator information table, message information table, the statistics of the votes, bulletin information table.

### 2.2 *Database logical structure designs*

Now need to convert the above database concept structure model to access the database system supported by the actual data model, database logic structure.

The user information table and message information table logical structure is as follows:

- 1 Member information table users: including username, password, data table structure as shown in [figure 1](#):

The column name	The data type	Field size	Required fields	describe
automatic numbering	automatic numbering	—	Yes	on the primary key
uname	the text	50	Yes	user name
upwd	the text	50	Yes	password

Figure 1. The user information table.

The column name	The data type	Field size	Required fields	describe
Automatic numbering	Automatic numbering	—	Yes	On the primary key
t_name	the test	50	Yes	A message people
t_message	the test	—	Yes	Message content

Figure 2. The message information table.

- The Administrator information table t\_admin: including user name and password.
- Message information table messages: includes message, message content information, data table structure as shown in [figure 2](#):
- Announcement table: including announcement contents, and notices the time information.

### 3 WEBSITE IMPLEMENTATION

#### 3.1 The database connection

This web site using IIS embedded in the ASP file ADODB, using the connection string to set the Access database connection, the general format is as follows:

```
<%
Set conn = Server.CreateObject("ADODB.
Connection")
conn.Open"DRIVER={Microsoft Access Driver
(*.mdb)};
&DBQ=" Server.MapPath("data\db.mdb")
%>
```

#### 3.2 Homepage

Website homepage you can see the website mainly has the following functions: teaching resources, courses, teachers, teaching evaluation, operation management, course BBS, online survey, data

download. Ordinary users can browse the first four content casually, after four content need to log in first before browsing, login successfully to enter the corresponding page.

#### 3.3 Teaching content module

Teaching content includes a series of web pages, including the experiment outline web page, the web page of teaching outline, teaching plan, related video lesson plans to teach web pages, web pages, web page, the resources such as course experiment, these includes the course information page.

#### 3.4 The user login module

The site's data download, job management, BBS communication modules such as the permissions, only members of this site is to be able to login, the login successfully rear can enter the corresponding page. The specific interface design as shown in [figure 3](#), the input user name liulixia, password is 123456.

Click "Login" button, enter the member center page, here, the user can enjoy only members can enjoy privileges.

#### 3.5 BBS message modules

BBS message module is used to implement the function of the complete message and delivered a

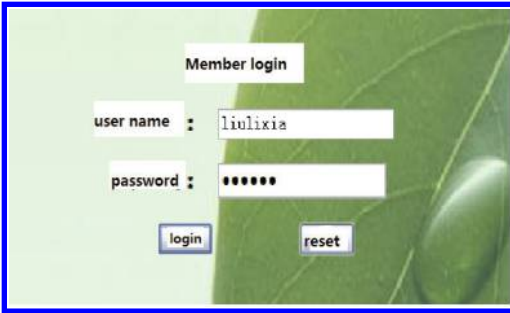

Figure 3. The login page.

message, can leave a message on another page view BBS content after published.

The following is a BBS message module handler < message. Asp > Code, this code can realize the function of the published message:

```
<form ACTION=""<%=MM_editAction%>"
METHOD="POST" name="form1">
<table align="center">
<tr valign="baseline">
<td width="70" height="40" align="right" nowrap>
A message people: </td>
<td width="367"><input type="text" name="t_name" value="" size="28"> </td>
</tr>
<tr>
<td height="66" align="right" valign="top" nowrap>
Message content: </td>
<td valign="baseline"><textarea name="t_message" cols="30"></td>
</tr>
<tr valign="baseline">
<td height="90" align="right" nowrap>&nbsp;&nbsp;&nbsp;</td>
<td><input type="submit" value="published "> </td>
</tr>
</table>
<input type="hidden" name="MM_insert" value="form1">
</form>
```

### 3.6 Uploads and downloads module

In the center of the member page, click the download data, can enter the data download page, here, you can download the related information. Click upload homework, can enter the upload page.

### 3.7 Background management modules

Click the "back office" at the bottom of the page, can enter the back office login page, input the correct user

name and password, you can manage the background. Background management module is divided into the message management, member management, bulletin management, comments, a member and announcements, respectively, for management functions such as add, modify and delete. In the announcement management page, the administrator may notice on the home page is updated, the user management page, the administrator can manage the user, as shown in figure 4.

Figure 4. User management interface.

## 4 THE SYSTEM TEST

- 1 Test method: from the perspective of the types of software testing, software testing can be divided into two kinds: black box testing and white box testing.
- 2 Test content: Content is divided into three types: unit test, integration test, function test.
- 3 Functional tests: mainly to verify this website each function, according to the functional test cases, item by item, test, checks whether the site is to achieve the function of the user's request.
- 4 Test results: the entire site in the process of test, basically achieved the expected design functions.

## 5 CONCLUSION

Based on ASP technology and network database technology exploration and research, algorithm design and analysis course website has been completed, the functions of basic meet user requirements. However, the entire design also shortcomings, such as in site planning, site management and web page updates and there are many shortcomings. These are all need to improve. The site there is quite a distance away from practical use, also need to constantly supplement and perfect father.

# Psychological warfare's influence on volleyball athletes' performance based on multi-layer data analysis and sports media

Xiao Hong An

Physical Education Institute, Yili Normal University, Xinjiang, Yining, China

**ABSTRACT:** How will the use of psychological tactics through the media stir up our athletes in the game? And how will the use of psychological tactics through the media interfere with the opponents in the game? These are key steps to help the athletes win the game. The one who can grasp before the complex competition process such a pre-match psychological warfare, will be able to win the game. In this paper, we research the existing problems of psychological warfare's influence on volleyball athletes' performance and the media influence on athletes, coaches psychological.

**KEYWORDS:** psychology; media; volleyball, competition results.

## 1 INTRODUCTION

In the modern society, the development level of the competitive sports has become a symbol of the material civilization and spiritual civilization development in the national and regional base. How to analyze the factors affecting the performance of athletes has become an important work of the development of competitive sports.

Related studies have found that the athletes' mental state often plays a decisive role in the success or failure of the game. However, there are many factors that can affect the athletes' mental state. In recent years, the modern media communication can not only bring convenience to the audience who watches the game, but at the same time, it can also bring new test to the athletes' psychological quality. [1]

## 2 THE EXISTING PROBLEMS OF PSYCHOLOGICAL WARFARE'S INFLUENCE ON VOLLEYBALL ATHLETES' PERFORMANCE RESEARCH

### 2.1 *The present condition of volleyball sports in the world*

At present, volleyball has been vigorously around the world. And no matter it is six men system volleyball or beach volleyball, it has shown their vitality. In fact, volleyball has become one of the world's highest levels of public participation in sports.

### 2.2 *The problem of volleyball athletes' performance in China*

Volleyball was introduced into China in 1905. After decades of development, in the 1980s, the Chinese volleyball development reached its peak period. During the period from 1981 to 1986, the Chinese women's volleyball team won the world champion, and thereafter maintained this honor for five consecutive years, creating first five winning in the Chinese women's volleyball history. The year of 2010 is a painful experience for the Chinese women's volleyball team. At the world championships, the team made it difficult for people to accept the second rare bad record, the 10th, in its history. The live coverage of the various media reports, especially after reporting some negative coverage, the athlete's performances were gradually influenced. This was an important factor that cannot be ignored. Athletes depressed mood were caused by these reports which exacerbated the fade of the athletes energy and the deterioration of anger, confusion, fatigue and tension, and eventually led to disorders the play of the game.[2-3]

### 2.3 *The problem of psychological warfare's influence on volleyball athletes' performance research*

Besides, as we all know, volleyball is a ball sport which is featured changeable and fast. And it is also not easy to control. Moreover, volleyball athletes' performance is often influenced by a group of factors, such as his own' practice, outside stress, competition skills and so on. So it is quite difficult to do the research.

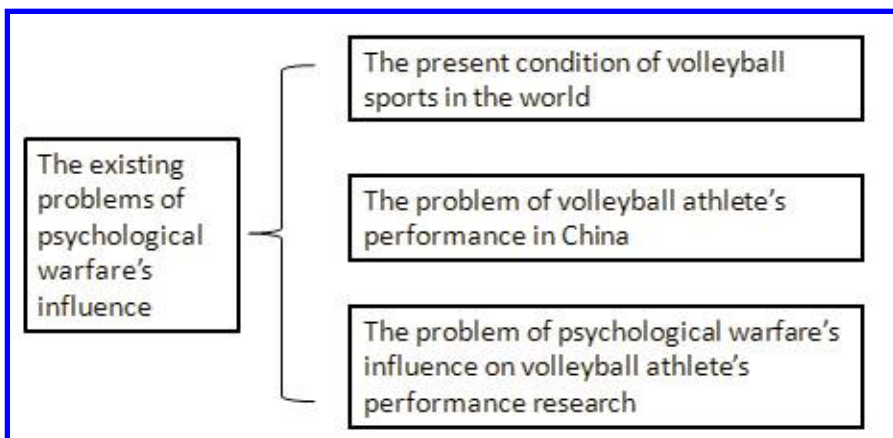

Figure 1. The existing problems of psychological warfare's influence.

### 3 THE MEDIA INFLUENCE ATHLETES, COACHES PSYCHOLOGICAL

#### 3.1 *Collect and report the media on various game intelligences*

Media reports can be said to be included in the physical aspects, but the key still depends on the event, reports of the athletes, these reports on the athlete's psychology will produce certain effects.

International or domestic events are the focus of attention of the majority of sports fans, and are also the focus of various media attention. Often from the start of the game to the end, we will see the media in the long tired calf. We should spare no effort to carry out all aspects of the coverage of the event through a variety of ways. The more important events, more sports loved by the public, for moving the level are high, the frequency and the degree of media attention is also higher. In particular, to participate in various major races in the athletes before, such as the football World Cup, the most important international events, each country in order to his national team to beat the opponent in the game, will be cheering on their team, but also will pass on the opponent's intelligence collection, to quote is not conducive to the opponent's game information, thereby the game of mental interfering with each other, make the athletes bear too much pressure.

#### 3.2 *The media influxes the athletes*

Because now the media highly developed, many sports events can spread around the world in a very short period, which athletes achieved excellent game scores, or which athletes due to adverse side was exposed and pushed to the inside the teeth of the storm. The athletes

of the report is an important content of the media, it is often with the athlete's fame together, the highest level athletes, winning high voice, the more will get media attention L. People in life, learning, work to understand the things around change, master all kinds of information, especially more attention to things and information related to their own interests as. So naturally, the athletes take part in the competition will be very concerned about media for their comments and views, these comments and views on the psychology of athletes also can cause certain effects.<sup>[3-6]</sup>

### 4 THE STRATEGY OF PSYCHOLOGICAL WARFARE'S INFLUENCE ON VOLLEYBALL ATHLETES' PERFORMANCE RESEARCH

The tight integration between media and sports is just because sports have a more widespread audience. In other words, sports are one creator of journalism. Sports attract a large audience with its splendid competition, which is a social phenomenon that also attracts numerous media reports and attention. Meanwhile, modern sports have an increasingly fierce competition. The sports competition performance depends on three main factors. They are the athletes' physical quality, sports tactics and psychological quality, and the three forms a stable dynamic system, where they connect, influence and interact with each other. It can be shown clearly in [Figure 2](#).

#### 4.1 *The mechanism of physical quality*

Physical quality is the foundation. Most professional athletes have particularly well-developed physiques obtained by extensive physical training and strict exercise accompanied by a strict dietary regimen.

Figure 2. The strategy of psychological warfare's influence on volleyball athletes' performance research.

#### 4.2 The mechanism of sports technology

Sports tactics provide condition. Competitive volleyball teams should master six basic skills: serve, pass, set, attack, block and dig. Each of these skills comprises a number of specific techniques that have been introduced over the years and are now considered standard practice in high-level volleyball. And volleyball is essentially a game of transition from one of the above skills to the next, with choreographed team movement between plays on the ball. These team movements are determined by the teams chosen serve receive system, offensive system, coverage system, and defensive system.

#### 4.3 The mechanism of psychological quality

Psychological quality is the inner motive power that makes physical quality and sports technology function better. When the media report on athletes, it can affect the psychological quality of athletes. Then influences their mood in the competition, and at last, it can impact the whole competition result. So from a certain point and degree, the psychological quality of the athletes can decide the success of the whole competition. So, psychological quality becomes the key to athletes that whether they can win the competition or not.

### 5 CONCLUSIONS

Therefore, in the modern society, the development level of the competitive sports has become a symbol of the material civilization and spiritual civilization

development in the national and regional base. The publicity in the media has more and more influence on athlete's psychological quality. These are key steps to help the athletes win the game. The one who can grasp before the complex competition process such a pre-match psychological warfare, he/she will be able to win the game. It becomes an unavoidable external environment. The effect is so important that it can't be ignored.

#### ACKNOWLEDGEMENTS

This work was supported by the Educational Planning Project of Yili Prefecture (No. YLJ13102, Direct) and the Education Planning Project of Yili Prefecture (No. YLJ13102, Direct).

# The application of computer image processing technology in arts creation

Chang Sheng Liu

Teachers' College, Beihua University, China

**ABSTRACT:** With the economic development, information technology advancement and the popularity of the Internet on a computer, the computer-based image processing technology developed rapidly and promotes the development of society. Computer image processing technology emerges with the advent of computers and information technology, which has powerful image processing capabilities and has been widely used in many fields of art creation, and has become one of the major creations of art painting techniques. This paper mainly discusses and analyzes the re-education, the application of computer image processing technology in arts creation learning.

**KEYWORDS:** arts creation; computer; image processing technology.

Computer image processing technology based on a computer network system as a platform and processed the pictures in accordance with people's subjective sense. With the development of science and technology, more and more image processing software provides great convenience for image processing and modern art teaching. In arts creation teaching, computer image processing technology improve teaching efficiency and teaching effectiveness and many universities are now using computer image processing technology for art teaching in order to improve student art creation modern technology to meet the needs of modern society.

## 1 THE OUTLINE OF COMPUTER IMAGE PROCESSING TECHNIQUES

### 1.1 *The basic connotation*

Computer image processing technology is the process of storing, optimizing, modifying and displaying geometric model and data technology on the basis of Internet technology in the computer software. In the process of computer image processing, we can design according to personal hobby the color of images, texture shading, graphics hidden lines and hidden surfaces digital image storage, image modeling design and modeling and digital image storage, image segmentation, analysis, coding, enhancement and restoration operations and also the technical processes such as image rotation, zooming, panning and projectors and so on. These processes make the image more beautiful with some artistic features to meet people's subjective requirements.

### 1.2 *The basic structure of computer image processing technology*

Such basic image processing technology components, including computer hardware and computer image processing software. Calculating and during image processing, the quality of their computer hardware has a direct impact on the image processing effect, and its software system is the conductors that connect the terminal and computer. Computer image processing technology often has the ability to self-rectification picture data, which can not only protect computer image processing technology but also can effectively improve computer software operating results. Computer keyboard and mouse are terminal input device, which plays a role in modifying and positioning functions in image processing.

### 1.3 *Functional analysis of computer image processing*

Computer image processing technology functions can be divided into five parts: dialogue, input, output, storage and computing, whose dialogue function mainly refers to interpersonal function. Input and output functions mainly refer to that, this technology can readily input and output related image information. Storage function mainly refers to effectively maintain and repair computer image data. Computing function refers to a computer-related switching and calculation.

## 2 THE IMAGE PROCESSING TECHNOLOGY AND ART CREATION

Arts creation is a human aesthetic creation activity, which is a relative complex aesthetic performance activity, which is a process from art conception to arts

transmit and whose final outcome is art works. So arts creation is the process where the creative arts is finished from brewing, composition to produce the perfect artwork. The performance object and form of art creation are comparatively colorful. Creative themes, types and media are extremely rich. With the progress and development of society, arts emerge creative thinking, creative genre, creative methods as well as classic works. A creative arts genre with its unique style and form provides a glamorous art world for us.

In recent times, with the progress of the popularity of computer and information computing, image processing technology has been developing rapidly. Computer-produced image improve the technology and effect of and image processing and break the limitations of traditional image processing, which bring modern aesthetic a huge shock and inspire. In recent years, image processing technology has been widely used in art creation and add to art works the sense of art and enrich the way and means of art production, which is another breakthrough in the art world. For example, the Japanese CG Masters astronomical illustrator Valley Rang adopted in 1995 to paint the whole computer, using computer depict a mysterious universe and the image screen is fine, deep mood and full of aesthetic value, received widely acclaim at home and abroad

### 3 THE APPLICATION OF COMPUTER IMAGE PROCESSING TECHNOLOGY IN ART CREATION

#### 3.1 Professional image processing software

Now in many art colleges and universities, computer image processing technology has become a required course and plays an important role in art creation. Computer image processing technology used in the creation of art first must have the appropriate hardware equipment and professional image processing software. Relative common image processing hardwares in the market are mainly digital cameras, scanners, printers, and pressure-sensitive pen, and relative common image processing software is Adobe's Photoshop software. The abbreviation of photo shop image processing software is PS, which is mainly used for image processing and process and make the picture produced on the basis of the existing processes, the use of software in some special effect, image processing. It includes image editing, compositing, color and special effects, etc. You can use special effects to complete the painting, drawing, painting, and other commonly used gypsum traditional art skills. The upgraded software also adds Photoshop, 3D extensions of creative arts and digital painting has a great role and significance.

#### 3.2 The image material arrangement

Computer image processing technology software generally has relative powerful image material. Arts creation can make blurred image clarity through these images material, so that the outline of the picture clearer, but also can remove flawed image and post-repair the image, It also can increase the roughness of the image, so that the image is more artistic.

#### 3.3 Color mode

In arts creation, the arts color is equivalent of Language arts Fine Arts, which is one of the main forms of performance art creation. In computer image processing technology, the most typical color modes are RGB and CMYK. RGB color mode mainly uses three colors: red, green and blue. These three simple colors into each other forms a color system. By the color system, a variety of colors rendered on the screen. CMYK is a color mode relying on reflection, which is mainly accomplished by changing the color of cyan, magenta, yellow and black into each other. This fusion of color patterns is widely used in computer image processing technology.

#### 3.4 Screen rendering

In the computer image processing technology, a functional model is widely used in creative arts, such as the picture rendering function in Photoshop, the picture is mainly used to render filter function, and the filtering process to the original picture can increase picture art appeal and makes the pictures more mood. Screen rendering will use some professional art painting techniques such as airbrush method, dot matrix method and so on. So the user must be familiar with some pixel constitution and the color gradation composition regulations. On this basis, through meticulous technique, refurbish and render image so that the image has a more artistic effect.

### 4 CONCLUSION

In recent years, computer image processing technology has been widely used in various fields. The most widely used is the artistic creation, which can not only improve the artistic value of artistic creation, but also improve the art creation efficiency in the future trends. The application of computer image processing technology in colleges and universities arts creation courses is the best way to improve students' modern creative technology, which promotes the modernization of universities.

# The man-machine engineering design of a multimedia platform

Chun Ling Pan

*WeiFang University of Science and Technology, Shou Guang, China*

**ABSTRACT:** Analysis of the status quo of college multimedia platform: platform layout is unreasonable, mesa design at present is not suitable for normal education teaching and so on. To solve the problem of the shortcomings of the current multimedia platform, we design the multimedia platform of man-machine. It is a multimedia platform of safety, ergonomics design, including interior design, including the design of the frame, the design of the console, the comprehensive layout, the display control and the layout of the devices such as mouse, keyboard, and scanner. Complete with a security firm, compact structure, convenient operation and design of the personal characteristics of humanization, interface, and powerful multimedia platform design.

**KEYWORDS:** Multimedia platform; Man-machine engineering; Design layout; Scientific and reasonable.

## INTRODUCTION

The safety man-machine curriculum designs topic for someone new campus multimedia classroom teaching multimedia platform. From a security point of view, in order to use the principle and method of ergonomics to solve multimedia platform of the surface of the man-machine combination of security, for the purpose of to improve the efficiency of teaching and teachers comfort level as the goal of the class. With the progress of science education and teaching and multimedia computer is closely connected, played a more and more important role in the education teaching. But after our actual survey and visit and his experience in multimedia teaching, the multimedia classrooms in some ways quite a lot of deficiencies, in order to solve the problem of multimedia classrooms in use, improve the efficiency of the class, better realize the goal of human institute of technology across the development, we must use their own professional knowledge to solve the problems, make themselves due to the development of the cross in our school. In project design, the system of the safety of the man-machine engineering theory, according to the requirement of the security in data processing of the man-machine engineering, in strict accordance with the mathematical statistics method, design a good man-machine interactive information, reasonable matching of the new multimedia platform.

## 1 MULTIMEDIA PLATFORM OVERVIEW

### 1.1 *The current situation of college multimedia platform*

Along with the computer to teach in the field of development, the computer aided teaching. Computer assisted instruction based on multimedia computer as the core, comprehensive use of modern means of teaching, changes the traditional way of spreading knowledge, in order to get the better learning effect. As an important multimedia teaching material carries - multimedia platform in the multimedia teaching equipment has a unique effect, on the one hand, it holds important equipment such as multimedia computers, support their work, on the other hand is an important tool of teacher work, it designs the reasonable degree of the teacher has a close relationship with the teaching efficiency. The multimedia teaching level of the school is higher (in XX district, for example), each big building several multimedia classrooms each layer, and functional comparison is complete, the computer configuration is high, audio-visual system is more complete, in line with the requirements of modern multimedia teaching.

### 1.2 *The problems existing in the multimedia platform*

1 Multimedia platform and layout are not reasonable. The platform is higher. The height is short of teachers, to sit down and later also can't see can't

even look unfamiliar interaction and students' positive effect have been unable to understand the whole situation of the class.

- 2 Mesa of multimedia platform design is not the normal education teaching. Our multimedia platform adopts the folding design, while in the process of teaching inevitably will produce a lot of chalk dust, the platform if there is no clear line in time, the next class at the next class will enter the interior of the multimedia platform, part of the glue on the screen, interfere with the teacher's teaching, some may enter the interior of the core of electronic devices, is likely to cause various faults. Interference and the folded platform in front of the students in class, especially when the teacher is smaller and is arranged very closely interference effect is obvious.
- 3 Multimedia platform detail processing is not really successful. A large part of our multimedia platform, the shake handstands of lack of the necessary device after a long time without cause if multimedia platform, open more difficult. Lock on the table directly, without any dust device easily into dust and other small objects, lead to can't open the multimedia platform, two edges and corners of processes is not good, too sharp, it is easy to hit accidentally met the above students.
- 4 Internal layout is not reasonable. Computer startup key, not in the center console, the teacher to start the multimedia equipment, must bend over to look for, because multimedia classroom teaching requirements, generally fitted with curtains, bad light, start more difficult. In the center console lacks of USB, and some necessary data connections, not only reduce the efficiency of teaching and sometimes may terminate the teaching.
- 5 Can't do the reasonable upgrade. Influenced by the design level of understanding, our multimedia platform modular design failed to do, hard to upgrade, and modern education, changing means more in a day, so it is difficult to adapt to the requirement of future schooling.
- 6 The man-machine design in order to solve the shortcomings in the multimedia platform, covering its support for auxiliary equipment such as screen, keyboard, mouse, and mike classification, improve teaching efficiency and boost the enthusiasm of the students listen to the teacher's, in order to achieve the requirements of building a harmonious classroom.

## 2 MULTIMEDIA PLATFORM OF SAFETY, ERGONOMICS ANALYSIS AND DESIGN

### 2.1 Appearance design

Multimedia platform must have a suitable height, too short in the class the teacher is too hard, long time use cause back pain, and the teaching

equipment operation is difficult; too high to cover the line of sight of the teacher, at the same time, lead to low efficiency of the teacher in class. The width of the multimedia platform must also conform to the requirements of ergonomics, too wide or too low is not appropriate for the teacher in class. The length will conform to the requirements of the teacher's class, to the appropriate length. In order to properly design, there must be plenty of realistic human body parameters.

### 2.2 The internal design and layout

#### 2.2.1 The design of the display window

The shape of the display box design mainly depends on the function of the instrument and the human visual motion law. Experimental research shows that different display box in the shape of the misreading of rate. Screen display should meet the requirements of the operator, its location and display the data of operating personnel with responsibility and function should be considered. Display should be simply possible, clear and easy to understand. In need of complicated and very detailed display, should have good organization and structure, in order to secure the need to display excellent organization and structure.

#### 2.2.2 The design of the console

Console design mainly includes the size of the button, button function layout, button on the mechanical characteristics and relations of comprehensive consideration information display and controller, information display and controller in the color and code, location, sound and the consistency of the respect such as an operation. Marshalling has shown at the same time, control system and is in line with the operator's way of thinking, a reasonable use of functions (system) marshalling, using sequence marshalling, use frequency marshalling, priority of marshalling, operation procedures of marshalling, simulation scheme marshalling, to make it conform to the relevant principles of man-machine engineering.

#### 2.2.3 Display control of the overall layout

According to the display device and the controller in color, coding, location, and the sound, the consistency of operation, display device and the controller of marshalling to conform to the operator's way of thinking, marshalling and reasonable use function, system organization, principle. We are on the left side of the core controller, on the right side of the display, in order to achieve at the beginning of the class the teacher would be able to realize the data

link, in the middle of the class will be able to control the progress of the class and in the best vision to look at the screen, so the other reasonable man-machine matching.

#### 2.2.4 *The layout of the other devices (mouse, scanner, keyboard)*

Keyboard is one of the input devices we use frequency is highest, according to the above, the relevant data of ergonomics, considering the hands of the associated normal area, we will place in the middle of the core, and often in the hands grip zone. Mouse as an important input device attached, considering the vast majority of people are using a mouse, with the right hand and habit is parallel with the keyboard, we set up the mouse in the top left of the core area, some teachers use left hand is considered the habit, we are setting aside a small area on the left side of the keyboard to spare. The scanner is a great volume of input devices, on paper document input is necessary, we already in the early stages of the design, considering, and set aside a special space. On the right side of the hands of the largest active space (careful habits of most people) to set aside a special space, the teacher can ease of use in order to achieve design requirements.

Figure 1. The appearance of the multimedia platform.

Figure 2. Multimedia platform of ergonomics design renderings.

### 3 THE CHARACTERISTICS OF THE NEW TYPE OF MULTIMEDIA PLATFORM

Into a common platform for multimedia, this paper through the analysis does not conform to the man-machine relationship, in order to put forward the method to solve the problem, through the improvement, the new multimedia platform has the following features:

- 1 Security firm is all steel anti-theft structure design, and increases the special safety device thoroughly solve the hidden dangers to the safety of anti-static, lightning protection, etc.
- 2 Mat design, compact structure, scientific and reasonable. Standard specification for machine body length and 1500 mm to 750 mm wide around 975 mm high platform designed in two parts, on the left part of the top left corner of the monitor screen of a computer installation, fixed the top right corner of all kinds of interface and power supply. Under mesa design for two locked cabinets, place the teacher belongings and mainframe computers. Upper part on the right side of the stage, is placed video display, lower placed wireless microphone, DVD player, tape recorder, video camera, audio power amplifier, such as equipment, this design not only conforms to the teachers' teaching habits, and can prevent the equipment jostling platform can be easily placed inside all the multimedia teaching equipment, with high integration.
- 3 Convenient operation. Use, just a card or a key to open a lock, easily inside all the doors open platform, truly achieves "a lack of control". Convenient and practical instrument panel, various operating at a glance. At the spare time in class, the platform is a standard desk.
- 4 Close-fitting humanized design. On the platform, designed the special lock store content ark, store items convenient teacher; In view of the present teaching teachers generally use a laptop or USB flash drive, and designed the portable computer storage area, equipped with 220 v AC power supply socket, and external audio input socket, USB, front-end ports, and the power of the desktop computer and restart the console in the middle of the switch. And is the standard, accord with human body science, design stand out the natural and comfortable science teaching platform height.
- 5 Powerful interface and power socket can fully meet the demand for teaching. Platform Mesa has 2 Settings

Set the USB input interface, 1 set of VGA input interface, two-way audio input, video input 1 road, three sets of power supply, input output power 2 road all the way, for the teachers teaching provides a convenient condition.

#### 4 CONCLUSION

In terms of the design of the multimedia platform, of course, just rely on safe man-machine related theory is not enough, must also be combined with the related disciplines and specialties, and actively listen to the teacher and classmates using the opinions and Suggestions, on the basis of considering the practicability of the products considering the economics and production of convenience, to develop new standards and promotion plan, layout, realize the goal of improve teaching efficiency.

## Electroencephalographic coherence for exposure to low-frequency noise

Ching Chang Yang

*Behavioral and Cognitive Electrophysiology Laboratory, Department of Environmental Science and Occupational Safety and Hygiene, Tajen University, Pingtung, Taiwan*

Chia Yi Chou

*Behavioral and Cognitive Electrophysiology Laboratory, Bachelor Degree Program of Fire Safety, Tajen University, Pingtung, Taiwan*

**ABSTRACT:** Epidemiological studies have indicated that exposure to environmental low-frequency noise causes annoyance. However, most studies during the past 2 decades have been based on information from questionnaires concerning the negative effects of noise on psychosomatic responses. This study investigated bilateral frontal electroencephalographic (EEG) activity changes during exposure to low-frequency white noise at various noise intensities by using power density and coherence analyses of EEG estimation. The authors hypothesised that distinct noise intensities affect bilateral frontal EEG activity, which would be reflected in the power density and coherence values. The test intensities of noise were background noise, 70-dBC, 80-dBC, and 90-dBC. Each noise level was sustained for 5 minutes, and the bilateral frontal EEG activity was recorded simultaneously. The bilateral frontal EEG responses were evaluated using power density and coherence of activity statistics obtained from EEG signals. The results showed that the power density, coherence, and blood pressure did not substantially change relative to the noise levels. However, the alpha band of power and coherence of the various conditions were higher than the other frequency bands. The power density and coherence showed no significant changes in the various levels of noise intensity. In conclusion, both power- and coherence-based analyses did not demonstrate that bilateral frontal EEG activity was sensitive to exposure to low-frequency white noise in short-term EEG time series.

**KEYWORDS:** power density, coherence, low-frequency noise exposure.

### 1 INTRODUCTION

Previous epidemiological studies have indicated that chronic noise exposure led to physiological changes such as hearing impairment, hypertension, annoyance, stress-related cardiovascular disorders, and sleep disturbance [1]. Low-frequency noise (20 Hz – 200 Hz) is becoming increasingly common in urban environments. Frequent sources of low-frequency noise are industrial machinery, vehicles, transformers, compressors, and indoor ventilation and air conditioning units. In addition, central nervous system disorders, such as emotional stress, anxiety, impaired cognition, and memory function, were observed after noise exposure and tinnitus [2]. Previous studies have suggested the involvement of the limbic system in emotional activation [3]; the amygdala and hippocampus are 2 major limbic areas that receive either direct or indirect neuronal information transmissions from the central auditory system [4]. In turn, auditory stimulation can directly or indirectly affect the functioning

of these regions. Earlier studies have also indicated that emotions are involved in the frontal area [5, 6]. Therefore, the current study investigated bilateral frontal connectivity of the function of the electrophysiological correlations by examining how the coherence of power density of various frequency bands is calculated between the left frontal and right frontal regions in low-frequency noise exposure on brain activity.

Coherence analysis is a conventional method for measuring electroencephalographic (EEG) signals. The analysis involves applying a digital signal processing technique for measuring the respective power spectrum of each EEG signal. Locatelli et al [7] indicated that the linear dynamics of EEG coherence might contain useful indicators of the mechanical characteristics of brain response systems. In addition, there is no direct evidence for the adverse effects of exposure to low-frequency noises of various intensities. Therefore, various methods for measuring EEG synchronisation, such as the phase coherence of EEG

signals, have been implemented [8]. A coherence value in frequency  $f$  indicates that the power in frequency  $f$  of the first signal is synchronous with the power of the second one. Coherence means synchrony or the coupling of 2 electrodes in a given frequency band [9]. The coherence measure has been considered to reflect functional connectivity [10, 11] in pathways linking the temporal activity of neural populations. Coherence analysis has previously been used successfully to diagnose diseases such as Alzheimer's disease [12] and Dyslexia [14], as well as to examine age and sex-based effects [13]. However, whether spectral coherence measure is helpful in determining the non-auditory effects of low-frequency noise exposure on EEG signals remains unclear.

## 2 MATERIALS AND METHODS

Eighteen healthy male volunteers participated in this study; the mean age was  $24.6 \pm 6.3$  years (mean  $\pm$  standard deviation). A pure tone audiogram was performed at the beginning of this study for each participant to ensure that their hearing acuity was normal. Informed consent was obtained from all of the participants, and they reported no medical histories of hypertension, neurological disease, or heart disease. The average intensity level of the background noise (BN) was less than 50-dBC. The participants were required to sit quietly with their eyes closed in a test room for 5 minutes for adaptation. Blood pressure (BP) was measured using an electronic sphygmomanometer (Omron JPN1) after each test.

The World Health Organization suggested that "when prominent low-frequency components are present, measures based on A-weighting are inappropriate... Since A-weighting underestimates the sound pressure level of noise with low-frequency components, a more accurate assessment of health effects would be to use C-weighting" [15]. The low-frequency white noise levels were generated using the built-in sound adapter of a personal computer, and the frequency of the sound output was 20–200 Hz at a 16-bit digital-to-analogue conversion. The maximum instantaneous output power of the loudspeaker was 5600 W. The white noise intensities used for each participant were BN, 70-dBC, 80-dBC, and 90-dBC. Each white noise level was presented binaurally and sustained for 5 minutes. An EEG signal for each participant was obtained from the AD Instruments PowerLab 26T. The impedance was below 5k $\Omega$ . The sampling rate of the bilateral frontal EEG recording was 1000 Hz, and the amplitude resolution was 3nV [noise < 1 $\mu$ V<sub>rms</sub> (.5 – 2kHz)]. Informed consent was obtained from all participants. The test was discontinued when the

participant experienced any discomfort from the noise. The BPs of the BN condition, post-70-dBC, post-80-dBC, and post-90-dBC white noise levels were measured for comparing noise levels of various intensities.

The initial EEG data were filtered in the range 1–50 Hz by using a 3-order Butterworth and artefact rejection. Bilateral frontal electrodes were selected to calculate the power density and the coherence (*Coh*). The power density and the coherence were analysed for delta (1–4 Hz), theta (4–7 Hz), alpha-1 (7–10 Hz), alpha-2 (10–13 Hz), beta (13–30 Hz), and gamma (30–50 Hz) frequency ranges. The selected electrodes were located bilaterally over the frontal region of the cortex where inter-hemispheric connectivity was measured. A fast Fourier transform was used to compute the power and the coherence for the spectral analysis.

EEG coherence represents the covariance of the EEG spectral activity at 2 electrode locations, and measures the temporal synchronisation of the EEG signals recorded at the pair of electrodes. The bilateral frontal EEG coherence, which is the square of the cross-spectrum of the electrodes divided by the product of the power spectra of the individual electrode, is often estimated separately for each of the frequency bands and for specific pairs of electrodes such as F3–F4. Coherence is defined as a spectral correlation between 2 time series, ranging from zero to one. In this study, coherence was calculated using the following equation [7, 16]:

$$Coh_{xy}(f) = \frac{|P_{xy}(f)|^2}{P_{xx}(f)P_{yy}(f)}$$

where  $Coh_{xy}$  is the magnitude squared coherence of bilateral frontal EEG signals  $x$  and  $y$  for a given frequency bin( $f$ ); the numerator contains the cross-power spectrum  $P_{xy}$  for  $x$  and  $y$ , whereas the denominator contains the respective power spectra  $P_{xx}$  and  $P_{yy}$  for  $x$  and  $y$ . This equation produces a real number between zero (no coherence) and one (maximum coherence).

Coherence analysis of bilateral frontal EEG signals has been used to evaluate the degree of functional connectivity among cortical neurons [7, 17]. Furthermore, the analysis of EEG coherence is the most common approach for investigating the functional coupling of EEG oscillations in aging [7, 18]. In this study, the bilateral frontal EEG coherence was computed in 18 healthy volunteers.

The mean BP, mean power density, and mean coherence between noise levels of various intensities were compared using repeated measures analyses of variance (ANOVA), and a post-hoc pairwise

comparison was conducted using the Tukey method. The threshold of statistical significance was  $P < .05$ . Graphic values are expressed as mean  $\pm 1.96 \times$  standard error.

### 3 RESULTS AND DISCUSSION

Figure 1 shows the bilateral frontal EEG power density in various frequency bands under various white noise intensities. The bilateral frontal EEG power density showed an insignificant difference between the noises of various intensities (repeated measures ANOVA: in the left brain, delta band:  $df = 3, F = .02, P = .90$ ; theta band:  $df = 3, F = .01, P = .99$ ; alpha-1 band:  $df = 3, F = .18, P = .91$ ; beta band:  $df = 3, F = .12, P = .95$ ; gamma band:  $df = .12, F = .02, P = .95$ ; in the right brain, delta band:  $df = 3, F = .15, P = .93$ ; theta band:  $df = 3, F = .06, P = .98$ ; alpha-1 band:  $df = 3, F = .69, P = .56$ ; alpha-2 band:  $df = 3, F = .28, P = .84$ ; beta band:  $df = 3, F = .01, P = .99$ ; gamma band:  $df = 3, F = .05, P = .99$ ). The mean BP of the BN condition, 70-dBC, 80-dBC, and 90-dBC noises did not demonstrate any significant difference. However, the power density of the alpha-1 band under the various conditions was higher than the other frequency bands. Figure 2 presents the bilateral frontal EEG coherence in various frequency bands for the white noise of various intensities. The bilateral frontal EEG coherence showed an insignificant difference between the noises

of various intensities. However, the coherence of the alpha band under the various conditions was higher than the other frequency bands.

In this study, the noise levels of various intensities did not demonstrate any significant changes in the functional cortico-cortical connections between the left and the right frontal regions of the participants' brains. The noise environment affects non-auditory brain regions such as the limbic system. The amygdala and hippocampus of the limbic areas receive either direct or indirect sensory input from the human auditory system [4]. Although the limbic system produces stress responses to noise, noise exposure or the resulting stress can also affect the limbic system [19]. Self-regulation of emotions and cognition occurs in the frontal areas of the brain, where activity can be easily detected [20]. Evidence confirms the importance of functional connectivity within the limbic-frontal regions during emotion regulation [21]. Therefore, structural and functional alterations may be observed in the limbic-frontal areas after the brain has been subjected to noise or stress. However, understanding the role of the limbic-frontal lobes in emotion and cognition requires further research [22]. In this study, the bilateral frontal EEG recordings were relatively short, which might have decreased the accuracy of the power density and the coherence results. In conclusion, the power- and coherence-based measurements of the bilateral frontal EEG activity did not demonstrate sensitivity to exposure to low-frequency noise.

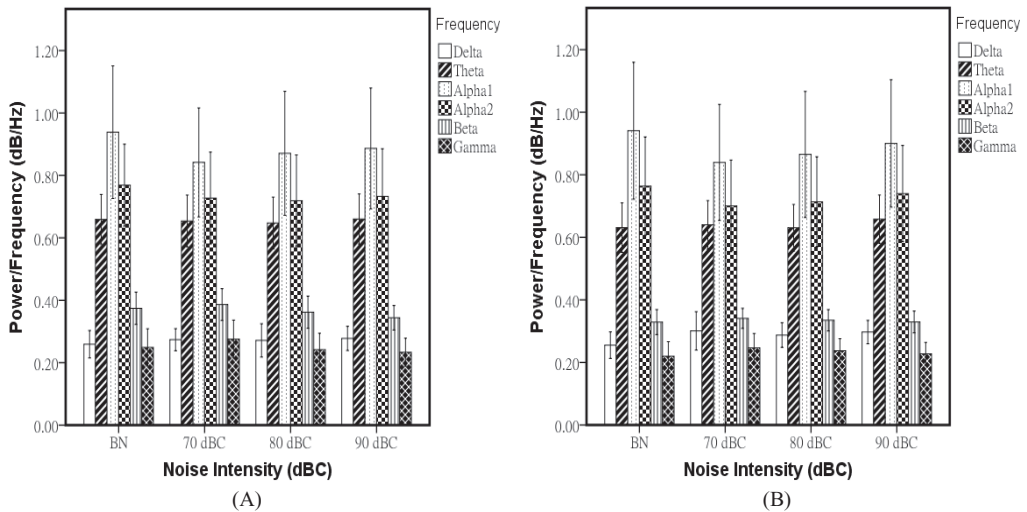

Figure 1. Spectral power density values for the left (A) and right (B) brain were averaged in various frequency bands for the white noise of various intensities. Vertical bars indicate 95% confidence intervals.

Figure 2. Coherence values at various frequencies for white noise of various intensities. Vertical bars indicate 95% confidence intervals.

#### ACKNOWLEDGEMENT

The authors thank Hong-Zhun Wu for his assistance in the data collection.

#### CONFLICT OF INTEREST

The authors declare no conflict of interest.

## The artistic expression analysis of animation technology based on three dimensions

Hua Nie

*Shichuan Tianyi University, Chengdu, Sichuan, China*

**ABSTRACT:** With the development of modern computer technology, animation technology based on three dimensions becomes mature. Virtual methods based on computer software could manufacture visual effects which are realistic. This is the perfect combination of science and art which could strengthen the expressive force of animation. It also could prompt the emergence of a new form of animation. This paper will analysis the artistic expression of animation technology based on three dimensions.

**KEYWORDS:** Animation Technology Based on Three Dimensions; Artistic Expression Animation Technology Based on Three Dimensions.

### 1 INTRODUCTION

Animation was first born in 1906, “Humorous Phases of Funny Face” made by Blake in Edison Laboratory symbol of the new times. With the development of the modern computer technology, animation has been combined with a computer. In the field of architectural design, 3D animation has become an indispensable tool for architects. Three-dimensional animation is also an architect design language to express their thoughts, effectively promoted the development of the construction industry. Today, the best form to reflect the architectural scheme is the animation technology based on three dimensions. It could reflect the authenticity of architecture program by the way of each external perspective and the real feeling of the internal environment and structure building. Architects can simulate their architectural creation visually by the animation technology based on three dimensions and show up the animation more realistic, complete and true.

Animation technology based on three dimensions is the technology which combined the 3D animation design and architectural design. This is a modern expression of art and new media. The traditional forms of construction are generally the facade design, graphic design, surface design department, this realization in the form of the problems is through a facade, flat, rigid profiles and some renderings hard to imagine the final architectural renderings. Three-dimensional architectural animation techniques just to compensate for the problems we talked about. By this way, people in the construction phase of a clear relationship between the environment and the overall future of the building exterior space, internal structure,

elevation, section, flat, and also move through the virtual lens observation no part of any face-to-building, complete the final plan renderings.

### 2 THE STATUS SITUATION OF THE ANIMATION TECHNOLOGY BASED ON SD AT HOME AND ABROAD

The animation technology based on 3D which we talked about is the technology which combined the 3D animation design and architectural design. Architect of some very abstract design data using three-dimensional visual effects, animation techniques translate into very real 3D animation, 3D building through computer animation will show up. It has an extensive use in the field of urban planning, architectural and landscape design. We can be as a means of three-dimensional animation, film special effects and computer technology methods combining animation will show the construction of a comprehensive environmental and style out. Vivid characters and living environment plot are also can be included and some buildings are very supporting life has been full of content display.

Animation technology based on three dimensions is beginning to develop from abroad. The main uses of the technology are simulation the difficult large 3D buildings. By this way, we can show the entire structure of the environment inside and outside the building and depict the effects of different climatic conditions brought the whole building. It is difficult to identify the realistic effects of the eyes. The development of animation technology based on 3D is relatively late in our country. In the mid-1990s, we

produced some 3D animation by the software just like MAYA, SOFTMAGE. We have made tremendous achievements in the past 20 years. With the development of the economy, the government has brought development to the animation technology based on three dimensions.

### 3 ARTISTIC EXPRESSIONS OF THE ANIMATION TECHNOLOGY BASED ON THREE DIMENSIONS

#### 3.1 *Expression of the light and shadow*

Set light to the scene due to different architectural changes. The use of light and shadow can express a transformation architecture atmosphere, characters' inner feelings and emotional situations. Designers can adjust the virtual light and achieve light interaction by the way of animation technology based on three dimensions. Animation production can use 3D animation software to adjust the virtual light, light and shadow to achieve transformation, the use of superimposed layers and layers to adjust the brightness of the scene to achieve specific. Technology makes building a scene with a real artistic expression. This technology can achieve mutual movement can make space and roles

#### 3.2 *Dynamic expression of the role of movement Lens expression*

This technology can achieve mutual movement can make space and roles. By this way, the designers need only virtual three-dimensional world driving air out of the structure, so that characters can be realized in any direction and move in any way. This technology has dynamic system, with a virtual camera movement, can achieve a very three-dimensional and real motion picture. This technique can produce a realistic three-dimensional sense of non-standard, This artistic expression can only be achieved through a three-dimensional technology. This technique for the construction industry has brought a revolutionary change.

#### 3.3 *Lens expression of animation technology based on three dimensions, Role modeling detail and texture*

This technique for the construction industry has brought a revolutionary change. The most prominent feature of the technology is the use of a virtual path to the virtual space and virtual camera frame and bindings. On the emotional aspects of the rendering, designers can three-dimensional architectural animation techniques, lens to achieve in real life is difficult to achieve the difficult lens effect. This unique expressive lens technology to bring a stunning visual

effect. The main character is the result of a one-time pre-production build a complete model of the character can be modified easily and quickly realize when details can portray the role of popular, to avoid aliasing distortion problems

#### 3.4 *Expression of role modeling detail and texture*

The main character is the result of a one-time pre-production build a complete model of the character can be modified easily and quickly realize when details can portray the role of popular, to avoid aliasing distortion problems. The technology draw maps can make the shape of the surface texture and pattern, enhance the role of the image of the design freedom. In terms of rendering textures on a very big breakthrough, is the traditional animation cannot be done.

#### 3.5 *Expression of special effects*

This technique can be made to describe the role of special effects. By definition for each pixel, the model can be built and real environment can be simulated. Using the definition of the role of the realization of the interaction between the environment, making the surrounding architectural environment and be able to move the action along with the role change, to get the real dynamic effect. The performance of the force generated by the animation effects, animation design adds a three-dimensional architectural charm, enhanced dramatic architectural animation.

## 4 PROBLEMS AND SOLUTIONS

This technology has gained great achievements in the market, showing pictures appear sense and realistic environment getting closer, but still exist on some issues such as artistic expression. Some artistic problem such as dull, static, lack of human feelings and the missing of vitality, the need to solve these problems is very urgent. The fundamental reason is that dynamic lighting is not fully reflected in the architectural space. These reasons make it very difficult for people to feel the beauty. We need to use software tools to express the architectural pictures. The operation of the program is very complex and the making progress is difficult. Only the three dimensional animation designer can finish the design task, but many of his ideas cannot realize really. In one word, an urgent problem needs to solve is artistic performance ability restrictions. In order to solve this problem, not only the architectural design but also the film art should be researched. We should find a new method from more fields. Architectural designer should consider the space design of the building and master dynamic image, special technology and lighting technology

accuracy. It's hard for an animation designer to understand the intentions of the architectural designer, so that, both the architectural design and animation design should be mastered by the architectural design. Only in this way, can the situation that the expression of the architectural animation is poor can be improved.

## 5 RESEARCH DIRECTION

With the development of Modern computer technology, animation technology based on three Dimensions becomes mature. The previous architecture display method is generally the plane design, elevation design, profile design, it is difficult to imagine the final building effect. People in the surrounding environment have undergone tremendous changes and we have rich perception, so that, it is very important to describe a person's emotion with animation art. So animation personnel not only need to pay attention to architectural design, but also for the research in many aspects of art, film, mechanical, computer, music, etc. The design concepts and creations thought of Architects should also catch up with modern 3D animation software technology. With creasing amplification of software, it simplifies the design as well. In the future, research on the artificial presentation of 3D architecture animation technology also contains real analogy of standardized light, the erections of standardized models, etc. in the current animation effects, the figures' skins and motion is still stiff, the gestures

are not lifelike enough, and along with the motion, the cloths can not perform real. In addition, the effects of some plants, the fusion of videos and graphs in dynamics, and how to show feelings in architectures, and technology of expression in aesthetics and movies are all important research directions.

## 6 CONCLUSION

This paper analyzed the expression of animation technology based on three dimensions. The paper has a conclusion that this technology needs a higher technical requirements and freedom. Because the limit of the equipment and other aspects, animation expressive force was weakened. Mechanics, digital, aesthetics, music and other elements should be used to strengthen the artistry and make it like nature itself.

# The impacts of computer graphics accessibility functions on ceramic paintings

Yang Gao

Jingdezhen Ceramic Institute, China

**ABSTRACT:** With the rapid development of computer technology, computer graphics auxiliary functions are more and more mature and are widely used in modern art design. Computer graphics-aided designation can effectively improve production performance and change works visual effects. You can say it relates to the engineering, technical field and also relates to the art designation fields. Its advantages of applications in ceramic paintings have high efficiency, strong performance and simple image processing. This article describes the development of computer graphics auxiliary functions and its applications in the field of ceramic paintings and effects on ceramic painting techniques.

**KEYWORDS:** computer; graphics accessibility functions; ceramic painting; development; application; influence.

## 1 INTRODUCTION

Ceramic painting can fully exhibit the artist's personality and self-perception, and is the reproduction that people are used to express language through related painting skills and is the aesthetic system by means of visual sensory effects. Many factors in the actual designation of the ceramic paintings can restrict and influence the artistic expressions of ceramic paintings. Artists use, flexible and creative ceramic art skills. The arts created factors, therefore are sufficiently uncovered and are also the development trends in modern flourishing ceramic painting arts. With the advent of photography and high-tech development, paintings began to show the personality unique development direction of the artist. The direction of the ceramic painting trends deeper express direction of thoughts and feelings. Therefore, use computer graphics functions assisting the creation of ceramic painting was more and more popularized by ceramic painting artists.

## 2 ANALYSIS ON COMPUTER GRAPHICS ACCESSIBILITY

Computer graphics accessibility primarily helps staff design graphic, which mainly applied the relevant knowledge of computer graphics. The main contents of computer graphics are demonstrated using computer graphics, using computer technology compute and process graphics are ultimately to show up in new forms. The main purpose of using computer graphics auxiliary functions for ceramic painting is to make the graphic shows a pleasing sense of reality.

Computer graphics and image processing operation mainly have six steps: (1) geometric transformation such as projection, pan, zoom, rotate, etc. (2) image analysis and segmentation, digitization and encoding, enhancement and restoration, etc. (3) hidden surface and line eliminating computer graphics. (4) Design computer graphics modeling and modeling. (5) Fitting operate the surface and curve of graphic image; (6) Finally, design the color and process the relative brightness and textures. Simply, use mathematical and concept realize the geometric graphics and data information model in the computer, and then further modify, storage, display and perfect them using computer technology.

We can see from the above that the computer auxiliary function in geometric design is inextricably linked with computer graphics. The main objection of the actual collection scene are entities and curves and surfaces. In addition, in practical applications, apart from applying the relevant knowledge of computer graphics, but also apply the required hardware such as graphical input and output devices.

## 3 ANALYSIS ON THE APPLICATION OF COMPUTER GRAPHICS ACCESSIBILITY FUNCTIONS IN CERAMIC PAINTING

To better apply accessibility, computer graphics auxiliary function to the ceramic painting, we must fully understand the requirements and characteristics of ceramic paintings. Ceramics, as our traditional instruments, include the artist rich imagination, profound ideological content, no matter using which painting

method, we should take fully into account the three painting requirements of the composition, skills, mood expression and so on.

First, the composition is the foundation of a successful paintings and we should make full use of computer graphics auxiliary functions to construct the corresponding geometric model, through continuous improvement to make the compose more complete coordination. For duplicate objects and elements, computer software can systematically analyze data and build a complete geometric model, which is more efficient compared to hand-painting way and compose more accurately.

Secondly, the use of painting techniques is a key step in the process of painting creation. The computer graphics auxiliary function is mainly used in ceramic painting techniques. The use of computer graphics principles can make the details of the work more sophisticated modification and improvement. For example, we can comprehensively input data information into the computer, while the traditional perspective drawings more rely on artists painting experience and artistic level.

Finally, the performance capabilities of the mood are the basic criteria judging whether a work is successful or not. Using computer graphics accessibility can maximum increase work performance and make it more artistic tension by rendering it more rigorous and rational. Color rendering is a direct factor in the performance of work tension. In terms of computer graphics auxiliary function more accurately distinguish and choose colors rendering works through a rigorous designed program. Just through a series of related instruction can we complete complex rendering and save a lot of hand-toning, coloring time at the time of ensuring color accuracy.

#### 4 ANALYSIS OF THE ROLE OF COMPUTER GRAPHICS ACCESSIBILITY FUNCTIONS ON CERAMIC PAINTINGS

Computer graphics auxiliary functions in ceramics, paintings auxiliary work fully show a sufficient incomparable superiority of computer software. Although the design of computer art does not exclude the traditional and modern art forms of creativity, but its advantages like high quality, high efficiency, fast processing speed and lifelike texture, etc., cannot be achieved by the general way of ceramics paintings. And it is more easy to learn and easy to operate,

which reduce the difficulty of ceramic painting. Its functions like lighting effects simulation provide great help for auxiliary painting and painters providing ideas. Computer-aided creative works are more perfect, which went through a rigorous calculation in the overall proportion, color matching, etc. Generally speaking, the application of computer graphics auxiliary function in ceramic paintings can achieve high efficiency, strong performance and simple image processing effects, and fully meets the requirements of the artistry and craftsmanship of ceramic paintings, which is a landmark change in ceramic paintings.

#### 5 CONCLUSION

In summary, the computer graphics accessibility features make full use of various design and production software and bring an enormous impact to ceramic paintings, and even a revolution in painting and ceramics. Although this technique needs constant innovation and improvement in the long-term practical applications. But for now, it has played an important role in improving painting efficiency and enhancing the work performance force. Even from an economic standpoint, fast and efficient creation process also saves a lot of manpower and resources for ceramic manufacturing and improves economic efficiency. Thus, speeding up and deepen the application of computer graphics accessibility in Ceramic paintings is the general trend.

# Basketball tactics system design based on .NET platform

Han Jiang

College of Physical Education, Wuhan Sports University, Hubei, China

**ABSTRACT:** This article is based on the basketball tactics and management system developed on the .NET platform. It realizes the information of management and reduces barriers of the mutual separation in time and space so as to improve efficiency of management and staff's technique level of work.

**KEYWORDS:** basketball; tactics System; statistics; .NET Platform.

## 1 INTRODUCTION

It is known to us all that competitive sports is an important part of our country enterprise of sports. With the development of our economy and the gradual improvement of people's living standard, competitive sport has raised more and more people's attention.

The goal of competitive sports games is to win which needs quite a lot of hard training as well as the contribution of science and technology support to do the scientific research. Doing scientific research of competitive sports games and providing scientific decision support for the sports games on various aspects is a very important link for athletes to win game. Therefore, to strengthen the scientific research on tactics system design of basketball, one kind of competitive sports games, based on the .NET platform is a very important aspect to improve the level of competitive sports.

## 2 THE EXISTING PROBLEMS OF BASKETBALL TACTICS SYSTEM DESIGN BASED ON .NET PLATFORM[1–3]

### 2.1 *The problem of the competitive sports games*

A sports game is a video game that simulates the practice of traditional sports. Most sports have been recreated with a game, including team sports, athletics and extreme sports. Competitive sports games are mainly those which need high level energy and pose high standard request for those athletes. And competitive sports are governed by codified rules agreed upon by the participants. So it is really hard for those athletes to do competitive sports games all their lifetime.

### 2.2 *The problem of ball games*

Ball games, or ball sports, are any form of game or sport which feature a ball as part of play. These

include games such as association football (soccer), baseball, basketball, and American football. Such games have diverse rules and histories and are of mostly unrelated origins. Ball games can be defined in several broad types, like Bat-and-ball games, such as baseball and cricket; racquet and ball games, such as tennis, squash and badminton; hand and ball-striking games, such as various handball codes, rebound handball and four square; goal sports, such as basketball and all forms of football, lacrosse, and hockey (except ice hockey); net games, such as volleyball; precision sports, such as bowling, lawn bowls, croquet, and golf, as well as cue sports, including snooker, pool, and forms of billiards. So ball games are featured as having fast pace and being highly open. And that will lead to complex to do the research.[4]

## 3 THE PROBLEM OF BASKETBALL TACTICS SYSTEM

From the above, we have known that basketball is a kind of ball game and it is also very complex. So how to find the law and constancy of athletes doing in the complex competition, which is always a problem to researchers interested in sports. Observing the performance of the athletes and providing objective and reliable feedback is one of the instructor's responsibilities. While the purpose of giving a quantitative judge of sporting performance is to objectively study the athlete's performance in doing sports and to reduce the instructor's prejudice of subjective impression, so as to value execution efficiency of player's tactics and training program correctly and at the same time, to build the sound and comprehensive knowledge of competitive sports games. And the existing problems of basketball tactics system design based on .NET platform are shown in [Fig 1](#).

Figure 1. The existing problems of basketball tactics system design based on .NET platform.

#### 4 THE STRATEGY OF DOING RESEARCH ON BASKETBALL TACTICS AND MANAGEMENT SYSTEM DEVELOPED ON THE .NET PLATFORM

At present, except doing regular supervision and inspect of body functional index and professional tactics and management training, information about human movement includes two categories: kinematic information and dynamic information. Kinematics information mainly relies on video observation ways to get relevant information in the process of training. In order to comprehensively improve the competitiveness, we are in urgent need to develop a real-time and stronger adaptability analysis system for special tactics ability. Dynamic information is mainly obtained by means of sensor technology. Take lower limb strength analysis as an example. Researchers can get 3d mechanical parameters of human movement through the three dimensional measuring force platforms and use one dimensional pressure plate to get the distribution data of static or movement of body in the process of plantar pressure. These dynamics information access can not only make measurement of the human body movement dynamics information accurately, stably, responding sensitively , but also can achieve real-time feedback and movement process control with the aid of computer, network and other sensor technology.[3]

#### 5 THE MECHANISM OF RESEARCHING METHODS OF TACTICS

The researching methods of tactics are composed of four parts, namely statistical analysis, data analysis, modeling analysis and systematic viewpoint analysis. These show in Figure 2.

Figure 2. The researching methods of tactics.

#### 5.1 The mechanism of statistical analysis

The statistical analysis of tactics and technology is the basic method when doing the research on tactics and technology. It is widely used and it has relatively lower requirement for the researchers or learners. It can only reflect the surface meaning and information of tactics and technology

#### 6 THE MECHANISM OF DATA ANALYSIS AND MODELING ANALYSIS

These two methods are the direction to do the sports research of tactics and technology. They can reflect the inner part laws and rules of research on tactics and technology.

#### 7 THE MECHANISM OF SYSTEMATIC VIEWPOINT ANALYSIS

This is a new thought and trial in doing research. However, it still needs to be proving because of some disputes and controversies academically.

#### 8 .NET TECHNOLOGY

With the development of computer technology in all areas of society, education information has made a great improvement. Remote online examination system is becoming one of the main areas of the design of educational software. Meanwhile, the current overall education trends also put forward a very high request to this field.

According to the structural requirement, remote test system can be divided into two categories: C/S structure and B/S structure, that is to say, browser / server model and client/server model. This paper introduces the design method and Implementation of the remote test system, in which B/S structure and NET technology are employed. Remote test system can take examinations in any time and any place by using an accurate, efficient and networking information technology. Thus, it has the superiority which traditional examination will never exceed.

Figure 3. The categories of the remote test system.

Based on actual demands of the remote test system, this paper discusses analysis of system requirements, development environment, and the design and implementation of the module function. A simple remote test process has been achieved. In the presented system, student users can login, register, test themselves and inquiry examination results; and administrators can manage test information, test results and so on.

## 9 NETWORK COMMUNICATION TECHNOLOGY

Especially the rapid progress of Internet technology makes the development of remote examination system enter into a new field. The emergence of the examination system based on Browser/Server structure makes up for the shortcomings of the system. In this mode, each computer can, with the help of using Internet/Intranet through the browser to communicate with the server, all operations can be done on the server sides and do not need to distribute a client program, which is easy to maintain and upgrade.

## 10 CONCLUSIONS

From what we have discussed above all, we can hold the notion that basketball tactics and management system developed on the .NET platform is a new way and we should do more work and research on this.

## Research on the information literacy education of university embedded cognition

Ning Ning Sun & Li Hua Ma

*Jilin Agricultural University library, Changchun, China.*

**ABSTRACT:** Starting from the information literacy education of the university library, the teaching practice of students in the process of information demands an analysis, to construct a cognitive view to embed information literacy education service.

**KEYWORDS:** Information literacy; Service; Cognition.

Information literacy is a must in the library and information retrieval skills and computer operation skills to increase the ability of creating and solving ability. From the angle of cognition, cognitive activity learning behavior is in a variety of cognitive tools to support learners. To analyze the information literacy education of the University in the perspective of cognition, is in the process of study from the perspective of cognitive training initiative, enthusiasm, learning of students, and then to have the high mental ability, thinking and behavior of students' access to information, information literacy has become strong.

### 1 INTRODUCTION

In 1974 the president of Information Industry Association, American Paul based first put forward the concept of "information literacy", information literacy education has gradually replaced the library user education [1], global universities have started the research on the theory of information literacy and education model, and the research heat increase year by year. The information literacy of our whole education at the initial stage, the lack of a complete theoretical system as guidance, the theoretical research on the information literacy education emphasizes "action and effect", namely all sorts of software upgrades and hardware system construction. The statistics found that education, experience less relevant foreign study on information literacy, and few metrology data analysis and empirical investigation, the research contents are mostly concentrated in the basic theory, which relates to the systematic construction research literature deep rarely, the overall research level still needs to be strengthened and extended.

From the angle of view of the professional information on college, student information literacy

education at present, the effect is not very ideal, college students in the major of information access and utilization compared to passive. The traditional information retrieval teaching belongs to the general teaching, although largely improving university students' information retrieval and analysis ability, but still unable to effectively improve the awareness of the need in the aspect of professional knowledge of students, unable to get information effectively integrated into personal knowledge base. Therefore, deepening the teaching process, following the students' information demand, the introduction of the idea of knowledge service, knowledge service model to construct the embedded in the teaching process, will greatly enhance the depth and level of the library service, to make a greater contribution to the teaching work.

### 2 THE RELATIONSHIP BETWEEN INFORMATION LITERACY EDUCATION AND COGNITION

The students used the inherent knowledge and experience to new information for the selection and treatment during the study, to extract the essence characteristic of them, and then combined with the related knowledge, the choice of the main, useful information storing them up. Cognitive style, cognitive ability, knowledge structure, the emotion will have an impact on the information literacy. College Students' cognitive demand and information search behavior exist between the results of the study show, information search behavior scores, demand variability available cognitive interpretation 9%, explain the cognitive level of demand and there is a positive correlation between information search behavior. Individual high cognitive demand level, inclined to explore, reasonable selection of information, the judgment of its

authority, reliability, novelty and accessibility, and actively strive to retrieve the desired information, adjust the retrieval strategy in the retrieval process, tended to have a comprehensive system for retrieval. Cognitive needs a relatively low level of individuals in seeking only pay attention to the problems to be solved related information, tend to rely on existing information and thus less effort, to evaluate the information and the judgment tends to be according to the external cues, enables its to search results of over generalization, cannot solve the current problems. They search for related information, does not care for its mode of action and mechanism to solve the problem, do not do to follow the thinking [2].

In the information literacy education for college students, there is little concern the individual life as well as the "human" existence. On the network today, our education should not only focus on cultivating students' information ability, we should strengthen the information ethics education, at the same time pay attention to the cultivation of students' individual characters [3] to better enable students to take the initiative to improve their information literacy and internalizes for own natural consciousness and natural demand. With the establishment of the research paradigm of cognitive view, information retrieval has appeared great change, gradually heavier technology and system paradigm to the cognitive paradigm shift. And the information literacy education is to emphasize information main body, namely the user's knowledge structure, cognitive context, user interaction with the system, the user task change. Our time for students in information literacy training should pay attention to the subjective initiative of its own, "on the premise of user cognitive oriented" as the cultivation of information literacy, pay attention to the study of the user's cognitive.

### 3 THE MAJOR POINTS OF THE INFORMATION LITERACY EDUCATION EMBEDDED IN COGNITIVE VIEW

The cognitive theory and the contents of the information literacy education to each other, to construct the embedded information literacy education based on cognitive theory, to the students learning guidance, to achieve the progressive training students' information literacy.

#### 3.1 *The cultivation of information cognitive process of embedded teaching of middle school students*

Information literacy is a part of the overall quality of the people, to improve the students' information literacy is the effective way to the comprehensive

implementation of quality education. Information emotional emphasis more on attitude and interest in the use of information technology, the cultivation of students' positive use of information technology to obtain information attitude is the first step in the information literacy education for embedded system. Students having a certain amount of information consciousness, he will automatically monitor their cognitive activities by this consciousness, make the cognitive behavior after smoothly[4].

#### 3.2 *The development of students' cognitive structure of mutual inspiration*

The famous psychologist Piaget thinks, cognitive structure is the result of the structure of human internalization activity. He put the cognitive structure is understood as a dynamic transition system, embodies the essence of the development of cognitive structure, learning ability is a product of the environment and the innate potential interactions. The development of cognitive structure is in the students' original knowledge system on obtaining, understanding, processing and application of information. From a psychological perspective, cognitive structure through schema, assimilation, adaptation and balance through the interaction to gradually develop and grow. Assimilation and adaptation are the two important cognitive processes, when through the balance operation actively monitoring for them with the adjustment, metacognitive ability depends on the development of cognitive structure will gradually improve. Therefore, to improve the students' cognitive structure development of metacognitive ability plays a role in adding fuel to the flames [4]. And mutual inspiration can make the interaction between teachers and students or students and students discuss with each other, not only, but also to accept questioning and criticizing each other, showing a two-way flow of knowledge. In the process of the discussion content of obtaining recognition, gradually understand each other, not only let the students gain new meaning and reconstruction, improve their knowledge structure; teachers will continue to examine their own education idea and the behavior of reflection and reconstruction, improve teachers' ability of self, and promote their professional development [5].

#### 3.3 *The information literacy curriculum embedded in other courses*

The integration of information technology course and other courses is the best mode to achieve the goal, and the reform of the teaching structure is the core task of integrating. Reforms in the teaching structure of teachers, students, teaching materials in the teaching media, the interaction of four factors, the

cultivation of students' cognitive ability will become easier. Enhancing information literacy embedded in other courses, to students' self awareness and self monitoring feedback to create a favorable environment, provides the basic guarantee for the cultivation of students' cognitive ability, make the students' cognitive ability can obtain the full display of [3] under the environment of information technology.

#### 4 SUMMARY

The main goal of the cognitive view of information literacy education is to improve the user use embedded on the literature information and absorption. It is the central focus point to "people", people used to integrate information and query, processing, and make the information literacy education towards the direction of the development of cognitive theory. At the same time, but also the information literacy education based on cognitive theory in the research field of information and other subjects combined, contribute to the development.

## Problems and countermeasures of the cohesive models between secondary vocational education and undergraduate education system—a case of automotive major

Pei Tang, Rong Ying Zhu, Hong Ming Lv & Ji Sheng Xia

*School of Automotive Engineering, Yancheng Institute of Technology, Yancheng, China*

**ABSTRACT:** In this paper, the importance and necessity of the secondary vocational education link with the undergraduate education system were researched. The existing problems of the link were summarized, and the problems were analyzed respectively. The corresponding countermeasures were put forward to solve these problems. It could provide universal significance and the application value of the secondary vocational education link with the undergraduate education system.

**KEYWORDS:** Secondary Vocational Education; Undergraduate Education System; Automotive Specialty; Cohesive Models.

### 1 INTRODUCTION

At present, an important task in the reform and development of occupational education in China was the systematic construction of modern occupational education which strove to improve the ability of servicing national strategy. The occupation education had been made great development in China in recent years. It had been from quantity expansion to qualitative improvement. The connotation of occupational education and its extension are patulous. The occupation college was developed actively by the Chinese government.

To produce the integrated education system in secondary vocational education higher vocational education and undergraduate education. Jiangsu Province of China designed three kinds of cohesive models such as: “3+2” or “3+3” piecewise teach between secondary vocational education and higher vocational education. Namely, students first studied the secondary occupation education for three years, then through the registration mode in higher vocational education to study for 2 years or 3 years. At last they obtained higher occupational diploma in education; “3+4” piecewise teaching between secondary vocational education and undergraduate education. Namely, students first studied the secondary occupational education for three years, then through the registration mode in undergraduate education to study for 4 years. At last they obtained undergraduate diploma in education; “3+2” or “5+2” piecewise teach between higher vocational

education and undergraduate education. Namely, students first studied the higher vocational education for 3 or 5 years, then through the registration mode in undergraduate education to study for 2 years. At last they obtained undergraduate diploma in education.

### 2 THE IMPORTANCE AND NECESSITY OF THE COHESIVE MODELS BETWEEN SECONDARY VOCATIONAL EDUCATION AND UNDERGRADUATE EDUCATION

At present the secondary occupation education and the higher occupation education were the main occupation education in China. The highly skilled talents mainly came from the relearn after general higher education and self-study and practice after vocational education. In this way not only the efficiency to develop high-end talents was low, but also the social cost was high and the success rate was low.

Occupation education had been reformed in China in recent years, It payed more attention to skill training. But subject to the educational system and the period was limited, the basic curricula such as physics, mathematics and some necessary professional basic curricula were compressed or canceled. The most visible consequence of this was that occupation education graduates were lack of knowledge renewal ability, innovation ability, technical transformation ability, occupation subsequent development ability and so on.

The modern manufacturing such as transportation, automotive design, machinery and electronics required highly skilled talents. The vocational education which lasted only three years must not cultivate high level technical talents. To extend the professional learning time for enhancing the training level, it was necessary to link the secondary vocational education with the undergraduate education. In order to establish and improve the occupation education system, the education department of Jiangsu province recently approved a number of modern vocational education system construction projects such as piecewise teach between secondary vocational education and higher vocational education, piecewise teaching between higher vocational education and undergraduate education. To improve the system of the modern occupation education and research the law of cohesive models between secondary vocational education and undergraduate education system, The talents training scheme and curriculum standard of automotive specialty should be formulated. The vocational colleges and universities should actively promote link of the education system between occupation education and undergraduate education. The cohesive contents included professional setting, curriculum, textbook, teacher, etc. The curriculum was the core and basis of cohesive models between secondary vocational education and undergraduate education system which laid the foundation for cultivating the high skilled talents.

### 3 PROBLEMS AND COUNTERMEASURES OF THE COHESIVE MODELS BETWEEN SECONDARY VOCATIONAL EDUCATION AND UNDERGRADUATE EDUCATION SYSTEM

#### 3.1 *Problem in the connection of major*

At present, there were several major fields of automotive in secondary vocational education such as manufacture and repair of automotive, decorative of automotive, electronics of automotive, sheet metal of automotive, marketing of automotive, etc. While the automotive specialties of undergraduate education were automobile service engineering and automotive engineering. The training content and training methods of secondary vocational education and undergraduate education should be researched so that the automotive major would be docked with the automobile industry.

#### 3.2 *Problem in the connection of cultivation targets*

According to the occupation post, the three parties which were composed of secondary vocational schools, undergraduate college and enterprise should

be cooperated together combined with the training goal of occupational education. The occupation ability and the occupation quality requirements of graduate were determined.

The occupation ability was classified from low to high scientifically. According to national occupation qualification system properly, the graduates must get the certificates such as car mechanics, auto repair technician or engineer trainee of vehicle inspection and repair. In the meantime, the training program and curriculum arrangement came into being. The secondary vocational schools and undergraduate colleges should conduct special teaching in each level.

#### 3.3 *Problem in the connection of curriculum structure*

The core of cohesive models was the curriculum. The vocational schools had attached great importance to the cultivation of practical ability. The proportion of practice teaching hours was very high, while the undergraduate colleges payed more attention to theoretical knowledge. It caused the following problems: The cultural basic curricula were disjointed between secondary vocational education and undergraduate education; The professional theory curricula were repeated sometimes. Therefore, we must revise training scheme. The principles and methods of curriculum design should be explored. Based on the investigation of talent demand, The target and standard of personal training between secondary vocational education and undergraduate education would be clarified respectively. According to the training laws of applied talents, the secondary vocational education graduates should be the talents who had operating skill, and the undergraduate education graduates should be the talents who had strong technique and independent study ability. Various levels of talents were cultured. It specified the direction for the development of teaching standards and curriculum standards.

#### 3.4 *Problem in the connection of curriculum content*

The secondary vocational school emphasized the occupation training of basic knowledge and the training of practical skills. It was lack of sufficient attention to basic knowledge of culture so that the curriculum hours of culture were relatively sparse. If students didn't attach importance to the basic cultural curricula in the secondary stage, they would study difficultly in some curricula such as university English higher mathematics. They also would encounter some obstacles on the understanding of professional practice knowledge. Finally, because the students were lack of perfect knowledge structure and

strong ability of self-study, the innovation ability and lifelong development of occupation were restricted.

The basic curricula played a basic role in quality education and lifelong learning. More wide basis curricula and professional basic curricula should be found in the connection of secondary occupational education and undergraduate education. The basic curricula such as physics and mathematics were essential in the study of secondary vocational education. It laid a good foundation for entering the stage of undergraduate education. This part of the basic curriculum, which provided the necessary knowledge for professional curricula were extended in the stage of undergraduate education.

### 3.5 *Problem in the connection of teaching mode*

The undergraduate emphasized the knowledge and academic, while the secondary occupation education emphasized the operability and practicality. The occupational ability was regarded as the center of teaching plan. The teaching materials were comprehensive and practical. The teaching methods were flexible. The teachers were called "the double teacher" which means that they were both teacher and engineer. All the above features had less common with undergraduate education. It would be a challenge for the cohesive models. The actual teaching was focused on typical work task as the main line. The typical work of the automobile 4S stores was regarded as the carrier. The learning activities were converted into work processes. The work process corresponded with the learning activities. The work process was refined. The theoretical knowledge and working skills were instilled in the process of all levels of teaching.

### 3.6 *Problem in the connection of teacher*

The cohesive models put forward a severe challenge to teachers, both secondary vocational schools and undergraduate colleges. The vocational school teachers would not only teach practical ability, but also they need to research automobile theory knowledge deeply. They would teach the preparatory knowledge completely to the students for implementation of undergraduate teaching. In the meantime, the university teachers would take more time and energy to a laboratory for strengthening the practical ability. To develop high level technicians, teachers of undergraduate colleges must possess the ability of engineering practice. The vocational school teachers and university teachers should often communicate each other.

They would join on the teaching and research activities and explore a set of curriculum system for the cohesive models.

## 4 SUMMARY

According to the construction requirements of modern occupational education, the cohesive models between secondary vocational education and undergraduate education put forward that the principle, method and route of a curriculum system which followed three elements concluded job, task and capacity. These ideas and achievements had important significance for theory guiding. Through the combination of theory and practice, classroom knowledge and practical ability, school and enterprise, class and certificate, it could provide universal significance and the application value of the secondary vocational education link with the undergraduate education system.

## ACKNOWLEDGEMENTS

The corresponding author of this paper is Tang Pei. This paper is supported by "Research and practice of the cohesive models between secondary vocational education and undergraduate education system which were based on the occupation ability training".

# Study on innovation in ideological and political education based on the internet age

Hong Xu Guo

*Student Work Department, Beihua University, Jilin City, China*

**ABSTRACT:** Internet sweeps word with strong vitality, permeates all social areas and also has an increasingly broad and profound impact on the college students' idea. Facing the internet age, ideological and political education has to advance with time and hold reform chance to grasp the initiative of ideological and political education based on the internet to improve its effectiveness.

**KEYWORDS:** Internet age; Ideological and political education; Improve; Effectiveness.

## 1 INTRODUCTION

In recent years, the network as an important feature in IT-centric technology revolution has affected all areas of society. "Internet" at an alarming rate profound impact on the future of social processes and human, changing the way people live, learn, work and ways of thinking. At present, large-scale Internet has entered the lives of the Chinese people, and affects all aspects of society. Now, our domestic Internet users are to grow exponentially, according to the Internet Center, October 31, 1997 was 620,000 Internet users in China, 31 December 1998 reached 2.1 million, in June 1999 Internet users in China rose to 4 million. According to official forecasts, by the end of 1999, mainland China's Internet users will reach 7 million; to 2001 or 2002 domestic Internet users will reach 30 million to 50 million. With the expanding influence of the Internet, in the 21st century China will enter the "network society."

Universities are Chinese social "network" development frontier, with the popularity and development of network information education, Internet students will continue to increase. "Internet" for college students' behavior patterns, values, political attitudes, psychological development, moral values, etc. Will have a growing impact on how the "Internet age" to strengthen ideological and political education of college students has become an unavoidable a major issue and needs to be resolved.

## 2 THE POSITIVE ROLE OF THE INTERNET

With the rapid development of China's social networking today, we must clearly understand the far-reaching impact of the "Internet" to bring the

current ideological and political work, which is both a positive side and negative side.

On the positive side is the "Internet" opened up a vast ideological and political education. Features networks with resource sharing, online information is shared by all mankind, everyone can get, can have. Meanwhile, online information sharing as well as another layer of meaning, that is, everyone can get information from the Internet, but also should make their own may provide information to others. Resource sharing network of ideological and political work in colleges and universities can occupy the market network, you can carry out ideological education of college students through the network, which overcomes the traditional ideological and political work of the smaller impact was weakness in a certain sense. Meanwhile, the network has to visualize, interesting features, network, graphics, animation, sound, image, fun and intuitive, so that it can be attractive. In addition, the network resource sharing can make the ideological and political workers learned from the Internet real idea of dynamic people, targeted at the right ideas and information posted online to educate and guide students, it sets up a good style of thinking, ideals, beliefs, and thus improve the ideological and political work of timeliness.

In the Internet age, due to new things emerging, increasingly competitive society, the ideological issues will be more complicated. Ideological and Political Education can take advantage of network-specific information highly integrated, two-way communication and selectively promote college education and targeted to achieve self-education. As the network has information can be copied, shared, real-time transmission of resistance, which makes the whole community college while receiving education possible, which is the traditional ideological

and political education can not. In addition, the new network to adapt to ethics and code of conduct of the Internet age, the ideological and political quality of the proposed higher requirements, which prompted college students to be self-disciplined, realistic, unity, cooperation, adherence to morality and ethics.

Network can maximize the ideological and political work of socialization, ideological and political work network with government agencies, families, schools connected, which participate in the ideological and political work for the community to provide a convenient and can achieve the ideological and political education combine family and social forces at work, so that ideological and political work better results will help to further the formation of the great advantages of ideological and political work.

Workers learned from the Internet real idea of dynamic people, targeted at the right ideas and information posted online to educate and guide students, it set up a good style of thinking, ideals, beliefs, thereby improving the timeliness of ideological and political work.

### 3 NEGATIVE EFFECTS OF THE INTERNET

In the Internet age, due to new things emerging, increasingly competitive society, the ideological issues will be more complicated. Ideological and Political Education can take advantage of network-specific information highly integrated, two-way communication and selectively promote college education and targeted to achieve self-education. As the network has information can be copied, shared, real-time transmission of resistance, which makes the whole community college while receiving education possible, which is the traditional ideological and political education can not. In addition, the new network to adapt to ethics and code of conduct of the Internet age, the ideological and political quality of the proposed higher requirements, which prompted college students to be self-discipline, realistic, unity, cooperation, adherence to morality and ethics.

Network can maximize the ideological and political work of socialization, ideological and political work network with government agencies, families, schools connected, which participate in the ideological and political work for the community to provide a convenient and can achieve the ideological and political education combine family and social forces at work, so that ideological and political work better results will help to further the formation of the great advantages of ideological and political work.

But on the other hand, the network brings not only the ideological and political work opportunities, but also has had an impact and challenges; its main performance is as follows:

First, the Western culture and yellow unhealthy things are easy to produce adverse effects on young college students on the Internet. On the Internet between different countries and cultural traditions, moral values and way of life very different from their conflict is very intense. The important feature of the network is a shared and anonymity, freedom and openness, and now the Internet to get information about our efficient service must resort to a database developed Western countries, Western countries such values, lifestyle, awareness morphology, and yellow, it can be a lot of unhealthy content input. The young college students to form a view of the world and is a critical period of life, and therefore, online Western culture yellow, unhealthy things will be very easy to destroy young students inherent morality, values and cultural outlook, and thus poison the young students so its quagmire unable to extricate themselves, ideological and political workers painstakingly nurtured ideas and principles destroyed. College students have been accepted in Western culture unhealthy things. Light on the political apathy, weight may go reactionary road, which we must not be complacent, laissez-faire.

Secondly, because in the network, information dissemination speed, scale, scope, and the occult are far more than any previous media, it is easily the Western hostile forces and superstition, cults reactionary organizations to use to publicize our penetration. For example, in the "Falun Gong" is most prevalent from 1998 to the first half of 1999, Li Hongzhi and Falun Gong backbone had opened thousands of worldwide web site, use the Internet to quickly spread its fallacies and instructions, to lure the masses fooled. Another part of the remnant of Falun Gong, the Chinese New Year gathering in Tiananmen Square to engage the so-called "macro-Law" criminal activity, but also advance the use of Internet e-mail with domestic and foreign criminals in series and planning. Therefore, the ideological and political work must attach great importance to the ideological and political education, occupying new areas of the Internet, in order to curb illegal bad guys on the Internet for all college students, and incitement. Also, because the network of people who are mainly exchanged, machine dialogue or computer-mediated communication. People all day dealing with computer terminals, and a lack of interpersonal feelings that easy to make people tend to isolate, selfishness, indifference and non-socialized, easy to make people happy in real life and social development of others indifferent. College is an important period people interpersonal skills and interpersonal formed due to interaction with the traditional network, interpersonal rapport with a different, often difficult to form authentic and safe relationships, college students in the network exchanges once cheated it is easy to be fooled real doubt, pessimism and hostile attitude. Most of the time a lot of

current college students and the Internet are playing online games, and online games are a lot of wars, violence, murder, etc. as the main content, which makes students addicted to online games could easily lead to cold, heartless and selfish personality, anxiety, depression and repressed emotions, and even serious will happen, "Internet syndrome", have an extremely adverse impact on their academic life.

#### 4 HOW TO USE THE INTERNET TO CONDUCT EFFECTIVE IDEOLOGICAL AND POLITICAL EDUCATION WORK

How to make full use of the Internet has brought opportunities and favorable conditions for the ideological and political work to occupy positions in the network culture, to further strengthen the ideological and political education of contemporary college students to learn and to think it through, I think of the following aspects:

First, you must get rid of old ideas, take full advantage of the opportunities, make great efforts to ideological and political work networking work. The ideological and political work refers to the computer network at the core of the network party and government organs at all levels, political workers and transmission systems, communication systems composed. Ideological and political workers can use the network, switching, transmission of ideological and political education of information, including text, data, sound, graphics, animation and other forms of ideological education of college students, incentives, guidance and control. Ideological and Political is to improve the ideological and political education of information transmission rates, utilization. Spread through the network, enable advanced model of speech, counseling experts, the television network directly into the classroom education seminars that teach one person, the whole community college while receiving education possible. And because fun, image, intuitive advantage of online teaching, learning educated achieved so far superior to the ordinary classroom. Ideological and Political Work network can also be other mass media, such as newspapers, radio, television, books, video and audio information relocated outdoor advertising on the network, in order to achieve the ideological and political education and other mass media in conjunction with a complementary, thus greatly enhanced appeal, attractiveness and education role in guiding the ideological and political education of college students. Meanwhile, the network also allows learners and educators to achieve two-way communication, timely access to counseling information and timely feedback to improve the efficiency of the ideological and political education, to further enhance its educational function.

To improve the ideological and political work of the network must be established ideological and political education sites on the Internet? How to use the site to carry out the ideological and political education of it in addition to the previously mentioned web seminar lectures and counseling, but also can use the following methods of ideological and political education online: First, the use of the electronic letter delivery list. We can delivery server via an electronic letter on the website will be published in the electronic correspondence list of articles, magazines, newspapers, in the form of emails sent to the user's e-mail box, users can express their views on a particular issue, writing articles, the server will automatically forwarded to another user's electronic mailbox articles users go. Ideological and political work on the site, users can post on the issues college students ideological and political aspects of their views and discuss the delivery list through e-letter, and ideological and political workers are involved, make their own positive view, guide the discussion deepening the ultimate purpose of the ideological education of students. Second, the use is an electronic bulletin system (BBC). We can set up an electronic bulletin system on the ideological and political education websites, the contents of the ideological and political education to join them. We can build in the system forum; college Users can express their views on, views and discussions on certain issues. Ideological and political workers can show their stand, viewpoint and publicize the party's principles and policies to address the ideological issues to achieve the purpose of ideological and political education among. We can also create a chat room in the system communicate through chat this way and ideological understanding of their state of mind, published proper perspective, ideological education. With the use of the electronic bulletin system to establish forums and chat rooms should always play a guiding role in the ideological and political workers, in order to avoid off-topic, reach the purpose of ideological education. Third is the establishment of news services on ideological and political education website, namely the use of network news servers to provide customers with a variety of topics for discussion and mutual exchange service. Ideological and political workers can express their views in a newsgroup topic and play a guiding role, so that more students can get the correct ideological guidance. Taking into account that not every college users will visit the site of ideological and political education, participate in discussions, this part of the thinking person's online education should not give up, take the initiative to deal with its ideological problems, you can use e-mail to those who were there for the of ideological and political education, but also through the exchange and discussion of the involvement of other sites, its ideological education.

## 5 CONCLUSION

To improve the ideological and political work of the Internet age, we should continue to improve information literacy ideological and political workers. To meet the demands of the Internet age, ideological and political workers must have good information literacy, which has excellent information awareness, information and good information ethics. At present, the ideological and political quality of information workers needs to be improved, taking into account most of them have a high ideological and cultural quality, so long as the proper application of computer and network training them, it should be said that most people are capable online the ideological and political work. Ideological and political workers to improve information quality is directly related to the educational level of their thoughts, they only have a good sense of information and the ability to understand the network environment, and access to the ideological and political information from the network, to understand students' ideological dynamics, and to its for education and management to go; but only with good information ethics, in order to consciously safeguard the network information model laws and regulations, and resolutely resist all kinds of reactionary, superstitious, yellow garbage dissemination of information, but also in order to truly become qualified Internet age the ideological and political workers.

At the same time, we must also strengthen the college network ethics, education, the legal system of the network, it has the legal awareness of the network to establish a correct concept of network ethics. We want to guide students to consciously resist the erosion of network garbage, to do not throw garbage, not to engage in infringement, do not look at pornography, not for hackers, do law-abiding members of civilized network, and can consciously safeguard the network order.

In addition, the ideological and political workers must also strengthen the monitoring and management of network behavior. To establish a permanent agency network information management, and the development of network codes of conduct, through the review

and monitoring to regulate network behavior of college students, on-line reactionary, yellow, unhealthy content to clean up, through analysis of monitoring to detect the presence of college students ideological problems and timely targeted education, so that "preventive measure", resulting in the formation of a healthy college campus, non-explicit, remove evil righting network environment. Only in this way can we take full advantage of the Internet age of ideological and political work, and training qualified personnel to complete the glorious task.

## Study on solfeggio teaching under MIDI environment

Yan An Wang

*Music College, Beihua University, Jilin City, China*

**ABSTRACT:** In accordance with current student condition under five-year-system pedagogical education, the author proposes the music educational model of taking students as the main body, and explores the solfeggio teaching way and method under the MIDI environment. The teaching actually affects and strengthens the innovation, and the education idea of the student multi-position whole development was enhanced by using the modernized teaching method.

**KEYWORDS:** MIDI environment; Solfeggio teaching; Auxiliary teaching.

### 1 INTRODUCTION

The current five-year teacher education is a hot “potato”, the quality of students and student decline of traditional teaching mode “disdain” for higher teacher education have posed a severe test. How to use modern teaching methods, to change the traditional teaching model, build a student-centered learning environment, and effectively improve teaching effectiveness, and promote the overall development of students’ multi-faceted, is the important issue of teacher education research. In this paper, high-division teaching ear training as an opportunity to focus on analysis, to explore ways of teaching ear training MIDI environment, methods.

Sight-singing, listening training, students of music hearing, memory, and the ability to accumulate musical vocabulary, etc., is to learn basic vocal music, instrumental music, music appreciation and other music professional skills, sight-singing and ear training to strengthen the two musical basic skills training enable students to better feel the music, expressive music and improve understanding of music.

Solfeggio Teaching MIDI environment, will make teachers lead the students to do lessons from the past that a lot of practice, a single boring teaching methods to get completely changed, and thus greatly liberating for piano teachers and students’ dependence and bondage. Change this teaching model not only greatly enriches our teaching form and content, but also for our current advocacy of innovative education has a positive role in promoting.

### 2 USE OF PROFESSIONAL TEACHING EAR TRAINING SOFTWARE SYSTEM

Australian software vendor RISING of Auralia ear training software and Denmark Solfeggio multimedia music education software Ear Master Pro 4.0 is being

recognized by excellent ear training software. For example Ear Master Pro 4.0 will have the following advantages:

Suitable for our operations habits Ear Master Pro 4.0 Chinese version only application 1.97M, lower demands on the hardware environment, it can run on almost all PC machines, friendly and user-friendly interface is very easy for beginners get started.

The software comes with a wide range of teaching, from debate to hear the tone interval, chords, tonality, rhythm and melody dictation, ear training encompasses virtually all teaching content; while, depending on the degree of learners, you can randomly choose schools for their own content, you can also sneak into the deep by progressively learning. There is a very important point is that in order to make better learners were listening to the debate, and at any time we can arbitrarily change the speed, which is almost all the music education software and music production software commonality.

It provides an interactive learning environment. Students learn basic ear training courses, software can give the students practice self-evaluation in the aid of the software, so that not only applies to the classroom, but also facilitate the students after-school learning. For example, listen to the rhythm of debate practice.

### 3 USE SONAR OR CUBASE ASSISTED INSTRUCTION SEQUENCER SOFTWARE

Known as “Soul Music”, “Music Bones” reputation rhythm is a considerable proportion of teaching ear training in the training process, and also the most difficult training. Comes with almost is all the typical percussion mankind invention SONAR or CUBASE etc. sequencer software, which not only sounds realistic, but also rich and expressive. These can be any combination of percussion made backing (woven

Figure 1. MIDI recording, editing, processing, mixing, and mastering environment.

Figure 2. Ear master pro 4.0 operating points.

rhythmic pattern), you can always change according to the teaching requirements of speed, strength, when traditional teaching and teacher stomp, clap their hands or mouth shouting “da da da” were compared its effects are worlds apart, so rich and vivid sound not only improve the efficiency of learning, but also easier for students to understand and accept. For example, Normal School music teaching “Music Integrated Course” in the second volume of a rhythm ear training exercises, the teacher playing the song “breathe”, the students clapping, Paitui, stomping whom accompaniment.

First, to show the exact music in the classroom is our sight-singing, singing lessons and enjoy an important element in common with the traditional handwritten sheet music is neither beautiful nor accurate, but also waste a lot of energy. MIDI music system provides us with such a convenient, one can always render accurate music, and as needed, to emphasize the content of classroom amplification local music; Second, while listening to music while watching the

play MIDI melody, which fully do static and dynamic binding, eyes, ears and mind open to students with great benefit; Third, these music files exported as JPG or GIF format, and then insert into your lesson plans or paper, that is what we should always do the job. Professional sheet music notation software such as Overture, Finale and other notation software such as Tony Tone, composers, TT composer and so can do this. As a sequencer software CUBASE3.0 also has a powerful music editing features, a variety of music symbols complete editing method is simple, those interested can search for relevant articles of learning online.

Secondly, multi-part solfege, by adjusting CUBASE3.0 acoustic phase (Pan), part volume, so that students in their own voices while sight-singing, to develop the habit of listening to other voices attention, which the bass auditory and intonation training is particularly important. For example, two part sight singing (children’s song) “small pine tree.” In this article, as the duet in the same rhythm down, both with degrees between the two voices, three degrees, there are six degrees of fauna carried out for accurate grasp of music image, singing quasi-pitch is the key, so the students singing and sound volume adjust timely between the upper and lower parts relative to solve the above problems have actively helped.

#### 4 TT COMPOSER USING INTELLIGENT SOFTWARE TO EXPAND THE TEACHING

TT is a composer from the Central Conservatory of Music Alto Company independently developed computer music production software, installation and use are very simple, it is called “Everybody will learn” software. Related information, please consult our website Alto (<http://www.centrmus.com>). TT composer using intelligent software to expand our teaching can indeed play a very helpful role.

TT composer is colorful accompaniment figurations of traditional piano accompaniment a good supplement. TT composer can bring students to a variety of accompaniment styles full of imagination, to avoid monotony automatic accompaniment software brings problems, and we can be part of the accompaniment texture after deletion using either different Style, figurations more complete in combination in the same song.

The teacher let the students know, not just music composer things each of us can create their own works of creative fun give our lives to add a bright color, the use of TT were music composer Writing music makes us feel not so mysterious. At the same time, we believe that music, especially children’s song writing into our music education, music education is not only the diversity of diverse needs, but also reflect the quality of education, innovation and education.

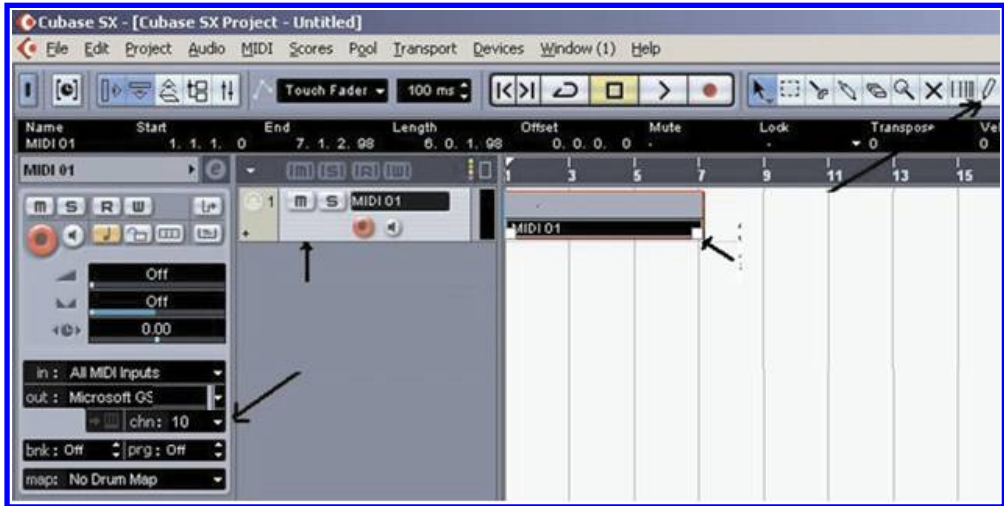

Figure 3. CUBASE3.0 in the process of establishing the rhythm track.

The teacher summarizes the students' work and gives correct me, then outstanding works entered into TT composer allocation chords and add accompaniment. Within a very short time, a big eye-opener for students to work with the birth, which makes traditional music teaching large Diego glasses, because this is no longer the "fancies", the "paper" becomes real "hearing art", I think this is our match every teacher and eager to do. As another example, given a few key tones 1, 2, 3, 5, 6, please use their imagination to any combination of notes, to create an ethnic-style eight sections of the works, the end of the sound to the tonic "1" on. Also, students are under the guidance of a teacher, with a positive allocation harmony chord for the song and export audio files, and then burn a CD to prepare students to exchange and learning.

For sight-singing works, we feel the changes consequent on the style by changing its signature, key signature, speed, etc. This in-depth understanding of our students to learn by analogy works and other related disciplines singing are also very good.

The song's speed is moderate Allegro, emotions are warm and lively, and we change its time signature, key signature and the speed, and then add the appropriate waltz accompaniment style TT composer, the music, the mood here has undergone great changes.

## 5 AUXILIARY PRACTICING EAR TRAINING METHODS AND TECHNIQUES

Snoar has a rich timbre but also can load a variety of sources. It has all the typical percussion effects, sound very realistic, extreme efforts have feel, from

electronic drums, bass drums, to the Japanese koto, and a hundred kinds of percussion instruments sanxian can be found. Teacher in the class is the actual audio sync to show students, instant playback, making rhythm training with different sounds and different sound. Difficulties encountered heavy rhythm, or difficult to grasp the rhythm of the students, teachers take varied sound to attract students of hearing and mobilize the enthusiasm of students, students can freely change their own particular type of rhythm instruments according to their preferences, and a time when speed is can be swapped. Change the past repeatedly listening fixed pattern. At the same time intervals, chords, melody and perception will not run because the low notes piano pop any deviation, its acoustics and teaching efficiency a big difference.

EarMaster ear training teaching abroad is many professional colleges in widespread use, referred to as an ear training guru. It is targeted; there is an intuitive precise statistical analysis, for different people to choose other advantages according to the learning focus. Figure 4 is a more comprehensive knowledge of EarMaster ear training software system, which the classification is easy to difficult, from simple to complex, progressive layers, has a highly targeted interaction and openness.

For example, teachers can follow the progress of teaching requirements and in accordance with the specific circumstances of the student's learning, individualized, targeted selection exercises. EarMaster can immediately provide the appropriate report card, showing the test of time, the number of examinations name and answer, the correct rate, draw rate, very intuitive and precise.

Teachers can base on these data, selects students in class solution assessment exercises, the more convenient for students learning purposes. As long as the user an overview of selected teachers, one can clearly know the lack of students. When teaching, the teacher in advance of the sight-singing melodies and listening content programming and playback, when you can walk into the middle of the collective exercise of individual students and student exchanges guide or explore this teaching method not only pulled into the distance between teachers and students , but also to better improve the efficiency and quality of teaching, but also to facilitate teachers to keep abreast of students' knowledge and grasp the situation, while allowing students to clearly know their place and to correct deficiencies, thus greatly improving the efficiency of teachers and teaching efficiency.

## 6 CONCLUSION

Solfeggio As music major institutions all normal basic courses, showing a particularly important role are particularly critical. However, with the development of the times, the problems of traditional teaching methods exist. Solfeggio paper spectrum of cases is difficult to produce the sound of hearing students' association, single and boring sound, intonation cannot be objective and quantitative analysis, no scientific accurate evaluation, etc., have been difficult to meet the needs of society. The technology used in computer music ear training is needed not only to the growing diversification of the times, or the transformation of classroom teaching and student needs. In this paper, several ear training software as the main object of study, research methods proposed computer music technology assisted teaching ear training. Traditional teaching carried out a detailed analysis of the problem, the use of computer music technology in electronic music can sound, audiovisual methods rich sound, digital audio analysis techniques, precise statistical analysis to solve the problem, for computer-aided teaching music technology feasibility and practicality were demonstrated.

However, in the domestic computer music technology in various music colleges teachers not common, most of the teachers and students do not understand this. How do the popularity of computer music technology knowledge is a question worth pondering. In this regard I have the following thoughts: for

the provinces municipalities and school, the establishment of specialized lectures and presentations of academic research, and constantly update the relevant books and audio books and other books. Relatively simple to set up interesting computer music appreciation classes in schools, so that students have a general awareness of this. In the course of various types of normal or can be set to music colleges in elective courses on computer music technology to attract more non-professional students to learn, so that is very conducive to the popularity of computer music technology. Meanwhile, the era of the 21st century continues to progress, coupled with computer music technology, operational and professional, thus educators and educated to be life-long learning is a must.

With the rapid development of technology, the computer music technology to solfeggio in training is an essential modern means. It updates the traditional teaching model to optimize the teaching methods, expanding the horizons of students, but also to encourage students to take the initiative in various channels to seek ways of learning and acquiring new knowledge, provide teachers with modern technology teaching tools and teaching methods in solfeggio teaching do have a great prospect.

# A study on English language acquisition of bilingual children with different bilingual proficiency

Feng Cun An, Yu Si Wu & Zhen Ai Zhang  
Yanbian University, Yanji, Jilin, China

**ABSTRACT:** This thesis is aimed at Chinese-Korean bilingual children who are the beginners to study English in China. According to the results of English teaching experiments and statistical analysis of the achievement data of different types of bilingual students, this thesis analyzes English acquisition characteristics of these bilingual children with different bilingual proficiency. The result shows that different bilingual proficiency has significant impact on English language acquisition.

**KEYWORDS:** bilinguals; bilingual proficiency; foreign language acquisition.

## 1 INTRODUCTION

China is a multi-ethnic country. Most of the ethnic groups still maintain their own languages, culture and customs. At the same time, as a unified multi-ethnic country, the Chinese government requires the entire nation including the minorities to master a common language - Chinese Mandarin to strengthen the unity of the country, develop economy and culture and strengthen the ethnical communication. Thus, China's ethnic minorities also need to master a second language - Mandarin. So there is bound to be the phenomenon with two or more languages used simultaneously in the minority's areas of China. Those who can use two or more languages to learn, work and live are called "bilinguals" or "multilinguals". The "bilinguals" phenomenon is more common in minority nationality areas in China.

Chinese Korean is a typical "bilingual" group. In social life, work and study, they use both of Chinese and Korean. Due to the unique bilingual social environment, most of Korean ethnic people can use Korean Chinese and Chinese freely. Then do the bilingual proficiency have any effect on the ability to learn a foreign language or whether bilingual proficiency can promote the foreign language acquisition?

For this reason, the authors spent a semester doing a teaching experiment to find out whether different bilingual proficiency can affect the foreign language acquisition result.

## 2 EXPERIMENTATION

### 2.1 *Examinee*

As there were a few research data on bilingual foreign language acquisitions and a lack of previous experience, we chose bilingual children from Grade Three to be the examinees who had never learned a foreign language before. Thinking about the influence of the elements of students' intelligence, and language skills, etc., we selected middle-level students as the examinees. The ages, genders and some other factors were taken into account, too. And finally, we have three different types of classes with 12 students in each class. We also arrange a Han Chinese class as a contrast class. The followings are the information in details:

Class A: Han ethnic in Han primary school

Class B: Bilinguals in Han primary school

Class C: Bilinguals in Korean Primary school

Class D: Korean ethnic in Korean Primary school

### 2.2 *Experiment content*

The English teaching experiment lasted for a semester. There were 40 class hours totalled, at the same time for the four different classes. The main teaching contents were alphabets, pronunciation, vocabulary, simple sentences, the simple use of *do*, *have* and *be*, and some daily conversations. Through explanation and practice, the students were required to memorize 26 English letters, to master IPA and different combinations, to distinguish

Table 1. Descriptives Scores.

	N	Mean	Std. Deviat	Std. Error	95% Confidence Interval for Mean		Min	Max
					Lower Bound	Upper Bound		
A	19	85.54	3.76	.86	83.72	87.35	77.7	93.3
B	19	89.27	2.59	.59	88.02	90.52	84.9	94.0
C	19	80.37	7.01	1.60	76.98	83.75	69.4	91.5
D	19	74.44	7.60	1.74	70.77	78.10	61.8	90.7

different pronunciations, to master the simple use of *do*, *be* and *have*, to make phrases and simple sentences with the words, to use the conversation learned flexibly and to gain the ability of using simple English.

The teaching content, teaching time, progress, assessment content and assessment methods of each experimental class were the same. The only difference was the teaching method. For Class A and D, teachers just used one language, that is Chinese and Korean, respectively, but for Class B and C, teachers adopted the method of bilingual teaching through the contrast of Chinese and Korean. But they had a slight emphasis on the teaching language. For example, the teacher of Class B mainly wrote Chinese on the blackboard while the teacher of Class C wrote Korean.

### 2.3 Data collection

There were assessments on the teaching contents after each lesson. Each time at the end of class, the four teachers would have a discussion about the teaching situation and the problems appeared in class. Then they came up with the way to deal with the problems and made preparations for the specific content for the next lesson. After each assessment, they had a serious statistic on the results, kept detailed records and analyzed how these difficulties and errors appeared then compared among different class types. After the end of the teaching experiment, they collected all data, carried on the statistics and analyzed the results.

## 3 DATA ANALYSIS

We used SPSS12.0 for the 19 assessments of different classes. Table 1 is the result table of descriptive statistics.

Table 3. Anova Scores.

			Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	(Combined)		2366.031	3	788.677	24.641	.000
	Linear Term	Contrast	1691.882	1	1691.882	52.861	.000
		Deviation	674.148	2	337.074	10.531	.000
Within Groups			2304.469	72	32.007		
Total			4670.500	75			

\*The mean difference is significant at the .05 level.

The table can show the average score sample content N, Mean, standard deviation, standard error, 95% confidence interval, minimum and maximum of the four classes.

As it could be seen from Table 1, the average scores of Class B were higher than Class A; Class C was higher than Class D. In that way, could we infer that there were differences between monolingual classes and bilingual classes and questioned whether these differences were significant? Was there a significance on foreign language acquisition caused by different bilingual proficiencies? We could not draw a conclusion just according to Table 1.

If we wanted to analyze the statistics further, we had to make sure that whether the variance of all data of each class had homogeneity, see Table 2.

Table 2. Test of homogeneity of variances Scores.

Levene Statistic	df1	df2	Sig.
9.707	3	72	.000

Of significance,  $p < 0.05$ , we can find that there were significant differences at the level ( $\alpha = 0.05$ ) in the variance of each class, so the variance of each class had no homogeneity. This conclusion was an important condition for selecting multiple comparison method.

Table 3 was a single-factor analysis of variance. It mainly used the variance of select items to analyze the results. The output showed squared deviations within the groups and between groups, the Sum of Squares, degrees of freedom (df), Mean Square, F value and probability p values. For the results  $p < 0.05$ , there was a significant difference in the mean at  $\alpha = 0.05$

level among the groups. So there was significance to carry on the statistics of each team's mean.

Since there were four different types of classes in this teaching experiment, we needed to carry out multiple comparisons about the mean with the LSD method and Games-Howell method, see Table 4.

Table 4 is the results of multiple comparisons. According to the results of the test of homogeneity of variances in Table 2,  $p < 0.05$  which illustrated that there were significant differences in the variance at  $\alpha = 0.05$  level of each class, so each class had no homogeneity of variances. So we only adopt Games-Howell method to analyze the results and made conclusions on all analytical data. To see from the results shown on the table, there were significant differences at the  $\alpha = 0.05$  level among A, B; A, C; A, D; B, C; B, D; but there was no significant difference between the C and D. In the table the one which was marked with "\*" showed that the mean difference was significant at the .05 level.

Scores as the vertical axis. The distribution of the mean of each class could be seen from the figure.

Then, based on the analysis above, bilingual comparison education had no significant difference in the scores of Class C and D. However, the difference of bilingual proficiency had significant differences in

Table 4. Multiple comparisons dependent variable: Scores.

		C	-5.9274	1.8355	.078	-12.3241	.4693

\* The mean difference is significant at the .05 level.

To demonstrate the mean comparison among the classes visually, the following Mean Scatter figure was designed with common factor variance Class as the horizontal axis and independent variable

foreign language acquisition. This difference also appeared in the process of bilinguals' and monolinguals' foreign language acquisition. Causes of the differences would be analyzed below.

#### 4 CONCLUSION DESCRIPTION

First, look at Class C and D. The natural circumstances of two experimental classes are almost the same, but in the process of English experimental teaching, Class C uses both Korean and Chinese simultaneously, and only Korean for Class D. According to the analysis of the results of statistics, there is no significant difference between class C and D. That is to say different teaching methods will not result in the differences of students' achievement significantly. But from the comparison of the mean scatter plots and descriptive statistics analysis table, we can see that the use of bilingual teaching in the classroom has more positive impact on students' language acquisition than monolingual teaching, but it is not very significant.

Next, let's see the differences among Class A, B, C and D. From result, it can be seen that there are significant differences between classes A, B and classes C, D. As it has already been mentioned above that different types of languages have influences on foreign language acquisition. Although Chinese and English belong to different types, there are many similarities between them, such as SVO word order, but Korean is SOV structure. This is the impact of foreign language acquisition caused by different types of languages. For this reason, many Korean ethnic students learn Japanese well. And for these children, their cognitive capacity for language is still not strong, so they do not have a full understanding of the differences between languages. In that way, to support the transfer function of language in the process of foreign language acquisition will bring great effect.

The following focuses on the differences between Class B and other classes:

Class B and Class C, D: The students in Class B, C, and D are all Korean ethnic, they are all in the same grade with ten years' experience, all master two kinds of languages with Korean as their native language and Chinese as their second language. The problem is that they have different bilingual proficiencies and different frequencies of using the two languages.

The students in a Class B study in Han ethnic school, during school they can use Chinese to study. At school, the active language code in the brain is Chinese. But when these students go back home, they communicate with their parents in Korean. Because of the needs of daily life, they have to learn Korean, then they can have no barriers in their lives. At home, Korean language code is active in the brain. Moreover, the Korean language and cultural knowledge are also acquired with native language. Although most of these students can't write or read Korean, it does not matter because the original form of the language is oral expression. Therefore, it does not affect their bilingual proficiency. School - family these two different locations to promote them to convert language

codes frequently and have different language thinking. Over the years, they have been accustomed to this frequent code switching. Accordingly, the two languages almost exist and develop in the brain simultaneously. In daily communication, they can start communication in different languages at any time with different language. The students who formed the habit to think and express in bilingual have strong bilingual proficiency.

The students in Class C and Class D are Korean ethnic learning in Korean Schools.

Although they also learn and use Chinese, the feeling and use of Chinese are different from the students in Class B. The students in the Class C study scientific and cultural knowledge in Korean, and the frequency of using Korean in the family and social interaction is also high. Generally, Chinese is just a course or a branch of knowledge for them. They have to use Chinese for some environmental needs, although they can use Chinese to communicate with others, Chinese is just a "second language" for them. For most students, the Chinese have not become necessary language for survival yet, so the level of their Chinese is not high, and they can not use Chinese knowledge flexibly. Thus, they can't use code-switching as freely as Class B. Although these students can use Chinese in their life, the consciousness by using Chinese is less than the students in Class B, and so are their bilingual proficiencies. In foreign language acquisition, the role of Chinese can not be fully mobilized. However, they have great potential, with the improvement of their Chinese and the increasing frequency of using Chinese, their bilingual proficiencies are enhancing gradually.

It is clear that the differences of bilingual proficiencies have significant effects on foreign language acquisition. Thus, we must strengthen the Chinese-Korean bilinguals' bilingual proficiencies which can not only develop their bilingual advantage, but also play a potential role in foreign language acquisition.

#### 5 CONCLUSION

It was found through the teaching experiment, there is a significant relationship between foreign language acquisition and bilingual proficiency. For a bilingual, the higher his bilingual proficiency is, the more advantages it has in foreign language acquisition. Therefore, for Chinese Korean ethnic students, they should start from childhood to strengthen their bilingual proficiencies. Language is an important tool for thinking. Language skills and thinking skills are mutually reinforcing, and the development of language skills can develop children's intelligence. In the process of foreign language acquisition, since bilingual have demonstrated their advantages, they should play to their strengths in foreign language acquisition.

Making good use of bilingual foreign language acquisition will eventually lead to multi-lingual people.

The research on foreign language acquisition based on bilingual is a systematic project. The foreign language acquisition research in bilingual is still in its infancy, both theory and practice are inadequate. There is still much to be researched in this area, but it also requires more manpower, material resources. The study did not find out how bilingual learn a foreign language. To get enough evidence and theoretical support, there is still much work to do. The function of this article is just throwing a stone to clear the road.

# Exploitation on school-based traditional ethnic sports course in primary and middle schools of ethnic region in northwest Guangxi

Li Chun Wei

*Institute of Physical Education, Hechi University, Yizhou, Guangxi, China*

**ABSTRACT:** Study on ethnic sports resources in Hechi, northwest of Guangxi, and exploration of school-based P.E. course in primary and middle schools show that exploitation on school-based course can be of assistance to schools to better establish their own special running characteristics. Also, it may upgrade the teacher's proficiency, enhance the development of the student's personality, realize individualized P.E. education and satisfy the plural needs of student; moreover, it will serve to popularize the inheritance and development of ethnic sports. The exploitation of text and course should be discussed in aspects of content selection, course exploitation, course implementation, and teacher's training.

**KEYWORDS:** Northwest Guangxi of China; Primary and middle schools in ethnic region; Traditional ethnic sports; Exploitation on school-based course.

## 1 INTRODUCTION

The new round of course reform has infused new vitality to P.E. education in primary and middle schools in ethnic region. It has altered the over-conformed situation of the course management by practicing a three-level system of state management, regional management and school management, which has promoted the course's adaptive capacity to certain region, teacher and student as well. It goes along with the international trend of course reform and highlights the school-based course in the project. The exploitation on school-based course can fully explore student's potential individual advantages, and enhance the all-rounded development of their personality; it conforms to the development of modern education, and gives expression to the superiority of traditional ethnic sports, in favor of giving play to teacher's initiatives and improvement in teaching and researching level; northwest of Guangxi is the gregarious dwelling of ethnic peoples, it is rich in traditional ethnic sports resources, and every project there possesses strong ethnic culture characteristics, which boasts infinite potential of exploitation. Utilize the traditional ethnic sports as school-based course can not only solve the problems of insufficient fund, venues and facilities, but also enrich the teaching content in class. It will also render systematic inheritance and further development of the traditional ethnic sports in northwest Guangxi.

## 2 SUMMARY OF TRADITIONAL ETHNIC SPORTS IN NORTHWEST GUANGXI

Northwest Guangxi in China is the gregarious dwelling of several ethnic groups with the Zhuang people as the body. It consists of 16 cities and counties and populates seven minority peoples: Zhuang, Yao, Miao, Molao, Dong, Monan, and Shui people. Among them, Molao and Maonan Autonomous County of Guangxi is the only ones for the people in China. The distribution of minority peoples feature in that "large area inhabited by several nationalities and small inhabited by their own". The people in northwest Guangxi is industrial, courageous, and earthy, and they have created and developed various traditional ethnic sports with diverse forms, rich contents, strong ethnic characteristics and profound appreciation of the people. The traditional ethnic sports is a gorgeous pearl in our treasury vault of our national culture, and our precious ethnic cultural heritage.

There are multiple traditional ethnic sports events in northwest Guangxi. According to incomplete statistics, there are totally 128 traditional ethnic sports in Guangxi, of which over 60 has been listed in the sports section of the General Annals of Guangxi, and 28 remains to be listed.

For example, in Zhuang people's culture, there are embroidered ball throwing, shoulder pole beating, turtledove jumping, Zhuang Kung Fu, frog Kung Fu, knife circle penetrating, fire circle penetrating, chair dragon line, wooden wheel rolling, headstand

walking race, three-person board shoes race, hunting, promotion picture, pack basket ball, Liao ball, bee drum beating, etc. In Yao's, there are bronze drum beating, dustpan beating, hasten laborer dance, wrestling, Spring buffalo dance, broze bell dance, Hongmen performance, strap beating, bamboo bar pulling, archery race, spinning top, knife mountain climbing, trumpet ball, pulling out the Huluxiao wine, Bamboo lyre drum beating, etc. In Molao's, there are elephant step and dragon dance, grass dragon dance, pearl grabbing, phoenix's egg protection, zongzi grabbing, fenghuo ball, etc. In Maonan's, there are "with the top", "with the filler", "with the patchwork", "with the back", stone lock carrying, and wrestling with tied waist, etc. In Shui people's tradition, there are horse race, archery race on horseback, and Huamei scraping, etc. Performance events are also quite abundant in Hechi, there has been 91 performance events exploited and collected since 1984.<sup>[1]</sup> In terms of their characteristics, they are rich in deep cultural implication, distinguishing in styles, and create diverse phenomena. In terms of their contents, some take their roots in agricultural production activities, some originated from ethnic cultural specialties, some evolved from religions and sacrificial ceremonies, and some derived from wars. They can serve to put forward local ethnic cultures, facilitate national coherence, and they boast commercial exploitation values.

According to the manifestation and the characteristics of the traditional ethnic sports, we divide them into four categories: the competitive events, the performing events, the fitting and entertaining events, and the events of the game.

### 3 DEFINITION OF THE SCHOOL-BASED COURSE AND ITS EXPLOITATION

School-based course is a scheme with teachers as its center. In the practical implementation of the national *Spots and Health Standard* and regional *Implementation Scheme of Sports and Health Course*, it will assess the students' demand in the school; on the basis of making the best of sports resources in schools and communities, it aims at promoting student's health.<sup>[2]</sup> School-based course exploitation refers to a series of reform activities under the guidance of the national *Spots and Health Standard* and regional *Implementation Scheme of Sports and Health Course*, which is intended to satisfy students' need of exercise and enhance their healthy growth according to the specific characteristics, conditions and educational resources of certain schools.

## 4 SIGNIFICANCE OF LAUNCHING SCHOOL-BASED COURSE EXPLOITATION IN PRIMARY AND MIDDLE SCHOOLS IN NORTHWEST GUANGXI

### 4.1 *Be assistant to build up sports teaching characteristics and establish special running styles of schools*

The characteristics of a school refers to its own distinguishable traits in comparison to those schools in the equivalent categories. In other words, schools should take full advantage of its own characteristics and merits in its running process, put the education scheme in effect creatively, and establish itself special and stable characteristics and style.<sup>[3]</sup> At the same time, its emphasis on the uniqueness and differences of teachers and students has involved in the schools particular running philosophy, which contributes to the creation and development of the tradition and running style of a school. The economy, culture, and education of Northwest Guangxi is relatively undeveloped, which cast an influence on the disadvantageous condition of the education facilities in local middle and primary schools compared with their urban counterparts. The schools should thus enhance their advantages and avoid their weaknesses, actively initiate sports teaching characteristics, and establish their special running styles, which lies in the utilization of the blessed ethnic cultural resources in Northwest Guangxi. In addition, the exploitation of school-based course will help to improve the sports teaching facilities and the establishment of special sports curriculum system.

### 4.2 *Be assistant to improve the professional developing level of P.E. Teacher*

The exploitation of the school-based P.E. course focus on the teachers, which established the position of professional autonomy, entitles them to participate in the exploitation and make decisions in it, and confer on them the right and responsibility in the process, reinforcing their sense of responsibility and obligation. However, this exploitation is one of creativeness with difficulties of multiple aspects; therefore it requires a higher standard of professional consciousness and quality. Teachers are supposed to go deeper into the exploration of the course, of the students and of the society, and be bold to innovate with breakthroughs of the out-of-date teaching pattern. The processing and integrating of traditional ethnic sports resources is a procedure of studying and innovating, which will elevate the individual thinking and innovative ability of teachers and promote their professional spirit, knowledge and competence.

4.3 *Be assistant to develop students' individuality, realizing individualized education and satisfying the diversified sports needs of students.*

One prominent trait of modern society is the principle of "people first", which highlights the development of people's individuality and creativeness. Sports activities lies the premise on people's physical activities. People will have various needs due to their differences in physical qualities, capacities, health conditions, interests, and living environment. As a result, on the basis of general unified requirements, the setting of P.E. course should consider the specific condition of individuals, make the most of the circumstances to accomplish individualized education and satisfy the diversified sports needs of students. There are plentiful ethnic groups settling in Northwest Guangxi, whose interests and customs are different from each other more or less. Consequently, the sports activities are abundant and diverse: some are competitive, some fitness-based, some entertaining, others feature in customs, or blend various characteristics together. These diverse sports activities provide schools with numerous available choices and expand the space of development, which will absolutely benefit the accomplishment of individualized education and satisfaction of students' diversified needs.

4.4 *Be assistance to inheritance and development of traditional ethnic sports in Northwest Guangxi*

The popularization and mass recognition of Chinese traditional sports is bound up with the rise and fall of traditional ethnic culture and inheritance and development of Chinese traditional culture. In the light of educational anthropology, education is the major way of generating culture. Also, inheritance of culture is an important part in education. For a long time, schools have always been the cradle of culture, the carrier of culture, the manufacturing location of culture, and an essential front of advanced culture. To cast our eyes on history, many sports activities started their origins, popularization in schools. So to carry out the exploitation of school-based P.E. course in primary and middle schools in Northwest Guangxi, and involve traditional ethnic sports in modern society genuinely, and complement the modern sports mutually is of great significance. And then, those graduating from schools with abundant and excellent knowledge of traditional ethnic sports can serve as the inheritor and transmitter of ethnic culture, which will be conducive to the inheritance and development of ethnic culture.

5 THE ADVANTAGES OF LAUNCHING SCHOOL-BASED COURSE IN PRIMARY AND MIDDLE SCHOOLS IN NORTHWEST GUANGXI

5.1 *Geographical resources advantages*

Hechi, city of Northwest Guangxi, populates 8 minority groups: Zhuang, Yao, Molao, Maonan, Shui, Dong, Miao, etc., which adds up to 3 million and 400,000, representing over 85% of all in Guangxi. The area is one of those dwells most minority groups.<sup>[4]</sup> In the history spreading thousands of years, the minority groups integrate and live with each other, together they creating and inheriting the traditional ethnic sports of distinctive styles, leaving precious cultural heritages for human civilization. Events like spinning top beating, board shoes race, board shoes dance, high-heel horse, embroidered ball throwing, bamboo ball, shoulder pole beating, all these iconic events of Northwest Guangxi, not only constitute the daily exercise activities of local people, but belong to the local original ethnic culture dated back to thousands of years ago. As a result, infusing these events in the school-based exploitation process in primary and middle schools in Northwest Guangxi can serve to radiate to a full extent the contents, forms, and cultural inheritance to teachers and students in that area, and further the integration of traditional ethnic sports into primary and middle school classes and establish its own characteristics.

5.2 *National policies lay a foundation of school-based course exploitation*

In 2001, it was clearly announced in the "Basic Education Curriculum Reform(trial implementation)" "in the National Education Work Meeting that" (schools are supposed to) alter the over-centralization of the curriculum management, and carry forward a three-level management system of state management, regional management, and school management, and strengthen the course's adaptive capacity to different locations, schools, and students."The new outline has proposed a curriculum management system that puts functions as its core, according to which the division of curriculum is conducted. On this background, the school-based course exploitation has broken through the old centralized management system, and provide schools, teachers, and students wider space to choose and make decisions. *School Management of Curriculum Guidelines* declaimed that schools should" explore students diversified sports developing needs, exploit and select text resources that match with their own characteristics and optional for

students.” It has also asserted concrete requirements of the exploitation process and modes of execution, which consolidates a firm guarantee of school-based course exploitation of traditional ethnic sports.<sup>[5]</sup>

## 6 THE IDEA OF SCHOOL-BASED EXPLOITATION IN PRIMARY AND MIDDLE SCHOOLS OF NORTHWEST GUANGXI

### 6.1 *Selection of contents*

The selection of course contents should reflect the educational purpose and reality. The traditional ethnic sports enjoy a time-honored history, and it mainly consists of various sports events and physical exercises. Its materials are abundant and extensive, which lead to the broad openness of its unfolding modes, and possess unique ethnic characteristics. The birth and development of traditional ethnic sports are tightly connected with the mass productive labor, custom, songs and dances of local folks, embedded with strong regional and ethnic flavor, which offers extensive space of the school-based course exploitation. Consequently, the selection of course contents should emphasize its ethnic features: lay a key consideration to the beloved traditional ethnic sports, correspond to the discipline of students’ mental and physical health development as well as school’s characteristics, and appropriately select suitable course contents of traditional ethnic sports. And then schools should take into account the local circumstances when selecting the course contents, comprehensively regarding the characteristics of different schools and students, available sites, faculties, and current situation of P.E. teaching to establish course contents with their regional characteristics. For example, firework grabbing, embroifered ball throwing, bronze drum beating, bar climbing, dancing with lusheng, elephant tug-of-war, these are all sports events demonstrating local customs and practices varied in styles. They mingle with the local customs, cultures, folklore, and historical evolution, constituting the ethnic characteristics of course contents in local schools.

### 6.2 *Course exploitation*

In the *Course Exploitation and Research Guidelines*, Mr. Steinhaus has come up with the famous “procedure schema”, which states the teacher’s important role in course exploitation. Accordingly, we should pay heed to the following aspects in the process of exploitation: firstly, we should highlight the principle of “health first”. The various forms of traditional ethnic sports in Northwest Guangxi can involve in multi-sensory experiences, which will boost the students’ capacity of reacting, flexibility, power and

endurance, stimulate them to think actively, and promote their healthy development physically and mentally. Secondly, we should stick to the philosophy of “people first”, adequately concern about the needs of students and achieve ideal teaching effects. Thirdly, we should respect the law of P.E. teaching. To incorporate traditional ethnic sports in the P. E. course system should always commit to the precondition of students’ capacity, recognition, a strong willingness to participate, and the convenience to practice and popularize of the events.<sup>[6]</sup>

### 6.3 *Course implementation*

Course implementation is the process of carrying out a course plan in reality by teachers, and it is the key to realizing the predetermined course plan. It includes: inverting the traditional ethnic sports in textbooks, making teaching plans, carrying out P.E. Teaching, and recording the teaching results. The first one requires P.E. teachers to systematically arrange the theoretical, skills, and practice parts of traditional ethnic sports, providing text documents for teaching. The theoretical part includes traditional ethnic sports knowledge, the principle, traits, structure, exercising values and significance of the events. The part of skills include the essentials of skills and teaching methods of traditional ethnic sports. The practice part includes the practical purpose, significance, methods, steps, and requirements of traditional ethnic sports. Teaching plan is the direct documents to carry out teaching process, which consists of annual plan, term plan, unit plan and teaching period plan. It is also the embodiment of teaching contents and teaching methods. Teachers should choose a feasible teaching organizing method and make a scientific distribution of the teaching period and the contents, according to course standard and the principles of compiling teaching plans. P.E. teaching is the practice section in course implementation, which should strictly follow the requests of course exploitation. We ought to have the foresight of the possible problems emerging in the specific teaching process, and solve them on time once confronted. The teaching process should be innovative, which can properly utilize new teaching and organizing methods and accomplish predetermined results.

### 6.4 *Training of the teachers*

In the school-based course exploitation, teachers are not only the executors of the curriculum, but also the master of it. The exploitation requires of theoretical supports and professional training. The teachers’ level of the relative proficiency will directly exert an influence on the quality of school-based course exploitation.<sup>[7]</sup>

The training of P.E. Teachers in primary and middle schools should base on the autonomous reading and mutual communication of the teachers by flexible, plural, lively and vivid measures. The teachers should get handle of the relevant skills, practicing methods, and general knowledge about the sports. We encourage the teachers to go deeper into the local folk's life, and experience to a full degree the geographic and cultural environments, and observe the sports activities carried out by local people. Only in that way will they be able to understand the profound values of local culture and the genuine spiritual substance of traditional ethnic sports, which will advance the inheritance and development of the sports. Schools can also employ some exports out of the campus to be the guide of the exploitation. The training can solve multiple problems: strengthening the course consciousness of the body part in the exploitation, establishing specific education and course concepts, distinguishing some incorrect perceptions and behaviors in the implementation; and then understanding the true connotations and traits of traditional ethnic sports school-based course exploitation, mastering the basic theory, basic method and basic characteristics of teaching and learning, developing lively and vivid, excellent and effective teaching activities.

## 7 SUMMARY

Traditional ethnic sports in Northwest Guangxi of China is one of the excellent national cultural treasures, tinted with deep-rooted cultural gene, and shoulder the historic responsibility of cultural inheritance. They not only bring together the traits of interests, competitiveness, fitness, entertaining, and performing, but also possess the economic values for the local materials can be drawn on and the requests of site are quite humble. They provide more optional materials for the school-based course exploitation in primary and middle schools of Northwest Guangxi, and have tremendous values and advantages of exploitation. To infuse traditional ethnic sports in the P.E. course will ease the shortage of fund, facilities, sites, and moreover, enrich the contents and connotation of P.E. teaching, activate the sports and cultural life on campus, and expand the practicability and operability of the physical facilities in schools. Meanwhile, the implementation and popularization of traditional ethnic sports through schools may dig out and collect more valuable and distinctive projects, which in turn will

accelerate the advancement and standardized development of traditional ethnic sports.

## A discourse-based English passive voice teaching

Xue Feng Zhai

*Faculty of Foreign Language & Culture, Kunming University of Science and Technology, Kunming, China*

Guo Feng Ding

*Law School, Kunming University of Science and Technology, Kunming, China*

**ABSTRACT:** Different from the traditional grammar teaching, in the discourse-based approach, teachers can teach target forms together with authentic or simplified discourse, which can supply learners with abundant examples of contextualized usages of the target structure to promote the establishment of form-meaning relationships, and accelerate students' master of the items, especially in their use. Thus, this paper, taking functional grammar as its framework and the teaching of English passive voice as an example, proposes grammar teaching of discourse-oriented approach.

**KEYWORDS:** discourse-based approach; English passive voice; grammar teaching.

### 1 INTRODUCTION

Grammatical competence is now considered as an integral component of communicative competence, and is extremely important for learners to improve their communicative competence and to achieve the desirable proficiency in their language learning. However, research shows that Chinese college students' grammatical competence is not satisfactory.

Li Qi's investigation of English major students in the North-eastern Normal University revealed that although the participants possessed solid grammatical knowledge, they lacked high level of accuracy and native-like appropriateness of actual use in given contexts (23). Kong Yan's error analysis of Chinese students' acquisition of English passive voice showed that for English learners of intermediate and advanced levels, despite lower error rates in passive structure, the error rates in use, especially in discourse, are still high (43).

To help develop college students' grammatical competence, a new and effective approach to college grammar teaching is in urgent need, one which should be able to overcome the shortcomings of the traditional approach, and should teach the rules of the language along with grammatical rules. Under this circumstance, this paper, taking functional grammar as its framework and the teaching of English passive voice as an example, proposes grammar teaching of discourse-based approach.

### 2 LITERATURE REVIEW

#### 2.1 *Different approaches to grammar teaching*

##### 1 Traditional sentence-based grammar teaching

The traditional approach to grammar teaching is form-oriented and is restricted at the sentence level. When presenting a grammatical item, it usually takes no account of its meaning and functional aspects, and isolates the structure from both its social and linguistic contexts. Thus, it can leave learners with the impression that they know something, but in fact they have often learned a structural pattern without understanding its context, register, and general appropriateness.

##### 2 Discourse-based grammar teaching

From the functional perspective, grammar is a general description of how language operates, a study of how syntax (form), semantics (meaning), and pragmatics (use) work together to enable individuals to communicate through language. Grammatical competence, as an integral component of communicative competence, should also be the aggregation of three dimensions, namely, grammatical form, semantic meaning and pragmatic use.

In contrast with the sentence-based traditional grammar teaching, a discourse-oriented approach acknowledges the indissoluble link between structures and functions in contexts and takes appropriateness and use as the heart of the explanation. In the discourse-based

grammar teaching, teachers can teach target forms together with authentic or simplified discourse, which can supply learners with abundant examples of contextualized usages of the target structure to promote the establishment of form-meaning relationships (Li Qi 36).

## 2.2 Different approaches to the passive voice

The passive voice has attracted a great deal of attention in the linguistic literature. In the analysis of issues concerning the passive, different approaches have been adopted and various views about its form, meaning, and function have been offered.

- 1 Structural view of the English passive  
Structuralism takes a purely formal approach to the passive. It treats passive structures in the framework of subject analysis, which views the passive as a structure in which the subject has the meaning of the undergoer of an action and occurs in the pattern of auxiliary be plus the past participle of the verb. This rigid approach to the passive fails in many respects and has received a lot of criticism.
- 2 Transformational study of the English passive  
In dealing with the passive, Chomsky, the founder of the well-known transformational-generative grammar adopts the traditional idea of an active-passive correlation in terms of passive transformation. He insists that grammar rules can produce grammatical sentences and the passive is derived directly from the active and is thus analyzed in light of the passive sentences themselves with no consideration of the contexts in which they occur.
- 3 Functional study of the English passive voice  
Functional study of the English passive voice is based on Halliday's functional grammar. Functional grammarians think that the active and the passive have the same ideational and interpersonal functions, but they are different in textual function since the focus of the speaker varies with the voice he selects and that, though the passive is not directly generated from the active, there exists an indirect systemic relation between them. What is more, both linguistic and extralinguistic, contextual elements are taken into account in their study of the passive with a view to discovering the motivation behind each passive that is used in a given text or utterance.

In the following part, English passive voice will be introduced from the perspective of functional grammar in terms of its use, to show how to carry out a discourse-based teaching of grammar.

## 3 TEACHING OF THE PASSIVE VOICE UNDER FUNCTIONAL GRAMMAR

In functional grammar theory, English voices are divided into two categories: the middle and the non-middle. "A clause with no feature of 'agency' is neither active nor passive but middle. One with an agency is non-middle or effective in voice" (Halliday 168). If the clause is non-middle, since either participant of the two (Medium and Agent) can become Subject, there is a choice between active and passive. The reasons for choosing passive are as follows: (i) to get the Medium as subject, and therefore as unmarked Theme; (ii) to make the Agent either a) latest news, by putting it last, thus achieving the end-focus and prominence; or b) implicit, by leaving it out, by which the process itself becomes focus information, thus being strengthened.

The above-mentioned reasons are the general functions of PV analyzed on its syntactical level. In the real discourse, the use of PV may be affected by many factors like the discourse producer's intention, the textual factors, and pragmatic factors as well. Its functions are briefly summarized as follows:

- 1 Syntactic function: the stress of the important part of a sentence
    - a. To stress the Agent by using the passive structure with an explicit Agent. See examples (4.4) and (4.5)
    - b. To stress the process by using the passive structure with an implicit Agent. See example (4.6).
- (3.1) A: How was the dam damaged?  
B: It // was damaged *by the flood*.
- (3.2) A: The flowers are all gone. What happened to them?  
B: They // were destroyed / *by the rain*.
- Given    New    Focus
- (3.3) And until recently this hostile attitude towards daydreaming was the most common one. Daydreaming // was viewed as a waste of time. Or it // was considered an unhealthy escape from real life and its duties. But now some people are taking a fresh look at daydreaming. Some think it may be a very healthy thing to do.
- taken from *Daydream a little*, Para. 2, Unit8 (text A, Band 3)
- 2 Textual functions: Keeping the textual topics; introducing a new topic or changing topics; textual cohesion and coherence.

Firstly, by application of the passive voice, comprehension of the semantic entailment of the textual topic could be achieved. In developing a text, to achieve thematic prominence in the textual layer, the writer often, by thematization, reorganizes the elements in a clause, and put what is wanted as the textual topic

at the theme position. The passive voice is just such a grammatical device for realizing such a function.

- (3.4) ...Mussolini, Hitler's fellow fascist dictator and partner in aggregation, had met his end, and it had been shared by his mistress, Clara Petacci. (topic: Mussolini and his mistress) ...They (Theme/topic) // had been caught by Italian guerrillas on April 27 while trying to escape to Switzerland and executed after a brief trial. On the Saturday night of April 28 the bodies // were brought to Milan in a truck and dumped on the town square. The next day they // were strung up by the heels from lampposts and later cut down so that throughout the rest of Sunday, they lay in the gutter. On May Day Benito Mussolini // was buried beside his mistress in the pauper's plot of a Milan cemetery. In such a horrible climax of degradation Mussolini and Fascism (Theme / topic) passed into history.— taken from *The Death of Hitler*, Para. 2 & 3, Unit9 (text B Band 3)

Secondly, by the alteration of the information structure and that of the information focus, the introduction or the transformation of the topics is achieved.

- (3.5) The Three Gorges Dam, which is the biggest construction project in China since the building of the Great Wall and the Grand Canal, has been built to control flooding and provide hydro-electric power for the central region of China. The dam is nearly 200 meters high and 1.5 kilometers wide. It is the largest hydroelectric power station and dam in the world and has cost more than any other construction project in history.

Thirdly the passive voice could play the role of combining and linking the text, that is, promoting the continuous development of the topic.

- (3.6) Concrete is produced by mixing together cement, water, and mineral aggregates. This mixture is placed into suitable mold, compacted, and allowed to harden.

### 3 Pragmatic functions

- a. The euphemistic tone of the speaker or writer  
The passive may be used as a way of deliberately obscuring who is doing what to whom. The passive had better be employed when the speaker does not wish to mention the actor and when it is inconvenient to mention the actor in consideration of certain communicative strategies, interpersonal relationship as well as politeness. See the following three examples. Compare and make choice under the given situations (the situations are omitted here).

- (3.7) a. The dishes must be washed up./ b. You must wash up the dishes.

- (3.8) a. You are requested to give a performance./ b. We request you to give a performance.

- b. Formal and objective statement of the fact  
The passive is resorted to when one wishes to use an impersonal style, for instance, in science writing and news report, in which the agent is left implicit and the process is stressed. See the following examples:

- (3.9) Concrete is produced by mixing together cement, water and mineral aggregates. This mixture is placed into a suitable mold, compacted (impacted) and allowed to harden. It is similar to building stone, but has the advantage that it can be easily molded into any suitable shape, and also that it can be conveniently reinforced with steel rods to improve its structural properties.

#### (3.10) News Item

Japan (1) Police have arrested the man reported to be the second highest leader in the Aum Shinri Kyo (Japanese AUM doomsday organization) religious group. (2) The man is the fifth leader of the group to be arrested on a number of charges (accused of). (3) The group's leader is still missing. The group was suspected of the nerve gas attack in Tokyo's underground train system last month. (4) However, the charges against those arrested are not directly linked to the attack. (5) The group had denied any link. (6) Also in Japan, as many as 300 people became sick after smelling a poisonous gas in the main railway station in Yokohama. (7) No serious injuries were reported. (8) Police say they do not believe the incident is connected to the attack in Tokyo  
—VOA Special English

## 4 CONCLUSION

Discourse-based grammar teaching is an important component of recent approaches to grammar teaching (Nassaji & Fotos 128). Different from the traditional teaching method, in the discourse-based approach, teachers can teach target forms together with authentic or simplified discourse, which can supply learners with abundant examples of contextualized usages of the target structure to promote the establishment of form-meaning relationships. As is demonstrated in the teaching of passive voice in the paper, only presented in discourse, can the various functions of PV be fully explained by the teacher and be deeply and really appreciated and understood by the students. And only when grammar is used in discourse, the appropriateness of the use of PV can be achieved.

# Study on the talent training model of safety engineering specialty based on career orientation

Xiao Yun Liu, Guan Hua Liu, Yang Jie Xiong, He Sheng Wang & Zhang Qi Xia

*College of Resources and Environmental Engineering, Wuhan University of Science and Technology, Wuhan, China*

**ABSTRACT:** This paper aims to strengthen the pertinence of safety engineering professional training, and ease the contradictions of industry security talent shortage, through methods such as literature research, data access and data statistics, based on clarifying the status of professional development and training of safety engineering in China, from the two dimensions of employment and employment number of students majoring in safety engineering employment market demand. We built in the talents training goal of “guide”, “interactive” theory and the practice teaching system, “collaborative” talent training methods as the main content of the employment guidance of safety engineering personnel training mode.

**KEYWORDS:** Career orientation; Safety engineering; Talented person cultivation; Market demand.

## 1 INTRODUCTION

The upgrading of safety engineering disciplines effectively promoted the reform of the safety engineering education system and the innovative of the personnel training mode which is of great importance to broaden the field of safety education and directions of student employment<sup>[1]</sup>. With society and economy developing, the need of safety engineering professionals has extended from traditional mining, metallurgy industry to oil, chemicals, machinery, construction, transportation, information and other fields<sup>[2]</sup>. Data show that in 2014 there are up to 7.27 million of university graduates, the difficulty of graduate employment has shown normalization. Whether safety engineering can withstand the impact of the employment pressure will be key to its survival and development<sup>[3]</sup>. Based on this, the analysis of safety engineering discipline development, personnel training, market demand, graduates employment situation, building safety engineering professional training mode, which has employment oriented industries to alleviate the shortage of safety professional conflicts, to promote the realization of the national safety production situation fundamental improvement to provide personal support and intellectual protection is of very great significance.

## 2 THE DEVELOPMENT OF SAFETY ENGINEERING DISCIPLINE AND TALENT TRAINING STATUS IN CHINA

### 2.1 *The development of the discipline of safety engineering*

1 Slow development period. The development of safety engineering major in China started in the 1950s, from

57 to 90s development has been slow. Xi'an Institute of Mining in 1957 in the country opened the “mine ventilation and safety”. In 1958, Beijing Institute of Labor opened the “industrial safety technology” and “industrial hygiene technology” undergraduate majors. In 1982, at the university of Hengyang-the affiliated school of Hunan University, setting safety engineering three-year specialist. In 1983, Shenyang Institute of Aviation Industry setting safety engineering four-year undergraduate programs, China university of Mining set up domestic mine ventilation and safety undergraduate majors for the first time. During this period, safety engineering, while development is slow, but still has trained a large number of professional and technical personnel, laid a solid foundation for the development of safety engineering.

2 Rapid development period. In 1993, the national standard “discipline classification and code” began to implement, the implementation name the safety science and technology as the standard of class discipline, breaking the natural science and social science in subject classification, set up “management, safety and environmental” comprehensive disciplines<sup>[4]</sup>. In 1998, the ministry of education promulgated the history of our country's higher education for the fourth time to modify the catalog of major of undergraduate course of common colleges and universities, and further integration of undergraduate specialties, cancelled the mine ventilation and safety professional, by safety engineering to cover all the safety problems of the industry, as a primary secondary under safety and environmental science disciplines, a subject of science and technology. After ten years fast developments in the 1990s, the scale of safety engineering began to develop fast.

3 Golden development period. In the 21st century, security engineering was in the golden period of development. In 2002, with the implementation of the Production Safety Law of the People's Republic of China, the enterprise demand for safety production management has increased dramatically, universities set up the number of safety engineering and related professionals also began to increase significantly. At the same time, on a safety engineering specialty in colleges and university curriculum reform, in order to adapt to the needs of society, more conducive to the cultivation of applied talents. In 2011, the state council degree committee, the ministry of education take "the safety science and engineering" as a graduate student discipline education level, the development of academic disciplines, which is of great significance to further advance security optimization security personnel knowledge structure, to speed up cultivating high-level security talents [5].

### 2.2 Safety engineering talents cultivation conditions

Because safety discipline is a very wide range of comprehensive interdisciplinary sciences, a lot of colleges and universities set up different types of safety engineering, including military industry, chemical industry, petroleum, mining, metallurgy, aviation, civil engineering, transportation, energy, environment, economy, etc. [6]. The Table 1 shows that since 2000, the numbers of new start safety engineering specialty in colleges and universities has been rising trend, the numbers has reached 153 now.

At present the national recruit safety engineering doctoral about 280 per year, about 1000 master's degree students. Safety engineering talents cultivation had already formed the bachelor, master and doctor multi-level, three-dimensional talent cultivation system. Set up safety engineering colleges and universities of safety engineering of the nation's provinces (municipalities) distribution from the point of geography, in addition to Hainan, Qinghai, Tibet, open safety engineering college of provinces and municipalities and autonomous regions of 28; From the point of quantity, Shandong, Jiangsu, Hubei, and Liaoning colleges and universities set up safety engineering quantity is more, it is 10, 11, 10, and 12.

## 3 THE MARKET DEMAND ANALYSIS OF SAFETY ENGINEERING STUDENTS' EMPLOYMENT

### 3.1 The classification of job market demand

- 1 Government department. At the national level, our country has the Production Safety Supervision Administration and the State Coal Mine Safety Supervision Bureau. Meantime, every province has Administration of Work Safety which bears the supervision and management of safety production in different industries. With the growing government's emphasis on safety production and gradual standardization of safety supervision and regulatory system, the government management of security has become a relatively stable industry. Nowadays, those people who want to work in security management departments mainly go through the public recruitment of the national civil service examination. This examination requires that candidates should have high comprehensive qualities and fully grasp the laws, regulations and industry standards, technical specifications in the security field.
- 2 Enterprise. The State Safety Production Law clearly indicates that if production units employ more than 300 people, they should set up a security management agency or employ professional security managers. If under 300 people, they should employ full-time or part-time security managers. On the one hand, enterprise internal security management requires relatively stable managers. On the other hand, hidden risks prevention in production processes within the enterprise also requires safety production technicians. In order to accelerate enterprises' development and enhance the competitiveness of enterprises, companies should attach importance to safety work and employ more and more security managers[7]. In other words, safety engineering students mainly work in enterprises.
- 3 Intermediary agency. Government departments often rely on intermediary agencies (third party) to evaluate safety production condition in the enterprise. Meantime, the government has strict requirements about the qualification and operation management of safety assessment intermediary agencies. These agencies need employees majoring different profession as well as conferred of National

Table 1. The numbers of safety engineering university in China.

Year	1957	1985	1990	2000	2002	2004	2006	2008	2010	2012	2014
number	1	16	17	30	45	68	85	114	127	139	153

Safety Appraiser. We can select a number of safety appraisers in the engineering field to organize a team to appraise enterprises' safety production condition, thus a relatively stable security assessment industry forms.

- Universities, research institutes and etc. These institutions undertake the analysis and study of key technologies and theories, including the existing state of hidden risks, analysis and research the mechanism of the accident, the accident prediction and control, and accident damage assessment. Select a project from the practical production, after in-depth study, the obtained results are applied in practical production, to solve various problems in safety production. With the party and government attaching great importance to safety production work, constant evolving of safe disciplinary and economic society, universities, research institutes and other organizations will need more specialized superior safety professionals.

### 3.2 The number of the market demand

- Statistical analysis of working field of graduates. The field of safety engineering Professionals is very broad. With the level of social development and the needs of different levels of safety professionals varying, the main areas of employment are also subject to change. As a result of the different colleges possess different safety engineering features, its field of employment is also different. Take 118 graduates who graduate from Wuhan University of Science and Technology from 2009~2011 employment data for example, from the employment industry distribution,72 graduates went to construction enterprises (China State Construction Engineering Corporation, China Railway Engineering Corporation, China Communication Construction Corporation, China National Nuclear Corporation, etc.), accounting for 61%; 15 chose Corporation Mining companies (China National Petroleum Corporation, Wuhan Iron and Steel Mining, Henan Coal, Jiangxi Jin shan gold deposit, etc.), accounting for 13%;19 went to other companies (China Construction Bank, Gree, Kai bang Motor, China Resources Gas, etc.), accounting for 16%;12 to Administrative institutions (Ningbo Municipal Group, the Second Artillery Corps, Hubei tobacco, Three Gorges Navigation Authority), accounting for 10%.Properties of employment units are mainly state-owned enterprises, accounting for a higher proportion. The number of graduates into the mining business and Administrative institutions shows a declining trend, the number of graduates employed in other business units increase yearly. From the geographical point of view of employment, graduates mainly work in Hubei, Guangdong and Jiangsu and Zhejiang. Among them, 40 graduates in Hubei

(Wuhan, Yi chang, Shi yan, Xiang yang, etc.), accounting for 34%;20 in Guang dong (Guang zhou, Shen zhen, Zhu hai, etc.), accounting for 17%;14 in Jiangsu (Nanjing, Lianyungang, Zhen jiang, etc.), accounting for 12 percent, Zhejiang (Hang zhou, Ning bo, Zhou shan, etc.) 9, accounting for 8%.Visible,enrollment base and economically developed areas and urban centers are still the priorities of graduates.

- Statistical Analysis about employing unit's position for demand .According to China's largest search engine's statistical information, alumni set in August 2014, the position of safety engineering requirements of the top 10 cities, nine cities position requirements are more than 100, Beijing, Shanghai, Shenzhen ranking top three. Beijing has the biggest demand for 516, as shown in Figure 1.

Figure 1. Safety engineering requirements of professional position chart.

Using Wuhan city as an example, according to a 2013 yearbook data in Wuhan city, according to the regulations of the state, there are a total of 1001 enterprises which are staffed with full-time security personnel. In addition there are all kinds of big companies a total of more than 40000 which don't need to has to be stuffed with full-time security personnel. According to the regulations of the state, enterprises above designated size must equipped with full-time safety-tech-management personnel, the safety engineering professional talent gap of up to 3000 people. The output of graduates of the safety engineering specialty which has been set up in Hubei's colleges and universities is less than 1000 people a year. Apparently, the gap of demand for the safety engineering professionals will not change in short term.

### 4 THE EMPLOYMENT GUIDANCE OF SAFETY ENGINEERING PERSONNEL TRAINING MODE'S CONSTRUCTION

Based on the above analysis, this paper tries to build the "Guide" to the talent training goal, the theory of the "interactive" and the system of practice teaching,

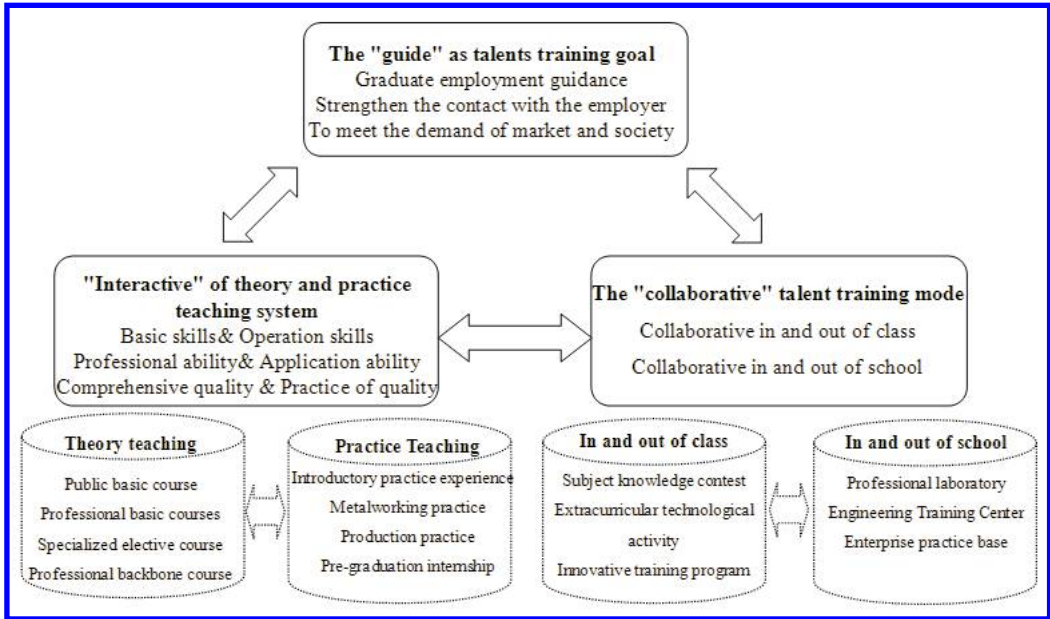

Figure 2. Personnel training mode of safety engineering major based on employment orientation.

“collaborative” talents training mode as the main content of “safety engineering personnel training mode based on employment guidance”, as shown in Figure 2.

#### 4.1 Set up the “guide” as talents training goal

Talent training objective is the aim and key of personnel training, which plays an affecting role in talent cultivation system, belonging to the first link. Multidisciplinary cross and blend of industries are the features of the safety engineering. For different industry, different social and economic development stage, different environment’s conditions, the requirements of safety and conditions of guarantee are very different. Safety engineering professionals must have a unique professional quality and engineering ability, in order to meet the needs of social and economic development [8].

Oriented talents training goal is to regard graduate’s employment as guidance, realize the docking with unit, to meet the needs of market and society, improve safety engineering students’ employment ability, to strengthen the pertinence of talent training. In training scheme, curriculum setting, discipline direction, focus, platform construction, etc., with the employment as the guidance, training the persons who can satisfy the needs of the development of regional economy and senior engineering and management. In particular, some schools which open safety engineering professional recently

determine the scale of personnel training on the basis of characteristics and teaching conditions and the location factors, not blindly following the trend, going with the flow.

#### 4.2 Build the theory of “interactive” and the practice teaching system

Theory and practice teaching system construction, which should be on the basis of the labor market demand for safety professional ability, unit of choose and employ persons (basic abilities and operation skills, professional skills, comprehensive ability and practice ability and application) to highlight the characteristics of “interactive”. By making feasible theory and practice of teaching evaluation system, rely on the industry to identify the core competence of professional requirements and various abilities and skills of the inspection standards, being strict on appraisal system, to ensure the quality of teaching.

“Interactive” teaching theory and practice, is to build the “public basic curriculum & professional foundation courses and professional courses & professional curriculum” to be the main course of theory teaching and “metalworking practice & cognition practice & production practice & graduation practice” as the main content of practice teaching system of interactive teaching, promoting the interaction between the students’ knowledge and skills of ascension, the interaction between intelligence and ability. The theory of “Interactive” and the practice

teaching system will be the focus of teaching reform to improve the current theory and the practice teaching link, improving students systematically using knowledge, the skills to solve problems and the ability to adapt, to avoid cultivating the students who are unfit for a higher post but unwilling to take a lower one and have difficulty living well in society. Through interactive teaching, making the effects to cultivate the students' core competitiveness of employment.

### 4.3 Use "collaborative" talent training mode

Collaborative talent training mode, is the strength of talent training, method and platform effectively integrate and full of the resource elements such as polymerization, advantageous to realize the superposition effect of talent training, to improve the quality of personnel training. To implement security engineering students "collaborative" talent training mode, explore the in-class and after-class collaborative, schools and enterprises. Classroom is given priority to with theoretical teaching, extracurricular is given priority to with practical teaching, the school focuses on basic ability training, enterprise focusing on development and improve the comprehensive ability.

Formed by the subject knowledge contests, extracurricular activities of science and technology, the innovation training program of innovation ability cultivation system together. Fully grasp the "earthquake disaster reduction day", "national safety production month", "11, 9" on fire, and other important time node, through academic lectures, social practices, safety classes of the community, such as form, let the students take an active part in these activities, guides the student to walk into society, understanding of production safety, cultivate their consciousness of security responsibility. Through professional characteristic laboratories, engineering training center, the teaching practice base and so on the synergy of subject platform and make the students in the process of practice gradually form a good professional habit, cultivate the students' professional quality, asked the students to the standard requirement of enterprise employees themselves, train the ability of effective engineering.

## 5 CONCLUSION

- 1 The development of the discipline of safety engineering major has entered into the golden stage of development, professional set up in colleges and universities showed a trend of increasing year by year, the number of personnel training and quality continuously strengthen.
- 2 The government departments, enterprises, intermediary organizations, universities and research

institutes is the main safety engineering graduates employment direction, the enterprise is the main body of safety engineering professionals demand. Safety engineering talents cultivation quantity cannot meet the demand of market supply and demand contradiction ease and still I need to ensure the quality of talent cultivation under the condition of further safety engineering personnel training scale.

- 3 This article constructed in the talents training goal of "guide", "interactive" theory and the practice teaching system, "collaborative" talent training mode as the main content of the training mode, to set up safety engineering specialty in colleges and universities education teaching reform has provided the beneficial reference and exploration, to relieve the contradictions of industry security talent shortage, in order to promote the national production safety situation to achieve a fundamental improvement in the talent support and intellectual protection is of great significance.

# The compared research of modern sports teaching mode in China and the USA

Lin Jie Wei

*Xi'an University of Architecture & Technology, China*

**ABSTRACT:** This article lists the Chinese modern physical education modes: “Three basic” teaching mode; enlightenment teaching mode and comprehend teaching mode, compared with the health-optimizing physical education mode and sports education teaching mode, which have been popular in the United States in recent years in order to find the gap and promote the development of modern physical education mode in China.

**KEYWORDS:** China; America; physical education mode; compare research.

For a long time, China followed the traditional sports teaching mode that was dominated by teachers: the teaching method is single, the teaching effect is poor. It damages the enthusiasm and initiative of students learning, and causes students to “prefer sports to physical education classes”.

goal setting, self-monitoring, self-reinforcement, and resisting negative influences that prevent engagement in physical activity. It makes students not only in physical education classes, but also at the rest time, which student in the school will engage in physical activity.

## 1 ANALYSIS OF THE AMERICAN MODERN MODEL OF TEACHING

In 1910, Clark Hetherington earned the title of “father of modern physical education” with his landmark paper “Fundamental Education.” Hetherington described both the scope and the categories of the new physical education. Hetherington’s four phases became the four primary objectives of the new physical education: physical development objective; motor development objective; mental development; social development objective. Lesson plans and the model of teaching organized around the four objectives quickly became the standard in the physical education curriculum in schools. Typically, the Health-Optimizing Physical Education Mode and the Sports Education Mode.

### 1.1 *The health-optimizing physical education mode*

Health-Optimizing Physical Education (HOPE) has as its primary goal that children and youths develop and value a physically active lifestyle. In HOPE mode, physical educators typically have an expanded role that goes beyond their responsibilities to plan and teach the physical education classes. HOPE mode typically aims to help students learn ways of managing their physical-activity behavior through planning,

### 1.2 *The sport education mode*

Recently, the Sports Education mode has already entry into the United physical, educational curriculum and instruction literature (Siedentop, 1994; Siedentop et al., 2011). The sport Education mode is based on the assumption that good competition is both fun and educationally useful. It has five defining characteristics that distinguish it from more traditional forms of physical education: Sport Education is divided into seasons that are longer than typical education units in a multi-activity program; Students are organized immediately into teams, and they retain that affiliation throughout the season; Seasons are built around a series of competitions that grow increasingly complex as students master the techniques and tactics involved in the activity for that season; Accommodations are experiences by employing graded competition and contests pit teams of similar skill levels; The season ends with a culminating event that not only determines the seasonal champion but also provides a festive way to conclude the experience; Records are kept throughout the season so that students and teams can mark their progress.

In Sport Education, teams are organized so that each team has a mixture of more and less-skilled students. Each team member has a role to play in ensuring that the team performs well and that the season is a success. In addition to employing a smaller team

sized, the mode also encourages teachers to modify the conditions of play to help students acquire techniques and tactics.

## 2 ANALYSIS OF THE CHINESE “THREE BASICS” TEACHING MODE

### 2.1 “Three basics” teaching mode

“Three Basics” teaching mode is the most common mode that used in Chinese sports teaching. “Three Basics” teaching mode is central in learning basic sports knowledge, technology and skills, and follow the law of students’ cognition and skill forming, divided the teaching course into perception, understand, consolidate, application and so on. Teaching process follows the educational thought of the former Soviet Union educator Kelof. The Chinese sports education aim is pass on the Basic knowledge, basic technology and basic skill, that is “Three Basics”.

After the teacher raising the teaching content, object and task, the teacher using some teaching methods to promote students’ perceptual knowledge of learning content, form the visual imagery. Students will establish action kinesthetic representation, the correct muscles’ feeling and skill formation through the imitation and representation practice. Then, teacher summarizes the content of the learning, evaluation and points out the problems and teaching feedback effect. “Three basic” teaching mode emphasizes the teacher’s dominant and control function, teacher is the soul of the teaching and the main power source. Teacher arranging the teaching aim, task, requirements, practice time, speed and rate, and evaluation, students will successfully complete the study task as long as take the teacher’s command and requirement.

### 2.2 Comprehend teaching mode

Comprehend teaching mode by trying to start learning (understand) movement technology, changing the defect of pursues skills, but ignore students’ awareness of the whole sports and grasp of the characteristics of the movement to improve the teaching quality. Comprehend teaching mode arises the idea of that the students try to understand the importance of learning sports skills, using integrity teaching before use decompose teaching mode, then organize the teaching activities in the form of competition in order to improve the students’ learning enthusiasm. The operating procedures are: introduce project—tentative competition—find the problem—technology teaching focus on the problem one by one—integrity

practice—practice again. Comprehend teaching mode is suitable for all kinds of ball games.

## 3 ANALYSIS OF THE MODERN TEACHING MODE IN THE USA AND CHINA

### 3.1 *The analysis of the teaching aim and guiding ideology*

Chinese ministry of education promulgated by the national general school sports working guiding points out that: School physical education curriculum is to promote the healthy development of students, using the physical exercises as the main means, enhancing the students’ constitution, improve their health, promote the harmonious development of students’ body and mind through the reasonable physical education and scientific physical training process.

The guiding ideology of the United States school physical education emphasis on the education—through—the physical mode started with optimal individual development within a democratic social framework as its primary value orientation. Chinese guiding ideology focuses on the students’ individual wellness while the United States see the students’ development as the center of physical education.

### 3.2 *The analysis of the operation process*

Wu Jian analyzed nearly 100 cases of physical lessons over Chinese country. He comes to the conclusion that the order of Chinese physical teaching course is that: Preparation part—the main teach and exercise—relax. We can deduce that the teaching process is designed as the main line of the forming the movement and the exercise load. Preparation part encloses the introduce, warming activity, game and so on. Basic part is the core of the teaching, teacher arranging different teaching content according to the task, choosing the teaching method, and guide students get the movement skill. Ending part usually have physical fitness exercise, relax and conclusion.

The United States physical class is starting from the teacher introducing the class’s content. From the warming up, the teacher will arrange warm up exercise around the teaching content or directly into the main content without a warm up. They think that some teaching content doesn’t warm up because the tension of the activity won’t injure the student and some activities have the effect of warm up itself. We hardly find the preparation, basic and ending structure in the United State physical class, but the teaching purpose and content consistently throughout the whole class.

### 3.3 *The analysis of teacher and student relationship*

Chinese physical teaching mode emphasizes the class is the basic organizational form of teaching, it fully affirmed teacher play a leading role in the teaching course. They decided the teaching content, teaching method and evaluate students. The student will get the exercise knowledge and skill as quickly as possible and little detours. However, student in the teaching process is subordinate position, they passively accepting knowledge is badly to cultivate their personality, ability and interest. There are bigger difference comparing with the American student participate in the teaching design and planning. The students have higher enthusiasm and creativity into the course of learning.

In the United State physical teaching, teachers pay more attention to training students' potential, self-learning and self-design ability, they also give priority to the learning and emphasize "taking students as the center" and "interesting center". Teacher arranging suitable activity for students who made the learning aim and program by themselves and freely seek and create the activity apply to their style, and self-assessment of learning effects. Students are both the learner and the policymaker, they are completing the teaching task through their autonomous learning activities such as exploration, discovery, and communicate with each other. Teachers are guiding the process, but mainly inspire and encourage the student learning.

## 4 EPILOGUE

In conclusion, the difference between China and the United States is dramatic. Although Chinese sports, education has some significant changes after reform and development in recent years, but we still need to learn some advanced experience in teaching philosophy, teaching content setting, teaching subject, teaching methods and operating procedures to make the physical education apply to the rule of students' body and mental development. We should take the student as the teaching body, fully arouse the students' enthusiasm, creativity and social intercourse ability, at the same time of trains the student to have a healthy body, give full play to the sports teaching in shaping the students form a complete personality of an irreplaceable role in the process, make sports become an indispensable part of the students' life.

# Network information foraging behavior strategy of virtual scientific research team members

Qi Wang & Wen Yong Chen

*Library, Jilin Agricultural University, Changchun, China*

**ABSTRACT:** By investment-revenue analysis, the article discussed network information foraging strategy of a virtual scientific research team, and expounded the behavior mechanism of the most favorable information source, the optimal information spectrum, the most favorable information patchy and so on, and the significance of information behavior.

**KEYWORDS:** Virtual scientific research team; Information foraging behavior; Information foraging strategy.

## 1 INTRODUCTION

Information is an important resource element which the virtual scientific research team requires. To a great extent, the acquisition time, cost, and obstacles of useful information affect the users' willingness and satisfaction. When mankind entered the network-centric world, they had been drowned by the huge amount of information they created. "Information explosion" or even "information overload", which make users encounter more difficulties and challenges when they seeking and utilizing information. Although information can be transformed into knowledge, and then it can be into behavior, decision-making ability, whereas in the chain of information to knowledge to capabilities, information is the starting point, our primary task is to obtain information on the behavioral decision. Because of the complexity of the network information environment, we must take appropriate information foraging strategies to obtain information. One purpose of researching information foraging is to explain and predict how people taking the most optimal information foraging strategies to change their behavior to adapt the changing of information environment.

## 2 INFORMATION FORAGING THEORY

The discussed model is given as follows:

In the 1970s optimal foraging theory was first developed by anthropologists and ecologists to explain how animals hunting for food. It suggested that the eating habits of animals revolve around maximizing energy intake over a given amount of time. For every predator, certain prey is worth pursuing, while others would result in a net loss of energy. In the foraging process,

animals need to constantly evaluate the predation food contained energy and their consumption energy, by selecting different environment and different food to optimize profit, the assessment results determine the animals remain to pray there or to find another one.

In the early 1990s, Peter Pirolli and Stuart Card from PARC noticed the similarities between users' information searching patterns and animal food foraging strategies. Working together with psychologists they analyzed users' actions and information landscape that they navigated (links, descriptions, and other data), they showed that information seekers use the same strategies as food foragers. People also need to achieve optimal balance between time, money, energy and the required information during searching for information. Therefore, they first proposed the information foraging theory [1], and pointed out that in the process of searching and absorbing information, people often need to constantly adjust their information foraging strategy according to their information environment to maximize information earnings.

Information foraging theory consists of three major components: information patches, information scent, and diet information.

Information foraging is the process of people seeking, acquiring, and absorbing information. Information foraging strategy refers to various methods and measures which people adapt to obtain maximum information foraging efficiency. Information patches are an aggregate with a rich information resource as a physical metaphor in the information environment, it can be a website, a paper, a book, a web and a collection of documents people seeking information through them. Information scent is a conceptual extension of search scent; it is a subjective evaluation between the information and the information correlation during the information

seeking process, with a navigation action determining the information seeking methods. In short, the role of information scent helps people step closer to the information they require. In the process of searching for Internet information, people use information related marker to find the best information patches. Information diet refers to the kind of foraging information. Because of the regularity of network information resource distribution, and time, money and energy, etc. scarce resources people spending in foraging information, people face how to select information in seeking information. If they seek scope is too narrow, it will make people spend more time to build a seek mode and increase the seeking results one-sidedness; if the selected range is too wide, people could be flooded with the retrieved information again. Thus, it's important that people select the appropriate information diet to search information under the networked information environment.

So in seeking information, we evaluate the strength of the scent (determined by relevancy), the index of patch richness (how much relevant information are we likely to find) and the distance of the patch (how difficult is it to get).

Information foraging theory is a theory which applied the animal optimal foraging theory to how people searching for information under the network environment. Its assumptions are: (1) Before seeking information, there was a "built-in" information foraging mechanism, which people judged the information (resources) by information classification based on the existing contents in their mind, then make different information foraging strategies on the basis of the specific tasks required information. By revealing, mastering and using this mechanism, it can be better to understand people's searching behavior in the network, and guide technical personnel to improve design quality and usability of a website and searching engines for any other users. (2) People's browsing behavior is guided by the information scent on the Webpage. Since Peter Pirulli and Stuart Card put forward the information foraging theory, PARC researchers developed detailed and systematic on information foraging theory [2-4], and researched the SNIF-ACT information foraging model (Models of information foraging). At present, the research on information foraging countermeasures are developing rapidly and deeply, it has become one of the hotspots of information behavior and information retrieval theory.

### 3 INFORMATION FORAGING STRATEGIES

#### 3.1 *Increasing the net value of the information*

According to the information foraging theory, there are a variety of information resources in a network environment, and different information resources'

quality, enrichment and distribution pattern are not identical. Because of the time, money and energy limitation, people choose information resources will play an important role in the gain information efficiency. Then, how people search for and digest the information in the network environment?

During the process of seeking and absorbing information, people need to consume time, money and energy obtain the necessary information, but also get some net value of information, the formula is:

Net value of information = total energy information-seeking energy dissipation-processing and absorbing energy dissipation

The ratio between the net value of information and information processing time is a measure of information resources advantage, in which the information processing refers to the time from seeking to absorbing [4]. The information behavior study found, people always choose the more advantageous information resources in the information foraging activities. According to the research of Gursoy and Umbreit [5], people try to choose the maximum net revenue of information resources in the network information foraging. For information seekers, they will spend more money on collecting information from the higher cost information resources, so the information net income is higher in unit search time; though low cost information resources will spend less money, the useful information resources are too little, so the information net income provided will be smaller. Therefore, people should choose middle cost information resources in the information foraging, its net income in unit searching time is almost the highest, and the advantage is also great.

#### 3.2 *Enhancing the information density*

In people's information foraging activities, if the most advantageous information density in the information resources is small, information acquisition efficiency is low; on the contrary, the advantageous information density is large, the acquisition efficiency is higher, so people would choose some smaller advantageous information resources. It is because that if the most favorable information density and acquisition efficiency is low, the recognition time of people choose the most favorable information will be longer, acquired information net income of unit total processing time (total processing time, including recognition time and processing time) will be small; if the people have no strict selection on the information types, the recognition time will shorten and the information net income will increase. Under the network environment, people's information spectrum should include how much smaller advantageous types of information resources? Sandatrom, Agata and Spink have conducted in-depth investigation and discussion about this [6-8], they put

forward the optimal information spectrum elements, respectively, the main points are as follows: ① if the advantageous information availability increases, the information category in the optimal information spectrum will decrease; ② during people's information foraging, recognition time and information average benefit will decrease with the expansion of information spectrum range; ③ according to the information advantage and recognition time, the types in the optimal spectrum information could be presumed. Due to the need of information efficiency, people's unit time in taking information energy should be maintained at a certain level [9]. It can be speculated that: ① if there is enough favorable information opportunity to meet to ignore the poor information, then no matter the number of poor information will not affect the information foragers' specific selection of favorable information; ② if the favorable information number increases, information foragers will immediately transform various types information foraging into a single, favorable information; ③ the assumption that people have been foraging optimal information spectrum range of types of information resources, there are two kinds of new information resources of X and Y, when forage X, the intake information energy in unit total processing time more than meet the information value people demand; when forage Y, the intake information energy in unit total processing time below information numerical which people's information needs, people always forage information resource X, and refuse to Y.

Under the networked information environment, the optimal information spectrum should also include specific information or information elements (such as some data information, factual information and picture information etc.), which fulfills people's necessary information needs. Foraging this kind of information, cannot target information net income energy, but fulfill to increase people's knowledge or change the knowledge structure. In addition, the optimal information spectrum is usually with the change of information requirements and the networked information environment.

### 3.3 *Reducing the information foraging investment behavior adaptation*

Information patches is an important theory in information foraging. Information foraging theory considers [10], the network information environment presents patches structure and information patches is a spatial and temporal characteristics of cluster information. Like selecting the most favorable information resources, under the network environment, people will seek the most favorable information patches to forage, namely people prefer to foraging in big amount and good quality information.

People's information foraging activities usually cause the "reduction" of information patches' valuable information, or need more cost to obtain valuable information which make information patches availability "lower" by time [3]. Therefore, people should choose the appropriate time to stop information foraging behavior, or transfer another information patches to search for information in the condition of less expense or overcoming the low technical. What mechanism makes people transfer one information patch to another at the right time? In 2005 Ingwerson and Jarvrvo [11] from the cognitive view, pointed out: "like animal foraging behavior in nature, patches structure in network information environment has great influence on people's information foraging behavior, even a decisive role on. In the uncertain network information environment, people need to constantly assess the information seeking expected cost and information expected value to determine their information foraging behavior." Therefore, people stay or leave the information patches is determined by giving up time (Which is the longest time between obtaining useful information first time to the next time?). In the information patches with large enough information density, two information foraging time interval is short, no more than the giving up time, so people will not transfer; but with a reducing value of information density, the interval time gets useful information is gradually extended, once more than the giving up time, people will give up this information patches and transfer to another. Giving up time is related to the seeking time, information transfer costs and the difficulty degree of information foraging, it equals the time from the last obtaining the useful information to leave the information patches. In the "built-in" information foraging mechanisms, people may have a relatively fixed giving up time, as if there is an alarm clock after each information foraging, people will leave when they cannot forage information.

### 3.4 *Information sampling foraging behavior*

From the economics view, when people choice the most favorable information patches, they will reduce investment and improve efficiency of information foraging with the help of information behavior. So, how people learn the relative advantages of information patches? When people enter a new information environment for information foraging, they usually obtain information patches status in information environment by information sampling foraging (test retrieval) behavior, and make the most favorable information foraging decisions according to these information. Generally speaking, people focus on the maximum information density of information patches, when the most favorable information patches quality decline,

people will transfer to the second favorable information patches to continue foraging information. In addition, people usually depend on the previous web or one time information seek behavior accumulating all kinds of information resource abundance on the network, and store relative advantageous of every information patches for use.

#### 4 CONCLUSIONS

The information foraging theory development is very fast although it appeared not long. At present, China has begun to study the theory [12–13]. After some general overview of the information foraging theory, this paper discussed the network information foraging strategy of virtual scientific research team by investment-benefit analysis method to cause the attention of people.

## Exploration on adaptability education for college students

F. G. Meng, K. Wang\* & M.X. Zhu

*College of Electrical & Information Engineering, Beihua University, Jilin City, Jilin Province, China*

**ABSTRACT:** University life is a new world for high school students. Teachers should fully understand the characteristics of freshmen, and based on these, develop effective adaptability education for freshmen from the psychology, learning, environment and economy, and get students into roles as soon as possible to shorten the period of adaptation to the new learning environment and start to study and live in the university in good mind.

**KEYWORDS:** University students; Adaptability education.

### 1 INTRODUCTION

Entrance education for freshman is the foundation of the ideological and political work in the whole work of institutions of higher learning. Whether this work is successful or not, it directly determines whether the students adapt to university life and future development as soon as possible and the ideological and political work is smoothly carried out in institutions of higher learning.

Therefore, it has practical significance to fully understand the characteristics of freshmen, develop adaptability education on this fruitful basis, shorten the adaptation period to the new learning environment, promote the healthy growth of college students, guide students to establish a right outlook on life and the right outlook on the world, make a right self-evaluation and develop all aspects of their ability positively.

Li, Hui 2010. analyzed situation change at the beginning of the college life, the freshmen who have just passed the college entrance examination have to face a new world, bidding farewell to the familiar environment and being away from their parents, they start the collective campus life and tackle all to affairs in life independently in an unfamiliar environment, if lacking of care and warm, they may have a sense of loneliness naturally. Therefore, adaptability education on Freshman should pay attention to lead the students to adjust their mentality, adapt to the new environment, have a further understanding of themselves, adopt into the new collective as soon as possible, find their own position and finish the “four adaptations” as soon as possible.

### 2 ADAPTABILITY EDUCATION METHOD

#### 2.1 *Adaptation to the psychology*

One is to accurate self positioning, and complete role transformation successfully. The students who can enter university are the outstanding ones in the high school stage usually win the attention from the parents, teachers and students, and usually are the central figure in life. After entering the university, all kinds of talents get together, almost everyone here has a glorious past, and everyone is talent in the study and the master wizards, if rescheduled for seating, only a few people can keep the original center position and role.

In contrast, most of the students will change from a central role to the general role, superiority of many students suddenly will disappear, as well as the confidence in their own ability, even they will have a strong sense of inferiority and lose power and enterprising, which will make many students fail in finding their positions. Therefore, it is necessary to teach students to adjust their own state of mind, learn to find their own strengths, accept the “not perfect” yourself, relax the ropes binding their spirit and adopt into university life in a cheerful mood.

#### 2.2 *Adjust expectations*

Establish and maintain a good attitude. Most freshmen have higher expectations of the university that have admitted them, and make a tentative plan and outline about the future of alma mater in their mind preschool. While after entering university, they find there is a large gap between the reality and expectation, including school hardware facilities, as well as

the school's various rules and regulations, some may be disappointed, frustrated and even rebellious.

In Lin, Lixia & Ru, Zhengkai, it is necessary to guide the students to face the reality and their own, lower their expectations, accept the "not perfect" environment, learn to self build good, optimistic, healthy, upward attitude, for university life, actively adapt into college life, and actively seek their own development under the existing conditions rather than blindly complain. Otherwise, the pessimistic disappointed mood will only contain the normal development and growth of themselves.

### 2.3 *Adaptation to the study*

Zou, Changhua & Han, Jiantao (2011) pointed out that college students' learning is a professional learning in a domain, adapting to a professional is one of the objectives of learning adaptation for college students. College students' professional adaptation levels directly affect the achievements of professional learning and the future employment for college students.

On the one hand, the university class site is "hit a shot for a place" which is different from the "a carrot a pit" in high school. And the library, Internet bar, dormitory, study room also has a big difference in the status of students in the study. Therefore, the Freshman adaptation education must help the students understand how to use the library, how to make use of the network, how to through various channels to obtain more information and how to use modern means of science and technology to master the use of their knowledge and improve their ability.

On the other hand, after entering the University, the teaching mode has changed from the teacher-centered mode to the student-centered self-study mode. The knowledge the teacher taught in the classroom teaching are just outline and framework, students not only have to digest classroom learning content, but also read a lot of related books and documents related, achieve mastery through a comprehensive study of the subject finally.

Effects of learning method for the learning results are self-evident, while the learning method in the University is different from that in primary and middle schools, self-learning ability has become an important factor affecting academic achievement, many students find it difficult to adapt to it. Therefore, it is necessary to carry on a series of learning methods introduction and learning experience exchange. With the help of the planned introduction and explanation of The characteristics of the University and the general method; the constantly exploring and learning in the actual study, active observation and thinking; learning experience introduction and exchange

between the new and the old, these can enable students to gradually adapt to the learning form and characteristics in university to learn the form and characteristics of learning and pass learning adaptation period smoothly.

### 2.4 *Adaptation to the environment*

Tian, Jiaqi (2013) analyzed the economic interaction between the university and the surrounding area is strong, which has a very strong correlation function. Because of the "school economic effect", the entertainment places around the colleges and universities attract students' consumption and hit on their likes. The students, who have been depressed by the college entrance examination students for a long time, once excessively relax themselves, various problems will occur. Some students indulge in surfing the internet and playing computer games all night, chatting and watching movies, which abandon their studies. Therefore, we need to carry out "self control, self education and self management" education among freshmen, teach students to deal with the relationship between learning and entertainment, learn how to be webmasters and carry out a number of preventive education.

### 2.5 *Adaptation to the economy*

In Zhang Yuanhong & Kong Qingna (2013) for the vast majority of students, entering the University is the first step for them to begin independent living in the true sense. After the University, the living environment has changed a lot, without the daily care of the parents and the elders, many things need to handle alone. From the family life that cannot live without parents to university life that everything needed to be handled independently, everything should be learned from the very beginning. Therefore, learning how to manage money is the first lessons to students learn to live independently for students.

With the national college recruitment of students, paying for university has been accepted by the students and parents. But as the increase of tuition fees and living consumption level, the economic capacity can bear by more and more families is very limited.

Therefore, the adaptability education in freshmen should involve in teaching students to consider, which costs in your life is a must, which is not. At the same time, they should learn to make their own consumption plan according to family economic ability, develop the habit of thrift rather than following the fashion or love ostentation.

In order to make the students adapt to the university life as soon as possible, it should require every

freshmen to adjust attitude actively, and make comprehensive understanding and relocation of themselves; do not have the psychological fear because of not adoption; do not have a sense of loss because of the disappear of the learning advantage; do not have a sense of disappointment because of the not adaption to the living environment; do not have a sense of inferiority because of temporary economic difficulties. To do this work well will play an effective role in the whole educational process.

# An empirical analysis of competitiveness of foreign trade in Guizhou province

Wei Liu & Yan Shang

Guizhou University of Finance & Economics, Guiyang, Guizhou, China

**ABSTRACT:** In recent years the economy grows rapidly in Guizhou, and foreign trade has developed fast. This paper reveals an index of comparative advantage and trade competitiveness through the share index of the international market, and evaluates the status of the competitiveness of foreign trade from many angles, which will promote the reasonable and healthy development of the foreign trade in the province.

**KEYWORDS:** Foreign trade; Guizhou; Competitiveness; Index analysis.

## 1 THE STATUS OF FOREIGN TRADE IN GUIZHOU PROVINCE

Guizhou province is located in China's southwest, it has a pleasant climate, nationalities, resources, tremendous development potential. However, due to historical reasons, the province's lags of economic development is behind and low degree of opening to the outside world, foreign trade and the utilization of foreign capital started too late. In 30 years of reform and opening up, foreign trade enters the stage of rapid growth, and it has made a positive contribution to the healthy and stable development of the economy. Especially since it joining in WTO, foreign trade in Guizhou presents the following features:

### 1.1 *The total of foreign trade has grown steadily*

Since 2002, the total volume of foreign trade has increased by 9.6 times, the absolute surplus rose by \$5.94 billion. Along with exports rising from 440 million in 2002 to 4.95 billion in 2012, 12 times, the absolute surplus rose by \$4.51 billion. Imports rose from 250 million in 2002 to 1.68 billion in 2012. This figure was 6.7 times bigger than before, while the absolute surplus rose by \$1.43 billion. Surplus of foreign trade increased from 190 million in 2002 to 3.28 billion in 2012. Increasing the scale of foreign trade has given a strong push to foreign economy, and improved the upgrading of industrial structure and export-oriented economy.

### 1.2 *The growth fast and huge potential*

From 2002 to 2012, the average growth rate of the total amount of foreign trade in Guizhou annually has reached 29%. Export has grown by an average of

30.5% in a year, and import has grown by an average of 27% in a year. In 2003–2011, the average annual growth rate of import and export in China was 21.7% and export was an average of 21.6%, and import was an average of 21.8%. It is obvious that the growth speed of foreign trade in Guizhou is higher than the national average. Especially in the severe financial crisis of 2008, the export of Guizhou province remained 30% growth, higher than the 24.8% growth of the whole country. Rapid development of foreign trade gives a drive to GDP, and it is an important source of leapfrog development in the province.

### 1.3 *Structure optimization of export commodity*

Structure of export commodity is the important basis to measure a foreign trade's situation of the structure, and the change of structure reflects a large extent the change of industrial structure. Export continued to maintain growth in 2011, of which the export of primary products stood for \$331 million, accounting for 11.07% of the total amount of export in the province, decreased by 5.2% than last year. Export of manufactured goods was \$2.65 billion, accounting for 88.9% of the total amount of export in the province, increased by 4.8% than last year. The decline of the primary products and the proportion of manufactured goods suggest that structure has been optimized, and Guizhou is in the rising stage of industrialization.

### 1.4 *Foreign trade gives priority to Asia, more diversified import and export market distribution*

According to the statistics in 2000–2010, the proportion of trade that Guizhou with Asian partners is 57% or more every year. The nations within the association

of Southeast Asia is the largest trading partner and the largest export market for Guizhou. In 2011 the export trade in Guizhou was \$507 million, accounting for 26.7% of the whole exports. Export trade with Hong Kong, Japan and South Korea are respectively \$228 million, \$107 million and \$067 million. This suggests that these countries have done an international trade with Guizhou very often because of the Asian geographical advantages. By 2010, export of Guizhou has spread to 139 countries and regions, and the top 10 are the United States, Indonesia, Australia, Japan, Vietnam, India, Taiwan, Korea, Hong Kong and Thailand, which suggest that Guizhou has gradually formed a key and full range of diversified pattern of foreign trade market.

## 2 AN INDEX ANALYSIS ON COMPETITIVENESS OF FOREIGN TRADE IN GUIZHOU PROVINCE

Foreign trade competitiveness refers to the ability that gets marketed and profit from a country or region. The country with the competitiveness can trade their products, industry. We generally selected indicators visually that can indicate the result of the international competitiveness when analysis and evaluating the international competitiveness of foreign trade. Here we choose RCA and TC to make analysis on the situation of competitiveness of foreign trade of Guizhou province in recent years.

### 2.1 The share analysis of the international market

The share index of the international market is the most simple and important index to reflect the competitiveness of a country's foreign trade. It refers to the products export of a country or region accounted for the proportion of the total amount of the world. The greater the proportion is that the stronger the international competitiveness of the export commodities is; the smaller the proportion is that the weaker the international competitiveness of the export commodities is. In 2006–2011, the scale of export trade expands unceasingly in Guizhou province, accounting for the proportion of China's export rising from 0.009% to 0.016%, while the proportion comparing with other provinces is in a large gap. But this figure presents a rising trend overall, which suggests that the trade competitiveness of Guizhou export commodities is enhanced.

### 2.2 Analysis of revealed comparative advantage index

The revealed comparative advantage index refers to the size that the proportion of a certain type of the products in export of one country or region relative

to the product in total world. In general, the RCA value is greater than 1, and it is said this product has a comparative advantage in the international market and a certain international competitiveness; the RCA values are less than 1, and it is said this product didn't have a comparative advantage in the international market, and the international competitive power is relatively weak. Due to the limit statistical data, this article divides the products into two major categories of primary products and manufactured goods, from 2006 to 2011. The RCA index analyzes the general situation of export trade in Guizhou. We know that the RCA index of primary products and manufactured goods in Guizhou less than 1 from table 1, but the RCA index is slightly higher than agricultural manufactured goods, which shows Guizhou is in a comparative disadvantage in foreign trade. It should be done to improve the added value of manufactured goods, while increasing the export volume at the same time and the international competitiveness of primary products.

Table 1. 2006–2011 RCA index of the export product in Guizhou.

year	primary	manufactured
2006	0.01063	0.02287
2007	0.01081	0.02855
2008	0.02067	0.02569
2009	0.01401	0.02404
2010	0.01437	0.02681
2011	0.01318	0.03519

### 2.3 Analysis of trade competitiveness index

TC refers to the proportion of a region's difference between the import and export trade for which accounts the total amount of import and export trade, namely the TC index = (exports – imports)/(exports plus imports). The indexes as a relative value are always between -1~1, eliminating the economic expansion and fluctuation. Its value is close to -1 indicates the competitiveness is weak, -1 is said the industry is only import without any export; the more close to 1 indicates the greater competitiveness, 1 is said the industry is only exported without any import. In 2006–2010, the TC indexes of Guizhou in the aspect of food, chemical industry and related industrial products, machinery and electronic products are greater than zero, and in which the competitiveness of food export is very strong with the TC index remained steady at 0.98 above. This figure shows that the food industry is at specialization level. Chemical industry and related industrial products, during 2006–2010, the TC index were 0.925, 0.954, 0.929, 0.936, 0.929; Mechanical and electrical products had kept rising,

grew steadily from 0.104 in 2006 to 0.327 in 2010. The TC index of minerals had been negative, which showed this industry was at imported professional level.

### 3 CONCLUSION

We can get the following conclusions from the multi-angle analysis of foreign trade competitiveness in Guizhou province that the foreign trade has been growing at a speed, while the share of international market increasing. But because of a lower base, smaller scale, the overall competitiveness of foreign trade is still relatively backward. In view of the situation of foreign trade competitiveness, in order to realize the development of foreign trade faster and better, it is urgent to need us to adjust the optimization structure of export commodity and develop the advantage industry; to encourage and guide all

relative enterprises to participate actively in international competition and achieve the scale of economies; to increase the intensity of investment and capital introduction and expand the international market share of foreign trade in Guizhou; to strive to improve the soft environment for investment in order to improve the export competitiveness of foreign trade.

## Evaluating the function and effect of an educational game

J.J. Tang & W.Q. Qu

*Institute of Educational Technology, Beijing International Study University, Beijing*

**ABSTRACT:** In order to survey its utility, we evaluated an educational game which was popular in China mainland. The research method was questionnaire survey. According to the statistical analysis of the survey, the effect of education is far below than expected. The users are not satisfied with the educational function of the game. The game designer is supposed to improve game to help users developing positive emotions and attitudes and correct living values.

**KEYWORDS:** gamification, game-based learning, educational game.

### 1 INTRODUCTION

Game-based learning is a process which makes students acquiring knowledge, skill and attitude with pleasant studying experience through using educational games in classroom or self-study<sup>1</sup>. In a broadest sense, educational game includes all games owing educational values. In a narrow sense, educational game is a computer game designed for certain teaching objects. As a new teaching and learning tool, educational game is getting so popular that the US government holds a National STEM Game Design Challenge every year<sup>2</sup>. In china, more and more games companies occupy educational game markets and invest more and more in developing educational games.

### 2 THE NECESSITY OF EVALUATING THE EDUCATIONAL FUNCTION OF EDUCATIONAL GAME

In recent years, many educational games have been put published, such as Mole manor, Roco Kingdom, Disney Club Penguin, webkinz, and poptropica etc.

By means of attracting many users, these games became popular quickly. However, the weak educational function leaves a negative impression on users' mind. Meanwhile, a lot of people worried about the violent images arising from the game. Even some people doubted the aim of the designer's objective on education. They also have questions on whether this product suits, children's cognitive ability.<sup>3</sup>

So it is necessary to evaluate the function of these games. We chose a popular educational game called Umfun in china to evaluate. This game declares that

its users are the students at the age of 12 to 16. The game aims at creating a happy learning environment, making knowledge learning through games.

### 3 THE METHOD OF EVALUATING

In order to evaluate the function of the Umfun game on education, A scale was designed. Based on the scale, a survey was made by the online system. After a statistical analysis of the survey's result, a conclusion has been drawn. In the survey, six hundred and forty-six students from 4 schools were being invited to complete this survey online. Among them, 534 are valid. Among the 534 students in case, 48.7% are boys, 51.3% are girls; 58.9% are 13 years old, 41.1% are 14 years old.

### 4 DESIGN OF THE SCALE

There are 35 items in this scale, divided into 3 dimensions: accessible UI, entertainment, education respectively.

Dimension one, the accessible UI can be seen from three aspects: rational layout, beautiful interface, convenience. Dimension two, the entertainment elements can be measured from the following five points: easy and comfortable hand control, authentic scenario experience, happy role players experience, wonderful success experience, pleasant communicating experience.<sup>4</sup> The third Dimension, the educational function is indicated in three parts: skills and knowledge, emotion, attitude and values.<sup>5</sup>

Answers and Score of each item:

For each item, there are five different answers. For each answer, different score is given.

Table 1. Answer and score of each answer.

	A.	B.	C.	D.	E.
answer	excellent	good	fair	poor	disappointing
score	5	4	3	2	1

## 5 THE STATISTIC ANALYSIS OF THE SCALE

### 5.1 The average score and standard deviation of each dimension

Table 2. The average score and standard deviation of each dimension.

Dimension	Average	Standard deviation
Accessible UI	3.562	.78359
entertainment	3.361	.45736
education	3.038	.28154

Table 2 shows the average score of each dimension and its standard deviation of each dimension. In this table, the average score of all dimensions is above “fair” and less than “good”. However, the average score of educational dimension is the lowest among the three dimensions while the entertainment dimension is in the middle and the UI is highest, which indicates the design of the game’s interface is best and the players like its accessibility and convenience.

Table 3. The average score and standard deviation of UI’s three factors.

Dimension	Average	Standard deviation
rational layout	3.394	.35434
beautiful interface	4.221	.58764
convenience	3.073	.36879

The above table shows the average score and standard deviation of the three aspects of UI dimension. All of these average scores are above “fair”. Especially, the average score of beautiful interface is high than 4, which indicates users thought the game’s UI is beautiful.

Table 4 shows the average score and standard deviation of the five points of entertainment. Most of these average scores are higher than three, which indicates the entertainment of this game is in the middle level. However, the average score of authentic scenario experience is “poor”. It is probably due to the

effect of the 2-D image of the game, which the users are not satisfied.

Table 4. The average score and Standard deviation of entertainment’s five points.

Dimension	Average	Standard deviation
Easy and comfortable hand control	3.116	.82334
Authentic scenario experience	2.814	.38728
Happy role players experience	3.535	.56322
Wonderful success experience	3.976	.67323
Pleasant communicating experience	3.669	.48729

Table 5. The average score of and Standard deviation from the three parts of educational function.

Dimension	Average	Standard deviation
emotion and attitude	2.911	.37657
skills and knowledge	3.383	.42325
value	2.821	.47845

Table 5 shows the average score and Standard deviation of the three parts of educational function. Among them the average score of skill and knowledge is higher than 3 while the other two are lower than 3. It indicates that the users can gain some knowledge and skills, while they don’t think the game is helpful for developing proper attitude and value.

### 5.2 Influence of age and gender on the result

Table 6. The influencing factors of age.

Dimension	age	N	average	Standard deviation	T value
Accessible UI	13	289	3.573	0.3755	0.478
	14	245	3.549	0.4128	
entertainment	13	289	3.401	0.7233	1.373
	14	245	3.313	0.8761	
education	13	289	3.031	0.3564	0.528
	14	245	3.046	0.3126	

Table 6 shows the influence of age of students in case on the survey result. Through T value, we know there is not distinctive difference in accessible UI and education, while there is a distinctive difference

in entertainment, which indicates different age users have different evaluations. The younger users prefer to play this game.

Table 7. The influencing factors of gender.

Dimension	Gender	N	Average	Standard deviation	T value
Accessible UI	Boy	253	3.573	0.4768	0.981
	Girl	281	3.552	0.3656	
Entertainment	Boy	253	3.454	0.8433	2.35
	Girl	281	3.251	0.7876	
Education	Boy	253	3.051	0.2541	0.967
	Girl	281	3.026	0.2178	

Table 7 shows the influence of gender of students in case on the survey result. Through T value, there is distinctive difference in entertainment, which indicates that the boys prefer to play this game, while the girls are not satisfied with the game's entertainment.

## 6 CONCLUSION

Through the analysis of the above data, one conclusion can be drawn that the overall level of the game is good because the most average scores of the dimensions are higher than the average level. However, taking the game's original object into consideration (creating a happy learning environment, making

knowledge learning through games), the effect is far below. In the meanwhile, the average score of "emotion and attitude" and "value" is much lower than expected. This shows that the users are not satisfied with the educational function of the game. The game designer is supposed to improve the effect of education as well as eliciting users' positive "emotion and attitude" and "value".

The purpose of the educational game is to promote learning. However, the educational function of deficient. Thus, if the educational game only attracts users playing games without helping users to achieve the educational object, it is a failure. So the finding of this article is to remind the game designer putting more energy into developing new process and method to improve the educational efficiency in the future. New games are expected to produce for users to form a good habit of learning, to help users developing positive emotions and attitudes, to build correct living values.

# Research into validity of implementation of humanistic quality-based education in integrated English teaching of English major

Zhi Hong Wang

*Anhui Xinhua University, Hefei, China*

**ABSTRACT:** The current situation of the English major in China shows that humanistic qualities are indispensable factors in the cultivation of English majors. An experimental study is adopted to compare academic achievement and humanistic qualities of the experimental class with those of the control class both before and after the teaching experiment, aiming to explore the validity of the implementation of humanistic quality-based education in Integrated English teaching. The results indicate that humanistic quality-based education is helpful to enhance the students' overall qualities, improve academic achievement and reform the teaching mode.

**KEYWORDS:** Integrated English; Humanistic Qualities; Validity; Academic Achievement.

## 1 INTRODUCTION

### 1.1 Background

Since 1970s, the concept of humanism, as well as humanistic approach, has gained attention from people at home and abroad. Hamachek (1977: 149) believes that "humanistic education starts with the idea that students are different, and it strives to help students become more like themselves and less like each other." Williams and Burden (1991: 38) summarize a number of humanistic messages for the language teacher, like creating a sense of belonging, involving the whole person, developing personal identity, encouraging creativity, developing knowledge of the process of learning, allowing for choice, etc. In China, some scholars emphasize the importance of humanistic quality in the English major. He (2004) holds that the features of English major lie in the fact that students majoring in English should not only have a higher proficiency in language than non-English major students, but also have stronger humanistic qualities than common English learners. Hu and Sun (2006) analyze the disadvantages in foreign education: just because humanistic education only makes up a lower percentage in the whole education, foreign language major students are weak in humanistic foundation and critical thinking, and have a superficial understanding of western culture and Chinese culture. Therefore, English education should revert to humanistic education, focusing on the training of talents by general humanistic quality-based education.

### 1.2 Objective

The present research aims to research the validity of the implementation of humanistic quality-based education in Integrated English teaching, focusing on three issues: whether humanistic education is helpful to the enhancement of students' overall qualities, whether humanistic education is conducive to the improvement of academic achievement, and whether humanistic education is advantageous to the reform of teaching mode.

## 2 CONNOTATION OF HUMANISTIC QUALITIES

Many scholars believe that humanistic qualities are comparatively stable internal qualities, but they differ in the understanding of the components of humanistic qualities (Shi 2008:12). Hu (1998: 29) argues that humanistic qualities are composed of knowledge, ability, concept, emotion, willpower, etc. Qian (2001:184) asserts that humanistic qualities cover humanistic scientific knowledge, social psychology, cultural cultivation, and humanistic spirit, and so on.

According to the practical teaching situation, research purpose, and the definition of humanistic qualities given by Baidupedia, human qualities can be defined as the integration of three aspects, including humanistic knowledge, humanistic competence and humanistic spirit. Humanistic knowledge is the basic knowledge about humanistic fields, like history, literature, politics, law, arts, philosophy, morality,

language, etc. Humanistic competence refers to the ability to apply humanistic knowledge to practice, including practical ability, interpersonal ability, creation ability, organizational ability, communication ability, and aesthetic ability. Humanistic spirit constitutes the base of world view and value stemming from humanistic thoughts and humanistic methods, represented in the concern for current affairs, creative spirit, morality, psychological qualities and legal awareness, etc.

### 3 RESEARCH PROJECT

#### 3.1 Research plan

For English major in China, the course of integrated English lasts two academic years. Approaching the end of the first academic year, a survey is conducted to examine the situation of humanistic qualities of the English major. Then two classes are selected as the experimental class and the control class respectively. During the second academic year, the experiment on implementation of humanistic quality-based education is carried out at the teaching of Integrated English. In order to control the influence of other factors on teaching effects, the same teacher adopts two different teaching methods to teach the two classes.

In the control class, the teacher plays the role of a lecturer, spoon-feeding students with language points and humanistic knowledge in each unit; students follow the rote-learning pattern; interaction between teacher and students is lacking in the classroom.

On the contrary, the teacher informs the students in the experimental class of the teaching method, and classifies the whole class into 6 small learning groups according to sex, academic achievement, learning style, etc. Each group leader organizes group members to learn the assigned task. The teachers' role transfers from a sole lecturer to a guider, advisor and supporter.

At the end of the fourth semester, the experiment is over. Then another questionnaire is used to compare the two classes from the perspectives of academic achievement, humanistic quality, and teaching effect.

#### 3.2 Research subjects

The research takes the students in the parallel two classes as subjects, with 23 students in each class.

#### 3.3 Research tools

Before and after the experiment, a questionnaire with the same structure but different contents is used to examine students' present humanistic qualities. The

first part includes 12 questions, covering politics, economy, culture, literature, etc., aiming to investigate students' humanistic knowledge. The second part and the third part are presented in the form of Likert Scale, with five options, i.e. "Completely Agree"(5 points), "Agree"(4 points), "Neither Agree Nor Disagree"(3 points), "Disagree"(2 points), and "Completely Disagree"(1 point). In the second part, there are 12 questions of multiple choices, helping students reflect on their humanistic competence, including practical ability, interpersonal ability, creation ability, organizational ability, communication ability and aesthetic ability. The third part contains 10 questions of multiple choices, exploring students' humanistic spirit, like the concern for current affairs, creative spirit, morality, psychological qualities and legal awareness.

### 4 RESULTS

#### 4.1 Pre-test result

Before the experiment, the first questionnaire is used to examine the students in the two classes, aiming to collect their humanistic quality data. The academic achievement of the second semester is taken as the pre-test score. SPSS 13.0 is adopted to do Independent-Samples T Test, thus obtaining the results of academic achievement and humanistic qualities.

Table 1. Pre-test result of academic achievement and humanistic qualities of the students.

Items	Class	Mean	Std. deviation	Std. error mean
Pre-test Score	1	81.3043	5.68439	1.18528
	2	80.9565	6.63653	1.38381
Humanistic Quality	1	29.13	5.354	1.116
	2	29.61	6.900	1.439
Humanistic Knowledge	1	3.09	1.676	0.350
	2	3.17	1.267	0.264
Humanistic Competence	1	14.26	3.583	0.747
	2	14.22	4.348	0.907
Humanistic Spirit	1	11.78	2.522	0.526
	2	12.22	2.999	0.625

In the tables through the article, Class 1 is the control class while Class 2 is the experimental class. A conclusion can be drawn from Table 1 that the two classes do not differ very much in academic achievement and humanistic qualities, for the difference of the mean is less than 1.

Table 2. Pre-test result of independent test samples.

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pre-test Score	Equal Variances: assumed	.596	.444	.191	44	.849	-.34763	1.82204	-3.32428	4.01990
	Equal variances: not assumed			.191	42.988	.860	-.34763	1.82204	-3.32670	4.02238
Humanistic Qualities	Equal variances: assumed	.689	.421	-.263	44	.794	-.478	1.821	-4.148	3.192
	Equal variances: not assumed			-.263	41.442	.794	-.478	1.821	-4.166	3.198
Humanistic Knowledge	Equal Variances: assumed	.821	.372	-1.98	44	.844	-.087	.438	-.970	.796
	Equal variances: not assumed			-1.98	40.947	.844	-.087	.438	-.971	.798
Humanistic Competence	Equal variances: assumed	.701	.407	.037	44	.971	.043	1.175	-2.324	2.411
	Equal variances: not assumed			.037	42.449	.971	.043	1.175	-2.327	2.414
Humanistic Spirit	Equal variances: assumed	.216	.648	-.832	44	.597	-.436	.817	-2.082	1.212
	Equal variances: not assumed			-.832	42.740	.597	-.436	.817	-2.083	1.213

From Table 2, it can be seen that significance level of equal variances  $> 0.05$ , indicating that equal variances is assumed. Besides, a significant level of pre-test score is  $0.849 > 0.05$ , and significance level of humanistic qualities is  $0.794 > 0.05$ . Therefore, under the condition of 95% confidence interval of the difference, there is no significant difference in students' academic achievement and humanistic qualities. This fact proves that the precondition of the teaching experiment is valid.

#### 4.2 Post-test result

After a school year's teaching experiment, the second questionnaire is used to examine students' humanistic qualities. In addition, the final examination result is taken as post-test score. Independent-Samples T Test is conducted again.

Table 3 shows that the students in the two classes differ in academic achievement and humanistic qualities. Compared with the control class, the students in the experimental class have higher numerical value in post-test scores ( $> 3.26$ ), humanistic quality ( $> 3.65$ ), the three components of humanistic quality ( $> 0.92$ ,  $1.35$ , and  $1.44$  respectively).

Table 4 shows that significance level of the post-test score, humanistic quality and its three components of the two classes  $< 0.05$ , so under the condition of 95% confidence interval of the difference, there is a significant difference in the two teaching methods. The result proves that the students in the experimental class have improved their

Table 3. Post-test result of academic achievement and humanistic qualities of the students.

Items	Class	Mean	Std. deviation	Std. error mean
Post-test Score	1	80.7826	5.96929	1.24468
	2	84.0435	4.65616	0.97088
Humanistic Quality	1	83.35	2.534	0.528
	2	87.00	3.943	0.822
Humanistic Knowledge	1	4.43	0.992	0.207
	2	5.35	1.774	0.370
Humanistic Competence	1	40.52	2.150	0.448
	2	41.87	2.160	0.450
Humanistic Spirit	1	38.39	2.426	0.506
	2	39.83	2.348	0.490

academic achievement and humanistic quality after one school year's experiment.

#### 4.3 Interview

Interview with the students from the two classes reveals the following information. The students in the experimental class are satisfied with the teaching method, for they have improved their learning habit and take initiative to gain knowledge and practice skills. By contrast, the students are accustomed to indoctrination by means of spoon-feeding method. They feel they lack practical ability, but they do not know how to improve themselves.

Table 4. Post-test result of independent samples test.

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Post-test Score	Equal Variances assumed	1.868	.179	-2.066	44	.048	-3.26087	1.87886	-6.44224	.07960
	Equal variances not assumed			-2.066	41.838	.048	-3.26087	1.87886	-6.44787	.07417
Humanistic Quality	Equal variances assumed	5.903	.019	-3.737	44	.001	-3.662	.977	-6.622	-1.683
	Equal variances not assumed			-3.737	37.822	.001	-3.662	.977	-6.631	-1.673
Humanistic Knowledge	Equal Variances assumed	5.578	.023	-2.155	44	.037	-.913	.424	-1.767	-.059
	Equal variances not assumed			-2.155	34.537	.038	-.913	.424	-1.774	-.082
Humanistic Competence	Equal variances assumed	.052	.821	-2.121	44	.040	-1.348	.635	-2.629	.067
	Equal variances not assumed			-2.121	43.999	.040	-1.348	.635	-2.629	-.067
Humanistic Spirit	Equal variances assumed	.001	.970	-2.038	44	.048	-1.435	.704	-2.854	-.016
	Equal variances not assumed			-2.038	43.983	.048	-1.435	.704	-2.854	-.016

## 5 DISCUSSION

### 5.1 Influence of humanistic quality-based education on individual overall quality

After one-year experiment, the students in the experimental class have improved themselves in the three aspects of humanistic qualities. The reasons for the students' progress can be analyzed in the following points.

First, proper learning tasks guide students to take the initiative in gaining humanistic knowledge. The teaching course book contains all kinds of humanistic knowledge points. The teacher designs some learning tasks centering around the knowledge points related to the theme of the text, and assigns them to smaller learning groups who are responsible for searching relevant information and sharing the knowledge with the whole class. The group work enables students to play an active role in the learning process and grasp the knowledge through practice.

Second, effective group work offers students the opportunity to improve humanistic competence. Each small group consists of 4 or 5 students with diversified learning abilities and learning styles. The group leader organizes each member to finish the assignment. Someone is responsible for searching useful materials from websites or library, others for writing down a coherent article, and still others for presentation. In the cooperative activity, students

improve interpersonal ability and an organization's ability from cooperation, cultivate practical ability, creation ability and aesthetic ability from preparing the presentation material, and enhance communication abilities from presentation and oral defense. After experiencing various learning tasks, naturally, students heighten their humanistic competence.

Third, the fair encouragement mechanism promotes humanistic spirits. The teacher helps students make the fair and equal regulations concerning the encouragement and punishment. So every student is motivated to make progress and develop the honor of collectivism in the atmosphere of cooperation and competition. While doing learning tasks, students heighten morality, temper psychological quality, and cultivate the awareness of observing regulations.

Fourth, extracurricular practice guarantees the internalization of humanistic knowledge and humanistic competence into humanistic quality. Humanistic knowledge can be gained from teaching and learning, while humanistic quality cannot be acquired from teaching. Because the cultivation of humanistic quality follows a certain rule: it is only during practice that a person can improve his humanistic quality by drawing on human knowledge and humanistic competence to solve the problems or meet the challenges. As a result, humanistic quality-based education requires the integration of classroom teaching and

extracurricular practice. The teacher should encourage students to participate in all kinds of activities, like English competition, English speech contest, translation competition, social practice, volunteer service, etc. Students may enhance the humanistic quality of these useful activities.

### 5.2 *Influence of humanistic quality-based education on academic achievement*

Implementation of humanistic quality-based education in teaching helps students make progress in human knowledge, humanistic competence and humanistic spirit. Humanistic knowledge and humanistic competence guide students to develop overall quality in all-round, while humanistic spirit imbues students with healthy personality. All these qualities stimulate the students' learning ability from both IQ and EQ, and further exert a positive influence on academic achievement.

### 5.3 *Influence of humanistic quality-based education on teaching mode*

During the process of implementation of humanistic quality-based education in teaching, the teacher does not need spoon-feed students with language knowledge, but guides students to accomplish learning tasks by means of task-based teaching or cooperative learning. While students are taking initiative in gaining language knowledge and humanistic knowledge, they practice humanistic competence and acquire humanistic spirit.

## 6 CONCLUSION

Implementation of humanistic quality-based education in integrated English teaching reveals the following three conclusions.

First, implementation of humanistic quality-based education is conducive to the heightening of students' overall quality. It is the whole-person education that plays a subtle impact on students' healthy growth. Accordingly, students perfect their overall quality while accomplishing learning tasks.

Second, implementation of humanistic quality-based education is advantageous to the improvement of academic achievement. Students may experience humanistic love in the harmonious yet competitive atmosphere, and take full advantage of subject awareness to form sustained inner driven power, thus helping individual self-learning, self-development and self-actualization.

Third, humanistic quality-based education is beneficial to the reform of teaching mode. It is different from the spoon-feeding teaching mode, for it can realize the teacher's guiding role and students' initiative.

## A brief talk about harmonious ideological-education

Yu Ting Dong

*College of Software, Jiangxi University of Science and Technology, Nan Chang, Jiang Xi, China*

**ABSTRACT:** The ancient great history recorder Sima Guang said “the one who is intelligent is the one who has morality, but the one who already has morality may not be intelligent”. College- and university students are our nation’s precious resources, and they are the hope of our people and the future of our country. At the same time, they are the treasures in our people’s eyes. Moreover, history makes them take the responsibilities to revive our nation. So, it appears that it is very necessary to give our students an education on morality. In order to achieve this point, many colleges and universities have already put efforts into it, but it appears to have little effect. This text will talk about the method of building a harmonious mind by teaching them “forgiveness” “benevolence” “bravery” and “independence”.

**KEYWORDS:** Characters; View of value; Harmonious mind.

As far as I’m concerned, many colleges and universities have already put efforts into it. And to that end, the colleges start a new course named <<Ideology with Morality & Basic Law Items>>. What’s more, colleges also equipped with specialists and psychological counseling rooms. That indicates colleges take ideological education very seriously. But it appears to have little effect. So I think Whether we can educate our students with a harmonious mind, we can start with teaching them “forgiveness” “benevolence” “bravery” “independence”, and that means, if you have the ability to forgive others, you will find peace; if you are kind enough, you will have nothing to worry about; if you are brave, you will be fearless; if you are independent, you live on your own.

“Forgiveness”, put it in a simply way, means forgive people, don’t hurt anyone, and don’t force anyone to do anything, even if someone had already hurt you, you should try your best to forgive him, and here I want to quote Confucious’ well-known saying “If you don’t want something, then you should not throw that to others”. This is the basic attitude towards the things and the surrounding people.

Well, when facing the person who has hurt you before, the person who cheated on your friends, you should use your big heart to forgive him, to let it go. Should we forgive the people who show no respect for you? The answer is yes, we professors ought to make students be aware of that forgiveness is a kind of let it go, shake off the pain which you don’t have to take, and don’t over thinking about the pain. If you still have the pain inside, you will lose in great depression, I once met a student, abused by another one for no reason, as time goes by, he cannot let it go,

always thinking about the dark side, and wondering why should a man insulted him like that,

He just buried that bitter story in his deepest heart, which makes him act abnormal in campus. From this example, what I tasted is the pain, that the student can never forget about it, he just let the pain growing inside, take the heart completely, and make it be numb, What I suggest for this kid is to look forward, let it go, he has a bright life waiting for him, give the student who abused him a chance and give him a chance.

Sometimes, we should not only teach students how to deal with people, but also teach them how to help people, and we professors should set a sample of “benevolence”, give them a hint that we human beings always need each other, when somebody needs help, we must try our best to help them out. As the Holy Bible says “It is more blessed to give than to receive”, to be a man with a kind heart, like I said before, you will have nothing to worry about.

We professors, are the people to give directions to students, to teach them that “If you have a mind of kindheartedness, you have nothing to worry about”. In brief, don’t let the small things take the place of your heart, with a positive attitude towards everything, for example, you will have disagreements with your friends, you will have an argument with your lover, inevitably, you will have problems with strangers. All the things are have ways to deal with, we don’t have a standard to judge it right or wrong. Just have a big heart, and accept what it is, don’t haggle over trifles. Our professors also should let them be aware of the true meaning of benevolence and what will make a person have a mind of kindheartedness. In fact, it is

actually teaching them how to deal with people how to make a stand in society.

Furthermore, there still have a question about how to help with our students have a kind heart. Confucius once said "If you want to make a stand in society, then you should help others first; If you want your dreams to come true, then you should help others dreams to come true first". "Do something within your ability to help others, feel the feelings in other mind, that is the way to be a kind man" <<The Analects of Confucius\*what is harmony>>

Judged by these rebellion cases, we professors must send a right message to our students, tell them what is the true brave. Here I quote Confucius words "There is nothing wrong for a person who is brave, but bravery should be limited by righteousness, if your bravery carried by your righteousness, then you have the true bravery"<< The Analects of Confucius>>

First of all, to envisage the regrets of your life, you should use your bravery to dissolve it. The king of Yue has suffered a lot, then have the power to retake his kingdom back, Han xin was insulted greatly, but he is one of the great men to build the empire of Han. Everybody knows that not every day is a sunny day, we just should be energetic and have a brave heart to the obstacles. Only brave people can find a light in the dark tunnel, finally get to the destination.

Secondly, to enhance the cultivation, self-examine yourself and have the courage to correct the bad. If you can do this every day, you can get everything under control, even if you made big mistakes. Briefly speaking, shake off your bad habits. There is a story about Confucius and his son. Confucius told his son to do something, his son just listened with an open mind, and correct his behaviors immediately. What about our students? Whether our students could take the good instructions and correct their bad acts or not? Did they just eager to find excuses for their mistakes?

Thirdly, college students should be brave enough to correct others bad behaviors. And have the courage to build a harmonious environment.

The emperor Taizong of Tang was known as the great man. The man who is not only good at warfare, but also good at culture. More importantly, he has the ability to feel others feelings and he always self-examines himself. As an emperor, it is not easy to act like that. It is also tough for his servant WeiZheng to survive around him. The old saying goes "serve the emperor is just like serve the tiger". What I respect him is that he has the courage to say something that others can't say, and he can do something that others can't do. This courage just like an arrow, straight and sharp, not afraid of nobilities. And from that example, we can draw a conclusion that there exist two kinds of courage. One is that you have the courage to admit your faults and correct them spite of your status. The

other one is you have the courage to point out others mistakes with a brave heart.

We often hear that a man should be independent when he is thirty. To be independent is that you can make a living on your own. Last but not the least, I want to say something about what is independent. And how can our students to be a man with self-reliance.

From the beginning, I want to talk the faith. Roman Roland once said "the most terrible enemy is the lack of strong faith" And I was always wondering how the faith plays a significant role in building a person's character? What makes me have an open mind is because I read an article named<<faith>>, I thought it was really enlightening. And now I want to share my own views with you. The faith is just like your backbone, once you have faith in your mind, you're one step closer to your success, once you have faith in your mind, you have the courage to pursue your dreams, once you have the courage, you will have the strength to build your own life. Simagang was sentenced to death by cruel way, but he didn't suicide, because he had the faith to finish his <<historical records>>. Zuchongzhi was insulted by his enemy, but he didn't panic, because he had the faith to carry out his policy. Luxun suffered a lot, but his faith makes him stand up and be a critic, to use his words to wake up the whole nation.

If you want to cultivate an attic faith in yourself, you need work with perseverance and have the spirit to strive to be stronger, be patient and do everything you have to do and trained yourself with basic skills.

Then I want to talk about the honesty. Almost every college has the problems about the students cheating in exams. As for another group of people, they didn't pay their tuition on purpose. These situations reflect a very serious issue. Now in this era, students at colleges are lack of attic faith. To improve their abilities to have good faith, we should grab the root, and teach them to be honest with people. The honesty is that if you say you would do something then you do it. Of course, our actions cannot break the law. For that, I propose several points to follow.

No.1: To strengthen the basic function of your league. And carry out more meaningful activities to help students build an attic faith.

No.2: To put more efforts to broadcast our will, And make our will be popular by recommending students with great movies, published books, radio broadcasting, fancy posters, press crops, and newspapers. And let the students grow a mind in their deep heart that being honest with people is how the society asking for Let the college press to report the dishonest behaviors to make students be aware of them

No.3: Establish and improve the students credit archives, and strengthen the supervision, broaden the students' feedback channels and take every feedback seriously.

I think it is better to put “forgiveness” “benevolence” “bravery” and “Independence” together to use it as a direction, to point out the way for our schools in ideological education. In order to build a harmonious campus, and educate our students ready to build a harmonious society. I always hold a belief, that with all the help of our school faculties, the experiences accumulated before, and the meaningful experiments, our professors would make more effective methods to educate our students, to send a fresh flood to build our harmonious to society.

## CONCLUSIONS

Above all, in my view, it is better to put “forgiveness” “benevolence” “bravery” and “Independence” together to use it as a direction, to point out the way for our schools in ideological education. In order to build a harmonious campus, and educate our students ready to build a harmonious society. I always hold a belief, that with all the help of our school faculties, the experiences accumulated before, and the meaningful experiments, our professors would make more effective methods to educate our students, to send a fresh flood to build our harmonious to society.

## Discussion on innovative talent cultivating mode under the ideology of CDIO engineering educational concept

Z.R. Bai, X.M. Liu, J.J. Liu & Y.L. Wang

*Hebei University of Architecture, Zhan, Jiakou, Hebei, China*

**ABSTRACT:** This thesis analyzes that in our country, presently, hysteresis of engineering educational concept, the curriculum is mainly theory-centered while weak in practice; the teaching staff structure is unreasonable and low in practice level and so forth. It proposes the establishment of an innovative cultivation mode under the CDIO engineering educational concept which includes building engineering educational concept of “major projects”, building the cultivation mode of coalition of college and enterprise, 3.3 establish curriculum system with integration, and improve students’ knowledge structure, establishing new-type teaching staff to draw lessons from for engineering educational reform in our country.

**KEYWORDS:** CDIO; engineering education; innovative talents; cultivating mode.

The development of society and economy and the innovation of technology require that higher education should provide talents that adapt to social and economic development. In Occident, engineering education has attracted much attention, and the key point in reform is under the prerequisite of continuing to keep the scientific basis to strengthen engineering practice training, and enhance to cultivate the comprehensive ability of students. How to qualify students with favorable moral integrity and with certain innovation ability teamwork ability and management ability within a limited educational system is the key point to reform and explore the higher engineering education.

### 1 THE DEFINITIONS OF CDIO ENGINEERING EDUCATIONAL CONCEPT AND INNOVATIVE TALENTS

CDIO engineering educational mode is the latest achievement of internal engineering educational reform in recent years. In 2000, MIT and RSIT and two other universities from the transnational research organization, and probe into and carry out a new mode of engineering education. After four years’ intensive research, it puts forward the CDIO engineering educational concept. CDIO applies engineering projects (including products, production process and system), product development and life cycle of a product running as a carrier, and stresses that learning the theory and practice of engineering through the process of conceive-design-implement-operate the system and product of the real world. The educational mode of

CDIO requires that the engineering talents from colleges and universities be proficient in these four links. CDIO requires the engineering educational graduates have four knowledge capabilities: engineering basic knowledge, personal ability, interpersonal teamwork ability and engineering system ability. CDIO educational concept advocates “learning through practice”, encourages students to obtain engineering ability actively and practically and arouses students’ learning interests. The engineering educational concept of CDIO is the inheritance and development of the long-term engineering educational reform of Occident and it covers the certain shortages of engineering professionals through many teaching methods and aims at fostering innovative engineering technological talents of with full development.

Innovative talents refer to the creative talents with innovative spirits and innovative consciousness and innovative passion and with questing spirits of critical and inquisitive, i.e, top talents with innovative consciousness, innovative thoughts and innovative ability who can have new inventions, new discoveries, new ideas and new explorations constantly in economy, scientific research, military and culture and can have innovative achievements.

### 2 THE PROBLEMS THAT EXIST IN THE PRESENT COLLEGES AND UNIVERSITIES ENGINEERING EDUCATION

There exists the problem of engineering education disjointing engineering practice in the traditional engineering educational cultivating mode in our country.

That is, the cultivation of engineering technology talents is mainly completed by colleges and universities, and the enterprises and employers seldom participate in the cultivating activities of students and the alleged practical teaching, many colleges and universities are simply the practice designed according to a certain course and lack of the specific requirements of the talents actively, making practical teaching a mere formality. Therefore, the apparent shortcoming of the traditional engineering education is to foster the uniqueness of the subject and to foster the unicity of the fostering approach. This not only leads to the waste of social resources, but also restricts the development of engineering education and it is mainly reflected in three aspects:

### 2.1 *Hysteresis of the engineering educational concept*

Engineering educational concept lags behind the demand of talent cultivation of colleges and universities. Teachers working on engineering education do well in theoretical teaching, but lacking of comprehensive knowledge of practical ability, they can only teach directing at a certain subject and the comprehensive quality cannot be enhanced. Under the engineering educational concept of CDIO, to become prominent professional ability, innovative spirits, strong practical ability, Comprehensive applied talents mastering basic laws and regulations and industry regulations, colleges and universities and teachers, as educational subjects, should transform the educational concepts and explore innovative talent cultivating modes appropriate to social demands.

### 2.2 *The curriculum focuses on theory teaching, and practical teaching is weak*

Developed countries in the Occident, the fostering of engineers centers on the fostering of practical ability and the present engineering educational mode has still stayed in the educational mode of rich theoretical knowledge but scanty practical ability. Weak practical ability is the bottleneck restricting the employment of graduates of colleges and universities. The fundamental problem lies in that on one hand, the teaching staff of engineering education lacking structural diversity, and most teachers conform to the college-college schema, and master and doctor graduates can get teaching posts with little practical experience. Lack of systematic, practical experience in engineering scheme, project approval, design, implementation and operation, resulting in teachers' repeating what the book says and lack of perceptual cognizance of practice. On the other hand, short of communication

between colleges and universities and enterprises, enterprises scarcely take part in the talents cultivation of colleges and universities, and do not attach due importance to the engineering practical joints of students.

### 2.3 *The structure of teaching staff is unreasonable, and the practical level is low*

At present, there exist the phenomena of seeking high academic qualifications of Undergraduate colleges and universities, making the teachers recruited mostly fresh graduates, lack of related academic, practical experience and a few of them have job qualification certificates whereas those with ample practical experience and professional skills but without high academic qualifications are rejected from colleges and universities. The lack of practical experience of professional teachers has directly led to the teaching mode of theory-based, more than practice-based during the teaching process. Furthermore, many colleges and universities focus their attention on the academic achievements of teachers while paying no attention to the practical ability during assessment and evaluation of professional titles. Thus, teachers put their energy mainly into scientific research, publishing papers and apply for projects, but do not attach due importance to the practical ability of students. The students many colleges and universities fostered have poor practical ability, have weak innovative ability, and have low comprehensive quality, so they do not gain recognition from enterprises and society. It is the lack of engineering practical background of the teaching staff of colleges and universities seriously that causes such a situation.

## 3 ESTABLISH THE INNOVATIVE TALENT CULTIVATION MODE UNDER CDIO ENGINEERING EDUCATIONAL CONCEPT

### 3.1 *Setting up the engineering educational concept of "major project"*

Innovating engineering educational concept is the nuclear and soul of the innovative engineering educational system and is the forerunner of building innovative engineering talent cultivation mode of colleges and universities. Only by the guidance of advanced and scientific engineering educational concept for the educational practice can realize the prospective goal, and cultivate large numbers of prominent engineering technology talents with innovative ability. Innovating engineering educational concept should first stick to the educational system of student-centered with many innovative talents showing up. To change the traditional

educational concept of imparting knowledge, based on the new concept of knowledge-transference and cultivating innovative ability as the core; to change the traditional educational concept of teacher-centered and establish the new concept of teacher-directed, and highlight the dominant position and function of students.

### 3.2 *Establish the cultivation mode of “coalition of college and enterprise” and strengthen students’ practical ability*

The cultivation mode of coalition of college and enterprise is to divide students’ learning time into two stages of which three years is to receive systematic professional knowledge education, and one year is to practice in enterprises. During the stage of learning on campus, colleges reestablish the curriculum and teaching contents and strengthen the cultivation of qualified versatile talents according to the practical need of enterprises and the accurate orientation of talent cultivation of colleges centering on engineering practical ability, engineering design ability and engineering innovative ability. During the year, practice in enterprises can be divided into different periods and also practice in enterprises throughout the year. If practicing in different periods, students are distributed to different enterprises to practice according to the degree of teaching contents. If practicing in enterprises for a whole year, students go to enterprises to practice after nearly finishing the teaching task. The cultivation mode of coalition of college and enterprise puts double-tutor system into effect. That is, colleges designate intramural teachers while enterprises appoint tutors with professional engineers with rich experience to instruct students learn and practice in enterprises. The students receive preliminary training of engineers through learning and practice to enhance engineering consciousness, engineering quality and engineering innovative ability to cultivate the ability to analyze and solve problems applying professional knowledge and participate in the design, research and development, debugging and operation management to promote their own engineering technological ability.

### 3.3 *Establish curriculum system with integration, and improve students’ knowledge structure*

Based on the CDIO curriculum system and its ability system, the engineering knowledge structure includes four graduations of knowledge: one is the base layer, including science of mathematics needed to establish engineering science, natural science reflecting the laws of cognition of man to the objective world,

humanities and social sciences needed by cultivating humanistic quality of engineers and scientific engineering outlook; the second is tool-approach layer, including the foreign language ability needed for engineers to refer to document literature and engineering softwares on the platform of internet and philosophy methodology instructing engineers to contemplate; the third is theory-experiment layer, including the professional theory knowledge needed for engineers to work, basic technological skills gained from experiment and disciplinary history containing historical engineering case experience and engineering scientific thinking essence; the fourth is experience-scientific research layer, including the empirical special knowledge for engineers accumulated from practice and exploration in different engineering circumstances, the frontier knowledge obtained from scientific thinking about the new engineering questions, and that is the nuclear knowledge for engineers to innovate.

Establishing the engineering education system with integration is to establish the interdisciplinary curriculum and break through the restrictions of traditional unitary discipline and specialty. According to the need of students’ professional development and the practical need of enterprises, integrating the latest achievements of modern engineering science into it and the curriculum content reflects the intersectionality, comprehensiveness and forwardness of subjects, and combine the unitary and repetitive curriculum content, increases the proportion of comprehensive curriculum on the premise of mastering basic knowledge of the subject

### 3.4 *Enhance teachers’ practical ability, and build new teaching staff*

To cultivate excellent engineers, it is needed to have innovative teaching staff with the high engineering practical ability. Colleges should perfect the training system of teachers, and let teachers take part in the teaching experiment and practice. Creating such chances for teachers to improve their teaching ability in key universities, to have titular positions in enterprises, participate in technological reform, technological innovation and technological research and development promote their theoretical competence.

In addition, having more ways to recruit teachers and implementing the appointment system of full-time and part-time teachers. On one hand, inviting famous professors domestic and overseas and experts in first-tier affair departments to give lectures to widen information range of teachers and students. On the other hand, it is feasible to invite professionals with ample practical experience and high

technological operation ability and with a certain education background to work as part-time teachers. These part-time teachers bring about the latest technology of the industry, narrowing the distance between colleges and society, and it integrates theoretical courses closely with practical teaching which not only intensifies students' theoretical knowledge but also enhances students' practical operational capacity.

## The predicaments of specialized English listening and speaking bilingual teaching for international trade majors

Yong Cai Han

*College of Economics and Management, Wuzhou University, Wuzhou, Guangxi, China*

**ABSTRACT:** The significance of learning and application of specialized English is presented by characteristics of the international trade specialty. It is undoubted that the listening and speaking course is the critical step to the application of professional knowledge. Currently, some predicaments such as scarcity of faculty, old-fashioned instruction and lack of textbook make the course difficult both to teach and to acquire. All teaching staff need to explore the innovative and scientific teaching and assessment methods, to prepare in-depth teaching materials and pre-courses by specialty, to create a good professional English training environment in listening and speaking.

**KEYWORDS:** international trade major; specialized English; listening and speaking course; predicament; bilingual instruction.

### 1 INTRODUCTION

The demand for professional communication in English by enterprise and society sees increasing, according to the characteristics of the international trade specialty and the inclination of graduate career-taken. All the teachers and the tutors face an arduous task that how to encourage students to read and comprehend English data related to specialty and speak it out fluently without any tongue slip. Because of the very reason, all colleges, universities and institutes energetically advocate instruction, specialty English bilingually and attaching great importance to cultivate the application skill to learn professional English. They also spare no efforts to reform and make some nucleus courses bilingual-based exquisite and high-end courses at all levels. There is no exception in our university, that is, we have also made a stride in syllabus design of the international business specialty courses in an all-round, from big class of over 100 students to about 40, from college teachers to professional teachers, from unilateral listening in class to various activities such as regular foreign trade English corner, from trial bilingual instruction to the success of applying for national project for special high-quality course, international trade special English bilingual teaching has gradually evolved into a teaching system with distinctive characteristics and played a crucial role in the curriculum construction and development.

Currently, we have set many courses in the way of bilingual instruction of all types and levels, such as Foreign Trade Practice English Reading Textbook of

professional-driven optional course, Excerpts from English Newspaper of professional main course, and International Trade Documentation Practice, Foreign Trade Talk in English, Foreign Trade Contract and International Business Correspondence of both the main professional courses and the practice round. We still have a long and uphill journey to finish in enhancing student's market tapping and business negotiation skills although we have made stride to integrate the in-class learning with extracurricular activities and synchronize the teaching practice with the theory study.

### 2 EXISTING PREDICAMENTS

#### 2.1 *Scarcity of eligible teachers*

The subject, professional English listening and speaking, is designed for senior students majored in international business and trade, who has laid a good foundation for English learning some knowledge in the field and grasped the terminology in the whole course of business transactions. The majors are generally showing interest in listening and speaking and strong desire to overcome the barriers of communication with business partners. So the demand for teaching staff keeps upward increasing because of the high expectation placed by his teaching objects. On the one hand, it is requested that teachers should master knowledge in all dimensions, including language listening and speaking instruction method and academic theoretic knowledge. Spoken English is expected as fluently and correctly as the natives. Teachers who

are eligible should learn the knowledge in the field of foreign trade systematically. On the other, technical handling is among others a must for teachers, who should be familiar with various advanced technologies with the popularity of multimedia. Teaching staff face more challenges when they change from the traditional grammar-translation method to situational one as they should study methodology. All these make teaching staff spend much more time and energy in preparing courseware. The hard job cools teachers' passion for they feel exhausted to be up to expectation. In a word, the resource for the eligible faculty sees scarce and can not meet the demand from society, university and knowledge recipients in the near future.

## 2.2 *Lack of innovative instruction*

It is not advisable to copycat traditional audio-lingual method or oral approach or both for their shortcoming could be brought out in teaching. Teachers have the inclination to use all-English teaching language in order to build up student's vocabulary and exercise their English practice ability. Students fail to practically use English deal with the problems arising from business negotiation or other difficulties in a transaction if the field terminology is unintelligible to them. Further, students who are used to normal English courses tend to be tired and get a sense of tediousness if the teacher pays most part of his attention to academic impartation or explanation. As a result, students by no means can get something from economic lectures, let alone sitting over the table as the trading specialist. What is more, multimedia-aided instruction may lead to a pure intensifying listening class because the technology which becomes a means of learning has almost replaced the teacher-student communication. Currently, language lab cannot facilitate students well for they find difficult to access to useful academic data, which make autonomous exploitative learning unrealistic.

## 2.3 *Lack of in-depth and systematic textbook*

At present, In addition to the international trade course teaching, China has published many versions of textbooks dealing with English listening and speaking in international trade, such as Foreign Trade Talk in English (by Chuan Qin), Listening and Speaking for International Business (by Jizhi Ruan), A Speaking Course of Foreign Trade English (by GeLin Zhu, Chun Jiang), A New Spoken English Course for International Business (by Ying Liao), English for Business Communication (by Baoguo Zhou) and International Business English Conversation (by MeiRong Teng), etc. These function-or-subject-centered

textbooks have their own limitations although these textbooks do good to students communicative skills to some extent. Some focus on building up vocabulary, some put emphasize on syntax practicing, others just list several dialogues and fall shortage of in-depth content, still others quite substantial in content, but as old as Adam, which means that they need to update or follow up so that can keep pace with the times. Just as mentioned above, our department has come across the predicament in continuity of textbook or teaching material selection. We had planned to offer the course of professional listening and speaking, as long as 3 terms but later on we had to reluctantly cut it down to only one semester. The very deep-rooted reason lies in the lack of international trade professional English textbook written in a systematic and continuous way.

## 2.4 *Difficult to integrate professional knowledge with language acquisition*

The teaching objects have acquired an English learning ability, especially the listening and speaking ability significantly in the year of freshman and sophomore. They will be coming into a plateau and experience temporarily fossilized state. Senior students begin to learn professional English listening course and actually they have just begun to put their book learning into academic practice. Here comes a contradiction, whether language acquisition and professional knowledge gaining can develop side by side. As such, for foreign trade, negotiations in English, business development and formal occasions for negotiation must follow the rule of Language appropriateness. Teachers guide students in combination with accuracy and fluency. Students are supposed to master the cultural background and the natives' texture of life. Students should not only master professional knowledge in a foreign language, but also develop cross-cultural communication skills. The fact that students must face pressures from a backlog of subject learning tasks and knowledge digesting makes difficult for them to focus on language acquisition. They may not distinguish the simplest terminology with a certain tone of voice, let alone to dialogue and exchange ideas. Many learners can't listen and practice speaking activities in spite of their better understanding in the language grammar and vocabulary. Learners interviewed by author said that they have no idea about the listening materials and retell or paraphrase it out, although the vocabulary is among the least difficulty and the speed the least quickly. That is to say, words appear individually could be intelligible before they being put together with some proper words or special terms. This phenomenon highlights that students have not yet built a framework of language acquisition during

the activities and neither internalized received data as the language cognitive structure. It's hard for them to enhance ability to intake language learning in the real sense. Some basic courses and professional backbone courses have not been taught in bilingual way, so it's common for students that they accumulate less special words and lower reading intelligibility. Therefore, students are likely to be frustrated by the psychological barriers. This tends to lead to a vicious circle that, according to human psychology, disadvantage of receipt of information may in turn hinder professional knowledge learning and transformation.

### 3 PROBE THE WAY OUT

#### 3.1 *To meet the demand for faculty*

In the first place, school authorities should attach importance to the training of bilingual teachers, stay focused on the communication-oriented bilingual talents and build a platform for English teachers to learn international trade professional knowledge. Only in doing so, can we improve academic level and teaching method of newcomers and to improve professional competence by the way of on-job training, self-taught, applying for further study, participating scientific research project, going abroad to equip teachers with strong ability of specialized subject (professional knowledge and their own literacy) and the technical ability (design and organization of classroom activity ability), at the same time avoiding too professional but little general knowledge staff. Teachers should not only probe into language knowledge and advanced teaching theory, but aptly explore teaching content involving the other knowledge. Secondly, university can import some talents abroad who are really aspired in teaching if the conditions permit and invite foreign trade experts, scholars and specialists to make professional knowledge of the full English lecture. Thirdly, it's highly recommended that universities employ some staff engaged with practical work experience or foreign international business personnel to present and participate in professional English teaching. The most practical way is to choose some from the economic teacher team who have got undergraduate courses in English major and then gets a master's or doctor's degrees in the economy, or the quality international English teacher who has got the further education experience abroad because they have solid English speaking skills with a wide range of professional knowledge. Their English, economic and trade experience in the field together will make the professional English teaching, especially in the listening and speaking teaching a new breakthrough.

#### 3.2 *To innovate teaching and assessing methods*

The faculties are supposed to comprehensively use various teaching methods and absorb the essence of situational teaching method and audio teaching while putting aside limitations. Direct teaching method should be cast away and neither should the grammar translation teaching method be copycatted. Teachers cannot completely apply American structuralism theory, which emphasizes on grammar and neglects the context. Grammar is instructed in an inductive or deducing way. Teacher, in his initiatives to innovate teaching method such as dictation training method, interactive listening and discussion methods with academic data to boldly challenge old-fashioned and stereotype teaching approaches. To put the students in the central place can stimulate their creativity for knowledge exploration, founding probing, and work cooperation to realize the meaningful construction of language acquisition. To adopt different listening strategies according to learners' language level can make the teaching efficient and develop students' ability to cope with all kinds of difficulties in listening and speaking. The challenging questions designed during teaching can exercise students' thinking over some complicated problems and professional knowledge outside the class. Teachers as a guide should not only excel in organizing activities in class, but be equipped with comprehensive knowledge in addition to teaching materials, especially cultural background knowledge to deal with the problem of information surfacing and deep-processing. Teachers guide learning tasks timely and effectively and organize the class activities closely based on the topic so that giving full play to teacher's professional knowledge and teaching skills. To make full use of modern multimedia in teaching is a good way to arouse student's passion for independent learning, so the early fossilization in listening could be avoided. In practice, teachers should be well aware of the auxiliary role multimedia facility played and write suitable and applicable courseware for students of this specialty. In addition, teachers are encouraged to come up with some new methods of assessments such as setting up an archive for each student's performance and to adopt the combination of process evaluation and goal assessment.

#### 3.3 *To select teaching materials carefully*

institutes can introduce original edition of teaching materials related to economy and trade from Hong Kong or America to solve the problem of continuity and gradation of the teaching materials. The selection should pay attention to professional characteristics and highlight international trade rules and practice in transaction. The contents should be arranged intensively and extensively and helpful for learners

further exploration. For example, the books may have bearing on how to solve the foreign trade disputes, especially resulted from the terms of the contracts and documents, how to do well preparing for business negotiations, how to maximize the profit while concluding a deal pleasantly as well as how to identify the authenticity of L/C, how to use the red clause of L/C and so forth. All these require learners' oral expression. Therefore, to select practical professional materials is one of the ways leading the predicaments out. It can be supplemented by articles or excerpts from foreign newspapers and network, which collect the latest international trade practice and application. There may not be perfectly customized materials for such kind of teaching system because of the complexity of international trade. So teachers can write teaching materials according to the actual situation and have learners help to errata every edition of the materials, list the work of follow-up in the long-term research planning, and download search the relevant international video conference as auxiliary materials.

### 3.4 To offer fundamental pre courses

Use Talents of international trade should grasp modern economics and the basic theories of management, master international business operation theory, practice, and professional techniques, be familiar with different cultures and economic and social status in the world. Their knowledge can meet requirements of economic globalization and regional development and can independently conduct multinational management and business planning. Therefore, major in international trade need to improve the language acquisition and application ability on the basis of accurate understanding and proficiency of language step-by-step. It's important to open some basic professional courses in bilingual teaching, international economics, International trade theory, International trade practice and international payment are among the list. The curricula can facilitate bilingual teachers with updating knowledge on the one hand and, on the other, learners can naturally realize perceptible internalization of professional knowledge by uniting theory digestion and language acquisition into case study. This job can get done better when teachers keep pace with the trend of world economy and have a keen eye in the world's latest economic dynamics

and share the field frontier research with students and reading a piece of economic news every day and study economists' achievements. Students can learn more from a prepared speech and improvisational economic reports.

To boil down, if teachers want to create an ecological learning environment in professional English listening and speaking through both inside classroom and extracurricular activities, it is desirable to adopt the small group of classroom like the earliest army teaching to maintain students' concentration inside classroom or grade the classes according to the level of listening ability. Meaningful classroom activities will turn superficial learning to under-skin learning and improve the proficiency of the listening. Constructivism holds that the learner is not a passive knowledge receiver, but the knowledge structure builder. The best way is to make them experienced in the real surroundings with the view to achieving the goal of cognitive meaning building. Students can improve the application skills in actual or quasi-professional simulation. Organizing students to pay a visit to enterprises or to take in professional post to get situational experience can compensate for the shortcoming of the in-class practice and develop three-dimensional practicing environment.

# Comparative study of open source e-learning systems

V. Maněna, M. Maněnová & K. Rybenská

Faculty of Education, University of Hradec Králové, Czech Republic

**ABSTRACT:** The paper is based on studies that compared the individual types of tools in open source Learning Management Systems Moodle and Claroline. Selected LMS systems are used in secondary schools in the Czech Republic. These systems are used primarily for their availability. In comparison system, we proceeded from the description of each tool, their functions and options. Individual instruments have been validated for both system in teaching practice, to their mutual comparison was valid. Results of the survey summarizes the comparison table.

**KEYWORDS:** LMS; E-learning; open source, comparative study.

## 1 INTRODUCTION

E-learning is one of the ways to effectively use information and communication technologies in education. Elements of e-learning began to be used initially in high schools and aimed to improve the quality of the educational process. Information and communication technologies are used to support the cognitive processes and social and psychological aspects of education. The teacher training is an indispensable factor, but his role is changing now. At the same time, the design of learning materials is changing too. As we already know, suitability of technology can not be assessed separately from the basic strategy approach to their use in the educational process. E-learning technology, we can use as a component of the educational process itself, as an administrative tool and also as a development tool for creating multimedia learning materials. On the market today there are several LMS systems in various price categories that provide these features. Many universities in the Czech Republic and the world have developed their own tools and systems. Some of these systems are also available for free, under some kind of open source license. E-learning has gradually expanded to high school and begin to use it as primary school many years ago. (Hansen, 2000)

## 2 THEORETICAL BACKGROUND

### 2.1 LMS moodle

The system Moodle is designed to support teaching and his name was originally an acronym for Modular Object-Oriented Dynamic Learning Environment. The first creator software was Martin Dougiamas and

the first version was published in 2002. Moodle is developed as a tool to support social constructivist approach to learning. Moodle can be used to support full-time, combined forms of education and distance education. It is provided free of charge as a free and open source software licensed under the GNU General Public License. To work with this software, user just need ordinary computer, tablet or smartphone with a web browser connected to the internet. (Moodle, 2014)

Moodle was designed to promote constructivist pedagogical approach to education. The advantage is that the courses can be developed within the system, resulting in considerable savings. The system can be used both for distance study, as a supplement to traditional teaching.

User interface is intuitive and easy for every user, which is at least minimally computer literate. Moodle is now extended with so-called repositories, which are used for data storage. All users can download or upload information into the repository and are not limited only to their own computer. Appearance of the system can be modified to match the original web site of school or organization.

The course is built from components called modules. Each module is characterized by its specific properties that can be set differently, according to user's needs. The standard Moodle package contains several modules, which can be used in any course, but it is also possible to install external modules. One type of modules represents study materials and the second type represents the activities of students. These two types of modules differ in level of interactivity of student. Study material is a unidirectional flow of information and creates a kind of basis. Moodle is based on the fact that the most important in the learning

process is the active involvement of students in various educational activities, and based on this, students acquire new knowledge. On the one hand, it is possible to use Moodle only as a system that enables the presentation of the study material on the Internet, on the other hand, it is possible and advantageous to use all his potential, which offers us, and to emphasize the student activity modules.

Standard modules of activities can be included in various sections of the course or in a block on side of the course. Part of the course can be arranged thematically or by week. Each week or topic is graphically separated. Modules can represent activities below:

- Poll. Teachers create a poll with multiple choice. The aim is to inspire students to arouse interest in the topic, think about it, etc.
- Chat. It enables each participant to send text messages to other in real-time discussion.
- Database. Allow students and teachers to create and view files of records that relate to any topic.
- Forum. This is the most common form of discussions among all participants of the courses. Participants have the opportunity to comment at any time on the topic. It is also possible to adjust the assessment of individual contributions by others. Users can also take advantage subscribe posts by email.
- Survey. A module that contains several questionnaires that are used to collect information about students, about teaching, etc.
- Lecture. Programming-based learning. It consists of several pages. On each page there is a question that has several choices. Student answers the question on the basis of the answers get farther or returns. The program may be either linear or branched.
- Dictionary. A module that provides students and teachers to create and edit a list of definitions.
- Test. Very often used module that allows teachers to build different kinds of tests. It is the choice of several types of tasks. For example matching, fill in blank, multiple choice, short text answer, numerical answer, true/false.
- Test Hot Potatoes. Tests are created in software Hot Potatoes and then are imported into Moodle.
- Assignment. The module, in which the teacher arranges tasks (may be an essay, papers, projects, etc.) and the student is responsible for its contents saved in the system. The teacher can enter the date of submission, if that expires, students no longer have the option to submit.
- Wiki. With this module, students can work together on web pages.

In addition to these basic modules that are included in each Moodle package, there are also external

modules that are constantly growing and are regularly updated.

Study materials form one of the cornerstones of the course. Moodle gives you the opportunity to choose from several different types of learning materials:

- Poll. Teachers create a poll with multiple choice. The aim is to inspire students to arouse interest in the topic, think about it, etc.
- Label. Text, which can be supplemented by pictures, which is located directly on the course page the links between different activities.
- Page. Content that is written as a text, klerý may contain images and other multimedia elements.
- Link to file or web. The teacher inserts a link to a file or web page.
- Folder. This is the option of opening a specific folder. A teacher can insert into a folder multiple files at once.

The philosophy of the system is based on a social constructivist theory of learning. Instructional tasks, activities or projects can be designed to allow for cooperation between teacher and students or between students. Students can be divided into groups to communicate with each other via chat synchronously or asynchronously in the forum. The wiki tool (module) allows students to write text together. Discussion forums can be set so that only the teacher or a student can start a new discussion topic (thread).

## 2.2 LMS claroline

It is a case of representative of opensource of LMS systém, which started to develop at the Université catholique de Louvain in 2000. Followingly Claroline Consortium originated in 2007, which is formed by 15 universities at present time (e.g. from Belgium, France, Canada, Spain, Chile) and Belgian and French universities are predominating. This is the reason why the starting language of system is French, English is in the second place. Basic feature of LMS Claroline is simplicity of user's dividing line and at the same well though-out implementation of the separate functions. (Šín, 2013)

Administration of the users is easy. Claroline distinguishes three types of users – student, teacher, administrator. Courses could be incorporated in different categories (defined by user).

In Caroline learning curriculum consists of separate topics, which affiliate educational materials (HML, pages, sets, references, tests, etc.). This thematic arrangement plays here an important role and to each of the topics is added its statistics with the survey of students' progress. Problematic seems to be possibility to record of one set only. In case of recording more sets it is necessary to zipp them.

Test is formed in the offer of the same name Training. Each test must have certain title and description. It is possible to select, if all tasks should be depicted together, or one question on one page. Self-evident are even “extended choices” concerning the possibility to set data and time of starting and closing of test, time limit and test behaviour after its completing (imagination or not imagination of correct answers, etc.) Tests could be used both for evaluation of students e.g. by setting of “one permitted attempt” and for training, by means of unlimited number of attempts. We can summarize generally that to the positives of the system could be placed easy installation and administration, administration of classes, limiting of students number in course, side menu and its understandability, statistics and their clear arrangement. As a problematic fact is considered insufficient localization in Czech language, less topics and extending modules than in Moodle, less extending setting.

### 3 THE PROJECT

#### 3.1 *Project aim*

The goal of our research project was to compare the options open source learning management systems. At the same time, we aimed to determine which LMS are used in secondary schools in selected locations.

#### 3.2 *Methodology*

Based on the goals we set as a basic research method, we chose comparative analysis. We used descriptive statistics to determine the type of LMS in secondary schools in selected locations. In this investigation, we analyzed websites of secondary schools, or contacted the school management. In total, our survey contained data from 89 high schools in region and 202 secondary schools in the capital city of Prague. For mutual comparison of LMS, we identified the following criteria:

- Tools intended for generating contents.
- Communication tools.
- Tools for collecting and evaluating activities.
- Tools for cooperation.
- Price.

Each of the selected LMS system was evaluated by four independent assessors - teachers who work with the system in the classroom.

#### 3.3 *Research results*

From a total of 291 schools, 64 were using e-learning (31.7%). Moodle was used in the 69 % of schools and

31% used a different system. There were versions of Claroline 1.10.7, Moodle 2.3–2.5.

First we compared basic functions of both e-learning systems. Moodle has more features, but Claroline’s features are enough for needs of primary and secondary schools.

Moodle has more communication tools than Claroline, but most of users prefer chat and discussion forum. Both of these tools are in Claroline and Moodle.

Both systems have equal tools for evaluation and self-evaluation.

Table 1. Basic tools of selected LMS – generating content of study.

Price	–	–

Generally speaking, Moodle has more and advanced features compared to Claroline. Both systems can be used very well on primary and secondary school. Moodle's advanced features are suitable for higher education, but can be used on primary school as well.

#### 4 CONCLUSION

We can say that the LMS Moodle is a sophisticated system for creating e-learning courses. It offers a fairly wide range of applications. We would like to emphasize in particular tools for collaborative teaching. The Claroline is simpler than Moodle, but may well serve the needs of schools.

## Transformation of higher vocational education in the context of economic transition

Hui Qing Li & Ping Li

*Shenzhen Polytechnic, Shenzhen, China*

**ABSTRACT:** The economic transition drives and forces the transformation of higher vocational education, which in turn promotes the economic development. The transformation of school-running system and mechanism for higher vocational education involves the diversification of school-running subjects, the marketization of resource allocation and the socialization of quality assessment; the adjustment of talent training mode is represented by synchronization of vocational education programs and economic planning, correspondence of major setting to economic restructuring, course development jointly completed by schools, industries and enterprises and multi-level vocational education; the transformation of higher vocational education philosophy should start with education philosophy, learning philosophy, scientific research philosophy and success philosophy.

**KEYWORDS:** economic transition; transformation of higher vocational education; mode adjustment; philosophy transformation.

China's economy has made remarkable achievements through 30 years of fast development, but at the same time it is confronted with a series of problems like growing environmental pollution, resource depletion and aging of population. The development mode characterized by low labor growth and high resource and energy consumption that has long been observed by China has been difficult to continue and entails economic transition imperatively. Any transformation ultimately involves the transformation of people. As higher vocational education features simultaneous development with the economy, it is particularly important to explore the transformation of higher vocational education in the context of economic transition.

### 1 TRANSFORMATION OF SCHOOL-RUNNING SYSTEM AND MECHANISM FOR HIGHER VOCATIONAL EDUCATION

Like the economic transition of China, the transformation of higher vocational education also has its intrinsic motivation and external pressure. First of all, the higher vocational education is separated from higher education system. It achieves rapid development by innovating major setting, curriculum system and talent training mode, but the operation system continues to follow that of higher education which is featured by low management efficiency and simple school-running mode, thus restricting

the development of higher vocational development. Therefore, the system and mechanism must be transformed if the higher vocational education wants to get thoroughly reborn. Next, the economic development is the foundation for higher vocational education development. The economic structure restricts the structure of higher vocational education, and the economic transition includes system and mechanism and economic restructuring. Thus, the effect of economic transition in driving and forcing the transformation of higher vocational education is quite apparent. Thirdly, the economic transition strives for the transformation from manufacturing to innovation as one of its goals, so it poses higher requirements for the overall higher education. In this context, the transformation of system and mechanism for higher vocational education plays the role of a pilot.

Most of the current higher vocational colleges are transformed from previous secondary technical schools and institutions of higher education. They contribute to the formation of vocational education system together with the training institutions from the society and enterprises. In fact, the system remains quite imperfect, such as unreasonable structure, poor school-running conditions, etc. In short, the system is far from powerful, so it fails to adapt to the requirements of economic and social development. The transformation of higher vocational education should divide universities into research-oriented type and applied technology type at first, of which the latter are only allowed to engage in higher

vocational education. In this way, the higher vocational education can be developed into a large-scale and multi-level system that adapts to or even leads the economic and industrial development.

At present, the higher vocational education colleges are mostly public institutions, characterized by unbalanced development between the east and the west and between public colleges and private colleges, simple subjects of school-running and monotonous school-running mode. The current economic transition promotes the development of mixed ownership economy, open to the domestic market in order to stimulate domestic demand and endow Chinese economy with endogenous vitality. The transformation of higher vocational education also applies the form of mixed ownership. That is to say, governments, industries, enterprises and individuals all can become the subjects of school-running by resorting to resources or technology, thus forming a diversified school-running pattern. In this way, it will help to expand the participation of the whole society in higher vocational education and improve school-running conditions.

The resource allocation for higher vocational education is also unreasonable because governments often allocate physical or monetary resources directly or indirectly as per the number of enrollment. The resource allocation varies greatly depending on school-running conditions and regions, so the practice is contrary to educational fairness. The process of resources is not targeted and fails to highlight the benefit-based principle, and resources often become school's "private property" once allocated, with low utilization rate. Therefore, the transformation of resource allocation must be made for higher vocational education as the economic transition progresses in order to realize market-oriented allocation of resources. The marketization of resource allocation is reflected in two aspects: marketization of resource source and sharing of resource utilization. As the subjects of school-running are diversifying, the marketization of resource allocation is the inevitable result of higher vocational education development. The governments may set up education funds and participate in the resource allocation for higher vocational education through such funds. As a result, the governments change to the subject of supervising resource allocation and utilization from the subject of educational resource allocation.

With the diversification of school-running subjects and modes, the role the governments play in higher vocational education is also changing accordingly. Specifically, the governments should perfect the education legislation and the school-running and access system for higher vocational education, establish the supervision system for higher vocational education quality, improve the assessment mechanism on the operation of higher vocational education system,

and identify the elimination mechanism for unqualified colleges or majors and the withdrawal system for school-running subjects, so as to provide institutional guarantee for the transformation of higher vocational education and its positive operation after transformation.

The diversified school-running pattern of higher vocational education has actually introduced the market mechanism, so the assessment on education quality is bound to socialization. The teaching assessment features inspection function and guiding function. The latter often exerts a greater social influence, for example, the university rankings arising from social assessment directly influence the enrollment, employment and recognition of universities. The assessment on teaching quality in higher vocational education should be carried out by third parties, and the results should be reported timely to governments, schools, industries and enterprises. The index system of quality assessment should seek for public opinions and feature openness and foresight, so as to establish unique higher vocational education in combination with economic transition.

## 2 ADJUSTMENT OF TALENT TRAINING MODE DRIVEN BY ECONOMIC RESTRUCTURING

For the past many years, the higher vocational education in China has been exploring a higher vocational education mode suitable for China all the time according to the psychological and mental factors of students by drawing on advanced foreign experience, such as "dual system" from Germany and "teaching factory" from Singapore. The project teaching, case teaching and other teaching methods based on working process have enjoyed great popularity through teaching practice. However, the economic transition denotes changing national conditions, so the talent training mode for higher vocational education should also be adjusted accordingly.

In the past, the fast economic development of China was achieved at the cost of huge consumption of material resources, energy and labor forces, while the economic transition exactly aims to improve the quality of economic operation and enhance the comprehensive competitiveness by relying on technological progress and independent innovation. Therefore, higher vocational education must serve as the distribution and processing center of new technologies. The governments should consider vocational education planning while making economic planning, or even incorporate it into economic planning. After that, schools, industries and enterprises should refine their own vocational education planning according to government planning and in combination with

school characteristics, so that the higher vocational education can develop simultaneously with economy. The higher vocational education should not only adapt to economic transition, but also participate in technological innovation and play a leading role in new technology, new processes and new products. An assessment and adjustment mechanism should be established for major setting and curriculum system of schools. The majors should be classified by categories as far as possible, the specialized courses should be determined based on market demands, and the curriculum development should be completed by schools, industries and enterprises and should not be put into implementation before approval by relevant governmental authorities.

The higher vocational education should strengthen practical teaching and insist on teaching activities which combine learning with working, manual laboring with thinking and study with practice. According to constructivism, if learners want to complete meaning construction for the knowledge learned, that is, to have a profound understanding of the nature and rules of the things reflected by such knowledge and the connection between these things and other things, the best way is to feel and experience in real world instead of merely listening to other's description and explanation of such experience. Here the best way to feel and experience is practice and training. To improve the process of practical training, the first is to strengthen the cooperation between schools and enterprises. The governments can transfer partial stock rights of state-owned enterprises to schools and the stock rights of higher vocational education colleges to enterprises, thus laying a solid foundation for school-enterprise cooperation. Next, in addition to strengthening the construction of training rooms, schools may also operate factories to serve as the experimental base of technological innovation.

The faculty is a key point in the transformation of higher vocational education. To strengthen the construction of double-qualified faculty, teachers must be familiar with industry developments and have international vision, and must be experts in both teaching and subject matters. The faculty training should be provided on a regular basis and integrate production and teaching.

The aging of population which influences labor supply is an important factor in economic transition from labor-intensive to technology-intensive. In addition to serving as the distribution center of technologies, the higher vocational education should also be adjusted structurally and provided at multiple levels for different objects. The first level is provided for students graduating from junior high schools, adhering to 3+2 educational system. The students graduate from secondary technical schools in the first three years and then graduate from junior colleges during

employment if they can pass the examination in the last two years. In this way, the students have the freedom to decide whether to graduate from secondary technical schools or junior colleges. They can choose to work for some time after graduating from secondary technical schools and then continue to finish the courses of junior colleges in the last two years. The second level is provided for students graduating from senior high schools, also adhering to 3+2 educational system. The students graduate from junior colleges in the first three years and then graduate from undergraduate colleges during employment if they pass the examination in the last two years, with equal freedom to choose. The third level is undergraduate and graduate education, and the fourth level is just-in-time training for re-employment and pre-job training for other people.

### 3 TRANSFORMATION OF HIGHER VOCATIONAL EDUCATION PHILOSOPHY DRIVEN BY ECONOMIC TRANSITION

The economic transition is bound to drive cultural transformation, but the fact is, new culture has often waken up when the original economy remains rushing forward with inertia. From the time perspective, economic transition and cultural transformation are like twin brothers. During pregnancy, the economic transition is the elder brother and drives the younger one, but during delivery, the roles are changed and the cultural transformation awakens the economic transition. From the relationship between the two, the economic transition decides the cultural transformation which then drives the economic transition again. The sensitivity of culture to economy is the characteristic of higher education, and the cultural transformation determines the transformation of higher vocational education philosophy.

Firstly, transformation of higher vocational education philosophy. The vocational education is often inevitably misunderstood, because people tend to think that it aims to teach students professional skills and make them useful for the society, and that the vocational education should base teaching on working process and combine learning with working as it is anyway for creating employment for students. In fact, this understanding is not accurate. The nature of education is to make learners perfect and transcend themselves, but not to serve as the tool of training for employment. The vocational education is a path, a grip and an environment for learners to constructed by themselves. Making the learners useful is indeed the result of vocational education, but not the overall objective. The teaching method that bases learning on working process and combines learning with working should focus on learning rather than working. The

vocational education is based on vocation, but also goes beyond it. It aims to foster a mind of seeking perfection and nourish humanistic reflection and critical spirit, which, if absent, would make use hard to imagine the transformation of China's economy from manufacturing to creation.

Secondly, transformation of learning philosophy. Currently, the new enrollments for higher vocational colleges remain junior or senior high school students, and the social training institutions continue to set up such positions to the society as cook and barber. Our vocational education remains in its primary stage. The economic transition leads to changes in employment, and re-employment training will strengthen the concept of life-long learning. The economic transition promotes social transformation to a learning-oriented society, so the education should not be limited to children or the undereducated nor for getting a job. The higher vocational education should play a leading role in the formation of a learning-oriented society and step into advanced stage.

Thirdly, transformation of scientific research philosophy. The pyramid structure of scientific research in China has its historical and practical reasons. The top-down research habits make us doubt how higher vocational college students engage in scientific research. People with such doubt often focus more on the results of scientific research, but ignore its target, viz. innovation. For higher vocational education, innovation can be cultivated as a kind of consciousness. Through vocational education, vocational scientific research can be made and innovation and entrepreneurship can be deeply rooted in the mind of learners and get popular in the society. For example, when Li Ka-shing asked his son of several years old to attend Board meetings, it is just like the students of vocational institutions engaging in scientific research. Therefore, vocational scientific research projects should be established and become the compulsory course of vocational colleges.

Fourthly, transformation of success philosophy. The success philosophy is actually the concrete representation of values, and the core of cultural transformation is the adjustment of values. The economic transition of human society is mostly established due to economic

crisis which is usually caused by violation of economic ethics due to wrong economic values. This is the indirect result arising from the humanity philosophy that success is understood as behaving more excellent and getting wealthier than counterparts. Therefore, higher vocational education should incorporate social sense of accomplishment, sense of social responsibilities and the spirit of unity, cooperation and mutual benefit. In this way, the pursuit of materials by human can be restricted by humanity.

#### 4 CONCLUSION

China's economy which is restricted by labor, resources and environment starts to transform. The subsequent transformation of higher vocational education should embark on systems and mechanisms. The transformation of systems and mechanisms will naturally lead to the change of talent training mode and the update of education philosophy. The transformation of higher vocational education will embrace the great development of vocational education and make due contribution to the high-quality comprehensive transformation of China's economy.

## Analysis on the Japanese language teaching reform in the institutions of higher learning

Fan Wu

*College of Foreign Language, Beihua University, Jilin, China*

Zhen Chen

*College of Information Technology and Media, Beihua University, Jilin, China*

**ABSTRACT:** As the economic exchanges between China and Japan become more frequent, the number of Japan's companies shows an increasing trend in China in recent years. Under such a background, there are increasingly more schools in China to offer a Japanese major and simultaneously there are increasingly more Japanese learners. As a result, the traditional education model becomes unable to meet the need of the modern society for Japanese language talents. How the teachers train the students who will be the most popular to be employed by enterprises and possess an excellent comprehensive quality after graduation is an issue necessary to be studied in this paper.

**KEYWORDS:** institutions of higher learning; Japanese language teaching; teaching reform; teaching methods.

### 1 THE CURRENT SITUATION OF JAPANESE LANGUAGE TEACHING IN INSTITUTIONS OF HIGHER LEARNING

In recent years, the vigorous development of Japanese major based on meeting the market demand for Japanese talents is closely inseparable with the high importance attached by the Japanese Language Subcommittee of the Ministry of Education. At present, the contents of the courses offered for Japanese language students are diversified; the tests for verifying the ability of students in Japanese language include not only JLPT (the Japanese-Language Proficiency Test), J. TEST, but also College Japanese Test Brand 4 and College Japanese Test Brand 8. Therefore, the learning of Japanese language students is tested through all sorts of Japanese language proficiency tests in terms of listening comprehension, grammar, reading comprehension, and composition, etc. However, a great number of students learn Japanese language only for passing the tests or obtaining certificates because they have no enthusiasm for Japanese language learning and also think lightly of the practice, so that they only acquire all kinds of certificates during the period of the upcoming graduation, but know little about Japan's economy, politics, and culture. Worse, the communication with Japanese people is beset with difficulties. Finally, they are incapable of making authentic

Japanese daily communication with Japanese people although they can apply the learned grammars and sentence structures to answering sheets. Considering this existing phenomenon, the problems in Japanese language teaching are analyzed as follows according to the actual teaching conditions.

#### 1.1 *The divorced closeness between the Japanese language teaching and the practical application*

According to student's employment directions, Japanese language courses such as Business Japanese, Japanese Economy, Tourism Japanese, and Science and Technology Japanese are offered in the curriculum provision; in order to let students gain a better understanding of Japan's history and culture, the courses such as an Introduction to Japan, Japanese Literature, and Japanese Linguistics are offered for students; in order to let students practice oral Japanese better, Japanese conversation courses taught mainly by Japanese language teachers are offered; in order to improve the students' listening ability, listening comprehension courses are offered for students. In the setting of these courses, the requirements in the accumulation of students' listening, speaking, reading, writing, and translating are considered. In the primary Japanese courses, top priority is given to comprehensive Japanese, Japanese listening, and

Japanese conversation courses. When students begin to learn Japanese language in institutions of higher learning, their problems are slow adaptation and poor pronunciation; the time for reciting pseudonym and practicing pronunciation will occupy students' a lot of time, making the time of the students too longer to learn basic Japanese language. In the teaching process, teachers often provide students with explanations according to the teaching materials. In this way, the designed teaching contents in each semester can be completed, but the teaching time is limited and there is no enough time for the teachers to let students practice in the classroom when many text contents are completed. The students in non-key institutions of higher learning are poor in self-study, memory, and ability in induction, comprehension, and practical application, so that they cannot make a connection between what they have learned.

### 1.2 *Fuzzy training objective*

At present, the institutions of higher learning usually set up Japanese major orientations such as business Japanese orientation, Japanese translation orientation, and IT Japanese when Japanese major is offered, in order to meet the needs of social development and market demand for the talented personnel. In the learning process, students are required to learn other professional knowledge in addition to Japanese professional knowledge. In terms of curriculum provision, the teaching materials marked with business and IT are basically chosen; the teachers only repeat what the book says, but do not get a good understanding of the essence in the major orientation, so that the interest of the students in learning is not stimulated or most students cannot understand the teaching materials once the contents are a little bit difficult. For the students in the ordinary institutions of higher learning, their initiative to self-study is very poor, and also the sheer Japanese knowledge has made them overwhelmed, making them feel unable to do what they hope to do plus the study of other professional knowledge; they can only scrape through the final exam of each semester by relying on the answers from teachers. During the period of the upcoming graduation, they cannot speak native Japanese at all or cannot basically speak Japanese without grammatical mistakes. This is a problem to emerge as schools only pursue the sources of students and make an expansion of enrollment, because enrollment expansion makes the major segmented and the originally unsound subject system is further into chaos, and the students do not obtain a solid foundation for the sheer language learning, and also their overall proficiency in Japanese is not improved plus the incomplete understanding of the professional knowledge. Thus, they only know a little but are not proficient in the related fields.

### 1.3 *Necessary to strengthen the faculty*

The development of Japanese major is restricted by the teaching methods. At present, an expository teaching method is commonly applied to Japanese education in China's ordinary colleges and universities, in which teachers are responsible for providing explanations and students only need to learn. However, it is not suitable for students to learn a foreign language, because students only receive the knowledge mechanically and passively, and the training in the language application ability of students is ignored by the teachers in the teaching process. In addition, the education will only be a mechanical copy and no top students will be trained if the teachers are not regularly engaged in advanced studies, keep divorced from the social environment, or do not possess practical experience in the business, along with the upgrading of the knowledge and the frequent change of the cultures. Therefore, it is necessary to improve the teaching methods in schools.

## 2 THE MEASURE FOR IMPROVING THE JAPANESE LANGUAGE TEACHING IN INSTITUTIONS OF HIGHER LEARNING

### 2.1 *Improving the construction of the Japanese language subject system*

In the construction of the Japanese language subject system, the training objective must be placed on how to train the students' ability to meet Japanese comprehensive practice, and also it can be geared to the different levels of college students for further highlighting the combination of college students' universality and individuality. The teaching guiding ideology and teaching objective of Japanese education decide that Japanese language teaching should closely keep pace with the advanced development of the times, reform and innovation must be constantly implemented in the teaching process, and then a teaching system to integrate theory with practice and the teaching with scientific research can be established. On the subject design, the basic education centered on the subject must be tightly implemented, and attention can be paid to offering both Japanese public courses and elective courses on the basis of the well-done basic education. In the public courses, attention must be paid to improving the comprehensive quality and knowledge structure of students. In the elective courses, the characteristic of Japanese society and culture should be stressed.

Besides, the special characteristics of Japanese major must be specifically introduced in the construction of the Japanese language subject system, and then the Japanese personnel training objective and a Japanese personal training plan must be further

defined. Also, a subject system must be constructed according to the difference of the major.

## 2.2 *Updating the teaching contents and strengthening the characteristics of the practicality and the times*

The teaching contents must be updated from the following points.

- 1 Teaching contents about Chinese and Japanese cultures can meet the requirements of the times change and the students
- 2 The spread of Chinese and Japanese cultures must be focused and also helps must be produced to train the ability of the students in comprehending and appreciating the Japanese culture
- 3 Teaching contents must be diversified and highlight the practicability and targets
- 4 Teaching contents can fit with the modern teaching means such as computer, multimedia, and network and facilitate the application of the modern technologies to teaching
- 5 Teaching contents must be interesting and ideological, which are conducive to improving the students' interest in learning Chinese and Japanese cultures and their ability in intercultural communication.

## 2.3 *Paying attention to the input of Japanese culture in teaching*

To infiltrate Japanese social and cultural knowledge in Japanese language teaching, the teachers must first get an understanding the social and cultural differences between China and Japan to let students feel aware of cross-culture as soon as possible. Through the following channels, Japanese social and cultural knowledge can be input into Japanese language teaching.

First, the selected teaching materials must be originally edited. In the primary stage of teaching, a percentage of the original Japanese textbooks must be chosen, in which many Japanese cultural backgrounds and customs are involved. In the easy-to-understand dialogues, all aspects of the Japanese culture may be involved.

Second, the cultural knowledge-related materials in the Japanese cultural background, social customs, and social relations must be intentionally accumulated by reading literary works, newspapers, and magazines, or surfing the Internet. The students must be encouraged to read many materials at the extracurricular time and especially in the reading days.

Reading the famous Japanese literary works is also an important method to learn Japanese culture, because the literary works of any nation should be

the essential part of its national culture, the accumulation of the traditional culture, and the most vivid and abundant material to know well its national character, inner world, cultural background, customs and habits, and social communication and so on.

In addition, Japan's latest information can be accessed through online reading. Also, online reading is the most direct, the most efficient way to know well, Japan's current social dynamics, social problems, and social relations. The information is not involved in the teaching materials.

Third, electronic and audio-visual teaching methods can be applied. All aspects of Japanese culture can be reflected by letting the students viewing pictures, videos, or films, so that Japanese society, interpersonal relationship, way of thinking, and other social culture are visually known well by the students. At the same time, the ability of the students to speak and listen to Japanese and accurately communicate in Japanese can be improved.

Fourth, the role of native Japanese teachers must be fully played. Native Japanese teachers can vividly introduce Japan's social situation, cultural life, and local conditions and customs to the students according to their personal experience, so the knowledge in social culture unavailable in the teaching materials are available for students. Moreover, the students, who learn Japanese at home, are in shortage of native Japanese social culture and language environment and have a few chances to make face-to-face communication with Japanese, so the first Japanese to communicate with them are the native Japanese teachers. Thus, the students must be encouraged to boldly communicate and frequently talk with the native Japanese teachers, aiming at speaking a fluent, native Japanese language.

# Application and research of multimedia teaching technique

Lei Xia

Wuhan Business School, China

**ABSTRACT:** Multimedia technology is rising rapidly, by its effective forms of pan, graphic, combining movement and extraordinary performance beyond time and space. Furthermore, it enhances people's understanding and feeling of abstract things and processes, and gradually gets into the classroom, introducing a new realm of teaching, and also makes modern multimedia technology become an important part of education.

**KEYWORDS:** multimedia; teaching technology; teaching application; advantages.

## 1 INTRODUCTION

With the development of society, things people pursue are constantly changing, especially today's next-generation successor of the new century naturally have a lot of curiosity to new things and courage to face them. Therefore, the use of multimedia teaching has become extremely popular. But at the same time, the widely use of multimedia teaching gives us a bigger challenge from which aspects of the matter. From multimedia teaching to traditional teaching and from traditional teaching to multimedia teaching, through analysis of their similarities and differences, profound observations are obtained about multimedia applications in language teaching.

## 2 MULTIMEDIA SOFTWARE TECHNOLOGY INTRODUCTION

### 2.1 PPT software

Currently PPT software is the most common software technology in multimedia teaching application. People can use it to design and create any slides in accordance with their own ideas and slide whatever they want to lay the foundation for the further development of multimedia teaching of a foundation to make a teaching model richer and more interesting.

### 2.2 D studio MAX dimensional animation software

In order to make multimedia software more dynamic can give people a lifelike effect, 3D Studio MAX dimensional animation software came into being, which gives the appearance of vitality and realistic effects we want. It is composed of windows9x or NT operating system three-dimensional animation software.

### 2.3 Director multimedia authoring software

This is a different technique from the first two ones, which specializes in mapping. If you need to map, it is the best choice, a multimedia authoring software based on the timeline. Through it, the producer can make various graphical effects through different production processes and procedures, if necessary, can produce different effects picture.

### 2.4 Flash web animation software

Flash is suitable for making small capacity animation files, in this regard it has a great advantage over the Director. Secondly. Since Flash is small Director, naturally it is animation is relatively easy, so it is very popular in current animation software.

## 3 ADVANTAGES OF MULTIMEDIA TEACHING

With the development of information society, especially today's fast development of science and technology provides a convenient condition for multimedia teaching to step ahead. Now people's lives are becoming more beautiful for the assistance of multimedia. Advanced multimedia technology has far exceeded the traditional teaching and demonstrated its unique advantages.

### 3.1 Visual novel multimedia teaching methods to improve the reproducibility of the scene

The practice has proved that various components of multimedia teaching methods make most students concentrate on learning something of interest, resulting in higher learning efficiency. Multimedia teaching has the features of a large amount of information and strong inclusion and its efficiency is quite

impressive. Learn more teaching knowledge through computer platform and network channels. During the process of teaching, the teacher only shows course contents to the students by sending the program, in this way completely change the teaching methods and teachers' resources are constantly expanding. Now there is a big difference between knowledge acquisition channels and traditional way of knowledge sources, multimedia teaching methods for teachers reduce handwritten costs, enhance teaching capacity and more effectively improve teaching quality and enhance the rhythm of classroom teaching and also students' awareness of hard work to promote students to have more information in a short time. Teachers can more easily achieve their educational objectives.

### 3.2 *The script show of new generation of calligraphy*

In modern multimedia teaching, ppt software production can effectively help us to understand the process about the course and the overall summary of the whole class. Thus, we can make all the class knowledge by different slides, and then through the appropriate adjustments and decor, complete the full integration of all information to demonstrate the students a simple analog calligraphy style of teaching. I believe this has a great necessity and enforceability.

### 3.3 *A combination of static and dynamic beauty show*

Multimedia teaching combines static and dynamic enough to make students feel the beauty, of course, and this unique animated teaching method must be consistent with the teacher's teaching requirements in order to obtain extraordinary teaching achievements. In other words, in multimedia teaching, we can purposely have different information member organically combined together to achieve this unique mode of teaching and make students feel the animated beauty anywhere.

### 3.4 *The beauty of making a courseware background picture*

The use of multimedia teaching needs different steps to produce a good effect slide to highlight the uniqueness of multi-media teaching, from which making the screen will have a great impact on the multimedia courseware teaching, because no matter where the class is, which the teacher is in the class will not present knowledge to the students for a whole class. Sometimes for students to better absorb and understand knowledge what they have learned, it is necessary for everyone to leave enough time alone to digest and deepen knowledge. In this process,

the courseware help students to integrate knowledge atmosphere through different background images. Adding in some pictures to courseware will make the effect change dramatically.

## 4 COUNTERMEASURES AND SUGGESTIONS OF MULTIMEDIA TEACHING IN MULTIMEDIA APPLICATIONS

### 4.1 *Application multimedia teaching should grasp the degree*

As the saying goes: everything should have a degree. That for multimedia teaching is no exception. Although it has a lot of unique advantages, it will never allow us to use anytime, anywhere with impunity, or it would only be a departure from its advantage and make it had a negative side. Maybe some people think that any problem in teaching will be solved by the use of multimedia teaching. If only so I will warn you that you will go into the abyss. At any time, we do not forget what the purposes are we using multimedia education, if you ascribed to the degree that the negative impact is likely to harm you, for example, so that we gradually lose their ability to deal with things and passion.

### 4.2 *Misunderstandings of multimedia teaching*

The development of multimedia technology really alleviates a lot of the burden for contemporary teachers and save a lot of time. But technology advancement does not mean that the teacher in class using multimedia software alone is sufficient but not necessary to practice the behavior of some operations. Whether, to what extent technologically developed, the most fundamental principle that we still can not lose is the so-called teacher behavior. If so, the teacher is a dereliction of duty; emergence of multimedia technologies and applications is a mistake. For the better applications of multimedia education. Multimedia technology must be closely combined together with the practice acts of teachers, and then give students a better education.

# Study on the needs of distance education in the development of the transportation industry

Pei Pei Tang

*Transport Management Institute, Ministry of Transport, Beijing, China*

Meng Bo Gao

*Qijiankaixuan Residential Quarter, Tongzhou District, Beijing, China*

**ABSTRACT:** This paper analyzes the work characteristics and the basic situation of transportation industry employees. Based on the requirements for quality it also researches the employee's needs in job training, law enforcement training, vocational skills training, continuing education of professional personnel and academic education of in-service personnel. The analysis shows developing modern distance education by the application of modern information technology tools in the transportation industry can integrate training resources. It is the most effective way to realize large-scale training of practitioners and building high-quality team of employees.

**KEYWORDS:** Distance education; Transportation industry; Continuing education; Training; Modern information technology.

## 1 INTRODUCTION

Transportation industry changing patterns of development have brought new challenges and opportunities to all levels of education and training of cadres' transportation. Distance education is a new form of education using the Internet and multimedia. Teachers and students are separated and teaching and learning through a variety of actions to achieve contact with educational technology and media resources. Distance education can make interaction and integration of various educational and training resources. This open and convenient feature is an effective way of educating. Situation industry professionals will be analyzed in this paper. It also explores industry practitioners to the demand for distance education in various fields.

## 2 SITUATION ANALYSIS OF THE TRANSPORT SECTOR EMPLOYEES

### 2.1 *Transportation industry employees work characteristics*

1 **Service:** Transportation industries are a modern service industry in providing services for social and public needs, and provide society with products mainly transportation. In the process of management and service it reflects its social value through

social recognition and reputation. The most basic responsibility of the transport sector is to improve the management level and easy line to protect people and achieve a smooth flow of goods. Transport sector employees should have a good sense of service and high level of service. It is necessary to receive regular continuing education and training.

2 **Security:** With the improvement of the level of China's economic development, road transport safety is increasingly being everyone's attention. The primary purpose is to ensure transport safety during construction and operation of construction safety. As the transportation industry employees should have a good safety awareness.

3 **Differences in the working environment:** Due to the wide distribution of traffic, road maintenance workers working and living environment is not the same. Workers at the bustling traffic on the working and living environment is relatively better. Workers in remote mountainous areas, working and living environment conditions are difficult. Regional differences in the transport sector have also led to uneven distribution of human resources.

Due to the transportation industry employees' work in the field and remote areas they cannot accept the long-term academic education. Open and flexible distance education become the most economical and convenient way of education. Features of distance

education are a two-way, real-time, interactive and controllable. Its significant advantage is: any person at any time and any place to start learning from any section of any course. Online Education convenient and flexible learning model directly reflects the learning and active learning features. It fully reflects the development of the basic requirements of modern education and lifelong education.

2.2 Analysis on the basic situation of employees in the transport sector

Source transportation industry employees are very extensive. Including national fixed staff, national contract workers; there is a considerable part of the temporary workers. This group of people is generally low cultural quality and greater disparity. Type the number of high-tech talents is small. This situation cannot meet the needs of China’s rapidly growing transportation industry.

Transportation employees are infrastructure-based conservation and transportation and production personnel. “Continuing Education transportation industry comprehensive study report” for industry practitioners’ qualifications, titles, and skill levels were analyzed.

Table 1. Transportation industry practitioners’ qualifications constitute.

Education (%)	Graduate and above	Undergraduate	College
Road infrastructure	0.2	6.1	12.2
Transportation and production areas	0.2	3.8	11.8
Education (%)	High School	Junior high school and below	
Road infrastructure	27.9	53.5	
Transportation and production areas	39.4	44.7	

Table 2. Transportation industry practitioners and technical titles constitute.

Quality Structure (%)	Advanced	Intermediate	Primary
Road infrastructure	1.5	7.0	12.2
Transportation and production areas	0.8	4.4	7.6

Data show that the transportation industry employees degree or above accounted for only a small part. High school education accounted for about 80%. Primary education accounts for about 50%. The number has the highest proportion of junior titles, the lowest proportion of senior titles. Most of which are junior titles below that constitute a technical level ratio cannot meet the needs of the industry.

3 THE DEVELOPMENT OF THE TRANSPORTATION INDUSTRY REQUIREMENTS FOR QUALITY OF EMPLOYEES

National Cadre Education and Training conference emphasized the need for reform and innovation to do a large-scale training of new cadres. “Implementation Opinions 2008–2012 large-scale training of cadres” a new round of large-scale training of cadres for the Organization Department of the CPC Central Committee General Office issued the direction. It puts forward new requirements under the new situation of cadres training. This new requirement is to enhance the ability to focus on scientific development, improve the quality and efficiency of education and training of cadres and cadres to actively promote education and training reform and innovation. Learn what is necessary to insist on doing. Through the implementation of full coverage, multi-tools, high-quality training, promote learning party and learning society. Cadre education and training is in order to make work better for the scientific development of services and services for the healthy growth of cadres.

China will strive to achieve transportation “three changes.” First, by relying on infrastructure investment and construction changes to the conservation, management and transportation services; Second, by relying heavily on increased consumption of material resources to science and technology, industry, innovation, resource-saving and environment-friendly changes; third change is by a single mode of transport to the development of an integrated transport system. This requires integrated management of the transport sector departments and leading cadres at all levels. They should be familiar with the highway and waterway transportation, but also master the aviation postal aspects of the business. They should also understand the knowledge of rail transport and integrated transport. In recent years a number of new situations often encountered snow disasters, earthquakes, and events such as the taxi industry groups. These events have on traffic cadres to improve crisis management capabilities and solve practical problems raised new demands. This also means that the industry needs a new management cadre system to support its knowledge management capabilities.

#### 4 DEMAND FOR DISTANCE EDUCATION OF TRANSPORTATION INDUSTRY PRACTITIONERS

##### 4.1 Vocational qualification training needs analysis of the transport sector

With the economic and social development and technological progress the industry demands on the quality of employees increases. Employees need to be trained in all aspects including basic vocational knowledge, skills and professional ethics, rules and regulations, knowledge and technology updates and posts adaptability. First is job training such as registered civil engineer and highway engineer supervising practitioners In the report of “Vocational Education Development Strategy” number of vocational qualification training needs of the transport sector were predicted.

Table 3. Future industry professionals predict the overall size (Unit: million persons).

Category	Year: 2010	Year: 2020
Trading of road passenger and freight transport and ancillary services	3256	5228
Motor vehicle maintenance and inspection	288	368
Transportation infrastructure construction and maintenance	1218	1345
Waterway transport	230	253
Port	106	123
Industry Administration	36	36
Total	5134	7354

Table 4. Future industry professional qualification training needs (Unit: million persons).

Strategy session	Year: 2011~2020
Total vocational qualification training needs	2200
Annual training requirement	220

Data shows that from 2020 the industry is expected to reach more than 73 million employees. 2010–2020 total transport sector vocational qualification training needs will increase by nearly 22 million people. Annual training needs of about 200 million people. Thus, the demand for vocational

qualification training for industry professionals is very large. Training task is very heavy we can remotely implement a variety of training to meet the demand.

##### 4.2 Analysis of transport sector law enforcement training needs

Transportation Management Institute in the “About our hospital professional and technical personnel to update their knowledge engineering training situation report” is mentioned as of October 2012, the National Transportation law enforcement officers a total of 41 million people. Where the number of secondary school education or below accounted for about 21% of the total number of tertiary education accounted for 53 percent; bachelor’s degree accounted for 23%; master’s degree or above accounted for 3%. In all law enforcement officers, the legal profession and the professional for 19 million people the number of traffic, accounting for 46%; other professional persons for 22 million people, accounting for 54%. Transportation employees in administrative law enforcement professionals are seldom especially legal type and technical talents. In some remote areas, units of graduate law enforcement officer are less. Most law enforcement officers had not received the knowledge of the education system. Overall quality of transport law enforcement officers needs to be improved.

In 2012 the National Transportation legal work meeting, Vice Minister Gao Hongfeng stressed that carrying out the work of transportation administrative law enforcement training to is necessary. We strive for three to five years for all law enforcement personnel rotations once. And this massive training relies on traditional forms of face to face training is very difficult to popularity. Distance education training methods can be more grassroots law enforcement team and expand the scope of training.

##### 4.3 Analysis of transportation industry management cadre training needs

Ministry of Transport proposed that in the next five years to further increase the size of the industry in the education and training of cadres. Training targeted has effective growing. Cadres according to law and public service capacity have been raised. That is to carry out large-scale industry management cadre education and training for one of the main tasks of this goal. The size of the whole industry education and training of cadres reached 2.2 million people. Faced with such a large-scale training mission, organize training not only can remotely be fully utilized and also is one of the most convenient

and effective channels of high-quality education and training resources.

## 5 SUMMARY

Analysis shows that the transportation industry employees in education and training and personnel training in all aspects put forward higher requirements. Industry practitioners' vocational qualification training demand is great. Professional and technical personnel are very scarce. Increasing the size of the industry management cadre training education and training leading to the traditional methods cannot meet the need. Transportation industry employees in urgent need of large-scale training of open and distance education and training methods.

## Research on the application of task-based language teaching for the English pronunciation course in high schools in China

Yi Lu Nie\*

*School of Foreign Languages, East China Normal University, Shanghai, P.R. China*

**ABSTRACT:** Though the importance of English education has long been recognized in China, the teaching of pronunciation has not received adequate attention. In this paper, we research the application of task-based language teaching method for the English pronunciation class in high schools in China. A 10-week teaching program was designed, involving three different groups consisting of 25 students. The two experimental groups, respectively received instructions by using the Task-Based Language Teaching method and the conventional teaching method. The third group, namely the control group, received no particular pronunciation instruction. Through analyzing the scores with two-way ANOVA and post-hoc method in SPSS, we find that the Task-based Language Teaching group showed more significant progress both on segmental and suprasegmental aspects in pronunciation than the other two groups, and the conventional group is better than the control group, which confirms the effectiveness of Task-Based Language Teaching method in high school English pronunciation course.

**KEYWORDS:** Pronunciation teaching in China's high school, Task-based Language Teaching Method.

### 1 INTRODUCTION

Cliché as it seems, Rajagopalan (2004) pointed that English is recognized as a world language. And China has set English as an important subject in elementary education since China's Opening and Reform in 1978. Despite the importance of English in China, "silent English" is still a label for Chinese students. One of the reasons is that they put most of their efforts in the training of grammar and reading to get a high score in the national college entrance examinations. This phenomenon poses a great challenge to English acquisition because the core language use lies in the communicative function of a language. And communication in English starts with the correct production of sounds and the combination of them, as Gimson & Ramsaran (1970) noted that "to speak any language, a person must know nearly 100% of its phonetics, while only 50%–90% of its grammar and 1% of the vocabulary may be sufficient". So, the current situation of pronunciation teaching calls for adjustment both applicable in English class under the Chinese education system and practicable in improving the pronunciation of secondary school students.

The teaching of pronunciation has long been influenced by two principles that are contradictory to each other—the nativeness principle and the intelligibility principle, pointed out by Levis (2005). The first principle states that English as Second Language (ESL)

learners are likely to achieve native-like pronunciation while the second principle holds that understandability is the key to one's pronunciation acquisition. The latter one has now been the guiding principle in the teaching of pronunciation as researchers agree that foreign language learners' ultimate goal is to achieve intelligibility. Rivers & Temperley (1978) have examined the effect of segmental instructions through phonetic transcriptions and imitation/repetition practice, as well as the effect of suprasegmental instructions which was pointed out by Levis & Pickering (2004). Moreover, Macdonald et al. (1994) probed into pronunciation instruction in authentic classrooms. Derwing et al. (1998) carried out a study where a 12-week course of instruction was conducted. They tried to evaluate the effects of 3 types of instruction (segmental accuracy, general speaking habits and prosodic factors, and no specific pronunciation instruction) on ESL learners. Students were tested in terms of accentedness, comprehensibility, and fluency before and after the course. In this research, they concluded that the choice of pronunciation instruction depended on the target of it, the way of measurement, and the aspects being measured. Also, they stressed that attention to both suprasegmental and segmental instructions benefited ESL learners. Moreover, Levis used two matrixes to analyze the importance of the two factors on pronunciation teaching, of which the first was a two-by-two Speak-Listener Intelligibility Matrix, and the second was a three-by-three World Englishes

\*Corresponding author: yilunie@gmail.com

Speaker-Listener Intelligibility Matrix. Results showed that the two factors weighed differently if different contexts were provided.

Task-Based Language Teaching (TBLT) was put forward in the 70s of the 20th century in the west, but it was not until the middle 80s that the systemic TBLT theory came into being. Several definitions of “task” appeared afterwards. The widely adopted definition of TBLT is the one put forward by Skehan (1998). He summarized the features of TBLT proposed by the former scholars, and concluded that a task is an activity in which meaning is primary, and learners are not given other peoples meaning to regurgitate, and there is some sort of relationship to compare real world activities, and task completion has some priority.

In this paper, we research on the application of task-based language teaching method to English pronunciation class in high school in China. Section 2 is the research design. Section 3 contains data collection and analysis. Section 4 is the conclusions and limitations.

## 2 RESEARCH DESIGN

### 2.1 Participants

This research has been undertaken in a Chinese high school. Altogether 75 students take part in the program, and they are divided into three groups of the same starting level according to their performance in the pre-test. Two groups, as the experimental groups, will receive pronunciation instruction, respectively by using TBLT method or conventional PPP (presentation, practice, and production) approach. While the third group, as the control group, will not have any particular pronunciation instruction session. For the two experimental groups, English pronunciation sessions will be given to students once a week. Each pronunciation session on the 10-week program will consist of two 40-minute parts with an interval of 10 minutes in between.

### 2.2 The operation of the TBLT class

The design of TBLT sessions is based on Willis' (1996) framework, which includes pre-task, the task cycle, and language focus.

The arrangement of the TBLT sessions is as follows: the teacher introduces the topic of the specific session, such as the distinction of the monophthongs: /e/, /Q/ and /E/ and the correct pronunciation of the monophthong /E/ and the diphthong /ei/. A quick elaboration on the topic will be given to help with students' primitive acquisition. Then, the task of the session is supposed to be described clearly until all students understand the steps. A model of task conduction may be presented if necessary. During the task phase, students will be split into pairs or groups

accordingly, and do a meaning-focused activity. In the next procedure, students complete the task and give reports, in which process the teacher serves as a monitor and lead students to focus on the language topic. Eventually, the teacher gives feedback and helps students consolidate their pronunciation acquisition.

### 2.3 Case study

The topic of the session is the correct pronunciation of the pair of short vowel /i/ and the long vowel /i:/ and sound link. The topic is set as two major problems often occur in students' pronunciation of these two vowels. The first one is that students tend to replace some vowels with Chinese pinyin. The other is that many students consider the difference between the short vowel and the long vowel lying only in their duration. As for sound link, students are rarely conscious of this concept even though they have heard it in the recordings. Sound link happens when a word ends with a consonant sound and the next word starts with a vowel sound and only when two words are in the same sense group, can they be linked.

In the pre-task phase, the teacher begins the session with some lead-in introduction to the pronunciation of /i/ and /i:/, including the correct pronunciation and the distinction. The teacher asks students to pronounce /i/, /i:/ and Chinese “yi”. If students find themselves mixing them, they must have done wrong. Then, the teacher demonstrates the correct pronunciation of /i/ and /i:/, and tells students the right positions of the lips and tongue when pronouncing the sounds. What is important is that the teacher should emphasize the difference of degrees of mouth opening when pronouncing the two sounds, as students may only see the difference in the lengths. Also, sound link will be explained and exemplified. The teacher reads the following phrase “get a move on” in two ways, with or without sound link, and asks students to tell the difference. If it is pronounced with sound link, the phrase may sound like two words that have the following phonetic symbols: /getE/ and /mu:vOn/.

The major part of the session is the task cycle and the main task of the session is a story making-up competition. The teacher introduces the task and the rules. After that, students get into groups of 7 or 8 to make up a story with given phrases. And each group has a group leader to make sure all the processes are undergoing according to the rules. Each student is required to make one or two sentences with a given phrase in the given order. When a group of phrases is used up, all the sentences made by the students should make up a coherent story. Different groups will be given a different phrase list, thus different stories will be made and assessed. The stories will be assessed in the following areas: completeness, coherence and the correct pronunciation of the given phrases and the use of sound link.

The topic of the session covers both segmental instructions and suprasegmental instructions. In the TBLT class, meaning is primary. And students know that task completion is somewhat prior to other requirements. Students in the class are not required to do drills and much repetition. They focus on group work and they have to do close-to-life communication with each other. In this process, there is no escape for them to employ all kinds of skills in English pronunciation. The close-to-life communications enhance students' communication ability, which is the ultimate goal of English speaking. And different skills are practiced and reviewed time and time again in every session. Comparatively, conventional class, mostly offers rigid exercises and patterns. Students often do repetitive practice which helps with the improvement of one or more particular skill. They probably know the skills, but it is not certain that they know how to put them into use in real-life communication.

### 3 DATA COLLECTION AND ANALYSIS

#### 3.1 Data collection

Research data come from the pre-test and the post-test results.

Three English teachers are the listener-raters responsible for both pre-test and post-test, which are conducted on all participants before and after the program with no time for preparation beforehand. And both tests consist of two parts—reading phonetic symbols and given words, and reading given sentences, both of which account for 100 points. The first part will be assessed in terms of accurate pronunciation and the second part of overall pronunciation, including accuracy, stress, fluency and intonation. To be specific, the result of the first part will provide data concerning segmental aspect and the latter can more or less reflect the level of student' suprasegmental pronunciation skills.

The first part includes 48 phonetic symbols and 26 words covering all phonetic symbols, each phonetic symbol accounting for 1 point and each word accounting for 2 points. The second part includes 10 sentences, each one accounting for 10 points. Accuracy, stress, fluency and the appropriateness of intonation and overall impression respectively account for 2 points in each sentence.

#### 3.2 Data analysis

For students' pre-test and post-test results, two-way ANOVA is used for data analysis for the two parts respectively, in which two factors can be measured at the same time. For each part, after submitting the data to the two-way ANOVA with pre-test and post-test as

dependent variables and the type of instruction as the fixed factor, one can get three sets of F-value/p-value, two of which are supposed to check if the factors cause any difference in students' pronunciation respectively, and the third one is to prove the significance of the two factors' interaction. A post-hoc test is also carried out in order to compare the effect of different types of instruction, which can prove if TBLT instruction is more effective than conventional instruction.

Table 1 and 2 are multiple comparisons of data from the pre-test concerning segmental and suprasegmental aspects respectively, which show that the significance values among the three groups are larger than 0.05. Apparently, there is no statistical difference in students' performance in the pre-test, which indicates that they have the similar starting line in terms of both aspects.

Table 1. Multiple comparisons of segmental aspects.

(I) Group	(J) Group	Mean difference (I-J)	Sig.
Control Group	Conventional Group	-0.0560	0.981
Control Group	TBLT Group	0.2280	0.924
Conventional Group	TBLT Group	0.2840	0.906

Table 2. Multiple comparisons of suprasegmental aspects.

(I) Group	(J) Group	Mean difference (I-J)	Sig.
Control Group	Conventional Group	-0.0973	0.966
Control Group	TBLT Group	0.8013	0.723
Conventional Group	TBLT Group	0.8987	0.691

Tables 3 and 4 are pairwise comparisons of between-subjects segmental and suprasegmental aspects. From table 3, the different effects of three types of instruction on the segmental aspects can be seen clearly. Both experimental groups show more significant changes than the control group, which has received no particular pronunciation instruction, as the mean difference between the conventional group and the control group is 4.213 and the sig is  $.026 < .05$  and the mean difference between the TBLT group and the control group is 7.974 and the sig is  $.000 < .05$ . In terms of the difference between the TBLT group and the conventional group, their mean difference is 3.761 and the sig is  $.046 < .05$ , which implies the existence of statistical difference between the two

groups and the effect of the TBLT group is better than the conventional group with regard to the segments. In terms of table 4, which is concerned with the suprasegmental aspects, though the mean value of the conventional group is slightly higher than the control group, the sig value is  $.656 > .05$ . Compared to the control group, the conventional group does not show noticeable changes, either. The mean difference between the TBLT group and the control group is 5.644 and the sig value is  $.013 < .05$ , and the figures between the TBLT group and the conventional group is 4.560 and  $.040 < .05$ . The effect of the TBLT instruction is apparent compared with the other two groups. Only the TBLT group improves significantly. This table indicates that the TBLT method has a positive effect on the improvement of pronunciation regarding suprasegmental aspects while the conventional method does not show a significant effect. The TBLT method focuses more on meaning than form, and thus students have more opportunities to do meaningful activities rather than repetitive drills. Students are encouraged to communicate with each other, which leads to students being exposed more often to suprasegmental practices despite part of the focus on segmental training in pronunciation class.

#### 4 CONCLUSIONS AND LIMITATIONS

In this paper, a 10-week program is designed to test the applicability of the TBLT method in a Chinese high school course.

Based on the students' test scores, SPSS is used to analyze the result. Two-way ANOVA and post-hoc are applied to prove the different effect of different kinds of instructions. According to the result of the analysis, the TBLT method proves to be more effective than no particular instruction and the conventional method both in terms of segmental aspects and of suprasegmental aspects.

However, in terms of the application of the TBLT method to EFL pronunciation class, there are several concerns. Just like Carless summarized in 2003, the language teacher may not fully understand the tasks at hand in The TBLT class. And even when the teacher does, he/she may not be able to apply TBLT method in pronunciation class successfully because it is not always easy to relate the pronunciation topics to tasks in real-life or close to real-life activities. On the other hand, not all the students welcome TBLT method as some of them may not have a correct understanding of it and they think it better not to shift the teaching method easily.

Table 3. Pairwise comparisons of between-subjects at segmental aspects.

(I) Group	Group (J)	Mean difference (I-J)	Sig.
Control Group	Conventional Group	-4.213	0.026
Control Group	TBLT Group	-7.974	0.000
Conventional Group	TBLT Group	-3.761	0.046

Table 4. Pairwise comparisons of between-subjects at suprasegmental aspects.

(I) Group	(J) Group	Mean difference (I-J)	Sig.
Control Group	Conventional Group	-.994	.656
Control Group	TBLT Group	-5.644	.013
Conventional Group	TBLT Group	-4.650	.040

**ABSTRACT:** At present, a college English teaching reform aimed at fully improving the English comprehensive application ability has been carried out. The main purpose of the reform is to improve the students' language application skills. The ability of listening is one of the most important skills in language application. However, many students can do nothing to help improve their listening ability. Although the students spend a lot of time practicing listening, the listening ability does not increase significantly. In order to improve the listening ability and quality, the listener has to get to know the related factors that have an effect on the listening ability, and take the corresponding measures to practice. The factors influencing the listening ability and quality can be divided into two aspects: language obstacles and non-language obstacles.

**KEYWORDS:** language obstacles; non-language obstacles; listening comprehension.

### 1 LANGUAGE OBSTACLES

For learning a foreign language, the main obstacle affecting the listening ability is from the language. It includes four aspects: pronunciation, vocabulary, grammar and comprehensive understanding.

#### 1 Pronunciation obstacles

Phonetics is the basic element of language. The first thing needed to improve listening ability is the correct pronunciation. If the listener's pronunciation is not accurate, when the correct pronunciation of the same word comes into the ears, it will not be responded in the mind, or get an incorrect response, mistaken for another word by the mind. Sometimes, the words heard are familiar. But due to listener's different pronunciation from correct one, they will not get to know this until reading the tape script.

#### 2 Vocabulary obstacles

Vocabulary is the foundation of the language. If the students want to quickly improve listening ability, they have to grasp enough vocabulary. Most of the students from colleges and universities in mainland of China have grasped much greater vocabulary in reading than in listening. This has much to do with our emphasis on reading ability,

ignoring listening, speaking and writing ability for many years.

#### 3 Grammar obstacles

Many students have a much more solid foundation of grammar learned in high school. But the problem is that they can only apply the grammar knowledge into reading. Few students can correctly apply them into listening.

#### 4 Comprehensive understanding obstacles

For many students, the most difficult task of listening comprehension tests is a comprehensive understanding of sentence and passage. Pronunciation, vocabulary and grammar are necessary bases in order to construct comprehensive understanding ability. But these are not enough, it is still hard to improve listening ability. Because this knowledge is embedded in the comprehensive understanding of the listening material. In other words, there is none of the questions is to examine how to distinguish pronunciation, vocabulary and grammar in listening tests. Some students focus their attention on the word, not the whole sentence or the passage when doing listening practice. On the surface, they may understand every word, but do not know what the dialogue or passage is saying when put all the words together.

## 2 NON-LANGUAGE OBSTACLES

Non-language obstacles refer to barriers that have nothing to do with language, yet they have much effect on listening ability. There are two aspects: psychological obstacles and cultural obstacles

### 1 Psychological obstacles

When doing listening practice, some students can't focus their attention, and are very nervous. This is a type of psychological obstacles. Inattention, mainly refers to the student body is sitting with the mind absent in listening practice. Even if this situation only lasts for a few seconds, the input of the listening material can be interrupted. It will naturally affect listening ability. Nervousness mainly refers the blank in the mind due to the tension in the tests. Students can't digest the input content, and worse is, listening material cannot be input into the brain.

### 2 Cultural obstacles

Language is the carrier of culture. From macro scope, no matter what language is learnt, one has to learn the culture in which the language takes root. At the same time, cultural differences between the native language and target language have to be understood. From microscope, the individual's width of knowledge also affects listening ability.

## 3 CORRESPONDING MEASURES

From the above analysis, we get a picture about the factors influencing listening ability. In order to improve the listening comprehension ability, university teachers can take measures from the following aspects:

### 1 Strengthen the input of culture

First, teachers should guide the student to read Chinese and foreign language books that are related to foreign culture, getting students to understand human geography and customs of the target language. Second, with the aid of multimedia, teachers help students get visual information through films, television, etc. In the end, foreign novels are strongly recommended for students. Foreign novels contain a large amount of authentic foreign language, and are also the best way to understand the culture of the target language.

### 2 Improve the students' interest in listening course

The listening ability is improved through keeping practice and practice. According to the content of the listening material, the differences between Chinese and foreign culture, teachers should make

listening course full of fun, with the aid of multimedia. It can fully mobilize students' subjective motivation and as much as possible to make every student participate in the classroom teaching.

### 3 Combine intensive listening and extensive listening together

Intensive listening is the basis of listening ability. When choose to listen material for students, teachers should choose those suitable for the students' present listening ability. The listening materials have to be accompanied with the tape scripts.

Extensive listening is an add-up to intensive listening. Extensive listening emphasizes that the amount of listening materials should be large. It only requires students to understand the main idea of each listening material.

No matter intensive listening and extensive listening, the listeners must grasp the key points when doing listening practice. They can take notes to summarize the main ideas of general dialogues or the passages. Taking notes can help listeners memorize the information that has been input. Listeners can adopt abbreviations, image code, etc. according to their own habits.

### 4 Emphasize the importance of vocabulary and grammar

Vocabulary is the basis of listening, speaking, reading and writing translation. It is very important to learn a foreign language. If one wants to improve listening ability, he must grasp a certain amount of vocabulary. This requires teachers to guide students to memorize words by using the pronunciation rules. There are no new grammar rules to be learnt in universities. The teacher needs to help students review the grammars in the process of teaching. Some important and difficult grammars need to be practiced. These lay a solid foundation to improve listening comprehension ability.

## Study on college students' learning motivation

Hong Mei Xing

**ABSTRACT:** Many ancient and modern, Chinese and foreign educators and psychologists have paid special attention to the role of learning motivation in the process of learning. For example: Gardner and Lambert, the most influential foreign language learning motivation researchers stated there were two types foreign language motivation: mating motivation and instrumental motivation.

**KEYWORDS:** learning motivation; learning requirement; learning expectation.

Motivation is the individual's internal psychological activity process that triggers and maintains individual activities, and directs efforts towards a goal. There is another definition of motivation that state as internal motive which govern people's action to achieve the purpose. Motivation can be divided into surface motivation and deep motivation. Surface motivation has a direction correlation to the future of the individual and motive is driven from the external; Deep motivation is generally not related to learners' future and economic interests, with learning motive coming from interest in learning knowledge or culture itself. Motivation has the following three functions: (1) the activation function, namely, motivation can make people act; (2) the directional function, that is, with the function of motivation, individual's action is directed to an aim; (3) the intensifying functions, namely after the activities, motivation can maintain and adjust activities.

Accordingly, learning motivation is an internal process or psychological state to inspire the individual to learn, maintain the triggered learning activities, directing the behavior towards certain learning objectives. It can trigger and reinforce learning activities. The reverse holds true. Once learning motivation is formed, it will stay in the whole process of learning activities. Two basic elements of learning motivation are learning requirements and learning expectations.

### 1 LEARNING REQUIREMENTS

Learning requirements refer to the individual's state of mind in which he feels the lack of the learning

activities and strives to gain satisfaction. It includes learning interests, hobbies and learning belief, etc.

#### 1 Learning interest

Interest (the deep motivation) is crucial to the success of a career. Without interest in specialty, there is no inspiration to learn. A minority of students have born interest in their chosen specialty. They enjoy learning specific subject as a kind of enjoyment, with learning initiative, relaxing, and the learning effect is obvious. Most people get interested in specialty out of work or life need. This kind of interest generated from the need is passive, weak at the beginning. When learning or advantage gets progress, the interest will become positive and intense. Great interest in learning will make people fully concentrate attention, think positively.

As the dynamic mechanism of generating learning activities, learning motivation is important qualification to launch, sustain and complete learning activity, and affects learning effect. The reason why learning motivation can influence the learning effect is because it directly constraints learning enthusiasm. Learning enthusiasm refers to the students' serious, tense, initiative and strong state showed in the learning activities. These mental states are mainly embodied in three aspects which separately are the students' attention level towards study, emotion tendency and perseverance and determination. They are external manifestations of learning motivation, and are consistent with the qualities and level of the learning motivation.

Emotion, is also a mood. Emotion is both spiritual, and at the same time, material. Science shows different emotions directly affect people's behavior. The joyful mood can generate an upward force on people, leading to active behavior and strengthened self-confidence. In the teaching practice, to create a relaxing and joyful learning atmosphere, is the guarantee and prerequisites to make students in high spirits.

Perseverance and determination is the highest form of self-confidence. Unshakable perseverance comes from self-confidence. It is very normal that in the process of learning there is ups and downs, fast and slow progress sometimes even backwards and stops. In the climax and fast forward, learner's self-confidence will be enhanced. They feel proud, even smug about themselves. If there is a slow progress or stop in learning, learners prone to be anxious. Some of them question their own ability of learning, losing confidence, and has never recovered. Generally speaking, the students with stronger anxiety have flaws in such aspects as grasping key points of examination, coding information, resulting in poor academic performance. On the other hand, poor performance is not only related to the situation of the exam itself, but also has much to do with the students' disorder in information processing, especially the unreasonable material organization.

## 2 LEARNING EXPECTATIONS

Learning expectation is the individual's subjective estimates on the goal to be reached in learning activities. It is another basic component in learning motivation structure. Learning expectation is closely related to learning goals, but these two can't be equally treated. Learning goal is the expected results that individual wants to achieve. The expected results stay in the mind in the form of ideas. And learning expectation is reflection of learning objectives in the individual's mind. The experiments showed that the better grades that college students want to get into

college, the stronger the learning motivation is. Without doubts, the expectations should be practical, and in accordance with the actual situation of their own. A reasonable learning goal would make them continue to work hard, in order to achieve more. Even if the temporary score is not outstanding, but if the learner continues to work hard, and with confidence to get good grades in a certain period of time, these learners will also be very hardworking.

Learning requirements and learning expectations are two basic components of learning motivation and are closely related. Learning requirements are the most fundamental driven force for individuals to engage in learning activities. Without this self-produced motivation, individual's learning could not occur. Thus, learning requirements hold the dominating place in the structure of learning motivation.

The role of motivation in the learning activities is complicated. For college teachers, to understand and grasp the types and features of the students learning motivation is of much benefit to effective teaching. Since there are no significant differences in most people's intelligence, it is particularly important to fully mobilize students' non-intelligence factors and stimulate their learning motivation. The approach and method to mobilize enthusiasm is varied. Out of teaching practice, in view of different specialties, different classes and different students, college teachers should adopt different methods to improve the students' motivation level, to encourage students to achieve learning goals, and produce more positive and effective learning motivation.

## Analysis and solutions to the private college students' mental health education

Yan Deng

Sichuan TOP IT Vocational Institute, Chengdu, Sichuan, China

**ABSTRACT:** Purpose: Recently, most of the colleges and universities have paid attention to this issue, but there still are so many deficits in specific strategies and policies. This thesis is based on the analysis of the college students' mental health education. Through the perspectives of enhancing the environmental building of college students' mental health education, gathering high quality professional teachers, enriching the methods of teaching in class and constructing the benchmark system of mental health, the thesis wants to investigate and conclude sufficient solutions to the college students' mental health education. Methods: Experiential summary. Conclusion: 1. Integration of resources to carry out college students' mental health education. 2. To form high quality teachers. 3. Rich private colleges college students' mental health education class teaching means and methods.

**KEYWORDS:** mental health education, background analysis, explore and think.

### 1 AN INTRODUCTION TO THE RECENT SITUATION OF COLLEGE STUDENTS' MENTAL HEALTH EDUCATION IN PRIVATE-OWNED COLLEGES

#### 1.1 *Ideological and political education as the mental health education*

The ideological and political education tends to make judgments according to students' behaviors and problems and lead them to the mainstream. On the contrary, mental health education does not help the students to make any decisions, or lead them to make any decisions by their own value system. The golden idea of mental education is that, educators or consultants must keep themselves neutral, not to offer any instructions for students, meanwhile, many mental health education theories emphasizes the function of men's selves, and believe that everyone has the ambition and capability to become better.

Some privately-owned colleges think that mental problems are thinking problems, so they can easily help the students realize their faults and step to the right direction via sentimental and rational convincing. It mixes the mental education with character building, so it is very difficult for the mental education's function to work.

#### 1.2 *Low qualities and rare opportunities of the privately-owned mental education teachers*

##### 1.2.1 *Education staff's lacking of occupation belongings leads to scarce career planning and stagnant education development.*

Mental health education organizations vary in different privately-owned colleges, some attached to student's union, some attached to Youth League Committee, and some attached to related teaching branches. These layouts make the mental education jobs unorganized and inefficient for lacking of overall planning, communication and ambiguity of liability.

##### 1.2.2 *Serious shortage of mental educational teachers*

Some privately-owned colleges seriously lack of psychological teachers, especially the professional teachers and researchers. The main sources of mental education staff are psychology, education and political theory teachers and supervisors, college hospital staff and part timers. A large number of them have no training on mental help and consulting.

Taking a Sichuan-based privately-owned college as an example, there are only three full-time professionals in mental center, but for education burdens,

they are also taking great portions of time in teaching tasks. So, it is very difficult for them to implement other mental educations. Because of cost issues, it is hard for privately-owned colleges to implement both professional and part-time mental educational teams. The part timers always work extra hours with little even without payment, in the long term; they will lose enthusiasm and quit the job.

### 1.2.3 *Shortage in mental education's training system of privately-owned colleges*

Compared with other developed countries and regions, we lack a high quality teaching team in mental education; the main reasons are that our mental education is still in its infant stage with low efficiency, and the training organizations are rare. It is worse in college mental education.

The mental education staff in many privately-owned colleges adopted their profession rather late in lives. Limited by their systematic study and training, they cannot handle the problems of students.

Meanwhile, survival issue and practice of operation offers almost no opportunities for the teachers to get leveled up. Sometimes, they have to pay the tuition by themselves to take training courses, as the charge kept rising, a lot of teachers have to drop the chance to take any training courses. So, the efforts of the mental educationists are not sufficient, and they need colleges to support them either in charge or in time, by doing so, it can help the educationists polish their skills and enrich their knowledge.

### 1.3 *Stiffness in privately-owned colleges' mental education*

College students' mental health has aroused more and more attentions, but there are still some colleges, which do not understand it well, and this makes the education worse.

Part of the privately-owned colleges included mental education into their curriculum, but for the practical part, they are always professional courses based on printed books. Their education mainly focuses on knowledge, so many students can not acquire any benefits from this course. It is totally not going to work with this pattern, on the contrary, it has a negative effect on students' minds and cannot achieve the goal of its original purposes.

From the perspective of mental health courses, different colleges have different ways. Some colleges set mental health courses as compulsory course, some set them as optional or limited optional course, and others set no such courses.

Taking a Sichuan-based privately-owned college as an example, there are only 16 class hours in freshman period, including mental adaptation, communication,

characteristics, personality, studying psychology, internet psychology, love and sex psychology and career psychology. However, all its courses are easy and hard to further explore, courses are always theories and knowledge that the students are always confused with. Limited by the curriculum, students cannot use this knowledge to practice.

For students, the mental courses have high popularity, and they want to relax themselves and study some skills from mental education. The survey supports my point, for there are over 78% questioned students thinking the mental education courses are insufficient and 85% of them needing variable instructions on mental health according to stage characteristics and missions.

### 1.4 *Wrong understanding of college students' mental health education*

Many teachers have always targeted the minority who has mental diseases as their focus. Since the job of mental health education is to popularize its importance and to shape one's personality, recently mental health education has not only limited the contents, but has no merit to solve the mental problems of college students. The worse is, by some degree, that it brings more burdens to the students, because they are always afraid of being treated as a psycho or being labeled as sick. That makes it very difficult to pave out the daily operation of mental education, not mention the solving of problems.

### 1.5 *Lack of mental education's measuring system of private-owned colleges*

First, privately-owned colleges pay much attention on survey to the new enrollments, but they neglect the overall understanding of whole schooling years. Recently, most colleges will take some valuation jobs over freshmen, but these jobs vary in time and focus. The SCL-90 chart is the most popular one to test the students, but after the first test, there is always no further test. Some problems such as communication, anxiety and body can be picked out from the test, so some colleges are taking some measurements to follow and probe these students. The lack of further investigation will lead to some problems, such as the issues of study, communication and emotion in sophomore, mental burdens of job hunting in junior and so on. The college cannot direct and release this burden for lacking of further investigations.

Second, some colleges will revalue the process and have talks with certain students who have such problems, and report them to related departments. But the process just ends here, they will not compare these data with previous ones and analyze why it happens. So, departments, which have direction relationship with the students' living, cannot realize the students from mental characteristics, and hard to think and explore the way to educate them sufficiently.

Last, archival management in some colleges is improper. In previous years, most colleges kept their archives by paper, and after the survey, all archives are isolated without proper care. Recently, after the popularity of computer software's, most colleges kept their archives on the computer, but still, they lack of data filing and handling.

## 2 THE EXPLORATION AND THINKING ON HOW TO IMPROVE THE MENTAL HEALTH EDUCATION OF PRIVATE-OWNED COLLEGES

### 2.1 *Improve the environmental construction of privately-owned mental health education*

#### 2.1.1 *Constructing and completing mental health evaluation systems, checking and tracking students' mental problems*

Colleges should adopt some methods like mental consulting or mental measuring to operate mental health survey and construct college student mental health archive, so as to find out problems and solve them immediately.

On the other hand, freshmen always run a higher degree in survey, but their mental conflicts will release or vanish when they gradually adapt themselves to the new environment. Meanwhile, new conflicts will come after their lives stepped in colleges. So, privately-owned colleges should take survey in every stage to follow and track students' mental health.

Except measurements, private-owned colleges should also try different channels to grasp the students' mental status. For example, a Sichuan college grasps their students' mental status monthly by filling monthly mental health chart. It is useful to find out the students' mental status so as to direct and intervene them immediately.

#### 2.1.1.1 *Setting mental health courses as compulsory course to popular mental health knowledge*

The mental health course has always been the common channel to popularize mental health knowledge. It not only makes the students realize themselves but erect the right health idea. Mental department has the liability to introduce the channel to improve mental health, and make the students grasp a scientific and sufficient way to study. It can develop students' potentials and cultivate their innovation and practical abilities. Besides, these courses should also convey the way of mental adaptation to make the students learn how to make mental adaptation and release mental problems sufficiently. Finally, these courses let the students learn the origins of mental problems and the main phenomena of mental problems to treat them with scientific attitude.

Furthermore, according to the situation, mental health teachers should improve the interactive communication between teachers and students in conveying mental health knowledge. Through the combination of theory and case, based on interactive analysis, teachers should let the students pay attention to self-adaptation. Meanwhile, the teachers must positively stimulate their students' enthusiasm and initiation to create good chances by scenario experience and discussion. Finally, teachers must research and learn from experience, emphasize the interactive process and probe the development rules with students. All these will improve students and complete their personality in the study and living.

#### 2.1.1.2 *Combination of resources, developing mental health activities and improving students' mental qualities*

The mental health education in private-owned colleges should cultivate the atmosphere, which care students' mental health and improve students' health quality. Colleges should take lectures, mental salon, mental knowledge competition, mental community and mental magazine as models to propagate and popularize mental health knowledge. Colleges should also support the mental health association, and help them to operate some special activities such as mental training, movie watching, mental salon and discussion to improve their abilities by helping themselves and others. Colleges should focus on the content and methods of mental health education, especially the Internet platform, because it can greatly improve the sufficiency of mental health education.

#### 2.1.1.3 *Campus atmosphere of mental health education*

First, colleges should move forward the development of infrastructure. Colleges need make the campus beautiful and green, and make the campus buildings different from others. Meanwhile, colleges should let the students feel that campus is the right place to learn knowledge; another way to improve the mental health education is to complete the teaching facilities such as enough books and good supporting services.

Second, colleges should pay attention to the development of software. The impact of good college and class atmosphere is profound to the students. Also, colleges should emphasize the importance of cultural propaganda, college ratio, college magazines and other media to fully utilize their functions.

#### 2.1.2 *Professional teams with high quality*

##### 2.1.2.1 *Professional mental education teams*

The job's orientation of private-owned colleges requires the professional training background and a certificate of its teachers. Besides this, the

professional teachers should be respectful and sincere to step into the students' inner heart.

Meanwhile, professional teams should improve their quality through basic experience and opportunity to get promoted. That will guarantee a sufficient and professional team to handle daily problems.

#### 2.1.2.2 Supervisor's quality of mental health education

The supervisor is the most familiar one to most college students. The supervisor knows their students better and they are the perfect one for students to confide. So it is very important to improve the quality of supervisors in colleges.

Although mental consulting avoids the double relationship between consultant and visitor, supervisors' daily job is not fully consulting, so improving the training of supervisors and letting supervisors handle daily problems with their mental health knowledge can guarantee the operation of mental health education efficiently.

#### 2.1.2.3 Introduction of professionals outside of the college

It is critical to introduce the professionals from outside. It can not only tighten the line between college and society, but also improve the relationship between full time and part time teachers. Colleges can hire some social, mental professionals to take some courses in colleges, and they can also precede some lectures to stimulate students' interests. By this way, the improvement of students' mental health has great guarantee.

### 3 THE MEASUREMENTS TO ENRICH THE MENTAL HEALTH COURSES IN PRIVATE-OWNED COLLEGES

Recently, some college mental courses are simple and unitary; basically, they utilize the traditional way of teaching, so this kind of teaching lacks the

interaction between teachers and students. Lacking of positivity made the education inefficient or even ended in failure, and in class, they have no innovation, so the course lost its original target as popularity and became boring to most of the students. So, it is vital for colleges to change the original design of courses. Increasing interactive content to class makes students experience different feelings in rehearsals, it not only improve the curiosity, but also make the students use the way into their daily lives.

Colleges should enrich the mental courses, and set a systematic, targeting and hierarchical course for their students. For example, they can set a system of studying the method, career training, living instruction, and emotional control based on different stages and grades.

As a conclusion, college students' mental health has a great impact on their growth and the success of total higher education in China. So, colleges should take great emphasis on students' mental health education to provide basic hardware or software support, and to contribute every possible resource to let the students learn knowledge and skill.

## A survey of the reform of college physical education teaching

Xiao Mei Zhao & Qiang Wei

Physical Education Department, Tangshan College, Hebei, China

**ABSTRACT:** This article analyzes the process of the reform of college physical education and the present situation, illustrates the principles that we stick to during the reform of physical education in colleges and some reform achievements, points out the existing mistakes and problems, and puts forward the corresponding strategy and the concrete operation scheme, in the hope of providing additional insights into the development of the reform of physical education in colleges and universities.

**KEYWORDS:** College physical education teaching; Reform; Teaching mode.

In recent years, the reform of college physical education teaching has brought rapid changes. Teaching methods and teaching thoughts have developed constantly. The single and rigid teaching modes have become various and flexible. Many new things appear. The new ideas, new teaching terms, and teaching methods have sprung up. The reforms of college PE teaching have been taken at any time. At present, the reform of college physical education teaching is stepping into a new era.

In the study of the reform of college physical education teaching, we should teach students in accordance with their aptitude, taking the physical differences of students into consideration, to make every student gets a proper physical education and proper physical exercises. At the same time, we should tap the potential of students in the process of the reform and cultivate their personalities, trying to create one kind of physical education class which can enhance the students' physical quality comprehensively. The reform should explore new teaching methods and teaching modes courageously, and break through the traditional shackles to change the traditional teacher-centered mode. Although the reform of college physical education teaching in recent years has made great achievements, some problems still exist. The author analyzed the reform of college physical education teaching and carried on a scrupulous research, pointed out some existing problems, and put forward some measures for improvement.

### 1 THE ANALYSIS OF THE PRESENT SITUATION

#### 1.1 *The unchangeable principles of the reform of college physical education teaching*

After studying the reform process of the university physical education teaching and exploring the meaning and the essence of the reform, we can see that it

is not hard to find, the principle is always the same although education reform is constantly changing. All of the reform measures are to make full use of the physical education time, to reflect the value of physical education, to tap the potential of physical education curriculum. Tapping the potential of physical education and embodying the value of physical education are the unchangeable principles of the reform of college PE teaching. They are the constant theme of sports reform, also the goal of the reform of college physical education teaching. A new era of reform of physical education is still to adhere to the constant principle, aiming at embodying the value of physical education and tapping the potential of physical education to push the reform through.

### 2 THE ACHIEVEMENTS OF THE REFORM OF COLLEGE PHYSICAL EDUCATION TEACHING

#### 2.1 *The deepening perception of the reform*

Knowledge is the precondition of all and it is the foundation of practice. Without the understanding of the things early, everything is hard to move on. For many years, the reform of college physical education teaching has been a process during which the perception is deepening and the thought is constantly improved. (1) The understanding of sports is constantly deepening. The understanding of sports has changed from the original thoughts of simple exercise into the increasing awareness of the theory of sports teaching now. The understanding of sports is becoming more and more perfect, and more and more rich. It is something from nothing. (2) The deepening understanding of the sports teaching purpose. Teaching purpose and the value of physical education

changed from one dimensional biological concept of sports in the multidimensional concept of sports in the aspects of biology, psychology and society.

The change of the value of physical education promotes understanding of sports. A lot of people realize that sports is not only a purely physical fitness, but also the guarantee of healthy life. A great number of people begin to attach importance to sports training and fitness. At school, for students, physical education curriculum changed from the original single recreation and exercise with the implementation of quality education, which put emphasis on cultivating comprehensive talents. More and more physical education curriculum is taken seriously by the school. The teaching contents are becoming more and more rich which can stimulate the interest of students and involve more students into the physical education. The understanding of sports is changing, and the value of sports is changing, as well as individual's inner perspective. Only in this way, can we pay attention to the sports in daily life, and take exercise intuitively and let people find new sports to enrich the sports world.

## 2.2 *The broader vision*

The changes of vision, to a certain extent, promote the reform. After the establishment of new China, the reform of college physical education has been based on the Soviet model, and then the view gradually expanded to the world, especially the western developed countries. After the study of other's teaching modes, and realizing the shortage of our own teaching mode, we began to take teaching reform in our country, and gradually got rid of the Soviet model, starting to absorb outstanding achievements in the reform of physical education all over the world. Second, the reform of college physical education was taken under the background of reform and opening up. It was comprehensive and powerful. The reform was taken from a single sports science development in a combination with a variety of other disciplines, including natural science, social studies, cultural and economic, social and so on.

## 2.3 *Diverse teaching modes and human-centered contents*

Compared with the previous physical education curriculum, the biggest change in the reform of college physical education is that the teaching modes have been increasingly diversified. The teaching contents are more and more humanized. The courses are becoming more and more attractive. The change of teaching modes and teaching contents is the practice of the deepening reform of physical education, and it is the greatest achievement of the reform of college physical education. The change of physical education

teaching modes is from top to bottom. The national education ministry issued the corresponding documents to guide the schools to carry on the reform the physical education mode. The various universities took deeper and broader reform in modes and contents in accordance with the guidance of the state, taking the actual situation of staff, venues and students into consideration and breaking the shackles. The single and monotonous education mode becomes rich and scientific. The teaching contents are well-designed and more attractive. In terms of teaching contents, the reform is directed at the philosophy of people-oriented; embodying the humanization of the reform of teaching content and well connecting the newly-emerged sports with traditional sports, providing students with a variety of choices, and teaching students according to their aptitude has been possible. The diverse and humanized teaching contents will be able to attract students and stimulate students' interests. In the diversification of teaching content, we should set limitation; the contents shouldn't be too many, adapting to the students' interest. Humanization should be given priority to.

## 3 THE EXISTING PROBLEMS

### 3.1 *Indistinct aim of the reform*

When making their own teaching tasks, different colleges cannot reflect their own personalization and lack innovation. Some of the colleges cannot embody their identity and fail to emphasize the importance of the lifelong physical exercise, the physical quality development and the cultivation of their own personalities. It is difficult to make students form a kind of lifetime sports faith to fulfill the mission of the college sports education. What's more, a lot of theoretical stuff stays on the books. And students learned a lot, but there is no practice, those things are just theoretical. Although some knowledge is comprehensive, but empty, lack of focus and goals, and without enthusiasm.

### 3.2 *The physical education classes are often normalized by the teachers*

The physical education classes are often normalized and simplified by the teachers. The teachers often organize the student to practice queue formation to enhance the coordination and mobilization, and put these as one of teaching evaluation. This form is too simple, monotonous and boring, and it can't let students play their own special skill and look for their favorite sports. This kind of sports classes is difficult to meet students' needs which are diverse and human-centered. And it is unfavorable for students to improve the interest in sports, and it cannot cultivate the students' faith of lifelong exercise.

### 3.3 *Too much autonomy in the reform of college PE teaching*

The reforms of college physical education are probably of two trends. The first trend is that the schools give students too much autonomy. They advocate the open policy overly, ignoring the supervision status of teachers. The students are neglected, inactive and at a loss, let alone physical exercise in advance. The second trend is that the schools are against passive teaching process. To stimulate student interests, meet the needs of the students, and give full play to the students' creativity and enthusiasm, the schools organize students to choose their own learning contents. Therefore, some of the teachers think that if we want to stimulate students' interests and meet the requirement of students, the teachers should just provide guidance to the students without teaching organization. But students in the class are lack of organization, discipline and regulation. In the long run, the college physical education teaching is difficult to become scientific and standardized, and the students are unable to master the spirit of sports and to tap the potential. This kind of teaching which is just to satisfy the students' a temporary need, denies the role of the teachers and it is very undesirable. The students' cooperation and active learning should be combined with the supervision under the guidance of teachers in order to create a positive learning atmosphere.

### 3.4 *Misunderstanding of competitive sports*

In quite a Long time, competitive sports have been strongly rejected and thought the cause of fights and disputes between students. Some people even think that competitive games should be expelled out of school. Are competitive sports not really suitable to exist in the campus? What's the matter with competitive sports exactly? The changes over the years have proved that there is nothing wrong with competitive sports. In recent years, the contents of the competitive sports have been weakened, while students are becoming increasingly weak. This shows that competitive sports are suitable for the campus. And competitive sports can arouse students' interest. The human nature had made it. But some colleges are lack of competitive sports; many students can only choose other items which are not appealing enough instead of funny competitive sports.

### 3.5 *Backward teaching materials*

Nowadays, the college physical education teaching materials are single and dull, which can't be made full use of by the students. The extracurricular practice teaching materials are less than the theoretical physical education materials. It is difficult for students to

get more useful knowledge. Now, composing sports teaching materials has been in the traditional and stable style. There is no innovation, and less new science of sports knowledge, even less new ideas in accordance to the needs of social development, let alone new contents. Sports teaching material are out of date, lack of local features and corny. The contents of teaching material are too single, lack of entertainment, and ignoring the cultivation of students' skills and interests, and not in favor of the students to take the initiative to find suitable ways to exercise.

## 4 COUNTERMEASURES FOR THE REFORM

### 4.1 *Regard the reform in the philosophical perspective*

The reform of college sports education should pay attention to a combination of teaching and learning. The reform should be well-organized, carefully planned and with clear purpose. As for the teaching, the teachers should set good examples, improve the sense of responsibility and take each class seriously. The simplification and formalization of class should be removed. As for the learning, it is from the perspective of students' obligations. The students should cooperate with the teacher for each class, give full play to their own expertise, and find their potential. The teachers and students are equal in the terms of value and status. The teachers should do their own things, and take responsibility, to create a learning atmosphere for students to learn actively with enthusiasm. The students should learn critically, explore new knowledge, and construct their own knowledge structure.

### 4.2 *Keep competitive sports in perspective*

All things exist for reasons. In the sports world, the existence of competitive sports has its reason. Competitive sports embody the technology and skills of sports, and the technology and skills of sports are the essence of sports. In addition to that, competitive sports and sports are also closely linked. The athletics sports are the most important way to improve students' physical fitness and to execute the objective of physical education. It is the essential means to promote students' development. Competitive sports play an indispensable role in education, socialization, and the development of their own personality.

### 4.3 *Improving the teaching material system*

Teaching materials which can appeal to more students should be designed. The relationship between the traditional and the new should be handled. We

should be groundbreaking and rational. A complete system of teaching materials, which can highlight the key points and be well-proportioned, should be established. The teaching materials should be modernized and localized to show the features. The curricular and extracurricular teaching materials should accord with these each other, coping with the relationship between the comprehensive development and individual personality.

## 5 CONCLUSIONS

To sum up, the reform of college physical education should be seen as a whole. The present reform should be combined with previous data, and be perfect gradually. Education reform is a process of rational

thinking and constant practice. Only a moment of passion and impulse cannot work. In addition, going in an extremely way in the reform of college physical education should be avoided. Therefore, in the face of the problems in the reform of college physical education, proper judgment and measures must be taken.

# Study on the application of art education based on multimedia teaching

Bao Quan Pan & Mei Ni Xiong

*College of Fine Arts, Beihua University, Jilin, China*

**ABSTRACT:** The significance and function of the multimedia teaching in art education were analyzed according to the special feature of multimedia technique, and the application of multimedia teaching in art education from three aspects was discussed. Prospects for the multimedia teaching in art education are given at last.

**KEYWORDS:** Multimedia skill; Teaching course software; Art teaching.

## 1 INTRODUCTION

With the rapid development of the information age, computer multimedia technology is widely used in the teaching of subjects, promoting education and educational technology change and progress, so that modern education in the information age. In recent years, more and more people have realized that IT is playing an increasingly important role in modern education teaching. In this environment, the art of teaching, great changes have taken place in the traditional fine arts teaching gradually integrated multimedia technology and theory, in the art of teaching has injected new vigor and vitality. However, most of the existing school art teaching professional application of multimedia technology is still in the primary stage, has not yet formed a complete teaching system. As a complement and supplement traditional teaching, the popularity of multimedia features and the computer so that the computer multimedia teaching has become an indispensable part of the art of teaching. Multimedia systems usually consist of multimedia hardware systems, multimedia operating systems, multimedia authoring tools, and multimedia applications in four parts. The multimedia hardware system includes a computer, CD-ROM, audio input/output, video input/output and other equipment, is the foundation of a multimedia system.

Real-time operating system includes multimedia task scheduling, and synchronization of multimedia data conversion control, drive and control of multimedia devices and a user interface with a graphical and pan functions and the like. Multimedia authoring tool is a tool to create multimedia applications software, collectively, it can be text, graphics, images, animation, video and audio and other multimedia information control and management, and put them into a complete connection required for multimedia applications. Multimedia application system developers to

use computer language or multimedia authoring tools to create multimedia applications software products, is directly facing the user. In the art of teaching are the multi-use multimedia applications. So, computer art multimedia technology compared with the traditional teaching of art teaching, advantages and practical significance were discussed.

## 2 THE ROLE OF COMPUTER MULTIMEDIA TECHNOLOGY IN TEACHING ART

The role of computer multimedia technology in teaching art has the following main aspects:

1 multimedia art teaching can improve the quality of teaching, improve teaching efficiency. Full use of modern teaching media for teaching knowledge and skills is promote the development of students' knowledge and skills to improve their mastery of knowledge, ability quality. The use of modern teaching media for teaching and vivid is infection and strong, easy to stimulate students' interest in learning and internal motivation. Students develop knowledge and skills in all aspects of perception, understanding, memory, applications can play a beneficial impact. Student learning and mastery of knowledge is a variety of senses (eyes, ears, nose, and body) to pass information to the outside world and the formation of the brain centers. These different functions of the senses, in the study, eyes, ears, brain function, coordinate better the play, the higher the efficiency of learning, which is a rule. The use of modern teaching media can fully mobilize the student's eyes, ears and brain function; improve the efficiency of student learning.

Multimedia art teaching offers a personalized teaching environment, so individualized and personalized learning a reality. Modern art education is education for the future of innovation. Individualized teaching is that we adhere to the objectives pursued,

because there is no personality, there is no innovation. Modern educational technology, especially the development of information technology, multimedia computers and networks are increasingly expanding range of applications in art teaching, to personalize teaching created unprecedented conditions. Better able to adapt to the individual differences of students to achieve individualized, so that students get a real subject of this innovative liberation.

Multimedia courseware easy to upgrade, you can make the art of teaching always walk in the forefront of teaching. Multimedia courseware upgrades can continue to improve rapidly add new content to accept the most advanced ideas and design philosophy of art, which is the traditional way of education as the main textbook is difficult to match.

4 multimedia art teaching art educations can expand and promote the popularity of art in a larger context. With the development of science, has been an increase in home computers, computer technology for multimedia teaching methods used for art education to create a good physical condition.

### 3 COMPUTER MULTIMEDIA TECHNOLOGY IN TEACHING ART

Computer multimedia technology in an art foundation course in computer applications in art teaching universities is generally placed in specialized courses designed art lesson, rarely involves basic course, most teachers believe that the traditional art of teaching is the key to solving the shape of basic skills students. But the study, we found that the traditional teaching of basic courses in computer multimedia teaching should be assisted. In this regard, we can learn on the computer and briefly studied art analysis. We know that the traditional art of teaching is mainly on the basis of sketches and color teaching, teaching in the sketch is mainly to solve our modeling capabilities, modeling training, perspective, anatomy, sense of space, texture, composition and other content; color teaching in our main solution hue contrast, color contrast, complementary color contrast and color space and color contrast and well-being and so on. We discuss these issues now can be done in a number of software, that is, for color sketch studies can be carried out entirely in the computer. Such teaching and research can save a lot of time, avoiding the production of hand-painted dull duplication of effort. Take a color mosaic effect work constitutes an example, if you want to complete a form, you need to repeatedly create and modify, wasting a lot of time and effort. The application of computers to complete simply enters an image in Photoshop software, and then performs Filter- Pix elate- Mosaic command, a mosaic work done in an instant.

We also found that there are some modern software can simulate the effect of a variety of drawing tools, has now developed software such as Fractal Design Painter is good painting software. It provides a lot of painting tools, such as pens, pencils, brushes, watercolor pen, oil paints, airbrush, crayons, etc., but also offers a wide variety of strokes, to a certain extent, truly mimics the effect of freehand drawing. Such as when using painting tools, mimic Van Gogh, Cezanne and other masters of the brush strokes; when the brush tool, combined with wet drawing paper, the effect of Chinese painting on rice paper for the imitable. Although it cannot fully replace the painting, the painting can be used as a research method and means. In this way, students can save a lot of freehand drawing practice time, students can also develop visual thinking and analytical skills, help cultivate innovation ability.

Computer multimedia technology in art appreciation class application is an important part of art class art teaching content. The purpose of art appreciation, mainly in fine arts teaching in two ways: first, through the appreciation of works of art, to understand the history of art development, grasp the law of development of fine arts; second, through appreciation, inspire students' creative thinking, and thus create outstanding works. Through appreciation, teaching courses on pictures or slides are operations due to the complexity of the fuzzy, often not very efficient. Using computer multimedia teaching, art appreciation class effect is greatly changed. As long as teachers have a multimedia computer, there are art appreciation information and data to a disc loaded into the optical drive (CDROM), students in the appreciation of classical works, a little mouse, a painter's masterpiece and biographies will appear, not only can get a glimpse of picture works, you can also zoom in partial observation; not only a comprehensive view of the works, you can also choose to enjoy or have a work print.

Students in the classroom can break time, space, geographical restrictions, and foreign gallop across the ancient and modern, art gallery stroll. Appreciate the art of architecture, when not only the usual way to appreciate the buildings form of visual perception in the stationary state, but also can do dynamic display, allowing the building to spin up, enjoy the multiple sides of the building. You can also incomplete, or damaged historic buildings were restored. Enjoy a graphic design or cover design time, but also can be altered according to their preferences, but it is also indispensable for students to creative material. These are the traditional appreciation class unmatched.

Computer multimedia technology in the computer is professional courses in art, as a modern tool, first used in art class in design teaching. It is widely used in the design, liberated the previous complex design work, improve work efficiency, the designer's right-hand man.

The accuracy is concerned, with the computer to produce an object the size of an absolute right, almost no errors. Such as the use of CAD software or 3DMAX produced graphics, with an accuracy of less than 0.1mm, it can show the most delicate part of the design, which is the traditional hand-painted difficult to achieve, but its camera angles, pleasant to the eye point of view, depending on from fully simulate the real, not the existence of handmade randomness and imprecision. Therefore, the authenticity of computer design by the majority of designers agrees. In recent years, the development of software used in graphic design software is gradually increasing, a common two-dimensional CorelDraw, Photoshop, AutoCAD, and three-dimensional 3DMAX other software.

In painting courses teaching, there must be a lot of painting techniques require students to master, every teacher of painting styles, techniques have their own characteristics. The instructor is necessary to allow students to expand their horizons, to absorb. Application of multimedia technology, breaking the teachers' knowledge of this one-way transmission of information sources, expanding the scope of information exchange teaching, breaks the teaching space, so that unrestricted access to information and delivery time and space. For example the Central Academy of Fine Arts masters editing techniques textbooks, covering drawing, painting, oil painting techniques, such as content, teachers can combine curriculum content for teaching demonstration, in the classroom so that students can see the famous painter's lecture demonstrations, but the key place to repeat Play, learn to understand the true meaning of painting masters. Similarly, professional instructor's techniques can also be made from their own multimedia courseware demonstration teaching, improve teaching effectiveness.

#### 4 IMPACT OF CONTEMPORARY CHINESE PAINTING ART EDUCATION DEVELOPMENT

Chinese painting as a symbol of Chinese art, has developed a number of years, has experienced a long history. Its development and development of traditional art education is basically synchronized. A traditional art education model for studying the development of self-contained Chinese painting provides a strong guarantee, but the crisis has brought to the development of Chinese painting, Chinese painting may lead to the development of stagnation and rigid.

With the introduction of Western culture, contemporary art education has been given a new content and features, traditional art education has been seriously challenged, and Chinese painting is no exception. Chinese and Western cultures fierce collision, given the contemporary art education conform to the

trend of the times, and the Chinese have a tendency to weaken the function of painting, we can see the impact on Chinese painting contemporary art education development is enormous. Therefore, Chinese painting to have sustainable development, we must look for a path.

Given the cultural heritage and cultural traditions there are significant differences among different ethnic, fusion of contemporary Chinese painting art education and the presence of significant challenges, mainly as follows: Western contemporary art education curriculum is based on the theory, although trying to achieve Western reconcile, western system in order to mark the traditional Chinese painting art education is based on the poetry of learning-based, it is trying to achieve a comprehensive innovation in the original basis. Since the starting point of contemporary art education and traditional art education, the focus is different. Should contrary to objective laws, not according to the actual situation of contemporary art education and the development of Chinese painting, blindly impose two very different systems together, will generate a lot of negative impact, but we should make an objective assessment, can not ignore the contemporary the positive role of art education for the development of Chinese painting.

Contradictions are opposites, we study the impact of Chinese contemporary art education in the process of painting effects, specifically requires an objective analysis of contemporary Chinese painting art education teaching, writing produced. This article from the aspect of two dimensions, the use of comparative approach, in teaching, through the teaching objectives, teaching methods, teaching materials, teaching content, teaching evaluation analysis of differences in traditional and contemporary art education art education; in the creative aspects of, will be an inspiration on Chinese painting, technique, emotion comparative study, summed up the pros and cons of contemporary art education for the development of Chinese painting, but overall, pros and cons, more harm than good.

Because of our long-term in a feudal society, and the ancient social, political, cultural and systems are designed to meet the needs of the ruling class. The prevalence of the traditional hierarchy is art education, just to satisfy the interests of the ruling class and the service. In this case, the role of art education is major with a strong "into enlightenment, helping Fallon," the. In this historical context, the traditional art education does not have a complete and standardized education system. In particular the teaching process, the main idea is to master personal education based, then painting learners main objective things through observation and copying works of the classical way to achieve the purpose of drawing creation. Contemporary Art education is committed to the community to cultivate creative talents, and the

fine arts education in the country gaining in popularity, becoming a national art education. Up to now, we have been gradually achieving the transformation of quality education by exam-oriented education to the “moral, intellectual, physical, aesthetic, labor” comprehensive development.

Visible, education has become the most basic rights of every person, and not a few aristocratic privileges, which will benefit the construction of a socialist harmonious society. Contemporary art education teaching objectives conducive to the development of our comprehensive quality education, improve the overall level of China’s national art knowledge. For the construction of a beautiful home that has everything to gain but no harm. However, we also see the shortcomings cannot be ignored him an objective reality. Universality corresponds to the peculiarities of contemporary art education is universal knowledge for all students in the art of Chinese painting teaching goal setting, and not as a traditional art education that, according to each student’s specific conditions, can amount tailor the most appropriate teaching painting learning objectives and teaching goals at any time to adjust according to the needs of learning. Contemporary Art by differences in education and Chinese painting teaching objectives analysis, summed up contemporary art education exists on the pros and cons of teaching objectives. We can see that they are closely related, the latter is dependent on the former, while drawing on Western art education.

## 5 CONCLUSION

Computer art multimedia technology in teaching, not only to speed up the progress of the art of teaching, improve learning outcomes, more important is that it can give students a more novel stimuli, resulting in the best area of the cerebral cortex related development, so as to stimulate their creative evolving thinking. To innovative works are art majors. The information age, computer multimedia teaching the art of teaching is the direction of development, however, stressed the

role of modern teaching media is not to deny the traditional teaching, but rather calls attention to a combination of both in teaching practice, flexible use. Contemporary art teaching focus on the integrated use of multimedia in order to continuously improve the quality and efficiency of the art of teaching. The main trends in the art of teaching is the traditional teaching media development and integration of modern teaching media, and gradually form a complete, current information society to adapt to the development of art education system.

## Research on higher art education based on the aesthetic intuition theory

Hui Jie Ji

*School of Chinese Language and Culture, Beihua University, Jilin City, China*

**ABSTRACT:** The problem of higher art education has been collated and analyzed by combing aesthetic intuition theory, investigating the actual educational situation and education experimental. The theory of aesthetic intuition solutions is proposed based on the basic law of higher art education.

**KEYWORDS:** Intuition; Aesthetic intuition; Art education; Comprehensive education.

### 1 INTRODUCTION

Art is a human and often by this mental activity, but also constitutes a history of human civilization is an important part, as early as in ancient times, arts education has existed. It is a unique way to penetrate into the depths of people's lives. Art was once thought to be in this science, as opposed to the discipline and rationality was shelved, art education and education are also divorced from the overall goal. Until the 1960s, some art-depth study of psychologists and psychological mechanisms of aesthetic theorist of art, perception and cross-cultural, just to make people aware of the value of art itself, an emerging trend of arts education grew and developed.

Arts education throughout the education foundation stage should play what role, what kind of arts education is the most effective? United States is the world's first art courses included in the core subjects of basic education; it would mean the so-called core subjects will stand on the same level with math, science, language these disciplines, equitable division of teaching time. As we all know, in today's education, discipline increasingly fine division. Such an increase implies something the students want to learn more and more, but their times are fixed. As a result, the constant increase in core subjects or other subjects only make students more overwhelmed. For this reason, the development trend of the moment the best education is infinitely split from discipline to a new integration. Arts education in this, should implement the existing curriculum standard, advocated artistic ability is to train students and humanity's integration development. It is an integrated aesthetic intuition all sense and sensibility to artistic ability into aesthetic activity. Therefore, how people perceive the aesthetic intuition, how to understand the process of aesthetic intuition in art education's role, and what kind of

approach to training is worth exploring issues such as students' aesthetic intuition.

### 2 AESTHETIC INTUITION THEORY

Intuition aesthetics is one of the modern Western aesthetic genres, produced in Europe in the early 20th century's. The main representatives are the French and British Whitehead Bergson. Is a philosophy of life as the philosophical foundation of an aesthetic genre, life philosophy that life is the essence of all things, the basis of existence, reason and experience can only grasp stationary things, and only intuition can experience the presence of life? Intuition is above life philosophy Aesthetic Theory in the aesthetic field. Bergson believed the ordinary way of things intuition and expression, not the expression of a direct perception of the phenomenon of life, resulting unique feelings, it's missing a number of specific characteristics of life. The artist has created a life can show stretches of perception; intuition is the beauty of this unique intuition, that is, artistic motives. Theoretically knowledgeable people also believe that intuition is less than the young and innocent little children, the artist must not lose the innocence of a child. Intuition aesthetics and performance aesthetics of the 20th century laid the aesthetic thought iconoclastic, anti-rationalism in the direction of the symbols on the aesthetics and aesthetics phenomenology had some impact. Intuition has become an important concept in modern aesthetic theory.

In the field of aesthetics, it is also known as the aesthetic beauty of intuition, the two words mean the same thing. In the 19th century, the Western emphasis on logic and experimental cultural background, once the aesthetic intuition irrational and mystical tendencies to the extreme. But it is precisely because of this

phenomenon, the West intuition theoretical psychology research shifted from philosophical speculation. People are with psychology, physiology and brain science to study the aesthetic intuition. Although each school on a range of issues there are differences, but in the presence of rational precipitation aesthetic intuition on this point is more consistent. On an aesthetic intuition emphasized the rational side, but it is not wholly logical. Intuition is not a simple and intuitive aesthetic is not in accordance with the usual "syllogism" deductive logic or inductive logic reasoning. This means that it has a strong insight and creativity. Aesthetic intuition can be used for art appreciation, but also can be used for artistic creation. Since the research on intuition and aesthetic intuition is derived from a branch of science refinement-visual psychology. Visual psychology is a psychological phenomenon in visual perception and visual perception caused for the study subjects.

### 3 REALITY ART EDUCATION CONFUSION

The overall goal of art education, new curriculum standards referred to "the learning process of students in art, rich visual, tactile and aesthetic experience, access to art of enduring interest in learning, form the basic art literacy", "improve the aesthetic ability to understand art the unique role of cultural life and social development." Here is more clearly explained the ultimate goal of art courses. In the "targets" in the four fields of study made specific teaching requirements, these instructional purposes basically not much difference with older versions of curriculum standards. It is worth mentioning that in the "comprehensive exploration of the area," the teaching objectives, calling for "understanding the relationship between art and nature, art and life, art and culture, between art and technology, to explore and comprehensive art activities, and to published in various forms of learning outcomes", where clearly pointed out a comprehensive exploration of objects and methods, while the new curriculum standards also require our art curriculum to make students feel a sense of pleasure and success.

As we all know, in today's education, discipline increasingly fine division. Such an increase implies something the students want to learn more and more, but their time is fixed. As a result, the constant increase in core subjects or other subjects only make students more overwhelmed. For this reason, the development trend of the moment the best education is infinitely split from discipline to a new integration. Arts education in this, should implement the existing curriculum standard, advocated artistic ability is to train students and humanities integration development. It is an integrated aesthetic intuition all sense

and sensibility to artistic ability into aesthetic activity. Therefore, how people perceive the aesthetic intuition, how to understand the process of aesthetic intuition in art education's role, and what kind of approach to training is worth exploring issues such as students' aesthetic intuition.

See some natural or man-made works of art, we tend to happen on an emotional excitement, perhaps pleasant excitement, perhaps sad passionate, whether it is the former or the latter, in short, we were moved, so emotional the excitement, called appreciation, that is, we are looking at things from the beauty. Education is when a person learned in school has forgotten the rest of the stuff. Into their own behavior within that part of the way of thinking is not visible knowledge is permanent. No matter what kind of art education means education methods, we want to achieve the ultimate goal is to train a person's right or even aesthetic intuition is a national beauty bright positive psychological intuition and aesthetic.

Because aesthetic intuition without hesitation and a look that is beautiful aesthetic phenomenon, people tend to go for the emotional behavior aesthetic intuition, put it on the shelf, and scientific and rational opposition. As Freud and psychoanalysis, led by Western modernist art is the artistic expression of this anti-rational. After careful thought is not difficult to find, aesthetic intuition itself is permeated with a rational deep component, bears deep and rich social and cultural connotations, this intuition has all the ability to think. It has a rational component, needs to be guided art education and promotion. Aesthetic intuition is an important measure of the strength of the aesthetic capacity through artistic training of artists generally has relatively strong aesthetic intuition.

### 4 LIGHT ART EDUCATION THEORY

Aesthetic intuition is the most common aesthetic procedure in a state of mind. In ancient times, people's living environment is difficult to see what kind of rules, and art to create simple, graphical rules, and created a sense of order in the midst of the confusion. Therefore, the original artist was regarded as a shaman; human ethnic groups have a higher cultural knowledge. In the original sense of the human simple, the artist represents the gods and prophets. Because of the lack of art and art-depth understanding of artistic creation is often attributed to divine inspiration, is a sacred and inviolable power. "Divinity" art naturally ruled mankind for a long time. "Aesthetic intuition" of the prototype, from Plato and Aristotle to Plotinus, has gradually formed. It is worth mentioning that in the "comprehensive exploration of the area," the teaching objectives, calling for "understanding the relationship between art and nature, art and life, art

and culture, between art and technology, to explore and comprehensive art activities, and published in various forms of learning outcomes”, where clearly pointed out a comprehensive exploration of objects and methods, while the new curriculum standards also require our art curriculum to make students feel the sense of pleasure and success.

Plato believed that only God’s creation is the ideal aesthetic. Just imitating what the artist craftsman made, like a mirror copy out the same and it is an imitation of God’s creation artisans creates useful objects. Plato’s “ecstasy,” said the same divinity with color, referring to nothing more than a gifted or possessed by the god’s subconscious creation. Among these, already contains intuitive grasp the whole meaning of the United States. Aesthetic point of view Plato’s divinity with a strong color, his art holding a pessimistic attitude that mankind is impossible to achieve, “God,” the realm of abstract painting cannot grasp the nature of the object.

To Aristotle, he turned to the topic of the aesthetic theory of the art technical aspects of the creative process, to avoid the continued discussion of the divine. Make aesthetic break free from the rich colors of theology, divinity Aristotle optimism after Chinese scholars with the views coincide. The impact of this transition is far-reaching, is the source of the integration of Chinese and Western aesthetic concepts, but also from the theological aesthetic research laid the foundation for the later. Pontius is to distinguish it from the general aesthetic feeling activities, and the creation of the visual aesthetic concepts. Research can feel the gradual transition from theological aesthetics of color visual description to describe the concept of rationality.

## 5 PRACTICE OF ART EDUCATION OF THE ROAD

Observation is an acquired skill acquisition, called the skill is learned through training. While some people are born with the advantages of focus, eye-hand coordination advantage, but most people need to be trained on its sensory organs. Here I am more willing to put into intuition and observation records, the most honest observation is that we see something intuitive, able to record directly to the most essential thing is intuition courses on other subjects very helpful thing. Just about the ability to observe these courses are often submerged in the culture keen on realism in art education, preferences technical than artistic.

About appreciation activities, no doubt, are to be developed through art education. A key material from the late finishing aesthetic experiment, you can find and enjoy their psychological types and performance capabilities there is a certain relationship. From a

narrow perspective, to appreciate a work of art is the expression of others to make one kind of feedback. A picture is good or bad, is neat piecemeal, everyone really is there so a standard, but the standard spots carefully grind down, you will find a subconscious standard. Factors for each type of art society in general have a similar psychological basis, whether children or adults in painting performance will be with a certain idea, but rejected the direct manifestation of an adult psychological tendency increases the complexity of the painting expression sex.

Few students lack the test standard of beauty; there are also various types of painting equivalent of each individual’s psychological tendencies. This is the most original aesthetic intuition, give a very simple example, let an intense phobia of people to enjoy a dense line of painting is not very realistic. Observation and appreciation of the culture are to comply with the students’ aesthetic level and preferences. Different preferences for each student, but always from the many types of art found in the subjects they are interested in, integrated teaching art classes cut from a different perspective, not only enrich the students’ knowledge, but also for aesthetic intuition made a very good bedding.

## 6 MATERIALS AND METHODS

Selection of Sprague-Daley rats, pregnant 9–10d. Pregnant rats were sacrificed by cervical dislocation, cut the skin, muscle and peritoneum along the midline to expose the uterus. Separated out the rat embryos were placed in vials containing penicillin Bouin’s fixative fixed 24 h. Under the rat tail with a scalpel cut the number of rat tail collagen fibers extracted root, first into penicillin vials containing Bouin’s fixative fixed 24 h. 2~3 min and then stained with eosin, and make it red. According to requirements of the paraffin-embedded tissue dehydration, transparent, dipping wax, pour the melted paraffin-embedded slot, and then head up the vertical placement of rat embryo groove surrounding the embryo is inserted vertically slightly longer than three embryos the longitudinal axis of rat tail collagen fiber bundles as a positioning line, so that rat tail collagen fiber bundles in the embryo outside evenly distributed and parallel to the longitudinal axis of the embryo.

Selection of 5 mm is serial sections of a sheep embryo (HE staining, 500). Sliced shot taken using a digital microscope image, due to the larger slices, each slice will be divided into several parts were taken and saved as JPEG format. Then run Motic images assembly 1.0, the number of rows and columns load pictures selected, and sequentially load images, select the appropriate consolidation method, the optimal scanning step and scan mode, mosaic image, and save it as JPEG format.

Using Adobe photoshop7.01, and the use of hand-positioning and computer positioning method combines two-dimensional image acquisition to be corrected positioning. Get image method in Java then the captured image from the DICOM format into JPEG format, select 256 colors (16-bit depth) image, to obtain black and white DICOM images while the image capture, compression processing. Finally, all converted to DICOM format two-dimensional image into a specific directory, run the three-dimensional reconstruction of medical software, complete three-dimensional reconstruction of a two-dimensional image.

A picture is good or bad, is neat piecemeal, everyone really is there so a standard, but the standard spots carefully grind down, you will find a subconscious standard. Factors for each type of art society in general have a similar psychological basis, whether children or adults in painting performance will be with a certain idea, but rejected the direct manifestation of an adult psychological tendency increases the complexity of the painting expression sex.

## 7 CONCLUSION

In this study, the specific impact statements and interviews statistical data analysis, from all areas of the Jilin-based art education art teacher and student perspective, a comprehensive understanding of the current status quo in particular the basis of the art of teaching and the problems Jilin area, and from the aesthetic intuition the paper analyzes the causes.

Outstanding cases related to the foreign culture intuitive analysis of finishing and modern educational

environment, designed two different levels of student learning, teaching cases, and adjust the implementation of the specific circumstances. Finally, analyzes and summarizes the information obtained teaching experiment results showed that significantly improve the students' interest in fine arts disciplines, changed their concept of aesthetic appreciation. Art Education for the training of basic aesthetic ability to provide certain significance. Meanwhile, the study of this subject in statistics and interviews enrich the research results of this project.

# Application of new multimedia teaching in music education

Ning Sun

Teacher's College, Beihua University, Jilin, China

**ABSTRACT:** According to the special feature of multimedia techniques, the significance and function of the multimedia teaching are analyzed in music education, then the application of multimedia teaching in music education is discussed from three aspects. Prospects for the multimedia teaching in art education is given at last.

**KEYWORDS:** New Multimedia Techniques (NMT); Music education; Application.

## 1 INTRODUCTION

With the continuous deepening of quality education in the regular teaching, with the “curriculum reform” in the conventional teaching development, multimedia technology as a new means of education has appeared in the music teaching in universities. It breaks through the limit of traditional teaching in time, space, greatly broaden the students’ vision of the music, to arouse students’ interest in music learning, enrich the teaching content, widen teaching view, stimulating students’ thinking. Therefore, paying attention to the organic integration of multimedia and music teaching is very important. But we also have to admit that some teachers have in this respect gone to another extreme, too much emphasis on multimedia materials show, reflect and ignore the teacher’s own technical quality and teaching ability, this is a new problem worthy of our attention.

“Compulsory education music course standard” explicitly pointed out: “modern education technology represented by the information technology greatly expands the capacity of music teaching, enrich teaching methods and teaching resources, has broad application prospects in music education, teachers should strive to master the modern information technology, the use of the combination of audio-visual, audio one, strong image, a large amount of information, resources and broad service for teaching.” So, under the new curriculum standard university music classroom should be how to apply multimedia technology, make its full service for classroom teaching. Here, the author of this problem from the following aspects to talk about their own views:

Multimedia music class”, refers to a variety of multimedia of combinatorial optimization music class”, also refers to “multimedia computer-assisted teaching of music class”. Especially the latter, integration and control of multimedia computers, diversification,
